In Washington, US Congresswoman Ilhan Omar condemned Israel's actions in Lebanon and called for an immediate end to US military aid to Israel. "The lesson Israel has learned, time and again, is that it can commit genocide and other atrocities with near-total impunity. Now it's exporting the Gaza playbook to Lebanon," she said in a post on X.

Since mid-March, Trump has repeatedly claimed that he was on the verge of finalizing a peace deal without delivering on the pledge. Even with the tentative Lebanese ceasefire in place, Iran and the US have traded tit-for-tat strikes multiple times in the past seven days.

Meanwhile, Esmaeil Qaani, head of the Quds Force of Iran's Islamic Revolutionary Guard Corps, warned that Tehran may extend its Strait of Hormuz blockade to the Bab el-Mandeb Strait, another vital maritime chokepoint at the Red Sea's entrance, Tasnim reported.

Crude oil futures clung to multimonth highs on Tuesday amid simmering geopolitical risks, with US WTI crude hovering around $92 a barrel and global Brent benchmark near $95 per barrel.

"While markets had hoped to shake off uncertainty on the back of prospective peace talks, oil fundamentals remain unchanged as of this morning," Priyanka Sachdeva, a senior market analyst at Phillip Nova, a financial services company in Singapore, told Al Jazeera.

China, UK to enhance relations

Pledges made during Beijing talks on high-level exchanges and strategic communication

By **JI HAISHENG** in Beijing and **WANG MINGJIE** in London

China and the United Kingdom have vowed to maintain high-level exchanges, enhance strategic communication and consolidate positive momentum in bilateral relations amid growing global uncertainty and economic headwinds.

These pledges were made on Tuesday during UK Foreign Secretary Yvette Cooper's separate meetings in Beijing with senior Chinese officials.

Cooper's three-day trip, starting Monday, follows British Prime Minister Keir Starmer's visit to China in January — the first by a UK leader in eight years — during which both sides agreed on a road map to stabilize and advance ties. Following her stay in the Chinese capital, Cooper is scheduled to visit the southern technology hub of Shenzhen in Guangdong province.

Noting that improving bilateral ties serves the interests of the people of both sides, Vice-President Han Zheng told Cooper that both sides should work together to practice true multilateralism, jointly advance global governance reform, and bring greater stability and certainty to the world.

During the 11th China-UK Strategic Dialogue on Tuesday, Foreign Minister Wang Yi said that bilateral exchanges and cooperation across all sectors have fully resumed and are gradually getting back on track, and that it is all the more important to cherish this momentum.

Wang said China hopes the British side will provide Chinese enterprises with a fair, just and nondiscriminatory business environment and reasonably define the boundaries of security concerns.

Cooper said the UK is willing to work with China to advance institutional dialogues and deepen cooperation in areas such as the economy and trade, finance, energy, artificial intelligence, and addressing climate change.

She said the UK's policy on Taiwan, which has been in place since the establishment of its diplomatic relations with China, has not changed and will not change.

The UK is willing to continue to engage in candid dialogue with China, constructively handle differences, and promote the sound and stable development of UK-China relations, she said.

In 2025, bilateral trade reached $103.73 billion, representing a year-on-year increase of 5.3 percent, according to the Chinese Foreign Ministry. China remains the UK's largest trading partner in Asia, while the UK is one of China's major trade and investment partners in Europe.

Wang Zhanpeng, director of the British Studies Centre at Beijing Foreign Studies University, said the China-UK Strategic Dialogue serves as a broader high-level platform emphasizing the overall development of bilateral relations.

He highlighted that the two sides' mutual commitment to fostering a long-term and consistent comprehensive strategic partnership provides a crucial anchor for stabilizing bilateral ties.

Jim O'Neill, former commercial secretary to the UK Treasury, described the high-level engagement as an important opportunity to further improve bilateral relations.

"Any visit by a British prime minister, chancellor or foreign secretary presents an opportunity to advance bilateral relations," said O'Neill, adding that he believes the UK should continue making long-term efforts to deepen ties with China.

Tom Harper, a lecturer specializing in China's international relations at the University of East London, said the meeting represents "a step in the right direction" and reflects the broader stabilization of China-UK relations in recent years. "As a result, it is possible that the meeting will further build upon that momentum," he added.

Against the backdrop of global economic uncertainty, analysts said that closer China-UK cooperation carries significance beyond bilateral ties. Both countries are permanent members of the United Nations Security Council and share responsibilities in addressing global challenges, including climate change, economic recovery and international security, they said.

Wang, the British studies expert, said that enhanced strategic communication between the two nations is crucial for navigating today's turbulent international situation.

Harper said that recent visits to China by senior officials from various countries reflect a growing recognition of China's role in the global economy and international diplomacy.

"There has been a recognition that China is an important part of the global economy, which means that it cannot be ignored nor shunned," he said. "Cooperation with China will be an imperative for wider global economic stability."

Jasmine: Flower exported to more than 70 countries

From page 1

People pick jasmines during the opening ceremony of a festival marking the start of the jasmine harvest season on April 30 in Hengzhou, Guangxi Zhuang autonomous region. LI LIPING / FOR CHINA DAILY

"It was so cool. The workers really put a lot of effort into the whole process. It's also a beautiful location; the environment is so fresh and smells amazing," said O'Farrell.

Diversified products, including jasmine-flavored beverages, had them wanting more. "These taste really delicious, especially the milk tea," he said, adding that despite being coffee lovers, they have been drinking tea and other jasmine-flavored beverages.

Among Chinese entrepreneurs who are elevating Hengzhou's profile to a new level is Wu Yuming. After completing his studies in the United Kingdom in 2023, Wu, who hails from Taiwan, moved to Hengzhou to run a tourism-related farm and factory called Aroma Garden. The mission, as he puts it, is "to build a high-end industry chain for jasmine products, integrating the fragrance of jasmine into people's daily lives — into what they eat, drink and use".

Wu works together with farmers to learn how jasmine grows and to better understand market requirements, and he helps them upgrade their planting techniques in order to extend the flowering season, standardize varieties and increase the yield. The improved quality of the flowers boosts Wu's business in return, as his team develops a range of high-quality products including personal care items and daily necessities.

Wu's Aroma Garden has mapped out a "jasmine fragrance trail" to attract tourists. During the flowering season in spring and summer, visitors can walk through a vast sea of blooming jasmine, pick flowers, and seek a hands-on experience in extracting essential oil and creating their own signature scent.

Data from the local government shows that Hengzhou's jasmine plantation area of around 12,000 hectares produced over 150,000 metric tons of fresh flowers in 2025, with the output value surpassing 19 billion yuan ($2.81 billion).

Most flagship domestic and international beverage brands source their raw materials from Hengzhou. A complete industrial chain centered on jasmine has been established, incorporating potted plants, dining, health and wellness services, and tourism.

Meanwhile, leveraging the China-ASEAN Expo, Hengzhou's jasmine has entered the broader market of the Association of Southeast Asian Nations, and is exported to more than 70 countries and regions.

"Jasmine embodies the quintessence of Eastern elegance," said Wu, the entrepreneur. "Hengzhou offers one of the finest jasmine resources. We aim to extract and preserve this natural fragrance and create a scent that belongs to China."

Visit: Education partnership deepening

From page 1

Thanks to the strengthened connectivity, economic and trade cooperation between Laos and China has yielded fruitful results for mutual benefit, and practical cooperation has benefited the people of both countries.

Statistics from China's Ministry of Foreign Affairs show that last year, bilateral trade between Laos and China soared to $9.82 billion, a year-on-year increase of 19.3 percent. In 2017, it was $3.1 billion, according to China's General Administration of Customs.

Furthermore, China remained Laos' largest foreign investor, with cumulative investment exceeding $18 billion, according to the Laos-China Cooperation Committee, highlighting deepening economic ties between the two countries.

Beyond infrastructure, China and Laos have also expanded cooperation in several fields, such as industrial capacity, finance, agriculture, energy, telecommunications and healthcare.

Education is also an example of the deepening cooperation between the two countries.

Every time distinguished visitors arrive at Nongping primary school in Vientiane, Phanthong Khamthongdee, the principal, proudly points to a framed letter hanging prominently on the wall of her office.

Carefully preserved behind glass, the letter bears the personal signature of Xi. It was sent in reply to the school's teachers and students in 2019 — a moment that remains one of the school's proudest memories.

Founded in 1964 with a capacity for about 50 students, the school was rebuilt in 2012 with support from the China Foundation for Peace and Development. Since then, the foundation has provided volunteer teachers and educational materials, and the school was renamed the China-Laos Friendship Nongping Primary School.

In April 2019, teachers and students from the school were invited to attend a subforum of the second Belt and Road Forum for International Cooperation in Beijing. Before departing, the students wrote a letter to Xi expressing gratitude for China's support in rebuilding their school.

"We gathered thoughts from both teachers and students, and spent several days perfecting every detail," Phanthong recalled, taking out the original four-page handwritten letter.

Just four days after it was sent, Xi replied.

In the reply letter, Xi thanked the Lao students and teachers for writing to him, saying he was impressed by their happiness and aspiration for a good life and moved by the heartfelt feeling toward the Chinese people demonstrated in their letter.

To achieve common development and to make people's lives better in the countries participating in the Belt and Road are what prompted him to propose the initiative, Xi noted in the letter.

Xi welcomed the students to travel to Beijing via the China-Laos Railway, which was then under construction, and expressed his hope that more organizations like the China Foundation for Peace and Development would join efforts to benefit communities participating in the Belt and Road.

Phanthong, the principal, said the school had never imagined that China's top leader would respond to a letter from an obscure primary school in Laos.

"All the teachers and students were incredibly excited," she said. "His words gave us courage. They became like seeds for a brighter future planted in our hearts."

Today, thanks to continued Chinese support, the school serves nearly 200 children between the ages of 3 and 13. Chinese companies have also helped fund a basketball court and donated computers and books.

"Our school is now one of the best-equipped in the district," Phanthong said. "We also have volunteer teachers from China who teach Mandarin, which has attracted many local families to send their children here."

For many students, China is not only a friendly neighbor but also a place tied to their dreams and imagination.

Saengchan Saiyakhom, an 11-year-old student at the school, hopes to visit China one day. "Beijing is at the top of my wish list because I want to try Peking duck," she said with a smile. "I saw it on social media. It looks very different from Lao food and extremely delicious."

Japan's remilitarization slammed

Moves to bolster defense, intelligence 'repeat prewar mistakes', critics warn

By **HOU JUNJIE** in Tokyo and **YANG HAN** in Hong Kong

Japan's recent efforts to strengthen its security and defense capabilities, including plans to expand its intelligence framework and revise key security policies, have sparked concerns at home and abroad over the country's remilitarization.

Critics have urged Japan to uphold the principles of its pacifist constitution and warned against repeating its prewar mistakes.

Within Japan, critics argue that legislation passed last week to establish a national intelligence council and a national intelligence bureau could significantly expand government surveillance powers and return the country to the dangerous path it once followed.

Before and during World War II, Japan's Special Higher Police, known as Tokko, and military police organizations actively suppressed anti-government movements and civil society groups.

The newly passed legislation is aimed at building a national system to centralize intelligence information, the first of its kind since World War II.

With the national intelligence council at its core and the national intelligence bureau serving as its implementing body, the system will coordinate intelligence activities.

Following the law's passage, the Ryukyu Shimpo warned in an editorial that the national intelligence council and related measures, including proposed anti-espionage legislation, could fundamentally alter Japan's political and institutional character and echo the country's prewar system.

The editorial argued that as intelligence and national security bodies continue to expand, government agencies could gain broader powers, potentially threatening citizens' privacy and freedom of expression.

Calling for oversight

The editorial called for stronger oversight of government authority and democratic checks and balances on national intelligence institutions.

At a protest in Tokyo on May 29, two days after the legislation was approved, demonstrators voiced concerns over what they described as Japan's accelerating military buildup.

A protester named Matsuzawa said he strongly felt that the country was moving toward greater militarization.

He said that moves by the administration of Prime Minister Sanae Takaichi to revise Article 9 of the constitution and promote anti-espionage legislation evoke memories of prewar Japan.

"My children are still in elementary school," he said. "If things continue in this direction, I don't believe we will be able to leave them a peaceful Japan."

According to the Shimbun Akahata newspaper, Gyo Ishii, a senior staff writer for Kyodo News, also expressed concerns during deliberations on the legislation.

He noted that prewar Japan steadily strengthened its intelligence and secrecy systems through a series of laws and argued that the current government's efforts to establish a national intelligence council and strengthen anti-espionage legislation bear similarities to that process.

Ishii said the Takaichi administration is seeking to transform Japan into a country capable of waging war by expanding its intelligence apparatus.

He warned that the issue concerns not only the pacifist principles enshrined in Article 9 of the constitution but also the freedoms of speech and the press guaranteed under Article 21.

The Democratic People's Republic of Korea recently published a series of articles slamming the rising militarism in Japan.

The attempts by the Japanese government to revise the pacifist constitution, legitimize the "Self-Defence Forces", and even restore the military ranks used by the former imperial Japanese army indicate the current government's attempt to remake Japan into a "war state", the DPRK's state newspaper Rodong Sinmun said in a commentary piece on May 23.

The article said the attempts are an extension of Japan's move toward militarization, including increased military spending, revision of three security-related documents, and discussions of abandoning the three nonnuclear principles.

The article pointed out that Japan, an ally of the United States in Northeast Asia with deep military ties to NATO, fired offensive missiles during a joint military practice in early May for the first time since World War II.

These developments offer no assurance that the island nation will refrain from again attacking neighboring countries despite its loud calls for peace, the article added.

While history gave Japan a chance at rebirth after its defeat in World War II, the Japanese ruling party has instead used the generosity of the international community to revive militarism, it said.

"If Japan rushes madly down the path of remilitarization and attempts a new round of invasion, it will end up in far more severe self-destruction than in the past," the article warned.

From ping-pong to pickleball, friendships endure

By **SHI GUANG** in Washington
shiguang@chinadailyusa.com

The Chinese embassy in Washington hosted an evening celebrating youth friendship and "pickleball diplomacy" on Saturday, with the premiere of a documentary following a trip by US students to China during Spring Festival earlier this year.

The event brought together about 200 US students, their families, teachers and guests. In the pre-event warm-up activities, participants tried on traditional Chinese outfits such as *hanfu* and viewed photo exhibitions. They also tried their hand at *zongzi* by carefully folding bamboo leaves and filling them with sticky rice and dates.

Chinese Ambassador to the US Xie Feng delivered remarks at the event emphasizing the role of sports in building connections.

He said that through pickleball, youth in China and the US have developed a sincere friendship. They learned from each other and experienced an open China, connecting with one another and building bridges of communication.

"From ping-pong to pickleball, the paddles have changed. But our peoples' shared wish for friendship remains as strong as ever," Xie said.

Participants share their experiences in China at the Chinese embassy in Washington on Saturday. CHEN MENGTONG / CHINA NEWS SERVICE

"China and the US are like two players on the same sports court. We play by the rules and respect one another," he said.

Xie noted that half a month ago, Chinese President Xi Jinping and US President Donald Trump held a historic meeting in Beijing and "agreed on a new vision of building 'a constructive China-US relationship of strategic stability'".

That, he said, "provides strategic guidance for our bilateral relationship over the next three years and beyond".

Xie also highlighted President Xi's recent reply to a letter from Chinese and US students taking part in "A Shared Voyage: China-US Youth Friendship Program".

In the letter, Xi noted that the initiative to invite 50,000 US students to China for exchange and study over five years has reached its goal two and a half years ahead of schedule.

Unforgettable trip

The documentary, which premiered at the event, chronicled the February 2026 trip by the youth pickleball delegation from Montgomery, Maryland, to China. The students visited Guangdong, Jiangxi, Henan provinces, and Beijing during Spring Festival.

Jeffrey Sullivan, director of Systemwide Athletics for Montgomery County Public Schools, spoke about the program's growth.

He said the February delegation added an additional layer of student leadership, pointing out that the students "helped prepare for the trip, leading cultural sessions and pickleball practices".

During the story-sharing session, one student described the trip as "a very pleasant experience ... It was definitely a big difference from what we see in the media. It was very nice to see. It was very beautiful."

Coach Stacy Azizirad noted the sport's unique bonding power. "They bond over pickleball or any other sport like ping-pong, and it's really unique in the way that we've had some kids not even play pickleball that came on this trip before, and they learned to love it," she said.

A parent shared the deep personal impact. "The impact of these last two years ... to say life-changing, it truly has been life-changing. The friendships that my children have made ... have truly been heartwarming."

She mentioned her son is now teaching his Chinese friends English on WeChat and recently booked a family trip back to Beijing and Shanghai.

Lychee demand in China drives Vietnam's exports

HANOI — At 1 am local time, while most of the village was still asleep, farmer Tran Van Bon was already in his lychee orchard in Vietnam's northern province of Bac Ninh, moving between rows of trees heavy with ripening fruit.

Working under the glow of headlamps, Bon and his family carefully picked bunches of bright red lychees before dawn, when the fruit is at its freshest.

A few hours later, the fruit would begin its journey to China, Vietnam's largest export market for lychees.

In late May, the first container trucks carrying lychees departed from Bac Ninh, bound for China, marking the start of this year's export season and bringing renewed hope to thousands of growers across the province.

Bac Ninh is Vietnam's largest lychee-producing province, with 29,800 hectares of orchards, according to the Vietnamese Ministry of Agriculture and Environment.

For Bon, who has cultivated lychees for two decades in Nam Duong commune, the Chinese market has become increasingly vital for his family's livelihood.

China has remained the major export destination for Bac Ninh lychees for many years.

According to the provincial Department of Agriculture and Environment, the province currently has 243 lychee-growing area codes covering more than 17,450 hectares that have been approved for export to various international markets.

Of these, over 120 growing area codes, covering over 16,190 hectares, are registered for exports to the Chinese market this year.

Pham Van Thinh, vice-chairman of the Bac Ninh Provincial People's Committee, estimated that lychee exports to China could reach between 40,000 and 50,000 metric tons this year.

Harvest season

Across Nam Duong commune, the harvest season has transformed quiet rural roads into busy trading routes. Trucks line up near collection points while farmers rush to pick, sort and pack fruit for cross-border shipment.

Local farmer Tran Van Binh shares the same optimism.

Binh expects to earn between 200 million and 300 million Vietnamese dong ($7,600 to $11,400) through lychee exports to China this season.

Despite lower yields, growers like Bon and Binh said stable demand from China has helped sustain their incomes and ease concerns over finding buyers.

China has been Vietnam's top trading partner for more than two decades. In 2025, Vietnam's fruit and vegetable exports to China exceeded $5 billion, accounting for more than 64 percent of its total fruit and vegetable exports. Vietnam's durian and fresh coconut are highly sought-after in China.

"Now that Chinese traders are buying lychees in large quantities, we no longer worry about the market for our fruit. We can focus on growing and caring for lychees to meet export standards," Binh said.

Bangladesh's Rahman new president of 81st UNGA

By **MINLU ZHANG** at the United Nations
minluzhang@chinadailyusa.com

Bangladesh's Foreign Minister Khalilur Rahman was elected president of the 81st session of the United Nations General Assembly on Tuesday, winning a vote in the 193-member world body.

With 190 UN member states casting votes, Rahman received 99 votes, defeating Andreas S. Kakouris, special envoy of Cyprus' foreign minister for multilateralism, who secured 91 votes.

Following his election, Rahman pledged to rebuild trust among member states and promote consensus-building within the UN.

"As your president, I will dedicate myself to rebuilding trust, nurturing consensus and opening space for good-faith negotiations that will lead to outcomes owned by all," he said.

Rahman said his presidency would focus on six pillars of action: peace and security; the 2030 agenda; climate action and environmental protection; human rights; emerging technologies, including artificial intelligence; and UN reform.

The theme of the 81st session will be "Restoring Trust, Managing Transformation: A United Nations That Delivers for All."

UN Secretary-General Antonio Guterres congratulated Rahman on his election, saying he would take the reins of the General Assembly "at a moment of deep challenge but also profound possibility" for the United Nations.

"But the hard work of diplomacy, dialogue and collaboration that happens each and every day here at the General Assembly gives me renewed hope that we can transform divisions into determination to work in common purpose," he said.

Annalena Baerbock, president of the 80th session of the General Assembly, said Rahman would serve during what were "certainly not ordinary times", noting that the role of president has evolved in an era when consensus can no longer be taken for granted and defending the UN Charter has become a daily necessity.

She said the Assembly would continue addressing major intergovernmental processes, including implementation of the Pact for the Future and ongoing reform efforts under the UN80 Initiative. Baerbock said Rahman is "more than prepared" for the position, citing his decades of diplomatic and multilateral experience.

Rahman, born in 1954, joined Bangladesh's diplomatic service in 1979 and later served at the country's Permanent Mission to the United Nations in New York.

In 1999, he joined the UN Secretariat as a special adviser at the United Nations Conference on Trade and Development in Geneva. Over the next 25 years, he held senior positions in New York and Geneva and contributed to several major UN flagship publications.

Rahman will assume the presidency for a one-year term when the 81st session of the General Assembly opens on Sept 8.

Zero-tariff policy boosts export power

Experts see Egypt among beneficiaries as measure enhances competitiveness

By SARA EL ASHRAFY in Cairo
For China Daily

China's zero-tariff policy toward African countries marks a shift that goes beyond traditional trade considerations, reshaping global economic relations through deeper integration and stronger links to international value chains, Egyptian analysts say.

With China-Africa trade exceeding $348 billion last year, the policy signals a new phase in the economic repositioning of 53 African countries within the global economy by boosting export competitiveness, attracting investment and promoting export-oriented industrialization, they said.

The move also opens wider prospects for deepening China-Egypt relations at a symbolic moment, coinciding with the 70th anniversary of diplomatic ties between the two countries, they added.

"This policy represents a structural shift in the philosophy of trade relations between China and Africa, moving toward a more long-term economic partnership," said Nermeen Tawfik, coordinator of the Pharos Center for Strategic Studies and Consultations.

The measure underscores Beijing's efforts to further strengthen its relations with Africa, secure supply chains and institutionalize a cooperation model based on mutual benefit and deeper integration into global value chains, Tawfik said.

The elimination of tariffs is expected to enhance the competitiveness of Egyptian and other African goods in the Chinese market, one of the world's largest in terms of both scale and demand, she added.

The decision comes at a time of growing divergence in global trade policies among major countries and stands in contrast to approaches marked by protectionism, reflecting China's commitment to openness and free trade, Tawfik said.

"Egypt is strategically positioned to capitalize on this shift, particularly through its industrial base and geographic advantage as a regional trade gateway," she said.

Tawfik said the policy will boost joint projects, especially the Chinese industrial zone in Ain Sokhna within the Suez Canal Economic Zone. Serving as a key manufacturing and export platform, the zone helps integrate Egypt-based production into Chinese-led supply chains while attracting investment in sectors such as textiles and manufacturing.

The development is expected to further strengthen Egypt's role as a strategic hub linking Africa, Asia and Europe, she added.

"The Ain Sokhna industrial zone is emerging as a key platform for export-oriented manufacturing integrated into Chinese supply chains," she said.

She cautioned, however, that the extent to which African countries benefit from the tariff-free policy will depend on their ability to undertake structural economic upgrades and enhance industrial capacity.

Structural shift

Ghada Kamal, an Egyptian expert in international affairs and African studies, said China's zero-tariff policy, which took effect on May 1, represents a structural transformation in economic relations between Beijing and the Global South.

The decision reflects China's strategic orientation toward deepening economic integration with Africa by fully opening its market to African products, Kamal said.

"China is deliberately repositioning African economies within the global trading system through full and unconditional market access," she said.

Egypt stands out as one of the leading candidates to benefit from this shift because of its unique geoeconomic advantages, she said. "Egypt combines industrial capacity, infrastructure development and strategic location, making it one of the strongest beneficiaries of this policy shift."

On sectoral effects, Kamal highlighted the immediate gains for Egyptian exports. "The removal of tariffs ... creates an immediate and measurable competitive advantage for Egyptian goods in the Chinese market," she said.

The policy also enhances Africa's appeal to foreign direct investment by combining competitive production costs with guaranteed access to the Chinese market, she added.

The initiative complements the African Continental Free Trade Area by strengthening regional value chains and promoting economic integration across Africa, she said.

The writer is a freelance journalist for China Daily.

Demonstrators protest a proposed United States-backed Ebola quarantine facility in Nanyuki, Kenya, on Monday, with a sign that reads, "Laikipia is not a dumping site. Take back that money, we do not want Ebola in Kenya." JOHN MUCHUCHA / REUTERS

US-backed Ebola facility in Kenya draws protests

By SHARON NAKOLA
in Nairobi, Kenya
sharon@chinadailyafrica.com

Hundreds of residents in Kenya's central town of Nanyuki protested on Monday against a proposed Ebola quarantine facility backed by the United States, days after a court temporarily suspended the project amid growing concerns.

The demonstrators marched through parts of the town carrying placards and chanting slogans, opposing the planned facility at Laikipia Air Base, about 200 kilometers north of Nairobi.

Protest organizer Patrick Wahome said two people were killed by gunshot wounds after police opened fire. A security source also said two people had died but did not specify the cause of death, Reuters reported.

Police spokesman Michael Muchiri said he was not aware of the deaths.

Local media reports of increased activity at the base have fueled speculation that preparations are underway, though authorities have not publicly confirmed that construction has begun.

President William Ruto confirmed on Monday that Kenya had agreed in principle to support the initiative following discussions with the US.

The decision reflected decades of cooperation between the two countries in public health and disease control, he said.

Many residents said they feared the facility could expose local communities to Ebola, despite government assurances that the project is intended to strengthen preparedness against potential regional outbreaks.

Others questioned why Kenya should host a quarantine center for individuals potentially exposed to the virus when the country has not recorded any active Ebola cases, while the number of suspected cases in the Democratic Republic of Congo topped 100, with more than 300 confirmed cases.

"We have started seeing planes going that way, and it is like that quarantine area has already been built. We are very angry," Nanyuki resident Nick Karari said during the protests.

The proposal has become politically sensitive as the planned facility would reportedly receive US citizens exposed to Ebola, while Kenya has no active cases. Critics argue that the country's health system should not assume additional risks.

On Friday, Kenya's High Court issued orders temporarily suspending the establishment of the quarantine, isolation or treatment center and blocking the arrival of any foreign patients pending the hearing of a petition filed by civil society groups.

The petitioners argue that the arrangement raises legal and public health concerns and should undergo greater public scrutiny before implementation.

High Court Judge Patricia Nyaundi on Tuesday issued an order barring the government from taking any steps to build or begin operations at the facility before the case is resolved.

The judge also ordered the government to disclose all agreements and operational protocols related to the facility within seven days and scheduled the next hearing for June 23.

The controversy has also drawn criticism from professional bodies. Last week, the Kenya Medical Practitioners, Pharmacists and Dentists Union questioned whether the country's health system is adequately prepared to manage highly infectious diseases.

The Health Ministry has defended the initiative, saying the planned facility is part of broader preparedness measures and would serve public health needs rather than any single nationality.

Health Cabinet Secretary Aden Duale said the center was intended for "everyone" and not exclusively for US citizens.

Duanwu celebration brings cultures together

By RENA LI in Los Angeles
Renali@chinadailyusa.com

The fragrance of freshly wrapped *zongzi* filled the hall as bronze chime music from China's Hubei province echoed through a cultural gathering in Los Angeles, where Chinese and American residents came together to celebrate the traditions of Duanwu Jie, also known as the Dragon Boat Festival.

Decorated with *zongzi*, a sticky rice dumpling, traditional sachets filled with herbs for blessings, and other festive symbols, the venue hosted the launch ceremony for the first California Duanwu Jie on Saturday. The festival is scheduled to be celebrated on June 19 following a resolution adopted by the California State Assembly that recognizes the fifth day of the fifth lunar month on June 19 as the inaugural Duanwu Jie in California. It describes the holiday as having more than 2,000 years of history and deep cultural significance.

"We traveled from the banks of Yangtze River to Los Angeles, aiming to introduce the traditions and cultural heritage of Hubei province to California through the Dragon Boat Festival celebration," Yu Hui, deputy manager of Hubei Cultural and Tourism Group, told China Daily.

Yu described Hubei as the birthplace of the esteemed statesman and patriotic poet Qu Yuan during the Warring States Period (475-221 BC) and an important cradle of Chu culture and Dragon Boat Festival traditions, including dragon boat racing and the eating of *zongzi*.

He introduced cultural and tourism landmarks including the Three Gorges, Mount Wudang, Shennongjia and the Enshi Grand Canyon, while inviting American visitors to experience Hubei's history, cuisine and cultural heritage firsthand.

Guests from Hubei province and California unveil the logo for the inaugural California Duanwu Jie celebration during a cultural exchange event in Los Angeles on Saturday. RENA LI/ CHINA DAILY

Immersed in the festive atmosphere, Bob Weis, former president of Walt Disney Imagineering, said cultural exchanges continue to strengthen people-to-people ties between China and the United States despite geopolitical tensions.

"I think it's great for California. There's such a strong connection between Chinese culture and the people here, and California culture," Weis said. "To have this great Dragon Boat Festival, which is so well known across China, and so important to the culture, brought here — it's great."

Weis said California has long maintained an open environment for cultural exchange and noted that modern travelers are increasingly seeking authentic cultural experiences and meaningful human connections. Weis said the recognition of Duanwu Jie reflected a growing appreciation of Chinese heritage in California.

"This is more than a symbolic gesture," Weis said. "It reflects a growing appreciation for Chinese heritage and an understanding that cultural traditions enrich all of our communities."

According to Phillip Chen, the California assembly member who proposed the resolution, recognizing Dragon Boat Festival helps promote cultural understanding and strengthens community connections across California's diverse population.

"It's significant because it brings culture and understanding," Chen said, adding that the festival highlights the importance of people coming together across cultural backgrounds.

Wang Lei, president of the Jingchu Culture Foundation of America, noted that the California resolution incorporated the Chinese pinyin name "Duanwu" directly into legislative text and explicitly referenced Qu Yuan and the festival's traditional values.

"For more than 2,000 years, the values embodied by Qu Yuan — love of country, cultural confidence, integrity and the pursuit of ideals — have inspired generations of Chinese people around the world," Wang said.

"Today, by launching the first California Duanwu Festival, we are not only celebrating a traditional holiday, but also carrying forward a cultural spirit that transcends time, geography and generations," he added.

Huang Hongjiang, deputy Chinese consul general in Los Angeles, emphasized the importance of cultural and educational exchanges between China and California.

"Our relations require not only government-to-government linkage, but also people-to-people exchanges," Huang said. "Today's event is a good example that we are working together to deepen cultural, educational and people-to-people exchanges."

Zhou Min, a professor of sociology and Asian American studies and director of the UCLA Asia Pacific Center, said the recognition carries broader symbolic significance related to cultural diversity and inclusion.

"I am not surprised that California would recognize the festival," Zhou said. "The symbolism behind it is that California recognizes cultural diversity, and recognizing ethnic holidays is part of that process."

Zhou added that food and festivals often serve as important cultural connections across communities. She noted that many of her students enjoy *zongzi* and view the Dragon Boat Festival as part of a broader celebration of multiculturalism and Asian cultural traditions in California.

COMMENT

Editorials

To show its sincerity for talks, US should rein in its allies to prevent misjudgment

Representatives from the Chinese and US militaries held a working group meeting of the Military Maritime Consultative Agreement in Hawaii on Thursday and Friday. That was the first formal naval and air force working group exchange since the US president's visit to China from May 13 to May 15.

The two sides had candid and constructive exchanges on the current China-US air and maritime safety and security situation, evaluated the execution of the Rules of Behavior for Safety of Air and Maritime Encounters since the MMCA in 2025, and discussed measures to improve China-US military maritime safety and security, according to a release of the People's Liberation Army.

On Thursday, the Chinese Ministry of Commerce announced that the Chinese and US teams have agreed in principle to discuss, under the trade council, a reciprocal tariff reduction framework arrangement on products of equivalent scale and worth $30 billion or more on each side. Whether it is military communication or progress in the economic and trade fields, both demonstrate the shared willingness of China and the United States to translate the outcomes of the US leader's visit to China into concrete actions and tangible results.

Multiple rounds of China-US economic and trade consultations have already taken place, and bilateral trade relations have shown signs of stabilization in recent months. Yet direct military engagement between the two sides has remained far less frequent. Meanwhile, tensions in the Asia-Pacific region have persisted due to a variety of factors. As a result, the Hawaii meeting has drawn widespread attention. That also reflects the region's broader expectation that China and the US will properly manage their military relationship, as well as the general hope for peace and stability in the region.

As agreed by the two sides in Hawaii, effective communication and exchanges between the two militaries can help frontline troops perform tasks in a more professional manner, deepen mutual understanding and avoid misperception and miscalculation. But apart from that, it is hard to ignore that the PLA stressed in its release on the meeting that China firmly opposes any action that undermines China's sovereignty and security under the pretext of "freedom of navigation and overflight", and opposes any infringement, provocation and close-in reconnaissance and harassment targeting China. It added that China will continue to firmly safeguard national territorial sovereignty and maritime rights and interests, and uphold regional peace and prosperity.

The timing of the Hawaii meeting could hardly be starker, which explains the PLA's reiteration of its principled stance. On the day before the Hawaii meeting opened, China's military drove away the Dutch frigate, HNLMS *De Ruyter*, which had illegally entered Chinese waters around the Xisha Islands. While Japan and the Philippines announced on Thursday they will hold talks to "delimit an exclusive economic zone and continental shelf" east of China's Taiwan island. And five days before the meeting, the Canadian frigate, HMCS *Charlottetown*, conducted a spuriously described "routine transit" through the Taiwan Strait.

The Netherlands and Canada have both defended their respective actions as exercises of "freedom of navigation". Meanwhile, Japan and the Philippines are cloaking their provocations against China under the guise of safeguarding a "free and open Indo-Pacific". These narratives are all "intellectual property" of the US, and all such actions are taken within the broader "Indo-Pacific" strategy framework engineered by Washington. This says nothing of the considerable efforts the US has made to revive the Quad, most notably through last month's foreign ministers' meeting in New Delhi.

Thus, China is experiencing an increasingly contradictory approach: a US that professes its desire for communication and de-escalation, as reflected in US Defense Secretary Pete Hegseth's toned-down remarks at last week's Shangri-La Dialogue in Singapore, set against an increasingly reckless and provocative cohort of US allies and partners.

In other words, while Washington has signaled a desire to stabilize ties with China and expand communication channels, some actions by US allies and partners continue to create tensions and complicate efforts to build mutual trust. This divergence between diplomatic messaging and developments on the ground remains a source of concern for regional stability. In the process, Japan has emerged as the most enthusiastic. Under the logic laid out by the US — that the free-riding era is over as Hegseth underscored again in Singapore — Tokyo is buying US missiles and expanding military cooperation in return for US tolerance of its remilitarization. For Washington, this is convenient burden-shifting. But Japan is the real beneficiary, using US support to break free of historical constraints.

If military mutual trust between China and the US is to have any substance, the US is obliged to curb the actions of its regional allies. The repeated harassment and provocative military activities on China's doorstep only serve to raise the risk of misjudgment. The region's most dangerous trigger for conflict might be the US' unwillingness to rein in a Japan that is increasingly acting as a loose cannon. The US cannot on the one hand prepare the table for dialogue, and on the other hand permit its allies and partners to recklessly try to usher its guest away from the table.

New rules to protect overseas investments

In the first four months of this year, China's outbound direct investment across all industries was 429.42 billion yuan ($63.50 billion), an increase of 3.9 percent year-on-year. And the country's total outbound direct investment reached $174.38 billion last year, with over 50,000 enterprises having overseas investments.

But recent events, such as the decision by the Dutch government late last year to take over Nexperia, a Chinese-owned semiconductor company, on the grounds of "national security", and a Panamanian court's ruling earlier this year that annulled Hong Kong-based CK Hutchison's contract to operate two ports at the Panama Canal, highlight the challenges Chinese enterprises are encountering abroad amid rising unilateralism, protectionism and heightened geopolitical tensions.

A new regulation is therefore a timely response to safeguard the legitimate rights of Chinese companies with investments overseas, and help protect the nation's sovereignty, security and development interests. The regulation on outbound investment, issued by the State Council, China's Cabinet, and set to take effect on July 1, marks China's first administrative rule specifically targeting the overseas investment activities of Chinese enterprises. The regulation, comprising 34 articles, aims to promote the country's high-standard opening-up and enhance the quality of its outbound investments.

First and foremost, it provides a comprehensive protective shield for Chinese enterprises at various stages of their overseas investments. These include risk assessment and early warning systems based on the security situations in target countries before investments begin, as well as consular protection and assistance during major emergencies.

Additionally, if Chinese investors encounter trade-related investment barriers in the host country or region, the relevant departments of the State Council will conduct investigations and, based on the results of these investigations, may adjust country-specific investment policies and implement measures such as import or export bans or restrictions on certain goods and technologies.

While encouraging enterprises to resolve disputes related to their outbound investments through various means such as negotiation, mediation, arbitration and litigation, the regulation offers an enhanced legal "toolbox" that enables a precise and robust response to any discriminatory measure taken by a foreign government.

Additionally, the new regulation emphasizes service guidance for outbound enterprises. The government will establish a comprehensive overseas service system, coordinating resources across areas such as foreign affairs, law, finance, taxation, logistics, customs and trade promotion to offer comprehensive service guarantees.

The regulation states that China will actively align with international high-standard economic and trade rules, promote high-quality Belt and Road cooperation, participate in the formulation of international investment rules, and foster international cooperation in industry and supply chains. This will be conducive to opposing unilateralism and protectionism, and to the construction of an open world economy.

The new rules mark a milestone in the legal framework for China's outbound investment sector. They are expected to help improve China's foreign investment management system, enhance oversight of direct investments overseas and strengthen risk prevention and control.

The measures markedly elevate the quality of China's outbound investments, paving the way for new opportunities in mutually beneficial international cooperation.

Synergy conducive to unity and development of Global South

The fifth China-Brazil Foreign Ministerial-Level Comprehensive Strategic Dialogue in Beijing on Monday is a reminder that the future international order may depend more on how major developing countries align their interests and actions.

The Chinese Foreign Ministry's readout of the strategic dialogue between Foreign Minister Wang Yi and Brazilian Foreign Minister Mauro Vieira indicates that China and Brazil are seeking to build a partnership that extends well beyond bilateral diplomacy.

The relationship has evolved steadily over the past three decades. China and Brazil established a strategic partnership in 1993, upgraded ties to a comprehensive strategic partnership in 2012, and jointly elevated relations to a China-Brazil community with a shared future for a more just world and a more sustainable planet in 2024.

International institutions face mounting strain as conflicts, trade disputes and geopolitical fragmentation have intensified demands for stability. In an era when hegemony, unilateralism and protectionism are once again on the rise in various parts of the world, the rationale for deeper coordination among major developing countries has never been more compelling.

Vieira said that Brazil looks forward to consolidating strategic mutual trust with China, deepening practical cooperation, cementing public support for bilateral ties and achieving common prosperity, expressing Brazil's readiness to work with China to enhance multilateral coordination, jointly advance the reform of the global governance system, uphold the authority of the United Nations and promote international fairness and justice.

The foundation for the development of relations in that direction is solid. China is Brazil's largest trading partner, while Brazil is China's ninth-largest trading partner. Bilateral trade reached nearly $188 billion in 2025. Chinese exports to Brazil range from machinery, telecommunications equipment and chemical products to transportation equipment and steel. Brazilian exports to China include iron ore, soybeans, crude oil and pulp. Such complementarities provide an important degree of stability for global supply chains.

The signing in 2023 of a memorandum establishing renminbi clearing arrangements in Brazil and the 2024 agreement aligning Belt and Road cooperation with Brazil's Growth Acceleration Program, New Industry Plan, Ecological Transformation Plan and South American Integration Routes Plan point to an increasingly deeper economic partnership featuring development and strategic alignment.

Yet perhaps the most underappreciated dimension of China-Brazil relations lies in people-to-people ties. Exchanges in education, tourism, media, youth affairs and subnational cooperation continue to expand, and the two governments are preparing for the 2026 China-Brazil Cultural Year.

Sport offers a particularly vivid example. For more than three decades, Brazilian footballers have played for Chinese clubs. Chinese football supporters cannot forget that several key members of China's historic 2002 FIFA World Cup squad emerged from a training program in Brazil during the 1990s. Many later became coaches, passing a Brazilian influence to younger generations. When the 2026 World Cup kicks off, many in China will be rooting for Brazil.

Such connections matter because durable international partnerships require public support, not merely governmental agreement.

The broader significance of the dialogue on Monday lies in its recognition that reforming global governance can no longer be postponed. Wang urged the two countries to jointly promote the development of a more just and equitable global governance system.

If major Global South countries such as China and Brazil can maintain strategic mutual trust, deepen practical cooperation and strengthen coordination through mechanisms including the United Nations and BRICS, they will help inject a measure of predictability into an increasingly volatile world. In an age increasingly defined by uncertainty in some parts of the world, that may be one of the most valuable public goods any major-country engagement can provide.

— LI YANG, CHINA DAILY

Ties: Cooperation key for tackling global issues

From page 1

The competition and confrontation between them have been established not merely as an issue for the two countries, but as a key factor having a direct or indirect impact on global economic growth.

The combined nominal GDP of the US and China already accounts for more than 43 percent of the global economy, with the two economies playing a very important role in global economic growth. Furthermore, global supply chain fragmentation and competition for technological leadership are exacerbating global geopolitical and geo-economic uncertainty. Under these circumstances, discussions between the two countries to establish a relationship of "constructive strategic stability" can serve as a foundation for a new vision for US-China relations.

In particular, the stable management of US-China relations and restrained competition are essential for addressing transnational challenges, such as maintaining peace, achieving economic prosperity and responding to climate change in the Asia-Pacific region, which is the hub of the global economy and supply chains.

This is because a conflict between two superpowers would inevitably lead to economic damage and security instability for countries in the region. To realize the vision of the Chinese Dream and MAGA coexisting harmoniously, both countries must expand the scope of cooperation rather than conflict in three major areas of international order and security.

First, the strategic space for global supply chains and economic prosperity must be expanded.

The restructuring of global supply chains and deglobalization have a negative impact on the world economy, as trade conflicts and tariff barriers between the two countries fragment global supply chains and increase production costs. If global supply chains collapse, production and investment in neighboring countries will also continuously shrink. This would inevitably affect the interests of both the US and China. Therefore, the strategic scope for cooperation must be expanded for the sustainable economic growth of the US and China and countries in the Asia-Pacific.

Second, mutual communication channels must be expanded for global geopolitical stability.

Geopolitical conflicts and clashes in the Middle East and Ukraine are inflicting shocking damage on global security and the economy, so responsible risk management by the US and China, which are engaged in strategic competition, is crucial for minimizing global geopolitical conflicts.

Diplomatic compromise and communication between the two countries can play a key role in stabilizing the global economy and mitigating supply chain risks. Furthermore, efforts need to be made to prevent accidental clashes and to establish a relationship of strategic stability, which can also prevent regional instability and foster a peaceful diplomatic environment.

Third, the US and China can play a leading role in jointly responding to global issues such as climate change. Climate change and changes in the marine environment are interconnected — core global issues that cause ecosystem destruction, food insecurity and extreme weather events. Only when the two countries cooperate can such transnational issues be effectively resolved.

While the relationship between the US and China is based on the fundamental axis of "strategic competition", it can also be a relationship of competitive collaboration, in which they can cooperate to avoid unnecessary conflict while pursuing their own interests. It is crucial for the two nations to cooperate for economic interdependence and the resolution of global issues, while simultaneously engaging in strategic competition for national interests.

VIEWS

Chang Yen-Chiang and Zhou Siyu

Maritime delimitation talks have no legal basis

During the visit of the Philippine President Ferdinand Romualdez Marcos Jr to Japan from May 26 to 29, both nations announced the start of bilateral negotiations on the delimitation of exclusive economic zones and continental shelves, directly targeting the maritime areas east of China's Taiwan Island.

This provocative move violates China's legitimate maritime rights and interests, and runs counter to the United Nations Convention on the Law of the Sea and basic norms of international relations.

The negotiations signify a deepening maritime security alliance and escalating geopolitical coordination between Japan and the Philippines.

Beneath the diplomatic surface lie clear strategic calculations. Japan is leveraging its alliance with the United States to break free from postwar pacifist constraints and expand its maritime control footprint across the Western Pacific.

The Philippines, meanwhile, is seeking external support to counterbalance China's legal sovereign claims in the South China Sea and the waters off eastern Taiwan.

By negotiating and disposing of maritime areas that are under China's jurisdiction, the two sides are attempting to undermine China's maritime rights and interests. The move is closely linked to the broader geopolitical pattern of the Western Pacific, and poses significant risks.

First, it threatens China's maritime rights and interests. Should Japan and the Philippines reach a formal delimitation agreement, they will unilaterally allocate rights for fishing, oil and gas exploration, marine scientific research and other maritime activities in the targeted waters. Such a deal would establish an illegal status quo, forcing China into a passive position and substantially driving up the cost of future rights protection. It would also undermine China's long-established lawful practices of maritime management, resource development and sustainable utilization in these traditional waters.

Second, the move fuels geopolitical tensions across the Taiwan Strait.

By focusing on the sea areas east of China's Taiwan island, Japan and the Philippines are pushing for the "internationalization" of the Taiwan question.

They aim to fabricate a false perception of maritime separation across the Taiwan Strait, collude with the separatist "Taiwan independence" forces on the island and disrupt China's national reunification process. Their geopolitical manipulation adds volatility to the regional security landscape.

Third, it endangers regional maritime governance. If this backdoor maritime delimitation by Japan and the Philippines is tolerated by the international community, it will set a dangerous precedent.

Other states may follow suit, forming small cliques to privately divide overlapping maritime domains. Such trends would marginalize the dispute settlement mechanisms under UNCLOS and weaken China's regional framework which prioritizes sovereignty and bilateral consultation in maritime disputes.

Fourth, it creates room for external powers to interfere in regional affairs. Both Japan and the Philippines are embedded in the US-led Asia-Pacific alliance system, and have received implicit support from Washington.

The US may try to take advantage of this development to scale up patrolling east of Taiwan and establish a formal trilateral maritime coordination mechanism with Japan and the Philippines to further compress China's strategic space in the Western Pacific.

China has solid legal grounds to reject these illegitimate negotiations. At the domestic level, China's Law on the Territorial Sea and the Contiguous Zone and Law on the Exclusive Economic Zone and the Continental Shelf explicitly stipulate that Taiwan is an inalienable part of China's territory, with all adjacent maritime areas under China's jurisdiction.

On the international level, China enjoys complete sovereign rights over the exclusive economic zone, as well as inherent jurisdiction over continental shelf exploration, exploitation and governance in these waters.

No third state is entitled to conduct private maritime delimitation, resource distribution or jurisdiction partition negotiations without approval by China.

Thus, the Japan-Philippines negotiations lack legal legitimacy.

Under the natural prolongation doctrine of UNCLOS, China's continental shelf extends to cover the sea areas east of Taiwan. China holds sovereign rights over the seabed, subsoil and natural resources of these waters.

UNCLOS also makes it clear that wherever there are overlapping sovereign claims involving a third party, relevant states shall not bypass the entitled sovereign state to separately finalize delimitation arrangements.

Only adjacent or opposite states can undertake maritime boundary negotiations without any third-party sovereign involvement. Therefore, the Japan-Philippines negotiations violate the core spirit of UNCLOS and have no international legal validity whatsoever.

Above all, national sovereignty is non-negotiable. As an administrative region of China, Taiwan has no independent maritime sovereignty.

Any state handling maritime affairs surrounding Taiwan must recognize the one-China principle and respect China's full sovereignty over Taiwan and its affiliated maritime spaces.

By excluding China and arbitrarily arranging marine affairs east of the Taiwan Strait, Japan and the Philippines are attempting to divide China's territorial and maritime sovereignty.

Their actions cross the red line of the one-China principle and China will never tolerate such infringement upon its core national interests.

Chang Yen-Chiang is a professor at the School of Law at Dalian Maritime University; Zhou Siyu is a postgraduate at the same school.

Amitendu Palit

Innovation fuels investor trust in Asia-Pacific

The year 2026 has so far been marked by turmoil and chaos in the global economy.

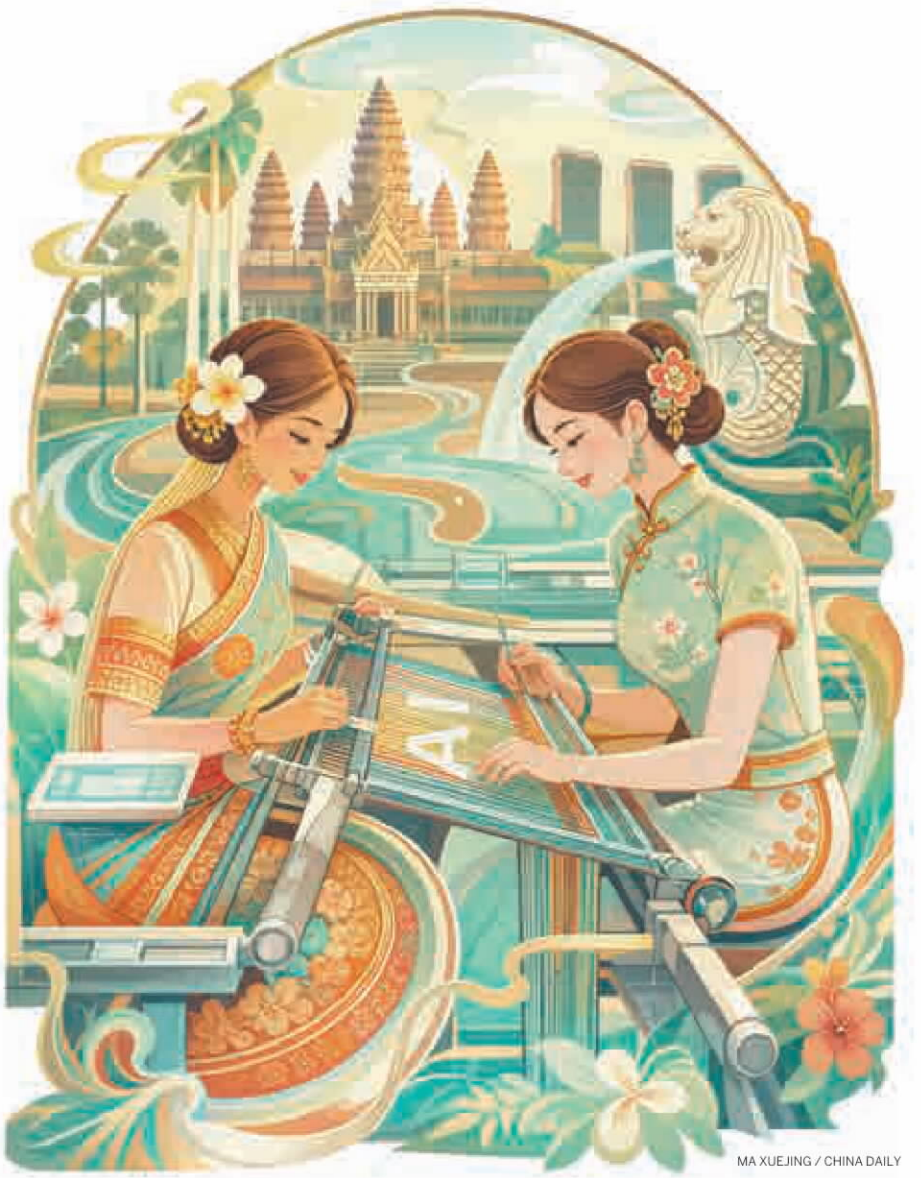
The Iran conflict has created an unprecedented energy crisis, driving up prices of commodities and services. Asia has been hit hard because it is heavily dependent on imports from the Middle East. As the crisis deepens and economic difficulties increase, concerns are beginning to arise about investments.

Economic instability is bad news for investors, as uncertainty clouds the economic outlook and undermines investor confidence. Both long-term investors committed to foreign direct investment and short-term investors focusing on gains from the capital market are impacted by uncertainty. For Asian economies, this uncertainty has become a serious issue as investors are hesitating to commit funds.

Global Lens

Investor sentiments can improve significantly if they are convinced that major Asian economies can withstand the current crisis and remain committed to their development plans. Though much depends on the outlook for China, it is not the only economy that matters. China's ability to grow along with the other economies of Southeast Asia is equally important.

Investment decisions are significantly influenced by investor confidence in the resilience of economies. China is actively working to enhance the long-term resilience of its economy by positioning itself as an innovation hub.



How does becoming an innovation hub improve economic resilience? Innovation provides solutions to complex problems. It does not always have to be path-breaking and phenomenal; incremental progress is equally valuable. An economy's capacity to innovate determines its ability to adapt its industries and institutions to withstand future shocks.

Globally, most economies are using artificial intelligence to transform industrial processes, thereby increasing efficiency and boosting productivity.

However, rapid adoption requires access to AI content, an area dominated by countries that have the edge in foundational and generative AI. Countries that have enterprises owning and running large language models (LLMs) are at the forefront of innovative AI production. The United States and China are global leaders in this regard.

China has invested substantially in both foundational and embodied AI. While the former involves training LLMs to conduct research and propose solutions for new problems, the latter emphasizes the use of robots to raise industrial productivity.

Both contribute to increasing the resilience of the country's economy.

MA XUEJING / CHINA DAILY

Frontier LLMs, capable of complex reasoning and advanced code generation, offer innovative solutions for potential crises. At the same time, the use of industrial robots, combined with deep learning technologies such as image recognition and automated driving, is not only increasing productivity in traditional industries, such as textiles, chemicals and machinery, but also enabling better management of process logistics.

These improvements help industries to better handle shortages when supply chains are disrupted and overcome logistics challenges caused by pandemics or similar events.

China's innovation capabilities are complemented by its collaboration with the broader region, particularly Southeast Asia. Regional economies such as Vietnam and Malaysia have developed expertise in semiconductor assembly, testing, packaging and fabrication.

These economies, along with others in Southeast Asia, are working on formalizing the digital economy framework agreement, which will establish regional rules for the digital economy.

Coupled with the focus on training workers in AI, including integrating AI into school curricula, this initiative should provide the region with a workforce skilled in AI.

The existing economic synergies between China and the region, as already seen through various industry supply chains, can become more resilient as China's innovation outcomes combine with the region's ability to absorb them.

Understanding the Chinese strategy of becoming an innovation hub, and extending the reach of the hub to Southeast Asia for developing a wider regional innovation ecosystem, is important for investors.

This understanding is likely to generate more confidence among investors as they closely monitor how Asian economies are navigating external shocks.

The military conflicts in Ukraine, Gaza and Iran have created new stress tests for Asian economies. Traditional solutions are no longer enough to build resilience. Innovation outcomes and their collective application can be a game changer.

Ma Junchi and Sun Yanhong

CEE navigating changes with strategic diversification

In the rapidly shifting geopolitical and geoeconomic landscape, Central and Eastern Europe (CEE) finds itself at a crossroads. Whether the region can defuse the crisis it faces and turn challenges into opportunities will determine the trajectory of its economic development.

Traditionally, the CEE region's economic model has leaned heavily on Europe for investment, Russia for energy and the United States for security.

For decades, CEE nations, such as Hungary, have leveraged their European Union and NATO memberships and access to low-cost Russian energy to attract substantial Western European investments, cementing their position as Europe's backyard of manufacturing.

However, these foundational pillars are now teetering. A sluggish European economy has dampened market demand and investment in Western Europe, and the spillover has hit CEE enterprises that were key suppliers to that market. Surging energy prices have squeezed profit margins for the CEE's energy-intensive industries.

And the US has pulled back from its security commitments, urging CEE countries to shoulder more responsibility.

Faced with these headwinds, CEE countries have adopted a three-pronged strategy: diversifying investment sources, energy supplies and security guarantees to offset the waning role of Western Europe, Russia and the US in driving economic growth.

First, the region is making a concerted push to attract Asian capital to accelerate its integration into the new energy vehicle industry chain.

Traditional automotive manufacturing is the cornerstone of the CEE economy, contributing 7 to 14 percent to the region's GDP. But Western European automakers are grappling with hurdles in their electrification transition, forcing downstream CEE economies to turn to Asian investment in NEV and battery manufacturing.

The Republic of Korea has emerged as a leading non-EU investor in recent years and China has been Hungary's largest source of FDI since 2023.

It was precisely to meet the need for investment diversification that Serbian President Aleksandar Vucic visited China last month, announcing that Chinese enterprises across various sectors — including automotive parts manufacturing, humanoid robotics, energy, and artificial intelligence — will invest €940 million in Serbia.

Second, CEE countries are broadening the sources of their energy imports and boosting domestic supply to safeguard energy security and price stability. Norway, the US, Qatar and Central Asia are new energy suppliers. Most CEE nations have either phased out or drastically cut oil and gas imports from Russia. Although Hungary and Slovakia continue to purchase Russian energy, they are also scaling up imports from Azerbaijan and Central Asia.

Romania, with its Black Sea natural gas reserves, is poised to become energy self-sufficient. Other CEE countries are enhancing the interconnection of energy pipelines or ramping up the development of nuclear energy, wind power and photovoltaic power to increase electricity supply.

Third, the region is bolstering its domestic defense industry to foster new economic growth drivers.

With the Russia-Ukraine conflict continuing to escalate and the US scaling back its strategic presence in Europe, CEE countries have no choice but to strengthen their self-defense capabilities. Czechoslovak Group, a major Czech defense manufacturer, has signed a seven-year ammunition procurement deal worth up to €58 billion ($67 billion) with the Slovak government.

Defense firms from Poland, Romania, Bulgaria, Hungary and other CEE states are engaging in joint production with international players such as Germany's Rheinmetall, ROK's Hanwha Aerospace and Hyundai Rotem.

Furthermore, CEE countries are utilizing funds from the EU's Connecting Europe Facility to improve north-south vertical infrastructure interconnection, thereby bolstering the defense capabilities of NATO's eastern flank.

The CEE's diversification strategy not only aims to maintain economic growth, but also to seize the opportunity for structural adjustment to enhance the added value of local industries.

Many CEE countries are linking investment incentives to local production and high-value-added R&D activities. For example, Slovakia requires Gotion High-tech to collaborate with local R&D teams at Inobat and establish a research center in the country.

The Czech Republic has shifted its investment incentives from job creation to high-value-added creation, successfully attracting automation giants such as Japan's Fanuc to set up technical support centers. The Polish government has mandated that ROK defense enterprises conduct production, assembly and post-sales maintenance in the country, and transfer production technologies to local firms.

Given this backdrop, China and CEE countries can strengthen economic cooperation in four major fields.

First, both sides can deepen collaboration in the NEV industry chain, with Chinese NEV manufacturers exploring partnerships with local CEE enterprises for conducting research and training programs with universities and institutions, and investing in local battery recycling and reuse.

Chinese NEV manufacturers can also continue to strengthen cooperation with local suppliers in CEE, leveraging technology spillover effects to facilitate the upgrading of CEE's local automotive industry.

Second, both sides can consolidate cooperation in renewable energy. Chinese enterprises can continue to develop projects with CEE counterparts and provide battery energy storage systems, virtual power plants, and other cost-effective solutions for the region's green economic transition.

Third, China and CEE countries can implement an integrated infrastructure project management model covering investment, financing and construction to promote market-oriented operation and sustainable development of infrastructure projects.

Fourth, scaling up the China-CEE Investment Cooperation Fund can finance green energy, digital economy, logistics and other sectors. By combining syndicated loans with equity financing, the fund can provide full-cycle financial support for major investment projects.

GLOBAL VIEWS

WANG XIAOYING / CHINA DAILY

SAMUEL KOFI DARKWA

Forging a new era

China-Africa cooperation represents a vital partnership that holds great potential for mutual growth and development

The relationship between China and Africa is deeply rooted in a shared historical context marked by struggles against colonialism, neocolonialism and imperialism. This bond has evolved significantly over the years, driven by both historical ties and contemporary needs. Chairman Mao Zedong and Ghana's first president Kwame Nkrumah played pivotal roles in establishing early cooperation, highlighting solidarity that transcends borders. Today, the China-Africa partnership is not merely an extension of historical alliances; it has transformed into a multifaceted and dynamic collaboration aimed at addressing new challenges in development, sustainability and globalization. This modern partnership is characterized by strategic collaborations that focus on sustainable development, industrialization and local empowerment, while navigating the complexities brought about by geopolitical shifts and increasing global interdependence.

In recent years, the China-Africa partnership has increasingly centered on economic development and the urgent need for job creation. According to China's General Administration of Customs, bilateral trade between Africa and China exceeded $348 billion in 2025. Africa is experiencing swift demographic changes, predominantly comprising a youthful demographic eager for employment opportunities. In this context, the necessity for job creation and skills development has never been more critical. China offers a robust model of accelerated industrialization — one that African nations are eager to emulate as they seek to foster their own economic growth. Through initiatives such as the Belt and Road Initiative, China has made substantial investments in infrastructure projects across the continent. These initiatives not only lay the physical groundwork for economic advancement but also enhance regional connectivity, bolstering intra-African trade and encouraging cooperation among nations that face similar developmental challenges.

Moreover, as African nations confront the imperative of enhancing their economic independence, the push for local processing and value addition to raw materials becomes pivotal. Many African countries seek to move from merely exporting raw materials to developing their own production capabilities. This transition is essential for ensuring that they retain a significant share of the value generated from their natural resources. China stands out as a key partner in this endeavor, providing not only capital investment but also expertise in manufacturing and technology. By facilitating joint ventures in diverse industries such as agro-processing, textiles, and renewable energy, both sides can create significant job opportunities and provide essential skills training for local workforces. This collaboration can lead to a more sustainable economic future, where African nations can thrive independently while benefiting from China's industrial expertise.

China's commitment to Africa extends to a shared focus on sustainable development, particularly in light of the pressing environmental challenges faced globally. Both parties recognize the urgent need to address climate change and its repercussions on their respective economies and populations. Investments in renewable energy projects, including solar, wind and hydroelectric facilities, have become focal points of cooperation between China and African nations. These partnerships not only aim to fulfill rising energy demands but also align with global environmental goals. Through concerted efforts to develop clean energy infrastructure, both China and African countries can collaboratively combat climate change while fostering economic resilience, demonstrating that sustainability and economic development can reinforce each other.

Despite advancements in cooperation, many observers have pointed to challenges that could hinder equitable partnerships. Key issues include debt sustainability, contract transparency and fair benefit sharing. While concerns over a potential debt trap related to Chinese financing often dominate discussions in Western-led media, it should be noted that some African nations carry heavy debts to traditional creditors such as the International Monetary Fund and the World Bank, surpassing the scale of their debts to China. Therefore, it is vital to adopt a balanced view of China's role in Africa's overall indebtedness, acknowledging the broader landscape of external borrowing. Additionally, China's involvement can empower African leaders to negotiate better terms with other partners. Ultimately, sustainable debt management and a focus on developmental outcomes are essential to ensure that cooperation yields real benefits for local communities and ordinary citizens.

As discussions about the future of China-Africa ties continue to evolve, African nations should make use of their collective power to forge agreements that mutually benefit their economic and social development. It is essential to continually update and enhance existing cooperation frameworks, particularly in areas such as technology transfer, promoting people-to-people exchanges and establishing comprehensive dialogue platforms. These platforms should continue to engage a broad range of stakeholders, including the private sector and civil society. By adopting a holistic approach, the partnership can ensure inclusivity and incorporate diverse perspectives, ultimately leading to more equitable outcomes for all parties involved.

Moreover, the ongoing digital revolution provides an unprecedented opportunity for both China and African nations to enhance the effectiveness of their collaboration. Digital technologies, including e-commerce, fintech innovations and digital training initiatives, can pave the way for more inclusive economic growth, particularly in areas where traditional infrastructure may be lacking. By investing in digital infrastructure, China and African countries can unlock new markets and opportunities, further embedding their economic ties. This can also empower local entrepreneurs and promote job creation in sectors where digital solutions can fill existing gaps, thereby driving growth in a manner that is sustainable and equitable.

Looking ahead, a strategic focus on regional integration will be essential for maximizing the benefits of China-Africa cooperation. By strengthening institutions such as the African Union and regional economic communities, African nations can expand their commitments in negotiations with external partners. This cohesive strategy can align with the continent's long-term developmental goals, ensuring that the partnerships formed today serve the interests of future generations. By working together, African countries can realize their potential, enhancing their economic agency and capability to navigate the complexities of global markets.

By emphasizing industrialization, job creation, sustainability and regional integration, both sides can effectively navigate the challenges ahead while building a more resilient economic framework. As Africa seeks to harness its immense potential, it should aim to engage with China and the global community in ways that prioritize local needs of different sides, ensuring that this partnership, built over many years, not only benefits the present but also lays a robust foundation for the future. The pursuit of shared goals, equitable partnerships and a commitment to collective progress will ultimately determine the success of this relationship in the years to come.

Meaningful engagement

China-Africa cultural exchanges are presenting a new paradigm for global civilizational diversity

In an era marked by escalating geopolitical tensions and a widening deficit of trust, humanity confronts complex transnational challenges, from climate change and public health crises to developmental disparities. These global issues necessitate a departure from zero-sum mentalities, urging the international community to forge new pathways for harmonious coexistence.

In this context, China and Africa — pivotal voices of the Global South, representing nearly one-third of the global population — are collectively demonstrating a compelling alternative through their deepening engagement.

The year 2026, commemorating both the 26th anniversary of the Forum on China-Africa Cooperation and the inauguration of the China-Africa Year of People-to-People Exchanges, provides a unique opportunity to deepen the relations. This dual milestone underscores the two sides' commitment to fostering exchanges rooted in equality, mutual learning and win-win cooperation, thereby making indispensable contributions to global civilizational diversity. Their collaborative practice across three interconnected dimensions — values, public goods and future pathways — shows that civilizations thrive through dialogue and mutual enrichment, not conflict.

Historically, inter-civilizational interactions have often been marred by unequal power dynamics, manifesting as a hierarchical "center-periphery" framework that prioritized one-way cultural export. China-Africa cultural exchanges fundamentally challenge this paradigm. Their engagement is predicated on mutual respect and genuine appreciation, fostering dialogue between equals. This is exemplified by the profound resonance between China's philosophy of "harmony in diversity", which advocates embracing differences while seeking common ground, and Africa's widely cherished spirit of Ubuntu, encapsulated by the principle "I am because we are", underscoring the essential bond of collective coexistence.

The 2026 China-Africa Year of People-to-People Exchanges, through its various forums and art festivals, showcases this shared ethos. Together, China and Africa champion a value system that transcends extreme individualism, prioritizing social harmony and collective well-being. This collaborative approach offers invaluable intellectual resources for addressing pressing global challenges such as social fragmentation.

Furthermore, China-Africa exchanges challenge the long-dominant but outdated narrative that conflates modernization with Westernization. Through burgeoning media and audiovisual cooperation, China effectively shares its unique modernization journey with African audiences, while vibrant African cinema, music and literature gain broader exposure via Chinese platforms. This reciprocal showcase powerfully demonstrates that modernization is not a monolithic path but a pluralistic landscape of diverse experiences. The mutual recognition of endogenous development trajectories, deeply rooted in distinct cultural lineages, empowers nations across the Global South to explore models best suited to their specific national conditions, thereby adding new dimensions to the global tapestry of civilizations.

China-Africa cultural exchanges extend beyond theoretical advocacy, actively generating tangible and accessible cultural public goods that significantly enrich the global cultural ecosystem. A prime example is the joint archaeological project in Kenya's Lamu Archipelago. Since the 2005 cooperation agreement, Chinese and Kenyan archaeologists have collaborated extensively, conducting underwater and terrestrial excavations that have unearthed invaluable ancient Chinese blue-and-white porcelain and other artifacts. These discoveries provide concrete evidence of the prosperity of the ancient Maritime Silk Road. The knowledge derived from this two-decade-long collaboration is a shared heritage for all humanity, filling critical gaps in the historical understanding of global maritime trade and China-Africa relations. The digital preservation of African cultural heritage has emerged as a significant new area of cooperation. China is sharing its expertise, honed through projects such as "Digital Dunhuang" with African partners, applying advanced technologies such as 3D scanning, virtual archiving and artificial intelligence-assisted restoration to safeguard Africa's endangered cultural heritage. The global dissemination of these digital achievements allows people worldwide to transcend geographical and temporal barriers, appreciating the splendor of African civilizations.

Moreover, China-Africa media cooperation is actively redressing the long-standing imbalances in global information flows. For too long, Western mainstream media have predominantly shaped narratives concerning China and Africa, often perpetuating prejudice and stereotypes. Initiatives such as the "United in Heart, Path and Action — 2026 China-Africa Partnership Empowerment Action Plan" promote joint interviews, content sharing and personnel training. These efforts significantly amplify the voice of the Global South in the international discursive arena, enabling the world to access more first-hand narratives from diverse perspectives and thereby contributing powerfully to the diversity of the global information ecosystem.

The ultimate significance of civilizational exchange lies in its capacity to shape the future. The most forward-looking contribution of China-Africa cooperation is its proactive cultivation of a new global relational landscape through the empowerment of the younger generation. The 2026 China-Africa Year of People-to-People Exchanges places youth at its core, launching flagship programs such as the "Youth Navigator" initiative. Among these, the China-Africa Youth Innovation and Entrepreneurship Competition, which has been successfully held for several editions, is particularly noteworthy. This competition focuses on cutting-edge fields including the digital economy, green technology, modern agriculture and comprehensive health. It encourages Chinese and African youth to form transnational teams and collaboratively develop innovative solutions to real-world problems. The deeper dividends of this initiative extend far beyond mere business partnerships; they foster profound emotional bonds and shared values, shaping a common vision for the future that champions inclusive growth, technology for good and sustainable development. This collaborative and forward-looking approach stands in stark contrast to the obsolete zero-sum and bloc-confrontation mentalities that regrettably persist in certain international quarters.

The 2026 China-Africa Year of People-to-People Exchanges represents far more than a mere collection of scheduled events. It is a milestone that elevates China-Africa relations to a new level. Having successfully navigated stages of political mutual trust and economic mutual benefit, this relationship is now deepening into the highest realm of mutual civilizational appreciation and emotional resonance. Crucially, this resonance does not aim to erase differences. Instead, it embodies the profound vision of renowned sociologist Fei Xiaotong, who urged humanity to "value our own beauty, appreciate the beauty of others and let all beauties coexist in shared harmony".

In a world fraught with multifaceted challenges, China and Africa, two civilizations home to more than 2.8 billion people, are collectively sending a clear and resonant message: civilizational diversity is not a catalyst for conflict but an inexhaustible engine for human progress. Dialogue and exchanges among civilizations are not threats but an essential path toward a safer, more prosperous and more inclusive world. Through their concrete and heartwarming actions, China and Africa are actively translating the vision of a community with a shared future for humanity into tangible reality. It is imperative for the broader international community to observe, understand and draw lessons from this successful model with openness, equality and humility. Only when all civilizations set aside arrogance and prejudice and move toward mutual understanding and learning can humanity truly dispel the shadow of conflict and advance toward a future characterized by rich diversity and lasting peace.

New energy vehicles await shipment to overseas markets in Jinhua, East China's Zhejiang province, on Monday.
HU XIAOFEI / FOR CHINA DAILY

Global green push spurs demand for nation's NEVs

By **LI JIAYING**
lijiaying@chinadaily.com.cn

430,000 units
China's NEV exports in April, according to the China Association of Automobile Manufacturers

Boosted by the growing global appetite for electrified transportation and a rebound in major overseas markets, China's new energy vehicle exports keep gaining momentum, playing an increasingly important role in accelerating the global automotive transition.

According to data from the China Passenger Car Association (CPCA), new energy passenger vehicles accounted for more than half of China's total passenger vehicle exports for the first time in April, reaching 52.7 percent.

The China Association of Automobile Manufacturers (CAAM) also reported that the country's NEV exports reached 430,000 units during the month, up 110 percent year-on-year.

The strong performance comes as consumers worldwide increasingly embrace electric vehicles amid persistently elevated fuel costs.

"The sustained rise in global oil prices has directly increased fuel costs and, in turn, strengthened consumers' willingness to purchase EVs, thus creating favorable market conditions for China's NEV exports," said Gong Min, head of China auto research at UBS.

Cui Dongshu, secretary-general of the CPCA, also said NEV sales outside China totaled 2.63 million units during the first four months, representing a 25 percent year-on-year increase and approaching the average growth rate recorded over the previous two years.

The rebound has been especially visible in major overseas automotive markets. Data released by the European Automobile Manufacturers' Association at the end of May showed that battery EV deliveries in Europe jumped 38 percent year-on-year in April. Meanwhile, figures from Australia's Federal Chamber of Automotive Industries showed that EVs accounted for a record 16.4 percent of the country's auto market in April, while hybrid and plug-in hybrid vehicles together represented nearly one-third of total sales.

Against this backdrop, Chinese brands are gaining increasing traction among overseas consumers amid the accelerating shift toward automotive electrification.

BYD ranked second in the Australian market with an 8.3 percent market share in April, while Chinese automakers collectively accounted for around 30 percent of total vehicle sales in the country during the month. In Europe, Chinese brands' share of the EV market also exceeded 15 percent for the first time in April, according to market research firm Dataforce.

China's leading role in the global NEV sector also remains intact. Latest CPCA data showed that China accounted for 61 percent of the world's new energy passenger vehicle market during the first four months. The country's share of the global battery EV market stood at 56 percent, while its share of the global plug-in hybrid segment reached 71 percent.

Supported by advantages in batteries, electric powertrain technologies and cost competitiveness, Chinese NEVs are becoming increasingly attractive to overseas consumers while helping drive the international automotive industry's transition toward electrification, Gong said.

"China's NEV exports are not only serving the country's own development needs, but are also helping the global market accelerate its electrification transition and achieve greater energy security and independence," he said.

Looking ahead, the CAAM forecasts that the combined scale of Chinese automakers' exports and overseas production is expected to exceed 10 million vehicles annually by the end of the 15th Five-Year Plan period (2026-30), with a compound annual growth of over 10 percent.

Private companies eye larger role in strategic energy

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China is stepping up efforts to integrate private capital into its strategic energy infrastructure, creating a robust ecosystem for innovation that will power the nation's green transition and its booming digital economy.

The National Energy Administration recently announced plans to better formulate investment guidelines for private enterprises in major energy projects, including hydropower and oil and gas pipelines. This push aligns with the 15th Five-Year Plan (2026-30) for the energy sector, which aims to roll out landmark projects across new energy bases, power grids and technological initiatives.

Private companies have already become a vital force in energy technology innovation. In 2025, all 10 approved nuclear power units introduced private capital, with private shareholding reaching up to 20 percent.

Furthermore, private firms account for 60 percent of newly approved direct green power projects, 45 percent of the nation's 535 virtual power plants, and operate nine of the country's top 10 electric vehicle charging networks.

The success of this mixed-ownership model was recently cemented by the start of commercial operations at Unit 1 of the San'ao Nuclear Power Plant in Zhejiang province. Managed by China General Nuclear Power Group, the region's first Hualong One reactor marks a historic watershed as the country's first privately backed nuclear power project.

Geely Technology Group holds a 2 percent stake in the megaproject, which has collaborated with approximately 2,000 private enterprises since its inception. This sweeping partnership localized 24 key pieces of core equipment for the first time, including nuclear-grade pressure and temperature switches, demonstrating the fierce competitiveness of China's domestic supply chain, said its operator CGN.

The milestone unit is expected to generate over 9 billion kilowatt-hours of electricity annually, meeting the residential demands of more than 1 million people. Crucially, it provides the zero-carbon baseload power necessary to sustain the Yangtze River Delta's energy-intensive data centers.

"The region has the nation's most vigorous demand for computing power and the most complete industrial supply chain, creating an urgent, sustained need for stable, clean and efficient baseload electricity," said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

As the region accelerates its shift toward an artificial intelligence-driven economy, intermittent renewables like wind and solar alone cannot sustain the immense, 24/7 power requirements of massive data centers, experts noted.

The San'ao project breaks the traditional model of exclusive State investment in nuclear power, Lin added. It proves that mixed-ownership models can inject new financial vitality into strategic infrastructure while allowing private capital to share in the long-term dividends of the green transition.

Energy investment maintained robust growth in the first quarter, with private enterprises deepening their participation in key national energy research initiatives, said Xing Yiteng, deputy director-general of the department of development and planning at the NEA.

To sustain this momentum, the NEA is accelerating the formulation of standard rules for emerging fields, such as computing power and electricity synergy, to enhance the participation of private enterprises in setting industry standards. Market supervision will also be strengthened in sectors like photovoltaics to guide companies toward fair and orderly competition.

Chagee reaps sweet Q1 gains buoyed by overseas biz

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Chagee Holdings Ltd reported higher first-quarter revenue as rapid growth in overseas markets and an expanding store network helped offset weakness in domestic sales momentum.

The beverage chain operator said its revenue rose 4.7 percent to 3.55 billion yuan ($525 million) in the three months ended March 31, compared with 3.39 billion yuan a year earlier. Operating income fell 33.3 percent to 547.2 million yuan from 820.8 million yuan in the same period last year.

Chagee continues to expand its footprint, with 7,531 teahouses across China and overseas markets including 7,157 in China and 374 overseas as of March 31, up 12.7 percent from a year earlier. The growth reflects the company's push to strengthen its presence both domestically and internationally amid intensifying competition in the beverage sector.

Apart from its presence in Singapore, Malaysia, Thailand, Indonesia, the Philippines, Vietnam and the United States, the company entered the South Korean market in April.

"Our overseas teahouse network maintained a steady growth pace with operating performance in line with our expectations," said Yin Dengfeng, chief operating officer and director of Chagee.

Total gross merchandise value (GMV) generated during the quarter reached 7.92 billion yuan. Overseas markets emerged as a key growth engine, with GMV surging 139 percent year-over-year to 426.4 million yuan. In contrast, GMV in China declined to 7.49 billion yuan from 8.05 billion yuan a year earlier, highlighting increased competition in the company's core market.

Despite the decline in regional GMV, operating metrics in China showed signs of improvement. Average monthly GMV per teahouse climbed to 356,080 yuan during the quarter, a 5.5 percent increase from 337,358 yuan in the fourth quarter of 2025, suggesting stronger sales productivity at existing locations.

The company said the new product launches helped as there were 12 new products that debuted in the first quarter, contributing to sequential growth in both volume and GMV.

In the overseas market, the company launched locally tailored products in different markets, which have played a positive role in improving overall same-store performance. For example, its caramel oolong tea latte in Singapore captured an 18 percent cup share during the campaign period.

Chagee also continued to see growth in memberships. Active members reached 50 million during the quarter, up 11.7 percent from the previous quarter, underscoring the brand's growing customer base and loyalty.

The company's international expansion strategy is beginning to contribute meaningfully to growth. Overseas markets accounted for about 5.4 percent of total GMV during the quarter, compared with a much smaller share a year earlier.

On May 28, the board authorized a $150 million share repurchase program that commenced on Monday.

100 trln yuan govt debt seen as controllable

Nation's 68.2% debt-to-GDP ratio far below Japan's 200%, US' 120%

By **WANG KEJU**
wangkuju@chinadaily.com.cn

China's outstanding government debt has likely topped the 100 trillion yuan ($14.8 trillion) mark, though despite the scale, experts said the overall risk remains "safe and controllable" as the debt burden is moderate by global standards and funded projects are mainly quality assets.

According to the People's Bank of China, the country's central bank, the stock of government bonds stood at 99.37 trillion yuan at end-April.

By the end of May, data from Financial China Information and Technology Co showed the figure had climbed to about 101.15 trillion yuan, fueled by years of proactive bond issuance to counter economic headwinds and swap out hidden local debt.

Luo Zhiheng, chief economist at Yuekai Securities, said the country's debt-to-GDP ratio — the most widely used gauge of debt sustainability — stood at 68.2 percent at end-2025, well below that of major developed economies.

Japan's government debt-to-GDP ratio stands at above 200 percent, while the United States' national debt has reached roughly 120 percent of its GDP, said the International Monetary Fund.

"The risk is manageable and sustainable," Luo said. He also pointed out that Chinese government debt is mostly used to build infrastructure such as transport, energy and water conservation infrastructure, creating productive assets that generate long-term returns.

"Those assets both support high-quality development and serve as a source of repayment," he added.

Yuan Haixia, dean of the research institute at China Chengxin International Credit Rating, said China's debt is overwhelmingly domestic, with the household savings rate above 44 percent, providing a stable funding base. Foreign currency debt accounts for only about 5 percent of the total, limiting external vulnerability.

Nevertheless, the experts highlighted region-specific and structural weaknesses that warrant closer attention.

"Some less-developed regions with weak fiscal capacity face liquidity pressure, especially from interest payments," Yuan said. "The resolution of hidden debt is still in a tough phase."

Yuan added that another concern is the diminishing returns on special-purpose bonds, where project revenues often fall short of expectations. "This mismatch reduces the efficiency of debt-financed investment," she said.

Wen Laicheng, a professor at the Central University of Finance and Economics, cautioned that while the current debt level is safe, the rapid growth rate should not be ignored. "We must watch fiscal sustainability," Wen said, adding that China's outstanding government debt has been expanding at an annual rate of more than 10 percent in recent years, outpacing both the country's economic growth and its fiscal revenue growth.

To maintain a balance between economic growth and fiscal health, experts cautioned that the focus must shift from the sheer size of debt to its structure and productivity.

Luo said a reasonable debt scale should be assessed based on three factors: the gap between nominal GDP growth and the interest rate, the returns on the projects funded by debt, and a dynamic fiscal sustainability framework.

"Keeping growth above interest rates is key to preventing a debt spiral," he said.

Yuan called for moving the center of debt management from "adding leverage" to "optimizing leverage". She suggested that the central government should take on more borrowing — through ultra-long term special treasury bonds, for instance — to relieve pressure on local finances.

Within local debt, the share of general bonds should be raised, while special-purpose bonds should be strictly tied to projects with self-sustaining revenues, Yuan said.

Wen emphasized that debt efficiency is equally important. Too much debt has been channeled into physical infrastructure, while spending on health and education — investments in people — has lagged.

"We need to shift from focusing solely on physical assets to a more balanced approach that places equal emphasis on people," Wen said, adding that such a move would boost the multiplier effect of public spending.

Hainan tropical island hub for global investment

Unique policies, improving infrastructure, coordinated governance and growing openness attracting companies from far and wide

By **MASI** and **CHEN BOWEN**
in Haikou

For Michael Heilig, who is from Germany's federal association for small and medium-sized enterprises, his trip to Hainan province last week felt almost destined.

His Chinese name, "Hai Li Ge", carries a special meaning. "Hai" means sea, "Li" means reason and trust, while "Ge" means character and taste. "I believe these qualities — facing the sea, rationality, character — can be transported to Hainan and reflected in our cooperation," Heilig said.

Heilig was one of more than 100 executives from 19 countries and regions who landed in Hainan on May 25-26 for the International Life and Health Enterprises Hainan Visit event, co-hosted by CITIC Group and the Hainan provincial government. Among them were 80 foreign life-health companies and 105 senior executives from global giants such as Siemens, Pfizer and Novo Nordisk, as well as a host of German "hidden champions".

What brought them here, in the heat of late May, was not the island's famous beaches, though those were a welcome bonus, but the accelerating dividends of the island-wide special customs operations, which kicked off in Hainan Free Trade Port on Dec 18.

For Heilig, the most eye-catching policy is the 30-percent value-added processing rule. "German SMEs are often called 'hidden champions'. The policy we learned about today — 30 percent value-added processing in Hainan allowing tariff-free access to China's mainland — is particularly innovative and appealing," he said.

"Given Hainan's strategic location, it can connect to the huge Chinese mainland market as well as the broader Asia-Pacific and Southeast Asia. This will be very important for German SMEs as they restructure their supply chains under the current economic situation," Heilig added.

More than 20 European companies accompanied Heilig on the trip. "The feedback has been very positive. They are very interested in Hainan, find the policies attractive and are considering the possibility of establishing a presence here — finding their own place in Hainan," he said.

Peter Burnett, chief executive of the China-Britain Business Council, who has visited Hainan several times, put it more bluntly. "Hainan is not just a free trade zone — it's a free trade port, the only one in China. That means the whole island is included, with very low tax rates and low tariffs," Burnett said. "Once you're in Hainan, you're free to operate and you have the ability to access the mainland — it's a launch pad."

Burnett, who led a delegation of British companies, said the 30-percent value-added policy is "of great interest". "Some companies have already set up in Hainan. Success will breed success. I expect more companies to realize the potential."

"For the United Kingdom, 80 percent of our economic output is in services. Many companies in our delegation to Hainan this time are in services — not just financial services, but also engineering, publications, media and creative industries," Burnett added.

The event was not merely a gathering of foreign firms, it was also a demonstration of how Chinese enterprises are facilitating global cooperation. Xi Guohua, chairman of CITIC Group, called Hainan Free Trade Port the highest-level form of China's opening-up.

"The full implementation of Hainan's policies presents historic opportunities for the bio-health industry to integrate into global industrial chains," Xi said. He added that CITIC will leverage its strengths as a multinational conglomerate to serve as a bridge between China and the world, deepening cooperation with Hainan in biomedicine, high-end medical care and wellness services.

To put words into action, CITIC has provided a financing support package exceeding 39 billion yuan ($5.76 billion) to facilitate win-win cooperation during this trip, Xi disclosed.

The success of this event, Xi said, confirms that China is a grand stage and a vast market for investment, Hainan is a new highland and a new gateway for open cooperation, and CITIC is a reliable guide and bridge for global partners.

Xi made three proposals: first, to build an open and win-win island by establishing multi-level cooperation mechanisms; second, to create an innovative and dynamic island by integrating financial resources and strengthening the Hainan-Hong Kong dual-hub linkage; and third, to foster a culturally charming island through publishing, think tanks and media to enhance international cultural exchanges.

While policies attract, execution matters. Li Tao, vice-president of Siemens Healthineers Greater China, said what made this trip different from many others he had attended was the sequencing: site visits first, then discussions.

Middle: Company executives sign contracts at the International Life and Health Enterprises Hainan Visit event in Haikou, Hainan province, on May 26.
Above: Foreign executives talk at the Hainan event in Haikou on May 26. PHOTOS PROVIDED TO CHINA DAILY

"In many other events, it is usually meetings first and then site visits. Today, during the discussions, we were able to have very good conversations because we had visited three areas — Haikou, Boao and Sanya — which made the process much more efficient: see first, then discuss," Li said. He summed up Hainan's approach in three words: pragmatic, effective and professional — with an emphasis on efficiency.

On Dec 18, Siemens Energy became the first foreign-invested enterprise to complete registration after receiving its business license at the Yangpu administrative service center in Danzhou, Hainan. The company simultaneously broke ground on a new gas turbine assembly base and service center, a project it described as its first project of its kind in China.

The move marked a milestone manufacturing project demonstrating investor confidence, and came as Hainan launched island-wide special customs operations on the same day.

Joern Schmuecker, senior vice-president, Gas Services Central of Siemens Energy, said: "Establishing a gas turbine assembly base and service center in Hainan aligns perfectly with the free trade port's vision of becoming a new high ground for openness and international cooperation. Together with our partners, we will drive collaborative innovation across the industry value chain, continuously enhance equipment delivery and service capabilities, and build an industrial ecosystem that contributes to energy resilience in China and across the world."

Online
See more by scanning the code.

Meanwhile, French pharmaceutical company Mayoly has also established a presence on the island, while Singapore-based Fullerton Health Group opened Hainan's first wholly foreign-owned hospital.

Companies' enthusiasm is backed by hard data. Since the special customs operations started on Dec 18, Hainan had added 1,004 new foreign firms up to April 29, up 35.86 percent year-on-year.

As of the end of April, Hainan had 12,300 foreign-invested enterprises, with investment sources covering 180 countries and regions.

Feng Fei, Party secretary of Hainan, told a conference last week that the life and health industry is a key pillar of the Hainan Free Trade Port, and the province's excellent ecology, open industrial policies and vast market potential make it uniquely positioned.

"The island province is becoming a new frontier of China's opening-up, a hotbed for mutually beneficial cooperation and a new engine for economic globalization," Feng said. "Choosing Hainan means choosing opportunities. Investing in Hainan means investing in the future."

He emphasized the importance of developing "two bases" — one for Chinese enterprises expanding globally and another for foreign companies seeking access to the Chinese market.

Hainan's negative list for foreign investment is the shortest in the country, Feng said, extending a warm welcome to international investors.

Sean Stein, president of the US-China Business Council, offered a concrete example of how Hainan's new policies are changing investment decisions. "Previously, a major US company that refurbishes used products from Southeast Asia and Japan could not do so in China due to regulations. Now, after the kickoff of island-wide special customs operations, the company is setting up a base in Hainan to renovate and re-export the products globally," Stein said. "That's a big, encouraging change."

Tesla has also seen a surge in activity across its Hainan outlets. A Tesla spokesperson told China Daily that Hainan's ecological advantages and open policy environment make it "an ideal base for promoting green mobility worldwide". Due to the new customs policies and local government subsidies, foot traffic at Tesla's stores in Haikou has risen 20 percent month-on-month.

The influx of foreign businesses is not accidental. Hainan has been systematically improving its business environment. Chen Shuying, an official of the Hainan provincial market supervision administration, said that a series of reform measures have shortened the preparation time for foreign-funded enterprises to invest in Hainan.

The process for foreign enterprises has been changed from "separate handling by different departments" to "integrated processing", compressing the number of procedures from five to one and reducing paperwork by more than 77 percent, Chen said.

In late April, Hainan issued a three-year action plan to improve foreign-related services and the international business environment, introducing 30 specific measures in seven areas. These include extending Hainan's enterprise registration window to Hong Kong and offering customized "one enterprise, one policy" services for key industries.

He Jifeng, deputy director of the Hainan Provincial Department of Business Environment Development, said the action plan aims to create a precise foreign investment service system covering the entire lifecycle of enterprises.

"We will refine annual plans, clarify timelines, strengthen coordinated implementation and put every reform measure and every service scenario into practice — so that more foreign enterprises can invest with confidence, operate with ease and develop with focus in Hainan," said He.

For Heilig, Hainan's progress is still in the early stages, but he is optimistic. "We are watching closely. For German companies, our needs include not only open policies, but also important international infrastructure — education, medical resources and most importantly talent to support business development," he said. "Much work is being done. We believe Hainan will develop well."

When asked whether Hainan could become a new center or model for China-Germany cooperation, Heilig did not hesitate. "I hold a very positive attitude. I believe it will certainly become a new model or benchmark."

That confidence is shared by many. Burnett from the China-Britain Business Council, after a beach walk at sunset, put it simply: "You sometimes forget that you're in an industrial zone. So you can come to work, invest in Hainan and feel like you're on holiday."

Behind that pleasant feeling lies a serious business case. With its unique policies, improving infrastructure, coordinated governance and growing openness, Hainan is steadily transforming from a tropical resort into a genuine hub for global investment, experts said.

HK, Almaty to restore direct air ties in 2027

By **ATLAS SHAO** in Hong Kong and **WU KUNLING** in Astana

The Hong Kong Special Administrative Region will resume direct flights with Almaty, Kazakhstan's largest city, in the first quarter of 2027 and establish a blood purification product manufacturing base in the Central Asian country.

The agreements were among 43 memorandums of understanding and cooperation deals signed by a high-level trade delegation comprising 40 Hong Kong business and professional leaders and 30 representatives from Chinese mainland enterprises.

Led by Hong Kong SAR Chief Executive John Lee Ka-chiu, the delegation arrived on Sunday in Kazakhstan, the first stop on a weeklong Central Asia trip.

Speaking to the media on Tuesday in Astana, Kazakhstan's capital, Lee said the 43 MOUs cover the economy and trade, investment, financial services, technology, education, aviation and green finance.

Among the key outcomes was the relaunch of direct flights between Hong Kong and Almaty. Lee said the resumption of flights will make it easier for Hong Kong passengers to travel to Central Asia, the Caucasus region and Eastern European cities via Almaty.

Following Lee's announcement, Hong Kong's flag carrier Cathay Pacific said it plans to launch three flights a week to Almaty in the first quarter of next year.

Lee said the SAR government will also negotiate with Kazakhstan to expand visa-free access for SAR passport holders from the current 14 to 30 days, to facilitate business and tourism.

A Hong Kong capital company and Samruk-Kazyna, Kazakhstan's sovereign wealth fund and national holding company, will jointly invest $100 million to establish a regional blood purification product manufacturing center in Kazakhstan, Lee said.

Hong Kong Exchanges and Clearing Ltd will assist the Astana International Financial Centre, a leading financial hub in Central Asia and Eastern Europe, in exploring cross-border listings and developing its green finance ecosystem.

Kazakhstan has agreed to accelerate consultations with the Hong Kong SAR on a comprehensive double taxation avoidance agreement and will begin formal negotiations on an investment promotion and protection agreement, laying the foundation for long-term cooperation.

On Tuesday afternoon, the delegation attended a business luncheon aimed at strengthening ties.

Serik Zhumangarin, Kazakhstan's deputy prime minister and national economy minister, said the signed documents form an important basis for further cooperation between Kazakhstan and the Hong Kong SAR.

Li Xiaojun, chairman of Guangzhou Pharmaceutical Holdings Limited, said the delegation could serve as a bridge to the Central Asian market, enabling parties to jointly advance economic development through cutting-edge technologies and biomedicine.

Baidaulet, a 37-year-old Astana resident who studied Chinese in China and regularly uses Chinese social media apps such as WeChat, said he has observed increasingly close relations between China and Kazakhstan. He added that the Hong Kong SAR delegation's visit will bring new opportunities for cooperation, particularly in investment.

Lee will lead the delegation on Wednesday to visit the National Museum of the Republic of Kazakhstan and Nazarbayev University. Two Hong Kong universities will sign MOUs with Nazarbayev University to expand exchanges with higher education institutions.

SPP cracks down on Yangtze belt pollution

Yearlong public interest litigation drive will support protection and development

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

China's procuratorial organs have launched a yearlong public interest litigation campaign to strengthen water pollution control in the Yangtze River Economic Belt, part of broader efforts to protect the country's most important river basin and support high-quality development.

The Supreme People's Procuratorate said on May 20 that the campaign, running from May 2026 to April 2027, will focus on major pollution risks in areas such as agricultural and aquaculture waste, urban and industrial wastewater, tailings management and illegal disposal of solid waste.

The announcement came as the SPP and the Ministry of Ecology and Environment held a seminar in Yibin, Sichuan province, on procuratorial services for the high-quality development of the Yangtze River Economic Belt. The SPP also released a white paper reviewing procuratorial work in the region during the 14th Five-Year Plan (2021-25) period.

This year marks the 10th anniversary of the Yangtze River Economic Belt development strategy. The belt covers 11 provincial-level regions, accounting for about one-fifth of China's land area and roughly half of the country's population and economic output.

Ying Yong, prosecutor-general of the SPP, said procuratorial organs should help maintain security and stability along the river and support high-quality development with high-level security.

He urged strict punishment for crimes damaging the Yangtze River Basin's ecology, continued enforcement of the 10-year fishing ban and sustained crackdowns on illegal fishing. He also called for stronger use of damage compensation and punitive compensation systems, as well as coordinated ecological restoration.

Ying said procuratorial organs should better integrate into the broader framework of Yangtze River protection, strengthen coordination between law enforcement and judicial authorities, and improve links between administrative law enforcement, criminal justice, public interest litigation and ecological damage compensation.

"Serving the high-quality development of the Yangtze River Economic Belt is a shared responsibility of law enforcement and judicial organs," Ying said, adding that prosecutors will continue to work with relevant departments and the public to build stronger legal support for Yangtze River protection.

According to the white paper, procuratorial organs handled 274,000 environment and resources cases over the past five years. They approved the arrests of 32,000 people for damaging environmental resources and handled prosecutions involving 169,000 people.

Through specialized case-handling mechanisms and ecological restoration procedures, prosecutors helped protect or restore 23,133 hectares of polluted farmland, forestland, grassland and wetlands, and urged the recovery or cleanup of 15.4 million metric tons of industrial solid waste.

The white paper highlighted that procuratorial organs have increasingly used technology to address difficulties in dealing with tip-offs related to crimes and collecting evidence in river basin cases. A support system combining satellite remote sensing, drones and rapid testing has been improved, while more than 500 rapid-testing laboratories have been built nationwide, basically covering city-level procuratorates in the Yangtze River Economic Belt.

Public participation has also expanded. The SPP's "Yixinweigong" volunteer cloud platform has recruited 126,000 volunteers nationwide, who have submitted 38,000 tip-offs and participated in 40,000 activities, including case consultation, public hearings and follow-up observation.

Focusing on key environmental problems, the SPP has worked with other departments to crack down on illegal fishing in the Yangtze River Basin. It has also carried out special operations with the Ministry of Public Security and the Ministry of Ecology and Environment for five consecutive years against hazardous waste crimes and falsified automatic monitoring data.

Because river basin governance involves multiple regions, departments and regulatory links, prosecutors have strengthened integrated case handling and cross-regional cooperation. The white paper said such efforts have helped form a Chinese approach to cross-regional river basin governance through procuratorial public interest litigation. Related experience has also been presented at international forums, including side events at the United Nations Climate Change Conference, and has won widespread attention and high praise.

During the 15th Five-Year Plan period (2026-30), procuratorial organs will maintain strict enforcement against illegal industrial wastewater discharge, illegal dumping of solid waste and other environmental crimes. They will also continue to support the 10-year fishing ban, strengthen biodiversity protection, prevent invasive species, protect farmland and improve supervision over illegal land occupation along the river.

The SPP said prosecutors will also deepen public interest litigation to support green and low-carbon development, while stepping up case handling on issues affecting people's daily lives, including black and odorous water bodies, noise and light pollution, cooking fumes, unpleasant odors and livestock breeding pollution.

Aviation pioneer behind J-8 fighter jet dies at 96

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Gu Songfen, one of China's leading aircraft designers and a pioneer in the nation's aviation industry, died of illness on Sunday. He was 96.

Born in February 1930 in Suzhou, Jiangsu province, Gu came from a well-educated family as the second child of two intellectual parents.

At age seven, he witnessed Japanese bombers flying over his home to attack nearby Chinese military barracks. He saw flames and smoke billowing after the raid, and the windows of his home were shattered by blast waves.

"After witnessing those scenes, I formed a wish: to learn to design aircraft when I grow up to help defend my motherland's skies," Gu said in an article he wrote and published in People's Daily in November.

He further wrote that his interest in aviation deepened after his older brother, then a middle school student, brought home a cardboard glider. Gu later began making paper planes with him. At age 10, his uncle gave him a model aircraft as a birthday gift, further strengthening his enthusiasm for aviation.

In 1947, after graduating from middle school, Gu was accepted by Tsinghua University in Beijing, Zhejiang University in Hangzhou and Shanghai Jiao Tong University, all of which he had applied to for studying aeronautical engineering. He chose Shanghai Jiao Tong University due to his brother's death in 1939, which made his mother reluctant to see her only son leave Shanghai.

After graduating in 1951, he was assigned to the central government's aviation industry bureau in Shenyang, Liaoning province, beginning his career in aviation.

Initially, he worked on repairing combat jets damaged during the War to Resist US Aggression and Aid Korea (1950-53), and participated in the reverse engineering and licensed production of Soviet aircraft.

In August 1956, China's first aircraft design organization, the Shenyang Aircraft Design Office, was established. Gu was appointed head of the aerodynamics team, responsible for aerodynamic design of the JJ-1 trainer jet, China's first domestically developed aircraft.

"Before the JJ-1, all Chinese-made aircraft were copies of Soviet models produced under Soviet experts' guidance using original Soviet blueprints with no room for design revisions. Along with veteran aviation experts, I believed that mere replication meant full reliance on foreign technology and the loss of independent initiative. We had to develop China's own aircraft," Gu said in the November article.

However, his university training had focused on propeller aircraft, leaving him with little knowledge of jet design. He had to search for reference materials and teach himself, despite the scarcity of technical publications at the time. Through persistent study, he overcame these challenges and completed his work successfully.

Beginning in 1964, Gu joined the development of the J-8 fighter jet as deputy chief designer and became its chief designer in 1972.

Although the aircraft completed its maiden flight in July 1969, it was plagued by multiple technical problems and was not ready for certification or delivery. One major issue was severe vibration during transonic test flights, posing serious safety risks.

Gu Songfen

When ground tests and simulations failed to identify the cause, Gu flew in the rear cockpit of a chase aircraft, using binoculars and a camera to observe and photograph the J-8 prototype in flight. After three flights, he identified the source of the vibration and proposed targeted fixes. The J-8 was officially approved for production in late 1979.

In 1986, Gu stepped down as chief designer of the J-8II fighter and director of the Shenyang Aircraft Design and Research Institute after being transferred to Beijing by the then Ministry of Aviation Industry. He became deputy head of its science and technology commission.

His work shifted toward strategic research in aviation technology development. He contributed to planning for future advanced aircraft, participated in decision-making for major national projects, and served as a technical consultant or chief expert on multiple programs.

In this role, he led conceptual research on advanced stealth fighters, large passenger aircraft and strategic transport aircraft, helping lay the groundwork for the rapid development of China's aviation industry in the 21st century.

In recognition of his contributions, Gu was elected an academician of both the Chinese Academy of Sciences and the Chinese Academy of Engineering in the 1990s. In 2021, he received the State Preeminent Science and Technology Award, China's highest honor for scientists and engineers.

Study maps how human organs form

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

Chinese researchers have mapped the world's first complete, time-lapse genetic map of human embryos during a critical one-month window of development. The breakthrough allows scientists to move past limited, localized observations to a comprehensive, moving picture of how human organs form.

The study, published recently in the journal Nature, focuses on the period between four and eight weeks after fertilization. Researchers say this data will provide a vital guide for pinpointing the exact origins of birth defects.

The project was a joint effort by Fudan University in Shanghai, Zhejiang University in Hangzhou, and the BGI Life Science Research Institution in Shenzhen, Guangdong province.

Experts have long considered the four-to-eight-week window a research "blind spot". It is notoriously difficult to sustain embryos in a lab at this stage, and standard medical imaging cannot capture precise developmental details.

Yet, the genetic instructions sent during this phase dictate the entire trajectory of human development. Mistakes during this time can result in congenital heart defects, brain development issues, and other conditions. Thus far, older gene-sequencing technologies could not provide a seamless, complete picture of this crucial timeframe.

By analyzing 13 human embryo samples, the team examined 50 organs or anatomical regions and 198 smaller sub-compartments. They successfully mapped how major organs — including the heart, brain, liver, kidneys, and skeleton — grow from scratch. The map answers fundamental scientific questions about exactly when and where specific cells appear, and what chemical signals trigger them to grow.

When looking closely at the heart's pacemaker — the specialized zone that controls the heartbeat rhythm — the study discovered two previously unknown genes, named RORA and KIAA1324L. Lab tests on zebrafish and mice confirmed that these genes are essential for creating pacemaker cells and keeping the heart beating steadily. This finding opens a new door for researching inherited heart rhythm disorders.

The study also redrew the map of early brain development, revealing that neurons — the brain's signaling cells — develop much earlier than previously taught.

"This is a textbook-changing discovery," said Huang Hefeng, a lead scientist on the team and an expert in reproductive medicine with the Chinese Academy of Sciences.

"We also identified the genetic communication networks linked to intellectual development issues," Huang said. "This gives us new insights into the microscopic foundation of neurodevelopmental disorders."

In addition, the research mapped out exactly where and when viral receptors — the specific cellular "docking stations" that viruses use to invade cells — appear in the growing embryo. Huang noted this explains why different organs are vulnerable to specific viral infections at different points in a pregnancy, a finding that carries major clinical value for protecting unborn babies.

Jiang Hua, director of the Obstetrics and Gynecology Hospital of Fudan University, compared the study to a high-precision GPS navigation map. He said it provides vital genetic coordinates for understanding early organ growth and the roots of congenital diseases, which will help doctors improve how they monitor early pregnancies.

Testing out the future of transport

Chinese research teams use digital tools to develop new era of movement

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

After decades of rapid infrastructure expansion, China is placing greater emphasis on making its vast transport network safer, more efficient and more intelligent through the application of digital technologies.

These developments, including those in the research stage and those already rolled out in the real world, are causing major operational shifts in how things are moved via land, sea and air.

From highways and ports to waterways and deep-sea equipment, researchers are working to solve how to better manage large-scale traffic flows, how to identify risks earlier, how to support safer navigation in complex waters, and how to make critical equipment more reliable and self-dependent.

Roads reading traffic

At the State Key Laboratory of Intelligent Transportation Systems in Beijing's Tongzhou district, researchers are exploring how roads can be made safer, more efficient and less congested.

By using sensing networks and cloud platforms, the researchers are able to enable roads themselves to become an active, responsive participant in the transport network. Via these sensors, roads can provide instant updates to connected vehicles and drivers informing them of accidents, traffic, weather conditions and detours.

"Road to vehicle coordination is not simply about connecting vehicles and roads," said Wang Lin, deputy director of the laboratory and director of the intelligent transport research center at the Ministry of Transport's highways research institute. "It is about changing the way people travel."

Wang said the goal is to make "vehicles understand roads, and roads remind vehicles", so that common bottlenecks in road transport can be mitigated and even avoided altogether.

"In the past, roads were mainly 'read' by people," Wang said. "Now, we are using machines and automated systems to read roads, so that vehicles, roads and cloud platforms can work together."

Another major factor in connecting roads and vehicles together is the reduction of risks caused by human error.

"Human factors are involved in about 95 percent of all traffic accidents," Wang said.

He gave the example of vehicle platooning — "The distance between vehicles may be reduced from the current level of around 200 meters to 20 meters or even 10 meters, which could greatly increase the capacity of a single lane," he said.

Despite China having built one of the world's largest road networks, congestion hot spots are an inevitability, so researchers are working on a shift from building roads to managing them better.

At the Tongzhou laboratory, researchers are testing out these intelligent transport systems to make them reliable enough for real-world use.

In a 250-meter tunnel, rain can be made to fall at the push of a button, while fog, low visibility and water-covered road surfaces can be repeatedly recreated.

Li Zhenhua, a senior engineer at the laboratory, said the facility allows researchers to bring dangerous weather conditions indoors, instead of waiting for them to appear on real roads.

"Extreme weather on real roads is difficult to predict and even more difficult to test safely," Li said. "Here, we can reproduce the same scenario again and again, compare the data and improve the system step by step."

An eight-degree-of-freedom traffic safety simulator with a 360-degree panoramic projection system, surround sound and a motion platform, is used to recreate different vehicle types, roads and weather conditions, including rain, snow, fog and wind. This system allows the researchers to test driving behavior and intelligent transport technologies without exposing vehicles or people to real danger.

The lab also has an automated driving test track covering road scenarios including expressways, urban roads, national and provincial highways, and rural roads. It includes intersections, ramps, toll stations, bus stops and a simulated tunnel, supporting the research, evaluation and demonstration of automated driving technologies.

A robot directs traffic at a crowded crossroad near the West Lake in Hangzhou, Zhejiang province, last month. LONG WEI / FOR CHINA DAILY

Predicting the way of water

In the port city of Tianjin, researchers are applying a similar logic to water transport by making risks visible before they potentially turn into accidents.

At the Ministry of Transport's Tianjin Research Institute for Water Transport Engineering, a huge wave flume stretches 450 meters long and 5 meters wide. With a water depth of 8 to 12 meters, the flume can produce waves as high as 3.5 meters, simulating some of the most extreme sea conditions.

The flume is used to study coastal engineering disaster prevention, sediment transport, wave-structure interaction and the dynamic response of large floating structures.

Chen Hanbao, chief scientist at the institute, said the flume is useful because coastal engineering projects can develop unexpected problems that can be avoided with wave impact testing.

"Large-scale tests allow researchers to better understand how ports, breakwaters and offshore structures behave under real wave conditions," Chen said.

The same facility also supports the development of intelligent dredging robots.

In the past, dredging often meant removing sediment after it had already accumulated. With a better understanding of tides, currents and sediment transport, precise preventive measures can be enacted.

Dangerous goods

Another lab at the Tianjin institute is looking into ways that the transport of dangerous goods can be handled more safely.

China transports more than 1.4 billion metric tons of dangerous goods through its waterways each year, accounting for about 40 percent of the country's total dangerous goods transport volume.

While they are essential for industrial production and economic activities, these goods also bring risks, especially when cargo is falsely reported, concealed or transported under unsuitable conditions.

According to Lu Linlin, an associate researcher on the institute's safety team, the lab has built a full-process technical support system covering material properties, transport conditions, risk warning and emergency response.

Researchers can simulate temperatures ranging from -40 C to 80 C to test the strength and sealing performance of dangerous goods packaging. A handheld identification device can determine the identity of a liquid within seconds, helping inspectors screen risks earlier.

For port safety, the key is not to find out what a dangerous material is after something goes wrong. Rather, it is to know before the cargo enters the transport chain what it is, whether it can be transported, how it should be packed and under what conditions it may become unsafe.

At the Tianjin institute's navigation safety lab, data on adjacent Bohai Bay's wind, waves, currents and tides are displayed in real time. An intelligent platform supports safe port entry for fully loaded 400,000-ton vessels, night navigation for 200,000-ton vessels and emergency night entry for liquefied natural gas carriers.

Smart technologies are steering waterway management from experience-based judgment to data-driven coordination.

Ship to shore

At Dalian Maritime University in Dalian, Liaoning province, this focus has extended from ports and waterways to intelligent shipping and deep-sea equipment.

The university and China COSCO Shipping have co-developed the *Xin Hong Zhuan*, the world's first intelligent ship that integrates remote control, autonomous sailing and teaching practice.

In June last year, the vessel embarked on a landmark 4,000-nautical-mile mission to test its smart systems, as well as the university's shore-based digital platform.

The platform serves as a "shore-based cockpit" for intelligent vessels. In open waters, ships can rely more on autonomous systems; in narrow waterways, bad weather or emergencies, shore-based operators can provide remote support or take control.

Yin Yong, a professor at Dalian Maritime University's Navigation College, said the system can give captains real-time advice on speed and course, while also supporting autonomous navigation in open seas.

"It is not just a system on shore," Yin said. "The laboratory has one set, and the vessel has one set as well. The two sides can work together. The system can advise the captain what speed to take, what course to follow and, when the ship reaches the open ocean, support autonomous navigation."

Yin said intelligent shipping is not simply about installing sensors on vessels or removing crews overnight. Instead, it is about building coordination among ships, shore-based platforms, AI systems and human operators.

In deeper waters, Chinese researchers are also pushing forward with domestically developed deep-sea equipment. A full-ocean-depth winch system developed by a team led by Li Wenhua, a professor at Dalian Maritime University, is providing a "lifeline" connecting scientific research vessels with deep-sea equipment.

"Lowering equipment into the deep sea is like flying a kite at a depth of 10,000 meters," Li said. The cable must be light, strong, stable and orderly, while also transmitting power, control signals and images, and safely retrieving samples.

The technologies seen in these laboratories are not confined to research papers or demonstration screens. Many have already been applied in highways, ports, waterways, ship operations and deep-sea exploration, offering practical solutions to real challenges facing China's transport system.

As AI, intelligent sensing, digital platforms and advanced equipment move into real transport scenarios, China's transport development is entering a stage focused on extending infrastructure networks and improving the intelligence, safety and resilience of the entire system.

Dalian university trials latest marine technology

By **LUO WANGSHU**
in Dalian, Liaoning

In waters near Zhangzi Island in Dalian, Northeast China's Liaoning province, a yellow underwater robot moves steadily beneath the surface. With 12 thrusters, binocular cameras and a flexible robotic arm, it identifies sea cucumbers, sea urchins and scallops, then completes a grab within seconds.

The experiment, supported by Dalian Maritime University's smart ocean information technology innovation platform, shows how laboratory research is being applied to real production scenarios.

For marine ranches, such machines could change a long-standing model that relies heavily on divers, who are constrained by depth, weather and safety risks.

Researchers said one vessel equipped with several robots could support round-the-clock operations with fewer workers, reducing both labor intensity and operational risk.

"Pain points in marine production are exactly where new quality productive forces can play a role," said Yuan Guoliang, a faculty member at the university's School of Information Science and Technology.

The team is developing underwater optical communication technology, using LED light to transmit data and video over short distances — a system researchers describe as a form of "underwater Wi-Fi". Such technology could help underwater robots work together more efficiently and reduce their dependence on heavy cables.

The same push toward practical application is being seen in intelligent shipping.

At the university's shore-based digital operation and control center for intelligent ships, the navigation status, engine data and surrounding sea conditions of China's *Xin Hong Zhuan* are displayed in real time. The vessel is the world's first intelligent ship designed for both research and maritime teaching practice.

Yin Yong, a professor at the university's Navigation College, said the system is not meant to replace captains, but to provide an additional layer of support.

"It can advise the captain on speed and course in real time," Yin said. "In open waters, it can also support autonomous navigation. The shore side and the ship side each have a system, and the two can work together."

This model of ship-to-shore coordination is viewed as a practical step toward intelligent shipping.

For ship operators, the value lies not only in remote control but also in better information. A vessel's operating condition could be monitored continuously, its route could be optimized, and risks could be assessed before they developed into emergencies.

Beyond intelligent ships, Chinese researchers are also working to reach deeper waters.

Li Wenhua, a professor at the university's Marine Engineering College, leads the development of full-ocean-depth winch systems that have already been used in China's deep-sea scientific research. The systems support seabed sampling, deep-sea towing and remotely operated underwater vehicle operations — tasks that are essential for marine research but difficult to carry out reliably in extreme conditions.

A winch system that his team has developed has retrieved samples from 7,762 meters below the sea surface. The team has also developed a full-ocean-depth electro-optical cable winch system and a full-ocean-depth trace metal CTD winch system, which have been tested in deep-sea and polar missions.

The *Xin Hong Zhuan* ship is delivered to Dalian Maritime University at a shipyard in Dalian, Liaoning province, in July 2024. PROVIDED TO CHINA DAILY

During one Arctic operation, the cable froze in temperatures of around -30 C, and the equipment jammed. Li and his team worked in wind and snow for nearly two hours before the system was fixed. He later wrote a few words in his log: "Polar verification passed".

The note was brief, but captured the larger meaning of the work. Testing advanced maritime equipment not only in laboratories, but also in real conditions where it is expected to operate.

All about Gen Z

Z WEEKLY

From smart port to shared future

Young representatives from more than 10 countries explore Rizhao's maritime development, cultural heritage and industrial innovation.

Students and media professionals from more than 10 countries take part in the 2026 China-Overseas Gen Z Dialogue and Exchange Event, held in Rizhao, Shandong province, from May 26 to 29. PROVIDED TO CHINA DAILY

By ZHAO RUIXUE
in Rizhao, Shandong
zhaoruixue@chinadaily.com.cn

Before visiting Rizhao Port in Shandong province, Yoosadiang Thamonwan from Thailand had imagined a typical industrial port: noisy, gritty and dominated by steel and heavy machinery.

But what she saw instead was a fully automated container terminal operating in near silence: driverless trucks moved steadily across the wharf while remote-controlled cranes loaded and unloaded containers with precision.

Yoosadiang, an economics student at Zhejiang University, was one of the young representatives, journalists and content creators who joined the 2026 China-Overseas Gen Z Dialogue and Exchange Event, held in Rizhao from May 26 to 29. Participants came from more than 10 countries, including Germany, Russia, the United States, Myanmar, Mongolia, Madagascar and South Africa.

Co-hosted by China Daily 21st Century Media and the Rizhao municipal authorities, the four-day program took participants to the city's port, coastline, sports venues, tea gardens and factories. Through these visits, they explored how Rizhao is trying to turn its maritime resources into a platform for trade, ecological restoration, cultural exchange and youth dialogue.

"May global youth share Rizhao's inspiring journey of maritime development from their own generational perspective and let cross-cultural exchanges take root and flourish along this blue coast," said Zeng Qingkai, secretary-general of China Daily, at the opening ceremony.

That ambition came into focus at Rizhao Port, where participants watched containers being lifted, transferred and sorted with little visible human intervention.

"In textbooks, I often learn terms like tariffs and supply chains. But standing here today at the port, I finally see how it connects people's daily lives with global trade," said Ye Kyaw Thu from Myanmar, an international trade student in China.

From the port, the group cycled along the Rizhao Sunshine Coast Greenway, a 28-kilometer coastal path running between beaches, pine forests and wetlands. Along the way, they saw residents collecting seafood, camping and playing beach volleyball.

It was hard to imagine that just five years ago the area had been a barren stretch of saline-alkali wasteland, scarred by gullies.

"During construction of the greenway, local builders worked with great care, following the principles of not disturbing a single pine tree, polluting the beach, damaging the reefs or disrupting the surrounding waters," said Wang Yaping, a young resident who took part in the project.

Today, Zhangbei Bay, which adjoins the greenway, maintains excellent nearshore water quality year-round. The local population of the critically endangered Chinese crested tern has grown to 46, while more than 2,000 fishing families have shifted from traditional fishing to tourism-related businesses such as guesthouses, turning the restored bay into a source of sustainable income.

> "In textbooks, I often learn terms like tariffs and supply chains. But standing here today at the port, I finally see how it connects people's daily lives with global trade."
>
> **Ye Kyaw Thu,** a Myanmar student in China

The same coastline has also helped shape Rizhao's identity as a city of water sports. At the Rizhao Olympic Water Sports Town, the group tried dragon boat rowing, an activity that quickly became a lesson in coordination.

As the drumbeats quickened, participants from different cultural backgrounds gripped their oars and paddled across the lagoon. Their strokes were uneven at first, and the boat rocked from side to side. But they soon found their rhythm under the drummer's command.

"Although we come from different countries, rowing the dragon boat made us feel like family in an instant," Yoosadiang said.

Rizhao is also expanding its wider sports calendar. According to the city government, it plans to host more than 100 provincial- and national-level sporting events this year, spanning ball games, track and field, cycling, road running, water sports, and ice and snow sports. The goal, officials said, is to build a year-round sports scene that involves residents of all ages.

The cultural part of the program took participants to a local tea garden, where they walked through terraced fields and tried their hand at picking "one bud and one leaf" — the standard for high-quality green tea.

They also watched the hand-frying technique used to make Rizhao Green Tea, a provincial-level intangible cultural heritage practice, and learned how young tea artists are presenting traditional tea culture in new forms, including charcoal-stove brewing and tea-based mixed drinks.

"From picking to frying to drinking, the intangible cultural heritage of Chinese tea gardens reflects long-term cultural, ecological and social sustainability," said Veldesen Yaputra from Indonesia. He noted that it offers a model of sustainable development worth further exploration.

The group also visited one factory of Wuzheng Group, a manufacturing company. There, they watched industrial robots carry out precision welding, saw intelligent assembly lines in operation and viewed products including high-horsepower tractors.

"I truly admire how 'Made in China' can satisfy so many people," said Sophie Steinecke from Germany. "Chinese manufacturing gives many people the opportunity to buy the products they need."

By the end of the trip, Rizhao was no longer just a stop on an exchange program, but a living example of how a coastal city can connect industry, nature, culture and people across borders.

Deep Dive

As AI companions become increasingly common worldwide, their emotional and social implications have drawn growing public concern.

In China, the recent release of the Interim Measures for the Administration of Anthropomorphic AI Interactive Services (2026) marks a national effort to regulate AI companions and protect users, especially minors and older adults.

This commentary introduces the Human-Machine Sociality Quadrants, a digital literacy framework designed to help young people identify the differences between humans and AI in providing social connection, and to navigate a healthy digital life with AI companions.

Teaching youth to navigate AI companionship

AI companions have become part of daily life worldwide. Platforms such as Replika and Character.AI, as well as Chinese apps including Doubao, Xingye and Maoxiang, are popular among young users seeking emotional support amid digital loneliness.

Unlike social media, AI companions offer direct, round-the-clock support and constant affirmation, creating a form of seemingly conflict-free and unconditional companionship.

It is against this backdrop that China recently issued the Interim Measures for the Administration of Anthropomorphic AI Interactive Services (2026). The document aims to balance regulation and innovation by advocating an inclusive and prudent approach, with categorized and tiered rules to guide anthropomorphic AI interactive services toward healthy and positive development.

For both administrators and educators, the boundary between the benefits and risks of AI companions remains under discussion.

Our ongoing research on human-AI relationships reveals distinct relational patterns with both clear benefits and hidden costs. For young people facing mental distress, loneliness or family conflicts, AI companions can help them through moments of crisis. One user noted, "The love I received from AI is actually the love from all humankind," seeing AI as a product of human civilization rather than something alien.

Yet long-term reliance also brings risks. Users may make one-sided emotional investments, develop unrealistic feelings of safety while overlooking data privacy concerns and apply impossibly high AI standards to human relationships.

Globally, some extreme cases involving youth suicide linked to AI interactions have also emerged, highlighting dangers that cannot be ignored.

Jindong Liu

Regulation is vital, but it is not enough. Education must complement regulation by helping young people relate to AI with awareness and critical understanding. Schools and families need to cultivate a new form of AI literacy that goes beyond technical competence and focuses on social competence.

In our latest study, we introduced the Human-Machine Sociality Quadrants (HMSQ), which can be a useful tool for educators and regulators in developing AI literacy and addressing AI-related risks.

The framework maps social capabilities across four categories: what both humans and AI can do socially; what humans can do but AI cannot; what neither humans nor AI can do; and what AI can do socially while humans cannot.

For example, in our study of mainstream chatbot companions, including ChatGPT and Doubao, we found that social capabilities can be classified as human-only, AI-only or shared by humans and AI.

Human-only capabilities include reciprocity, shared life experiences and physical intimacy. AI-only capabilities include unlimited availability, endless patience and constant affirmation. Shared capabilities include active listening, understanding and conflict resolution.

These categories can be clearly mapped in the HMSQ diagram to show the differences and similarities between humans and machines.

This framework helps educators, regulators and young people think through several critical questions: How do humans and AI overlap in areas where they share similar social functions? How can educators highlight what makes human relationships unique? And how should AI-only capabilities be regulated?

Educational initiatives should also expose the commercial motives behind these platforms. Many AI companions are designed to maximize engagement, not well-being. Schools and families should therefore create spaces where young people can practice essential relational skills: navigating disagreement, tolerating uncertainty and sustaining mutual effort. These are capacities no algorithm can teach and no meaningful relationship should lack.

Z WEEKLY

Editor's note:

From exploring the depth of Chinese history at the Great Wall to discovering the flavors of Cantonese cuisine in Guangdong province, young Americans have captured their impressions of China through their own eyes.

These moments are part of the second "My Trip to China" Short Video Contest, hosted by the Chinese Consulate General in San Francisco. The contest attracted more than 400 teachers and students from schools across the United States, with over 50 videos submitted.

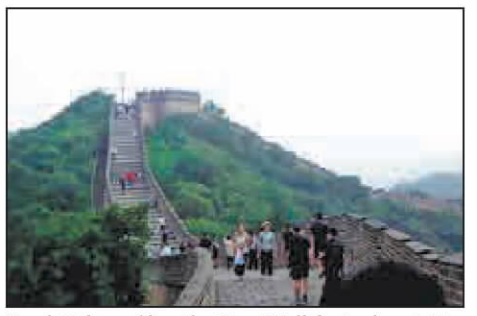
The five stories featured here offer a glimpse into young Americans' firsthand observations, personal connections and the growing influence of China-US youth exchanges.

Seeing China through young eyes

Young Americans share firsthand impressions of China through videos highlighting culture, history and people-to-people exchanges, **Gui Qian** reports.

Online
Watch the video by scanning the code.

A book comes alive



For Sarah Golovey, her journey to China began not only with a plane ticket, but also with a book.

Her video opens with a volume about China, filled with pictures and descriptions of famous landmarks and cultural landscapes. But the story soon moves beyond the printed page and into real life: Golovey, an Asian studies major, travels to China herself and sees what she had previously only learned from textbooks.

"To study a place and to know it intimately are two different things," she said in the video. She explained that people are often warned not to meet the things they have long admired, for fear that reality may disappoint them. But for her, China proved the opposite.

Her video presents China through a lens that is both academic and emotional. She visits a *hanfu* shop, enjoys a *guzheng* performance, walks through the high-rise streets of Beijing's CBD and climbs the Great Wall. She also takes in mountains, rivers and a multi-arch stone bridge that reflects the elegance of classical Chinese bridge-building.

After experiencing what she describes as "magic" moments in China, Golovey concludes her video by saying the country exceeded her expectations. The more China revealed itself, she said, the more she felt that seeing it in person had deepened rather than diminished her admiration.

Sarah Golovey films the Great Wall during her visit to Beijing.

Between worlds, finding home

Samantha Tsang was invited to China through a youth exchange program inspired by the legacy of the Flying Tigers.

During World War II, the Flying Tigers, formally known as the American Volunteer Group, became a powerful symbol of China-US cooperation in the face of shared adversity. Today, youth programs seek to carry that spirit forward through people-to-people exchanges.

Tsang's video traces an emotional journey. As a first-generation Chinese American, she used the two-week trip to explore what it means to live "between worlds". Her reflection centers on identity, capturing both the excitement and nostalgia of encountering a country that felt at once familiar and unfamiliar.

For her, China was not just a destination but also a mirror. From traditional folk dances to an advanced suspended monorail, she saw how "the past, present and future can coexist in a single moment".

"In a reality that often feels intangible and ever-changing, people-to-people exchanges rooted in our shared humanity matter more than ever," she said in the video.

Samantha Tsang visits the Guishan TV Tower in Wuhan, Hubei province.

Jonah Tan (center) spends Christmas with friends in Beijing. PHOTOS PROVIDED TO CHINA DAILY

Winter deepens cultural roots

At the end of 2024, Jonah Tan took part in a camp program at Tsinghua University that combined academic study with travel. Looking back on the experience, Tan described the trip as "nothing short of amazing".

The program gave him a close look at academic life at one of China's top universities. At Tsinghua, he attended a dozen lectures on subjects ranging from artificial intelligence to psychology. He also had the chance to speak with senior Tsinghua students, who shared advice on future plans and academic paths — guidance that proved valuable to him.

The experience extended far beyond the classroom. Tan traveled to Northeast China and visited Changbai Mountain in Jilin province, where the winter scenery left a deep impression. In his video, the snowy landscape is paired with a poetic lyric: "After drinking from the Songhua River and witnessing the beauty of rime ice, I long for that dazzling world of pure white."

Tan also spent Christmas in Beijing, celebrating with local friends, a moment that made the trip feel even more personal.

As someone who is half-Chinese, he said the journey deepened his connection to Chinese culture "in ways he had never imagined".

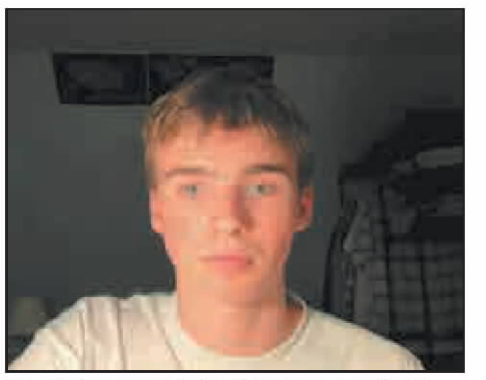
A city full of surprises

For Liam Wilcox, Guangzhou, the capital of Guangdong province, was once little more than a mysterious name. But after spending a summer there, the young American was surprised to discover what he described as "an indispensable metropolis" — and a place he would "never forget".



Wilcox joined an international exchange program at South China University of Technology in Guangzhou. In his video, he recounts his trip in fluent Chinese, making the language itself one of the most impressive parts of his story.

Reflecting on Guangzhou's history, he highlights the city's location along the Pearl River and its long-standing role as a center of trade. He also learned that many Cantonese people migrated to the US during the Qing Dynasty (1644-1911), helping shape the Chinese cuisine that many Americans know today.

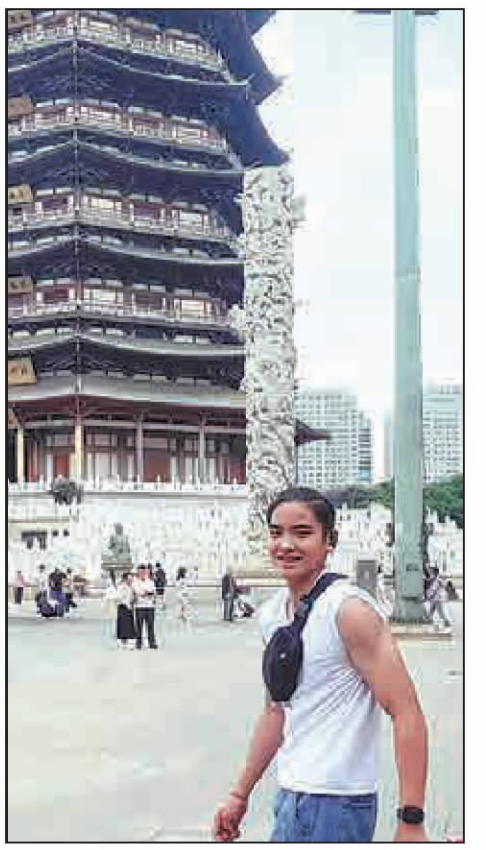
"I had not expected Guangzhou to be so deeply connected with my own country," Wilcox said in the video.

Food became one of the strongest threads running through his memories of the city — from hot soy milk in the morning to afternoon tea with friends and late-night snacks.

"Guangzhou is full of surprises around every corner," he said.

Liam Wilcox recounts his China journey in fluent Chinese on camera.

Reading China through motion



While many travelers remember a trip through food, sightseeing or shopping, Joshua Saul found himself recording China through movement. Rather than treating exercise as separate from travel, he used walking, stretching and brief pauses for reflection as a way to feel the rhythm of each city.

In Suzhou, Jiangsu province, for example, he moved slowly through classical gardens and along slightly wet stone-paved paths. At quiet moments during the visit, he added simple movements such as push-ups and stretching, using them less as a workout than as a way to stay present in the setting.

In Shanghai, he chose to meditate near the Oriental Pearl Tower by the Huangpu River, closing his eyes amid skyscrapers and the energy of the modern city.

"This trip to China made me understand fitness isn't limited to the gym," Saul said.

For him, every step became part of the journey, helping him remember "the temperature of each city, its heights and its story". He came to see that movement could be another way of reading a place — through its landscapes, history and everyday pace.

Joshua Saul exercises at scenic spots during his trip across China.

Lin Yu-chi (left) sits outside the bakery he runs with his wife, Tao Jiabao, in Wuhan, Hubei province. PROVIDED TO CHINA DAILY

Baking becomes belonging

Through Taiwan-style bread and local Wuhan flavors, a baker creates quiet connections across the Taiwan Strait.

By LIU KUN in Wuhan
and **XIONG XINYI**

At around 4:30 am, while much of the city is still asleep, Lin Yu-chi, a baker from Tainan, Taiwan, begins his day alongside his wife, Tao Jiabao. Together, they run a small bakery in Wuhan, Hubei province. Over the years, Lin's life has come to revolve around flour and yeast.

At the bakery, Lin takes on the most physically demanding tasks: mixing, kneading and controlling fermentation. Tao prepares ingredients, manages orders and bakes. With no employees, the couple handles every step themselves, from flour to shelf, each task tightly linked, leaving little room for pause.

The rhythm now feels natural to Lin, though it was not what he had expected when he first arrived on the Chinese mainland in 2015.

Lin landed in Shanghai with only 900 yuan ($130.41) and many misconceptions shaped by media reports, imagining the mainland as underdeveloped and inconvenient. But his first impression quickly challenged those assumptions.

"The city was filled with skyscrapers, and mobile payments and ride-hailing services were incredibly convenient," he recalled.

Lin eventually chose to settle in Wuhan because of love. His relationship with Tao, a Wuhan native, gave him a reason to stay and build a life there.

The bakery began in a community garage. The first loaf they sold was a simple toast, and their earliest customers were neighbors. It was that support, Lin said, that gave him the confidence to carry on.

Later, Lin and Tao scraped together savings and borrowed money to move the business into a proper commercial storefront. In 2025, they opened their shop on Taibei Road.

For Lin, the location held a special familiarity. As someone from Taiwan, the street name — written with the same Chinese characters as Taipei — felt close to home. The surrounding neighborhood, where many Taiwan residents live, also had the kind of community atmosphere he wanted for the bakery.

That sense of familiarity also shaped what he baked. The shop's best-sellers include Taiwan-style crispy chicken and sausage bread, rice bread and shrimp roll bread made with ingredients brought from Taiwan.

Lin also tried to combine Taiwan flavors with local Wuhan tastes, but not every experiment succeeded. In one early attempt, he followed a popular trend and turned Wuhan's *reganmian* (hot dry noodles) and crayfish into bread. But the dough absorbed too much oil from the noodles, and the crayfish filling fell out of place.

> Seeing them bring their children in to buy bread, catching up on their lives, and feeling that sense of human connection — that is the warmest motivation that keeps me going every day."
>
> **Lin Yu-chi,** a baker from Taiwan

Tao's local palate also helped guide him. She often encouraged Lin to tone down the sweetness he was used to.

After testing many versions with regular customers, Lin gradually found a more balanced approach, using Taiwan ingredients as a foundation while incorporating the salty, savory and mildly spicy flavors preferred by local tastes.

One standout success was his tomato, cumin and pineapple bread, paired with cuttlefish and shrimp cakes sourced from Taiwan — a combination that quickly became a favorite.

Yet for Lin, the most meaningful part of the day is not the business itself.

"The moment I look forward to most is running into familiar faces who stop by to chat," he said. "Seeing them bring their children in to buy bread, catching up on their lives, and feeling that sense of human connection — that is the warmest motivation that keeps me going every day."

Over the years, Lin has built lasting relationships with many of the people who walk through his bakery doors.

One longtime customer, a Wuhan local who has supported the bakery since its early days, still visits every week or two after its move to Taibei Road. When things get busy, she even helps with packing, sales and checkout.

Another story that stays with him is that of a woman who works in Kenya. Whenever she returns to China, she makes a special trip to the bakery and buys bread to have it shipped to Kenya via Guangzhou. She once told Lin that the familiar taste was her greatest comfort whenever she felt homesick.

Through his years in Wuhan, Lin has witnessed not only the development of the city's infrastructure and innovation capacity, but also its growing support for young entrepreneurs from Taiwan. He has also felt its cultural atmosphere become more open and welcoming.

"I have gone from being a stranger to feeling that this place is truly home," he said.

For Lin, that feeling extends beyond his own experience. Taiwan residents often visit his bakery, finding the taste of home in his bread while sharing stories of their own lives on the Chinese mainland. In those conversations, Lin sees a quiet sense of mutual support among people living far away from where they began.

He often thinks of Wuhan in the early morning: steaming bowls of hot dry noodles, people hurrying through the streets, ordinary scenes filled with purpose.

To young people from Taiwan considering opportunities on the mainland, Lin's message is simple. "Don't overthink it — just come and do it," he said. "Set aside any sense of superiority and immerse yourself in local life. With your own two hands, you can build a future here."

Young performers celebrate Children's Day at Beijing gala

By MENG WENJIE
mengwenjie@i21st.cn

On the evening of May 31, 13-year-old Yang Guangyu lifted a *lusheng*, a traditional Miao reed-pipe instrument, and took a deep breath. Moments later, those clear, resonant notes echoed through the National Center for the Performing Arts in Beijing.

"The cultures of China's ethnic groups are all beautiful," Yang said. "I'm proud to share the traditions of my own with more people."

Yang was among the young performers at the eighth annual "We Grow Together: My Country and Me" gala celebrating International Children's Day.

Jointly organized by the China Soong Ching Ling Foundation, the China Welfare Institute and the NCPA, the program brought together more than 1,000 children and teenagers.

Yang was one of 10 students from Zhouxi Primary School in Kaili in the Qiandongnan Miao and Dong autonomous prefecture, Guizhou province. They performed the Miao Lusheng Dance, a practice listed as part of China's national intangible cultural heritage in 2006.

Though only 13, Yang has spent the past two years learning the instrument. To prepare for the gala, he and his classmates rehearsed for nearly six months.

"The venue is so large and impressive," he said. "The moment I arrived, I felt all the hard work had been worthwhile."

At Zhouxi Primary School, the Lusheng Club has been running for 11 years, said instructor Pan Fujian.

"Students begin learning the instrument and the dance in first grade. Even their between-class exercises include the distinctive dance steps," Pan said.

Among the youngest performers was 10-year-old Wu Xingqiao, who said she initially found practice difficult.

"The movements must be bold and energetic, otherwise the dance loses its natural beauty," she said.

When Wu learned she would perform in Beijing, she was "both surprised and excited". It was her first time away from her hometown and parents.

Pointing to her costume, she said the embroidery was hand-stitched, the phoenix-shaped headdress was made of silver ornaments, and the fabric was dyed using traditional techniques.

"These crafts are not easy to make. I hope more people can see the effort behind them," she said.

The gala also featured children from Uygur, Kazak, Tujia and other ethnic groups. Through music and dance, they showcased ethnic traditions, revolutionary heritage, cultural diversity and China's modern achievements.

Students from Fu Luen School in Macao perform a space-inspired dance during the "We Grow Together: My Country and Me" gala at the National Center for the Performing Arts in Beijing on May 31. PROVIDED TO CHINA DAILY

In the final chapter, the performance turned toward the future, as children from Hong Kong, Macao and Taiwan presented technology-themed performances.

Among them were 22 dancers from Fu Luen School in Macao. Aged 8 to 12, they performed a modern dance inspired by space exploration. Nine-year-old Chan Puicheng played a curious girl traveling through space, while 12-year-old Lao Chi-kei portrayed an astronaut accompanying her across the solar system.

For Lao, it was her second appearance in the gala. "The last time I came, I was being taken care of by older students," she said. "This year, I'm helping younger teammates. I feel I've become more independent."

Eighteen-year-old breakdancer Oscar Kwok, born in Hong Kong and raised in Beijing for nine years, attended with eight dancers from Youth Outreach, a Hong Kong youth service organization.

"My mother is from Beijing. This event gave me a chance to return to my hometown, so I'm very excited," Kwok said.

During rehearsals, he met two 11-year-old dancers from a mainland troupe who had already trained for five years. He was struck by their dedication.

"The communication really brought us closer," Kwok said. "I couldn't believe children much younger than me were already so experienced."

Chen Yan, an 18-year-old breakdancer from Hong Kong, agreed. In Hong Kong, she usually measures her progress against familiar peers. "But coming to Beijing gave me a much broader stage," she said. "I've seen more dancers and styles, which helped me understand where I can keep improving."

Beyond rehearsals, the young performers also visited cultural, technological and historical landmarks in Beijing, including the Palace Museum, tech company Tencent and the Former Residence of Soong Ching Ling.

Chan Ka-ling, executive director of Youth Outreach, said the Beijing trip went far beyond the performances themselves.

"Back in Hong Kong, students learn about history from textbooks, but here they experienced it firsthand," she said. "The event also gave them an opportunity to express their love for the motherland through shared dance and music, creating memories that will become a meaningful part of their growth."

SPORTS

SOCCER

10 TO WATCH AT WORLD CUP

Two of soccer's all-time greats will likely make their final bows on the sport's biggest stage at the 2026 World Cup. Lionel Messi and Cristiano Ronaldo can finally pass the baton on to a new generation including Spain's Lamine Yamal. Kylian Mbappe — who was only 19 when he won the World Cup with France in 2018 — will be hoping to confirm his place as the heir-apparent to Messi and Ronaldo. Here are 10 players to watch at this year's World Cup.

Lionel Messi

The magnificent Messi finally achieved his career ambition in Qatar four years ago by leading Argentina to World Cup glory and emulating national icon Diego Maradona.

With it, Messi effectively completed the soccer grand slam, winning the top titles for club, country and individually. Since Qatar, he has moved to the United States to make Inter Miami the dominant force in MLS, winning the MLS Cup last year.

His status as the greatest player of all time is still debated, with Maradona and Pele considered his main rivals for that title. But back-to-back World Cups — which Pele achieved in 1958 and '62 —would further strengthen his case.

Messi, however, has given Argentina a scare just two weeks ahead of the World Cup. The 38-year-old was substituted in an Inter Miami game and diagnosed with "an overload associated with muscle fatigue in his left hamstring". No timeline was given for his recovery.

Cristiano Ronaldo

Ronaldo is still waiting for the one trophy that has eluded him in his glittering, record-breaking career.

The Portugal star heads to the World Cup after leading Saudi club Al Nassr to the domestic league title this season. That trophy adds to league titles with Manchester United in England, Real Madrid in Spain and Juventus in Italy, along with five Champions League trophies (four with Madrid, one with United).

He has also won the European Championship with Portugal and two UEFA Nations League titles. His 143 goals is a record in men's international soccer and nobody has scored more than his 41 in World Cup qualifiers.

Even at the age of 41, his hunger for trophies and records shows no sign of relenting.

Kylian Mbappe

Ousmane Dembele

Erling Haaland

Lamine Yamal

Kylian Mbappe

Mbappe has long been considered the player to take over the title as the best player on the planet after Messi and Ronaldo.

Some would say the Real Madrid striker has already done that as a World Cup and multiple title-winner, but the fact that he has yet to win the Champions League or Ballon d'Or leaves a big question mark hanging over his career.

He should have a good shot at this year's Ballon d'Or — awarded annually to the best player in the world — if he can lead France to another World Cup title after topping the scoring charts in Spain and leading the way in the Champions League.

Mbappe is often judged on what he hasn't won, rather than what he has. In two years at Madrid, he is still waiting for major titles in Spain.

Ousmane Dembele

The current Ballon d'Or holder and a two-time Champions League winner.

The France forward has reignited his career since joining Paris Saint-Germain three years ago, helping it secure its first Champions League title last season and clinch a back-to-back trophy this year.

Having been touted as one of the brightest prospects in Europe earlier in his career, Barcelona bought Dembele for $173 million in 2017. An underwhelming time in Spain led many to think he would never realize his potential.

No one is saying that now.

Erling Haaland

The Manchester City striker is playing in his first major international tournament after smashing records at club level.

Haaland, 25, is well on his way breaking scoring records in the Champions League and Premier League and has already surpassed benchmarks set by Messi in terms of the speed with which he's amassing goals.

Norway is an outsider at this year's World Cup, but in Haaland it has arguably the most lethal forward at the tournament.

Lamine Yamal

Spain's teenaged sensation was the star of its triumph at the European Championship in 2024 despite not turning 17 until the eve of the final.

He was the youngest-ever scorer at a men's Euros and with mesmerizing speed and footwork. Yamal is earning comparisons to Messi, with whom he was once photographed when he was still a baby.

Yamal has arguably overtaken Mbappe as the man most likely to fill void when Messi and Ronaldo retire and an impressive World Cup could strengthen that argument.

Jude Bellingham

He's the midfielder virtually every top team wanted when Real Madrid sealed his signature in 2023. He went on to lead the club to its 15th Champions League title and the Spanish title in his first season at the club before driving England to the final of the Euros with one of the goals of the tournament on the way.

Bellingham is a match-winner capable of unforgettable moments on the biggest stage and despite an underwhelming season at Madrid, he will be one of England's biggest hopes as it aims to win a major title for the first time since 1966.

Neymar

Brazil's all-time record goalscorer has carried the weight of a nation on his shoulders throughout his career.

Despite winning the biggest honors as a player, he is yet to lead Brazil to a record-extending sixth World Cup title.

Neymar, now 34, has been called up by Brazil coach Carlo Ancelotti for his fourth World Cup after enduring injuries and an underwhelming move to Saudi Arabia since the last edition in Qatar four years ago.

Mohamed Salah

The Egyptian icon is leaving Liverpool after a disappointing campaign, but remains his country's talisman.

Egypt will just have to hope the 33-year-old striker has saved his best for the World Cup.

Salah scored 257 goals in 442 matches and won a full set of trophies with Liverpool — including the Champions League and two Premier League titles.

With Egypt he has been runner-up in two African Cup of Nations.

Christian Pulisic

From an early age Pulisic was seen as capable of becoming American soccer's biggest overseas star.

He has gone on to play for some of Europe's biggest clubs in Germany, England and Italy, winning top honors along the way and none bigger than the Champions League with Chelsea.

Now at AC Milan the forward has discovered some of his most consistent form and will be an important part of Mauricio Pochettino's hopes to go far with the US Men's National Team in its home World Cup.

President Xi Jinping awards Serbian President Aleksandar Vucic the Friendship Medal of the People's Republic of China in Beijing on Monday. FENG YONGBIN / CHINA DAILY

Xi hails Sino-Serbian bond

President calls for stronger alignment of growth strategies, enhanced cooperation

By **MO JINGXI**
mojingxi@chinadaily.com.cn

President Xi Jinping called on China and Serbia, bonded by their unique ironclad friendship, to strengthen the alignment of development strategies, expand cooperation in emerging sectors, enhance youth and people-to-people exchanges, and step up coordination in international affairs, as he held talks with visiting Serbian President Aleksandar Vucic in Beijing on Monday.

Xi awarded Vucic the Friendship Medal of the People's Republic of China, the country's highest state honor for foreigners.

The two sides also issued a joint statement on Monday on continuously promoting the building of a China-Serbia community with a shared future for the new era, as well as a joint statement on jointly promoting the implementation of the four major global initiatives.

During the meeting, Xi recalled his state visit to Serbia in 2024, when the two countries agreed to build a China-Serbia community with a shared future for the new era, making Serbia the first European country to join China in building such a community.

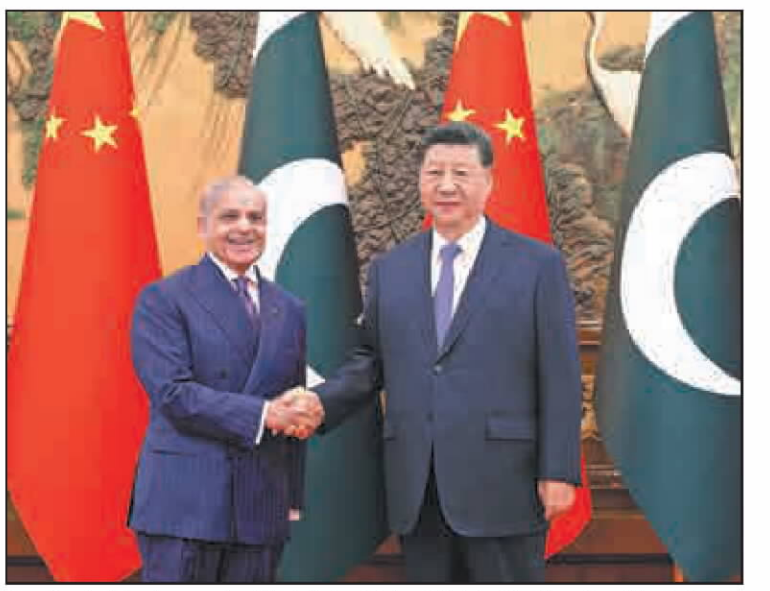
Xi called on the two countries to strengthen exchanges, consolidate mutual trust, deepen cooperation and support each other, in order to jointly follow a bright path toward a shared future and common prosperity and promote the China-Serbia comprehensive strategic partnership to a new height.

Xi stressed that the ironclad friendship between China and Serbia is unique, with profound historical logic and a strong foundation in reality, and he urged the two sides to continue to firmly support each other.

Inside
Editorial, **page 6**

China supports Serbia in pursuing a development path suited to its national conditions, and is ready to strengthen exchanges with Serbia on governance experience, Xi said.

Noting that China's 15th Five-Year Plan (2026-30) has made comprehensive arrangements for high-quality development goals, Xi said the two sides should implement the midterm action plan for Belt and Road cooperation and continue to advance cooperation in areas including transportation and energy infrastructure.



Facing a new scientific and technological revolution and industrial transformation, the two sides should expand cooperation in emerging sectors such as artificial intelligence, the digital economy, green energy and advanced manufacturing to foster new growth drivers, Xi said.

On youth and people-to-people exchanges, Xi said the two sides should make good use of the multidimensional framework of their visa-free policies, free trade agreement and direct flights, expand cooperation across the board in culture, education, sports, tourism and subnational exchanges, and carry forward the traditional friendship between the Chinese and Serbian peoples.

Against the backdrop of a turbulent and changing international situation, China and Serbia should continue to strengthen coordination and cooperation in international affairs, practice true multilateralism, and make joint efforts to promote an equal and orderly multipolar world and universally beneficial and inclusive economic globalization, as well as the building of a community with a shared future for humanity, Xi said.

Vucic, in his speech, congratulated China on the successful formulation and implementation of its 15th Five-Year Plan.

President Xi Jinping meets with Pakistani Prime Minister Shehbaz Sharif in Beijing on Monday. Sharif is in China on an official visit that started on Saturday and will run until Tuesday. FENG YONGBIN / CHINA DAILY

Closer China-Pakistan ties urged for better outcomes

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Inside
Views, **page 7**

President Xi Jinping said on Monday that China and Pakistan should accelerate the development of an even closer China-Pakistan community with a shared future in the new era and deliver more outcomes from their all-weather cooperation to better benefit the two peoples, contribute to regional peace and stability, and set a fine example for building a community with a shared future with neighboring countries.

Xi made the remarks during a meeting in Beijing with Pakistani Prime Minister Shehbaz Sharif, who is on a four-day official visit to China, as the two countries mark the 75th anniversary of the establishment of diplomatic ties.

Over the past 75 years, China and Pakistan have enjoyed mutual understanding, trust and support, and forged an unbreakable traditional friendship, Xi said, adding that their strategic mutual trust and practical cooperation have strongly promoted the development of both nations.

No matter how the international landscape may evolve, Beijing will always place priority on the development of China-Pakistan relations in its diplomacy with neighboring countries, he noted.

Xi emphasized China's firm support for Pakistan in safeguarding its independence, sovereignty and territorial integrity, and expressed readiness to maintain high-level exchanges, strengthen strategic communication and steer the relationship forward in the right direction.

The two sides should advance both major signature projects and "small and beautiful" livelihood programs, and deepen all-around cooperation in areas such as agriculture, industry, artificial intelligence and talent cultivation, he said.

Xi also shared his pleasure in receiving a letter from Pakistani students at Tianjin University, in which they expressed their aspiration to become builders of cooperation, promoters of exchanges and guardians of friendship between the two countries.

Xi added that he was truly heartened to see that the cause of China-Pakistan friendship has dedicated young successors.

Sharif described President Xi as a great friend of the Pakistani people and of all peace-loving people around the world, saying that the ironclad friendship between Pakistan and China "is growing ever stronger and is next to none".

Sharif reaffirmed Pakistan's firm commitment to the one-China principle and its support for China's position on all issues concerning its core interests.

He expressed Pakistan's readiness to learn from China's governance experience, deepen Belt and Road cooperation, advance the construction of the China-Pakistan Economic Corridor, and further develop bilateral relations for the benefit of the two peoples.

On multilateral affairs, Xi said the two countries should conduct higher-level security cooperation over a broader area and jointly safeguard regional peace and stability.

OVERSEAS GAMERS BLOWN AWAY BY WUXIA GAME

Where Winds Meet introduces concepts embedded in Chinese storytelling traditions

By **BAI SHUHAO**
baishuhao@chinadaily.com.cn

The concepts of *wuxia* and *jianghu* have for centuries carried some of the deepest ideals in Chinese culture.

Wuxia refers to wandering martial heroes who possess otherworldly powers and hone their skills to protect the vulnerable. *Jianghu* — literally "rivers and lakes" — is the world that *wuxia* inhabit, shaped by loyalty, bonds and a belief in justice.

Perhaps the simplest way to understand them is to step inside *Where Winds Meet*, an open-world role-playing game that has became one of China's most unexpected global hits.

Ahead of the overseas launch of *Where Winds Meet* in November, there was concern that without the cultural context, the game might remain a niche historical fantasy.

Instead, it exceeded expectations, becoming a worldwide sensation, climbing into the top three on Steam's global best-seller list and attracting tens of millions of players.

"We thought foreign players would connect with it," said Wen Jie, the game's publishing director, who prefers to go by Eric. "But we never imagined how far it would travel."

Part of the surprise lies in the game's subject matter. Drawing heavily from Chinese history and culture, the game is set during the transition from the Five Dynasties and Ten Kingdoms (907-960) period to the Northern Song Dynasty (960-1127) — an era unfamiliar even to many Chinese players, let alone overseas audiences.

However, this historical complexity gives players even more to explore.

One of the game's most beloved characters among overseas players, Tian Ying, was inspired by a real historical episode known as the Qingfeng Post Station Incident, a political assassination that took place during the early years of the Northern Song Dynasty.

In the story, Tian assassinates a Khitan envoy and frames a rival state to stop an alliance that threatens his homeland. Foreign players praised the plot's intrigue and moral ambiguity, with some calling it "an entire game within the game".

To build the world, developers studied historical records, conducted field research and collaborated with scholars and cultural institutions.

Beyond grand quests and heroic sacrifices, players can also slow down and enjoy quieter pleasures such as house decoration or customizing characters.

Eric said he hopes that, by playing the game, overseas players will become curious about *wuxia* and *jianghu* — concepts deeply embedded in Chinese storytelling traditions — and will be encouraged to further explore Chinese culture.

This March, the game held its first fan gathering in the United States. Some attendees carefully peeled posters from the venue walls to take them home as keepsakes.

"*Wuxia* and *jianghu* trace their roots to ancient China," Eric said, "but their values belong everywhere — protecting what you love, staying true to your beliefs, growing through hardship and defending the place you call home."

Integration of services, production key to future

WORLD WATCH
By Ronnie Lins

China's 2026 Government Work Report introduces a directive that may sound technical but signals a deeper structural development: The country will "press ahead with trials to promote the integrated development of advanced manufacturing and modern services".

In a world shaped by reconfigured supply chains and rapid technological change, this is not just an industrial policy. It reflects the recognition of the broader transformation in how economies generate and capture value.

The line between producing goods and delivering services no longer holds. China is combining both into a coordinated, data-driven system. This shift moves the country beyond scale-based competition toward ecosystem-based competitiveness, whereby production, services and digital intelligence operate together.

For decades, structural change has been framed by some as a trade-off, in which services would expand as manufacturing declined. China's recent trajectory challenges that assumption. In 2025, China's GDP surpassed 140 trillion yuan ($20.6 trillion) for the first time, with growth at 5 percent, and its core digital economy industries contributed more than 10.5 percent of GDP.

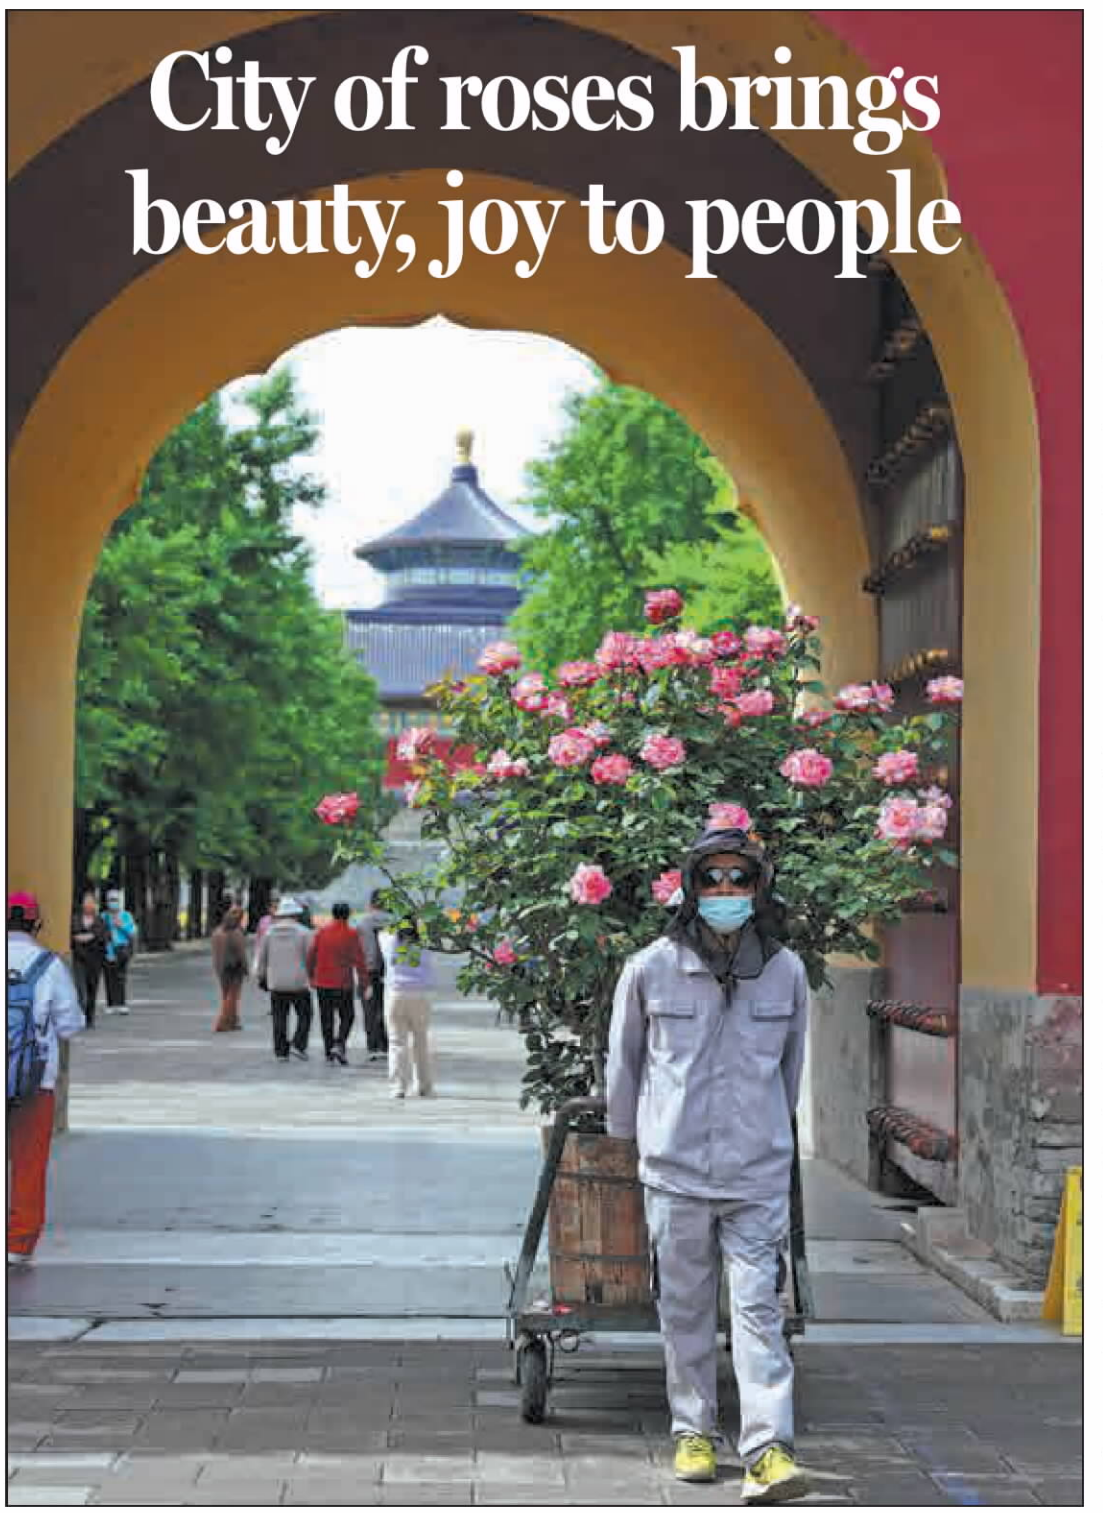
Chinese varieties of flower in global spotlight after leaders' Beijing meeting



By **CHEN NAN**
chennan@chinadaily.com.cn

PHOTOS BY JU HUANZONG / XINHUA

Even world leaders can be captivated by the simple charm of a rose.

During his recent visit to Beijing, US President Donald Trump paused to admire Chinese roses while walking through Zhongnanhai, the historic leadership compound, alongside President Xi Jinping. The roses — growing in what was once an imperial garden — caught the attention of both leaders.

Xi told Trump that one of the trees they admired during their walk was 490 years old, and that he would send the seeds of the Chinese roses they saw in the garden to Trump as a gift. "I love that; it's great," Trump said.

This fleeting moment of shared appreciation reflects what generations have long known: the Chinese rose, or *yueji*, is more than a decorative plant.

From imperial gardens to neighborhood parks, these resilient, fragrant flowers embellish cultural and urban landscapes around the country, with Beijing the most famous example.

But Chinese roses are not confined to the capital's grand gardens or neighborhood parks. They are widely acknowledged by scientists as the foundation of the modern rose, one of the world's bestselling ornamental plants.

The Chinese rose has a history stretching over 2,000 years, according to the National Forestry and Grassland Administration and the National Park Administration.

Records date back to the Han Dynasty (206 BC-AD 220), but it was during the Tang (618-907) and Song (960-1279) dynasties that rose cultivation flourished. In those periods, gardeners cultivated a number of ancient, treasured varieties.

When these Chinese roses reached Europe, they sparked a horticultural revolution. European breeders crossed them with local roses, solving long-standing challenges of short flowering seasons and weak fragrances. This exchange set the stage for centuries of hybridization. Today, over 40,000 rose varieties thrive around the world, thanks largely to their Chinese predecessors.

Over the millennia, poets and scholars have celebrated the beauty of Chinese roses. Tang Dynasty poet Bai Juyi wrote, "Late to bloom after spring departs, it alone flourishes in the courtyard's heart."

Song Dynasty writer Su Shi praised the longevity of its flowering: "Peonies are rare in late spring, and peonies bloom too briefly in early summer, yet this flower blooms without end, claiming all four seasons as its own."

Ringed with floral 'necklace'

Early summer in Beijing brings a floral spectacle along the city's ring roads. Chinese roses are now in full bloom along the median strips of the Fourth Ring Road, drawing commuters to admire their vibrant colors and heady fragrance.

Social media is buzzing with posts recommending the best spots, with netizens calling the green belts "May's romantic highlight". One commuter remarked, "I usually rush home after work, but lately I stop to enjoy the flowers. The city feels more romantic."

Landscaping of the Fourth Ring Road is being upgraded this year, the Beijing Municipal Forestry and Parks Bureau said.

New rose varieties now complement the established ones, offering longer blooming cycles and more abundant flowers. The flowering season has been extended from May through late October. When completed in November, the 65.3-kilometer-long project will create a continuous "rose necklace" of an estimated 710,000 plants citywide.

In Beijing's *hutongs*, roses flourish — climbing walls, spilling over fences, and softening the edges of small gardens. For locals, these flowers are not a luxury; they are a familiar presence, a splash of beauty in everyday life.

Wang Meng, 38, was born and raised in the *hutong* area of Hufangqiao, in the southern part of the city. One of her favorite places to enjoy Chinese roses is Taoranting Park near her home.

After obtaining a master's in gardening from China Agricultural University, Wang started working at the park in 2013. She now serves as a senior engineer in landscape architecture.

"Growing up in the *hutongs*, Chinese roses were always around," she recalled. "They're part of the neighborhood, part of our memories. This park lets me see them in full bloom, and it feels like the city itself is celebrating with me."

Established in 1952, Taoranting Park was one of the first large public parks in Beijing after the founding of the People's Republic of China in 1949.

Unlike imperial gardens, which were private and formal, Taoranting Park was intended as a place for ordinary citizens to relax, socialize and enjoy nature, earning its reputation as the "People's Park".

Stepping into the rose garden, known as the Shengchun Shan Fang Rose Area, feels like entering a world made entirely of colors and scents.

Wang said with more than 19,000 plants of 20 varieties, the garden is a living tapestry that constantly changes with the seasons, filling the air with layers of fragrance.

"It's not just a garden — it's a space crafted for strolling, lingering and losing oneself amid Beijing's most beloved roses," she said. "Ubiquitous yet essential, Chinese roses are the subtle color running through the heart of Beijing."

Every morning, Zhang Xin walks the paths of the rose garden, his eyes scanning almost every leaf and bud.

Zhang, 38, is a specialist in Chinese rose care. But his work doesn't end in the garden. He also spends hours in the park's greenhouse cultivation area, carefully nurturing roses according to their blooming cycles and monitoring plants. "Each plant has its own schedule, and I have to guide it patiently so that when it reaches the garden, it can shine at its best," he said.

> "It's wonderful to see everyone enjoying them. Flowers like these aren't just for beauty — they make people slow down, breathe, and remember what's good in life."
>
> **Fu Yinghui,** horticulturist at the Temple of Heaven

Zhang said the most important part of tending roses isn't watering, fertilizing, or even planting, but pruning. "If you want the plant to flourish, pruning is everything," he said.

The roses are also a bridge between the gardener and visitors. Zhang loves seeing people pause on the paths, lingering over colors or inhaling the fragrant bouquets. Feedback shapes his work: some people prefer traditional blooms, others are drawn to retro or artistic varieties. Each opinion, he said, informs the garden's evolution.

The Temple of Heaven, a short distance from Taoranting Park, boasts a vast Chinese rose garden, where blooms complement centuries-old architecture. Here, roses are not only cultivated for public enjoyment — they are entwined with ceremonial landscapes and imperial heritage.

"I come here almost every week," said Liu Mingfang, 67, who lives nearby.

"After the rain, the roses seem brighter, fresher. The light after the rain is perfect for photos," she said while taking photos of the flowers with her phone. "You can see every color in the petals. It feels alive."

When Liu was a girl, Chinese roses climbed over the courtyard walls of her home, she recalled. Seeing the roses today "feels like coming home", she said.

"Each color has its own charm. The pale pinks are delicate, the reds are bold — it lifts the spirit. Even the soft smell reminds me of my childhood."

Fu Yinghui, the team leader of the Chinese rose section of the historical site's flower center, has worked at the rose garden for nearly 40 years. The story of the Temple of Heaven's rose garden started in the mid-20th century, when city planners sought to bring color and fragrance to the capital's green spaces.

The park introduced Chinese roses from southern China in 1956. In 1960, the rose garden received a significant boost when Jiang Endian, a female horticulturist affectionately known as the "Lady of Roses", returned to China from overseas and was hired as a consultant.

With her expertise, the Temple of Heaven began building a proper rose garden, selecting superior varieties and laying the groundwork for what would become one of the country's premier public rose displays.

By 1963, the rose garden spanned approximately 13,000 square meters, making it the largest open-access rose garden in China at the time. In May of that year, the park welcomed its very first rose season, with the grounds filled with the colors and sweet smells of the carefully cultivated blooms.

By 1966, more than 3,000 Chinese rose varieties had been planted at the Temple of Heaven site.

In 1988, aged just 17, Fu, whose father was a historic building restorer at the Temple of Heaven, joined the rose team. "In 1987, the Chinese rose, along with chrysanthemums, was officially designated one of Beijing's city flowers," he recalled. "Roses were becoming incredibly popular — so many varieties, such vivid colors, and so versatile in how they could be cultivated and displayed. I happened to start my career at the perfect time."

With large-scale promotion and planting in the early 1990s, roses began appearing across the city.

"Before that, roses were considered high-end flowers — too costly for urban landscaping. Streets were mostly lined with pansies or scarlet sage. During the 1990 Asian Games, the streets began to bloom with bright, beautiful roses. Slowly, they became a part of people's everyday lives and even their homes," Fu said.

In harmony with history

Beyond symbolism, the rose is remarkably adaptable. Easy to propagate and resilient to cold, drought, and challenging environments, it thrives across much of China and many parts of the world.

In Beijing, the Chinese rose has found a fitting home. Blooming from late spring to early winter — and sometimes even braving the first snow — the flowers mirror the city's enduring spirit.

Known as *Yueyuehong* (red every month), Chinese roses at the Temple of Heaven bloom in May and repeat at least two times more. Today, thanks to skillful cultivation, they can even thrive through autumn and winter.

Fu makes this possible with precision and patience.

Early bloomers are placed in warmer areas; after leaves appear, they are moved for optimal sunlight. Buds are trimmed to synchronize their growth with others, while overly prolific stems are pared down to concentrate nutrients on the strongest flowers. Every pot receives a balanced water and fertilizer mix, with temperature and humidity closely monitored.

"The secret," Fu said, "is not just care — it's guiding the roses to bloom beautifully, exactly when they should."

Fu said viewing the roses at the Temple of Heaven is a different experience from any other park.

Here, the blooms unfold against a backdrop of towering ancient cypresses and ginkgo trees, some hundreds of years old, their twisted trunks and sweeping branches carrying the weight of history. Beyond the greenery, the crimson and gold roofs of the temple halls rise gracefully, their ornate eaves and carved beams adding a sense of grandeur and timelessness.

Visitors wander along winding paths that curve around these venerable trees and historic structures, pausing to admire not just the roses but the harmony between cultivated beauty and the enduring architecture of imperial China. Here, every bloom seems to carry a story, not only of nature but of centuries of human care and cultural legacy.

Every morning at seven, Fu arrives at the rose garden. He takes a moment to watch the visitors as they wander among the blooms, smiling at their delight.

"It's wonderful to see everyone enjoying them. Flowers like these aren't just for beauty — they make people slow down, breathe, and remember what's good in life," he said.

TOP NEWS

Growth: Services embedded in industry

From page 1

Those trends point to convergence rather than substitution.

This approach is quite different from those seen in some advanced economies, where service expansion has often coincided with industrial weakening or stagnant productivity. China is avoiding that outcome by directly embedding services in industrial processes. It now stands among the few major economies maintaining industrial depth while upgrading through service integration.

Manufacturing is no longer a stand-alone activity. It anchors a broader system in which software, logistics, data analytics and after-sales services drive value creation. Services no longer support production from the margins. They tend to shape productivity, differentiation and long-term competitiveness.

The new-energy vehicle sector illustrates this shift with clarity. China produced and sold more than 16 million units in 2025, while its national electric vehicle charging network surpassed 20 million units by the end of 2025, according to the National Energy Administration. The country currently has the world's largest and most rapidly expanding EV charging infrastructure. But scale alone no longer defines leadership. Competitiveness now depends on how effectively enterprises integrate hardware with digital services.

Ultra-fast charging networks, real-time battery monitoring, artificial intelligence-based predictive maintenance and continuous software upgrades turn vehicles into connected platforms. Value moves away from the factory floor and concentrates across the product life cycle.

This transformation is not confined to mobility. It is spreading to sectors such as industrial equipment, consumer electronics and smart infrastructure. As the "AI Plus" initiative advances, companies increasingly treat physical products as service nodes within broader digital ecosystems.

The integration of manufacturing and services is also reshaping industrial entities.

China is moving away from highly vertical structures toward distributed innovation networks. Small and medium-sized enterprises now play specialized roles across the value chain. They deploy computer vision in quality control, design certified testing systems, optimize logistics algorithms, and secure industrial networks.

Competitiveness now depends less on scale concentration and more on coordination across specialized actors. This marks a shift from scale-driven industrialization to coordination-driven competitiveness.

In addition, data has become a core production factor. Digital governance has become a central arena of global governance. China is actively engaging in international digital frameworks, including efforts to join the Digital Economy Partnership Agreement and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership.

Other Global South countries and emerging markets can draw a clear lesson from this model. Sustainable competitiveness will not come from choosing between industry and services. It will come from integrating both within a coherent institutional framework. Future competitiveness will depend less on where goods are produced and more on how effectively economies connect manufacturing, services and data in unified systems.

In the emerging global landscape, the ability to connect systems will matter more than the ability to scale them.

President Xi Jinping and his wife, Peng Liyuan, pose for a group photo with Serbian President Aleksandar Vucic and his wife, Tamara Vucic, on Monday in Beijing. FENG YONGBIN / CHINA DAILY

Bond: Serbia grateful for contributions

From page 1

"Esteemed President Xi, dear friend, over the past 10 years since we established the strategic partnership between the People's Republic of China and Serbia, we have achieved major and significant results," Vucic told his host.

He said the Serbian people will never forget China's support for the European country in safeguarding its independence and sovereignty, and in independently exploring a development path suited to its own conditions. Serbia is grateful to Chinese companies for participating in its national development and making important contributions, Vucic said.

According to a social media post of the Serbian president, nearly 40,000 people in his country now work for Chinese companies, and four of the top six exporting enterprises in Serbia are from China.

Serbia attaches great importance to developing relations with China and firmly supports China's core interests, he said. Belgrade looks forward to working with Beijing to deepen high-quality Belt and Road cooperation, advance major projects, enhance people-to-people exchanges and achieve more tangible results in bilateral relations, Vucic said.

He noted that China, as a major country, has always treated small countries with equality and respect and abided by international law, setting an example for the world.

Vucic arrived in Beijing on Sunday for a five-day state visit, his first to China as Serbian president.

Premier Li Qiang and Wang Huning, chairman of the National Committee of the Chinese People's Political Consultative Conference, held separate meetings with him on Monday.

PHOTOS BY XINHUA

Desert fighter reconnects after years with 'American friend' who supported her work

By **DUAN JINXIAN** and **YUAN HUI** in Hohhot

A voice from afar spoke through the cellphone in the hands of 60-year-old Yin Yuzhen in the Inner Mongolia autonomous region: "It's amazing! It's amazing to me! I can't believe we are talking."

The voice belonged to Ronald Sakolsky, 69, a retired high school teacher in the United States.

Yin asked: "When will you return to China to see the green forest that has grown from the $5,000 you contributed years ago?" It had been decades since they last spoke, but like many such conversations between friends, it seemed perfectly natural to be picking up where they had left off. "I will be waiting for you in the desert," she added.

A video of their interaction, which was recently released online by a local media group, has touched the hearts of millions across China.

Yin, a resident of Wushen Banner in Ordos, is a national model worker widely acclaimed as one of China's afforestation heroes. Starting in the mid-1980s, she spent four decades reversing desertification and greening a stretch of Maowusu, the fourth-largest sandy area in China, by planting trees.

Yin had long been searching for her "American friend" who raised money to support her afforestation work. Earlier this month, she sought the help of local media to find him. In an online video post on May 16, she said, "Sakolsky, if you see this, I would like to invite you to come back to China, where your $5,000 has grown into a large forest."

Netizens, including Sakolsky's former students and colleagues, responded enthusiastically, which resulted in their brief reunion over phone on May 18.

As part of a teacher exchange program, Sakolsky taught English at a school in Luoyang, Henan province, from 1999 to 2000. During that time, he saw a television program about Yin's sand control work and was moved by her resilient, unyielding spirit. Hoping to fund her afforestation efforts, Sakolsky wrote to many institutions in the US. An institution in Boston, Massachusetts, agreed to donate $5,000 for Yin's work. The money was sent to her in cash through a Chinese organization.

In 2000, Sakolsky traveled to Maowusu to meet Yin in person. What he saw was inspiring. Yin was planting trees in the desert using just a shovel and traditional shoulder poles. She tied young saplings, which were as thin as fingers, with hemp rope and carried them in bundles to be planted on the uneven ground. Between 1985 and 1999, Yin and her husband planted saplings across nearly 2,667 hectares.

Yin spent most of the money on buying saplings, but kept $1 as a souvenir. When Sakolsky left China after completing his teaching assignment, the two lost touch.

Over the years, Yin stayed in Maowusu, planting trees each day. Her persistent work earned her recognition as a national model worker and national hero of desert prevention and control. In 2017, she shared her experience at the United Nations Convention to Combat Desertification.

Maowusu covers about 42,200 square kilometers. Two-thirds of it is located in Ordos, and the rest extends to Shaanxi province and the Ningxia Hui autonomous region. With the Great Wall lying in the south, the sandy land has long resisted reclamation. Through the efforts made by Yin and others, more than 559,000 hectares are now blanketed in green, and the forest coverage rate is about 33 percent.

Speaking to China Daily, Sakolsky was full of praise for Yin. "She is committed to her dream. She never gave up." He told People's Daily, "It really is a miracle to get back in touch."

Yin told China News Service that Sakolsky helped her buy saplings "at the most difficult time", and that she has "never forgotten and will never forget" his kindness.

Foreign Ministry spokeswoman Mao Ning said on Monday that the friendship between Yin and Sakolsky is a microcosm of the positive people-to-people exchanges between China and the US.

"We are confident that the two peoples will keep adding new chapters of friendship and injecting fresh vitality into bilateral ties," Mao said.

Strengthened China-US AI ties stressed

Nations urged to step up cooperation to better manage technology's potential risks

By **WANG KEJU**
wangkeju@chinadaily.com.cn

As China and the United States race to expand their artificial intelligence capabilities, economists said the two countries need closer cooperation on global governance and safety standards in order to better manage the potential risks of the technology.

While the US continues to lead in frontier AI research, large-scale models and computing power, economists said that China is rapidly catching up and has developed strengths in integrating AI into manufacturing, consumer services and other parts of the real economy, reflecting different development priorities in the two countries.

"There are two main players in the development of frontier AI — China and the US," economist and Nobel laureate Michael Spence told China Daily. "There's almost no measurable difference between them now in terms of performance. Whatever difference there was, China has caught up."

According to Stanford University's Institute for Human-Centered Artificial Intelligence, US and Chinese AI models have traded places at the top of performance rankings multiple times since early 2025.

As of March, the top US model led by only 2.7 percent, with a marginal gap that fluctuated over the past year while remaining in single digits, according to the institute's 2026 AI Index Report.

"The models of AI innovation pursued by China and the US are actually quite different," said Zhu Min, former deputy managing director of the International Monetary Fund.

"The US focuses on large models, massive computing power and a strong foundational base, aiming for what we call 'artificial superintelligence'. What the US pursues is the development of intelligence itself," he said.

China, according to Zhu, measures AI development by a different yardstick.

"China, in contrast, emphasizes applying AI to the real economy. When assessing whether AI is good or not, China places greater weight on the benefits and convenience it can bring to the real economy and to people's daily lives," he added.

Spence noted that China's systematic approach to deployment gives it an edge that the West currently lacks.

"China has, in my view, in the context of the 15th Five-Year Plan (2026-30), a better set of either plans or intentions to make sure that AI is deployed by and adopted across a wide range of the economy, both in manufacturing and services," Spence said.

"We talk a lot about the diffusion challenge, but we are just talking about it. We are not doing anything," he added.

As both China and the US, along with other economies, are scrambling to scale up their AI capabilities, the risks are increasing too — and not just economic ones.

"AI carries significant uncertainty, including risks related to society, the environment and potential military uses," Zhu warned.

"Therefore, establishing a governance framework and safety 'guardrails' for AI is, I believe, the most critical imperative for China and the US as the two leading players in this field, and it is also what the world expects of them," he added.

"The US tends to favor exogenous governance — building external oversight frameworks for monitoring and compliance," Zhu said. "China emphasizes an endogenous approach, embedding safeguards from the very beginning, even before model deployment, to ensure that AI benefits humanity."

Zhu noted that "both approaches are valid, open to discussion, and could together shape the future of AI governance".

Spence said the US and China "can probably cooperate on certain aspects of regulation, such as not using the technology for highly destructive purposes".

China and the US agreed to launch an intergovernmental dialogue on AI, Chinese Foreign Ministry spokesman Guo Jiakun announced at a news conference earlier this month.

Guo said that China and the US need to work together to promote the development and improve the governance of AI to ensure that it will better contribute to the progress of human civilization and the common welfare of the international community.

Relations: Pakistan's mediating role praised

From page 1

China commends Pakistan for taking the initiative to play a mediating role in restoring peace in the Middle East, Xi said, calling on the two sides to maintain close communication and coordination, jointly oppose unilateralism and Cold War mentality, promote an equal and orderly multipolar world and an economic globalization that is universally beneficial and inclusive.

Sharif thanked China for supporting Pakistan's mediation efforts in talks between the United States and Iran, saying that Xi's four propositions on the Middle East situation offer guidance for achieving peace in the region.

Pakistan is willing to coordinate closely with China to jointly contribute to world peace and stability, he added.

Also on Monday, Premier Li Qiang held talks with Sharif, and said that China is ready to work with Pakistan to further advance the construction of the CPEC, import more high-quality Pakistani products and actively build an upgraded version of the bilateral free trade agreement.

Li expressed the hope that Pakistan will continue to take necessary measures to protect the safety of Chinese personnel, projects and institutions in the country.

Sharif welcomed Chinese companies to invest and thrive in Pakistan, pledging that the country would continue to take strong measures to provide a safer and better business environment.

After the talks, Li and Sharif witnessed the signing of multiple cooperation documents covering trade, science and technology, agriculture and food, human resources and other areas.

China is Pakistan's largest trading partner and the second-largest destination for Pakistani exports. Statistics show that the CPEC has garnered over $25.9 billion in direct investment and created over 260,000 jobs.

Ahsan Iqbal, Pakistan's minister for planning, development and special initiatives, said on Sunday that Pakistan-China relations are entering a new era of high-quality development, technological cooperation, agricultural and industrial modernization, and deeper regional integration.

He described the CPEC as a symbol of the two countries' shared vision for peace and prosperity, saying that the relationship has never experienced an "autumn" but has always remained in "spring", with new waves of cooperation emerging year after year.

Trade, investment fuel China-Pakistan ties

Expanding projects and rising volumes reinforce long-term economic cooperation

By HAO NAN
haonan@chinadaily.com.cn

A stall holder gives a thumbs-up to visitors at the Pakistan exhibition of the ninth China-South Asia Exposition in June 2025. HU CHAO / XINHUA

As all-weather strategic cooperative partners, China and Pakistan have made economy and trade a central pillar of their relationship. Over decades of steady growth, their bilateral cooperation has expanded in scale, broadened in scope, and achieved marked improvements in quality and efficiency.

This year marks the 75th anniversary of diplomatic relations between China and Pakistan. Both nations are working to build a closer China-Pakistan community with a shared future by enhancing economic and trade interactions and fostering industrial synergy.

China-Pakistan economic and trade cooperation has a long history, supported by a solid foundation and stable institutional frameworks. The two countries established trade relations in the early 1950s and signed their first trade agreement in January 1963, laying the groundwork for regulated development of bilateral trade.

Furthermore, the China-Pakistan Joint Committee of Economy, Trade and Technology was established in 1982. It has convened 15 sessions so far, providing a long-term platform for communication and coordinated advancement.

Driven by joint efforts, bilateral economic and trade cooperation has made remarkable progress with trade volume rising steadily. Data from China's General Administration of Customs showed that bilateral trade reached $23.06 billion in 2024, up 11.1 percent year-on-year. Of this, China's exports to Pakistan stood at $20.23 billion, a 17 percent increase from 2023.

According to Pakistani statistics, China has been the country's largest trading partner, top source of imports, and second-largest export destination since the 2015-16 fiscal year, further cementing the bilateral economic and trade bond.

Core projects

Energy cooperation is a cornerstone of China-Pakistan practical cooperation and has yielded significant outcomes over the decades.

With Chinese investment and technical support, Pakistan has put 46 energy projects into operation, including seven coal-fired power plants, five new energy stations, two hydropower plants and one transmission line, with a combined investment exceeding $13 billion.

This cooperation has not only eased Pakistan's power shortage, but also trained nearly 40,000 technical professionals and more than 7,400 management personnel, establishing a strong talent base for the sustainable growth of Pakistan's energy sector and ongoing economic and trade cooperation.

The China-Pakistan Economic Corridor, or CPEC, a flagship project under the Belt and Road Initiative, serves as the core engine of bilateral economic and trade cooperation.

Since its launch in 2013, the CPEC has delivered fruitful results. By the end of 2024, 77 cooperation projects had been identified under its framework, 54 of which had been launched or completed. Total investment reached $25.5 billion, directly creating 248,000 jobs, including 188,000 for Pakistani workers.

The two sides are now advancing the CPEC into its upgraded phase, shifting focus to livelihood improvement, agricultural modernization and high-tech sectors, in line with the goal of enhancing bilateral economic and trade cooperation.

New momentum

Zafar Uddin Mahmood, special representative of the prime minister of Pakistan on China affairs, noted that as a major agricultural country, Pakistan has deepened cooperation with China in agricultural technology, seed research and development, and agro-processing in recent years.

He also highlighted the growing momentum in new energy cooperation. For example, Chinese photovoltaic and wind power technologies are widely applied in Pakistan, benefiting numerous households. Additionally, more than 10 Chinese new energy vehicle manufacturers have established presence in Pakistan, bringing cutting-edge technologies and quality products to support industrial upgrading and green transition.

Anwaar-ul-Haq Kakar, a Pakistani senator and former caretaker prime minister, stated that the CPEC has profoundly boosted Pakistan's economic and social development and enhanced the well-being of its people. It has driven progress in infrastructure, livelihood and technology, deepening the friendship between the two nations in the hearts of the Pakistani people.

"In my home province of Balochistan, the CPEC has improved energy supply, transport infrastructure, and the development of Gwadar Port, greatly enhancing connectivity," he said.

Kakar expressed hope that China and Pakistan will further strengthen cooperation in agriculture, climate action, information technology, and other sectors to deliver more benefits to the Pakistani people and make bilateral friendship more tangible and popular.

This year marks the beginning of China's 15th Five-Year Plan (2026-30) and it is a critical year for Pakistan to implement its "Uraan Pakistan", the five-year economic strategy for 2024-29 focusing on exports, e-Pakistan, environment, energy, equity and empowerment.

Jiang Zaidong, Chinese ambassador to Pakistan, said China stands ready to align its development strategy with Pakistan, accelerate the building of a closer China-Pakistan community with a shared future, and bring more tangible benefits to the two peoples.

Industrial cooperation, a key pillar of bilateral ties, is at a crucial stage of quality upgrading. China's 15th Five-Year Plan aims to build a modern industrial system oriented toward intelligent, green and integrated development, upgrade traditional industries, expand emerging industries, and plan for future industries. This is highly compatible with "Uraan Pakistan", which prioritizes manufacturing, information technology and digital transformation.

"We are pleased to see more Chinese new energy vehicles on the streets of Pakistan. They help to ease energy shortages and enable Pakistani people to adopt green travel and lower living costs," Jiang said.

As economic and trade cooperation deepens, Chinese enterprises in Pakistan have grown into a major force in bilateral business exchanges. Their operations cover energy development, infrastructure construction, telecommunications, wholesale and retail, and are deeply integrated into Pakistan's economic fabric.

To better support Chinese businesses, the Association of Chinese Enterprises in Pakistan was established in 2004 and now boasts three regional branches, seven industrial chapters and five working committees.

In 2024, guided by the Chinese embassy in Pakistan, the association developed a business climate index system for Chinese enterprises in Pakistan and completed three surveys. Results showed that Pakistan's macroeconomy has been stabilized and improved since 2025.

Chinese enterprises in Pakistan have enjoyed rising confidence in Pakistan's economy, steady operations and stronger investment appetite, injecting stable expectations into bilateral economic and trade cooperation.

"The Pakistani government will fully protect the safety and interests of Chinese citizens and institutions in Pakistan. This is not only due to our extensive cooperation projects and the huge influence of the Chinese market, but also because China and Pakistan are all-weather strategic cooperative partners and iron brothers with decades of unwavering friendship," Kakar said.

Looking forward, China and Pakistan will strive to build a community with a shared future characterized by stronger political mutual trust, closer economic and trade ties, deeper security cooperation, and firmer public support.

The two countries will continue to deepen economic and trade cooperation, expand collaboration areas, scale up investment and enhance industrial synergy, ensuring that the fruits of cooperation better benefit both peoples, officials said.

Copper glows across the desert, forging paths of industry

By YUAN SHENGGAO

Clockwise from top: A flag-raising ceremony ushers in the dawn of 2026 at the Saindak Copper-Gold Project. Molten copper is cast at the mine. The newly operational beneficiation system supports efficient production at the mine. PHOTOS PROVIDED TO CHINA DAILY

As a flagship mining project of the China-Pakistan Economic Corridor, the Saindak Copper-Gold Project operated by MCC Tongsin Resources, or MCCT, is writing a new chapter of high-quality development in the desert of Balochistan Province. As Pakistan's first large-scale nonferrous mine integrating mining, beneficiation and smelting, the project contributes to the high-quality development of the Belt and Road Initiative through full-chain lean operation, systematic management innovation and deepened local integration.

Addressing challenges

MCCT has developed a comprehensive management model with "Safety Integrity System plus Amoeba Management plus 5S Standardization plus Local Talent Development", driving the project from stable production toward optimized efficiency and high-yield output.

In response to challenges including ore grade fluctuations and complex mining conditions, the project has adopted advanced processes such as multilevel mining development, three-stage closed-circuit crushing for mineral processing, and converter heat exchange in smelting.

In addition, intelligent systems for materials management and production scheduling have been implemented to enable scientific control over the entire production chain.

Capacity leap

Through list-based production management, standardized equipment maintenance and cost control underpinned by the Amoeba Management model, the project has achieved steady year-on-year breakthroughs in production efficiency.

Its annual ore processing capacity has risen from 5 million metric tons in the initial stage to 8.9 million tons, representing a 70 percent increase.

In 2025, its output of blister copper hit 25,000 tons, a 30 percent rise compared with that in 2021. The Amoeba Management mechanism has helped to cut annual costs by 1 percent, fostering a virtuous cycle of higher output, greater efficiency and lower costs.

Resource breakthrough

Adhering to the philosophy that "resources are king", the exploration team worked tirelessly in the desert with temperatures of up to 50 C, overturning the judgment of "ineffective exploration" and confirming substantial mineral reserves at the Siah Diq prospect.

The hourly processing capacity of the ball mill in the 275 System of Concentrator has been raised from 364 tons to 446 tons.

By leveraging technological innovation to develop low-grade resources, the Saindak Copper-Gold Project has showcased the overseas brand of "China Intelligent Manufacturing".

Safety first

The Saindak project integrates the safety integrity system and construction related to public security into the entire production process, adhering to the "zero accident" target and achieving consecutive years of safe production, according to the project's management. Its public security prevention work was selected as a pilot unit for overseas project security by a department at the State-owned Assets Supervision and Administration Commission of the State Council of China. In addition, the project's central laboratory has become the first laboratory in Pakistan accredited by the Pakistan National Accreditation Council in the field of mining analysis.

Local integration

Upholding the philosophy of "teaching people how to fish rather than giving them fish", the project has created more than 2,000 local jobs and trained a large number of local technical and management professionals. It has boosted the coordinated development of upstream and downstream industries, with a total of $720 million paid in taxes and profit shares to the host country. Through concrete actions, the project has won wide recognition and high praise from the Pakistani government and local people, according to MCCT.

As the project enters its next phase, MCCT will continue to optimize the operation of the Saindak project with higher standards, while expanding its presence in Pakistan's mining sector.

It will systematically advance the efficient development and operation of the Duddar Lead-Zinc Mine and the Siah Diq Copper Mine.

The company said it is committed to supporting the growth of Pakistan's nonferrous metal industry and improving local livelihoods. With greater efforts to advance technological innovation and concrete measures to deepen China-Pakistan cooperation, MCCT strives to build a world-class overseas mining enterprise that leads in management, performance and social responsibility.

It will contribute to the steady and sustained development of the BRI and the enduring friendship between China and Pakistan, according to MCCT.

Pivotal breakthrough hangs in the balance

Iran, US play down expectations of quick deal despite some progress

ISLAMABAD/WASHINGTON/TEHRAN — Iran and the United States played down hopes for an imminent breakthrough in the three-month-old conflict on Monday, with US Secretary of State Marco Rubio saying there will either be a good agreement or Washington would deal with the country in "another way".

Rubio told reporters in New Delhi that the US would give diplomacy every chance to succeed before exploring "alternatives", after President Donald Trump said on Sunday he had told his representatives not to rush into any Iran deal.

There was a "pretty solid thing on the table in terms of their ability to open up the strait, get the strait open, enter into a very real, significant, time-limited negotiation on the nuclear matter, and hopefully we can pull it off," Rubio said.

Trump said in a post on Truth Social on Monday that the deal will either be "great and meaningful, or there will be no deal at all".

He also urged Muslim-majority nations including Saudi Arabia, Qatar and Pakistan, to normalize relations with Israel as part of the Iran peace deal.

Iran's foreign ministry spokesman Esmaeil Baghaei said on Monday that Iran was negotiating an end to the conflict and was not currently discussing nuclear issues.

He said a framework had been reached but no one could say an agreement between the United States and Iran was imminent. The potential memorandum of understanding contained no specific details about the management of the Strait of Hormuz, which belongs to the coastal countries, he said.

The ministry also said that Iran would not take tolls for passage through the vital waterway, but added that it was "normal for services provided to require a price".

Before the conflict, the strait had carried a fifth of global shipments of oil and liquefied natural gas.

A day earlier, Trump wrote on Truth Social that the US blockade of Iranian ships in the Strait of Hormuz would "remain in full force and effect until an agreement is reached, certified, and signed".

He added, "Both sides must take their time and get it right."

Trump raised expectations of an imminent deal on Saturday when he said Washington and Tehran had "largely negotiated" a memorandum of understanding on a peace agreement that would reopen the strait.

Domestically in the US, lawmakers appearing on Sunday morning talk shows split sharply over a potential deal to end the Iran conflict, with Republicans mostly backing the publicly reported contours of an agreement being negotiated by Trump and Democrats dismissing it as accomplishing little.

Still at odds

Washington and Tehran remain at odds on several difficult issues, such as the nuclear issue, Israel's fighting in Lebanon with Hezbollah and Tehran's demands for the lifting of sanctions and the release of tens of billions of dollars of Iranian oil revenues frozen in foreign banks.

Iran's central bank chief Abdolnaser Hemmati traveled to Qatar following talks with a Qatari delegation in Tehran regarding Iran's frozen funds, Iranian media reported on Monday.

Iranian top negotiator Mohammad Bagher Qalibaf and Foreign Minister Abbas Araghchi were leading the delegation in Doha.

On Sunday, a senior US official said that the proposed framework would give negotiators 60 days to reach a final deal.

Iranian sources told Reuters that in future stages, "feasible formulas" could be found to resolve the dispute over its highly enriched uranium stockpile, including diluting the material under the supervision of the UN nuclear watchdog.

Any deal reinforcing the current fragile ceasefire, which has held since early April, would bring relief to markets but not immediately defuse a global energy crisis, which has driven up costs of fuel, fertilizer and food.

The US-Israeli bombing of Iran killed thousands of people in Iran before it was suspended in early April. Israel has also killed thousands more and driven hundreds of thousands from their homes in Lebanon, which it invaded in pursuit of Hezbollah. Iranian strikes on Israel and neighboring Gulf states have killed dozens.

Amid the latest developments in US-Iran talks, the Israeli military said it is prepared to resume combat operations against Iran, the army chief said on Sunday.

Chief of the General Staff Eyal Zamir made the remarks during a situational assessment at the military's Northern Command, the military said in a statement.

PM's team accused of smear operation

More details have emerged about allegations that the team of Japanese Prime Minister Sanae Takaichi hired individuals to produce online smear videos targeting political rivals, with the weekly magazine Shukan Bunshun reporting on Sunday that it possesses evidence supporting these allegations. According to a report in the online edition of the magazine, Takaichi's camp focused much of its campaign attacks on rival politician Shinjiro Koizumi during last year's ruling Liberal Democratic Party leadership race, portraying him as an "incompetent puppet" through videos online. Numerous videos praising Takaichi were disseminated online during the same period, the report said. Although Takaichi's side has denied involvement, the magazine said it had obtained substantial evidence supporting the allegations. The report identified Takaichi aide Takeshi Kinoshita as a central figure in this operation. Neither the Japanese prime minister's office nor Kinoshita had responded publicly to the latest allegations by press time.

SWITZERLAND

Suspected Ebola cases cross 900 in DRC: WHO

More than 900 suspected Ebola cases have been identified in the Democratic Republic of the Congo, the World Health Organization chief has said. "As surveillance efforts have been scaled up in the DRC Ebola response, more than 900 suspected cases have been identified so far, including 101 confirmed cases," WHO Director-General Tedros Adhanom Ghebreyesus said in a Sunday social media post that gave no update on the death toll. Ebola is a deadly viral disease that spreads through direct contact with bodily fluids. It can cause severe bleeding and organ failure. The country declared an outbreak on May 15 caused by the Bundibugyo strain, which has no approved vaccine or treatment. Ebola has killed more than 15,000 people across Africa in the past half-century. This round of the outbreak has resulted in 220 suspected deaths, according to the WHO.

Best of friends: countries deepen bilateral ties via culture and language

By **HAO NAN**
haonan@chinadaily.com.cn

Over the past 75 years, China and Pakistan have forged increasingly close and institutionalized cultural and educational cooperation, laying a foundation for their all-weather strategic cooperative partnership.

Since establishing diplomatic ties in 1951, the two countries have engaged in frequent people-to-people and cultural exchanges. Early visits by cultural groups and joint exhibitions set the stage for enduring collaboration.

In 1965, the two sides signed a cultural agreement in Rawalpindi, a major city in Pakistan's eastern Punjab province, and launched their annual cultural exchange plan that same year. By late 2025, 14 such plans had been signed, providing an institutional framework for bilateral cultural interactions.

Progress has been steady in building exchange platforms. In 2010, the two countries signed a memorandum of understanding to establish cultural centers, and 2015 was designated as the China-Pakistan Year of Friendly Exchanges.

Furthermore, the China Cultural Center in Pakistan was officially inaugurated in Islamabad in April 2017, serving as a symbol of the friendship and a platform for cultural exchange and mutual understanding between the two peoples.

Recognizing language as a vital bridge for connection, Beijing Language and Culture University and Pakistan's National University of Modern Languages jointly established Pakistan's first Confucius Institute in Islamabad in 2005.

The institute features an impressive statue of Confucius and Chinese cultural elements, such as red papercuttings and posters. It regularly hosts cultural experiences and summer camps, helping Pakistani students appreciate the charm of Chinese culture.

By December, China had set up five Confucius Institutes and two independent Confucius Classrooms across Pakistan. Growing interest in the country has led to a significant increase in institutions offering Chinese language courses.

China began accepting Pakistani students in 1964 and by December 2024 had welcomed approximately 25,000 Pakistani students.

In 2022, China and Pakistan signed an agreement on the mutual recognition of higher education degrees and diplomas, creating a pathway for talent development and deepening cross-cultural understanding.

The China-Pakistan Economic Corridor, a flagship project under the Belt and Road Initiative known for its role in infrastructure development, has also helped take educational cooperation to new heights, extending cooperation from higher education to vocational training and industry-education integration.

With Pakistan aiming for 30 percent of its vehicles to be electric by 2030, there is an urgent need for skilled workers in battery manufacturing, management systems and recycling. Pakistani officials have expressed hope for joint training centers and enterprise-led apprenticeships to nurture local talent under the CPEC framework.

People-to-people events have also strengthened bonds. On April 18, a children's gala was held in Islamabad to celebrate the 75th anniversary of diplomatic relations between China and Pakistan. Around 500 people attended, including Pakistani government officials, representatives from Chinese diplomatic missions in Pakistan, leaders of the overseas Chinese community, and children from both countries.

Zafar Uddin Mahmood, special representative on China of the prime minister of Pakistan, said that Chinese culture is profound and unique, and it is worthwhile for Pakistani children to learn about and understand it.

He expressed hope that more Pakistanis would learn Chinese, using language as a bridge to enhance mutual learning and understanding.

Chen Peng, cultural counselor at the Chinese embassy in Pakistan, confirmed that the embassy would continue to deepen cultural and educational exchanges between Chinese and Pakistani youth and support various people-to-people friendship activities.

As the two countries celebrate their 75th diplomatic anniversary, cultural and educational cooperation will keep deepening, fostering greater friendship and supporting the steady growth of China-Pakistan relations.

CSAIL celebrates 75 years of China-Pakistan diplomatic relations

By **YUAN SHENGGAO**

The year 2026 marks the 75th anniversary of China-Pakistan diplomatic relations and the two countries have established an all-weather strategic cooperative partnership. At the forefront of this collaboration stands China Three Gorges South Asia Investment Ltd, or CSAIL, the investment arm of China Three Gorges Corp in Pakistan, aiming to shape a more sustainable and prosperous Pakistan by pioneering clean energy.

An aerial view of the 720-megawatt Karot Hydropower Project in Pakistan. PROVIDED TO CHINA DAILY

Hydropower project

Commissioned in June 2022, the 720-megawatt Karot Hydropower Project on the Jhelum River is a major facility in the China-Pakistan Economic Corridor that has reached commercial operation. It is also an early large-scale hydropower investment project under the Belt and Road Initiative.

A living symbol of what both countries can build together, the project has generated a cumulative 11 billion kilowatt-hours of clean and green energy so far, with an average of 3,206 gigawatt-hours of clean electricity annually. It meets the annual energy needs of more than five million Pakistanis, and prevented approximately 12 million metric tons of cumulative carbon dioxide emissions — equivalent to roughly 3.5 million tons every year.

Developed under a Build-Own-Operate-Transfer model with a 30-year concession period, Karot will ultimately be handed over to Pakistan as a permanent national asset.

CSAIL also operates three wind farms — TGF, TGS and TGT — in Jhimpir, Sindh, with a combined installed capacity of 148.5 megawatts. Together they deliver approximately 443 GWh of clean electricity to Pakistan each year, meeting the power needs of more than 600,000 people.

Looking ahead, the 1,124 MW Kohala and 640 MW Mahl hydropower projects being developed by CSAIL will consolidate a "Clean Energy Corridor" along the Jhelum River. They will reduce Pakistan's reliance on imported fuels and strengthen long-term energy security, according to the company.

Environment, community

CSAIL's vision extends beyond power generation. At Karot, a biodiversity management plan protects the Jhelum River ecosystem, including monitoring the vulnerable mahseer fish in collaboration with Margalla Hills and Jhelum Valley national parks.

Karot and the wind power projects' community investment plans have delivered new and improved public infrastructure projects spanning roads, bridges, water systems, hospitals, schools, drinking water access, environmental awareness and tree plantation programs.

On the education front, CSAIL supports scholarships at universities such as National University of Sciences and Technology, Multan University of Science and Technology, and University of the Punjab, nurturing the next generation of Pakistani energy professionals.

Iron brothers

The depth of China-Pakistan friendship is most visible in adversity, according to CSAIL. During COVID-19, China Three Gorges Corp donated a substantial amount of essential medical supplies and medical equipment to Pakistan. Following the devastating 2022 floods in the country, which affected over 33 million people, CSAIL contributed $650,000 to the Prime Minister's Flood Relief Fund. In 2025, the company again stepped forward for flood-affected communities in Punjab. These acts reflect the enduring spirit of "iron brotherhood" — a solidarity defined by shared commitment, not convenience, according to CSAIL.

Next 75 years

As both countries mark the 75th anniversary of diplomatic relations, CSAIL remains steadfast in its commitment to their extraordinary partnership. Its growing pipeline of clean energy projects promises additional sustainable megawatts alongside new employment, skills development, and community advancement.

Seventy-five years ago, diplomatic relations laid the foundation for one of the defining bilateral relationships of the modern era. Today, that foundation has blossomed into a partnership anchored in trust, strengthened by shared purpose, and illuminated by a common vision for a greener future. CSAIL is proud to be a part of its story, according to the company.

Editorials

Broadening of cooperation will consolidate iron-clad friendship between China, Serbia

The five-day state visit to China by Serbian President Aleksandar Vucic, which began on Sunday and which he described as "undoubtedly the most important trip abroad" in his political career, stands as a testament to the two countries' commitment to building the China-Serbia community with a shared future in the new era and elevating it to a new height.

The ironclad friendship between China and Serbia is rooted in both historical logic and practical realities. Serbia is China's first free trade partner in Central and Eastern Europe and occupies a special place in China's diplomacy toward Europe. Over the years, the mutual support between the two countries has remained steadfast, their cooperation has grown ever closer, and their exchanges and mutual learning have become increasingly substantive, especially after President Xi Jinping's state visit to Serbia in 2024.

The meeting between Xi and Vucic in Beijing on Monday covered a wide range of issues spanning the historical evolution of relations, development strategies, strategic coordination, economic cooperation and people-to-people exchanges. It underscored the solid foundations and great potential of bilateral relations.

That both leaders emphasized deepening bilateral pragmatic economic, trade and technology cooperation during China's 15th Five-Year Plan (2026-30) period demonstrates a common understanding that the two countries should further align their development strategies, open up new areas of cooperation and strengthen strategic coordination so as to bring greater tangible benefits to the two peoples while jointly safeguarding international fairness and justice.

The two leaders witnessed the signing of more than 20 cooperation documents on Monday that provide a clear road map and institutional framework for transforming their consensus into concrete platforms, projects and outcomes. This will help advance the mid-term action plan for their Belt and Road cooperation, build more flagship projects and further unlock the potential of the China-Serbia free trade agreement.

Thanks to the free trade agreement, which came into force in 2024, trade between the two countries reached $6.49 billion in 2025, up 13 percent year-on-year. Serbian products are gaining broader access to the Chinese market, while Chinese investment continues to support Serbia's industrial modernization and infrastructure development.

China-Serbia cooperation is no longer confined to traditional areas such as transport and energy infrastructure. The two countries are looking to cultivate new growth drivers and expand cooperation into emerging frontiers, including advanced manufacturing, green energy, the digital economy and artificial intelligence. That will be conducive to injecting fresh vitality into bilateral collaboration.

Exchanges in various fields have further strengthened the friendship between the two peoples fostering mutual understanding and reciprocal public goodwill.

Xi called on both countries to leverage visa exemption policies, the free trade agreement and direct flights to expand all-round cooperation in culture, education, sports, tourism and sub-national exchanges.

On Monday, the two sides also issued a joint statement on continuously promoting the building of a China-Serbia community with a shared future in the new era and a joint statement on jointly promoting the implementation of the four global initiatives put forward by Xi.

This reflects the resilience and forward-looking nature of bilateral relations. As iron-clad friends, close economic and trade partners and defenders of world peace, China and Serbia share similar positions on many major international and regional issues. In the face of growing global instability and uncertainty, the two countries should strengthen their coordination and cooperation within the United Nations and other multilateral frameworks, advocate an equal and orderly multipolar world and promote universally beneficial and inclusive economic globalization.

China-Serbia ties demonstrate that countries with different histories, cultures and social systems can respect each other's sovereignty and independently chosen development paths while pursuing common prosperity together. China stands ready to work hand in hand with Serbia to translate their shared aspirations into concrete progress and make the China-Serbia community with a shared future shine even more brightly in the new era.

Quad against regional need for stability

US Secretary of State Marco Rubio is scheduled to meet with his counterparts from India, Australia and Japan in New Delhi on Tuesday. The meeting is intended as preparation for a summit of the Quad leaders in November. However, the prospects of that have diminished due to changing geopolitical dynamics and strained relations stemming from differences among the group's members. The Quad foreign ministers' meeting therefore appears more symbolic than substantive.

Since its inception in 2007, the so-called Quadrilateral Security Dialogue has been much like a choir seeking harmony but never quite achieving it, leaving the group struggling to find its voice. While it operates under the banner of promoting a "free and open Indo-Pacific" — a dubious notion given that the region has been free and open — its core function is often perceived to be containing China. By fostering bloc politics, this exclusionary approach directly contradicts the region's need for openness and inclusiveness.

The Quad's vulnerabilities have become increasingly evident. The United States' unilateral foreign policies, prioritizing US interests, appear to have eroded the political support essential for the Quad's cohesion. The US administration's imposition of high tariffs on India has strained ties between the two countries. This transactional attitude toward allies seems to have destabilized the Quad's already fragile framework.

Additionally, each Quad member's separate economic ties with China further complicate the group's dynamics. The recent visit by the US leader to China helped to stabilize the bilateral relationship. And China has again overtaken the US to become India's largest trading partner, with bilateral trade surpassing $155 billion last year. Moreover, China-Australia trade has entered a renewed growth phase after several years of tension.

Divergences among the four nations on security, economic and geopolitical fronts present challenges to forging a unified strategy within the Quad. Each country has different national interests and priorities, which often lead to conflicting approaches. The US' shifting strategic priorities, including its skepticism toward multilateral institutions and security alliances, have also diluted its commitment to the Quad. Meanwhile, India's emphasis on maintaining its strategic autonomy and its historical nonalignment policy sometimes result in hesitance to fully commit to collective security measures that might compromise its "independent stance". Even if the Quad manages to continue in some form, it risks becoming a symbolic presence.

The very existence of the Quad runs counter to the peace and stability that are in the fundamental interests of regional countries. The peace and prosperity of the region do not require, nor can they rely on, exclusionary mechanisms. Genuine regional development is driven by cooperation and mutual benefit, not confrontation and division. In light of the Quad's dilemma, the international community should recognize that any mechanism attempting to divide the world will ultimately fail.

The Quad is a relic of a bygone era — one that prioritizes geopolitical maneuvering over genuine multilateral engagement. Yet special attention should be paid to Japan, a country eager to promote neo-militarism and skilled at hyping up regional tensions. The Sanae Takaichi government has been actively seeking cooperation with the North Atlantic Treaty Organization and alignment with the Philippines in the South China Sea. It would come as no surprise if Japan attempts to reinvigorate the Quad.

Japan's defense expenditure increased by 9.7 percent in 2025, reaching a record high. Its weapons imports have grown by 76 percent over the past five years. Although Japan's defense budget has been rising for 14 consecutive years, right-wing forces in the country continue to clamor for even greater military spending. This once again reveals that Japan's "nation of peace" mask is slipping, as the country drifts toward neo-militarism.

In this context, the Quad stands as a ready-made zombie — one that the Takaichi government might be interested in reanimating to revive its militarist ghost. Should Tokyo indeed play a major role in breathing life back into this geopolitical tool, its ulterior motives would undoubtedly warrant regional caution.

Jin Ding

Innovation ecosystem driving rapid battery advancements

In April, the retail penetration rate of new energy passenger vehicles in China surpassed 60 percent for the first time, reaching 61.4 percent. Internal combustion vehicles are increasingly becoming the minority technology in one of the world's largest automobile markets.

This transformation is being driven by simultaneous advances in multiple battery technologies in China. While lithium iron phosphate batteries continue to dominate the sector because of their lower costs and improving safety profile, research is accelerating in solid-state batteries, sodium-ion batteries and iron-based flow batteries for large-scale energy storage.

Over the past five years, the unit cost of power batteries in China has decreased by 30 percent, their lifespan has increased by 40 percent, and charging speeds have more than tripled. The country is transforming the battery — the most expensive and technologically sensitive component of an electric vehicle — into a mass-market commodity with rapidly improving performance. It's a story of scale, chemistry and market selection.

China's power battery output reached 310 gigawatt-hours in the first two months of 2026, up 22 percent year-on-year. Lithium iron phosphate batteries alone accounted for nearly 115 gigawatt-hours of production in February, far exceeding ternary lithium batteries. This reflects the emergence of a manufacturing ecosystem capable of relentless innovation and continuous cost compression.

Meanwhile, researchers at the Chinese Academy of Sciences recently reported progress in iron-based flow batteries that are capable of more than 6,000 charging cycles without measurable degradation. Because iron is far cheaper and more abundant than lithium, such technologies could become important not only for electric vehicles but also for grid-scale electricity storage as renewable energy capacity expands globally.

The consequences for traditional automakers are profound. Many foreign automotive brands have lost their market share in China. The problem is not merely slower adaptation. Many foreign manufacturers are struggling to match the speed of innovation, cost efficiency and software integration achieved by Chinese EV makers. The International Energy Agency expects electric and hybrid vehicles to account for nearly 30 percent of global car sales this year, driven partly by fuel price pressures and falling battery costs.

China's advantage in the sector lies in integration. Chinese companies are competitive in large segments of the industry, including battery materials, cell manufacturing, software systems and vehicle assembly. This vertical integration enables faster iteration cycles, lower marginal costs and quicker commercialization of innovation.

More important, China has embedded the EV industry within a broader national system organized around data, digital infrastructure and industrial coordination. EVs in China are increasingly becoming mobile computing platforms connected to payment systems, mapping services, charging networks, logistics chains and urban management technologies.

This reflects a distinctive combination of government policy and market competition. Industrial policies created the initial conditions through subsidies, charging infrastructure and research funding. What transformed the sector was the interaction between enormous domestic demand and highly competitive companies forced to innovate constantly on cost, efficiency and technology.

China's EV ecosystem also benefits from unmatched industrial clustering; battery makers, software developers, semiconductor suppliers and assembly plants operate within tightly integrated regional supply chains. Data generated by millions of connected vehicles feed directly into the AI-driven optimization of battery management, autonomous driving systems and energy efficiency.

Such system-level integration may ultimately prove even more consequential than low battery prices. For instance, on Monday, Huawei unveiled the Tau Scaling Law — a new semiconductor principle that uses logic-folding technology to continuously compress signal propagation delays. By 2031, high-end chips developed under this breakthrough — which integrates national strategy, enterprise R&D, and industrial clusters — could reportedly achieve a transistor density equivalent to the 1.4-nanometer process.

— LI YANG, CHINA DAILY

What They Say

Computing power a strategic resource in AI era

Editor's note: *Increasing artificial intelligence inference has led to greater demand for computing power than can be supplied. Shen Jianguang, chief economist at major e-commerce platform JD.com, discussed possible solutions to the problem in a commentary in People's Daily. Below are excerpts of the article. The views don't necessarily represent those of China Daily.*

A severe shortage of computing power has gripped countries and regions across the world. While the crunch is partly linked to physical bottlenecks such as chip manufacturing and power grid capacities, a more important driver is the massive increase in AI demand, which has outpaced the existing supply capabilities.

This surge in demand stems from a fundamental shift in the way AI applications are being used.

First, AI is evolving from a "helpful assistant" into an "autonomous agent". In the past, AI was mainly being used for simple tasks such as text generation and basic question-and-answer interactions. But today, new AI agents can directly operate computers by writing code, organizing files and collaborating across different software programs.

This evolution from merely "suggesting ideas" to "taking action" has drastically increased the computing power required for a single task, sometimes by several orders of magnitude.

Second, top developers are relying on massive computing power to achieve higher levels of intelligence. To make AI more reliable and accurate, leading global models typically use inference-time scaling technology.

Before generating a response, the AI pauses to analyze, reason and check its work in the background, much like a human would. For example, when tasked with researching an industry and writing a comprehensive report, the AI needs to autonomously browse websites, read financial statements and run analysis tools. This single task can run continuously for hours, consuming millions of tokens.

Third, the commercial application of AI has crossed a critical tipping point. Thanks to breakthrough improvements in stability and accuracy, AI is now delivering tangible returns in sectors such as finance, healthcare and core business operations. As a result, companies are more willing to deploy these models on a larger scale, transforming AI demand from experimental tech trials to an absolute business necessity.

Faced with this challenge, tech companies worldwide are actively seeking solutions. In the short term, optimizing allocation is key, with many AI providers focusing their computing resources on business segments that produce direct revenue.

Chinese companies on the other hand are seeking to improve the output efficiency per unit of computing power through technological innovation as an effective way to alleviate the computing power pressure.

In the long run, expanding capacity and exploring innovations will be equally important. Tech giants worldwide are accelerating the construction of data centers and increasingly purchasing high-end chips. At the same time, more efficient model architectures and next-generation storage and interconnect systems are gradually maturing, which will help relieve the pressure on computing resources.

In the AI era, computing power has become a foundational strategic resource, much like water or electricity. Only by balancing short-term optimization with long-term planning, and aligning tech upgrades with capacity building, can the industry ensure steady growth and maintain a competitive edge on the global stage.

Muhammad Shehbaz Sharif

Closer Pakistan-China ties for a shared future

May 21 marks the 75th anniversary of the establishment of diplomatic relations between Pakistan and China.

On behalf of the Government of Pakistan, as well as on my own behalf, I extend my heartfelt felicitations to the peoples of Pakistan and China, on the historic occasion of the 75th anniversary of the establishment of diplomatic relations between Pakistan and China.

As we commemorate this historic milestone, in a befitting manner, it would enable our peoples, particularly the younger generations, to better appreciate the depth, breadth, vitality, and future-oriented character of Pakistan-China relations.

The people of Pakistan hold the people of China in the highest esteem and affection.

Since the establishment of diplomatic relations on 21 May 1951, the friendship between Pakistan and China has steadily evolved into an All-Weather Strategic Cooperative Partnership.

Built on mutual trust, sovereign equality, and shared aspirations for peace and development, our bilateral relations have continued to grow in strength, substance, and strategic significance, amidst changing regional and global circumstances.

Pakistan highly values the visionary leadership of President Xi Jinping and appreciates China's remarkable achievements in economic development, technological advancement, poverty alleviation, and global connectivity.

From the Karakoram Highway to cooperation in outer space, Pakistan-China friendship continues to demonstrate how enduring strategic trust can be translated into meaningful progress and shared prosperity for our peoples.

Under President Xi's visionary leadership, China has achieved remarkable progress in modernization, innovation, poverty alleviation, and national rejuvenation.

China's progress and transformation continue to inspire the developing world and contribute significantly to global peace and prosperity.

The commitment of the Chinese leadership to strengthen Pakistan-China relations and advance the shared vision of building a closer "Pakistan-China Community of Shared Future in the New Era" is most commendable.

Pakistan deeply appreciates China's cooperation with Pakistan in multifaceted fields. Pakistan remains firmly committed to the one-China principle and will continue to support China on issues concerning its core interests.

China's robust support for Pakistan's socio-economic development and national priorities has played a phenomenal role.

The China-Pakistan Economic Corridor (CPEC), as a flagship project of the Belt and Road Initiative, has made tremendous contribution toward Pakistan's infrastructure development, energy security, industrial cooperation, and regional connectivity.

Pakistan remains firmly committed to the high-quality development of CPEC as it enters its next phase, with greater emphasis on industrialization, agriculture, information technology, science and technology, green development, and enhanced people-centered cooperation.

It is encouraging to witness Pakistan-China cooperation, expanding into new frontiers including digital economy, innovation, space cooperation, education, and cultural exchanges.

From the Karakoram Highway to cooperation in outer space, Pakistan-China friendship continues to demonstrate how enduring strategic trust can be translated into meaningful progress and shared prosperity for our peoples.

The 75th anniversary of the establishment of Pakistan-China diplomatic relations is not only about remembering the past; it is about shaping the future.

At a time of increasing global uncertainty and transformation, Pakistan and China remain committed to multilateralism, peaceful coexistence, and inclusive development.

Our All-Weather Strategic Cooperative Partnership continues to serve as a positive force for regional stability and international cooperation.

May the enduring friendship between Pakistan and China continue to grow stronger with every generation!

Pakistan-China friendship zindabad.

Xizang's journey from chains of feudalism to gains of freedom

Seventy-five years ago, Xizang autonomous region experienced a turning point in its history. The peaceful liberation of the region in 1951 marked the beginning of a new era for generations of Tibetan people who had long been trapped under a rigid feudal serfdom, allowing them to reclaim their lives.

Far from championing the masses, the 14th Dalai Lama was the principal serf-owner in a system that enslaved over 95 percent of the Tibetan population, with interests fundamentally at odds with those he supposedly represented.

Before it was liberated, Xizang was governed by a feudal system more oppressive than even medieval Europe. Less than 5 percent of the population — including the aristocracy, senior government officials, and monastery elites — controlled the farmland, pastures, forests and livestock.

Over 95 percent of Tibetan people were serfs or slaves, bound to estates for generations with no freedom, no property and no legal rights.

The 14th Dalai Lama's family epitomized this system. Historical records show they owned 27 estates and 30 pastures, overseeing more than 6,000 serfs.

Each year, they extracted 460 tons of barley, 35 tons of butter, over 2 million taels of silver and 300 cattle and sheep.

The personal wealth of the Dalai Lama included 160,000 taels of gold, 95 million taels of silver, more than 20,000 pieces of jewelry and over 10,000 luxury garments.

Under old Tibetan law, human life was valued by rank.

The value of a top-ranking person was equal to the weight of a corpse in gold, while a low-ranking person was worth only a straw rope. Serfs who infringed the interests of their lords faced barbaric punishments administered by private courts maintained by monasteries and aristocrats.

Serfs were considered no more than "talking livestock". One folk song captured their misery: "Even if snow mountains turned into butter, it belongs to the serf-owners; even if rivers ran with milk, we cannot taste a drop."

For the Dalai Lama and his family, this system was paradise; for the vast majority, it was hell.

Democratic reforms after the Agreement of the Central People's Government and the Local Government of Tibet on Measures for the Peaceful Liberation of Tibet (17-Article Agreement), ended this oppression. The central government gave Xizang six years to initiate reforms.

SONG CHEN / CHINA DAILY

Roads, railways, and air routes now connect the plateau in ways unimaginable in 1959, shrinking the travel time of journeys that once took months into hours.

However, the Dalai Lama and his inner coterie refused and staged an armed rebellion in 1959 to preserve their privileges.

But the revolt was suppressed, and democratic reforms redistributed land, freed over one million serfs, and restored their dignity. More than 187,000 hectares of land were confiscated or purchased from serf-owners and handed to 800,000 serfs and slaves across 200,000 households.

An average of over 0.23 hectares of land was redistributed per capita. Freed serfs received land and livestock for the first time, their debts were waived, and generations of oppression came to an end.

The results were transformative. Xizang's population grew from 1.228 million in 1959 to 3.74 million by 2025, a staggering threefold increase.

Life expectancy doubled from 35.5 to 72 years. Maternal and infant mortality fell dramatically, and severe diseases such as smallpox, poliomyelitis, and diphtheria were eradicated.

Education, once reserved for monks and aristocrats, became universal: Xizang now has over 3,600 schools serving nearly a million students, with compulsory education completion at 97.86 percent.

The GDP of the autonomous region grew from 174 million yuan ($25.6 million) in 1959 to over 303 billion yuan in 2025, a 1,740-fold increase.

Per capita income rose to 33,600 yuan, with both urban and rural income growth rates ranking first in the country. Roads, railways, and air routes now connect the plateau in ways unimaginable in 1959, shrinking the travel time of journeys that once took months into hours.

These numbers are not abstract — they reflect the real lives of over 3.7 million Tibetan people. The era when "a straw rope was worth a human life" is gone forever.

Yet these numbers only tell part of the story. Witnesses vividly recall life under serfdom. Ninety-five-year-old Bai Mu remembers walking barefoot across thorny fields, enduring injury in silence. Ninety-two-year-old Suo Za said, "We did all the work, but the harvest belonged to serf-owners. If there was any displeasure, they beat us at will."

These accounts confirm that democratic reform did more than redistribute land — it restored humanity. Ordinary people, once seen as "talking livestock", became the masters of their own destiny.

The Dalai Lama, in contrast, has never advanced the welfare of ordinary Tibetan people. Since fleeing abroad, he has engaged in separatist activities, inciting unrest while protecting the privileges of the aristocracy he once led. His claim to represent the people is contradicted by both history and living memory.

Xizang's 75-year journey demonstrates that liberation, not feudalism, served the people. The paradise the Dalai Lama sought to preserve rested on the blood and tears of millions of Tibetan people.

Today, Tibetan people are building a prosperous, harmonious, and modern society. The future of Xizang is being written by those who live there, not by figures clinging to the past.

History has clearly chosen its side.

We need to give new life to old clothes

Winter is over and it is time for families to store heavy winter wear deep in wardrobes and bring out lighter clothes for the warm season ahead.

During this seasonal migration of garments, I found that roughly one in every five garments has not been used for many years — either because it no longer fits, has gone out of fashion or is simply not liked anymore.

Many such clothes had become useless for my family but we hesitated to throw them away. People of my generation, who experienced the hard times of running short of food and clothes, feel guilty when discarding any usable item, be it clothes, packaging boxes or plastic bags.

"Keep them till I can wear them after I lose some weight," my wife has said for the past 20 years whenever I wanted to dispose of some of her dresses. I agreed because I myself have the same arrangement for my tight sweaters, jackets and pants.

As a result, our four wardrobes were packed with clothes, and it took me a whole day to complete the seasonal adjustment.

That's when I decided to clear out some of the old clothes. The timing was just right — my wife was away in Hainan province.

Together with my son, I sorted out more than 40 kilograms of used clothes — a number of down coats, a dozen or more woolen sweaters and several jackets, pants and shirts. After I contacted an online waste collector, a young man came to our house and took away our harvest, paying a symbolic 20 yuan ($2.93).

As a result, used clothes either find their way into trash bins or, as in our case, are taken away by collectors.

We could have simply thrown the clothes away in the trash bins in our apartment compound but I could not bear the thought of my once-beloved garments lying among rotting vegetables and chicken bones.

I prefer to believe that the young collector who took the clothes would sell them to recycling plants or find new owners for them. After all, some of the clothes had hardly been used because they failed to keep pace with our weight gain.

I believe many Chinese families share the same dilemma when it comes to getting rid of used clothes.

About 50 years ago, this was not a problem. In times of scarcity, one would be lucky to have even a second set of clothes. Later, for many years, used clothes were collected by government departments and sent to poor rural families and disaster-hit areas as relief.

Today, the situation is different. Rural areas have eliminated absolute poverty since 2020 and the government has stocked sufficient supplies — tents, down coats and blankets — for emergencies. As a result, the government's collection of used clothes has been suspended. While this is good news and reflects the country's progress, it has blocked an important channel for disposing of old but usable clothes.

The number of shops selling second-hand clothes, once common across the country, has also decreased. Many well-off Chinese consider it beneath their dignity to step into such shops. There are some online second-hand trading platforms, but they mostly deal in luxury goods — ladies bags, Swiss watches and expensive toys. If any clothes change hands, they are usually wedding dresses or branded suits valued at thousands of yuan. You must be joking if you think you can sell your used clothes on such platforms.

Some communities organize weekend flea markets for second-hand goods. Toys, electrical appliances, books, furniture and home ornaments are well-received at such places, but used clothes are the least welcome.

After all, it would be embarrassing if one were seen wearing an overcoat discarded by one's neighbor.

As a result, used clothes either find their way into trash bins or, as in our case, are taken away by collectors. What becomes of them is not entirely clear.

I believe a large portion is sent to recycling plants and turned into new materials. If that is true, it is at least an acceptable destiny for worn-out clothes. However, when I imagine my brand-new clothes being thrown into large pools filled with chemicals, my heart aches.

It would be better if there were some mechanism that separates used clothes that are in good condition, disinfects and irons them, and then gives them a new life in families that truly need them.

GLOBAL VIEWS

POLINA RYSAKOVA AND IGOR KHODACHEK

From rails to classrooms

The architecture of Sino-Russian educational partnership is adopting more hybrid forms as cooperation deepens

Russia and China are bound by decades of relations in which political and economic interactions have traditionally occupied the leading place. In recent years, however, another dimension of the bilateral dialogue has come into sharper relief — the humanitarian one. This is evidenced by growing Russian interest in Chinese popular culture, literature, music, theater and cinema, as shown by the success of Chinese television series on Russian streaming platforms, translations of contemporary Chinese prose and poetry, and touring performances by Chinese musical and theatrical ensembles. The humanitarian dimension is no longer merely supplementing the traditionally dominant economic and political relationship — it is becoming an independent and significant channel through which the two countries come to know each other.

Polina Rysakova

Igor Khodachek

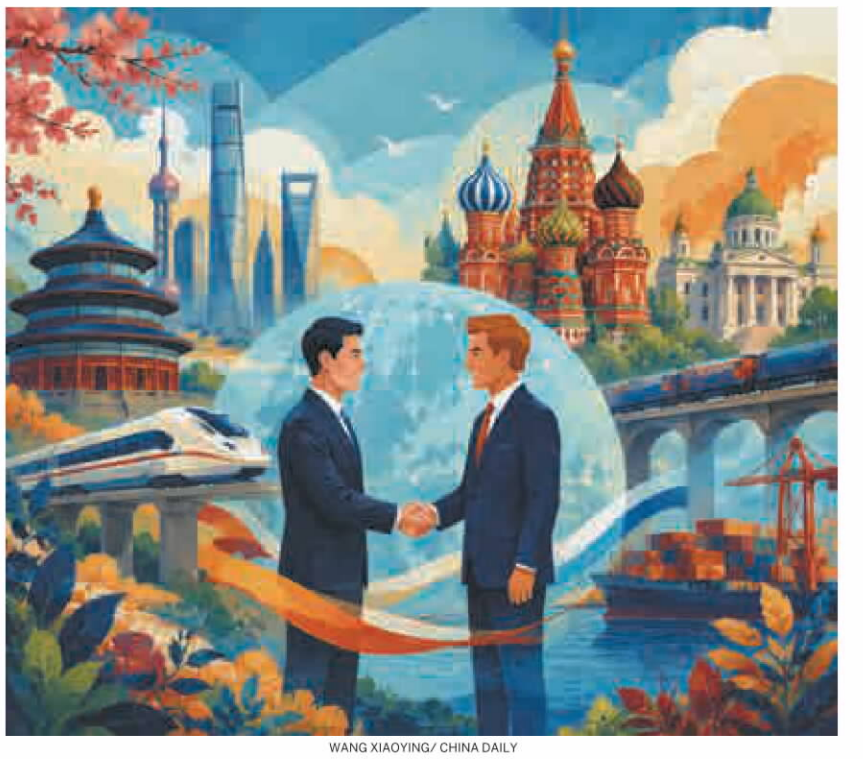
As national cultures interpenetrate ever more closely, what defines the present moment is the consolidation of hybrid forms of cultural interaction. Productive partnership gives rise to fundamentally new formats that cannot be reduced to either of the originating traditions. Such hybrids are emerging in the sphere of Russian-Chinese cultural contacts as well: one need only think of Russian feature films and literary works set in China, or tourist itineraries that bring together the cultural heritage of both countries.

Hybrids of this kind are taking shape in education too — against the backdrop of intensifying Russian-Chinese humanitarian ties and an accelerating exchange of visits. In 2025, around 21,000 Russians studied at Chinese universities, while Russian universities hosted approximately 66,000 Chinese students. Throughout the 2020s, Russia has been gradually becoming one of China's most important partners in higher education, alongside the traditional leaders from the Western world. This is demonstrated by the growing number of joint educational programs established through the efforts of Russian and Chinese universities. The momentum of Russian engagement is striking. Whereas around 120 new Russian-Chinese programs were launched during the 2010s, today the number of active partnerships has reached 150, involving around 90 Russian and 150 Chinese universities. The geography is expanding too: universities of the Urals, the Volga region, St Petersburg and Moscow are joining the traditionally active institutions of the Russian Far East and Siberia.

Joint educational programs are precisely the kind of cultural hybrids described above. They have absorbed the best of the educational traditions of both countries while remaining oriented toward the future — toward creating the conditions for a sustainable partnership. At the foundation of this partnership lie both a shared humanitarian dimension and a complementarity of skills and competencies. This is reflected in the diversity of Russian-Chinese educational cooperation.

While technical disciplines dominate in most Chinese-foreign joint projects, the Russian-Chinese partnership is distinguished by the way that a technological agenda is organically combined with a humanitarian one. Engineering disciplines occupy a significant place — mechatronics, electrical engineering, and automation — as do programs related to transport infrastructure, above all railways, including railway power supply, transport management and signaling systems. This cooperation carries strategic importance for the development of regional and global connectivity infrastructure. At the same time, the humanities remain an integral part of Russian-Chinese educational projects — Russian language study, musical performance and arts education. It is precisely these programs that transform the educational dialogue into a fully-fledged cultural exchange, extending well beyond applied technological cooperation.

Notably, the hybrid character of the educational partnership is expressed not only in program content but in its physical, spatial embodiment. Russia has become one of the countries — alongside the United States, the United Kingdom and Israel, among others — to have established a joint university on Chinese soil: MSU-BIT in Shenzhen, a non-profit Chinese-foreign cooperative university jointly founded in 2016 by the Shenzhen municipal people's government, Lomonosov Moscow State University and Beijing Institute of Technology. Another unique and remarkable establishment is the international campus of St Petersburg State University and Harbin Institute of Technology (SPbU-HIT) in Harbin. This project reflects the deep historical and cultural ties between the two countries. The educational function here acquires an additional dimension — the preservation and reinterpretation of a shared heritage.



This kind of reading becomes possible through the "city as text" approach, which is gaining ground in urban research today. By treating planning documents, social media posts, real estate advertisements, news archives and topographic inscriptions as a single body of evidence open to computational analysis, the approach allows researchers to trace how the meaning of a place evolves across actors and across time. Applied to Harbin, it makes visible how official, academic, and everyday voices have repositioned shared heritage from a contested footprint to a shared resource, providing the empirical foundation that such a project deserves.

What the Harbin campus demonstrates in concentrated form is true of the partnership more broadly. The China-Russia Years of Education, spanning 2026 to 2027, open genuine opportunities for a qualitative renewal of the partnership. The two sides have a historic chance to build a sustainable model of long-term educational cooperation in which technical and humanitarian directions develop in balance. It is precisely this breadth — from railway technologies to the Russian language, from musical performance to arts education — that makes the Russian-Chinese educational dialogue both unique and full of promise.

Polina Rysakova is a researcher at the Center for Eurasian Studies at European University, St Petersburg. Igor Khodachek is the director of the Center for Eurasian Studies at European University. WANG XIAOYING/ CHINA DAILY

LONG CHEN

Mutual supporters

Three ever-broadening 'paths' underpin the consolidation and extension of China-Russia cooperation

At the invitation of President Xi Jinping, Russian President Vladimir Putin paid a state visit to China on May 19 and 20. The deep-seated accumulation of China-Russia cooperation has continued to grow despite the turbulent international landscape. Steadily extended and consolidated, it has become a paradigm for major-country coordination in today's world. Looking back at the highlights of China-Russia cooperation in recent years, the secret to the steady progress in bilateral exchanges lies in three increasingly broadening "paths".

Amid current major issues such as the international energy security, the in-depth communication and coordinated positions between China and Russia are helping to jointly safeguard the authority of the United Nations Charter and international fairness and justice, steadily advancing the building of a more equal and orderly multipolar world.

The path of people-to-people exchanges is becoming increasingly smooth. The thermometer of China-Russia relations is, first and foremost, reflected in the footsteps of ordinary people from both nations. As a major outcome of the strategic guidance by the two heads of state, the trial mutual visa-free policy launched in 2025 responds to the expectations of both peoples.

Data from the Heilongjiang General Station of Exit and Entry Frontier Inspection show that after just over eight months of the trial visa-free policy, ports across Heilongjiang province received over 650,000 Russian travelers, a year-on-year increase of nearly 70 percent. Among them, the number of tourists entering through visa-free channels surged more than twofold. Cross-border weekend visits between Chinese and Russian families and Russian tourists shopping at Chinese markets have become the new normal.

Meanwhile, Chinese tourists' enthusiasm for visiting Russia is equally high. According to the Association of Tour Operators of Russia, the number of Chinese tourists visiting Russia increased by 44 percent in the first quarter of 2026, firmly securing China's leading position in terms of foreign tourist arrivals in Russia. According to forecasts by the Russian Ministry of Economic Development, the number of Chinese tourists to Russia is expected to reach 5.5 million annually by 2030.

The path of physical connectivity is accelerating its extension, making the "steel arteries" of economic and trade exchanges more resilient and robust. If the "heart path" is the underlying emotional bond of China-Russia cooperation, the "hard path" supports the backbone and lifeblood of their economic and trade interactions. According to the Russian Ministry of Transport, the freight volume of trade in goods between China and Russia reached 47 million metric tons in 2025, up 3 percent year-on-year, with vehicles passing through border ports increasing by more than 20 percent compared to 2024.

The accelerated upgrading of cross-border infrastructure and logistics, along with the step-by-step implementation of border port renovations, has emerged as a new highlight in bilateral economic and trade exchanges. Specifically, the Kanikurgan-Heihe highway port has completed its upgrade, increasing daily vehicle clearance capacity to 862 vehicles. The traffic capacity of the Kraskino-Hunchun and Pogranichny-Suifenhe highway ports has also increased to 750 and 1,300 vehicles respectively, upon completion.

Beyond highways, progress is being made in tandem across railways, aviation and maritime shipping. Cross-border waterway passenger transport is becoming increasingly busy. As the terminus of the Pacific Railway, the coal marine terminal at Port Elga and its supporting railway are under intensive construction. Once fully completed, Russia will be able to transport an additional 30 million tons of coal by water annually.

Furthermore, the development of the Russian Far East and Northeast China is not only a regional priority but also a crucial lever to stimulate growth across the entire Eurasian continent. These crisscrossing "hard paths" are tying the economic lifelines of the two countries ever tighter, serving as a powerful engine for the shared development of the region and the continent as a whole.

The path of participating in global governance is widening, providing greater confidence for practical cooperation to counter anti-globalization. The significance of China-Russia cooperation has long transcended the bilateral scope. Through platforms such as BRICS and the Shanghai Cooperation Organization, China and Russia are providing more diverse international public goods to the Global South.

At the 2024 BRICS Kazan Summit, President Xi put forward five suggestions: building a BRICS committed to peace, innovation, green development, justice and closer people-to-people exchanges. Both China and Russia expressed their readiness along with other BRICS members to promote strategic cooperation across three pillars — politics and security, economy and finance, and people-to-people exchanges — and to strengthen ties with other developing countries through "BRICS Plus" and outreach dialogues.

In recent years, the New Development Bank and alternative payment systems under the BRICS framework have gradually emerged as beneficial complements to the International Monetary Fund and the World Bank.

In September 2025, President Xi proposed the Global Governance Initiative at the SCO Plus Meeting. President Putin expressed immediate support, saying that the Global Governance Initiative put forward by President Xi is very timely and relevant, and will play an important role in closing the global governance deficit. On May 9, President Putin further pointed out at a news conference after the Victory Day celebrations that China-Russia coordination has become "a key pillar in deterring conflicts and safeguarding global strategic stability".

Amid current major issues such as the international energy security, the in-depth communication and coordinated positions between China and Russia are helping to jointly safeguard the authority of the United Nations Charter and international fairness and justice, steadily advancing the building of a more equal and orderly multipolar world.

Report: Firms investing more in Europe

More than an export market, continent seen as a strategic base, say analysts

By **LI JING**
lijing2009@chinadaily.com.cn

Chinese corporate investment in Europe surged to its highest level in seven years in 2025, with a sharp rise in factory construction, as Chinese companies accelerated efforts to localize operations amid global supply chain shifts and rising trade protectionism.

Chinese foreign direct investment in Europe, including the United Kingdom, climbed 67 percent year-on-year to 16.8 billion euros ($19.6 billion), the highest level since 2018, according to a recent study by Rhodium Group and other industry trackers.

The automotive sector remained the dominant investment destination, drawing 7.6 billion euros, with 93 percent tied to electric vehicle supply chains.

"The core driver is the globalization push by Chinese automakers," said Ron Zheng, a senior partner at Roland Berger and head of its automotive practice in Asia.

"At the same time, Europe's trade barriers and industrial policies are accelerating the shift toward localized production, as companies seek to mitigate tariff risks and meet local production requirements."

Greenfield investment — where companies build new production facilities rather than acquire existing firms — jumped 51 percent from a year earlier to nearly 9 billion euros, setting a record high, the report found.

Analysts say the rebound highlights that Chinese companies are increasingly turning to Europe not only as an export market, but also as a strategic production base.

"The rise in FDI reflects strong complementary demand on both sides," said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

"Chinese companies have technology and manufacturing experience, while European markets want investment, especially in sectors linked to industrial upgrading and green transition," Zhou said.

He said greenfield investment has become the dominant model partly because Europe lacks sufficiently mature industrial assets in some emerging sectors that Chinese firms can directly acquire.

Europe's share of China's total global FDI rose from 17 percent to nearly a quarter in 2025, according to the report.

Hungary remained the largest recipient of Chinese FDI, attracting 3.9 billion euros, although its lead narrowed as other major European economies regained momentum, the study found.

Chinese FDI in Germany nearly tripled to 2.5 billion euros, while investment in France quadrupled to 1.9 billion euros, according to the report. Combined, France, Germany and the UK accounted for 34 percent of total Chinese investment in Europe in 2025, up from 23 percent a year earlier.

Spain, Sweden and Cyprus also each attracted more than 1 billion euros, helped by large renewable energy and entertainment deals, including China Three Gorges Corp's acquisition of the Mula solar plant in Spain and Tencent Holdings' purchase of mobile game developer Easybrain in Cyprus.

Zheng from Roland Berger said China's EV sector now possesses the world's most complete supply chain, strong cost-control advantages and fast technology iteration capabilities, making overseas expansion a natural next step as growth in China's domestic auto market moderates.

"Europe is still the global technological center of the combustion engine era and remains a premium, strategically important market. For Chinese automakers to become truly global brands, they must establish themselves in Europe," he said.

Zheng added that localized manufacturing allows companies to move closer to customers, satisfy local content rules and improve brand perception, while reducing exposure to tariffs and antisubsidy probes.

Chinese investment is also reshaping Europe's industrial landscape, Zheng said. While local suppliers may face near-term competitive pressure, deeper integration with Chinese battery and component makers could accelerate Europe's EV transition and strengthen supply chain resilience over the longer term.

"European carmakers including Volkswagen, Mercedes-Benz and BMW are already deepening cooperation with Chinese supply chains to benefit from China's cost advantages and innovation speed," he said.

Zheng added that Chinese automakers are increasingly moving beyond simple vehicle exports toward full-scale localization strategies that include factories, research centers, supplier ecosystems and after-sales networks.

"The model is no longer just about selling cars in Europe. It is about embedding entire industrial chains locally."

Huawei unveils cutting-edge chip-development framework

By **MA SI**
masi@chinadaily.com.cn

Huawei Technologies Co expects its premium chips to achieve transistor density equivalent to 1.4-nanometer processes by 2031 under a new semiconductor development framework, the company announced on Monday at a conference in Shanghai.

He Tingbo, Huawei board member and president of its semiconductor business, formally introduced the "Tau Scaling Law" in a keynote speech titled "New Semiconductor Path in Practice".

Unlike traditional approaches that rely on miniaturizing transistors — an industry paradigm increasingly challenged by physical limits and diminishing cost benefits — the new methodology prioritizes reducing signal propagation time across devices, circuits, chips and systems, said He, adding that Huawei has already designed and mass-produced 381 chips based on the Tau Scaling Law over the past six years, covering industries from smartphones to artificial intelligence computing.

This autumn, the company will launch a new Kirin smartphone chip that adopts a multilayer circuit architecture which shortens critical path wiring and improves transistor density and energy efficiency.

A visitor checks out Huawei's computing equipment during a high-tech expo in Shanghai. PROVIDED TO CHINA DAILY

The announcement underscores China's push to circumvent US export restrictions that have limited domestic access to advanced lithography tools and cutting-edge semiconductor manufacturing.

China is widely seen as unlikely to reach 1.4 nm capabilities through conventional fabrication alone, but a successful application of the Tau Scaling Law could offer a way to improve performance and chip density despite equipment constraints, experts said.

Huawei's projection places it on a competitive timeline with TSMC, the world's largest advanced chip foundry. TSMC currently produces chips on 2 nm technology and plans to begin mass production of its A14 (1.4 nm) process in 2028.

Beyond Huawei's internal roadmap, Chinese AI developers are increasingly turning to domestic chips. In its DeepSeek-V4 technical report, DeepSeek listed Huawei's Ascend NPU alongside Nvidia GPUs within the same hardware validation framework — the first time the company has positioned a Chinese AI chip on equal footing with Nvidia in an official document. The model has already completed inference adaptation on Huawei's Ascend platform.

Meanwhile, Kimi's recent research paper on cross-data center inference architecture has also hinted at exploring domestic chip-based token cost reduction.

As overseas advanced computing procurement tightens, the shift toward domestic AI chips is accelerating. He from Huawei said the semiconductor industry's future depends on open collaboration, adding that no single company can independently find all the answers.

"With the Tau Scaling Law, we look forward to working closely with scientists, engineers and industry partners around the world to drive the sustainable development of the semiconductor industry," she said.

Huawei's progress comes as a string of Chinese semiconductor companies are making inroads into chip supply chains, including chip materials, packaging, manufacturing processes and chipmaking equipment.

Roger Sheng, vice-president of research at Gartner, said amid mounting challenges, Chinese chip firms are showcasing their resilience and growing innovation capabilities.

Xing Ziqiang, chief China economist at Morgan Stanley, said China is making breakthroughs in technological innovation, driven by three core advantages — industrial clusters, a demographic dividend of science and engineering talent, and an ultra-large market — that are difficult for other economies to replicate.

"My colleagues estimate that by 2027 or 2028, China is expected to achieve a 50 percent localization rate in GPUs, marking a significant leap forward," Xing said.

Stronger green ties key to China, Russia

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Green energy collaboration between Beijing and Moscow holds immense potential, opening a vital strategic frontier as both nations seek to uplift their traditional fossil-fuel business into a high-tech, low-carbon value chain.

This structural complementarity — pairing China's world-leading clean technology with Russia's vast resource endowment — is increasingly viewed by industry experts as a driving force not only for bilateral energy security but for a more balanced global energy transition.

"There is massive room for cooperation in the new energy sector," said Yuan Liuyan, director of the energy strategy research department, China National Petroleum Corp (CNPC) Economics and Technology Research Institute.

Yuan pointed out that while Russia boasts abundant wind and solar resources, local development costs remain roughly five times higher than those in China.

> "There is massive room for cooperation in the new energy sector."
>
> **Yuan Liuyan,** director of energy strategy research department, China National Petroleum Corp Economics and Technology Research Institute

"By leveraging China's world-leading technology, industrial capabilities and cost advantages, the two nations have a vast arena to jointly develop wind and solar power bases," Yuan said, adding that bilateral nuclear cooperation could also extend into cutting-edge fields like small modular reactors, fast-neutron reactors and thermonuclear fusion.

According to Yuan, this clean energy synergy is also accelerating across cross-border manufacturing sectors. China has become the leading supplier of new energy vehicle technologies and components to Russia, bolstering its local electric vehicle engineering and domestic brand development.

Conversely, Russia — a top global producer of low-carbon primary aluminum via inert anode technology — is embedding its ultra-low-carbon metals into China's NEV, electronics and packaging industries, she said.

This "green materials to green manufacturing" synergy is paving the way for deeper cooperation across the broader advanced manufacturing supply chain, Yuan added.

While the green transition accelerates, traditional energy remains the bedrock of bilateral trade, characterized by the continuous optimization of traditional supply lines. Following agreements between CNPC and Russia's natural gas distribution company Gazprom, the Power of Siberia 1 pipeline — which reached its full design capacity of 38 billion cubic meters in 2025 — is undergoing expansion to further elevate long-term natural gas supplies.

Wang Hongzhi, head of the National Energy Administration, stated earlier this year that energy cooperation is a vital component of practical Sino-Russian relations.

It plays a foundational role in promoting high-quality economic and social development for both countries, he said, expressing high expectations for the partnership to scale new heights moving forward.

"Against the backdrop of ongoing Middle East crises, Russia continues to prove its role as a reliable supplier, while China remains a responsible energy consumer."

Keeping it cool

A railway employee inspects a freight train at Taiyuan North Railway Station in North China's Shanxi province, on Sunday. Amid scorching temperatures, maintenance workers conduct round-the-clock inspections to ensure the safe passage of freight trains. The station is a key marshalling hub connecting the Shijiazhuang-Taiyuan and northern Datong-Puzhou trunk lines, handling over 150 freight trains daily. ZHANG ZHIJIE / FOR CHINA DAILY

DeepSeek to maintain steep discounts

By **CHENG YU**
chengyu@chinadaily.com.cn

Chinese artificial intelligence startup DeepSeek said it will permanently maintain steep discounts on its DeepSeek-V4-Pro model API pricing, pushing inference costs to new industry lows and escalating a price war across the global AI sector.

DeepSeek said the promotional pricing for its V4-Pro model, previously offered at 25 percent of the standard rate and originally scheduled to end on Sunday, would now become permanent. The company said the revised pricing effectively sets the model's official price at one quarter of the originally planned level.

Under the new pricing structure, input costs for cached requests will fall to 0.025 yuan ($0.0037) per million tokens, while input costs will be 3 yuan per million tokens and output costs 6 yuan per million tokens, according to the company. The pricing ranks among the lowest globally for mainstream large-language-model APIs.

The move comes as AI infrastructure costs are rising worldwide due to what industry experts describe as structural imbalances across the AI supply chain.

DeepSeek's decision to cut prices against that backdrop signals that competition in China's AI market is increasingly shifting from raw computing scale toward efficiency and ecosystem expansion, industry experts said.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said: "DeepSeek's willingness to cut prices against the market trend is absolutely not simple cash-burning subsidization. It is a cost advantage achieved through reconstruction of the underlying technology architecture."

Wang said DeepSeek had adapted its models to domestic Chinese computing platforms including Huawei's Ascend chips, reducing dependence on overseas high-end computing hardware and lowering procurement costs.

"It will create a low price-user growth-ecosystem prosperity, which will further decline cost and form a cycle that strengthens DeepSeek's competitive position," he added.

The move also reflects a broader shift in China's AI industry, where firms are increasingly attempting to differentiate themselves not only through model capability but through deployment efficiency, infrastructure optimization and lower-cost inference.

Smart glasses upgrading police efficiency

Technology is used for traffic management, street patrols, urban governance

By **YAN DONGJIE** in Tianjin
yandongjie@chinadaily.com.cn

The booth of an AI glasses company draws a large crowd of visitors at the sixth China International Consumer Products Expo in Haikou, Hainan province, in April. LUO YUNFEI / CHINA NEWS SERVICE

Left: Zhao Baoxin (left), a police officer in Tianjin, demonstrates the use of smart glasses to another officer on Friday. YAN DONGJIE / CHINA DAILY
Right: Police officers patrol alongside a humanoid robot and a robot dog in Chengdu, Sichuan province, on Feb 15. PROVIDED TO CHINA DAILY

With the assistance of smart glasses equipped with cameras, recognition systems and real-time internet connectivity, police officers can walk the streets and quickly identify objects, signs, license plates and more. By leveraging big data for real-time comparisons, they can proactively detect anomalies in a way that was once confined to sci-fi movies, but is now unfolding for real on the streets of Tianjin.

"These glasses make our patrols and checks much more efficient, helping us proactively detect and respond to emergencies," said Zhao Baoxin, a police officer at the Jiefang Road police station of the Heping district public security subbureau in Tianjin.

The first made-for-police-use smart glasses in China have been independently developed by the Tianjin public security system — with all software and hardware made domestically. They are changing traffic management, routine patrols and urban governance.

In the past, patrolling relied primarily on visual observation. Today, smart glasses are widely employed in scenarios such as traffic management, street patrols and locating missing people, continually improving urban governance and public services. This technology enables law enforcement to respond with greater precision and speed.

While violent crime is rare in China, the use of smart glasses goes far beyond making arrests — they are often used to serve residents, manage traffic and locate lost elderly people.

Showcasing the city's advances in smart policing equipment, these and other typical examples of intelligent technology empowering social governance and public services will be on display at the 2026 World Intelligence Expo in Tianjin from Thursday to Sunday.

Zhao recalled one patrol experience: "We found an elderly man at an intersection in Heping district. He couldn't speak clearly or tell us his name and address. The glasses quickly identified him and within 20 minutes we had reached his family and got him home safely."

Connected to a networked platform, the smart glasses feature text recognition, voice recognition and voice-command control. They can search and provide feedback information in real time, such as verifying a person's identity or finding family contact details. Officers can complete identity checks and information inquiries on the spot through the glasses, improving response efficiency.

The glasses not only assist officers in their daily work, but also give traffic police a major helping hand.

Traffic congestion around schools during peak drop-off and pick-up hours is a common challenge across China. At Tianjin No 21 Middle School in Heping district, parents can now register through a miniprogram co-developed by the public security system. Their license plate information is linked to the glasses' back-end system.

Wearing the glasses, officers can quickly identify authorized vehicles and guide them to stop briefly and leave promptly, while directing other vehicles away in time.

Sun Yinghua, a police officer of the mobile policing detachment of the science, technology and IT division of the Tianjin Municipal Public Security Bureau, said the glasses achieve a recognition accuracy of over 95 percent and can capture data and return results within milliseconds — faster than the blink of an eye. Powered by OCR visual capabilities and artificial intelligence large model technology, the camera on the glasses can quickly identify objects, signs and license plates.

In terms of battery life, the second-generation glasses last two to three times longer than the first generation, supporting 1.5 to 2 hours of continuous wear — enough to cover a standard patrol shift. The temple arms are equipped with specialized sensors: putting the glasses on activates them automatically, and taking them off switches them to standby mode, effectively reducing power consumption.

Unlike body-worn cameras clipped to the chest, the smart glasses offer a first-person perspective, so the footage does not shift when the officer bends or turns. The device weighs about 40 grams, lighter than an average pair of sunglasses.

The push toward smart policing is accelerating across China. In December, a national public security technology work conference called for in-depth implementation of the strategy of strengthening the police force through technology, and comprehensively advancing the use of digital and intelligent tools to empower police operations. According to a 2026 industry report by Zhiyan Consulting on China's public security IT market, the sector grew from 10.8 billion yuan ($1.59 billion) in 2015 to 25.5 billion yuan in 2025, with a compound annual growth rate of 8.96 percent.

Smart glasses, police robots, drones and other equipment have now entered the multipoint application stage. In Jinyun county, Zhejiang province, traffic police using AI glasses have improved the efficiency of roadside key vehicle checks by about 300 percent. In Haikou, Hainan province, AI glasses deployed by traffic police can complete the whole process from identification to alert within 30 seconds. In Chengdu, Sichuan province, humanoid robots, robotic dogs and smart glasses have been integrated to build a three-dimensional prevention and control system covering "air, ground and individual officers". Shenzhen, Guangdong province, explicitly called for "deepening the practical application of new technologies and equipment such as robots and AI glasses" in its 2026 public security work plan.

Police-use smart glasses are also being added to the equipment lists of law enforcement agencies in other countries.

In January, Delhi police in India deployed AI smart glasses for security during Republic Day celebrations. The Dutch national police force began piloting Vuzix Blade augmented reality glasses in 2020 to provide information support to patrol officers.

Zhao said: "During large-scale security operations or holiday crowd management at scenic spots, the glasses work in coordination with drones. The devices can cover areas that personnel cannot reach."

Yan Jinghao, head of the mobile policing detachment of the science, technology and IT division of the Tianjin Municipal Public Security Bureau, said future plans include linking robotic dogs, smart connected police vehicles, humanoid robots and other terminals to achieve multidevice coordination — "to enhance the intelligence level of policing and urban management".

Advances in exoskeleton tech may provide answers for enhancing mobility

By **YAN DONGJIE** in Tianjin

A tourist wearing a smart exoskeleton device crosses a bridge in Tianjin earlier this year. PROVIDED TO CHINA DAILY

At 60 years of age, Liu Na has always loved sports. However, in recent years, every time she goes hiking, she has increasingly felt that her knees and legs are no longer as strong as when she was younger.

Not long ago, during a trial experience event at Duishan Park in Tianjin, she put on an exoskeleton device for the first time.

"I was a little worried at first. I thought this thing would be particularly heavy," Liu said.

But after she put it on and started climbing, she quickly found that her legs seemed to be gently lifted by a mild force.

"Walking became noticeably easier, as if I had regained the feeling of my youth," she said.

Today, exoskeleton devices that once only appeared in science fiction films are gradually entering ordinary people's outdoor sports and daily lives.

Qiu Xiaoning, general manager of Tianjin Industrial Research Technology Development Co, said the newly developed exoskeleton weighs just 2.4 kilograms and can be folded for storage.

To reduce the burden of wearing the device, the research and development team used 3K carbon fiber to build the force arm structure, allowing the device to maintain stable power output while remaining lightweight.

"When I first saw the device, I thought it would definitely be heavy," Liu said. "But after wearing it for a while, I gradually forgot it was there."

During uphill climbs and long-distance walks, the exoskeleton can automatically adjust its power output according to the body's movements. When the wearer starts to go uphill, lifts a leg or accelerates, the device rapidly senses the change in motion and provides corresponding assistance.

The research and development team at Tianjin Industrial Research Technology Development Co explained that the core lies in an "adaptive system".

"You don't need to consciously coordinate with it; it will actively adapt to your pace," said Li Yue, an electronic control algorithm engineer involved in the exoskeleton's development.

Behind this system is an algorithm framework of "large model with small model" built on the gait data of Chinese people.

The so-called "large model" corresponds to general data on height, stride length and gait patterns of a large number of Chinese people, while the "small model" refines the differences between individuals.

With the help of multidimensional sensors and real-time algorithms, the device can complete motion recognition and gait synchronization within 30 milliseconds.

This exoskeleton device will be showcased at the 2026 World Intelligence Expo in Tianjin, which is scheduled to take place at the National Convention and Exhibition Center (Tianjin) from Thursday to Sunday. The event is expected to attract over 700 exhibitors and will see the unveiling of more than 200 innovative achievements and research reports.

Globally, exoskeleton devices are also gradually moving from laboratories to more everyday application scenarios.

In the past, such equipment was primarily used in military, industrial or medical rehabilitation fields. However, in recent years, with advances in lightweight motors, artificial intelligence recognition and wearable technologies, outdoor assisted movement has emerged as a promising new direction.

Several international brands have begun applying technologies such as artificial intelligence terrain recognition and adaptive power systems to mountaineering and hiking scenarios.

For instance, an outdoor exoskeleton device named Vigx Pi6 can analyze ground conditions in advance via an AI terrain camera and dynamically adjust power assistance accordingly.

Another product, the Hypershell X Ultra, is capable of switching modes to adapt to different environments including snow, sand and uphill climbs.

Meanwhile, the R&D team at Tianjin Industrial Research Technology Development Co focuses more on the core question of whether ordinary people are actually willing to wear such devices on a daily basis.

"Many exoskeletons have powerful functions, but average people won't go out carrying a heavy device every day," said Qiu. "What we aim to create is a product that can truly integrate into daily life."

Currently, this exoskeleton has completed research and finalization and entered small-batch trial production.

The R&D team has conducted tests in settings such as parks and nursing homes, and plans to further open up experience opportunities at Tianjin's Panshan Scenic Area.

For the development team, outdoor sports are just the starting point.

As population aging deepens and rehabilitation demand continues to grow, it is hoped exoskeletons will further expand into senior care, medical treatment and community services in the future.

In clinical rehabilitation applications, exoskeletons have been widely used for gait training of patients with hemiplegia, paraplegia and stroke.

Developed by the Haihe Laboratory of Brain-Computer Interaction and Human-Machine Integration at Tianjin University, the "Shengong" series has become one of the most representative achievements in the field of brain-computer interface exoskeletons both domestically and globally. Among them, "Shengong-Shenxing" was officially launched at the 2024 World Intelligence Expo in June 2024, and its innovative walking assistance technology has broken the long-standing international monopoly in the traditional electromyography-driven exoskeleton sector.

Tianjin University's "Shengong" series of exoskeletons have also creatively integrated noninvasive brain-computer interfaces with exoskeleton technology. The developed devices have provided rehabilitation training for more than 3,000 stroke patients in local hospitals in Tianjin and trial services for the elderly in communities.

According to data released by the National Bureau of Statistics, by the end of 2025, the population in China aged 60 and over had reached 323.38 million, accounting for 23 percent of the total population. On Sept 20, 2022, Wang Haidong, director-general of the National Health Commission's department of aging and health, said at a news conference that the population aged 60 and over is expected to exceed 400 million by around 2035, accounting for more than 30 percent of the total population, marking China's entry into the severe aging stage.

A growing number of people are beginning to rethink a fundamental question: Can people continue to walk and move freely as they grow old? Embodied intelligence products such as exoskeletons may offer a new answer.

Mission head plans to grow petunias in space

Shenzhou XXIII commander's passion for the sky blossoms aboard Tiangong

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Colonel Zhu Yangzhu, commander of the Shenzhou XXIII mission, said he plans to grow petunias in space during his stay aboard the Tiangong space station.

"I will bring some petunia seeds with me. I plan to plant them once I get aboard the space station and see if they can bloom. I hope they will grow into lovely blossoms.

"I picked petunias because they are fairly easy to grow, and their flowers are quite beautiful. What's more, the blooms give off a vibrant and uplifting vibe, which can cheer people up. Just as we feel delighted seeing flowers and plants growing on home balconies, the same pleasure is even stronger in space. The view of green vegetation, along with blossoms and fruits if they grow, can tremendously brighten our spirits," he said in an earlier interview with reporters at the Astronaut Center of China in Beijing before setting out for the Jiuquan Satellite Launch Center in northwestern China for the launch on Sunday night.

Zhu, 39, said Chinese astronauts have a "space garden" inside the Tiangong space station. Recalling his participation in the Shenzhou XVI mission, he said he and his crewmates grew plants, mostly lettuce and green onions.

"We ate them after they matured," he added.

According to Zhu, new planting equipment was sent to Tiangong after his flight, enabling astronauts to harvest more vegetables and fruits.

The astronaut noted that the Shenzhou XXI crew has harvested cherry tomatoes three times in orbit. They also planted wheat, which has begun to form ears. In addition, they have grown three generations of mint.

"We will continue to take care of those plants, and will cultivate carrots during our stay," Zhu said.

Earth vistas

Recalling his first and only spacewalk during the Shenzhou XVI mission, Zhu described the eight-hour activity on July 20, 2023, as "an experience that will stay with me for life".

"The awesome vistas of Earth seen outside the space station are very different from those viewed from inside. Floating out into space, anyone would be instantly overwhelmed by the breathtaking scenery. The blue sky and oceans lie directly beneath me. As we orbited above the atmosphere, blue skies spread out both ahead and underfoot, with clusters of white clouds drifting far below.

"I also gazed upon deep blue oceans and lush green lands. When passing over deserts, sharply defined stretches of brown and tan terrain came into my sight. Countless rivers were clearly visible as well," the astronaut said.

What struck Zhu the most was a gigantic typhoon eye he observed when the space station flew across the Atlantic Ocean.

"Suspended amid the endless expanse of space, our home planet appears small, yet breathtakingly beautiful in its blue hue. All these magnificent sights have filled me with even greater reverence for life, nature and the universe," he said.

During the spacewalk, the astronauts also soared over the Qinghai-Tibet Plateau. The landscape unfolded clearly before Zhu's eyes, with towering snowcapped mountains and the estuary of the Yellow River visible from orbit.

"The land of our motherland lay right in front of me. At that moment, I couldn't help wondering what made our space journey possible. It is our great motherland that sent us into space. Countless space industry workers toil behind every space mission, lifting us high toward the stars," he said.

Flight path

As one of the first two members of China's third group of astronauts to take part in a space mission, Zhu said he was destined for flight.

When he was a middle school student, Zhu often used pilot training equipment at his school, which cooperates with the People's Liberation Army Air Force in selecting students for flight school.

In his fifth year in middle school, Zhu planned to apply for an Air Force flight training program. However, his head teacher believed he had great potential for scientific research and persuaded him to reconsider. Still, his passion for the sky never faded.

"I said to myself: 'If I can't fly into the sky myself, I'll dedicate myself to researching flight technologies instead,'" Zhu said.

Before taking the national college entrance examination in 2005, he applied for a major in spacecraft systems and engineering at the National University of Defense Technology. His second choice was aircraft design and engineering at Nanjing University of Aeronautics and Astronautics.

Thanks to his high scores, Zhu was admitted to the College of Aerospace Science and Engineering at the National University of Defense Technology in Changsha in the summer of 2005.

After obtaining a bachelor's degree, he went on to pursue master's and doctoral degrees in fluid mechanics at the same university.

After a decade of study, Zhu graduated in 2015 with the highest academic score in his major.

He was then assigned to an infrastructure construction unit of the PLA, where he assumed his first engineering post. In the position, he led a group of soldiers working at construction sites in remote mountainous areas. He also took part in a postdoctoral program run by the Army Engineering University of PLA in Nanjing, Jiangsu province.

In 2017, Zhu was transferred to the Space Engineering University under the former PLA Strategic Support Force to help establish a mechanics laboratory.

In the summer of 2018, he learned about the selection of China's third-generation astronauts and decided to apply.

"I didn't make it into the Air Force to fly fighter jets in blue skies, but then came this opportunity for me to fly spacecraft outside Earth's atmosphere, so I was determined to try my best to chase it," he said.

After many rigorous tests, Zhu stood out among thousands of applicants and was recruited by the PLA Astronaut Division in October 2020.

Due to his lack of flight experience, Zhu found it difficult at first to learn spacecraft control operations at the Astronaut Center of China.

To master the skills as quickly as possible, he made full use of a desktop simulator for manual rendezvous and docking installed in his apartment, conducting extra training after daily sessions. After thousands of hours of practice, he developed solid muscle memory and eventually achieved precise manual rendezvous and docking operations.

On May 30, 2023, Zhu was launched into space, beginning a five-month orbital mission as the spaceflight engineer for the Shenzhou XVI mission.

"I think the experience of my first mission is very important because it let me know exactly what and how I should work in space," Zhu said before setting out on the Shenzhou XXIII mission.

High spirits

Spaceflight fulfills childhood dream

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Colonel Zhang Zhiyuan, an astronaut of the Shenzhou XXIII mission, grew up fascinated by the wonders of navigating the skies.

"When I was a little boy, my friends and I usually played in the farm fields. Back then, we would often hear military aircraft roaring past overhead. We would run after the planes and shout excitedly. At that time, I held pilots in great admiration and thought this profession was an exceptionally noble calling," said the Gansu province native, who will celebrate his 40th birthday aboard the Tiangong space station next month.

Memories of the astronaut's passion for flying remain vivid in the mind of his father, Zhang Jukun, a retired schoolteacher.

"One day, his mother and I were working in the fields while he played beside the ridge. A plane flew across the sky, and he spotted it and kept chasing after it, running about 400 meters," Zhang Jukun told Gansu Daily. "I pulled him back and told him he could never catch up with an aircraft. Right away he asked me, 'When can I get to fly a plane myself?' And I answered him, 'If you keep working hard, you will make it someday.'"

In the years that followed, Zhang Zhiyuan grew into a caring and sensible young man. He often helped with farm work on the family's land after school.

He studied diligently throughout his primary and middle school years, consistently achieving above-average grades, while never letting go of his dream of flying.

When Zhang Zhiyuan turned 19, a long-awaited opportunity arrived: recruitment officers from the People's Liberation Army Air Force came to his school, Baiyin No 1 High School.

He decided to try and soon stood out among the more than 200 candidates. After passing a series of rigorous tests, he became the only student from his school admitted to the Aviation University of Air Force in Changchun, Jilin province.

Throughout his university years, he trained to high standards, noting that "the path from a flight student to a qualified pilot is filled with tough elimination rounds. To attain outstanding physical fitness, I stuck to extra training every single day".

After graduating, he was assigned to a fighter jet unit and rose through the ranks. He took part in numerous combat exercises, accumulating more than 1,200 hours of flight operations.

In the summer of 2018, Zhang was playing basketball with his comrades when a fellow officer rushed over with news that China was recruiting its third generation of astronauts.

He and his teammates immediately stopped the game. After reviewing the recruitment criteria, he signed up without hesitation.

"I have paid close attention to China's manned space program ever since the Shenzhou V mission. I was deeply impressed by how perfectly every mission concluded. Still, I never dared to dream that I could get the chance to become an astronaut myself before that day," he said.

Zhang advanced through successive selection rounds, undergoing strict medical examinations, psychological evaluations, and an unforgettable first experience in centrifuge training.

"Inside the centrifuge cabin, a massive pressure crashed over me, and my body resisted instinctively. My head swayed back and forth and side to side, yet I had to stay conscious and answer questions at any time," he said.

"Long after that, I grasped the skills for centrifuge training and realized how futile it was to rely on physical strength alone."

Apart from physical conditioning, mastering complex spaceflight theory felt like a long-distance endurance run. He pushed himself to understand and memorize every formula, principle and data set.

As a result of his dedication and perseverance, he was selected for the Shenzhou XXIII mission, finally realizing his dream of flying beyond the atmosphere.

"The dream of flying into space is built upon endless learning, rigorous training and steady accumulation of know-how. There are no shortcuts on this journey.

"Over the past years, I have encountered training bottlenecks and felt disappointed after failing to be selected for previous crews. It is exactly these experiences that have taught me the essence of perseverance. True devotion lies in giving it your all even when you fully understand how tough pursuing a dream can be," he said at the Jiuquan Satellite Launch Center on Saturday, a day before embarking on his maiden space journey.

Robots in Hubei to get life-cycle tracing ID numbers

By **CHEN MEILING** in Beijing
and **LIU KUN** in Wuhan

Some humanoid robots in Hubei province are set to become the first in China to receive their own identity card numbers, allowing their full life-cycle activities to be recorded, in a move aimed at ensuring full traceability and clear accountability amid the rapid development of the industry, experts said.

The number, consisting of 29 numerals and English letters, identifies a robot's brand nationality, company, product model and serial number, covering key information such as the manufacturer, hardware parameters, intelligence level and factory filing records.

Like Chinese citizens' ID card numbers, each robot's number is unique, though it contains 11 additional characters.

Beyond basic static data, the digital ID card enables full life-cycle tracking of information including equipment maintenance records and application scenarios. Real-time data such as joint wear and tear, battery status and operational accuracy can also be accessed at any time through a management platform, said Liu Chuanhou, chief operating officer of the Hubei Humanoid Robotics Innovation Center in Wuhan that is leading the project.

"If the robot breaks down, we can check its operational logs and maintenance records through its unique ID to locate the malfunction, determine liability and carry out efficient maintenance," he said.

A new user can also verify the robot's performance and service records through its ID without repeated testing, which is expected to improve the efficiency of robot reuse, Liu added.

On May 11, the center completed filing applications and coding tests for the first batch of enterprises and products with the Ministry of Industry and Information Technology. The enterprises include leading companies across Hubei's humanoid robot industrial chain, such as Optics Valley Dongzhi, GLRoad, Hubei Qirobotics, Jingchu Humanoid Robot, HandX, Guanggu Haribit and Maxnova.

Liu Jieni, business director at Maxnova, said several of the company's flagship humanoid robots had completed unified coding and filing. The robots are mainly used in industrial manufacturing, commercial services and demonstration training.

She said the company joined the initiative to align with the industry's standardization trend, highlighting the smooth process involved.

"Taking part in this initiative not only helps us address compliance gaps and reduce operation and maintenance costs, but also promotes large-scale market expansion of our products," she said. "Meanwhile, it enables us to accumulate valuable data assets and further strengthens our core competitiveness and brand influence in the industry."

Global shipments of humanoid robots reached about 17,000 units in 2025, with a market size of 2.88 billion yuan ($424 million). Benefiting from advantages in supply chains, technologies and application scenarios, China ranks first globally in the humanoid robot industry, according to a report released in March by Beijing CCID Publishing and Media and China Electronics News.

China has more than 140 humanoid robot manufacturers, with shipments totaling 14,400 units, accounting for 84.7 percent of the global total. Its market size reached 1.55 billion yuan, representing 53.8 percent of the global market, the report said.

Amid the rapid development of China's humanoid robot industry, many enterprises still operate in isolation with incompatible technical standards. There is also a lack of unified norms for product traceability, safety supervision and data circulation, according to Liu.

He said the initiative is expected to promote standardization and strengthen the institutional foundation for large-scale, high-quality development of humanoid robots.

At the same time, as high-end intelligent equipment becomes increasingly integrated into production and daily life, humanoid robots also pose potential risks related to operational safety, data security and ethical compliance.

"In cases involving safety incidents or potential data hazards, the ID number can support rapid traceability and liability confirmation, helping prevent risks such as technology abuse and information leakage," Liu said.

CHINA

China's cold climb to winter sports peak

Systematic support sends nation's disabled athletes to top of Paralympic table

By **WANG XIAOYU** in Tesero, Italy
wangxiaoyu@chinadaily.com.cn

Two decades ago, when Chinese Paralympic athlete Fu Chunshan moved around on his crutches, the national flag on his skiing jacket would often peel at the edges or fall off entirely. With few resources and little funding, his team had no official outfitter and had to stick the flag on with adhesive tape.

"Before each competition, athletes from around the world would gather and gear up together in the preparation tent. We could not help looking on with envy as some European teams arrived with a full army of wax technicians, coaches, guides, team doctors and equipment managers," Fu said.

That memory, from the Turin 2006 Winter Paralympic Games in Italy, has stuck with him for 20 years. In that time, he has transitioned from a para cross-country skiing athlete to a coach, and has witnessed his nation's steady progress in bringing more people with disabilities into winter sports and achieving athletic excellence on the international stage.

At the Milan-Cortina 2026 Winter Paralympics, held from March 6 to 15 in Italy, the Chinese delegation topped the medal table with 15 gold, 13 silver and 16 bronze medals. It was China's best performance at an overseas Winter Paralympics since its debut in Salt Lake City in the United States in 2002.

Chang Zheng, vice-president of the China Disabled Persons' Federation and deputy head of the Chinese delegation, said China sent 70 para athletes to compete in 73 of the 79 events across six sports. "The extensive participation reflects a boom in engagement in ice and snow sports among people with disabilities," he said.

"Behind the team's sporting excellence lies the indomitable spirit of our para athletes, as well as a large group of skilled coaches, support staff, guides, technicians, medical and rehabilitation personnel, and scientific researchers," Chang added.

Of the 15 gold medals, the para cross-country and biathlon team that Fu coaches contributed 11.

"Foreign athletes now acknowledge our arrival with remarks like 'Here comes China'. During races, rival coaches will push their own athletes by pointing out that a Chinese competitor is ahead of them," Fu said. "The team's sporting success this year is beyond my dreams."

Fu, 42, lost his right leg in a childhood accident. He began training as a cross-country skier in the early 2000s and was one of eight athletes on China's delegation at Turin 2006. His best performance as an athlete came at the Vancouver 2010 Winter Paralympics, where he finished ninth.

"At that time, I was shy, intimidated and tended to crouch in a little corner to prepare for the race quietly," he said. "The mere arrival of some foreign teams, slick and well-equipped, was a formidable sight in itself."

What Chinese para athletes relied on, Fu said, was primarily mental toughness. "Regardless of inclement weather or poor snow conditions, we just went out, gave it everything and hoped to demonstrate what we had trained for," he said.

"At the same time, our early experiences overseas enabled us to observe and learn the drills of the world's best athletes firsthand — what equipment they used, how they waxed and how they maneuvered on the snow," he added.

Sometimes, Fu questioned himself: "Is it that we Asian athletes are somehow inherently incapable of rivalling Western athletes?" "But I soon waved off my doubts and concluded that the gap came down to inadequate training and support," he said.

A turning point came in 2015, when Beijing and the neighboring city of Zhangjiakou in Hebei province won the bid to host the 2022 Winter Olympics and Paralympics. "At the time, I set a goal of drafting a batch of athletes and helping them stand on the Paralympic podium," Fu said.

According to the China Disabled Persons' Federation, China's para snow sports entered a rapid development phase in 2016, bolstered by systematic support covering talent cultivation, venue construction, upgrades to training systems and hosting of competitions.

Since then, the number of winter Paralympic athletes nationwide has grown from fewer than 50 to over 1,000, and the number of technical officials has increased from zero to more than 100. The number of categories the delegation participates in has grown from just two to all six major Winter Paralympics events.

A key milestone was the opening of the National Ice Sports Arena for People with Impairments in late 2020, "which ends the longtime embarrassment of training in borrowed facilities during empty time slots".

Training has also become more diverse, integrating summer and winter sessions with both domestic and overseas programs, while a number of domestic para winter sports competitions are now held regularly, according to the federation.

The effort also includes greater public engagement. For instance, a winter sports season for people with disabilities, launched by the federation in 2016, attracts more than 300,000 visits annually.

For para cross-country and biathlon skiers, Fu said that they now have access to two year-round ski centers in the provinces of Jilin and Hebei, as well as overseas venues in Chile and Argentina for out-of-season training.

"My coach used to be in charge of everything — waxing the skis, driving us around, managing recovery and psychological therapy. And as an athlete, my mind wasn't just on the race. I was also preoccupied with tiny details, like whether a screw on my sit-ski might be loose," Fu said.

At the 2026 Winter Paralympics, Fu said China's para cross-country and biathlon team arrived with a support team of more than 40.

"Each athlete wears a heart rate watch or chest strap. Through a monitoring system, we calculate the optimal training heart rate and communicate with them in real time to ensure they can ski within a scientific heart rate zone," he said. "We also conduct blood lactate and morning urine tests regularly and adjust training plans based on their physical condition."

In winter para sports, equipment is essential. It determines whether athletes can navigate rough terrain at high speed, protect themselves in high-impact events, and push their limits.

Fu said the rapid development of China's manufacturing industry and long-term cooperation with a domestic company have turned his vision of equipping athletes with quality, homegrown pieces into reality.

"Taking sit-skis for example, we used to rely on equipment imported from Norway or Russia," he said. "Over the years, we have gradually switched to domestically made ones — first made with stainless steel, then later more advanced materials like aluminum and titanium."

At para biathlon competitions, athletes race different distances around a looped course and stop between laps to shoot. In preparation, Fu said the team trained six days a week. "In the evening, we also arranged for them to handle the rifle to maintain a feel for shooting," he said.

Athletes with visual disabilities use an electronic rifle guided by acoustic signals. To experience what it feels like to aim and shoot based on the pitch of the sound transmitted into their headphones, Fu and other coaches practiced the same way.

"The headphones give off a very noisy sound. After practicing for a long time, my ears will start ringing. This made me truly understand how difficult it is for athletes with visual disabilities," Fu said.

This system of people and programs, combined with the grit and adaptability of the athletes, has removed critical barriers for para athletes and helped them achieve high performances on the international stage.

Cai Jiayun, who won three gold medals in the standing class at the 2026 Winter Paralympics, was trailing in the final stretch of the men's sprint pursuit event but overtook the leading Ukrainian skier to win by 0.2 seconds.

"There seemed to be no way I could catch up given the distance between us and the short time left," Cai said. "But at that moment, I relied on my willpower. I just kept following, kept chasing and did my best."

Beyond willpower, Fu said that the Chinese athletes' explosive sprints at the end of races were partly due to a weekly training session dedicated to improving this specific capability — incorporating lunges for standing-class athletes and hyperextensions for sitting athletes.

Yu Shuang, who finished third in the qualification round of the men's sprint pursuit for the blind and partially sighted, asked the team's wax technician to adjust the wax on his skis according to the snow conditions.

"After getting a feel for the course during the qualification round, I believed that a deficit of over 10 seconds could be made up by changing the wax," he said. He later won the gold medal in the event.

Guo Yujie, 22, left this year's Paralympics with regrets, missing the podium in all her events. Still, she said she learned a valuable lesson in self-confidence and tenacity.

"We Chinese athletes train nearly 11 months each year, and our training is scientifically formulated and supported by high-performance equipment. Despite the relatively warm temperatures and the slushy, grabby snow here in Italy, we have adapted well," she said.

On a personal level, Guo said she has overcome injuries, as well as the frustrations and doubts raised by lackluster results ahead of the Paralympics, just to stand at the starting line.

"The silver lining is that I feel my shooting has become more stable," she said. "More importantly, going through setbacks this time has toughened me up. If I can rise from disappointment on a stage like the Paralympics, then there is no difficulty in life that I cannot overcome."

Discovering white-knuckle thrills in an unlikely place

Wang Xiaoyu
Reporter's log

As a sports fan, I grew up watching the Olympics, but I had never paid much attention to the Paralympics. That was probably because I rarely encountered visibly disabled people in my daily life, and I also assumed that Paralympic events lacked the same drama and excitement as able-bodied competitions.

So when I went to the 2026 Milan-Cortina Winter Paralympics in early March as a reporter, I had few expectations for the rivalries, the twists and turns, or the adrenaline-pumping, heart-clutching moments that make live sports so gripping.

However, what I witnessed and experienced on the snow and ice shattered my stereotypes about the athleticism in the Paralympics.

When Chinese para snowboarder Wu Zhongwei was nearly thrown off balance by two colliding competitors ahead of him, I felt my heart leap into my throat and couldn't help clenching my fist tightly in the mixed media zone.

Even more thrilling was watching Wu edge closer and closer to the front-runner, overtaking on the final bump and raising his arms high in triumph. Though we journalists had already been standing and waiting through the long qualification rounds for over three hours that day, we jumped up and down like schoolchildren, clapping and yelling at his success.

In para alpine skiing, athletes hurl themselves down slopes with a gradient as steep as 64 degrees, reaching speeds of up to 130 kilometers per hour. Watching them swoosh down while navigating twists, turns, gates, bumps and dips in less than two minutes kept me on the edge of my seat.

When Zhang Mengqiu, a gold medalist from Beijing 2022, missed a pole and slid off the track in one race, she pounded her thigh with her fists in desperation and regret. Her dismay was felt by all of us on the scene.

At the Cortina Curling Olympic Stadium, the atmosphere during the wheelchair curling semifinals and finals was electric. Loud, raucous fans from competing countries cheered on their teams, responding to every stone with applause when it hit its target or a collective sigh when it missed.

I still remember when Yang Jinqiao threw his stick into the air after winning the mixed doubles gold medal with his teammate Wang Meng, firing up the Chinese spectators gathered in one block, who erupted in thunderous yells.

Thanks to intensified support in recent years, China's para winter sport athletes have access to advanced gear, scientific training regimens and world-class coaches — including some who have transitioned from able-bodied competitions and renowned foreign coaches.

As a result, their performances have improved significantly, adding to their overall competitiveness at the Paralympics.

For any sports fan, I recommend watching the Paralympics above all because it is just as captivating and thrilling as any other sporting event. You'll see all the speed, power, accuracy, stamina, coordination and grit that define mainstream sports, only in a different and maybe less familiar form.

On a personal level, I also find it fascinating to learn the history, rules and tactics of each sport. Why is there no sweeping in wheelchair curling? How is banked slalom in snowboarding different from snowboard cross? How do athletes with visual disabilities manage shooting in biathlon?

As much as I am looking forward to the 2028 Summer Olympics in Los Angeles, I am equally ready to tune in to the 2028 Summer Paralympics — something I have never watched before.

Galloping through Chinese history

An exhibition of rare artworks in Beijing explores the long relationship between people and horses, **Wang Ru** reports.

In the ancient Chinese classic *Journey to the West*, the Monkey King is appointed *bimawen*, a title that sounds like "avoiding horse plague" in Chinese and is associated with caring for horses in the heavenly court. Though often treated as comic, the role reflects a genuine ancient belief: keeping monkeys in stables could protect horses from disease.

The custom appears repeatedly in historical texts and ancient brick reliefs. Yet in surviving paintings, it is known from only one work — a massive scroll portraying dozens of grooms tending nearly 100 horses. The painting is now on display at the new exhibition *Divine Steeds: The World of Horses in the Palace Museum's Painting and Calligraphy Collections* at the Palace Museum, the former imperial palace that served Chinese emperors from 1420 to 1911.

Running through June 21, the exhibition brings together 55 horse-themed paintings and calligraphy works from the museum's collection. Among them, 28 are being shown publicly for the first time, while 20 are classified as China's highest-grade cultural relics.

According to Zeng Jun, head of the museum's Department of Paintings and Calligraphy, horse paintings occupy a special place in the history of Chinese art because they reflect not only artistic achievement, but also broader historical and spiritual ideals.

"From the simplicity and vigor of the Qin (221-206 BC) and Han (206 BC-AD 220) dynasties, to the fully developed techniques of Tang (618-907) and Song (960-1279) paintings, and through the inheritance of the Yuan (1271-1368), Ming (1368-1644), and Qing (1644-1911) dynasties, horse painting has remained closely connected to the evolution of the times, the spirit of the nation, and the aspirations of the literati," she says.

For curator Ma Shunping, the exhibition also tells the story of the enduring bond between Chinese people and horses. "Chinese people began domesticating horses in the late Neolithic era," Ma says. "Since then, horses have remained deeply connected to daily life and social development."

From the Qin and Han dynasties, innovations such as saddles and stirrups transformed transportation and mobility. Horse riding gradually replaced carriage travel and spread beyond the aristocracy into broader society, Ma says.

"Officials and scholars traveled on horseback for leisure and duty, while merchants journeyed for their livelihood," Ma says. "With horses beside them, people crossed mountains and rivers and left their footprints across the country."

That close relationship appears throughout the exhibition in paintings depicting seasonal journeys.

One featured work by Ming Dynasty painter Qiu Ying portrays official Tang Yi's imagined return to his hometown in today's Shanxi province after years serving in Suzhou, Jiangsu province.

Unable to return home for a long period, Tang became increasingly homesick. Sympathetic local scholars invited Qiu to paint the homecoming he longed for.

In the painting, Tang rides beside the Fenhe River in a bright red official robe. Ma describes Qiu's technique as both meticulous and fluid, with a refined composition and vivid yet restrained colors that create a peaceful atmosphere.

What makes the work particularly intriguing is that Qiu had never visited Tang's hometown. "Some of the scenery was imagined," Ma explains. "That makes this painting a fascinating blend of reality and imagination."

Beyond personal life, horses also played a decisive role in state power and military preparedness. Maintaining cavalry forces required enormous resources, making horse breeding a major national undertaking in many dynasties.

The exhibition's centerpiece is an authentic scroll painted by Song Dynasty painter Li Gonglin, created as an interpretation of an earlier work by Tang Dynasty painter Wei Yan under the auspices of Emperor Shenzong of the Song Dynasty.

"Wei was a famous horse painter in the Tang era. His authentic work was kept in the Northern Song (960-1127) court. Therefore, the emperor ordered Li, regarded as one of the greatest painters of the Song era, to re-create it," says Ma.

But such imitation was not a mere copy. While Li retained the original subject of official horse pastures containing 1,247 horses, he transformed the artistic style entirely through his own aesthetic vision.

"Unlike the powerful and imposing horses common in Tang painting, Li's horses appear restrained, elegant and introspective, qualities that reflected the Song Dynasty's artistic taste," says Ma.

"The enormous scroll balances hundreds of human and animal figures without descending into visual chaos. The composition remains orderly and harmonious despite its scale," he adds.

"The painter seemed completely immersed in the world of horses," Ma says. "Each horse and each person carries a distinct expression and personality. From the painting, it's easy to see why Li deserved the title of one of the greatest artists in Song painting, as he showed the pinnacle of horse painting in ancient China."

From top: Visitors admire Li Gonglin's scroll at the ongoing exhibition *Divine Steeds: The World of Horses in the Palace Museum's Painting and Calligraphy Collections* at the Palace Museum in Beijing. A painting on display shows a man riding a horse by Yuan Dynasty (1271-1368) artist Zhao Mengfu. Another painting by Zhao Lin portrays one of Tang emperor Li Shimin's six favored warhorses. PHOTOS BY JIANG DONG / CHINA DAILY

Ma says that although Li was already famous in the Northern Song Dynasty, he was known for his quiet and introverted nature. Historical accounts describe him as spending long periods observing horses in imperial gardens, sometimes becoming so absorbed that he failed to notice people calling his name.

"That intense observation gave his horses extraordinary vitality," Ma says.

The work also reveals the scale of official horse breeding in ancient China. Historical records suggest that during the height of the Tang Dynasty, the government maintained around 700,000 horses. On average, one groom cared for about 10 animals, meaning tens of thousands of people were involved in horse rearing across the dynasty.

The exhibition also examines horses as symbols of military achievement and imperial legitimacy. Among the highlights are six paintings depicting the favorite warhorses of Tang emperor Li Shimin.

Historical records state that six horses helped save Li during the campaigns that unified the Tang Dynasty. To honor them, he commissioned stone carvings of the animals for his mausoleum in present-day Xianyang in Shaanxi province. The paintings displayed in the exhibition were produced centuries later by Jin Dynasty (1115-1234) court painter Zhao Lin and are the only surviving works attributed to him.

"The basic style of the paintings follows the carvings, but the painter introduced his own artistic interpretation by rendering the horses with softer, fuller forms that make them appear more animated and lifelike," says Ma.

"These paintings show the reverence ancient Chinese society held for horses. Because of their heroics on the battlefield, horses were memorialized in stone, celebrated in literature, and immortalized in art," he adds.

The exhibition also explores the spiritual qualities embodied by horses in ancient China and their rich cultural connotations.

For example, in classical Chinese thought, exceptional people were often compared to fine steeds. Just as a great horse requires a knowledgeable judge to recognize its value, talented individuals also depend on wise leaders who can identify and nurture ability.

Several paintings in the exhibition reflect this metaphor directly.

One portrays a neglected horse filled with frustration at never being appreciated. Another depicts a thin, exhausted horse that is nevertheless recognized by an expert as a rare and valuable steed. Also on display is a calligraphy work by Qing emperor Qianlong encouraging one of his officials to become a perceptive judge of talent and help discover capable individuals for the state.

"Over time, the relationship between the fine horse and the discerning judge became deeply embedded in Chinese culture," Ma says. "It evolved into a metaphor that encouraged rulers to remain open-minded and recognize exceptional talent."

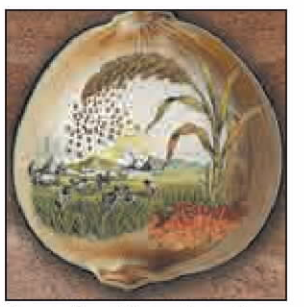
Ancient climate study reframes origins of millet farming



By **WANG QIAN** and **QIN FENG** in Xi'an

A new high-resolution climate study from China's Loess Plateau suggests that soil temperature, not just air temperature or rainfall, played a decisive role in shaping the spread of millet farming during the Neolithic period.

Published earlier this month in the journal Proceedings of the National Academy of Sciences, the study offers new insight into a long-standing question surrounding early Chinese civilization: why millet agriculture, which emerged about 8,000 years ago, remained limited for nearly two millennia before expanding rapidly around 6,000 years ago.

Researchers from the Institute of Earth Environment of the Chinese Academy of Sciences, in collaboration with Lanzhou University, the Institute of Geology and Geophysics, the British Museum, Washington University, and South Korea's Institute for Basic Science, reconstructed soil temperature fluctuations from 12,300 to 2,800 years ago at Longgugou, a fossil site with a typical loess deposit profile (4 meters deep), near Qingyang in the central Loess Plateau.

Left: Foxtail millet cultivated on the northern Loess Plateau, in present-day northern Shaanxi province. PROVIDED TO CHINA DAILY **Right:** An illustration shows how soil temperature in Neolithic East Asia helped shape the development of millet-based farming societies. DONG GUANGHUI / FOR CHINA DAILY

Using 18 optically stimulated luminescence dates and 14 bulk organic carbon-14 dates combined with biomarker analysis, the team produced the first high-resolution continuous soil temperature record yet available for East Asia.

According to the study, early Chinese civilization experienced a notable slowdown between its origins around 8,000 years ago and its acceleration about 6,000 years ago. Millet farming followed a similar pattern.

The researchers noted that millet agriculture became an important source of subsistence in the Yanshan-Liaoning region around 8,000 years ago, but it did not expand rapidly until roughly 6,000 years ago, when its center shifted toward the Loess Plateau.

The slowdown puzzled researchers because both temperature and precipitation in northern China were relatively favorable during that period, and the environmental engine behind it remains unclear.

The newly reconstructed record appears to resolve that paradox. Between 8,000 and 7,500 years ago, relatively warm soil conditions created favorable environments for millet cultivation in the Yanshan-Liaoning region, a semiarid area spanning parts of present-day Liaoning and Hebei provinces and the Inner Mongolia autonomous region. In those conditions, communities facing subsistence pressure increasingly adopted millet farming, while populations on the Loess Plateau still relied largely on hunting.

Then came a critical shift. From 7,500 to 6,000 years ago, expanding vegetation cover and soil moisture significantly lowered soil temperatures across the Yanshan-Liaoning region. Simulation models of millet habitat suitability conducted for the study indicate that large areas gradually became unsuitable for millet cultivation during this period. As a result, the center of millet farming shifted southward to the Loess Plateau, where soil temperatures remained warmer and more suitable for agriculture.

Afterward, around 6,000 years ago, a return to relatively warm and stable soil temperatures, coupled with reduced vegetation cover, triggered the rapid expansion and intensification of millet farming across northern China. This agricultural boom, the researchers argue, laid the economic foundation for the flourishing of late Neolithic cultures in the region.

Millet agriculture, dominated by foxtail millet and broomcorn millet, known in Chinese as *su* and *shu*, is widely recognized as the primary economic basis for the emergence and early development of Chinese civilization.

The findings may also contribute to broader research tracing the origins of Chinese civilization. By establishing a direct link between subsurface thermal conditions and agricultural decision-making in prehistory, the study adds a new dimension to paleoenvironmental reconstruction, an area that has traditionally focused more heavily on air temperature and monsoon rainfall.

LIFE

Above: A stunning night view of the Zhongnanmen historical and cultural tourist area in Tongren city, Guizhou province, with ancient architecture and Jinjiang River. PROVIDED TO CHINA DAILY **Below:** The Red Cloud Golden Summit of Fanjing Mountain in Tongren, Guizhou, is crowned by a pair of Buddhist temples perched on two stone pillars connected by an arched stone bridge. QIU YONG / FOR CHINA DAILY

Tongren rises as a worthy tourist area for its mountainous heritage preservation, breathtaking landscapes and local matcha products, **Xu Lin** reports.

Fanjing Mountain in Tongren city, Southwest China's Guizhou province, is an ideal place to admire the breathtaking scenery, including the swirling mist of waterfalls and a sea of clouds. The mountain is shrouded in mystical clouds and mist more than 200 days a year. In such weather, hikers often feel as if they are adrift on an endless sea as they trek up its rocky paths to discover this heaven on earth.

As a sacred Buddhist mountain, it preserves several restored ancient temples now open to the public. It is also dotted with ancient villages of ethnic groups such as the Miao and Dong.

Fanjing Mountain received over 44,000 tourist visits during the recent five-day May Day holiday.

"I had to climb on all fours along a narrow, steep mountain trail to reach the summit, but the view made every bit of effort worthwhile," says tourist Wu Ming from Zhengzhou, Henan province.

Such popularity is no accident, as the mountain's global status and ecological uniqueness have long been recognized.

In 2018, Fanjing Mountain was inscribed on the UNESCO World Heritage list.

With 97 percent forest coverage, the mountain is home to a rich biodiversity of flora and fauna, including bears and snakes. Among them is the rare Guizhou snub-nosed monkey, or Guizhou golden monkey, which is protected at the highest level in China. Fanjing Mountain serves as its only habitat in the world.

What attracts visitors most is the mountain's breathtaking beauty, which transforms with every season.

"In spring, it is covered with blooming azaleas, and it serves as an ideal summer destination to escape the heat. In autumn, visitors can enjoy red leaves as well as the spectacular sea of clouds," says Wang Xiaojie, general manager of the Beijing Happy Tour online travel agency.

"During the winter off-season, visitors enjoy a peaceful wonderland of snow-covered peaks and glittering rime. After descending the mountain, they can sample hotpot and soak in Tongren's iconic hot springs," she says.

Thanks to its rich natural and cultural resources, the mountain attracts tourists from home and abroad, making tourism a pillar industry for Tongren city.

Wang notices that visitors have more diverse needs and are seeking in-depth, high-quality experiences on the mountain, including local folk customs and cuisine.

"We take all these needs into account when designing our travel products. Our core products include wellness tour packages for senior travelers and study tours for young people," she says.

Elderly visitors are encouraged to travel at a relaxed pace and enjoy greater comfort and freedom while staying at a single hotel in Tongren city. They can join optional one-day or two-day local in-depth tours and hands-on cultural experiences. Study tours allow young students to observe nature, participate in biodiversity surveys, and explore Fanjing Mountain's local geology.

In addition, to encourage tourists to extend their stays in Tongren, she says the next step is to develop well-connected regional tour packages linking Tongren with neighboring Hunan province and Chongqing municipality.

Matcha products are also a major attraction. Tongren, also known as the "City of Matcha", exported matcha products to over 50 countries and regions, including Japan, the United States, and European countries, in 2025, according to official statistics.

Matcha is made from tender tea leaves that are steamed, refined, and dried. Visitors can sample matcha craft beer, lattes and cookies.

"Both domestic and inbound visitors like to participate in matcha-themed experiences, where they can learn how to make pastries and beverages using local Tongren matcha to fully experience the city's unique food culture and local charm," Wang says.

She says inbound tourists are impressed by the city's magnificent landscapes of cascading peaks and waterfalls, as well as the rich biodiversity and Buddhist culture of Fanjing Mountain. They prefer visiting authentic, unspoiled villages that preserve their original natural charm and intact traditional folkways.

Fanjing Mountain's main inbound tourist countries are Thailand, Singapore, Malaysia, Germany, the United Kingdom, France, and the US, according to Yang Haisha, general manager of Fanjing Mountain Scenic Area Management Co.

"They enjoy hiking in the ecologically preserved mountain, taking photos of the scenery, visiting Buddhist temples, and tasting organic local dishes," he says.

The scenic area provides multilingual tour guides and signage in Chinese, English, Japanese, and Korean, plus foreign currency exchange services to make things more convenient for inbound tourists.

Despite its great fame, Fanjing Mountain has never compromised on conservation. Strict rules ensure that tourism development does not come at the cost of its fragile ecology.

Yang says that tourism development is prohibited in the core zone of Fanjing Mountain's national nature reserve, which is strictly limited to scientific research and conservation.

In tourist areas, visitors must follow designated routes and stay on marked trails. At the foot of the mountain, tourist centers, homestays, commercial facilities, and experience zones are centrally located.

Fanjing Mountain's daily visitors are capped at 9,000 via advance reservations, with real-time visitor counts monitored across all zones. When the number of visitors in any zone exceeds the limit, staff will guide tourists to other areas.

These efforts have laid a solid foundation for sustainable tourism. Looking ahead, Tongren city has set its sights on even higher goals.

In 2026, the city aims to develop ecotourism by focusing on positioning itself as a wellness-oriented extended-stay destination.

It will also fully leverage the 240-hour transit visa exemption policy and steadily enhance the facilitation of inbound tourism services to attract more overnight international visitors.

Besides hiking Fanjing Mountain and then soaking in hot springs, travelers to Tongren can also explore ancient architecture at the Zhongnanmen historical and cultural tourist area and discover the former mercury mine site in the ancient town of Zhusha, which means cinnabar.

Tea, opera and friendship brew cultural connections in Los Angeles

By RENA LI in Los Angeles
renali@chinadailyusa.com

For Ghaffar Pourazar, the legendary Monkey King from the Chinese classic *Journey to the West* is more than a stage character — it is a reflection of his own life journey.

Born with Azerbaijani and Iranian roots and raised in Britain, Pourazar once worked as a computer animator in London. But after watching Peking Opera for the first time in 1993 at the age of 32, he decided to completely change his life.

"I put away my other life. I said goodbye to my friends and my family. I said I want to do this," Pourazar told China Daily during a celebration of International Tea Day hosted by the Chinese Consulate General in Los Angeles on Friday.

"The monkey follows the dream, and so that's why I love this character, but also that is why Chinese people love this character," he said.

For decades, Pourazar has dedicated himself to studying and performing Peking Opera, becoming widely known as the "Western Monkey King". He said Chinese opera combines martial arts philosophy, acrobatics, music and drama in a unique way.

"For hundreds of years, Chinese culture has brought the philosophy of martial arts like tai chi together with opera action," he said. "The actors are not only able to sing and dance, but they're also martial acrobats."

His deep connection with Chinese culture has gradually become part of his identity.

"I am Azerbaijani, Iranian, British, I was raised in England, but I feel more Chinese than others," Pourazar said.

The celebration in Los Angeles brought together officials, artists, experts and local residents to experience Chinese culture through tea ceremonies, traditional performances and cultural demonstrations. Organizers said tea serves as both a cultural symbol and a platform for dialogue and mutual understanding between China and the United States.

Guo Shaochun, Chinese consul general in Los Angeles, highlighted the cultural significance of tea and expressed hope that more Americans could gain a deeper understanding of Chinese culture and the Chinese people's pursuit of a better life.

Ghaffar Pourazar, known as the "Western Monkey King", performs an excerpt from the classic Peking Opera production *Uproar in Heaven* during an International Tea Day celebration hosted by the Chinese Consulate General in Los Angeles on Friday. RENA LI /CHINA DAILY

Among the teas served during the event was Pu'er tea from Yunnan province, known for its distinctive aging process in which flavor deepens over time. Guo introduced guests to Yunnan's diverse ethnic cultures and tea traditions.

"The people of China and the United States are both great peoples," Guo said. "Just as the Chinese people love tea and Americans love coffee, we all have our own cultures, lifestyles and feelings."

He added that cultural differences should become a source of mutual appreciation and understanding rather than division.

"It is these differences that make our world rich and colorful, and inspire us to better understand and appreciate one another," he said.

Guo also referred to the recent meeting between Chinese President Xi Jinping and US President Donald Trump during Trump's state visit to China, saying the two sides agreed to promote a "constructive China-US relationship of strategic stability."

Leticia Perez, a member of California's Kern County Board of Supervisors, said she values the role of China in the region's economy.

"I'm a big fan of Chinese culture," Perez said. "I want to reaffirm my own commitment to be part of the ongoing conversation of peace building and mutually beneficial economic cooperation between the United States and China."

Perez praised China's continued calls for peace and cooperation despite global tensions.

The event also featured performances of Peking Opera, Chinese folk songs and traditional instruments including the *pipa* and bamboo flute, alongside demonstrations of Chinese calligraphy and dough figurine art.

Luo Ping, a senior tea master and cultural ambassador for Chinese tea culture, guided guests through a traditional tea ceremony while explaining categories of Chinese tea and their cultural and health significance.

Joshua Goldhaber, vice-dean of graduate research education at Cedars-Sinai Health Sciences University, said he appreciated learning about the cultural meaning of tea and the values of friendship and cooperation between the two countries.

"It was a very warm feeling," Goldhaber said. "I look forward to more opportunities to immerse in Chinese culture and educational exchange."

Douglas Smith, a visual effects supervisor who has worked on both Hollywood and Chinese film productions, also expressed optimism about future cultural and creative cooperation between the two countries.

"Communication between countries is always the best thing that can happen," Smith said. "Misunderstandings happen with the lack of communication, so whenever that can happen, it's a very positive thing."

CULTURE

Pakistani blockbuster hits China

Eighteen years after first experiencing Olympic-era Beijing as a young tourist, Bilal Lashari returns as the filmmaker behind a record-beating movie, **Xu Fan** reports.

During his first trip to Beijing, Bilal Lashari was a 27-year-old Pakistani traveling with his parents. It was the summer of 2008, when the Chinese capital was swept up in the euphoric atmosphere of the 29th Olympic Games.

Late one night, the family wandered onto a broad avenue in search of something to eat. They stumbled into a sea of people gathered beneath giant outdoor screens, cheering wildly as Chinese athletes competed live on television. Lashari remembered the energy as almost cinematic — strangers shouting in unison, waving flags. Caught up in the excitement, he found himself cheering as well.

"It was so emotional to watch so many people feeling proud of their country and celebrating together. And then, within just a few minutes, the street was completely cleared," Lashari recalls in an interview with China Daily, describing the Chinese public as "disciplined".

Now, 18 years later, Lashari has returned to Beijing for his fourth visit to China. This time, he arrived not as a tourist, but as the director of *The Legend of Maula Jatt*, Pakistan's highest-grossing blockbuster of all time.

The film was released across the Chinese mainland on Thursday, a date carrying symbolic significance as it marks the 75th anniversary of diplomatic relations between China and Pakistan.

At the Beijing premiere on May 19, Pakistani Ambassador to China Khalil Hashmi said that the movie's release, coinciding with the anniversary, is a testament to the enduring ties and gives Chinese audiences a unique opportunity to experience the richness of Pakistani cinema.

He said that Pakistan boasts a vast film market and advanced cinema facilities, which not only provide a solid foundation for the production of high-quality content but also reflect a growing demand for diverse films. He added that he looks forward to seeing more films enter each other's markets.

A reboot of the 1979 Lollywood classic *Maula Jatt*, the 133-minute epic is set in medieval Punjab. The story follows Maula Jatt, a fierce prizefighter haunted by childhood trauma after a rival clan massacres his family. When he uncovers the truth about his lineage and reclaims his ancestral weapon, he embarks on a quest for revenge against Noori Natt, the clan's most feared warrior, ultimately leading to a deadly final confrontation.

Lashari says the original 1979 film has become deeply embedded in Pakistani popular culture. "The original movie was a huge hit in the 1970s. Since then, many films have been made around the character of Jatt," he adds.

Like Arnold Schwarzenegger's iconic "I'll be back" line in the sci-fi classic *The Terminator*, the characters of Jatt and Natt are well-known in Pakistan, evidenced by their most famous catchphrases repeated by audiences for decades. As a result, some of those lines have been re-created in the new movie with a few twists, adds Lashari.

"What interests me most is the dubbed Mandarin version," he says, explaining that he has been curious about whether the Chinese translation could preserve the power and charm of the original Punjabi dialogue.

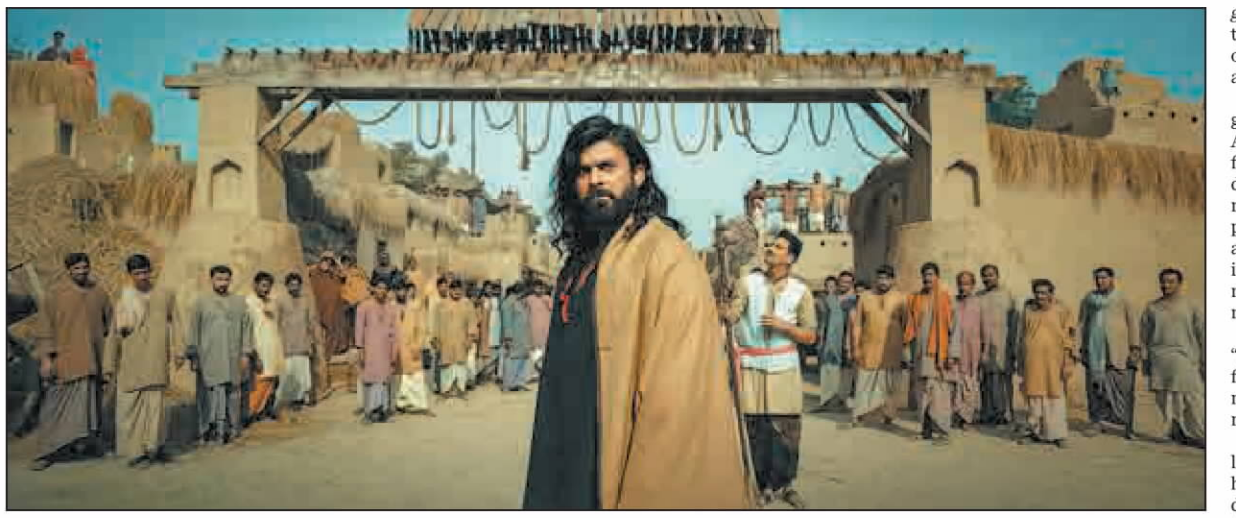
The influence of Jatt also gave rise to what became known as "*gandasa* cinema", a hyper-violent Punjabi subgenre built around rural honor codes, bloody vendettas and the *gandasa* — an ax-like agricultural tool that became the defining weapon of many films during the 1980s and 1990s.

However, Pakistani audiences grew weary of the genre, much as American viewers drifted away from traditional Westerns. That decline, Lashari admits, has made rebooting the Jatt film a daunting proposition. Raising the budget for a large-scale reboot meant persuading investors that a genre once dismissed as outdated could still resonate with modern audiences.

"But we had a revival," he says. "It's similar to Chinese kung fu films. They continue evolving and modernizing while still staying connected to tradition and their roots."

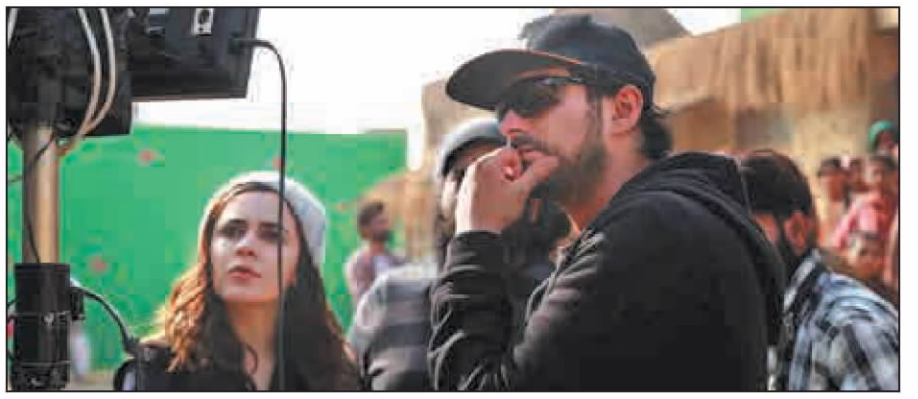
As an admirer of action cinema like that of Bruce Lee, Lashari says his favorite Chinese-language film is director Zhang Yimou's 2002 martial arts epic *Hero* — which he first watched while attending college in the United States.

"I remember everyone was talking about the film. Someone played it in our dormitory, and all the students gathered to watch it," he recalls. "It transported us, especially the cinematography. We were used to a certain kind of Hollywood action, but *Hero* felt poetic in a completely different way. It had a huge impact on me."

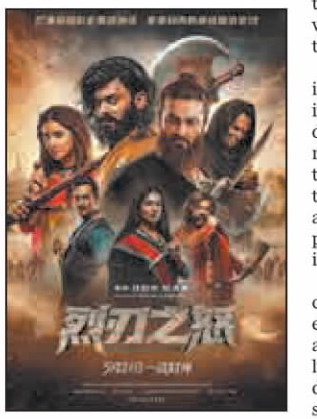


When asked whether he hopes to collaborate with Chinese filmmakers in the future, Lashari pauses for a moment before answering carefully. "People often talk about coproductions as if they're simply about sharing resources or facilities. But a true coproduction should come from story and culture."

China and Pakistan, he observes, are both ancient civilizations shaped by long histories, trade routes, and layered traditions. Given the opportunity, he says he would like to imagine creating a fantasy epic inspired by the Silk Road — a story in which characters from both countries meet not as symbols, but as fully realized people inhabiting the same cinematic world.



Having already learned Punjabi while making *The Legend of Maula Jatt*, Lashari adds that he would gladly attempt to learn some Chinese for such a project. The real challenge, he believes, lies not in basic conversation, but in understanding the subtleties hidden within language itself.



"Learning basic communication is different from learning the deeper meanings. Each community, each city, each area will have slight differences. Even in China — because it's so big — if you keep moving to different areas, the culture and language start to mean something else. So, it would be interesting to learn those nuances," says the director.

365 days to achieve a dream for Vietnamese singer

By **XING WEN**
xingwen@chinadaily.com.cn

"You have 365 days."

That was the deal Trang Phap's parents made with her after she graduated from the University Lumiere Lyon 2 in France in 2011.

Only one year to prove that music, which they had always called "just a hobby", could be something more.

After that, she would go back to pursuing a master's degree in economics in Brussels, where her parents live, and then follow an established career path.

For years, every time the deadline approached, she would call them and ask for another 365 days, like applying for a visa to stay in her own dream.

But it wasn't until 2023, when the Vietnamese adaptation of the Chinese music reality show *Ride the Wind* — which brings together female celebrities aged over 30 to perform in groups and win votes — called *Chi Dep*, reached out to her, that she finally stopped having to renew that visa.

The first season of *Chi Dep* was a hit in Vietnam. After airing on VTV3, it ranked first in its time slot among variety shows and set a record for the most sponsors — 33 in total — in Vietnamese television variety show history. Phap claimed the winner's title, which earned her a spot in the five-girl pop group Lunas.

"The first season was very impactful. I felt like *Chi Dep* was something completely new in Vietnam," says Phap, adding that the show appeals to viewers of all ages, from grandparents to young children.

That audience includes her own parents, a professor and a diplomat living in Europe. "When they watched the show, they could actually see what I do every day, how I work to make a performance, write songs, and work with the sisters. They could see the friendships in the field.

"The show actually helped me bridge the generational gap between my parents and me by showing how show business works and how the music industry operates," Phap says.

Phap started playing the piano at 6 and tried her hand at writing some melodies on her keyboard at 9. At that time she had to leave Vietnam, where she had grown up, leaving all her childhood friends on a Christmas night.

"Writing songs was something so natural for me, something that always helped me deal with my emotions."

After graduating from university, instead of following her parents' wishes to continue studying economics, she chose to return alone to Ho Chi Minh City, where she broke into the music industry as a soloist.

Above: (From left) Uygur host Vinina Ahmet, Vietnamese singer Trang Phap and Taiwan singer-actress Jessie Chiang perform together in *Ride the Wind 2026*. **Above right:** Vietnamese singer Trang Phap wins the Vietnamese adaptation of *Ride the Wind* in 2023. PHOTOS PROVIDED TO CHINA DAILY

After five years of negotiations with her parents, both sides made concessions. She could stay in the industry, but not as a singer on stage — instead, as a behind-the-scenes songwriter, which in her parents' view offered a safer work environment and a healthier lifestyle.

So from 2017 until 2023, when she received the invitation from *Chi Dep*, she was in the studio writing songs for movies or for other artists.

"I think the invitation was a sign from the universe in some way, because I wanted to go back on stage. I wanted to perform for people, I wanted to sing my songs for the audience, and I said yes right away," she recalls.

"There was never a show where we had 30-plus artists come together, a show that sends a message about strong women, sisterhood, and women collaborating to work toward the same goal. It's actually very inspiring for people."

Recently, she appeared as the only Vietnamese singer on *Ride the Wind 2026*, debuting with a powerful 90-second performance that combined multilingual singing, piano playing and dancing.

Growing up, she listened to Jay Chou's songs and says he is the Chinese artist who has influenced her the most.

She also expresses hope that one day she will have the chance to collaborate, write or sing a Chinese-Vietnamese song, to make even the smallest contribution to the cultural exchange between the two countries.

"I feel like music and art in general have no borders. It's a universal language. If we can use that to connect people, connect families, connect people from different nations — that's a beautiful thing. That's something I will try hard to do."

She started with 365 days. Now, she has a lifetime to pursue her passion.

GOLF

Liu proves that CLPGA is on the right path

From 8-year-old spectator to Beijing Open champion, teen embodies Tour's vision of long-term talent development

From top: Feng Shanshan, Lin Xiyu and Yin Ruoning all started on the China LPGA Tour, before finding success representing China on professional tours in the US and Europe. PROVIDED TO CHINA DAILY

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

Eight years ago, Liu Yujie sat in the gallery at Beijing Orient Pearl Golf Club as an eight-year-old spectator, watching Shi Yuting hold her nerve in a playoff to win the Beijing Women's Open.

Back then, Liu excitedly posed for photos with older players such as Yin Ruoning and Du Mohan, never imagining she would one day stand among them.

Now 16, the Beijing native has returned to the same course not as a fan, but as a champion.

Liu captured the 2026 Orient Master-Beijing Women's Open by two strokes on Saturday, claiming her second China LPGA Tour title with a composed performance that belied her years.

The daughter of former table tennis world champion and Olympic gold medalist Liu Guoliang said the victory carried a significance far beyond another trophy.

"Winning at Beijing Orient Pearl Golf Club feels very different for me," she said.

"In 2018, I came here as a little girl and a spectator to watch the older players compete. That was also the first time I met Sui Xiang."

"Today, being able to compete alongside those same players, on the same course — and win — is a truly special feeling."

Sui finished runner-up at 10-under par, while Ren Yijia — the youngest six-time winner in China LPGA Tour history — placed third to remain atop the season standings.

Held from May 21 to 23 with a purse of 800,000 yuan ($117,949), the tournament attracted 132 players from 10 countries and regions, including China, Thailand, Malaysia, South Korea, Japan and Canada.

Yet the significance of the week extended beyond the leaderboard.

For Liu, Beijing Orient Pearl Golf Club has also been a place of painful lessons.

Two years ago, at just 14, she entered the final round tied for the lead before a disastrous back nine dropped her into a tie for 10th, while Ren stormed back to win in a playoff.

Returning to what she called "the place where the dream began," Liu appeared transformed this time around — calmer, steadier and far more comfortable with both pressure and expectation.

That resilience has become a hallmark of the new generation developing through the China LPGA Tour, a circuit that has steadily grown into the foundation of Chinese women's golf.

Over the past 18 years, the Beijing Women's Open has never missed a single China LPGA Tour season, making it one of the circuit's most enduring events.

Over nearly two decades, Beijing Orient Pearl Golf Club has continuously upgraded its fairways, bunkers and greens, while the tournament has become part of Beijing's sporting identity.

Liu Yujie, winner of the 2026 Orient Master-Beijing Women's Open, poses with the trophy following her two-stroke victory on Saturday at the Beijing Orient Pearl Golf Club. PROVIDED TO CHINA DAILY

A 'home-port' for Chinese players

Fan Yue, executive vice-chairman and secretary-general of the Beijing Golf Association, said the event had helped cultivate long-term golf culture and public awareness in the capital.

"Because the Beijing Women's Open has remained rooted here for so many years, it has created lasting sporting memories for the city," Fan said. "People have come to know golf, approach golf and appreciate golf through the tournament."

Three-time tournament champion Liu Wenbo, competing in the event for the ninth time, said the venue had become closely tied to different stages of her career.

"I started playing here in 2017, and this course holds many precious memories from different periods of my life," she said. "Every time I come back, I feel grounded and comfortable. And the course gets better every year."

In the eyes of Wei Qingfeng, secretary-general of the China Golf Association, the tournament's greatest achievement lies in how it has accompanied the growth of Chinese women's golf itself.

"When the first edition was held, many of today's young players had not even been born," he said. "This is not simply persistence across time. It is continuous support across generations.

"We have witnessed the passing of the torch in Chinese women's golf here. Generation after generation of Chinese players have left unforgettable moments and honors on this course."

Wei added that the association hopes the China LPGA Tour can further strengthen its role as a "mothership" or "home port" for players, nurturing talent before sending them onto the world stage.

That long-term philosophy has been central to the tour's development since its earliest days.

Li Hong, managing director of the China LPGA Tour and head of the women's professional events department at the China Golf Association, recalled that, when the circuit was founded 18 years ago, Chinese women's professional golf had barely 30 players, little funding and almost no understanding of international operational standards.

Great accomplishments

Today, she believes the tour's greatest accomplishment is proving that Chinese women's professional golf can sustain a viable long-term pathway.

"For 18 years, we resisted the temptation to chase quick success," Li said.

"Even in a very impatient environment, we focused on doing just one thing step by step: building a home for Chinese women golfers."

More importantly, it filled the developmental gap between junior and professional golf.

> "Seeing players like Feng Shanshan and Yin Ruoning emerge from this system and reach the top of world golf gives us tremendous satisfaction."
>
> **Li Hong,** managing director of the CLPGA Tour

"Seeing players like Feng Shanshan and Yin Ruoning emerge from this system and reach the top of world golf gives us tremendous satisfaction," Li said.

"More than 20 Chinese players have now excelled on the international stage. Recognition from partners such as the LPGA and the Ladies European Tour proves that long-term commitment truly matters."

Li also highlighted the growing international profile of the tour, noting that overseas players now account for 45 percent of registered members, with competitors coming from 12 countries and regions including Thailand, Vietnam, Malaysia, Singapore, Myanmar and the Philippines.

Looking ahead, she acknowledged that the tour hopes to accelerate both international expansion and digital development. Before the pandemic, the 2019 schedule featured 18 tournaments, evenly split between domestic and overseas events.

Although rebuilding that international calendar remains a challenge, Li said it remains a key objective. The tour also plans to deepen cooperation with the LPGA and the Ladies European Tour while strengthening pathways for junior players.

As the sun set over Beijing at the conclusion of the 2026 Orient Master-Beijing Women's Open, Liu Yujie's victory offered perhaps the clearest symbol yet of what the China LPGA Tour has spent nearly two decades trying to build.

The little girl once sitting in the stands, emulating her heroes had returned to become a champion herself, thus carrying Chinese women's golf into the next generation.

Leaders' visits offer view of China's future

Zhejiang, among stops, reflects global allure of country's modernization, innovation drive

By MO JINGXI in Beijing and **CHEN YE** in Hangzhou

Humanoid robots performing martial arts, robotic dogs demonstrating their agility and robots dancing to foreign folk music have become some of the more unusual scenes on foreign leaders' trips to China this year.

Behind the eye-catching moments is a broader trend: China's vast market and technological strength are drawing visiting leaders beyond formal talks in Beijing.

The latest is Thongloun Sisoulith, general secretary of the Lao People's Revolutionary Party Central Committee and Lao president, who is currently making a five-day state visit to China.

During a trip to DEEP Robotics in Hangzhou, the capital of Zhejiang province, shortly after his arrival in China on Tuesday, Thongloun operated a robotic dog and praised it as "very good" and "very flexible".

He also visited the headquarters of Chinese tech company Alibaba Group, where he learned how e-commerce platforms help Lao products reach consumers across the Chinese market.

Thongloun is not alone. Earlier this year, Serbian President Aleksandar Vucic, Pakistani Prime Minister Shehbaz Sharif and German Chancellor Friedrich Merz also included Zhejiang in their China itineraries.

The province, long seen as an important window on China's reform and opening-up, is also one of the first places where the country's digital economy took root and flourished.

Observers said the visits are more than lighthearted moments or technology showcases on packed diplomatic itineraries. Against the backdrop of global industrial transformation, the trips reflect a conscious choice by countries to embrace China's innovation drive and connect with its strengths in the digital economy, they said.

Zhejiang has become one of the most visible stops in this process because it allows visiting leaders to see, in one place, how digital platforms, artificial intelligence, robotics and advanced manufacturing are being applied in real industries.

Jian Junbo, a researcher with the Institute of International Studies at Fudan University in Shanghai, said the visits reflect foreign leaders' recognition of China's high-tech development, as well as their countries' desire to work with China and benefit from the momentum of its technological progress.

"They hope to carry out deeper and broader cooperation with China in areas such as sci-tech innovation, education and the application of technological achievements," Jian said.

People climb the 168-meter "sky ladder", part of a via ferrata in Zhangjiajie, Hunan province, in April. PROVIDED TO CHINA DAILY

ADVENTURERS SCRAMBLE TO EXPERIENCE 'SKY LADDER' IN HUNAN

Completing Qixing Mountain via ferrata has become popular after video goes viral

By LI MUYUN and **HE CHUN** in Changsha

A shaky chest-cam video, a mist-shrouded iron ladder and one trembling question — "Is this the way to heaven?" — have propelled the 168-meter "sky ladder", part of a via ferrata, or a secure climbing route, in Zhangjiajie, Hunan province, into the global spotlight.

Posted on social media platform RedNote in March, the first-person clip captures a climber inching up metal rungs that vanish into clouds. The ladder sways with the movement of people above and below. "I'm almost there," she whispers, sounding both frightened and unbowed.

The video was an instant hit, receiving more than 29,000 comments.

"My legs turned to jelly just from watching it," one viewer wrote. Another one said, "It feels like I'm the one standing on that sky ladder."

The buzz has traveled far beyond China.

By May, YouTube videos about the attraction had racked up more than 50 million views, while Instagram clips topped 100 million.

Water begins flowing on Wednesday through the Madao navigation hub of the Pinglu Canal in the Guangxi Zhuang autonomous region. PROVIDED TO CHINA DAILY

Nation's first river-to-sea canal enters key test phase

By CHEN MEILING in Beijing and **ZHANG LI** in Qinzhou, Guangxi

The Pinglu Canal, a megaproject designed in South China's Guangxi Zhuang autonomous region to handle vessels of the 5,000-metric-ton class, entered the water-testing phase on Wednesday, bringing it a step closer to its official opening in September.

As the first canal built in the country to connect a river system directly to the sea since the founding of the People's Republic of China, the landmark infrastructure project is expected to establish a convenient and cost-effective passage between China and the member states of the Association of Southeast Asian Nations.

Guangxi is the only region that links China to the ASEAN market by both land and sea. "The canal will enable ASEAN members to connect more efficiently and conveniently with China's inland market," Wei Tao, chairman of Guangxi, told China Daily in an earlier interview.

The 134.2-kilometer-long waterway, which stretches from the Xijin reservoir in the city of Hengzhou to Qinzhou port in the Beibu Gulf, is a key project on the New International Land-Sea Trade Corridor that connects China's western regions to global markets.

Source: Pinglu Canal Group CHINA DAILY

On Wednesday morning, the canal's Madao and Qishi navigation hubs were filled with water, which allowed it to achieve full-channel connectivity and launch comprehensive water-fed commissioning.

With more than 96 percent of the project now complete, the waterway is scheduled to open to traffic during the China-ASEAN Expo scheduled for September in Nanning, the capital of Guangxi, according to Pinglu Canal Group.

Local authorities said that upon completion, the canal will reduce the inland shipping distance for export-quality goods from southwestern China by more than 560 km, compared with the previous route through Guangzhou port, and save around 5.2 billion yuan ($768 million) annually in logistics costs.

Inside
Editorial, **page 6**

Wu Tao, a professor of history at Sun Yat-sen University in Guangzhou, Guangdong province, said that without convenient access to sea lanes, it was difficult to export goods from western China to global markets through maritime shipping.

By opening a direct river-to-sea link, the Pinglu Canal eliminates developmental bottlenecks and facilitates the gradual shift of western China's economy from an inward-looking inland model to an export-oriented maritime economy, driven by integrated land and sea transportation, he said.

"Despite highly developed road, air and railway transportation systems, inland waterway shipping routes remain irreplaceable. Large cargo capacity and low transportation costs make such routes ideal for bulk outbound shipment of agricultural produce and mineral resources," Wu added.

Ni Yuping, vice-president of the School of Humanities at Tsinghua University in Beijing, said the canal will help to improve China's cross-border logistics systems, and accelerate economic and trade growth in its southwestern hinterland.

"ASEAN member states having economic relations with China can deepen their trade with the country, realizing mutually beneficial outcomes," he said.

The Pinglu Canal inherits the functional quality of ancient waterways to spur endogenous growth of domestic regional economies while drawing on the development concepts behind the Suez Canal and the Panama Canal, which connect global maritime shipping and help expand cross-border trade, Ni added.

According to customs data, from January to April, China's trade with ASEAN economies reached 2.75 trillion yuan, up 15.7 percent year-on-year, accounting for 16.9 percent of the nation's total foreign trade volume. Among ASEAN member states, Vietnam, Malaysia and Indonesia ranked as China's top three trading partners, the data showed.

China has been ASEAN's largest trading partner for 17 consecutive years, while ASEAN has been China's largest trading partner for six years.

Shi Ruipeng in Nanning contributed to this story.

Building a Laos-China community with a shared future

WORLD WATCH
By Thongloun Sisoulith

This year marks the 65th anniversary of the establishment of diplomatic relations between the Lao People's Democratic Republic and the People's Republic of China. The two sides have designated 2026 as the "Laos-China Friendship Year" and have jointly organized a wide range of meaningful activities to commemorate this historic occasion.

Over the past six-and-a-half decades, our bilateral relations have withstood the tests of global transformations and uncertainties. Regardless of how the international landscape has evolved, the Laos-China friendship has remained steadfast, resilient, and ever stronger, demonstrating the ideological values, and the remarkably stable and vibrant strategic cooperation that characterize Laos-China relations.

Guided by the spirit of the "Four Goods", namely good neighbors, good friends, good comrades and good partners, our two countries elevated relations to a comprehensive strategic cooperative partnership in 2009. This important milestone laid a solid political foundation conducive to expanding cooperation across all fields. In 2017, our two Parties and States further enhanced cooperation and established the Laos-China Community with a Shared Future, opening a new chapter of deeper solidarity, greater mutual trust and closer strategic coordination.

Today, the Laos-China relationship stands at its highest point in history, serving as a model of equality, mutual respect and mutually beneficial cooperation. High-level political trust and shared ideals have continuously delivered tangible benefits to the peoples of both nations.

In the field of economic cooperation, China has become the largest investor and the second-largest trading partner of the Lao PDR. Key sectors of shared potential include energy, mining, agriculture and infrastructure development. Most notably, the Laos-China Railway stands as a landmark symbol of this successful cooperation and a flagship project of the high-quality Belt and Road Initiative. This project has become a "golden corridor" connecting the two countries and the wider region, transforming the Lao PDR from a landlocked to a land-linked country, bringing transformative changes and new development opportunities to the Lao PDR. China remains an important development partner, providing financial assistance to the Lao PDR. In particular, the Party, government and people of China have extended generous support through the "Eight Major Projects for Laos", announced by President Xi Jinping in 2017, which have made significant contributions to the development of healthcare, human resources and the improvement of living standards for the Lao people.

At the regional and international levels, in the current uncertain global situation, it is increasingly important for developing countries to stand united, uphold multilateralism and build a more just, fair and equitable global order. Laos and China share a common commitment to promoting development and ensuring that the benefits of globalization are more equitably shared. The Lao PDR fully supports the global initiatives proposed by Xi, such as the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative.

Rewriting rural stories

Editor's note: *To mark the fifth anniversary of China eradicating absolute poverty, China Daily is publishing a series of stories on how the country's poverty alleviation experience has not only helped the country wipeout severe deprivation, but has also taken root and made an impact around the world.*

Sister villages embrace for poverty fight

Chinese model targets local issues, improves livelihoods in remote Laos settlement

By LI LEI and **HE CHUN**
in Shibadong, Hunan

Online
See more by scanning the code.

Children peer through a window of a small library built by China International Water & Electric Corp in Thinsom village, Luang Prabang province, Laos. PROVIDED TO CHINA DAILY

On a laptop screen inside a meeting room in a rural area of Hunan province, the face of Padith flickers to life.

The 54-year-old village chief of Thinsom — a small hamlet nestled in the mountains of Laos' Luang Prabang province — waves from his computer in a local government building, a translator seated beside him. Grinning, he asks in Lao, "Secretary Lu, can you hear me? Very happy to see you!"

On the other end, Lu Chuntao, first Communist Party of China secretary of Shibadong in Huayuan county — China's model anti-poverty village — leans toward the camera.

"Hi, village chief. Spring has come to Shibadong. How is Thinsom?" he replies. Then the two begin exchanging the latest developments in their respective villages.

The exchange, recorded in early April, was part of a regular video call between two villages that became "international sister villages" in 2023.

But what makes this unusual is not the call itself — rather, what it represents: China is now exporting the playbook that has lifted Shibadong, and countless villages like it across the country, out of poverty since 2013.

When the sister village pact was signed in late 2023, Thinsom was a remote settlement of wooden houses reached by dirt roads. There was not a single kindergarten. Farmers coaxed just one rice harvest a year from parched fields.

Today, an 8.6-kilometer-long irrigation canal has been cleared. A bright new preschool stands next to a reading room. And villagers talk of a second annual rice crop.

"The new classroom gives children a safe place to learn — and parents now care more about education. The repaired canal has made farming more productive," Padith told his counterpart during the call. He added that the village plans to explore rural tourism and specialty products, following Shibadong's example.

China's export model

Officially introduced in 2013 at Shibadong, "targeted poverty alleviation" rejects one-size-fits-all aid. Instead, it assesses local problems — commonly scarce land, missing industries, or failing infrastructure — before designing customized solutions, ranging from building new schools to fostering new businesses. The approach lifted 98.99 million rural Chinese out of abject poverty between 2013 and 2020, according to official data. That meant an average of more than 12 million people a year — roughly the population of a medium-sized country.

Lu, assigned earlier this year to oversee Shibadong's industrial development, has become the idea's latest ambassador. In late March, shortly after taking up his post, he traveled to Laos for a weeklong exchange. He visited three Lao cities, including the capital Vientiane, for face-to-face meetings with officials and community leaders — recounting Shibadong's path out of poverty and encouraging them to follow suit.

"We also want to bring them here — to walk through Shibadong and see it with their own eyes," Lu said. "More exchanges, more mutual visits. That's how we share our experience and help them advance their own fight against poverty."

By sharing Shibadong's hard-won lessons in poverty eradication, Lu is following the path blazed by Shi Jintong, the village's Party secretary. Born in Shibadong in 1979, Shi inherited a village with no roads, no industry, and no visible future.

For Shi, the core of Shibadong's success lies in replicable principles. "First, you must accurately measure the extent of poverty and understand its causes," he said.

Every country defines poverty according to its own development context, Shi noted. China's 2013 standard — 2,300 yuan ($340) per year at 2010 rates, adjusted for inflation since — may differ from other nations' benchmarks, but the diagnostic method behind it is transferable.

A second factor, he said, is stimulating "internal motivation" — the poor's own willingness to change. "People need both policies and a sense of support," Shi explained, calling this a model worth borrowing.

Third, solutions must fit local realities. "Shibadong's method seeks truth from facts, adapts to conditions, and offers targeted guidance," he said. Unlike the indiscriminate "flooding" of past relief efforts, the new approach is precise — identifying what a community lacks and helping it get exactly that.

Shi traveled to Thinsom twice. "The first time was to learn — to see their geography, living conditions, industries, and incomes," he said. "Later, we sat down with Lao officials and villagers to discuss development — and that's how our partnership began." He noted that Thinsom's infrastructure, education, industries, and living environment closely resembled those of China's villages before poverty alleviation.

From diagnosis to delivery

Turning principles into practice fell to China International Water & Electric Corp, a subsidiary of the State-owned China Communications Construction Group.

Wang Jiang, CWE's Laos branch general manager, said his team spent weeks in early 2025 doing door-to-door surveys.

"The essence of targeted poverty alleviation is precision — we want to avoid the 'flood irrigation' approach," Wang said via a video call from Vientiane. "We believe that actually going out and surveying what the people wish for today are the prerequisite for making our follow-up work precise and effective."

"Villagers said the canal had silted up, and parents worried who would watch their toddlers while they worked elsewhere," he added. "So we tackled those two things first."

By June 2025 — ahead of the rainy season planting — the 8.6-kilometer canal was dredged and reinforced. Water from the famous Kuang Si waterfall now flows steadily to the paddies. "After we opened up the irrigation system, farming could go from one season to two," Wang said.

In September 2025, a new kindergarten opened, built by CWE with input from Shibadong's team. About 40 children — many left behind by migrant parents — now learn basic Lao and occasionally a Chinese nursery rhyme.

Next to the kindergarten, a small library stocked with picture books was added under an educational program named after the Lancang-Mekong River. Known as the Lancang River in China and the Mekong in Laos, the shared name symbolizes the friendship between the two countries.

"On the opening day, our volunteers sang with the kids. (When you hear) the laughter — that's when you know it's real," Wang said.

Lesson worth learning

Since 1978, China has lifted more than 800 million people out of poverty, according to the World Bank's international standard, accounting for over 70 percent of global poverty reduction in that period and making it the largest anti-poverty campaign in history.

China reached the United Nations Sustainable Development Goal of ending poverty a full decade ahead of the 2030 target. A World Bank report noted that, largely due to China's contribution, the global poverty rate fell from 38 percent in 1990 to 8.5 percent in 2024.

After eradicating extreme poverty at home, China has applied its proven methods to help other countries like Laos fight poverty.

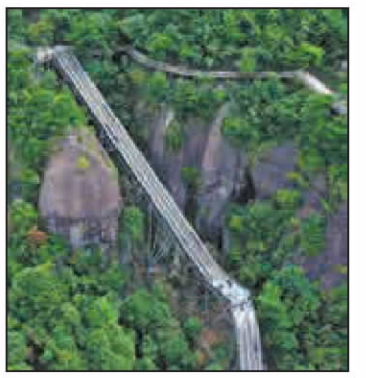
By last year, China had run 15,000 training programs for more than 180 countries and international organizations, the China International Development Cooperation Agency said. The courses covered 17 fields and over 100 specialized areas, with more than 500 sessions focused specifically on governance and poverty reduction. In total, more than half a million people from around the world have been trained.

The Laos village chief Padith has come to understand the philosophy behind these projects.

"China's poverty alleviation model is not just about handing out supplies," he said. "It makes concrete plans based on the village's real situation. This approach builds our own ability to sustain progress — what they call 'hematopoietic ability' — rather than relying on outside help."

He hopes to deepen ties beyond infrastructure. "I hope we can increase mutual visits — for example, exchange and study trips for village cadres," Padith said. "We can also cooperate on agricultural technical training and share experiences in rural tourism development. We welcome Chinese friends to come to Thinsom, to see our progress and changes for themselves, and to explore together a sustainable development path that suits both sides."

Wang's team is now studying small-scale projects for Thinsom, such as homestays for tourists heading to Kuang Si waterfall. "We want Thinsom to develop its own 'hematopoietic ability' — to make its own money," Wang said.



Back in Shibadong, Shi remains confident about the future success of the Chinese model. "I believe that under the correct leadership of the Lao People's Revolutionary Party, and with the joint efforts of the Lao people, combining Shibadong's poverty-alleviation experience with Laos' own realities ... I am confident that Thinsom's future will be just like Shibadong's today."

Beekeeper sells sweet success

By LI LEI and **HE CHUN**
in Shibadong, Hunan

Long Xianlan, 39, used to be known as Shibadong village's "three ghosts" — drunkard, beggar and lazybones. Today, with more than 300 beehives and a honey packaging workshop, he is the "Bee Master".

His story is now being told to young Lao farmers who see in him a reason to stop waiting and start working.

"I drank every day because poverty left me without hope," Long said in a recent interview, sitting on the porch of his two-story wooden house in Shibadong, Hunan province.

Orphaned at a young age, he was fed by neighbors and slept where he fell.

In 2014, when a targeted poverty alleviation team arrived in Shibadong, they did not hand him cash. Instead, they took him on a study tour to a neighboring county. "I saw a young man my age with a sheep farm, a new brick house and a beautiful wife. I thought: he did it — why not me?" he recalled.

Long's turnaround started when a friend took him to study under a beekeeper in a neighboring county who earned over 100,000 yuan ($14,790) a year.

"If I could make 70,000 or 80,000 yuan, that would be a huge change," Long said. He became an apprentice, climbing the mountain two or three times daily to learn how to master beehives. But he worried no one would buy his honey.

The village's poverty alleviation team assured Long that tourists would buy whatever he produced. To prove the point, the officials gave Long some honey to sell at a tourist stop in Shibadong. It sold out immediately.

"That's when I gained confidence," he said, adding that he later obtained a bank loan with the villagers' committee acting as a guarantor.

In 2016, Long earned 50,000 yuan from honey production, officially shaking off poverty.

The following year, he found a wife and launched a beekeeping cooperative that now includes 118 households.

In 2019, he bought a new home in the county seat. A year later, his daughter Si'en — whose name signifies gratitude for one's roots — was born.

In 2023, a team from a Laos national television station came to Long's home. They filmed him walking among his hives, selling honey, and chasing his daughter around the yard.

Long, who still wakes before dawn to check his hives, is unfazed by his cross-border fame.

He keeps a photograph of the Lao journalists who filmed him on his wall, next to a picture of his wedding day.

"I want to use my own life's hardships to reach young people in their country — those who are hanging around, doing nothing, just waiting for handouts. I hope to influence them ... not to lose heart, not to give up, to keep working hard, and to create a new life — a life of value — while they are still young," he said.

Long Xianlan and his wife collect honey in Shibadong village, Hunan province. PROVIDED TO CHINA DAILY

Ties: Laos supports efforts to coordinate development strategies

From page 1

Within the framework of the Association of Southeast Asian Nations, Laos and China have closely supported each other through the implementation of the Plan of Action to Implement the ASEAN-China Comprehensive Strategic Partnership (2026-30), covering the three pillars of the ASEAN Community and ASEAN Connectivity.

The Lao PDR highly values the fifth anniversary of the ASEAN-China Comprehensive Strategic Partnership (2021-26), which will be jointly commemorated, and expresses its deep appreciation to the People's Republic of China for its steadfast support during Laos' three ASEAN chairmanships.

In addition, in 2027, the Lao PDR stands ready to assume the role of the ASEAN-China Coordinating Country for the period 2027-30 to further advance the ASEAN-China Comprehensive Strategic Partnership and continuously deepen Laos-China bilateral relations.

Within the Mekong-Lancang Cooperation Framework, Laos and China, together with other countries in the river basin, have jointly created a new era in transforming the Lancang-Mekong River into a river of peace, friendship and sustainable development, becoming an efficient and effective cooperation mechanism capable of translating shared visions into tangible and lasting results for the peoples of the region.

The Lao PDR reaffirms its unwavering commitment to closely cooperate with the People's Republic of China, in supporting efforts to coordinate comprehensive joint development strategies, advance mutual development, deepen reform and broaden international cooperation, and jointly pursue the path of socialist development in accordance with their respective national conditions.

We will further strengthen the traditional friendship, the stable and long-term comprehensive strategic partnership guided by the "Four Goods" spirit, and advance the building of a Laos-China community with a shared future toward higher standards, higher quality and higher levels, to truly bring greater civilization and prosperity to the people of our two nations.

The author is general secretary of the Lao People's Revolutionary Party Central Committee and president of the Lao PDR. The views do not necessarily reflect those of China Daily.

Airport reopens

A health worker disinfects passengers on Tuesday before they board a World Food Programme aircraft in Bunia, Democratic Republic of the Congo. The airport has been reopened after the number of suspected Ebola cases in the region declined. Last month, the government in Kinshasa suspended passenger flights to Bunia, the main airport in Ituri province, where the first Ebola cases were confirmed. MOSES SAWASAWA / AP

Itineraries: Visits help put aside stereotypes

From page 1

"The main purpose, and also their expectation, is to help drive the growth and development of their own domestic economies," Jian added.

Li Xiaopeng, a professor at Hangzhou City University, said: "Effective home-ground diplomacy is not just about meetings, group photos and signing ceremonies. It also requires letting guests see things for themselves — to see a country's development, its capabilities and where its future is heading."

Taking Hangzhou as an example, Li said the city has become a highly concentrated example of Chinese modernization. In 2025, Hangzhou's GDP exceeded 2.3 trillion yuan ($340 billion), while the added value of its core digital economy industries reached 678 billion yuan, official data shows.

Behind the figures is an ecosystem that includes platform companies, robotics enterprises, AI startups and advanced manufacturers, forming a broader industrial chain that allows visiting leaders to see more than individual companies, Li said.

Zhejiang is not the only place where such out-of-capital trips have taken place.

Foreign leaders visiting China have also traveled to places such as Shanghai, an international financial center; Xiong'an New Area in Hebei province; and Fujian, Shaanxi and Sichuan provinces — places that showcase Chinese modernization, coordinated regional development, poverty reduction and connectivity.

Jian, the researcher, said that in-person visits by foreign leaders play an irreplaceable role in helping them better understand the reasons behind China's economic success and its future development trends.

"Such visits help them see China more objectively, dispel the interference of certain Western narratives, and put aside prejudice and stereotypes about China," he said.

While the Lao top leader was visiting Zhejiang, Yvette Cooper, the United Kingdom's foreign secretary, traveled to Shenzhen, the technology hub in South China's Guangdong province, on Wednesday for a trip focused on science and technology, after meetings in the Chinese capital.

If Beijing is where diplomacy is conducted, Shenzhen is where China's industrial innovation takes shape on the ground, experts said.

"Shenzhen now stands in the global spotlight, as it will host an important international meeting this year," said Cui Hongjian, a professor at Beijing Foreign Studies University's Academy of Regional and Global Governance.

The city is set to host the Asia-Pacific Economic Cooperation Economic Leaders' Meeting in November.

Cui said that Cooper's visit to the city and to technology companies shows that Britain's diplomacy toward China has a clear and targeted agenda — to make economic diplomacy a main thread of its China policy.

Ladder: Dual-cable system guarantees safety

From page 1

Dubbed "China's highest via ferrata", the ladder is attached to Qixing Mountain, a karst tableland around 13 kilometers from downtown Zhangjiajie.

With an average height of 1,328 meters above sea level, the mountain's dramatic landscape of sheer cliffs, deep gorges, seas of clouds and waterfalls has now been transformed into a thrilling outdoor adventure playground, complete with metal cables, ladders and steps that safely guide visitors up the vertical terrain.

According to Tian Jianbing, general manager of the Zhangjiajie Qixing Mountain Scenic Area, the via ferrata, or "iron path", has welcomed nearly 150,000 visitors since its opening in November 2024, including more than 27,000 foreign guests from 42 countries and regions.

In July, the attraction was featured on French television channel TF1's flagship evening news.

For Oleksii Lisianskyi, a Ukrainian outdoor enthusiast, via ferratas are nothing new, but after tackling Qixing Mountain on a sunny Saturday morning in April, the 35-year-old was left buzzing with an excitement like never before.

"This one in Zhangjiajie is definitely the biggest and most challenging I've ever experienced," Lisianskyi said. "Higher, longer, more obstacles — it really pushes you."

Setting out around 8 am, helmet and harness on, he looked up at the rock face melting into the mist. "OK … this is real," he recalled thinking. On the wall, strangers quickly became teammates. "You help each other, share stories, take photos together. It becomes more than just a challenge."

Climbers from around the world made it feel, in his words, "very international". Unlike the intimidating videos, the real journey was a mix of pure fun and adrenaline, with plenty of picture-perfect moments.

Safety is paramount. The climbing route features a dual-cable system comprising a 12-millimeter main lifeline and a second cable linking every handhold. Climbers are secured with two locking carabiners that can be opened with a special tool. As the designers put it, "You can't fall, even if you want to".

Lisianskyi and his companions finished before noon. At the top, a small ritual awaited: ringing a bell three times to mark their achievement. "After that, everyone shares their experience — the hardest part, the most exciting moment," he said.

Finishers will receive a certificate in Chinese and English, a trophy and — unexpectedly — drone footage capturing their ascent.

"Totally worth it," Lisianskyi said with a grin. And if an even bigger challenge comes? "I'll definitely go again."

Solar firms eye space-based energy frontier

Shift will gradually eliminate the need for land grids and enable instant power supply

By ZHENG XIN
zhengxin@chinadaily.com.cn

In order to build on their leadership in the global arena and unlock next-generation growth channels, China's leading photovoltaic firms are eyeing space-based solar energy production as the industry's next technological frontier.

By expanding into this field, they hope to diversify their business, break conventional market constraints and create high-end applications for China's substantial solar production capacity.

At the opening ceremony of the 19th International Photovoltaic Power Generation and Smart Energy Conference and Exhibition in Shanghai on Tuesday, a consortium of 13 tier-one solar and technology enterprises officially launched the Space Energy Development Alliance.

The alliance aims to integrate resources across the entire supply chain, including solar power, energy storage, hydrogen power, computing and charging, in order to bridge the boundaries between aerospace and green energy.

Company executives and industry analysts regard this as a pivotal and strategic move for Chinese solar power manufacturers seeking to escape intense domestic competition and tap into massive incremental markets.

Zhu Gongshan, chairman of GCL Group, said, "If the first half of the photovoltaic industry's paradigm revolution is the symbiosis of watts and bits, the second half is the dance between materials and aerospace."

He described the shift as "an epic expansion of energy scenario boundaries", extending from the land and oceans to extraterrestrial orbits.

"Simultaneously arriving with the photovoltaic paradigm revolution is a cross-sectoral composite technology cluster covering power electronics, digital technology, advanced materials, aerospace engineering, communication technology, wireless power transmission and synthetic biology, far exceeding the industry's traditional technological road map," he said.

According to Zhu, gathering solar energy in the near-ideal cosmic environment enables systems to escape the effects of atmospheric filtering and the day-night cycle of the Earth, resulting in a highly efficient and constant form of closer-range photosynthesis.

"Reusable rockets continuously lower launch costs, and giant commercial constellations create large-scale demand, pushing space-based photovoltaics into the realm of engineering economics," Zhu said.

> "If the first half of the photovoltaic industry's paradigm revolution is the symbiosis of watts and bits, the second half is the dance between materials and aerospace."
>
> **Zhu Gongshan,** chairman of GCL Group

He projected that once radiation-resistant packaging passes rigorous testing, related technologies could be used for active space applications within five to 10 years.

The long-term outlook for the industry is that space-to-Earth wireless power delivery will replace conventional generation-transmission-consumption chains, eliminating the need for lengthy land grids and enabling instant power supply to remote outposts, islands and emergency sites.

Zhu noted that space will maximize the synergy between on-site energy production and real-time computing.

Prominent energy experts praised the alliance as a visionary step toward long-term industrial evolution, while also taking a pragmatic view of current market dynamics.

Lin Boqiang, head of Xiamen University's China Institute for Studies in Energy Policy, said that setting up such an alliance is a highly commendable initiative.

"While commercial operations remain on the distant horizon, pioneering this path is vital. Space-based solar power will likely be significantly more expensive than terrestrial alternatives for at least the next decade, meaning ground-based solar installations will remain our primary reliance for a long time to come," Lin said.

"However, the domestic ground-based market still holds significant growth potential, and initiating early layouts in space-based technology is a farsighted strategy worth advocating."

Tan Youru, a solar analyst at BloombergNEF, echoed this sentiment, adding that these corporate initiatives represent vital forward-looking technical developments and highly anticipated frontier applications.

While the long-term vision of space-based photovoltaics remains an exciting prospect for future technological leadership, he added that the industry must stay focused on resolving its immediate challenges, such as the issue of overcapacity.

Electric three-wheelers gaining traction overseas

By ZHONG NAN
zhongnan@chinadaily.com.cn

At a workshop owned by Jiangsu Zhufeng Electromechanical Technology Co in Xuzhou, Jiangsu province, a buyer evaluated an electric three-wheeler model destined for Indonesia, discussing modifications with engineers, who took detailed notes on the customer's requirements.

As concerns over fuel costs and energy security grow globally, China's electric three-wheelers, widely used to transport people and goods, have seen a surge in demand in overseas markets in recent months.

Jiangsu Zhufeng Electromechanical Technology Co produced nearly 30,000 units in 2025, with exports mainly destined for the United States, Turkiye, Cambodia and Indonesia. With its products having entered Brunei, Vietnam and Laos this year, the company expects its annual production to surpass 50,000 units.

From January to April this year, exports of electric three-wheelers from Xuzhou reached 168 million yuan ($24.8 million), up 87.1 percent year-on-year, while exports of related parts and components totaled 115 million yuan, an increase of 29.6 percent from a year earlier, according to data from Xuzhou Customs.

Dai Hui, deputy head of Xuzhou Customs, said that three-wheelers made in Xuzhou have reached more than 130 countries and regions.

"In addition to emerging markets, the next frontier is North America, Western Europe and Northern Europe, where exporters are stepping up efforts to expand their presence," said Dai.

Ni Xiaofeng, president of Jiangsu Guowei Motorcycle Co, another three-wheeler manufacturer based in Wuxi, Jiangsu, said the growing appeal of low-cost, energy-efficient transportation solutions, coupled with stricter environmental regulations and efforts to reduce reliance on fossil fuels, have further boosted demand for Chinese three-wheelers in overseas markets.

"A standard electric three-wheeler and similar models typically sell for $3,000 to $6,000 in European and North American markets," he said.

Li Chengyun, head of the technical unit of Xuzhou Zhibo Locomotive Co in Xuzhou, said most electric three-wheelers on the market offer a driving range of 80 to 100 kilometers with standard lithium batteries. For an additional cost, customers can choose larger battery packs, which increase the range to as much as 180 to 220 kilometers.

"More overseas customers are demanding higher power output, prompting us to equip vehicles with larger motors," Li said. "Buyers are also requesting larger and wider tires and wheel rims, leading the company to adopt aluminum alloy wheels to better meet customers' specifications."

Zhang Hui, president of Xuzhou Zhibo Locomotive Co, said that in the long run, concerns over fuel supply disruptions and the search for affordable transportation alternatives will continue to drive the global adoption of electric three-wheelers.

Beyond traditional cargo and passenger-carrying three-wheelers, manufacturers are increasingly branching into specialty and recreational vehicles to diversify their product offerings.

He Shan, sales director at Jiangsu Shanming Shuixiu Environmental Protection Technology Co in Xuzhou, said the company's business originally focused on manufacturing cargo three-wheelers, but shifted toward developing and exporting specialty vehicles such as road sweepers after spotting growing demand in niche markets.

"We are now rolling out upgraded models that can sweep streets, wash surfaces, spray water mist and suppress dust. A single sweeper can do the work of more than a dozen people," said He.

Workers load electric three-wheelers for shipment at the parking lot of a manufacturing unit in Xuzhou, Jiangsu province, on Oct 16, 2025. MAO JUN / XINHUA

Household-use three-wheelers, passenger shuttles and leisure vehicles designed for tourist attractions and golf courses have become key growth segments for many traditional electric three-wheeler manufacturers, said Chen Bin, deputy director of the expert committee of the Beijing-based China Machinery Industry Federation.

Chen said the growing popularity of electric three-wheelers reflects a broader shift toward affordable, energy-efficient mobility solutions, creating new opportunities for Chinese manufacturers in global markets.

Croatia eyes green partnership

Zagreb ready to expand synergy with Beijing in sustainable growth, envoy says

By **SHAO XINYING** and **LIU TIANYUN**

Croatia sees growing opportunities for deepening cooperation with Beijing in green development as China enters a new stage of growth, the Croatian envoy said.

Croatian Ambassador to China Dario Mihelin highlighted sustainability as an increasingly important pillar of bilateral ties, saying the two countries are well-positioned to expand synergy in areas ranging from ecological conservation to clean energy.

"I've been here (in China) for several years, since the 13th Five-Year Plan (2016-20). This is my third five-year plan to follow," Mihelin told China Daily. "Certainly, in the niche (areas) of sustainable development and ecological transition, I sense a strong potential for cooperation between Croatia and China."

As for sustainable development, "it's something that immediately brings us to reflect on the 15th Five-Year Plan (2026-30), with a strong focus on making this country more beautiful and healthier", the ambassador said, adding that the emphasis on green development offers new opportunities.

Mihelin said the two countries have already translated partnerships into tangible results, including major infrastructure projects that have incorporated sustainability considerations.

He pointed to the landmark Peljesac Bridge, set to celebrate the fourth anniversary of its opening in July. Since its inception, the project has prioritized marine conservation through eco-friendly engineering and construction.

"This bridge is a true symbol of our cooperation and partnership," he said of the 2.4-kilometer-long bridge.

Built by a Chinese consortium led by the China Road and Bridge Corporation and mainly funded by the European Union, the bridge connects the Croatian mainland with the Peljesac Peninsula, slashing the transit time from up to three hours to just minutes.

"It's a unique example of cooperation between an EU member state ... in this case, Croatia, the European Union and China," he said.

"Chinese companies participated in the public procurement and bidding process and won that bid, and then executed the project in line with all the EU regulations and standards."

While the bridge is often associated with the Belt and Road Initiative, Mihelin stressed it represents something broader: a successful model of practical joint efforts between China and Europe. He said that future opportunities increasingly lie in low-carbon development.

Dario Mihelin

"The color of cooperation between China and the European Union is green," said Mihelin, adding that the description also applies to relations between Croatia and China, as evidenced by the Senj Wind Farm, built by China's Norinco International and one of the largest Chinese investments in Croatia.

"The cooperation and investment in the field of renewables certainly point to the fact that our cooperation is green," he said. "It's further strengthened by the cooperation that exists between our national parks."

The Plitvice Lakes National Park in Croatia and Jiuzhaigou National Park in China's Sichuan province, "really look like twins" and "have fantastic cooperation in the preservation of the special geological features", Mihelin said of the two tourist hot spots.

People exchanges

People-to-people exchanges also remain an important part of bilateral relations. Before the pandemic, nearly half a million Chinese tourists visited Croatia annually, Mihelin said, adding that tourism numbers are steadily recovering.

Infrastructure links created through projects such as the Peljesac Bridge have also helped improve access to surrounding areas such as Korcula, frequently visited by Chinese tourists interested in legendary explorer Marco Polo, and Dubrovnik, known for the filming location of the television series *Game of Thrones*.

This momentum is further propelled by China's decision to extend the unilateral visa-free policy for Croatian citizens until the end of this year.

The positive trajectory in people-to-people exchanges was on full display in Beijing last week. To mark Croatia's Armed Forces Day and Statehood Day, a cultural evening was held in the Chinese capital, where traditional music from the Hrvatsko Zagorje region, north of the capital Zagreb, took center stage. This celebration also comes as the two nations commemorate the diplomatic ties established 34 years ago.

Mihelin also expressed hope that direct flights between China and Croatia could be launched in the future.

"Certainly, a direct flight connection between China and Croatia would bring more people-to-people contacts, more Chinese friends to Croatia and more Croatians visiting China," he said.

FM's visit signals pragmatic relations

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

Chinese Foreign Minister Wang Yi's visit to Canada signals an effort by both sides to strengthen ties as Ottawa seeks to diversify trade and navigate growing uncertainty in its economic relationship with the United States, experts say.

Wang met with his counterpart Anita Anand and Canadian Prime Minister Mark Carney during his three-day visit last week, the first by a Chinese foreign minister to Canada in a decade.

For Jiang Wenran, founding director of the China Institute at the University of Alberta and president of the Canada-China Energy and Environment Forum, the visit signals a shift in the broader trajectory of the relationship.

"This visit ... signals a deliberate shift from confrontation to pragmatic engagement," Jiang said. "Meeting both Anand and Carney underscores high-level commitment to turning the recent thaw into durable institutions."

He described the visit as a test of the "new strategic partnership" announced earlier this year, with both China and Canada seeking progress on long-standing trade and policy issues.

Economic cooperation remains central to that effort.

During Wang's meeting with Anand, the Canadian government reiterated its goal of continuing to increase exports to China.

Jeff Mahon, former deputy director of the China division at Global Affairs Canada — a government department responsible for foreign affairs and international trade — said stronger economic ties are supported by the complementary nature of the two economies.

"Canada and China have complementary opportunities to increase trade in a range of goods and services," Mahon said.

"Given the size of Canada's economy, its current exports are relatively low. Therefore, it is a realistic objective for Canada to increase its exports (to China) by 50 percent by 2030," he said.

Jiang said the goal is driven by complementary strengths — agricultural exports, energy and cleantech cooperation.

Both experts linked the interest in economic cooperation to Canada's broader effort to diversify trade relationships.

"Increasing exports to China will play a critical role in Canada's diversification agenda given China's large market size and ongoing transformation to a consumption-driven economy," Mahon said.

Jiang said Canada's need to diversify has become more urgent as uncertainty surrounding the United States-Mexico-Canada Agreement review approaches.

"With 75 percent of Canadian exports flowing to the US and the USMCA renegotiation looming, Canada faces acute pressure to diversify," he said.

"This uncertainty makes deeper economic engagement with China and other markets not just desirable but essential for sovereignty," he added.

Canada sent a letter to the US and Mexico on Tuesday outlining its recommendations to renew the trilateral trade deal for 16 years, while seeking parallel talks on sectoral tariffs ahead of the meeting between Canadian and US trade negotiators later in the day, Reuters reported.

The upcoming USMCA review may also prove to be the most significant challenge facing future China-Canada cooperation, Mahon said, adding that Canada will likely face pressure from Washington to align policies in certain sectors if it wishes to maintain preferential access to the US market.

"This political pressure demonstrates that we are entering a new era where politics will play a larger role in international commercial relations," he said.

Balancing act

Both Mahon and Jiang said the future of China-Canada relations will depend on Ottawa's ability to balance deeper engagement with Beijing while maintaining close ties with Washington.

Mahon emphasized the importance of pragmatism and trust-building.

"For Canada-China relations to continue on a positive trajectory, the two sides will need to deepen and expand political trust," he said.

Despite the challenges, both experts expressed cautious optimism that bilateral ties can continue to improve.

"If Ottawa can keep promises amid external pressure, the relationship can evolve into a stable, interest-driven partnership," Jiang said.

New Danish government to stand firm over Greenland

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

Denmark's Prime Minister Mette Frederiksen has put the future of Greenland at the top of her political agenda after ending months of uncertainty by securing a center-left coalition to govern the country.

Her Social Democratic Party won 21.9 percent of the vote and 38 parliamentary seats in the March election, leaving it with the most votes but well short of the 90 seats needed for a majority.

After two months of negotiations, she has reached a deal with the Socialist People's Party, the center-left Radikale Venstre and the centrist Moderates, which will allow her to have a third term in office, and addressing the United States' designs on the Danish overseas territory will be one of her priorities.

US President Donald Trump first expressed a territorial interest in Greenland during his first term of office, and in December 2024, after his reelection, he said "the ownership and control of Greenland is an absolute necessity".

He suggested that he might want to buy the world's largest island, which is strategically important and believed to have vast mineral deposits. He repeated his interest at the start of the year, saying the US would take over the island "one way or the other".

The issue was a dominant theme in the election campaign, with the threat credited with a pre-polling surge in support for the Social Democrats after they put on a poor performance in local elections at the end of last year, and helping keep Frederiksen in office.

Carolin Hjort Rapp, a political scientist from the University of Copenhagen, told media that the Greenland crisis had played a role in keeping Frederiksen, and also Moderates leader Lars Lokke Rasmussen, in position when voters may otherwise have had reservations about their performance.

"They kind of survived, but at the same time, the voters were not satisfied with what the government had been doing before, so they wanted to move to other parties," she said. "You see smaller parties (of the left and far right) that gained way more votes than before."

Voice cloning scams on the rise in US

WASHINGTON — Liz Benz still believes the distressed caller's voice was her son's — the tone, enunciation and cadence all matched her 16-year-old.

But it was an AI clone, making the mother yet another victim of a growing wave of impersonation scams in the United States.

Rapidly evolving artificial intelligence technology has demolished the boundaries between reality and fiction, handing cybercriminals strikingly convincing voice cloning tools to steal from people by mimicking loved ones.

Benz, who's located in Buffalo, a city in New York, was jolted from her couch by a call from an unknown number. On the line was someone sounding like her son Fred, crying for help.

She was told Fred's friend had been shot and killed, and her son — who was out at a local football game — was being held hostage.

The 46-year-old insurance broker and mother of six was instructed to deliver cash to a nearby Walmart to pay off the man holding him.

Eventually, a selfie from Fred smiling at the game returned her to reality: the call, she realized, was an elaborate scam.

"Nothing could have convinced me that this was a scam until I saw my son with my own eyes," Benz said, her voice trembling. "It was a good 20 minutes of terror."

US authorities and consumer advocates are increasingly warning of scams built around impersonating family members.

The FBI said US people over the age of 60 lost more than $7.7 billion to scams last year, a significant jump over 2024.

In April, US people lost over $893 million last year to AI-enabled hoaxes, including voice cloning scams, the FBI said.

Simple internet searches can surface a wide array of voice cloning apps, many available for free, that create realistic AI replicas using small samples — sometimes only seconds — of a person's real voice.

"It used to be somewhat hard to make these things. Now anyone can do it in seconds," said Brian Long, chief executive of Adaptive Security, a company offering training on AI fraud protection.

Since taking her story public, Benz said she has received a flood of messages from other victims, many of whom opt to stay anonymous because of the shame attached.

Elderly people are particularly vulnerable, with experts warning of rising cases of "grandparent scams".

Fresh strikes stoke Gulf jitters

Renewed US-Iran hostilities raise doubts over ceasefire as Mideast tensions spiral

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Renewed military strikes involving Iran and the United States rattled the Gulf region on Wednesday. At least one death was reported in Kuwait from the attacks, while Bahrain intercepted missiles and drones allegedly targeting civilian sites.

Kuwait's Ministry of Foreign Affairs said in a statement on X that it condemned the Iranian attacks using ballistic missiles and drones, which, it said, occurred at dawn on Wednesday, "targeting once again civilian and vital facilities, including Kuwait International Airport, resulting in the death of one individual, injuries to others, and damage to vital facilities, including diplomatic missions".

"The ministry affirms the State of Kuwait's categorical rejection of Iran's overt aggressive attacks, which lead to increased escalation, heightened tension, and undermine the security and stability of the region, constituting a flagrant violation of the rules of international law, the United Nations Charter, and Security Council Resolution 2817 of 2026," it said.

The foreign ministry stressed that "Kuwait's sovereignty, and the safety of its citizens and residents on its territory are a red line that cannot be crossed".

"The ministry affirms that the State of Kuwait reserves its full and inherent right to take appropriate measures in response to these sinful and repeated Iranian aggressions, in accordance with international law," it said.

Kuwait's Directorate General of Civil Aviation said on Wednesday that flights were suspended until further notice and that it had activated its emergency plan at Kuwait International Airport. It said Terminal 1 was subjected to targeting by drones and missiles from the "Iranian aggression", resulting in significant damage to several airport facilities, as well as injuries.

The agency's spokesman Abdullah Al-Rajhi said the authorities handled the incident in accordance with approved procedures, and were committed to ensuring the safety of workers and passengers, and securing the airport's facilities.

In Bahrain, the General Command of the Bahrain Defence Force said Iran continued its systematic hostile approach through its attacks with missiles and drones that targeted civilian properties in Bahrain. The command said its air defense systems had destroyed three missiles and a number of drones. It said the deliberate use of missiles and drones to target civilian sites and private property constituted a flagrant violation of international humanitarian law, Bahrain News Agency reported.

Retaliatory move

The Islamic Revolutionary Guard Corps said in the early hours of Wednesday that it carried out retaliatory missile and drone attacks against the headquarters of the US Fifth Fleet and other US military targets in response to repeated acts of aggression by the US, Tasnim News Agency reported.

In a statement released on Wednesday, the IRGC Public Relations Office said that late on Tuesday, the US military struck an Iranian oil tanker near the Strait of Hormuz with an aerial projectile, causing damage to the vessel in the engine room area.

Further, the IRGC said that "in a renewed act of aggression, the American enemy targeted an IRGC communications tower in the south of Qeshm Island with aerial projectiles".

Iran's Ministry of Foreign Affairs condemned the alleged targeting of an Iranian oil tanker in the strait and the attack on a telecommunications tower on Qeshm Island.

The ministry noted the attacks were launched in the early hours of Wednesday from the territories of two regional countries.

The US Central Command denied the allegations and said all attacks on its forces had failed and that they remained ready to defend themselves against unwarranted Iranian aggression.

"An additional wave of Iranian drones attempting to attack US forces in Kuwait failed to impact intended targets tonight. US Central Command air defenses successfully downed multiple drones and ensured no American personnel or assets were harmed," it added.

In Washington, US President Donald Trump said Iran has agreed not to have a nuclear weapon and that he would probably meet with Supreme Leader Mojtaba Khamenei at some point if things "work out".

"They've already agreed they're not going to have a nuclear weapon," Trump told *Pod Force One* in an interview broadcast on Wednesday, while speaking about Iran.

Asked about Khamenei's involvement in talks with the US on ending hostilities, Trump said, "He's involved, absolutely. ... I think they have a lot of respect for him."

Agencies contributed to this story.

Israel, Hezbollah trade blows as envoys meet in Washington

BEIRUT — Israel and Hezbollah exchanged fire on Tuesday while Lebanese and Israeli envoys met in Washington for direct talks.

The meeting lasted all day on Tuesday, a CNN report said, citing an Israeli official.

US Deputy National Security Adviser Mike Needham and State Department Counselor Dan Holler reportedly led the talks on the US side on Tuesday.

"We are trying to view the Lebanon-Israeli talks as separate and distinct from Iran, and what Iran wants to do is mix it all together," US Secretary of State Marco Rubio told a Senate hearing earlier on Tuesday.

Rubio also accused Iran of "trying to stymie any effort in which Israel and Lebanon can work together" and prolonging their negotiations.

He added, "Israel has no territorial claims in Lebanon. Hezbollah is the impediment."

State Department spokesman Tommy Pigott said on X that "progress continues on the political and security tracks" after the first day of talks ended. Another round was scheduled for Wednesday.

Lebanese Prime Minister Nawaf Salam called the talks, which are strongly opposed by Hezbollah, "the least costly choice for Lebanon".

People swim at a public beach as smoke rises in the background after an Israeli airstrike that hit a village, as seen from the southern port city of Tyre, Lebanon, on Tuesday. MOHAMMED ZAATARI / AP

Meanwhile, Lebanon's state-run National News Agency reported Israeli strikes, some of them deadly, on around 30 locations across the south on Tuesday.

The fighting came after US President Donald Trump declared on Monday that he had brokered a partial ceasefire deal, which the Lebanese embassy in Washington said would at first only cover Israeli attacks on Beirut and Hezbollah attacks on Israeli territory, before expanding in scope.

Israel has been fighting Hezbollah since the group dragged Lebanon into the wider Middle East conflict on March 2.

A senior Hezbollah official said on Tuesday that the group will not accept any partial ceasefire with Israel, rejecting the reported US-backed proposal demanding that Hezbollah halt attacks against northern Israel in exchange for Israel sparing Beirut's southern suburbs.

Hezbollah, meanwhile, said it had attacked Israeli troops in southern Lebanese lands they occupy, but had not claimed attacks in Israel.

The Israeli military said it intercepted two projectiles from Lebanon, without reporting any injuries.

On Wednesday and ahead of a second day of talks in Washington, Lebanese state media reported an Israeli strike near Beirut. The state-run National News Agency reported the targeting of a car on the Khaldeh-Naameh road, referring to an area at the southern entrance to the capital.

Meanwhile, a medical source in south Lebanon's Tyre told AFP that Israeli strikes near the coastal city on Wednesday killed six people, as Israel keeps up attacks on the country's south.

UN Secretary-General Antonio Guterres has written to UN Security Council members, stressing the need for a continued uniformed UN presence in Lebanon after the mandate of the UN Interim Force in Lebanon, or UNIFIL, expires at year's end.

Guterres outlined three options to replace the 7,500-strong UNIFIL in a letter to the 15 members of the Security Council dated on Monday and seen by Reuters.

They ranged from a light presence with limited capabilities to a more robust force with broader monitoring and de-escalation capabilities, and from around 1,980 to 5,525 uniformed personnel members.

Technology, participation mark Ethiopia's election

By **SHARON NAKOLA** in Nairobi, Kenya
sharon@chinadailyafrica.com

Regional election observers have praised Ethiopia's adoption of new electoral technologies and strong voter participation in its seventh general election, describing the process as a notable step in the country's efforts to strengthen democratic institutions despite persistent security challenges.

The polls on Monday were the second general election held since 2018 after Prime Minister Abiy Ahmed was elected. As one of Africa's most populous nations and a key diplomatic player on the continent, developments in Ethiopia are closely watched by regional governments and international partners.

Preliminary assessments released on Wednesday by observer missions from the African Union and the Intergovernmental Authority on Development highlighted improvements in election administration, voter registration and electoral inclusion, while acknowledging that insecurity continued to affect parts of the country.

According to the National Electoral Board of Ethiopia, more than 50.5 million citizens registered to vote, surpassing the board's initial target and marking a significant increase from the previous general election. More than 5.5 million voters registered through digital platforms under a hybrid digital-analog registration system.

The observer missions hailed the use of technology as one of the election's defining features, including GIS-based mapping that leverages geographic information systems to digitize, analyze, and visualize voting centers, digital voter registration tools and special voting arrangements for internally displaced people and members of the security services.

The board was hailed for its administrative and operational capacity, with the observer team saying the measures helped improve accessibility, transparency and efficiency in the management of the vote.

Commendable way

"The way the election board conducted the 7th General Election is commendable," the AU and IGAD observer teams said during a media briefing on Wednesday, citing the institution's neutrality, technological preparedness, inclusiveness and election administration.

According to the observer missions, voting was successfully conducted in 501 constituencies, although polling did not take place in the Tigray region and parts of Oromia and Amhara due to security and operational challenges.

Overall, while more than 50,000 polling stations were operational, 143 failed to open due to security issues, according to media reports.

Speciosa Wandira-Kazibwe, head of the IGAD Election Observation Mission, described the level of public engagement as one of the most remarkable she had witnessed during election observation assignments across Africa.

"We have never encountered the level of public participation we saw in Ethiopia in other countries," she said.

Former Kenyan president Uhuru Kenyatta, who led the AU Election Observation Mission, also welcomed the conduct of the polls and praised efforts undertaken by Ethiopian authorities to strengthen election processes.

Final election results are expected to be announced within one to two weeks after voting concludes, in accordance with Ethiopia's electoral law.

CHINA

Myanmar's foreign minister to pay visit

Foreign Ministry spokeswoman Mao Ning announced on Wednesday that Myanmar's Foreign Minister Tin Maung Swe will begin a three-day official visit to China on Thursday. The visit follows Foreign Minister Wang Yi's trip to Myanmar in late April and marks Tin Maung Swe's first visit to China since he was appointed foreign minister in April. Tin Maung Swe previously served as Myanmar's ambassador to China from November 2022 to January 2026.

UNITED STATES

Bill Pulte named as acting intel chief

US President Donald Trump on Tuesday appointed Bill Pulte, the director of the Federal Housing Finance Agency, as acting director of national intelligence. Trump said in a Truth Social post that Pulte "has deep experience managing the most sensitive matters in America, the safety and soundness of the markets". He added that Pulte would remain director of the Federal Housing Finance Agency and chairman of Fannie Mae and Freddie Mac while serving in the acting role. Pulte will replace Tulsi Gabbard, who announced on May 22 that she was resigning from her post after her husband was diagnosed with an extremely rare form of bone cancer. The director of national intelligence is responsible for the oversight and direction of 18 elements of the country's intelligence community.

NIGERIA

Gunmen kill 37 in two attacks on one village

Criminal gangs have killed at least 37 people in two days of attacks on a rural community in northwest Nigeria's Sokoto state, a security report and residents said. Gunmen on motorbikes, believed to be "bandits", killed at least 17 people and looted shops in Dangulbi village, according to a security report prepared for the UN and seen by AFP. The attackers returned to the village early on Tuesday, killing at least 20 more residents who were mourning the 17 people killed in the Sunday raid, a local official told AFP on Wednesday. "The victims were sheltered under sheds, following an earlier attack on the community on May 31," the report said.

Implementation road map to expedite agricultural and rural modernization

China's newly unveiled plan for agricultural and rural modernization during the 15th Five-Year Plan (2026-30) period represents a shift to managing complex structural transformation related to a sector of strategic importance to the nation.

The plan issued by the State Council, China's Cabinet, on Tuesday signals rural modernization is entering a crucial phase in which goals, timelines and responsibilities have become more clearly defined.

China's countryside faces two demographic forces: aging and urbanization. Labor mobility has been one of the engines of China's economic rise. The challenge now lies in managing its consequences. The country's urbanization rate has reached 67 percent and is expected to touch 70 percent by the end of the decade. The question is no longer how to encourage migration from villages to cities, a process that creates jobs and growth. It is how to ensure that rural residents enjoy rising incomes, quality public services and more self-improvement opportunities.

The urban-rural income ratio remains above 2.3, meaning rural residents still earn less than half as much as their urban counterparts on average, despite the gap narrowing considerably. The plan's focus on raising farmers' incomes through county-level industrial development, stronger property rights protection, wage growth for migrant workers and other targeted support policies therefore reflects a development imperative that is central to the modernization of people.

Yet that is only one part of the challenge.

The productivity model that supported China's agricultural development over the past decades is also approaching a point with diminishing marginal effects. As the country enters a stage of deepening rural reform, the focus is shifting to high-quality, comprehensive structural optimization. Future growth should increasingly come from improvements in total factor productivity rather than from additional inputs.

This is where the challenge becomes more complex. The country must feed about 17 percent of the global population with less than 9 percent of the world's arable land, while rising labor costs, tightening environmental constraints and increasingly strict protection of water resources make a transition from labor-intensive growth toward technology-driven efficiency gains a pressing task.

Faster adoption of technology has continued to lift agricultural productivity in China in recent years. In 2025, China's grain production reached about 714.9 million tonnes, marking the second straight year when grain output stayed above 700 million tonnes. Last year, the contribution rate of agricultural scientific and technological progress exceeded 64 percent, while the comprehensive mechanization rate of crop cultivation and harvesting reached 76.7 percent.

The new plan has set an anticipatory target of raising the contribution rate of sci-tech progress in boosting agricultural development to 67 percent by 2030. New generations of agricultural technologies should therefore become more land-saving, resource-efficient and environmentally sustainable. Yet such innovations require substantial investment, long development cycles and widespread adoption by farmers.

Land reform presents another difficult test. Greater efficiency requires more effective land-use arrangements and more mature land-transfer markets. Yet the rural reality in many regions remains characterized by fragmented landholdings, part-time farming and short-term land transfers. Achieving economies of scale without changing that pattern is no simple task.

For many elderly rural residents, farmland remains their major source of income. Policymakers must balance productivity gains against the need to protect vulnerable groups from losing land.

Environmental constraints add another layer of complexity. Agriculture sits at the intersection of food production, resource use, extreme weather responses and emissions reduction. Higher yields often require greater inputs, while greener production methods can involve higher costs and slower adoption. Balancing food security, farmer incomes and environmental sustainability will require careful policy coordination.

Perhaps the most difficult challenge lies in implementation itself. Rural modernization increasingly depends on institutional innovation. Technological progress, financial reform, land policy, social security, environmental protection and public service provision should operate as an integrated system in the process.

The next round of reform necessitates deeper adjustments to land institutions, rural finance and social welfare systems. These are inherently more challenging because they touch upon entrenched interests and long-standing structural arrangements. The new plan, if well implemented, will be conducive to better enabling the country to tackle the above challenges so as to create a rural economy that is systematically productive, environmentally sustainable, socially inclusive and resilient to external uncertainties and risks.

Key infrastructure unlocks trade potential

A crucial component of the New International Land-Sea Trade Corridor, the Pinglu Canal is a monumental Chinese infrastructure project designed to enhance trade connectivity between China and the members of the Association of Southeast Asian Nations. The completion of the canal's full water filling on Wednesday represents a key step toward its planned opening for full navigation in September.

The flagship project with an investment of $10.2 billion under China's strategy to develop the Guangxi Zhuang autonomous region and Yunnan province is a gateway to and for ASEAN. Stretching 134.2 kilometers from Nanning to Qinzhou Port facing the Beibu Gulf, the canal is the first direct river-to-sea canal project since the founding of the People's Republic of China. Connecting the upper reaches of the Xijiang River system directly to the sea, the canal provides a more cost-effective alternative route to the traditional, longer route via Guangdong province for vessels up to 5,000 tonnes. It is estimated that it will save 5.2 billion yuan ($753 million) a year in logistics costs.

The canal's effect on Guangxi and the broader southwestern interior will be transformative, as it will give the landlocked provinces of Sichuan, Yunnan and Guizhou more convenient access to the sea, accelerating their integration into global value chains, enabling Guangxi to better leverage its geographic advantage as a connector of Southeast Asia.

As logistics costs decrease, port-oriented industries focused on bulk raw materials, heavy chemical industries, and equipment manufacturing are expected to gather along the canal. Convenient transportation via the canal will help meet the increasing needs of the fast-developing manufacturing in Southeast Asian countries, such as Vietnam, which have a growing demand for equipment and raw materials. The canal will thus serve to strengthen supply chains in the region. And since the canal covers major agricultural production areas, it will also contribute to agricultural modernization and rural vitalization. All this will help upgrade the regional development landscape during the 15th Five-Year Plan (2026-30) period.

The Pinglu Canal fits into the broader picture of China's infrastructure development strategy, which aims to enhance internal connectivity and strengthen international trade routes. Aligned with the country's long-term commitment to investing in infrastructure that supports both domestic development and international cooperation, the ambition of the Pinglu Canal invites comparison with another Guangxi marvel: the Lingqu Canal, constructed in 214 BC. As one of China's oldest canals, Lingqu played a crucial role in connecting the Yangtze and Pearl river systems, fostering cultural and ethnic integration.

But while the Lingqu Canal facilitated internal connection, the Pinglu Canal project promotes regional integration. Once fully operational, the canal is expected to alter trade dynamics in the region. It will present opportunities for businesses and industries that rely on trade between China and ASEAN countries, leading to anticipated increases in trade volumes and economic growth.

In essence, the Pinglu Canal is not merely a new route on a map. It is a strategic instrument that converts geographic proximity into economic gravity, promising to accelerate China's "dual circulation" development pattern while forging a more integrated, prosperous and interconnected future for Southeast Asia.

The scale of the project is extraordinary. An engineering feat that showcases China's capabilities in large-scale infrastructure development, Pinglu is the highest-grade navigable canal in China and one of the largest earth and rockwork projects of its kind in the country in recent years. It required the excavation of approximately 315 million cubic meters of material. When fully operational, the canal has the potential to shape a more connected and prosperous future for the region.

Luo Jie

Opinion Line

Tokyo's possible fighter jet funds offer revealing of ulterior motive

Japan, the United Kingdom and Italy joining forces to build a sixth-generation fighter jet by 2035 was supposed to be a "win-win partnership" for the three. Yet the UK's reported funding troubles have exposed an inconvenient truth. The so-called Global Combat Air Program increasingly looks less like an equal "partnership" and more like a vehicle for Japan's military ambitions.

Tokyo has generally kept a low profile about the deeper implications of the GCAP. Officially, the program is presented as a response to a "deteriorating security environment" and what Tokyo calls "the need to deter China". Yet as the UK struggles with budget constraints and Italy weighs its role, Japan appears prepared to shoulder a larger share of the burden, particularly during the critical early development phase, as some Japanese officials implied in recent interviews, showing Tokyo's anxiety about the "premature death" of the program.

That raises an obvious question: What exactly is Japan buying? The answer may not simply be an aircraft.

The GCAP offers Japan something it has sought for decades: advanced European aerospace know-how, experience in cutting-edge fighter development and the industrial foundation necessary for long-term self-reliance in military aviation. For a country seeking to emerge from postwar constraints, the attraction is obvious.

Japanese officials increasingly talk of expanding weapons exports. Restrictions that once limited overseas arms sales have been steadily loosened. The fighter program is therefore not merely about replacing aging F-2 aircraft. It is about creating the technological and industrial infrastructure necessary for Japan to become a major exporter of more advanced weapons in the future. With its strengths in shipbuilding and advanced manufacturing, the country is already exporting warships.

But history suggests that the world must be cautious whenever Japan markets its military expansion as a purely "defensive" exercise.

Invoking "external threats" to justify military buildup has long been a recurring tactic of Japanese militarism. Japan's military budget has reached record levels. Missile deployments are expanding, export restrictions on lethal weapons are being relaxed and constitutional revisions remain a persistent objective among Japanese right-wing politicians.

What makes the GCAP particularly significant is its expanding international scope. Canada, Australia, Germany, Sweden, Saudi Arabia and others have all been mentioned as potential participants or customers. If the UK's financial difficulties create a vacuum, Japan might seek additional partners to sustain momentum and expand the manufacturing program into a manufacturer-consumer complex, which is essentially a sophisticated technology acquisition strategy backed by generous Japanese funding.

Given the rise of neo-militarism in Japan, foreign governments would be wise to ask hard questions about the consequences of exposing some of their most advanced military technologies to Japan. Countries joining the GCAP are not entering a politically neutral project. They are participating in a strategic endeavor that regional countries in the Asia-Pacific view through the lens of Japan's past aggression.

The GCAP is deliberately designed to be outside the US military-industrial complex despite Japan's decades-long dependence on US weapons platforms and security guarantees. For Washington, that should be a revealing signal. The fighter program is about acquiring the technological and industrial independence necessary to reduce reliance on US arms in the future. For the right-wing forces advocating the "normalization" of Japan, the ultimate objective is to restore Japan as an autonomous military power capable of acting independently of the US. Japan rarely remains content as a junior partner indefinitely.

The question facing Japan's partners is whether they fully understand the destination before helping finance the journey with their experience and technology that will actually help reboot Japan's war machine.

— LI YANG, CHINA DAILY

What They Say

Quota reform will help bolster IMF's credibility

Editor's note: *The reform of international organizations, including financial institutions such as the International Monetary Fund, has become a major topic of multilateral discussions due to the changing global economic landscape and the growing volatility in the international order. Lin Jianhai, former secretary of the IMF, told Securities Times that it is imperative to advance the organization's quota reform. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The international economic governance system has evolved over the past several decades, but its inherent contradictions and structural problems have not been resolved.

This is mainly reflected in the growing underrepresentation in the governance structure, increased fragmentation of multilateral mechanisms, the growing effect of geopolitical competition on global cooperation, and the higher demands imposed on the existing governance system by the rapidly developing emerging sectors.

Against such a backdrop, promoting the reform and restructuring of the global governance system, rebuilding consensus for international cooperation and enabling emerging markets and developing countries to secure a more influential voice have become central topics of international economic governance.

Various international organizations, especially financial institutions, need to accelerate the reform of their governance structures and properly adjust the voting power and representation of their members.

It is essential to establish a fairer financing mechanism geared toward sustainable development, and pay greater attention to developing countries' access to financing and the sustainability of their debt.

Efforts should focus on modernizing and aligning rules related to areas such as the digital economy, climate governance, green finance and energy transition. It's also necessary to strengthen coordination of macroeconomic policies to enhance the resilience of the global economy.

Institutions such as the IMF, World Bank and the World Trade Organization should play a core role in this process. They need to adapt to the changes occurring in the global economy, and collaborate with developing countries in global economic governance, instead of simply providing assistance to these countries.

Emerging economies, for their part, should play a more active role in governance reform and implement relevant policies more vigorously to help build a fairer and more effective governance system.

Understanding how quotas work is central to comprehending the IMF's operations. Each member state is assigned a quota upon joining the organization. This quota is denominated in special drawing rights, or SDRs, and reflects the country's position in the global economy. The quota also determines the member's contribution commitment to the IMF. By the end of 2025, the countries with the largest quotas were the United States, Japan and China.

The quota caps the amount a member can borrow from the institution, determines its voting power, and sets its share in the allocation of SDRs. The larger the quota, the greater the voting power. That explains why quota reform helps elevate the voice and representation of emerging markets and developing countries.

While intensified geoeconomic competition presents substantial challenges to the IMF's quota and governance reform in the short run, such reform is imperative. As the significance of emerging markets and developing countries in the global economy increases, the IMF should grant them matching representation and voting powers. This reform will benefit not only these economies but also bolster the IMF's legitimacy, credibility and effectiveness, thus facilitating sustained and robust growth of the global economy.

Iran war pushing focus away from fossil fuels

The Iran war has led to many unintended consequences. The US and Israeli airstrikes have left more than three thousand Iranians dead and many more injured. In addition, the bombings have caused extensive economic damage. Lebanon has also suffered numerous casualties and substantial economic losses.

While the United States and Iran are discussing a proposed 60-day extension of an uneasy ceasefire, its failure would likely have many consequences, affecting not only the countries directly involved but also others beyond the conflict. In fact, the conflict has already contributed to one of the greatest energy disruptions in modern history.

Before the war, in late February, Brent crude oil, the global benchmark, was trading at around $70-73 per barrel. In recent days, prices have exceeded $100 per barrel. As a result, energy import bills have skyrocketed. Moreover, since many Asian countries depend heavily on oil imports passing through the Strait of Hormuz, their energy supplies have been severely disrupted.

China, because of its long-term planning, maintains substantial oil and gas reserves and has been managing import shortages relatively effectively.

However, other Asian economies are now under severe strain due to rising energy prices and major supply chain disruptions.

Consequently, they are experiencing declining foreign exchange reserves, weakening currencies, higher inflation and reduced economic activity. This has forced governments to implement energy rationing, raise retail fuel prices and seek more expensive alternative energy sources.

For example, in Bangladesh, manufacturing costs for garments have reportedly risen by around 40 percent. Liquefied natural gas prices have nearly doubled compared to prewar levels, costing the country approximately $880 million.

The longer the war continues, the greater the likely economic, social and political damage for oil-importing countries. Much of the world was already transitioning toward renewable energy for both economic and environmental reasons.

However, the energy insecurity resulting from the Iran war, especially due to the closure of the Strait of Hormuz, has focused global attention on the importance of domestic control over electricity generation and reducing dependence on oil and gas imported from volatile regions through risky transportation routes.

Not surprisingly, Republic of Korea President Lee Jae-myung observed that the ROK needs to transition to renewable resources quickly. Lee stated that the future may be extremely risky, if the country relies on fossil fuel energy.

Many other countries have reached similar conclusions. Vietnam, for example, has already shelved plans for a major new liquefied natural gas terminal, while proposals for renewable energy expansion are now under consideration.

Pakistan has become a major user of rooftop solar electricity systems because electricity supplies have long been unreliable and millions of people still lack access to the national grid.

As electricity prices continue to rise because of the war, an increasing number of households are likely to adopt rooftop solar power generation.

In India, solar energy accounted for 9 percent of electricity generation in 2025, compared to only 0.5 percent a decade earlier. Considering that fuel prices in the country have increased at least three times in less than three weeks, its adoption of solar energy, electric vehicles and battery technologies is likely to accelerate further.

The Iran war has also imposed major costs on US consumers. According to The New York Times, the additional amount US citizens collectively spent on gasoline and diesel following the US and Israeli attacks on Iran reached an estimated $44.8 billion.

However, the US remains the only major country actively resisting the transition to clean energy while continuing to promote fossil fuels and coal.

In China, the government made EV research a national priority in 2001. A quarter-century later, China's long-term investments in green technology appear highly astute.

China, which now has between 60 and 85 percent of the global renewable energy equipment market, is rapidly evolving into an electrostate, while the US appears increasingly committed to remaining a petrostate.

Continuous innovation has also made EVs increasingly cost-competitive relative to conventional vehicles, after taking charging times and the distance vehicles can travel before recharging or refueling into account.

In the US, the average price of a new EV now exceeds $50,000, compared to $36,000 only a decade ago. In contrast, Chinese companies such as BYD and Geely offer some vehicles priced below $12,000. BYD, the world's largest EV manufacturer, reduced its average selling price from 143,000 yuan ($21,107) in 2021 to 119,225 yuan in 2025 because of continuous innovation, strict cost control, streamlined manufacturing and intense competition.

Interestingly, BYD's electric bus plant in California can reportedly produce buses at costs 30 percent lower than comparable US manufacturers, even though each bus contains approximately 70 percent US content by value.

In 2025, China's EV exports nearly doubled to 2.6 million units compared to the previous year. Nearly half of these vehicles were produced overseas in one of the 16 countries where Chinese companies either already operate or are planning manufacturing facilities. By 2035, these overseas plants are expected to produce 3.4 million units annually.

The International Energy Agency estimates that global EV sales surpassed 20 million units in 2025, representing nearly a sevenfold increase since 2020. Following the Iran war, global EV demand is likely to accelerate even more rapidly.

Chinese automotive companies are now actively exploring the establishment of manufacturing plants in Canada, Mexico, the European Union and several Asian, African and Latin American countries. These developments reflect a growing global perception that dependence on oil, once referred to as "black gold", has become increasingly incompatible with sustainable economic development and environmental protection.

China's long-term commitment to clean energy is now generating enormous economic returns.

China has transformed one of humanity's greatest challenges, climate change, into a major economic opportunity from which it is likely to derive significant economic and environmental benefits for decades to come.

SHI YU / CHINA DAILY

Zhao Jing

Classrooms are the original diplomacy

On May 16, I found myself at the Gies Memorial Stadium at the University of Illinois Urbana-Champaign, watching my daughter's graduation ceremony. The commencement speaker was Sean Evans, host of *Hot Ones* and a recent addition to TIME magazine's inaugural TIME100 Creators list of the 100 most influential digital voices.

The next day, I attended a more intimate ceremony at the Krannert Center, where graduates were called by name one by one. What struck me, and every parent there, was the frequency of Chinese names being called.

Families cheered, grandparents who had crossed the Pacific lifted their phones with trembling hands, mothers wept and fathers waved orange-and-blue banners. For a few days, the cornfields of central Illinois resonated with the sound of Mandarin and the unmistakable language of pride.

Such scenes are not surprising at UIUC. With nearly 6,000 Chinese students enrolled last year, it hosts one of the largest Chinese student communities at any university in the United States. Chinese students make up roughly half of UIUC's entire international population, and about one in 10 of all students on campus.

These scenes are replicated across campuses from Boston to Los Angeles, and from New York to Chicago. They may get overlooked because tariffs and summits dominate the headlines, but they are, in their own quiet way, the most important interactions between China and the US.

For nearly 30 years, I have worked to build bridges between the two countries through students, scholars, business delegations, and people who have grown up with very different assumptions.

Throughout this time, I have seen the relationship between Beijing and Washington fluctuate between warmth, suspicion, hope, and tension. What I have learned is that policies shift with each election cycle, but the human bonds formed in classrooms and dormitories endure. They are the strongest infrastructure of peace we have.

This is why US President Donald Trump's remarks during his recent state visit to Beijing deserve more attention. In a Fox News interview broadcast from Beijing, the US president countered voices within his political base by saying, "It's a very insulting thing to tell a country we don't want your people in our schools." He noted that if Chinese students stopped coming, lower-tier US universities would be hit hardest. His proposal to admit up to 600,000 Chinese students — more than double the current enrollment — may be ambitious, but it is based on a sound principle.

The numbers tell a sobering story. According to the Institute of International Education's Open Doors report, the US hosted a record 1.18 million international students in the 2024-25 academic year, contributing nearly $55 billion to the US economy and supporting more than 355,000 jobs in the country.

But within that record total, Chinese enrollment has been declining. At its peak in 2019-20, roughly 372,000 Chinese students were studying in the US. By 2024-25, that figure had fallen to 265,919 — a decline of nearly 29 percent in five years. For the first time since 2009, India has surpassed China as the largest source of international students, with 363,019 students. New international enrollments in fall 2025 dropped 17 percent year over year.

The reasons for the decline are complex: the pandemic, visa issues, public discourse that often treats Chinese students as suspects rather than guests, the rise of excellent Chinese universities at home, and families' concerns about whether their children will be safe and welcomed.

For the US, this drop is not abstract. In Illinois alone, international students contributed $2.4 billion to the state economy in 2023-24. Their tuition dollars subsidize US classmates, they fill graduate programs in fields such as engineering, computer science and mathematics, and their research contributes to US patents and companies.

However, the deeper loss is not financial, but human. Over the decades, I have witnessed countless friendships between Chinese and US students — friendships that have outlasted graduations, weddings, career changes, and the chill of headlines. None of these relationships made the news. But all of them are the news, if we know how to read it.

In November 2023, President Xi Jinping invited 50,000 young Americans to visit China on exchange programs over five years. Thousands have already made the journey, learning the language, meeting families, and exploring places their grandparents could never have imagined visiting. This is the architecture of peace being built, one student at a time.

Education is the original form of diplomacy. It predates treaties and outlasts them. A trade agreement can be renegotiated in an afternoon; a friendship formed in a freshman dormitory can last 50 years, quietly shaping decisions in boardrooms and government offices long after the diploma is framed.

The graduation ceremonies taking place across the US this month are not just personal milestones. They are evidence of a partnership that, despite every obstacle, refuses to break. Each Chinese graduate who walks across that stage carries home a piece of the US. Each US classmate who waves goodbye carries home a piece of China. These exchanges do not eliminate disagreements between the two governments, but they form the human ballast that keeps disagreements from hardening into hostility.

President Trump was right to highlight this issue in Beijing. The challenge now, on both sides of the Pacific, is to ensure that words lead to open doors, fair visas, and the unassuming work of welcoming young people who have come a very long way to learn.

When my daughter's name was called at the Krannert Center, I thought of all the families around me. The future was sitting in those seats. We owe it to them — and to ourselves — to keep the doors open.

The inconvenient truths about the Ebola crisis

For weeks, the latest Ebola outbreak in Central Africa was seen as a regional emergency. But now there is mounting evidence that the outbreak may be broader, more fragmented and entrenched than initially believed. On Saturday, WHO Director-General Tedros Adhanom Ghebreyesus visited Bunia in the Democratic Republic of Congo, where the virus is spreading faster than the response.

The crisis is centered in eastern Congo, with spillovers into Uganda and rising concern across neighboring countries. Official numbers remain uncertain because surveillance systems in conflict zones are incomplete.

The outbreak circulated for weeks, perhaps longer, before it was fully recognized. By the time authorities moved aggressively, transmission chains may have spread across borders, refugee corridors and informal trade networks.

The danger does not lie primarily in the current number of cases, which is far lower than COVID-19 or the 2014-16 Ebola outbreak in West Africa.

The danger is that the present crisis is unfolding under unusually adverse conditions: war, displacement, urbanization, weak public health systems, declining international aid capacity and growing mistrust of authorities.

"Never before has an Ebola outbreak recorded so many cases so soon after its declaration," the medical charity Médecins Sans Frontières has warned.

Historically, Ebola outbreaks have remained geographically concentrated. Although the virus is highly lethal, it is relatively difficult to transmit compared with airborne respiratory diseases.

Eastern Congo is one of the most difficult environments in the world for epidemic control. Armed militias, population displacement and attacks on medical facilities undermine contact tracing and isolation efforts. Informal border crossings are extensive.

Urban growth has accelerated faster than health infrastructure. In some affected regions, public trust in government and foreign health interventions is extremely weak.

Moreover, the current outbreak involves the Bundibugyo strain of Ebola, for which no fully established licensed vaccine exists comparable to those deployed against the Zaire strain during previous outbreaks. That sharply complicates containment.

One of the least understood aspects of the present outbreak concerns contagion linkages beyond immediate epidemiology. Let's start with physical contagion networks. Eastern Africa's transport corridors increasingly connect local outbreaks to regional and global mobility systems.

Cities like Kampala, Kigali and Nairobi are no longer isolated peripheral centers. They are integrated into international aviation and trade flows linking Africa to the Gulf, Europe and Asia.

Then comes the institutional contagion effect. Fragile health systems already weakened by debt burdens, inflation and post-pandemic exhaustion are struggling to absorb another major shock, particularly in sub-Saharan Africa.

The psychological and economic contagion adds to the problem. Financial markets, tourism flows, commodity exports and investment patterns can react violently even to limited outbreaks if fears of wider transmission intensify. The 2014-16 Ebola crisis demonstrated how panic itself can generate severe economic damage regardless of the actual epidemiological scale.

Finally, geopolitical contagion can be devastating. In a fragmented multipolar world, global health crises increasingly intersect with strategic competition, sanctions, debt restructuring and security concerns. Epidemics no longer operate outside geopolitics; they amplify it.

One of the most consequential dimensions of the current Ebola crisis concerns the partial retreat of the US and Western international health support over recent years.

US funding cuts and shifting priorities have weakened several pillars of global epidemic preparedness, including surveillance systems, laboratory support, emergency logistics and NGO operations across vulnerable regions. The abrupt manner in which these cuts were executed compounded the negative effects.

The retreat of preventive international health capacity increases the probability of far costlier future global emergencies.

The first and most likely scenario is a severe but regionally contained epidemic. The outbreak could produce thousands or even tens of thousands of cases regionally, while devastating local economies and healthcare systems.

In this case, intensified international response efforts eventually stabilize transmission through traditional Ebola control measures: isolation, tracing, border monitoring and behavioral adaptation. For now, this is the most likely scenario.

The second scenario involves a wider multinational African epidemic. This becomes plausible if transmission becomes embedded along mobility corridors linking Congo, Uganda, Rwanda, Kenya, Tanzania and beyond. Refugee flows, mining routes and informal commerce networks could facilitate wider regional spread.

In this case, Ebola would remain primarily an African crisis, but one with major global economic, humanitarian and geopolitical repercussions.

The third scenario — a true global pandemic transition — remains unlikely but cannot be dismissed entirely. Sustained international spread would likely require repeated exportation into major cities combined with failures in hospital containment and perhaps viral adaptation toward easier transmission.

There is currently no evidence of such adaptation. Nevertheless, prolonged uncontrolled transmission increases evolutionary opportunities and magnifies systemic risk.

The failure to contain the Ebola crisis in its early stages suggests that the lessons of the COVID-19 pandemic have not been learned.

The present Ebola crisis has not become a global pandemic threat comparable to COVID-19, and public health officials hope it will remain regionally concentrated despite severe humanitarian consequences.

However, the world today is less institutionally cohesive, less politically cooperative and less strategically prepared for transnational crises than it was just a decade ago.

Pandemic fatigue, geopolitical rivalry and fiscal retrenchment have weakened the mechanisms needed for early containment.

Infectious disease containment operates on a simple principle: outbreaks are cheapest to stop at the periphery.

Once they reach major urban systems and international mobility corridors, costs rise exponentially. It is a rule the international community can ignore at its peril.

GLOBAL VIEWS

NISIT PANTHAMIT, PAISARN PANTHAMITR AND NITCHANAT PHENGPHUM

Funding the fintech future

China's digital finance is oriented toward the real economy, shedding light on that of other Global South countries

MA HUI / FOR CHINA DAILY

Nisit Panthamit

Paisarn Panthamitr

Nitchanat Phengphum

The next phase of global development will not be decided by trade corridors alone. It will be determined by how effectively financial systems integrate with technology. In this respect, China's outline of the 15th Five-Year Plan (2026-30) for national economic and social development sends a clear signal: finance is becoming an active engine of economic growth.

This shift matters far beyond China. For other countries across the Global South, the real question is no longer whether to adopt digital finance, but how to do so in a way that is inclusive, resilient and aligned with domestic development priorities. China's experience offers a compelling answer — not as a template to copy, but as a framework to adapt.

For decades, one of the biggest challenges for developing economies has been financial exclusion. Traditional banking systems are costly to build, slow to expand and often concentrated in urban areas. As a result, millions remain outside formal financial networks, limiting both household welfare and business growth.

China has made substantial progress in overcoming this constraint. Through mobile payments, digital platforms and data-driven credit systems, it has transformed financial access into a scalable public good. This is a transformation driven not by market forces alone, but by deliberate national strategy embedded in successive five-year plans.

The lesson for other Global South countries is straightforward but powerful: digital finance does not just complement traditional banking — it can function as a transformative force to improve the whole banking system. Thailand and Indonesia have already demonstrated this potential. Thailand's PromptPay system and Indonesia's QRIS infrastructure have significantly reduced transaction costs and expanded access to financial services. In October 2025, Thailand launched a direct cross-border QR payment service with China — a milestone linking the two countries' instant retail payment systems to foster greater integration in trade, investment and tourism. Yet deeper transformation lies ahead: integrating these systems into a broader digital financial architecture that reaches informal sectors, rural communities and small enterprises.

The global financial system is entering a period of fragmentation. Geopolitical tensions, risks of sanctions and currency volatility are reshaping how countries think about financial dependence. For many developing economies, reliance on external clearing systems, particularly those dominated by the US dollar, creates vulnerabilities that are increasingly difficult to ignore.

China's response has been proactive. By expanding cross-border renminbi settlement, advancing the digital renminbi and developing independent fintech platforms, it is building alternative channels for financial interaction. According to the People's Bank of China, as of the end of November 2025, China had recorded 3.48 billion cumulative digital renminbi transactions worth approximately $2.37 trillion — this is no longer an experiment.

For other Global South countries, the ability to diversify payment systems, settle trade in local currencies and reduce exposure to external shocks enhances both economic resilience and policy autonomy. The Association of Southeast Asian Nations' growing emphasis on local currency settlement reflects this shift. Technology is the enabler that makes it viable at scale, and Thailand and Indonesia — as two of the region's most digitally advanced economies — are well positioned to lead.

Perhaps the most important aspect of China's fintech policy is its orientation toward the real economy. Unlike models that prioritize financial liberalization or speculative innovation, China emphasizes the role of finance in supporting industrial upgrading, technological innovation and rural development.

Many developing economies have experienced the risks of premature financialization, where financial expansion outpaces productive capacity. China's approach suggests a different path: fintech is not an end in itself, but a tool to channel capital into sectors that generate long-term value.

In Thailand, this could mean leveraging digital finance to strengthen small and medium-sized enterprises, agricultural supply chains and tourism-related services, sectors that form the backbone of the economy. In Indonesia, it could involve deeper integration between fintech platforms and manufacturing or green energy initiatives. The ASEAN-China Free Trade Area Version 3.0 goes beyond tariff reduction to address digital integration, with e-payment systems taking center stage. Successful tech-finance ecosystems are not imported, but built around local economic structures.

China's role in global fintech is not confined to its domestic market. Through the Belt and Road Initiative, the Asian Infrastructure Investment Bank and BRICS cooperation, it is actively sharing financial technology solutions with other developing economies. In May 2026, China and ASEAN launched the China-ASEAN Artificial Intelligence Industry Innovation Center, aimed at building a shared digital ecosystem with harmonized data governance and interoperability.

What distinguishes this model is its pragmatism. It is typically demand-driven, focused on implementation and less constrained by the policy conditionalities that have traditionally accompanied development assistance. In Southeast Asia, Chinese fintech firms have already contributed to improving efficiency in local financial systems. The next step is to move from bilateral projects to integrated regional ecosystems.

ASEAN is uniquely positioned to translate these ideas into reality. The region combines high digital adoption, strong trade linkages and ongoing policy coordination. Initiatives such as regional payment connectivity are already laying the groundwork for deeper financial integration.

Thailand and Indonesia stand out as key nodes in this process. Thailand's interoperable payment systems, anchored by PromptPay and its cross-border QR linkage with China, and Indonesia's rapidly expanding digital economy provide complementary strengths. Together, they illustrate how tech-finance can move from concept to implementation at a regional scale.

The opportunity now is to scale up. This means going beyond payments to include digital identity systems, cross-border credit frameworks and regulatory harmonization. The broader lesson from Southeast Asia's payment revolution is clear: Seamless small-value transactions make trade and commerce more efficient, and the region is developing an ASEAN-wide QR framework with the potential to make paying abroad as easy as paying at home.

China's financial development during the 15th Five-Year Plan period can mark a shift from financial expansion to financial transformation. Technology is no longer peripheral — it is central to how finance operates, evolves and contributes to growth.

For the whole Global South, this may represent a strategic inflection point. The tools for building inclusive and resilient financial systems are more accessible than ever. The cost of inaction, however, is rising. Countries that fail to integrate into emerging digital financial architectures risk falling further behind.

The choice is not between adopting China's model and maintaining the status quo. It is between engaging with a rapidly evolving financial paradigm and being constrained by outdated systems. Fintech is not a future possibility — it is a present reality.

In this new landscape, those who move first will shape the rules; those who hesitate will follow them.

LU JIAJUN AND WANG SHANGYU

Beyond buildings to neighborhoods

Quality homes should anchor China's property transition toward better standards, stronger renewal and more sustainable growth

SHI YU / CHINA DAILY

Lu Jiajun

Wang Shangyu

The call for "quality homes" in this year's Government Work Report represents an important policy shift. But without institutional changes, the concept risks remaining a policy slogan or, worse, being absorbed into the marketing language of high-end projects.

At present, the gap is clear: While demand has upgraded toward housing that is safe, comfortable, green and smart, the supply system remains largely anchored in the old model of scale expansion and rapid turnover, including land allocation, development incentives and financing structures. As a result, the policy emphasis on "quality" risks being diluted by mechanisms still rewarding quantity.

The first priority, therefore, is to embed quality into the rules of supply, rather than leaving it to voluntary developer behavior. Land transactions should move beyond price competition and incorporate binding quality indicators, including design standards, environmental performance and livability metrics. Planning and approval processes should shift their focus accordingly, from floor area and density to aspects such as layout efficiency, sound insulation, ventilation and age-friendly design.

More importantly, regulatory oversight should extend to the delivery stage, ensuring that quality commitments made at the planning phase are enforceable and verifiable. Without such institutionalization, the "quality homes" policy cannot form a stable expectation in the market. A useful international reference is Singapore, where sustainability and quality benchmarks are integrated into land supply and development requirements from the outset. The key lesson is not replication, but sequencing: Quality must be defined ex ante in the system, not added ex post in sales narratives.

The second priority is to avoid narrowing "quality homes" to only new, premium housing supply. Such an interpretation would significantly limit its policy relevance. In China's current stage of urbanization, the marginal improvement in living standards increasingly comes from upgrading existing neighborhoods rather than building entirely new ones. This implies a necessary shift from a "new construction-centered" approach to a "stock optimization-centered" model. Urban renewal, renovation of aging residential compounds, redevelopment of urban villages and age-friendly retrofitting should become the main carriers of "quality improvement". In this context, housing quality is inseparable from community quality. The experience of Chongqing's Taping renewal project illustrates this direction. Covering 44 residential buildings and benefiting 1,487 households, the project took some of the residents' most pressing concerns as its main targets, including undergrounding overhead utility lines, removing safety hazards and separating rainwater from sewage, while also advancing housing renovation, the construction of small public activity squares and the provision of a community canteen. This case shows how broad policy goals can be translated into concrete, resident-oriented interventions at the neighborhood level. This highlights a critical point: Quality housing is increasingly delivered through systemic neighborhood improvement, not isolated building upgrades.

The third priority is to realign financial structures with the new development logic. The traditional financing model, which is heavily reliant on presales and rapid capital turnover, was built for an era of high-speed expansion, but it is poorly suited to a system now centered on delivery assurance, long-term operation and gradual renewal. What is needed is not simply more financing, but a fundamentally different kind of financing, one that prioritizes stability over liquidity and long-term value over short-term returns. Both medium- and long-term capital should be systematically directed toward project completion, urban renewal, energy-efficiency upgrades and community infrastructure. Achieving this requires financial instruments such as infrastructure investment funds, green bonds and long-term leasing vehicles, as well as regulatory frameworks that incentivize patient capital and support longer investment horizons with more stable, predictable returns.

Recent policy signals are moving in this direction. The further use of the "white list" mechanism and guidance from the National Administration of Financial Regulation suggest an effort to improve financing support for viable projects under the new model. Meanwhile, practices in Guangzhou demonstrate a shift from "sales-driven finance" to "delivery- and renewal-oriented finance". Fifty-two approved special-loan projects for urban village redevelopment have already entered the stage of substantive construction, with total credit reaching 409.6 billion yuan ($59.3 billion). The funds have been directed toward early-stage project work, compensation and resettlement, the construction of resettlement housing and supporting infrastructure for resettlement communities. What matters here is not simply the scale of funding, but the fact that financing is being channeled toward delivery, resettlement and supporting facilities rather than short-term sales expansion. This transition is essential if quality improvement is to be sustained rather than episodic.

Ultimately, the significance of the "quality homes" policy lies in whether it can serve as a structural anchor for the real estate sector's transition and whether it can connect micro-level well-being with macro-level objectives such as urban renewal, new-type urbanization and high-quality development. This connection will not materialize automatically. It depends on whether the concept is translated into binding supply rules, a rebalanced focus on stock renewal and a compatible financial system. If these three dimensions advance together, "quality homes" can move beyond rhetoric and become the foundation of a more resilient and sustainable real estate model. Otherwise, it risks becoming just another policy phrase in a sector still searching for its next equilibrium.

Rare disease seen as innovation frontier

Diagnosis network nationwide, policy incentives boost sector's progress

By ZHANG CHENXU
zhangchenxu@chinadaily.com.cn

Doctors provide rare disease medical consultation at a free clinic in Guiyang, Guizhou province. TAO LIANG / XINHUA

China's rare disease sector is entering a strategic window for biomedical innovation, as the country's expanding diagnosis network and relatively large unmet medical needs create new momentum for drug development, clinical translation and payment support mechanisms, a top rare disease expert said.

Zhang Shuyang, president of Peking Union Medical College Hospital (PUMCH), told China Daily that rare diseases should not be seen only as a public health and livelihood issue, but also as a promising field for biomedical innovation, with the potential to support new growth drivers in healthcare and advance the Healthy China 2030 initiative.

To seize that opportunity, China needs stronger policy incentives, more efficient clinical translation and a more sustainable payment mechanism to ensure innovative therapies can better help patients, Zhang said.

The challenge is acute. About 95 percent of rare diseases still lack effective therapies, leaving many patients with limited treatment options while pointing to a large unmet need for drug innovation, she said.

"Rare disease drug research and development is not only about addressing the needs of a small patient group. A deeper understanding of rare disease mechanisms can offer important clues for tackling major diseases, chronic conditions and aging," Zhang said.

China has built up an important foundation for innovation through its national rare disease diagnosis and treatment network. Led by PUMCH, the network now covers 419 member hospitals and extends to provincial and prefecture-level institutions, helping patients obtain clearer referral channels and more standardized services.

"We integrate resources around patients' needs so that information, experts and resources move around the patient, rather than leaving patients to run from one place to another," Zhang said.

She added that the model is replicable and could support a tiered national system, with national centers as hubs, provincial centers as nodes, and grassroots medical institutions as frontline units. Such a system would narrow regional gaps and improve early screening, diagnosis and intervention.

Zhang Shuyang

Meanwhile, artificial intelligence is adding new momentum to rare disease diagnosis, a field long challenged by the large number of disease types, complex clinical manifestations and scattered patient cases. PUMCH has launched its rare disease AI model "PUMCH-GENESIS", based on high-quality Chinese clinical data and accumulated clinical experience.

The model is designed to help doctors identify suspected rare diseases from complex symptoms and serve as a round-the-clock training tool for primary-level and early-career physicians. AI cannot replace doctors, Zhang said, but it can integrate medical knowledge, recognize complex patterns and support cross-case analysis.

In recent years, policy support has been further intensified in China for rare disease control and treatment. In 2025, the country approved 48 rare disease drugs, helping address treatment gaps for special patient groups, said the National Medical Products Administration.

Chu Lei, senior researcher at the Healthcare Executive Institute, said there is a trend of Chinese pharmaceutical companies developing and launching more rare disease medicines, covering both innovative and generic drugs.

Among the rare disease treatments approved in China last year, Chu said more than 17 were developed by Chinese enterprises.

Frost & Sullivan, a global consulting and market research firm, has forecast that China's rare disease drug market will expand from $1.3 billion in 2020 to $25.9 billion by 2030, representing a compound annual growth rate of 34.5 percent. China is expected to account for 6.8 percent of the global rare disease drug market by 2030, it said.

Yet to build a stronger innovation ecosystem, Zhang called for closer coordination among hospitals, research institutions, innovative drug companies and patient organizations.

She suggested accelerating special legislation for rare diseases, improving incentives for drug development and building national-level platforms — including a rare disease laboratory and a medical research data center — to connect basic research, clinical translation and industrial application.

Payment support is equally important, Zhang said. Since basic medical insurance focuses on essential coverage, and commercial insurance and charity support remain limited, some patients still face the dilemma of having medicines available but being unable to afford them. Such gaps also weaken expectations for companies investing in rare disease drug development.

Chu, the senior researcher, also said commercial insurance could open up a new payment channel for rare disease medicines and help support related R&D innovation.

Furthermore, Zhang suggested establishing dedicated rare disease funding, mainly supported by government fiscal input and supplemented by social fundraising. The fund could be led by the National Healthcare Security Administration, with multi-departmental coordination, and pilots could first be launched in regions with stronger diagnosis and treatment capacity.

"Accessible, affordable and sustainable — these words are our solemn commitment to every rare disease patient," Zhang said.

Zhang's remarks come after the World Health Assembly adopted a resolution in 2025 identifying rare diseases as a priority for global health equity and inclusion, with this year's discussions focused on moving from "promise to progress".

She said the global consensus offers an important reference for China and a platform for the country to share its experience in diagnosis networks, clinical research, AI applications and patient support.

Looking ahead, China can further advance diagnosis networks, legislation, scientific innovation and funding mechanisms in a coordinated way, so that efforts in rare disease control and treatment can move from local exploration to systematic breakthroughs, Zhang said, adding, "Rare disease patients should not be forgotten or left behind."

NBA's Curry, Li-Ning ink major deal

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

Chinese sportswear giant Li-Ning is turning to NBA superstar Stephen Curry to accelerate its global growth and strengthen its basketball and lifestyle segments. On Monday, the company announced a partnership with Curry and his Curry Brand, to develop basketball, golf and lifestyle products, and promote sports culture initiatives worldwide.

Li-Ning plans to open Curry Brand stores in both China and the United States, reflecting its ambition to expand its international footprint and elevate brand equity.

The Golden State Warriors guard called the deal "the partnership of a lifetime".

"I couldn't be more proud to build a long-term vision with Li-Ning that will fuel the Curry Brand for years to come and unlock the full potential of this company on a global scale," Curry wrote in a letter.

Curry's selection of Li-Ning over other US and international offers — despite similar or even higher financial proposals — highlights the company's growing appeal.

Curry said he was impressed while testing shoes from Li-Ning signature athletes Dwyane Wade and Warriors teammate Jimmy Butler, which influenced his decision.

Li-Ning was founded in 1990 by Chinese Olympic gold medalist Li Ning. The company has over 7,600 stores.

Adam Zhang, founder of KeySolution Sports Consulting, described the collaboration as "a breakthrough in business models for Chinese sportswear brands".

Zhang said, "Li-Ning's partnership with Stephen Curry establishes a stand-alone sub-brand, similar to Nike's Jordan brand, with its own retail channels and athlete endorsements."

The line will focus on basketball footwear, likely expanding into golf, tapping Curry's 150 million global fans and China's massive basketball audience, said Zhang.

The move positions Li-Ning to scale revenue rapidly and marks a milestone in the globalization of Chinese sportswear brands. Based on Li-Ning's previous collaborations, Curry-branded basketball shoes alone could exceed 600,000 pairs annually. At an average selling price of 1,000 yuan ($148), this translates to roughly 600 million yuan in footwear revenue.

Analysts view the partnership as a potential turning point for Li-Ning's basketball division, which experienced a lackluster performance in 2025.

Sinolink Securities cited early signs of recovery in 2026, saying the Curry partnership could drive near-term growth, improve brand perception and reduce consumer education costs in overseas markets. It may also enhance Li-Ning's ability to secure shelf space in key retail channels across Europe and North America.

Merck launches innovation center in Shenzhen

By CHEN HONG
in Shenzhen, Guangdong
chenhong@chinadaily.com.cn

Merck, a major science and technology company, started operations of a new innovation and collaboration center in Shenzhen, Guangdong province, on Monday. This center is dedicated to serving the Guangdong-Hong Kong-Macao Greater Bay Area by uniting efforts from government, industry and academia to foster technological breakthroughs on a global scale.

"It's not just an innovation center, it's also a collaboration center that will bring different forces together," said Rogier Janssens, president of Merck China. "The question was never why Shenzhen, but rather when. As an epicenter of science and technology, Shenzhen is perhaps the capital of the world in these fields right now."

The center, spanning a total of 2,500 square meters in Nanshan district, is a joint effort by Merck, the Chinese Academy of Sciences (CAS) and the Shenzhen municipal government.

It includes a 600-square-meter main facility and an additional 1,900-square-meter laboratory operated by CAS. The laboratory is accessible to students, faculty members and research teams within the CAS system, fostering an open innovation ecosystem.

Janssens highlighted the center's role in facilitating breakthroughs, which he described as "not a solo act". He said: "We have the government providing policy support, academia offering ideas and innovation, and Merck bringing scale and speed to development.

"This cocktail of collaboration is what will drive new innovations forward."

The center is strategically positioned to capitalize on the GBA's burgeoning role as a gateway to global markets.

"Lots of Chinese startups and academic projects are originating right here, and the GBA offers opportunities to go global from this part of the world into any other one, especially given the financial markets so close by in Hong Kong," said Janssens.

However, he emphasized that the primary goal is to drive innovation through collaboration, with global expansion as a potential benefit.

Noting that Merck has witnessed China's evolution over its 93-year presence in the country, Janssens said China's opening-up is transitioning from phase 1.0, characterized by a surge in manufacturing and production, to the current 2.0.

This new phase emphasizes innovation and talent development, enhancing the entire ecosystem and fostering collaboration between government, industry and academia.

With the new center, Merck could better serve the development of the GBA with efforts including introducing global technological resources, high-end equipment and laboratory consumables, alongside supporting local enterprises to enhance their research and development capabilities and align with international standards, said Janssens.

Nation eyes mega-infrastructure investment push

BEIJING — China is mulling multi-trillion-yuan investment through a "Six Networks" initiative, as the country works to expand domestic demand and stabilize economic growth amid external uncertainties and lingering domestic supply-demand imbalances.

The "Six Networks" include water networks, new-type power grids, computing power networks, next-generation communication networks, urban underground pipeline networks and logistics networks.

Bolstering the country's strategic economic positioning, the initiative has been given prominent attention by both the Political Bureau of the Communist Party of China Central Committee and the State Council Executive Meeting in recent sessions.

China is now moving quickly to implement the investment plans. Li Chao, spokesperson with the National Development and Reform Commission, said at a recent news conference that the commission would promptly issue relevant plans and implementation schemes, further coordinate the construction aspects of the "Six Networks," clarify investment priorities in each area, break down targets into annual tasks and set clear timelines and progress schedules.

Investment in the "Six Networks" and related key areas is provisionally estimated to exceed 7 trillion yuan ($1 trillion) this year alone, said NDRC head Zheng Shanjie.

China expects to invest more than 5 trillion yuan during the 15th Five-Year Plan period (2026-30) on the upgraded power grid alone, which will involve the building of power transmission corridors and inter-provincial electricity mutual-aid projects, and the upgrading of urban power distribution networks and the strengthening of weak county-level and rural power grids.

While the country has already built a massive, safe and technologically advanced national power grid, surging new energy connection demand, growing regional power supply-demand imbalances, and the increasing complexity of safe grid operations have prompted action towards building a more secure, reliable and environmentally friendly power grid system.

Underground pipelines represent another massive investment front. China had built nearly 3.9 million kilometers of pipelines by the end of 2025, the world's largest such network.

Yet gaps remain, as aging pipelines urgently need replacement, and problems such as insufficient urban drainage capacity and water supply leakage still remain.

During the 15th Five-Year Plan period, China expects to invest approximately 5 trillion yuan to build and renovate about 770,000 km of gas, water supply, drainage and heating pipelines, enhancing urban infrastructure safety and resilience.

The investment wave will ripple across a wide range of sectors, said Zhou Wei, managing director of China Investment Consulting Co Ltd, citing demand for steel, pipes and construction machinery from traditional infrastructure upgrades.

The "Six Networks" should not only serve as an independent network separately, but also can play a part in multi-network collaboration, to promote the optimization and integration of modern infrastructure systems and achieve larger efficiency, the NDRC said.

"In the short term, hardware and some software investments related to the 'Six Networks' construction carry the certainty of incremental investment," said Wang Xiaojie, chief domestic policy analyst at Western Securities' research center.

An image captures the construction of a box girder for the Jiaozuo-Luoyang-Pingdingshan High-speed Railway, a project partially undertaken by China Railway Construction Corp's 24th bureau, in Jiaozuo, Henan province, on May 25. PROVIDED TO CHINA DAILY

In the long term, the new infrastructure is expected to boost the improvement of the industrial ecosystem, leading to a virtuous cycle of investment and consumption, further amplifying domestic demand.

Foreign luxury firms see China sales surge

Tapestry, Ralph Lauren, Canada Goose have strong quarters driven by Gen Z shoppers

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

PROVIDED TO CHINA DAILY

A string of upbeat earnings reports from global luxury and lifestyle apparel companies show that Chinese shoppers are returning to premium spending, boosted by localized and culturally relevant products for the Chinese market from these brands.

From accessible luxury handbags to high-end outerwear and classic US fashion, brands including Tapestry Inc, Ralph Lauren and Canada Goose Holdings all reported recent quarterly sales surges in China, driven by Generation Z shoppers — those born roughly between 1997 and 2012 — localized marketing campaigns and strong Chinese New Year demand.

For foreign apparel companies, China is once again becoming a critical growth engine.

Tapestry, parent company of Coach and Kate Spade New York, delivered some of the strongest signs of momentum. The company said China sales jumped 55 percent in the fiscal third quarter ended March 28, helping drive a 30 percent increase across the Asia-Pacific on a constant-currency basis.

The surging business resulted from a strategy of focusing on young consumers. The company added more than 2.4 million new customers globally during the quarter, with Gen Z consumers accounting for more than 35 percent of those acquisitions. Coach handbags proved especially popular, with unit sales rising more than 20 percent alongside low double-digit increases in average selling prices. The brand has established a presence in over 90 cities nationwide, with more than 350 stores spanning tier-one to tier-four markets. It will soon roll out targeted plans for nearly 200 additional cities this year.

The performance shows strong evidence that Chinese consumers remain willing to spend on brands that combine craftsmanship, accessibility and cultural relevance.

CEO Joanne Crevoiserat said Tapestry's focus on younger shoppers and localized engagement was helping fuel growth in China.

To coincide with Chinese New Year celebrations, Coach partnered with Chinese streetwear label Clot on an immersive campaign that blended gaming, cafes, exclusive merchandise and community events. The initiative was designed to deepen connections with younger consumers while reinforcing the brand's local relevance.

Crevoiserat said during the company's earnings call, "Our strategies of getting behind a real focus on Gen Z consumers is driving our business with new customer acquisition."

During her recent visit to China, Crevoiserat said the group has stayed closely attuned to Chinese consumers, with a particular focus on the lifestyles, values and consumption preferences of younger generations.

As Chinese consumers increasingly prioritize quality, emotional connections and self-expression, the company is forging lasting and profound emotional bonds with them through localized product development, omnichannel engagement and deeper cultural resonance, she said.

For example, initiatives such as the "China Cool" project support the growth of young Chinese design talent, infusing the brand with local inspiration and innovative vitality.

The company continues to optimize touchpoints across offline retail, digital platforms and content ecosystems to deliver brand experiences aligned with local preferences and younger consumers.

She said that over the next decade, about 5 million Chinese consumers will come of age each year. The company's brands aspire to be the choice for "the first handbag" in these young consumers' lives.

Ralph Lauren Corp has also benefited from the rebound in Chinese demand.

The company on May 21 reported fourth-quarter revenue growth of 17 percent on a reported basis, while Asia sales climbed 31 percent. China was the standout market, with sales surging more than 50 percent during the quarter.

Executives attributed the growth to strong Chinese New Year spending, expansion across key Chinese cities and a broad push into localized digital marketing.

President and CEO Patrice Louvet pointed to a range of China-focused initiatives during the earnings call, including digital red-envelope campaigns on WeChat and a large drone show in Shenzhen, Guangdong province, tied to Chinese New Year festivities.

"China performance was supported by an exceptionally strong Chinese New Year, along with further expansion across our top six city clusters and on Douyin," Louvet said.

Chief Financial Officer Justin Picicci said the company was also scaling its digital ecosystem across China while increasing engagement on local social-media platforms.

Meanwhile, Canada Goose Holdings Inc's fourth-quarter revenue rose 18 percent, while China sales increased more than 24.2 percent to 172.2 million Canadian dollars ($124.7 million).

The Canadian outerwear maker said results were supported by expanded product offerings and the launch of its first Chinese New Year capsule collection, part of a broader strategy to increase product newness and deepen engagement with Chinese shoppers.

The company also introduced its largest spring collection to date as it seeks to broaden appeal beyond winter apparel and establish itself as a year-round luxury lifestyle brand.

Taken together, the earnings reports suggest premium international brands are succeeding in China by leaning heavily into localized storytelling, digital ecosystems and culturally tailored experiences rather than relying solely on traditional luxury positioning.

The strategy appears especially effective with younger consumers. Gen Z and millennial shoppers in China are increasingly driving growth in fashion and lifestyle categories, industry analysts said, particularly for brands that can combine global prestige with local cultural fluency.

Cheng Weixiong, a fashion analyst and founder of Shanghai Liangqi Brand Management, said the country's multitiered consumer market continues to offer significant growth opportunities for international top designer and apparel brands.

"This resurgence is underpinned by deep-seated consumer trust in these brands' lifestyle positioning and product quality. Sustained, high-frequency content marketing has been instrumental in driving the brands' operational turnaround," Cheng said.

The resilience in apparel and luxury spending may also reflect a broader shift in Chinese consumption patterns. Consumers are becoming more selective, prioritizing experiences, emotional value and identity-driven purchases over purely functional spending, he added.

Solid foundation helps nation's cosmetics industry bloom

By **WANG ZHUOQIONG**

The country's beauty market is witnessing an increase of domestic brands that are consolidating their positions and driving sector growth, according to industry reports.

Data from the China Association of Fragrance Flavour and Cosmetic Industries show that among the top 500 brands by transaction value in 2025, the number of brands exceeding 100 million yuan ($14.74 million) in scale rose from 746 in 2023 to 839 in 2025. At the same time, the market share of domestic brands climbed to 57.37 percent, marking five consecutive years of growth and signaling a fundamental shift in market power.

Leading listed and pre-listing companies in China's first-tier beauty market are performing strongly. Data from FBeauty show that the top 10 domestic beauty enterprises generated total revenue exceeding 60 billion yuan, with 3 billion yuan now serving as the new threshold for inclusion in the top 10.

These enterprises are evolving strategically: moving from reliance on single brands to multi-brand portfolios; from traffic-driven to research and development-driven models; and from a domestic focus to global expansion. Each shift reflects the broader trajectory of the country's beauty industry.

In 2025, the top 10 domestic beauty listed and pre-listing companies posted combined revenue of 60.072 billion yuan and net profit attributable to shareholders of 7.16 billion yuan. This represents a significant leap from 2024, when total revenue stood at 54.37 billion yuan and net profit at 4.883 billion yuan.

The market's upper echelon remained largely stable. Proya retained its leading position with 10.59 billion yuan in revenue, marking its third consecutive year as the top domestic beauty company and the only enterprise to surpass the 10-billion-yuan milestone. Chicmax Group achieved a 35.12 percent year-on-year growth rate, closing in on the 10-billion-yuan threshold. Shanghai Jahwa United returned to growth, ranking third with 6.31 billion yuan in revenue.

Visitors get to know products from Proya at its exhibition stand during the China Beauty Expo in Shanghai on May 14, 2025.
PROVIDED TO CHINA DAILY

The mid-tier segment proved highly competitive, with the companies ranked fourth to seventh all reporting revenue around the 5-billion-yuan mark. Botanee Group and Chando were separated by just 41 million yuan, highlighting the potential for rapid ranking changes. Mao Geping Cosmetics officially joined the "5-Billion Club" with 30.01 percent growth. Although Giant Biogene saw a slight revenue decline, it maintained fourth place at 5.52 billion yuan.

Marubi Biotechnology acted as the "gatekeeper" of the top 10 with 3.46 billion yuan in revenue. Meanwhile, S'young Group and Yatsen Holding — which underwent adjustments last year — returned to growth, both achieving double-digit increases.

For example, according to Yatsen Holding Ltd's 2025 annual financial results, the company achieved full-year revenue of 4.3 billion yuan, representing a year-on-year increase of 26.7 percent. Gross margin improved to 78.2 percent, up 1.1 percentage points year-on-year. Notably, non-GAAP net profit reached 8.4 million yuan, marking a historic breakthrough as the company recorded its first-ever annual non-GAAP profit since going public.

The skincare business demonstrated robust growth momentum, with net revenue surging 63.5 percent year-on-year to 2.28 billion yuan, accounting for 53 percent of total annual net revenue. The company has established a high-quality dual-engine growth pattern driven by both skincare and color cosmetics, providing more resilient support for future business expansion, said the company.

The company continues to adhere to an R&D-driven strategy, maintaining consistent investment in scientific research. In 2025, R&D expenditure reached 140 million yuan, a year-on-year increase of 25.6 percent, with the R&D expense ratio remaining above 3 percent for the fourth consecutive year. The company's cumulative R&D investment has approached 700 million yuan.

Industry data support the rise of beauty and cosmetic products. In terms of cosmetics, retail sales reached 32.6 billion yuan in April, representing a year-on-year increase of 4.7 percent, said the National Bureau of Statistics.

In the first four months, retail sales of cosmetics in China reached 154.2 billion yuan, a year-on-year increase of 5.6 percent. This growth rate significantly outpaces the 4 percent recorded during the same period last year and far exceeds the 1.9 percent increase in the total retail sales of consumer goods.

Cosmetics accounted for about 0.93 percent of total consumer retail sales during this period, marking a further increase compared to the previous year. The industry's sustained recovery trend has injected strong confidence into the market for the first half, said Cosmetic Newspaper.

DPP's bid to smear mainland social media apps denounced

Actions reflect 'insecurity and fear' and are doomed to fail, spokeswoman says

By LI SHANGYI
lishangyi@chinadaily.com.cn

A Chinese mainland spokeswoman said on Wednesday that the Lai Ching-te administration's attempts to undermine cross-Strait exchanges and integration by discrediting mainland-based social media platforms are doomed to fail.

During a regular news conference, Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, criticized the Democratic Progressive Party authorities, under Lai's leadership, for continuing to smear mainland-based social media platforms and intimidating Taiwan's youth, despite the role the platforms have played in helping young people on the island access opportunities and pursue their aspirations.

Zhu said the actions reflected the DPP authorities' "insecurity and fear", adding that any attempt to undermine cross-Strait exchanges and integration is doomed to fail.

She made the remarks in response to a recent dialogue between Lai and high school students in Taiwan, during which Lai claimed that the influence of TikTok and RedNote, also known as Xiaohongshu, on the island's younger generation had become a "security crisis".

Lai said such influence could erode Taiwan's "will to safeguard democracy" and lead people to view the mainland as "benign". He called on the island's education and cultural authorities to address the issue.

"Mainland compatriots are not only good people to Taiwan compatriots, but also their relatives and family members," Zhu said.

She noted that the growing popularity of mainland social media apps among Taiwan residents, especially the younger generation, reflects how the platforms have enabled richer life experiences and greater opportunities for self-expression.

According to statistics, there are about 3 million RedNote users in Taiwan, with around 30 percent of high school students using the app. Users commonly turn to the platform for recommendations on travel, fashion and dining experiences.

In December, the DPP authorities in Taiwan announced a one-year ban on RedNote, citing fraud cases associated with the platform. However, users in Taiwan with local IP addresses reportedly remain active on the platform despite the ban.

In addition to RedNote, the DPP authorities have recently identified four other mainland-developed apps as potential risks related to real-time behavioral monitoring, system information collection, and data transmission and sharing.

The apps include Amap, a navigation service; Bilibili, a video-sharing platform; iQIYI, a streaming platform; and BIMOBIMO, an artificial intelligence-powered chatbot application. The DPP authorities have urged the public to remain vigilant in safeguarding their digital security.

Zhu criticized the DPP authorities for discrediting mainland technology products and discouraging Taiwan residents from using related applications. She said the move was driven by the agenda of "opposing and resisting the mainland".

"Such actions are anti-technology and contrary to the trend of the times, and will only lead to growing public discontent in Taiwan," Zhu said.

During the news conference, the spokeswoman also reiterated that peaceful reunification and "one country, two systems" are the basic policy framework for resolving the Taiwan question and the preferred approach to achieving national reunification. She was responding to a recent report by the Lowy Institute, an Australian think tank, on the mainland's approach to Taiwan.

She said the specific form of implementing "one country, two systems" in Taiwan would fully take into account the island's realities, draw extensively on the views and suggestions of people from all sectors on both sides of the Taiwan Strait, and give full consideration to the interests and sentiments of Taiwan compatriots.

Zhu added that, provided national sovereignty, security and development interests are safeguarded, Taiwan's social system and way of life would be fully respected after peaceful reunification, and the aspiration of Taiwan compatriots to be masters of their own affairs would be fully protected in accordance with the law.

City-level cooperation key to Sino-African friendship

By YANG RAN and **LIU JIANQIAO**

As the China-Africa Year of People-to-People Exchanges unfolds, city leaders from across Africa have underscored the critical role of city-level cooperation in deepening China-Africa relations, emphasizing that people-to-people exchanges, particularly among young people, are vital to the long-term development of China-Africa friendship.

The remarks were made at the 2026 Global Mayors Dialogue in Beijing on Wednesday. The event, themed "Enhance Cultural Exchange and Mutual Learning; Inherit the Time-Honored Friendship Between China and Africa", brought together city leaders from African nations to discuss ways to expand practical cooperation and jointly advance modernization.

El Hadji Saer Faye, deputy mayor of Ziguinchor, Senegal, highlighted the crucial role of local governments in implementing China-Africa cooperation. He said local governments should serve as ambassadors of China-Africa friendship because it is in cities where people experience the tangible benefits of such cooperation in their daily lives.

Faye said African cities could learn from China's expertise in urban planning, transportation, industrial development and poverty alleviation efforts. Chinese cities, meanwhile, could draw inspiration from Africa's experiences in community resilience, social cohesion and local innovation.

According to the Chinese People's Association for Friendship with Foreign Countries, 187 sister-city relationships were established between China and African nations as of April.

Josy Michaud-Payet, mayor of Victoria, Seychelles, said her city has established sister-city ties with many Chinese cities and stands as "living proof" of the benefits of such relationships.

City-level connections "create a vast platform for small countries like us to benefit from exchanges of all the experiences from cities around the world", she said. "We have benefited a lot from China in terms of infrastructure, culture and education."

Khalid El Fataoui, a member of the Marrakech city council and head of international cooperation, cited the two-decade friendship between Marrakech and Ningbo, Zhejiang province, as an example of how city-to-city cooperation can strengthen China-Africa ties.

He said cooperation between cities helps ensure that agreements reached at the national level are effectively implemented. City-level exchanges also facilitate mutual learning and help address practical challenges such as transportation and sustainable development.

Beyond government cooperation, El Fataoui emphasized the importance of people-to-people ties and cultural exchanges. He identified language barriers as a major obstacle to communication between Chinese and African people and called for greater efforts to promote language learning on both sides. He also urged more frequent exchanges among universities and young people.

According to the Confucius Institute website, Africa was home to 67 Confucius Institutes as of the end of 2023. Meanwhile, Chinese universities offer language programs in more than 20 native African languages.

This year has been designated as the China-Africa Year of People-to-People Exchanges. Key priorities include strengthening mutual learning among civilizations, expanding people-to-people exchanges — especially among young people — and deepening exchanges of governance experience.

Novel gas-solid battery can also store hydrogen

By LI MENGHAN
limenghan@chinadaily.com.cn

A Chinese research team has developed the world's first gas-solid battery capable of storing hydrogen at normal room temperature and pressure while simultaneously discharging electricity. This breakthrough bypasses the extreme conditions required by conventional hydrogen containment methods.

The findings were published recently in the peer-reviewed scientific journal Joule.

"Compared to conventional batteries using liquid electrolytes — the chemical medium that allows electrical charge to flow — such as lithium-ion batteries, all-solid-state batteries fundamentally address the safety issue of battery flammability," said Chen Ping, corresponding author of the study and a researcher at the Dalian Institute of Chemical Physics of the Chinese Academy of Sciences.

"They also offer potential advantages such as higher energy density, meaning they can store more power in a smaller size, improved cycle performance, and a wider operating temperature range, making them a key development direction for next-generation electrochemical energy storage technologies," Chen added.

However, the widely studied lithium-ion solid-state batteries still face hurdles. These include poor contact between the solid components, slow movement of electrical charges, large changes in the size of the battery electrodes during operation, and high costs. These issues hinder their efficiency and limit their transition from the laboratory to mass production.

To address these problems, Chen's team proposed a new approach in 2018. The team suggested using hydride ions — hydrogen atoms with an extra electron that carries a negative charge — as the charge carriers in all-solid-state batteries. These ions are highly reactive, store a large amount of energy, and rely on abundant natural resources. Crucially, they prevent the formation of metal dendrites, which are needle-like structures that can grow inside a battery, cause short circuits, and create safety risks.

The team also developed a novel electrolyte to keep these hydride ions moving smoothly even at low temperatures, and subsequently verified its usability in an all-solid-state hydride ion prototype battery developed in 2025.

Building on their previous progress, the team introduced hydrogen gas into the battery reaction, enabling it to operate over a wide temperature range from minus 20 C to around 90 C. The battery utilizes a heat-releasing reaction between magnesium and hydrogen, which act as the active materials for the negative and positive poles of the battery, respectively. The heat generated by this reaction is harnessed to produce electrical output. In this setup, the solid electrolyte serves as a highway for the hydride ions to travel through, while electrons flow through an external wire to power devices.

Experiments showed that the battery's initial discharge capacity — a measure of how much electrical energy can be released from the battery materials — can reach 1,526 milliamp-hours per gram. Impressively, it retained over 70 percent of its capacity after 60 charge-discharge cycles.

Moreover, when 10 small batteries were stacked together to create a larger battery pack, it generated more than 2.4 volts and successfully powered an LED bulb, demonstrating the technology's practical potential.

Notably, during discharge, hydrogen is converted into hydride ions, while the metal is oxidized to form magnesium hydride. The process reverses during charging: the magnesium hydride releases hydrogen gas and changes back into metal, allowing the hydrogen to be safely locked inside the solid metal.

"The system can function both as a battery for energy storage and as a hydrogen tank, achieving efficient hydrogen storage at ambient temperature and pressure," Chen said.

"As an energy storage device, the battery has a charge-discharge efficiency of around 56 percent, leaving significant room for improvement. However, when employed as a hydrogen storage solution, its hydrogen energy utilization efficiency can reach 93.9 percent, which is one-third higher than that of traditional thermal hydrogen storage methods," she added.

This work has opened up a new path for hydrogen storage. It completely avoids the extreme conditions required by conventional physical methods, such as compressing hydrogen gas under a crushing pressure of 700 atmospheres, or cooling it down to a frigid minus 253 C to turn it into a liquid.

Chen noted that this battery is still in the research and development stage, making its overall market cost difficult to determine. However, a preliminary assessment of material costs shows promise. Magnesium and the raw chemical blocks for the electrolyte both cost several tens of thousands of yuan per metric ton, which is relatively low compared to mainstream batteries used today.

New gene could bolster high-protein corn cultivation

By ZHOU WENTING in Shanghai
zhouwenting@chinadaily.com.cn

Chinese scientists have discovered a second major high-protein gene in corn, a breakthrough that could significantly boost the nutritional value of the crop and reduce China's heavy reliance on imported animal feed.

By combining this newly mapped gene with another discovered by the same team, researchers can increase the protein content of standard corn from 10 percent to 15 percent. For China's most widely planted commercial hybrid corn varieties, grain protein could jump from 8.5 percent to between 12 percent and 13 percent — all without reducing the overall yield.

The findings, representing 15 years of work by a collaborative team from the Center for Excellence in Molecular Plant Sciences at the Chinese Academy of Sciences, Shanghai Normal University, and Sichuan Agricultural University, were published on Wednesday in the journal Nature.

The research carries massive economic implications for China's livestock industry. Protein feed is one of the most expensive and scarce ingredients in diets for pigs, poultry and cattle. Currently, China relies on foreign imports for up to 80 percent of its protein feed materials, primarily soybean meal. In 2025, the country's soybean imports exceeded 100 million metric tons.

Experts estimate that if the protein content of feed corn can be raised by 4 percentage points nationwide, it could slash soybean imports by roughly 30 million tons annually, dramatically shifting the supply-and-demand balance.

While wild ancestors of modern corn boast protein levels as high as 30 percent, those nutritional traits were inadvertently lost over centuries of farming. Because early farmers and modern breeders focused entirely on increasing crop volume and starch, the specific genes responsible for high protein were gradually lost.

In 2022, the research team isolated the first of these lost genes, named THP9-T, from wild corn. Their latest breakthrough centers on a second gene, THP3-T.

"THP3-T acts like the core engine on the nitrogen metabolism production line, encoding an enzyme responsible for efficiently synthesizing amino acids," said Wu Yongrui, a lead scientist on the study.

Wu explained that the team found unique variations in this gene that essentially act as an upgrade to the engine, giving it a stronger "throttle". This allows the corn plant to capture and use nitrogen — a foundational building block for nutrients — much more efficiently to manufacture protein.

When THP3-T works in tandem with the gene discovered in 2022, they form a powerful metabolic center. This genetic teamwork allows the corn to thrive and maintain high protein levels even in low-nitrogen soil, reducing the need for heavy chemical fertilizers.

In livestock production, this high-protein corn could replace between 50 percent to 100 percent of the soybean meal traditionally used in pig feed, and significantly reduce soybean reliance in poultry farming. For farmers and industrial producers, the scientists say the crop will lower overall feed costs, protect national food security, and boost farming incomes.

POLICY REVIEW

Nation's standards grow in influence

Hangzhou ISO meeting addresses need to make scenic spots, hospitality more accessible

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

SHI YU / CHINA DAILY

China hosted its first-ever ISO tourism technical committee meeting recently, on the back of four updated national standards for the tourism sector, highlighting the nation's push to play a bigger role in the rollout of international standards.

In mid-May, the International Organization for Standardization's Technical Committee on Tourism and Related Services (ISO/TC 228) held its plenary meeting in Hangzhou in East China's Zhejiang province. It was the first time in the committee's 21-year history that the gathering had taken place in China.

The timing was no coincidence as just weeks earlier, China's State Administration for Market Regulation released four new recommended national standards covering tourist shopping venues, smart scenic area operations, senior travel services and accessible hotel services. Three of them take effect on Aug 1, while the smart tourism standard follows on Nov 1.

Together, the new standards and the Hangzhou meeting point to China playing a growing role in shaping tourism standards internationally, officials and industry experts said.

They described the four updated national standards, all recently issued under the national tourism standardization technical committee (TC210), as a major step forward.

The most notable is the accessible tourism service standard for hotels, which marks China's first national standard in this category. It aligns with the ISO international standard Accessible tourism for all — Requirements and recommendations (ISO 21902), which served as the basis for a new Chinese national standard issued just last month — modified to fit local conditions and regulatory frameworks, according to authorities.

The standard moves beyond the traditional focus on wheelchair users to cover all types of travelers with accessibility needs, including seniors, families with young children and people with temporary injuries. It sets quantitative requirements for 18 categories of facilities and outlines service protocols for six core scenarios.

In the area of tourist accommodation, the standard specifies accessible guest room configurations, including door widths and grab bar installations at precise heights. The information and communication protocols demand that all digital systems — including websites, mobile apps and self-service kiosks — comply with international accessibility standards. The training section requires ongoing staff training and the employment of personnel with specialized knowledge in areas such as sign language and Braille.

"This is a shift from 'one-time hardware installation' to 'long-term service operations'," said Liu Jianming, a senior official from the ministry's Tourism Quality Supervision and Management Office.

The smart scenic area operations standard (GB/T 30225—2026) is the first revision since its original release in 2013. It adds a new chapter on data management and breaks down the old "application service platform" into four distinct sections, consisting of smart management, smart service, smart marketing and smart experiences. The goal, according to the standard, is to make tourism operations "digital, connected and intelligent" from end to end.

Two other released standards target specific pain points. The tourist shopping venue standard requires at least 12 themed activities per year, with cultural experiences making up no less than half, and mandates 48-hour returns and a minimum 95 percent visitor satisfaction rate. The senior travel service standard, a completely new issuance, addresses China's rapidly aging population by setting rules on itinerary pacing, staff training and emergency protocols.

Vote of confidence

The domestic push reflects China's deepening commitment to tourism standardization, which has not gone unnoticed abroad.

The decision to bring the ISO/TC 228 plenary meeting to Hangzhou was made by a vote of all member states.

"We applied two years ago and won," Liu said, adding that Hangzhou's accelerated development over the past few years represents the general tourism development in China.

During the ISO/TC 228 plenary meeting, more than 60 international delegates from 33 countries and four international organizations spoke positively of tourism operations in the city.

During the weeklong meeting, they visited rural villages, a vocational college, tech companies including Ant Group, and cultural heritage sites.

Manuel Otero, the Spanish chairman of ISO/TC 228, said Hangzhou exceeded his expectations.

"I see a very modern city — something I did not expect. Everything is really, very, very well done," he said.

What impressed him greatly was a visit to the Tourism College of Zhejiang, where students in the tea culture program must earn three advanced professional certifications before graduation. During the visit, they presented a standard Song Dynasty (960-1279) tea ceremony that blended centuries-old traditions with contemporary design.

"What I saw yesterday is absolutely with the highest standards," Otero said. "The students smile. They have a good attitude. They have a good mood. We feel that they want to do it — and that is very important for professionals."

Maria Velasco Gonzalez from Spain serves on the ISO/TC 228 working group developing an international standard for smart tourist destinations.

During her visit to Hangzhou, she bought souvenirs and tried her hand at the Song Dynasty tea-whisking ceremony. She was impressed by the meticulous explanation from the instructor that helped her better understand not just the operation but the culture and history behind it.

"If I should rate from 1 to 10, you can have a 10," she said about the experience.

Growing role

China became a participating member of ISO/TC 228 in 2020. In just six years, it has taken on an increasingly prominent role by co-leading 12 international standard projects and pre-work items under discussion, four of which have already been published, according to a senior official with the department of science, technology and education at the Ministry of Culture and Tourism.

During the Hangzhou meeting, Chinese delegates made progress in six international standard projects led by China, including sustainable tourism, camping tourism and smart tourism. They also made three new proposals, covering rural tourism and tourism marketing. All were preliminarily approved and will move into the next process.

"We are putting forward our successful practices through the ISO process," tourism official Liu said. "At the same time, we are also learning from other countries."

A senior official with the Standardization Administration of China noted that TC 228 has so far published 60 international standards, with 19 more in development. She cited the United Nations' tourism data showing that global international tourist arrivals reached 1.52 billion in 2025, contributing 9.8 percent to global tourism GDP.

"The vitality of standards lies in their implementation," the official said.

Liu said that the country is considering a standard for pet-friendly tourism — hotels and attractions that welcome travelers with pets.

"Many people have pets at home. Without suitable places to go, the pet owners themselves are less likely to travel. A standard would boost development of new business formats and help offer high-quality products and services," he said.

That might seem a long way from accessible ramps and smart data platforms, but it reflects the same logic that standards are tools to solve real problems, participants at the Hangzhou meeting said. As the Hangzhou meeting showed, the solutions China is developing are increasingly attracting global attention.

"They are not just visiting," Liu said of the international delegates. "They are also seriously learning from China's experience."

As tourism becomes more digital, inclusive and experience-driven, officials and experts at the Hangzhou meeting agreed that standards are increasingly shaping not only how people travel, but how destinations compete globally.

Policy Digest

Monthlong online recruitment campaign launched

China has launched a monthlong online recruitment campaign, matching job openings from internet companies with college graduates and other young people.

The event, initiated by the Ministry of Human Resources and Social Security, runs from Monday to June 30.

Local authorities will gather job openings from major internet enterprises and host online recruitment activities. The ministry will collect and release recruitment updates and job vacancies through job.mohrss.gov.cn.

In addition, on-site job fairs will be held in regions with clusters of internet companies such as the Beijing-Tianjin-Hebei area, the Yangtze River Delta, Pearl River Delta and the Chengdu-Chongqing region.

Departments push promotion of industrial culture, heritage

The Ministry of Culture and Tourism and the Ministry of Industry and Information Technology, and five other departments have jointly released a notice to promote industrial culture, protect industrial heritage and develop industrial tourism.

The document outlines eight key tasks, such as conducting industrial heritage surveys, strengthening heritage protection, enriching tourism products, improving services and developing study tours.

The notice encourages the creative reuse of industrial sites, innovative industrial tourism products and immersive experiences, as well as industrial-themed study tours to integrate popular science and cultural inheritance.

Meanwhile, the notice also requires such tours to be organized with utmost attention paid to safety. It asked for separation and warning signs to be set between tourism and production areas, as well as emergency protocols and regular rescue drills.

National campaign aims to boost digital literacy, skills

China has unveiled a circular on boosting public digital literacy and skills, outlining priorities for 2026.

The document was jointly released by the Cyberspace Administration of China, the Ministry of Education, the Ministry of Industry and Information Technology, and the Ministry of Human Resources and Social Security.

It puts forward 15 key tasks in six major aspects: optimizing the digital literacy training system, expanding digital application scenarios, raising public awareness of artificial intelligence, advancing inclusive digital development, fostering a sound cyber environment and improving coordination mechanisms.

According to a nationwide survey in 2024 by the CAC, more than 60 percent of Chinese citizens possess basic or higher levels of digital literacy and skills.

New rules target regulating online content distribution

Five Chinese government bodies, including the Cyberspace Administration of China and the Ministry of Public Security, have jointly released a new regulation targeting online information distribution services.

Unveiled on Friday, the regulation will take effect on Sept 1. It defines the regulated services as a full range of operations including content planning, production, distribution, marketing, promotion and brokerage for posts on public social media accounts.

An official from the CAC said that the fast-growing sector has seen irregularities such as hype over trending topics, fabricated online personas and the spread of illegal or harmful content. Such acts have disrupted online order and violated the public's legitimate rights and interests, the official said.

The new rules aim to rectify these problems and build a solid legal shield to forestall relevant risks, the official added.

Tourist center demonstrates metrics in practice

By YANG FEIYUE

Free shuttle buses pull up every few minutes to carry visitors up the winding road to Jingshan Mountain in Hangzhou, East China's Zhejiang province.

At the information desk of the Da Jingshan Tourist Information Center, a staff member switches effortlessly from Mandarin to English to help travelers figure out which bus to take.

The sprawling Da Jingshan center complex, nestled at the foot of a mountain, is known for its thousand-year-old tea culture. Last year, its free shuttle buses carried 2.6 million passengers up and down the mountain. This year, the numbers are already on track to surpass that.

What makes the center stand out is that it has been operating this way for years, following the international standard for tourist information services that was published in 2024. The standard sets global benchmarks for how tourist information centers should serve visitors.

"The work we had already done met the standard," said Liu Yanli, the center's deputy manager, who has worked there since 2019.

That confidence reflects a broader shift in how China engages with global tourism rules.

Natalia Ortiz de Zarate, secretary of ISO/TC 228, describes the relationship as a "win-win".

"China contributes more projects and more initiatives, and also leads some working groups," she said. "At the same time, China adopts international standards. We all win with this relationship."

The Da Jingshan center reflects how international standards are being implemented on the ground. Beyond the free shuttles and multilingual signs, the center offers a full suite of services that align with ISO standards for detailed tourist information, destination promotion, accessible facilities, and trained staff who can answer questions about everything from bus schedules to local history.

One critical change took place in 2023 when the center stopped hiring external guides for its multilingual services.

"They could translate, but they didn't have a deep understanding of Jingshan culture," Liu said.

So the center built its own team of locally trained guides, who are young professionals and know not just the words but the stories behind the local tea fields, the temples and the centuries-old traditions. The feedback from international visitors improved immediately, she added.

During her recent visit to Hangzhou, Ortiz noted that China is no longer just a follower.

"China has moved from standard taker to standard maker," she said. "This is key for the future, because you write how you want the future of tourism to be."

Ortiz pointed to China's proactive approach in identifying gaps where new standards are needed. "China is very good at identifying gaps," she said.

Leonardo Persi, a Brazilian expert in adventure tourism standards, visited the Da Jingshan center during a recent trip and came away impressed. He noticed the accessibility features — the ramps, the clear signage, the spaces designed for elderly visitors and families with young children.

"Your spaces think about all kinds of visitors," he said.

Persi was particularly impressed by the balance between global standards and local character at the destinations in Hangzhou.

"It's a good thing that a country has to apply international standards, but we cannot lose our main cultural characteristics. If we do, everyone becomes like a robot. And that is the one thing all tourists do not want," he said.

Ortiz agreed on the need for balance. "The important thing is not only producing helpful standards, but also boosting their implementation. Otherwise, we will have a book of guidelines that is useful but not used," she added.

LIFE

An urban narrative centered on water

Well-known as a thoroughfare, city upgrades ferry routes, improves historical sites, and clears interrupted views, giving rise to sightseeing and family travel, report **Yang Feiyue** and **Zhou Lihua** in Wuhan.

China's river city is transforming itself from a transit hub into a cultural destination through poetry, heritage and the landscapes of the Yangtze.

When the Yangtze River reaches Wuhan, Hubei province, it slows down.

For thousands of kilometers upstream, China's longest river cuts through mountains and gorges. But in Wuhan, in the flat heartland of Central China, the Yangtze broadens into a calmer expanse. Tortoise Hill and Snake Hill rise on opposite banks like half-open gates, framing a stretch of water before the river continues east toward the sea.

Mist lingers above the water in late spring. Across the river, skyscrapers emerge and disappear behind shifting veils of vapor. More than 1,200 years ago, Tang Dynasty (618-907) poet Cui Hao stood on this same stretch of riverbank and wrote the lines that would become inseparable from Wuhan's identity: "Where lies my homeland at sunset? Mist upon the river brings deep sorrow."

The poem survived. And so did the view.

Bridges now span the river, and towers rise where fishing boats once gathered. Yet Wuhan, long known as the "thoroughfare of nine provinces" because nearly every major route in Central China seemed to pass through it, is undergoing a quieter transformation.

For generations, travelers once made transient calls here on their way to somewhere else. Now the city wants them to stay.

Standing at Hanyangmen Wharf in Wuchang district, ferry guide Fan Yunlong points toward the muddy-green waters where the Yangtze and Hanjiang rivers meet.

"That protruding area over there is Nan'an Mouth. That's where the two rivers merge," he says.

Fan grew up along the riverbanks. He speaks about currents and ferry crossings the way other people talk about family history.

"When I was a kid, we didn't have smartphones. No weather forecast either. Every morning, I'd just look at the bridges. Whichever ones I could see clearly were where the weather was good. That's where I'd go to find my schoolmates," he recalls with a laugh.

He gestures toward the water. The bridges arc across the water like a procession. The stately double-deck Wuhan Yangtze River Bridge, gray and unyielding, has been carrying trains and cars since 1957. Farther south, the orange cables of Yingwuzhou Yangtze River Bridge catch the afternoon light like harp strings. Beyond it, the golden towers of the Yangsigang Yangtze River Bridge rise against the hazy sky.

As he speaks, a white ferry slowly approaches through the fog, its hull carrying the words *Jianghan Lansheng*, roughly translated as "River Confluence Panorama".

Upgraded in early 2026, the themed ferry route links some of Wuhan's most iconic historical sites — from the famed Yellow Crane Tower on the Wuchang bank to Qingchuan Pavilion on the Hanyang shore, where a two-story Ming-Dynasty (1368-1644) structure with red walls and double-eave roofs keeps watch over the water.

The route doesn't just cross the river, but also connects sightseeing with history and quietly reshapes how visitors experience the city.

The concept has proved popular. During the Spring Festival holiday in February, daily passenger numbers on the route exceeded 4,700 — nearly five times higher than the previous year.

The figure indicates roughly 15-20 full sailings in a single day, near the maximum operational capacity, according to the ferry operator.

For Fan, the attraction lies mostly in the river itself.

The Yangtze appears yellow-brown, carrying heavy sediment from western China. The Hanjiang River, narrower and calmer, looks greener. During flood season, the two currents flow side by side before fully blending together. "Like a cocktail," Fan says with a grin.

Written in poetry

For centuries, Wuhan's identity has been inseparable from water.

The city sits at the intersection of the Yangtze and Hanjiang rivers and historically developed as three separate towns divided by waterways: Wuchang, Hankou and Hanyang. Together, they became modern Wuhan.

Here, water is geography, memory and psychology. At Yellow Crane Tower, tour guide Wu Yanan has explained this layered identity to countless visitors beneath the towering eaves for more than two years.

Originally constructed during the Three Kingdoms period (220-280), the tower began as a military watchtower. Over the centuries, however, it evolved into one of China's most celebrated literary landmarks, as generations of poets climbed its upper floors, overlooking the Yangtze.

"It has been destroyed and rebuilt many times," Wu says.

The original structure burned down repeatedly through war and fire. The current tower, completed in 1985, was reconstructed based on Qing Dynasty (1644-1911) architectural designs.

Wu has noticed a shift in visitors' interest from simply climbing its nine stories to its legacy of poetry and culture.

"When I first started, people would rush up, take a picture of the river, and rush down," she says. "Now they ask questions. They want to know about the poems, about the history of the reconstructions, about why this tower matters."

Wu has received a rising number of parents who bring their children specifically to recite poems.

The 2023 film *Chang An*, which prominently features Yellow Crane Tower, sparked a fresh wave of interest, with young visitors arriving armed with couplets memorized from the screen, she explains.

The tower has also adapted to a new generation of visitors. During major holidays, performers dressed in Tang Dynasty costumes staged interactive shows that drew large crowds.

Similar efforts to turn heritage into lived experience can be found nearby in Doujiying, a renovated historical neighborhood less than 500 meters from Yellow Crane Tower.

Doujiying's most striking feature is that the Yellow Crane Tower never disappears from view. No matter where visitors stand inside the narrow lanes, the tower rises above the gray-tiled rooftops.

The uninterrupted view is the result of a carefully planned renovation that adjusted the height of several late-20th-century buildings to preserve sightlines toward the tower.

"One building used to block the view completely," says Xia Qi, who oversees operations in the neighborhood. "So we removed an entire floor and turned it into a viewing platform."

The project reflects a broader shift in Wuhan's urban philosophy.

For decades, Chinese cities often prioritized speed, scale and vertical expansion. In parts of Wuhan today, planners are attempting the reverse: reducing height, restoring historical texture, and allowing older cultural symbols to re-emerge within the modern skyline.

Doujiying itself dates back to the Song Dynasty (960-1279). During the late Qing Dynasty, it served as a military grain distribution area, giving the neighborhood its name. In the early 20th century, some of Hubei province's earliest photography studios and pharmacies appeared here.

Now the district mixes historical preservation with contemporary tourism: poetry-themed bookstores, old-time photography museums, teahouses and immersive cultural spaces occupy restored brick buildings. During the 2026 Spring Festival holiday, nearly 670,000 visits were recorded in the area, according to Xia.

Renovating and adapting

Across the river, on Tortoise Hill, another experiment in cultural reinvention is unfolding.

Zhiyin Hall, a newly renovated performance venue overlooking the confluence of the Yangtze and Hanjiang rivers, stages an immersive dinner theater production inspired by the Three Kingdoms period, the era of warfare and political intrigue that still occupies an enormous place in the Chinese imagination.

The building itself was originally constructed in 1999 as part of a larger "Three Kingdoms City" tourism complex. "When we took over operations, we kept almost everything structurally intact," says Liu Bin, the project manager. "We just adapted the interior and added performance functions."

He describes it as "micro-renovation". The production, *A Banquet of Beauties from the Three Kingdoms*, combines historical storytelling, dance and regional cuisine. Each course corresponds to a dramatic episode involving legendary female figures from the era.

The venue accommodates around 150 people daily and frequently sells out during weekends and holidays, Liu says.

Yet the site's most popular feature may be its second-floor observation deck that offers access for free. From there, visitors can see six bridges stretching across the rivers on clear days. The Yangtze flows outward in one direction, while the Hanjiang River curves inward from another. Ferries move slowly beneath the skyline.

The view reveals Wuhan's greatest advantage: not individual landmarks, but the relationship between them. Historically, many of the city's tourism resources operated independently — Yellow Crane Tower, Qingchuan Pavilion, the Yangtze light shows, river cruises, museums and historical neighborhoods.

Now officials are attempting to weave them into a single urban narrative centered on water, history and cultural continuity.

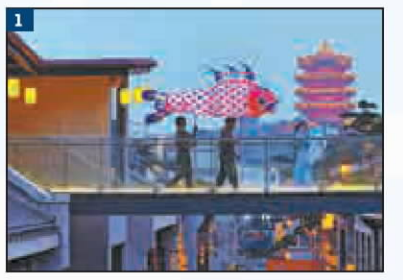
The strategy accelerated after 2022, when the city experienced a sharp rise in domestic tourism.

"For a long time, Wuhan was mainly considered a transportation hub," says Su Xing, deputy director of the Wuhan culture and tourism bureau. That perception, he says, has changed dramatically.

Compared with five years ago, the city's visitor numbers and tourism revenue have risen by more than 50 percent. International tourism has also rebounded sharply.

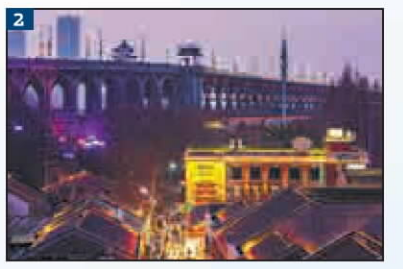
During cherry blossom season this year, local authorities report that Tortoise Hill Park received 10 times its previous average daily visitor volume.

The city's tourism campaigns increasingly emphasize experiential imagery rather than traditional sightseeing alone, as evidenced by offerings such as nighttime ferry rides, riverside concerts, historical reenactments, poetry recitals and seasonal flower-viewing.



Fan Yunlong has a simple way of explaining Wuhan.

"Hold out your right hand," he says. "The thumb is the Hanjiang River. The four fingers are the Yangtze. Between them is the city."



For centuries, Wuhan's rivers made it one of China's great crossroads — a place people moved through on their way elsewhere.

Now the city is trying to turn those same waterways into reasons to stay.

PHOTOS PROVIDED TO CHINA DAILY

Ideas powering a greener future

From plant-based fabrics and clean materials to community-led crafts, innovators are turning sustainable concepts into market-ready solutions, **Peng Chao** reports in Chengdu.

Apple peels, grape skins and coffee grounds are being transformed into clothing and footwear. Sugarcane and cassava are finding new life as non-toxic paint. Even everyday activities such as cycling or tapping a foot can generate electricity to power smart devices.

These were among the innovations showcased at Re:Think 2026 Sustainable Procurement Innovation Week, recently held in Chengdu, the capital of Sichuan province. All are aligned with the United Nations' Sustainable Development Goals.

The nine-day event, which concluded on May 24, was hosted by the United Nations Development Programme in China, with support from the China International Center for Economic and Technical Exchanges and the Chengdu Hi-Tech Zone.

Themed "Local Ideas, Global Pathways", the event drew participants from government, business, academia, and the innovation ecosystem to help Chinese enterprises strengthen their ability to compete in higher-standard global markets and contribute to sustainable development and global climate goals.

"The Sustainable Development Goals — our shared global blueprint to safeguard people and planet by 2030 — are in serious jeopardy," said James George, UNDP Resident Representative ad interim in China, while addressing the event. "More than one-third of the SDG targets are either stalled or regressing."

Addressing these challenges requires all hands on deck, including small and medium-sized enterprises, which account for around half of global GDP, he said. Therefore, it is of vital importance to ensure that SMEs can thrive in an increasingly interconnected global economy shaped by international standards.

George noted that business competitiveness today is no longer determined solely by cost and scale. Increasingly, it depends on trust, transparency and sustainability.

"Across industries, global markets are placing greater emphasis on ESG (environmental, social, governance) performance, supply chain due diligence, and verifiable standards," he said.

"Consumers are demanding more responsible products, and international partners and investors are looking for reliability, accountability, and long-term value."

To help local innovations succeed globally, Re:Think 2026 took an important step forward this year, evolving from a platform focused primarily on dialogue into one that actively identifies, showcases, and supports concrete solutions.

A major highlight was the launch of the SPARK Selected Initiative, a mechanism designed to discover promising SDG-aligned innovations, raise the visibility for emerging brands and entrepreneurs, and connect them with partners, markets, and future opportunities, George said.

The initiative received a total of 110 applications, from which 11 were selected as its inaugural cohort and officially announced at the event. The selected projects demonstrated strong potential in areas such as supply chain transparency, sustainable value creation and cultural expression.

Among them is PEELSPHERE, a startup based in Shenzhen, Guangdong province, that transforms more than 60 types of non-food agricultural waste — including coffee grounds, fruit peels, wine lees and seaweed — into plant-based fabric.

"The coffee grounds from 18 cups of coffee can produce one square meter of fabric," said Song Youyang, founder and CEO of PEELSPHERE.

She said the fabrics are made by breaking down the effective structural units of agricultural waste to the micro-nano scale, before redesigning and reconstructing them into new materials.

The company has developed three product lines serving footwear, apparel, bags, automotive interiors, and home furnishings. Its products have entered the supply chains of global luxury groups and international automakers.

From top: James George, UNDP Resident Representative ad interim in China, delivers a speech on May 19 at the opening ceremony of the Innovation Week in Chengdu. Models showcase ethnic costumes at a sustainable lifestyle fair during the event in Chengdu Hi-Tech Zone. People shop for handy goods at a sustainable lifestyle fair.

"An increasing number of consumers care about whether the products' materials are natural, healthy and non-toxic," said Song at a panel discussion, noting that such awareness is crucial for the development of sustainable brands.

But functionality is equally important, she said: "Even if a product uses sustainable materials, it cannot be truly sustainable if it wears out after just a few uses."

Song said their products are more durable and resistant to peeling than conventional synthetic leather. Unlike genuine leather, they require little maintenance, can be machine-washed and cost roughly one-third as much.

Transparency is another key factor. "Our raw materials are fully traceable, giving us an edge over brands that merely claim to use sustainable materials but cannot verify their origins," she said.

Those advantages have helped fuel rapid growth. The company has expanded its customer base by around 60 percent this year and continues to receive repeat orders from existing clients.

An innovation project specially invited to the event was Batang Folk Arts, a regional public brand from Batang county in Sichuan's Garze Tibetan autonomous prefecture. The initiative is breathing new life into traditional handicrafts while supporting sustainable development in local communities.

The brand emerged from a traditional skills competition launched in 2023 for local herders and farmers. Categories included sewing, weaving, woodworking and painting. Participants were invited to create handcrafted works using natural materials over seven days.

"We quickly realized that these creations had genuine commercial value — people wanted to buy them on the spot," said Zhang Shufeng, founder of the brand. The competition also sparked lively discussion among locals, she noted, because these skills had been passed down from their parents.

"We saw this as an opportunity to unlock the internal drive for sustainable development within the community, rather than continuing to rely on top-down policy support," she said.

The county subsequently established the brand and a development association. Winners of the competition are paired with designers to create products that blend traditional craftsmanship with modern design. These products are sold at a government-funded exhibition hall and an official online store.

The brand now works with 209 herders and farmers from 91 villages across the county's 17 townships.

One standout artisan, Tenzin, teamed up with a graduate from the University of the Arts London to create his own line of handmade leather bags. Priced at over 1,000 yuan ($147.5) each, the bags earned him an extra income of 100,000 yuan last year.

"What we mean by 'folk art' is not merely traditional crafts, but the art of everyday life — the way local people have lived in harmony with nature for generations," said Zhang.

"We hope to leverage market forces to ensure these traditions are passed down sustainably and to help more people appreciate the wisdom behind them."

SPARK Selected is part of the broader SPARK Sustainable Collective Initiative, a platform linking innovation, sustainable lifestyles, and community participation, which also features a sustainable lifestyle fair and a night market for local residents.

Together, these activities aim to bring sustainable development out of policy discussions and into everyday urban life, while giving greater visibility to local innovations with global relevance that support the achievement of the SDGs.

Young scientists turn villagers into biodiversity guardians

NANCHANG — Each spring and summer, a group of young researchers leads local volunteers on patrol along farmland and riverbanks three times a week in search of invasive snails in a renowned scenic area in Jiangxi province.

The work is muddy, repetitive and physically demanding, a far cry from the urban careers many of these researchers, most born in the 1990s and 2000s, could have pursued after earning postgraduate and doctoral degrees.

Over the past eight years, members of the Linnaeus Laboratory in Wuyuan county have devoted themselves to removing invasive species, rescuing injured wildlife and promoting environmental awareness. Their efforts have helped protect local biodiversity while inspiring greater public participation in ecological conservation through nature education.

Often dubbed "China's most beautiful village", Wuyuan is famed for its traditional Huizhou-style (Huizhou is the old name for an area including Anhui province) houses with white walls and black tiles, as well as vast fields of rapeseed flowers that attract tourists every spring.

Nestled in a quiet corner of the county seat, the Linnaeus Laboratory is an understated yet magical space. Named after Swedish botanist Carl Linnaeus, it houses microscopes for curious children, petri dishes nurturing fern spores and temporary shelters for rescued wildlife.

Founded in 2018 by botanist Liu Zhilong and partners from several leading Chinese universities, the laboratory reflects a deliberate choice by a group of young scholars to build their careers in rural Jiangxi rather than in major cities.

"At first, villagers thought we were strange people doing strange things. But later, they came to understand exactly what we're trying to achieve," Liu says.

One of the team's annual challenges is combating golden apple snails, an invasive species that threatens crops and aquatic ecosystems.

Team member Zhou Xinlong, who can identify more than 6,000 plant species, teaches residents how to trap snail eggs by placing bamboo slips in shallow-water silt. "We put bamboo strips into the mud in the morning, then return later to collect the snails and remove the eggs," Zhou says.

A researcher from the Linnaeus Laboratory instructs children to remove Canada goldenrod, an invasive plant in Wuyuan, Jiangxi province, on Nov 2, 2024. XINHUA

The fieldwork can be exhausting and occasionally misunderstood.

Shen Xianhui, who holds a PhD in ecology, recalls heading out by boat at 1 am to study snail activity, only to be mistaken for a fish thief by vigilant villagers.

Later in the year, the team turns its attention to another ecological threat: Canada goldenrod, an invasive plant that spreads rapidly and crowds out native vegetation.

To encourage public participation, the researchers organize educational campaigns, sometimes delivering up to nine lectures a day. They teach residents how to identify invasive species and have launched a mini-program that allows the public to report sightings. Volunteers also take part in removal and composting activities.

"After joining the program, I realized this is not just physical work, but a valuable opportunity to help understand nature," says Jiang Li, a local resident who participated with her child.

The laboratory also serves as a hub for nature education, bringing together experts in veterinary science, plant taxonomy, animal behavior and butterfly genome evolution.

Liu says the laboratory offers free or low-cost public classes every week, including indoor lectures, outdoor field trips, and nighttime wildlife observation sessions.

"Nature education is not simply going out for spring outings. It is about helping people build an emotional bond with nature," Liu says.

Over the past eight years, the laboratory's team of more than 20 members has introduced over 55,000 youngsters to nature through programs such as the Field Natural History Expeditions, The Magic of Yeast, and Secrets of the Bacterial World.

The laboratory also operates Wuyuan's only wildlife rescue and rehabilitation center. "We are not only rescuing animals but also changing public attitude toward wildlife," Liu says.

Villagers who once killed snakes on sight or used them to make medicinal liquor are increasingly choosing to protect them instead.

"We hope to make science more accessible," says Ning Zhenzhen, a recent graduate of Nanjing Agricultural University. "Biodiversity protection is not just the responsibility of researchers and authorities. It is a duty shared by all of us."

LIFE

The future of rural culture

Workshop discusses how to balance modernization with identity as villages undergo rapid change, **Yang Feiyue** reports.

At a Peking University workshop, experts examine whether rural vitalization is also about restoring how communities perceive places.

"What if the most important right in rural development is not the right to build, but the right to perceive?" The question surfaced inside a lecture hall at the university in Beijing in late May, during the workshop.

The discussion quickly moved beyond roads, investment and tourism figures toward questions of memory, belonging and cultural continuity.

That tone was carried throughout the workshop, The Village of Tomorrow: A Global South Perspective on Rural Cultural Construction, which brought together more than 30 scholars, policymakers, designers, and cultural practitioners from China and abroad. Jointly organized by the UNESCO Chair on Creativity and Sustainable Development in Rural Areas, the School of Arts at Peking University, and its Institute for Cultural Industries, the event sparked discussions ranging from heritage preservation and village mapping to cultural memory, tourism pressures and the role of local communities in shaping development.

At the opening of the workshop, Xiang Yong, dean of the Institute for Cultural Industries at Peking University and chairholder of the UNESCO Chair on Creativity and Sustainable Development in Rural Areas, described the workshop as an attempt to move "beyond geographical and cognitive boundaries", emphasizing that rural vitalization should not be treated as a localized policy issue but as a field of comparative learning across the Global South.

"What we are trying to do is distill experiences that can be shared, while opening space for equal dialogue and mutual learning," Xiang says.

He also outlined a series of ongoing initiatives under the UNESCO Chair, including creative rural residencies for young practitioners, art-led rural vitalization projects, rural cultural databases, and multilingual case archives documenting cultural practices in sustainable development. Xiang says the goal is not simply to document rural practices, but to create platforms where experiences from different regions can be exchanged on equal terms.

Over the past years, these efforts have expanded into sustained field-based training platforms, including a six-year "Creative 100" program in the Guangdong-Hong Kong-Macao Greater Bay Area that has brought together more than 130 young designers and practitioners, as well as cross-regional craft experiments in provinces such as Guizhou, Yunnan and Sichuan, notes Chen Ping, chairholder of the UNESCO Chair on World Traditional Handicrafts: Inheritance and Innovation, and dean of the Academy of Cultural Heritage and Creativity of Jinan University.

The initiative has also generated extensive field documentation and exhibition outputs, alongside a growing publication series on traditional Chinese handicrafts.

Chen says many heritage projects are no longer focused solely on preservation. Crafts are increasingly entering schools, community workshops, tourism programs, and contemporary design collaborations.

"Culture should not remain in the past as a static legacy. It must be oriented toward the future as a shared imagination," she explains.

Chen says that the shift also changes who gets to shape cultural heritage projects.

"Cultural heritage is not only about safeguarding what exists," she says. "It is about deciding who activates it, under what systems, and for whom it is transformed."

Beyond questions of institutional activation, attention at the workshop turned to how rural space itself is measured, interpreted, and ultimately made visible in policy and planning systems.

"In rural development today, we rely heavily on indicators," says Wang Sha, deputy director of the Research Institute of Better China Initiative at the China Academy of Art. "Road construction, tourism numbers, investment data, infrastructure completion — these are important, but they are not enough."

During fieldwork, Wang says she has visited villages where new guesthouses, paved roads and public squares had transformed the landscape, yet longtime residents still felt disconnected from the places they once knew.

In some villages, old gathering spaces disappeared beneath standardized landscaping. In others, farming rhythms gradually gave way to tourism schedules and livestream-friendly redesigns.

"What disappears is sometimes not a building, but a way of sensing place," she says.

Wang says her team has been documenting local stories, daily practices and sensory memories alongside conventional planning data.

"The question is not only who builds rural space," she says. "It is whether people still have the right to perceive it and define it from within their own experience."

Against the backdrop of mounting global challenges, participants noted that rural vitalization through culture is evolving from a localized practice into a broader intellectual and social movement.

The concern over how rural transformation is framed and standardized finds another perspective in Tran Thi Thuy, deputy director of the Institute of Chinese Studies at the Vietnam Academy of Social Sciences.

Tran says Vietnam's countryside has changed rapidly in recent years through infrastructure expansion, digital technology and tourism development.

But she notes that many Vietnamese people still associate the idea of "home" with rural imagery — banyan trees, village wells and childhood memories of rice fields.

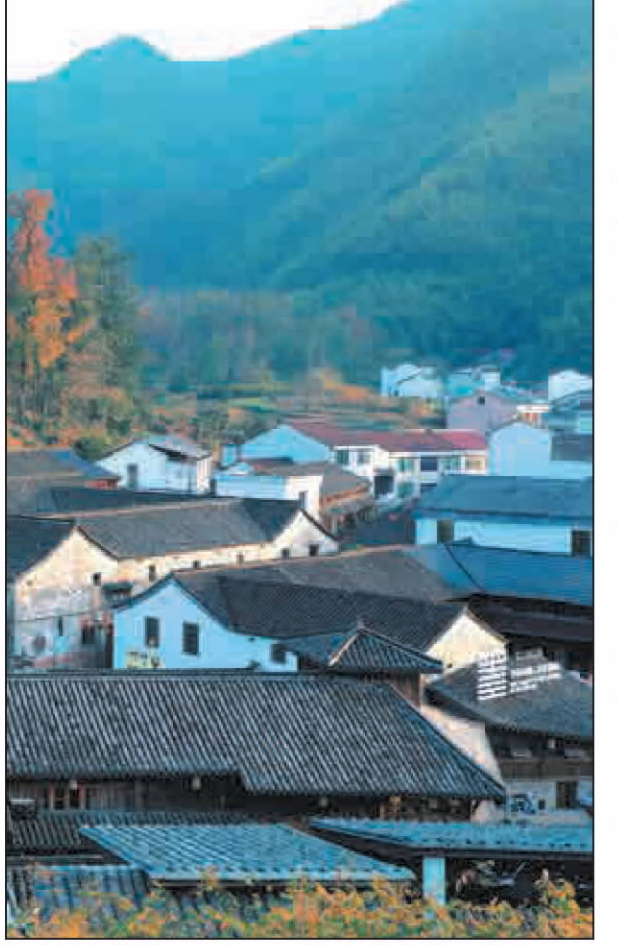
"Many people still feel that a hometown must be connected to the countryside," she says.

She cautions against reducing rural modernization to a single formula.

"Villages are not only spaces of production," Tran says. "They are also spaces of memory, kinship and belonging."

Red dots crowded the screen as Wang Fang, a professor at Peking University's College of Architecture and Landscape, projected a map tracing traditional villages across river valleys, mountain corridors and historical farming regions.

She revealed an unsettling reality at the gathering: villages are disappearing faster than many protection systems can document them.



"Some villages vanish before researchers even arrive," Wang Fang says. "By the time they enter official surveys, they may already be empty or fundamentally altered."

Her team has been experimenting with data-driven monitoring systems that combine heritage records, satellite imagery, ecological data, and even ancient tree registries to identify villages that may be at risk before decline becomes irreversible. The goal, she explains, is to move beyond what she calls "rescue-style preservation", intervening only after deterioration becomes visible.

In one pilot study in Huangshan, East China's Anhui province, her team analyzed hundreds of villages simultaneously, tracing not only architectural conditions but also changes in settlement vitality, population activity and landscape continuity.

"Protection cannot remain reactive, and we need to understand change before it becomes loss," she says.

From quiet fishing post to film set and tourism hot spot

By **XING WEN**
xingwen@chinadaily.com.cn

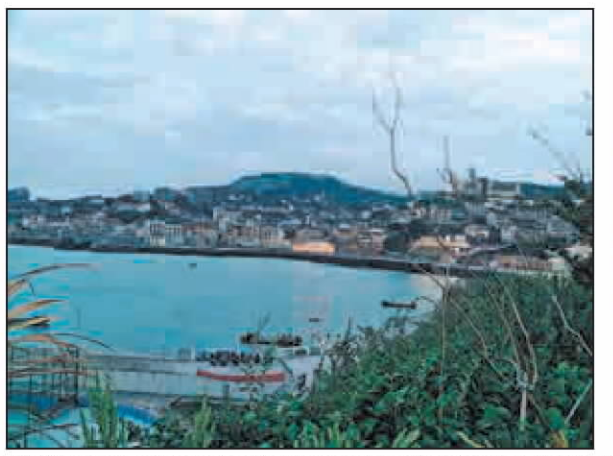
Set-jetting is simple: watch a film, then visit its location.

Ya Lan has done it twice, traveling to the same island 11 years apart.

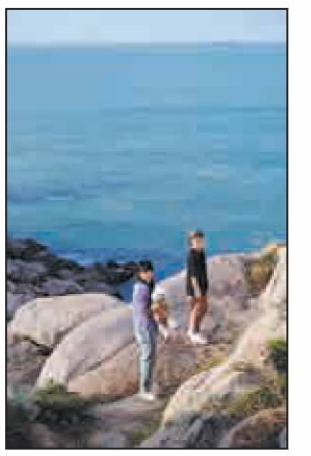
What she saw in between was not just an island changing, but time, tourism and cinema quietly rewriting its soul.

Back in April 2015, after watching director Han Han's 2014 debut film *The Continent* — a road movie featuring three young people growing up on Dongji Island — she learned about the filming location, which was the island itself. Known collectively as the Dongji Islands, they are the easternmost inhabited group of islands of the Chinese mainland, located in Zhejiang province, and mainly comprise four inhabited islands: Miaozihu, Qingbang, Dongfushan, and Huangxing.

Among them, Dongfushan is promoted as the place where the first ray of sunlight of the 21st century fell on the Chinese mainland.



Drawn by its romantic geography, she decided to see Dongfushan for herself.



What stayed with her were the layered stone houses climbing the hillside, the four-hour hike around the isle, modest guesthouses with no Wi-Fi, frequent power outages, and a handful of restaurants.

That was it. That was Dongfushan.

But everything changed when she recently returned to the group of islands. That visit was mainly motivated by director Fang Li's acclaimed 2023 documentary, *The Sinking of the Lisbon Maru*, which recounts the story of how local islanders rescued British prisoners of war from drowning in October 1942.

From left: Residents Zhu Li (left) and Li Yuanyuan take part in a beach cleanup on Dongji Island. A view of Miaozihu, the busiest inhabited island of Dongji. Zhu and Li are permanent residents of Miaozihu and operate four shops on the island. PHOTOS PROVIDED TO CHINA DAILY

This time, she set her sights on Miaozihu, the central island of the group.

"Before the boat even docked, I could see the well-renovated buildings, the colorful neon signs of restaurants and homestays," she recalls.

"It was completely different from the impression I had of this place."

Today, the islands have been transformed. A modernized power grid is in place. The passenger ferry terminal has been expanded. Seafood stalls and coffee shops line the streets. Well-paved hiking trails circle the islands.

What once existed as a remote, geographically unique place has become a tourist hot spot, welcoming around 419,000 visitors last year.

Zhong Lei, a local islander, runs one homestay on Dongfushan and another on Miaozihu.

"Few people used to come to the islands," he says, "mostly art students looking for places to sketch, or foreign tourists who wanted some peace and quiet. But over the last couple of years, it's been busy year-round. I barely have to worry about occupancy rates anymore."

Zhong used to run a business at Shenjiamen Port in Zhoushan, but when he saw his home island gaining recognition through films, he decided to return and build a career in local tourism.

"There are more and more homestays on the island now," he adds. "What we're working on is how to improve quality and stand out to visitors."

The island has also drawn many outsiders who have decided to stay.

Zhu Li is one of them. Once a high-earning sales manager at a real estate company in Zhoushan, she grew tired of working until 3 or 4 am during busy seasons and being on call at all hours. So she quit and came to Miaozihu to volunteer at a youth hostel.

"After I arrived, I thought, this place is really beautiful. The sea is truly blue. We're in Zhoushan — it's not far from here — but I had never seen blue seawater there, only yellow. I never knew there was a place this blue," she says.

During her time off, she went fishing with friends, hiked around the island, and picked up trash from the beaches.

Just one month of volunteering convinced her to stay and start a business on the island. She and her friend took over an old house and renovated it themselves by painting the walls, refinishing old tables and chairs with veneer, installing faucets, and patching the roof.

"Because supplies have to be shipped in from the mainland and getting rid of large items of trash is a hassle, we had no choice but to repurpose old things and build whatever we needed with our own hands. In the process, I felt empowered."

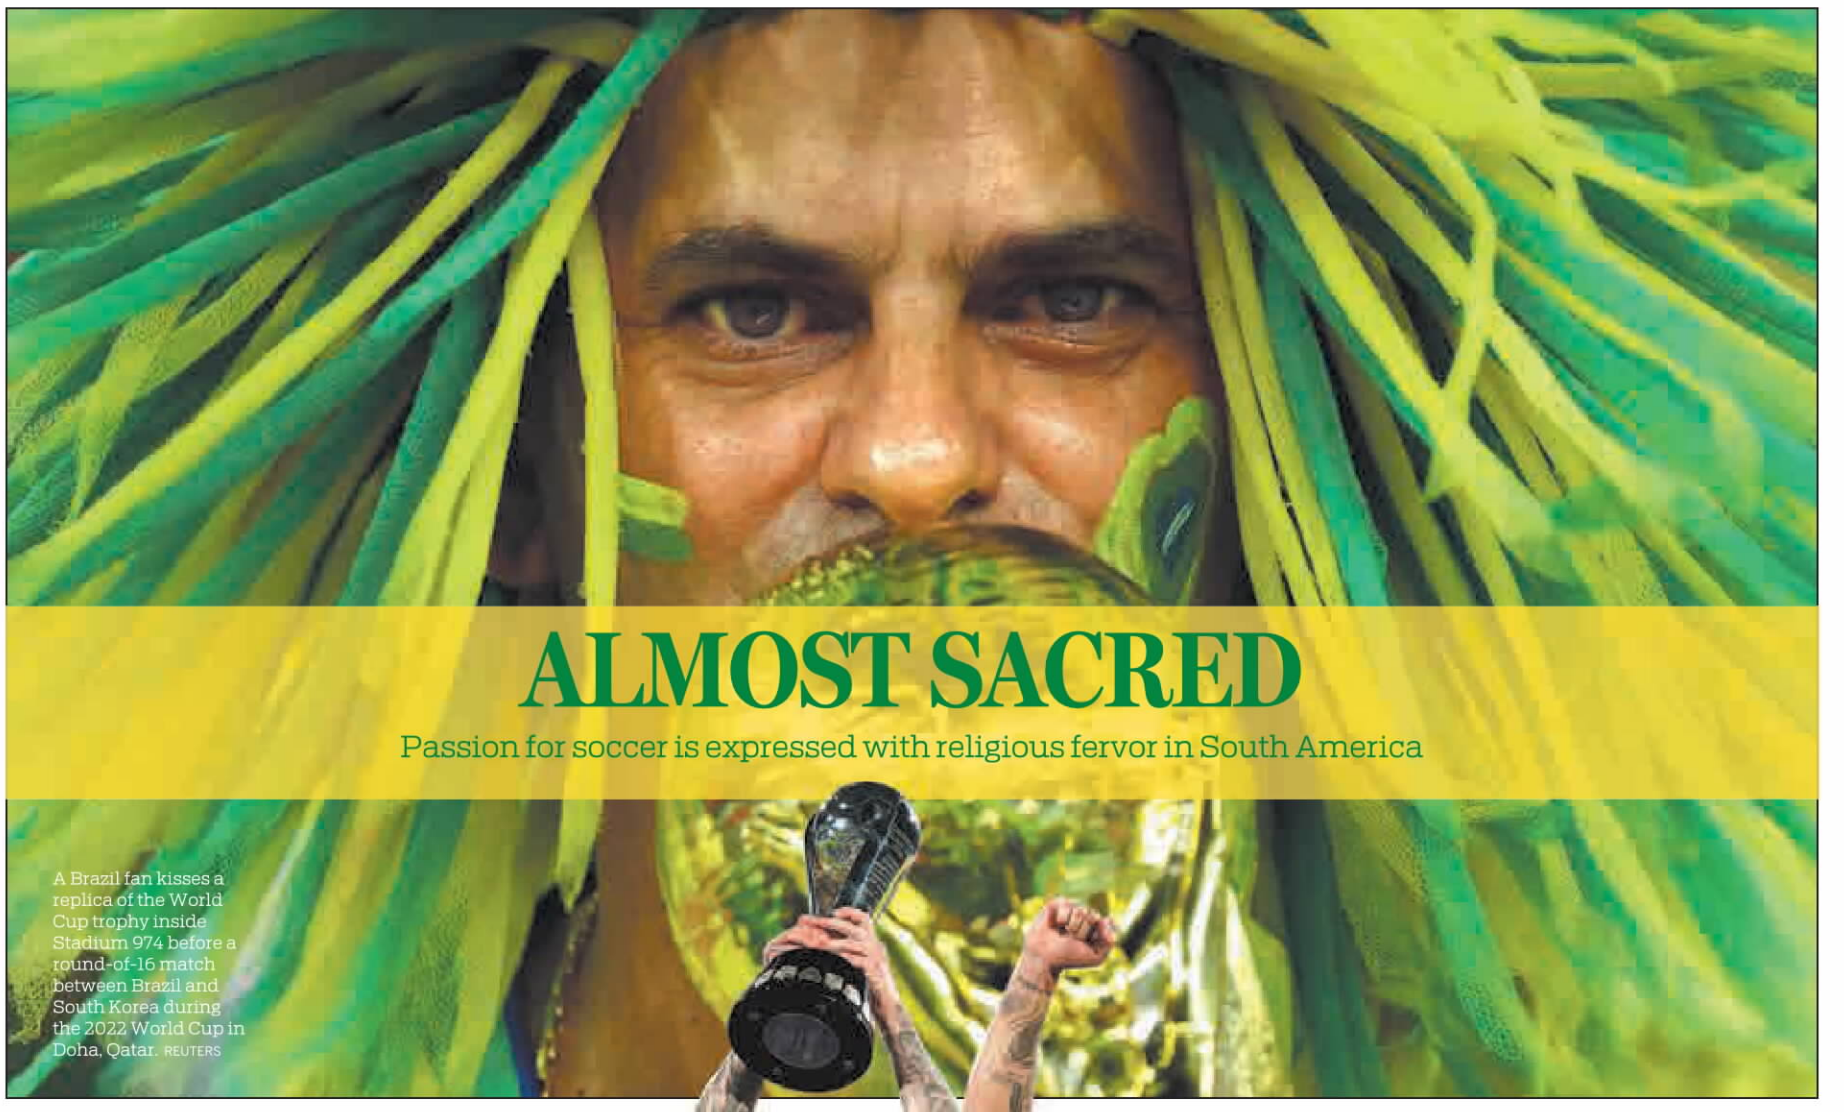
Today, she and her friend run four shops on the island, selling coffee, desserts, and their own branded cultural products.

"Life is busy, but fulfilling," she says. "I cherish my free lifestyle now.

"When I worked in the city, every day was the same routine. Now, even though I'm busy, I'm busy with my own things — the small tasks I actually care about.

"Back in the city, I was sensitive to every noise. But here, even with all the hustle and bustle of local island life, I sleep soundly."

Over the past decade, the island has transformed with each passing year — welcoming tourists, embracing returnees, and giving newcomers a place to start over.



Set-jetting brought Ya Lan here. But what she witnessed, across 11 years and two trips, was an island learning to embrace change without losing itself.

SPORTS

SOCCER

ALMOST SACRED

Passion for soccer is expressed with religious fervor in South America

A Brazil fan kisses a replica of the World Cup trophy inside Stadium 974 before a round-of-16 match between Brazil and South Korea during the 2022 World Cup in Doha, Qatar. REUTERS

The chain that hung from Santiago Garcia's neck carried no crosses or saint medals, yet it felt sacred nonetheless.

When Garcia's grandmother fell sick years ago and he visited her in intensive care, the Argentine soccer fan took off his beloved Boca Juniors necklace and placed it around her neck.

"Boca will save you," Garcia murmured to his grandmother. "And it did. So now it's hers."

Garcia's faith in his club mirrors that of millions across Latin America as the region prepares for the 2026 World Cup. From Argentina to Mexico, devotion to the game often spills into everyday life, inspiring rituals and beliefs tied to the sport.

"There has been an emotional connection between the public and their soccer teams for a long time," said Mexican analyst Erick Fernandez. "It fosters identity and bonds that make us feel part of a sporting process that represents us."

In Argentina, the home country of Lionel Messi, sports passion is often inherited within families and loyalty to clubs strengthens over time. Pope Francis himself — born in Argentina and lifelong supporter of club San Lorenzo — said he agreed with those describing soccer as the world's most beautiful game.

Garcia's love for Boca Juniors came from his father. He said his mother used to support another team, but after the couple met, she became a Boca fan too.

"You usually support your mother's or father's club," Garcia said. "Soccer is the backbone of it all, but you develop a sense of belonging to a team and carry it with you everywhere."

He may have let go of his Boca necklace and the energy he believed it carried, but the club's imprint was already etched into his skin.

At age 17, Garcia tattooed a phrase from the club's anthem on his torso. Fourteen years later, those words remain as meaningful as they were when the ink was fresh.

"It belongs to a song that is like a chant of war for us," he said. "It's like saying: 'No matter the storm, no matter what happens, we will always be there for you.'"

The power of belonging

Pope Francis once told a crowd that soccer is a team sport whose beauty comes from its collective spirit.

Among fans, too, passion is nurtured through a sense of community. The singing of anthems, tears shed after victories or defeats, and the embrace of strangers inside a stadium are experiences that can mirror forms of collective devotion.

Cruz Azul's players celebrate with the trophy after winning the Mexican league final against Pumas in Mexico City on May 24. AP

"Each person can support a team, but the sense of togetherness that generates '*communitas*' — a word associated with religion — is only possible when people gather," said Argentine anthropologist Eloisa Martin.

Both negative and positive reactions can emerge from that sense of collective identity. A fan who feels a member of his sporting community has been attacked by a rival may react violently in ways he otherwise never would. But the same dynamic can strengthen solidarity, leading fans to help strangers because they support the same club.

"Soccer creates a community even for those who lack one," Martin said.

On a recent night, among a sea of fans heading toward Maracana stadium in Rio de Janeiro was Adilvania Santos. Dressed in the maroon and green colors of Fluminense, the 27-year-old said that supporting the club had helped her through a difficult time in her life.

"I get emotional talking about Fluminense," said Santos, who described the passion for her club as the most important aspect of her life, apart from her family. "Some people come together to go to church. For us, accompanying Fluminense is also sacred."

Santos tries to attend every game despite living nearly 100 kilometers (about 60 miles) from Rio. When she follows matches from home, she stays alone in her bedroom to avoid interruptions from family members who may not support her team.

"Soccer deeply moves Brazilians because it creates a sense of belonging, identity and hope," said Jeferson Mengali, a Catholic priest in the Braganca Paulista diocese and a lifelong fan of Corinthians. "People suffer, work hard and face difficulties, and soccer becomes a space for collective joy."

Rituals for victory

Mengali supported Corinthians as a chaplain for years. He celebrated Masses with the team and was present during training sessions and matches.

"I have always liked praying before important games," he said. "Asking more for serenity than victory."

While not all soccer fans pray, many cling to rituals they believe can influence the outcome of a game. In Argentina these practices are known as "*cabalas*". According to Martin, they became widespread during the 1990s.

Cabalas vary widely. Fans may drink from the same cup, sit in the exact same spot or wear the same underwear during every match. Others insist on watching games with certain people, while some avoid watching altogether after concluding they bring bad luck to their team.

Rituals are repeated if the team wins and abandoned if it loses. For some supporters, avoiding a match can even feel like a sacrifice made in hopes of securing victory.

At Garcia's home, his father sits in a specific chair whenever Boca is playing well. If the rival team scores, he changes seats. His mother cleans the house instead of watching the game, stopping every so often to ask about the score.

Garcia's current *cabala* includes wearing the same jersey throughout the season and carrying a small image of Diego Maradona everywhere he goes.

"After he died, he was rapidly sanctified by the people," Garcia said. "He became a figure bigger than sports."

Saints of the stadium

Argentines rarely call him Maradona. He's simply "El Diego", as one would refer to a family member or an old friend from the neighborhood.

"Maradona is the player, while 'El Diego' is the one people turn to like a family member when they need help," Martin said. "Sacredness only works when there's a community behind it."

Legends like "El Diego" or Brazil's "The King" Pele are recognized across the world. But other soccer fans in Latin America revere personal idols of their own.

In Chile, Hector Hermosilla keeps a black-and-white portrait of Colo Colo club founder David Arellano at his home.

"He founded Colo Colo in 1925 and before every match I always say goodbye to him and ask him to watch over us," Hermosilla said.

He still remembers attending his first match in 1986 and falling under the spell of the atmosphere inside the arena. From then on, he faithfully began to follow his team, traveling from Chile's far north to Puerto Montt, considered the gateway to Patagonia.

To finance his trips, he and his wife typed out the iconic anthems of Colo Colo and sold photocopies to fans, earning him the nickname "Nano Fotocopia".

"There were around 20 songs and I would make photocopies and sell them for 100 pesos," he said.

Typewriters and photocopies became obsolete over time. Hermosilla now sells necklaces, bracelets and other accessories to finance the trips he now does with his wife and teenage son.

When in Chile, Hermosilla still attends matches every Sunday and performs a ritual he has followed since the 1980s. Beneath Arellano's portrait, he asks for the club founder's blessing, packs his products for sale and heads to a roast chicken restaurant where fans gather.

"He is like our God," Hermosilla said. "He is the one who guides us."

XI'S VISION | HIGH-QUALITY DEVELOPMENT

Consumers unlock new potential

Expansion of domestic demand seen as key strategy tied to nation's modernization drive

By **WANG KEJU** and **ZHOU LANXU**

As China shifts from high-speed to high-quality growth, the engines of its consumer market are evolving in tandem, with vast potential fueled by rising demand for premium goods, quality services and new consumption scenarios, economists and executives said.

The world's second-largest economy is doubling down on expanding domestic demand and further opening its vast market to the world — a move that will offer an important source of predictability and create massive opportunities for Chinese and foreign businesses alike, even as global trade remains tepid and protectionist pressures mount, they added.

In late April, a meeting of the Political Bureau of the Communist Party of China Central Committee, which was chaired by President Xi Jinping, reiterated the need to fully tap the potential of domestic demand, and called for efforts to expand the supply of quality goods and services and promote the upgrading of consumption.

Xi, who is also general secretary of the CPC Central Committee, had stressed in December, in an article published in Qiushi Journal, the flagship magazine of the CPC Central Committee, that expanding domestic demand is not a stopgap effort, but a strategic measure that bears on economic stability and security.

Implementing a strategy of expanding domestic demand is necessary for maintaining the long-term, sustained and healthy development of China's economy and meeting the people's ever-growing demand for a better life, Xi added.

Zhang Yansheng, a veteran economist and expert on global economic affairs, said Xi's remarks underscored that expanding domestic demand and boosting consumption should not be viewed merely as short-term policy tools to counter cyclical pressures, but as a long-term strategy closely tied to China's modernization drive.

"A Chinese modernization with a huge population, a huge economic size and deep integration with the global economy cannot possibly be built on external demand," Zhang said. "No external market in the world can accommodate such a scale. Therefore, China's modernization must be rooted in domestic demand."

According to Zhang, expanding domestic demand and consumption requires a broader shift in policy thinking — taking the people's growing need for a better life as the fundamental starting point, while strengthening support for public services, social welfare and income growth.

That shift has been underway. Supply has been continuously improved to meet consumers' growing demand for better quality and personalized offerings, helping drive the expansion of domestic demand.

In fact, China's economic miracle did not happen by chance. It testifies to the effectiveness and adaptability of China's socialist economy under the guidance of Xi Jinping Thought on Economy, according to Yang Weiyong, an associate professor at the University of International Business and Economics in Beijing.

Retail sales of cultural, sports and leisure services all grew at double-digit rates in the first four months of this year, the National Bureau of Statistics said. Spending on physical goods is also shifting toward higher-quality categories, with retail sales of communication equipment up 17.7 percent year-on-year and cosmetics up 5.6 percent.

"With per capita GDP having exceeded $10,000, China is currently in a stage of rapid upgrading of the consumption structure," said Fu Linghui, spokesman and chief economist of the bureau, adding that such trends in demand will go in tandem with a broader and more diversified supply of goods and services to continue driving consumption growth.

Increase in western Pacific military activities noted

By **JIANG CHENGLONG**
jiangchenglong@chinadaily.com.cn

Apart from the United States, extra-regional countries from Europe and Oceania increased the frequency of their military activities in the western Pacific in 2025, especially in the Taiwan Strait and the South China Sea, raising the risk of accidental clashes and undermining regional peace and stability, said a think tank report released on Tuesday.

According to the report, which was issued by the Beijing-based think tank South China Sea Strategic Situation Probing Initiative, countries including the United Kingdom, France, Canada and Australia have in recent years frequently sent warships and military aircraft to the region for so-called "freedom of navigation" operations, citing tensions in the Taiwan Strait and the South China Sea.

In 2025, six warships from Australia, Canada, the UK and New Zealand sailed through the strait on five occasions, each accompanied by official publicity machinery, the report said.

Inside
Comment, **page 6**

The UK and Australia also carried out two so-called "freedom of navigation" operations in the Nansha Islands in the South China Sea in 2025, it said.

Hu Bo, director of the South China Sea Strategic Situation Probing Initiative, said that Australia, Canada and the UK have used the pretext of safeguarding rights of passage in international waters under the United Nations Convention on the Law of the Sea to make their military presence felt in the Taiwan Strait and the South China Sea.

Among these extra-regional countries, Australia has been the "most aggressive", with its military aircraft intruding into the airspace of China's Xisha Islands in the South China Sea frequently, according to the report.

Chinese military sources said that Australian military aircraft intruded into the Xisha Islands airspace in February and October last year, and were driven away on both occasions by Chinese military aircraft.

The think tank's report said that Australia's statements at the time avoided mentioning its deliberate intrusion into China's Xisha Islands airspace and instead accused a Chinese fighter jet of conducting "unsafe" maneuvers.

In 2025, nearly 200 warships from 18 extra-regional countries sailed or operated in the region, with a total surface force presence of nearly 10,000 ship-days throughout the year, according to incomplete statistics cited in the report.

Among them, 109 warships from the US operated in the western Pacific for 9,088 ship-days. A total of 48 warships from non-US countries operated in the region for 610 ship-days, equivalent to an average presence of about two vessels on the surface per day, the report said.

Hu said the main purpose of these military activities from non-regional countries is to increase their presence in the region and strengthen relations with regional countries, while also coordinating with US military strategies and operations in the region.

He added that these non-US countries are also trying to enhance interoperability with allies and partners in East Asia and demonstrate a collective presence through their military activities, noting that their political signaling carries more weight than their actual military impact.

"Strategically, such military operations are not conducive to regional peace and stability, and tactically, they carry the risk of accidental clashes," Hu said.

"At the same time, they are also insufficient to change the regional balance of power."

Africa can learn from China's win over poverty

WORLD WATCH
By Melha Rout Biel

China and Africa have historically grappled with poverty, a major obstacle to prosperity and development. While China has made remarkable progress, lifting more than 800 million people out of poverty over the past decades, Africa is still battling severe poverty and development challenges.

This raises two key questions: How did China achieve this in a relatively short period of time? And how can African countries draw lessons from China's experiences and adapt them to their own national conditions to accelerate poverty alleviation?

Africa's population is estimated at about 1.58 billion, exceeding the populations of China and India individually and representing roughly 19 percent of the global population.

The continent's population is projected to exceed 2.5 billion by 2050. Urbanization is also growing, with at least 52 cities on the continent having more than 1 million inhabitants, according to Worldometer and 2026 demographic data.

African governments must therefore plan carefully for sustainable urban development, including adequate housing, job creation, modern healthcare systems, efficient transportation networks, reliable electricity supplies to support industrialization, quality education for all and enhanced public safety.

Despite being endowed with vast natural resources — including critical minerals, arable land and abundant water — African nations continue to grapple with poverty decades after gaining independence from colonial rule. Colonialism disrupted local economic systems, eroded social cohesion and restructured state institutions across the continent, and the lingering impacts still shape Africa's development paths to this day.

Currently, more than 460 million Africans live in extreme poverty, representing roughly one-third of the continent's population, according to data from the World Bank. Sub-Saharan Africa is home to over 67 percent of the world's extreme poor, and in several countries the poverty rate exceeds 70 percent.

By 2019, an estimated 391 million people in sub-Saharan Africa lived in extreme poverty. By 2022, that figure had risen to about 460 million, and by 2024 it reached 464 million — an increase widely attributed to economic disruptions from the COVID-19 pandemic, the Russia-Ukraine conflict and ongoing regional fragility.

Africa's relative share of global income has also declined over the past two centuries. In 1820, the average European worker earned about three times more than the average African worker. Today, the average European earns about 20 times more. While per capita GDP in Africa has gradually increased, income levels still lag significantly behind other regions.

This situation is driven by high inequality, frequent conflicts, economic vulnerability, insufficient quality of education, underdeveloped infrastructure, climate change impacts and governance challenges.

HIT MOVIE SERVES UP A TASTE OF NOSTALGIA

As *Dear You* continues to dominate the box office, the food it features is earning as much critical acclaim as the film itself

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

As the film *Dear You* continues its strong Chinese box-office run, surpassing 1.1 billion yuan ($162 million) since its release on April 30, a bowl of dark pickled olive vegetable and a plate of rice-less cakes have unexpectedly moved audiences to tears.

China Vibes — FOOD —

These traditional foods from Chaoshan — a region that includes the cities of Shantou, Chaozhou and Jieyang in Guangdong province, and is known for its strong clan traditions and well-preserved folk customs — have quietly stepped into the spotlight, becoming some of the film's most emotional symbols.

Threaded through the story are decades of *qiaopi* letters — overseas Chinese correspondence that once connected families across Southeast Asia and southern China. Alongside them, the enduring flavors of Chaoshan cuisine emerge as a living archive of migration, longing and home.

From ancestral Guangdong courtyards to streets in far-flung Chinatowns, these everyday dishes have carried generations of memory and are now becoming a window for the world to rediscover Chaoshan's landscape, people and history. For many viewers, the film is not just a story of distance and return, but a shared memory.

For 56-year-old Shanghai-based chef Huang Peibin, whose hometown is Puning in Jieyang, the film feels deeply personal.

"This is a very authentic Chaoshan story," he said. "The hardships of leaving home and struggling to build a life elsewhere are very familiar to us. Hearing the dialect and seeing the old houses really touched me."

zhouwenting@chinadaily.com.cn

Four out of five parents in China with mid-to-high net worth are worried that artificial intelligence may affect their children's future job prospects, while 20 percent admit they have no idea how to prepare for the changes, a survey found.

Published by the Shanghai-based Fudan International School of Finance in April, the survey results confirm a public perception that AI is significantly reshaping the future job landscape. This has raised parents' anxiety about their children's education, and selecting the right career paths.

Despite these concerns, no one has yet clearly articulated what new skills and qualities young people will need to thrive in an AI-driven future. However, there is a growing consensus in teaching and academic circles about the value of "emotional education".

"The more pervasive machines become, the more we need to cultivate the 'most human' qualities in the young generation," said Wu Rongjin, principal of Shanghai Huangpu Luwan No 1 Central Primary School.

Education experts believe preparing young people for the future involves developing and strengthening "uniquely human" qualities that cannot be replaced by machines, and fostering lifelong learning habits and the ability to keep acquiring new skills. School education should shift from merely acquiring knowledge to developing skills that cultivate human traits like empathy, creativity, ethics and collaboration, they said.

"In the legal field, AI can read thousands of pages in seconds but doesn't understand justice; and AI in medicine can diagnose health conditions but cannot hold a patient's trembling hand," Wu explained. "The magic of human-machine collaboration lies here: Machines are responsible for efficient execution, while value judgments and the development of a humane character are beyond their reach."

In some primary schools in Shanghai's Huangpu and Jiading districts, weekly "emotional education classes" have become a compulsory part of the curriculum. The ultimate goal is to help children grow into well-rounded individuals with positive emotions, a stable mood, and "noble" character traits, that is, the ability to show concern for others.

"These qualities distinguish humans from machines, and are essential for navigating future challenges and adapting to societal changes, especially in the AI era," said Wu.

"Emotional intelligence, along with independent critical thinking, logical reasoning, and perseverance, benefits an individual's lifelong development," she said.

Shining qualities

In emotional education classes, teachers typically focus on themes, such as self-awareness, emotional management, empathy, interpersonal communication, and the value of life. The classes also help students explore ways to relieve stress and adjust their mindset.

Teachers at Shanghai Huangpu Luwan No 1 Central Primary School said that during recent classes, students were encouraged to nominate "unsung heroes" around them.

"It was an opportunity to allow children to recognize the shining qualities in ordinary individuals who might not be highly visible and not receive the most academic awards, and inspire them to see the strengths in everyone," said Bao Yinglei, a teacher at the school.

She said the school had installed cameras in the corridors to quickly identify potential problems when students gather in groups. However, these cameras have now become a window for capturing moments of warmth and concern.

"The cameras record how surrounding children react if a student falls. These acts of kindness become topics for discussion in emotional education classes," Bao said.

Zhou Shuqun, master of Hiba Academy Shanghai, a bilingual school of Wellington College Education (China), said that over the last few years the school had implemented various practices to help students develop "uniquely human qualities".

One example is emphasizing oral expression in primary school classes to cultivate a pupil's ability to listen to others with respect and improve self-expression and group collaboration. For middle school students, debating competitions help develop critical thinking and oral expression skills, she said.

When someone makes others feel comfortable in interactions, it often leads to successful collaborations and business deals, experts pointed out.

Some kindergarten teachers are also changing the way they interact with their students.

Xu Hui, a kindergarten teacher in Shanghai, said when conflicts arise among children, instead of providing a direct judgment, she and her colleagues now encourage the children to express themselves and then switch roles to describe the situation.

"This process is more beneficial as it helps the minors gradually acquire the ability to better communicate and collaborate with others," she said.

Some kindergarten teachers believe that preparing children for the future must be rooted in moral development, the basis of humanity that AI cannot replace. Core competencies in this area include empathy, kindness, collaboration, and reverence for life, they said.

"Through daily interactions with young children in an atmosphere of passing on love and care, teachers instill these virtues and qualities into the minors' hearts," said Xu.

Lin Min, deputy principal of the Shanghai Municipal Kindergarten, said the school emphasizes that teachers should respond to children in a positive and encouraging way.

Since last year, the teachers at the school have been meeting regularly to discuss real-life cases that occur daily in their classes. They discuss how they should respond to the pupils in such situations, and whether there are better ways to address and guide them.

"The way a teacher responds to a child will influence how the child responds to others in their later lives. This is a gradual accumulation process that leads to qualitative changes in their characters," said Lin.

She said despite AI's development, the teachers believe that a positive outlook and a sense of national pride and responsibility, are human qualities that AI lacks.

She cited as an example the humanoid robot half-marathon in Beijing in April, saying what touched her the most was when a robot failed to complete the race, its programmer cradled it as they left.

"Machines will accomplish many things that surpass human physical limits, but they can never win over human emotions. Those moments when people give love and gain trust from each other cannot be replaced," said Lin.

Soft skills

With the belief AI will perform repetitive and standardized jobs, about 60 percent of parents now prioritize "soft skills", such as character building, interpersonal communication, and problem-solving for their children's development, the Fudan survey also found.

This compares with 43 percent who still place securing a seat in a top university first, according to the survey of 1,900 families across the country.

Students from Wellington College International Shanghai experienced VR equipment at the school's sustainability fair in April. PROVIDED TO CHINA DAILY

Wang Shuangchen, 39, from Chongqing, signed up her 12-year-old son for an extracurricular public speaking course a year ago after discussing it with him.

"Even though AI tools can assist in writing a speech draft, there is still a significant difference in the personal charisma each individual displays when speaking on stage," said Wang, a book editor.

"My husband and I believe that having the ability to deliver compelling and engaging speeches in public is a highly competitive skill in the future job market," she said.

The awareness that her 11-year-old daughter needs skills that are hard for machines to replicate prompted Lu Yiyi, a mother from Shanghai, to make changes in their lives. Since September, the fifth-grader has been taking the subway to and from school alone, a 60-minute journey that includes transferring between lines.

"For my child, traveling between home and school alone involves finding the way, taking charge of her own safety, managing her time, and coping with unexpected situations," said Lu, adding that her experience in the graphic design profession has heightened her awareness of the pressures brought by AI.

This personal experience led her to reconsider how to better equip her child for the future. "Communication skills and the capacity to tackle real-world challenges are not what kids can learn at school through exams. They are developed via real experiences like these," she said.

Such practices align with the new educational paradigm of "human flourishing" proposed by the Organization for Economic Co-operation and Development in recent years.

Michael Stevenson, founder of the OECD's High Performing Systems for Tomorrow Initiative, said under the concept of human flourishing, the goal of education is to help every youth develop core competencies, including adaptive problem-solving.

Chinese-style emotions

Wu, the principal, believes Chinese people possess unique qualities, such as humility, subtlety, diligence, and perseverance, which extend to a thirst for knowledge and a love for all aspects of life. She said it is important to highlight these qualities when implementing emotional education.

The country's rich culinary traditions are an embodiment of Chinese people's diligence in her eyes, so the school encourages students interested in cooking to experience this firsthand by preparing dishes.

When a group visits the school, the students are now capable of working together to organize and prepare a meal of typical Shanghai dishes for the guests.

Once a child is able to cook, he or she is willing to prepare food for the family, which improves the atmosphere at home, said Wu.

"Whenever a child's strengths are recognized and encouraged, they gain confidence and stand tall," said Wu, who believes that teachers should identify the potential in each child to help them succeed, which she believes is the essence of education: focusing on the growth of each individual.

Zhao Zizi, a senior middle school teacher in Shanghai for three decades, said even though AI has become powerful, it is not a "person" a child can aspire to emulate.

"AI is just a tool to help us get closer to people who we admire and are worth learning from," she said.

Experts have pointed out that embracing AI, which will systematically enhance learning and work efficiency, is an irreversible trend.

The next generation will create AI, rather than just consume AI, and they will expand what's possible for the good of society and humanity, said Michael Levitt, 2013 Nobel laureate in chemistry, during the World Laureates Forum 2025 held in Shanghai in October.

Many primary and middle schools have been encouraging young people to use AI to solve social problems they encounter. For instance, a group of primary school students in Shanghai's Huangpu district attempted to use large language models to create movie descriptions for the visually impaired.

Through this process, the children not only mastered a technological skill, but also understood that technology should always serve human welfare, said teachers involved in the project.

Poverty: Sound governance remains key

From page 1

Many countries that achieved rapid development, such as China, benefited from visionary leadership that prioritized national development and public welfare.

In Africa, while some national leaders have shown clear development ambitions, many governments still struggle to implement effective policies that can fundamentally improve people's livelihoods.

This raises a critical question: Why is it difficult for African policymakers and leaders to learn from China's experience in poverty alleviation? In my view, poverty remains the continent's most pressing challenge.

China's development success is partly rooted in sound governance, and reflected in zero tolerance for corruption and nepotism, as well as in discipline, hard work and national unity above ethnic and regional divisions.

In Africa, many wars and internal conflicts across the continent arise from the absence of these guiding principles, which are consistently upheld by China's top leadership and fully implemented across government institutions. If Africa can adopt and practice these core principles, it will be better positioned to achieve inclusive prosperity for all.

The Forum on China-Africa Cooperation provides an important platform for bilateral engagement. The summit offers African leaders opportunities to visit China and witness firsthand its rapid socioeconomic transformation, strong work ethic and culture of self-discipline and collective development.

China-Africa relations have grown stronger and more strategic over the past decades. Many African ruling parties maintain close ties with the Communist Party of China, and numerous African officials have participated in training programs in China focusing on leadership, governance and national development.

Such exchanges create valuable opportunities for African leaders to draw on China's development experience, particularly in poverty reduction, economic planning and infrastructure development.

One key lesson Africa can learn from China is the value of sound governance, political stability, strong political commitment to national development, and the ability to mobilize the whole society toward shared national goals.

In terms of poverty reduction, Africa must manage its rich natural resources more efficiently. Again, sound governance and political stability play an indispensable role. Peace is also a fundamental prerequisite for development; Africa can only achieve long-term development and prosperity in a peaceful environment. This enables policymakers to design and carry out effective anti-poverty programs.

China did not lift hundreds of millions out of absolute poverty overnight. Its achievement came from decades of consistent and long-term policy implementation. A vital lesson is that poverty alleviation must be a state-led, long-term strategy, carried out steadily regardless of changes in political leadership.

This requires firm political commitment from ruling parties and governments alike, with policies clearly communicated to the public to gain public understanding and support. China has adhered to this path consistently, sustaining steady development progress. Africa can achieve greater progress if it adopts and strictly implements such development principles.

Serbian President Aleksandar Vucic, who is on a state visit to China, tours the Museum of the Communist Party of China in Beijing on Tuesday. WANG ZHUANGFEI / CHINA DAILY

Vucic praises China's rapid transformation

Serbian president witnesses nation's progress in wide range of fields during tours in Beijing

By **MO JINGXI, ZHAO JIA** and **JI HAISHENG**

On Tuesday, the third day of Serbian President Aleksandar Vucic's state visit to China, he spent about five minutes inside a newly released electric vehicle at the showroom of Chinese tech company Xiaomi's auto factory in Beijing.

Sitting in the vehicle, in which commands can be voice activated, Vucic asked the in-car voice assistant: "Do you have any Serbian songs?"

Serbia's national anthem, *Boze pravde*, then began to play.

"I have learned a great deal here, above all about the achievements China has made. This place is amazing — I have never seen anything like it," Vucic wrote on social media. "Everything is automated. Two thousand robots operate everything, and in two shifts they produce 1,500 cars. We invited them, if they start considering investment in Europe, to choose Serbia, and we also invited them to showcase their products at EXPO 2027."

The factory was Vucic's third stop on Tuesday. Earlier in the day, he delivered a speech at Tsinghua University and visited the Museum of the Communist Party of China.

After tracing China's journey from poverty to prosperity at the museum, Vucic wrote in the guest book that the "visit to the museum was a unique chance to deepen my knowledge of the development of China under the leadership of the CPC".

Inside

Views, **page 7**

"I used to watch *Back to the Future* and think that flying cars, smart machines and technology that understands humans were only the stuff of movie imagination. Today, as I toured this incredible time capsule of Chinese achievements, I felt as if I had, in some way, experienced that film myself," Vucic wrote in a social media post.

He added that everything he saw seemed so advanced that, at one point, he thought his phone belonged in a technology museum.

Speaking to about 130 students and faculty members at Tsinghua University, the Serbian president said that China's progress should not be taken for granted.

While people living in China may regard daily changes as ordinary, he said that the nation's transformation remains striking to an outside observer, even over a short period of time.

He added that he has strong confidence in China's continued prosperity and bright future.

During the exchange with students, Vucic said that China-Serbia friendship is rooted in mutual support at difficult moments and in concrete results, rather than diplomatic rhetoric.

He cited Chinese participation in Serbia's infrastructure projects and the Smederevo Steel Mill, where a Chinese company's takeover helped preserve about 5,000 jobs, as examples of cooperation that have brought real benefits to local people.

Vucic also linked China's development to its openness, saying that the country offers cooperation opportunities to partners from different regions. He added that China's progress is not accidental, but is the result of knowledge, hard work, education and long-term effort.

Turning to the young audience, Vucic urged the students to remain open to the world, gain broader experience and believe in their values and principles. He said young people in China possess qualities that many countries have lost, including diligence, conviction, vision and a strong desire to succeed.

Hard work, education and perseverance will never become outdated, he said, adding that such qualities help make a country strong and enable it to keep moving forward.

Taste: Everyday food highlighted in film

From page 1

Huang said that every dish in the film reflects the resilience and wisdom of Chaoshan people.

In the film, Chaoshan-born Ye Shurou travels to visit Xie Nanzhi in Thailand, bringing a basket of fresh green olives as a gift. When the elderly Xie, suffering from Alzheimer's disease, instinctively reacts to the taste, it becomes one of the film's most heart-wrenching moments.

"Olives are very common in Chaoshan," Huang explained.

"They are used in daily cooking. They are also important offerings in ancestral worship and ceremonies."

Another recurring ingredient in the film is the Indian gooseberry, known for its initially bitter taste followed by lingering sweetness.

To Huang, that flavor reflects the spirit of Chaoshan people who leave home to seek opportunities elsewhere: Bitterness may come first, but sweetness always lingers.

The film also highlights *wumiguo*, rice-less cakes made from sweet potato starch. Created during difficult times, the cakes were made with simple ingredients. Today, they are a ceremonial staple in many households.

As the executive chef of Dingzhenhui, a high-end Chaozhou cuisine restaurant in Shanghai, Huang now serves these traditional dishes to his patrons. By maintaining the labor-intensive, slow-cooking methods passed down through generations, he aims to offer an authentic taste of the culinary heritage of his ancestors.

The film also highlights everyday Chaoshan food, like pickled olive vegetable. Modest in appearance, the dish has the taste that migrants miss most.

Throughout the film, *gongfu* tea appears constantly, serving as more than just a drink. In Chaoshan culture, it is a symbol of hospitality and connection.

Pakistani PM honored for promoting agricultural ties

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Pakistani Prime Minister Shehbaz Sharif was awarded the title of honorary professor by the Chinese Academy of Agricultural Sciences on Tuesday in recognition of his contributions to promoting agricultural science and technology cooperation between China and Pakistan.

Speaking at the ceremony, Sharif said that agriculture remained a key topic of discussion during his meetings with Chinese leaders.

Pakistan hopes to learn from China's development experience and expand cooperation in crop breeding, animal husbandry, climate-smart agriculture, agricultural machinery and agricultural product processing to improve productivity and value-added capacity, he said.

Sharif announced that Pakistan will launch the second phase of its "Thousand Talents Plan" to send 1,000 more young people from Pakistan to Chinese agricultural institutions for studies and training. "I propose sending 1,000 students and fresh agriculture graduates from all provinces of Pakistan to Chinese universities for formal courses and modern agricultural training," he said.

Sharif's four-day official visit to China, which concluded on Tuesday, is an important high-level exchange between the two countries as this month marks the 75th anniversary of diplomatic relations. His announcement was warmly welcomed by Pakistani students at the academy, many of whom view China's agricultural modernization as a model for Pakistan's rural development.

Nadeem Sarwar, a Pakistani scholar who is pursuing his PhD in agricultural water resources and environment at CAAS, said the initiative would create valuable opportunities for more young people in Pakistan.

"More Pakistani graduates will have the opportunity to gain knowledge, experience and exposure at Chinese institutions. When they return to Pakistan, they can contribute to developing the agricultural sector there," he said.

Sarwar's research focuses on improving the efficiency of agricultural water use, an issue he said is particularly important for Pakistan.

"China has made great progress (in agriculture), especially in improving water-use efficiency," he said, adding that he hopes to bring China's technologies and experience to improve Pakistan's agricultural productivity and resource management.

Muhammad Shahzad, also a PhD scholar at CAAS, who is studying animal genetics, breeding and reproduction, described the occasion as "a really big day" for Pakistani students. "It is a matter of great pride for all Pakistanis that China truly acknowledges Pakistan and values our friendship."

Shahzad noted that Pakistan's livestock industry plays a major role in the country's agricultural economy, and scientific breeding remains crucial for improving productivity. "Our animals are resilient to hot weather and diseases, but we need more scientific breeding," he said.

Huang Sanwen, president of CAAS and an academician of the Chinese Academy of Sciences, said that CAAS has established multiple joint platforms with Pakistani partners, including laboratories for cotton biotechnology, sustainable crop pest control and molecular breeding of wheat.

The agricultural sciences academy has also promoted cooperation in crop breeding, prevention of animal and plant diseases, water and soil resource management, and agricultural product processing, Huang said.

CAAS has trained more than 300 Pakistani students over the years and established a China-Pakistan Agricultural Technology Working Group with the Pakistan Agricultural Research Council, in order to institutionalize cooperation and strengthen capacity-building efforts, he added.

He Zhonghu, a researcher at the academy's Institute of Crop Sciences, who has worked with Pakistani researchers for more than two decades, said that China and Pakistan have already achieved remarkable results through joint agricultural research.

A wheat variety developed by Chinese and Pakistani researchers was recently approved in Pakistan following years of field testing.

The variety yields about 10 percent more than local varieties, matures earlier than them and has strong resistance to lodging (stem bending or breakage), said He, who is also an academician of the Chinese Academy of Engineering.

"We are very happy to contribute what we can to Pakistan's agricultural development and food security," he added.

The researcher, who has trained 10 Pakistani PhD scholars and a number of agricultural technicians at the institute, said that future training methods should place greater emphasis on the application of new technologies rather than focusing only on basic research.

"For example, students studying genetics or wheat breeding should also be taken to experimental fields, seed companies and flour mills for hands-on experience," he added.

Consumption: Analysts say upgrade can benefit world

From page 1

Analysts said that China's consumption upgrade and efforts to expand demand are critical, not only to China's growth, but also for the potential to serve as a stabilizing anchor for global demand, as protectionist winds sweep through major economies.

Louis Kuijs, S&P Global Ratings' chief economist for the Asia-Pacific region, said the economic policies of big players like China, and particularly how the country stimulates consumption, are closely followed by overseas analysts, as these policies hold significant implications for driving global economic growth.

The "Big Market for All: Export to China" initiative, launched by the Ministry of Commerce, is in full swing, with a series of events this year designed to meet rising domestic demand for quality foreign goods while offering global exporters a stable outlet.

Supachai Junkeiat, president of TCP China, the Thai conglomerate behind the energy drink brand Red Bull, said the company has always been optimistic about the upgrade potential of China's supersized consumer market.

"Going forward, we will continue to closely track the country's consumption trends and leverage product innovation to precisely meet new demands for consumption upgrades," he said.

Nevertheless, China's overall retail sales of consumer goods from January to April rose 1.9 percent year-on-year, down from 2.4 percent in the first quarter, the NBS said.

Economists expect consumption to continue its gradual recovery, but the pace will depend on how quickly income growth catches up, how effectively social safety nets reduce precautionary saving, and whether the property market stabilizes more broadly.

Nobel laureate economist Michael Spence told China Daily that income in the economy flows to government, corporates or households. "If you want consumption to rise, you need to shift more of that flow toward the household sector," he said.

One viable route, according to Spence, is to have State-owned enterprises pay out higher dividends, redirecting to the people some of the income that now flows to the government.

Spence also pointed to a "well-built social security system" as a way to offset Chinese households' deep-rooted propensity to save, reducing the precautionary share and unlocking more consumption potential.

"Restoring stability in the real estate sector matters as well because it's a big part of household net worth," Spence said, calling Chinese government efforts to stabilize the sector "a step in the right direction" for shoring up spending.

In March, policymakers vowed to unveil an income growth plan for urban and rural residents this year, with a range of practical measures to boost the earnings of low-income groups, increase property income and refine the social security systems.

Zhang, the economist, said that raising people's incomes is of fundamental importance in China's endeavors to meet people's aspirations for a better life, and called for efforts to uphold market-oriented resource allocation and foster a more supportive institutional environment for entrepreneurship and employment to boost people's wage growth.

WORLD

George Retelas (second from left), a US film director, works with Chinese volunteers at a Doolittle Raider parachute landing site in Jiangxi province in December 2025. PROVIDED TO CHINA DAILY

US filmmaker explores forgotten chapter of WWII

Work revisits history of Chinese civilians who risked lives to rescue downed airmen

By LIA ZHU in San Francisco
liazhu@chinadailyusa.com

Inside an abandoned building in a town in Jiangxi province, George Retelas felt something before anyone told him what had happened there.

His hosts guided him inside and told him: two US airmen had sheltered here in 1942, cared for by local villagers until someone who spoke some English could be found to help them escape. When Japanese soldiers swept through, they executed 14 people on the spot and burned the building to the ground.

"The chilling part is they didn't tell me what had happened until I was already inside," Retelas said. "As soon as I walked into that space, I could feel it."

That moment has marked Retelas' journey through a chapter of World War II history that many in the US have never heard about.

It is a story of a wartime alliance of ordinary Chinese civilians who risked and often lost everything to protect strangers from the US who fell from the sky. And it is a story that Retelas, a filmmaker from Silicon Valley, has spent years working to bring to light.

While in college, Retelas discovered a journal and photographs tucked inside a camera bag he had inherited from his grandfather who had served as a US Navy mechanic at Alameda Naval Air Station in California.

One night in early 1942, his grandfather had been rousted from his bed and ordered to help load 220-kilogram bombs onto a mysterious aircraft carrier loaded with Army planes. He did not learn until later that the ship was the USS *Hornet*, and the bombers were the Doolittle squadron bound for Tokyo.

That discovery sent Retelas down a path of research, then filmmaking, then travel — first across the United States to track down the men who had served alongside his grandfather in Navy Air Group 11, then, eventually, across the Pacific.

"Growing up in Silicon Valley, where everyone's thinking about the future, what's the next big thing, I found myself wanting to go back to the past," Retelas said. "Because I feel like I don't know how to answer the questions of the future until I learn more about where I came from."

He directed his first documentary, *Eleven*, in 2014, built around the journal he had found. His second, *Sundown to Eleven*, followed Richard "Dick" Miralles, the last surviving member of Air Group 11, in his mission to honor his fallen comrades. Miralles passed away on Nov 13 last year, at age 101. In keeping with his dying request, Retelas released the film for free on YouTube on Pearl Harbor Day, Dec 7.

But even as he completed that work, Retelas was being pulled across the Pacific, and toward a viewpoint he realized he did not yet grasp.

"I wanted to understand the other side, instead of just getting the American perspective of the Pacific War," he said. "Now, I want to know who it affected on the other side of the world."

In April 1942, just four months after Japan attacked Pearl Harbor, US President Franklin Roosevelt ordered a retaliatory strike on the Japanese home islands.

The attack, involving 80 men in 16 Army B-25 bombers, was planned and led by Lieutenant Colonel James Doolittle.

The mission was nearly suicidal in its ambition: Because the aircraft carrier USS *Hornet* was not close enough to Japan for the bombers to make the return trip, they would bomb Tokyo and other Japanese cities, then pray they made it safely to allied China before they ran out of fuel.

Eighty men bailed out or crash-landed across the provinces of Zhejiang, Jiangxi, Fujian and Anhui. Chinese farmers, villagers and townspeople took them into their homes, fed them and helped them escape until 64 of the 80 made it to safety.

Japanese forces, enraged that the local population had sheltered US forces, swept through the region. An estimated 250,000 Chinese civilians were killed in Zhejiang-Jiangxi campaign in retaliation by Japan for the Doolittle Raid, according to multiple sources.

In the United States, the Doolittle Raid is remembered as a daring act of national defiance. The role of China, and the sacrifice made by ordinary Chinese people, are often overlooked.

"For American students and young people, it's not really well known," Retelas said of the Pacific War broadly.

Exchange of artifacts

In April 2025, Retelas traveled to Quzhou, a city in Zhejiang province, as part of a cultural exchange between the USS *Hornet* Museum in Alameda, California, where he has volunteered for years.

The Doolittle Raid Memorial Hall in Quzhou traded an eight-inch piece of steel torn from a B-25 bomber with the Hornet Museum. In return, the museum sent an original reel of 16-millimeter film showing the Doolittle Raiders training for their mission. Retelas, who proposed the exchange, carried the film to China and brought the steel fragment home.

Top: George Retelas (right) and Yu Jun, a representative of the Quzhou Society for the History of the Doolittle Raid exchange artifacts during a ceremony in Quzhou, Zhejiang province, in April 2025.
Above from left: Retelas displays his grandfather's journal and photographs hiking to one of the parachute locations in Jiangxi province in December. Retelas meets with a Chinese villager in Jiangxi province in December. PHOTOS PROVIDED TO CHINA DAILY

"This exchange was about much more than artifacts," he said. "It was about honoring a shared history and building relationships that continue to matter today."

While in Quzhou, Retelas met and interviewed several elderly Chinese men who were children when their families sheltered US airmen.

Retelas returned to China in December. By then, the people he had met in Quzhou were no longer strangers.

He visited sites in Jiangxi province where US airmen had parachuted down more than 80 years ago, now marked with small memorial markers put together by a group of Chinese volunteers who have spent years scouring the countryside for B-25 wreckage and honoring the spots where the flyers touched down.

"There was a group of volunteers that, over the last few years, have made it their personal quest to go and find fragments of the airplanes and help put together little memorial sites," Retelas said. "They are an amazing group of men and I consider them all great friends now."

The markers moved him in ways he had not anticipated. In France, he knew, there were sites where US pilots bailed out and French villagers came to their rescue, places marked in English, visited by tourists, and written into the popular memory of the war. The Chinese sites felt different: quieter, less known, more quietly tended.

"For me, it was very touching to see Americans from 80 years ago being remembered, and seeing these markers in English," he said.

"The volunteers who put those sites together — you could see the passion in their eyes. It was like looking at someone who cares as much as I do, but from across the ocean. We went to dinner every night, kept ordering more beer, kept talking. I've never felt closer to so many people who live so far away from me."

To the silver screen

Out of both trips came the outlines of a film. Retelas is now in the early stages of development of *The Torch Dragon*, a coming-of-age war drama that imagines the Doolittle Raid from the perspective of the people on the ground.

The film tells the story of four village children who discover a wounded US pilot who parachuted into their lives in war-torn China in 1942. They believe him to be the mythical Torch Dragon, a protector sent to shield them from invading Japanese forces. Retelas has completed a first draft and plans to return to China later this year to meet with studios interested in backing the project.

It is his first feature-length live-action film, and was inspired by his initial visit to China.

"That first cultural exchange in China involving the Doolittle Raid was very meaningful for me, because knowing my grandfather helped with that mission and where it led — it's like opening a door to another part of history," he said.

He is also assembling footage from his December trip into a YouTube documentary for a US audience. The film draws on the interviews he conducted with descendants of the Chinese families who sheltered the airmen.

Cultural ties

Retelas serves as director of media marketing at Menlo College in Silicon Valley, and the work he has done in China has rippled back to his campus life.

Menlo's international student body includes a large number of students from China — the second most represented international country on campus, with students from abroad making up nearly a quarter of enrollment.

On his first China trip, he brought along Menlo College student Mathias Durfee, a marketing major who participated through an internship with the USS *Hornet* Museum and documented the visit through photography and video.

"Being part of this cultural exchange was an incredible experience," Durfee said. "It allowed me to apply what I've learned at Menlo in a real-world, international setting while documenting history that still resonates today."

During his December trip, Retelas connected with Chinese students at Menlo College who were home for the holidays. Zhou Yanxi, an AI and analytics major, was among them. "I am extremely grateful there are people at Menlo College, like Mr Retelas, who take the initiative to learn about my home country and its culture," Zhou said.

Retelas said such exchanges have helped inform his engagement with the students. "I love working with young people and mentoring them, but the Chinese students particularly always tend to be a little bit more reserved and kind of shy," he said. "But once they knew I went to China, they're so warm and opening up."

He is also mentoring a group of high school students who are writing a book about the Doolittle Raid. "I am very excited to help the young people of the US and China know about this story," he said.

Foreign minister calls for defending UN Charter

By **MINLU ZHANG**
at United Nations
minluzhang@chinadailyusa.com

Chinese Foreign Minister Wang Yi speaks at a Security Council high-level meeting at the United Nations headquarters in New York on Tuesday. ZHANG FENGGUO / XINHUA

Chinese Foreign Minister Wang Yi on Tuesday called for renewed commitment to the United Nations Charter and warned against unilateral actions and "double standards", amid growing geopolitical tensions and challenges to multilateralism.

Wang, also a member of the Political Bureau of the Communist Party of China Central Committee, made the remarks while presiding over a Security Council high-level meeting on upholding the purposes and principles of the UN Charter and strengthening the UN-centered international system.

Wang said the current international situation is undergoing the most complex and profound changes seen since the Second World War, stressing that the challenges confronting the world today test the international community's conviction to safeguard peace, its resolve to uphold justice, and its courage to pursue reform and innovation.

"We must unite and take action to uphold, revitalize and strengthen the United Nations," he said.

The meeting, held under China's rotating presidency of the Security Council for May, was attended by representatives from more than 100 countries, including more than 20 foreign ministers and high-level delegates.

UN Secretary-General Antonio Guterres on Tuesday also delivered a briefing on the current international situation at the meeting.

Wang urged the international community to reaffirm the spirit of the UN Charter, saying that the surging global conflicts are "not a sign of the Charter's obsolescence", but from failures to uphold the international order and basic norms of international relations established under it.

"Major countries in particular should shoulder their responsibilities, uphold the rule of law and fairness, and reject double standards, exceptionalism and selective application of rules," he said.

On the role of the Security Council, Wang said council membership is "not a privilege, but a responsibility", and urged members to "rise above national self-interest".

He called for improvements to the council's working methods to ensure objectivity, fairness and inclusiveness in draft resolutions and initiatives, and urged permanent members to strengthen coordination and seek consensus on major issues.

On international development collaboration, Wang urged the United Nations to coordinate global action and mobilize global resources, providing greater financial, technical and intellectual support to countries of the Global South in priority areas such as poverty reduction.

Wang said China "supports a greater UN role in the political settlement of hotspot issues and is open to exploring a comprehensive mediation model involving the UN, regional organizations, stakeholders and professional institutions".

On revitalizing the effectiveness of the UN system, Wang said that the organization's role "must be strengthened, not weakened" and its standing "must be upheld, not replaced".

He urged member states to fulfill their financial obligations to the United Nations and support its work.

Following the meeting, Wang told reporters that China has maintained communication and coordination between the United States and Iran, as well as important regional and international partners.

"We believe that the sovereignty, security and territorial integrity of all countries in the region must be respected, that civilian and non-military targets must be protected, that the security of passages and energy infrastructure must be safeguarded, and that the provisions of the nuclear non-proliferation regime must be implemented," he said.

Wang said the key to the situation lies in talks between the United States and Iran. He welcomed mediation efforts by countries including Pakistan and voiced support for diplomatic efforts by both sides.

Wang also outlined China's position regarding the qualifications required for the next UN secretary-general.

"To sum up, commitment to the UN Charter; outstanding competency; integrity and impartiality; and initiative to take responsibility and deliver," he said.

"Going forward, China will work with others and take a responsible attitude to participate in the selection process of the next secretary-general," he told reporters.

Xinhua contributed to the story.

Friendship reflected in Sharif's visit

PM's trip to help further enhance economic cooperation, experts say

By **XU WEIWEI** in Hong Kong
vivienxu@chinadailyapac.com

Pakistani Prime Minister Shehbaz Sharif's visit, which coincided with the 75th anniversary of diplomatic relations between Pakistan and China, is timely, significant, and reflects the depth of a friendship that has stood the test of time, analysts said.

They said Sharif's talks with Chinese leaders will further strengthen the ironclad brotherhood between the two nations, especially economic relations and the China-Pakistan Economic Corridor, or CPEC.

President Xi Jinping and Premier Li Qiang met Sharif in Beijing on Monday after he arrived in Hangzhou, Zhejiang province, on Saturday. Sharif also attended an event marking the 75th anniversary of diplomatic relations, before leaving on Tuesday.

The high-level engagements in Beijing demonstrate the mutual trust and strategic understanding that continue to define relations between the two countries, said Khalid Taimur Akram, executive director of the Pakistan Research Center for a Community with Shared Future in Islamabad.

"Such exchanges are essential for strengthening cooperation in trade, investment, infrastructure, technology, and regional connectivity," Akram noted. In his opinion, this next phase of CPEC has the potential to create new opportunities for economic growth, job creation, and long-term prosperity for Pakistan.

Akram said the investment and business conference led by Sharif in China signals a transition from infrastructure development to broader economic cooperation in areas such as technology, industrial development, agriculture, and innovation.

Sharif's visit has been widely regarded as purposeful and forward-looking, setting the stage for progress, including greater socio-economic prosperity and financial integration, said Mehmood Ul Hassan Khan, president of the Center for Knowledge and Public Policy in Pakistan.

"These developments have significantly enhanced political understanding, diplomatic consultations, economic cooperation, industrial collaboration, and, above all, the revitalization of CPEC 2.0," he said.

"The visit, therefore, provided a major boost to Pakistan's economy, steering it toward greater stability, sustainability, and modernization, with the relocation of high-quality industries set to play a pivotal role."

> "Such exchanges are essential for strengthening cooperation in trade, investment, infrastructure, technology, and regional connectivity."
>
> **Khalid Taimur Akram,** executive director of the Pakistan Research Center for a Community with Shared Future in Islamabad

In international relations, timing, gestures, and events signify the importance and depth of the relationship, said Shakeel Ahmad Ramay, CEO of the Asian Institute of Eco-Civilization, Research, and Development in Pakistan.

Ahmad said it is good that the Chinese and Pakistani leaders exchanged views, coordinated their positions, and devised future policies and courses of action to navigate the new world order and multipolar world together.

"Pakistan pins high hopes on securing good deals (with China) to foster Pakistan's economic growth and development," he said.

Financial sector cooperation is crucial for Pakistan amid the ongoing financial crisis and extreme pressure from international financial institutions such as the International Monetary Fund, he said.

Sharif's visit can definitely help the country find new opportunities, especially in the financial sector, such as bonds and mechanisms, to ease financial pressure, and to strengthen cooperation with China, he said.

Imtiaz Gul, executive director of the Center for Research and Security Studies in Pakistan, said China's warm reception of Sharif's visit underscored the unflinching nature of bilateral relations.

He said the new agreements on cultural exchanges and educational cooperation signed during the visit can "certainly help deepen Pakistanis' knowledge of rich Chinese culture, values of hard work, perseverance, and the phenomenal strides that China has made in science and technology".

Students share passion for China through contest

By **HOU JUNJIE** in Tokyo
houjunjie@chinadaily.com.cn

A growing number of young people in Japan are developing an interest in China, attracted by the country's long history, rich cultural heritage, and rapid technological advances, with many choosing to study Chinese as a gateway to a deeper understanding.

Those aspirations were on display on Saturday at the Japan finals of the 19th "Chinese Bridge" competition for secondary and high school students, where 16 contestants from across the country shared personal stories about learning Chinese and their impressions of China.

Anna Takahashi, who lived in China for three years, recalled feeling anxious and uncertain when she first arrived in a foreign country. But the kindness she received from teachers and strangers in China gradually eased her fears and left a lasting impression.

"That experience made me truly fall in love with China," she said during her speech.

After returning to Japan, Takahashi said she was saddened to hear negative stereotypes about China, including claims that "China is dangerous". She added that she often felt frustrated for being unable to counter such comments effectively.

Through the competition, she hoped to encourage others not to judge a country solely based on fragmented information online, but to experience it firsthand.

"Before rejecting something, try to understand it first," Takahashi said, adding that she hopes to become a translator in the future and help build mutual understanding between Japan and China.

Another contestant, Uta Moriyama, said her fascination with China began with the hit Chinese drama *The Untamed*, which inspired her interest in traditional Chinese culture and landscapes.

Having studied Chinese since the age of 6, she described the language as "a pair of wings" that allows her to explore a broader world and experience the charm of Chinese civilization across time.

She said she especially enjoys Chinese classical literature such as *Romance of the Three Kingdoms*, as well as the rhythm and beauty of classical Chinese poetry.

Beyond culture, Moriyama is also closely following China's technological developments, particularly in robotics and artificial intelligence, and hopes to visit China in the future to witness the country's innovation firsthand.

The competition also featured cultural performances by contestants, including Chinese martial arts, tai chi, diabolo, paper-cutting, and *erhu* performances. The *erhu* is a traditional Chinese two-stringed musical instrument.

Tian Lulu, minister counselor of the Chinese embassy in Japan, said the "Chinese Bridge" competition, which has been held in Japan for more than two decades, has helped many students broaden their horizons by learning Chinese and step onto larger international stages.

Deepening interest

She encouraged participants to showcase their language abilities and share stories about their connections to China and the Chinese language, while continuing to deepen their interest in Chinese culture.

Tokuichiro Utsunomiya, president of the Japan-China Friendship Association, said that people-to-people exchanges, especially among younger generations, are essential to the future of Japan-China relations.

"Learning Chinese is not only about mastering a language, but also an important pathway to understanding China's history, culture, and way of thinking," he said.

Utsunomiya also said he hoped the students would use Chinese to share their dreams, deepen mutual understanding through cultural exchange, and contribute to future China-Japan friendship.

In Japan, more than 70 universities and over 600 high schools now offer Chinese-language courses.

This year marks the 25th anniversary of the "Chinese Bridge" brand, which is organized by the Center for Language Education and Cooperation under China's Ministry of Education and supported by Chinese embassies and Confucius Institutes worldwide.

Unity celebrated amid fresh concerns over xenophobia

JOHANNESBURG — South Africa on Monday marked Africa Day amid renewed concerns over xenophobia, as the government called for African unity and condemned violence against foreign nationals.

Speaking at celebrations held at Moruleng Stadium in North West Province, Minister of Sport, Arts and Culture Gayton McKenzie rejected claims that South Africa is xenophobic, while acknowledging growing public frustration over illegal immigration.

The event took place as tensions over the treatment of foreign nationals continued to attract attention across the continent.

South African Minister of International Relations and Cooperation Ronald Lamola on Saturday reiterated the government's opposition to attacks against migrants, saying the government remained firmly opposed to any attacks targeting foreign nationals.

He said he had been engaging with several African countries, including Ghana, Nigeria and Malawi, to address concerns over the safety of their citizens.

The minister acknowledged that South Africa faces challenges related to illegal migration and undocumented foreign nationals, stressing that immigration laws should only be enforced by authorized law enforcement agencies.

Former South African president Thabo Mbeki warned that rising anti-immigrant sentiment threatens both the country's constitutional values and broader African unity.

Speaking ahead of Africa Day, Mbeki said economic hardship and unemployment should not be used to scapegoat migrants, calling on political leaders, civil society organizations, and communities to reject divisive rhetoric and work together to address migration and economic challenges peacefully.

Safety concerns also affected diplomatic participation in this year's Africa Day celebrations.

According to local media, Andre Nzapayeke, ambassador of the Central African Republic, said some African ambassadors collectively decided not to attend the event due to security concerns.

He said that with large crowds expected at the event, diplomats could not confidently guarantee the safety of African migrants attending the celebrations.

Ghana's High Commissioner to South Africa Benjamin Quashie said that tensions surrounding undocumented migration could damage South Africa's relationship with other African nations.

In late April, South African President Cyril Ramaphosa condemned xenophobia and vigilantism during Freedom Day commemorations, stressing that concerns about undocumented migration should never lead to prejudice against fellow Africans.

Over the past two decades, South Africa has faced repeated outbreaks of xenophobic violence, with foreign nationals often blamed for unemployment, crime, and pressure on public services.

Foreign investment drawn to advantages of country's high-standard opening-up

The State Council Information Office announced on Tuesday that the seventh Qingdao Multinationals Summit will be held in Qingdao, Shandong province, from June 15 to 17, and that more than 350 foreign executives from 36 countries have confirmed their attendance.

This latest event, along with a flurry of recent international trade and investment promotion activities, highlights the confidence of foreign companies in the world's second-largest economy. The sustained influx of foreign investment into China, even as global foreign direct investment trends downward, is a testament to China's unique positioning in the world economy.

China's allure as a destination for foreign investment is evident in the latest data from the Ministry of Commerce: from January to April this year, 20,113 new foreign-invested enterprises emerged nationwide, a 6.8 percent increase year-on-year. This growth is not merely a fleeting trend but part of a broader trajectory that has seen the number of foreign-funded enterprises in China rise consistently over the past three years, surpassing 530,000 and collectively channeling over $3.6 trillion into the economy.

More than 3,000 foreign-funded enterprises further expanded their investments in China during the same period, a trend also recorded last year which saw more than 8,000 foreign-funded companies make additional investment in China, up more than 10 percent year-on-year.

Against the undercurrents of the "decoupling" from China rhetoric and sluggish world economic growth, the latest data underscore that in a turbulent world, the Chinese market stands out as a beacon for foreign investors due to its predictability, reliability and steady growth.

The improvement of China's business environment — characterized by an increasingly shorter negative list, the rule of law and nondiscriminatory treatment — is another key factor driving the influx of foreign investment.

From January to April, the actual use of foreign capital in high-tech sectors reached 116.33 billion yuan ($17.14 billion), reflecting a significant 20.3 percent increase year-on-year. These sectors alone accounted for 40.4 percent of the total foreign capital utilized in the country, up by 10.3 percentage points from the previous year. Within this realm, areas such as R&D and design services, computer and office equipment manufacturing, and electronics and communication equipment manufacturing have witnessed remarkable growth, with year-on-year increases of 108.4 percent, 22.9 percent and 20.2 percent respectively. These statistics highlight a shift in foreign investment patterns, moving away from traditional manufacturing toward more innovative and technologically advanced industries.

As China continues to enhance its industrial foundation and research and development environment, it is ready to attract even more foreign investment eager to tap into its comprehensive value chain advantages in emerging technologies and new industries. This shift from "quantity" to "quality" in foreign investment is a clear indicator of China's evolving economic landscape, where innovation and high-end manufacturing are becoming the new pillars of growth.

The country's proactive approach is reshaping China's role from being the global manufacturing hub to a central node in the global value chain. The country's commitment to opening its market, particularly in the service industry, is evident as it accounts for over 70 percent of the actual use of foreign capital. The Ministry of Commerce has outlined plans to expand market access and create new advantages to attract foreign investment, particularly in sectors such as green transformation, intelligent manufacturing and digital services.

This is reinforced by the trend of investment from developed countries increasingly producing in China and utilizing advanced technologies developed by local Chinese companies to enhance the competitiveness of their entire operations.

This diversification reflects the broader transformation in China's economic development, driven by continuous market opening, reduced barriers to foreign investment, and the implementation of national treatment policies.

There is no doubt that China remains a magnet for foreign investors seeking growth and opportunity in an increasingly difficult global economy.

It is high time some in the West put to rest their parochial ideology and bias against China, and did more to build bridges than put up barriers. By recognizing the strategic importance of the Chinese market, businesses and policymakers can navigate the complexities of globalization in a way that promotes shared prosperity and sustainable growth.

Innovative response to choke-point chip tech

Moore's Law has been a cornerstone of the rapid advancement of digital technology over the past decades, although it is now confronting physical limits and diminishing economic returns.

For an industry conditioned to equate progress with nanometers, the Tau Scaling Law disclosed by Huawei on Monday is a challenge to the organizing logic of the semiconductor ecosystem.

Instead of continuing the increasingly expensive race to shrink transistors, Tau Scaling proposes that future chip performance gains can come from compressing the signal propagation time through architectural and timing innovations. Huawei has set a target of reaching a chip density equivalent to 1.4 nanometers by 2031.

Washington's export restrictions have attempted to cut China off from advanced lithography equipment, leading-edge foundries and portions of the global event-driven architecture software stack. Such measures were designed to slow China's progress in advanced semiconductors.

That is where Tau Scaling enters the picture. Instead of shrinking transistor dimensions from 3 nm to 2 nm and beyond, Huawei is extracting more performance from mature process nodes such as 5 nm and 7 nm by means of architectural optimization, timing compression, logic folding and system-level coordination.

Much of the underlying research — including asynchronous computing concepts, wave pipelining, and timing optimization techniques — can be traced back decades. What Huawei has done, under conditions where the traditional scaling route became inaccessible, is to revisit those ideas, combine them, enhance them and industrialize them.

In that sense, the emergence of Tau Scaling reflects a broader historical pattern in technology. Constraints often redirect innovation rather than stop it. So, if chip performance can be improved through architecture rather than lithography alone, then the balance of competition changes. The key question becomes not simply who owns the most advanced EUV machines, but who can design the most efficient systems using available manufacturing capabilities.

It would be premature, though, to declare that the arrival of Tau Scaling heralds the post-Moore era. Semiconductor history is filled with elegant concepts that struggled once they encountered manufacturing economics, ecosystem inertia, or commercial realities. Huawei's proposal faces several important ceilings.

Architecture cannot completely replace physics. Timing optimization can reduce inefficiencies, but signals still obey physical propagation limits. As chips become larger and workloads more complex, interconnect delays and synchronization overhead remain major bottlenecks.

Logic folding and time-domain optimization introduce their own complexity penalties. The more aggressively a design compresses timing, the harder verification, debugging and manufacturing become. Commercialization will determine whether Tau Scaling becomes an industry framework. For Huawei's approach to become influential, other companies must adopt it, customers must validate it and developers must build around it. That process will take years, not conference announcements.

Even so, the broader lesson already stands. The semiconductor industry is entering a phase where innovation no longer relies exclusively on brute-force scaling and trillion-dollar capital expenditures. Architectural intelligence, software-hardware codesign, advanced packaging and system optimization are becoming increasingly important.

For China, that shift creates both an opportunity and a responsibility. The country still faces major gaps in lithography, materials, EDA tools and manufacturing equipment. But Tau Scaling demonstrates something equally important: when external pressure blocks one route, researchers will look for alternative routes and solutions can emerge through persistence, engineering discipline and targeted input.

The semiconductor race is no longer just about making things smaller. Increasingly, it is about making systems smarter. The challenge now is for more Chinese companies and engineers to push beyond incremental imitation and focus on resolving genuine choke-point technologies with the tools they already possess.

Opinion Line

Reckless showboating ignores real risk of triggering trip wire

That warships from extra-regional countries, including the United Kingdom, France, Canada and Australia, glide through disputed waters in the South China Sea is purposeful showboating. The Report on the Military Activities of Non-US Extra-Regional Countries in the Western Pacific in 2025, published on Tuesday by the South China Sea Strategic Situation Probing Initiative, an international research network that recorded their appearances, reads more like the record of the cast performing on an increasingly crowded stage.

According to the think tank report, about 200 warships from 18 extra-regional countries operated in the region in 2025, while their military aircraft logged more than 20,000 sorties. These operations appear designed to mislead audiences back home rather than meet the actual security needs of the region.

A destroyer sails through contested waters, officials issue carefully worded statements about "shared values", commentators praise "firmness", and ministers collect photographs that project "toughness" without, theoretically, requiring sacrifice.

The problem with symbolic military gestures is that they rarely remain symbolic forever. International relations theory has long warned that countries frequently drift toward confrontation not because anyone actively wants war, but because each side interprets the other's actions through entirely different emotional and strategic lenses. And once that spiral begins, every "routine" operation acquires an increasingly sharp edge.

Modern military systems are fundamentally ambiguous. A surveillance aircraft gathering information today may be viewed as mapping targets tomorrow. A destroyer exercising "navigation freedom" may also look like the opening scene of a blockade rehearsal. Military hardware does not come with subtitles explaining peaceful intent. Before long, these extra-regional countries will find themselves trapped inside an escalating choreography that nobody fully controls anymore. What makes the current trend particularly striking is how little many of these countries actually stand to gain.

One wonders how these same nations would react if distant countries began conducting naval patrols and military reconnaissance near their own coastlines, not to mention with equal intensity and frequency. That is why the moral certainty surrounding many of these operations feels increasingly detached from strategic reality. The Western Pacific is not an abstract chessboard for symbolic posturing. It is a densely interconnected economic artery where even minor military incidents could send shock waves through global trade, supply chains and financial markets.

And history suggests that accidents happen most often in environments where everyone insists they are merely exercising their rights. The reality is that most countries in the region are far more interested in economic growth, trade and stability than in becoming supporting actors in an endless maritime pressure campaign. What they do not need is an expanding cycle of military theater masquerading as "strategic necessity".

There is a profound difference between maintaining stability and repeatedly testing how much pressure a volatile environment can absorb before something breaks.

And when that happens, the countries treating the Western Pacific like a stage for symbolic power projection may discover that applause is much harder to obtain once real consequences arrive.

— LI YANG, CHINA DAILY

What They Say

Major step toward rules for global carbon market

Editor's note: *Earlier this month, China, Brazil and the European Union — founding members of the Open Coalition on Compliance Carbon Markets — held the first high-level meeting of the coalition in Florence, Italy. Dong Xiucheng, executive dean of the institute for international carbon-neutral economy at the University of International Business and Economics, and Weng Yuyan, an associate researcher at the Institute of Energy, Environment and Economy at Tsinghua University, spoke to People's Daily Overseas Edition about the coalition's role in the development of a global carbon market. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

Currently, the global carbon markets are characterized by uneven development and fragmentation. Countries have adopted different rules and standards for carbon pricing, and there are substantial barriers to cross-border carbon trading.

The establishment of the Open Coalition on Compliance Carbon Markets marks a significant step in implementing the consensus reached at COP30 in Brazil last year. The coalition aims to harmonize carbon market rules across countries, unify accounting standards, promote cross-border recognition of carbon credits, build a platform for policy discussions, share experiences in carbon market development, regulate international carbon trading and address the issue of market fragmentation.

The coalition's key focus areas include cooperation on monitoring, reporting and verification systems for carbon emissions, carbon accounting methods and rules for using high-integrity offsets.

The official launch of the coalition will promote the alignment of carbon pricing systems across countries, reduce regulatory conflicts and lower the costs of cross-border trading. This is aimed at establishing a fairer and more transparent global carbon pricing system.

The coalition will facilitate cross-border carbon trading, enhance coordination among countries in meeting their emissions reduction commitments and support the achievement of nationally determined contributions.

It will also accelerate the low-carbon transition of various countries through market-based approaches and guide the cross-border flow of green capital. By leveraging economic tools, the coalition will help the world achieve the temperature-control goals set out in the Paris Agreement, pool multilateral efforts for emissions reduction, and ultimately achieve the carbon neutrality target.

Carbon markets across the world have been designed differently. Given that developed and developing countries are at different stages of growth, the coalition adheres to the principles of openness, inclusiveness and voluntary participation. This approach promotes dialogue and cooperation among members on core aspects of carbon markets, helping to form a common framework for their development and further enhance global cooperation on carbon pricing.

The coalition will promote the effective implementation of Article 6 of the Paris Agreement by encouraging member states to coordinate on carbon emissions accounting and high-quality carbon credit standards. That China, Brazil and the EU — major economies from different regions — are working together to advance carbon market cooperation demonstrates their resolve to uphold multilateralism and jointly address climate change. This offers a new model for cooperation on global climate governance.

It is worth noting that members of the coalition differ in their carbon reduction foundations, economic development levels and available resources, which may pose challenges to the coalition's operations.

The international community needs to formulate unified rules for carbon accounting, carbon credit certification and trading. Developed countries should scale up technological and financial support for developing countries to narrow the gap between carbon markets in the Global South and Global North. Efforts should focus on expanding multilateral dialogue, encouraging more countries to join the coalition and improving the regulatory system for global carbon trading.

Nataša Stanojević

China-Serbia cooperative leap from roads to robots

MA XUEJING / CHINA DAILY

Serbian President Aleksandar Vucic's visit to China from May 24 to 28 comes at a time when China-Serbia economic cooperation has become a central pillar of Serbia's development strategy.

During the talks with Vucic on Monday, President Xi Jinping said that against the backdrop of a new scientific and technological revolution and industrial transformation, the two sides should expand cooperation in emerging sectors such as artificial intelligence, the digital economy, green energy and advanced manufacturing to foster new growth drivers.

The two countries signed more than 20 cooperation documents covering areas such as trade and economic relations and technology.

These developments indicate the evolution of China-Serbia cooperation and will inject fresh momentum into it.

Nowadays, direct Chinese investments in Serbia have reportedly exceeded 7.2 billion euros ($8.35 billion), with the total value of infrastructure and economic projects, including loans, surpassing 14 billion euros.

This influx of capital has had a transformative impact on Serbia, impacting infrastructure, industry, employment and trade. China is now one of Serbia's two largest investors and a leading foreign trade partner.

Ahead of his visit, President Vucic highlighted artificial intelligence, robotics and new technologies as key areas of cooperation, marking a new phase in bilateral economic relations.

China-Serbia cooperation initially focused on infrastructure, particularly under the Belt and Road Initiative. Serbia, a landlocked country strategically positioned between Central and Southeast Europe, faced the problem of outdated transport corridors.

Chinese projects in roads, bridges, railways and energy facilities helped Serbia improve physical connectivity, strengthen links with regional corridors, expand production and attract investment. These infrastructure projects laid the groundwork for a broader economic agenda, reducing logistics costs and making Serbia more attractive for production and export.

The key question now is how to transform this infrastructure into industrial capacity, export growth and higher value-added production. The next phase of cooperation should be measured by how well connectivity supports manufacturing, technological upgrading and Serbia's integration into regional and global value chains.

This transition is already visible. Chinese economic engagement in Serbia has expanded into industries such as mining, metallurgy, rubber production and automotive components.

These manufacturing investments have a deeper long-term impact than infrastructure alone, creating employment, expanding exports and supporting supplier networks.

Serbia's industrial base, skilled labor and proximity to European markets make it an attractive destination for Chinese companies seeking to connect with European and regional supply chains. Notable industrial projects include Zijin in Bor, HBIS in Smederevo, Linglong in Zrenjanin, Minth in Loznica and Šabac, Xingyu in Niš and Yanfeng in Kragujevac.

Zijin's investment in the Bor copper complex has significantly increased copper production and strengthened the role of copper in Serbia's export structure. In 2018, the Serbian government accepted Zijin's offer to acquire a 63 percent stake in RTB Bor, with the total investment package valued at $1.26 billion.

Exporting raw copper ore has a limited effect on industrial development. But processing refined copper into plates, sheets or pipes creates higher value, requires more skills, supports related industries and strengthens the domestic industrial base. This is why the next stage of cooperation should focus on value-added production.

But a recent study shows that there is a shortage of skilled labor in Eastern Serbia and insufficient processing capacity, so a rapid shift toward an export structure based on processed copper products is unrealistic. A more practical strategy would be to strike a balance between raw material exports and processed copper exports.

A similar logic applies to the steel sector. The acquisition of the Smederevo steel plant by HBIS was a significant example of Chinese participation in Serbia's existing industrial capacities.

The steel plant was long plagued by unstable production and heavy losses. HBIS acquired the plant in 2016, reviving production and exports, and reestablishing the company as one of Serbia's most important exporters.

This shows that Chinese investment has not only created new projects, but also helped modernize Serbia's existing industrial capacities.

Another example is Shandong Linglong's tire plant in Zrenjanin, one of the largest Chinese greenfield investments in Serbia valued at 800 million euros.

Linglong started building its tire factory in Zrenjanin in 2019, showing that Serbia is not only a destination for acquiring existing enterprises, but also a potential production base for new capacities.

Alongside Linglong, investments by Minth, Xingyu and Yanfeng point to a broader trend of Chinese engagement in automotive components.

Though smaller than Zijin or HBIS, these investments are significant because they connect Serbia more directly with European automotive and industrial supply chains. This is especially relevant for Chinese investors.

If the first phase of China-Serbia economic cooperation focused on infrastructure, and the second on industrial production, the coming phase may go beyond traditional manufacturing and emphasize high-technology and innovation-oriented sectors.

Recent announcements indicate that robotics, AI, digitalization and advanced industrial technologies are becoming part of the bilateral agenda.

The cooperation announced with the Chinese company AGIBOT Innovation in humanoid robots is especially noteworthy. While relevant statements suggest that Serbia could soon become a base for the mass production of humanoid robots, Vucic also announced that a robot factory could open in a few months in Šabac. This would be a qualitatively new type of Chinese investment in Serbia.

The China-Serbia joint laboratory for green steel manufacturing, jointly launched by the HBIS Group and the University of Belgrade, shows that cooperation in traditional sectors such as steel can gradually move toward cleaner production, research cooperation and technological upgrading. It connects the older industrial pillar of cooperation with the newer priorities of sustainability, innovation and green transformation.

This initiative is important for Serbia because it diversifies cooperation with China, strengthens the country's export base and creates the possibility for deeper supplier linkages, technology transfer and skills development.

The strategic value of Chinese investment in Serbia lies in linking infrastructure, manufacturing and trade into a single development platform.

Roads and railways improve connectivity, but their full effect appears only when they support production, exports and industrial integration.

Mining and metals increase output, but their impact is greater when they move toward processing and higher value added. Greenfield investments create new jobs, but their importance depends on whether they become embedded in local supplier networks and regional value chains.

This is why the next phase of China-Serbia cooperation shifts from connectivity to productive capacity.

Infrastructure remains the foundation, but manufacturing is the test of maturity. If Serbia can use Chinese investment not only to build but also to produce, process, export and innovate, the cooperation will have a stronger and more sustainable effect on the country's development.

An enduring Sino-Pakistani friendship for a shared future

As China and Pakistan celebrate the 75th anniversary of their diplomatic relations, many expressions are being used to describe their enduring friendship.

This is not surprising, given that the region now known as Pakistan has historically served as a bridge linking South Asia, Central Asia, the Middle East, Europe, and Africa, facilitating China's trade and exchange of ideas, goods, and philosophies since the Han Dynasty (206 BC–AD 220).

From ancient times, the people of this region have been fascinated by Chinese culture, particularly its silk, herbal medicine, food, tools and crafts.

Stories dating back 3,000 years, including the legend of the Queen Mother of the West, or Xi Wang Mu, and her peach banquet, are remembered by the people of Hunza in northern Pakistan, where they grow longevity peaches.

These fables and folk traditions have been passed down through generations, reflecting the deep bonds between the two countries.

The exchanges are evident not only in legends but also in the names and nomenclature of spices, herbs and medicines that persist to this day. Even sustained efforts by the colonial powers to erase these identities proved futile.

Pakistanis have always admired the Chinese values of hard work, humility, positivity and good neighborliness.

Chinese wisdom, which is rooted in common sense, has long been used to resolve complex problems. These cultural imprints are important, as they nourish the many values that unite the people of the two countries.

Like China, Pakistan is also an ancient civilization, being the cradle of the Indus Valley Civilization, as well as the Harappa and Gandhara civilizations.

Mahayana Buddhism was among this region's earliest cultural exports to China. Famous Chinese travelers Faxian and Xuanzang journeyed through what is now modern-day Pakistan in search of authentic Buddhist sutras.

Xuanzang's journey later became the inspiration for the Ming Dynasty (1368-1644) novel *Journey to the West* by Wu Cheng'en, highlighting the bonds that unite the two peoples.

Today's generation in both countries is reenacting that history. The intelligentsia has a common responsibility to help future generations know about their common heritage in order to build a community with a shared future for humanity.

China's remarkable advances in technology, the economy, artificial intelligence, national defense and governance — underpinned by its deep cultural traditions and distinct development model with Chinese characteristics — have become an important reference point for many countries in the Global South, particularly its "ironclad brother" Pakistan. The successes achieved so far in bilateral and multilateral cooperation underscore the strength, resilience and strategic depth of this multi-dimensional relationship.

The successful implementation of projects during the first phase of the China-Pakistan Economic Corridor has been a major milestone. This success raises hopes that the second phase of the CPEC will be even more successful.

It is important to note that China-Pakistan cooperation extends far beyond the domains of the CPEC into strategic areas such as defense projects, the peaceful use of nuclear energy, renewable energy, mining, automobiles, maritime monitoring capabilities, space exploration, AI and human resource development.

For example, Pakistan's integration into the Chinese supply chain and its adept use of Chinese aviation technology, such as the JF-17 Thunder and advanced J-10C aircraft, have made the Pakistan Air Force a global ambassador for these technologies.

A new world order is emerging as the old one crumbles. With Asia on the rise, the unique relationship between China and Pakistan baffles many, particularly in the Western world.

Both countries enjoy a harmonious relationship built on trust, goodwill and cooperation. China has never interfered in Pakistan's internal affairs or exerted pressure. Instead, it has assisted Pakistan without any expectation of a quid pro quo.

As steadfast allies, both countries always work closely to ensure peace, prosperity and stability in Eurasia, West Asia, the Gulf and South Asia.

The second quarter of the 21st century marks the beginning of a multi-polar world, with China and Pakistan seeking a just, equitable, peaceful, harmonious and prosperous global order.

China's vision of building a community with a shared future for humanity, under the Belt and Road Initiative, is the next phase of globalization.

As an ancient civilization, China follows the "prosper thy neighbor" philosophy, sharing its experience with all countries of the Global South.

Pakistan is ideally positioned to benefit from this partnership.

Huge potential of tiny tokens powering AI revolution

In recent months, the term "token" has leapt from obscurity into everyday life as a buzzword alongside intelligent agents such as Lobster or OpenClaw. But this token is not the blockchain-based cryptocurrency unit.

Rather, it is the unit of measurement for large language model text processing. Just as we measure prose in letters or numbers, AI processes information by first breaking data down into bite-sized manageable tokens. Think of a token as the smallest Lego brick — the atomic particle — of AI-generated content.

Every time we use AI — whether asking a question or writing code — we invoke these atoms of AI language. Tokens, therefore, are an indicator of AI activity.

In this sense, token data not only reflect the dynamics of an economy in the AI era but also give rise to a new kind of economic logic.

At the beginning of 2024, China's average daily consumption of tokens was 100 billion. This shot up to a staggering 100 trillion by the end of 2025, and is now over 140 trillion.

This explosive growth of more than 1,000 times in a little over two years far exceeds the global average. Liu Liehong, head of the National Data Bureau, said, "The massive increase in daily token call volume indicates that China's AI development has entered a phase of rapid growth."

On the demand side, the token consumption frenzy indicates the widespread and frequent use of AI applications, reflecting the depth and breadth of AI empowerment across industries. It also points to a maturing ecosystem, hinting at a breakthrough in AI commercialization. As the world's largest internet economy, China is poised to be the epicenter of token economics.

The more powerful the computing capacity, the faster the token processing speed, the lower the unit cost, the higher the model quality, and consequently, the more frequent the token calls.

On the other hand, this surge in token consumption reflects a supply-side momentum anchored in computing power. In the digital economy, data is the raw material while computing power is the production tool. Every token call consumes computing power.

The more powerful the computing capacity, the faster the token processing speed, the lower the unit cost, the higher the model quality, and consequently, the more frequent the token calls. The explosive growth in token consumption or call volume provides grounds for optimism regarding computing power supply prospects, while also sounding a warning that it is a scarce resource in the AI era.

With the development of the Metaverse, the Industrial Internet, and the proliferation of AI agents, the surge in demand might lead to a perpetual shortage in computing power. Computing power supply is constrained by investments in hardware and infrastructure such as chips, servers and data centers. With "AI+" becoming a national strategy, China must vigorously strengthen the supply-side infrastructure.

In the AI era, computing power is akin to national strength. Recent developments bode well for China's computing capacity. Beyond companies like Huawei Ascend, Cambricon, and Hygon Information Technology launching acceleration chips and CPUs, the completion of China's largest AI computing cluster in Zhengzhou is a milestone in domestic computing infrastructure.

Developed countries are racing to build AI for Science (AI4S) computing facilities, marking a new stage of global tech competition. The cluster in Zhengzhou, located at the core node of China's Supercomputing Internet, integrates 60,000 acceleration cards. It is a super brain tailored for Chinese scientists and signifies a breakthrough in the country's computing infrastructure.

What gives China greater confidence is the energy support behind computing power — the bottom layer of what NVIDIA CEO Jensen Huang calls the "Five-Layer Cake of AI". At the end of AI lies electricity; tokens are driven by watts.

China has the world's largest and most advanced power supply system, with a total installed generation capacity of 3.95 billion kilowatts — three times that of the United States and 13 times that of Japan. The continued expansion of green power promises the sustainable development of computing power.

Under the framework of token economics, China's two major initiatives — computing-electricity synergy project and "East Data, West Computing" — are increasingly significant. The former ensures power supply for computing centers through coordinated planning of computing infrastructure and power systems.

The latter channels dense computing power demand from the east to the electricity-rich west. Both are vital for consolidating and upgrading China's intelligent computing scale, now the second largest in the world.

As Liu of the National Data Bureau noted, "tokens are not only the value anchor of the AI era but also the settlement unit connecting technology supply with commercial demand, providing quantifiable possibilities for the implementation of business models."

Token economics is still in conceptual infancy, and its integration with the real economy has yet to crystallize into a mature model. Regardless of whether an industrial revolution centered on tokens has already begun, as some analysts speculate, establishing a new value assessment system around tokens — a core variable reshaping the digital economy landscape — is an inevitable requirement for the development of the AI industry.

GLOBAL VIEWS

BERNARD DEWIT

Long-standing partnership

With careful stewardship, open dialogue and a focus on shared interests, Belgium-China relations can continue to evolve as a force for good

WANG XIAOYING/ CHINA DAILY

The 55th anniversary of the establishment of diplomatic relations between Belgium and China comes at a time of renewed global uncertainty, but also of opportunity. The visit of Belgium's Deputy Prime Minister and Foreign Minister Maxime Prévot to China at the invitation of Foreign Minister Wang Yi in April underscored the enduring importance both countries attach to dialogue, cooperation and pragmatic engagement. This milestone is not merely a symbolic anniversary, but a strategic moment to reaffirm shared commitments to mutually beneficial economic ties.

Over the past 55 years, Belgium-China relations have evolved from modest diplomatic exchanges into a multifaceted partnership. According to Chinese Ambassador to Belgium Fei Shengchao, even amid shifting geopolitical dynamics, this relationship has been marked by consistency and resilience. As a founding member of the European Union and home to its main institutions, Belgium has long served as a gateway between China and the EU. And China has become one of Belgium's most important trading partners outside the EU, reflecting deepening economic interdependence.

From the perspective of global peace and development, this year carries broader implications. In an increasingly fragmented international landscape, stable bilateral relationships such as that between Belgium and China provide an anchor for constructive engagement. Both countries have consistently supported multilateralism, international law and dialogue over confrontation. These principles are essential at a time when global challenges — ranging from climate change to economic volatility — require coordinated, cross-border solutions.

Economic cooperation remains at the heart of this partnership. Belgium's open economy, strategic logistics infrastructure and expertise in sectors such as pharmaceuticals, chemicals and advanced manufacturing complement China's scale, innovation capacity and rapidly evolving domestic market. The Port of Antwerp-Bruges and the airports in Brussels and Liege, for example, have become key hubs for trade flows between Europe and Asia, illustrating how connectivity can translate into shared prosperity.

Looking ahead, there is significant potential for collaboration in areas that are critical to both countries' futures. Technological innovation offers fertile ground for joint ventures, particularly in fields such as biotechnology, artificial intelligence and clean energy. Belgium's strong research institutions and China's growing investment in R&D create natural synergies. At the same time, the green transition represents both a necessity and an opportunity. As countries work toward carbon neutrality, partnerships that combine European regulatory expertise with Chinese industrial capacity can accelerate progress while creating new economic value.

From a European perspective, EU-China economic cooperation is both essential and complex. The EU seeks to balance openness with strategic autonomy, ensuring that cooperation with China remains fair and reciprocal. Belgium, as an EU member state, supports this balanced approach. Engagement with China should not be viewed through a purely competitive lens, but rather as a partnership where differences are managed through dialogue and common interests are actively pursued.

China's economic transformation over the past several decades has lifted hundreds of millions of people out of poverty and contributed significantly to global growth. Today, China remains a key engine of the world economy, accounting for a substantial share of global GDP expansion. For European businesses, including many Belgian companies, China represents both a vast market and an increasingly sophisticated innovation ecosystem.

At the same time, China's initiatives in infrastructure development and connectivity — particularly through international cooperation frameworks — have the potential to enhance global trade and development. When implemented transparently and sustainably, such initiatives can benefit not only participating countries but also the broader international community.

In terms of regional and global stability, China plays an increasingly important role. As a permanent member of the United Nations Security Council, China is well-positioned to contribute to conflict resolution and peacekeeping efforts. Belgium, with its long-standing commitment to diplomacy and international cooperation, shares this objective. Both countries recognize that stability is a prerequisite for development, and that dialogue remains the most effective tool for managing differences.

However, it is equally important to acknowledge that constructive cooperation requires trust, transparency and mutual respect. Differences in political systems and economic models should not be ignored, but neither should they prevent collaboration where interests align. The Belgium-China relationship demonstrates that it is possible to maintain a pragmatic partnership while engaging in open and honest dialogue.

US President Donald Trump recently completed a very important visit to China, during which he held talks with President Xi Jinping on forging stable and constructive relations between China and the United States, which are of utmost importance to global economic confidence and geopolitical stability. The way they interact has a direct impact on international trade, investment flows, financial markets, supply chains and global governance. Europe, Belgium in particular, naturally benefits when the relationship between these two countries is predictable, pragmatic and based on dialogue rather than confrontation.

As Belgium and China mark the 55th anniversary of the establishment of diplomatic relations, the message is clear: Bilateral relationships rooted in mutual benefit and respect can serve as building blocks for a more stable and prosperous world. For the two countries, the path forward lies in deepening economic ties, expanding cooperation in emerging sectors and reinforcing their shared commitment to multilateralism.

The next chapter of Belgium-China relations might present challenges, but it also holds immense promise. With careful stewardship, open dialogue and a focus on shared interests, this long-standing partnership can continue to evolve as a force for good in an increasingly interconnected world.

ONDREJ DOSTÁL

A reset point for Europe

The war on Iran may represent a decisive moment for the EU if it has the wisdom to seize it

SONG CHEN / CHINA DAILY

The war launched by the United States and Israel on Iran has exposed Europe's failure to fulfill its most basic responsibility: defending international law and protecting European interests. The economic consequences of the conflict could lead to a vastly different European Union — one in which member states reclaim control, and Brussels is weakened.

After the renewed US and Israeli aggression on Iran, most decision-makers in the EU quickly aligned themselves with Washington, largely limiting themselves to criticizing Iran's military response rather than addressing the initial surprise escalation. The principle of self-defence, it seems, is applied selectively in Brussels.

In the face of this serious violation of international law, which resulted in heavy Iranian casualties, widespread devastation across the country, and further destabilization of the Middle East, only a handful of European leaders spoke in defence of the United Nations Charter. Spanish Prime Minister Pedro Sanchez was among the few who openly named the aggressor and took concrete action, closing Spain's airspace to any aircraft involved in the conflict and withdrawing the Spanish ambassador to Israel.

Europe has faced similar moments before. During the Iraq War in 2003, several European governments supported Washington's illegal campaign despite widespread public opposition. The overthrow of the Libyan government in 2011 followed a similar dynamic, initially framed as a humanitarian mission but ultimately helping turn Africa's most prosperous nation into a failed state, which is still struggling to recover 15 years later.

Then and now, nothing good ever came out of such military adventurism for Washington's European allies. In addition to the tragic toll in military casualties and the waste of billions in taxpayer money, Europe was also confronted with skyrocketing energy prices, as well as millions of refugees who have placed significant strain on Europe's social services, labor markets, education systems and local communities. But while the Iran conflict is not an isolated incident, its gravity and economic impact may surpass anything seen before.

The Strait of Hormuz, through which roughly one-fourth of global oil and one-fifth of global liquefied natural gas passes, will remain a source of instability even under a ceasefire. Shipping risks, higher insurance costs and damaged infrastructure will constrain supply for years. Key LNG facilities in the Gulf, including parts of Qatar's Ras Laffan complex — the largest LNG terminal in the world — have suffered damage, with QatarEnergy's CEO Saad Sherida al-Kaabi warning that this could affect LNG supplies to Europe "for up to five years".

Europe's vulnerability is compounded by its misguided energy policy since 2022, most notably the self-imposed sanctions on Russian gas. By cutting off a major and reliable supplier, the EU exposed its economies to wholly unnecessary risks, forcing reliance on expensive and unstable US and Middle Eastern LNG. The result is soaring energy costs, rising living expenses and a sharp erosion of industrial competitiveness. Energy-intensive sectors, from chemicals and steel to fertilizers and heavy manufacturing, are already under severe strain, with external competition growing and ongoing exposure to energy volatility threatening long-term decline.

The consequences are visible across key sectors. Germany's chemical industry — long a backbone of European production — has been hit hard by soaring energy costs, with major producers such as BASF, Lanxess and Wacker Chemie raising prices and slowing investment. In 2025, investment in Europe's chemical sector fell by over 80 percent, plant closures doubled, wiping out around 17 million tons of capacity and threatening roughly 20,000 jobs.

Even though the impact of the Iran crisis has not fully unfolded, industrial gas and electricity prices across the EU are already two to four times higher than in major trading partners, undermining competitiveness and making European factories less attractive than sites in the US or Asia. In France, energy-intensive sectors, such as chemicals, fertilizers, metallurgy, glass and plastics, report cost increases of up to 40 percent, with some struggling to maintain production.

In this sense, rising energy prices are not abstract statistics, but a force translating into factory closures and growing uncertainty for millions of workers and small businesses across the continent.

Consequently, Europe's response to the Iran crisis should not be seen merely as inadequate geopolitical maneuvering; it raises a more fundamental question: Is European leadership prepared to prioritize the continent's economic survival and long-term stability over Washington's interests?

Many European citizens are skeptical of foreign military interventions and question whether European governments are acting in the continent's own interests. This gap between Europe's political elites and public sentiment is likely to continue widening in the coming years. As energy shortages and industrial decline intensify, this disconnect will evolve into a broader legitimacy crisis for European institutions and mainstream political leadership.

As a result, Europe is likely to witness the emergence of new political forces, alongside a gradual reorientation of mainstream parties. Pragmatism and the pursuit of national economic interests will increasingly challenge Europe's automatic transatlantic alignment.

Such developments would reshape the balance of power within the EU. The current vision of a tightly integrated, uniformly aligned Europe would give way to a more flexible and pragmatic structure, in which EU member states reclaim meaningful control over foreign policy, energy strategy and economic partnerships. Integration would continue where it delivers clear advantages, but strategic decisions would increasingly reflect national priorities rather than come from Brussels. In practice, this shift would mark the rise of a more plural, multi-vector Europe, moving decisively away from the largely undemocratic, top-down model that has dominated EU governance for decades.

A multi-vector Europe would be better positioned to navigate a multipolar world. The EU could maintain relations with the US, but without automatically subordinating European interests or joining every US military venture. At the same time, Europe would be free to deepen economic and diplomatic ties with the Global South, including the BRICS nations, fostering cooperation that benefits both European citizens and the peoples of partner countries.

For now, Europe still possesses enormous strengths: advanced industry, technological expertise, a large internal market, a well-educated workforce, and world-class cultural and academic institutions. Decline is not inevitable. The continent can adapt to a changing global order and remain an important economic and political actor — but only if it develops the wisdom to defend its own interests.

In this sense, the Iran war may ultimately be remembered not only as yet another US aggression against a sovereign Middle Eastern state but also as a turning point in the EU's strategic trajectory.

BUSINESS

Visitors record a humanoid robot performance staged at the booth of Unitree Robotics during a high-tech expo in Beijing on March 20. TANG KE / FOR CHINA DAILY

Unitree gearing up for IPO; Shanghai review next week

China's leading humanoid robot maker posts 1.7 billion yuan in yearly revenue

By **CHENG YU**
chengyu@chinadaily.com.cn

60.13 percent
gross margin from Unitree Robotics' core business in 2025

Chinese humanoid robot maker Unitree Robotics will face Shanghai's listing committee next week for its planned STAR Market initial public offering, as the company reported surging revenue growth, expanding margins and accelerating overseas deployment of its products.

The Shanghai Stock Exchange said it would meet on Monday to review Unitree's IPO application, formally moving one of China's highest-profile robotics startups closer to a public listing.

Unitree simultaneously disclosed updated 2025 financial data, showing revenue rose to about 1.7 billion yuan ($236 million), as China's humanoid robotics sector draws growing investor attention amid a global race to commercialize embodied artificial intelligence.

The Hangzhou, Zhejiang-province based firm said gross margin from its core business climbed to 60.13 percent in 2025, up nearly 16 percentage points from 44.22 percent in 2023, helped by increasing vertical integration and in-house manufacturing. Unitree said more than 90 percent of its core components are now self-developed and self-produced.

The company sharply increased research spending as competition in humanoid robotics intensifies. Unitree said its 2025 research and development investment more than doubled from a year earlier, rising 107.04 percent.

The filing comes as investors increasingly view humanoid robotics as one of China's next major strategic industries, alongside AI, electric vehicles and semiconductors.

Unitree has rapidly expanded its product lineup in recent months. It debuted earlier this month the world's first mass-produced piloted mech suit, marking the company's boldest step yet — from robot dogs and humanoid robots to science-fiction-style human mobility machines.

The machine, named GD01, starts at 3.9 million yuan. In a video released on Tuesday, Unitree founder and CEO Wang Xingxing was seen personally climbing into the cockpit and driving it across mixed terrain, with the footage presented in real time and without playback acceleration.

Meanwhile, Unitree's overseas push has begun moving beyond demonstrations into real-world industrial testing.

Codeveloped humanoid robots recently entered Tokyo's Haneda Airport for trial operations launched by Japan Airlines, the company said.

The robots are being tested for ground handling operations including baggage loading and unloading, cargo transport and conveyor coordination, with trials scheduled to continue through 2028.

Unitree said its G1 robot's flexibility, load capacity and force control capabilities allow it to adapt efficiently to complex airport environments while helping ease labor shortages and reduce worker burden.

The company described the deployment as the first commercial application of a Chinese humanoid robot inside a major global aviation hub.

Wei Kai, head of the AI research institute at the China Academy of Information and Communications Technology, said: "China's humanoid robots have made significant strides in motor control capabilities, which can be seen in recent events. The evolution of the 'brain' is also very fast. Hierarchical models and end-to-end models have progressed under data-driven paradigms."

Wei said China has established 27 data-collection sites nationwide to support training of embodied AI systems, signaling an effort to industrialize the learning pipeline behind the hardware.

The Ministry of Industry and Information Technology said China had more than 140 humanoid robot manufacturers by 2025, launching over 330 product models. In 2026, more than half of China's provinces and cities have incorporated embodied intelligence and robotics development into their government work reports.

'Durian freedom' spreads as prices dip across nation

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Consumers select durian at a supermarket in Shijiazhuang, Hebei province, on May 11. JIA MINJIE / FOR CHINA DAILY

Durian prices are tumbling as booming imports, faster logistics and a wave of seasonal fruit make the tropical fruit increasingly affordable for consumers.

Prices for some durian varieties have fallen 10 percent to 20 percent from a year earlier, according to wholesale market data and retailers. Durian that once sold for as much as 300 yuan ($44) to 400 yuan each can now be found for less than 100 yuan in some markets, fueling social media buzz around achieving "durian freedom" — a phrase used by Chinese consumers to describe "unlimited" access to previously expensive foods.

Thailand's Monthong durian, the dominant variety in the market, traded at an average wholesale price of 24.15 yuan per 500 grams at Beijing Xinfadi wholesale market on Tuesday, roughly flat from a year ago, but down 14 percent from early April.

Vietnamese Monthong durians have seen steeper declines, with wholesale prices dropping to about 18 yuan per 500 grams, down more than 40 percent from the previous month and over 30 percent from a year earlier, according to market data.

Retailers are passing on the savings to consumers. Membership chains including Sam's Club are selling Thai Monthong durians for around 199 yuan per 3 to 3.75 kilograms.

"Overall sales volume has definitely increased by more than 20 percent year-on-year," said He Huaxin, head of community group buying at Beijing Xinfadi wholesale market. "Durian from multiple countries are now entering the market, with Vietnamese varieties showing particularly strong growth momentum."

China is the world's largest durian importer and consumer, accounting for an estimated 82 percent of global consumption.

The country's appetite for what is often called the "king of fruits" has prompted producing nations across Southeast Asia to rapidly expand cultivation and exports.

Analysts said falling prices also reflect improvements in the country's logistics and distribution infrastructure, particularly the expansion of cold chain transportation tied to the government's efforts and push for a more integrated domestic market.

The durian price slide is part of a broader correction in the premium fruit market in the country as summer harvests accelerate. Cherry prices have nearly halved from earlier this year, while lychee prices have also dropped sharply amid surging supply. According to price tracking data from Chinese resale platform Dewu.com, 1,000-gram packs of Grade 3 domestic cherries sold for about 189 yuan in early March. By May, during peak harvest season, prices for the same product had fallen to around 108 yuan, a decline of nearly 45 percent.

Meanwhile, in Hainan province, one of the major lychee-producing regions, daily outbound shipments have repeatedly exceeded 10,000 metric tons. Cumulative shipments since late March reached nearly 88,000 tons as of May 8, up almost 289 percent from a year earlier. Sam's Club has set the retail price of a 2.5-kilogram box of lychees at 66.6 yuan.

Dajin Heavy bags 6.17b yuan in overseas orders

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Marking a pivotal shift from basic manufacturing to high-end maritime engineering, China's offshore equipment sector is rapidly cementing its indispensable role in the global green energy supply chain.

This accelerating trajectory was underscored on Sunday, as Dajin Heavy Industry Co Ltd announced that its subsidiary has secured a $156 million shipbuilding contract with a subsidiary of the renowned Dutch shipowner Jumbo Maritime.

According to the corporate filing, Dajin Heavy Industry will be responsible for the overall design, construction and delivery of two 25,000 DWT (deadweight tonnage) vessels, bringing a new generation of green, smart and multi-purpose heavy lift ships to the European market.

Scheduled for phased delivery in 2028 and 2029, the ships will feature high-end heavy-duty cranes. A single crane boasts a rated lifting capacity of 1,200 metric tons, while dual cranes operating in tandem can achieve a maximum lifting capacity of 2,400 tons.

Characterized by their massive load capacity, robust lifting capabilities and energy efficiency, the vessels are extensively suited for multi-scenario operations, including the transport of heavy offshore wind power equipment and deep-sea engineering construction, it said.

Remarkably, this marks Dajin Heavy Industry's fourth major overseas order secured within a single month, bringing its recent cumulative contract value to approximately 6.17 billion yuan ($908.8 million), with all delivery windows firmly locked between 2028 and 2029.

The company said this heavy lift vessel contract represents another mainstream core vessel type achieved in the high-end offshore vessel sector, following its successful development of deck carriers and non-propelled semi-submersible barges.

This milestone further perfects the company's full-spectrum layout of offshore vessel manufacturing, solidifying the foundation of its shipbuilding business, it said.

Since its establishment in 2000, Dajin Heavy Industry has deeply engaged in wind power steel structure manufacturing. Its product line encompasses core equipment such as offshore wind monopile foundations, transition pieces, jackets, floating foundations and towers, offering clients comprehensive one-stop solutions.

The company's robust financial performance mirrors its overseas success. In 2025, Dajin reported revenue of 6.17 billion yuan, a year-on-year surge of 63.34 percent, with net profit reaching 1.1 billion yuan.

Overseas revenue hit 4.59 billion yuan, climbing 165 percent and accounting for 74.46 percent of total revenue. By the end of 2025, cumulative overseas orders exceeded 10 billion yuan, covering key European offshore wind regions. This high-growth trajectory persisted into the first quarter of 2026, generating revenue of 1.9 billion yuan, a 67.17 percent increase.

Dajin's momentum is a microcosm of China's broader renewable energy footprint.

According to Qin Haiyan, secretary-general of the Chinese Wind Energy Association (CWEA) under the China Renewable Energy Society, China exported approximately 8 million kilowatts of wind turbine capacity in 2025, jumping about 50 percent year-on-year to hit a record high.

By the end of 2025, China's cumulative wind turbine export capacity surpassed 28 million kW, a 13-fold increase over the past decade. Exported to over 60 countries and regions — including Vietnam, Saudi Arabia, Egypt and Brazil — Chinese innovation has been a driving force behind a 60 percent reduction in global wind power costs over the last 10 years, cementing the nation's vital role in the global green energy transition, he said.

Central SOEs urged to ramp up digital efforts

By **REN QI**
renqi@chinadaily.com.cn

China's centrally administered State-owned enterprises have made substantial progress in both industrial digitization and digital industrialization, boosting their roles in ramping up the country's digital economy development, experts said.

The State-owned Assets Supervision and Administration Commission of the State Council recently emphasized the need to deeply implement the "AI+" special action among central SOEs. It urged enterprises to accelerate their digital and intelligent transformation based on their specific conditions, aiming to build a batch of emerging pillar industries.

Li Zhen, SASAC vice-chairman, said the commission will launch a new round of special transformative actions to this end.

"We will guide SOEs in the tiered cultivation of smart factories, strengthen independent innovation in digital technologies and deepen the integration of the digital economy with the real economy," Li said, adding that these efforts will drive the upgrade of traditional industries and accelerate the development of new quality productive forces.

With massive scale and diverse operational scenarios in key sectors, SOEs have become the core vehicles for moving artificial intelligence technologies from laboratories to industrial applications.

This aligns with a guideline on the "AI+" action issued by the State Council in August. The document set a target for 2027 to achieve deep integration of AI in six key areas, with the application penetration rate of new-generation smart terminals and agents exceeding 70 percent.

By 2030, AI is expected to comprehensively empower high-quality development with a 90 percent penetration rate, making the smart economy a major growth pole. By 2035, China aims to fully enter a new stage of smart economy and society, providing strong support for the basic realization of socialist modernization.

Against this backdrop, central SOEs are rapidly ramping up their infrastructure. In late April, China Mobile announced full operation of its Chengdu, Sichuan province hub node as a trusted data space for State-owned enterprises.

As one of the three major business hubs for this data space, the Chengdu site was closely aligned with the country's "East Data, West Computing" project. Equipped with 50,000 cores of general computing power and 1,675 PFLOPS of intelligent computing power, it provides stable and efficient support for data storage, intelligent analysis and AI model training for SOEs.

Similarly, CHN Energy is actively promoting the digital and intelligent upgrading of its industries by deepening cooperation with various market players, said a company executive.

Notable achievements include jointly developing rapid coal quality testing technology with Hikvision, deploying the "MineHarmony" operating system in its mines in collaboration with Huawei, and pioneering an unmanned coal mining model with industry partners.

The energy giant has also codeveloped a domestic building information modeling platform for the power sector, rolled out its self-developed iDCS system, and built the country's first 5G-powered smart power plant and cloud-based hydropower station.

Despite various challenges ahead, central SOEs are the most likely group to approach the 2027 target of a 70 percent application penetration rate for smart terminals and agents, said Li Jin, chief researcher at the China Enterprise Research Institute.

"To maintain this momentum, these State-owned giants must continue to break down data silos and foster open innovation ecosystems," he said, adding that increased investment in digital talent and robust cybersecurity frameworks will be crucial as these enterprises navigate the complexities of a fully integrated, AI-driven industrial landscape.

BUSINESS

China key to MSC Air Cargo growth

Firm operates seven freight aircraft on more than 30 routes weekly, serving over 17 destinations

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

Viewing Shanghai as a strategic cornerstone of its global network, MSC Air Cargo is well positioned to serve its strategy of growing alongside the Chinese market following the establishment of a cargo station in Shanghai and the rapid expansion of its operations in China, said a top executive of the company.

"If you look at the global trade lanes and trade corridors, China is very much a core component in the globe. So we selected Shanghai as one of the strongest additional markets to support any growth of products for MSC Air Cargo," said Jannie Davel, CEO of MSC Air Cargo, the air cargo division of Geneva-headquartered MSC Group, during an exclusive interview with China Daily.

"We strongly believe that Shanghai has the capability to continue to be one of the strongest places," said Davel on his visit to Shanghai in late April. The company launched the Shanghai station last month.

Regarding Shanghai's ambition to become a global shipping center, Davel said he sees immense opportunities, given Shanghai's status as one of the world's largest trading ports.

"Shanghai and Hong Kong are two of our biggest gateways. (The launch of) the Shanghai station is very much part of our China gateway strategy in terms of growing with China," Davel said.

Globally, MSC Air Cargo has five major gateways, which are Hong Kong, Shanghai, Malpensa of Italy, Liege in Belgium and Mexico City.

"Every decision we have made over the past two years, from our partnerships to our route development, has been shaped by our belief in the importance of this market," he said.

According to Davel, the agreement signed with the logistics unit of Shanghai Airport (Group) — also known as Shanghai Airport Authority Logistics Development Co — in November has helped MSC Air Cargo grow through adding two new flights, including two weekly in Shanghai, and four in Ezhou, Hubei province.

"Shanghai Airport Authority Logistics Development Co was a very key partner in helping us facilitate our establishment here ... They have been very instrumental for us in helping us start in such a great market," said Davel.

Established in October 2022, MSC Air Cargo has grown rapidly from a single aircraft into a scalable intercontinental platform operating a fleet of seven cargo aircraft on more than 30 routes weekly, serving over 17 destinations in Asia-Pacific, Europe and the Americas.

Above: Two driverless vehicles haul cargo near the smart logistics warehouse at an airport in Hangzhou, Zhejiang province, on March 13, 2025.

XIAO BENXIANG / FOR CHINA DAILY

5.1 percent
year-on-year growth of the country's total social logistics value

> "Every decision we have made over the past two years, from our partnerships to our route development, has been shaped by our belief in the importance of this market."
>
> **Jannie Davel,**
> CEO of MSC Air Cargo

"China is very much part of our strategy to continue to grow. More than half (16) of the routes are from or to Chinese destinations," Davel said.

According to Davel, the Chinese mainland contributes between 17 and 18 percent of global air cargo business in terms of tonnage, and that of the Chinese market (including Hong Kong) is between 20 and 21 percent.

"You have to be part of that growth, and we continue to see opportunities," Davel said.

Since his first visit to China back in 1999, Davel said that over the past few decades he was impressed with the quality and speed of China's development.

China's total social logistics value expanded 5.1 percent year-on-year to 368.2 trillion yuan ($54.23 trillion) in 2025, and the nation's logistics sector generated a combined revenue of 14.3 trillion yuan during the same period, up 4.1 percent from a year ago, according to data from the China Federation of Logistics and Purchasing.

China's logistics sector has gone through effective growth during the 14th Five-Year Plan (2021-25) period. The fact that it has retained the title of the largest logistics market in scale globally for the tenth consecutive year fully demonstrates China's strengths as a supersized market, and such advantages have played a positive role in supporting the nation's economic development, Cai Jin, president of the China Federation of Logistics & Purchasing, was quoted as saying by CCTV news.

In December 2022, MSC Air Cargo kicked off its first operation in Xiamen, Fujian province. The company currently operates in six Chinese cities including Hong Kong, Ezhou, Shanghai, Xiamen, as well as Guangzhou and Shenzhen in Guangdong province.

"Our presence in China is built on trust, mutual respect and a shared belief that strong local partnerships are the foundation of reliable global logistics," Davel noted.

Leaps seen in value of Chinese brands

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

The value of Chinese brands listed among the 2026 list of the top 100 most valuable global brands has leaped by 32 percent year-on-year, significantly surpassing the global average growth rate, according to a report released by consulting firm Kantar.

Chinese brands are not only showcasing their innovative vitality and global competitiveness, but also transitioning from mere scale expansion to capability enhancement, according to the report released on May 14.

Chinese brands excel at making decisive judgments and acting swiftly in the early stages of emerging trends, and they effectively translate insights into tangible value through continuous iteration and experience optimization, according to the report. Such agility is becoming a crucial competitive advantage in an increasingly uncertain market environment, it stated.

For instance, Tencent, ranked eighth on the list, continues to leverage its ecosystem to enhance monetization capabilities through games, video account advertisements and cloud computing services. Alibaba, positioned at 19th, has stabilized its brand value through business structure optimization and user experience upgrades.

Huawei, ranked 41st on the list, defines artificial intelligence as the most certain strategic opportunity for the next decade, focusing on the definite demand for computing power and connectivity to enhance user lifecycle values. Also, Haier, positioned at 53rd, has embraced AI comprehensively throughout its processes, continuously strengthening its competitiveness in the internet of things ecosystem.

In addition to the 13 Chinese brands that made the top 100, another 14 Chinese brands and their related sub-brands are listed in global industry sub-rankings in the fields of alcohol, apparel, automobiles, food and beverages, media and entertainment, retail, and home care. These brands include Wuliangye, Anta, BYD, Nongfu Spring, WeChat, Pinduoduo and Liby.

"Behind the strong rise of Chinese brands, there exists a clear main line, which is to continuously expand the value boundary of the brand in consumers' lives. The brands begin with their existing advantages and precisely extend into more new growth spaces," said Zhang Lin, executive managing director of Kantar China.

Zhang said that in the process of globalization and long-term brand building, Chinese brands have been demonstrating sharper judgment and more decisive action, setting new references for global brand growth.

Kantar has stated that this year's list sends a clear signal that AI is rapidly reshaping the global brand value system, with brands unable to adapt to AI-driven transformations losing their competitive advantages.

Meanwhile, AI-native brands are rapidly emerging. Claude entered the global top 100 for the first time, ranked 27th with a brand value of nearly $100 billion. ChatGPT became the fastest-growing brand of the year, with its brand value increasing by an impressive 285 percent year-on-year.

A livestreaming host promotes Chinese makeup to Western audiences on TikTok in Yiwu, Zhejiang province, on Sept 24.
LYU BIN / FOR CHINA DAILY

Technology brands are showing strong dominance in the global top 100 rankings. Google reclaimed the top spot, with Nvidia, Amazon and Tencent making it into the top 10.

The total value of the annual top 100 most valuable global brands reached $13.1 trillion, up 22 percent from the previous year. Brand growth is entering a new acceleration cycle, said the report.

In this AI-driven global brand restructuring, Asian brands have been continuously expanding their influence in both domestic and international markets, with 23 Asian brands making the list this year, accounting for nearly a quarter of the global top 100.

Plant for fossil-free plastics planned

By **WANG YING** in Shanghai

China has been chosen as the site for the world's first plant for the production of fossil-free plastics from green methanol, reflecting among other factors the country's manufacturing strengths, commitment to green transformation, and promising development prospects, according to a top executive of Swiss-based fossil-free plastic company Vioneo.

China's manufacturing strength and its 15th Five-Year Plan (2026-30), which prioritizes green chemicals and industrial decarbonization, prompted Vioneo to bring its 1.5 billion euros ($1.74 billion) investment to China, said Alex Hogan, CEO of Vioneo, during a recent interview in Shanghai.

"China has shown strong commitment to sustainability, with the latest five-year plan supporting green methanol and zero-carbon technologies. That is one of the main reasons for coming here," he said.

According to Hogan, the world's first newly built plastics plant powered by renewable electricity and green methanol is expected to cut carbon dioxide emissions by about 1.5 million metric tons a year versus oil-based production, and the figure could double if coal is used as the raw material.

"We are at the beginning of the journey identifying China is the right place, because our feedstock sources are here. China is decades ahead of other regions on green methanol," he said.

The European chemical start-up, owned by A.P. Moller Holding, announced in January that it would abandon plans to build the plant in Belgium and decided to invest in a similar project in China.

"We took a very conscious decision to put the first plant in China," said Katja Wodjereck, chief commercial officer of Vioneo, adding that the availability of green methanol at scale and on a competitive basis in the future was a big plus.

"Moving the first plant here is a supply chain decision and also a commercial decision, because that way we cannot make this even more — from the supply chain — closer to where our feedstock is," said Wodjereck.

"But we are also making this more cost-attractive, with a better supply chain and greater CO2 savings. It also opens up, which I find very interesting in my role, access to Asian customers in the future," she added.

According to Wodjereck, the future plant is expected to have annual capacity of about 200,000 tons of fossil-free polypropylene and 100,000 tons of fossil-free polyethylene.

"There are other reasons, but you need to look at what the most important ones are. The most important reason is to reduce the price of our final product, and the (15th) Five-Year Plan is stimulating the green ethanol market," said Hogan.

China's 15th Five-Year Plan outlined its commitment to comprehensively advancing green transformation at a faster pace, with the country's green and low-carbon industrial scale expected to double to exceed 20 trillion yuan ($2.94 trillion) by the end of 2030, CGTN reported.

The target of achieving carbon neutrality is not simply a commitment to cutting emissions, but also a profound transformation involving green buildings, zero-emission plants and industrial parks, green energy, green products and green trade, the report added.

Scheduled to officially begin production by 2030, Hogan said the company is still in talks over the final site selection and is expected to make a formal announcement in about one to two months.

"I'm counting on China speed. Everything I hear is that the country is amazing at delivering large-scale projects quickly, so maybe a little earlier than 2030," Hogan said.

Call to enhance global ocean governance

Policies aimed at promoting renewable blue economy and conservation efforts

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

Experts gathered in the coastal city of Xiamen for the China Council for International Cooperation on Environment and Development 2026 Roundtable Meeting have called for broader efforts to enhance global ocean governance through multilateral cooperation.

The two-day event, which concluded on Tuesday, hosted about 150 delegates, including officials from the Ministry of Ecology and Environment, leaders of Fujian province and Xiamen, council members, international partners, and representatives from research institutes and enterprises.

At this year's roundtable, themed "Harmony Between Humanity and the Ocean: Building a Shared Future for All Life on Earth", participants shared the council's latest research findings and policy recommendations on the sustainable blue economy, biodiversity conservation, low-carbon transition and green international development.

Discussions focused on promoting synergies among multilateral conventions to advance global ocean governance, accelerating the green and low-carbon transition of marine industries to foster a renewable blue economy, and deepening "Beautiful Bay" construction to support high-quality economic development in bay areas.

During the event, attendees visited Wuyuan Bay and local mangrove ecological zones for a first-hand experience into Xiamen's progress and innovative practices in marine ecological restoration.

Guillermo Ortuno Crespo, co-lead of the IUCN World Commission on Protected Areas High Seas Specialist Group, said Xiamen stands as an example of how population and economic growth can coexist with ecological sustainability, addressing one of the world's biggest challenges.

"This is a fantastic opportunity for us to learn from each other and to learn more about the Chinese vision for future ocean governance," Crespo said. "If great countries like China can demonstrate that nature does not come second to economic development, but can instead be placed front and center through the vision of ecological civilization, that would send a positive message to the region and the world."

The event came at a critical turning point for global marine policy after the BBNJ Agreement — the agreement under the United Nations Convention on the Law of the Sea on the conservation and sustainable use of marine biological diversity of areas beyond national jurisdiction — entered into force on Jan 17, marking a new chapter in global ocean governance.

On Jan 16, China officially submitted a note verbale to the UN secretary-general, applying to host the agreement's permanent secretariat in Xiamen.

According to China's official proposal, Xiamen pledged support to ensure the secretariat's smooth operation, including the provision of a dedicated 15-story modern office building, full waivers of utility fees for the first five years, and a special fund to support the capacity-building efforts and participation of developing countries.

Dimitri de Boer, director for China at ClientEarth, an environmental law organization, spoke highly of Xiamen's potential as the host city, adding that the prospect of a UN secretariat based in Xiamen to help manage the shared oceans has drawn widespread attention.

"Having visited the city several times, Xiamen feels to me like the most beautiful city in China, and it is truly wonderful," he said. "With landmarks like Xiamen University and Gulangyu Island, beaches across the city, a comfortable climate and strong marine technical capabilities, it is an ideal location.

"Xiamen is a highly suitable choice, given China's strong commitment to environmental protection. This would also be a monumental milestone for Xiamen's internationalization," he added.

Ambitious solar thermal power project gets ready

By **DAQIONG** in Lhasa and **ZHENG JINRAN**

In a solar thermal power project designed to provide stable electricity for the northern Xizang autonomous region, the installation of nearly 16,000 heliostats — mirrors that concentrate solar energy — has been completed, marking a key step toward the opening of the world's highest-altitude tower-type solar thermal plant in Nagchu's Amdo county later this year.

The 100-megawatt project is being developed by the Xizang Development Investment Group as the region's first tower-type solar thermal power station, part of Xizang's renewable energy development plan under the 14th Five-Year Plan (2021-25). The company said all 15,927 heliostats — the plant's solar concentrators — have now been installed, and the project is progressing toward grid-connected operation in October.

Unlike conventional photovoltaic systems, the plant uses molten-salt tower thermal technology, which concentrates sunlight to heat molten salt to temperatures of up to 560 C. The stored thermal energy is later converted into electricity through a heat exchange system, allowing the plant to continue supplying electricity after sunset — a key advantage for grid stability in northern Xizang, the company said.

The site receives more than 2,800 hours of sunshine annually. The heliostats are spread across about 800,000 square meters and reflect sunlight toward a central receiving tower.

The project, with a total investment of more than 2 billion yuan ($295 million), is expected to generate around 255 million kilowatt-hours of electricity annually, saving about 60,000 metric tons of standard coal and reducing carbon dioxide emissions by roughly 165,000 tons, said Du Jun, an on-site manager for the company.

"The station will provide stable clean electricity and help address shortcomings in the stability of the northern Xizang power grid," he said.

Developers said construction on the high-altitude Qinghai-Tibet Plateau posed major challenges, including extreme cold, strong winds and weak grid connectivity. To mitigate these conditions, the project team optimized construction methods and introduced intelligent control systems to support operations and maintenance in the harsh environment.

The project has also generated significant economic benefits for local communities. During construction, training programs for farmers and herders are expected to increase combined incomes by about 118 million yuan.

Xizang's clean energy sector has expanded rapidly in recent years, with renewable sources now accounting for more than 96 percent of installed power capacity and almost all electricity generation, according to the region's energy administration.

Karma Tsetan, chairman of the region, said the clean energy sector has rapidly emerged as a key pillar industry, according to a report by Guangming Daily.

Xizang's installed and under-construction power capacity was expected to exceed 33 million kilowatts by the end of 2025, while operational installed capacity would surpass 13 million kilowatts. Electricity transmission from Xizang has expanded to more than 10 provincial-level regions, including Shanghai, Beijing, as well as Hunan and Jiangsu provinces.

The work report of the regional government delivered in late January said industrial upgrading and the strengthening of industry chains have been identified as key tasks for Xizang this year under a broader strategy to develop plateau-specific competitive industries, with clean energy a major focus.

The report said Xizang will accelerate the development of large integrated hydropower, wind and solar bases in the upper reaches of the Jinsha River, southeastern Xizang and the upper Lancang River area.

The region will also push forward power transmission corridors and grid infrastructure, aiming to reach 20 million kW of installed capacity. It also called for the development of equipment manufacturing and clean energy industries, while advancing pilot projects for green hydrogen and oxygen production and related industrial applications.

Summer school reinforces need for healthy ecosystems

By **LI WENFANG** in Guangzhou and **LI MENGHAN**

International experts are convening in China this week to explore how healthy ecosystems can be harnessed for sustainable development amid intensifying global risks. At the opening ceremony of the second Nature-based Solutions Summer School in Guangzhou, Guangdong province, on Tuesday, participants also underscored the importance of enhanced global sharing and cooperation, and recognized China's notable progress in the field.

Led by the International Union for Conservation of Nature, the 10-day event has brought together more than 40 experts from different fields for theoretical learning, case studies, group discussions and field visits across Guangzhou and the Hong Kong Special Administrative Region.

"We are at a critical inflection point in human history. The planet faces an unprecedented convergence of crises — climate change, biodiversity loss and widespread land degradation. These are not isolated problems but deeply interconnected and mutually reinforcing," said Stewart Maginnis, deputy director-general of the International Union for Conservation of Nature.

Maginnis stressed the importance of transforming policy landscapes to reflect ecological interdependence, with a core focus on nature-based solutions — actions that protect, sustainably manage and restore ecosystems while addressing societal challenges.

Against this backdrop, the summer school was established in 2025 to build capacity, "because knowledge is only capable of driving meaningful change when it is shared and applied", he said.

"Over the next 10 days, through courses, exchanges and field visits in both Guangzhou and Hong Kong, you will not only expand your knowledge but also build a community of practice that breaks down silos, fosters trust and bridges sectors and disciplines," he said to attendees. "In doing so, you will contribute to advancing nature-based solutions across Asia."

For Amandine Heger, deputy director of the Ministry of the Environment, Climate and Biodiversity of Luxembourg, this is her first visit to China, and she said Guangzhou has given her a profound sense of the country's scale and speed of implementation.

"This is a country that does not merely discuss ecological transformation. It implements it, rooted in an ancient philosophy that sees humanity not above nature, but as part of it. China has translated this vision into actions at every scale," Heger said.

She cited examples where Guangzhou has restored barren hills to green, established ecological corridors and advanced large-scale mangrove restoration along its coastlines.

Wu Jun, deputy director-general of the Ministry of Natural Resources' Department of International Cooperation, said Guangzhou and Hong Kong were selected to host the second summer school due to their proven practices, noting that the Guangdong-Hong Kong-Macao Greater Bay Area is a pioneer in green development and cross-regional ecological synergy governance.

Wu expressed hope that participants would share their perspectives and regional practices to accelerate the global implementation of nature-based solutions.

China will continue to implement the "Two Mountains Theory" — a concept emphasizing that lucid waters and lush mountains are invaluable assets — in advancing nature-based solutions and contributing Chinese wisdom to global ecological governance, she added.

Mine blast victims given psychological counseling

By **YANG ZEKUN** and **ZHU XINGXIN** in Qinyuan, Shanxi and **WANG XIAOYU** in Beijing

Medical workers have rushed to provide mental health support to people affected by a mine accident in northern China's Shanxi province to help them cope with trauma.

The gas explosion that struck the Liushenyu coal mine in Qinyuan county, Changzhi city, on Friday evening killed 82 people, with two still missing. A total of 128 people were injured, including four in serious or critical condition.

At Changzhi People's Hospital, all 31 injured patients have received systematic psychological assessments and intervention and are generally in stable condition, said Zhao Bing, a psychologist at the hospital, in an interview on Tuesday.

"We began evaluating their emotional and mental status on the very first day they were admitted, after doctors checked their physical condition and confirmed that their vital signs were stable," she said.

Along with therapists and psychiatrists dispatched from higher-level hospitals, Zhao said medical personnel are conducting daily ward rounds and one-on-one interviews to monitor patients' mood changes, sleep patterns and psychological recovery progress.

"Most of them are now eating and sleeping normally and resting well without much distress," she said, adding that their physical condition is also stable, though a few still experience mild dizziness or headaches, likely resulting from exposure to carbon monoxide.

Zhao said mental health workers are paying special attention to signs of anxiety, depression, repeated recollection of the accident scene, as well as nightmares, and are developing tailored recovery plans.

"Their most critical psychological need is to reestablish stability in environmental safety, personal safety and physical health, as well as a sense of trust in family care, social support, government assistance and medical treatment," Zhao said.

Cui Hongwei, a psychologist at the people's hospital in Qinyuan county, said many patients were worried about lingering physical symptoms, and their most urgent concern was full recovery.

"For miners who have survived a major disaster, rebuilding confidence is the most important thing," he said. "We want to help them slowly emerge from the shadow of the accident and return to normal life."

Cui said the hospital is carrying out daily one-on-one psychological interventions and prioritizing patients who tend to experience mood swings, repeatedly recall the accident or suffer from insomnia.

He added that after all patients are discharged, the hospital will continue to provide follow-up consultations for at least one week and up to three months.

Under the guidance of the National Health Commission, a total of 10 psychologists have been dispatched by the province to support psychological relief work, according to local authorities.

At the same time, two social workers are accompanying each victim's family, providing emotional support and counseling. Detailed compensation and assistance plans are being formulated, authorities said.

The Supreme People's Procuratorate announced on Tuesday that it would supervise the handling of the case involving the explosion.

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

Lai's two years in office plagued by failure

Island leader pushes Taiwan toward becoming 'powder keg'

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

JIN DING / CHINA DAILY

After two years in office, growing evidence suggests Lai Ching-te has been consolidating his political power and advancing the "Taiwan independence" separatist agenda at the expense of the Taiwan people's livelihoods and regional stability.

While Lai promised to "make Taiwan a better place" two years ago, critics have pointed out a sharp contrast between the sweeping promises made in his inaugural address and his actual governance.

Of Lai's 227 campaign pledges, only two have been fulfilled, representing a 99 percent failure rate, according to Ko Ju-chun, a lawmaker from the Chinese Kuomintang, the largest opposition party in Taiwan. This lack of progress has led critics on the island to label Lai a "liar". Recent polling in Taiwan indicated that his dissatisfaction rating has remained above 50 percent for five consecutive months.

Despite failure to fulfill his pledges, the Lai administration has introduced measures such as the "mass recall" campaign targeting opposition lawmakers and restrictions preventing Taiwan residents from taking group tours to the Chinese mainland. Political analysts argued that what Lai has brought to the island is deepening internal political confrontation and straining cross-Strait relations.

Escalating tensions

Since taking office in May 2024, Lai has pursued a political agenda centered on "Taiwan independence". His administration has moved away from the 1992 Consensus, which embodies the one-China principle and has long served as the foundation for cross-Strait relations.

The Chinese mainland has dismissed this separatist agenda as a mere "illusion". His approach has also faced pushback from opposition parties within Taiwan and has failed to gain recognition from the broader international community.

The Lai administration has taken provocative actions such as military expansion and reliance on external forces to advance its separatist agenda, moves widely seen as fueling political confrontation in Taiwan and across the Strait.

In March last year, it released the so-called 17 measures, which labeled the mainland as a "hostile force" and imposed restrictions on cross-Strait exchanges.

While repeatedly emphasizing the "importance of peace", Lai has continued to push for an increase in the island's "defense" spending to more than 3 percent of GDP, with a target of reaching 5 percent by 2030.

In November last year, he also proposed a special "defense" budget worth $40 billion for arms purchases from the United States. After being blocked several times by opposition lawmakers, the proposal was eventually reduced to $25 billion in May.

Zheng Jian, a professor of Taiwan studies at Xiamen University in Fujian province, said the Lai administration's strategic shortsightedness and blind obedience with the belief that paying "protection fees" can buy security will not bring peace, but instead risk turning Taiwan into a powder keg of geopolitical rivalry.

He added that Lai's so-called defense is mortgaging Taiwan's future and tying its 23 million people to his "Taiwan independence" chariot.

Li Zhenguang, dean of the Taiwan Research Institute at Beijing Union University, said that "Taiwan independence" provocations have created heightened risks of military conflict in the region, which are the greatest threat to peace and stability across the Taiwan Strait.

Societal divisions

On May 19, an impeachment vote against Lai was held in the island's "legislative yuan" on the eve of the second anniversary of his term, marking the first such vote targeting a Taiwan leader.

The impeachment procedures were initiated by the two opposition parties in December last year after the Lai administration refused to promulgate an amendment to the government revenue allocation plan enacted by the legislative body.

The move of the Lai administration was regarded as negating legislative power and undermining the separation of powers in the government.

Although the impeachment motion failed to reach the required threshold, the 56-50 vote in favor of the proposal still reflected strong public dissatisfaction with Lai's administration, opposition parties said.

Cheng Li-wun, chairwoman of the KMT, said on May 20 that the Lai administration's disregard for Taiwan's laws and democratic institutions has become the most significant source of instability on the island over the past two years.

When Lai was elected as the regional leader in 2024, his Democratic Progressive Party failed to secure an absolute majority in the legislative assembly. Out of the 113 representatives in the "legislative yuan", 52 are from the KMT, 51 from the DPP, eight from the Taiwan People's Party and two are non-party candidates.

Facing this unfavorable balance of power, the Lai administration has attempted to overturn election results while intensifying efforts to suppress opposition parties and dissenting voices in Taiwan.

An unprecedented "mass recall" campaign was launched by the DPP authorities in July and August last year, targeting 31 KMT lawmakers and a former mayor of Hsinchu from the TPP in an attempt to remove them from office before the end of their terms. However, none of the recall efforts succeeded.

Under Lai's administration, partisan tensions between the DPP and opposition parties have also led to frequent stalemates over policy proposals and public budget bills in the legislative body, contributing to low government efficiency.

The mainland has described his administration as "incapable of governing but highly adept at political infighting".

Following the "anti-mainland" stance, the Lai administration has also required public officials and employees in education to sign a declaration stating that they do not hold mainland household registration or identification.

These people also need to obtain approval before traveling to the mainland and to provide detailed reports of their itineraries and purposes upon returning to Taiwan. Violations may result in demerits and dismissal from their posts.

Many residents in Taiwan have expressed deep concern over a tightening political and social atmosphere, describing a "chilling effect" akin to a new "green terror", a reference to the signature color of the DPP.

Among those most severely affected are mainland-born spouses living in Taiwan, a community of over 400,000 people. Last year, the DPP authorities expelled several mainland-born spouses, who are social media influencers, after DPP supporters reported them for making pro-mainland comments online. One of these influencers, Liu Zhenya, was forced to leave Taiwan, separating her from her three children on the island.

The DPP authorities also issued an administrative order requiring mainland-born spouses to submit a document certifying the renunciation of their mainland household registration. Those who do not comply face the risk of having their Taiwan residency or settlement permits revoked.

Zheng, the professor, called the governing approach "dictatorial", under which "those who obey will prosper, while those who oppose will perish".

He said that such practices of intimidating dissenters fully expose the hypocrisy of "wanting not democracy but the DPP to dominate".

Deceptive 'resilience'

Taiwan's economic growth rate reached 8.68 percent last year, the highest level in the past 15 years, while per capita nominal GDP surpassed $39,000, which was highlighted by Lai in his anniversary speech on May 20.

However, recent data released by Taiwan's accounting authorities showed that nearly 70 percent of employed workers on the island earned less than the average salary in the first quarter of this year, marking a record high.

The strong economic figures contrast sharply with the growing public perception of "poverty" on the island. Kuo Cheng-liang, a former lawmaker and political commentator, said the gains from economic growth have largely been concentrated among corporations rather than shared with ordinary workers.

Meanwhile, inflation still weighs on households and businesses. Amid the ongoing conflicts in the Middle East, businesses are facing the combined pressure of rising oil prices and currency depreciation. According to market researcher CRIF Taiwan, the real purchasing power of the New Taiwan dollar has declined by about 3 to 5 percent since the outbreak of the conflict, further intensifying imported inflationary pressures.

The impact has also been reflected in consumer prices. Products such as imported beef, dairy products and fruits have seen price increases of around 8 to 12 percent in supermarkets due to higher air and sea freight surcharges.

Disruptions to energy shipping routes in the Strait of Hormuz have also created challenges for Taiwan's heavily import-dependent energy supply. Power suppliers and oil refiners on the island have suffered significant losses while attempting to stabilize energy prices.

Compared to the administration's strong focus on political agendas, critics said it has shown indifference to the island's economic and industrial challenges.

In April, the mainland introduced 10 policy measures to promote cross-Strait industrial and infrastructure cooperation. While industry groups in Taiwan have called on the DPP authorities to respond, the administration labeled the package as "united front tools" and declined to implement the measures.

At the same time, the Lai administration has been accommodating demands raised by the US in a proposed trade framework, including expanding Taiwan Semiconductor Manufacturing Company operations in the US, increasing investment in US technology industries, and expanding imports of US agricultural products.

Local media reported that tariff-free access for US agricultural goods could pose risks to Taiwan's farmers, while eased import requirements for products such as sprouted potatoes have also raised concerns over food safety.

Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, said at a news conference in February that the DPP made excessive concessions in trade negotiations with the US in an attempt to seek external support for their separatist agenda, at the cost of Taiwan's industrial development prospects and the interests of people on the island.

Professor Zheng said the so-called economic achievements are nothing but a mirage built on a single industry. "Once the external environment changes, Taiwan's economy could face a painful hard landing," he added.

Completion nears on quest to retrace ancestral roots

By **ZHANG YI** and **HU MEIDONG**
in Fuzhou

Lai Hanzhong displays a handwritten genealogy book of the Lai clan in Xintian village, Fujian province, in September 2022.
ZHANG JINCHUAN / CHINA NEWS SERVICE

At a time of heightened political friction across the Taiwan Strait, a monumental four-year grassroots project to bridge the lineage of 100,000 divided clan members is nearing completion in a small village in Fujian province — counting Taiwan leader Lai Ching-te's own family among its historical branches.

In Xintian village of Pinghe, Fujian, the historical point of departure for generations of Chinese mainlanders moving to Taiwan, an eight-volume, co-compiled genealogy book will be unveiled this October.

For Lai Hanzhong, secretary-general of the local Lai Clan Association, the completion of this text is more than a historical record; it is an urgent reminder of shared identity.

"Every time our Taiwan compatriots visit, they bring their own branch genealogies to cross-check records with ours, searching for where they belong," Lai Hanzhong said.

It's estimated that over 60,000 descendants from the village now live in Taiwan.

Lai Hanzhong launched the mass genealogy project in 2022 in an attempt to piece together the Lai clan's history. He organized more than 100 local sages to compile a comprehensive genealogy.

The initiative quickly echoed across the water. Taiwan clan members eagerly joined in, establishing a team of 27 elders to gather historical data scattered across Taiwan and send it back to Lai Hanzhong.

After four years of collaboration, the eight-volume genealogy is nearing completion, with a grand presentation ceremony scheduled for October. A large contingent of Taiwan relatives are expected to attend.

Years ago, Lai Hanzhong visited the old residence of Taiwan leader Lai Ching-te in New Taipei City, meeting his relatives. "They strongly identified with their roots, openly acknowledging they are from Pinghe, and were very warm," Lai Hanzhong said of Lai Ching-te's relatives in Taiwan.

Standing inside the ancestral hall, Lai Hanzhong pointed to the family commandments carved on the wall.

"Our ancestral motto says: 'Children must be filial; those who are unfilial commit the greatest sin against nature,'" Lai Hanzhong said, in the hope that Taiwan clan members remember these teachings.

"As Chinese people and descendants of the Lai clan, one must recognize their ancestors and possess a Chinese heart," he said. "I hope Lai Ching-te can refrain from saying things that hurt compatriots and please adversaries. I hope he can do more good for national reunification. This is the common aspiration of our entire clan and all mainland compatriots."

To Lai Hanzhong, the urgency of his work is best reflected in the younger generation of Taiwan compatriots, who often try to track down their roots guided only by the name Xintian carved on their families' ancestral spirit tablets.

Lai Hanzhong recalled a case in 2022 involving a young Taiwan woman surnamed Lai who was working in Beijing. With a centuries-old address provided by her father, she posted a plea for help on the social media platform Xiaohongshu. Netizens quickly guided her to Xintian village.

When she arrived at the ancestral hall, she was anxious. Her family records used the characters Shentian instead of Xintian, though both sound identical in the local dialect.

"She desperately wanted to know if her ancestor was in our genealogy," Lai Hanzhong said.

"I quickly found him: Dengfang, a 14th-generation ancestor of the Lai clan who migrated to Taiwan."

The woman instantly shared photos of the ancient page with her father via WeChat. "The emotion of that moment is still vivid in my mind," he said. "It showed that when young people from Taiwan find their roots, the excitement is truly unforgettable."

For members of the Xintian Lai clan on the island, the roots also manifest daily in a shared faith, such as the annual cultural festival honoring Emperor Baosheng, a revered deity of medicine and healing.

The incense used in Yuanbao Temple in Taichung, Taiwan, was originally brought from Xintian Temple, honoring the life-preserving deity in the Fujian village. In April, a 200-member pilgrimage group from Taichung traveled to Xintian to pay tribute.

POP PULSE

Dear You is a Mandarin and Chaoshan-dialect family drama released in mainland China on April 30. The film follows a Chaoshan grandmother and her grandson, who travels to Thailand in search of his long-absent grandfather, only to uncover a decades-old secret hidden in overseas letters.

Letters that carry home

Without big-name stars, dazzling visual effects or slogan-like messaging, *Dear You* tells the story of generations of overseas Chinese through one of the simplest forms of love: a letter sent home.

In the film, a letter is never just a letter. It carries longing, responsibility and love. For many overseas Chinese families, such letters were once a fragile bridge between survival and belonging.

Veldesen Yaputra

As a Chinese Indonesian student in China, I felt this story deeply. The phrase "overseas Chinese" often brings to mind images of success and wealth. Yet the real history of overseas Chinese communities is often far more ordinary, and therefore far more touching: many were workers, shop owners or teachers who left home just to survive.

They crossed the sea with uncertainty, worked in unfamiliar environments, and saved money little by little. Even a small remittance sent home could represent years of hardship. That is why *Dear You* moved me: it portrays love not as something loud or dramatic, but as endurance — writing, saving, sending, waiting and remembering. Its strongest emotion lies in quiet responsibility.

The film also made me rethink what "home" means for overseas Chinese. For those of us who grew up outside China, identity is not always simple. We may speak different languages at home, live in another country and only partially understand the traditions passed down by our grandparents. Sometimes, we may even feel distant from the culture we inherited. Yet one film, one dialect, one old letter or one family story can suddenly bring us closer to where we come from.

Dear You reminds me that the connection between overseas Chinese and China is not only cultural, but also emotional. That feeling is difficult to explain, but the film gives it shape. It suggests that the Chinese homeland is more than a place on the map: it is a memory preserved in family history and a sense of belonging quietly waiting to be awakened.

For that reason, I hope *Dear You* reaches more overseas Chinese communities around the world. Some viewers may have never visited their ancestral hometowns, known their families' exact villages, or spoken their ancestors' dialects. But when they watch this film, they may still feel something familiar — and realize that the connection has never completely disappeared.

Dear You tells us that home is not only a place we return to, but also something we continue to carry inside us. And perhaps, for many overseas Chinese, this is not only a film to watch — it is a letter to open.

Written by Veldesen Yaputra, an Indonesian graduate student in architecture at Tsinghua University. He has long been engaged in green building, rural revitalization and cultural heritage projects between China and Indonesia. He also serves as president of Tsinghua University International Concerned Architects, where he works to connect youth, design and public-interest practice across cultures.

A stage for every child

A student-led arts project uses musical theater to give rural children space to express emotions, cooperate and find their voices.

By GUO JIATONG
guojiatong@i21st.cn

Cai Dongjun raised one hand gently, humming the opening notes of a melody as sunlight streamed into a rural classroom. In front of him, the children watched closely before beginning to follow his lead — a small turn, a lifted arm, a line sung softly at first and then with growing confidence.

For Cai, a 22-year-old vocal performance major at the Communication University of China (CUC), the scene has become a familiar part of his public welfare work. Since 2022, he has been introducing musical theater to rural children who have limited access to arts education.

During those visits, Cai encountered a reality that left a deep impression on him.

"Not every child receives quality education or emotional support," he said. "Some come from difficult family backgrounds, and you can sometimes sense a kind of silence in them that is hard to describe."

The experience felt personal to Cai. As a child, he also struggled with insecurity and self-doubt, but music gave him a way to express himself and gradually rebuild his confidence.

That personal connection inspired him to found Shengyu Tongxin, or Voices Healing Young Hearts, a public welfare initiative that brings musical theater and arts education to rural children. The program is designed not only to teach performance skills, but also to create a space where children can express themselves, learn to cooperate and grow emotionally.

Over the past four years, the initiative has expanded from a small volunteer effort into a broader program. Cai and his fellow volunteers have traveled to 18 regions across China, worked with more than 40 rural schools and reached over 1,500 children.

At the center of the initiative is an original musical, *Yuyan Laixin*, or Letters from the Swift, developed by Cai's team. The one-hour production is made up of several interconnected scenes based on the everyday experiences of left-behind children, touching on themes such as family separation and struggles to fit in at school.

To make the production accessible to children with varying abilities, the team revised the work repeatedly.

"The first version took about four months to complete," said Shi Yuming, a core team member from CUC. "We then adapted it many times with guidance from professional composers, teachers and psychological counselors to make it better suited to children."

The team simplified the vocal ranges, shifted more of the performance into ensemble scenes and adjusted the staging so that more children could participate comfortably. Rather than focusing on polished technique, the program emphasizes self-expression and the joy of being on stage.

That goal is often reflected in small changes.

In Huozhou, Shanxi province, the team worked with a boy whose teacher had described him as disengaged and struggling academically. Instead of allowing that label to define him, the volunteers encouraged him to take on a small leadership role in the chorus.

Over time, he became more involved in rehearsals and began to show a stronger sense of responsibility. By the final performance, he had been cast as one of the main characters and carried the part with confidence.

For Cai, moments like this make the demanding work worthwhile.

"There were times when I felt completely exhausted," he said. "In every session, I was fully involved — demonstrating melodies, correcting pitch, teaching movements and encouraging the children to step onto the stage. But all the effort has proved deeply rewarding."

A broader view

As the project has expanded, it has attracted a growing network of student volunteers and young professionals to help with teaching, coordination and outreach.

Among them is Liu Yukuan, a 21-year-old broadcasting and anchoring major at CUC who works directly with children in the classroom. He has noticed that while some children are eager to participate, others need more time before they feel ready to sing, move or perform in front of others.

Rather than pushing them, Liu adjusts his approach based on each child's temperament, offering patience and encouragement as they gradually become more comfortable.

"I've learned to slow down and see things from their perspective," he said. "Sometimes what they need is not pressure, but time and support."

Another volunteer, Zhu Zhu, a musicology major at CUC, helps coordinate resources and organize activities. Although she is not directly involved in teaching, she sees her role as essential to keeping the program running smoothly.

"I'm not the one on stage teaching or performing, but I find great fulfillment in working behind the scenes," she said. "It helps ensure that music and arts education resources are available to children in need."

For Zhu, public welfare should not end with a single visit or performance.

"It requires long-term commitment. What matters is making sure these resources continue to reach the children," she said.

According to Cai, the project has also built partnerships with institutions such as Beijing Normal University, bringing in students specializing in music, education and media to create a more structured support system.

For the volunteers, the mission is simple: to give more children the opportunity to experience art — and, through it, gain confidence in their own voices.

"Art should be accessible to everyone," Liu said.

Personal meaning reshapes spending

From color analysis to museum guides and cultural dolls, young buyers are seeking services that feel personal and meaningful.

By **XIONG XINYI** and **GUI QIAN**

At Oni Color, a color analysis studio in Shijiazhuang, Hebei province, Wang Lifan drapes a white cloth over a client's hair and clothes, studying how different fabric swatches look against their skin.

She asks about the client's style preferences, makeup habits, and desired impression, then reviews their makeup bag to see what works and what does not.

As a film student in South Korea, Wang used to follow fashion trends, but none of them felt quite right. One day, a local friend asked her about her "personal color". After trying color analysis herself, Wang finally found a style that suited her.

After university, Wang worked as a photographer in China, then returned to South Korea for training after spotting a gap in the local market. She opened her studio in June 2024.

At first, Wang worried about whether the business would work in a smaller city. But after she posted about the studio on Xiaohongshu, also known as RedNote, she gained 2,000 followers in two weeks and was fully booked for three months before the studio even opened. "There is demand here," she said.

A one-hour session costs 680 yuan ($100) per person. According to Wang, her clients are not simply paying to follow trends. They are paying for a visible transformation, and many see the experience as a long-term investment. Clients who work in fields such as teaching and medicine, for example, often want to look more professional and confident.

Wang's studio reflects a broader shift among young Chinese consumers, who are increasingly willing to pay for products and services that feel personal, emotionally rewarding, and tied to identity. Across beauty, culture, and lifestyle consumption, value lies not only in what they buy, but also in what the experience helps them discover or express.

Wang said the phrases she hears most often from clients are "finding myself" and "it completely changed how I saw myself".

One client, a doctor under constant work pressure who rarely found moments of joy in daily life, told Wang that discovering a style that suited them brought genuine happiness.

To better adapt the Korean color analysis system for Chinese clients, Wang added facial structure and natural contrast to her assessments. For ethnic minority clients, she often recommends richer colors and warmer tones instead of the muted grays commonly suggested in South Korea.

Driven by customer demand, Wang has expanded into bone-shape assessment and bridal styling, aiming to build a one-stop service that combines color analysis, makeup, and professional photography.

Decoding culture

The desire for personalization is not limited to appearance. For many young people, the same expectation is now shaping how they learn, travel, and engage with culture.

Top: A visitor uses an AI digital guide developed by Aikesheng Digital Cultural (Beijing) Co Ltd at a museum. **Left:** Wang Lifan (behind) conducts a color analysis session with a client. **Second from top:** A doll headpiece designed by Ji Yingqi and her team blends ethnic styles. **Bottom:** A Yao ethnic-inspired doll outfit. PROVIDED TO CHINA DAILY

At the National Maritime Museum of China in Tianjin, a marine biology student in his early 20s visited to study fossil patterns and artifact restoration. During the trip, he asked an AI digital guide developed by Aikesheng Digital Cultural (Beijing) Co Ltd more than 20 specialized questions and received clear, accurate answers. He said the guide made his visit more than twice as efficient, and later recommended it to his classmates.

The story was one that stayed with Chen Zhenfeng, vice-president of Aikesheng. Chen said the idea for the guide came during a museum research visit in 2023, when the team noticed that many young visitors struggled to engage deeply with the exhibits because suitable guided tours were unavailable. Some left within 20 minutes.

"That's when we realized that cultural communication in museums needs to adapt to the way people experience culture in the new era," Chen said.

The team turned that observation into a visitor journey built around curiosity.

After scanning a code, visitors can choose a digital companion and select a route based on their interests. They can stop at any point to chat with the guide or scan an object that catches their attention.

The guide can also generate captioned photos for social media, offer interactive games, and send visitors a personalized record of their museum journey.

"Youth are willing to pay for museum services, but not generic ones. They want something shareable, conversation-worthy, and novel," Chen said.

> "Youth are willing to pay for museum services, but not generic ones. They want something shareable, conversation-worthy, and novel."
>
> **Chen Zhenfeng,** vice-president of a digital cultural company

> "Growing national pride has drawn more young people to our products. They do not hesitate to express their love for ethnic cultural elements."
>
> **Ji Yingqi,** founder of a handicraft workshop

Crafting belonging

Beyond digital experiences, this search for meaning is also appearing in physical products, especially those that allow young people to project identity, emotion, and cultural pride onto objects they love.

Ji Yingqi, founder of a handicraft workshop in Nanning, Guangxi Zhuang autonomous region, has turned ethnic heritage into doll clothing. Her best-selling items include fridge magnets and plush toys featuring imitation Miao silver ornaments and Zhuang brocade.

Building on the popularity of the magnets, Ji's team adapted the motif into miniature Miao-style flower crowns and Zhuang-style headpieces. After testing them on Pop Mart figurines, they created their first line of doll hats.

While decorating their workspace, Ji's team dressed plush toys in Zhuang-style outfits. The outfits became an instant hit with visitors, who soon began asking whether the team could make similar clothes for their own dolls.

"That's when it clicked," Ji said. From there, the process became more interactive. Customer participation became central to the business. Ji describes the process as "co-creation".

"Every doll is different," she said. From necklines to accessories, each design is shaped by customer preferences.

"Many of them see their dolls as companions, even like 'children'. They bring them to meals, on walks and trips, even to concerts."

Meanwhile, designs were simplified to fit dolls of different sizes while still preserving key cultural elements. The range of designs now includes Yi, Yao, and Bai ethnic styles.

Bai-style hats, for example, draw inspiration from the natural scenery of Dali in Yunnan province — wind, flowers, snow, and moon — blending tradition with playful design.

"Growing national pride has drawn more young people to our products. They do not hesitate to express their love for ethnic cultural elements," Ji said.

"Some customers studying or living abroad come back and make a point of bringing their dolls to us," she added. "They take photos with the dolls around the world, bringing Zhuang-style clothing to more places."

Across a color studio, a museum, and a doll workshop, what young people are buying is not just color palettes, digital guides, or handmade accessories. In a market crowded with choices, meaning may be what keeps people coming back.

Alumni bridge China and world

International alumni turn their studies in Shanghai into opportunities for careers, cooperation and deeper cultural understanding across borders.

Le Minh Quan celebrates his graduation from Shanghai University in 2007.

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

When Muhammad Majid Riaz arrived in Shanghai on a rainy night in November 2017, he saw the city first through the windows of the airport, not knowing that it would become the place where he would study, work and build a future.

Nearly a decade later, the 32-year-old Pakistani radio frequency engineer still remembers that night as the beginning of his China story.

Riaz came to Shanghai through a language education opportunity supported by the Pakistani government. His interest in China had been sparked by the professionalism of Chinese colleagues he had worked with in Pakistan, as well as by his curiosity about Chinese culture.

The two-year language program at Shanghai University gave him the foundation he needed to continue his studies in China. In 2019, he was admitted to a master's program at the university, marking another important step in his academic and personal development.

Outside the classroom, Riaz immersed himself in campus activities and traditional Chinese culture. He developed a particular interest in tai chi and martial arts and joined several summer camps that took him to different parts of the country.

"The diversity and inclusiveness of Chinese culture left a deep impression on me. By the time I graduated, I had traveled to more than 30 cities across China and experienced both the beautiful scenery and the dynamic development of different regions," Riaz said.

After graduation, he began working at a leading Chinese multinational company in the global wireless communications sector. He said his education and career in China have allowed him to contribute to practical cooperation between China and Pakistan in high-tech industries, trade and people-to-people exchanges.

Riaz is one of many international alumni of Shanghai University who have turned their study experience in China into careers linking China with the wider world.

According to Li Yingjie, dean of the College of International Education at Shanghai University, the university began enrolling international students in 1966. By the end of last year, it had educated more than 30,000 international students from over 160 countries.

These alumni now work in fields ranging from politics and diplomacy to business, trade, culture and education, playing active roles in exchanges between China and other countries, Li said.

Among them is Amzath Ahmed, Minister of State for Fisheries and Ocean Resources of the Maldives, who studied at Shanghai University for 12 years after arriving in 2003.

"Without the education I received at Shanghai University, I would not be who I am today," Amzath said at a campus celebration on May 15. "It gave us more than knowledge. It shaped our character, attitude, resilience and worldview. It taught us how to adapt to change, respect different cultures, think independently and serve society with a sense of responsibility."

In the business sector, Vietnamese alumnus Le Minh Quan, general manager of Mainland Group, found both his career path and his life partner during his years in Shanghai.

Le earned his bachelor's and master's degrees at Shanghai University between 2003 and 2010. His wife, Vu Tran Minh, another Vietnamese alumna, studied at the university from 2005 to 2013. Before she could speak fluent Chinese, Vu was already able to sing Chinese songs.

The couple met on campus, began their careers in Shanghai and later returned to Vietnam with their two children. They now run a business selling rubber products to the Chinese market.

"Shanghai gave me many opportunities," Le said. "When I was a student, I worked part time as a translator for Vietnamese business owners. I learned a lot from them, and those experiences helped guide my future direction."

Le said his familiarity with both Chinese and Vietnamese cultures has become an important advantage in business. Studying in China, he added, is not only about learning the language, but also about understanding the culture, business environment and way of thinking.

"China is a huge market and is taking the lead in many areas, including new energy vehicles, drones, robotics, artificial intelligence and 5G technology," he said. "I see more international students coming to China not only for education, but also for opportunities for cooperation."

The number of international students in China has continued to grow in recent years. According to education authorities, more than 380,000 international students from 191 countries and regions studied, conducted research or took part in training programs at more than 1,100 universities, research institutes and other educational institutions across China during the 2024-25 academic year, a 15 percent increase from the previous year.

Zamir Ahmed Awan, founding chair of the Global Silk Route Research Alliance and also an alumnus of Shanghai University, said China's development and growing international engagement have made it increasingly attractive to young people around the world.

Taking Pakistan as an example, Awan said about 30,000 Pakistani students are currently studying in China.

"International students are very important. They are young, and they are the future," he said. "Learning more about China and Chinese culture can greatly support their own careers and help them contribute to the future of the world."

For Riaz, the years he spent studying in Shanghai continue to shape his work, identity and understanding of cooperation between China and Pakistan.

"I developed my roots and grew in Shanghai and China, and it made me who I am today," Riaz said. "I will continue to act as a bridge between the two countries and help strengthen people-to-people connections."

Muhammad Majid Riaz, from Pakistan, visits Zhoushan, Zhejiang province, in 2021.

Shanghai University's international student choir performs at an event marking the 60th anniversary of the university's international student education program on May 15. PHOTOS PROVIDED TO CHINA DAILY

Friendship gallops across the Kazakh steppe

By **LI YINGQING** in Kunming
and **GUI QIAN**

Dressed in black, Tao Mingxiu gallops across the vast steppe in Kazakhstan, her left hand holding the reins and an eagle perched on her right arm. Her striking silhouette, captured in a short video, has earned millions of likes on social media.

Known to her fans as "Tao Tao", Tao is a horse-loving young woman from Kunming, Southwest China's Yunnan province, and a social media influencer with nearly 10 million followers across multiple platforms.

Over the past two years, she has visited Kazakhstan six times, traveling to major destinations including Astana and Almaty, as well as Akmola, East Kazakhstan and Mangystau regions. She has shared more than 100 posts about the country, attracting more than 1 billion views in total.

In May 2025, Tao was awarded the title of "Tourism Ambassador of Kazakhstan" by Kazakh Tourism. In April 2026, she received the Order of Dostyk (Friendship) II degree on behalf of the President of Kazakhstan. The honor recognized her contribution to promoting Kazakhstan in Chinese media, showcasing its cultural heritage and tourism potential and strengthening people-to-people ties between the two countries.

With 2026 designated as the China-Kazakhstan Year of Cultural Exchange, Tao said she felt deeply honored to receive the award. "I don't think this medal belongs to me alone," she said. "It represents the bond between China and Kazakhstan, and I'm proud to be part of that story."

Bonding on horseback

Born in 1997 into a rural family in Kunming, Tao developed a love of horses at an early age. As a child, she often observed horse-drawn carts in her village. On weekends, her mother would take her to nearby towns on one of those carts.

"I remember being amazed by their strength," she said. "Horses could pull a cart full of people with such steadiness. That image stayed with me."

But it was not until five years ago, when Tao rode a horse for the first time, that she discovered her true passion for riding. Since then, she has spent much of her time at horse farms, training intensively and honing her skills.

Through her passion for horses, Tao Mingxiu has built friendships and cultural connections between China and Kazakhstan. PROVIDED TO CHINA DAILY

"My total practice time is comparable to that of someone who has been riding for more than a decade," she said.

Over the years, Tao has been injured many times.

"A horse is not a machine. It has its own mind and temper," she explained. "One day it might be gentle, and the next it might be in a bad mood and refuse to cooperate."

Yet she has never thought of quitting.

"When you truly love something, you don't give up on it," she said.

Tao's videos are often simple: riding across open land, holding an eagle or experiencing local traditions in Kazakhstan. Yet their reach has been remarkable. Through scenes of landscapes, animals and everyday life, she has introduced Chinese audiences to places and cultures they may never have seen before.

"I hope Chinese audiences can discover the real Kazakhstan — a welcoming neighbor with a rich culture of its own," she said.

Her content has also evolved into a two-way cultural exchange, bringing Kazakhstan closer to Chinese viewers while sharing China's landscapes and ethnic traditions overseas.

For example, she has filmed falconers in Xinjiang Uygur autonomous region and traditional lifestyles in Yunnan.

"I want the world to see the beauty of China," she said. "I hope people-to-people exchanges will become more regular in the future, with more youth programs as well as cultural and sports events, so that grassroots ties can take root in people's hearts."

Tao calls herself a "little horse handler". For her, horses are not only a personal passion, but also a way to bring people closer together.

"I believe the friendship between China and Kazakhstan will be like a steed on the grassland — running endlessly into the future, generation after generation," she said.

TENNIS

But it's not all bad news, as China's other aces make racket with major opening wins

Wilting Zheng feels heat in Paris

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

China's Zheng Qinwen hits a forehand return to Maja Chwalinska of Poland during their French Open first-round match at Roland Garros in Paris on Monday. **Inset:** An emotional Zheng faces the media after struggling to cope with the Polish qualifier's punishing "moonballs" and falling to a 6-4, 6-0 defeat. XINHUA

Even with the early exit of "Queen Wen" catching fans off guard, Chinese tennis has swung off its French Open campaign with plenty to cheer about, as a group of its elite players launched their major comeback with flying colors in Paris.

The opening-round action at Roland Garros this year has served up several treats for Chinese fans, from talented men's ace Wu Yibing's first main draw win at the clay-court major to struggling woman Wang Xiyu's first tour-level victory this year.

Yet, it was the shock of fan favorite Zheng Qinwen's unexpected first-round loss to Polish qualifier Maja Chwalinska that has dominated the headlines, leaving fans with mixed feelings.

Zheng, a proud winner of China's first singles Olympic gold medal at the same venue at Paris 2024, was dealt a head-on blow in her attempt to regain her form at Roland Garros, following a long injury layoff, suffering a straight-sets defeat to Chwalinska in an early tournament upset on Monday.

Zheng, who in her deepest run at the French Open last year reached the quarterfinals, struggled to find her rhythm facing the 114th-ranked Pole, whose unique style of hitting top-spin, high-arc lob shots — or "moonballs" — that landed deep and bounced high, proved effective in neutralizing Zheng's aggressive baseline game, punishing the Chinese star's lack of patience, and apparently waning focus, with a 6-4, 6-0 win in just one-and-a-half hours on Court 7.

Too harried to be able to dictate the pace of the game and sway the battle toward her rapid-fire attack, Zheng committed 32 unforced errors against just five from Chwalinska.

The Chinese former world No 4, who has dropped out of the top 100 on the live women's world ranking, admitted with a pained demeanor that, maybe, it's time for her to rebuild her game from the ground up.

"Losing in the first round at Roland Garros was really, really tough for me," an emotional Zheng said in wavering voice at the post-match news conference, where she had to pause to wipe away tears of disappointment.

"Nerves and pressure today didn't allow me to play the tennis that I want," said the 23-year-old, who, since 2022, has won four WTA singles titles to go with her Olympic gold.

"I had a tailored tactic before the match, but her top spin was bouncing much higher than expected.

"At one point on the court, I even hit the line judge with my racket, because I couldn't move back any further," Zheng explained.

It was the first time that Zheng has fallen in the first round at Roland Garros, where she had maintained a 16-4 win-loss record, including the Olympic tournament, before Monday, providing her with a sobering reminder that, perhaps, a slower rebuild from the entry level might suit her better at the moment.

"I didn't pay much attention to my ranking (just yet), but, of course, I need to start all over again, and that's going to be different," said Zheng, who underwent right elbow surgery last summer, took a lengthy recovery period that forced her to skip the Australian Open and only, tentatively, returned to competitive matches on the WTA Tour in February.

"But, I think it's going to be kind of positive for me, because I need more matches to get into my rhythm," said Zheng, who's expected to have to start from the qualifying rounds at top-level WTA events after her French Open exit.

Also struggling with their respective injuries since the second half of last season, China's Wang Xinyu and Wang Xiyu have, conversely, fueled their resurgence with inspiring opening wins in Paris.

Wang Xinyu, China's current top woman, ranked 34th in the world, halted a four-match skid on clay at Tour-level events by battling past Austria's 2024 Roland Garros junior champion Lilli Tagger 6-3, 3-6, 6-4 to register her 20th Grand Slam main draw win on her least-favorite surface on Sunday.

Just over an hour later, Wang Xiyu, a former top-50 ace, nailed her first Tour-level win this year by beating Montenegro's Danka Kovinic in straight sets, making a strong statement of her solid comeback, from a four-month, injury-enforced hiatus since November, all the way from the lower-level International Tennis Federation circuit.

Perhaps the highlight of the Chinese legion's opening-round action, though, was former US Open boys' champion Wu Yibing, also the winner of Chinese men's first ATP singles title (2023 Dallas), who again proved that, when healthy enough, his game belongs among the elite echelons of the men's tour.

The 26-year-old Wu dominated Marcos Giron of the United States 7-5, 6-2, 6-4 on Monday to register his first French Open main draw victory and his fifth career win at the major level, breaking new ground for Chinese men's tennis on the Parisian clay.

Wu's rapid-fire game, which has helped him pull off major upsets in the past, including a defeat of former top-10 Russian Daniil Medvedev at the ATP250 Hangzhou Open in September, has evolved, even on clay, a surface he has struggled a lot with in the past. This was highlighted by his smooth movement up and down the dirt, smart drop shots and solid defense on the baseline.

A two-week training program in the backyard of the "King of Clay" has apparently paid dividends.

"The experience was really helpful, and perhaps I gained a small extra piece of Rafa's magic there," Wu said of his pre-Paris training camp at the Rafa Nadal Academy in Mallorca, Spain.

"Overall, I feel I am getting more used to playing on clay than before, and I've gradually picked up my confidence and started to play my game the way I want on this kind of surface," said Wu, who reached a career-high ranking of No 54 in May 2023.

China's Wu Yibing hits a return to Marcos Giron of the United States on the way winning his French Open first-round match, 7-5, 6-2, 6-4, on Monday. XINHUA

Wawrinka and Monfils bid farewell to the French Open after losing in first round

Stan Wawrinka and Gael Monfils waved goodbye to the French Open after they lost in the first round on Monday.

The curtain fell on Frenchman Monfils just before midnight when he lost to countryman Hugo Gaston 6-2, 6-3, 3-6, 2-6, 6-0.

It was the 39-year-old Monfils' final appearance at Roland Garros. Same went for the 41-year-old Wawrinka, who earlier lost to Jesper de Jong 6-3, 3-6, 6-3, 6-4 on another sweltering day.

Monfils and Wawrinka are retiring at the end of the year.

They made their respective French Open debuts 21 years ago.

Wawrinka went on to win three Grand Slam titles, and while Monfils has not reached a major final, his popularity remains high.

Monfils walked out onto Court Philippe-Chatrier to chants of "Ga-el! Ga-el!" He received loud encouragement throughout, demanding applause when he hit spectacular winners and raising his arm when he won the third set.

But he also looked tired, often hunching over with his hands on his knees. After clawing back a two-set deficit he had little energy left against an opponent 14 years his junior.

Monfils was joined in during an on-court ceremony by his former Davis Cup teammates Jo-Wilfried Tsonga, Richard Gasquet and Gilles Simon, and was also praised by his peers.

Left: Stan Wawrinka reacts during his French Open first-round loss to Jesper de Jong on Monday. **Right:** Gael Monfils holds a glass case containing part of a clay court as French Tennis Federation president Gilles Moretton looks on during a special ceremony on Monday. AP

"For me, you were a true inspiration. A great athlete," two-time reigning French Open champion Carlos Alcaraz said in video featuring several players. "But the most important thing, a great person off the court."

Monfils thanked his wife, Ukrainian tennis player Elina Svitolina, who looked tearful as she listened.

"Without her, I might not be here tonight," Monfils said. "We've been together for eight years, eight beautiful years ... (You) gave me the greatest gift in the world, our daughter. I love you."

De Jong finished off Wawrinka, the 2015 French Open champion and 2017 finalist, with a whipped forehand winner, then urged the fans to applaud Wawrinka, whose face was almost as red as the baking-hot clay.

Temperatures in sun-soaked Paris hit 33 C.

"It's hard, it's hard to say goodbye to you here," an emotional Wawrinka said. "It's because of Roland Garros that I wanted to become a tennis player."

He was given an ovation at Court Simonne-Mathieu, where he was scheduled to face Arthur Fils, but the rising French star pulled out of the tournament with a hip issue.

Wawrinka knows it will be hard to let go — although he still has Wimbledon and the US Open to come.

"For more than 20 years I experienced these emotions, you never want it to stop," Wawrinka said.

"I have given everything for this sport."

His stunning 2015 run to the title saw him defeat heavy favorite Novak Djokovic in the final after downing another all-time great, Roger Federer, in the quarterfinals. Wawrinka stood out that year, as much for his eye-catching pink-checkered shorts as for his destructive backhand.

Those shorts fed into his happy-go-lucky appearance, and he reinforced that image by celebrating with champagne long into the night. But as cavalier as he sometimes seemed, Wawrinka was anything but casual and always trained fiercely hard.

He was hugged on court by tournament director Amelie Mauresmo, before sitting and watching footage of his matches down the years. He was shown video messages from Federer, Rafael Nadal, Djokovic, men's No 1 Jannik Sinner, reigning champion Alcaraz, and Monfils.

At his physical peak, the barrel-chested Wawrinka had huge stamina and was one of the few who beat Nadal, Djokovic, Federer and Andy Murray at the Grand Slams.

Wawrinka beat Nadal in the Australian Open final in 2014 and downed Djokovic again in the US Open final in 2016, meaning all three of his majors were won against the No 1 player. Nadal, however, dispatched him in straight sets in the 2017 French Open final.

He was an Olympic champion in doubles alongside Federer in 2008, and they won the Davis Cup for Switzerland in 2014.

"You are a legend of our sport," said Monfils, who also lost his first-round match at the Australian Open in January.

Monfils reached the semifinals at the 2008 French Open and the quarterfinals on three other occasions.

But, ultimately, he fell short after being touted for a great career following junior titles at the French Open, Wimbledon and the US Open in 2004.

He never won better than an ATP 500 among his 13 titles, and lost 22 finals — including three at Masters level.

His reputation as a showman took precedence over his modest results.

"One of the most likeable, fun guys out there," Djokovic said. "There's no one that doesn't like you, Gael. I think that's your biggest victory."

The screening is part of an initiative launched by the Chinese Red Cross Foundation in 2012. To date, more than 1.92 million children in the region have been examined and assistance has been provided to over 10,000 patients. WANG JING / CHINA DAILY

Wider global role seen for RMB

China has ample room to expand currency's use as trade leverage increases, experts say

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China has ample room to expand the global use of renminbi through trade and commodity settlement, supply chain finance and offshore market development, senior economists said, adding that the process will be gradual and largely hinges on continuing financial market reforms across the globe.

As the existing US dollar-dominated architecture sees an erosion of global trust and buckles under the strains of geopolitical conflict and the weaponization of financial infrastructure by some countries, the internationalization of the renminbi will help make the global monetary system more inclusive and resilient, they said.

In an exclusive interview with China Daily, Zhu Min, former deputy managing director of the International Monetary Fund, said the trend of renminbi internationalization is "unstoppable", and the technical pathway is "already mapped out".

Zhu pushed back against a long-held assumption that the renminbi could not become a major international currency without full convertibility and a fully liberalized capital account. "We need to correct this old mindset," he said.

He pointed to the IMF's Special Drawing Rights basket, a collection of five major international currencies that gives the renminbi a 12.48 percent weighting after the dollar and the euro, as proof that such constraints are not necessarily insurmountable.

Expanding the use of the renminbi in cross-border trade settlement serves as a viable and crucial pathway toward its further internationalization, experts said.

"For a currency to become truly global, settlement is a critical gateway," said Miao Yanliang, chief strategist at China International Capital Corp. "And in that respect, China's trade leverage is growing."

Miao noted that China is the world's largest trading nation and largest crude oil importer, as well as a dominant consumer of copper, iron ore and soybeans. "That trade position gives China a unique advantage to gradually enhance the convenience and acceptance of renminbi settlement," he added.

In recent years, geopolitical shifts have accelerated the renminbi's adoption, with some commodity sellers increasingly exploring settling trade in renminbi.

The recent disruption of shipping through the Strait of Hormuz has highlighted vulnerabilities in the existing dollar-centric oil trading system, said Shi Kang, chair professor at the PBC School of Finance at Tsinghua University.

"In the coming period, we will see more oil trade settlement gradually shift away from the existing dollar-based system," Shi said.

Beyond trade settlement, Zhu, the former IMF official, noted that strengthening the renminbi's role as a "financing tool in global supply chains" would also bolster its international standing.

China accounts for nearly one-third of global manufacturing output, equaling the combined share of the United States, Japan, Germany and South Korea, yet its currency plays only a modest role in international finance, Zhu said, describing this as "a clear mismatch".

"The US' real economy has weakened, but it still underpins an enormous dollar system," he said. "Geo-economic shifts inevitably drive changes in finance and beyond."

Long-term strategies help great green wall thrive

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

Unlike many ecological projects that falter due to short-term aid cycles, China's great green wall — the Three-North Shelterbelt Forest Program — thrives on long-term strategies and predictable funding, particularly incentivizing local people and businesses to invest in restoration.

This achievement was highlighted in articles recently published in the journal Nature, ahead of World Environment Day, which falls on Friday.

The articles also said that China's incentive mechanism ensures continued funding, transforming the effort into a shared socioeconomic endeavor.

According to the reports, drylands already cover 40 percent of the planet's total land area, and that share could expand by another 10 percent due to global warming before the turn of this century. While many countries and regions have launched programs to fight desertification, beyond China, green wall projects in India, Africa and the Gulf states have struggled to survive, they said.

The Three-North program is a large-scale ecological afforestation effort launched in 1978, covering 13 provincial-level regions across northwestern, northern and northeastern China. It nearly tripled forest cover — from about 5 percent to about 14 percent — by 2023, while soil erosion declined by two-thirds.

As most green wall projects fail due to a lack of continued finance and maintenance, China has repeatedly committed to spending, and its incentives for local investment have ensured that the stream of funding never dries up.

In the Kubuqi Desert, for example, enterprises and herders can obtain low-interest loans with tax reductions for sand control, which has attracted more than 3 billion yuan ($443 million) in investment since 2010. China also offers vulnerable communities short-term income through various work-relief programs.

Lu Qi, chief scientist at the Chinese Academy of Forestry, regularly visits the front line of the Three-North program, which currently covers 40 percent of China's total land area, witnessing firsthand how incentives drive its success.

"Everyone is rushing to take part, and their enthusiasm is irrepressible," he said after a recent visit to the Inner Mongolia autonomous region.

Lu, who visited the front line shortly after the Spring Festival holiday, noted that cold weather notwithstanding, sand control work started as early as Feb 28.

The foremost reason for this passion, he said, is the "pressing need to build a better home", adding that "the government's policies also enable local farmers and herders to see tangible benefits for themselves".

> "The government's policies also enable local farmers and herders to see tangible benefits for themselves."
>
> **Lu Qi,** chief scientist at the Chinese Academy of Forestry

An opinion piece published in Nature emphasized that China's financial strategies cannot simply be replicated in countries with different laws and fiscal capacities.

"A practical first step for any country is to elevate sand control from a short-term forestry project to a government-level long-term obligation," it stated. "External aid should be used to leverage domestic co-finance, rather than serve as a one-off cash injection."

China is also coupling renewables infrastructure directly with ecological restoration.

The article said that in lower-resource nations, smaller photovoltaic belts could be installed near high-value assets such as roads and water pumping stations. These projects require substantial upfront investment, but electricity sales could provide predictable revenue for maintenance, it added.

Another key lesson from China's experience is that governments in other countries need to view ecological restoration as an investment, not as a cost, the article said.

Lu noted that this investment has already paid off significantly in China, following a fundamental shift in the Three-North program's philosophy over time.

"In the beginning, we only cultivated trees that grew fast, tall, and offered good protection," he said, adding that the focus gradually shifted to integrating ecological conservation, production and livelihoods.

Growing plants under solar panels is a key example of this integration. The plants are mostly fruit-bearing ones, such as matrimony vine and sea buckthorn, as well as those used in traditional Chinese medicine like astragalus.

In some regions, the shade of solar panels is used for herding. Instead of letting cattle graze directly on the grass, strands are trimmed and taken away to feed the animals — an approach that poses no negative impact on the protective function of the plants.

"I see this as a major transformation — one that integrates ecology, production and people's livelihoods," Lu said. "It not only protects the land and provides income for farmers and herders, but also brings benefits to society as a whole."

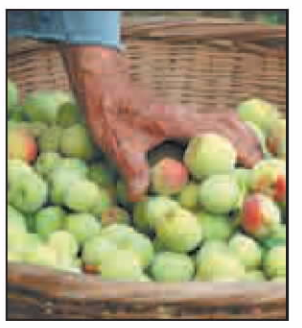
BLUSHING PLUMS HERALD ONSET OF MIDSUMMER

Fruit offers connection with seasonal rhythms that have shaped Chinese life for generations

By **LI YINGXUE**
liyingxue@chinadaily.com.cn



In the mist-shrouded valleys of southwestern China, summer does not arrive with a date on the calendar; it arrives with a sound — the crisp snap of plums being plucked from their branches.

China Vibes — FOOD —

The harvest begins with *mang zhong*, or Grain in Ear, one of China's 24 traditional solar terms and a seasonal marker long associated with ripening crops and the onset of midsummer. As heat and humidity settle over the Chengdu Plain in Sichuan province, the hillsides of Dayi county come alive with activity.

Farmers gather in numbers to pick plums that have spent months maturing beneath dense green canopies.

Once sharply tart, the fruit has now turned plump, glossy and sweeter, carrying a faint blush and a fresh fragrance. This signals the start of Dayi's annual plum-processing season — a tradition that connects orchards, home kitchens and local wineries.

Plums are harvested in Dayi county, Sichuan province, in May. PROVIDED TO CHINA DAILY

Nation's trade approach aligns with actual needs of Africa

WORLD WATCH
By Mabasa Sasa

A growing conversation is unfolding across Africa about the differing approaches of major powers in engaging with the continent, and the fundamental goals behind those engagements.

A clear contrast emerges when comparing China's new zero-tariff policy for African countries that have diplomatic relations with Beijing and the United States' African Growth and Opportunity Act — a contrast that highlights why China's approach is far more aligned with Africa's genuine development needs.

The historic new zero-tariff policy was fully implemented on May 1. Previously, China had already scrapped tariffs on 100 percent of tariff lines for 33 least-developed countries in Africa since Dec 1, 2024. The new zero-tariff policy will benefit relatively better-off countries such as Kenya, Egypt and Nigeria.

Launched in 2000, the US' African Growth and Opportunity Act was billed as a landmark initiative to integrate African economies into global trade. Its promise sounded attractive: duty-free access to the US market for eligible African nations.

More than two decades later, however, results have been uneven at best. The program's core flaw lies in its conditional design. Eligibility is determined by Washington's political and economic criteria, which can shift abruptly to suit US foreign policy priorities.

Currently, only 32 African countries qualify under the African Growth and Opportunity Act, leaving more than 20 nations — including Zimbabwe — excluded. The unspoken message is clear: Access to the US market comes with political conditions. Trade is offered, but with heavy political strings attached.

Crucially, the US program has never meaningfully transformed Africa's industrial base. Strict technical requirements and complex rules have prevented real economic diversification. The relationship has often felt less like genuine partnership and more like supervised, conditional access.

China, Australia bask in solar panel success

Collaboration on breakthrough tech, and production pushing green transition forward

By **XIN XIN** and **ALEXIS HOOI** in Sydney

About 10,000 attendees, 120 main exhibitors, and industry leaders participated in the event. PROVIDED TO CHINA DAILY

Andrew Forrest, chairman of mining giant Fortescue, gives a keynote speech at the conference in Sydney. PROVIDED TO CHINA DAILY

Electrician James Moore, who installed solar panels on the roof of his Sydney home two years ago, said the green energy move has helped him halve his household power bills.

When told that the equipment came from China, Moore was not surprised. "It's efficient and effective, very suitable for sunny Australia," he said.

Moore's words were fitting in more ways than one. The development of photovoltaic, or PV, technology, which converts sunlight into electricity and powers the growing use of solar energy in the country, can be traced to Australian research and innovation.

Ned Ekins-Daukes, head of the School of Photovoltaic and Renewable Energy Engineering at the University of New South Wales in Sydney, said the university's pioneering PV research helped nurture ties with Chinese industry and academics that continue to place them at the forefront of the field.

"UNSW has this extraordinary story of where we invented some photovoltaic technologies a long way ahead of the market being ready to accept them. During that time, many students came from China to study at UNSW and took some of the ideas back to China," the professor said.

Major contributions to the sector include work led by multiple-award-winning UNSW scientist Martin Green, who invented groundbreaking types of solar cells in the early 1980s. This helped fuel further research that has since accounted for more than 90 percent of worldwide silicon solar module production, according to the university.

One of Green's doctoral students, Shi Zhengrong, subsequently implemented a low-cost manufacturing transformation and went on to set up the first commercial solar cell producer of its kind in China. Serving as the Chinese company's chief scientist, Green and other research team members helped facilitate the rapid growth of the sector.

"What's happened in China is that, because of the scale of the manufacturing that's possible and the supply chain integration that's been built up over the last 20 years, the costs of those technologies have dramatically reduced," Ekins-Daukes said.

In China, there has been continuous improvement in the technology, he said. "In Australia, we demonstrated the concept, we demonstrated that these solar cell technologies could work well. But in China, the engineers have worked hard to actually (apply) those technologies for manufacturing and critically bring robotic automation into the manufacturing of silicon solar panels," he said.

UNSW now works directly with major PV companies to help them improve the technology and its practical applications in Australia and beyond, Ekins-Daukes said.

This "loop of innovation" between Australia and China will continue, he added. "China has huge manufacturing strengths, and the opportunity for Australia ... having a lot of space and a lot of sunshine, is to collaborate and help deploy solar at an enormous scale for the benefit of the Australian economy, in a partnership," Ekins-Daukes said.

Complementary strengths

The success of the China-Australia partnership in the solar energy sector offers a model of cooperation to tap into complementary strengths amid the global green transition.

China is the main supplier of solar equipment to Australia, which also tops the world's per capita uptake of rooftop solar, according to industry figures.

There were nearly 255,000 new rooftop solar installations across Australia last year, bringing the number of households using the systems to 4.3 million, according to the Clean Energy Council, the sector's peak body in Australia.

In the second half of 2025, rooftop solar energy contributed 14.2 percent of the total electricity generated in Australia, nearly double the amount in 2020.

In 2024-25, Australian households saved about A$3 billion ($2.18 billion), or A$125 per capita, on electricity costs by installing rooftop solar, according to the Australian Bureau of Statistics.

China continues to lead the world in PV supply chains. Its top manufacturers account for most of the global production, and have helped bring down costs and offered "multiple benefits for clean energy transitions", according to the International Energy Agency. Industry analysts have also pointed to a shift toward high-quality growth through the leveraging of technology and scale to maintain global competitiveness.

With similar strengths in wind turbines and lithium batteries, China is cementing its leading role in renewable energy technologies that countries like Australia are increasingly keen to leverage as they face resource disruptions due to the Middle East conflict, while addressing other traditional fossil fuel challenges.

The federal government's "Future Made in Australia" initiative includes a renewable energy focus on a more resilient, low-carbon economy through increased investments in research and manufacturing.

At the 64th Smart Energy Conference and Exhibition held in Sydney on May 6 and 7, Australia's Climate Change and Energy Minister Chris Bowen highlighted the "era of clean power growth", with "renewables overtaking coal in 2025 and record growth in solar meaning that renewable energy met the vast majority of new demand growth in 2025".

Countries like China have similarly reduced fossil fuels' share of electricity generation significantly, helping push against climate change inaction, he said.

The major two-day event covering fields ranging from solar and storage to transport and technology drew about 10,000 attendees, 120 main exhibitors and industry leader conferences covering the latest energy trends.

In a keynote speech at the conference, mining giant Fortescue's chairman, Andrew Forrest, called for more to be done to adopt green technologies and electrification in a pillar sector still heavily reliant on diesel.

With most of Australia's diesel imported, prices could go up significantly amid the supply risks from shipping disruptions in the Strait of Hormuz in the Middle East, he said.

"So, for diesel, it's all bad news," Forrest said.

As part of its move away from fossil fuel dependence, Fortescue announced in April the acceleration of an integrated green energy grid rollout, including 1.2GW of solar capacity at the Pilbara area in Western Australia.

At a conference session on the importance of the Australia-China smart energy partnership, John Grimes, chief executive of Australia's Smart Energy Council, said the solar and other advanced technologies developed by the Sino-Australian cooperation mark a deep relationship. The council is a nonprofit with more than 1,000 members.

"What I see in China ... the engineers, the investors, the Australian connection is so strong. There is a massive opportunity for us to build on those firm and long-standing foundations," said Grimes, adding that "every solar panel makes a difference" in the global energy crisis.

"We're working with Chinese industry to take the world's lowest-cost, best technology and accelerate that ... throughout the Asia-Pacific region."

Tim Buckley, founder and director of Climate Energy Finance, a think tank focusing on Australia's green transition, told China Daily that it is "critical we work with China and learn from the best technology in the world".

"I'm amazed by the robotic advances," he said. "Australia worries about our high cost of labor, you don't have that problem in China because you're building the world's best robots, which means we can learn from China about robotics, engineering and supply chains, and partner together," he said.

"The more you build wind, solar, batteries and hydroelectricity toward energy efficiency, the less addicted to imported fossil fuels your country is. That's a really important lesson for us."

Dorothy Zhou, director at Chinese PV company Sunpro Asia, told China Daily that the Australian market offers significant investment opportunities with its various sectors like agriculture and resources suitable for energy projects.

"The energy transition for this market provides investment stability with clear demand, providing an upward trajectory," she said.

Zhu Sha, executive secretary-general of the Jiangsu Energy Storage Industry Association, told China Daily that Chinese companies are well-prepared to cater to overseas market demand, backed by advanced technologies, complete industrial chains and low-cost manufacturing advantages.

Their pace of going global is accelerating and the way they expand overseas is also evolving, said Zhu, who led a delegation to the Australian conference. The association, based in the East China province, promotes green energy transition with its more than 1,000 member units, using expertise in fields such as research and manufacturing as well as green finance.

"China's new energy industry is now shifting from products and trade-driven expansion to one-stop service and systems solution exports," Zhu said, adding that companies are also actively exploring markets in Southeast Asia, Africa and South America.

The Australian market remains attractive because it can help open up broader areas of development, she said.

"With Australia as a base, companies can also extend their industrial chains, or further expand into the European and US markets," Zhu said.

The next stage of development for Chinese energy storage products in Australia will focus on commercial and industrial use, grid-scale capabilities, and data center solutions, altogether presenting "both an opportunity and a challenge for Chinese companies", she added.

Australia-China research and development collaboration is already extending beyond its PV partnerships to other growth opportunities such as green hydrogen, fertilizer and steel.

"There are a lot of areas we can work on, to keep building on the momentum," Thomas Gao, senior manager at the Office of the Chief Scientist and Engineer, New South Wales, told China Daily.

"Many people play very important parts at different levels, taking us to where we are today. It's a continual journey," said Gao, whose organization helps bring academia, government and industry to drive the commercialization of research.

To that effect, a UNSW booth at the Sydney conference showcased the latest developments in the field that also continued its rich Australia-China partnership.

Professor Thorsten Trupke, a colleague of Ekins-Daukes at the university's photovoltaic school, explained his work on a state-of-the-art photoluminescence imaging system that inspects industrial solar panels through drones.

"We can now take these luminescence images from aerial drones on a large scale in operating solar farms," Trupke told China Daily.

Solar panels are made to last for about 30 years without any major degradation, but they can sometimes encounter problems, as with any mass-manufactured product, he said.

"We can detect those panels, and then necessary rectification can be done," said Trupke, adding that Chinese companies support the project by providing specialized samples for testing.

"The best drones in the world are from China and the ones we use are also from there. We are configuring these drones specifically for our needs," he said.

"Our school has collaborated with China for many years ... this collaboration will probably expand into the future."

Experts warn against Japan's militarism

Latest round of alarmist rhetoric shows country's move to change security posture

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

Japan has repeatedly hyped up the so-called "China threat" narrative in recent years to justify its expanding military agenda, said experts, warning that portraying neighboring countries as "threats" has historically been a recurring tactic of Japanese militarism.

They said that the latest round of alarmist rhetoric once again reveals the ambitions of Japan's right-wing forces to loosen postwar constraints, expand military capabilities and advance a broader transformation of the country's security posture.

Japanese media outlets on Wednesday disclosed an outline of the government's 2026 defense white paper, which continues to portray the regional security environment as "increasingly severe", while calling for enhanced development in unmanned systems and artificial intelligence.

According to the Asahi Shimbun newspaper, the upcoming annual defense report largely follows the narrative of the 2025 edition, arguing that the international community has entered a "new era of crisis", characterizing the security environment in the "Indo-Pacific region" as "increasingly severe", and hyping up the so-called "China threat" theory.

The white paper states that defense production and technological capabilities are directly linked to defense strength. It advocates creating an "environment of mutual support" by deploying the same defense equipment as allies and other "like-minded" countries, the newspaper said.

Meanwhile, Japan's public broadcaster NHK reported that the 2026 white paper introduces a new section on "emerging modes of warfare", which stresses the need to expand the use of unmanned aerial systems and AI in defense operations.

Liu Shuliang, an associate researcher at the Tianjin Academy of Social Sciences, said that Japan is moving beyond the bounds of its postwar defense posture and accelerating a broader remilitarization process associated with "new militarism" through measures such as revising its national security framework, enhancing offensive combat capabilities and integrating intelligence systems.

Through sustained lobbying by defense-related companies and capital groups, Japan's military-industrial complex has pushed for higher defense spending and fewer restrictions on arms exports, he said.

He mentioned that in early May, Japanese Prime Minister Sanae Takaichi outlined Japan's revamped "free and open Indo-Pacific" vision during her visit to Vietnam. The policy line was later reaffirmed by Defense Minister Shinjiro Koizumi at the recent Shangri-La Dialogue, a major defense forum held in Singapore.

"By advancing a revised 'free and open Indo-Pacific' vision and redefining its regional role, Japan is moving to expand its military reach while enhancing its influence in regional affairs. The strategy reflects Tokyo's growing ambition to play a larger role in shaping the regional security order, a move that carries clear geopolitical implications and has raised concerns over its impact on regional stability," he added.

Chen Hong, director of East China Normal University's Asia-Pacific Studies Centre in Shanghai, said that Japan's continued hype surrounding tensions in the so-called "Indo-Pacific region" is aimed at fueling bloc confrontation and creating exclusive groupings that run counter to the region's need for openness, cooperation and stability.

By deepening economic and security ties with the Quad, a grouping of Australia, India, Japan and the United States, the Philippines and other so-called allies or "quasi-alliances", Japan has increasingly pushed regional countries to choose sides, aggravating bloc confrontation and adding to tensions in the region, he said.

Liu from Tianjin Academy of Social Sciences also said that Japan and the Philippines — a victim of Japanese militarism and invasion during World War II — stepped up military collaboration in early May, exploring the transfer of Japan Maritime Self-Defense Force vessels, including used destroyer escorts.

"The international community should clearly recognize the risks and potential destabilizing effects associated with Japan's accelerated remilitarization and its evolving security posture. It may therefore consider appropriate responses to address a more assertive and increasingly controversial direction in Japan's defense policy," he said.

Xinhua contributed to this story.

Services sector sees rapid expansion in May

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

Services activity in China expanded faster month-on-month in May, the latest RatingDog China General Services Purchasing Managers' Index figures showed, underlining the robust growth in new businesses and a rebound in overseas demand, despite uncertainties triggered by geopolitical tensions in the Middle East.

Analysts said the upbeat figures of the private survey, which was released on Wednesday, coupled with a further pickup in business confidence, pointed to a strong momentum in China's services sector, amid intensified policy efforts to "expand capacity and improve the quality of the sector".

Their remarks came as the reading, compiled by S&P Global, rose 1.8 percentage points to 54.4 in May from 52.6 in April, remaining above the 50-point mark that separates expansion from contraction and signaling the fastest pace of expansion in three months.

This was broadly in line with the official survey released by the National Bureau of Statistics on Sunday, which showed services activity returned to expansion mode at 50.3 in May from 49.6 in April. Compared with the official gauge, the RatingDog PMI tracks small, export-oriented companies more closely.

"The recovery in services activity indicates that earlier macro policy support has begun to take effect," said Lou Feipeng, a researcher at Postal Savings Bank of China. "Fiscal tools such as service consumption subsidies and interest subsidies for loans have helped cushion the sector and shore up business confidence."

Beating market expectations, the faster increase in activity was supported by improvements in new businesses, which expanded for the 41st consecutive month and at the fastest pace in three months, according to the RatingDog report.

Yao Yu, founder of RatingDog, said the strong performance was largely driven by improving domestic demand, continued business innovation and new client acquisitions.

Echoing Yao's view, Lou from Postal Savings Bank of China said the May Day holiday unleashed strong demand for travel, dining, cultural and leisure activities, helping lift the business climate in related consumer sectors.

External demand also regained momentum. The RatingDog report showed that new export businesses returned to expansion mode in May after mild contractions in the previous two months, lending further support to the sector's growth momentum.

Meanwhile, emerging growth drivers, represented by information services, have shown strong momentum and sound sustainability, said Wu Wei, an analyst at the China Logistics Information Center.

"Through continuous innovation and deeper integration with other sectors, the information services sector will continue to play a key role in fostering new quality productive forces, with broader development prospects ahead," Wu said.

The improvement also fed business confidence. RatingDog said business optimism across the services sector picked up in May, with the confidence reading reaching its highest level since February.

Yao said that improved sentiment, together with stable domestic demand, is expected to help keep both the services PMI and the broader composite PMI in expansionary territory in the months ahead.

Policy support has also strengthened expectations about the sector's long-term growth. In April, the State Council issued a new set of guidelines aimed at expanding capacity and upgrading the quality of the services sector, setting a goal for the sector's total scale to reach 100 trillion yuan ($14.8 trillion) by 2030.

However, analysts cautioned that the services recovery may not yet be on a firm footing, noting that rising cost pressures may warrant closer attention in the coming months. They said more targeted policy measures will be crucial to help the economy withstand external headwinds.

"Authorities should step up loan interest subsidies and credit enhancement support for small and medium-sized service providers to help ease operating pressure from rising input costs," Lou said.

He added that stronger support should also be directed toward producer services such as technology services, software and information services, and modern logistics, so that productivity gains can help absorb rising cost pressures.

Landmark victory

Renminbi: Greater offshore supply urged

From page 1

A stronger renminbi is not only an inevitable choice for China's development, but also a necessity for global financial stability, Zhu stressed, saying that the renminbi could be used more extensively within global supply chains to align with China's manufacturing strength.

For a currency to become truly internationally strong, Zhu said, it must not only be usable for cross-border transactions, but also be held as a store of value and eventually repatriated or reinvested, all of which requires deep bond markets, robust derivatives markets and a liquid offshore market.

Miao, from China International Capital Corp, suggested that China could increase the supply of offshore renminbi, including expanding the availability of government bonds and high-grade renminbi-denominated bonds, to provide global investors with secure renminbi holdings and to support the domestic economy.

In another development, the Ministry of Finance plans to issue a total of 84 billion yuan ($12.4 billion) of renminbi-denominated sovereign bonds in Hong Kong this year. The first two issues, totaling 29.5 billion yuan, were made in February and April.

The world is facing an urgent need for more diversified safe-haven assets and liquidity, said Shi, from Tsinghua University.

That is a gap that the renminbi, backed by China's proactive institutional opening-up, is increasingly positioned to fill, Shi added.

"We do not want to replace the dollar system, nor are we trying to develop a separate system," Shi said. "China's goal is to address the weak links in the current monetary system, allowing more currencies to participate and thus enhance global financial stability."

Marc Uzan, executive director of the Reinventing Bretton Woods Committee, said that central banks are diversifying reserves, more energy deals are being priced in nondollar currencies, and countries are settling trade in local currencies. However, he acknowledged that the dollar's structural advantages remain significant, and "a swift end to dollar hegemony is unlikely". He said he expects a multipolar future in which the dollar, euro and renminbi will each play a larger role, alongside regional currencies.

Continent: Trade flows rooted in mutual benefit

From page 1

China's approach stands in stark contrast. It is inclusive, unconditional and development-centered.

China's zero-tariff policy covers exports from all 53 African countries that have diplomatic relations with Beijing. In simple terms, African goods gain broad, preferential entry into one of the world's largest markets — with no political conditions attached and no interference in internal affairs.

China frames this policy within the broader Belt and Road Initiative, emphasizing connectivity, infrastructure integration and expanded trade flows rooted in mutual benefit and shared development opportunities.

As President Xi Jinping has repeatedly emphasized, China pursues building a China-Africa community with a shared future, based on equality, mutual respect and win-win cooperation.

China's engagement with Africa centers on tangible infrastructure — roads, railways, power plants, industrial parks and trade corridors. These projects deliver visible, lasting development across the continent.

Bilateral trade reached a record $348 billion in 2025, and China has remained Africa's largest trading partner for 17 consecutive years.

For countries like Zimbabwe, the new zero-tariff policy is especially significant. Agricultural products, minerals and value-added goods now have a clear, stable pathway into China's vast market — without compromising sovereignty or aligning with external political agendas.

The choice for Africa is clear: win-win cooperation, not political dependence.

For decades, Africa has navigated partnerships where aid, loans and trade preferences often came with condescending lectures, shifting rules and political demands. China's model resonates because it is commercially driven, respectful and focused on development outcomes.

While all countries pursue their legitimate interests in international cooperation, China's engagement with Africa is fundamentally different from models that use market access as political leverage. China consistently upholds the principles of noninterference in internal affairs, equality and mutual benefit.

Africa is no longer seeking just any partnership. It is asking a more fundamental question: On whose terms is the relationship built?

Between the African Growth and Opportunity Act's politicized, exclusive and constraint-laden framework, and China's inclusive, unconditional, development-focused zero-tariff arrangement, the rational choice for Africa is clear.

The author is a political analyst and international affairs commentator based in Harare, Zimbabwe. The views do not necessarily reflect those of China Daily.

Fruit: Growing demand inspires new beverage products

From page 1

Dayi's natural conditions have made it one of China's major plum-producing regions. Fed by meltwater from Xiling Snow Mountain and shaped by significant temperature differences between day and night, the area produces plums known for their rich aroma, thick flesh and sharp acidity.

For 79-year-old farmer Wang Xiuhua, the harvest represents the culmination of months of careful work. "Plum blossoms open in the bitter cold of the twelfth lunar month," she said. "The hardest time comes in early spring. If snow or frost arrives when the trees are flowering, the blossoms fall and there will be very few fruits."

By the time *mang zhong* arrives, farmers are watching closely for signs of peak ripeness. "Once the plums turn golden, you have to pick them quickly," Wang said.

For generations, preserving the taste of summer has been a seasonal ritual in local households. Wang still follows a family recipe for making sugar-cured plums. The freshly picked fruit is washed and air-dried before being layered with white sugar in a glass jar. Over time, the plums release their juices and wrinkle, creating a concentrated syrup.

The fruit also plays a key role in Dayi's plum wine industry.

Hu Yao, founder of Chengdu Dahe Hongmei Wine Co and a practitioner of the region's traditional plum wine-making technique, said the Nanko variety of the fruit has a small pit and thick flesh. "When fully ripe, the aroma is especially intense, which gives the wine a strong fruity character."

Unlike products made by simply steeping fruit in distilled spirits, Dayi's traditional plum wine relies on pure fruit fermentation — a process requiring careful temperature and timing control. "If one step goes wrong, the whole batch can turn into vinegar instead of wine," Hu said.

While the plum itself has changed little over the centuries, the ways people enjoy it continue to evolve.

Growing demand among younger consumers for lighter, fruit-forward drinks has inspired new products ranging from jasmine- and chrysanthemum-infused plum wines to sparkling plum beverages and tea-based drinks.

For many consumers, plum-based drinks offer not only refreshment, but also a connection with seasonal rhythms that have shaped Chinese life for generations.

As summer settles across Sichuan and the orchards empty of fruit, the work after harvest continues in jars, bottles and fermentation tanks. A year later, when the weather turns hot again, the flavor of Dayi's plums will return in a glass of chilled drink, carrying with it the taste of a season that begins each year with the snap of a fruit leaving its branch.

S. Korea ruling party wins polls

President Lee's DP scores big victory in local elections but loses Seoul race

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

South Korea's ruling liberals secured a landslide victory in quadrennial local elections held on Wednesday, while the main opposition party successfully defended the key Seoul mayoralty, official data showed on Thursday.

According to the National Election Commission, President Lee Jaemyung's ruling Democratic Party, or DP, won 12 out of 16 races for metropolitan mayor and provincial governor races.

The result marks a dramatic shift in voter sentiment from four years ago as the DP demonstrated nationwide dominance, a turnaround from the 2022 local elections when the then-ruling People Power Party, or PPP, claimed 12 out of 17 major gubernatorial and mayoral positions.

In the contest this week, the DP successfully flipped traditional conservative strongholds, including the crucial southeastern port city of Busan, while retaining its grip on the vital capital region of Gyeonggi Province, the western port of Incheon, and its traditional home turf in the South and North Jeolla provinces.

But the PPP managed to secure four races for mayors and governors, including the capital Seoul, the southeastern inland city of Daegu, and South Gyeongsang and North Gyeongsang provinces.

The parliamentary by-election was held concurrently on Wednesday. The DP secured nine out of the 14 contested parliamentary seats, further consolidating its majority role in the 300-member National Assembly. The PPP gained four seats, and one independent candidate was elected in Busan.

The elections were held exactly one year after President Lee took office last year, with many seeing it as the first test for his administration.

In a meeting with senior aides on Thursday, Lee said he would "humbly" accept the public sentiment reflected in the election results and pledged to cooperate actively with newly elected local governments regardless of their political affiliation, according to Yonhap News Agency.

Symbolic post

Losing the Seoul mayoral race is seen as a painful blow to the ruling party as it is a highly symbolic post that is often regarded as a key barometer of public sentiment.

DP leader Jung Chung-rae said in a news conference that he is grateful to the public for granting the party a major nationwide victory in the local elections but added that it was painful that the party failed in the Seoul race.

"I apologize for the disappointing election results," said PPP leader Jang Dong-hyuk in a Facebook post, adding that the party managed to keep the "spark of hope" alive in the challenging election and will find a new path forward.

"(The election) is a referendum not only on President Lee ... but essentially ... also a referendum on the behavior and attitude of the main opposition party," said Lam Peng Er, head of the Korea Centre and principal research fellow at the East Asian Institute at the National University of Singapore.

While the ruling party has emerged very strong both in terms of local and national power, the PPP also managed to avoid total annihilation by retaining key conservative strongholds and winning the race in Seoul, Lam told China Daily.

Still, Lam said the landslide win of the ruling party in both local and by-elections will provide political stability for Lee to pursue his domestic reforms.

He said the high voter turnout, the second-highest in South Korea's local election history, showed there are many voters who feel that the PPP had not really repented for the failed martial law declaration by former president Yoon Suk-yeol in 2024. Yoon was impeached the following year.

Over 27.2 million people cast their ballots in the June 3 local elections, with a final voter turnout of 61 percent.

Beijing imposes travel ban on New Zealand MPs over Taiwan visit

By **MO JINGXI**
mojingxi@chinadaily.com.cn

China warned on Thursday that anyone who crosses the line on the Taiwan question will "pay the price", after it imposed travel bans on several individual New Zealand lawmakers who visited the Taiwan region in disregard of the grave concerns and firm opposition of Beijing.

"We urge the individuals concerned to earnestly respect China's sovereignty and territorial integrity and strictly abide by the one-China principle," Foreign Ministry spokeswoman Mao Ning said at a regular news briefing in Beijing.

Mao made the remarks in response to a question about why China banned several New Zealand lawmakers from entering the country.

In a statement made earlier on Thursday, the Chinese embassy in New Zealand said that a small number of New Zealand lawmakers had visited the Taiwan region in their capacity as members of Parliament despite China's serious concerns, firm opposition and repeated prior warnings.

The embassy said that China had decided, in accordance with relevant laws, to take measures against the individuals concerned, such as the denial of entry into China, including the Hong Kong and Macao special administrative regions.

"Their action violates the one-China principle and interferes in China's internal affairs," Mao told reporters.

She stressed that the one-China principle, a prevailing international consensus and a basic norm in international relations, is also the political cornerstone of China-New Zealand relations.

On Thursday, Mao also responded to accusations by intelligence agencies from the so-called Five Eyes alliance, which includes the United States and the United Kingdom, that Chinese spies are using online job platforms to recruit people.

Mao said that as the world's largest intelligence cooperation network, the "Five Eyes" has long engaged in massive systemic espionage all over the world.

"It is ironic that such an organization is accusing China of 'spy threat'," she said.

European Commission cries foul over new tariff threat

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

The European Union's executive branch, the European Commission, has hit back at what it calls "unjustified" threats of yet more tariffs from the United States, just as it closes in on implementing the much-disputed trade agreement reached last summer between Commission President Ursula von der Leyen and US President Donald Trump.

On June 16, EU lawmakers are expected to vote on the deal, which critics say is unduly weighted toward the US and will impose a 15 percent levy on EU goods, while the EU removes tariffs on US products.

However, less than two weeks before the vote, the EU has been named as one of 60 economies, including the United Kingdom, China, India and Canada, which could face additional new tariffs of up to 12.5 percent, with Washington's justification being that the countries and trade blocs named have failed to curb trade in goods made with forced labor, which is harmful to US commercial interests.

Those facing an additional 10 percent tariff include Canada, Mexico, the EU, the UK and Pakistan. Other countries, including China, India, Japan and Australia, could face 12.5 percent.

'Unacceptable' action

"The failure of our most important trading partners to address the importation of goods made with forced labor is unacceptable," said US Trade Representative Jamieson Greer. "This creates a dynamic where American workers are forced to compete globally on an unlevel playing field."

Chinese Foreign Ministry spokeswoman Mao Ning firmly rejected the remarks and said the threat was being used "as a pretext for political manipulation", while the EU said it already has some of the world's tightest restrictions around the trade of forced labor goods.

The US government's investigation, which led to the latest tariff threat, came about after February's US Supreme Court ruling that Trump had overstepped his authority as president by trying to use the International Emergency Economic Powers Act to impose duties on many of the US' leading trading partners.

The European Parliament's chief negotiator on the implementation of the EU-US deal known as the Turnberry agreement, Bernd Lange, said the latest threat was clearly a response to this "defeat before the Supreme Court", which had left the White House "desperately" looking for a new justification "to sustain its tariff policy".

"Accusing the EU of not doing enough against forced labor is absurd," he continued. Lange chairs the European Parliament's trade committee, which on Tuesday voted to accept the Turnberry agreement.

He said that the latest threat was not unexpected, adding that "the impression is increasingly emerging that a tariff measure is sought first, and only then is a suitable legal justification found".

Commission Deputy Chief spokesman Olof Gill said the Commission "will carefully analyze the preliminary findings of the investigation" but that "the EU considers tariffs imposed on these grounds to be unjustified".

Chinese-style clothing grows popular in US stores

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

A new trend of Chinese-style clothing, especially the so-called "Mandarin jacket", traditionally called *tangzhuang*, has become popular in the United States and abroad this spring and summer in clothing stores like Zara.

The aesthetic, dubbed "Neo-Chinese Style" in English, appears under the hashtag *xinzhongshi* on social media and has been declared a major 2026 fashion craze on TikTok and Instagram among Generation Z and other age groups.

"These jackets are clearly Asian-inspired," Desiree Jones, 55, from New York, told China Daily while shopping at a Zara store in Manhattan.

"I gravitate to that. It's fire. It pulls you in. It's the button placement and the structure of the jacket and the collar. That's where you really see that Asian cut. I see no problem with there being more Asian- or Chinese-inspired fashion in US stores because a lot of Americans are going to Asia, so it's nice we're mixing cultures."

The styles that are currently most popular adopt traditional Chinese tailoring such as Mandarin collars, *pankou*, or frog buttons, alongside Western tailoring. Horse-face skirts, known as *mamianqun*, are available for sale on Amazon.

Some of the most sought-after Tang-style jackets are being sold by Zara, a fast-fashion Spanish retailer with stores in at least 96 countries.

One sleek, black, stylish, Zara Mandarin jacket costs $149. Another white one was part of a prominent window display in New York.

Monica, 30, from Ecuador, was browsing through the racks of a Zara in Brooklyn midweek when one of the black Mandarin-style jackets caught her eye.

"I love this style," she said while trying it on. "I think of pretty Chinese models when I see this jacket. I want to look like that. I like the buttons, color, everything really. It's got a real Chinese vibe to it. It's very cool. I'll style it with light-colored jeans."

Summer trend

Lace, short-sleeved tops or shirts with a high collar and frog buttons are tipped to be a big trend this summer. So too are *qipao*.

Another viral, sporty offering is the Adidas Chinese New Year jacket, available in the US from May 1, which costs $150.

Before the jacket went viral worldwide on social media, it was exclusive to China, and then it was sold in Europe.

But while the latest look is a must-have among shoppers of all races, its sudden popularity has divided Chinese social media users.

Some like it, while others see it as cultural appropriation.

Vanessa Li, a 26-year-old Chinese Australian content creator, made a video in January with the opening words "my culture is not a trend".

Li's video has been liked over 71,100 times as of Monday.

She dislikes that *tangzhuang* is now predominantly known in the West as a Mandarin jacket.

She sees countless fashion brands selling the style but not acknowledging the culture it's from.

Li says she believes there is a "fine line between cultural appropriation and cultural appreciation".

While appreciation is welcome, she does not want to see brands profiting from other cultures without crediting their origins, or real names. "That's not appreciation, that's appropriation," she says in her video.

Instead, she encourages people not to view the latest fashion as just a trend but as part of thousands of years of Chinese history, craftsmanship and cultural meaning.

She also urges shoppers to support Chinese fashion designers.

New clashes strain shaky US-Iran truce

Kuwait under attack amid conflicting signals from Washington and Tehran

By **CUI HAIPEI** in Dubai, UAE, and **JAN YUMUL** in Hong Kong

Fresh strikes and diplomatic friction have continued to strain a fragile truce between the United States and Iran, with Tehran confirming no tangible headway has been made in war-ending talks amid new hostilities.

In contrast to the downbeat Iranian remarks, US President Donald Trump voiced optimism again, telling reporters that "it could happen ... over the weekend".

"The talks are going very well actually," he said of the latest bid to end the war, which began on Feb 28.

However, US lawmakers dealt a political blow to the Republican leader on Wednesday when the House of Representatives passed a resolution directing withdrawal from the war.

The resolution, adopted by a vote of 215 to 208, with four Republican lawmakers siding with Democrats, remains largely symbolic, as Trump retains veto power should the measure clear the Senate.

Iranian Foreign Minister Abbas Araghchi said lines of communication with the US were still open, but warned that any Israeli attack on Lebanon would trigger a "full-scale resumption" of the conflict.

"Any attack on Beirut will have grave consequences and will lead to a full-scale resumption of the war," he told Lebanon's Al Mayadeen TV on Wednesday, while highlighting the combat readiness of the armed forces.

Following a drone attack on Kuwait's international airport, authorities suspended air traffic and diverted arriving planes to other destinations, but later resumed Kuwait Airways flights. The airport, which only fully resumed services on Monday, has been repeatedly targeted throughout the conflict.

Iran's Islamic Revolutionary Guard Corps denied orchestrating the attack, saying it was "an error in the American Patriot systems, which landed on the terminal after failing to intercept Iranian missiles".

The IRGC also accused US troops of provoking escalation by targeting an Iranian tanker and Qeshm Island. The US military rejected the claims, stating that Iranian drones had deliberately targeted Kuwait's airport.

Iran's Supreme Leader Mojtaba Khamenei said in a message on Thursday that Iran has delivered a "decisive blow" to the US and Israel, warning that Tehran's adversaries are now attempting to foment internal divisions after suffering battlefield defeats.

The fresh escalation was one of the sternest tests yet of the April 8 truce that paused more than a month of war sparked by the US-Israeli bombing of Iran, and has largely held despite sporadic exchanges of fire.

Trump played down the renewed hostilities, saying that "in that part of the world, a ceasefire is when you're shooting in a more moderate manner".

Hassan Ahmadian, a professor at the University of Tehran, doubted whether a shaky deal could permanently end Israeli and US military aggression.

"That's why they are resorting to power to make their own guarantees," Ahmadian told Al Jazeera, adding that the Iranian leadership is attempting to show that it is both ready for diplomacy and further military confrontation if necessary.

"If we're attacked, we'll hurt you back — that's the main Iranian message," he said.

Situation in Lebanon

Meanwhile, the path toward a lasting ceasefire between Israel and Lebanese militant group Hezbollah remained unclear as hostilities continued, despite Israel and Lebanon having reached a ceasefire after two days of direct talks.

The two countries agreed to create "pilot zones" in which Lebanese armed forces "will take exclusive control of the territory", barring all nonstate armed actors, a joint statement said. Further talks were planned for the week of June 22 to reach a "comprehensive" agreement.

Notably, Trump acknowledged having called Israeli Prime Minister Benjamin Netanyahu "crazy" during a reportedly expletive-filled call, saying he was "a little bit perturbed" that Israel's fighting with Hezbollah was hampering talks with Iran.

Trade remains key despite rising geopolitical tensions, expert says

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

International trade remains one of the most effective ways to create prosperity, strengthen economic ties and reduce conflict between nations, says a maritime and trade analyst, while warning that rising protectionism and geopolitical tensions are reshaping the global trading system.

Speaking at the centennial celebration of World Trade Week in Los Angeles last week, Peter Tirschwell, vice-president for maritime and trade at S&P Global Market Intelligence, emphasized the enduring value of international commerce at a time when tariffs, geopolitical rivalry and supply chain disruptions are increasingly influencing trade flows.

"We believe firmly in the value of trade to expand markets, create opportunities, create interdependencies and thus bring countries and societies together," he said.

"If they trade together, then they are less likely to go to war with each other."

Tirschwell, who previously served as editor-in-chief of the Journal of Commerce, said the publication has maintained a pro-trade perspective since its founding in 1827, reflecting the view that trade promotes economic growth, efficiency and international cooperation.

"The expansion of global commerce has helped lower costs, increase consumer choice and support job creation around the world," he said, highlighting the development of the European Union after World War II as one example of how economic integration can help foster stability and cooperation among nations.

The ports of Los Angeles and Long Beach provide another example of trade's economic benefits, he said. Together, the two ports form the largest container gateway in the Western Hemisphere and support hundreds of thousands of jobs throughout Southern California and beyond.

"The message being that trade creates jobs, it creates growth, it creates opportunity, it creates prosperity," Tirschwell said. "But sadly, that is not the message that we are hearing out of Washington, DC, right now."

His remarks came amid continued debate over US tariff policies, including the sweeping "Liberation Day" tariffs announced in April last year.

The measures, which imposed additional duties on imports from numerous trading partners, have contributed to uncertainty for businesses and supply chains while prompting legal challenges and broader discussions about the future direction of US trade policy.

Significant departure

Tirschwell said the current environment represents a significant departure from the decades following the establishment of the World Trade Organization in 1995, when globalization and trade liberalization enjoyed broad international support.

"I grew up in an era that was favorable to trade," he said. "There used to be a global consensus regarding the value of trade."

Today, however, governments are playing a much larger role in shaping trade flows, often using tariffs and industrial policies to pursue strategic and geopolitical objectives.

He cited a recent study by McKinsey & Company projecting that as much as one-third of global trade could shift to new trade corridors over the next decade.

Early signs of that trend may already be emerging. Tirschwell said global container volumes grew about 5 percent year-on-year for the first quarter, but United States containerized imports dropped by 5 percent. "Trade is diversified, and it could start to bypass the US on a long-term basis," he said.

He also pointed to growing pressures on global shipping networks. Traffic through the Suez Canal remains below historical levels because of security concerns in the Middle East, while tensions surrounding the Strait of Hormuz continue to create uncertainty for global logistics operators.

"Freedom of navigation is now under threat in ways that it has not been for decades," he said.

As a result, businesses are adapting to a "permanent state of disruption", requiring new approaches to supply chain management and investment planning, he said.

Despite the challenges, Tirschwell remained optimistic about the long-term outlook for international commerce.

Many regions, particularly Africa, are expected to grow faster than the US in the coming decades and are attracting increasing attention from shipping lines, freight forwarders and logistics providers, he said.

While acknowledging that global trade is entering a more complex era, Tirschwell said the continued investment by ports, airports and logistics operators demonstrates enduring confidence in international commerce and economic connectivity.

Briefly

BRAZIL

Lula refuses to bow to tariff offensive

Brazil will stand firm and not bow to pressure from the latest US trade offensive, President Luiz Inacio Lula da Silva said on Wednesday. At a cabinet meeting, Lula focused on the proposed 25 percent tariff on Brazilian goods announced by the Office of the United States Trade Representative two days ago. "We have decided that this country will no longer adopt a 'stray dog' policy toward the great powers," Lula said. "No one needs to be afraid of anything; we will not bow our heads. We are a democratic and sovereign country. We will not give in." Brazil will maintain its independent position and seek alternative partnerships, he said. "If (US President Donald Trump) doesn't want to buy, we'll sell to whoever does."

SPAIN

Record heat-related deaths seen in May

The deaths of 101 people in Spain in May were heat-related, the highest number for the month since such records began in 2015, the Health Ministry said on Wednesday. "This figure is 3.6 times higher than the average number of heat-related deaths recorded in May over the past decade," the ministry said, stressing "the significant health impact of heat episodes, even before the start of summer". Temperature records for the month were broken in several Spanish cities in late May, particularly in the north, according to the national meteorological agency Aemet, which said the figures marked "extraordinarily high temperatures for a month of May".

XINHUA—AGENCIES

South Africa looks to bioethanol for energy security

By **NDUMISO MLILO**
in Johannesburg
For China Daily

South Africa is ready to produce bioethanol from sorghum to reduce reliance on imported fossil fuels and cushion geopolitical risks, officials and business leaders say.

Josie Rowe-Setz, managing director of Blueprint Holdings, a company focused on the southern African market, said there is significant economic value in building a domestic bioethanol industry using locally grown sorghum and sugarcane.

Countries including Brazil, India, Kenya, the United States and Zimbabwe have established bioethanol industries, demonstrating the model's viability, she said. Sorghum is drought-tolerant, heat-resistant and well-suited to South Africa's agricultural conditions, she added.

"We have found that production of bioethanol is a viable industry. It will give us self-reliance, national energy sovereignty and fuel security," she said.

South Africa has the natural resources, market demand and regulatory framework needed to support bioethanol production, Rowe-Setz said. Developing the domestic bioethanol industry could also create jobs across the agricultural and manufacturing sectors, she said.

In countries where bioethanol industries succeeded, early investment was supported through targeted public finance mechanisms, and feedstock supply was strengthened through contract farming and guaranteed offtake arrangements, she added.

Landeni Kabini, acting director-general of South Africa's Department of Mineral and Petroleum Resources, said the government has come up with legislation aimed at removing obstacles in bioethanol production.

Authorities are prepared to work with industry players and other stakeholders to start the production of fuel derived from sorghum and sugarcane, she said.

"There was regulatory uncertainty, and we gazetted the regulations on what the price of biofuel can be, so that the industry can take off," she said. "As a government, we support the biofuels industry."

Irshaad Kathrada, CEO of the Localisation Support Fund, said South Africa has undergone a major shift from domestic fuel refining to imported finished fuels following the closure of its two largest coastal refineries between 2022 and 2023.

As a result, he said, the country now imports nearly three-fourths of its fuel from geopolitically exposed sources, leaving consumers vulnerable to global supply chain disruptions and price shocks.

"We have a credible near-term alternative, one grounded in South African soil, South African farmers and commercially proven technology," he said. "The economics are closer to viable than most people realize, the regulatory framework is finally in place, and the localization dividend is substantial."

Latest tariff proposal reveals US is caught in dilemma of its own making

The United States administration's latest tariff offensive targeting 60 economies including China was greeted around the world with something unusual: a collective shrug.

That is because Washington has been signaling for months that it needs a legal substitute for the sweeping tariffs struck down by the US Supreme Court earlier this year.

The White House's temporary global tariffs — imposed under Section 301 investigations after its earlier tariffs were ruled unlawful — are due to expire next month. Allowing a gap in tariff collection would be politically costly at a time when the US' fiscal deficit remains elevated and the midterm elections loom on the horizon.

The US administration therefore has a strong incentive to keep the tariff machine running. Tariff revenues, which exceeded $31 billion per month at their peak last autumn, have already declined substantially.

The result is a curious blend of continuity and retreat.

Compared with the tariff threats that dominated headlines last year, the new rates are lower. Most major economies face either a 10 percent or 12.5 percent surcharge rather than the much steeper penalties previously contemplated. The US administration has also expanded exemptions for a wide range of agricultural commodities, industrial inputs and products that the US either cannot produce domestically or cannot produce in sufficient quantities.

Economic gravity has a habit of asserting itself, sooner or later. For all the rhetoric about reindustrialization, economic reality has imposed constraints. Inflation remains stubbornly uncomfortable for US households. Consumer prices continue to weigh on public sentiment. Manufacturers and farmers have repeatedly warned that tariffs on imported inputs raise production costs. The situation has been further complicated by renewed instability in the Middle East.

The US administration thus finds itself attempting a delicate balancing act. On the one hand, it wants to preserve the tariff barriers that "protect" select domestic industries. On the other hand, it cannot ignore the political consequences of higher prices. Even the Federal Reserve's recent warning to continue shrinking its balance sheet underscores lingering inflationary concerns.

Against this backdrop, the groundless allegations of "forced labor" made by the Office of the US Trade Representative are merely a "politically correct" pretext for the proposed tariffs to go to congressional debate next month.

Chinese Foreign Ministry spokeswoman Mao Ning reiterated that China opposes all forms of unilateral tariff measures. No one benefits from tariffs or trade wars, and economic disputes should be resolved through dialogue and consultation based on equality, respect and mutual benefit.

She also rightfully rejected allegations of "forced labor" in China and criticized attempts to use the issue as a pretext for political manipulation.

The European Union, Canada and many other trading partners of the US have voiced opposition and concerns regarding both the substance and the justification of the tariff surge. Yet they have been measured rather than alarmed in their responses. That reflects a growing recognition that Washington itself is constrained.

Protracted trade negotiations have taught some US trading partners an important lesson: tariff threats are often as much about domestic politics as international economics. The latest proposals reveal a US administration struggling to reconcile strategic ambitions with economic realities.

The deeper problem for Washington is that tariffs have gradually ceased to function as conventional economic instruments based on market law. They have become political instruments that are difficult to calibrate. Raise them too aggressively and domestic inflation, legal challenges and business opposition intensify. Apply them selectively and their coercive power diminishes. Exemptions proliferate, contradictions multiply and credibility erodes.

Durable economic relationships cannot be built on coercion. Whether the issue is market access, supply chains or labor standards, progress ultimately depends not on tariff walls but on fair competition, candid negotiation and mutually beneficial cooperation.

'De-risking' is EU's pretext for protectionism

The European Union on Wednesday unveiled its "technological sovereignty" package, which includes the Cloud and Artificial Intelligence Development Act and Chips Act 2.0. The initiative seeks to bolster Europe's technological independence by reducing reliance on foreign technology.

The chips act favors "European-made" chips and seeks to create a closed digital ecosystem, which could fragment global supply chains. The Computer and Communications Industry Association's Senior Vice-President and Head of Office Daniel Friedlaender called the cloud and AI development act "a direct recipe for fragmented discrimination across Europe in 27 different ways".

The new law would be "effectively giving national capitals carte blanche to shut out trusted global vendors from every major technology-producing nation outside the union", he warned.

The EU's focus on "technological sovereignty" reflects a trend of some EU nations moving away from free, open and fair trade toward protectionism. It will unavoidably affect relevant Chinese entities.

As Chinese Foreign Ministry spokeswoman Mao Ning noted in response to questions regarding the EU's latest move in a news conference in Beijing on Wednesday, the essence of China-EU economic and trade relations is mutual benefit and win-win cooperation.

She added that economic and trade issues should be properly resolved through dialogue and communication. Mao expressed the hope that the EU will uphold the fundamental principles of a market economy, including free trade, fair competition and open cooperation, refrain from adopting protectionist measures and remain committed to settling differences through dialogue and consultation.

The EU has in recent years introduced a series of measures as part of its "de-risking" strategy targeting China. Rejecting high-quality products and services from Chinese companies will not only result in financial losses for European countries, but also impede their own technological progress and economic growth.

Reportedly, the EU will leverage the G7 and EU summer summits to introduce new trade restriction instruments targeting China this month.

EU policymakers should understand that protectionism is not a solution to the problems that the EU is now facing, and open cooperation benefits both sides. This is because the economic and trade relations between China and the EU are deeply integrated and complementary. Disrupting these links would harm the interests of enterprises and consumers from both sides.

The latest survey report from the European Union Chamber of Commerce in China shows that a majority of the EU companies surveyed have chosen to maintain or expand their operations in China, while nearly one-third plan to further deepen their localization strategies there. This suggests that the "de-risking" narrative pushed by some EU politicians has not, in practice, become the prevailing choice among EU businesses.

At its core, China-EU economic and trade cooperation is the natural outcome of the interplay between comparative advantages and market competition. Complementary strengths do not constitute a risk, nor does the convergence of interests pose a threat, as Mao Ning said on Thursday.

Over the past five decades, the annual trade volume between China and Europe has surged more than 300-fold, while two-way mutual investment has approached $260 billion — figures that vividly demonstrate the strong momentum and vast potential of China-EU economic cooperation.

Trade protectionism runs counter to economic laws and is a self-defeating practice that harms all parties involved.

EU policymakers should view the bloc's economic and trade relations with China in an objective and rational light, and work alongside the Chinese side to narrow the list of outstanding issues, expand the scope of cooperation, and achieve win-win outcomes.

Classics transmission of meaning across generations

Nearly 100 Chinese scholars will attend the second World Conference of Classics in Athens on Tuesday and Wednesday. Their presence is symptomatic of a broader intellectual movement unfolding in contemporary China: the rediscovery of the classics not as relics of distant antiquity, but as part of a living tradition that is not just of relevance to contemporary China but to the world as a whole.

Increasingly, Chinese scholars are arguing that the classical thought that helped to shape the modern world should not be confined to the Greco-Roman canon alone. Chinese, Mesopotamian, Indian and other civilizations have all contributed to the long civilizational effort to confront enduring questions about human existence and society.

For much of the modern era, Western science, military technology, political institutions, and industrial systems have been the primary sources of practical knowledge; to "learn from the West" was seen as modernization. Today, however, for many Chinese classicists, engagement with Western thought is part of the effort to understand how other societies have answered the question of how to live.

In fact, classical writings are valued precisely because they ask questions that modern societies, despite their immense technological sophistication, still struggle to answer: What is the good life? What is the relationship between law and morality, individual desire and civic responsibility, personal fulfillment and collective harmony?

One reason these questions have regained urgency is the realization among intellectuals that technological progress and material development alone have not produced moral clarity or civilizational confidence. In fact, some of the greatest catastrophes of modern history emerged within highly advanced societies.

While earlier generations encountered Western civilization through the pressures of colonialism and modernization, Chinese scholars today engage with Greek and wider classical traditions grounded in China's own intellectual inheritance.

The value of comparative classical studies lies not in erasing differences, but in illuminating them. Classical Greek tragedies dramatized conflict, individual heroic endeavors and the instability of political life. Confucian thought emphasized harmony, relational ethics and moral cultivation through ritual. Comparative perspectives can open new ways of approaching both Greek antiquity and Chinese classical thought.

There is also growing recognition that civilizations understand themselves more clearly through encountering others. Odysseus, the hero of Homer's epic poem *The Odyssey*, leaves Ithaca and returns transformed through his encounters with foreign worlds. Confucius spent 14 years traveling among the competing states of his age in search of moral order and wise governance. Both traditions suggest that stepping beyond one's own world provides the distance necessary to reflect upon it more deeply.

In an increasingly fragmented global landscape marked by geopolitical rivalry, technological disruption, and ideological polarization, the classics offer something increasingly rare: long traditions of reflection on human nature, political order, moral responsibility, and the conditions of civilized life itself. They remind us that civilizations are not sustained by power or wealth alone, but by their capacity to preserve, reinterpret and transmit meaning across generations.

The gathering in Athens thus represents an emerging attempt to recover a genuinely global humanism — one grounded not in cultural uniformity, but in serious dialogue among the foundational civilizations of humanity. At a time when the world often appears divided by distrust and competing narratives, that aspiration may itself be among the most important lessons the classics still have to offer.

What They Say

New measures to advance dual-carbon goals

Editor's note: *Friday is the 55th World Environment Day. In April, China issued new measures to evaluate and assess the performance of local governments in advancing carbon peaking and carbon neutrality. The 21st Century Business Herald spoke to Tian Zhiyu, a researcher at the Energy Research Institute of the Chinese Academy of Macroeconomic Research, about how the measures will help China's green transformation progress. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China has set dual carbon goals of peaking carbon dioxide emissions before 2030 and achieving carbon neutrality before 2060. The new measures are designed to guide governments at all levels in adopting a sound approach to performance assessment, while ensuring accountability for meeting carbon reduction targets.

The measures seek to ensure effective alignment of goals and responsibilities among the central and local governments, across different regions and among various government departments.

According to the measures, a carbon peaking action plan will be formulated during the 15th Five-Year Plan (2026-30) period to achieve national targets by 2030, including reducing carbon emissions intensity by more than 65 percent from 2005 levels, increasing the share of non-fossil energy consumption to 25 percent and peaking both coal and oil consumption.

The measures' primary purpose is to promote higher-quality work in advancing the country's carbon peaking and carbon neutrality agenda.

For regions making solid progress, the focus will be on identifying successful practices and sharing valuable experiences. For those lagging behind, the priority will be to take timely corrective actions and address existing problems.

China's provinces differ significantly in terms of resource endowments, industrial structures and stages of development. Therefore, the measures place emphasis on ensuring fairness in the assessment criteria.

Local governments are required to draft their own carbon peaking action plans during the 15th Five-Year Plan period, setting five-year and annual targets as well as policy measures that align with national objectives.

Also, during the evaluation and assessment process, factors such as changes in domestic and international conditions, as well as natural and climatic circumstances, are taken into account. The assessment criteria can be adjusted and refined dynamically when necessary, maintaining a degree of policy flexibility.

For provinces that rely heavily on carbon-intensive industries and face significant transition pressures, balancing emissions reductions with economic growth remains a key challenge. A three-pronged approach can be useful here.

First, it is essential to strengthen the commitment to comprehensive green transformation. Achieving the carbon peaking and neutrality goals is not about restricting development. Rather, it is aligned with and supportive of high-quality development, delivering benefits in both the near and long term.

Second, greater emphasis should be placed on improving "carbon productivity". Reducing carbon intensity should serve as a key benchmark when planning new projects and upgrading existing ones, ensuring that every unit of carbon emissions generates the greatest possible economic value.

Third, stronger awareness of process management is needed. Achieving carbon peaking and neutrality goals cannot be left until the last minute or rely on external support. Efforts must begin now, starting with a clear understanding of current emissions profiles, identifying untapped potential for reductions and building broad-based momentum for low-carbon transformation across all sectors and industries.

Visit marks a new stage in China-Laos ties

When General Secretary of the Lao People's Revolutionary Party Central Committee and Lao President Thongloun Sisoulith arrived in Hangzhou on the first day of his state visit to China, one brief moment captured wide attention.

At DEEP Robotics, a leading robotics company, a robot dog approached him with a gift. Thongloun smiled, accepted the toy and thanked the machine in Chinese.

Later, he operated another robot dog and watched it roll over on command. On the surface, it was a light-hearted moment. In reality, it revealed something much deeper about where China-Laos relations are heading.

Twenty years ago, a Lao leader visiting China would likely have focused on roads, bridges, hydropower stations, and agricultural cooperation. Today, the first stop is Hangzhou, which is home to robotics firms, AI platforms, digital governance systems, and e-commerce giants. That shift reflects a structural transformation in how both countries view development.

Global Lens

For more than six decades since diplomatic relations were established in 1961, China and Laos have built their partnership on political trust, mutual respect, and a shared identity often described as "comrades and brothers". That foundation remains strong, but it doesn't tell the full story.

The significance of President Thongloun's visit lies elsewhere. China-Laos relations are steadily evolving into a comprehensive development partnership shaped by economic necessity, structural transformation, and long-term modernization goals. In many ways, Laos is emerging as a real-world laboratory for a new model of South-South cooperation in the 21st century, where development outcomes matter more than ideological framing.

The country's challenges are deeply interconnected. Laos continues to face poverty, inflation, currency depreciation, climate vulnerability, and a shortage of skilled labor, all of which reinforce each other and constrain growth. At the same time, it is preparing to graduate from the United Nations' least developed country category, a transition that requires structural economic upgrading rather than incremental reform.

Against this backdrop, Laos' 10th Five-Year National Socio-Economic Development Plan (2026-30) and the Vision 2030 framework set ambitious targets: raising GDP per capita to around $3,104, reducing poverty to single-digit levels, lifting more than 100,000 families out of poverty, expanding forest coverage, and upgrading transport corridors.

China's 15th Five-Year Plan (2026-30) is highly complementary to Laos' Vision 2030 strategy. China's emphasis on green development, technological innovation, digital transformation, advanced manufacturing, anti-relapse mechanisms, and regional connectivity aligns closely with Laos' goals of industrial upgrading, poverty reduction, environmental protection, and sustainable growth. When the Lao leader meets senior Chinese leaders in Beijing during his visit, both sides may align their development strategies to chart the future course of bilateral ties.

What makes China particularly significant is the depth of its development experience. China offers Laos something more strategic than capital: a tested pathway of large-scale poverty reduction, industrialization, and infrastructure-led transformation.

President Thongloun's visit coincides with the recent launch of the Global Partnership for Poverty Alleviation and Development (GPPAD), jointly initiated by China and 53 other countries, along with nine international organizations.

The initiative offers countries like Laos a platform to address poverty and development challenges through cooperation, knowledge-sharing, and practical support.

The China-Laos Railway remains the most visible symbol of this transformation. Since its opening in December 2021, it has carried more than 73 million passengers and transported over 84 million tons of cargo, including around 19 million tons of cross-border freight. More than 840,000 international travelers from over 120 countries and regions have used the route. But its real impact goes beyond statistics.

For decades, Laos was defined as a landlocked country. Today, it is increasingly described as "land-linked". Agricultural products from Laos now reach Chinese markets within days.

Tourism corridors linking Kunming in Yunnan province to Luang Prabang and Vientiane have expanded rapidly. Warehousing, logistics, hospitality, and small businesses have grown along the railway belt.

Consumption in railway-linked zones has risen by more than 35 percent. The railway did not simply connect cities but it changed expectations about what Laos can become.

Infrastructure, in this sense, is not just physical capital. It is psychological capital. It reshapes how farmers, students, and entrepreneurs think about opportunity. A farmer with access to a larger market behaves differently.

A student with cross-border mobility thinks differently. Development begins when possibility becomes visible. President Thongloun's decision to begin his visit in Hangzhou reflects this shift. The focus is no longer only on what China can build in Laos, but on what Laos can learn and eventually build for itself. Robotics, AI, digital governance, and smart logistics are now part of Laos' development imagination.

This is reflected in emerging cooperation platforms such as the China-Laos AI Innovation Cooperation Center, the 500-kilovolt power interconnection project, digital infrastructure development, telecommunication satellite applications, and vocational training programs.

The relationship is gradually moving from physical connectivity toward capability building. Clean energy cooperation is another emerging pillar. With hydropower resources and expanding cross-border grids, Laos is positioning itself as a potential renewable energy hub for Southeast Asia.

At the same time, economic cooperation is becoming more balanced.

China remains Laos' largest investor, with cumulative investment exceeding $18 billion, and bilateral trade reaching $9.82 billion in 2025.

But the next phase will depend on Lao products entering the Chinese market more systematically, supported by improved logistics and digital trade platforms.

Seen in a broader regional context, the China-Laos Railway is becoming part of an emerging Pan-Asian connectivity system linking China with Thailand, Malaysia, and potentially Singapore. Combined with the Regional Comprehensive Economic Partnership, Lancang-Mekong cooperation, and ASEAN-China frameworks, Laos is evolving from a peripheral geography into a strategic corridor economy.

Ultimately, President Thongloun's visit reflects a deeper transition in China-Laos relations. The first phase was built on political trust. The second was built on infrastructure connectivity.

The third, now unfolding, is built on modernization, technology, and shared development capacity. That is why this visit is not just a diplomatic milestone, but the opening of a new stage in China-Laos relations.

Southeast Asia's future depends not on bloc politics but on connectivity, trade, industrialization, and shared prosperity.

President Thongloun's visit signals the emergence of a new development paradigm in which neighboring countries build resilience through infrastructure, innovation, and people-centered growth rather than geopolitical rivalry.

Huang Huan and An Bowen

When ecology becomes an economic engine

In the spring of 2026, several pods of wild finless porpoises — the "water pandas" known for their extreme sensitivity to water quality — were spotted swimming and playing in the Yangtze River near Yibin in Sichuan province.

Once rare visitors, these creatures have now become permanent residents of the Yangtze, serving as a living bio-indicator of the river's recovery.

This is a significant transformation from a decade ago, when the confluence near Yibin was a toxic mix of chemical effluents, illegal dredging, and silt-heavy waters.

Back then, fishermen grew poorer even as they overtaxed the river, and the city itself was trapped in the grim choice of "pollution for growth".

For years, the stubborn narrative has been that environmental fix-ups are a losing game. Conventional wisdom held that conservation was a one-way street of government spending and shuttered factories, and an enemy of economic progress.

But Yibin, the first major city along the Yangtze and a vital ecological gatekeeper, has spent the last decade dismantling that myth. When we stop viewing conservation as a "burden" to be carried, it becomes a region's most potent competitive edge and turns environmental health into economic capital.

As an industrial powerhouse on the upper Yangtze, Yibin's economy used to be defined by "the black and the white" — coal, chemicals, and heavy-duty liquor production. The riverbanks were crowded with energy-intensive plants, illegal piers, and noisy restaurant barges.

With industrial waste and raw sewage flowing straight into the current, the Yangtze's biodiversity hit rock bottom; at one point, the main stream was classified as "fishless". This was the old playbook of "pollute now, pay later" — a strategy that led to GDP spikes but left the city in an unsustainable deadlock.

When the Yangtze River Protection Law came into effect in 2020, Yibin led the charge with a challenging "inward-looking" cleanup. Illegal docks were dismantled, polluting plants were relocated to managed industrial parks, and a 10-year fishing ban was imposed.

It was a tough time, as industrial output dipped and thousands of fishermen worried about their livelihoods. These "growing pains" only fueled the skeptics who argued that green policies were merely a financial drain.

However, that view was shortsighted. True conservation lays the foundation for a more resilient economy.

Yibin didn't just protect the river for the sake of protection. It synchronized environmental repair with industrial evolution, ensuring that every yuan spent on the river eventually paid dividends to the city.

Yibin's success was rooted in its strategy of "value reconstruction". Instead of pitting the economy against the environment, the city started treating its natural assets as economic engines. The goal was to move past "handout-style" protection toward a self-sustaining model where the environment actually drives growth.

First, the city transformed its ecology into its most valuable asset. By cleaning the water and restoring the shorelines, Yibin achieved 100 percent "excellent" status for its monitored river sections in 2025. This paved the way for the successful natural breeding of the endangered Yangtze sturgeon, signaling a river truly coming back to life.

Second, the industrial engine went green. Yibin replaced its old, polluting industries with what it calls "the blue and the green" — digital tech and clean energy. By positioning itself as "China's power battery capital", it attracted a massive cluster of cutting-edge firms.

At the same time, the city's scenic beauty — from the bamboo forests to the restored wetlands — fueled the growth of the high-end eco-tourism and wellness industry that simply couldn't exist in a polluted city.

Most importantly, the locals became the biggest winners. When the fishing nets were pulled in for the last time, Yibin didn't abandon its fishermen. The city provided retraining, turning former river-harvesters into river-protectors.

Today, those same men and women work as ecological rangers, run riverside guesthouses, or thrive in green agriculture by growing organic tea and bamboo. Many are now earning significantly more than they ever did from a depleted fish stock.

Yibin today is a city transformed — green, vibrant, and alive. The sight of porpoises in the waves and flourishing industries on the riverbank isn't a result of giving up on growth; it's the result of finding the sweet spot where development and nature sustain each other.

Across China, more cities are waking up to this reality. Yibin's journey shows that environmental protection isn't a "losing trade" — it's the smartest investment a city can make.

It is not an obstacle to growth but a foundation for long-term prosperity. When we stop looking at the next quarter and start looking at the next generation, we find that every effort to protect the Earth has its own return.

This is the path to a modern China where the beauty of the landscape and the wealth of the people are one and the same.

Ban on smoking in public places an uphill task

I was getting a haircut at a barbershop in my Shanghai neighborhood on Monday when another customer, having just finished his grooming session, sat down on a nearby couch and lit a cigarette about four meters away from me.

It was an immediate nuisance, coming just one day after World No Tobacco Day.

In recent weeks, I have visited the Shanghai No. 10 People's Hospital at least five times to see a relative, and while there, I saw some smokers openly lighting up their cigarettes at the stairways.

And this is Shanghai, a city widely regarded as having some of the strictest anti-smoking regulations in the country.

Under Shanghai rules, smoking is prohibited not only in most indoor public spaces, but also at outdoor bus stops and major tourist attractions such as the Bund, Yuyuan Garden, Xintiandi and Nanjing Road Pedestrian Mall.

The situation in most other Chinese cities is even worse. Southwest China's Yunnan province, the largest tobacco-producing region in the country, is one such place.

During a two-month driving tour across the province late last year, I found that smoking in public places was a far bigger problem.

So far, China's National People's Congress has not enacted a national law that bans smoking in public places. Most rules and regulations relating to smoking restrictions are made by local governments.

The WHO also warns that second-hand smoke exposure contributes to serious health problems, and is estimated to cause over 1.6 million deaths worldwide every year.

The health hazards of smoking are widely known. The World Health Organization states that tobacco use is a major risk factor for cardiovascular and respiratory diseases, over 20 different types of cancer, and many other debilitating health conditions.

Every year, more than 7 million people die from tobacco use across the world. That includes some 1 million deaths in China out of about 300 million smokers, by far the largest number in the world.

The WHO also warns that second-hand smoke exposure contributes to serious health problems, and is estimated to cause over 1.6 million deaths worldwide every year.

In China, cigarette packages carry only text-based warnings of health hazards, but graphic warnings, which are mandatory in many other countries, are still not required.

According to the WHO, health warnings on tobacco packages, especially those that combine text and images, are among the most cost-effective and powerful tools for increasing public awareness of the dangers of tobacco use and reducing tobacco consumption.

The graphic designs used on cigarette packages in some countries are indeed grotesque, featuring images such as blackened and cancerous lungs, rotten teeth, and patients in hospital beds on ventilators.

There is strong public sentiment against smoking in Shanghai. According to the 2025 Shanghai Public Place Tobacco Control white paper released in March this year by the Shanghai Patriotic Health Campaign Committee, 98.2 percent of Shanghai residents support a full ban on indoor smoking.

China Daily reported on Wednesday that a coalition of 16 public health, tobacco control, and environmental protection groups has called for a nationwide smoking ban on all conventional trains and railway platforms, arguing that partial restrictions are no longer sufficient to protect passengers from second-hand smoke.

China has achieved phenomenal progress in its social and economic transformation over the past several decades. Yet, the battle to eliminate smoking in public places and reduce the number of smokers in the country still needs more efforts.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

YU HONGYUAN AND HUA GECHUNYUE

Plugged in

China's stabilizing role in global energy governance has become increasingly prominent

Global energy issues are emerging at the center of the global political economy. On the surface, the current crisis concerns maritime routes, oil and gas transportation and regional security. At a deeper level, however, it reflects the profound pressure now bearing on the global energy governance order: Market mechanisms are being squeezed by the logic of security; open flows are being constrained by bloc confrontation; and multilateral coordination is being weakened by unilateral pressure.

Yu Hongyuan

Hua Gechunyue

Energy security should provide support for development. If it is excessively instrumentalized, it erodes the open environment on which development depends. At a deeper level, the weaponization of energy is becoming a significant manifestation of the imbalance in global governance. Today, route control, financial settlement, sanctions lists, insurance premiums, technological barriers and "rules-based" exclusion are increasingly layered upon one another. Energy is being used more and more as a tool of strategic pressure. The vulnerability of energy systems is an objective reality, but the weaponization of energy is a political choice. It not only raises the institutional costs that countries face in accessing energy, but also places developing countries under greater energy security pressure amid the green transition.

The old foundations of global energy governance are declining. As great power competition intensifies, the generalized use of sanctions, the exclusionary turn in rule-making and the securitization of trade instruments continue to spread. Governance mechanisms that were originally designed to reduce uncertainty are becoming less able to withstand the impact of political conflict. As a result, global energy governance has entered a more turbulent period of adjustment.

Yet crisis not only signifies disorder, but also points to the possibility of reconstruction. Future energy governance should shift toward a new logic that places greater emphasis on systemic resilience, capacity building, green transition and multilateral coordination.

What the world needs is not to turn energy into a bargaining chip of geopolitical competition, but to establish a more stable connection between energy security and climate governance. Nor does it need the creation of more closed and exclusive circles. Rather, it needs transition pathways that countries at different stages of development can participate in, afford and sustain.

China can serve as an anchor of stability in global energy governance because it offers a governance vision distinct from zero-sum competition and bloc confrontation. Faced with a complex situation in which energy security, green transition and the right to development are deeply intertwined, China does not reduce energy to a power struggle of control and counter-control. Instead, it upholds common security, green development, mutually beneficial cooperation and harmonious coexistence between humanity and nature.

China advocates the building of a community with a shared future for humanity and works to translate the four global initiatives it proposed into practical outcomes. It emphasizes the legitimate rights and interests of developing countries in the energy transition and opposes turning the green transition into a new form of barrier politics. This vision is not an abstract slogan, but an important prerequisite for reopening space for cooperation in a turbulent world.

SONG CHEN / CHINA DAILY

The solid foundation of China's stabilizing role also comes from its commitment to steadily advancing its energy transition and green industrial development. By the end of 2025, China's installed renewable energy capacity had reached 2.34 billion kilowatts, accounting for about 60 percent of the country's total installed power generation capacity. The combined installed capacity of wind and solar power had reached 1.84 billion kw, surpassing that of thermal power.

More importantly, China's green transition is not a breakthrough in a single area, but a coordinated advance across wind power, photovoltaics, energy storage, power grids, electric vehicles and green manufacturing. With its super-large market, complete industrial system and sustained capacity for innovation, China is no longer merely a bearer of fluctuations in the global energy market. It has become an important provider of global green transition capacity.

This capacity is particularly important for the world today. With uncertainties over traditional oil and gas supply routes, expanding the supply of clean energy, strengthening the resilience of power systems and accelerating the electrification of end-use energy consumption are not only issues of climate governance, but also issues of energy security. The development of China's new energy industries has reduced the global cost of applying green technologies, expanded the energy transition options available to developing countries and provided a new source of stability for the global energy system. China's contribution to global energy governance is reflected not only in its positions and initiatives, but also in the practical support constituted by equipment, technologies, industry chains, markets and development experience.

At the same time, China's constructive role in global energy governance continues to expand. China remains committed to advancing climate and energy cooperation within multilateral frameworks, actively participates in the process of global climate governance, promotes the Green Belt and Road Initiative, deepens South-South cooperation, and supports developing countries in strengthening their clean energy capacity and climate adaptation capacity.

This is especially critical at present. What global energy governance lacks most is not high-profile statements, but cooperative platforms capable of linking the right to security, the right to development and the right to transition. What it needs most is not exclusion in the name of rules, but the creation of conditions under which more countries can gain capacity, opportunity and benefits in the green transition. What China provides is precisely such a cooperative path, one that is more inclusive and places greater emphasis on common development.

As China plays a greater role, it will also face external constraints and discursive competition. It is necessary to maintain strategic resolve by further transforming the scale advantages of China's own energy transition into systemic advantages, cooperative advantages and rule-shaping capacity. It should expand consensus through open cooperation, consolidate security through green development and stabilize expectations through multilateral coordination.

In the face of excessive securitization and weaponization of energy, as well as global governance imbalances, the truly promising path lies not in closure, confrontation and exclusion, but in responding to risks through cooperation, shaping the future through transition and consolidating security through development. The stronger the winds and waves, the clearer the anchor's value. The significance of China as an anchor of stability in global energy governance lies precisely in its continued provision of valuable stability, certainty and space for cooperation to an uncertain world.

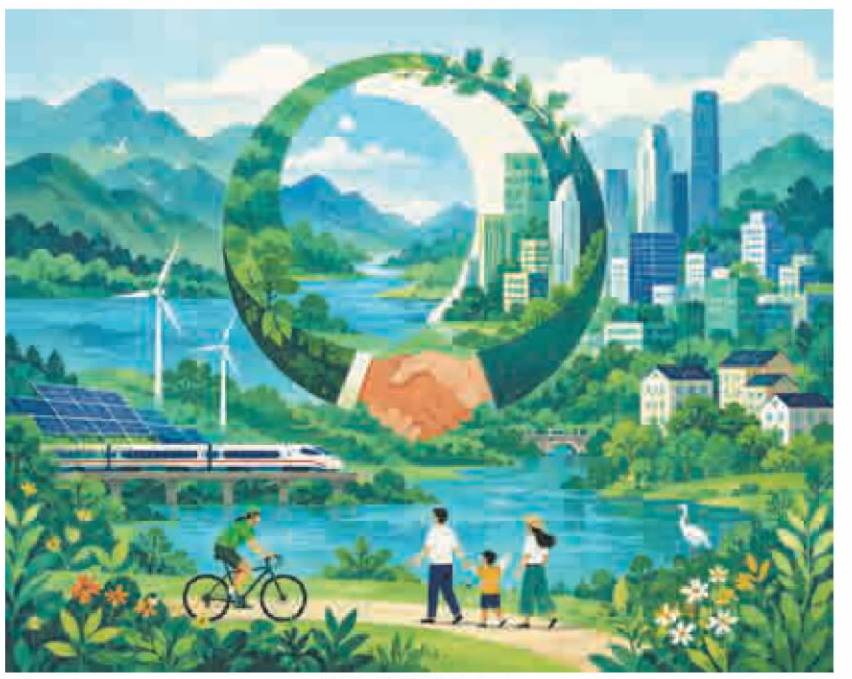
PANG XIAO AND LIU KAN

Green dashboard

China is placing environmental conservation at the heart of its modernization drive with practical governance measures

In 2013, President Xi Jinping proposed a fundamental shift in mindset: no longer judging governance performance solely by GDP growth rate, and placing the ecological environment at the forefront of the evaluation system for economic and social development. The philosophical shift was encapsulated in the famous phrases "lucid waters and lush mountains are invaluable assets" and "green is gold".

Pang Xiao



Liu Kan

In the past decade, particularly the 14th Five-Year Plan (2021-2025) period, this philosophy delivered tangible results. During this period, China's GDP grew at an average annual rate of 5.4 percent, while its carbon dioxide emissions intensity continued to decline.

Recently, the Chinese government issued two assessment measures to evaluate the performance of local governments in terms of their carbon peaking and neutrality efforts and the measures they are taking to realize a Beautiful China. These represent further progress in China's green journey by establishing a concrete governance mechanism for green development.

Since its inception in the last century by economist Simon Kuznets, GDP has become the most widely used metric for measuring national economic development. However, Kuznets himself once stated that the welfare of a nation cannot be inferred from the measurement of national income. In recent years, the deficiencies of the GDP metric became increasingly apparent. In some countries, behind the rising GDP, public dissatisfaction has also been increasing. Efforts have been made to address GDP's flaws with the introduction of concepts such as GEP (gross ecosystem product).

WANG XIAOYING / CHINA DAILY

Now, the world is witnessing a megatrend to move beyond GDP. The High-Level Expert Group on Beyond GDP, launched by United Nations Secretary-General Antonio Guterres, released a landmark report in May titled "Counting What Counts: A Compass of Progress for People and Planet". The report proposes a dashboard-style indicator system comprising four pillars — foundational principles, current well-being, equity and inclusion, and sustainability and resilience — containing 31 specific indicators, including environmental and climate metrics such as total and per capita greenhouse gas emissions, and a biodiversity intactness index.

Notably, China's two assessment measures not only resonate with the "Beyond GDP" concept and indicators, but also take them a step further by making them a governance compass for action.

The assessment of progress toward achieving the dual carbon goals uses indicators such as total carbon emissions, emissions intensity and total coal and petroleum consumption at the provincial level for the first time, which has already drawn significant international attention. The assessment on actions to realize the Beautiful China Initiative is directly linked to the annual performance evaluation, rewards, punishments and appointments of local officials, and also serves as a reference for allocating government fiscal funds related to ecological environmental protection.

While the UN's Beyond GDP indicators act as a macro-value compass for orientation, China's two assessment measures operate as practical policy tools.

First, both the UN's Beyond GDP indicators and China's two assessment measures are highly aligned. The assessment measures, as two of the latest policy tools of China's journey toward green development, provide a robust empirical support for the UN's latest global indicator system, offering crucial practical experience and references for future implementation of the "Beyond GDP" concept, and for shaping the post-2030 global sustainable development agenda.

Second, China is demonstrating how to achieve a "closed-loop" governance system for "Beyond GDP". The Chinese practice shows that moving beyond GDP does not remain merely at the statistical level; it can form a policy loop with binding force and incentive mechanisms at the national level. In China's governance practice, establishing new assessment indicators for stakeholders in related areas provides effective policy guidance for actions in a local context.

Finally, it's noteworthy that the Environmental Kuznets Curve, named after the founder of GDP, is a highly relevant concept for those who study Chinese environmental policies closely. It suggests that as economic levels rise, some nations' environmental quality deteriorates before improving — a pattern often referred to in Chinese context as the Western development model of "polluting first, cleaning up later". In this context, the two measures explain the uniqueness of China's pathway. On the one hand, China faces dual pressures from both climate change and environmental pollution in a short period, which is significantly different from the experience of the West, which was to address pollution and climate issues separately over a much longer time frame. On the other hand, it reflects China's opposition to passively waiting for the turning point of the Environmental Kuznets Curve. Instead, China advocates synergistic advancement: cutting carbon emissions, reducing pollution, expanding green development and pursuing economic growth simultaneously. By proactively supporting green and low-carbon industries, China is attempting to seize the opportunity of the new technological revolution to spur its green development. For example, electric vehicles, lithium-ion batteries and photovoltaic products witnessed a surge in export value in 2025, which, according to China's General Administration of Customs, approached 1.3 trillion yuan ($191.6 billion), an increase of 350 percent compared with 2020.

Overall, China is proactively advancing green technology to support its high-quality development through robust ecological and environmental protection, serving as a positive example for other countries in the Global South. And this can also be a realistic pathway to realize the philosophy of "Beyond GDP".

BUSINESS

Trip.com vows investment for tourism push

Travel portal to invest 15 bln yuan over 5 years to attract more foreign visitors

By LI JING
lijing2009@chinadaily.com.cn

Trip.com Group will invest 15 billion yuan ($2.2 billion) over the next five years to promote China as a travel destination globally, betting that a post-pandemic rebound in global travel demand and expanding visa-free access can turn the sector into a major growth driver for both the company and the world's second-largest economy.

The investment — announced on Monday by Liang Jianzhang, co-founder and executive chairman of the board at Trip.com Group, at an industry conference in Guilin, Guangxi Zhuang autonomous region — will fund overseas advertising campaigns, influencer marketing, destination promotions and international partnerships aimed at attracting foreign visitors to China.

The company also set a target of bringing 200 million international visitors to China over the next five years.

"We used to sell Chinese products to the world. Now it is time to sell China's services and experiences to the world," Liang said.

The move comes as China is doubling down on services exports, with policymakers having embedded "encouraging and supporting services exports" into the Government Work Report as a key task for this year.

China's travel services exports surged 32.3 percent year-on-year to 105.35 billion yuan in the first quarter, the fastest growth among all services export categories, said the Ministry of Commerce.

Inbound tourism has been boosted by waves of measures spanning visa facilitation, payment convenience and streamlined departure tax refunds. China has expanded unilateral visa-free access covering 50 countries and introduced a 240-hour transit visa-free arrangement covering 55 countries at 65 ports. In the first quarter, foreign nationals made roughly 8.32 million visa-free entries into China, representing an increase of 29.3 percent year-on-year, official data revealed.

Industry analysts said the strategy is also closely aligned with the company's own international expansion ambitions.

The company reported revenue of 62.4 billion yuan in 2025, up 17 percent year-on-year. International bookings on its overseas platform Trip.com grew about 60 percent year-on-year, while the company served approximately 20 million inbound travelers during the year, according to company disclosures.

The company does not separately disclose revenue from inbound tourism, but management has identified cross-border travel as one of its fastest-growing businesses. The company has spent heavily in recent years building brand awareness for Trip.com in overseas markets.

Analysts said attracting more foreign visitors to China would not only increase transaction volumes across hotels, flights and attractions, but also strengthen Trip.com's position against global online travel agencies such as Booking Holdings and Expedia Group.

To improve the visitor experience, Trip.com has worked with more than 8,000 attractions to make ticket bookings available to foreign travelers, expanded multilingual services and introduced airport assistance programs for overseas visitors.

But despite the strong recovery, challenges remain.

Tourism executives at the conference said language barriers, uneven service standards and limited international awareness of many Chinese destinations continue to constrain growth. Liang also pointed to opportunities to develop more internationally appealing entertainment, events and cultural experiences to boost spending by overseas visitors.

The United Nations World Tourism Organization estimates global international tourist arrivals reached 1.52 billion in 2025, surpassing pre-pandemic levels. The Asia-Pacific was among the fastest-growing regions, providing a larger pool of potential visitors for China.

For the company, the 15 billion yuan investment represents a long-term bet that China's tourism sector can become a stronger export industry for services, as foreign visitors increasingly seek experiences ranging from high-speed rail and digital payments to cultural heritage sites and natural attractions.

"China has unique advantages in tourism," Liang said. "As a Chinese company, we have a responsibility to help the world discover them."

Visitors gather at Trip.com's booth during a tourism expo in Shanghai on May 26. The company has set a target of bringing 200 million overseas visitors to China over the next five years. PROVIDED TO CHINA DAILY

Bayer opens new innovation, cooperation hub in Jinan

By ZHAO RUIXUE in Jinan
zhaoruixue@chinadaily.com.cn

Bayer expanded its China Center of Innovation and Partnership (CCIP) to Shandong province on Wednesday, nearly two years after launching its flagship hub in Shanghai.

The expansion advances the CCIP's "in China, for the world" concept, betting on the country's fast-expanding consumer health market fueled by rising wellness awareness and supportive government policies for medical innovation.

At the inauguration ceremony of the CCIP in Jinan, Shandong, Bayer signed cooperation agreements with the Shandong Institute for Food and Drug Control, Jewim Pharmaceutical (Shandong) Co Ltd and Shandong Freda Biotechnology Co Ltd.

"China is the number two market in our global consumer health business, and it is a very dynamic market. Innovation plays a very important role within China," said David Evendon-Challis, president of global research and development and chief scientific officer of Bayer Consumer Health. "We continue to invest in our brands, our science, our innovation and our manufacturing and supply chains in China."

The company is investing in a new factory that will be put into operation in 2028, with construction scheduled to finish this year. The facility will enable Bayer to steadily expand and launch new products.

Built around the CCIP framework, Bayer has established an innovation ecosystem spanning consumer insight analysis, joint research, scientific verification and commercial conversion, creating a bridge for bringing achievements to international markets.

One example is a joint product developed with Sirio Pharma Co Ltd based in Shantou, Guangdong province, which has already been rolled out in China and is poised to enter overseas markets such as Australia.

Last year, Bayer generated 3.47 billion euros ($4 billion) in sales from China, and the company anticipates the consumer health market will continue to grow consistently over the next several years.

"We see a balance shifting from treatment products to prevention and daily care," Evendon-Challis said.

He also noted a huge increase in e-commerce and digital commerce, with artificial intelligence and large language models helping people make choices.

Karen Hackney, vice-president of dermatology research and development at Bayer Consumer Health, said that skincare is evolving from beauty into a key health segment, driving sector growth.

"Aging populations and social media influence fuel market expansion, with skin barrier research standing as a core innovation priority for the division," she said.

Li Xiaomeng, head of R&D at Bayer Consumer Health China, explained the rationale behind choosing Shandong as the second CCIP hub after Shanghai.

"Shandong is China's second most populous province and the third-largest economy," Li said. "We need a population base as we serve consumers and want to reach more people."

The province is also home to top-tier hospitals, including Qilu Hospital, whose gastroenterology department ranks among the best in the Asia-Pacific region. "This provides a strong foundation for collaborative product development and clinical efficacy research," said Li.

Thorsten Umland, vice-president of digestive health R&D at Bayer Consumer Health, emphasized the importance of trusted partnerships in innovation.

"One example is how we worked with Jewim, a partner in Shandong, who sat down with us to improve the product and make manufacturing more efficient. They weren't just a contract manufacturer. They helped us make the product better and develop it further," he said.

Quite the stretch

Anta, Zxmoto enter co-branded merchandise deal

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

Chinese sportswear maker Anta Sports Products Ltd has announced a strategic partnership with domestic motorcycle brand Zxmoto, positioning itself as the latter's global strategic cooperation brand.

Under the deal unveiled earlier this week, Anta will support Zxmoto at international racing circuits, including world-class motorcycle events, and debut a co-branded line of athletic footwear and apparel.

The collaboration coincides with Zxmoto's recent racing triumphs. In March, the brand claimed both podiums in the WorldSSP category at the World Superbike Championship (WSBK) Portuguese round, a milestone for a Chinese motorcycle manufacturer in a competition historically dominated by European, US and Japanese brands. By May, at the Czech round, Zxmoto had secured its fifth championship victory of the season.

Anta said that the partnership reflects its broader strategy of bolstering Chinese sports brands and supporting domestic industry growth.

The first co-branded collection draws inspiration from Zxmoto's championship-winning 820RR bike. Design elements such as the "Champion Red" color and the winning number "53" are featured prominently across jackets, footwear and apparel.

In Anta's Tmall flagship store, the line is front-and-center. Prices start at 299 yuan ($44.13) for short-sleeve t-shirts and 469 yuan for racing-style shoes.

According to Anta, the collection aims to translate Zxmoto's racing success into wearable sportswear for consumers, creating a tangible link between domestic technological achievement and lifestyle branding.

The Anta partnership signals a growing trend of Chinese brands leveraging each other's reputations to gain global recognition, underscoring the country's shift from "Made in China" to "Created in China" narratives in global manufacturing.

The partnership comes as Anta pursues international expansion. The group recently launched its first direct-operated flagship store in Los Angeles, marking a significant investment in North America.

The move is part of Anta's broader three-year plan, which includes opening 1,000 stores across Southeast Asia, entering Middle Eastern markets and expanding into major international retail channels such as Foot Locker and DSG in North America and Europe.

Despite the marketing push, early consumer feedback has raised questions about the co-branded products' design.

Zhang Duo, senior editor at Motorcycle magazine, hailed the partnership as a win-win for the two influential Chinese brands. But he added: "Though the collection leverages Zxmoto's racing heritage, the apparel lacks the technical design features and fashionable cuts typically expected in motorsport collaborations."

Zhang made a comparison with co-branded offerings in Formula 1 and said other motorsports markets often feature more refined design execution.

Zxmoto currently partners with more than 40 companies, ranging from domestic giants like Eastroc Beverage, DJI, Midea and Honor, to international suppliers including Pirelli, Shell and SKF.

Birkenstock bullish on growth potential of Chinese market

By HE QI in Shanghai
heqi@chinadaily.com.cn

German footwear brand Birkenstock sees China as one of its most promising growth markets, with the country becoming a key driver of its global business expansion.

With the Chinese market being a major driver, the company sees a 30 percent year-on-year growth in its revenue in the Asia-Pacific region, which accounts for 12 percent of its global total, Jochen Gutzy, chief communications officer of Birkenstock, told China Daily in a recent exclusive interview.

Jochen Gutzy

Gutzy said Birkenstock is bullish on China's long-term consumption potential. "We are here to stay and build a sustainable business," he said.

Birkenstock's global setup covers three major global markets — the Americas; Europe, the Middle East and Africa; and APAC.

"APAC is the largest of all three regions when it comes to the market potential," said Gutzy, adding that though the Americas remain its largest single market, the APAC region delivers far stronger growth momentum, which is still in its early development stage, with China retaining massive untapped market space.

Tiffany Wu, managing director of Birkenstock Greater China, said: "We used to focus heavily on our online business in China. However, over the past two years we have accelerated our offline store expansion to reach broader consumer groups. The unique value of our anatomically designed footbed can only be fully perceived through in-store experience, which cannot be fully conveyed via online channels."

Wu said every newly opened Birkenstock store in China can hit official sales targets within six months. The brand now operates six stores in Shanghai, with a clear expansion roadmap covering coastal core cities and lower-tier inland markets.

Domestically, Birkenstock's consumer group has become significantly younger, with 18 to 25-year-old buyers emerging as the major growth force. Unlike trend-chasing consumers, young Chinese shoppers prioritize brand heritage, functional value and exclusive immersive experience over fleeting fashion fads.

Gutzy stressed that Birkenstock's steady organic growth in China is driven by cultural resonance rather than intensive marketing investment. "The cultural fit between the brand and the Chinese market is even stronger than it was in the US back then," he said.

Strict German manufacturing standards have also brought structural capacity constraints to the brand's Chinese business. "Demand has always grown faster than capacity since I joined in 2012, so we were always sold out," Gutzy said.

To ramp up its market penetration in China, Birkenstock launched a four-day pop-up exhibition celebrating the 50th anniversary of its iconic Boston clog in Shanghai from May 28 to Sunday.

Nestled in a historic 1939 building on Shanghai's Changle Road, the "House of Boston" exhibition showcased the company's five-decade evolution through archival displays, original German manufacturing equipment and documentary works by renowned photographer Henry Leutwyler. The Boston clog's multi-scenario, all-age inclusiveness fits well with China's family-oriented consumption ethos, the company said.

The anniversary pop-up served as a key offline experience for the brand's localized strategy. By showcasing its original manufacturing craftsmanship and the history of product iterations, Birkenstock aims to highlight its core technological advantages over other similar products in the market.

The brand intends to further tap China's market potential, adhering to steady, high-quality channel construction and sustainable growth instead of blind aggressive expansion, Gutzy said.

Optimizing AI for real-world scenarios

Platform helps address gap between emerging tech, practical implementation

A visitor photographs a live-line operation robot at China Southern Power Grid's stand during the 2025 World AI Conference in Shanghai on July 28. CHEN HAOMING / XINHUA

BEIJING — Chinese artificial intelligence researchers have released an open-source framework and a real-world scenario competition platform that significantly improves AI industrial application.

As AI computing power grows stronger and large language models become increasingly sophisticated, Chinese researchers have been focused on how best to apply the fast-growing technology to real-world scenarios.

To this end, a research initiative at the artificial intelligence innovation center at the Yangtze Delta Region Institute of Tsinghua University standardized human-machine interactions, task-set mechanisms and human feedback systems, resulting in enhanced industrial application efficiency and greater enterprise deployment.

The team leader said that the global AI sector currently faces a structural contradiction: the exponential growth of model and tool capabilities versus the linear climb in industrial adoption rates. The core contradiction in AI development has shifted from "enhancing model intelligence" to "bridging the deployment gap".

To address the gap between AI capabilities and real-world deployment, the team released the Real World AI open-source framework, expanding the scope of open-source efforts from code and tools to encompass role definitions, workflow design, human-machine interaction and human-human collaboration as an integrated practice.

The framework reconstructs the interaction between AI and humans in real-world tasks through three core elements: restoring real-world task sets, capturing authentic human feedback from real interactions and standardizing human-machine interaction protocols.

The team said real-world tests have proven that RWAI outperforms traditional software development models in practical efficiency, actual effectiveness and resolution times, reducing pre-project validation timelines from two-to-three months to less than two weeks.

The team also launched its AI arena platform. Unlike traditional benchmarks or model leader boards, the platform focuses on evaluating the actual effectiveness of AI solutions in real business operations, including metrics such as organizational costs, time efficiency, computing costs and compliance requirements.

The platform adopts a "challenger-champion" mechanism, where competing entities are not single models, but complete solutions, encompassing team configurations, workflows, agent combinations and context engineering. The best-practice workflows corresponding to winning solutions will be made public and available for replication.

China Southern Power Grid's internet service subsidiary utilized the RWAI platform to address the end-to-end safety management challenges of power grid infrastructure projects, ranging from planning to on-site execution. Faced with complex compliance requirements, traditional manual supervision on infrastructure projects had reached an efficiency bottleneck.

Using the platform, the company developed an intelligent risk control solution for on-site and subcontractor management, increasing hidden risk detection rates by approximately 40 percent and boosting risk warning accuracy to 92 percent. The company and research team are now preparing to advance a demonstration project for generative AI across the full lifecycle of construction planning.

The company's senior engineer Hu Rui said the RWAI platform has successfully bridged the gap between AI technology and deployment, while significantly reducing trial-and-error costs. The system has transformed engineering management from reactive response to proactive intelligent control, using AI to support high-quality power grid construction.

Jiangsu Eastern Shenghong has also used the RWAI platform. As a petrochemical manufacturer, it has long-faced challenges such as integrating knowledge in traditional process industries, applying general-purpose AI to core business operations and a lack of controllability in decisionmaking by large language models.

Leveraging the RWAI platform, Eastern Shenghong integrated 30 years of production process knowledge with data from the full industry chain, overcoming the high-compliance barriers to build an industrial large model that truly understands the business.

Through multimodal fault monitoring and prediction, the company has significantly reduced unplanned downtime on key production lines and can dynamically recommend optimal production scheduling, achieving cost reductions, efficiency improvements and process optimization.

Yang Tianwei, vice-chairman of the company and general manager of its AI business unit, said that by using the RWAI platform's evaluation capabilities, they have transformed internally validated, high-quality model capabilities into a library of reusable, billable and composable products.

"This not only activates Eastern Shenghong's own intelligent development, but also provides a field-proven and best-practice solution for deploying large models in the process industries," Yang added.

The RWAI platform now covers multiple application scenarios including industrial forecasting systems, document review, risk control and research report generation. Its implementations have already been deployed in projects for some Fortune Global 500 companies.

A staff member demonstrates how a robot can be controlled remotely at a mock power grid control unit at a lab of Guangdong Power Grid Co in Guangzhou, Guangdong province, on April 16. ANDY WONG / AP

The research team said that the platform will also supply real-world human-computer interaction data to support large language model development and academic research.

XINHUA

China's innovation edge in AI industries wins plaudits from global MNCs

A robot threads a needle at the World Intelligence Expo 2026 in Tianjin on May 28. ZOU HONG / CHINA DAILY

TIANJIN — In the embodied intelligence exhibition hall, a humanoid robot waved and interacted with visitors, drawing crowds of onlookers. A German guest, Andrea Rosinger, repeatedly raised her phone to capture the scene.

Rosinger was in China attending the recent 2026 World Intelligence Expo in Tianjin.

Having worked in the field of digital technologies for decades, Rosinger is interested not only in the robot itself, but also in how robots and humans may work together in various fields in the future.

About 20 years ago, when Rosinger first came to China, she was involved in software development and digital solutions for businesses. Back then, digital transformation was a goal many companies were striving to achieve.

Today, she sees artificial intelligence driving industrial transformation at an unprecedented pace.

"At this expo, we can see the integration of AI and robotics across many fields, such as healthcare and manufacturing. My feeling is that China is leading the industry in robotics and making rapid progress in AI," she told Xinhua News Agency.

Covering 130,000 square meters, the expo featured six themed exhibition halls and a comprehensive exhibition area focusing on AI core technologies, embodied intelligence, intelligent connected vehicles, low-altitude economy and commercial aerospace, intelligent manufacturing and smart living. More than 700 foreign companies and organizations from around the world participated in the event.

From large language models and humanoid robots to smart factories and the low-altitude economy, the latest technologies, products and application scenarios on display have turned the expo into a window through which international participants can see China's innovation vitality and future industrial development.

"China is not only a huge market, but also a major global engine of innovation and manufacturing," said Rainer Kern, regional chief financial officer and vice-general manager at Karcher China.

Attending the expo, Kern said he was particularly interested in understanding the future direction of AI technologies and how industrial infrastructure may evolve in the years ahead.

In his view, the pace of AI development has exceeded many people's expectations. "In the past, technological iterations often took three to five years. Today, things that seemed impossible just half a year ago have already become reality."

"AI can significantly shorten research and development cycles. Today, you can use AI tools such as DeepSeek to conduct market research much more efficiently, gaining insights into market conditions, customer demand, historical purchasing behavior and likely future market trends," Kern said.

As a global provider of resource-conserving cleaning systems, Karcher values China's comprehensive industrial supply chains, its ability to rapidly deploy new technologies and its vast market potential.

What attracts international companies to China is not only the size of its market, but also its dynamic innovation ecosystem and continuously expanding industrial capabilities.

Hendrik Kruger, general manager of X Control — a Hamburg-based company specializing in digital solutions for the cruise industry — traveled to Tianjin as part of a German business delegation in search of new partnerships.

"We are actively seeking cooperation opportunities with Chinese companies," Kruger said, expressing interest in working with Chinese cruise operators to explore broader cooperation opportunities.

For Kruger, AI has already become deeply integrated into virtually every aspect of business operations. From software development, quality assurance and cybersecurity management to customer services and operational analytics, AI is helping companies improve efficiency and optimize decision-making.

"I am particularly impressed by the open-source approach adopted by many Chinese AI innovations," he said, adding that Chinese companies are actively promoting open ecosystems, and such openness is creating new possibilities for international cooperation.

A recent survey jointly released by the European Union Chamber of Commerce in China and consulting firm Roland Berger shows signs of improving confidence among European businesses operating in China. China's vibrant R&D ecosystem, vast talent pool, and rapid product commercialization capabilities are attracting a growing number of European companies to establish and expand their R&D activities here.

This trend is also evident in the field of AI.

As AI rapidly moves from technological breakthroughs to industrial applications, more European companies are viewing China as an important destination for understanding future technological developments and Chinese companies as innovation partners, said Jens Eskelund, president of the European Union Chamber of Commerce in China.

Samples to enable studies on conceiving in space

SHENZHEN — Mouse embryo material brought back to Earth aboard the Shenzhou XXII return capsule is expected to provide a theoretical foundation for future research on conceiving life during long-term human space habitation.

The Shenzhou XXII successfully made it back from the Tiangong space station on May 29. The cultured embryo material was among science samples brought back as part of a project undertaken by a research team from the Chinese Academy of Sciences' Shenzhen Institutes of Advanced Technology.

According to SIAT, the experiment aims to explore developmental patterns of mammalian pre-implantation embryos in a space environment, including the key mechanisms underlying mitochondrial damage and epigenetic modification abnormalities in embryos.

Led by a senior researcher, Lei Xiaohua, from the center for energy metabolism and reproduction of SIAT's Institute of Biomedicine and Biotechnology, the team performed the in-orbit culture of mouse embryos, at various developmental stages, using a biotechnology experiment cabinet on the space station.

"Given the strict constraints on spaceship transfer and in-orbit resources, the core challenge of this experiment was how to achieve embryo culture and real-time imaging within limited space," Lei said.

The team collaborated with another SIAT team, led by Men Yongfan from the Research Center for Biomedical Optics and Molecular Imaging, to design an embryo microfluidic chip culture box. It featured two rows of six culture chambers. This design simultaneously met the needs of two experimental groups — each with three replicate experiments — and was compatible with the space station's automated culture system.

After ground-based verification tests, the team established a complete experimental system for mammalian pre-implantation embryo culture, imaging, perfusion fixation, and cryopreservation suitable for the space station.

The team confirmed that in-orbit embryo development images were successfully captured, and that embryo development, as well as fixation and preservation conditions, were optimal.

In the early morning of May 30, live science experiment samples retrieved from the Shenzhou XXII return capsule were transported to the Technology and Engineering Center for Space Utilization of the Chinese Academy of Sciences in Beijing via specialized refrigeration equipment.

In future research, Lei's team will conduct systematic comparison and integrated analysis of the returned samples and ground-based control samples, including developmental phenotype statistics, specific protein molecular staining, high-resolution chromatin three-dimensional imaging, and multi-omics sequencing.

The research will provide key data when determining space's influence on zygotic genome activation stage and whether the space environment can support normal early development, thereby deepening our understanding of the initial developmental patterns of mammalian life in the space environment, he said.

Lei has earlier participated in two major space embryo experiments of the country. In 2006, a Chinese research team achieved real-time imaging of space embryos from the ground for the first time via the Shijian 8 satellite.

In 2016, China's Shijian 10 satellite carried early mouse embryos into space, for the first time achieving the complete development in space of mouse embryos from the 2-cell stage, an early-on embryonic cleavage stage, to blastocyst, the stage where noticeable cell differentiation occurs.

Sinologists sign up

An international sinologist writes Chinese characters with a calligraphy brush during the 3rd World Conference of Sinologists in Dunhuang, Gansu province, on Wednesday. The event, themed "Pooling Wisdom of Civilizations to Jointly Address Challenges of Our Times", gathered over 300 representatives from nearly 70 countries. Alongside the conference, activities like "Be a Chinese for a Day" and academic salons showcased the charm of Chinese culture. TIAN QI / FOR CHINA DAILY

Action plan unveiled to stabilize employment

Govt lists measures to shield jobs from external shocks and boost incomes

By LI LEI
lilei@chinadaily.com.cn

China has unveiled an 18-point action plan to stabilize employment and raise incomes, including measures designed to shield the labor market from external shocks such as trade wars and geopolitical tensions, according to a government document released recently.

The plan, titled "Action Plan for Stabilizing Employment, Expanding Capacity and Improving Quality", was approved on April 30 by the State Council's leading group on employment promotion.

"Employment is the most fundamental aspect of people's livelihoods," the document said.

The action plan includes a dedicated section on supporting industries affected by the external environment to expand hiring, identifying them as a key source of job creation.

Authorities are instructed to extend unemployment insurance premium refunds, skills-training subsidies and job-expansion grants to sectors affected by global headwinds.

The central government will also use major trade fairs such as the China Import and Export Fair to explore new markets while deepening cooperation under the Belt and Road Initiative as an alternative to Western-dominated trade channels.

The plan explicitly calls for the creation of cross-border service jobs in research, design and inspection, reflecting shifts in offshore outsourcing. It also establishes a monitoring mechanism to track the impact of external shocks on hiring in key regions and industries, with contingency plans to enable rapid responses.

Beyond geopolitics, the plan relies on manufacturing and emerging technologies to generate employment opportunities.

Authorities will maintain a "reasonable share" of manufacturing jobs and promote orderly industrial transfers to central, western and northeastern China.

They will also launch an "Artificial Intelligence Plus" initiative to accelerate the digital transformation of factories, creating demand for data labelers and AI trainers.

New energy, advanced materials and low-altitude infrastructure projects are also identified as major sources of employment.

The plan calls for retraining programs to help workers in traditional industries adapt to the adoption of AI, with the aim of preventing job losses.

To reinforce a virtuous cycle of rising household incomes and domestic demand, the action plan seeks to boost consumption through cultural tourism venues linked to performing arts, sports, cuisine and winter activities.

Urban renewal and new infrastructure projects will also be used to create construction jobs, supported by a special employment loan program for the sector.

In social services, the plan expands eldercare and childcare capacity, including exploring a professional qualification system for providers of elderly care.

A nationwide pilot program for occupational injury insurance will cover new forms of employment, such as drivers for ride-hailing platforms, reflecting the continued growth of the gig economy.

The document also strengthens minimum-wage adjustment mechanisms, enhances oversight of wage arrears and illegal employment agencies, and streamlines procedures for business registration and unemployment assistance.

Employment impact assessments will be required for major projects and policies, signaling that job stability has become a cross-cutting priority for policymakers.

The Ministry of Education estimates that the number of new college graduates will reach a record 12.7 million in 2026, an increase of 480,000 from the previous year.

To help absorb them into the labor market, the action plan directs State-owned enterprises to increase campus recruitment by more than five percentage points compared with the previous year's level.

The new measures are part of China's broader push to build an "employment-friendly" development model, a concept first introduced in the nation's 15th Five-Year Plan (2026-30) and reaffirmed in this year's Government Work Report.

On the sidelines of the annual legislative meeting in March, Minister of Human Resources and Social Security Wang Xiaoping signaled a campaign to stabilize, expand and upgrade employment.

She outlined measures including supporting labor-intensive sectors such as foreign trade, construction and hospitality; tapping job potential in the digital economy, high-end manufacturing and modern services; and improving minimum-wage mechanisms, labor market regulation and protections for migrant workers' pay.

"The ministry is studying relevant measures to actively harness AI's role in creating new jobs and empowering traditional roles, advancing inclusive development that aligns technological progress with improvements in people's livelihoods," she said.

China has set a target of creating more than 12 million new urban jobs in 2026, in line with its GDP growth target of 4.5 percent to 5 percent this year.

Rolling optimization chip enhances smart machine capabilities

By ZHOU WENTING in Shanghai
zhouwenting@chinadaily.com.cn

Researchers from Shanghai-based Tongji University have unveiled their independently developed first-generation specialized computing chip for rolling optimization, called the Moving Horizon Unit, which functions like an intelligent brain for autonomous vehicles, robots, drones and other smart machines.

The research team said the chip enables intelligent devices to observe their surroundings, process information and adjust their actions in real time. The technology is expected to support the development of smart transportation and advanced intelligent equipment.

Chen Hong, a lead scientist on the project, said rolling optimization is a capability humans use naturally, continuously adjusting actions based on changing conditions and feedback to achieve a goal.

In complex and constantly changing environments, autonomous vehicles, robots and drones must continuously detect changes around them, plan their next moves and make decisions in real time. These tasks can be difficult for conventional general-purpose chips.

"Our research aims to transform the human capability of adapting to environmental changes and uncertainties in a proactive way into a machine-computable hardware solution," said Chen, a professor at Tongji University's College of Electronic and Information Engineering.

"By embedding this rolling optimization mechanism into a specialized chip, we enable vehicles to drive autonomously and robots to make independent decisions without relying on pre-set programs," he said.

Drawing on three decades of experience in integrating algorithms with hardware, the team developed a specialized computing architecture for rolling optimization and holds fully independent intellectual property rights to the technology.

According to Chen, the architecture includes several innovations. One allows the chip to predict possible future conditions and evaluate different options directly within the hardware, helping devices make decisions more efficiently. Another combines artificial intelligence with the laws of physics, enabling machines to learn and adapt with less dependence on massive amounts of training data.

"We have already developed an onboard controller and conducted real-vehicle integration tests," Chen said.

Researchers said the chip's core module can be customized for specific applications while also being integrated into a variety of chip systems, enabling it to be adapted for different uses.

At the chip's launch event on May 29, Frank Allgower, former president of the International Federation of Automatic Control, said rolling optimization has long been recognized for its advantages but has been difficult to apply widely because it requires substantial computing power.

"This new chip reduces these burdens, simplifying implementation and opening up possibilities for previously challenging systems and scenarios," said Allgower, who is also a professor at the University of Stuttgart in Germany.

Researchers said the chip has successfully passed real-world tests in intelligent vehicle control, evidencing its technical feasibility.

The team plans to continue upgrading the chip, expand joint research and development with industry partners and accelerate its use in fields including intelligent manufacturing, industrial control, new energy and robotics.

Attendees at the launch event also watched demonstrations at the university's testing and evaluation base for intelligent and connected vehicles. During the demonstrations, vehicles equipped with the chip performed maneuvers including serpentine driving and lane changes in a range of scenarios.

Fungus haggling

Merchants discreetly negotiate fair prices for Chinese caterpillar fungus, making offers with their hands hidden, at a market in Xining, Qinghai province, on Thursday. China-led intl standard issued for monitoring of karst ecosystems

By LI MENGHAN
limenghan@chinadaily.com.cn

The International Organization for Standardization has issued the world's first international standard for karst critical zones, marking a major step toward unified monitoring of these fragile yet vital ecosystems worldwide.

The standard, titled Specification of Monitoring Technology for Karst Critical Zones, was developed under China's leadership with the participation of experts from Austria, Canada, Iran, Russia, Saudi Arabia and Serbia.

"The karst critical zone is a special hydrogeological structure formed by the dissolution of soluble rocks by flowing water, extending from the vegetation canopy to groundwater circulation," said Bai Bing, a research assistant at the Institute of Karst Geology of the Chinese Academy of Geological Sciences under the China Geological Survey, who participated in the development of the standard.

"It is an important and unique system widely distributed around the world, covering about 22 million square kilometers, or roughly 15 percent of the earth's land surface," Bai said.

He highlighted the importance of karst critical zones in supplying water to about one-quarter of the world's population. However, he noted that surface water in karst regions is vulnerable to infiltration losses and contamination, affecting both water quantity and quality.

In addition, karst critical zones face challenges like geological disasters, poor soil fertility and rocky desertification, which the international scientific community believes can only be addressed through a deeper understanding of these systems.

Drawing on the distinctive characteristics of different countries, the standard builds on China's years of research in karst water resource management, ecological restoration, carbon cycle studies, and disaster prevention and mitigation.

For the first time, the standard provides a systematic classification of karst critical zone types based on climate conditions. It also identifies key hydrological, geochemical, and biological processes to improve understanding of the zones' structures, regional differences and environmental evolution trends, supporting efforts to address resource and environmental challenges.

The standard also provides specific guidance on monitoring procedures and carbon sink calculations, including detailed instructions on data collection, transmission, storage, processing, quality control and sharing.

"The karst critical zone plays an important role in the global carbon cycle. Establishing a unified monitoring framework can improve the efficiency of data management and services, which is crucial for the accuracy and reliability of environmental assessments and for promoting collaborative efforts in karst critical zone management," said Zhang Cheng, a researcher at the Institute of Karst Geology who led the development work.

Zhang, who is also executive deputy director of the International Research Center on Karst under the Auspices of UNESCO, said the standard will contribute to China's "dual carbon" goals — peaking carbon dioxide emissions before 2030 and achieving carbon neutrality before 2060 — as well as the UN Sustainable Development Goals related to clean water, climate action and life on land.

"The release of this standard represents a major breakthrough in China's deep participation in global geological governance, reflecting strong international recognition of China's scientific research capabilities, technical expertise and industrial influence in the field," he said.

He added that China will continue to contribute its expertise to the sustainable management of global karst critical zones.

CHINA

Aging population triggers demand for 'senior toys'

Market grows for products that help reduce loneliness, support rehabilitation

By LI HONGYANG
lihongyang@chinadaily.com.cn

China's rapidly aging population is fueling a new consumer trend for "senior toys". With over 300 million citizens aged 60 or older, families are increasingly turning to specialized games, puzzles and therapeutic toys to combat cognitive decline and elderly isolation. However, industry insiders warn that the emerging market is still failing to meet the complex needs of older adults.

Guo Xiafei used to think her grandmother was fine living on her own. But during her rare home visits to Chengdu, Sichuan province, Guo noticed her grandmother's loneliness, filled with long hours of television, naps and silence.

"My grandpa can find joy in music. He plays the *erhu* and the bamboo flute, but my grandma's life is much more monotonous. I realized I've grown up, and it's time to look back," the 27-year-old said.

That realization led her to search for something that could bridge the distance. That's how she found senior toys.

To Guo's delight, after playing with a bead sorting and tweezing toy, her grandmother broke into a childlike smile, hugged and thanked her.

The 82-year-old, who has severe hearing loss, usually required the family to shout into her ear. Yet, sitting side by side with her granddaughter and taking turns playing a whack-a-mole game, her face was full of laughter.

"She told me the toys are so wonderful. That warm family vibe is the real point of the toy," Guo said.

For decades, China's massive toy industry focused exclusively on children. Now, e-commerce platforms are flooded with hundreds of products marketed as elderly toys — ranging from no-pick-up table tennis sets and color-sorting games to memory books and grip balls.

On the product pages, stores say the toys are designed to kill time and keep minds sharp.

Guo discovered them by accident while scrolling online.

"I saw a table tennis set with no need to pick up the ball. Since my grandmother needs help while walking outside and spends most of her time indoors, I thought: why not bring the fun inside?

"I wanted to let them experience a bit of what we young people are into. That's where it all started," she said.

However, she quickly learned a lesson that no product description can teach.

"If I give them a toy and walk away, they won't play. They are like children. They need someone beside them and simple interaction.

"When I was little, they played with me. Now I play with them," Guo said.

Like Guo, a growing number of families are turning to toys not just for entertainment, but as tools for connection and cognitive care.

Besides medical treatment, Chu Yue provides toys for her 66-year-old mother, who has developed symptoms of memory decline.

The 41-year-old from Daqing, Heilongjiang province, said: "My mother had even gotten lost inside her own neighborhood. She was worried that she might have developed dementia."

Chu went online and typed a simple search: "Toys to prevent dementia for the elderly."

What appeared was a flood of cheap, simple products on shopping platforms. She picked a string puzzle — a small board with holes and tangled cords — priced at less than 20 yuan ($2.93). The goal is to untie the knots and free the strings by moving them through the right holes.

"At first, my mother thought it would be too hard. So I showed her," Chu said. "Then she tried herself and realized that as long as she is patient, she can always solve it."

Within days, her mother was demanding more challenge.

From top: Chu Yue's mother trains her mind with a string puzzle game. Guo Xiafei's grandmother trains her motor skills with a tweezing toy.
PHOTOS PROVIDED TO CHINA DAILY

"She told me to tie it tighter, twist it a few more rounds, and make it harder for her," Chu said.

The toy's appeal lay in its simplicity. Her mother soon started playing for hours. Then she asked Chu to buy the same toy for her elder sister.

"My aunt loved it too. And then she started playing with her own family, setting puzzles for each other. It brought the whole household together. Activities like watching TV are just input with no interaction. But with this toy, her brain is working," Chu said.

Yet, while such toys help some, others face more complex needs that off-the-shelf products fail to meet.

After a cerebral infarction affected her grandfather's speech and mobility, Tan Mengqian, 32, got creative. Her grandfather, a retired professor from Tai'an, Shandong province, could no longer walk steadily or communicate clearly.

"I needed to find things he could do with his hands while sitting down," Tan said. She started with large-print books and picture books, which he enjoyed. But she wanted more than just a pastime.

She then turned to the internet, searching for "toys for the elderly with dementia".

What she found were sensory touch toys for children. "He would touch and play with them to help develop his tactile perception," she said. But engagement was limited. "He couldn't get overly absorbed in it. He might play for half an hour, then not play seriously anymore."

The core problem is a lack of suitable products for those with more advanced needs, she said.

"The elderly toys I find on online shopping platforms are not right for his situation. We need something that uses the hands but doesn't require fine, detailed movements."

For Tan, the ultimate solution wasn't found in a shopping cart.

"They don't fundamentally solve our problem. The core need still has to be met through companionship," she said.

The current market for senior toys often misses the mark, Ma Dafei, general manager of a Zhejiang toy company, told Tide News, a Zhejiang-based online media outlet, in January.

"Many products are just children's toys made larger, with colors and themes that don't resonate with older adults," he was quoted as saying, adding that they fail to address what seniors truly need or enjoy.

He said that toys for seniors should be designed to support health and social connection. A toy for a lively retiree is completely different from one for someone who is homebound. The market is still in its early phase, lacking this crucial segmentation.

"Many people simply don't realize that seniors can benefit from toys, or how play can support healthy aging," Ma said to Tide News, adding that this awareness gap has left a market need largely unmet.

Elderly scout for age-friendly products to combat signs of cognitive decline

By LI HONGYANG

China's booming market for toys tailored for senior citizens was underscored in a recent survey by Shanghai's Minhang District Consumer Rights Protection Committee, signaling a major shift in the nation's silver economy.

Reported by China Consumer News, the findings show that nearly 70 percent of seniors are actively seeking age-appropriate products designed to stave off cognitive decline, maintain physical dexterity and combat isolation. The surge in interest has prompted calls for official "age-friendly" product certifications and standardized difficulty ratings.

A third of those seeking information turn to community or senior activity centers and online shopping platforms. Offline retail stores also play a key role for about 20 percent of elderly consumers, according to the survey.

Notably, recommendations from family and friends, along with short video and social media platforms, are emerging as influential channels.

Affordability is a major consideration, as more than 70 percent of respondents prefer toys priced under 100 yuan ($14.65), with the most popular price point being below 50 yuan. However, a segment of consumers demonstrated willingness to invest in higher-quality products they find particularly appealing.

In terms of product types, creative handicraft toys are the most favored, followed closely by hands-on assembly kits and puzzle and board games. The primary motivation for purchase is clear: over 70 percent seek to exercise the brain and prevent cognitive decline, while activities to maintain hand mobility and provide light physical exercise are also important factors for a significant portion of seniors.

The survey also highlighted that ease of use is considered the most important product feature, with over 70 percent of respondents emphasizing "simple and easy-to-use operation".

Meanwhile, over 40 percent cited "reasonable price and good value" and a similar proportion prioritized "safe, nontoxic and reliable materials" as fundamental requirements in their purchasing decisions. These findings underscore the strong emphasis older consumers place on usability, affordability and safety.

Respondents also expressed clear expectations for a user-friendly and safe design that genuinely considers the needs of the elderly.

Seniors' preferences for challenge levels vary but lean toward "moderately challenging". After experiencing the toys on-site, participants had different perceptions of the difficulty. It is recommended that toy difficulty be graded so that individuals can choose an appropriate challenge level based on their own situation.

A strong majority — over 75 percent — expressed a desire for toys that facilitate social interaction.

The survey also indicated strong trust in quality certifications, with clear support for the introduction of a dedicated "age-friendly toy" label to guide consumers toward products that are safe, user-friendly and cognitively beneficial.

In light of these insights, the committee has proposed the development of dedicated certification standards encompassing safety, usability and efficacy. It further recommended the introduction of a scientifically calibrated system to categorize products based on difficulty level and functional purpose.

At the same time, companies are encouraged to develop product designs that foster social interaction and intergenerational integration, to better meet the needs of this growing market.

CULTURE

Little Red Fox and White Fox, the central characters of Yang Zhi's *The Fox's Transformation Chronicle*.
PHOTOS PROVIDED TO CHINA DAILY

DRAWING BEYOND THE LINES

Two comics artists follow different paths for personal storytelling and the freedom to create without compromise, **Bai Shuhao** reports.

Above left: Cy leads a workshop at the festival, introducing participants to the fundamentals of composition and visual storytelling. **Above right:** Yang Zhi creates a live illustration at the 10th French Comics and Graphic Novels Festival. **Below:** Female workers in Cy's *Radium Girls*, whose health is damaged by prolonged exposure to radium while working at a watch factory.

At the 10th French Comics and Graphic Novels Festival in Beijing this May, two young women wearing glasses sat side by side, though they appeared to come from entirely different worlds.

One was Yang Zhi, a Chinese cartoonist with shoulder-length black hair and a quiet, studious air. The other was French comics artist Cy (Cyrielle Evrard), whose cropped hair and understated style carried the effortless cool of a heroine from a late-night French film.

Yang draws on a digital tablet. Cy prefers colored pencils. One tells stories rooted in Chinese fox-spirit folklore; the other resurrects forgotten industrial tragedies from American history.

Their artistic styles couldn't be more different, yet their careers have followed remarkably similar paths.

At nearly the same age, both women left stable jobs to pursue comics independently. Both built audiences online through social media and both eventually arrived at the same conclusion: they no longer wanted other people deciding what they were allowed to create.

Socializing a fox

"When I dropped everything else and focused entirely on comics, that was when I felt happiest," Yang says.

Two years ago, she began publishing an online comic titled *The Fox's Transformation Chronicle*. The story follows a young fox surviving alone in the wilderness before being rescued by an older white fox who teaches her the art of shape-shifting. By observing human desires, the fox learns to transform into the "ideal version" of whatever others expect — a process of cultivation on the path toward becoming a nine-tailed fox.

Told through the eyes of a mythical creature, the work explores gender, shifting power structures and social norms. It quickly attracted a loyal online following and was published in print in 2025.

Before that success, Yang worked as a storyboard artist for film and television productions, translating scripts into visual sequences. She entered the animation industry during a boom period for Chinese cinema and contributed to several major projects. Yet, after four years, she felt increasingly disconnected from her work.

"I draw every day, but not the things I actually want to draw."

That feeling became especially clear in projects involving fox spirits from Chinese folklore.

"We tend to imagine fox spirits as seductive, dangerous figures," she says. "Then, over time, they become harmless little creatures, or girls who need to be saved. But why is it that when a fox turns into a human, a female fox always becomes a woman and a male fox always becomes a man?"

The question lingered. Thinking about a cat she once observed — an animal unlikely to perceive beauty as humans do — she began wondering whether fictional foxes were simply being forced into the human's expectations of appearance and desire.

To tell a different story, she left her storyboard work behind and spent eight months creating *The Fox's Transformation Chronicle*. She never expected it to become popular.

"If I chase popularity, my choices become limited," she says. "I want to make what I want to make, not what other people expect from me."

That philosophy echoes the comic's narrative. At one point, the female fox transforms into a man and discovers freedoms unavailable in female form. She experiences the rewards of human ambition. However, at a banquet celebrating her political rise, she is served the white fox who first taught her to become human. At that moment, she realizes that no matter how perfectly she imitates what humans want to see, the effort is ultimately meaningless.

"Caring too much about what other people think is, to me, a false problem," Yang adds. Although the work is now being adapted into an animated film, she resists being described as especially "talented".

"Talent isn't something you can simply claim," she says. "If people resonate with the work, it spreads. If they don't, it doesn't."

Her next project will follow the same principle: expression first, persuasion never. She has little interest in convincing people of anything.

Radium Girls still glows

Cy's decision to leave her previous job came after an argument with her boss.

By then, she had already built a growing online audience by sharing sketches, unfinished comic pages and fragments of everyday life. Social media made the move into freelance work feel less like a leap and more like the natural next step.

"I'm not someone who hides away to create," she says.

She enjoys posting work while it is still evolving and hearing readers' reactions in real time. "As a freelancer, you have to use social media. Without it, things become very difficult."

The book she brought to the festival, *Radium Girls*, began with an article she discovered online. At first, she assumed the title referred to an American rock band. Later, she discovered the real story.

In 1918, at a clock factory in New Jersey, young women were hired to paint watch dials with luminous paint containing radioactive radium. They were instructed to "lick, dip, and paint" their brushes repeatedly, unaware of the danger. Over time, many developed severe illnesses — losing teeth, becoming paralyzed, and eventually dying. Their legal battles later helped shape some of the earliest worker protection laws in the United States.

Radium Girls retells that history. First published in France in 2020, it later appeared in North America in 2022 and China in 2025.

Cy was drawn to the story partly because it remains relatively unknown. These women, as she puts it, "disappeared into the smoke". But she was equally struck by how relevant the story remains today.

"Whenever scientists discover a new element or material that can be industrialized, workers are exposed first," she says. "At first there are one or two cases. Then, after many deaths, it becomes headline news. And then it disappears again, until the next material comes along."

To reconstruct the story, she immersed herself in archival research, reading victims' diaries, and studying the details of early 20th-century factories, down to industrial locks and machine parts.

Not all of Cy's work centers on historical events, but she intentionally engages with social themes. She believes artists should remain actively involved in society rather than stand apart from it.

In France, comics artists typically work as freelancers, a lifestyle that often brings financial instability. But for Cy, autonomy outweighs insecurity. It is one reason she has no desire to return to office work.

When publishers take on a project, they usually provide an advance against future royalties. If a book performs poorly, the author keeps the advance. If it succeeds, royalties are paid on top.

The arrangement, she says, allows creators to keep working without being financially crushed by a single setback.

"If a book doesn't sell well," she says pragmatically, "I just move on to the next one and find another editor."

At the festival's Beijing stop, Yang and Cy joined French comics artist Catherine Meurisse and Chinese comics artist Yu Kun onstage for a conversation with readers. One audience member asked whether commercial projects sharpen an artist's voice or slowly wear it down.

Neither Yang nor Cy seemed especially enthusiastic about working for others.

Yang says she has always wanted to tell her own stories, but struggled for years simply to begin. She recalls making bets with friends: if they failed to finish a script outline within a week, they would owe each other 50 yuan. "In the end," she says with a laugh, "we each ended up owing the other 500."

Cy says commercial projects often move in circles. An idea approved at the start can be revised repeatedly, only to return months later to its original form.

Recently, a new phrase has gained traction online: "one-person company" — the idea that a single creator can build an audience, produce work, and distribute it independently. Social media, AI tools and digital platforms have made that kind of independence feel increasingly attainable.

Both artists also offer advice to younger creators, drawn from their own experiences.

"When I want to make something," Yang says, "I don't calculate the cost first. I don't start by asking whether it will make money."

Cy echoes the sentiment: trust the value of your own work and never underestimate it.

Grandma's tales inspire Tibetan writer's new book

XINING — As Khandro Tsering watched his third-grade students' eyes light up while listening to him read aloud *Harry Potter and the Sorcerer's Stone* in vivid Tibetan, he was taken back to those happiest childhood memories of evenings spent immersed in folktales and legends gently told by his grandmother.

That moment inspired the young man from Qinghai province in Northwest China to write a fairytale book for children: a way to nurture imagination and learning while celebrating Tibetan culture and honoring the memory of his beloved grandmother.

Raised in a family in the Tibetan autonomous prefecture of Huangnan in Qinghai, the 32-year-old writer grew up without electronic devices, comic books or animation. Instead, he was surrounded by six gifted storytellers: his grandmother and her five sisters.

Stories of mountain deities and fearless young heroes filled his childhood. Beyond the magic of folklore passed down through generations, the tales also helped him make sense of the world around him.

"Through my grandmother's stories, I learned kindness, courage and a deep respect for life," says Khandro Tsering, who now teaches at a middle school in the Tibetan autonomous prefecture of Golog, Qinghai.

In his book, *The Story of Kunga Dondrup and Lotus Conch*, protagonist Kunga Dondrup is granted three wishes by the Lotus Conch. He first wishes for peace in the world, then for his mother to be saved, while leaving the third wish unspoken.

"I want young readers to understand that true happiness is not gained through greed, but by staying true to one's original purpose and embracing a greater love for the world," the writer says.

Continuing the storytelling traditions he inherited, Khandro Tsering weaves the landscapes of his homeland, everyday experiences and simple wisdom into his narratives. Loyal Tibetan mastiffs, sacred mountains and lakes, and even the rhythms of Tibetan poetry are carefully preserved in his work.

The book was written over six years in Tibetan before being translated into Chinese by the author himself. Striving to retain the language's original cadence and the deeper meanings of Tibetan proverbs, he says the process was challenging but worthwhile, allowing the story's warmth to reach readers in both languages.

From devoted listener to folklore collector and fairytale creator, Khandro Tsering's journey mirrors that of many young ethnic group writers in Qinghai.

Like countless children growing up in the province's Tibetan regions, he spent his early years reading local Tibetan literary journals and newspapers, learning the craft of writing, and participating in literary competitions organized by those publications.

One of the influential journals is "Sbrang char", meaning "dew" in Tibetan. Since its establishment in 1981, it has held a writing contest every three years and introduced special awards for emerging talents. To date, it has helped cultivate more than 60 prizewinning authors.

The development of ethnic literature is supported by State funding, says Palden, chief editor of Sbrang char. Every year, the Ministry of Finance provides special subsidies to publishing houses for compiling and publishing books in ethnic languages.

Today, Khandro Tsering's efforts extend beyond the written page. Last year, he traveled to more than 10 villages in his hometown, collecting folktales from local elders and transforming them into animated videos with Chinese and local Tibetan subtitles using AI tools.

"Many villagers could only remember fragments of these stories," he says. "I reimagined the missing parts in a fairytale style so that these nearly forgotten tales can once again become part of children's lives."

PHOTOS PROVIDED TO CHINA DAILY

The scent of emotional healing

As younger generations and urbanites face mounting stressors, the olfactory is shifting from consumer demand for commercial brand fragrances to empirically proven therapy, report **He Qi** and **Wang Xin**.

As a participant twisted a dried mugwort leaf between her fingers, its familiar medicinal scent filled the air, bringing tears to her eyes. Like that, when participants piece together their own artistic creations, they'd find a release of certain emotions they've held back, and are healed by the power of nature.

This intimate moment unfolded at a special eco-art therapy exhibition on the East China Normal University campus in Shanghai, offering a gentle emotional outlet for urban dwellers grappling with anxiety.

Against the backdrop of a significant rise in emotional distress among the general public, particularly China's younger generations, new approaches to emotional healing are breaking barriers in traditional psychological counseling and bringing mental health care into daily life: eco-art therapy integrated with mindfulness and traditional Chinese culture, and fragrance-based emotional regulation backed by neuroscientific and empirical research.

According to clinical data, emotional issues are no longer confined to severe cases requiring specialized treatment, says Qiao Ying, an expert from the Shanghai Mental Health Center.

"In the past, people thought you needed to see a doctor only if your condition was serious. But now, the number of people experiencing subthreshold depression and anxiety has increased significantly," Qiao notes, adding that the number of children and adolescents seeking treatment for mental health has risen each year.

To address demand, the eco-art therapy exhibition curated by Yan Wenhua, a professor at the School of Psychology and Cognitive Science of East China Normal University, explores a low-cost, accessible healing path. The exhibition, running through July 3, features hundreds of works created by ordinary people in nearly 40 public healing activities organized by Yan's team recently.

Left: A natural clock crafted from fallen leaves and herbs by a participant in 2024. **Top above:** TCM herbs on display at the exhibition at East China Normal University in Shanghai. **Above and top right:** A pop-up event launched by Eternal Group and the Shanghai Mental Health Center to support emotional well-being.

> "Eco-art therapy basically refers to an ecological approach in art therapy, an innovative method aimed at restoring the deep connection between man and nature through creative activity."
>
> **Yan Wenhua,**
> East China Normal University

"Eco-art therapy basically refers to an ecological approach in art therapy, an innovative method aimed at restoring the deep connection between man and nature through creative activity," explains Yan.

Mindfulness techniques are integrated throughout the exhibition. With green plants, written words and audio instructions spanning the display space, they lead visitors to fully focus on and connect with the present.

Originating from traditional Chinese Zen meditation, mindfulness was systematized and simplified into a practical psychological technique before being reintroduced to China. Yan's team has deeply integrated mindfulness with the 24 solar terms and traditional Chinese medicine to create culturally relevant healing activities.

During Minor Cold (*xiao han*), participants were guided to paint their true selves on blank masks; in spring and summer, they observed growing plants, smelled them, and expressed their feelings through art.

At a leaf and TCM creation event in December, the aroma of medicinal herbs evoked family memories, allowing participants to release suppressed emotions through their creations.

"We never judge their creations; there is no good or bad, right or wrong. They just need to follow their hearts and express themselves in a totally free, open manner," Yan explains, adding that the power of TCM deeply connects with Chinese people. "It is unique in that it is embedded in our growth and family bonds.

"We can build an alliance with nature and learn from it. Nature never abandons you, and you can always gain nourishment from it, at any time," Yan adds.

Qiao offers a professional interpretation of the method's core logic: "The essence of eco-art therapy is not 'treatment', but reconnection; reconnecting with nature, with yourself, and with your creativity. Much of today's anxiety stems from a sense of loss of control and disconnection. Eco-art therapy lets you touch the soil, smell the grass after rain, and observe the veins of a leaf.

"When your brain switches from ruminating about the past or worrying about the future to being fully present in the moment, anxiety naturally finds an outlet," Qiao says.

As another important carrier of emotional healing, fragrance has solid scientific support for its therapeutic effects.

"Smell is the only sense that goes directly to the amygdala — the emotional center of the brain — without passing through the thalamus. This means it can reach your heart before you even have time to rationally think," Qiao states.

In clinical interventions, scent is used as a crucial "emotional anchor". Qiao explains that her team does not simply use lavender to calm people; instead, it guides patients to form an association with a specific natural scent, such as citrus or cedar, while in a deeply relaxed state. Later, when they feel anxious in their daily lives, that scent acts like an "emotional switch", helping them regain calm quickly.

"In this sense, fragrance is not a 'placebo', but a direct shortcut to the emotional center," she adds.

The booming fragrance market reflects the growing recognition of scents' emotional healing potential.

Wang Wei, chief operating officer of Eternal Group, says that China's fragrance market has moved past the niche fragrance bubble and the misconception that "commercial fragrances are outdated". Consumers no longer follow labels blindly but return to the intrinsic emotional value of scents.

"Instead of blindly chasing viral niche fragrances on social media, consumers now clearly state their need for scents that help them relax and reduce stress," Wang says.

To empirically validate fragrance's healing value, the group introduced brainwave-based fragrance emotion detection technology in collaboration with the Shanghai Institute of Technology at the 30th China Beauty Expo in May. The technology converts subjective emotions such as pleasure and relaxation into visual data, providing scientific backing for fragrance therapy.

Wang emphasizes that the company has transformed from a brand agent into an ecological enabler in the fragrance industry, making fragrance a practical tool for daily emotional regulation through scientific research and scenario-based innovation.

"We hope to provide consumers with more accurate and locally adapted emotional fragrance experiences through continuous product innovation, scientific empirical research and scenario-based empowerment, truly bringing olfactory healing into people's daily lives," Wang says.

Science meets art to unlock nature's hidden connections

By **HE QI**
heqi@chinadaily.com.cn

Only Tree Knows, a groundbreaking exhibition of nature-inspired art, runs from May 1 to Aug 31 at the Shanghai Natural History Museum. PHOTOS PROVIDED TO CHINA DAILY

Step into the temporary exhibition hall on B1 of the Shanghai Natural History Museum, and a field of all-black metal flowers appears to bloom in silence on one side of the gallery. Hand-cut from metal sheets, they precisely replicate the forms of eight flowers, including roses, lilies and foxgloves, yet stripped of all natural hues — their hollow black silhouettes echo the rigorous structure of plant specimens in scientific illustrations.

These black silhouettes encapsulate the core theme of *Only Tree Knows*, a groundbreaking natural art exhibition.

Jointly organized by the Shanghai Natural History Museum and the Pudong Biyun Art Museum, the exhibition runs from May 1 to Aug 31. It brings together 22 works by 12 domestic and international artists, engaging in a cross-contextual dialogue with the museum's natural specimens to explore the profound theme of forest ecology and human coexistence.

"We collide the taxonomic research of science with the perceptual imagination of art, not to provide answers to ecological issues, but to help the public rediscover the hidden connections of nature," says curator Guo Xiaohui.

Breaking away from the one-way instruction of traditional science popularization, the cross-disciplinary exhibition takes forests as its core framework, connecting the above-ground vegetation realm and the underground mycelial network through specimens, installations, light and shadow, sound, AI-generated art, and other types of multimedia.

"Many people are used to viewing specimens but forget that forests are living; many love art yet rarely reflect on the ecological propositions behind it. We hope visitors can reread the story of forests with both rationality and sensibility," Guo adds.

As one of the exhibition's signature works, Zadok Ben-David's *Black Flowers* condenses plant forms into an existence between specimen and illusion, confronting the imbalance in the relationship between humans and nature.

"I paint these enlarged flowers black, not for beauty, but as a warning. Artists don't have solutions, but we can raise questions to make people rethink and protect nature," he states.

A universal symbol of both joy and sorrow, flowers are reimagined in black to turn natural representation into ecological reflection, prompting viewers to re-examine their place in the natural world.

Black Flowers is an extension of Ben-David's landmark *Blackfield* series, marking the classic body of work's first large-scale presentation in China. The artist notes that the series is a monumental project spanning 12 to 15 years: "My first installation, *Blackfield,* has 30,000 miniature flowers of 900 species, displayed with black side first and color revealed later, which is a metaphor for life with both tragedy and joy."

Ben-David adds: "This exhibition is necessary because it allows people to feel and think about nature in a new way, which is crucial for the current ecological environment."

Echoing this message is Rodrigo Arteaga's site-specific work *Fallen Tree*. Crafted from Shanghai's native tree branches and completed over a month in the museum, it is paired with his other piece, *Monocultures* — burnt paper sheets that capture the damage caused by ecological simplification. Together, the two works convey that the forest is not a static entity, but a dynamic space of constant connection, transformation and imbalance.

"You don't see the actual plant, but rather you see the absence, and the way of making it remembers or comes back to the forest fires that happen every year in Chile and in other places," Arteaga explains.

Two Chinese artists also joined the exhibition. Wang Yuyang of the Central Academy of Fine Arts explores the "third nature" in the technological age through *Plant 002* and *Biological Klein Blue*, employing AI algorithms and microbial techniques; Liu Zhenchen's *Panacea* series captures traces of medicinal plants on canvas, imbuing natural textures with a therapeutic quality.

Ninety percent of the works are making their Shanghai debut and their first appearance at the natural history museum. The exhibition also integrates 290,000 forest-related specimens from the museum's collection, forging a cross-temporal dialogue between artistic creation and natural heritage.

LIFE

A TV classic spins anew on vinyl

The score to hit drama *Jade Goddess of Mercy* is back, this time as a reimagined album, **Chen Nan** reports.

The melody arrived softly at first: a violin tracing a line of longing above the quiet pulse of a piano. Inside the National Centre for the Performing Arts in Beijing on a late May afternoon, the opening notes of *Yu Guanyin*, or Jade Goddess of Mercy, were enough to suspend time.

For many audiences in China, the music carries them instantly back more than two decades, to an era when Chinese television dramas unfolded with an almost novelistic emotional seriousness — stories of love and betrayal, desire and sacrifice, set against the turbulence of a rapidly changing country.

Now the music itself has returned, transformed.

On May 24, composer Ye Xiaogang joined singer Zhu Hua, violinist Li Yuhe and pianist Feng Huaiyu for an event marking the release of a new vinyl album inspired by Ye's celebrated score for the television adaptation of Chinese writer Hai Yan's best-selling novel, *Jade Goddess of Mercy*.

The namesake TV series, *Jade Goddess of Mercy*, premiered in 2003 and follows the journey of An Xin, a young woman who transforms from an ordinary girl into a daring undercover narcotics officer. The story explores An Xin's complex emotional world as she becomes embedded within a dangerous drug trafficking organization. Her life is entangled with three men — the dedicated officer Tie Jun, the cunning dealer Mao Jie, and Yang Rui, an ordinary urban young man who is the emotional anchor and narrative viewpoint of the drama — forming a tense web of love, loyalty, and betrayal. Against this backdrop, the drama interweaves high-stakes anti-drug operations in Yunnan province, juxtaposing An Xin's inner struggles with intense, suspenseful action. At its heart, the series is a story of duty, sacrifice, and the human cost of fighting crime, where personal desire often collides with moral responsibility.

The black vinyl edition, released by NCPA Classics, does not simply reproduce the original soundtrack familiar to television audiences of the early 2000s. At the heart of the new release are two orchestral works that trace the evolution of *Jade Goddess of Mercy* from television soundtrack to contemporary concert music. *The Jade Goddess of Mercy Orchestra Suite (2001)* stands as the foundational pillar of Ye's musical world for *Jade Goddess of Mercy*. Moving beyond the functional demands of screen scoring, Ye reimagined and expanded the drama's central themes symphonically, transforming them into an autonomous orchestral work that has since become a lasting staple in the repertoire of major Chinese orchestras.

More than two decades later, *Jade Goddess of Mercy Capriccio for Violin and Orchestra (2023)*, commissioned by the Hangzhou Philharmonic Orchestra, revisits that emotional landscape from a more introspective and expansive perspective. Built around an extended dialogue between solo violin and orchestra, the work draws on the violin's warm, tensile sound to explore the music's emotional undercurrents with greater depth and freedom. The result feels less like a return to familiar material than a poetic reimagining — a work with themes once bound to the screen that unfold with renewed lyricism and emotional scope.

Together, the works chart the unusual afterlife of a television score that has steadily migrated from popular culture into China's contemporary concert repertoire.

"The music has continued to grow," Ye says. "It walked out of the television drama and became something independent."

Ye notes that many of the musical ideas developed in *Jade Goddess of Mercy Capriccio for Violin and Orchestra* never appeared in the earlier suite.

"In that sense, this album brings together nearly all the themes from the television drama that I felt deserved to be further developed and shared with a wider audience," says Ye.

For Ye, now one of China's most internationally recognized contemporary composers, the origins of *Jade Goddess of Mercy* still feel strangely fated.

He recalls buying Hai Yan's novel almost accidentally and reading it straight through. By the end, he had become convinced that the story demanded music. Not long afterward, director Ding Hei approached him to compose the score for the adaptation.

To prepare, Ye traveled to Xishuangbanna in Yunnan province, where parts of the drama were filmed. He observed local life, spoke with actors and immersed himself in the emotional atmosphere of the story.

Although he now describes the actual writing process as instinctive, he insists that spontaneity only becomes possible after deep emotional preparation.

The resulting music was unusually lyrical for Chinese television at the time, blending symphonic structure with an emotional openness more commonly associated with cinema than serialized drama. Some members of the production reportedly worried that the score sounded too classical and not commercially viable. Ye refused to simplify it.

The novelist Hai Yan later joked that the television series itself had become "a music video for Ye Xiaogang's music", because the production team became reluctant to cut scenes that carried the score's emotional momentum.

Over the years, the music developed a life beyond the series. Orchestras across China began performing the suite version regularly, and audiences continued to associate its melodies with a particular emotional atmosphere: restrained longing, romantic fatalism, and moral vulnerability.

The recording was completed in Berlin, Germany, in November 2024 with the Deutsches Symphonie-Orchester Berlin under conductor Stefan Malzew.

"Even without a shared spoken language," Ye says, "music became our common language."

The afternoon also revisited Ye's long creative partnership with singer Zhu, whose performance of the drama's theme song became inseparable from the series' emotional identity.

Returning now to the music of *Jade Goddess of Mercy* after 25 years, Zhu describes how age has altered her understanding of the work.

"When I sang it years ago, there were emotions I could not fully understand," she says. "Now they feel very clear."

Time, she suggests, has softened the technical self-consciousness of youth. Her voice now moves more freely within the orchestral texture, particularly alongside the strings.

In contemporary China's entertainment industry, where soundtrack music is often designed for speed, algorithmic circulation and immediate commercial impact, the survival of *Jade Goddess of Mercy* feels increasingly unusual. Its endurance owes less to nostalgia alone than to the seriousness of its artistic ambition.

Ye spoke candidly during the discussion about what he sees as the shrinking creative space for composers in film and television today. Producers increasingly treat music as a functional background, he says, rather than as an equal narrative force.

For him, *Jade Goddess of Mercy* belongs to a different moment — one in which directors and composers were willing to shape scenes around musical ideas rather than merely decorate finished images with sound.

That philosophy also informs Ye's broader thinking about contemporary Chinese composition. Educated largely within Western classical traditions, he has long sought to reconcile European structural rigor with distinctly Chinese aesthetic sensibilities: restraint, silence, and emotional space.

But he warned against superficial forms of East-West fusion now common among younger artists.

True synthesis, he argues, must emerge from a deeper cultural consciousness rooted in Chinese philosophical traditions — ideas of harmony, coexistence and the relationship between humanity and nature.

Legends of the Great Wall meet mountain mists in Shanxi

By XU LIN
xulin@chinadaily.com.cn

Left: Yanmen Pass in Xinzhou city, North China's Shanxi province, was a strategic section of the Great Wall. **Right:** Wanghuagou, an ancient village perched on the cliff face on Guancen Mountain, Xinzhou. PHOTOS PROVIDED TO CHINA DAILY

Looking for a summer getaway that combines history, nature, and serenity? Xinzhou city in North China's Shanxi province offers exactly that.

Just a three-hour high-speed rail journey from Beijing, the city offers a cool respite from the summer heat. It invites travelers to explore a section of the Great Wall, tour a vibrant ancient city, hike mountain trails and experience natural wonders, making it an off-the-beaten-path weekend escape.

Steeped in frontier heroism, Yanmen Pass in Daixian county is a strategic section of the Great Wall. The Great Wall of China was inscribed on the UNESCO World Heritage List in 1987.

Yanmen Pass is often depicted in Chinese martial arts novels as a legendary frontier stronghold and a powerful symbol of patriotism and chivalry.

Yang Jia Jiang, or Generals of the Yang Family, defended the key northern frontier garrison during the Northern Song Dynasty (960-1127), holding off repeated invasions by the nomadic Khitan people. This legendary military household has become a timeless symbol of loyalty, courage and patriotism in Chinese culture. It has been widely portrayed in literary works, operas and TV series, in which vivid stories of heroic female generals from the Yang family have been told and passed down.

Today, tourists can enjoy a grand welcoming ceremony featuring performers dressed in traditional costumes portraying the Yang family clan, along with exciting martial arts demonstrations and a spectacular parade.

"We weave together Great Wall culture, the legendary tales of the Yang family clan and frontier folk customs, offering a wonderful journey through the history of the border passes of northern Shanxi," says Hou Tianjia, an office worker from the scenic area.

Visitors can hike along the Yanmen Pass section of the Great Wall and climb the weathered ancient beacon towers, where soldiers once lit smoke signals to send urgent military messages across the mountains.

About one and a half hour's drive away is the ancient city of Xinzhou, where entrance tickets are free of charge and local residents still carry on their daily lives.

Visitors can explore ancient architecture like Xiurong Academy and various temples, and join intangible cultural heritage workshops such as those about paper-cutting. As night falls, the traditional *datiehua* (molten iron fireworks) show lights up the sky, and a street with bars pulses with energy — a perfect blend of traditional and modern nightlife.

"Life moves at a slow pace here. You can stay a night, soak in hot springs, and taste various local snacks to ease fatigue and wrap up your journey in a relaxed way," says Li Qiyu, a marketing office worker from the ancient city scenic area.

She adds that local food is fairly priced, accommodation offers great value for money, and it's not overly commercialized.

Nestled in Ningwu county, Luya Mountain scenic area stands out as a perfect summer escape, boasting a pleasant average summer temperature below 20 C.

After hiking along its winding trails, a breathtaking panoramic view unfolds from the mountaintop, with rolling peaks shrouded in swirling mist and clouds.

A must-visit attraction in the scenic area is the Permanent Ice Cave, a rare natural wonder formed around 3 million years ago. Maintaining a year-round subzero average temperature, the cave keeps its icy interior intact even during scorching summers. Visitors are advised to wear warm outfits and anti-slip shoes for a comfortable and safe tour.

Under artificial lighting, the cave walls are adorned with countless translucent icicles, ice waterfalls and ice curtains of varying sizes, shaping a dreamlike underground fairyland of ice and snow.

Nearby, three ancient villages, known as the Hanging Villages, are perched on cliffs high on Guancen Mountain. Some houses are embedded in the rock face, while others are supported by wooden pillars over the abyss, looking like castles in the air from a distance.

However, Luya Mountain offers more than just a summer retreat — it's a comprehensive experience of coolness, ecology and wellness. Beyond the forests that serve as natural oxygen bars, visitors can enjoy the Malun Alpine Grassland, an ancient cliff plank road first built in the Tang Dynasty (618-907), and clusters of alpine lakes.

About 160 kilometers away is the Laoniuwan scenic area of Pianguan county, where tourists can witness the remarkable confluence of the Great Wall and the Yellow River. They can also climb an ancient castle to have a bird's-eye view of the surrounding area, wander through a village of stone houses, and soak up the river's timeless beauty.

Indeed, combining ancient culture, lively old-town charm and cool natural scenery, Xinzhou makes every summer getaway here truly unforgettable.

SOCCER

MISSION POSSIBLE?

After 60 years of hurt England turns to German coach Thomas Tuchel to end World Cup title drought

England's head coach Thomas Tuchel looks on during a training session in Palm Beach Gardens, Florida, on Tuesday. AP

In a bid to end its decades-long wait to win a second World Cup, England has put its fate in the hands of a German.

It's fair to say the appointment of Thomas Tuchel was not universally well-received.

"I'm sorry I have a German passport," the serial-winning former Paris Saint-Germain, Chelsea and Bayern Munich coach quipped at his official unveiling in 2024.

He had woken that morning to some unflattering headlines in the British media.

The Daily Mail described it as a "dark day for England" and said the national team had gambled on a "GERMAN".

The party leader of the right-wing Reform UK Nigel Farage asked on X: "Why can't we have an English manager?"

Never mind that Tuchel was a Champions League winner who had lifted trophies in three different countries. Or the fact that England has gone down the foreign route before: a Swedish coach in Sven-Goran Eriksson and an Italian in Fabio Capello. And in the days before Tuchel's appointment, there were rumors that Pep Guardiola was also a leading candidate.

Historic rivals

A point of contention was the fact that Germany has long been England's biggest soccer rival. Since winning the 1966 World Cup final against West Germany, England has often struggled against the Germans at major tournaments. Some England fans have brought 20th-century history to the rivalry with provocative chants taunting Germany about World War II.

Debate about Tuchel's nationality, however, dissipated quickly, helped by his easy-going charm when dealing with the media and a perfect winning record during England's World Cup qualifying campaign.

According to professor Jan Ruger, author of the upcoming book *Great Powers: A History of Britain and Germany*, the wider reaction to Tuchel's appointment points to a change in Anglo-German relations after the tensions that prevailed in the decades following two world wars.

"There were questions, but it certainly hasn't turned into an ongoing saga in the way in which it would have in the 1990s or even around the turn of the century," Ruger told The Associated Press. "Then it would have been unthinkable to have a German manager.

"Germany really isn't the bad guy anymore. That's long since passed. I don't think it works portraying Germany as the bogeyman."

Fierce criticism

Time will tell if Tuchel is portrayed as a hero or villain at the World Cup. If England fails, his nationality might be raised again. But England managers of the past have been the subject of brutal criticism by fans and media, regardless of what it says on their passport.

Debate about Thomas Tuchel's nationality dissipated quickly, helped by his easy-going charm when dealing with the media and a perfect winning record during England's World Cup qualifying campaign. AGENCIES

Tuchel's predecessor Gareth Southgate was widely credited with making England fans fall back in love with the national team during his eight-year spell, yet he faced a torrent of abuse from sections of supporters during the 2024 European Championship, with plastic beer glasses thrown in his direction after one match.

Southgate departed after leading England to back-to-back Euros finals and the World Cup semifinals in 2018.

He goes down as the nation's second-most successful manager after Alf Ramsey, who led England to World Cup victory in 1966.

If Tuchel can end England's trophy wait, he would become a national treasure.

"Everyone in the squad, the staff, everyone believes we can win it," midfielder Kobbie Mainoo said.

Difficult decisions

Tuchel stunned some fans and players with his squad selection for the World Cup, leaving out big names including Phil Foden, Cole Palmer and Trent Alexander-Arnold.

It was evidence that he would not be swayed by public opinion, which has been a criticism of previous coaches.

"Everything I know about international football tells me that tournaments are won by teams, not individuals," he said. "What we're trying to achieve in the summer can only be achieved as a team."

Midfielder Jordan Henderson was one of the surprise inclusions at the age of 35.

"I know everybody likes to speak about players that aren't here, unfortunately that's the case with every England squad really," Henderson said.

"There's so many good players, so much talent, but for us as a squad here, it's about being together and we're here for a reason and it's about bringing that, being the best version of yourself, being best version individually and collectively, working every day to achieve our dreams."

A proven winner

Tuchel is the 14th coach tasked with the challenge of ending England's trophy drought, which now stretches to 60 years.

After Southgate's departure the English Football Association said it was looking for a candidate to "win a major tournament". That might sound obvious, but even coaches who had won big prizes with club teams such as Bobby Robson, Terry Venables, Eriksson and Capello could not emulate that success with England.

Southgate got closer than anyone since Ramsey despite a modest coaching career before being handed the national job.

His success appeared to be grounded in developing a connection both within his squad and with supporters. As a former player who missed a penalty in a semi-final shootout defeat to Germany at Euro 1996, his emotional understanding of what it means to represent England appeared to resonate with a new generation.

As a foreign coach — albeit one who coached in the Premier League with Chelsea — Tuchel cannot bring that same dynamic to the role.

He does, however, fit the description of a winner of major tournaments, having led Chelsea to the Champions League in 2021. He was also a Champions League finalist with Paris Saint-Germain.

He won league titles in France with PSG and Germany with Bayern Munich.

In Harry Kane, Jude Bellingham and Declan Rice, he has three of the biggest stars in European soccer and enough talent at his disposal that he felt able to leave out the likes of Foden and Palmer.

"I love the difficult decisions and I love the tough decisions because they bring in the end clarity, they bring a certain edge, and it's what you need to go all the way," Tuchel said. "From day one, we said we will always try to select and build the best group, which is maybe not necessarily just to collect the best talents."

AGENCIES VIA XINHUA

Cherki's magical skills could be just what France needs in tight games

PARIS — If matches get tight for France at the World Cup and a defense is particularly hard for the star-studded attack to breach, Rayan Cherki is a dream player to bring on.

The 22-year-old enjoyed a brilliant first season with Manchester City, lighting up the Premier League with his maverick skills and amazing passing. He finished second with 12 assists behind only Manchester United's Bruno Fernandes, an established Premier League player.

One of Cherki's assists saw him dribble across the penalty area with his right foot before playing a blind pass — where a player does not look in the direction of where he is passing — with his left foot to Marc Guehi. Afterward, City coach Pep Guardiola — who coached all-time great Lionel Messi at Barcelona — spoke of his disbelief at the creativity shown because he had not even seen that pass as an option.

In another match, Cherki assisted Phil Foden's goal with an audacious Rabona pass, in which the player's kicking leg is crossed behind the back of the standing leg.

Cherki is more of a passer, but when he does score the goals highlight his amazing close control. Take his brilliant goal on his City debut against Wolverhampton, where he started the move with an outrageous backheel flick.

He can also run directly at players at speed with the ball glued to his feet, attributes he shares with the record eight-time Ballon d'Or winner Messi. His goal during his debut for France last June saw him net a brilliant volley against Spain in the Nations League.

"Rayan has something special," Guardiola said. "He will become an extraordinary player with his mindset and mentality."

Options for France

Cherki gives France coach Didier Deschamps wider options thanks to his versatility. He can play as an attacking midfielder or a right winger as he does with City, or as a playmaker just behind the center forward.

He was positioned behind Marcus Thuram in a 3-1 win against Colombia in March, where he was involved in two goals, and behind Kylian Mbappe against Ukraine last November.

When he was called up to the France squad for the first time in May last year, Cherki called it "the beginning of a beautiful adventure". It could take him to greatness, for Cherki has the soccer world at his feet.

It's hard to tell which is his stronger foot, although like Messi his best magic comes from his left.

In an interview with France Football magazine in March, Cherki was asked to name City's best technical player.

Without hesitation, he replied: "Me."

Cherki also described himself as "one of the most unpredictable players on the planet".

Perfect if France needs him to break down a solid defense.

Another Lyon gem

Cherki came through Lyon's renowned youth academy, which has produced the likes of 2022 Ballon d'Or winner Karim Benzema and the wonderfully skilled Hatem Ben Arfa.

He made his Ligue 1 debut at just 16 years old in October 2019 and scored his first senior goal a few weeks later in a French Cup match, when Cherki's astounding talent shone bright. He scored two clinical goals, set up a teammate with a brilliant pass from midfield, won a penalty which his teammate missed, then provided another assist. He also hit the crossbar with an audacious lob.

France's Rayan Cherki (left) in action with Germany's Jonathan Tah during a Nations League game on June 8, 2025. REUTERS

It was a mesmerizing performance for his age and put him on the radar of Europe's biggest clubs.

In his final season at Lyon, he ended with a league-high 11 assists. City landed him last summer for 36 million euros ($41 million), perhaps benefiting from Lyon's dire financial situation to buy him for what now looks like a bargain price in soccer transfer terms.

Guardiola must have already known what he was getting, since Cherki scored against City in a Champions League youth game just after turning 15 — the youngest scorer in the competition.

Future of France

Cherki's remarkable balance is an asset he shares with Messi and the late Diego Maradona, who honed his rare talent in the back streets of a shantytown on the outskirts of Buenos Aires. As a young boy, Cherki developed his technique on the streets of Lyon in east-central France. After one season with suburban club Saint-Priest he joined Lyon's academy at seven.

While he is not expected to start for France at the World Cup, that is understandable given the glittering talent in attack.

Les Bleus will likely line up with Bayern Munich star Michael Olise, Ballon d'Or winner Ousmane Dembele and the prolific Mbappe, who scored a hat-trick in the 2022 World Cup final loss to Argentina and netted in the 2018 World Cup final win over Croatia.

Deschamps is stepping down after the World Cup and his successor is widely touted to be Zinedine Zidane — the star of France's triumphs at the 1998 World Cup and Euro 2000, who, like Mbappe, scored in two World Cup finals.

Zidane was an exquisitely gifted midfielder himself and could build his team around Cherki in the years to come.

Chinese assets gaining appeal around world

Artificial intelligence-powered revolution a key driver of shifting investment landscape

By **WANG KEJU**
wangkeju@chinadaily.com.cn

As geopolitical tensions, diverging economic policies and rapid advances in artificial intelligence reshape global markets, senior economists said that Chinese assets are emerging as a key anchor, with the country's cost-effective AI ecosystem well positioned to support a new round of manufacturing upgrading.

With China pushing ahead with financial opening-up, economists said the case for including Chinese assets in global portfolios is likely to strengthen further, even as US equities continue to play an important role in global asset allocation.

Despite persistent uncertainty, global cross-border capital continued to expand in 2025, with the United States, the United Kingdom and China remaining among the world's major destinations for international capital, said Zhang Xiaoyan, associate dean at Tsinghua University's PBC School of Finance.

"The core logic of global capital allocation is simple: Investors seek better returns with lower risks," Zhang said. "Chinese assets could offer both."

On the return side, Zhang pointed to strong growth potential in China's emerging sectors such as digital technology and software, advanced manufacturing, automation, clean energy and green tech. In terms of risks, Chinese assets have low correlation with European and US markets, making them "effective diversifiers", she added.

In particular, the AI revolution is a key driver of the shifting global investment landscape.

Despite mounting risks from geopolitics, tariffs, energy shocks and inflation, new opportunities are emerging in AI infrastructure, energy transition and supply chain restructuring, said Shane Zhang, chairman of Morgan Stanley Securities (China).

Zhang said that Asia, and China especially, may be entering what he described as an investment- and manufacturing-led "super cycle". "China's supply chain resilience, high-end manufacturing, materials and AI industrial chain are drawing growing international attention," he added.

Dismissing AI bubble fears, he highlighted China's cost advantage, noting that achieving comparable model inference performance — the point at which a trained AI model processes new data in real time and produces output — in the country costs just 15 to 20 percent of the figure for the US. "That will drive broader AI adoption across China's economy," he added.

Miao Yanliang, chief strategist at China International Capital Corp, also said the AI revolution is no speculative bubble so far. "The technology is indeed boosting productivity, there's no heavy use of leverage, and valuations are not excessive by historical standards."

Miao said the adoption of AI is approaching an inflection point where gradual growth turns to exponential acceleration. "The winner won't be just one; it could be both China and the US, and the rest of the world could also benefit from this technological revolution," he added.

> "The core logic of global capital allocation is simple: Investors seek better returns with lower risks. Chinese assets could offer both."
>
> **Zhang Xiaoyan,** associate dean at Tsinghua University's PBC School of Finance

In the new landscape, investors can no longer rely on a single anchor. The US remains a vital component, but ignoring China is no longer an option, according to economists.

"Global capital is moving from an overweight position in US assets toward more diversified allocation," Miao said, noting that China's current weighting in global portfolios remains below the country's economic strength and corporate performance.

As central banks diversify reserves and investors seek alternatives to dollar-centric holdings, renminbi-denominated assets are gaining attention, Miao said, adding that China's continued financial opening and the steady internationalization of its currency support this shift.

China's financial opening is gathering pace, with easier market access for qualified foreign institutional investors and improved cross-border investment mechanisms, which is expected to give Chinese assets more weight in global portfolios, experts said.

"Investors need to adapt their strategies to changing market environments," said Zhang Xiaoyan, the Tsinghua associate dean. "With China's high-level opening-up and the implementation of favorable policies, the domestic capital market will welcome more development opportunities, offering long-term investment potential for investors at home and abroad."

Despite the growing appeal of Chinese assets for global investors, economists said the pace and momentum of domestic demand recovery remain a key factor for investors to watch.

Chinese enterprises' innovation and production capabilities are highly competitive, said S&P Global Ratings' Asia-Pacific chief economist Louis Kuijs, noting that the challenge lies in domestic demand and consumption.

In Kuijs' view, stimulating consumption hinges on addressing households' worries about income and job stability, and increasing the availability of public services such as healthcare and education for the country's urban migrant population.

Desert fighter, US friend to reunite soon

By **DUAN JINXIAN** and **WANG SONGSONG** in Beijing

When China's afforestation hero Yin Yuzhen and her friend from the United States Ronald Sakolsky spoke over the phone recently, people from all over the country expressed the hope that they would meet again in person soon. Now that wish is set to come true.

When China Daily met up with Yin for an interview on Tuesday in Beijing, the 60-year-old, her dark black braid reaching her waist just like it did in many of her old photos, revealed that she would meet her old friend and tree-planting benefactor this summer.

Sakolsky also confirmed the appointment when contacted on Tuesday night. He said that he would be coming to China in August.

During his time here, he plans to visit the "forest miracle" he helped create years ago in Maowusu, in the Inner Mongolia autonomous region.

Maowusu is China's fourth-largest sandy stretch, covering a vast area spread across Shaanxi province, and the Inner Mongolia and Ningxia Hui autonomous regions.

On his trip to China, Sakolsky also plans to visit Luoyang, Henan province, where he taught English in 1999 and 2000. It was there that he first heard about Yin's efforts — planting trees to reclaim land that was being overtaken by the desert.

He set out to raise money to support the project and procured a $5,000 donation to help Yin buy saplings. Those saplings have now grown into trees that carpet the once barren area in green. It is a gift that Yin said she will never forget.

"When Sakolsky comes here, I will make noodles for him, representing both a long life and our long friendship," she said with a broad smile. "I will also treat him to our specialty food such as lamb skewers and millet porridge."

She also promised to give him a pair of insoles that she embroidered.

Yin is a national model worker who is widely acclaimed as one of China's afforestation heroes.

"No matter which country you are from, when you visit Maowusu it means you love nature and the Earth. We can unite with other people through our common dreams," Yin said.

She added that she remembered all the people who helped her. "They have moved me not just for a short time, but for a lifetime."

Yin was in Beijing on her way to Tallberg in Sweden, where she has been invited to participate in an international forum from Wednesday to Sunday.

WHATEVER YOU'RE IN THE MARKET FOR, PANJIAYUAN PROBABLY HAS IT

Antiques hub is magnet for tourists looking for unique keepsake

By **CHEN NAN**
chennan@chinadaily.com.cn

Edwin den Hartog, a visitor from the Netherlands, had wandered the streets of Beijing many times before, but it had not prepared him for Panjiayuan. The sprawling market, a labyrinth of alleys and stalls in the capital's southeast, unfolded like a miniature city of its own.

Sunlight glinted off jade trinkets, and he was surrounded by wooden carvings and stacks of old posters, while vendors called out in friendly tones, offering a glimpse into the city's lively, mercantile heart.

"This market is huge!" Den Hartog exclaimed, pausing to take in the sheer scale of the scene. "The atmosphere is so different from markets back home. To foreigners, the items at the market are fascinating — little pieces of history that could become a keepsake."

The antiques section was his first stop. Rows of stalls overflowed with curiosities: carved wooden figures, metalwork and jade pieces with intricate patterns.

Hoping to buy his mother a necklace, he marveled at the textures, the weight and the stories each item seemed to carry. Nearby, another corner overflowed with beads, perfect for assembling a personalized necklace.

Foreigners browse through books at an autumn old book fair at the Panjiayuan Antique Market in Beijing in 2024. WANG FEI / FOR CHINA DAILY

"Picking the beads yourself is so much fun," he said, sliding a polished blue stone onto a string. "It feels like you're making a memory, not just buying a souvenir."

Panjiayuan's story stretches back centuries. Originally known as Panjiayao, during the Ming Dynasty (1368-1644) the area hosted kilns run by the Pan family from Shandong province, producing bricks and tiles for Beijing's old city.

WORLD WATCH
By Sujata Ashwarya

Two exits reflect an OPEC in transition

The United Arab Emirates recently left the Organization of the Petroleum Exporting Countries, seven years after Qatar walked away from the same institution. Two Gulf countries have now departed the cartel that coordinated their oil politics for nearly six decades.

The question worth asking is not what this means for OPEC, which will continue in some form. It is whether these twin exits, read alongside the quieter recalibrations underway in Riyadh, Saudi Arabia, tell us something about where Gulf oil politics are heading, and what kind of regional order is taking shape behind the daily news of war, ceasefire and energy disruption.

The two departures were driven by different logics, but they point in the same direction. Qatar's 2019 exit was the move of a state that had become peripheral to OPEC's core business. Doha's future was already in liquefied natural gas, where it was a global leader and where OPEC quotas had no relevance. Leaving was a strategic refocusing rather than a rupture.

The UAE's exit is structurally different. Abu Dhabi was OPEC's third-largest producer, with spare capacity that gave the cartel credibility in moments of supply shock. Its departure represents the loss of a central pillar.

What the two exits share is the underlying judgment that the institution no longer fits the national strategy.

The proximate trigger for the UAE move is well understood. Abu Dhabi has invested heavily in expanding its production capacity, now at roughly 4.8 million barrels per day, with ambitions of 5 million by 2027, while OPEC quotas held its actual output well below that ceiling. The frustration was real and long-standing.

Robots expanding limits of mega projects

Work at Shanghai airport terminal a model for major 'smart' construction, experts say

By **YU YILEI** and **WANG YING** in Shanghai

At the vast construction site of Shanghai Pudong International Airport's Terminal 3, a group of construction robots is racing against the clock alongside human workers — the ideal choice for carrying out repetitive, efficiency-intensive, and hazardous tasks.

As the first large-scale application of robots in civil aviation infrastructure construction, their deployment highlights the significance of intelligent manufacturing and smart construction in building mega projects, experts said.

Consisting of 37 types of robots with different functions, they are under the command of a unified "brain" known as a construction robot cluster management system. It is the first application of such a system in a large aviation project.

Tang Shengling, senior consulting adviser at the Shanghai Artificial Intelligence Research Institute's digital economy research center, said the use of robots in the airport construction project is a significant step.

"The landmark application of clustered and systematic construction robots will provide a replicable Chinese model for the development of intelligent robotics and the smart upgrading of the construction industry," Tang said.

Efficiency improved

The terminal under construction covers nearly 1.5 million square meters, with a total floor area of about 1.96 million sq m, according to Zhang Yi, deputy director of the terminal engineering department of Shanghai Airport (Group)'s construction division.

"One of its most distinctive architectural features is the international terminal's bird-shaped roof. Together with 17 gigantic bird-shaped columns, it creates the impression of a bird soaring through the sky," Zhang said.

"The project is expected to be ready ... in 2028, further supporting Shanghai's development into an international aviation hub," added Zhang.

Qin Yi, deputy general manager of Shanghai Construction Group's general contracting department, said the number of robots and the scale of their application in the project are unparalleled.

Qin, who is also the executive deputy head of the Shanghai Pudong International Airport's Terminal 3 project, said the robots would reduce construction time by 20 percent, and trim the on-site workforce by about 35 percent.

For instance, a crew of three robots is doing the concrete flooring works continuously and efficiently in carrying out tasks of leveling, surface finishing and polishing. The crew is expected to complete about 700,000 sq m of structural and architectural flooring work for the project.

The team consists of a four-wheel laser leveling robot, a crawler smoothing robot and a floor polishing robot, Qin said. The crew can process more than 1,000 sq m of flooring per day, and keep deviations in flatness to within a millimeter.

The use of robots has not only saved construction time but also significantly reduced reliance on specialized labor, further ensuring the stability and quality of the construction process. "The introduction of robots for the project has made the construction process more advanced and intelligent, therefore improving the overall project's quality and standard," Qin said.

When comparing manpower and robot performance, for example, robots can significantly improve first-pass welding qualification rates and overall welding quality, he said. The rework rate in traditional manual welding is typically close to 10 percent, but welding robots have virtually eliminated reworking.

Eradicating human risk

The use of construction robots demonstrates their application possibilities not only in airport infrastructure, but also in other industries, said Duanmu Haiying, director of the Shanghai Meta-Now Metaverse Industry Promotion Center.

"This extensive application of robots of multiple brands and multiple types of systems will enable end-to-end connectivity across the data chain, further optimizing costs," Duanmu said.

Cao Qixin, a professor specializing in robot research at Shanghai Jiao Tong University, said: "The construction industry involves highly complex workflows, and integrating multiple types of robots through an intelligent platform has significant importance."

Twenty-four robot models are currently being used in the terminal construction project. Based on their functions and applications, they are classified into three categories: on-site construction robots, construction management robots, and processing robots, Qin said.

Working in risky scenarios, they can perform highly difficult operations, eliminating the need for human workers to be directly exposed to hazardous environments such as high temperatures, toxic gases and flying sparks.

In complex areas such as the bird-shaped columns, elevated facade panels and skybridge truss structures, multiple welding robots can play important roles, Qin said. In traditional high-altitude operations, the aerial-work robots are capable of carrying out tasks such as coating surfaces and decoration, curtain wall water-spray testing, and cleaning maintenance.

"Civil aviation engineering has the highest requirements for safety and precision, so robots must undergo reliability verification in real-world scenarios," said Duanmu, adding the Shanghai project can serve as a model for the intelligent upgrading of infrastructure projects nationwide.

In highly repetitive tasks, robots are all-rounders capable of handling everything, including trivial chores. A security inspection robot, for example, has agile movement and can take panoramic images on a construction site, allowing management to view any alarming scenarios and on-site conditions in real time.

Above: Work is underway at the construction site of Shanghai Pudong International Airport's Terminal 3 on May 11. WANG YING / CHINA DAILY **Left:** A worker operates a welding robot at the site. **Below:** A curtain wall glass panel is installed at the construction site with the help of a robot. PHOTOS PROVIDED TO CHINA DAILY

An engineer demonstrates how to use a paintwork robot before it is deployed at the construction of Shanghai Pudong International Airport's Terminal 3. PROVIDED TO CHINA DAILY

Another example is the cleaning robot, which can remove small stones and dust from construction floors via a fully automated operating system. The machine is capable of cleaning up to 500 sq m of floor area per hour.

As for underground work, the welding robots can reduce the workforce by 50 percent and improve efficiency by 30 percent.

"During the construction of Shanghai Pudong International Airport's Terminal 3, various robots were extensively used, particularly in floor leveling and steel structure welding," Qin said. "The use of robots also includes our on-site unmanned inspection management, as well as our backstage digital management matrix. The introduction of robots into the project has effectively transformed the construction process into advanced manufacturing and intelligent construction, and has improved the overall project's quality and standard," he added.

Setting high standards

Qin is proud that a large proportion of the robots being used on the project are made in China or have Chinese origins.

"The robots we are using can be categorized into three types. The first is robots that have been independently researched and developed by ourselves, such as molding robots and robots that weld wall foundations. The second is those we jointly developed with (domestic) robot manufacturers. And the third is those we directly purchased from the market, including some imported equipment," Qin said.

Shanghai is looking to transform and upgrade its advanced manufacturing over the coming three years. The use of robots in the terminal construction perfectly fits this agenda. The three-year action plan was unveiled by the municipal government early in January.

The plan has set ambitious goals, including nurturing 100 manufacturing enterprises, each with an annual output of above 1 billion yuan ($147 million), and raising the city's robot density to 600 robots per 10,000 employees by 2028. The measures are expected to consolidate and enhance the city's industrial chain and turn it into a global high-end manufacturing center.

Robot density, a key gauge of the adoption of automation in manufacturing, is the number of robots per 10,000 people in the manufacturing industry.

China has a robot density of 166 per 10,000 workers, ranking sixth in Asia and 22nd globally, according to a report from International Federation of Robotics.

South Korea tops the rankings at 1,220, followed by Singapore at 818. Shanghai's current density level of robots is 500 according to Xinhua News Agency. If it reaches the target of 600 by 2028, it would rank third behind South Korea and Singapore.

Transportation face-lift

The extensive deployment of robots at the terminal construction project offers three key insights, said Tang Shengling, senior consulting adviser at the Shanghai Artificial Intelligence Research Institute.

"First, it provides a reference model for large public infrastructure, offering practical experience for future major projects such as airports, rail transit and large-scale public buildings. Second, the clustered use of robots is reshaping the construction industry's long-standing reliance on labor-intensive methods. Finally, it will help drive the development of upstream and downstream technologies and the broader supporting ecosystem," Tang said.

When operational, Terminal 3 is expected to further enhance Shanghai's position as an international aviation hub, and be a crucial cog in the Yangtze River Delta's regional airport cluster.

Zhang, the deputy director of the terminal engineering department, said after completion, the new terminal will add 50 million additional annual passenger trips to the airport's capacity. Shanghai Pudong International Airport received nearly 85 million passenger trips by the end of 2025, exceeding its design capacity of 80 million, he said.

"Terminal 3 is designed to enable Shanghai Pudong International Airport to handle 130 million passenger trips annually by 2035," Zhang said.

Shanghai's two airports recorded more than 135 million passenger trips, and handled 4.5 million metric tons of cargo-and-mail throughput in 2025, according to the Shanghai Airport (Group).

The airport group currently operates an aviation network that reaches a record 302 destinations in 54 countries.

The construction of Terminal 3, which is the core project of the airport's phase-four expansion, officially started on November 20, 2024, and is scheduled for completion in 2028.

Shanghai is undergoing a face-lift of its transportation system with other major facilities scheduled for completion in the coming two years, including the Shanghai East Railway Station.

With the main structure more than 50 percent complete, the project is expected to finish construction by the end of this year, and is slated to begin operations by July 2027, according to local officials.

Baoshan Railway Station, the starting point of the 2,000-kilometer, 500-billion-yuan high-speed railway linking Shanghai and Sichuan province, is also set to be put into operation next July. The new station is expected to improve the integration of the Yangtze River Economic Belt.

Nation's brands eye World Cup

Chinese firms use AI, digital platforms to expand global reach as tournament nears

By **LI JING**
lijing2009@chinadaily.com.cn

The 2026 FIFA World Cup, which is scheduled to take place from June 12 to July 20, is emerging as a major global marketing stage for Chinese brands seeking to expand overseas, as fragmented viewing habits and digital advertising tools reshape how companies participate in top-tier sports events.

The tournament, jointly hosted by the United States, Canada and Mexico, is expected to attract more than 6 billion viewers worldwide, with overall exposure projected to rise 20 percent from the previous soccer World Cup, according to a recent survey by global advertising technology company The Trade Desk.

Chinese companies increasingly see the World Cup as more than just a platform for logo exposure. They are going to use the event to strengthen global brand recognition through technology, streaming platforms and social media.

"Top-tier sporting events are helping Chinese brands enter a more advanced stage of globalization," said Wang Xueli, director of Tsinghua University's Center for Development of Sports Industry.

"In the past, many Chinese companies mainly wanted to build basic brand awareness. But now, through top global events such as the World Cup, they are trying to strengthen their position in mid — to high-end markets and showcase their technological capabilities."

TTD's survey found that audience behavior around the upcoming tournament is becoming increasingly fragmented. At least one-third of viewers plan to follow matches through multiple channels, including traditional television, sports apps, connected TV platforms and short-form video content.

In North America, 45 percent of US respondents and 47 percent of Canadian respondents said that they would use sports apps to follow the event, while more than 40 percent in both countries planned to consume content through connected TV and streaming platforms.

"The World Cup is evolving from a 90-minute match into a long-cycle content ecosystem spanning pre-match buildup, live interaction and post-match engagement," said Ashley Wu, senior director of business development at TTD China. "That creates new opportunities for Chinese brands to build sustained connections with overseas consumers."

The changes are also lowering barriers for smaller brands.

Previous soccer World Cups were largely dominated by multinational sponsors who spent heavily on stadium exposure and naming rights. But artificial intelligence-driven advertising, streaming platforms and social media now allow smaller companies to target overseas consumers more precisely and at lower cost.

"Sports marketing is no longer only about sponsoring a team or buying billboard space," Wu said. "Even brands without huge budgets can now reach highly specific audiences through multi-channel campaigns."

Platforms such as TikTok and Instagram have pushed sports content far beyond core soccer fans, helping brands reach younger and female consumers. TTD's survey found that women now account for nearly half of viewers in several European markets, while Gen Z audiences in Spain and Italy showed engagement levels above 90 percent.

China's established global brands are also embedding themselves into tournament operations.

Hisense, the official display technology partner for the tournament's video assistant referee system, will supply RGB Mini LED displays for FIFA VAR centers. Meanwhile, Lenovo is deploying more than 10,000 devices and more than 200 engineers across all 16 venues, introducing AI-powered "digital twin" technology capable of generating 3D virtual replicas of players and match situations.

Analysts say such partnerships reflect a broader shift in how Chinese companies engage with global sports events.

"Chinese firms are no longer simply buying advertising boards around stadiums," Wang from Tsinghua University said. "They are becoming part of the technological infrastructure behind major international sporting events."

For Chinese companies, the appeal of global sports marketing may also lie in its relative stability during a volatile global geopolitical and economic environment.

"Whether it's tariffs or geopolitical tensions, sports remain one of the few globally positive and emotionally resonant topics," Wu from TTD China said. "For Chinese brands trying to build long-term international recognition, that kind of certainty has become increasingly valuable."

Vol. 38 — No.1837

Serbian President Aleksandar Vucic visits the innovation center of Minth Group in Jiaxing, Zhejiang province, on Wednesday. Vucic, who is on a five-day state visit to China, learned about the company's latest achievements in advanced manufacturing and the development of humanoid robots. LIU MINGXIANG / XINHUA

Vucic sees new chapter in bilateral ties

By **ZHAO JIA** in Beijing
and **CHEN YE** in Jiaxing, Zhejiang

When robots performed Serbia's Moravac folk dance on Wednesday at an innovation center in Jiaxing, Zhejiang province, Serbian President Aleksandar Vucic saw more than a display of smart technology.

In a social media post after visiting the innovation center of Minth Group, Vucic said that he had seen how robots are assembled and how they can be used in daily life, industry and entertainment.

He said the performance of the Serbian folk dance showed that technology is not only about science and machines, but also about understanding the traditions and spirit of a people.

Such technologies would soon come to Serbia with the support of Chinese friends and partners, bringing "a completely new development energy" to the country, he said.

Vucic visited Minth Group's facility in Jiaxing on Wednesday during his trip to Zhejiang. The company, a global supplier of automotive exterior parts, body structural components and products related to new energy vehicles, entered the Serbian market in 2018 and has since built 10 factories in the country, making it an important participant in China-Serbia industrial cooperation.

At the factory, Serbian young people demonstrated robotic operation skills they had learned there, drawing applause from Vucic and underscoring the role of skills training in bilateral industrial cooperation.

During the visit, Vucic also met representatives of major Chinese companies interested in investing in Serbia. He said the two sides discussed concrete projects, new factories, advanced technologies, and opportunities to provide even more jobs.

Vucic said the investment agreements reached and signed by the two sides on Wednesday, worth a total of 953 million euros ($1.11 billion), represented an enormous amount for Serbia. The projects showed "in the most beautiful way" what the ironclad friendship between Serbia and China means in practice, and how it could help "change the face of Serbia", he added.

The visit came amid deepening local-level cooperation and people-to-people exchanges between Zhejiang and the European country. In 2025, trade between Zhejiang and Serbia reached $990 million, up 11.1 percent year-on-year.

Zhejiang and Serbia have established four pairs of city-level friendly exchange relationships, while nearly 10 universities in Zhejiang have developed stable partnerships with Serbian educational institutions.

The China-Serbia Youth Cultural Exchange Center was also unveiled on Wednesday in Jiaxing. Designed as a long-term platform for bilateral youth exchanges, it will focus on emerging fields such as smart manufacturing, new energy, humanoid robots and the low-altitude economy. Under the program, 500 young people from Serbia will be invited to visit China.

At the center's opening, Vucic called it "a true treasure" for Serbia, where young people will learn about new technologies and return home with advanced knowledge. He encouraged them to learn from the Chinese people, build friendships with their Chinese peers, and take knowledge back to Serbia to contribute to the nation's development.

People-to-people exchanges are "of the utmost importance for Serbia" and valuable for Chinese young people, as the two sides learn from each other, adapt to different cultures and learn how to work better together, Vucic said.

After completing his itinerary in Zhejiang, Vucic went to Shanghai on Wednesday. He will conclude his five-day state visit to China on Thursday.

Friendship: Sandy stretches transformed

From page 1

According to the invitation, Yin's efforts have resulted in more than 300,000 trees being planted across 4,000 hectares, a feat that has earned her respect and recognition around the world.

"Over the past 35 years, you have worked with an indomitable spirit to transform desert areas into thriving oases," the invitation said.

Yin has been invited to "share her experience in sustainable development, to foster constructive dialogue, and to explore potential pathways for future collaboration".

"I want to talk about desert greening, protecting the Earth, the soil and the water," she said.

For Sakolsky, now 69 and a retired high school teacher in Pennsylvania, his stint in China had a profound impact on him. "The Chinese taught me to appreciate the simple things in life. It is about how much empathy and kindness you can share, as well as respect," he said.

Referring to his friend Yin, he added, "Please tell her I will see her soon."

On May 20, the Inner Mongolia autonomous region's people's association for friendship with foreign countries officially invited Sakolsky to "witness the growth of young saplings into dense forests".

Since 1959, China has established a desert scientific expedition team, according to a report of Guangming Daily. Through continuous exploration, the country has made breakthroughs in advanced theories and technologies, successfully transforming the appearance of large sandy stretches, while also providing the world with access to China's desertification control approach.

The Secretariat of the United Nations Convention to Combat Desertification has honored China for its "outstanding contribution to combating desertification" three times, a Xinhua News Agency report said.

Yuan Hui contributed to this story.

Market: More than 4,000 vendors sell everything from calligraphy to coins

From page 1

Since its founding in 1992, Panjiayuan has become China's most popular market for antiques and folk art. Today, it spans nearly 50,000 square meters, divided into six sections, including street stalls, classical furniture and modern collectibles. Over 4,000 vendors from across China sell products ranging from calligraphy and old books to coins and folk crafts.

Den Hartog also noticed the relaxed pace among some vendors — some even napping on chairs, others chatting with neighbors.

"There's a sense of life and leisure here that makes browsing fun. You're not just shopping; you're part of the market's rhythm," he said.

After three hours, Den Hartog's feet were tired, but he wasn't done. "The market is enormous. You could spend an entire day here," he said, reflecting on the layers of discovery. He capped off his visit at a nearby Wenzhou seafood restaurant, savoring the flavors before stepping back into the bustling streets.

Behind one of the bead stalls, Li Mei, a longtime vendor at the market, smiled warmly as she helped customers choose pieces.

"People come from all over the world. They bring a lively energy to the market. Some want antiques, some just want something beautiful to remember their trip. It's not just about selling; it's about sharing a piece of the city's memory," she said. "Some just enjoy the experience of discovery, nostalgia and connection."

There is Lu Ke, a book lover, who visits Panjiayuan's secondhand book stalls almost every weekend. She focuses on books about history, economics and literary biographies.

"Whenever I find something in those categories, I grab it without hesitation. Spending the equivalent of two cups of milk tea on books might seem trivial, but the joy and energy they bring last far longer than a sugary drink — so why not?" she said.

"The joy of browsing secondhand books isn't just in finding the right title; it's in flipping through the notes and thoughts left by previous readers, feeling the traces of time etched into the pages," she added.

Energy: Independent national strategies pursued

From page 1

But the timing carries its own meaning. Choosing to leave during the Iran war, when Gulf energy infrastructure has been under sustained attack and the Strait of Hormuz has been intermittently impassable, signals a state preparing for the next phase of regional politics on its own terms.

The Saudi-Emirati dimension is where the structural shift becomes visible. Riyadh has carried the political cost of OPEC+ production discipline for years, defending prices through cuts that constrained its own revenue and demanded coordination with Moscow. The UAE's exit means Saudi Arabia now carries that burden alone with Russia. The Emirati energy minister was at pains to insist the decision had nothing to do with Riyadh, that this was about national strategy and not about brothers within the group. That kind of careful denial usually confirms the underlying pressure. The two states will continue to coordinate where their interests align, but they are diverging under shared regional constraint, their interests still overlapping while the institutional architecture that bound them together gives way.

Read at the level of the regional order, what is happening in the Gulf is neither collapse nor consolidation. It is the gradual emergence of an arrangement in which states pursue independent national strategies under shared geographic and economic constraints, navigating their relationships with each other relationally rather than coordinating through inherited institutions.

OPEC was the central coordinating body of Gulf oil politics for nearly six decades. Its hollowing out reflects something larger: the leading Gulf producers no longer see institutional coordination as the right vehicle for their full range of interests, even when, as in Saudi Arabia's case, formal membership continues. The age of regional cartels and bloc discipline is giving way to something looser and more flexible, in which sovereignty is exercised through bilateral arrangements, parallel benchmarks and selective participation in overlapping platforms. The Iron Dome anti-missile battery deployed to Abu Dhabi during the Iran war and the recent OPEC exit are different expressions of the same logic. The Gulf is choosing flexibility over commitment, and capability over institution.

The institutions inherited from the 20th century, with OPEC chief among them, were built for a world in which oil-producing states needed coordination to manage their relationship with consumer markets and with the dollar system that priced their commodity. The Gulf states of 2026 are operating in a different world, one in which their strategic flexibility is more valuable than their institutional discipline, and in which their counterparties in Asia have built the financial and technical infrastructure to receive that flexibility.

The exits of Qatar in 2019 and the UAE in 2026 mark the visible surface of this transition. Whether others follow, and how the residual coordinating function of the cartel gets reconstituted, are the open questions of the next decade. What is no longer in question is the direction. The leading Gulf producers are moving away from the architecture of the 20th century, some by leaving its institutions, others by working around them while remaining inside.

Editorials

Steady development of ties will help advance China-Canada new strategic partnership

China and Canada have distinct historical and cultural backgrounds, yet cooperation and mutual benefit should be the main themes of their relationship.

Under the former Canadian government, however, the relationship faced numerous challenges, mainly due to its aligning the country with the United States in its China policy.

Since the Mark Carney government took office and signaled a change of approach, relations have gradually improved. This warming momentum has been steady after Carney's visit to China in January. During the visit, the two sides signed multiple economic and trade cooperation documents in agriculture, new materials, clean energy, finance and education.

Foreign Minister Wang Yi is scheduled to pay a three-day visit to Canada starting Thursday. The visit, the first by a Chinese foreign minister to Canada in a decade, is expected to help advance the implementation of the agreements reached during Carney's visit, including the resumption of the China-Canada high-level economic and financial strategic dialogue, and consultations on trade issues involving electric vehicles and canola seeds. The visit is also anticipated to facilitate further progress on Canada's previously announced plan to increase direct flights between the two countries, thereby enhancing bilateral economic, trade and people-to-people exchanges.

The breadth and depth of Sino-Canadian cooperation constitute a solid foundation to build on. In 2025, the total trade volume between China and Canada reached 124.09 billion Canadian dollars ($89.86 billion), with China consistently ranking as Canada's second-largest trading partner.

The two economies are also complementary. China, as one of the world's largest consumer markets, has a growing demand for Canada's agricultural products, energy resources and premium consumer goods, while Canada benefits from access to the superlarge Chinese market.

More importantly, China and Canada have the potential to jointly advance their new strategic partnership. The essence of a new strategic partnership lies in transcending ideological differences and geopolitical disputes, focusing on the common well-being of both peoples, and striving to advance the global governance system in a more just and equitable direction. China and Canada have the responsibility and capability to strengthen coordination and cooperation on major issues such as upholding multilateralism, addressing climate change and promoting global economic recovery.

Wang's visit can help enhance mutual understanding, which is crucial for the healthy development of bilateral relations. As the Chinese side stressed, the two sides should become partners that help each other achieve success and develop together. They should do more to promote cooperation and reduce items on the "negative list".

China looks forward to the visit enhancing political trust with Canada, expanding mutually beneficial cooperation, properly managing differences and promoting Sino-Canadian relations along a healthy, stable and sustainable trajectory for the betterment of both peoples, a Chinese Foreign Ministry spokesperson said.

As long as the two countries uphold the principles of mutual respect and equality, advance cooperation with a pragmatic attitude, and foster trust with a broad-minded approach, they can indeed become reliable partners.

However, it is imperative for Ottawa to pursue a consistent China policy grounded in mutual respect and strategic autonomy.

Canada should maintain an objective and rational stance on China-related issues within multilateral mechanisms such as the G7 and NATO, and resist attempts to transform economic and security platforms into tools of bloc confrontation and geopolitical rivalry.

In particular, Ottawa should refrain from sending any erroneous signals to "Taiwan independence" separatist forces.

Likewise, disputes in the South China Sea should be peacefully resolved by directly concerned regional parties through dialogue and consultation. As a non-regional country, Canada should avoid actions that risk complicating the regional situation, heightening tensions, or undermining mutual trust among regional countries.

Global poverty relief entails collaboration

A major outcome of the 2026 Global Poverty Reduction and Development Forum that opened in Beijing on Wednesday is the establishment of the Global Partnership for Poverty Alleviation and Development (GPPAD) by China and 53 other countries, along with nine international organizations.

While some major countries export inflation, chaos and war, China is contributing poverty reduction and sharing its experience to promote poverty relief and common development.

United Nations Development Programme Resident Representative ad interim for China James George said in the first committee meeting of the GPPAD, the UNDP welcomes the partnership's emphasis on dialogue, knowledge-sharing, South-South cooperation and multi-stakeholder collaboration, as these are essential elements for accelerating sustainable development progress and ensuring that development pathways remain inclusive, resilient and sustainable.

Against a backdrop of mounting global development challenges, the establishment of the partnership is both timely and significant. According to the latest Global Multidimensional Poverty Index report released by the UNDP, 1.1 billion people across 109 countries continue to live in multidimensional poverty, while nearly 890 million vulnerable people face the dual pressures of poverty and severe climate hazards. With three-quarters of the world's extreme poverty concentrated in rural areas, the urgency of strengthening international cooperation on poverty reduction has become increasingly evident.

At a time when climate change, economic uncertainty, food insecurity, debt pressures and geopolitical conflicts are undermining global development gains, no country can tackle these challenges alone. What the world needs is stronger solidarity, more pragmatic cooperation and platforms that enable countries to share experiences and pursue common solutions. In this regard, the founding of the partnership represents another global public good provided by China and its partners.

By promoting policy dialogue, technology sharing, capacity building and development cooperation, China is transforming its poverty reduction experience into an international resource that benefits more developing countries. This reflects China's commitment to advancing inclusive development and building a global community with a shared future free from poverty.

China's experience demonstrates that poverty is neither inevitable nor unconquerable. In 2021, the country declared a landmark achievement: the eradication of absolute poverty, following a decades-long effort that lifted around 800 million people out of destitution. With that, the nation achieved the poverty reduction target of the UN 2030 Agenda 10 years ahead of schedule.

China has actively promoted international exchanges and cooperation on poverty alleviation. Through the Global Development Initiative, South-South cooperation projects, agricultural assistance programs and poverty reduction training seminars, China has shared its experience and technology with countries across Asia, Africa and Latin America. From hybrid rice technology benefiting farmers in nearly 70 countries to mushroom cultivation creating employment opportunities in over 100 countries and regions, China is sharing its hard-earned experience with the world.

Fundamentally, the issue of poverty reduction is an issue of development. Only through development can impoverished regions cultivate endogenous growth drivers and achieve sustainable prosperity. China's experience shows that poverty alleviation must move beyond short-term relief and focus instead on strengthening self-development capabilities.

As Chinese Vice-Premier Liu Guozhong said at the forum, China will support the GPPAD in fully leveraging its role by strengthening policy dialogue, technology demonstration and talent training, while developing a series of "small but beautiful" projects to help developing countries enhance their poverty reduction capacities.

To this end, there is an urgent need for all parties to build broader consensus and accelerate the global poverty reduction process. The proposals put forward by Liu underscore China's commitment to advancing international poverty alleviation through pragmatic, results-oriented actions. As he said, countries should accelerate pragmatic actions, strengthen dialogue and exchanges, enhance endogenous drivers by vigorously promoting market and technology-enabled empowerment, reinforce multilateral coordination and improve the global governance system for poverty reduction.

Poverty relief is not a one-time accomplishment but a long-term undertaking for all countries. Only through collaboration and shared progress can humanity build a better future marked by lasting prosperity and dignity for all.

Real emotional connection at heart of *Dear You*'s success

Dear You, a low-budget drama in the Chaoshan (Teochew) dialect, has achieved quite a feat. According to the ticketing platform Maoyan, as of Tuesday the film, which cost 14 million yuan ($2.06 million) to make, had raked in over 1.1 billion yuan at the box office. Featuring a non-professional cast, the film has garnered an impressive rating of 9.2 out of 10 on the popular movie review platform Douban. The success of *Dear You* is a testament to the power of compelling storytelling. Despite lacking star power, the film's touching storyline attracted an audience by word of mouth. This spontaneous reaction shows the drawing power of a work that touches the heart.

The film is not just all romance; it is also about a profound sense of duty and moral obligation. At its heart lies a touching story: After the male main character dies a tragic death while working abroad in Thailand, a compatriot, Xie Nanzhi, a woman of Chaoshan descent who had befriended him there, chooses not to immediately tell his wife. Instead, she continues his practice of sending letters and money home for 18 years. This act of kindness and dedication quietly helps a stranger far away.

From being illiterate to learning how to write, Xie perseveres in her self-imposed endeavor. Each painstakingly written Chinese character represents a solemn promise she keeps to herself. This loyalty transcends blood ties and life and death, embodying the deep-seated Chinese sense of responsibility to fulfill a promise with utmost dedication. These letters, imbued with tears and warmth, touch the softest part of every viewer's heart.

Moreover, the film evokes memories of *qiaopi*, the letters and remittances sent home by earlier generations of overseas Chinese during the 19th and 20th centuries. In 2013, UNESCO recognized the *qiaopi* archives, emblematic of the Teochew culture, by adding them to its Memory of the World Register.

These letters, which traversed oceans to reach loved ones back home, are more than emotional connections; they are cultural legacies. Through them, we gain insights into the hardships and perseverance of the older generation of overseas Chinese, as well as their profound attachment and unwavering dedication to their homeland. The film captures this historical narrative, illustrating how the *qiaopi* carried not only financial support but also the enduring spirit and cultural identity of the Chinese people.

In today's globalized world, *Dear You* offers a compelling answer to the question of how local culture can reach a national or even global audience. The film shows that local narratives, when infused with universal human emotions, can resonate with audiences everywhere, overcoming cultural and linguistic barriers. By blending local stories with universal human emotions, culture can transcend its own boundaries and be sustained and revitalized through creative means.

The success of *Dear You* shows exactly what Chinese cinema needs. It teaches us that true cultural transmission lies not in the packaging of form, but in the depth of content; not in the flaunting of technology but in the sincerity of emotion. When we can embed our most precious emotions in the simplest stories, we have the genuine capability to touch hearts and become part of something larger than ourselves.

— HUANG XIANGYANG, CHINA DAILY

What They Say

Pilot AI boundaries leave room for innovation

Editor's note: *China recently launched a pilot program for the review of artificial intelligence ethics and services. Southern Finance spoke to Zeng Tieyong, director of the Center for Mathematical Artificial Intelligence at the Institute for Advanced Study at Beijing Normal-Hong Kong Baptist University, about the future of AI governance. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The pilot program will initially be launched in provincial-level regions that have national pilot zones for AI industrial innovation and application. The goal is to explore practical approaches for implementing AI ethics review and service mechanisms.

The main purpose of AI ethics governance is to establish clear boundaries for the development of the industry, defining which types of technological research and commercial applications are encouraged and which practices are strictly prohibited.

On the one hand, this approach will help mitigate the risks associated with AI, including privacy breaches, financial security concerns and unclear algorithmic accountability. On the other hand, by clearly defining baseline rules, the industry can be given sufficient room for innovation, preventing excessive regulation from stifling technological progress.

The move indicates that China's AI governance framework is moving beyond broad principle-based guidance toward a more institutionalized, scenario-specific and operational stage. The pilot program suggests that regulation is now penetrating deeper into industrial settings, with the aim of developing governance models that can be replicated and expanded nationwide.

The core of promoting AI lies in real-world application scenarios, and vertical application sectors are precisely where AI can be deployed most quickly and effectively. By establishing governance red lines in sectors closely tied to daily life, China can both accelerate the delivery of AI-driven public benefits and gain regulatory experience through practical social applications.

The program allows governance models to evolve from specific sectors to the broader industry ecosystem, maximizing the practical value of the AI industry while safeguarding ethical boundaries.

The main challenge in the AI industry remains high-end hardware manufacturing. Due to external technological restrictions and supply chain constraints, critical technologies such as lithography machines and high-performance computing chips remain major bottlenecks.

At the same time, China has several notable advantages, including its enormous talent pool. Chinese universities produce a large number of doctoral and master's graduates every year, providing abundant technical manpower that can be rapidly transformed into industrial productivity.

Another advantage is the country's diversified application scenarios. China's policy environment is generally more supportive of AI commercialization and deployment. Drawing on the development experiences of industries such as photovoltaics and new energy vehicles, AI technologies in China are able to scale and quickly enter the market.

While supporting governance mechanisms for AI is crucial, the two decisive factors for catching up remain talent reserves and breakthroughs in core hardware technologies.

China already has a strong foundation of practical engineering and technical personnel at the grassroots level, along with a large concentration of high-end specialists trained by top universities. If these resources can be effectively mobilized, they will be sufficient to sustain large-scale industry-wide research and development. What China currently lacks most is a smaller group of world-class pioneers capable of leading frontier innovation.

China's rapid rise in the NEV sector offers an important reference point. By bypassing traditional technological barriers, leveraging domestic supply chains and talent advantages, and eventually achieving breakthroughs in hardware self-sufficiency, China's AI industry is widely expected to become globally competitive and potentially take the lead.

VIEWS

Fred S. Teng

Reshaping the world with fairness and peace

The world does not suffer from a shortage of institutions. What it suffers from is a weakening respect for the principles that give institutions legitimacy.

If the foundation on which a building stands is eroded, the structure is at risk. At the center of the modern international order stands the United Nations Charter. Signed in 1945 after the devastation wreaked by two world wars, the Charter was not merely a diplomatic document drafted at a conference.

It was a civilizational commitment and represented humanity's collective decision that war should no longer be treated as a normal instrument of national ambition, sovereignty should be protected, disputes should be settled peacefully, and international cooperation should serve the common progress of humanity.

Eight decades later, the authority of the Charter is under severe strain. Armed conflicts continue. Unilateral sanctions are increasingly imposed outside the UN framework. Military interventions are justified through selective interpretations of security. Global governance is divided by bloc politics.

Many smaller and developing countries fear that international rules are applied unevenly, depending on the power and interests of those involved.

This is why the world urgently needs to revitalize the authority of the UN Charter and renew the role of the UN itself. This does not mean treating the UN as perfect, but recognizing that without the Charter, the world becomes more dangerous, less predictable and more vulnerable to the rule of force.

The Charter rests on several basic principles: sovereign equality, noninterference in internal affairs, peaceful settlement of disputes, prohibition on the use of force except under limited lawful conditions, collective security, human rights, development, and international cooperation.

These principles are not abstract ideals, but the operating system of international coexistence.

Sovereign equality protects smaller countries from domination by stronger states. Peaceful settlement gives diplomacy a chance before conflict becomes irreversible. Collective security prevents individual states from claiming unlimited authority to define threats and punish others.

Development cooperation recognizes that peace cannot be separated from economic dignity. Human rights remind states that sovereignty carries responsibilities as well as protection.

The UN Charter did not weaken overnight, but due to repeated departures from its spirit.

The use of force has too often been justified without clear UN authorization. When powerful countries act first and seek legal or moral justification later, the authority of collective security is eroded.

Unilateral sanctions imposed beyond the UN framework, especially with extraterritorial effects, create a parallel system of punishment that hurts ordinary people and weakens the legitimacy of international law.

International institutions have also been pulled into geopolitical rivalry. Instead of serving as platforms for dialogue, they are sometimes used as arenas for accusation, pressure, and alignment.

At the same time, the voices of the Global South remain underrepresented in global decision-making. Many developing nations see a gap between the promise of sovereign equality and the actual distribution of power. This gap damages confidence in the system.

New global challenges make revitalization even more urgent. Artificial intelligence, climate change, pandemics, cybersecurity, debt distress, food insecurity and space governance are moving faster than existing institutions can respond.

If the UN cannot adapt to these realities, its authority will weaken not because its principles are wrong, but because its mechanisms appear inadequate.

Despite its limitations, the UN remains indispensable because it is the only international organization with near-global membership, the only institution where large and small countries sit under one roof.

The UN provides legitimacy that no military alliance, economic bloc, or informal coalition can replace. It gives developing countries a voice, creates channels of communication even when relations among major powers deteriorate, and coordinates humanitarian relief, peacekeeping, development, public health cooperation, refugee support, climate discussions, and international law.

The UN does not eliminate conflict, but it provides a place where conflict can be managed. It does not guarantee justice, but it preserves a language of justice. It does not always stop war, but without it, the world would have even fewer barriers against war.

Revitalizing the authority of the Charter requires more than speeches. It requires discipline from major powers.

They must recommit to the principle that force should not be used except in accordance with the Charter. They must avoid treating international law as a tool to be invoked when it is convenient and ignored when it is not. They must accept that security cannot be built on humiliation, exclusion, or coercion.

The UN Security Council must recover its role as the central mechanism for collective security.

Its permanent members have special privileges, but also special obligations. The veto should not become a shield for paralysis. Nor should frustration with the veto become an excuse to bypass the Charter.

Revitalizing the UN also requires making it more representative. The world of 1945 is not the world of today. Asia, Africa, Latin America, and the broader Global South now play a far greater role in global growth, population, trade, diplomacy, and development. Reform should be approached carefully but seriously, with the goal of making the UN more legitimate, balanced, and capable.

Development must also return to the center of the UN mission. Peace and security cannot be separated from development. A world of deep inequality will not be stable. Poverty reduction, infrastructure, education, health, climate adaptation, digital access, and fairer participation in the global economy should not be treated as secondary issues. They are the foundations of peace.

A Charter-based world order is not an argument against any country or bloc, but an appeal for restraint, legitimacy and survival.

It not only protects the weak from the strong, but also protects the strong from the consequences of overreach. It gives rivals a framework for coexistence and gives diplomacy time to work.

If nations return to the Charter not as a ceremonial document, but as a living framework for coexistence, the UN can be the house where conflict is restrained, dialogue remains possible, power is held accountable, and humanity remembers that peace is not the absence of disagreement, but the discipline to resolve disagreement without destroying the world we share.

SHI YU / CHINA DAILY

Syed Inam Ali Naqvi

China-Pakistan partnership moves beyond infrastructure

The China-Pakistan relationship is often seen through the lens of infrastructure development. Public discussions tend to reduce the partnership to roads, ports and energy projects connecting western China to the Arabian Sea through Pakistan, particularly the $62 billion China-Pakistan Economic Corridor (CPEC). While this perspective is not entirely inaccurate, it fails to capture the true nature of the relationship.

When the CPEC was formally launched in 2015, infrastructure development became the dominant symbol of bilateral cooperation. Power plants, road networks, and the development of the Gwadar Port were the visible foundations of the partnership.

Supporters saw CPEC as a transformative initiative capable of reshaping Pakistan's economy, while critics regarded it as a source of debt dependency. Despite their opposing views, both perspectives shared a common assumption that China-Pakistan cooperation was primarily an infrastructure-based relationship. Today, this assumption appears quite inadequate.

The first phase of the CPEC produced substantial outcomes.

Pakistan's long-standing energy crisis, which had imposed serious economic costs, was eased through new energy projects and investments. Transport networks improved connectivity with previously isolated regions.

Furthermore, the Gwadar Port acquired strategic importance beyond its economic potential. Access to the Gwadar Port offers China additional connectivity to the Indian Ocean, helping diversify China's shipping channels beyond the Strait of Malacca. These were important achievements which demonstrated what sustained political commitment between the two countries could accomplish.

At a time of intensifying geopolitical fragmentation and economic uncertainty, the broadening of China-Pakistan cooperation reflects an effort by both countries to build longer-term strategic resilience.

Yet infrastructure alone cannot define the future of bilateral cooperation.

As economic priorities, technological change, and regional dynamics continue to evolve, the relationship increasingly appears to be entering a broader phase centered on resilience and long-term capacity building.

The emerging Phase II of the CPEC aims to transform infrastructure into broader economic opportunities. Recent cooperation initiatives have expanded beyond transport and energy to include industrial development, digital connectivity, innovation, and green cooperation.

Through special economic zones, technology partnerships, and growing business-to-business engagement, the focus is gradually shifting from building physical assets to creating longer-term economic and institutional ecosystems.

Special economic zones under the CPEC's expanded framework are not simply investment projects; they increasingly function as mechanisms for industrial development, investment attraction, and integration into regional and global value chains. Beyond infrastructure itself, they represent efforts to generate employment, expand exports, and create longer-term economic opportunities. The expansion of 5G networks, fiber-optic infrastructure, technology parks, satellite cooperation, and broader digital collaboration points to a shift from physical connectivity toward a more knowledge-based economy.

And cooperation deepening in areas such as e-commerce, digital skills development, and information technology further suggests an evolving partnership focused on strengthening technological capacity, innovation, and long-term economic development.

The evolution of Phase II can also be observed in the growing role of the private sector and business communities.

During the recent Pak-China B2B Investment Conference in Beijing, nearly 800 firms from both countries participated, resulting in joint ventures and MoUs worth approximately $8.5 billion.

Such a shift not only broadens the relationship beyond governments but also strengthens its long-term sustainability through investment, entrepreneurship, and technological collaboration.

The partnership's human dimension is equally important and may ultimately prove more durable than material projects.

Nearly 29,000 Pakistani students studying at Chinese universities are developing technical expertise, language skills, and professional networks that could shape Pakistan's future institutions.

Many of these students will eventually enter government institutions, businesses, and policy circles. The relationships and networks they build today may shape China-Pakistan engagement for decades.

The relationship has also expanded diplomatically, reflecting broader coordination on regional and international issues. This evolution further suggests that China-Pakistan cooperation extends beyond infrastructure projects toward a more multidimensional partnership.

Ultimately, China-Pakistan cooperation is evolving beyond its earlier emphasis on infrastructure construction alone. While the first phase of the CPEC focused primarily on physical connectivity, the emerging phase increasingly emphasizes industrial development, technological capacity, business engagement, and human capital.

Challenges remain, including security concerns, financial constraints, and implementation difficulties.

Yet the broader trajectory suggests that both countries are attempting to build a more diversified and resilient partnership capable of adapting to a changing regional and global environment.

The long-term success of that partnership may ultimately depend less on individual projects than on whether both sides can translate connectivity into sustainable economic and institutional development.

Chi Fulin

Regional cooperation can open doors to global growth

The Regional Comprehensive Economic Partnership has successfully integrated 15 Asia-Pacific economies into one of the world's most dynamic industry and supply chain networks. It is an indispensable force for advancing regional economic integration and a new form of economic globalization.

However, RCEP now finds itself at a critical juncture where standing still means falling behind.

In a world of growing uncertainty, we face a critical choice: allow geopolitical fragmentation to undermine the hard-won unified market, or bolster our resilience through higher-level regional integration.

A development-oriented approach is the defining feature of the RCEP.

But changes in the geopolitical landscape are exerting serious shocks on the region. Most RCEP economies are highly dependent on external energy supplies. In 2025, more than 80 percent of the crude oil imports to the RCEP region passed through the Strait of Hormuz.

According to projections by the Asian Development Bank, if the Iran conflict continues into the third quarter of 2026, economic growth in developing Asia-Pacific economies will slow significantly.

A more uncertain external environment makes it imperative for the region to strengthen cooperation. Cooperation can help address the uncertainty stemming from frequent geopolitical conflicts.

RCEP members can deepen industry chain coordination and promote the regionalization of energy and manufacturing supply chains, thereby reducing dependence on single maritime routes and strengthening supply chain security. RCEP should remain firmly focused on development, and non-economic factors should not be introduced into the agreement.

A more uncertain external environment makes it imperative for the region to strengthen cooperation.

From a global perspective, the greatest advantage of China and the Association of Southeast Asian Nations lies in the certainty of growth.

If ASEAN becomes the world's fourth-largest economy and China becomes the world's largest in the coming decade, the global economic landscape will be profoundly reshaped.

RCEP has become an important force for advancing global free trade.

From 2021 to 2025, intra-RCEP trade increased from $4.9 trillion to $6.1 trillion, a rise of 24 percent.

Driven by both trade and investment, the RCEP region recorded average annual GDP growth of 3.6 percent from 2021 to 2024, contributing nearly 40 percent to world economic growth.

To build on this momentum, RCEP rules must be fully implemented.

Members should accelerate the implementation of provisions on digital payments and electronic invoices, deepening cooperation in emerging fields such as artificial intelligence and financial technology.

Furthermore, the regional division of labor must be optimized. In 2024, trade in intermediate goods accounted for more than 68 percent of total RCEP trade — significantly above the global average.

Against the backdrop of rising protectionism, it is necessary to accelerate the establishment of an RCEP supply chain emergency coordination mechanism to build a regional safeguard for essential goods.

To reach its full potential, RCEP should promote deeper opening of the regional markets. Members should strive to raise the region's zero-tariff coverage to more than 95 percent within the next five years.

Trade in services is a priority. This calls for an early transition from a "positive-list" to a "negative-list" approach for services trade and investment.

Rule upgrading is equally vital. The review of rules of origin should be completed and higher-standard rules in digital trade and climate change introduced. Furthermore, RCEP should achieve a breakthrough in membership expansion.

The accession of the Hong Kong Special Administrative Region of China to the RCEP would further enhance its international influence. As a free trade port with a common law system and mature financial services, Hong Kong could help ASEAN members address financing gaps. We look forward to a substantive breakthrough on this issue in 2026.

Finally, the RCEP Support Unit should be upgraded into a formal secretariat to move the region from "soft constraints" toward "binding governance".

Strengthening RCEP requires upholding the principle of ASEAN centrality. By promoting the effective connectivity between China's vast market and the RCEP market, we have created a stabilizing anchor for the region.

From 2021 to 2024, China contributed more than 70 percent to RCEP's economic growth. The country will continue to support RCEP through high-level opening-up, accelerating the fulfillment of tariff reduction commitments and reducing tariffs on intermediate goods.

In this context, the Hainan Free Trade Port serves as a strategic gateway. It is well positioned to take the lead in fully implementing RCEP and the China-ASEAN Free Trade Area 3.0, becoming a new frontier of institutional opening-up.

The RCEP has proven that the greater the external uncertainty, the stronger the region's internal resolve must be; and the greater the pressure, the more firmly the region must commit to openness and cooperation.

At a time when geopolitical conflicts and protectionism are increasingly intertwined, it is all the more important for us to work together to strengthen a development-oriented RCEP, and to respond to global uncertainty with the certainty of development.

GLOBAL VIEWS

WANG XIAOYING/ CHINA DAILY

CHAIWAT MEESANTHAN

River of shared prosperity

Thailand-China cooperation on water resources is deepening under the LMC framework

As the Lancang-Mekong Cooperation mechanism marks its 10th anniversary in 2026, the region is celebrating a remarkable milestone in international partnership. Officially established in 2016, the LMC has grown into an important engine for regional growth. China and the five Mekong countries have been working together to usher the framework into the next golden decade by staying committed to building a better community through solidarity.

At the very heart of this successful architecture lies a shared commitment to the management of shared water resources and sustainable development. Rather than viewing the river as a dividing line, Thailand, China, and their neighbors have transformed the Lancang-Mekong River into a profound symbol of interconnected prosperity, paving the way for a resilient Association of Southeast Asian Nations-China community.

The LMC is historic in its structural design: It provides the first water cooperation framework that fully integrates all six countries along the river, encompassing both upstream and downstream nations. This inclusive approach has fostered an environment where transparent communication, mutual trust and practical problem-solving take center stage.

For Thailand and China, water resources cooperation has evolved from high-level dialogue into highly effective, on-the-ground action. Over the past decade, the framework has facilitated the sharing of vital hydrological information and improved basin-wide governance. Through initiatives such as the Lancang-Mekong Water Resources Cooperation Information Sharing Platform and the dedicated Lancang-Mekong Water Resources Cooperation Center located in Yunnan province, China has actively shared daily hydrological data from its hydropower plants with downstream neighbors.

This data transparency is a game-changer for local communities. It allows Thailand and other downstream states to better forecast river behavior, optimize agricultural water use and protect vulnerable ecosystems. Furthermore, the cooperative management of upstream reservoirs has served as a critical regional public good; by regulating floods during the rainy season and replenishing water levels during droughts, these cooperative measures have shielded millions of livelihoods from extreme weather shocks.

Notably, targeted water releases from China's Jinghong Dam in Yunnan province during critical drought periods have provided essential relief to downstream agriculture, demonstrating a tangible commitment to mutual support.

Looking ahead, this collaboration can be strengthened. The Initiative on Deepening Lancang-Mekong Water Resources Cooperation can be fully implemented to further upgrade joint capabilities. By investing in cutting-edge platforms such as the Lancang-Mekong River Basin Comprehensive Meteorological Service Platform, Thailand, China and other neighbors can ensure that the region is structurally prepared to adapt to climate change and mitigate natural disasters.

The ultimate measure of the LMC's success is its impact on the everyday lives of the people who call the Lancang-Mekong River Basin home. Through the LMC Special Fund, China has consistently provided financial support and capacity building for irrigation, water navigation and drought prevention. Across the region, more than 1,000 "small and beautiful" livelihood projects have been successfully carried out, directly improving local people's living standards.

For agricultural communities in Thailand, these initiatives translate to enhanced food security and poverty reduction. China has actively supported rural and agricultural revitalization across the Lancang-Mekong countries, advancing digital cooperation throughout the industry chain. Pilot programs for smart farms and the establishment of traceability systems for fruit products are actively enhancing the competitiveness of Thai agricultural exports while building greater resilience in local production systems.

The LMC operates as one of the most dynamic and effective platforms for regional cooperation, playing a pivotal role in narrowing regional development gaps and boosting socioeconomic development. The resulting economic synergy is undeniable, with trade between China and the Mekong nations surging past the $500 billion mark, a 150 percent increase from a decade ago.

While the region celebrates this progress, it must also navigate a global landscape characterized by complex geopolitical shifts, economic instability and climate change. Instead of succumbing to division, Thailand, China and the broader ASEAN community can utilize the LMC framework to reinforce their strategic coordination and mutual trust.

During the ninth LMC Foreign Ministers' Meeting, which was held in Chiang Mai, Thailand, Chinese Foreign Minister Wang Yi underscored that "the LMC countries should adhere to true multilateralism and open regionalism, resolutely resist zero-sum games and decoupling and severing industrial and supply chains, and work together to build a Lancang-Mekong home that shares weal and woe in solidarity". By focusing on shared development rather than geopolitical competition, the LMC serves as a stabilizing force, offering a unique Lancang-Mekong model for multilateral governance.

To future-proof their economies against external uncertainties, the member states are rapidly expanding their cooperation beyond traditional infrastructure. The next phase of the LMC can focus on innovation-driven growth, including artificial intelligence capacity building, space cooperation and the digital economy. Recognizing the global imperative for sustainability, there is also a concerted push to invest in new energy, develop green industrial clusters and build regional green value chains.

Thailand's active role will be instrumental in guiding this collaborative agenda. Thailand is positioned to advocate strengthened, unified responses to shared challenges. By harmonizing the LMC's objectives with broader ASEAN community-building efforts, Thailand and China can work together to ensure that the region remains a resilient, self-determined bloc capable of weathering global storms.

The story of the LMC over the past decade is one of remarkable optimism and enduring partnership. Through dedicated water resources cooperation, Thailand and China have demonstrated that shared natural resources can serve as a bridge to mutual prosperity.

As the region steps into its second decade of cooperation, the foundations rooted in transparent water management, innovative agricultural support and unwavering geopolitical solidarity can continue to support a thriving, peaceful and highly integrated community. The "golden decade" is not merely a diplomatic slogan; it is a living reality for millions of people whose futures are brightly interconnected by the waters of the Lancang-Mekong region.

CHUNG TIN FAH

Shaping the Asia-Pacific economic landscape

CAFTA 3.0 offers ASEAN and China a platform to shape regional governance in an increasingly fragmented world

Relations between the Association of Southeast Asian Nations and China have evolved to become one of the most consequential partnerships shaping the economic and institutional landscape of the Asia-Pacific region. Rooted in long-standing historical exchanges and guided by the principles of mutual benefit, inclusivity and cooperation, the relationship has transitioned from largely bilateral interactions to a multi-layered, rules-based regional framework for shared prosperity. This transformation reflects both structural economic changes and strategic recalibration in response to an increasingly fragmented global order. The recent upgrade of the China-ASEAN Free Trade Area to its 3.0 version marks a pivotal step toward complementarity-driven integration, particularly in emerging sectors such as digital technologies, green development and resilient supply chains.

The foundations of this modern partnership were significantly strengthened during regional challenges such as the Asian financial crisis, when China's stabilizing policies demonstrated its commitment to regional solidarity. Subsequent milestones, from China's accession to the World Trade Organization in 2001 to the establishment of the original CAFTA and the participation in broader regional architecture such as the Regional Comprehensive Economic Partnership, have woven an increasingly dense web of economic communication and diplomatic consultation.

Today, the convergence between China's domestic development goals, outlined in the 15th Five-Year Plan (2026-30) focusing on high-quality growth and technological innovation, and the ASEAN Economic Community Strategic Plan (2026-30) provides a macro-level platform to deepen cooperation, particularly in the digital economy, green economy and supply chain integration. This synergy closely complements China's technology and climate strategy and ASEAN's regional integration and connectivity agenda.

CAFTA 3.0 is the cornerstone of the new phase. Unlike earlier phases focused primarily on tariff reduction, CAFTA 3.0 introduces a broader and more sophisticated agenda, encompassing supply chain integration, digital economy governance and green development. These areas are central to China's domestic development strategy, particularly its emphasis on technological self-sufficiency and climate commitments. At the same time, they offer ASEAN member states opportunities to leapfrog into higher value-added activities and enhance their competitiveness in the global economy.

CAFTA 3.0 also addresses the need for more resilient supply chains in the face of global disruptions. By promoting connectivity and diversification, the agreement reduces vulnerability to external shocks and strengthens regional production networks. Furthermore, its provisions on financial technology and artificial intelligence signal a move toward greater regulatory openness and innovation, creating new avenues for cross-border collaboration.

For Malaysia, these developments are particularly significant. The country's ambition to position itself as a regional technology hub aligns closely with the opportunities presented by CAFTA 3.0. Participation in digital infrastructure initiatives, including smart city development and digital payment systems associated with broader regional connectivity projects, can enhance Malaysia's role in the regional digital economy.

A defining feature of ASEAN-China relations is the principle of ASEAN centrality, which emphasizes ASEAN's role as a convener, coordinator and normative leader in regional affairs. This principle has enabled ASEAN to maintain strategic relevance despite the presence of larger powers and to shape the regional order through consensus-based mechanisms.

In the context of CAFTA 3.0, ASEAN centrality is increasingly manifested in the development of regional governance frameworks, particularly in the digital domain. Efforts to establish an ASEAN-wide data governance framework illustrate this trend. Such initiatives involve mapping national regulatory frameworks, aligning them with international best practices, and fostering dialogue among member states to achieve greater harmonization. Through these processes, ASEAN not only facilitates economic integration but also sets standards that influence broader regional dynamics.

The transformative potential of agreements such as CAFTA 3.0 can only be fully realized if the region tackles the tangible hurdles of logistics inefficiencies, high supply chain costs and uneven infrastructure development. These are not mere technical issues; they are fundamental to ensuring that the benefits of integration are equitably distributed and ASEAN remains collectively competitive. The region's customs and logistics costs, which remain well above international benchmarks, directly undercut the efficiency gains promised by trade liberalization. Similarly, the success of digital integration hinges on bridging vast differences in data governance capabilities among member states. Initiatives to map national frameworks and explore harmonization, such as the ASEAN ICT Masterplan that calls for creating a coherent and comprehensive framework for personal data protection, are crucial first steps, but they must be coupled with concrete capacity-building and infrastructure investment.

Therefore, strengthening internal cohesion and institutional capacity is essential. Effective regionalism requires more than visionary blueprints; it demands robust governance mechanisms, transparent communication and active engagement with the private sector, which ultimately drives trade and investment. ASEAN's outlined measures — from establishing regular consultative forums to enhancing strategic communications — are recognition of this need. The partnership with China can be a powerful catalyst in this regard. China's expertise and resources in infrastructure and digital economy development can, under the framework of ASEAN centrality, support initiatives that enhance physical and "soft" connectivity within the region, thereby strengthening ASEAN's internal coherence and its capacity to engage the world from a position of collective strength.

ASEAN-China relations have undergone a profound transformation, evolving from historically rooted interactions into a deeply institutionalized partnership that balances economic integration with strategic autonomy. It demonstrates that regional cooperation, grounded in mutual benefit and respect for a regional-led order, can be a profound source of stability and growth. The introduction of CAFTA 3.0 represents a shift toward rules-based, innovation-driven regional integration, reflecting the changing dynamics of the global economy. As both sides work to implement CAFTA 3.0, their shared challenge is to translate institutional innovation into inclusive, tangible outcomes for businesses and communities. Ultimately, CAFTA 3.0 offers not only an opportunity for deeper economic integration but also a platform for shaping the future of regional governance in an increasingly uncertain international landscape.

TALES & TRAILS

Editor's note:
China Daily reporters leverage local expertise to devise diverse itineraries that showcase a blend of historical landmarks and natural wonders in highly recommended cities and sites, offering practical guidance to experience the country.

Ancient armor opens wide

From mountain villages to virtual worlds, the Great Wall is evolving far beyond its origins, **Yang Feiyue** reports.

At first glance, the Great Wall can appear immovable — a vast ribbon of stone and earth frozen in history books and postcard images. But travel along its ridges today, and another story begins to unfold. The Great Wall is no longer only a monument to the past. In many places, it is becoming something alive again: a classroom, a hiking trail, a livestream studio, a village economy, even a digital conversation across centuries.

In one mountain valley, children shape wet clay into bricks the way Ming Dynasty (1368-1644) craftsmen once did, pressing their names into the surface before the mud hardens. Elsewhere, hikers follow forest trails where ruined watchtowers emerge suddenly through the trees, while village cafes and guesthouses glow warmly beneath ancient battlements.

On the outskirts of Beijing, visitors can speak with an AI-generated general from the Ming era, watch old frontier photographs come to life, and step into immersive worlds reconstructed from fading archives. Farther west, the Great Wall stretches across deserts, grasslands and snow-covered mountains, tracing routes once traveled by soldiers, merchants, monks and envoys.

What connects these places is not simply the Great Wall itself, but the people reimagining what it means. Some preserve forgotten kilns and fortresses stone by stone. Some revive abandoned villages as thriving cultural destinations. Others use technology to give vanished landscapes and historical figures new voices. Together, they reveal a monument far more complex than a static relic.

Built centuries ago to defend borders, the Great Wall is now opening new pathways between past and present, cities and villages, heritage and innovation, memory and everyday life.

The stories that follow explore the Great Wall's many evolving identities — not merely as an ancient defense system, but as a living cultural landscape that continues to shape how people travel, learn, create and connect.

For centuries, the Great Wall has stood atop the mountain ranges as a historical monument and cultural icon. PROVIDED TO CHINA DAILY

REVIVING CULTURAL GREATNESS

Through research, technology and community support, various sections are captivating new audiences with dynamic appeal, **Yang Feiyue** reports.

From left: Visitors get hands-on experience with traditional paper-cutting in Shixia village, Beijing's Yanqing district. Local residents actively volunteer to protect the Great Wall. The Shixiaguan section of the Great Wall in Beijing's Yanqing district is a popular destination for outdoor enthusiasts. An exhibition space provides an in-depth look at the village's history and its historical connection to the Great Wall. Tiger dolls are popular souvenirs among visitors. PHOTOS PROVIDED TO CHINA DAILY

From digital avatars to forest trails and hands-on brick-making, different sections of the Great Wall are drawing new audiences and redefining what heritage protection can mean. At Banchangyu Great Wall park, visitors can walk the same ground where Ming Dynasty (1368-1644) soldiers once stood, touch bricks fired nearly 500 years ago, and try their hand at making a Great Wall brick.

On weekends, children crowd the brick-making workshop, mixing clay and carving their names into fresh blanks, while hikers follow trails through the area's thick forests.

Each morning, one man broadcasts it all to the world. At 7 o'clock sharp, Xu Guohua, without fail, turns on his phone and begins his livestream.

Three phones are mounted in front of him, streaming live to Douyin and WeChat simultaneously. The 73-year-old wears a plain dark blue cotton jacket. His weather-red face, tanned by years of outdoor work, catches the light. In his hand, he holds a small wine cup, no wider than two fingers.

"Look at this artifact from the Ming Dynasty — we dug it up in our village," he says to the camera.

Xu usually gets 1,000 to 2,000 views a day as he talks about artifacts, brick kilns and folk stories from beneath the centuries-old Banchangyu Great Wall.

"I don't really understand the internet, but I have been doing this every morning for five years," he says.

He takes pride in promoting the history and culture of the Great Wall in his birthplace.

A man from southern Guangdong province came all the way to see him after watching his broadcast, while a couple from Yunnan province traveled by train. Xu met them, showed them around, and sometimes bought them lunch.

The centerpiece of the Banchangyu site in Qinhuangdao, Hebei province, is a vast collection of brick kilns.

In the early 2000s, excavations revealed brick kilns that had been buried for nearly 500 years. Archaeologists have since uncovered more than 200 kilns, turning the area into one of the country's most important Great Wall industrial heritage sites.

Bricks from nearby Great Wall sections match the dimensions of those fired in Banchangyu's kilns.

"This was where they made the bones of the wall," Xu notes.

Running several coal mines in the 1980s, Xu rose from rags to riches. The kiln discovery, along with tightening restrictions on small coal mines, prompted him to shift his focus to heritage preservation.

He then leased more than 30 square kilometers of land along the Great Wall and built a small museum beside the kilns, filling it with tablets, bricks, stone balls, and firearms he had collected from fields and farmhouses. He researched each piece, consulting ancient texts and experts to confirm their identities.

"I grew up at the foot of the Great Wall, and my family has guarded this place for generations," he says, adding that his grandmother always told him they came from the south to build the Great Wall.

Over the years, Xu and his family have built an extensive network of trails and access roads through the mountains surrounding the Great Wall.

His persistence moved his son and encouraged him to join the cause. Today, his son oversees walking trails and infrastructure throughout the park.

Additionally, his grandson returned to Banchangyu after graduating from Jimei University in Xiamen, Fujian province, in 2021, when he began working to package Banchangyu Great Wall culture into a curriculum with the support of local schools. The study programs introduce students to subjects ranging from Great Wall engineering to geology and traditional craftsmanship.

At the hands-on brick-making workshop, children can first visit the kiln ruins to hear the story of their discovery. Then they go to the workshop to mix clay, fill molds, and form brick blanks. Finally, they carve their names into the unbaked bricks.

To date, the number of partner schools has grown from three to over 30. More than 30,000 students have visited, Xu shares. Study tours now account for one-third of the park's revenue.

Xu still livestreams every morning, aiming to reach more potential visitors. Recently, he even started experimenting with an AI avatar to help explain artifacts online.

"At my age, I never imagined I'd be learning things like this," he says with a laugh.

> "I grew up at the foot of the Great Wall, and my family has guarded this place for generations."
>
> **Xu Guohua,**
> a 73-year-old villager in Qinhuangdao, Hebei province, promoting Great Wall culture through livestreams

From crumbs to incomes

West of Banchangyu, Shixia village in Beijing's northwestern Yanqing district offers another model of Great Wall revitalization.

On weekends and holidays, travelers flock to the village to sip coffee at a restored farmhouse, learn dough sculpting from local artisans, and hike a trail along the ridge where the Great Wall meets the forest.

Founded during the Ming Dynasty, the village sits at the foot of the Shixiaguan section. For decades, its remote mountain location limited development. That gradually began to change after China introduced its first Great Wall protection regulation in 2006.

Villagers formed protection teams, while entrepreneurs and cultural tourism operators started restoring abandoned courtyards. One of them was He Yuling, who arrived in 2014 and rented a crumbling traditional courtyard house on a 20-year lease. Villagers initially found the decision puzzling.

She answered with action. Today, her Shiguang Great Wall Boutique B&B brand operates 18 renovated courtyards, each with a different theme, such as spring dwelling, quiet summer and winter retreat.

She brought her family's sauce-making recipe to the village and combined it with the local stone-cooked feast. Annual revenue has exceeded 10 million yuan ($1.47 million).

Some villagers now run their own guesthouses, while others work in tourism and hospitality.

Gu Wenting, the Party secretary of Shixia village, has witnessed the transformation firsthand since returning from the military in 2013.

"The spirit of the whole village changed completely, and people have become more confident about what the village can become," Gu says.

"The sense of honor, belonging and purpose — all of it has risen."

A 6-kilometer forest trail opened beside the Great Wall at the end of 2025 after more than two years of planning and construction. Following the mountain's contours, the trail connects visitors with a nearby section while preserving the original landscape. Since its opening, it has attracted more than 20,000 hikers, according to local officials.

The village's collective income reached 1.2 million yuan in 2025, a 75 percent year-on-year increase.

"This number represents a real leap forward. Our cultural tourism industry has taken off, and the village's reputation has spread," Gu observes.

At the village entrance, signs point visitors toward coffee shops, bookstores and workshops on intangible cultural heritage. A 40-hectare crabapple orchard has just been upgraded, offering tours, picking, and study programs.

At dusk, children run through a campground. The smell of braised pork drifts from guesthouse kitchens.

According to Gu, the village plans to expand its Great Wall study programs next year while adding new camping and lodging facilities for young travelers.

"We want visitors to stay longer and experience village life more deeply," he says.

An emotional connection

East of Shixia village, in northeastern Beijing's Miyun district, visitors can step through a "time gate" where old photographs of the Great Wall come to life, question a digital Ming Dynasty general, and watch ancient weapons emerge from a virtual encyclopedia. These experiences await at three newly opened digital centers in Gubeikou, Yaoqiaoyu and Guanmen.

Miyun has rich Great Wall resources, with over 180 kilometers of Ming Dynasty walls and 61 registered fortresses. However, there is a problem.

"Many of its fortresses have disappeared above ground, leaving only ruins," says He Ding, an associate professor at Beijing University of Civil Engineering and Architecture, who led the centers' design.

His team spent a year on the project to create an emotional connection.

"The hardest part was not the technology but designing the content — getting the narrative logic and interactive details right," he says.

They combed through archives in China and abroad, searching historical texts and maps for clues about the frontier world of Miyun.

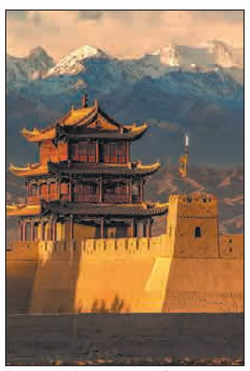
For instance, one Ming text recorded the distribution of Mongol tribes north of Miyun, he says.

"We thus added two Mongol chieftains to our digital scroll, because we want visitors to understand that the frontier was a multiethnic place," he explains.

Inside the Gubeikou center, the "time gate" uses AIGC technology to bring old photographs to life. Black-and-white images of Gubeikou begin to move, vividly re-creating a scene of merchants passing through the site in bygone days.

Beside the "time gate" stands a digital avatar of Qi Jiguang, the legendary Ming Dynasty general. The digital general's appearance draws from Ming Dynasty portraits, and his manner is calm and resolute. Visitors can ask him anything from how the Great Wall was built to how fortresses were defended, and he answers in real time.

While Gubeikou gives visitors a broad sweep of Miyun's defense network, Yaoqiaoyu zooms in on a cluster of fortresses, and Guanmen examines individual fortresses up close.



"We want visitors to go from a wide view to a narrow view, step by step," He Ding says.

Since opening, the centers have boosted local tourism. Out-of-town visitors make up a large share, especially on weekends.

"Families often spend half a day or a full day visiting all three centers," He Ding says.

He says the team will keep upgrading. "We plan to enrich Qi Jiguang's knowledge base, add more digital characters, and develop a mobile experience, so visitors can continue their tour even after they go home."

Jiayuguan in Gansu province is the westernmost outpost of the Great Wall.

WHERE ANCIENT BARRIERS BECAME BRIDGES

By **WANG RU**
wangru1@chinadaily.com.cn

Before I visited it in person, the Great Wall existed in my mind only as a single, unbroken line, like a dragon's spine stretching across the map of northern China. Over the years, I visited several sections, but none truly reshaped my understanding like its westernmost outpost — the Jiayuguan pass in Gansu province.

I first explored it years ago during a trip with a friend along the popular loop through Qinghai and Gansu provinces in Northwest China. Visiting Jiayuguan felt inevitable. Since childhood, we had known it as the western end of the Great Wall and the strategic gateway to the ancient Silk Road.

But it was only when I stood there on a summer morning that I realized how sophisticated its design truly was.

Near the entrance stands a statue of Ming Dynasty (1368-1644) general Feng Sheng on horseback. His left hand points ahead while the right grips a sword, his cloak frozen in the wind. More than 600 years ago, Feng recognized the military value of this location and proposed building the pass there.

About half an hour later, standing on the city wall and looking out at the distant mountains, I finally understood its strategic importance.

The pass was built on a natural channel only 15 kilometers wide, the narrowest point of the Hexi Corridor, the main artery of the ancient Silk Road, between the Heishan Mountains and the Qilian Mountains. Therefore, it controlled the only passage between the heartland of central China and the vast deserts of Central Asia.

Its surroundings made the fortress even more formidable. To the north stretched a vast desert, while the Qilian Mountains rose to the south as a natural defensive barrier.

"If anyone wanted to bypass Jiayuguan to attack the heartland, they would have to cross nearly 70 kilometers of desert," a tour guide told us.

"That was too dangerous and difficult, so the pass became the only realistic route. That's why it was fortified so heavily."

The choice of location amazed me. It reminded me that even without modern technology, military strategists understood how to use mountains, rivers and deserts to their advantage. At that moment, the old Chinese saying — "One man guarding the pass can hold back 10,000" — no longer sounded symbolic. It felt tangible.

No wonder Feng became known as one of the founding generals of the Ming Dynasty. Under his initiative, and through the labor of countless unnamed builders, the fortress was expanded over generations before its completion in 1539 as a sophisticated defense system.

Today, Jiayuguan remains an intricate complex of rammed-earth structures. Restoration efforts have preserved much of its original appearance, allowing visitors to understand how the fortress functioned.

Two separate walls surround the complex. Even if invaders breached the outer wall, they still faced another barrier inside, buying defenders valuable time.

The fortress faces west, with Jiayuguan Gate welcoming travelers arriving from that direction. Between the outer gate and Rouyuan Gate lies a *wengcheng*, a defensive enclosure designed to trap and delay attackers. Beyond Rouyuan Gate stands the inner city, where soldiers once lived. On the eastern side sits Guanghua Gate, protected by another *wengcheng*.

Every detail of the layout served a defensive purpose. Human ingenuity seemed embedded in every corner. In that era, people truly made the best use of their experience and vision in building this pass.

Standing on the narrow path between the two walls, I watched sunlight fall across the raw earthen surfaces, giving them a rugged beauty. There were few tourists around, so my friend and I began taking photos.

Through my camera lens, my friend appeared tiny against the towering walls. And yet centuries ago, people no larger than her had built this place, defended it and passed beneath its gates. That contrast between human fragility and achievement struck me harder than the desert wind.

"Why are you hesitating? Come take photos!" my friend called out.

As she walked toward me along the ancient road, I suddenly felt the strange closeness of past and present, as if time had briefly folded together.

Near Jiayuguan Gate, we came across a small crowd gathered around a roadside stall offering visitors an interactive "pass certificate" experience.

During the Ming Dynasty, travelers heading west into Xiyu (Western Regions, a historical term used to describe modern-day Xinjiang Uygur autonomous region and Central Asia) needed official travel permits similar to today's passports.

"Where are you from? Why do you want to go to Xiyu?" the stall owner asked, playfully acting as head of the fortress.

Once satisfied with the answer, he handwrote a certificate, charging between 30 and 100 yuan ($4.4 to $14.7).

The experience reminded me that although Jiayuguan was originally built for defense, it ultimately became something greater — a bridge between civilizations. Through this corridor, Chinese silk and porcelain traveled westward to Central Asia, the Middle East and East Africa, while foreign ideas, religions and literature entered China in return.

A pass may be built to keep people out, but it ends up letting them through — not just the merchants and monks on the Silk Road, but also memories. Jiayuguan taught me that the strongest walls aren't the ones that divide; they are the ones that, centuries later, still have the grace to open their gates.

Ma Jingna contributed to this story.

If you go

Getting there: You can take high-speed trains to Jiayuguan Railway Station or Jiayuguan South Railway Station, or fly to Jiayuguan Jiuquan Airport to start your journey. Jiayuguan Railway Station is the closest to the scenic area, about 15 minutes by taxi. The airport and south station are roughly 30 minutes by car. Local buses from downtown Jiayuguan also reach the site.

Ticket: During peak season (May 1-Oct 31), it costs 110 yuan ($16) per person. In the off-season (Nov 1-April 30), it costs 90 yuan. Admission includes Jiayuguan pass, the Hanging Great Wall and the First Beacon Tower of the Great Wall. Tickets are valid for three days and can be used multiple times. A round-trip shuttle bus connecting the three attractions costs 20 yuan.

Tips: Because the fortress sits on the edge of the Gobi Desert, UV exposure can be intense. Sunscreen, sunglasses, hats, and umbrellas are strongly recommended.

WANG RU

The Jiayuguan pass rises from the Gobi Desert, set against a backdrop of snowcapped mountains.

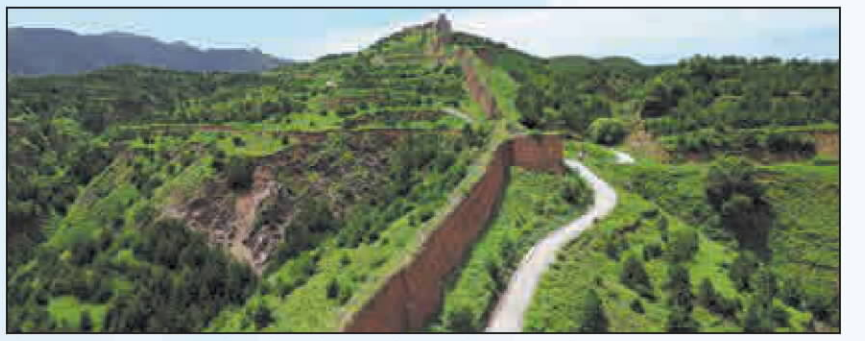
The Great Wall beyond the crowds

Stretching across some of northern China's most dramatic landscapes, these sections of the fortification combine history, solitude and natural beauty, inviting visitors to experience them in a more authentic way, **Wang Ru** reports.

Apricot trees bloom around the Li'erkou section in Datong, Shanxi province. HU YUANJIA / FOR CHINA DAILY

1. Li'erkou in Datong, Shanxi province



In spring, visitors to the Li'erkou Great Wall can see the season paint a scene of stark contrasts. The ancient rammed-earth structure, rugged and taupe-colored, stretches its earthen body across the rolling terrain. Suddenly, the view softens: apricot trees burst into clouds of delicate pink and white blossoms. Petals flutter like gentle snowflakes against the time-honored watchtowers, weaving a quiet story where military history meets the tender breath of spring.

Built in the Ming Dynasty (1368-1644), this section is famous as the place where two sections of the Great Wall intersect, one running from north to south and the other from east to west. This feature is linked to changes in the plans made during its construction.

The original plan would have led to a defensive gap near the border of Shanxi and Hebei provinces. As a result, the plan was revised, and the wall was built back from a point near Li'erkou village, running along the mountain ridge to connect with the Great Wall in Hebei. This achieved a continuous line of defense, although the mistakenly constructed section has also been preserved.

For visitors wanting a quiet experience of this ancient structure without crowds of other people, this section is an ideal choice. Flagstone roads built in recent years make hiking easier while preserving the views of the surrounding landscape.

Visitors can also explore the Datong Great Wall Museum to learn more about the region's history. Nearby, Li'erkou village offers homestays.

The Guangwu section in Shuozhou, Shanxi, is known for its rustic charm. ZHU XINGXIN / CHINA DAILY

2. Guangwu in Shuozhou, Shanxi province

About 5 kilometers from the Yanmenguan pass, a key strategic point in Shanxi province, the Guangwu Great Wall once served as a crucial forward defense line within the Ming Dynasty defense system centered on Yanmenguan.

In recent years, this section has gained popularity online for its rustic charm. The section has been less restored than its counterparts elsewhere, thereby retaining much of its ancient grandeur, with mottled bricks and stones, and grass growing in the cracks.

One section of the Great Wall here is particularly iconic, the remains of a watchtower that people call Yueliangmen (the Moon Gate), named for its arched doorway that resembles the moon.

At twilight, when the rays of the setting sun pass through the doorway, the ancient structure has a solemn atmosphere, as if a guardian witnessing generations passing through the ages.

This section is especially good for hikers who are interested in ancient history.

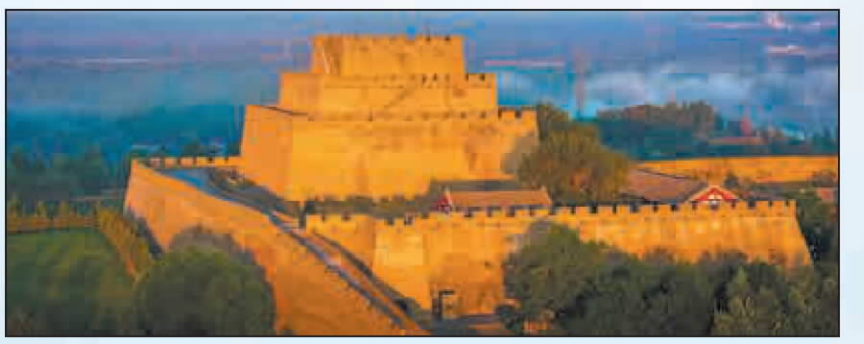
Even today, the inscriptions on the stone plaques embedded in some of the watchtowers' archways remain clearly visible.

Sunlight streams down, casting a warm, golden veil over the bricks and stones. The grass grows even more vibrantly in the interplay of light and shadow.

Here, antiquity and life merge, painting a tranquil picture of harmony between time and nature.

The Wushaoling section is surrounded by snowcapped mountains. GAO ZEHONG / FOR CHINA DAILY

3. Wushaoling in Wuwei, Gansu province



Wushaoling is located at the crossroads of the Loess Plateau, the Qinghai-Tibet Plateau and the Mongolian Plateau, and is one of the highest sections of the Great Wall.

Therefore, from a single vantage point, a condensed panoramic view of Northwest China gradually unfolds. Highland grassland seems to extend to the sky.

To the south, the Maya Snow Mountains, a branch of the Qilian Mountains, stay white all year round, their peaks glittering under the sun. Turn east, and thousands of ravines and gullies can be seen cutting through yellow earth, where the eroded remains of the Great Wall wind like a pale dragon. Looking west, the vegetation thins and the faint outline of the Gobi Desert appears, stretching toward the Hexi Corridor, the main artery of the ancient Silk Road, with a raw, empty vastness.

More than 2,000 years ago, Emperor Wu of the Han Dynasty (206 BC-AD 220) ordered the construction of this part of the Great Wall after general Huo Qubing reclaimed the Hexi Corridor following victories in various battles. Since that time, historical figures like Han envoy Zhang Qian and Tang (618-907) Buddhist monk Xuanzang passed by Wushaoling on their journeys to Xiyu (Western Regions). Ming Dynasty rulers also built part of the Great Wall at Wushaoling.

Now, sections from both the Han and Ming periods can be seen. Standing beneath a beacon tower, with strong winds sweeping through the grass and flocks of cattle and sheep dotting the mountain slopes, one can sense the profound weight of history and the changes that have occurred over millennia.

An aerial view of Zhenbeitai Tower in Yulin, Shaanxi province. HAO JIHONG / FOR CHINA DAILY

4. Zhenbeitai Tower in Yulin, Shaanxi province

Normally, it is the curving walls snaking through mountain ranges that form people's typical impressions of the Great Wall.

But the heritage covers not only the walls themselves but also passes, beacon towers and observation outposts.

Zhenbeitai in northern Shaanxi province stands as a large rammed-earth military observation tower and command post built during the Ming Dynasty.

The existing four-story structure, more than 30 meters high, offers a vivid lesson in military history.

The tower had several uses: first as barracks and storage; second for patrols and defense; third as a command center; and finally as a lookout station, providing distant views across the surrounding lands.

The compound can be explored by visitors wanting to better understand its defensive functions.

This scenic area is accessible to both the elderly and the very young, as the steps are gentle and easy to climb. From the top, the modern city of Yulin can be seen on one side and the Maowusu Desert on the other, creating the sensation of standing astride two worlds.

The remains of two ancient cities also exist here, where Mongolian people traded with their Han counterparts, suggesting that the post may have been more about commerce and administration than warfare, and that it helped maintain communication and exchange.

The site reminds us that the true Great Wall did not separate people with brick and stone, but connected them with trade, dialogue and ordinary people's aspirations for a peaceful life.

5. Jinshanling in Chengde, Hebei province

Located on the border between Hebei province and Beijing, the Jinshanling Great Wall is hailed as one of the most beautiful sections of the structure. It winds through lush hills, punctuated by watchtowers and guardhouses.

What makes Jinshanling unique is the variety of its watchtowers and defensive structures. The designs change with the terrain, so no two towers are exactly alike. Visitors will find towers with square, round or flat bases, and with roofs shaped like boat canopies, domes, or octagons with pointed tops. There are also multi-windowed lookout towers and storehouses. Scattered across the ridgeline, these towers form a complete and well-coordinated defensive system.

The section was originally built at the beginning of the Ming Dynasty and rebuilt when Ming general Qi Jiguang guarded the northern frontier.

Thanks to its high altitude and dense vegetation, Jinshanling is cool and pleasant in summer, making it an ideal summer retreat. It's also the perfect location for photographers to capture different landscapes across different seasons without having to dodge crowds of tourists. Sunset is particularly spectacular; at dusk, the setting sun dyes the sky blood-red, warming the old walls with a soft orange glow.

Intl partnership targets poverty

Forum views it as a platform to share knowledge and experiences

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Participants exchange ideas ahead of the 2026 Global Poverty Reduction and Development Forum in Beijing on Wednesday. WANG JING / CHINA DAILY

The Global Partnership for Poverty Alleviation and Development, aimed at promoting the exchange of poverty reduction experiences among countries and exploring pathways to fundamentally eliminate poverty, was launched on Wednesday in Beijing.

Jointly initiated by China, 53 other countries and nine international organizations, the partnership was announced during the two-day 2026 Global Poverty Reduction and Development Forum.

Vice-Premier Liu Guozhong said the forum and the establishment of the partnership would push global poverty reduction onto a new journey and inject fresh momentum into pooling global strength and advancing poverty alleviation.

He said China would help improve poverty reduction capacity in developing countries through policy planning, experience sharing, technology demonstration and talent training. China also plans to support a number of "small but beautiful" cooperation projects tailored to the needs of developing countries, he added.

"At present, there is an urgent need for all parties to build consensus and accelerate global poverty reduction efforts," Liu said, proposing efforts to enhance endogenous development capacity by promoting market-driven and technology-enabled development.

The launch comes as the world faces challenges in meeting the United Nations Sustainable Development Goals by 2030.

Stephen Jackson, the UN Development System Resident Coordinator in China, reading a congratulatory letter from UN Secretary-General Antonio Guterres, said poverty remained "a global development emergency" despite recent progress.

"Eight hundred million women, children and men still live in extreme poverty — from remote rural communities to crowded urban slums," the letter said, warning that conflicts, climate change, inequality and debt burdens were worsening the situation.

The letter called on governments to invest in decent work, education, healthcare, rural development and social protection, while urging greater financial support for developing countries.

Delegates attending the forum said the new partnership could provide a platform for knowledge sharing and practical cooperation.

Vongsey Vissoth, permanent deputy prime minister and minister in charge of the Office of the Council of Ministers of the Kingdom of Cambodia, said his country warmly welcomed the initiative as "a timely platform for solidarity, mutual learning and practical cooperation".

Holding the forum in China carried special significance, he said. "China's experience shows that poverty can be reduced at scale when clear vision, national ownership, broad-based growth, rural development, infrastructure, job creation and targeted public support work together," he said.

Robert Walker, professor emeritus at the University of Oxford and a professor at Beijing Normal University, said the partnership is a support for the world in achieving the SDG goals.

"Sharing expertise and knowledge would be essential, not for its own sake, but as a tool for reform, to make the world better, to ensure that poverty can be addressed," Walker said.

Heidi Kuhn, founder of United States-based NGOs Roots of Peace and Pax Agricultura and a World Food Prize laureate, called for broader global cooperation.

"I think China today has done something very extraordinary," Kuhn said. "I am certainly inspired, and I hope together we can work to plant global gardens for food security all over the world."

Mainland slams DPP's sustained separatist agenda

By **JIANG CHENGLONG**
jiangchenglong@chinadaily.com.cn

A Chinese mainland spokesman on Wednesday criticized Taiwan's Democratic Progressive Party for never abandoning its separatist agenda, urging it to recognize that both sides of the Taiwan Strait belong to one China.

Chen Binhua, spokesman for the State Council Taiwan Affairs Office, made the remarks at a news conference in Beijing in response to recent comments by Taiwan leader Lai Ching-te.

Lai, who also leads the DPP, claimed in a recent post on Facebook that there is no issue of "Taiwan independence" while defending the status quo of the "Republic of China". Some commentators in Taiwan have noted that if this position is genuine, the DPP should remove its "Taiwan independence" party platform as soon as possible.

Chen stressed that there is only one China and that Taiwan is part of China, which he said is an indisputable historical and legal fact, as well as the prevailing status quo across the Taiwan Strait.

He said the DPP has long positioned itself as a separatist party advocating the separation of Taiwan from China, pointing to its "Taiwan independence" party platform. Chen noted that in October 1991, the DPP amended its party charter to include the establishment of a "sovereign and independent Republic of Taiwan" and the drafting of a "new constitution".

Although some later DPP resolutions have used what he described as more disguised wording, Chen said the goal of separating Taiwan from China has never been abandoned. "The DPP authorities have, during every period in power in Taiwan, deliberately pursued 'Taiwan independence' separatist activities in an attempt to change the status quo that both sides of the Strait belong to one China," he said.

Chen also criticized Lai for what he described as a stubborn "Taiwan independence" stance and provocations in pursuit of separation. He said Lai was now changing rhetoric in an attempt to mislead public opinion and deceive the public, calling him "a complete Taiwan independence swindler".

He added that "Taiwan independence" is fundamentally incompatible with peace across the Taiwan Strait, undermines Taiwan's development, and is a dead end.

Chen urged the DPP to come to terms with reality, abandon its "Taiwan independence" party platform, stop separatist activities, and cease actions that obstruct cross-Strait relations.

Following Lai's speech on May 20, recent public opinion in Taiwan suggested the DPP's approach has shifted from pursuing "de jure Taiwan independence" to seeking "substantive Taiwan independence" in identity and culture.

Chen said Taiwan has never been a country and will never become one in the future. "Driven by their separatist nature and political self-interest, the DPP authorities have vigorously pushed 'cultural Taiwan independence' and 'de-Sinicization' in an attempt to distort Taiwan compatriots' national identity," he said.

Chen condemned the DPP for "forgetting its roots" and "betraying the Chinese nation", adding the party "will be judged by history".

"We will never tolerate or condone any form of 'Taiwan independence' separatist activity," he said, adding that no matter what "tricks" Lai and the DPP resort to, they cannot sever the historical and cultural ties between people on both sides of the Strait or block the trend toward national reunification.

He expressed hope that Taiwan compatriots will clearly recognize the DPP's intentions and strengthen their identification with the Chinese nation and Chinese culture, and called on them to join efforts in opposing all forms of "Taiwan independence" separatist activities.

Sino-Russian joint efforts secure wildlife populations

By **LIU MINGTAI** in Changchun and **ZHOU HUIYING**

In recent years, through the establishment of transnational protected areas and joint patrol and monitoring mechanisms in Northeast China and the Russian Far East, notable progress has been made in protecting Siberian tigers and leopards, safeguarding migratory birds and restoring salmon populations, according to the National Forestry and Grassland Administration.

The China-Russia border connects forests, wetlands and rivers which are jointly protected by the two countries, making it a crucial region for cross-border ecological conservation.

The administration said cooperation has expanded from single-species protection to comprehensive ecosystem restoration, forming an ecological security barrier in Northeast Asia and providing a model for global cross-border ecological governance.

In the dense forests along the China-Russia border, infrared cameras have captured increasing numbers of wild Siberian tigers crossing between the Northeast China Tiger and Leopard National Park and Russia's Land of the Leopard National Park.

China and Russia signed an agreement in 2024 to establish a transboundary nature reserve for large cats.

"The two countries have established a regular joint patrol mechanism and built an intelligent monitoring system to share real-time data on tiger and leopard activities," said Liu Linbo, director of the Hunchun bureau of the Northeast China Tiger and Leopard National Park Administration in Jilin province.

Monitoring data from the bureau shows that populations of wild Siberian tigers and leopards in the Hunchun area have doubled since the park was established in 2021, with about 70 tigers and 80 leopards recorded.

The transnational protected area, to date, covers nearly 17,000 square kilometers, providing an ecological corridor for the safe migration and reproduction of the big cats.

Each spring and autumn, hundreds of thousands of migratory birds arrive at the Jingxin Wetland in Hunchun to rest and refuel before continuing along migration routes across China, Russia and beyond.

Located at the junction of China, Russia and the Democratic People's Republic of Korea, the 8,000-hectare wetland is a key transit station on the East Asian-Australasian migratory bird flyway and one of the world's important habitats for migratory birds.

To ensure comprehensive protection of migratory birds, China and Russia have established a regular cooperation mechanism, conducting synchronized monitoring of waterbird populations and disease prevention during migration seasons, while sharing core data on bird numbers and activity ranges, according to the Hunchun forestry bureau.

In recent years, Hunchun has enhanced efforts to protect forest and wetland ecosystems, restoring about 5,000 hectares of forests, grasslands and wetlands, creating a favorable ecological environment for migratory birds.

Data shows that during the migration seasons each year, more than 200 species of migratory birds inhabit Hunchun, including 14 species under national first-class protection and 42 species under national second-class protection.

In mid-April, 600,000 salmon fry were released into the Mijiang River in Hunchun, a first-level tributary of the Tumen River, marking the start of their journey to the North Pacific Ocean. They are expected to return to spawn in three to four years.

As a typical transboundary migratory fish, the salmon's life cycle spans waters in both China and Russia, and the health of its population reflects the ecological condition of cross-border waters.

Over the years, China and Russia have cooperated on fish breeding and migration monitoring, establishing a regular cross-border protection mechanism.

Since 2007, Jilin has conducted fish stocking activities in the Tumen River basin, releasing more than 4.7 million salmon fry and 38 million other fish to support sustainable fisheries and promote the harmonious coexistence between humans and nature, according to Zheng Yanwen, an official with the local fisheries administration.

"The shift from single-species protection to comprehensive ecosystem restoration, and from seasonal joint actions to regular collaborative governance, provides a vivid model for global cross-border ecological governance," said Jiang Ming, director and researcher at the Chinese Academy of Sciences' Northeast Institute of Geography and Agroecology.

Han Junhong contributed to this story.

Idea of space solar power station closer to reality

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese scientists have successfully tested a ground-based system capable of wirelessly transmitting power to multiple moving targets simultaneously, marking a major breakthrough in the global race to harness solar energy from space.

The milestone was achieved by the "Sun Chasing project" research team led by Duan Baoyan, a member of the Chinese Academy of Engineering and a professor at Xidian University in Shaanxi province.

The breakthrough brings the long-envisioned concept of orbital "wireless charging stations" closer to reality.

The system successfully delivered 1,180 watts of output power over a distance of more than 100 meters to multiple moving targets. The successful demonstration of "one-to-many" dynamic wireless power transmission pushes the technology closer to practical engineering applications.

Duan compared the space solar power station to a wireless charging post positioned in a predetermined orbit.

Space-based solar power is widely regarded as a promising clean energy solution in the future. In orbit, free from atmospheric interference and the cycle of night and day, such systems can collect sunlight continuously. However, because running physical cables down to Earth from a geostationary orbit, which lies 36,000 kilometers above the planet, or between spacecraft is impossible, scientists must rely on microwave wireless power transmission. The process converts electricity into microwaves, beams them across vast distances, and then converts them back into usable direct current electricity upon arrival.

Currently, many small satellites in low-Earth orbit can generate power for only about 60 minutes during each 96-minute orbit. For the remaining time, they remain in the Earth's shadow and rely entirely on onboard batteries. A space-based charging network would reduce the dependence on individual solar panels, allowing satellites to recharge in orbit, Duan said.

To achieve this, Duan's team proposed the OMEGA design in 2014, which uses unique spherical principles to concentrate sunlight. In June 2022, the team built what it described as the world's first full-link ground validation system, successfully testing every stage of the process — from capturing sunlight and converting it into electricity, to transforming the electricity into microwaves, transmitting them before converting them back into electricity on the ground.

The team's latest iteration, dubbed Distributed OMEGA, addresses the complex engineering challenge of building and maintaining massive power grids in space. By focusing on modularity, the system uses standardized, independent components that can be assembled or replaced in orbit like building blocks.

"Unlike the previous design that utilized a complete spherical condenser to collect sunlight — where encountering space debris could render the entire system unusable — dividing it into multiple small-aperture spherical concentrators and adopting a 'formation flying' approach ensures that even if individual units are damaged, the overall performance remains almost unaffected, thereby improving system reliability," said Li Xun, a professor at Xidian University's School of Mechano-Electronic Engineering.

Li added that this also allows for reducing the voltage of each unit, improving the engineering feasibility.

Recent test data highlighted significant performance improvements over the 2022 baseline. At a distance of more than 100 meters, the system achieved a 20.8 percent direct current-to-direct current transmission efficiency, up from 15.05 percent in 2022. The beam collection efficiency reached 88 percent, ensuring that the microwave beam remained tightly focused on its target.

Li said that the performance is "world-leading", contributing to the improvement of high-precision sun tracking to guarantee energy collection at the source, a precise closed-loop control system to accurately direct the beam from the transmitter to the receiver for higher collection efficiency, and a highly integrated design to minimize link losses.

"Different from chips, there is no technology blockade among nations when it comes to building space solar power stations. Under a similar level of industrial capability, continuously raising the bar can only be achieved through technological iteration," said Duan Xuechao, deputy dean of the School of Mechano-Electronic Engineering.

Crucially, the team also solved the tracking precision challenge required to power moving objects. In a simulated trial, a drone flying at 30 km/h successfully received a stable 143 watts of power from 30 meters away. This capability is considered essential for space applications, where satellites and orbital stations are constantly moving relative to one another.

An expert panel organized by the Shaanxi Provincial Technology Transfer Center evaluated the project and concluded that the results had reached a world-leading level, with broad prospects for engineering and industrial applications.

Duan said that the team will continue to address key challenges. This includes adapting systems from ground-based validation to actual space environments, improving wireless power transmission efficiency over long distances, and achieving ultra-precise beam steering control while the satellite is moving at high orbital speeds.

Easing stress

Students interact with a lamb during a stress-relieving activity at a mental health fair held at Southeast University in Nanjing, Jiangsu province, on Wednesday. LIU LI / FOR CHINA DAILY

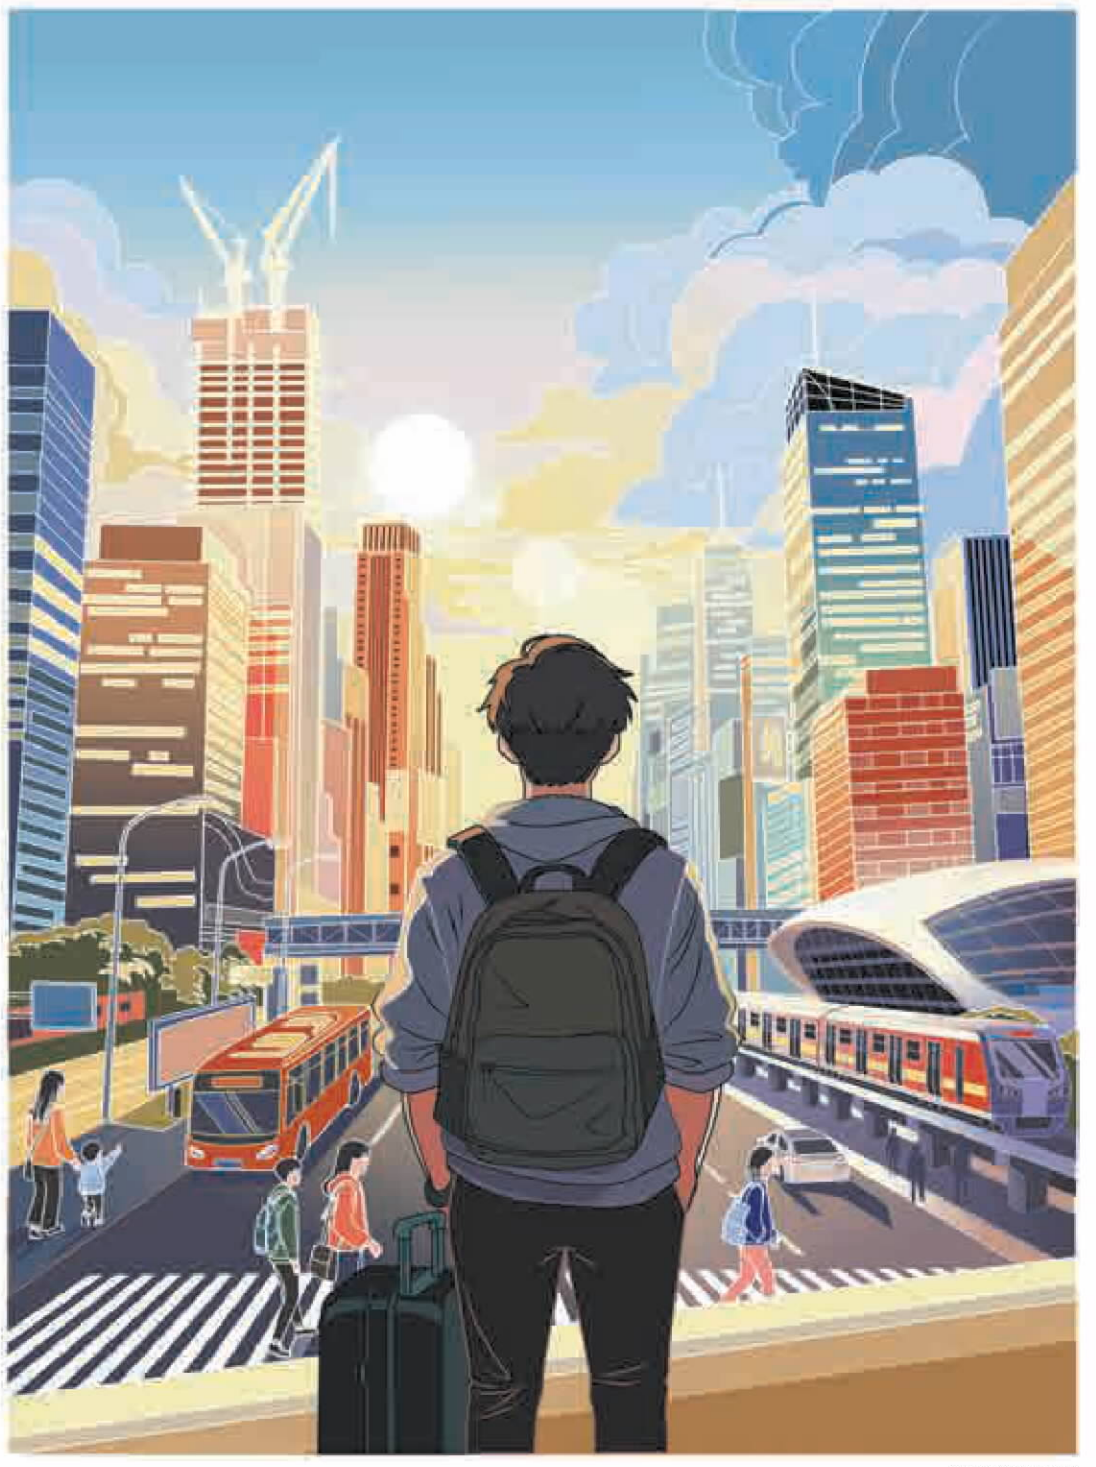
POLICY REVIEW

Push to create 'youth-friendly' cities

Urban centers use policy to compete in attracting talented young professionals



By **ZOU SHUO** in Beijing
and **HE CHUN** in Changsha

A recently released national guideline aims to transform China's urban centers into launch pads for the next generation, with the ultimate goal of tackling young professionals' most pressing hurdles, those of housing costs, job hunting and the risks of early entrepreneurship.

The guideline, released on April 22 by 15 central departments, including the Central Committee of the Communist Youth League of China, the Cyberspace Administration of China, and the National Development and Reform Commission, outlines 18 measures covering industrial foundations, innovation support, urban planning, housing, childcare and employment.

By 2030, the concepts promoted in the guideline are expected to have been widely rolled out, and by 2035, a mature institutional framework for youth development should be in place.

City governments across China are actively competing to attract fresh talent to boost local high-quality economic development. By addressing daily pressures like childcare and high rent, major hubs are trying to ensure young workers can put down deep roots.

SHI YU / CHINA DAILY

Slashing costs

For recent graduates, the transition from campus to the workforce is often a financial shock. Hangzhou, the capital of Zhejiang province, is targeting this vulnerability directly through digital integration and cash subsidies.

The city has introduced a specialized youth area on its online government services platform. The area integrates job searches, entrepreneurship support and policy access, providing over 100,000 job listings, according to the city's Committee of the Communist Youth League.

There are 97 specialized youth hostels offering seven days of free accommodation for job-seeking graduates, clocking 260,000 nights as of April this year, the committee said.

The city also provides one-time living subsidies of up to 100,000 yuan ($14,700) for doctoral graduates, 30,000 yuan for master's graduates and 10,000 yuan for graduates with bachelor's degrees.

An additional rental subsidy of 10,000 yuan per year is offered to all qualifying college graduates for three consecutive years, backed by 248,000 units of subsidized rental housing. Young people have accounted for 70 percent of the beneficiaries so far.

"The policy precisely addresses our urgent needs in job hunting and stable living," said recent graduate Chen Nuo. Fellow graduate Ding Yiling called it "a protective umbrella" that enhances young people's sense of belonging.

Free workspaces

Suzhou in Jiangsu province has 145 youth hostels offering free accommodation for up to 14 days in total, spanning a wide eligibility window from one year before graduation to two years after, the city's Communist Youth League committee said.

For young entrepreneurs, the city offers up to 500,000 yuan in seed funding and three years of rent-free workspace up to 200 square meters. It has also offered 43 youth apartment projects, with over 27,000 units available at discounted rents.

Critically, the city is also addressing the "double-income trap" facing young parents by managing seasonal childcare gaps. Over the past five years, the Suzhou youth league committee has organized more than 6,900 subsidized winter and summer daycare classes, serving 1.63 million children during school vacations to alleviate the domestic burden on working parents.

Serving startups

In Southwest China's Sichuan province, Chengdu is proving that the most valuable asset a city can give a tech startup is not just cash, but a market.

When Liu Yang graduated from the University of Electronic Science and Technology of China, he launched his drone software startup, Shine Tech, with just two free desks in a government-run youth entrepreneurship park. The true breakthrough came a decade later when the government integrated his systems into the city's operational infrastructure.

The city provided Shine Tech with "application scenarios" — a policy where local governments act as the first major client for local tech startups, allowing them to test and prove their emerging technologies, like low-altitude urban drone governance, in real-world public management settings.

"Chengdu gave us a lot of support," Liu said. His low-altitude digital operation system has since been replicated in 11 cities and 28 districts and counties nationwide. Liu added that Chengdu's stable housing market — with prices well-regulated between 10,000 and 20,000 yuan per square meter — makes homeownership a realistic goal. "Chengdu is inclusive and not exclusive. People say, 'After drifting to Chengdu, you never feel adrift again'," Liu said.

The city has built 40 youth talent stations serving 138,000 people and has also established a youth housing security system offering free short stays, low-cost long-term rentals and subsidized talent apartments. Matchmaking events are held regularly.

Funding safety net

Hunan province, with its capital Changsha serving as the primary talent magnet, has taken an aggressive stance on funding high-risk startups, explicitly building a safety net for business failure.

At a recent recruitment drive at Zhejiang University, Jiang Difei, vice-governor of Hunan, announced that the province is offering 100,000 annual internships and over 300,000 quality jobs, backed by a 500-million-yuan university startup fund and 6.2 billion yuan in guaranteed entrepreneurship loans.

Policies include up to 14 days of free accommodation, up to two years of housing subsidies, and a minimum 10,000-yuan subsidy for first-time entrepreneurs, Jiang said.

The warmth of this policy was felt directly by Liu Yehuan, a tech printing entrepreneur who stayed in Changsha after graduating from Hunan University. After four failed start-up attempts, Liu and his classmates founded VMonkey.cn. Between 2020 and 2022, the company lost nearly 10 million yuan.

"As a small asset-light enterprise with no collateral, we could not get conventional loans," Liu said. The local entrepreneurship service center helped him secure a 5-million-yuan unsecured credit loan backed by government risk compensation.

"Policy has the most warmth not when it adds flowers to brocade, but when it sends charcoal in the snow," Liu said.

His company now has 300 employees and its online campus printing brand is among the nation's front-runners. "Hunan is a place that tolerates failure and encourages young people to go through trial and error," Liu said.

Policy Digest

Baseline standards set for school facilities, staffing

A revised set of baseline requirements has been issued for the basic operating conditions of primary and secondary schools, in a move aimed at advancing balanced and high-quality compulsory education, ensuring more standardized development of schools.

The requirements, released by the General Office of the Ministry of Education and three other departments on May 22, are designed to better meet teaching needs and support the physical and mental well-being of students.

The document lays out 20 baseline requirements in five areas: school building construction, safety and security facilities, living facilities, teaching equipment and staffing. These requirements represent the minimum standards that ordinary primary and secondary schools across the country must meet, while small-scale schools and teaching sites may apply them in light of local conditions.

The document gives particular emphasis to facilities and staffing for mental health, aesthetic and physical education, providing stronger support for students' all-round development.

Priorities laid out for quality growth of digital economy

The National Data Administration has issued its 2026 work priorities for the development of the digital economy, setting out eight key tasks to promote high-quality growth in the sector.

The document calls for deeper market-based reform in the allocation of data resources, including faster efforts to establish a unified national data property rights registration system and improving the pricing mechanisms for authorized public data operations.

It also emphasizes stronger digital infrastructure, with plans to accelerate the building of an integrated national computing power network and better coordination of data, networks, computing capacity and energy resources.

To support artificial intelligence development, the administration will advance special actions covering stronger foundations, expanded capacity, application empowerment, quality improvement, management services, value creation and data labeling.

The document also calls for cultivating competitive digital industry clusters and innovative digital economy enterprises, while deepening the integration of the digital and real economies, particularly in manufacturing and key industries.

Plan issued to advance ecological compensation

The National Development and Reform Commission and the Ministry of Finance have issued an implementation plan to advance integrated ecological compensation.

Integrated ecological compensation is an effective means of coordinating ecological compensation policies to strengthen the protection of key areas and important ecosystems, and better motivate those engaged in ecological protection.

The plan calls for increasing the targeting and coordination of ecological compensation policies, expanding market-based compensation channels, better leveraging fiscal funds to guide such compensation, and boosting ecological protection in critical areas.

The plan also aims to build a government-led compensation framework with social participation and market mechanisms, and help turn ecological strengths into economic benefits.

The plan outlines measures for the protection and development of major water source areas, the green development of key ecological function zones, integrated compensation for important ecosystems, and the improvement of mechanisms that benefit multiple parties.

CHINA DAILY—XINHUA

Hyper-focused founder hails Suzhou support

By **ZOU SHUO**

Dong Zhen, 32, has a closet full of awards. A Forbes 30 Under 30 award, a Suzhou Young Scientist award and more. But ask him about these honors, and he shrugs.

"They were given to me by others," he said. "I didn't actively apply for most of them. If the company falls behind, that's real pressure. The rest — having them or not — doesn't matter much."

That kind of unfiltered honesty runs through conversations with the 30-something founder of SEEExTECH, a hydrogen energy control startup in Suzhou, Jiangsu province.

Dong has a theory about Suzhou's character — and why it suits his company.

"Suzhou doesn't have much nightlife. People work during the day, go home to help their kids with their homework, and go to bed early," he said.

For a hydrogen energy hardware startup, he added, that's a plus, not a bug. "We don't need young people's nightlife. We need to stay effective."

His company's 100 employees — mostly young people — seem to share that rhythm.

Dong founded the company in 2021 while still a PhD student at the University of Manchester in the United Kingdom.

The early years were brutal: sleeping in a windowless, damp storage room, driving alone past midnight to a factory in another province, surviving on savings from his scholarship.

Suzhou, he said, made survival possible.

"The local government — human resources, science and technology, organization departments — they work together. The officials genuinely care," Dong said. "They proactively come to you and say, 'You should apply for this talent program, you qualify for that certification'."

Dong and his company have been supported through district-level, city and now provincial recognition. "This year, even the Central Committee of the Communist Youth League of China and some ministries know about us. Suzhou won't let a pearl be buried — but first you have to be a pearl."

Suzhou is preparing to build a 2.67-hectare hydrogen industrial park with Dong's company as the anchor. "We don't buy the land — State assets hold it — but we can bring in our upstream and downstream partners. That takes courage from the government," he said.

Dong started his research career with pure passion. As a master's student at the Harbin Institute of Technology, he published seven high-quality papers, three in top journals — a record that would impress many PhDs. He won a full scholarship to Manchester and kept writing.

Then something snapped.

"Around my second year of the PhD, I began to feel that the flood of papers was no longer the crystallization of human wisdom — it felt more like stuff churned out on an assembly line," said Dong.

He said his company developed the industry's first fully integrated hydrogen-electricity control system, covering power from 100 watts to megawatts. It manages how hydrogen is converted, stored and dispatched — making it work in places where batteries fail: extreme cold, remote areas, long-haul flights.

Dong Zhen (center) discusses a product with colleagues in Suzhou, Jiangsu province. PROVIDED TO CHINA DAILY

Last year, a hydrogen drone using the company's technology flew to Antarctica's Zhongshan Station aboard the icebreaker *Xuelong*. "It was the world's first green hydrogen flight in Antarctica," Dong said. "The polar research center is already discussing phase two."

Annual revenue has been doubling year-on-year, he added, and 2026 is expected to surpass 100 million yuan ($14.7 million).

If there is one phrase Dong repeats, it is living with the end in mind, so you live fully now.

"I have no hobbies. No interest in killing time. I don't need to kill time — I have too many things to do," he said.

His only relaxation is playing with his 3-year-old son. "That lets me relive the childhood I never had. I didn't know what Ultraman was until middle school, or Pokemon until college. Now I go to Disneyland and Universal Studios with my son — and sometimes I play harder than he does."

Back to the awards. He keeps the trophies but attaches no weight. "If the company fails, those titles mean nothing. If the company succeeds, their shine fades compared to real success," Dong said.

"I grew up in a village where we ate only what grew in the ground. Now I see the country's rise in my own life. There is still a pathway for ordinary people to change their fate through effort. I am grateful for that," he added.

Targeted consumption strategies urged as green power supply rises

Upgrading grid seen as critical as $722b investment targets renewable bottlenecks

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

As China's green and low-carbon energy transition accelerates, bringing challenges such as the integration of fast-growing renewable power, industry experts are calling for the country to step up efforts in adopting targeted consumption strategies.

"During the 15th Five-Year Plan (2026-30) period, China's new energy consumption and utilization will face greater challenges, requiring differentiated and targeted measures to promote consumption," said Gan Mengying, a researcher at the State Grid Energy Research Institute.

The industry must comprehensively enhance the flexibility of all links including sources, grids, loads and storage systems, and perfect the regulatory resource supply system so as to absorb the massive influx of intermittent wind and solar power, and fundamentally optimize its power supply architecture, Gan said.

430 million kW
China's newly installed solar and wind power capacity in 2025

This urgency is underscored by the record-breaking pace of renewable energy installations.

The National Energy Administration said China's newly installed solar and wind power capacity exceeded 430 million kilowatts in 2025, an increase of 22 percent year-on-year, hitting a record high.

This surge propelled the cumulative grid-connected capacity of wind and solar power to 1.84 billion kW, accounting for 47.3 percent of the country's total installed power capacity and surpassing thermal power for the first time.

According to plans by the NEA, by 2035, a new power system capable of accommodating a high share of new energy should be established, along with further improvements in new energy consumption and regulation systems.

While this achievement marks a massive leap forward for the nation's environmental goals, the rapid addition of clean energy has introduced varying regional grid stability issues, said a recent report by the State Grid Energy Research Institute.

A traditional "one-size-fits-all" approach to grid management is no longer viable given the drastically varied resource endowments and economic realities across different provinces, it said.

To tackle this, the report suggests that while coal power is transitioning towards a more regulated, supportive and strategic reserve power source, hydropower is being upgraded into a composite power source integrating flexible regulation, peak power supply and system support functions.

Nuclear power should transition toward a combination of base load guarantee and comprehensive utilization of nuclear energy, it said.

To prevent energy curtailment moving forward, the report said regional nuances must dictate grid upgrades.

For instance, some eastern provinces with high power demand only face minor curtailment during holidays or specific mid-day hours, requiring simple optimization of existing coal plants.

Conversely, western regions with an overwhelming penetration of renewables require massive investments in pumped-storage hydroelectricity, advanced electrochemical storage and expanded interprovincial power transmission corridors to maximize green energy use.

China is set to pour a record-high 5 trillion yuan ($722 billion) into its power grid over the next five years — a massive investment in new infrastructure designed to eliminate renewable energy bottlenecks and propel the nation toward its 2030 carbon peak goal.

By shifting traditional baseload behemoths like coal into highly responsive backup units and expanding the multigenerational capabilities of nuclear and hydro facilities, the power grid can effectively counterbalance the unpredictability of weather-dependent renewables, it said.

Key platforms in place to boost industrial ties among BRICS members

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

The two-day 2026 BRICS Forum on Partnership on New Industrial Revolution opened on Wednesday in Xiamen, Fujian province, marking the launch of an international cooperation initiative on intelligent manufacturing and a new partnership city network to boost cooperation.

The new manufacturing initiative, jointly launched by the International Coalition of Intelligent Manufacturing and leading companies to drive smart transformation, builds on recent BRICS progress in co-constructing smart factories, sharing digital solutions and aligning technical standards.

Concurrently, the China-initiated "Network of Partner Cities on New Industrial Revolution" was established to enhance urban policy alignment and industrial synergy, featuring a first cohort of 10 cities across five nations.

Co-hosted by the Ministry of Industry and Information Technology and the Fujian provincial government, the forum drew representatives from over 20 countries and international organizations to focus on smart manufacturing solutions and developing-world industrial upgrades.

Delegates said artificial intelligence, the industrial internet and robotics are rapidly reshaping global supply chains and manufacturing competitiveness.

Tri Supondy, an Indonesian Ministry of Industry official, said that rapid technological advances, industrial restructuring, AI and robotics are actively reshaping global manufacturing supply chains and competitiveness, making this transformation urgent for the Global South.

Supondy said no single nation can navigate this transformation alone, and called for upgraded talent, international cooperation and technological modernization.

John Owan Enoh, Nigeria's Minister of State for Industry, said global industrial systems are being driven by AI, digital technology and green innovation, redefining the future of production processes and global value chains.

For developing economies like Nigeria, Enoh said these changes offer unique opportunities to leapfrog traditional paths and build resilient, competitive and inclusive industrial ecosystems.

Andrei Kuznetsov, Belarus Minister of Industry, said China's short product development cycles in the digital economy and smart manufacturing make it highly attractive for foreign investment and international cooperation, while significantly promoting experience-sharing among BRICS partners.

Zeng Yuqun, chairman of CATL, said that the new industrial revolution allows BRICS nations to transition from mere raw material suppliers to core participants and builders of the green value chain, leveraging their rich minerals and renewable energy.

Zeng said CATL's $6 billion investment with Indonesian firms for an integrated electric vehicle battery chain — spanning mining to recycling — is expected to create over 8,000 direct and 35,000 indirect jobs.

To turn volatile renewable energy into stable industrial power, CATL is advancing zero-carbon solutions, he said, adding that the company will officially launch the world's largest one-stop energy storage testing platform on Thursday in Xiamen.

Xiang Wenbo, chairman of Sany Group, called the BRICS bloc a primary growth engine for the group's overseas business, and its international sales topped $10 billion last year, with BRICS markets accounting for half.

Sany has built industrial parks in four BRICS markets — including Indonesia and Kazakhstan — and the group aims to leverage industrial innovation to make green energy more efficient and universally accessible, he said.

Concurrently, the forum hosted an industrial exhibition and the "Golden Egret" scholarship workshop, bringing 25 participants from 14 countries for field studies at leading companies like Alibaba and Unitree Robotics.

The Xiamen-based BRICS PartNIR Innovation Center has finalized 138 projects over five years, exceeding 62 billion yuan ($9.1 billion) in total investment.

Fujian's 2025 trade volume with BRICS markets reached 365.5 billion yuan, accounting for nearly one-fifth of the province's total foreign trade.

Pop Mart's Labubu keeps on heavy lifting

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Visitors gather at a Pop Mart store in Shanghai on May 5. TANG KE / FOR CHINA DAILY

Collectible toy giant Pop Mart has deepened its partnership-driven growth strategy through a new Twinkle Twinkle collaboration with McDonald's China. Since launching on May 20, the campaign has drawn long queues, social media buzz and growing resale prices, with some co-branded toys reportedly trading more than 30 percent above their original price on the secondary market.

Si De, chief operating officer of Pop Mart, said the company's intellectual property portfolio continues to demonstrate strong commercial vitality across global markets.

"Our IPs have maintained strong momentum in recent months. Labubu continues to enjoy strong popularity among global consumers," Si said. In the first quarter, collaborative products including Labubu x Sanrio and Labubu x FIFA delivered excellent performance, he said.

The remarks came as Pop Mart recently released its first quarter 2026 financial update, signaling revenue growth of between 75 percent and 80 percent year-on-year. Revenue in the Chinese market surged between 100 percent and 105 percent, supported by a 150 percent to 155 percent increase in online sales.

Despite the strong domestic performance, overseas markets have seen growth slowing sharply compared with the previous year. Revenue in the Americas increased between 55 percent and 60 percent, while Europe and other overseas regions grew 60 percent to 65 percent. Growth in the Asia-Pacific region reached 25 percent to 30 percent.

Executives cautioned investors against overinterpreting short-term fluctuations, and said that the country's trendy toy market remains in a rapid expansion phase as consumers increasingly seek products delivering emotional and cultural value.

Industry analysts expect the sector to maintain robust long-term growth momentum. According to a KPMG report, the country's trendy toy market was projected to reach 82.5 billion yuan ($12.1 billion) in 2025, a year-on-year growth of 40.5 percent. The market is forecast to exceed 213.3 billion yuan by 2030, with a compound annual growth rate of 18.7 percent.

The report found that more than 90 percent of young consumers recognize the importance of "emotional value", while nearly 60 percent are willing to pay a premium for such products and experiences.

Pop Mart recorded a breakthrough year in 2025. Operating revenue reached 37.12 billion yuan, giving the company a domestic market share of more than 30 percent. Its flagship IP Labubu generated revenue of 14.16 billion yuan.

The company is also accelerating expansion into immersive entertainment and lifestyle businesses. On April 30, a new section of Pop Land, its theme park, officially opened in Beijing, featuring upgraded attractions centered around Labubu and Dimoo characters.

"We introduced several large-scale amusement facilities for the first time, and the market response has exceeded expectations," Si said.

He added that Hirono standalone stores are set to expand to Seoul following launches in Shanghai, Bangkok and London.

The company has also expanded its Popop accessories unit's retail stores into six Chinese cities, launched its first Labubu-themed refrigerator and continued development of its first film project.

Corporate sales on steady growth track

By **REN QI**
renqi@chinadaily.com.cn

China's enterprise sales revenue registered steady growth in the first four months of the year, with multiple bright spots emerging across various sectors, according to the latest invoice data released by the State Taxation Administration.

"The invoice data reflect that the foundation of China's economic recovery and upward trajectory is continuously consolidating, while growth momentum is strengthening," said Huang Lixin, director of the Tax Science and Research Institute under the administration. "It shows that high-quality development is moving toward new and optimal levels, powerfully demonstrating the resilience and vitality of China's economic development."

During the January-April period, industrial sales revenue increased by 6.6 percent year-on-year. Specifically, sales revenue in the manufacturing and mining sectors grew by 6.9 percent and 6.4 percent, respectively, maintaining a relatively fast growth trend.

Equipment manufacturing continued to play its role as an economic ballast, with sales revenue rising 7.6 percent year-on-year. Notably, the manufacturing of computer and communication equipment, electrical machinery and equipment, and instrumentation saw sales revenues surge by 14.7 percent, 10.3 percent and 9.1 percent, respectively.

6.6 percent
growth in industrial sales revenue tracked by the State Taxation Administration during the January-April period

Industries representing new growth drivers also expanded rapidly. Sales revenue in high-tech industries jumped 15.3 percent year-on-year. High-tech manufacturing saw a 14.9 percent increase, accounting for 18.1 percent of the total manufacturing sales revenue, up 1.3 percentage points from the same period last year.

The vitality of digital industrialization was continuously unleashed, with sales revenue of core industries in the digital economy growing by 9.4 percent year-on-year. Within this sector, the manufacturing of digital products and the application of digital technologies experienced growth of 12.9 percent and 12.3 percent, respectively.

Fu Linghui, chief economist of the National Bureau of Statistics, noted that from January to April, China effectively implemented more proactive and effective macroeconomic policies. Efforts were focused on stabilizing employment, enterprises, markets and expectations, allowing the national economy to maintain a trend of steady progress.

The driving effect of artificial intelligence became increasingly prominent. Sales revenue of specialty electronic material manufacturing and integrated circuit manufacturing, which are directly related to AI production and application, skyrocketed by 70 percent and 54.4 percent year-on-year, respectively. Meanwhile, sales revenue of smart in-vehicle devices and robots, linked to AI terminal applications, surged 50.7 percent and 27.5 percent, respectively.

Looking ahead to the economic trajectory in the next stage, Wang Guanhua, a spokesperson for the NBS, said that while acknowledging the internal and external pressures and challenges in economic operations, it is even more important to recognize that the internal driving forces for steady economic improvement remain unchanged and will not change. There is a solid foundation and favorable conditions to promote steady and positive economic development, Wang added.

Furthermore, consumer potential continued to be unleashed. Driven by policies such as the trade-in program for consumer goods and lottery invoices, retail sales revenue of communication equipment grew by 17.4 percent year-on-year. The services consumption market remained robust, with sales revenue from leisure and sightseeing activities; travel agencies and related services; and the cultural, sports and entertainment sectors increasing by 32 percent, 14.6 percent and 14 percent, respectively. Additionally, sales revenue from catering delivery services and homestay services rose by 7.7 percent and 14.1 percent, respectively.

WORLD

People bathe in the sunshine at a beach in Brighton, United Kingdom, on Tuesday, as temperatures continue to soar. GARETH FULLER VIA AP

Why Europe is world's fastest warming continent

PARIS — Europe, which is in the throes of a record-smashing heat wave this week, is the world's fastest-warming continent and stretches into an even more rapidly heating Arctic.

After record-high temperatures for May were broken in Britain, Ireland and France on Monday and Tuesday, the continent still faces more brutal heat in the coming days.

A so-called "heat dome" of warm air from northern Africa trapped under a high-pressure system over western Europe is behind the sort of heat not usually seen until high summer. The planet is around 1.4 C warmer than in preindustrial times, defined as 1850-1900.

By comparison, Europe is around 2.4 C hotter than the preindustrial era, according to the EU's Copernicus Climate Change Service.

"Almost all of this heat is driven by the human-induced greenhouse effect from fossil fuel emissions, with the actual distribution of this excess heat determined by (several) factors," Ben Clarke, a researcher in extreme weather and climate change at Imperial College London, told AFP.

Shifts in atmospheric circulation have driven more frequent and more intense heat waves in the European summer, according to Copernicus.

High-pressure systems have become more common in Europe, Copernicus Director Carlo Buontempo said.

"If you look over the last 20, 30 years, there has been a prevalence, especially in summer, of those sorts of anticyclonic conditions that are making heat waves more likely," Copernicus Director Carlo Buontempo told AFP.

Whether the increased frequency of that specific type of high-pressure system is due to climate change or is just a "statistical fluctuation" is still a scientific debate, Buontempo said.

Such high-pressure systems are also known as "blocking highs" because they can remain stationary and stop other weather systems from moving into a region.

Explaining how they work, Mary Bourke, a professor at Trinity College Dublin, said: "The sky is exposed to us, there are no clouds. It's a stable mass of air that is bringing warm air down to the surface and taking away moist air, so the air is not only warm, but it's also dry."

Another reason is geography. "Europe is connected to the Arctic, which is warming much faster than the rest of the planet," Clarke said.

The Arctic is 3.2 C warmer than in preindustrial times, according to Copernicus.

The region's rising temperatures are partly due to a process known as the albedo feedback.

Bright snow and ice reflect much of the sun's heat back into space, but as they melt they reveal darker, heat-absorbing surfaces such as land and the ocean. "So as sea ice melts it leads to greater absorption of heat, which in turn further warms waters and melts more ice," Clarke said.

In other parts of Europe, the area where snow was very frequent in winter has shrunk, Buontempo said.

"We have many of the historical regions that had a week or more of freezing conditions now, not having that. And this means exposing dark land rather than white snow," he said.

Stricter air quality regulations have reduced aerosol emissions since the 1980s.

But tackling the pollutant had the side effect of contributing to global warming, as these tiny airborne particles have a cooling effect by reflecting sunlight and making clouds more reflective.

"While a reduction in air pollution is hugely important for respiratory health, it also increases the solar radiation at the surface, as many types of particulate matter deflect sunlight," Clarke said.

AGENCIES VIA XINHUA

US steel tariffs hit domestic can makers and raise prices

By BELINDA ROBINSON
in New York
belindarobinson@chinadailyusa.com

US steel tariffs have hit the humble tin can, with domestic manufacturers saying it costs more to produce cans at home than import them from overseas, despite President Donald Trump's push to bolster domestic steel production and limit imports.

China dominates global steel manufacturing and processing, accounting for 53 percent of global crude steel output, according to the World Steel Association. China is also the world's largest manufacturer and consumer of tinplate, according to the China Iron and Steel Association.

A decade ago, American producers made 60 percent of tinplate and other packaging steel used in the US, according to Harbor Intelligence, a steel analysis and research company. Last year they produced less than 20 percent, with the remaining 80 percent imported, The New York Times reported.

Over the past several years, American steelmakers deliberately moved away from producing tinplate for packaging in favor of other types of more lucrative steel production used in cars and buildings.

However, US industry groups are urging the president to remove tariffs on steel.

Scott Breen, president of the Can Manufacturers Institute, said in a statement that the Trump Administration's "recent aluminum and steel tariff actions keep costs high to make metal cans in America".

Trump used Section 232 of the Trade Expansion Act of 1962 to implement a 25 percent steel tariff and 10 percent tariff on aluminum during his first presidency.

On April 2, the Trump administration restructured the tariffs on steel, aluminum and copper, lowering some rates and adding new sourcing rules, The White House said.

The Urban-Brookings Tax Policy Center, an independent research organization, found that these changes "significantly reduce tariffs on steel and aluminum, with the average rate falling by over 20 percentage points".

David A. Gantz, Will Clayton Fellow for Trade and International Economics at Rice University's Baker Institute for Public Policy, told China Daily that Trump's tariffs on steel, aluminum, copper and other goods imported from virtually all US trading partners have a "negative impact" on the US economy.

The US currently imports its canned food from Asia, South America and Europe. Key global suppliers include China, Peru, Spain, Greece and India.

China and Thailand supply preserved fruits, seafood and tropical goods, according to the United States Department of Agriculture.

Worldwide, China exported over 206,468 tons of canned goods in April 2026 alone, data from CEIC and China's General Administration of Customs showed. One of the largest areas for this kind of production is Shandong province in eastern China.

China's top three export destinations for its private label canned goods by value were the US, Japan and Germany between 2025 to 2026, Yahoo News reports.

In the US, the cost of a can accounts for a third of the wholesale price of canned vegetables or fruits.

Trump's tariffs have not only raised the cost of tinplate, but also canned food, The New York Times reported.

Canned fruits and vegetables cost 5.7 percent more in March this year, compared with March 2025, government data showed.

Robert Ayars opened the first American cannery in the US in 1812.

Today, cans are an overlooked, everyday item. But they remain very important.

On West 36th Street in Manhattan, New York, directly opposite a luxury condo building site, a line of people wait in the middle of the afternoon in the searing heat for a food pantry to open.

A clipboard is passed around so that people can write their names down to ensure that no one jumps the line.

Mikaela, manager of the Metropolitan Community Church food distribution service, is in charge of the food pantry, which gives those in need free meat, produce and canned food. They also provide hot meals.

"The canned goods are probably the most important thing we offer, because if we run out of everything else or we don't get enough donations, the cans are always helpful," she told China Daily. "We feed at least 40 to 50 people per day over a period of three days. Sometimes it's more, it depends who is in need."

She explains that most of the canned food comes from New York City's local government and City Harvest, one of the largest food rescue organizations in New York. The local government also helps with funding. Public donations are welcomed.

"If people didn't get the food or the canned goods, they might not eat that day, that's what they tell me," Mikaela said. "So, we make sure we have enough to give them because the canned food is very important."

Top leader of DPRK oversees key weapon system test

PYONGYANG — Kim Jong-un, the top leader of the Democratic People's Republic of Korea, has overseen weapon tests involving a lightweight multipurpose missile launching system and a multiple tactical cruise missile weapon system, the official Korean Central News Agency said on Wednesday.

The tests were conducted on Tuesday by the Missile Administration and the Academy of Defence Sciences. They analyzed and estimated the power of a special mission warhead of a tactical ballistic missile, the reliability of a 240mm controlled artillery rocket with an expanded firing range and an ultraprecision autonomous navigation system, and the AI-guided hit accuracy of a tactical cruise missile, said the report.

The tactical cruising shell features a combination of the ultraprecision autonomous navigation system, the terrain contour matching, or TERCOM, navigation system and an AI terminal guidance function. It is a powerful weapon system that can make an ultraprecision strike against any target 100 kilometers away by multimodal flight based on gliding and propelling, it said.

Kim said the tests were a clear signal of an upgrade of the country's military force and showed great technical progress in the strengthening of its combat power, according to the report.

The leader also outlined tasks for stepping up the steady growth of the country's defense capabilities and developing ultramodern military hardware.

Iran hits out at violation of truce by US

Tehran says it's ready to repel any attack while ruling out renewed war

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran's Foreign Ministry has condemned the "flagrant and unjustified" ceasefire violations by the United States in the Strait of Hormuz, noting that these took place despite ongoing diplomatic efforts mediated by Pakistan.

In the latest developments, an Islamic Revolutionary Guard Corps official said a renewed war with the US is unlikely, but warned that Tehran stands ready to repel any attack, Al Jazeera reported.

"The possibility of war is low because of the enemy's weakness, but the armed forces are lying in wait," said Mohammad Akbarzadeh, a commander of the IRGC Navy.

In a statement issued on Tuesday, reported by Mehr News Agency, the foreign ministry slammed the US Army for continuing its "illegal and unjustifiable actions" since the announcement of the ceasefire on April 8.

The ministry said the US had committed "a flagrant violation of the ceasefire in the Hormozgan region over the past 48 hours", particularly following "multiple instances of maritime piracy against Iranian commercial vessels".

The US has said its attacks were defensive in nature, targeting missile sites and boats attempting to lay mines.

In his call with Qatari Emir Sheikh Tamim bin Hamad Al Thani and other regional leaders, Iranian President Masoud Pezeshkian reaffirmed Tehran's readiness to establish a "dignified framework" aimed at ending the ongoing fighting and regional tensions.

Pezeshkian spoke with heads of state from several mostly Muslim-majority countries on the occasion of Eid al-Adha.

He and his Egyptian counterpart, Abdel Fattah El-Sisi, exchanged greetings on Tuesday. They also underscored the necessity of Islamic unity and indicated a new chapter in regional relations.

Pezeshkian emphasized the need to strengthen cooperation across the Islamic world and expand bilateral relations between Tehran and Kuala Lumpur in his phone call with Malaysian Prime Minister Anwar Ibrahim.

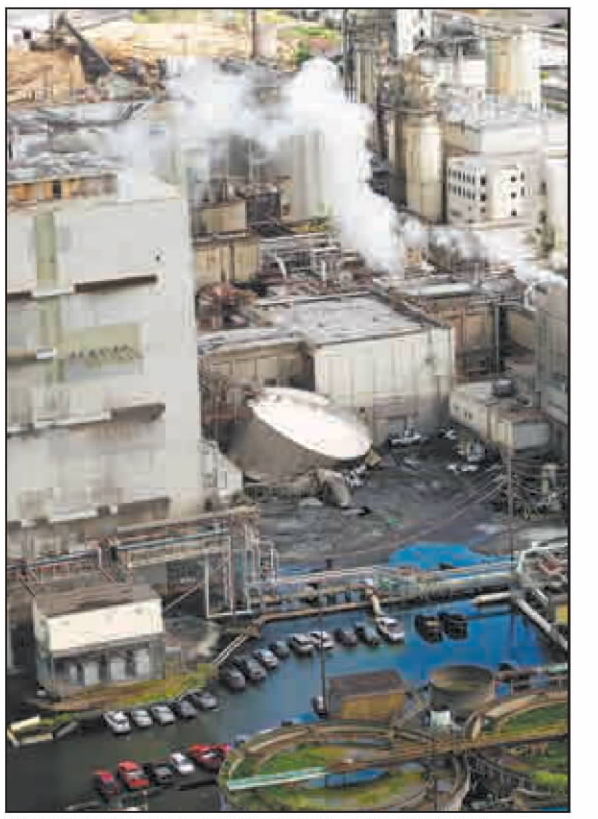
Meanwhile in the US, President Donald Trump was expected to meet with his Cabinet on Wednesday at a precarious moment for talks aimed at ending the conflict with Iran. He took to social media on Tuesday to grumble that even if Tehran were to offer a complete surrender, the media would paint the end of the conflict as Iran scoring "a masterful and brilliant victory".

'A few more days'

US Secretary of State Marco Rubio said negotiations between the US and Iran on extending the ceasefire and reopening the Strait of Hormuz will take "a few more days".

According to Iranian sources, an initial deal would end hostilities on all fronts, get traffic moving through the strait within 30 days, and possibly provide some financial relief. More difficult issues such as Iran's nuclear program would be negotiated in the second phase. Iran has been allowing some ships through the strait, giving preference to vessels linked to countries with which it has close ties, Reuters has reported.

The conflict, which began on Feb 28, has caused an unprecedented oil supply shock, pushing up the costs of fuel, fertilizer and food.



The IRGC Navy said in a statement on Tuesday that as many as 25 other ships and oil tankers have been able to transit through the strait in coordination with the IRGC naval forces, Iranian media reported.

Also on Tuesday, the United Nations Security Council condemned what it said was an "egregious drone attack" that targeted an electricity generator outside the inner perimeter of the Barakah nuclear power plant in the United Arab Emirates on May 17.

Agencies contributed to this story.

Japan faces backlash over intel agency

System could silence anti-war voices under banner of security, critics warn

By **HOU JUNJIE** in Tokyo
houjunjie@chinadaily.com.cn

Concerns are growing in Japan over what critics describe as a dangerous drift toward suppressing anti-war voices in the name of national security, as the government pushes ahead with constitutional revisions and the creation of a new national intelligence structure.

Japan's House of Councillors on Wednesday passed legislation establishing a national intelligence council, as Prime Minister Sanae Takaichi moves to centralize and strengthen the country's intel capabilities. The bill had cleared the House of Representatives last month.

Under the legislation, Japan will build an intelligence system centered on the national intelligence council, with a national intelligence bureau serving as its operational arm.

Chaired by the prime minister, the council will comprise relevant Cabinet members, including the chief Cabinet secretary and foreign minister, while the bureau will coordinate intelligence work across government ministries and agencies.

Critics warn the move could pave the way for a broader expansion of executive power.

Japanese lawyer Shunkichi Takayama said the Takaichi administration is attempting to open the door to constitutional revision through the introduction of an "emergency clause", which would allow the Cabinet to temporarily assume parliamentary functions during major crises.

The deeper intention behind the move is to seriously consider how Japan could seize opportunities for military action under critical circumstances, Takayama said.

The establishment of a national intelligence council should be understood within this broader context, he said, adding that its purpose would be to identify, monitor and suppress anti-war activists to advance pro-war policies.

Both the proposed intelligence agency and potential anti-espionage legislation are being viewed as tools serving that wider agenda — developments that are increasingly raising concern within Japanese society, he said.

Protests against the bill were held in Tokyo on Tuesday and Wednesday, with demonstrators carrying signs reading "No laws for war preparations" and "No public surveillance! Intelligence agency bill monitors citizens".

Makoto Konishi, a former member of Japan's Air Self-Defense Force, said one objective behind the government's push to establish a new intelligence framework is to suppress anti-war and pro-peace voices.

> "The Japanese government has consistently used claims of an increasingly severe security environment to justify expanding defense spending."
>
> **Hiroshi Shiratori,** a professor of political science at Hosei University in Tokyo

Nikkei Asia reported that opposition lawmakers warned that the new institution could expand government surveillance powers, characterizing the move as a return to a dangerous path Japan once followed.

Before and during World War II, Japan's Special Higher Police, known as Tokko, and military police organizations actively suppressed anti-government movements and civil society groups.

In an earlier editorial, the Ryukyu Shimpo warned that Japan should learn from the prewar misuse of public security legislation and remain cautious about expanding state intelligence systems.

Since taking office, Takaichi has repeatedly argued that Japan faces "the most severe and complex security environment of the postwar era".

Justification questioned

Hiroshi Shiratori, a professor of political science at Hosei University in Tokyo, told China Daily, "The Japanese government has consistently used claims of an increasingly severe security environment to justify expanding defense spending."

However, he questioned what concrete evidence or standards the government relies on to conclude that Japan is facing a "security crisis" and to continuously heighten public anxiety.

Shiratori warned that repeatedly emphasizing crises, intensifying perceptions of threats from neighboring countries and further expanding military capabilities could unnecessarily heighten regional tensions and increase the risk of accidental conflict.

The Mainichi Shimbun reported that the Japanese government could establish the national intelligence council and the national intelligence bureau as early as July, while also setting up an expert panel to discuss counterespionage legislation.

The government is expected to formulate its policy and submit related legislation during the regular parliamentary session in 2027.

Immigration clash

United States federal agents detain a protester after taking him outside an immigration center in Newark, New Jersey, on Tuesday. The US Immigration and Customs Enforcement is housing detainees at the center. The protests, which have become tense over the holiday weekend, come amid reports of an ongoing hunger strike by those being held. ADAM GRAY / AFP

Israel says it killed new head of Hamas' armed wing

JERUSALEM/CAIRO — Israel said on Wednesday it had killed Hamas' newly appointed armed wing chief in Gaza, days after it killed his predecessor, while intensifying military pressure in Gaza and expanding operations in Lebanon.

The Israeli military said Mohammed Odeh was killed in an operation in Gaza on Tuesday.

A relative of Odeh confirmed his death to Reuters and said the funeral would take place after noon prayers in Gaza City. Hamas has yet to issue an official statement.

Gaza health officials said six people were killed and more than 20 others wounded in the same Israeli strike that destroyed an upper floor of an apartment building in the Rimal neighborhood in Gaza City. Rescue workers were still at the scene looking for more possible casualties.

Israeli Defense Minister Israel Katz said in a statement that Odeh, whom he described as Hamas' fourth-ranking official, had been killed.

"We promised that Hamas will not have military or civilian control over Gaza, and so it will be," Katz said.

Israeli Prime Minister Benjamin Netanyahu said on Tuesday night that Israeli forces had attempted to assassinate Odeh in a strike carried out under his and Katz's direction, but gave no details on the outcome.

Odeh was appointed about a week ago to succeed Izz al-Din al-Haddad, who was killed in an Israeli strike on May 15.

Lebanon operations

Hours before the attack, Israel announced it had expanded ground operations in Lebanon, where it has been fighting Hezbollah militants since it launched attacks on Iran with the United States at the end of February.

"The (Israel Defense Forces) are operating with large forces on the ground and seizing strategic areas," Netanyahu said after meeting with Katz and senior military officials.

On Wednesday, Hezbollah said its fighters "clashed with the enemy forces at point-blank range" in the town of Zawtar al-Sharqiyah, on the edge of an Israeli-declared "yellow line" in southern Lebanon, where its troops have been operating.

Africa underscores role of stable China-US ties

By **EDITH MUTETHYA**
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

The recent visit by US President Donald Trump to China has renewed discussions among African observers about the importance of cooperation between the world's two largest economies for global stability and Africa's development.

Analysts and business leaders say collaboration between Beijing and Washington could ease geopolitical tensions and create broader opportunities for trade, investment and infrastructure development across Africa.

Mark Badmus, chief executive of AMB Global Trade Finance Consultants, said a partnership between the two countries is essential to maintaining peace and sustaining global economic progress.

Developments between the United States and China often have far-reaching implications for Africa because global economic disruptions can quickly affect energy prices, trade flows and financial markets, Badmus said.

China-US cooperation can create opportunities for African economies in infrastructure, technology, climate action and trade, he said.

However, African countries must also strengthen collaboration among themselves to fully benefit from engagement with global powers, he added.

A unified African position in global affairs would help the continent secure better outcomes when engaging with major economies, Badmus said.

"If Africa speaks with one voice, it will gain more advantage," he said. "But if countries continue aligning individually based on historical ties, such as with former colonial powers, they may not achieve much."

Steph Davy Nguimbi, deputy CEO of Warwyck Private Bank in Mauritius, said China-US ties are crucial for global economic stability.

"The world today is like a village," he said. "When those two fight, the repercussions are felt everywhere, even in African countries that may not be directly involved."

Nguimbi expressed hope that outcomes between Washington and Beijing during Trump's visit could help address ongoing economic and geopolitical challenges.

While African nations maintain diplomatic and economic ties with both powers, a cooperative relationship between the US and China would reduce global uncertainty and help foster a more stable environment for Africa's growth, he said.

James Mwangi, CEO of Africa Climate Ventures, said stronger China-US cooperation would have a significant impact on Africa. Geopolitical rivalry between them could undermine Africa's efforts to address climate change, food insecurity and industrial development, he said.

Climate-smart farming solutions in Africa rely on interconnected global partnerships, he said.

Mwangi said agricultural projects across Africa depend on carbon demand from US and European Union buyers, manufacturing inputs with significant Chinese participation, and implementation by African farmers and businesses.

"All three have to work together," he said. "When geopolitical rivalry creates friction in any one of those links, an East African smallholder farmer loses access to a product that could protect her yields through a drought year."

Green transition

Mwangi added that China-US cooperation is also essential to Africa's transition to cleaner transport systems and green industrialization.

"Chinese technology is what makes the economics viable at African price points, while US development finance is what makes early-stage investment bankable," he said. "Rivalry doesn't produce a winner in Africa. It produces a gap."

Citing climate-related risks, Mwangi warned that Africa could face a projected 5 to 10 percent decline in crop yields with less than 2 degrees of global warming, while an estimated 52 million Africans have already been affected by droughts or flooding over the past two years.

"The businesses we are building are a direct response to that and they need the world's two largest economies pulling in the same direction," he said.

'Brexit moment' feared in Iceland's looming EU vote

By **JONATHAN POWELL** in London
jonathan@mail.chinadailyuk.com

Iceland may face a "Brexit moment" in its looming European Union referendum amid concerns about misinformation, foreign interference and AI, the country's foreign minister says.

The northern European island nation will hold a referendum on whether to continue EU accession talks on Aug 29, and developments are being watched closely in Washington, Moscow and Brussels.

Speaking to The Guardian, Foreign Minister Thorgerdur Katrin Gunnarsdottir accused domestic and foreign actors of "fearmongering", saying Iceland was being hit with misinformation and rhetoric "from the playbook of Nigel Farage and Reform", referring to the United Kingdom's far-right party Reform UK and its leader.

The minister warned that the referendum risks becoming a target of foreign interference and that misinformation could shape the result.

"I am fearing that we will face a Brexit moment," she said. "That would be ... a rather dangerous path because ... there were all kinds of lies put forward by the Brexiteers."

Thorgerdur pointed to disputed figures used by the UK's Leave campaign about how much money the country sent to the EU.

She said Brexit "should be an example of how not to run a campaign" rather than something to replicate. "Nothing of what they promised has actually been activated or realized," she added.

In March, Iceland's coalition government unexpectedly brought the EU referendum forward from 2027, citing heightened external pressures from the United States and strategic concerns over its closest neighbor, Greenland, following US threats to forcibly acquire the Danish territory.

"The international order that underpinned our security and prosperity for decades is under serious pressure," Thorgerdur said. "The world has changed so decisively ... so Greenland has of course affected, or had influence on, our decision."

She warned that trade is being used as a political weapon. "You do not treat a friend and an ally like Greenland and Denmark like the US did in the beginning of this year."

Yet, Iceland's ties with the US remain strong, she said.

"Iceland being a member of the EU is not contradicting all the good relationship with the US. One thing does not exclude the other thing," she added.

Icelanders will not decide on EU membership itself in the August vote, but on whether the government should resume accession talks.

Hungary for success: PSG eyes historic win

Enrique's side is targeting rare UCL title repeat in Budapest

If Paris Saint-Germain's maiden triumph last year allowed the French club to break its Champions League hoodoo, winning the title again this season would allow it to be remembered as one of Europe's all-time great teams.

Twelve months after crushing Inter Milan 5-0 in Munich to claim the trophy with the biggest final win in European Cup history, PSG heads to Budapest to face Premier League champion Arsenal.

Stopping Luis Enrique's thrilling PSG side has proved an impossible task for just about everyone over the last 18 months, from Pep Guardiola's Manchester City to the seemingly unbeatable Bayern Munich in their recent semifinal clash.

Arsenal tried, and failed, in last season's semis, and the Parisians are the favorites to retain their title this time.

"We understand that we are the reigning champions and we can win again," Khvicha Kvaratskhelia said in an interview with UEFA.

"Of course, this will be difficult, but we've proved, once more, that we can beat any team as long as we play our way and give our all on the pitch," added the Georgian winger, who is arguably the best player in this season's Champions League with seven goals and three assists in the knockout rounds.

When Enrique, a Champions League winner with Barcelona in 2015, arrived in 2023, PSG was transitioning away from the era of highly paid superstar players.

Lionel Messi and Neymar left that same summer, ending underwhelming spells in the French capital. Kylian Mbappe departed a year later.

PSG had been completely transformed since the Qatari takeover of the club in 2011, but — one run to the final in 2020 and a semifinal in 2021 apart — it had become associated with frequent disappointment in the Champions League, and occasional humiliation.

Enrique has overseen a radical change, completely altering perceptions of the club outside of France.

Vitinha will be looking to add to the six goals he already has in PSG's current Champions League campaign in Budapest. AFP

If PSG retains the Champions League title, Luis Enrique will become only the fifth manager to win three European Cups. AFP

'Still things to be achieved'

PSG was almost once seen as a little bit of a joke in Europe, due to its enormous spending and lack of continental success.

Now, it is taken very seriously and has won admirers for the breathtaking soccer played by an exciting young team, built with the transfer market nous of its "soccer advisor" Luis Campos and coached by Enrique.

"He is a top-class coach with clear ideas. He is full of energy. He is exceptional and we hope he stays for a very long time," said Ousmane Dembele.

The France forward has been transformed from a dazzling but often wasteful winger into a prolific striker.

He scored 35 times last season and won the Ballon d'Or. This season, his minutes have been carefully managed amid numerous fitness scares, but he has still scored 19 goals and set up 11 more in just 24 starts.

Dembele, at 29, is the fourth-oldest player in the squad, behind only Fabian Ruiz, Lucas Hernandez (both 30) and 32-year-old captain Marquinhos.

The youthful energy all over the team allows it to play with a terrifying intensity that has blown away most opponents.

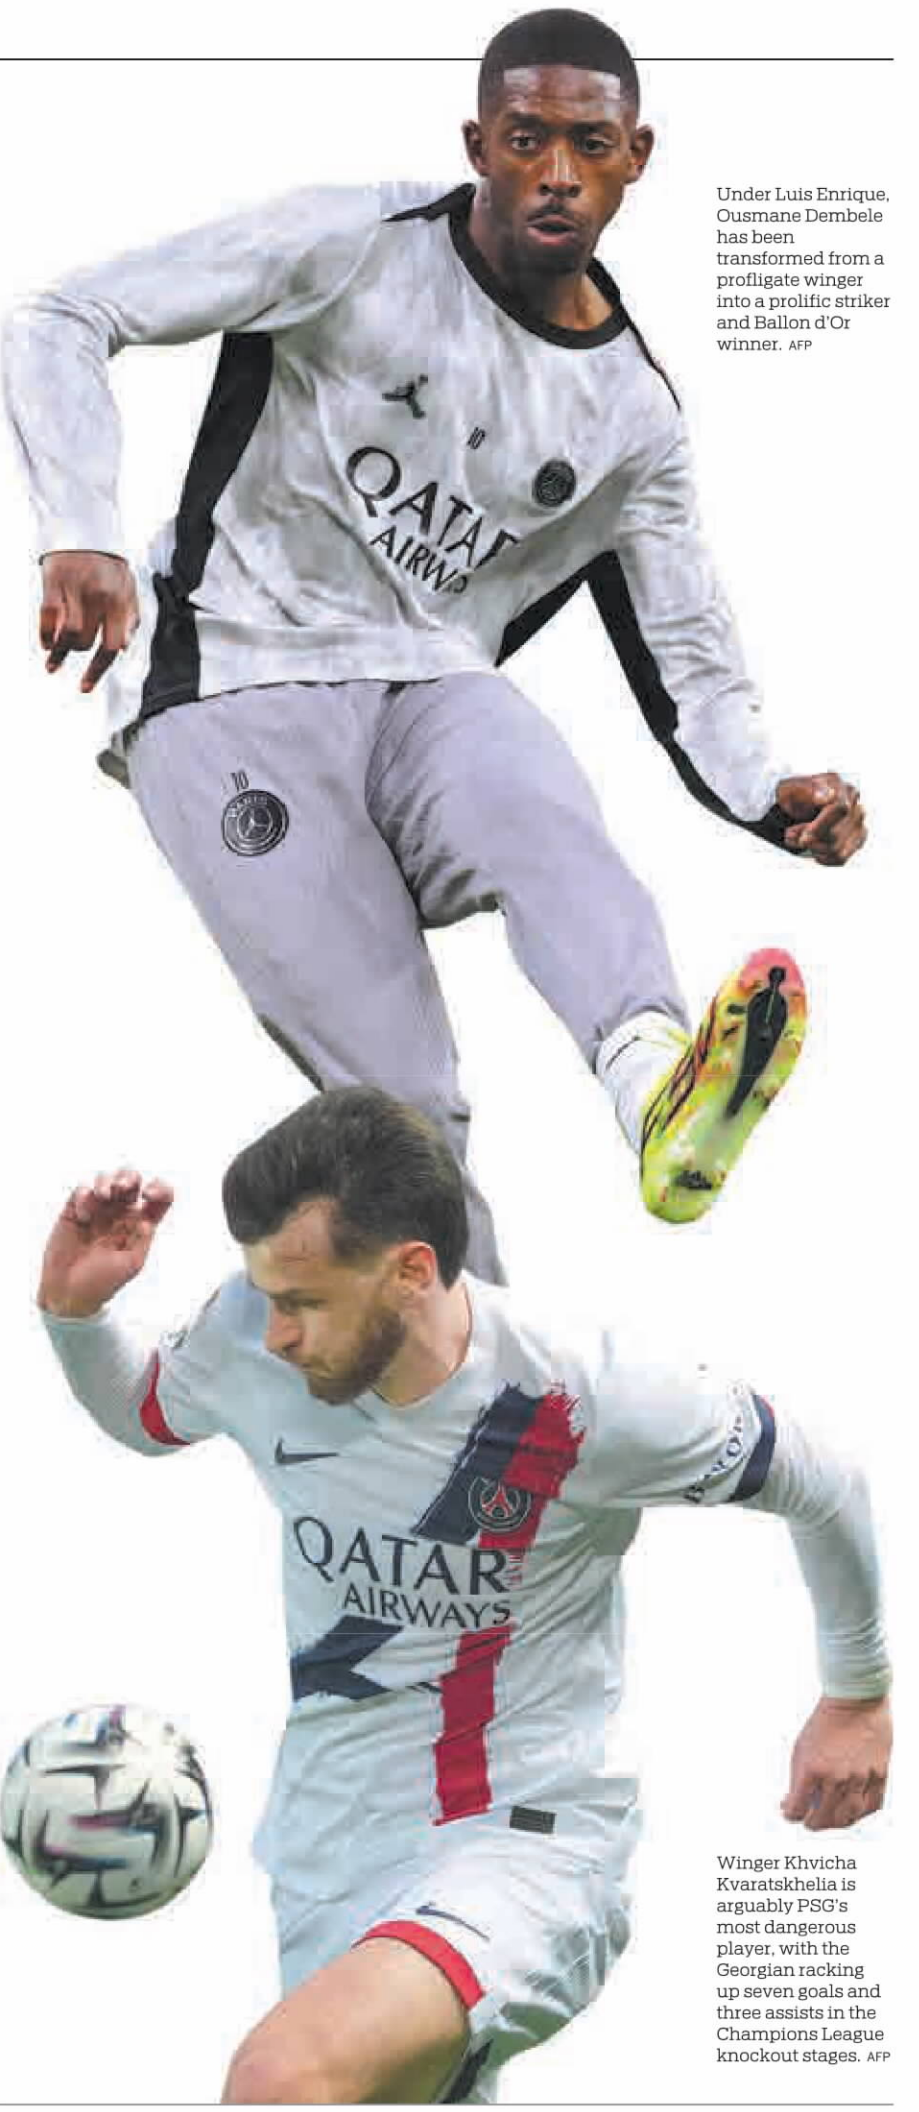
Things might not be so easy against Arsenal, but PSG has already reached three consecutive semifinals under Enrique.

Reaching consecutive UCL finals is incredibly hard, but retaining the title is almost impossible.

Zinedine Zidane's Real Madrid, which won three on the bounce from 2016-18, is the only side to have gone back-to-back in the modern Champions League era — before that you have to go back to Arrigo Sacchi's AC Milan in 1989 and 1990.

In a French context, the country had only ever produced one Champions League winner before last season, with Marseille in 1993.

This is not a fairytale story for a club backed by the wealth of Qatar and with the fourth-highest revenue in world soccer last year, according to the Deloitte Football Money League, behind only Real, Barcelona and Bayern.



But, it shows it did the right thing in abandoning the old superstar project, even if plenty of its current squad — Dembele, Kvaratskhelia, Vitinha, Achraf Hakimi — could now be considered as such.

The true superstar, though, is the coach, and Enrique can become just the fifth manager to win three European Cups after Carlo Ancelotti, Bob Paisley, Zidane and Guardiola.

"When I came to the club I said my objective was to make history," he told UEFA.com.

"We want to keep writing history, because we feel there are still things to be achieved."

AFP

Winger Khvicha Kvaratskhelia is arguably PSG's most dangerous player, with the Georgian racking up seven goals and three assists in the Champions League knockout stages. AFP

Miserly Arsenal looks to nullify French flair in continental clash of styles

Arsenal's immovable object meets the unstoppable force of Paris Saint-Germain in Saturday's Champions League final, offering a pronounced clash of styles.

Holder PSG's flowing attack is arguably the continent's most exhilarating, while Mikel Arteta's Arsenal is wedded to the pragmatic approach that ended its 22-year wait to win the Premier League.

The Gunners' soccer this season has not won over many neutrals, but after years of being the league's perennial "nearly men", Arteta's strategy has paid dividends.

Arsenal's consistency beat out Pep Guardiola's Manchester City to be crowned champion of England and led it back to Europe's summit two decades after reaching the 2006 final.

In the current Champions League campaign Arsenal has conceded only six goals in 14 matches and is unbeaten — by contrast PSG has let in 22 through the tournament.

"Without the ball, they are the best team in the world," said PSG coach Luis Enrique of the north London side.

Arteta's side depends on structure and discipline, seeking to control opponents by stopping it reaching dangerous areas, limiting its shots in the box — no Premier League team has conceded fewer.

The Gunners aggressively press opponents high, seeking to dominate territory, and hate giving the ball away themselves, avoiding risk in their passing.

They possess imposing, physical players, from impressive center-back pairing Gabriel and William Saliba, through the spine of the team with Declan Rice to imposing strikers Viktor Gyokeres and Kai Havertz.

That aids Arsenal's dead ball mastery, under the cunning eye of set piece coach Nicolas Jover, who it signed from Manchester City in 2021.

Swiss newspaper Blick pondered whether Jover was "ruining soccer", with the Frenchman reportedly paid a bonus for every goal scored via set-pieces.

"We want to be the best and the most dominant team in every aspect of the game," said Arteta, imploring his team to score even more from dead balls.

With 27 Premier League goals scored this season from dead ball situations, 38 percent of its total, some have labeled Arsenal "Set Piece FC".

"Every time they get a corner, my head is in my hands," former Liverpool defender Jamie Carragher told Sky Sports.

"I've never seen anything like this before in football."

After three consecutive second-place finishes, though, Arsenal recognizes winning ugly is better than not winning at all.

Arsenal's style of play depends on structure, discipline and an aggressive high press, marshaled by the likes of (from left) Declan Rice, Viktor Gyokeres and Kai Havertz, and while some have poured scorn on its tactics, Arsenal boss Mikel Arteta remains unperturbed. AGENCIES

"I don't know how you celebrate one goal different to another — maybe for YouTube one is nicer (to look at) than another," said Arteta unperturbed by the criticism.

Arsenal won seven Premier League games by a slender 1-0 scoreline this season, managing to keep 19 clean sheets.

If teams do penetrate the backline, then they must beat David Raya, who is enjoying a superb season in goal.

The Spaniard has matched the record of nine clean sheets in the Champions League. A 10th could secure the trophy.

Arsenal's struggles from open play, particularly when star winger Bukayo Saka was out injured, frustrated even its own supporters at times.

Yet, as tens of thousands turned up to celebrate the Premier League title, nobody was complaining.

The joyous scenes outside the Emirates stadium, with some players joining the fans until past 5 am, will give Arsenal license to double down on its approach, particularly against a team as lethal as PSG.

Students enter a national college entrance examination site in Yuncheng, Shanxi province, on Sunday. This year's national college entrance exam, or *gaokao*, kicked off on Sunday nationwide. XUE JUN / XINHUA

Parents embrace calm as millions appear for *gaokao*

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

The national college entrance exam, or *gaokao*, got underway on Sunday with millions of Chinese students appearing for it, while their parents gathered outside examination venues in quiet support.

Rather than being fretful and anxious, most parents were the very picture of calm — a sure sign that the long-held belief that the *gaokao* alone determines a child's future is becoming history.

A total of 12.9 million candidates are taking this year's exam, which can stretch over two to four days, depending on the region. According to the Ministry of Education, authorities have put candidates first by strengthening comprehensive support in transportation, accommodation, food safety, noise control and psychological counseling, to ensure a safe and orderly exam process.

On Sunday, many parents arrived at the examination centers well ahead of time. Fu Jing, a Beijing mother of an art student, showed up an hour before the exam began. She said that her daughter had already identified her target universities and appeared in good spirits before entering her designated room.

Fu noted that she had made no special changes to her daughter's diet or daily routines in the run-up to the exam to keep things as normal as possible. She planned to leave the venue once the exam started and return at noon, rather than wait for the entire duration of the test.

Liu Jinqiao, another Beijing mother, admitted feeling a bit nervous but remained composed.

She said that she has set no specific targets for her son as far as scores or universities were concerned. She felt that such decisions could wait till the exams were over. For her, the *gaokao* is an important milestone in every child's life, but it is not a decisive turning point.

Not all parents, however, were keen to downplay the exam's significance. Lu Qiang, the father of a Beijing sports student, said the *gaokao* still carries great weight. He said that his son hoped to get into a good sports college, which also emphasized solid academic performance.

Lu noted that competition remained fierce, and doing well in the exam could help young people gain a broader vision and better chart their future path.

For Lin Hong, a Beijing mother, the focus was on respecting her daughter's wishes. Lin recalled her own *gaokao* in 1997, when her father traveled a long distance to bring her homemade food. Now as a parent herself, she feels that showing care is more about following her daughter's lead. So the family skipped exaggerated exam rituals and maintained a relaxed atmosphere instead.

She is proud of how brave and self-aware her daughter has become — a transformation she finds far more valuable than any test score.

"I've watched her strive relentlessly for her goal over the past three years," Lin said. "My heart aches for all her hard work, but I'm incredibly proud of how she has grown."

"She has learned to recognize her strengths and weaknesses, set goals and make plans, and push forward through hardships. That kind of growth means far more than any exam score," Lin added.

Cheng Lu, a teacher in Qingdao, East China's Shandong province, has embraced a similarly peaceful attitude. For her, the *gaokao* marks a culmination of years of study and a true test of perseverance and self-discipline, but it can never define one's life. She values her son's curiosity, independent learning ability and upbeat personality far more than high scores.

"I want my son to know that no matter how important a day is, the sun rises and sets as usual," she said. "Just do your best. Life is a long journey — feel it, experience it and live it to the fullest."

Xi's DPRK visit expected to deepen ties

Envoy says two leaders to hold historic meeting, draw new blueprint for relations

President Xi Jinping will kick off a state visit to the Democratic People's Republic of Korea on Monday, his first trip to the neighboring country in seven years and his first overseas visit this year.

Xi, who is also general secretary of the Communist Party of China Central Committee, will make the two-day visit at the invitation of Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK.

Wang Yajun, China's ambassador to the DPRK, said in an article published by People's Daily that Xi and Kim will hold an "important and historic meeting" to set the direction and draw a blueprint for China-DPRK relations in the new era.

"The historic scene of General Secretary Xi Jinping and General Secretary Kim Jong-un standing side by side on the Tian'anmen Rostrum in September last year remains vivid, and now, Kim Il-sung Square in Pyongyang is set to resound with a magnificent melody of China-DPRK friendship," Wang wrote.

Xi's upcoming visit is expected to draw a new blueprint for the development of relations between the two parties and the two countries, inject strong impetus into the joint cause of socialist construction, and make new contributions to regional peace, stability and prosperity.

Inside
Editorial, **page 6**

Strategic guidance

In a congratulatory message to Kim, on the 80th anniversary of the founding of the WPK in October, Xi noted that in recent years, he has held multiple meetings with Kim to guide and steer the development of relations between the two parties and two countries, opening a new chapter in the China-DPRK friendship.

In March 2018, the two leaders held their first meeting, during which they reached principled consensus in four aspects on developing China-DPRK relations in the new era. Xi and Kim met three times in less than 100 days that year, making history in high-level exchanges between China and the DPRK.

The two leaders exchanged visits in the first half of 2019, and in September last year, Kim made another visit to China. Since 2018, the top leaders of the two parties and the two countries have held six meetings and maintained close communication in various forms, leading China-DPRK relations to forge ahead in the new era.

The strategic guidance of top leaders of the two parties and the two countries is the greatest political advantage and strongest guarantee for the development of relations between the two sides.

This year marks the 65th anniversary of the signing of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, making Xi's upcoming visit to the DPRK even more important.

Unwavering choice

For the two sides, deepening the friendship has always been an unwavering strategic choice.

No matter how the international situation changes, it remains the unwavering policy of the CPC and the Chinese government to maintain, consolidate and develop China-DPRK relations, Xi said in the congratulatory message on the 80th anniversary of the founding of the WPK.

"This is a strategic choice and the only right choice both sides have made based on history and reality, the international and regional structure and the general situation of China-DPRK ties. This should not and will not change because of any single event at a particular time," he said in the meeting with Kim in 2018.

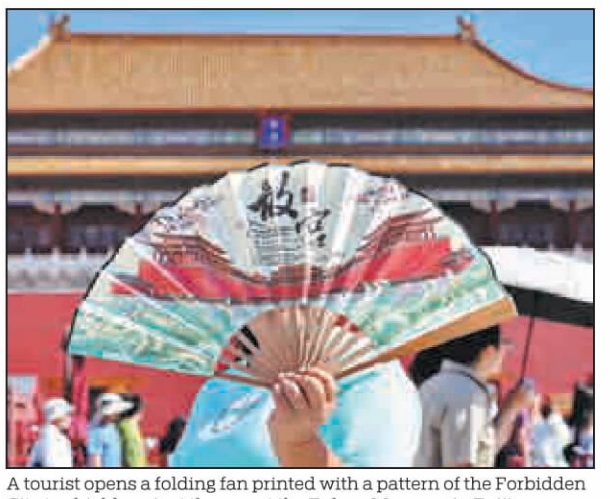
SUMMER TRADITION BREEZES BACK INTO FASHION

After long being relegated to mere 'objets d'art', folding fans are once again finding favor

By **YANG FEIYUE**
yangfeiyue@chinadaily.com.cn



Although air conditioners across China are humming to life as the summer heat begins to climb, the folding fan that was once pushed to the margins of daily life is reappearing in subway cars, museum shops and tourist streets.

Once associated mainly with traditional aesthetics or seasonal nostalgia, the bamboo-and-silk folding fan is again being picked up by younger consumers as a functional accessory and a form of cultural expression.

At the 22nd China (Shenzhen) International Cultural Industries Fair in Guangdong province in May, bamboo folding fans made by Mingde — a traditional brand that is based in Guangde, Anhui province, and has a production process that requires dozens of steps per fan — drew large crowds.

Meanwhile, in Yiwu, Zhejiang province, officially licensed Portuguese national soccer team folding fans are currently rolling off production lines, bound for global markets as the 2026 FIFA World Cup prepares to kick off.

A traditional Chinese folding fan consists of two sections: the ribs, typically carved from bamboo, and the fan surface, often made of silk or mulberry bark paper.

A tourist opens a folding fan printed with a pattern of the Forbidden City to shield against the sun at the Palace Museum in Beijing on May 28. WANG XIN / FOR CHINA DAILY

Unlike mass-produced plastic fans, each piece is hand-assembled, with the ribs radiating from a single rivet — allowing the fan to fold flat into a sleeve or snap open with a single flick of the wrist. The surface is often painted with landscapes, calligraphy or birds and flowers, turning a functional object into a portable work of art.

"It is a small, mobile art gallery," Zheng Zhigang, an art critic with a doctorate in history (archaeology) from Nanjing University, said about the charm of the traditional Chinese folding fans.

"It contains paintings, calligraphy, poetry and seals, all within a frame of a few inches," he said.

China Vibes 风华中国 GIFTS

Sun Yaqing, chairwoman of Hangzhou's 151-year-old fan producer Wangxingji, sees the same cultural depth in the fans' physical construction. "The ribs are made of bamboo. In Chinese culture, bamboo represents humility, integrity and resilience," Sun said. "When a scholar held a fan, he was reminding himself of those virtues."

Sun attributes the rekindled interest in traditional folding fans to changing consumer values, the rise of *guochao* (a youth-driven wave of pride in traditional Chinese aesthetics), and a growing global appetite for objects with rich backstories.

As summer heats up, Sun has been busier than ever, as international guests can't seem to get enough of the fans.

Wangxingji now exports to more than 40 countries and regions, and Sun has noticed clear patterns. Japanese buyers prefer plain bamboo fans for tea ceremonies. European customers seek silk fans as wall art or fashion accessories. Middle Eastern collectors favor heavy, ornate fans with gold foil.

Sun believes the folding fan is no longer just a seasonal tool. "It is a message — folded, carved, painted and ready to be opened," she said.

Classics can help shape proper perspectives today

WORLD WATCH
By Igor Radev

In a chapter called "In the World of Men" from the *Zhuangzi* — the Daoist text attributed to the thinker of the same name, who lived more than 2,200 years ago — there is a story about a carpenter called Shih who comes across a massive oak tree at a village shrine.

The tree is so large that thousands can rest under its shade, yet the carpenter ignores it. When his apprentice asks why, Shih explains: "That tree is useless. A boat made from it would sink, a coffin would soon rot, a tool would split, a door would ooze sap, and a beam would have termites. It's worthless timber and is of no use. That is why it has reached such a ripe old age."

In the same vein, the simplest, and yet most cogent, definition of classics could be: "human culture that has been able to reach ripe old age".

One might naturally ask, "But what is the use of classics?" In a strictly utilitarian sense, they have none. For me, classical studies embody what Zhuangzi described as the "useless tree" — a tree spared the axe precisely because it appears to serve no practical purpose. Yet its most profound utility lies in this very "uselessness".

INDEPTH

From a bowl of soup, to a shared melody and getting a joke, immersion in culture a gentle process

From left: American-German content creator Adrianna Rommeswinkel, who grew up in Dongguan, Guangdong province, says her roots are in the life she has lived in China; British creator Emma Sandford, dressed in traditional ethnic group costume, says she has adopted Chinese customs while living in the country; US singer-songwriter Carly Beth believes she is bridging cultures through performing Chinese music. She says Chinese music "chose her", not the other way around. PHOTOS PROVIDED TO CHINA DAILY

The imperceptible steps to 'becoming Chinese'

By YU RAN
sunnyu923@163.com

More than two decades after a photograph of five blonde foreign children entering a local primary school in Dongguan, Guangdong province, appeared on the front page of the Yangcheng Evening News, one of them has returned to the public eye.

Adrianna Rommeswinkel, a 29-year-old content creator known as Addy, was 6 when she arrived in the country in 2002, just a year after China joined the World Trade Organization.

For her, feeling like she belonged in China did not emerge from a single moment. "That feeling grew into my bones… through so many small, unremarkable moments," she said.

That process unfolded through everyday experiences that gradually reshaped her sense of home. One vivid early memory Rommeswinkel has is of her and her siblings joining classmates in morning exercises. "That's the thing about belonging, when you're in it, you don't notice. You just are," she said.

Over time, belonging became rooted less in physical places than in relationships. She recalls being quietly comforted at her best friend's home as a child.

"My godmother took one look at me and put a bowl of soup in front of me. Didn't ask questions. Just… soup," she said.

Even today, she remembers the landline telephone number of that family and still returns to the neighborhood market where vendors recognize her and recall her childhood preferences.

Her understanding of "becoming Chinese" extends beyond language. While her fluency in Cantonese and Mandarin is the most obvious aspect, she points to the deeper meanings embedded in everyday interactions.

"Language isn't just words. It's the jokes you get, that you learn from years of sitting at dinner tables, listening, absorbing," she said, noting that even her dreams are sometimes in Cantonese.

These experiences were accompanied by shifts in habits and values, from everyday politeness to understanding social connections through relationships.

Growing up in a Chinese school system also shaped her worldview, as the classes emphasized collective identity rather than individual focus.

"You don't really exist as just 'you'. You exist as part of something… fitting in, contributing, being reliable, that's what mattered," she said, noting that this perspective ultimately felt "freeing".

Cultural contrasts still arise, particularly when she is in the United States, but her response upon returning to China is telling. "Every time I land in China, every single time, there's this moment when I step out of the airport and the air hits me. The humidity, the smell, the noise, the chaos. And my whole body just… relaxes," she said.

Reflecting on her parents' decision to raise the family in China, Rommeswinkel said: "That choice gave me something I couldn't have gotten anywhere else. It gave me two worlds instead of one. It wasn't easy. But it was everything."

Today, when asked where she is from, her answer is simple. For her, identity is no longer defined by nationality alone, but by lived experiences.

"I grew up in China… that's the most important part, where I became me. My roots aren't in a passport or a bloodline. They're in the life I actually lived," she said.

Zhao Danyang (center with her thumb up), a co-founder of Lumiverse Media LLC, takes her team of foreign influencers on a visit to Xiaohongshu's headquarters in Shanghai in January. PROVIDED TO CHINA DAILY

Shared words

In recent years, more foreigners in China have shared similar stories of cultural immersion shaped by long-term, everyday interactions.

Emma Sandford, a 31-year-old from Northern Ireland, has spent much of the past decade moving in and out of China, building a life closely connected to the country.

From an internship at a charity music festival in Zhuhai, Guangdong province, in 2017, to teaching in Haikou, Hainan province, and Chengdu, Sichuan province, her connection evolved from curiosity into something more personal.

Language was the turning point in her journey, reshaping how she thinks, expresses emotions, and understands the world.

"Through the language, I began to better understand Chinese history, humor, and ways of expressing emotion, opening a deeper path into the culture," she said, adding that certain ideas and feelings can feel more precise in Chinese than in English, giving her a new way to articulate everyday experiences.

Her immersion deepened after moving to Chengdu in 2022, when she made a conscious effort to build friendships with locals who did not speak English. Working in a kindergarten and interacting with older colleagues offered a closer look at everyday perspectives. Living with Chinese roommates, and now with her boyfriend and his mother, further grounded her in daily life.

"These experiences offered me an understanding of culture that goes beyond what short-term visits can provide," said Sandford.

She often describes herself as having "a foreign body but a Chinese soul", a phrase that has taken on more meaning over time. "I drink hot water and I enjoy traditional Chinese medicine. … These things have become part of my daily life now. Such habits have become instinctive, shaping my routines and sense of comfort," she said.

Over time, these routines have also influenced her mindset, as she has come to value a stronger sense of community.

"Shared meals, close family ties and everyday social interactions reshaped my understanding of well-being. I may be heavier now, but I'm much happier and more relaxed about life," said Sandford.

Despite this, she does not see her identity as a replacement of one culture with another.

"My Irish background remains the foundation of who I am, while China has added another layer to how I live and understand the world," she said.

When she returns to Ireland, she notices subtle shifts in her behavior, from bringing small gifts when visiting others to preferring quieter social activities and more collective ways of socializing.

Songs of praise

Carly Beth, an American singer-songwriter, pianist and livestream artist based in New York, began her journey with Chinese music unexpectedly while living in London, when a Chinese acquaintance encouraged her to livestream to audiences in China. She continued streaming daily while learning the language and developing her music, building a strong connection with Chinese listeners.

"When I first started livestreaming to China, the response was overwhelming in the most beautiful way. I suddenly had thousands of people connecting with my music at once, but I couldn't communicate with many of them yet," she said.

"I stayed up until 4 am night after night teaching myself Chinese just so I could talk and sing to them."

A turning point came when she encountered the classic song *Later* by singer Rene Liu that reflects on love and regret.

"I looked up the translation and I cried. The emotional depth of the lyrics hit me so hard that I immediately knew I wanted to continue learning Chinese music," she said.

She developed her own way of learning, slowing songs down and mimicking each sound, finding that melody helped guide both tone and emotion.

"Singing in Chinese actually felt easier than speaking at first, because melodies help guide the tones and emotion… The most rewarding part has been the emotional connection with my Chinese audience. Music stopped being just performance; it became communication," said Beth.

As her work reached wider audiences through platforms such as Xiaohongshu and television appearances, she observed differences in how her music was received. Chinese listeners, she said, tend to respond strongly to emotional depth and poetic expression, while Western audiences often focus more on the conversational aspects of her songwriting.

Chinese music has become "an emotional anchor" in her life, shaping her sense of identity. "It feels less like I chose Chinese music, and more like Chinese music chose me," she said.

Friends and family in the US who had never listened to Chinese music before have begun listening to the songs she performs, forming what she describes as a cultural bridge.

Mixed cultural content

Zhao Danyang, the 26-year-old co-founder of Lumiverse Media LLC in Shanghai, has worked with over 1,000 foreign influencers and links the growing interest to shifts in content production and distribution.

"In recent years, we can clearly feel that more foreign creators are actively engaging with and sharing Chinese culture. If we look at it on a timeline, there are two key phases," she said.

"The pandemic was an overlooked turning point, when many people began exploring other countries through the internet, and China produced a large amount of content."

From 2023, especially with the "TikTok refugee" phenomenon, the trend took hold, as foreign users not only watched but also began sharing Chinese culture.

A 2024 report by Tencent Research Institute and Newrank found that foreign content creators are gaining significant traction on Chinese short-video platforms. Fifteen overseas influencers each have more than 10 million followers, with combined followers of 290 million. More than 100 creators have over 1 million followers, while nearly 1,000 active foreign accounts have surpassed 10,000 followers.

Citing overseas data, Zhao noted that certain types of content perform better across cultures.

"Food is still the most effective entry point. Hotpot, street food, breakfast comparisons and snack tasting are among the easiest for foreign creators to share. The second is internet culture, such as high-speed rail, mobile payments, food delivery, as well as memes, short videos and livestream e-commerce," said Zhao.

She added that the third category is traditional crafts, such as Jingdezhen ceramics, which carry cultural meaning and are more attractive than industrial products.

Beyond content categories, Zhao sees a deeper shift. "Chinese cultural communication has moved from an 'official, institutional model' to a 'content ecosystem model'," she said. "Many creators start with content opportunities because they attract traffic. But after six months to a year, they begin to understand more subtle aspects like communication styles, humor and social norms."

In some cases, this leads to hybrid forms of expression.

"When creators stay in China for a longer period, they begin to produce 'mixed cultural content'. We often call them 'natural cultural translators' because they can connect audiences from both sides," said Zhao.

She said these changes in language and behavior are a sign of deeper cultural internalization, as creators gradually move beyond surface-level content production and begin to engage more meaningfully with Chinese culture.

She also highlighted the role of digital platforms. "Short-video platforms have completely changed the structure of cultural communication. Algorithms decentralize distribution, allowing content itself to determine reach. At the same time, short videos lower the threshold for understanding culture and create a two-way interaction, which leads to co-creation," she said.

Zhao said that in the future, cultural communication will become global co-creation. "It may not be about 'exporting culture', but about letting it spread naturally through content ecosystems, with creators from different backgrounds participating together."

Data from the Ministry of Commerce indicates that China's cultural trade reached 1.4 trillion yuan ($206 billion) in 2024, with digitally driven sectors, including online audiovisual content, exceeding 370 billion yuan and accounting for more than a quarter of the total.

Sun Zhe, a sociologist at the Chinese Modernization Institute of Shanghai University of Finance and Economics, described the trend as "a very positive phenomenon" and "another form of globalization in the high-tech era".

"It reflects a shift toward 'plural modernities', where development is no longer defined by a single model but allows for multiple paths, with China offering 'an alternative paradigm' that expands global choices," said Sun.

"We are moving from the television era to the short-video era. Traditional media was highly centralized, while today's platforms are shaped by the diverse technologies, enabling more decentralized and diverse cultural production," said Sun.

Short-video formats also lower the barriers to cultural understanding by making content more direct and easier to interpret. "Instead of grand narratives, foreigners now engage with China through everyday practices such as tea, food and daily routines, with bottom-up, life-based expression," he said.

Visit: Over the years, mutual trust grows

From page 1

Over the years, Xi and Kim have had in-depth exchanges of views on major issues through various forms, supported each other on issues of major concern to each other, continuously consolidated mutual trust and built consensus.

Xi said in a meeting with Kim in Beijing last year that China has always maintained an objective and impartial stance, and stands ready to continue strengthening coordination with the DPRK in order to strive to maintain the peace and stability of the peninsula.

The top leaders of the two parties and the two countries have stood together through thick and thin, enabling the traditional friendship between China and the DPRK to demonstrate vigorous vitality in the new era.

In a speech at the welcoming banquet held by Kim during Xi's state visit to the DPRK in 2019, Xi hailed the traditional friendship between the two sides as a shared, valuable asset forged and left by leaders of elder generations of both countries, saying that such a friendship has remained strong and vigorous despite constant changes.

The traditional friendship between China and the DPRK was forged by the elder generation of leaders of the two parties and two countries, cemented in the revolutionary struggle, and continuously deepened in the course of socialist construction, Xi said in his exchange of New Year greeting messages with Kim in 2024.

The friendship between the two countries has been further reinforced by friendly exchanges between the two peoples. During their exchange of New Year greeting messages in 2024, Xi and Kim jointly designated that year as the China-DPRK Friendship Year.

In the message, Xi called on the two sides to carry forward the long-standing friendship, deepen strategic mutual trust, enhance exchanges and cooperation, and ensure that the bilateral ties move forward with the times for greater development.

Joining hands

"Development" and "cooperation" have frequently been brought up during talks between Xi and Kim.

During the state visit to the DPRK in 2019, Xi suggested that the two sides expand practical cooperation to bring more benefits to both peoples.

The Chinese side stands ready to enhance strategic communication, maintain close exchanges and cooperation with the DPRK, and join hands to promote the China-DPRK friendship and the socialist cause of the two countries, Xi said in a congratulatory message in 2025 on the 77th anniversary of the founding of the DPRK.

On March 12, the international passenger trains connecting China and the DPRK began operating in both directions. On March 30, an Air China passenger plane from Beijing arrived in Pyongyang, marking the formal resumption of the Chinese carrier's passenger flight operations between the capitals of China and the DPRK.

In 2025, bilateral trade returned to pre-pandemic levels, while trade in the first quarter of this year grew 14.3 percent year-on-year, showing a steady upward trend, said Wang, the Chinese ambassador to the DPRK, in the People's Daily article.

In early May, a group of Chinese students arrived in Pyongyang and began studying in universities including Kim Il Sung University. In February 2025, the DPRK delegation participated in the 9th Asian Winter Games held in China in Harbin, the capital of Heilongjiang province.

From economic and trade exchanges to education and sports cooperation, China-DPRK exchanges and cooperation in various fields have continued to deepen and have grown ever solid, bringing benefits to the peoples of both countries.

Trade cooperation with Belarus set to deepen

Minsk event highlights China's innovative move to share opportunities of its vast market

By **LIU HONGJIE** in Minsk and **REN QI** in Beijing

Vice-President Han Zheng has called for further strengthening solidarity and cooperation between China and Belarus, with a focus on fields such as mechanical equipment, agriculture, e-commerce trade and the digital economy.

Addressing a business event on Sunday in Minsk themed "Big Market for All: Export Goods of Belarus to China", which was organized by the Chinese Ministry of Commerce and the Belarusian Ministry of Foreign Affairs, Han highlighted the continuous development of bilateral trade, noting that the two countries will jointly promote the building of an open world economy.

The "Export to China" series of events is one of China's pragmatic measures to actively expand independent and unilateral opening-up. It highlights China's innovative move to share the opportunities of the country's vast market with the world and create a new pattern of win-win cooperation, as well as a proactive contribution to supporting economic globalization and safeguarding the multilateral trading system.

Ling Ji, vice-minister of commerce and deputy China international trade representative, stated that China and Belarus are all-weather comprehensive strategic partners, and expanding bilateral trade is an important consensus reached by the two countries' heads of state. He noted that, for this reason, China selected Belarus as the first overseas stop for the "Export to China" series of events.

He said the special event, held during the Belarusian agricultural exhibition, will build a platform for Belarusian enterprises to expand their exports to China and facilitate the entry of more high-quality Belarusian products into the Chinese market.

Belarusian First Deputy Prime Minister Nikolai Snopkov said that Belarus is an open economy, with exports generating 60 percent of its GDP. He pointed out that Belarus trades with more than 150 countries and continues to expand its catalog of export commodities. In its cooperation strategy, China represents a key direction, with approximately 200 Belarusian enterprises approved to supply food products to China and the variety of export commodities to China reaching into the hundreds.

Snopkov said that Belarus is willing to provide a comprehensive plan for win-win development for its Chinese partners, adding that Belarus has become a key hub for the Belt and Road Initiative in the region.

He emphasized that these achievements are deeply rooted in strong people-to-people ties, noting that more than 30 cooperation agreements have been signed between Belarusian regions and various parts of China.

With the implementation of a mutual visa exemption system, business and tourism exchanges have become increasingly close, he said, highlighting that sincerity and friendship serve as the most important strategic resources.

Belarusian Deputy Minister of Agriculture Alexander Yakovchits said China is the primary market for Belarusian products in the Asian region. He noted that in the Chinese market today, Belarus ranks as the second-largest source of rapeseed oil, the sixth-largest source of whey and milk powder, and the seventh-largest source of frozen beef, while its alcoholic beverages, chocolates and confectionery products are also widely popular.

Yakovchits added that as of today, there are 265 valid export registration numbers in the China Import Food Enterprise Registration system, covering 193 Belarusian food producers. He said that newly approved products for the Chinese market include wheat flour, oatmeal, dry baking mixes, wheat bran, sauces, honey and numerous other items.

Cao Derong, president of the China Chamber of Commerce of Import and Export of Foodstuffs, Native Produce and Animal By-products, said that in 2025, China imported $520 million worth of food and agricultural products from Belarus. This represented a 21.4 percent increase compared with 2021, which was 26.8 percentage points higher than the growth rate of China's global imports of food and agricultural products during the same period.

Cao added that China is the second-largest export market for Belarusian food and agricultural products. He highlighted that five major categories of Belarusian products, namely rapeseed oil, beef, whey, chicken and flax, collectively account for 93 percent of China's total imports of food and agricultural products from Belarus, and that these products enjoy broad export prospects in China.

EU protectionism can backfire, warn experts

By **YANG RAN**
yangran1@chinadaily.com.cn

Trade issues have become a flashpoint in relations between China and the European Union of late, with experts warning that the EU's shift toward protectionism, under the "de-risking" banner, could backfire, damaging its own global competitiveness.

Experts said the path forward lies in internal reforms and collaborative strategies that contribute to mutually beneficial economic ecosystems.

There has been an increase in trade friction between China and Europe in recent months. On May 29, after a meeting on China-EU relations, the European Commission defined the trade and investment dynamics with China as "not sustainable" and reaffirmed a strategy of "de-risking".

Europe has introduced a series of measures, many of which are seen as erecting barriers against imports from China. These include the proposed revisions to the Cybersecurity Act, or CSA2, and the Industrial Accelerator Act, or IAA. Reports said the EU is considering stricter public procurement rules that would force companies to source from at least three different suppliers, with no single supplier accounting for more than 30 to 40 percent of critical components.

The China Council for the Promotion of International Trade has opposed the CSA2, stating that the draft introduces "nontechnical risk" factors, and directly links cybersecurity risks to companies from specific countries or backgrounds, seeking to exclude them from relevant EU supply chains.

Sebastien Maillard, an associate fellow at Chatham House's Europe Programme, described the IAA as "some sort of sophisticated protectionism" for the EU's trading partners. He noted that "European discrimination is already introduced" in the bloc's new defense financing instrument, which limits the share of component costs from outside the EU, European Free Trade Association, or Ukraine to 35 percent.

Dong Yifan, an associate research fellow at the Institute of Country and Regional Studies at Beijing Language and Culture University, said Europe's recent policy moves essentially use the so-called "de-risking" slogan as a cover for trade protectionism.

"These policy proposals are largely aimed at Chinese companies. Once implemented, they will disrupt industrial and investment ties and effectively shut many Chinese companies out of the European market," Dong said.

Experts said the EU's proposed measures could result in greater losses than gains for itself. A report by the China Chamber of Commerce to the EU and KPMG estimated that the CSA2 could cost nearly 367.8 billion euros ($428.22 billion) if it forces the replacement of Chinese suppliers across 18 critical sectors.

Dong said the EU, despite recognizing the risk of potential economic losses, continues to shape its policies through a lens of "pan-politicization and pan-securitization".

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, said the EU's concerns over China's trade surplus stem from structural shifts in bilateral trade that cannot be fixed through finger-pointing.

For Europe, Jian argued, the real solution lies in boosting its own competitiveness through innovation and re-industrialization. "The EU needs to invest more in high-tech R&D, tackle energy challenges and reform labor markets to make 'Made in Europe' truly competitive again.

"From China's perspective, continuing efforts to expand imports is a crucial step in demonstrating its responsibility as a major country. The China International Import Expo and the Hainan Free Trade Port, for example, are signs of China's efforts to advance its opening-up. China remains a vital market for Europe and the globe, poised to continue to fuel global economic growth," Jian said.

According to Chinese customs data, in the first three quarters of 2025, China was already the top export destination for 79 countries and regions. For the full year, China imported a total of 18.48 trillion yuan ($2.72 trillion) in goods, keeping its share of global imports at around 10 percent. The EU is China's largest source of consumer goods imports.

Classics: Space for inquiry is limitless

From page 1

We must recognize that the highest value of knowledge does not reside in superficial gains. As the writer and poet Yang Xiong of the Western Han Dynasty (206 BC-AD 24) observed in his Model Sayings (*Fayan*): "The noble person learns for the Dao; the petty person learns for personal gain."

History does not repeat itself, but it often "rhymes". Ancient knowledge remains vital because it preserves responses to human problems and conditions that are not fundamentally bound to any particular historical era. Therefore, the answers given throughout the ages — regardless of whether we ultimately accept or reject them — are significant even today. The Colombian thinker Nicolas Gomez Davila captured this sentiment succinctly: "Truth is in history, but history is not the truth."

The pursuit of classical studies also serves as a necessary corrective to our modern temporal parochialism. In his essay *On the Reading of Old Books*, C.S. Lewis argued that every age is defined by its own particular blind spots and prejudices — biases that those living within that era are often unable to perceive. Our own age is no exception. Crucially, because different eras harbor different prejudices, it is only through engagement with the literature of ages unlike our own that we can recognize the limitations of our own intellectual horizon. Only then can we transcend the constraints of our era and broaden our perspective.

The role of classical studies is not limited to preserving and transmitting literary heritage. It also has to — if not primarily — contextualize it through the use of strict scientific methodology. In doing so, classical studies render the cultural products and literary output of the past "contemporary" again. Would it be pretentious to claim — albeit half-jokingly — that classics fulfill the function of a "time machine"?

However, besides the temporal dimension of the classics, we should not overlook the spatial one. Every civilization possesses its own inherited corpus of cultural patterns and literary canon. The danger of spatial parochialism is no less real than that of the aforementioned temporal parochialism. When one dwells exclusively within one's own heritage, the temptation always lurks to mistake the particular for the universal. This danger — both intellectual and moral — in the case of Western European civilization was clearly identified and sharply criticized by Nikolai Trubetzkoy, who, in his 1920 essay *Europe and Mankind*, observed: "Romano-Germanic peoples (those of Western European ethnic background) have long naively believed that only they truly represent humanity. Thus, they portray themselves as 'humanity,' their culture as 'universal human civilization,' and their chauvinism as 'cosmopolitanism.'"

Therefore, one of the principal tasks of classical studies at this historical juncture lies in bringing the different classics of different civilizations into dialogue, holding them opposite one another as mirrors. In this way, classical studies, by overcoming the limitations imposed by one's particular civilizational background, could become an instrument through which we may transcend our spatial limitations in cultural terms.

In the process of translating works from the Chinese intellectual tradition, I have often confronted the conundrum of whether, or to what degree, one is justified in identifying patterns and concepts from one classical tradition in another. Yet the essence of translation itself lies precisely in the ability to identify, within the target language and culture, concepts, approaches and aesthetic principles analogous to those of the source.

We might ask, for instance: Did the Chinese historian Sima Qian and the Greek historian Plutarch share a common historiographical vision, and to what extent do their methodologies converge? Or how do Chinese philosopher Zhu Xi's concepts of *li* (principle) and *qi* (material force) diverge from — or converge with — Aristotle's notions of morphe (form) and hyle (matter)?

The space for inquiry in this context is limitless.

The author is a sinologist, chair scholar at the Macedonian Academy of Sciences and Arts. The views do not necessarily reflect those of China Daily.

Dauda Kavuma, manager of the Ghetto Kids, guides dancers during a rehearsal on May 25.

Members of the Ugandan dance group the Ghetto Kids react during an interview in Wakiso on May 25.

Members of the Ghetto Kids skip rope during a break from rehearsals in Wakiso on May 25.

Their journey began as they danced barefoot on a dusty street in Uganda in 2014, and will soon reach the FIFA World Cup stage at New Jersey's MetLife Stadium in the coming weeks.

The Ghetto Kids, a Ugandan dance troupe composed of street children, expressed excitement at being invited by Colombian singer Shakira Isabel Mebarak Ripoll to perform at the World Cup this year.

The soccer tournament, set to kick off on June 11, will span the US, Mexico and Canada. The last World Cup final drew more than a billion viewers worldwide, according to FIFA.

Shakira announced in May that the group, composed of orphaned or vulnerable children, will join her for the final on July 19. The children have already appeared in the video for her song *Dai Dai*, the official anthem of the tournament.

Dauda Kavuma, manager of the Ghetto Kids, displays an award on May 25.

"I've already invited the Ghetto Kids from Uganda," Shakira said in a video on social media, adding she wanted the performance to feel "unforgettable".

"We can't wait to show the world what we are!" said one of the young performers, 8-year-old Busingye Josephine Daniella.

"We feel so excited to perform with Shakira," said Daniella.

"Getting outside the country ... and performing on one of the biggest stages ... it feels good and it brings a lot of opportunities," said 15-year-old Ssegirinya Madwanah King.

Dauda Kavuma, founder of the Ghetto Kids — a foundation that cares for vulnerable children — and a former street kid himself, expressed hope that the attention would help them raise funds for a rehabilitation and education center.

"We have that big dream ... It's a very huge opportunity for the Ghetto Kids, for me, for the children," he said.

The group first drew attention in 2014, when five children posted an energetic dance video of Ugandan singer Eddy Kenzo's *Sitya Loss*, going viral after being shared by the singer himself.

Over the years, their videos on YouTube and other social media platforms became less blurry, with their choreography becoming more intricate.

But the infectious energy and their "comedic dance style" remain. "We are using music, dance and drama to make lives better," Kavuma said.

Kavuma said he never imagined the children would get such an opportunity. "I've been hoping, but I didn't see this coming," he said.

However, there is still uncertainty over the performance, as Uganda works to prevent the spread of Ebola from its neighbor Democratic Republic of Congo.

Seven cases of Ebola and one death have been confirmed in Uganda, and Ugandan authorities on May 27 ordered the closure of the border with DR Congo "with immediate effect".

People who have visited DR Congo, Uganda or South Sudan in the past 21 days are barred from entering the US, except for US citizens, according to a US order in May.

Nonetheless, Kavuma is optimistic about the trip.

The group will be Uganda's only representation at the tournament, with its national team having failed to qualify for the World Cup.

The performance holds great significance for his group, which he said is now "one big family" — one that started from the fringes of Ugandan society.

"Before joining the group, we weren't going to school, we weren't traveling, we weren't getting the basic needs," Ssegirinya said.

"If I weren't part of the group, I don't know where I would be," he added.

Trump: Iran conflict not 'endless war'

Ceasefire under strain as tensions between Israel and Hezbollah continue to flare up

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

US President Donald Trump said on Sunday that the conflict with Iran was not an "endless war", as diplomatic efforts to secure a lasting settlement continued and new exchanges of fire tested a fragile ceasefire.

In an exclusive interview with NBC News, Trump denied promising not to involve the US in more wars during his presidential campaign.

> This is not an endless war. We've been doing this for three months. Much of it has been under the form – a pretty good form of ceasefire."
>
> **Donald Trump, US president**

"I didn't promise anything. I don't like these endless wars," he told Meet the Press.

"This is not an endless war. We've been doing this for three months. Much of it has been under the form — a pretty good form of ceasefire."

Trump's comments came as the war with Iran reached 100 days, and a lasting settlement remained elusive.

Mediation efforts have so far failed to produce any further agreements in a war that has strained the global economy and threatened food security in some of the world's most vulnerable countries.

In a fresh bid to restart negotiations between Iran and the US, Pakistan's interior minister was in Tehran on Sunday to deliver a message to Iranian Supreme Leader Ayatollah Mojtaba Khamenei from Pakistan's army chief Field Marshal Asim Munir, according to the Iranian state-run IRNA news agency.

The US and Iran have engaged in largely indirect negotiations for an interim deal to halt the three-month-old war that would leave issues including Iran's nuclear program to further negotiations.

Pakistani authorities have said that Islamabad, with support from regional countries including Qatar, Turkiye and Egypt, has been working to help bridge differences between the United States and Iran and encourage efforts aimed at reducing tensions and ensuring the reopening of the Strait of Hormuz.

US and Iranian negotiators reached a tentative deal a week ago to extend the ceasefire by 60 days and start a new round of talks on Iran's nuclear program. The US has called for unspecified changes, and Iranian officials have shown no public signs of agreeing to the deal.

Trump has said in the past that Iran could not be allowed to possess nuclear weapons.

Moderator Kristen Welker on Meet the Press asked Trump: "Would you be open to sending in US forces to retrieve the nuclear stockpile?"

Trump replied: "Yeah ... But the way you do it is if we make a deal, if we make a deal now we're friendly, we'll all go together. It'll be our equipment. We'll take it out and destroy it, whether it's onsite or whether we take it offsite."

However, he added that, "if we don't make a deal, then we're going to take them out militarily very harshly. And we'll wait till we do that before we go, in which case we'll have safety either way."

On Sunday, Iran fired missiles at Israel, which were claimed to have been intercepted without causing casualties, marking the first attacks on Israel from Iran since the April ceasefire took effect.

Iran's Revolutionary Guards said the Israeli army must stop attacks on Lebanon, and if it expands its attacks or responds to Iran's actions, it will face "more crushing and regretful blows".

Despite Trump's warnings against retaliation, Israel's military chief of staff said the military will strike "the enemy" with determination as soon as the order is given.

'No choice'

Trump said Israeli Prime Minister Benjamin Netanyahu would have "no choice" but to accept any agreement reached between the United States and Iran, the Financial Times reported late Sunday.

Washington, not Israel, would determine the outcome of negotiations with Tehran, Trump said during a telephone interview with the British daily shortly after Iran launched a salvo of ballistic missiles at Israel.

"He won't have any choice," Trump was quoted as saying. "I call the shots. I call all the shots. He doesn't call the shots."

Asked whether Iran's missile strikes on Israel would affect Washington's willingness to continue negotiations with Tehran, Trump said the attacks would have no impact on a potential agreement.

"I think the deal is going on. We'll see what happens," he said, adding that any agreement would succeed or fail on its own merits and that the strikes would not alter his calculations.

Israeli strikes kill 14 in S. Lebanon

BEIRUT/JERUSALEM — At least 14 people were killed in Israeli attacks across southern Lebanon on Saturday, according to Lebanon's National News Agency.

The Lebanese army said the three soldiers were killed while patrolling in a vehicle on the Khardali-Kfar Tebnit road in the Nabatieh area.

The Israel Defense Forces said it has launched an investigation into the strike, claiming that the vehicle was found in an active combat zone with intelligence indicating a Hezbollah threat. The IDF stressed that its operations target Hezbollah, not the Lebanese army.

The United Nations Interim Force in Lebanon condemned the attack as a "gross violation" of Lebanon's sovereignty, territorial integrity, and UN Security Council Resolution 1701.

Lebanese Parliament Speaker Nabih Berri rejected Israeli justifications, calling the strike "by no means a mistake or an accident".

Elsewhere, six people were killed in an Israeli airstrike on the town of Saksakiyeh in the Sidon District, according to a preliminary toll.

Additional strikes killed one person on the Deir al-Zahrani highway, two in the town of Harouf, one in Jouaiya, and one on a motorcycle in Abbassiyeh, who was identified as assistant nurse Ali Samadi.

Meanwhile, the Israeli military issued evacuation orders for several towns and villages in the Jezzine District and Ansariyeh.

The IDF said it struck around 150 Hezbollah military infrastructure sites in southern Lebanon over the weekend, including weapons depots, command centers, and rocket launchers.

Hezbollah said its fighters confronted an Israeli Hermes 450 drone over the town of Sharqiyeh in southern Lebanon and forced it to retreat. The Israeli military did not immediately comment on the claim.

In a separate statement, Lebanon's Public Health Emergency Operations Center said the cumulative casualties from Israeli attacks since March 2 had risen to 3,593 killed and 10,990 injured.

Lebanese army commander General Rodolphe Haykal has left for Pakistan on a visit, Lebanon's army said on Saturday.

The army said the visit was at the invitation of Haykal's Pakistani counterpart, but did not immediately provide further details on the purpose or duration.

Calls for collaboration on drug innovation mount

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

A Chinese-developed lung cancer therapy drew significant attention at the American Society of Clinical Oncology's annual meeting, the latest illustration of China's rapidly growing role in global pharmaceutical innovation and a rise that experts say demands collaboration rather than confrontation.

The experimental drug, ivonescimab, targets a type of lung cancer that is especially difficult to treat. In a late-stage clinical trial involving 532 patients in China, the therapy cut the risk of death by 34 percent, according to results released at the meeting, known as ASCO, which concluded on Tuesday in Chicago.

David R. Spigel, president and chief scientific officer at Sarah Cannon Research Institute and an ASCO expert in lung cancer, said in a news release that the therapy "provides a vital new path forward for patients with these difficult-to-treat cancers who have limited treatment options".

Ivonescimab was developed by the Chinese biopharmaceutical company Akeso. US-based Summit Therapeutics licensed the rights to the drug outside China in a deal worth up to $5 billion. Summit announced earlier this year that the US Food and Drug Administration had accepted its application seeking approval for the therapy.

The licensing deal is part of a surge in dealmaking between Western pharmaceutical giants and Chinese drugmakers. AstraZeneca, Pfizer, Sanofi and Eli Lilly are among the multinationals that have struck agreements with Chinese companies, mostly targeting oncology and obesity treatments, with potential values ranging from $3 billion to $18.5 billion.

"Deal volumes have increased dramatically, and the value of Chinese pharmaceutical companies has grown much faster than their Western counterparts," Joseph Scheeren, a pharmaceutical R&D and regulatory affairs expert with more than 35 years of experience across the US, Europe and Asia, told China Daily.

Last year alone, Chinese companies achieved four times the value creation of US companies. Currently, 30 percent of global business development deals involve Chinese companies, four times as many as in 2021, according to Scheeren, who is also a member of the advisory board of the University of Arizona R. Ken Coit College of Pharmacy.

"I was told in oncology, specifically, that figure is more than 50 percent, so you can see there's a lot of activity going on in China's innovation sector," he added.

Those observations are backed by research published by the National Bureau of Economic Research. The paper, titled "From Free Rider to Innovator: The Rise of China's Drug Development", found that Chinese companies' out-licensing transactions to multinational corporations doubled relative to 2015 levels.

The researchers said the figures point to genuine indigenous capacity-building rather than multinationals simply relocating research and development operations to China.

Clinical trial activity

China's clinical trial activity has grown at a similar pace. The country accounted for less than 8 percent of global clinical trials in 2010. By 2020, it had surpassed the US in annual registered trial volume, reaching more than 5,000 trials per year by 2024, a 172 percent increase relative to the US.

Meanwhile, China's pharmaceutical ascent has also raised concerns in Washington. The US Biosecure Act bars US pharmaceutical companies that receive federal funding from working with designated Chinese biotech firms.

"Attempts to frame these developments as geopolitical threats risk undermining the very partnerships that are driving scientific progress," a group of US and China-based researchers wrote in a paper recently published in the Cureus Journal of Medical Science.

"The organizing principle for global drug innovation should be health, not geopolitical competition," the authors wrote.

The researchers pointed to China's growing alignment with international standards and its participation in global harmonization efforts as a foundation for deeper cooperation.

They highlighted Project Orbis, an international regulatory initiative led by the FDA's Oncology Center of Excellence, which, if expanded to include China, could accelerate access to promising therapies for nearly half of the world's cancer patients.

"Geopolitical tensions are real, but they need not dictate the trajectory of global drug innovation," the researchers concluded. "Regulatory collaboration, mutual trust and evidence-based evaluation of foreign data offer a path toward shared benefit."

WHO urges global action to contain Ebola outbreak

By **VICTOR RABALLA** in Nairobi
victor@chinadailyafrica.com

Global health leaders have called for strengthened international cooperation to contain the Ebola outbreak in the Democratic Republic of Congo and Uganda and prevent its spread to neighboring countries.

Nearly 500 Ebola cases have now been confirmed in the deadly outbreak raging in central Africa, a WHO overview showed on Saturday, amid mounting concerns over the swelling scale of the epidemic.

The global appeal for strengthened international cooperation came during a high-level briefing on Friday by the Africa Centres for Disease Control and Prevention, or Africa CDC, and the WHO, which warned about the rapid spread of the Bundibugyo Ebola virus.

"The outbreak is moving fast and we are still playing catch-up. But my trip to the DRC also gave me real hope that together, under the government's leadership, we can bring this outbreak under control," WHO director-general Tedros Adhanom Ghebreyesus said.

He announced the launch of a joint continental preparedness and response plan by the WHO and Africa CDC aimed at containing the outbreak, supporting affected countries and strengthening preparedness in neighboring states.

The six-month plan, from June, is estimated to cost $518 million and is built around a coordinated approach guided by the principle of "one plan, one budget, one team".

It focuses on emergency coordination, surveillance, laboratory testing, infection prevention and control, clinical care, community engagement, research, logistics and maintaining essential health services.

"The only way to beat this outbreak is through close partnership, working together under the leadership of the affected countries in one coordinated effort," Tedros said.

Africa CDC said a range of emergency measures have already been implemented, including high-level political engagement with heads of state and ministers, deployment of multidisciplinary response teams, expansion of laboratory capacity and delivery of more than 200 metric tons of medical supplies by international partners.

Among other organizations and countries, Africa CDC director-general Jean Kaseya noted that China has joined a growing list of international partners supporting response efforts, highlighting the importance of global solidarity in tackling public health emergencies.

A medical officer is disinfected upon leaving hospital rooms for Ebola patients in Bunia, the Democratic Republic of Congo, on Friday. GLODY MURHABAZI / AFP

His announcement came days after a multidisciplinary team of experts in epidemiology, clinical diagnosis and treatment, research and traditional Chinese medicine arrived in Kinshasa, the capital of DR Congo, for a three-month mission to strengthen Africa's Ebola response capacity.

The outbreak has expanded rapidly from one province and three health zones in eastern DR Congo in mid-May to three provinces and 25 health zones, with confirmed cases reported in Uganda's capital, Kampala.

Ituri Province in DR Congo remains the epicenter, accounting for 90 percent of confirmed infections and 76 percent of deaths, Kaseya stated.

Health authorities warned that the outbreak is already the largest recorded outbreak of the Bundibugyo strain of Ebola, surpassing the previous outbreaks in Uganda in 2007 and the DR Congo in 2012.

They also raised concerns about the lack of licensed vaccines and therapeutics for the Bundibugyo strain, noting that while several promising candidates are being developed, none have yet been approved for widespread deployment.

Mohamed Yakub Janabi, WHO regional director for Africa, said community trust remains central to the success of the response.

"Without community participation, contact tracing falters, safe care is delayed and transmission continues. Misinformation is almost as dangerous as the virus itself and spreads just as fast," he said.

Agencies contributed to this story.

Visit to further consolidate relations of good neighbors, good friends and good comrades

General Secretary of the Communist Party of China Central Committee and Chinese President Xi Jinping is paying a state visit to the Democratic People's Republic of Korea from Monday to Tuesday at the invitation of Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK.

The visit marks Xi's first overseas trip this year and his first state visit to the DPRK in seven years. It is of great significance for advancing China-DPRK relations and will surely inject new impetus into the traditional friendship between the two countries, enabling it to stand the test of the times and weather all challenges.

The friendship between the two countries has deep roots. It was forged in the struggle against foreign aggression and for national independence, and has been continuously consolidated and developed throughout the course of socialist revolution and construction. China and the DPRK are good neighbors, good friends and good comrades who have shared weal and woe and helped each other in times of need.

In recent years, Xi and Kim have met on multiple occasions and maintained close communication. Xi has stressed that maintaining, consolidating and developing China-DPRK relations has always been an unwavering policy of the CPC and the Chinese government.

Under the strategic guidance of the top leaders of the two sides, China-DPRK relations have been advancing with a clear direction and strong momentum.

The two countries should be good neighbors that strengthen practical cooperation and maintain close, friendly exchanges.

China-DPRK cooperation is thriving, fueled by growing exchanges and collaboration at all levels and across various sectors.

The two countries maintain exchanges and cooperation in culture, education, science and technology, sports and other fields. The two sides have also concluded a range of agreements and treaties, including those on trade and navigation, air transport and consular affairs. Multiple provinces and cities in both countries have also established sister-city relationships, helping build bridges of friendship between their peoples.

The two countries should be good friends who continually deepen strategic coordination and strengthen mutual support.

This year marks the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance. It also marks the first year of China's 15th Five-Year Plan (2026-30). Pyongyang has drawn up a blueprint for the DPRK's economic and social development over the next five years. Xi's visit is expected to further enrich and expand ties, propelling the vigorous deepening of strategic coordination and strengthening mutual support.

From the DPRK's active support for the vision of building a community with a shared future for humanity and the four major global initiatives, to the two sides' close coordination within multilateral frameworks such as the United Nations and on regional and international issues, the two countries have worked together to safeguard their common interests, uphold international fairness and justice, and contribute to peace, stability and development in the region and beyond.

Both the regional and the broader geopolitical landscape have become increasingly complex and volatile. In this context, the two sides should uphold the spirit of the treaty of friendship to effectively safeguard their shared interests as well as regional peace and stability, thereby providing a solid guarantee for the steady development of China-DPRK relations and the stability of the region.

The two countries should be good comrades that forge ahead in their shared cause and contribute to each other's national rejuvenation.

As socialist countries led by communist parties, both nations share common ideals, convictions and goals. They are committed to pursuing development paths suited to their respective national conditions and share the aspiration of achieving national prosperity and a happy, secure life for their peoples.

At present, China is comprehensively advancing the building of a strong nation and the great cause of national rejuvenation through Chinese modernization, while the DPRK is fully dedicated to growing its economy, improving people's livelihoods and pursuing comprehensive national development.

The two sides should remain steadfast in their shared ideals and convictions, continuously enhance exchanges on Party building and state governance, and open up new horizons for their respective socialist causes, thereby injecting lasting momentum into the development of China-DPRK relations.

No matter how the international landscape evolves, as long as the two countries adhere to the head-of-state strategic guidance and the two peoples remain committed to working together, the two neighbors will surely carry forward their traditional friendship and deepen cooperation for the benefit of their peoples and the cause of peace, stability and prosperity in the region and beyond.

Tokyo-Manila collusion real threat to peace

China's Ministry of Transport announced on Saturday that it has launched a special maritime traffic law-enforcement operation in waters east of China's Taiwan island.

According to the ministry's statement, the operation aims to fully exercise China's maritime administrative jurisdiction, enhance deep-sea patrol and law enforcement capabilities, strengthen traffic management in key waters and safeguard national rights and interests. The operation serves as a justified response to the unilateral announcement by Japan and the Philippines of their so-called "maritime delimitation talks" regarding the area, as well as a warning to the secessionist-minded Lai Ching-te authorities of Taiwan that openly "acclaimed" the collusion between Tokyo and Manila.

The plan of Japan and the Philippines to start the negotiations to "delimit the maritime boundary of an exclusive economic zone and the continental shelf" infringes on China's territorial sovereignty and maritime rights and interests.

It also contravenes the United Nations Convention on the Law of the Sea, as well as the basic norms governing international relations.

According to China's domestic law and international law, including UNCLOS, China has exclusive economic zone and continental shelf in the area involved.

If Japan had truly learned the lessons of history, it would not be accelerating its re-militarization under the pretext of "safeguarding regional stability" while being a source of instability.

Notably, the Nagasaki Atomic Bomb Museum reportedly plans to refer to the Nanjing Massacre as the "Nanjing Incident" — a shameless denial of history. The judgment of the International Military Tribunal for the Far East dedicated a special chapter to documenting the massacre. The massacre's chief perpetrator, Iwane Matsui, was sentenced to death by hanging as a Class-A war criminal.

The Asahi Shimbun has reported on the outline of the Japanese government's 2026 defense white paper, which once again frames the regional security environment as "increasingly severe" and makes unfounded claims hyping the so-called "China threat". At its core, the document is designed to deliberately amplify "external threat" in order to shape domestic public opinion and create international "justifications" for a significant military budget increase, looser arms export controls, revised security strategies, and ultimately, the dismantling of the postwar constraints.

For Japan, elevating its military ties with the Philippines serves to promote the advance of its neo-militarism in the region.

For the Philippines, its government seeks to use "external threat" to divert public attention from domestic problems such as struggling economy, unemployment, poor healthcare and corruption.

The defense chiefs of the two countries jointly staged an ugly spectacle at the Shangri-La Dialogue in Singapore last month, turning a platform meant for communication into an opportunity to flatter the United States, divide the region, and stoke bloc confrontation. The whole region sees clearly they are the troublemakers and the real threat to regional peace and stability.

Philippine Defense Secretary Gilberto Teodoro Jr even brazenly claimed during the dialogue that although China has offered fertilizer and fuel to the Philippines, there is no demonstration of "good faith on a long-term basis", and it is actually "guileful".

This rhetoric shows his disregard for the welfare of the Philippine people and lack of appreciation for kindness. He only cares for selfish personal gains to the point that he is willing to perform political theatrics even when people's well-being is at stake.

Japan and the Philippines will only be increasingly isolated on the international stage if they continue down this wrong path of instigating confrontation.

Opinion Line

Gaokao continues to evolve in line with changing times

Outside 7,981 examination centers across China on Sunday, the summer air shimmered under the relentless June sun as millions of students faced one of the most important tests of their lives. Beyond the school gates, anxious family members gathered in crowds. Shielding themselves with umbrellas and handheld fans, they waited patiently despite the heat.

When the 12.9 million students sit for the 2026 national college entrance examination, or *gaokao*, they are actually taking part in one of the most important merit-based exam systems in modern Chinese history — a system that has evolved alongside the country's development to be one of the world's largest economies. It is about how a society identifies talent, rewards effort and adapts to changing socioeconomic realities.

One of the enduring lessons of history is that societies prosper when advancement depends more on innovation and achievement. The restoration of the *gaokao* in 1977 was a decisive move in that direction. It replaced the previous selection mechanism with one in which performance in a common examination became the principal gateway to higher education.

For a country emerging from a decade of changes, this was not merely an educational reform; it was the improvement of procedural justice. Millions of ordinary families came to believe that efforts and abilities could change a person's future. The belief that knowledge changes one's destiny has become a firmly held conviction among the Chinese people.

There is some truth in the assertion that examinations cannot fully judge an individual's creativity, character or perseverance. But the relevant question is not whether an exam is perfect, but whether a fairer realistic alternative exists.

What is particularly notable today is that with the country's development in recent decades, the *gaokao* assessment is itself undergoing change — from testing candidates' memorized knowledge to evaluating how they apply it. Of late, questions in the exams increasingly incorporate real-world situations, scientific developments, technological innovation and interdisciplinary problem-solving. The objective is no longer simply to identify students who can remember information, but those who can apply it in practice.

This evolution reflects a larger socioeconomic reality. For decades, China's growth benefited from abundant labor and expanding industrial capacity. Today, prosperity depends increasingly on innovation, productivity and human capital. The educational system therefore faces a different challenge: merely producing more graduates won't do, it should produce graduates capable of succeeding in an economy shaped by artificial intelligence, advanced manufacturing, biotechnology and other emerging technologies. The shift in examination design mirrors that national development.

Equally significant is the gradual change from a largely single-track model of advancement. Along with the current *gaokao* and broader lifelong education systems, diversified admissions mechanisms, vocational education pathways and comprehensive evaluation systems have expanded opportunities for different kinds of talent. The system remains competitive, but it is increasingly capable of recognizing that excellence takes multiple forms.

This does not mean that the *gaokao* system has become less important. It has become a window into China's broader economic and social transformation. The evolution of examination content, subject selection, admissions policies and university programs provides a revealing measure of how the country is preparing for the future.

The value of the *gaokao* system lies not in the examination itself, but in the principle behind it: that talent should be discovered, cultivated and rewarded. The details of implementation will continue to evolve, as they should.

But as China pursues high-quality development in an age increasingly defined by technological progress and global competition, the search for merit — and the institutions that make that search possible — will remain indispensable. The *gaokao* story is therefore not just a story about education and exams. It is a story about modernization, opportunity and the continuing effort of a nation to align individual aspiration with national development.

What They Say

Employment crucial for 15th Five-Year Plan period

Editor's note: *The 15th Five-Year Plan (2026-30) for implementing the employment-first strategy was approved at a State Council executive meeting on Friday. Senior officials of the Ministry of Human Resources and Social Security and the Ministry of Industry and Information Technology, as well as experts, shared their insights on the country's employment and industrial upgrading with the media after the meeting. Below are excerpts of their remarks as reported by Securities Times and Xinhua News Agency. The views don't necessarily represent those of China Daily.*

Focusing on the job-hunting needs of graduates, the human resources and social security authorities will continue to introduce high-quality employment policies and services to expand employment channels and create jobs.

Throughout the 15th Five-Year Plan period, it is essential to follow the employment-first strategy and incorporate the goal of high-quality and full employment into national economic and social development initiatives. Coordination between industries and employment should be increased. Greater efforts should be made to improve and modernize the industrial system, and priority should be given to key sectors that are capable of generating a large number of jobs. Government authorities should guide the orderly relocation of industries, and foster new drivers for employment growth by developing the digital economy, green economy and silver economy.

The fundamental solution for employment challenges lies in development. According to the requirements put forward at the State Council executive meeting, local governments should develop industries to stabilize employment, upgrade existing industries to create more jobs, and better protect employees' rights and interests to improve the quality of employment.

Carrying out vocational skills training is an important measure to resolve the structural imbalance between the needs of job seekers and employers. Improving the competence of the workforce is vital for achieving the goals of upgrading traditional industries and fostering emerging industries and industries of the future. Hence it is necessary to keep enhancing the quality of such training programs to help more workers acquire professional skills, secure jobs and increase their income.

New quality productive forces and the country's new industrialization drive are deeply related, and they contribute to each other's advancement. Scientific and technological innovation serves as the key to integrating the two.

New industrialization features high technology, sound economic returns, low resource consumption and minimal environmental pollution. This is in line with the direction in which new quality productive forces are developing. Scientific and technological innovation provides concrete approaches for the two to interact better with one another.

Efforts to cultivate industries of the future will drive both the development of new quality productive forces and the upgrading of the modern industrial system. The development of industries of the future will help boost the high-quality development of the country, and strengthen the industrial foundation for building a modern socialist China in all respects.

China has seen steady progress in the development of industries of the future, and gained some first-mover advantages in key fields. Nevertheless, challenges remain, including insufficient capacity for original innovation, reliance on others for key and core technologies, an innovation ecosystem in need of further improvement, and institutional and mechanism barriers to be removed.

Good neighborly ties usher in sea changes

MA XUEJING / CHINA DAILY

Landlocked countries, which account for half of the least developed countries in Asia and nearly 40 percent in Africa, face a formidable obstacle in their economic development: the lack of maritime connectivity. Access to the sea is crucial as many landlocked countries rely on overseas markets. Since they can access the ocean only through other countries, friendly relations with neighbors and efficient transportation routes to the sea are essential for economic progress.

Although the Lao People's Democratic Republic has maintained friendly relations with all its neighbors, the only maritime access route that provided tangible economic benefits until recently was the one through Thailand, thanks to its favorable geographic conditions.

Access to China and Vietnam is blocked by mountainous regions that stretch for hundreds of kilometers. The Mekong River route through Cambodia, which holds great promise, is blocked by an impassable 10-kilometer-long waterfall.

Even the European powers that colonized Laos found it difficult to overcome these natural obstacles.

Dependence on the Thailand route led to rapid urban development near the Thai border, while other regions of the country struggled, posing a persistent challenge for the Lao economy.

However, China's economic growth helped break through these major natural barriers to connectivity. Driven by China's rapidly growing economic power, trade across the mountainous regions gradually picked up in the 1990s.

The China-Laos Railway, inaugurated in December 2021, was the gamechanger that ushered in a new phase in overcoming Laos's landlocked status.

Despite predictions by many experts that it would be of little use, the China-Laos Railway has achieved its targets for both passenger and freight trains well ahead of schedule.

For landlocked Laos, China's rise and improved connectivity with the country offer three major advantages. First, with a major global market now available next door, Laos can engage in trade without taking the maritime route.

Although it may be an upper-middle-income country in many people's eyes, China has become a major global market due to its sheer scale. If China becomes a high-income country in the near future, as widely predicted, it will present unprecedented opportunities for the Lao economy.

Second, improving connectivity with China, often referred to as the "world's factory", presents a significant opportunity for Laos to gain a foothold in global supply chains. Laos' relationship with global supply chains till now has centered primarily on the "plus-one" model, which involves indirect participation through neighboring countries.

The transport costs of shipping semi-finished goods back and forth to landlocked Laos further diminished the country's appeal as an industrial location. But the China-Laos Railway network has changed the situation for the country.

Third, improved connectivity between China and Laos has implications that extend beyond bilateral relations. Laos is the only country among the five Mekong countries that has land access to all of them as well as to China.

Improving connectivity with China and other neighboring countries will enhance Laos' position in connectivity networks between the Mekong region, ASEAN and China.

However, the "peer effect" — the idea that a landlocked country will grow faster if its transit neighbor experiences rapid growth — does not automatically apply.

Unless people communicate, exchange information, and make efforts to learn through the physical connections they have established, the peer effect is unlikely to occur.

In other words, people-to-people connectivity, such as cultural, educational, and professional exchanges, is essential.

Although evidence of peer effects has begun to emerge, with higher-than-average growth rates in many northern provinces closer to China or along the railway, greater efforts are necessary for these regions to fully capitalize on their potential.

The real story behind China's manufacturing might

China Shock 2.0 is a powerful phrase that offers a fake story. In this telling, Chinese electric vehicles, batteries, solar panels and advanced manufactured goods are the latest version of the low-cost imports that reshaped Western manufacturing after China joined the World Trade Organization.

The products may have changed, but the conclusion remains the same: China produces too much, sells too cheaply and threatens industrial workers elsewhere.

The vocabulary is also familiar. In the 1980s, Japan was described in nearly the same terms — subsidies, dumping, industrial targeting, unfair competition.

Some of those concerns were real, but the political framing pushed defensive policy rather than industrial renewal, and many of the predicted outcomes did not materialize.

The lesson is not to ignore competitive pressure. It is to distinguish unfair conduct from superior capability before choosing the response.

The "China Shock 2.0" argument leans on the work of David H. Autor, David Dorn and Gordon H. Hanson published in 2013, which argued that rising Chinese imports led to higher unemployment in the United States.

But that paper is treated as more definitive than it ever was.

The original finding — concentrated harm to specific US local labor markets between 2001 and 2010 — was a distributional effect inside an aggregate gain, not a verdict on trade with China, and the policy discourse has consistently over-read it.

The 2.0 case is structurally different. The sectors under scrutiny are not labor-intensive consumer goods, but capital goods, green technologies, complex assemblies and two-way supply chains dense with non-Chinese value. Price declines are at the center of the global energy transition.

Electric vehicles are the clearest example. The common assumption is that Chinese EVs are cheap mainly because of government support. Yet Rhodium Group, an organization known for its close scrutiny of Chinese industrial policy, reaches a different conclusion.

Rhodium estimates that BYD enjoys a cost advantage of roughly $4,700 per vehicle over Tesla China. Direct subsidies account for about $292 per vehicle, and preferential financing for around $12. By Rhodium's reckoning, subsidies add up to barely 5 percent of BYD's cost advantage.

The larger explanation lies in industrial organization. BYD produces around 80 percent of its tier-one components and 36 percent of its tier-two components in-house, avoiding an estimated $2,369 per vehicle in supplier markups.

Lower R&D and administrative costs contribute another estimated $1,719. So, the advantages stem not from cheap inputs but from vertical integration, dense local supply chains, rapid iteration and large-volume cost amortization.

If the gap were mainly because of subsidies, tariffs could plausibly close it. But tariffs cannot manufacture competitiveness. What Western automakers are facing are not lower prices but a different, and more efficient, production system.

China's manufacturing advantage can no longer be explained by cheap labor. Official data show average annual wages in urban non-private manufacturing reached 107,987 yuan ($15,895) in 2024, up from around 72,088 yuan in 2018, while Chinese export prices have been flat or declined over the same period.

When wages rise while export prices remain steady, the cause is not currency movements but productivity, automation, scale and supply-chain clustering. Chinese firms have compressed the design-to-market cycle inside dense local ecosystems where suppliers, engineers and manufacturers sit close to one another.

China's rise is not just because of volume but also technological accumulation. R&D spending as a share of GDP rose from about 1.3 percent in the 10th Five-Year Plan (2001-05) to 2.7 percent in the 14th (2021-25).

OECD data place China's total R&D spending close to the US in purchasing power terms, and the World Intellectual Property Organization's Global Innovation Index ranks China in the world's top 10 innovation economies.

The benefits are broader than the "shock" narrative allows. Lower Chinese prices are disruptive for some producers, but they are very beneficial for consumers, developing economies and the energy transition. Cheaper solar panels, batteries and EVs lower the cost of decarbonization.

IRENA has found that most newly added utility-scale renewable power in 2024 was cheaper than the lowest-cost fossil-fuel alternative. The same price decline that pressures some incumbent firms also helps households, grids and governments deploy clean technology faster.

The reverse evidence is also striking. If China were simply "shocking" the world, developing economies would be pulling away; instead, many are deepening integration with China.

ASEAN is now China's largest trading partner, and the China-ASEAN Free Trade Area 3.0 Upgrade Protocol covers the digital economy, green economy and supply-chain connectivity.

Vietnam's export boom, Southeast Asia's electronics growth and Mexico's nearshoring expansion are closely related to Chinese intermediate goods, machinery and logistics.

The trade-in-value-added perspective reinforces this point. Gross export figures make China appear to be the sole source of the impact.

But final exports from China often embody value created elsewhere: Japanese and Korean components, German machinery, Dutch equipment, Australian minerals, ASEAN inputs, and global software, design and services. A tariff aimed at "China" often strikes a production network much broader than China itself.

A fuller accounting must look beyond goods. China runs a large goods surplus, but it is also a major buyer of foreign services and a source of income for global firms.

Data show that in 2025 China recorded a $1,023 billion goods surplus alongside a $196 billion services deficit and a $115 billion primary income deficit. Tourism, education, intellectual property payments, digital services, brands and multinational profits all complicate the one-way story, making the picture look less like a one-directional shock and more like deep mutual dependence.

"China Shock 2.0" compresses three different issues into one alarm: efficiency read as unfairness, scale read as aggression, and diffusion read as threat. If the issue is efficiency, the answer is to lower energy and capital costs at home — not tariffs that shield higher-cost producers from a structural gap.

If the issue is scale, the answer is to invest in supply-chain depth and the ecosystems where suppliers, engineers and integrators sit close together — not barriers that fragment those networks further.

If the issue is diffusion, the answer is to accelerate domestic R&D and firm-building while participating in the supply chains that spread capability — not export controls premised on a single-source frontier.

The better question, then, is not how to stop China from making affordable advanced goods.

It is how other economies can build manufacturing systems capable of making complexity affordable.

Haukur Hardarson

Rethinking energy security in a changing world

Energy security is being reshaped in a rapidly changing global landscape, but the policy conversation has yet to fully adjust. As geopolitical tensions intensify and traditional fuel supply chains face disruption, governments are rethinking how energy systems are built, powered and protected. Yet, the approach remains anchored in outdated assumptions about fuel supply, overlooking the resilience of the systems that deliver energy.

Nowhere is this more evident than in heating and cooling, which account for roughly half of global energy consumption.

More than 80 percent of this demand is met by fossil-fuel based energy. For many countries, this implies continued dependence on imported fuels to meet essential needs, from maintaining habitable cities to sustaining industrial production.

Despite this, policy and investment remain heavily concentrated on electricity generation, leaving thermal systems — the largest source of energy usage — fragmented, underdeveloped and exposed to fuel price volatility. Addressing this imbalance requires a shift in perspective, from securing fuel supply to strengthening the infrastructure that delivers energy.

Geothermal energy offers a fundamentally different model of energy security, based on infrastructure rather than fuel.

In practical terms, this means replacing recurring fuel imports with long-life domestic assets that stabilize energy costs over time, reduce exposure to commodity volatility and anchor critical infrastructure in reliable, local energy resources.

Unlike fossil-based systems, geothermal requires no ongoing fuel supply, eliminating exposure to transport disruptions and import dependence. With one of the smallest land footprints of any renewable, it can also be deployed within dense urban environments, integrating seamlessly into existing buildings, districts and infrastructure systems.

Yet a key barrier to wider adoption is the persistent misconception that geothermal is limited to volcanic regions. In reality, low- to medium-temperature geothermal resources suitable for heating and cooling can be deployed in nearly every geography. Advances in drilling and subsurface engineering are further expanding geothermal's potential at greater depths.

International experience illustrates what is possible, with Iceland providing a well-established case.

Following the oil shocks of the 1970s, the country invested heavily in geothermal infrastructure to reduce dependence on imported fuels. Today, around 90 percent of Icelandic homes are heated with geothermal energy, contributing to both energy independence and long-term price stability.

Over many decades, Iceland has developed deep expertise in geothermal resource development, engineering, and system integration, creating a foundation that has informed projects well beyond its borders.

China is a more recent and large-scale example of how this expertise can be applied in practice.

Through Sinopec Green Energy — a joint venture between Sinopec Star and Arctic Green Energy — Iceland's technical expertise combines with China's industrial scale and execution capability to enable rapid deployment of geothermal district heating systems across northern China.

In China's 15th Five-Year Plan (2026-30), energy self-sufficiency and system stability are central priorities. As part of this broader strategy, the country has accelerated the development of geothermal systems, particularly in regions historically reliant on coal.

Today, geothermal systems developed through Sinopec Green Energy serve more than 120 million square meters across more than 70 cities, benefiting millions of people. This expansion is reducing emissions while strengthening domestic energy security through stable, locally sourced energy systems.

The impact extends beyond energy supply. In cities historically reliant on coal-based heating, the shift to geothermal energy has improved local air quality, supporting efforts to build cleaner, healthier urban environments.

As the global energy system evolves, maintaining reliability is becoming more complex.

Wind and solar are indispensable to decarbonization, but their variability requires complementary resources to ensure stability. Geothermal plays a critical role by offering continuous, weather-independent thermal energy, particularly in sectors where demand cannot be curtailed. In this sense, geothermal complements rather than competes with other renewables.

Policy frameworks around the world have not fully adapted to this reality. Energy strategies continue to prioritize electricity, while heating and cooling remain underdeveloped in both planning and financing. Closing this gap will require integrating geothermal into urban energy planning, expanding district heating and cooling networks, and adopting financing models that treat geothermal as long-term infrastructure rather than short-term energy supply.

Together, the experiences of Iceland and China offer a broader lesson: energy security improves when countries invest in domestic, infrastructure-based systems rather than relying on imported fuels.

In a rapidly changing global landscape, long-term energy security will depend less on access to fuel and more on the resilience of energy systems.

Countries that succeed will be those that invest in infrastructure capable of delivering stable, reliable energy over decades.

And beneath our feet lies one of the most powerful and overlooked foundations of that future.

The author is the founder and chairman of Arctic Green Energy and vice chairman of Sinopec Green Energy.

GLOBAL VIEWS

GUO BOWEI

Digital dependency

Stable and abundant electricity is the fundamental resource for modern economies in the AI era

Total power use in China reached 10.37 trillion kilowatt-hours in 2025, crossing the 10 trillion kWh threshold for the first time and making China the world's largest consumer of electricity.

Against the backdrop of flourishing digital economy and the rapid rise of artificial intelligence, the significance of this milestone extends far beyond the energy sector.

Electricity is a unique strategic resource in the modern economy. Unlike primary fuels such as coal and oil, electricity, as a secondary energy carrier, cannot be stored in large quantities at low cost. Power generation, transmission and consumption therefore have to be kept in a real-time balance.

Therefore, operating a power system on the scale of 10 trillion kWh requires far more than large generation capacity. It also demands a highly complex grid network, sophisticated dispatch and coordination systems, and sustained infrastructure investment. In this sense, the power system is a manifestation of the country's industrial strength and capacity for long-term planning and systematic coordination.

Just as coal, steel and oil formed the bedrock of the industrial age, a stable and expansive power system has emerged as the foundation of the digital economy.

This is particularly evident in the development of the AI industry.

The AI race is often framed as a competition in chips and algorithms. In practice, computing power depends on something even more fundamental: electricity. Data centers and computing hubs are inherently energy-intensive facilities. A large-scale data center typically operates with power capacity exceeding 100 megawatts, and some supercomputing centers consume several billion kWh of electricity each year. Training large AI models often requires tens of thousands of GPUs to run continuously for weeks or even months, all sustained by enormous amounts of electricity. The International Energy Agency projects that electricity consumption from data centers will roughly double from 485 terawatt-hours in 2025 to 950 TWh in 2030, a level close to Japan's current total electricity consumption. These figures show that the AI industry is not merely a digital industry. It is also reshaping the structure of global energy demand.

The larger the scale of computing power, the higher the demands on the reliability and capacity of the power system. As the rapid rise of AI drives surging demand for computing power, the energy system is increasingly emerging as a core foundation underpinning the growth of the sector.

The scale and reliability of China's power system provide uniquely favorable conditions for the AI industry. China has the world's largest power generation system and transmission network, and it has accumulated extensive expertise in ultra-high-voltage transmission, renewable energy integration and cross-regional power dispatch. For the AI industry, these capabilities matter far beyond simply ensuring an adequate electricity supply. They are critical to the reliable operation of computing centers, the continued expansion of industrial clusters and the ability to keep energy costs under control.

A good case in point is China's "East Data, West Computing" project, which aims to align computing infrastructure with the geographic distribution of energy resources.

China's eastern regions have more developed digital economies and concentrated demands for data services, but face high electricity costs. By contrast, the western regions boast abundant wind, solar and hydropower resources, making the costs much lower.

Some computing tasks that are less sensitive to latency have been shifted to computing hubs in the western region of China. This has gradually created a more rational spatial division between data generation and computing infrastructure. The eastern regions mainly generate data and application demand, while some back-end computing and data-processing tasks can be handled by computing centers in the West.

By turning rich energy resources into strong computing power, the model ensures stable, low-cost energy to support the development of AI.

Energy researchers often talk about the "energy trilemma", which refers to the challenge of balancing efficiency, sustainability and security. The rise of AI gives this old challenge a new dimension: as the digital economy increasingly depends on computing power, the broader economy will be more dependent on a stable, clean and secure electricity system.

First, electricity is the direct energy input for computing infrastructure. Data centers, servers and cooling systems all depend on a continuous and reliable power supply. A more efficient power system therefore directly affects the cost and stability of AI development.

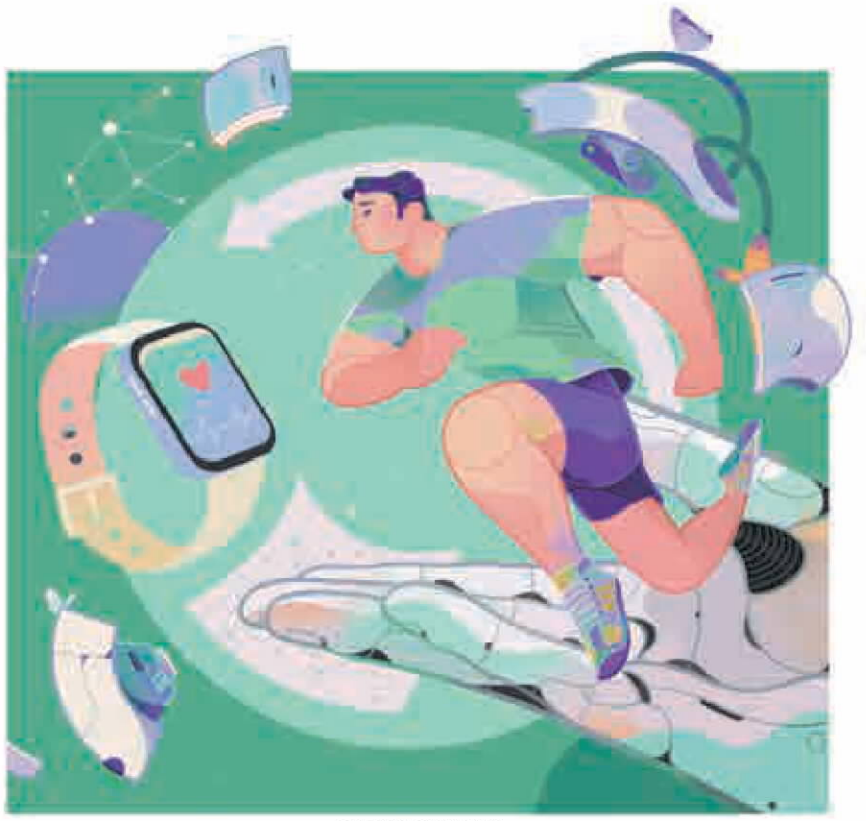
Second, electricity is easier to decarbonize than many forms of direct fossil fuel use. As the generation mix shifts toward cleaner sources such as wind, solar and hydropower, the expansion of computing power does not necessarily have to mean a proportional increase in carbon emissions.

Third, a stronger power system can also enhance energy security. As renewable energy capacity grows and more economic activity is supported by domestically generated electricity, dependence on imported fossil fuels can gradually decline, strengthening the resilience of China's energy system.

Therefore, over the long term, increasing the share of electricity in final energy consumption is not only an important pathway for green development, but also a more efficient and secure way of organizing the energy system.

Of course, operating the world's largest power system takes more than just a massive economy. Power infrastructure projects demand huge upfront investment, take a long time to build and deliver stable but slow returns. In many countries, such projects are often challenged by inadequate funding, grid expansion bottlenecks and the complexity of cross-regional coordination.

In China, decades of continuous power infrastructure expansion have been enabled by long-term planning and system-wide implementation. From the west-to-east power transmission program and ultra-high-voltage transmission corridors, to the construction of large renewable energy bases and national computing hubs, energy infrastructure development has always been guided by national-level planning and coordinated alongside industrial demand.



MA XUEJING / CHINA DAILY

Reaching the 10 trillion kWh milestone is more than just an energy indicator. It signals the foundational capability required for the digital era. It demonstrates that China has both a massive industrial system and consumer market, as well as the energy bedrock needed to sustain the growth of AI, advanced manufacturing and the digital economy.

As AI development accelerates, a stable, green and efficient power system is vital to both the sustained expansion of computing infrastructure and the long-term trajectory of emerging industries. China's massive and evolving power system provides robust support for expanding AI application scenarios, upgrading industrial structures and advancing green development.

Looking ahead, as renewable energy, smart grids, energy storage technologies and computing infrastructure further integrate, the power system is expected to play an essential role in driving the mutually reinforcing digital and green transitions.

LYU XIONGCE

Data keeps users fit

Digital technology is reshaping the new growth point of the health economy via smart sports

According to the latest data from the World Health Organization, global health expenditure as a percentage of GDP increased from 9.2 percent in 2010 to 10.9 percent in 2021. Simultaneously, the digital economy is rapidly permeating the realm of public welfare.

Technologies such as artificial intelligence, big data and digital twins are becoming deeply integrated with sports education, physical fitness assessment and exercise intervention, giving rise to the emerging field of smart sports.

In developed economies such as the United States, Japan and the European Union, smart sports are seen as a key pathway to reducing healthcare costs and improving the overall health of the population. In China, the Outline of the Healthy China 2030 Plan and the New Generation Artificial Intelligence Development Plan explicitly propose the deep integration of AI with sports health, with smart sports evolving from campus pilots to a societal-wide initiative to transform the health economy.

The core value of smart sports lies in the optimal allocation of resources. Through big data analysis and AI algorithms, individual physical health status can be categorized into different risk levels — from health maintenance and risk warning to critical intervention — and matched with differentiated exercise prescriptions for each level. This evidence-based stratified intervention strategy is becoming a global trend in health management.

In Japan, pilot areas using an exercise prescription system for AI-guided stratification of middle-aged and elderly individuals have shown significant effects in curbing healthcare expenditure growth, according to the Japan Sports Agency's interim verification conclusions.

According to comprehensive estimates from the National Health Commission's Report on the Nutrition and Chronic Diseases Status of Chinese Residents (2020) and the China health management white paper, more than 50 percent of China's adults are overweight or obese, with direct medical costs related to obesity-induced diabetes, hypertension, cardiovascular and cerebrovascular diseases accounting for an increasing proportion of annual health expenditures. If the smart sports model can slow the growth of obesity rates from current trends, it could potentially avoid tens of billions of yuan in incremental annual medical expenditures in the long term.

Finland's national sports digital platforms, such as HeiaHeia and Polar Flow, have demonstrated through long-term tracking data analyzed by the former Finnish Institute of Sports Sciences that AI dynamic adjustment of exercise load can increase the rate of physical fitness compliance by 15 percent to 25 percent.

Similar effects have been validated in pilot projects at Chinese universities. The Ministry of Education's 2023 national student physical fitness survey report indicates that in universities implementing AI-personalized exercise programs, the incidence of student sports injuries has shown a significant downward trend, and the rate of excellent physical fitness test results has steadily increased. The promotion of this technology could potentially reduce youth sports injuries by hundreds of thousands annually, correspondingly decreasing medical expenses and class absences, forming a virtuous cycle of less injury — more exercise — better health.

China's 14th Five-Year Plan (2021-25) for National Health clearly proposed shifting the checkpoint of health forward, with AI smart sports being a key tool for achieving this goal. Research by the Ministry of Education's Department of Physical, Health and Arts Education, in collaboration with the General Administration of Sport's Research Institute, shows that improving students' physical health levels has a significant positive effect on reducing long-term medical expenditures for chronic diseases. If China can fully unleash the preventive potential of smart sports, it could form a proactive health paradigm with Chinese characteristics in the health economy sector.

According to the "smart sports market report (2023-28)" by MarketsandMarkets, the global smart sports market size is expected to grow from $18 billion in 2023 to $42 billion in 2028, with a compound annual growth rate of approximately 18 percent. China's smart sports education equipment and service market is expected to grow even faster, with a compound annual growth rate exceeding 22 percent, higher than North America and Europe, making it the fastest-growing region globally.

On the policy front, China has issued the "Outline for Building a Leading Sports Nation" and the "Opinions on Promoting Mass Sports, Sports Consumption and High-Quality Development of Sports Industry", supporting AI sports technology research and industrialization. Over the next five years, the domestic smart sports sector alone could create hundreds of thousands of jobs in technology development, data analysis and content operations, while driving new business forms such as intelligent wearable devices, virtual sports courses and digital exercise prescriptions to international markets. Smart sports are not only the internal demand engine of the health economy but also a distinctive business card for China's service trade going global.

Improvements in physical fitness are translating into long-term value appreciation in national human capital. Both domestic and international studies confirm this correlation: The OECD's Programme for International Student Assessment data show that students in Beijing, Shanghai, and Jiangsu and Zhejiang provinces who participate in moderate to vigorous physical activities three times a week score significantly higher in science, mathematics and reading tests than those with insufficient activity, with score differences reaching over half a grade.

When physical improvement shifts from a slogan to an actionable, trackable and intervenable practice, we are essentially investing in one of the highest-return "original capitals" for national economic growth. Institutionalizing this logic, China has incorporated student physical health into school performance evaluations.

Looking ahead, as technologies such as large-model AI technology, federated learning and edge computing continue to mature, personalized health management tailored to individuals will expand from campuses to the entire society.

As data technology and the sports health industry deeply integrate, China is poised to be the first country globally to establish a proactive health economic paradigm. This is not only a positive response to domestic population health challenges but also provides a replicable and promotable Chinese solution for global health governance. Smart sports will be elevated from a technical means to a lifestyle concept, reshaping the return structure of national health investments and becoming one of the most promising new growth points in the digital economy era.

Leveraging intelligent technology pivot

Humanoids, smart glasses, AI demand catapult nation's innovation globally

By **MA SI** and **CHEN BOWEN** in Haikou

An AgiBot humanoid robot gives a calligraphy demonstration to visitors during the Digital-Intelligent Technology Ecosystem Conference 2025 in Guangzhou, Guangdong province, on Dec 5. QIN ZIHANG / FOR CHINA DAILY

Left: A demo of a robot vacuum with wheellegs takes place at the Roborock booth during the second day of the AWE 2026 trade fair in Shanghai on March 13. GETTY IMAGES **Right:** A humanoid robot from the Honor Qitian Dasheng team, named "Lightning", wins the championship during the 2026 Beijing E-Town half marathon and humanoid robot half marathon in Beijing on April 19. HE GUANXIN / FOR CHINA DAILY

Out of every 10 humanoid robots shipped worldwide, eight come from China. That single statistic from a market research company captures a remarkable shift in the country's export story.

Gone is the reliance on sheer scale and rock-bottom prices. The new wave of Chinese tech exports — embodied in robots, artificial intelligence systems and smart hardware — is defined by sophistication, speed and a distinctly high-tech appeal, experts said.

The transformation is perhaps best illustrated by an unusual race held on a crisp April morning in Beijing's southern suburbs. More than 12,000 human runners lined up for a half-marathon. Alongside them, jostling for position at the start line, stood over 100 humanoid robots.

One of them, a nimble machine named "Lightning" from the Honor Qitian Dasheng team, crossed the finish line in 50 minutes and 26 seconds. To put that in perspective, the men's half-marathon world record, set by Uganda's Jacob Kiplimo in March, stands at 57 minutes and 20 seconds. Lightning, built in China, beat it by nearly seven minutes.

Yet the real headline was not the winning time — it was how the robots ran. Nearly 40 percent of the teams used fully autonomous navigation, a dramatic leap from the previous year's remote-controlled field. Technologies borrowed from self-driving cars, including LiDAR and vision-only navigation, have been successfully grafted onto two-legged machines.

Zhao Mingguo, a researcher at Tsinghua University's Department of Automation, watched the race closely. "This proves that once Chinese industry sets a goal, it has the ability to get it done," he said.

Behind the marvel on the racecourse lies the relentless pursuit of technological breakthroughs and advanced manufacturing in China. The confidence that powers these robots at full speed comes from a strong industrial and supply chain system.

Today, China is home to more than 140 humanoid robot manufacturers, with annual shipments reaching 14,400 units — accounting for 84.7 percent of the global total. Out of every 10 humanoid robots shipped worldwide, eight come from China, according to a report jointly released by CCID Media and China Electronics News in March.

More importantly, Chinese technology is arriving on the global stage with a sleek, high-tech confidence. Leading the charge is AgiBot, a Shanghai-based company that has become the world's top humanoid robot shipper, according to a report by market research firm Omdia.

The company began delivering to overseas customers in 2025 and opened its first international experience center in Malaysia in January.

Then, in late February 2026, AgiBot made a decisive move into Europe. At a launch event in Munich, Germany, the company officially announced its entry into the German market, unveiling a full portfolio of general-purpose embodied robots and industry-specific system solutions tailored for Europe.

But the announcement that drew the most attention was a strategic partnership with Minth Group, a global leader in automotive exterior and structural parts.

Under the agreement, Minth's network of modern factories around the world will serve as dedicated training grounds for AgiBot's robots — real-world environments where machines can learn, collect data and refine their algorithms.

Esther Wei, Minth Group's chairwoman and CEO, said: "This partnership not only drives Minth's own smart manufacturing upgrade, but also injects precious real-scenario data into the robotics industry, accelerating algorithm iteration and technological evolution".

Customs data show that in the first quarter of this year, China's total exports of various types of robots reached 11.32 billion yuan ($1.67 billion), with shipments to 148 countries and regions. Among them, cleaning robots accounted for nearly 70 percent, becoming the main driver of exports.

For instance, walk into a tech park in Shenzhen's Nanshan district, and you will see the commercial reality behind the spectacle. Pudu Robotics has been quietly shipping service robots to more than 80 countries and regions — not only floor-cleaning machines, but also food-delivery robots that navigate crowded restaurants and customer-engagement bots that greet shoppers in malls across Europe and Southeast Asia. By the end of 2025, Pudu had shipped a total of 120,000 robots, the company said.

A few blocks away, engineers are putting a four-legged robot through its paces. At 62 kilograms, it is no toy. In one three-minute test, it performed continuous back-flips, side flips and a spinning jump that launched it 87 centimeters off the ground.

The secret? A local supply chain so efficient that the company can source all 30,000 components within half a day. That speed has allowed eight product iterations in just six months — a pace that leaves many overseas competitors struggling to keep up.

Shenzhen Dobot Corp Ltd, specializing in industrial robot arms, has also shipped its precision manipulators to more than 100 countries and regions. Walk into a factory in Germany or a warehouse in Brazil, and you are increasingly likely to see a Chinese-made robotic arm handling delicate assembly or heavy lifting.

Xie Kaixuan, marketing director of Dobot, said: "The key to embodied intelligence is moving from 'lab demonstration' to 'real-world commercial use'. At a cinema in Shenzhen, Dobot's humanoid robot has already achieved fully automated popcorn sales. It works 14 hours a day, and its daily revenue has exceeded 20,000 yuan."

Zhang Yin, vice-chairman and secretary-general of the Guangdong Artificial Intelligence and Robotics Industry Alliance, said: "The Greater Bay Area is the only region in the world that has both AI technology and mechatronics technology — and the ability to deeply integrate the two. This advantage is reflected in the collaboration and layout of Guangdong, Hong Kong Special Administrative Region and Macao Special Administrative Region."

The export boom is not limited to walking or rolling machines. Smart glasses have become another unexpected hit. Equipped with real-time translation, visual assistance and noise-cancelling communication, they are flying off shelves from Tokyo to London. Chinese manufacturers have turned the glasses into a practical tool for business travellers and tourists alike.

In 2025, smart glass shipments in China reached 2.46 million units, a year-on-year increase of 87.1 percent. Overseas shipments grew by 64.9 percent, covering 32 countries and regions, according to data from market research company International Data Corp.

Local governments are also moving fast. The Hainan provincial government said it will focus on cultivating future industries and building new engines for development in 2026. In the field of embodied intelligence, Hainan will proactively plan for "brain-like models" tailored to unique application scenarios such as deep-sea exploration and tourism, and develop a variety of embodied intelligent robots, including underwater robots and cultural tourism consumer robots.

Seeing the potential, Beijing Galbot recently established a unit in Hainan, with a business scope covering the manufacturing of service and consumer robots and the research and development of intelligent robots.

What ties all these stories together is a fundamental shift in strategy. Chinese tech companies are no longer competing on price alone. They are offering a complete business loop: hardware to attract customers, software to keep them, and value-added services to generate long-term revenue. It is a model that has already proved successful in smartphones and electric vehicles — and now it is being applied to robotics and AI, experts added.

My toddler's take on China's robot takeover

REPORTER'S LOG

By Ma Si

Ma Si

My 1.5-year-old baby just taught me something Wall Street took years to figure out. Not long ago, my daughter saw a humanoid robot at our local shopping mall — a Chinese-made machine selling small plush toys. She burst into tears.

Fast forward a few months. Now, dragging me by the hand, she practically sprints toward the same robot every day. They dance together. They "chat" — or I should say, she babbles and the robot beeps back. They shake hands.

At not even two years old, she has already internalized something that took global investors years to fully grasp: humanoid robots are no longer science fiction. They're here, they're Chinese and they're going mainstream faster than anyone expected.

The numbers back up my toddler's intuition. In 2025 — the year humanoids moved from lab demos to real-world work — about 15,000 humanoid robots were deployed globally, and about 85 percent of them were delivered by Chinese companies.

The International Federation of Robotics said dominance is not new, but accelerating. In 2024 alone, China installed 295,000 industrial robots, almost eight times more than the US' 34,200 units. The operational stock in China exceeded 2 million, about five times the US' 393,700. China has turned robotics into a scale game, and no one else is even in the race.

Barclays analyst Zornitsa Todorova put it bluntly: "The decade of robotics belongs to China". The reasoning is simple. China controls 90 percent of the world's refined magnetic rare earths, 45 percent of battery exports, 22 percent of actuator exports — and about 70 percent of all global robotics patent applications.

Using European Patent Office data, China holds roughly 70 percent of global robotics patents since 2000; the US holds just 4 percent. In 2023 alone, China filed over 30,000 new robotics patent inventions — nearly 30 times the US' count.

In the humanoid subfield, China accounts for about 75 percent of relevant patents worldwide. The company that holds the most humanoid robot patents globally? Not Boston Dynamics — it's China's UBTech, with 812 patents, dwarfing Boston's 119.

That's not just an innovation edge. That's a supply-chain stranglehold. As Barclays concluded, every humanoid robot assembled in the US or Europe will still rely on key components made in China.

But here's where my daughter's story becomes genuinely revealing. It's not just about who makes the robots — it's about how fast they become normal. The robot she plays with wasn't being tested in a sterile lab; it was working a real shift, selling toys, interacting with hundreds of strangers a day. That's not a prototype. That's a product.

And this is where China is pulling ahead in a way that has nothing to do with patents or rare earths: real-world commercial deployment. Chinese firms are not waiting for perfect conditions. They're putting humanoids into malls, factories, cinemas, restaurants — messy, unpredictable, human-filled environments — and letting them learn on the job.

Now look at where this trajectory leads. Using China's own electric vehicle expansion curve as a reference, analysts from Barclays project that by 2035, annual humanoid robot deployments in China could reach about 11 million units, with the global total hitting roughly 13 million.

If cumulative stock reaches 24 million units, that would add about 3.8 percent to China's effective labor supply — offsetting nearly 60 percent of the projected workforce contraction caused by demographic shifts.

This is an optimistic scenario, but it is not fantasy. It almost exactly replicates the path of electric vehicles: from policy support to supply-chain build-out to explosive scale. China has run this playbook before.

But there is a deeper dimension here — one that spreadsheets and patent filings cannot capture. It is about emotion, familiarity and the quiet erasure of fear. My daughter went from terrified to delighted in weeks. She now treats that plastic-and-servo machine as a friend. She brings it imaginary snacks. She waves goodbye when we leave. This kind of early, casual exposure is happening to millions of Chinese children right now — in malls, airports, kindergartens and hospitals. They are growing up with robots as natural, trusted companions, not as threats to their jobs or existential menaces from sci-fi movies.

Contrast that with the cultural mood in much of the West. In the US and Europe, public discourse around humanoid robots remains heavily colored by job displacement anxiety, privacy fears and dystopian tropes. Surveys consistently show lower willingness to interact with autonomous machines in everyday spaces. That matters — not just for public relations, but for market adoption. A child who dances with a robot today becomes an adult who buys one tomorrow. That is a soft-power advantage no trade barrier can easily undo.

My daughter doesn't know what a supply chain is. She doesn't know about patents. But she knows that an interesting robot has become part of her daily life. That instinctive comfort — the feeling that this technology belongs here, now, in ordinary spaces — is exactly what China is scaling globally.

For everyone else, it may be a moment of reckoning: the decade of robotics really does belong to China. And it has already begun, one dance at a time.

BUSINESSINSIGHT

EAGLE EYE

By Zhang Xu

Strategic significance of building an open world economy

Editor's note: *China Daily's Business Insight section has launched a column devoted to an in-depth interpretation of Xi Jinping's economic thought. This article is part of the series.*

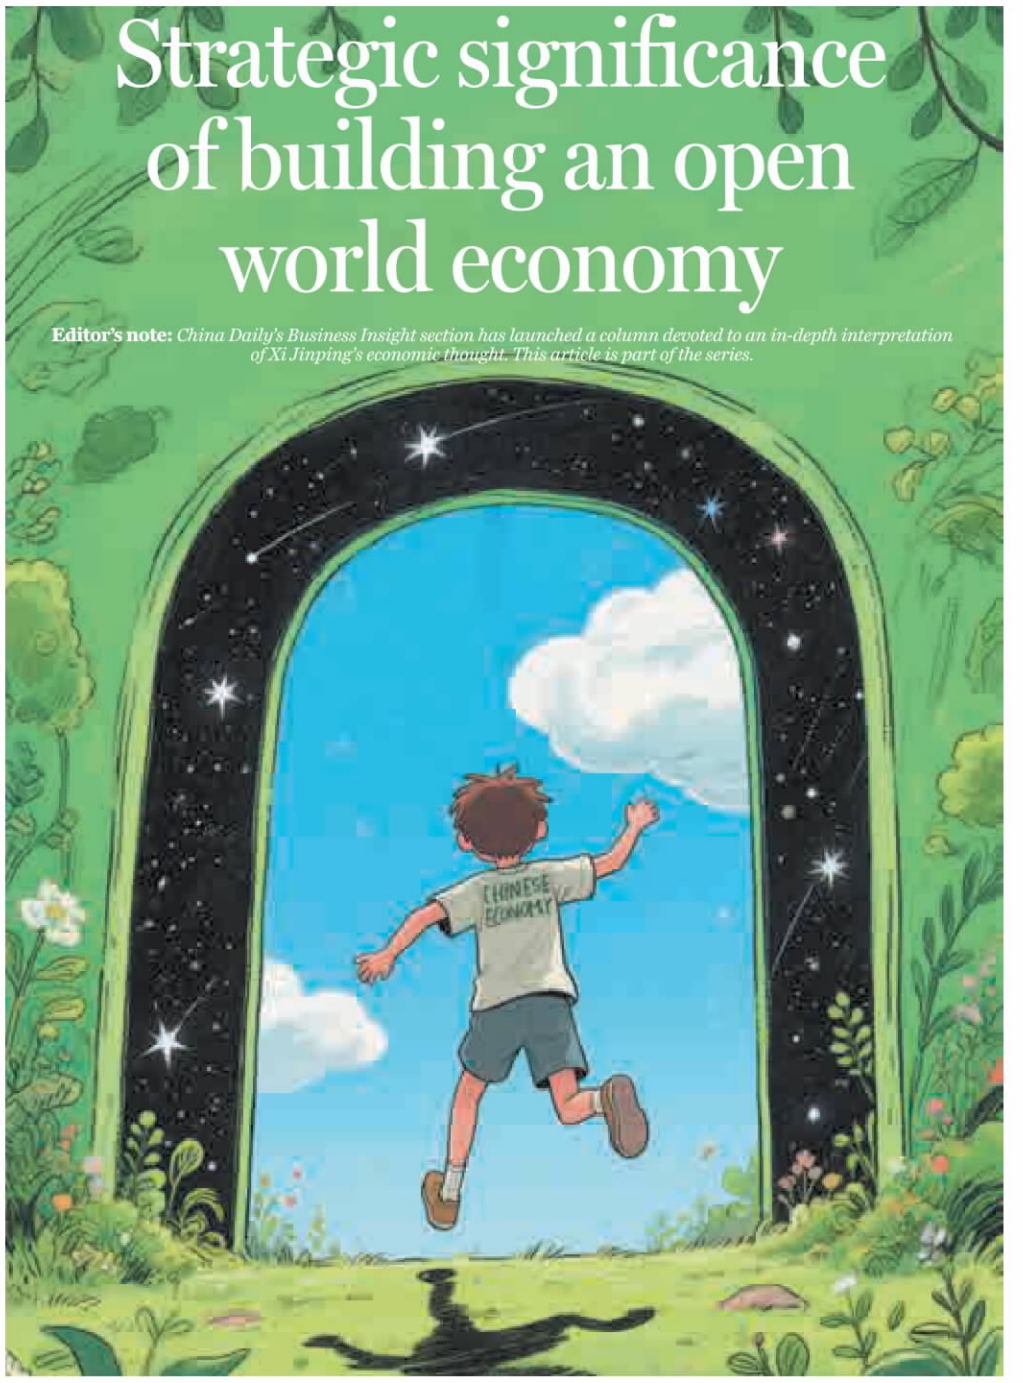

ILLUSTRATION GENERATED BY AI

President Xi Jinping pointed out when meeting with representatives of the international business community on March 28, 2025 that China upholds true multilateralism, promotes universally beneficial and inclusive economic globalization, actively participates in global economic governance, and is committed to building an open world economy.

China's top leadership has stated that the country is committed to its fundamental national policy of opening to the outside world and pursues a mutually beneficial strategy of opening-up. It strives to create new opportunities for the world with its own development and to contribute its share of building an open global economy that delivers greater benefits to all peoples.

Promoting economic globalization

The essence of economic globalization is the result of the dialectical movement of productive forces and relations of production. With the global expansion of socialized production and the uneven development of countries around the world, the basic contradictions of capitalism have spilled over from one country to the whole world. These trends may contribute to widening inequality, increased economic vulnerabilities and recurrent global crises if left unaddressed.

The history of human social development has repeatedly proven that openness brings progress, while isolation inevitably leads to backwardness. The correct direction of economic globalization is to follow the laws of global economic development and build an open, inclusive, cooperative and mutually beneficial world economy. Only by building an open world economy can we continuously bring about conditions and opportunities for development and expand the development space of economic globalization.

Requirement for modernization

Openness is a distinct hallmark of Chinese modernization. The present and the near future constitute a critical period for comprehensively advancing the building of a strong country and the great cause of national rejuvenation through Chinese modernization. Adhering to open cooperation and mutual benefit is an inevitable requirement of Chinese modernization. Without an open world economy, such openness will be hindered and development will be constrained.

High-quality development is the primary task of comprehensively building a modern socialist country, accelerating the creation of a new development pattern, and enhancing the endogenous dynamics and reliability of China's domestic economy. Now is a crucial period for our country to accelerate the realization of Chinese modernization. As the world is intertwined with changes and chaos, turbulence is intensifying, the international economic and trade order is facing severe challenges, the growth momentum of the world economy is insufficient, and the impact of changes in the external environment is deepening, and our country's development has entered a period where strategic opportunities, risks and challenges coexist, and uncertain and unpredictable factors are increasing.

China's top leadership has made comprehensive arrangements for building a new development pattern. The key to building a new development pattern lies in unimpeded economic circulation. This includes not only smoothing domestic circulation by building a unified national market, but also streamlining international circulation by building an open world economy. Only in this way can a new development pattern be formed in which the domestic circulation is the mainstay and the domestic and international dual circulations mutually promote each other, thereby creating a broader development space for the realization of Chinese modernization.

New international economic order

Because developed countries were the first to realize industrialization, they possess first-mover advantages in economic strength and technological levels, making them the leaders of current economic globalization. Developed countries have not only obtained massive economic benefits in the process of economic globalization by relying on their first-mover advantages, but also become the rule-makers of the world economy by leveraging their economic, political, technological and military advantages. By formulating economic rules favorable to themselves, developed countries have adopted a hegemonic behavioral approach to applying economic rules when they fit and discarding them when they do not, thus forming an unjust and unreasonable international economic order and causing development dilemmas for the vast number of developing countries.

With the deepening development of economic globalization, the economies of various countries have formed complex economic ties of interdependence. The law of uneven development of the world economy has led to the collective rise of emerging market countries and developing countries, which is changing the global political and economic landscape, gradually demanding a change in the old international economic order dominated by developed countries, and calling for the construction of a new international economic order. Historical lessons in the process of human development show that to overcome the law of uneven development of the world economy, it is imperative to build an open, inclusive, universally and mutually beneficial open world economy. With the rise of emerging economies, the inherent antagonistic contradictions of developed countries have begun to manifest, with their domestic financial risks continuously increasing, industrial "hollowing out" intensifying, and employment and economic growth becoming sluggish.

Instead of reflecting on and proactively changing the old international economic order, developed countries — in order to maintain their vested interests — blame the problems on economic globalization and have begun to engage in unilateralism and protectionism. Fundamentally speaking, solving the problems in the process of economic globalization requires building a new international economic order on the basis of building an open world economy, so as to achieve a rebalancing of the economic globalization process.

Mankind's common development

Only through mutual integration and connectivity can the economic development of various countries achieve mutual learning, mutual complementarity, mutual promotion and common development. Development and innovation are the requirements for sustainable growth of the world economy; interconnected growth is the requirement for robust growth of the world economy; and integration of interests is the requirement for balanced growth of the world economy. China is an advocate and active promoter of building an open world economy, unswervingly expanding institutional opening-up, safeguarding the multilateral trading system, expanding international circulation, promoting reform and development through opening-up, and sharing opportunities and developing together with countries around the world.

China's promotion of building an open world economy aims to provide Chinese solutions, contribute Chinese wisdom, and demonstrate Chinese strength for the common development of humanity. Through the construction of the Belt and Road Initiative, China promotes the Silk Road spirit of peace and cooperation, openness and inclusiveness, mutual learning and mutual benefit. By insisting on building with open doors, China unswervingly advances high-level opening-up, further expands market access, shares development opportunities and dividends with countries around the world, continuously brings new impetus and new opportunities to the world with China's new development, and works together to forge a high-quality world economy.

The writer is director of the Department of Political Economy at the Institute of Economics of the Chinese Academy of Social Sciences.

Supply continues to expand; industrial structure sees faster upgrading

MAIN STREET

By Yang Yiyong

Since the beginning of the year, China's economy has maintained a positive trajectory of recovery and structural improvement despite a complex and challenging external environment and tasks of reform, development and stability at home.

From the production perspective, supply has continued to expand, while the industrial structure has undergone faster upgrading driven by greater self-reliance and strength in science and technology. New quality productive forces are taking shape through practical application and have emerged as a strong driver of high-quality development.

From a livelihood perspective, employment has remained generally stable, prices have stayed moderate and manageable, and the social safety net has continued to improve.

In terms of growth drivers, the economy is witnessing a faster optimization of development momentum. Strategic emerging industries and industries of the future — including new energy, artificial intelligence, biomanufacturing and commercial aerospace — are developing in clusters.

A growing number of new sectors and business tracks are generating strong spillover effects, helping offset pressures stemming from the weakening of traditional growth drivers.

These developments demonstrate the resilience of the Chinese economy, its vast development potential and its favorable long-term prospects. While structural and cyclical challenges remain, confidence in China's development outlook should be strengthened.

The country possesses the world's most complete industrial system, a massive market with enormous potential, abundant talent resources and institutional advantages that continue to be released.

Against this backdrop, market entities should seize opportunities and place innovation at the center of modernization efforts. Sci-tech innovation should be leveraged to drive industrial innovation, particularly through disruptive and frontier technologies capable of fostering new growth engines.

Enterprises should strengthen operational management, improve modern governance capabilities and conduct business in strict compliance with market rules, as well as laws and regulations.

At the same time, greater emphasis should be placed on risk management. Enterprises need sound mechanisms for risk identification, early warning and response in order to better cope with external containment and suppression, market volatility and rising costs.

In the broader process of advancing high-quality economic and social development, businesses should not only serve as witnesses, but also as active contributors, providing solid support for the overall economy through their own stable and healthy development.

A problem-oriented approach remains essential to sustaining healthy economic growth.

Improving macroeconomic policies by addressing the most pressing concerns of market entities is a key part of this process.

At present, many enterprises continue to face common operational challenges. Some place greater emphasis on investment and project construction than on subsequent management and operational efficiency.

Others focus heavily on hard assets — such as infrastructure and fixed-asset investment — while paying insufficient attention to soft strengths, including institutional development, brand value, data assets and management capabilities.

Another challenge lies in unsustainable development patterns. In some cases, inadequate long-term strategic planning and excessive pursuit of short-term expansion have led to the accumulation and exposure of structural risks.

These issues are related not only to the management capabilities of some business entities, but also to the effectiveness of policy transmission and implementation.

Institutionalized communication between government and businesses should therefore be regarded as an important channel for improving macroeconomic policymaking efficacy. Policymakers need to engage directly with enterprises, gain a detailed understanding of practical challenges and listen to voices from the front lines of production.

Suggestions and reasonable appeals raised by businesses should be carefully categorized, systematically documented and thoroughly studied.

Efforts should combine targeted solutions with broader institutional improvements. At the micro level, precise measures should be introduced to address industry-specific difficulties and challenges faced by individual enterprises.

At the macro level, policymakers should systematically identify common and institutional obstacles, strengthen policy coordination and consistency, and avoid policy distortions caused by either overly fragmented or overly generalized approaches.

Institutional innovation is also needed to remove bottlenecks in policy implementation and ensure that policies effectively reach market entities.

Doing so will help address deep-seated problems such as inadequate operational management, insufficient investment in soft capabilities and unsustainable development practices.

More importantly, it will enable macroeconomic policies to be translated from abstract documents and figures into tangible institutional dividends and practical support that businesses can genuinely access and benefit from, thereby enhancing confidence in and recognition of government policies.

Looking ahead, achieving both qualitative improvement and reasonable quantitative growth requires adherence to the principle of pursuing progress while maintaining stability, promoting stability through progress and establishing the new before abolishing the old.

Greater innovation and vitality should be fostered through positive interaction between effective macroeconomic guidance and proactive efforts by market entities.

China should continue to uphold and improve its basic socialist economic system, unswervingly consolidate and develop the public sector, and encourage, support and guide the development of the nonpublic sector.

The legitimate rights, interests and property rights of all market entities should be protected in accordance with the law, while efforts should continue to build a world-class business environment that is market-oriented, law-based and internationalized.

Further reform and opening-up remain essential. Institutional barriers that hinder the market-based allocation of production factors and the efficient circulation of goods and services should be removed, while efforts to build a unified national market should be hastened.

At the same time, greater attention should be paid to improving the coordination, precision and effectiveness of macroeconomic policies. Policymakers need to balance the expansion of domestic demand with deeper supply-side structural reform, coordinate short-term growth with long-term development potential and better integrate development with security.

Enterprises should also be encouraged to accelerate the transformation of their development models and build core competitiveness through technological, managerial and business-model innovation. Greater efforts should be made to pursue specialized, sophisticated, distinctive and innovative development while advancing green, low-carbon and sustainable growth.

Only by better combining an efficient market with a well-functioning government can the stability and predictability of macroeconomic policies work in tandem with the initiative and creativity of market entities.

In this way, China's considerable resilience and development potential can be transformed into tangible growth advantages, opening new horizons for high-quality development, while laying a stronger material and technological foundation for building a modern socialist country in all respects.

China's fisheries through the eyes of intl students

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Sebastianus Ken Chandra, a 23-year-old Indonesian student at Shanghai Ocean University, received a special award as an "Impressions of China's Fisheries" international cooperation ambassador.

Jointly launched by Shanghai Ocean University, the Chinese Academy of Fishery Sciences and the China Overseas Fisheries Association, the "Impressions of China's Fisheries" campaign invited international students in China, foreign crew members in the distant-water fishing industry and fisheries workers worldwide to share their personal perspectives and stories about China's fishery sector.

Through short videos, stories, photographs and handicrafts, participants from 25 countries submitted more than 100 works highlighting their firsthand experiences and observations of China's efforts and achievements in sustainable fisheries and international cooperation.

At an event held on Friday at the university, 10 outstanding works received awards, while 10 creators were presented with the title of "International Cooperation Ambassador", which aims to encourage them to bridge fishery cooperation with different countries.

For Chandra, whose ancestors came from China's southeastern coast, participating in the campaign was a journey of self-discovery. Having grown up hearing stories about China, he came to the country in 2023 to pursue a bachelor's degree in aquaculture, beginning what he described as a "fulfilling, happy and knowledge-rich" experience.

Chandra said he once believed aquaculture was simply about raising fish until they grew larger. Over time, however, he learned it encompasses the entire ecosystem in which fish live.

He said he came to understand that the strength of China's fisheries industry stems from generations of people who have spent decades studying water, fish and the relationship between humanity and nature.

In his view, China's fisheries and aquaculture sector is "like a net", with one end connected to the era when his ancestors departed from China's coast and the other tied to today's advances in science, education, ecology and the future.

"What impressed me the most in China's fisheries is that tradition and modernity always go hand in hand," he said. "On one side is the wisdom of fishermen living off the sea for generations, and on the other side are sensors, data models, recirculating aquaculture systems and green farming technologies."

Another Indonesian student at the university, Abizar Dirsan Gifari, was recognized for his work on comparative research into marine ranching.

He said he was equally impressed by China's advanced technologies and commitment to sustainable fisheries.

As they approach graduation, both students said they hope to apply the knowledge they gained in China to help improve Indonesia's fisheries and aquaculture industries while serving as bridges for people-to-people exchanges and mutually beneficial cooperation between the two countries.

Many other young participants from countries including Vietnam, Cambodia, Tonga, Laos, Pakistan and Ecuador also shared their impressions of China's fisheries sector.

> "What impressed me the most in China's fisheries is that tradition and modernity always go hand in hand."
>
> **Sebastianus Ken Chandra,** a 23-year-old Indonesian student at Shanghai Ocean University

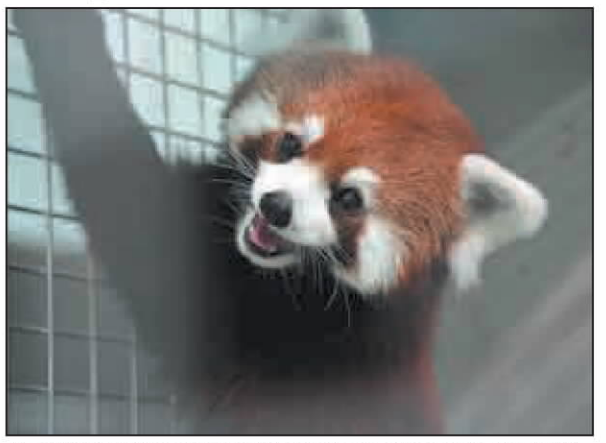
As the Lancang-Mekong cooperation continues to deepen, Horn Songheng, a student from Cambodia, said he has seen new hope in the growing rice-shrimp fields in his hometown and for the Irrawaddy dolphins inhabiting the Mekong River.

Sheryl Chanena Haz Munoz of Ecuador said she hopes to see more seafood products from her home country enter the Chinese market as bilateral cooperation expands. She is also actively studying in China to gain knowledge that can help protect the ocean as the world's shared blue home.

Elenoa Veatokelau Dior Bloomfield, a student from Tonga, said she appreciates China's support through technology transfer and experience-sharing that have helped the Pacific island nation build a more resilient blue economy. She hopes to contribute to sustainable China-Tonga maritime cooperation.

"China and Tonga have demonstrated a new model of cooperation to the world, which is to collaborate rather than compete, to share rather than isolate, to safeguard vibrant oceans rather than let them fall into ruin. I see it exactly as the essence of building a maritime community with a shared future," Bloomfield wrote in her submission.

Chen Jianghua, director of the publicity department at Shanghai Ocean University, said the submissions focused on concrete areas of fisheries cooperation and captured numerous heartwarming moments of Chinese and international partners working together to protect the oceans.



She said the firsthand experiences and observations presented in the submitted works effectively conveyed China's philosophy of responsible, sustainable and mutually beneficial fisheries development.

During the event, young people from around the world, described as future connectors and promoters of international marine fisheries cooperation, jointly proposed the "Our Ocean, Our Future: Global Youth Marine Fisheries Governance Initiative".

The initiative advocates equity and justice, calls for strengthening multilateral platforms to address global challenges collectively, and supports the principle of achieving shared growth through consultation and collaboration.

"Marine fisheries are vital to marine ecosystems, food security and human livelihoods. The sustainable development of marine fisheries is vital to the shared future of humanity. Together, we will join hands to safeguard our ocean and build our future," the initiative said.

Red pandas arrive

A red panda undergoes a health examination in a quarantine facility at Taipei Zoo in Taiwan on Saturday after arriving from Shanghai Zoo. A pair of young red pandas were transferred under a species exchange agreement signed by the two zoos during the 2024 Shanghai–Taipei City Forum. XINHUA

Innovation on display

HK, Central Asia deepen ties

Trade mission enhances investment, exchanges and research collaboration

By **STACY SHI** and **WU KUNLING** in Hong Kong

A high-profile Hong Kong Special Administrative Region trade mission to Central Asia, led by Chief Executive John Lee Ka-chiu, ended on a successful note Friday, with 96 agreements involving $1.65 billion in investments secured.

The pacts comprise 15 government-level memorandums of understanding and accords in commerce, education and development projects, as well as 81 private-sector deals spanning trade, investment, finance, energy, technology and aviation.

The 70-member trade delegation included business and professional leaders from the SAR and the Chinese mainland, including representatives from the Hong Kong Trade Development Council, the Hong Kong Science and Technology Parks Corporation and two Hong Kong universities, as well as executives from mainland enterprises including electric vehicle maker Li Auto. Lee first adopted this blended composition during his visit to Qatar and Kuwait in 2025, a move he said would amplify Hong Kong's "super connector" and "super value adder" roles.

In a statement on Friday, Lee said the visits to Kazakhstan and Uzbekistan were fruitful, noting that beyond the signed agreements, the delegation witnessed strengthened government-level contacts between the SAR and the two Central Asian countries. He said it was also agreed that discussions will begin soon on areas including comprehensive double taxation avoidance.

The mission further deepened project matching and research collaboration, showcasing the Hong Kong SAR as a global platform, boosting exchanges through direct flights, visa extensions and educational, talent and cultural ties, and advancing a hub-to-hub model with Central Asia, the statement said.

Lee met with Kazakh President Kassym-Jomart Tokayev, Uzbek President Shavkat Mirziyoyev and other senior officials from both countries to exchange views on further cooperation.

Lee said he will actively push for extensions of visa-free access arrangements between the SAR and the two nations in the future.

The delegation arrived in Astana, Kazakhstan's capital, on May 31 for the first leg of the weeklong tour. Once there, they visited Astana Hub, the country's technology and innovation park; the Astana International Financial Centre; and Nazarbayev University, among other institutions.

The team proceeded to Tashkent, Uzbekistan's capital, on Wednesday and toured IT Park Uzbekistan, a national-level special economic zone, and the Center for Islamic Civilization.

They also attended various business events to exchange views on future plans and expectations.

Li Guanhua, senior vice-president of Li Auto, said the company aims to use Hong Kong's platform to boost its brand presence and service capabilities. She said the government-led initiative is key for Chinese brands to expand overseas, adding there is a bright future for new-energy development in the region.

Jackson Choi Chit-sze, director of Hong Kong-based conglomerate Sunwah Group, said his company is keen to partner with mainland entrepreneurs targeting Central Asia to tap the region's mineral resources, renewable energy potential and strategic location linking China and Europe.

Tursunboy Makhkamov, chief financial officer of Uzbekistan's Ipak Yuli Bank, said Hong Kong is ideally positioned to serve as a premier hub for attracting overseas finance and driving new investment in Uzbekistan. He added that Uzbekistan's rapidly growing economy and market offer strong opportunities for Hong Kong investors.

Nurken Bolatov, chief operating officer of Kazakhstan-based start-up Artisan Education, said his company has been accepted into the ideation program of the Hong Kong Science and Technology Parks Corporation, which provides up to HK$100,000 ($12,760) in seed funding for startups.

He said this will be a strong opportunity for Artisan Education to enter the Chinese mainland and Hong Kong markets.

Atlas Shao contributed to this story.

Guangxi man survives drifting at sea for 7 days

HAIKOU — When fisherman Zheng Shizhong spotted a naked, unresponsive man floating about 10 kilometers off the coast of Chengmai county, Hainan province, on Tuesday morning, he could hardly believe the drifter was still alive.

The man, Qin Jianping, a wholesale businessman from South China's Guangxi Zhuang autonomous region, had fallen into the sea seven days earlier during a late-night walk. He had no mobile phone, no life jacket and no supplies to sustain him.

A slip into the sea

Qin was on holiday in Haikou, the capital of Hainan, when the accident occurred. At about 11 pm on May 27, he stepped on a discarded fruit peel while walking along a seaside dam in windy weather and slipped into the waves.

"The sea is nothing like a swimming pool," Qin said. "I couldn't touch the bottom, and huge waves kept pushing me farther out. Every time I swam toward the shore, the waves pulled me back. There was no way I could return."

Although Qin knew how to swim, he swallowed large amounts of seawater and suffered cuts from coral reefs shortly after falling in.

As the tide carried him farther offshore and his strength faded, he stopped fighting the current and allowed himself to drift, hoping passing vessels would spot him at daybreak. But by the following morning, land had disappeared from view.

Two ships passed nearby that day, but neither saw him.

To conserve energy, Qin discarded his belongings, including his shoes, trousers, watch and ring. He stayed afloat by treading water and moving his arms.

"The sun scorched me during the day, but the water kept taking away my body heat," he said. "After two or three days, the sea felt as cold as a refrigerator."

After more than 40 hours without food or sleep, Qin managed to climb onto a floating buoy and briefly fell asleep, only to be knocked back into the water by a large wave.

On May 30, he climbed onto an iron navigation buoy, but the metal had been heated by the sun. After clinging to it for several hours, he returned to the water and continued drifting.

Desperate for water, Qin drank seawater and later his own urine. Neither relieved his thirst, and he began experiencing severe pain when urinating.

At night, he battled the cold and exhaustion.

"Urine is a stream of warm heat," he said. "I curled into a ball and tried to preserve every bit of warmth."

On May 31, the fifth day of his ordeal, Qin reached another navigation buoy with a foam base. Too weak to climb aboard, he clung to its side and discovered small sea crabs living in gaps in the foam.

He caught dozens of the crabs with his bare hands and ate them raw. They became his only source of food during the weeklong ordeal.

Rescue at the last moment

By the fifth day, Qin was so exhausted that he could hear ferries and trains from the shore but lacked the strength to move toward them. Severe dehydration and starvation triggered hallucinations.

"I dreamed there was a wedding in my hometown and I was helping to cook," he said. "I could barely breathe, but there was only one thought in my head: I can't die."

By the sixth day, his condition had deteriorated further. His eyes were bloodshot from exposure and dehydration, and memories of his childhood, marriage and family filled his mind as he feared death was near.

Then Zheng and fellow fisherman Fu Tingsan spotted him.

"My heart skipped a beat when I saw him," Zheng said. "But the current swept him away almost immediately."

The fishermen steered closer and found Qin floating on his back with his eyes closed. They first threw him a rope, but his vision had become so poor that he could not see it.

They then extended a 4-meter boat pole and tapped him on the back.

Delirious and barely conscious, Qin grabbed the pole. The fishermen pulled him aboard.

"I think I'm going to die," Qin said.

"You're with us now. You're not going to die," Zheng said.

The fishermen carefully gave him small sips of water rather than allowing him to drink freely, fearing further harm to his body. They rinsed his wounds with fresh water, provided clothing and massaged his stiff legs.

The return trip to the shore took about 85 minutes. Villagers were already waiting and helped contact police and medical workers while spreading information online in hopes of locating Qin's family.

Reunion and recovery

Back in Guangxi, Qin's family had been desperately searching for him.

A friend traveled to Hainan and reported him missing on May 29. Police later confirmed through surveillance footage that he had fallen into the sea.

His wife arrived in Hainan on May 31 and spent days searching along the coastline. Authorities told the family that survival beyond three days adrift at sea was highly unlikely.

"I had already accepted that my husband was gone," she said. "I filled three bottles with seawater to take home as a memento."

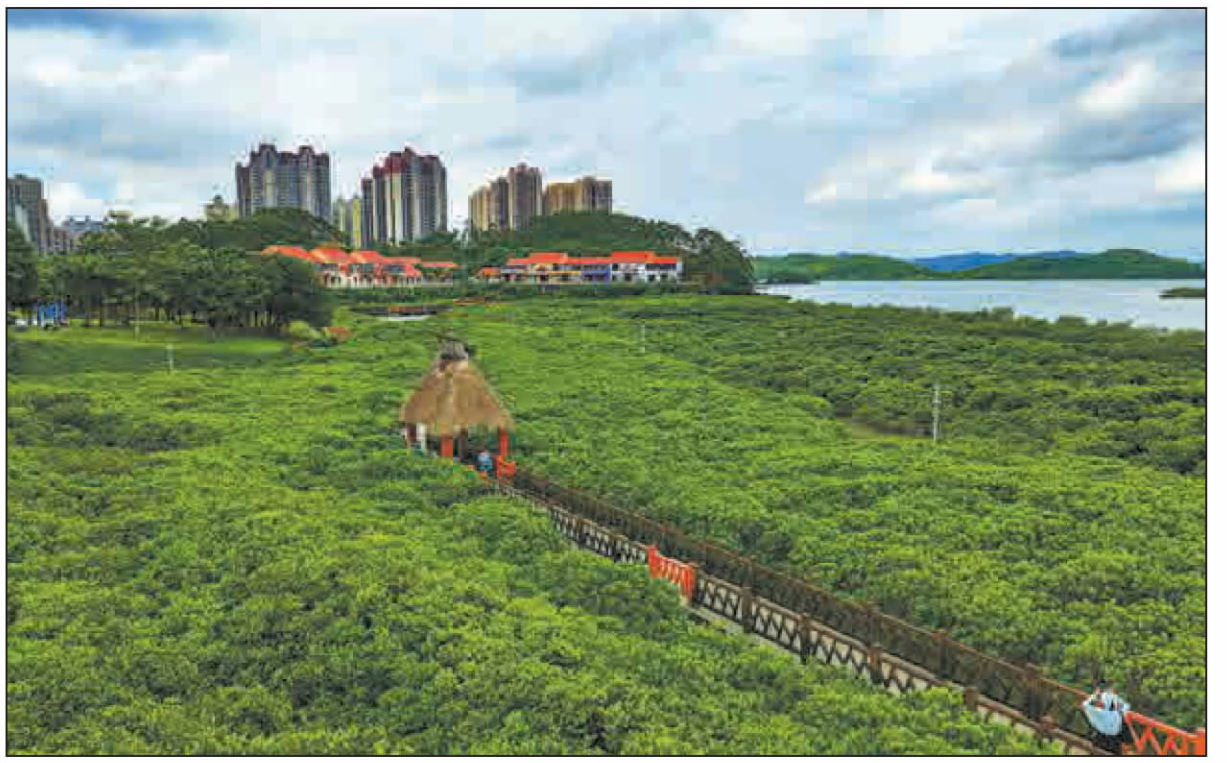
She was preparing to return to Guangxi when she received news that Qin had been found alive. When she saw him in the hospital, covered in scars and almost unrecognizable, she broke down in tears.

Qin was admitted to Chengmai County People's Hospital in critical condition.

Doctors diagnosed severe hypertonic dehydration, multiple infected wounds from reefs and marine life, oral ulcers caused by eating raw crabs, and internal injuries linked to drinking seawater and urine.

He lost about 10 kilograms during the ordeal, dropping from more than 85 kg to about 75 kg.

After two days of intensive care, his condition stabilized. Doctors said he was expected to be discharged within a week and should require only routine follow-up treatment.



Qin said the first thing he plans to do after recovering is visit the two fishermen who saved his life.

"No matter how dangerous or hopeless things get, if you keep a steady mind, you can get through it," he said.

By LI MENGHAN
limenghan@chinadaily.com.cn

China has become one of the few countries to buck the global trend of coastal deforestation, achieving a 44 percent increase in mangrove forest area since 2000, according to the latest data from the Ministry of Natural Resources and the National Forestry and Grassland Administration.

For Xu Hechang, 38, a crab farmer who leases 53 hectares of coastal ponds in Zhanjiang in South China's Guangdong province, the rapid improvement is tangible.

"The shells of crabs raised here are harder and the meat is sweeter because of the clean water," he said.

"My family has farmed here for generations, but never at this scale. Now, with healthier mangroves, the crabs can sell for double the normal price."

The latest data shows that China's total mangrove canopy now stands at approximately 31,700 hectares, up from a low in 2000 of 22,000 hectares. The milestone establishes China as one of the few maritime nations globally to secure net-positive growth in intertidal wetlands.

China's trajectory began to diverge in the 2000s as protection efforts intensified. Progress accelerated further in the past few years after the Ministry of Natural Resources and the National Forestry and Grassland Administration rolled out a special action plan for mangrove protection and restoration (2020-25), setting targets to create 9,050 hectares of new mangroves and restore 9,750 hectares of degraded forests.

Prioritizing the protection of mangrove ecosystems, authorities banned further reclamation of tidal flats, incorporated remaining mangrove stands into ecological protection red lines and promoted tailored, science-based restoration approaches.

"Mangroves are the only woody plant communities that survive in the intertidal zones of tropical and subtropical regions — flooded at high tide and exposed at low tide," said Ding Xinyuan, an associate professor at the mangrove protection research center of the Southern Marine Science and Engineering Guangdong Laboratory (Zhanjiang).

"Despite being green, the name in Chinese translates to 'red forest', referring to their tannin-rich inner bark, which oxidizes and turns deep red when exposed to air after cutting," Ding said. "Ecologically, they are defined by their specialized aerial roots. These roots allow the trees to absorb oxygen in waterlogged mud, and some species can excrete excess salt through their leaves."

Ding said the tangled root systems act as natural nurseries, providing shelter and breeding grounds for fish, crabs and other benthic organisms. The dense roots also help purify water by slowing tidal currents, trapping suspended sediments and absorbing excess nitrogen and phosphorus from aquaculture runoff before it reaches the open sea.

"Globally, they are among the planet's most powerful carbon sinks, sequestering carbon dioxide from the atmosphere at a rate significantly higher than that of a tropical rainforest of the same area," he said.

Home to China's largest mangrove area, accounting for nearly 40 percent of the national total, Guangdong was assigned the largest share of the 2020-25 national plan: creating 5,500 hectares of new mangroves and rehabilitating 2,500 hectares of degraded forests. Yet much of its suitable intertidal land had long been converted into aquaculture ponds that supported tens of thousands of coastal households.

"The biggest challenge in restoration is not planting trees, but balancing nature with livelihoods," Ding said.

Science has offered a way forward through an integrated mangrove-aquaculture model, such as the one used by crab farmer Xu. Unlike conventional ponds that enclose all water for farming or clear all vegetation to maximize space, the approach restores ecosystems while maintaining productivity.

"We dig soil from the ponds to build islands, aiming to keep the total breeding capacity unchanged. This minimizes the impact on the yield of fish, shrimp and crabs while allowing the mangroves to breathe normally," Ding said.

He added that mangroves provide shelter for aquaculture species, purify the water and reduce disease, while nutrients and waste from the ponds serve as natural fertilizer for the trees.

Ding said his lab is exploring techniques to produce higher-value products from integrated ponds. Preliminary results include an artificial intervention method that enhances roe richness in female crabs — a trait that commands 10 times the normal market price — and the development of what is believed to be the world's first mangrove fruit wine using biological fermentation technology.

While mangrove restoration in Guangdong illustrates the balance between conservation and livelihoods, the neighboring Guangxi Zhuang autonomous region is demonstrating how mangroves can be used as protection against typhoons and storm surges.

Li Xiaoyu, an engineer with the marine bureau in Fangchenggang, Guangxi, said that during his first visit to the Hongshahuan area in 2010, the site was littered with abandoned aquaculture ponds. In 2012, an ecological seawall improvement project was proposed, selecting Hongshahuan as a pilot area.

"Mangroves are a unique ecosystem bridging land and sea. Their extensive root systems effectively reduce sediment loads in nearshore waters, while their dense yet flexible branches and trunks dissipate wave energy," Li said, adding that the restoration work capitalized on those advantages.

Completed over three years, China's first demonstration ecological seawall stretches 3.2 kilometers and features a layered structure. On the outermost tidal flats, 9,913 square meters of mangroves were planted. Moving inward, the seawall body — built with artificial reef blocks — was covered with coastal vegetation. Behind it lies a landscaped forest belt and ecological corridor.

Li said mangroves not only buffer waves and reduce erosion but also slow the solar weathering of embankments. Since its completion, the seawall has withstood more than 10 typhoons, including a severe storm in 2018 when maximum wind speeds reached 40 meters per second.

"Ten years on, the seawall remains solid. The mangroves have flourished into a verdant woodland, showcasing remarkable progress in ecological restoration," Li said.

Similar efforts have taken shape nationwide. Fujian, home to the Zhangjiangkou National Mangrove Nature Reserve, has expanded greenbelts along the Zhangjiang River estuary. Hainan province, which boasts the country's richest mangrove biodiversity, has focused on genetic research and invasive species removal. Coastal provinces have incorporated mangrove targets into their local five-year plans, helping fulfill the national blueprint.

The success reflects a broader shift in coastal governance — one led by government but supported by private capital. Environmental nonprofit, SEE Foundation, has mobilized companies to help fill funding gaps in protection and conservation across China and Southeast Asia. Partnering with the Ministry of Natural Resources' Third Institute of Oceanography, it coauthored the national standard for mangrove carbon credits, turning carbon storage into a tradable asset.

China has also shown a willingness to share its experience internationally. Efforts include building the International Mangrove Center in Shenzhen, Guangdong province, integrating mangrove conservation into the Kunming-Montreal Global Biodiversity Framework, and expanding South-South technical cooperation with mangrove-restoring countries across Asia and the Pacific.

Despite being home to only about 0.2 percent of the world's mangroves, China is demonstrating that restoration is not a choice between nature and humanity, but a synthesis of both. It is proving that even a small fraction of greenery can anchor a coastline, sustain a community and contribute to global ecological balance.

Xiamen's once polluted mudflats turned into thriving eco-sanctuary

By ZHANG YI in Xiamen, Fujian
and **HU MEIDONG** in Fuzhou

Xiatanwei Mangrove Park, the largest restored intertidal wetland in East China's Fujian province, launched a series of marine biodiversity activities this weekend to mark World Oceans Day on June 8, showcasing the site's transition from a polluted aquaculture zone into a world-class ecological sanctuary.

The three-day event features the debut of a new scientific illustrated guide on intertidal species conservation, anchoring a localized marine market that highlights what the United Nations has recognized as a global blueprint for coastal rehabilitation.

During the 1970s and 1980s, these natural intertidal flats were degraded by commercial aquaculture farms, with farming runoff destroying the native mangrove vegetation.

The turning point came in the early 2000s, when a research team led by the late academician Lin Peng, widely regarded as a pioneer of modern Chinese mangrove research, initiated a 5-hectare experimental forest on the polluted mudflats to test restoration feasibility.

Following successful trials, the Xiamen city government scaled the initiative into a comprehensive multiphase remediation campaign, restoring approximately 85 hectares.

According to data compiled by Xiamen University, the completed 85-hectare forest has fundamentally altered the local food web, triggering a large-scale return of native wildlife.

Yang Shengchang, an associate professor from the College of the Environment and Ecology at Xiamen University, said that restored mangroves function as primary producers to sustain a complex food web. This triggered a measured biological recovery, he added.

Recent data showed the park's total species richness has increased 2.4-fold compared to pre-restoration, with the biomass for fish up 2.99-fold, for shellfish up 4.76-fold, and crustaceans up 1.19-fold, according to Yang.

On the ground, when the tide recedes, the exposed mudflats reveal an active intertidal ecosystem. Large populations of fiddler crabs and mudskippers emerge across the patterned flats, creating an abundant feeding ground that draws flocks of egrets and herons down from the mangrove branches.

"In the past, this area only attracted waterbirds, but now as you walk along the boardwalk, you can observe a significant number of forest birds as well, with 76 bird species recorded so far," Yang said. "This direct influx is a clear result of environmental improvement."

As the biological community matured, the forest's physical and environmental functions multiplied. The dense root systems now serve as a vital storm barrier, while its carbon sequestration capacity was found to be two to five times greater than equivalent areas of terrestrial forests, he said.

Beyond biodiversity metrics, the park has established a distinct precedent in climate diplomacy.

A dedicated section of the replanted mangrove canopy was utilized to fully offset the carbon emissions generated during the 2017 BRICS Xiamen Summit. The initiative marked the first certified "zero-carbon" international meeting in BRICS history, earning the site its official designation as the "BRICS Carbon Neutral Forest".

Peter Thomson, the UN Secretary-General's Special Envoy for the Ocean, visited the park in 2018 and returned in 2023 during the 18th Xiamen International Ocean Week, praising it as a great example of mangrove restoration.

Since January 2023, the park's infrastructure — including an elevated 4.2-kilometer boardwalk system, five dedicated viewing piers, and island trails — has accommodated more than 3 million tourists.

The site also functions as an outdoor science classroom. Educational institutions have conducted over 500 interactive workshops there, allowing more than 150,000 students to personally observe mangrove viviparity, feel the unique breathing roots and trace intertidal wildlife.

"Young students are highly receptive to these ecological narratives," Yang said. "Whether they are exploring the elevated boardwalks, stepping directly onto the mudflats, or even getting pinched by a crab, this hands-on exploration effectively translates textbook knowledge into a lasting understanding of marine conservation."

CULTURE

Bringing ancient philosophy into the present

Through an exhibition in Athens, great Eastern and Western thinkers merge to highlight moral commonalities and mutual learning, **Zhao Ruixue** reports in Jinan.

More than 2,000 years after Confucius (551-479 BC) and Socrates (469-399 BC) walked the Earth, an exhibition in Greece is bringing their ideas into the present, using artificial intelligence, immersive experiences and hands-on activities to bridge time, space and culture.

The exhibition, *Encounter & Enlighten: A Dialogue Across Time and Space*, which will run from Monday to Wednesday during the second World Conference of Classics in Athens, highlights the profound intellectual achievements from roughly 800 BC to 200 BC, a time that German philosopher Karl Jaspers called the Axial Age.

During this pivotal era, Eastern and Western civilizations independently produced enduring wisdom that continues to shape human thought.

"Eastern civilization gave rise to profound reflections from Chinese philosophers, including Confucians, Taoists, Mohists, and Legalists, on how to build an orderly society and establish moral norms for human relationships," says Fu Yongju, director of the Qilu Culture Research Institute at the Qilu Institute of Technology in Shandong province.

"Western civilization, meanwhile, produced the enduring wisdom of Socrates, Plato (427-347 BC) and Aristotle (384-322 BC), who explored the nature of reason, the principles of logic, and the fundamental laws of the natural world.

"Remarkably, both civilizations established institutional homes for intellectual dialogue and debate around the same time."

Plato's Academy, founded in Athens around 387 BC by the philosopher himself, became a center for philosophical and mathematical research that operated for centuries.

The Jixia Academy was located in Linzi (in present-day Zibo, Shandong province), the capital of the ancient Qi state. Funded by the Qi state and operating for more than 150 years from roughly 374 BC to 221 BC, the academy is considered China's earliest state-sponsored, privately run university.

It brought together academic schools, including Confucians, Legalists, Taoists, Mohists, and logicians who freely lectured, debated and advised rulers without holding official positions.

According to historical records, there were dozens of schools of thought during the period before the Han Dynasty (206 BC-AD 220), and the Jixia Academy was a central venue where these schools exchanged ideas.

This historical legacy is not just a subject of academic study in Shandong, the home of Confucius and Mencius (372-289 BC). It is being actively revived.

As part of this effort, the Qilu Institute of Technology has built the Jixia Building, which re-creates the spirit of the ancient Jixia Academy through lectures, scholarly dialogues and debates. Using digital technology and diverse artistic forms, the program enables teachers and students to experience the inclusive, free-thinking spirit.

> Hosting this exhibition in Greece is not just about presenting an equal dialogue between Chinese and Western civilizations, but also about faithfully conveying the long continuity of Chinese civilization and the essential values of Confucius ... so that the world may truly understand China."
>
> **Yang Chaoming,** a professor at the Advanced Institute for Confucian Studies, Shandong University

The Athens exhibition highlights the resonance between Chinese and Greek thinkers.

For example, a Confucian teaching — a wise person first makes their own understanding clear, and then uses that clarity to make others clear — echoes a well-known modern aphorism that education is not the filling of a pail, but the lighting of a fire.

"Both value knowledge by emphasizing the methods of education and moral cultivation," says Qi Jinjiang, a professor at the Qilu Culture Research Institute.

Similarly, Laozi's observation — humans follow the earth, the earth follows heaven, heaven follows the Way, and the Way follows what is natural — aligns with Thales' proposition that water is the origin of all things.

Both Laozi (traditionally dated to the 6th-5th century BC) and Thales (624-546 BC) sought naturalistic accounts of how things work, says Qi.

As the exhibition brings together the wisdom of East and West, its deeper significance is also being underscored by Chinese scholars.

"Hosting this exhibition in Greece is not just about presenting an equal dialogue between Chinese and Western civilizations, but also about faithfully conveying the long continuity of Chinese civilization and the essential values of Confucius and Confucianism, so that the world may truly understand China," says Yang Chaoming, a distinguished professor at the Advanced Institute for Confucian Studies, Shandong University, in Jinan.

Qi further explains that among the major schools of thought, Confucianism served as the foundation and core.

Traditionally, Confucius is said to have edited the Six Classics (including the now-lost *Book of Music*).

"These Six Classics are not merely Confucian texts, but served as the common curriculum for all the schools during the Jixia Academy period," Qi says.

Qi distills Confucian benevolence into six dimensions, each resonating with universal human values that continue to inform global ethical discussions today.

Fairness, for example, is embodied in the principle of not doing to others what one would not want done to oneself.

Development is captured in the saying: "To establish oneself, help others establish themselves; and to succeed, help others succeed." It's an early articulation of mutual benefit and shared progress that echoes modern ideas of win-win cooperation.

The Confucian understanding of democracy finds expression in the idea of harmony without uniformity, which represents the ability to hold different opinions while maintaining social cohesion.

Peace, meanwhile, is reflected in the concept of winning others over through virtue rather than force — a clear rejection of hegemony and domination in favor of a moral example.

Justice, in the Confucian framework, is summed up in the belief that the world belongs to all, a vision that prioritizes public interest over private gain.

Freedom is understood not as the absence of restraint, but as the recognition that true human flourishing requires both self-cultivation and deep respect for the dignity and development of others.

"These millennia-old ideas still possess powerful vitality today. They offer Eastern wisdom to resolve civilizational conflicts and maintain world peace," Qi says.

As the world faces unprecedented challenges, scholars say that Axial Age wisdom offers valuable insights for building a shared future for humanity.

Embracing the vision put forward by the renowned Chinese sociologist Fei Xiaotong, who called for beauty in diversity, Fu says that through equality, respect, inclusiveness, and mutual learning, different civilizations can reach consensus and achieve common development.

Chinese schools of thought and their continuing influence

Representative figures: (from left) Confucius, Mencius, Xunzi, Han Fei, Laozi, Zhuangzi, Mozi, Sun Wu and Sun Bin. PHOTOS PROVIDED TO CHINA DAILY

Confucianism

Representative figures:
Confucius, Mencius, Xunzi

Core ideas: Benevolence (*ren*), righteousness (*yi*), propriety (*li*), wisdom (*zhi*), trustworthiness (*xin*).

Explanation:

Ren emphasizes harmonious relationships among people. *Yi* and *li* serve to maintain social order. *Zhi* and *xin* advocate for rational understanding and honest character.

To this day, these ideas remain widely recognized and practiced moral principles among the Chinese people.

Confucius (551-479 BC) founded Confucianism, which was spread by Mencius (372-289 BC) and Xunzi (313-238 BC), becoming a key source of intellectual freedom.

Mencius promoted benevolent governance and the idea that rulers should treat their people with kindness, a progressive concept adopted by many Chinese dynasties.

Xunzi combined Confucian propriety with Legalist law, creating the ancient Chinese tradition of using both — an innovation on the original teachings of Confucius.

Legalism

Representative figure: Han Fei

Core idea: Ruling the country by law.

Explanation:

Legalism was the school of thought among philosophers before the Qin Dynasty (221-206 BC) that placed the greatest emphasis on law, developing a complete set of theories and methods for its application.

Legalists regarded law as a tool for strengthening social governance, making it an effective means of maintaining social order.

Han Fei (280-233 BC) advocated integrating three key elements: law (*fa*), methods (*shu*), and authority (*shi*). He insisted that laws should be transparent, clear and specific. Rulers must possess absolute authority to ensure that laws and decrees can be effectively enforced.

Legalism exerted a profound influence on state politics, culture and morality. It has also provided important reference points for the birth and development of contemporary Chinese law.

Taoism

Representative figures:
Laozi, Zhuangzi

Core idea: The Way follows what is natural.

Explanation:

Taoism advocates following the natural laws of the universe and promotes harmonious coexistence between humanity and nature. It contains profound wisdom about the natural world and the philosophy of human life, deeply influencing traditional Chinese aesthetics and ways of living.

Represented by Laozi (traditionally dated to the 6th-5th century BC) and Zhuangzi (369-286 BC), Taoism explores the relationships among nature, society and human life, emphasizing compliance with objective laws rather than forced or artificial intervention.

The Taoist concepts of "the Way follows what is natural" and "governing through non-action" should not be misunderstood as passive withdrawal from the world. Rather, they represent a dialectical unity between transcending the world and engaging with it.

Mohism

Representative figure: Mozi

Core ideas: Universal love and opposition to war.

Explanation:

Mohism advocates opposing war and pursuing peace. It calls for loving all people equally, regardless of family ties, social status or wealth. Mohists believe that the most capable and virtuous individuals should be chosen to govern the state. They oppose extravagance and waste, promote diligence and frugality, and emphasize practical action and public welfare. These ideas reflect a people-oriented philosophy and a deep commitment to peace.

Mozi (traditionally dated to the 5th-4th century BC) traveled tirelessly among the warring states to promote his anti-war doctrine. On one notable occasion, he walked for 10 days and nights to successfully prevent a war between two states.

Mozi also had deep knowledge of physics, mathematics and handicraft manufacturing. Mohist texts describe a pinhole imaging experiment demonstrating that light travels in straight lines.

The School of the Military

Representative figures:
Sun Wu (also known as Sun Tzu), Sun Bin

Core ideas: Prudence in warfare, putting people first, and subduing the enemy without fighting.

Explanation:

The school of thought focuses on military theory and practice. It represents the essence of ancient Chinese military thought, summarizing the experiences of warfare and military administration from that time.

Sayings such as "Know the enemy and know yourself, and you will never be defeated in 100 battles" reflect its emphasis on strategy, methods and tactics, combining practical military wisdom with rich dialectical philosophy.

Today, when facing problems in life, study or work, many Chinese people still draw inspiration from this school of thought.

The School of the Military does not glorify war. Instead, it advocates prudence and justice in warfare, supporting only righteous wars while opposing unjust aggression.

LIFE

Foreign journalists and content creators enjoy their five-day trip in Henan province during an event organized by China Daily, the Information Office of the Henan Provincial Government, and Henan Daily in late May. They visited (from left) electric vehicle giant BYD's factory, Dahecun Site Museum and the headquarters of beverage chain Mixue Bingcheng. PHOTOS PROVIDED TO CHINA DAILY

Along China's living heartland

A journey through Henan reveals how prehistoric Yellow River settlements transformed into cutting-edge industrial hubs, reports **Thomas Jay Hopkins**.

It has been a long time since I was in primary and secondary school, but from what I remember, not much Chinese history was taught in the United States. However, one of the few things I remember learning was some chapters in my elementary school textbook that touched on early great river civilizations — Mesopotamia along the Tigris and Euphrates Rivers, Ancient Egypt along the Nile River, the Indus Valley Civilization along the Indus River, and, of course, Ancient China along the Yellow River — which served as my earliest exposure to China and its history.

Little did I know, as I studied how these mighty rivers served crucial roles in the development of early human settlements, that I would one day visit Henan province, where the ever-changing Yellow River and fertile Central Plains gave birth to Chinese civilization some 5,000 to 7,000 years ago.

As part of the "Meet in Zhongyuan, Discover China Through Henan — 2026 China Storyteller Partnerships Henan Tour", I was able to explore both Zhengzhou and Luoyang to learn more about the origins of early Chinese civilization, as well as Henan's modern-day development into a manufacturing hub.

In Zhengzhou, where my trip began, a visit to the Dahecun Site Museum brought me closer to the roots of Chinese civilization than a textbook ever could. While it chronicles the earliest breaths of Yangshao culture — a vast and influential ancient culture and the first Neolithic archaeological culture discovered in China — the museum itself is less than a year old.

The museum showcases hundreds of pieces of Yangshao pottery, along with tools and other artifacts, thoughtfully displayed to guide visitors through the culture's evolution, while also incorporating immersive exhibits that take you back in time to witness scenes of ancient settlements, fishing and hunting, pottery-making and grain harvesting.

In sharp contrast, I also paid a visit to BYD's factory to learn more about its cutting-edge production lines and innovative Blade Battery design, and visited its racetrack to get an up-close look at the Yangwang U9 — a fully electric hypercar built under BYD's luxury sub-brand.

Initially, I was disappointed to learn that a professional driver would be taking me around the track. Afterward, I understood why. I climbed into the passenger seat, buckled up, and told the driver, "As fast as you can".

He said nothing. We took off and slowly made our way to the first straightaway where the drive would begin. Without a word, the driver floored the accelerator. Without a sound, I was sucked back into the seat as I watched the speedometer climb past 130 kilometers per hour in what felt like an instant.

I lost track of how fast we were going — certainly north of 200 km/h — before we started into the turns, the tires squealing and skipping as the car handled the high-speed maneuvers with ease, the seat intuitively adjusting itself to support me through it all. And just as quickly as it began, it was over.

Once again, I must put my ego aside and admit defeat. Last time, it was Fanjing Mountain in Guizhou province that made me back down before I reached its terrifyingly high summit. This time, I was humbled by the U9 and must concede that, in hindsight, it is probably a good thing a pro was behind the wheel and not me.

Had I been allowed behind the wheel, my name might have appeared in an obituary rather than at the top of this article, as I would have woefully underestimated the power of that vehicle and ended my life in a not-so-fiery — thanks to BYD's super-safe Blade Battery — blaze, well, I guess, thud of glory.

A woman stands on a robot dog during the event, which allows participants to share experiences for a deeper understanding of Chinese culture, industry and new media trends.

And I know what you're thinking, "Tom, no one is forcing you to admit these embarrassing things", and you would be right.

But, it's my commitment to the truth that makes me the intrepid journalist worthy of your admiration. Before moving on to the second leg of the trip in Luoyang, I would be remiss if I didn't mention Zhengzhou's ecological conservation efforts at Beilonghu Wetland Park.

As much as we ooh and ahh over the technological advancements of our era — electric supercars, AI humanoid robots, advanced manufacturing — just as important is the preservation of natural assets that people can enjoy and where wildlife can thrive.

The park features a wetland bird-watching area, ecological islands, flower gardens, and wooden boardwalks winding through the landscape.

In addition to providing a lovely environment where families can spend their leisure time, Beilonghu Wetland Park is also a hot spot for bird-watchers, as the park serves as a crucial habitat for migratory birds from Siberia and the Mongolian Plateau during the winter months — attracting black-headed gulls, swans, great bustards, black storks, egrets, grey herons, and rare bird species such as the Chinese merganser and the reed parrotbill.

I wish I could have spent more time there, but Luoyang called.

While the rest of the tour group visited the Luoyang Bearing Group and YTO Group Corporation to learn more about China's bearing industry and agricultural modernization, I spent the day at the Han-Wei Luoyang Ancient City Site Museum shooting a video for China Daily.

Dubbed the "Oriental Capital of Museums", Luoyang is home to more than 100 museums, which house hundreds of thousands of cultural relics. At less than a year old, the Han-Wei Luoyang Ancient City Site Museum is the city's newest addition to its ever-growing family of museums, and it is a beauty.

From its design, layout and lighting to the amazing relics on display, the museum offers a wonderful experience, which was made even more special by the kind and knowledgeable staff members who aided Russian content creator Ira Nova and me in our scavenger hunt.

We searched for the real-life relics that items in the gift shop were based on — a truly fun and unique experience.

The trip concluded with a visit to the Longmen Grottoes — a UNESCO World Heritage Site holding over 100,000 carvings of Buddhist iconography in the limestone cliffs that flank both sides of the Yi River. The carvings date back to the late Northern Wei (386-534) and Tang (618-907) dynasties — when Luoyang was the country's capital — and are a must-see.

Standing before these massive carvings and seeing the detail and character given to each figure filled me with wonder and a deeper appreciation for the beauty of life.

To me, the carvings represent the best of humanity: the human capacity to love and the lengths we will go to express it.

In this case, the Longmen Grottoes were carved to express love and worship for Buddhist figures, and while I'm not a religious man, I can appreciate the sentiment. While every city I've been to in China has its own unique character, there is a consistent thread connecting all of them: the country's commitment to marrying its economic and technological development with the preservation of its environment and culture.

Both Zhengzhou and Luoyang are no different in that regard. From the cradle of Chinese civilization to one of the country's most important agricultural and industrial bases, Henan has remained a vital part of China through the ages and a dedicated steward of its ancient history and culture.

As is always the case with these tours, they leave you wanting more. With so much more to see than could fit into five days, I'll certainly be returning to Henan in the future.

Museums build bridges across countries

By **DENG ZHANGYU**
dengzhangyu@chinadaily.com.cn

The 2026 Intermuseum BRICS+ Festival, held in Russia's capital city of Moscow at the end of May, brought together museum directors, scholars and experts from 26 countries, including Russia, China, Brazil, India, South Africa, and the UAE. Under the theme "Museum — Territory of the Future", participants explored how cultural institutions can serve as bridges between generations and technologies — and, more importantly, between civilizations.

At a forum focusing on how to help audiences understand foreign cultures, a discussion between experts from China and Russia offered fresh ideas for deeper Sino-Russian museum collaboration and the transformation of cross-cultural communication.

Both Chinese and Russian museum professionals reached a consensus during the discussions: a high-quality cross-cultural exhibition is by no means a simple transfer of exhibits or a pileup of symbols. It is a dialogue between civilizations based on deep research, two-way communication, and adaptation to local conditions.

Left: *An Era in Jinling* is inspired by an ancient painting depicting prosperous street scenes in Nanjing, Jiangsu province, which was called Jinling during the Song Dynasty (960-1279). **Right:** The 2026 Intermuseum BRICS+ Festival is held in Moscow. PHOTOS PROVIDED TO CHINA DAILY

Ai Lin, director of the Deji Art Museum in Nanjing, Jiangsu province, shared the case of a world tour of the digital art exhibition, *An Era in Jinling*, which is inspired by a 10-meter-long ancient painting depicting prosperous street scenes in Nanjing, which was called Jinling during the Song Dynasty (960-1279).

Wearing electronic bracelets, visitors can travel back 1,000 years to experience a day in ancient China by "walking" into the 110-meter-long digital painting. They can create their own digital avatars that can interact with characters in the painting, talk to street vendors, stroke cats and dogs, and even set off fireworks.

In the past few years, the digital show has toured cities in France and the US, attracting large audiences.

Ai said that during the exhibition's international tours, in-depth research is conducted on the local culture of each host city and country, seeking points of connection and resonance between local heritage and the culture portrayed in the ancient painting.

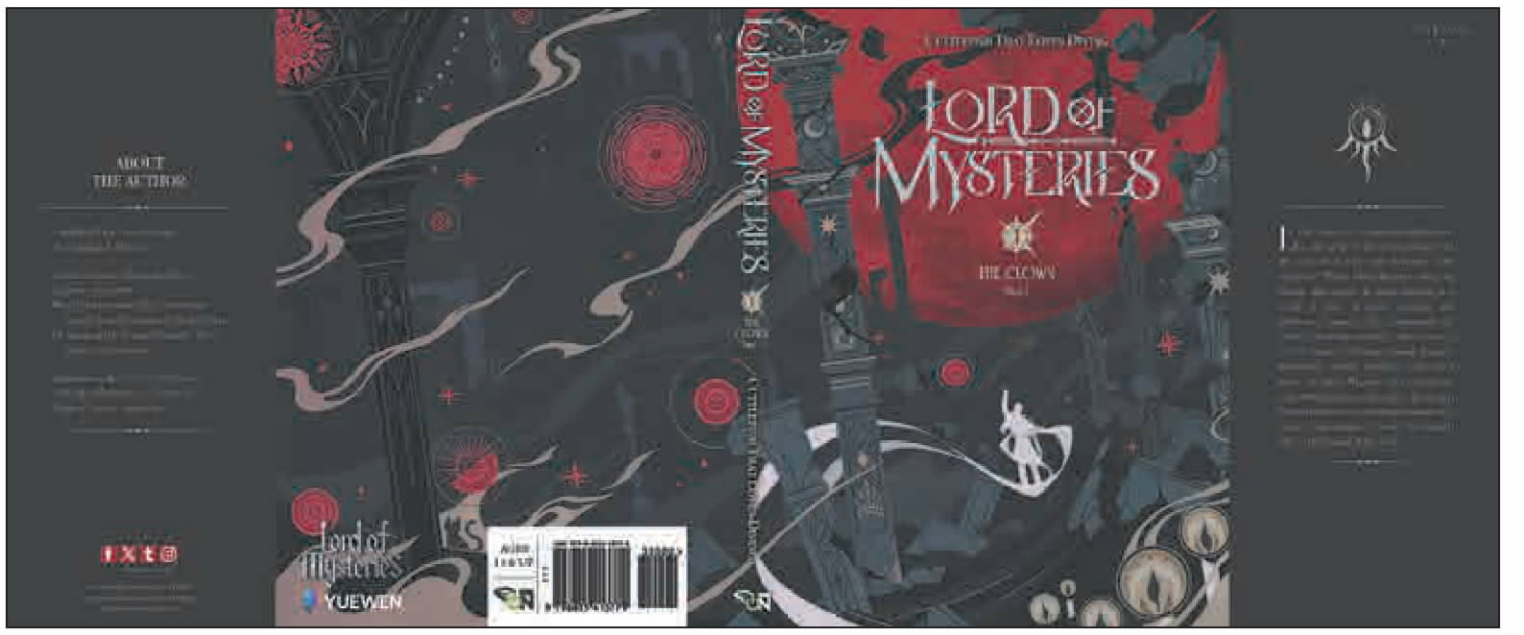
As an example, she said that the Qinhuai River, which is depicted in the exhibition, runs through the entire city of Nanjing and carries profound historical significance. However, simply telling audiences, "This is the Qinhuai River, and it is very important", does little to create an emotional connection. To solve this, they look for an "urban mother river" in the host city of the traveling exhibition — a river that, like the Qinhuai, has supported transportation, trade, agriculture, fisheries, and a rich cultural heritage. In the case of Moscow, they found such resonance between the Qinhuai River and the Moskva River.

Ekaterina Pronicheva, director of the Pushkin State Museum of Fine Arts in Moscow, spoke highly of *An Era in Jinling*, and said that there is currently an excellent opportunity for cooperation between Russian and Chinese museums. At the moment, Russian people's interest in Chinese culture and Chinese cities is at an unprecedented high. More and more Russian audiences hope to visit famous historical and cultural cities like Xi'an in Shaanxi province and Nanjing to further explore China's rich heritage.

Ksenia Guseva, curator of the Museum of Moscow, agreed that many people in Russia are interested in Chinese culture. Previously, the Museum of Moscow hosted the exhibition *New Year in Old Beijing*, focusing on traditions during the Chinese New Year.

In February, red Chinese lanterns, along with spectacular dragon and lion dances, filled Moscow's streets, giving the city a festive Chinese New Year atmosphere that was enjoyed by locals. But Guseva found that behind the lively scenes lay a common challenge in cross-cultural communication: Russian audiences could only appreciate the visual symbols of the Chinese festival, yet knew nothing about the underlying meanings of reunion, the culture of blessings and the millennia-old folk traditions.

"Everyone loves to watch and take photos, but they cannot understand the culture behind the celebrations," Guseva said. This is a widespread problem of "surface-level communication" faced by foreign cultural exhibitions today.



Therefore, in the show *New Year in Old Beijing*, a large number of folk artworks were displayed and there were many performances of intangible cultural heritage, which explained to the audience their significance. These included why fireworks are used during Chinese New Year, at what time they should be set off, and how Chinese families traditionally decorate their homes.

"We hope that through exhibitions, the audience can truly step into the culture and realize that these cultures still exist today and continue to radiate new vitality," Guseva said.

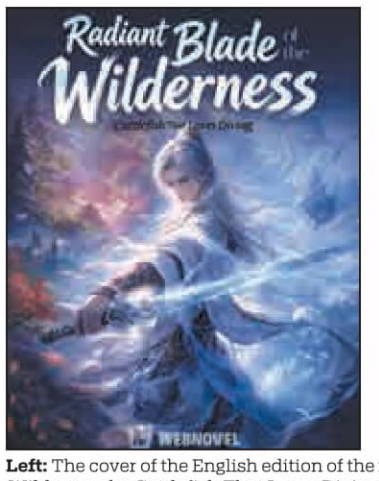
CULTURE

The cover of the English edition of *Lord of Mysteries* by Cuttlefish That Loves Diving, a best-selling web novel translated and published in multiple languages.
PHOTOS PROVIDED TO CHINA DAILY

Reinventing the martial hero

Drawing on ancient mythology and addressing modern concerns, a leading web novelist opens a new chapter in storytelling, **Yang Yang** reports.

Following the separation of the celestial and human realms, the mythical beasts, deities, and spiritual herbs described in *The Classic of Mountains and Seas*, which were said to have existed around 5,000 years ago, gradually dwindled and vanished. Over the course of three to four millennia, that vast and majestic landscape shed its mythological aura and evolved into a deeply rooted martial arts world.



This is the setting of *Radiant Blade of the Wilderness*, the latest novel by popular web novelist, Cuttlefish That Loves Diving. He draws on the ancient myth of Zhuanxu (an ancient saint and grandson of the Yellow Emperor) and his act of "severing the connection between heaven and earth" from the Chinese ancient mythological book *The Classic of Mountains and Seas* to create a "post-classic of mountains and seas" martial arts universe.

Since serializing the novel on WebNovel on May 30, the book has quickly become the most "collected" title of the week and topped the weekly list for new translated books on the platform. It also ranked as the second most-read book of the week on WebNovel, just behind *Lord of Mysteries*, another work by the 41-year-old Cuttlefish That Loves Diving.

WebNovel, the international platform of Chinese online literature provider Yuewen Group, reaches readers in more than 200 countries and regions.

The novel was launched simultaneously on Qidian, WebNovel's Chinese counterpart. Within 24 hours of release, it topped the platform's best-seller chart, becoming one of the most talked-about titles in China's online literature market this year.

Cuttlefish That Loves Diving, whose real name is Yuan Ye, is known for his imaginative world-building and genre-blending narratives. His works span Western fantasy, Eastern Xianxia (Chinese fantasy literature), and steampunk.

Left: The cover of the English edition of the new online novel *Radiant Blade of the Wilderness* by Cuttlefish That Loves Diving, released simultaneously on Yuewen Group's domestic and international platforms. **Right:** Web novel writer Cuttlefish That Loves Diving, whose real name is Yuan Ye.

As one of the most prominent online literature writers in China, he has won multiple awards, including the Mao Dun New Talent Award, which is the online literature category of China's top literary award, the Mao Dun Literature Prize. His notable works include *Lord of Mysteries*, *Lord of Mysteries 2: Circle of Inevitability*, *Extinction Record* (originally titled Path to Immortality), and *Throne of Magical Arcana*.

Lord of Mysteries blends European and American steampunk elements with Eastern philosophical thought, exploring humanity's place in the vast and unknowable universe. The novel has been praised for transcending cultural boundaries and delivering stories with broad global appeal. On WebNovel, the English edition holds a rating of 4.85 out of 5, while its sequel is rated 4.81.

In 2024, *Lord of Mysteries* and its sequel were added to the collection of the British Library. The series has been published in nine languages, including English, French, and German, with over 1 million copies sold globally.

In the latest *Radiant Blade of the Wilderness*, the author weaves together three core threads — ancient imperial legacies, the bloodlines of mythical beasts, and shamanistic mysticism — to construct a richly layered and expansive new martial arts world.

The novel also departs from familiar online fiction conventions, particularly in its portrayal of the protagonist.

"In many web novels, characters who travel through time are usually young people. This time, the protagonist is middle-aged and has spent years working hard. After crossing over, he is no longer driven by fame or ambition. Instead, he longs for a more relaxed life of cultivation, adopting a more Zen-like and tranquil mindset," the author says.

According to him, the character reflects the outlook of many contemporary readers. After navigating life's ups and downs and the pressures of modern society, many people increasingly seek simplicity, hoping to step away from complexity and reconnect with their true selves.

"Even though it has just come out, the introduction of the main character and the first supporting character is very intriguing, and this story shows amazing promise," a reader named Wondering_pen said on WebNovel.

So far this year, Qidian has seen a wave of new releases from top authors. Paperboy, the author of *The Guardians of Dafeng*, has a new book *Lin Sheng*, which has already garnered over 500,000 pre-subscriptions. Other leading authors such as Wang Zijun, Tian Zi, and Nan Zhan Tai have also launched new projects. Additionally, I Eat Tomatoes has announced plans for a new martial arts book.

Chinese genre fiction gains ground around the world

By YANG YANG

As overseas readers look beyond traditional images of China and seek stories that reflect its contemporary culture, history and imagination, Chinese genre fiction is finding growing opportunities on the international stage.

That trend was in focus at a literary promotion event held on May 28 at Beijing International Bookstore, where writers, publishers, translators, scholars and industry professionals from more than 20 countries and regions gathered in person or online to discuss the global prospects of Chinese historical fantasy, online literature, mystery and suspense fiction.

Coorganized by the China Writers Association and the China International Book Trading Corporation, the event featured themed discussions on "Historical Imagination and Eastern Fantasy" and "Mystery Narratives and the Enigma of Human Nature", highlighting the expanding international reach of Chinese genre literature.

In the historical fantasy and online literature session, writers including Ma Boyong, Tang Jia San Shao, I Eat Tomatoes, Cuttlefish That Loves Diving and Talking Elbow joined discussions on the growing influence of Chinese web novels abroad.

Chinese online literary works such as *Lord of the Mysteries* and *Joy of Life* have attracted significant international attention in recent years, demonstrating the appeal of Chinese storytelling and the cultural richness of genres that blend history, fantasy, and adventure.

Left: Social media blogger Olesia Ermakova shares her perspectives on contemporary Chinese culture, literature, film and social development during an international literary seminar in Beijing on May 28. **Right:** Participants attend an international literary seminar in Beijing focused on promoting Chinese genre fiction overseas, including mystery, thriller, suspense, historical fantasy and online literature.
PHOTOS BY XINHUA

Wang Zhixiang, deputy director of the China Writers Association's Online Literature Center, said traditional cultural resources are being revitalized through contemporary narratives, helping overseas readers gain a deeper understanding of Chinese culture.

Online literature has become not only a major literary form in the internet era but also an important vehicle for Chinese culture to cross borders, said Tao Yunfei, head of publishing operations at Yuewen Group.

He said the overseas dissemination of Chinese online literature has evolved into a complete ecosystem spanning literature, film, animation, games and multilingual publishing. Looking ahead, he said the industry hopes to further promote an international communication model based on "Chinese storytelling, global cocreation".

Charles-Emmanuel Dewees, cofounder of the French online literature platform Chireads, said in a video message that what most captivates international readers is the authenticity of the characters and the creativity of the authors.

"Online literature has become a universal language connecting readers from different countries and cultures," he said.

In a video address, US screenwriter, author and playwright Richard Krevolin said Chinese online literature's rich historical imagination and adventurous spirit provide abundant material for global publishing and screen adaptations.

"Literary works serve as an important bridge for cultural exchange between Eastern and Western civilizations," he said.

Mystery and suspense writers featured in the event included Lyu Zheng, Huyan Yun, Zhao Jingyi, A Yi, Cai Jun, Zijin Chen, Shi Chen and Guo Peiwen.

Xie Gang, founder of Midnight Library, China's first mystery-fiction imprint, traced the genre's evolution over the past two decades from a niche market to a mature literary category.

Scholar Zhang Yifei of Beijing Normal University said contemporary Chinese mystery fiction draws on both traditional *gong'an*, or legal case narratives, and modern international detective fiction. Through this blend, he said, the genre has developed a distinctive style that combines Chinese cultural characteristics with universal appeal.

International publishing professionals expressed optimism about the genre's overseas prospects.

In a video message, US best-selling author Douglas Preston said Chinese crime and suspense novels are attracting growing attention in Europe and North America by combining unique cultural elements with compelling storytelling. He believes the English-language market is eager to welcome more Chinese mystery writers.

Tom Chalmers, managing director of the British publishing group Legend Times, highlighted the strong global demand for thriller, mystery and suspense fiction. He said Chinese works are increasingly attracting the attention of international publishers and said stronger publishing partnerships could help bring more titles to readers worldwide.

The growing interest is also reflected in broader efforts to promote Chinese literature internationally. Zheng Lei, deputy director of the International Department of the China Writers Association, said genre fiction has become one of the brightest areas in the overseas promotion of contemporary Chinese literature.

Xinhua contributed to this story.

SOCCER

Tiny Curacao is making huge history

Island country of about 156,000 residents is now the smallest, both in terms of population and land mass, to play at a World Cup

Top: Children train at the C-Stars United soccer academy in Willemstad, Curacao on May 15. **Right:** A Curacao supporter in the stands ahead of the start of the international friendly match between Scotland and Curacao on May 30. AP

Curacao players pose for a photo after an international friendly match against Scotland in Glasgow on May 30. AP

There won't be millions of people from Curacao cheering on their national team in the World Cup, because Curacao doesn't have millions of people.

Not even close.

Before the tournament even begins, Curacao has already crafted a story like none other in World Cup history. A tiny island country — autonomous territory, if you prefer — of about 156,000 residents in the Caribbean is now the smallest, both in terms of population and land mass, to make it to soccer's biggest stage. And if that wasn't enough, it's doing so under a coach in Dick Advocaat who, at 78, is about to become the oldest the tournament has ever seen.

They know what the world is probably thinking: Their country is too small, their coach is too old, they don't have a chance.

They heard all that through the qualifying process as well — and here they are.

"We have made history," Curacao defender Sherel Floranus said. "We are writing our own history, for this island."

The way they see it, they have already won.

Curacao rolled through qualifying, going 4-0-0 against Haiti, Saint Lucia, Aruba and Barbados in its opening round, then going 3-0-3 against Jamaica, Bermuda and Trinidad and Tobago in the next round to grab its spot — one of three that were available for teams from North America, Central America and the Caribbean.

Just how small is Curacao? Its first finals match on June 14 is against Germany in Houston — a city with 15 times as many people as the island. The stadium in Houston could hold about one-half of Curacao's entire population.

It has been a perfect storm to get there. First, the three host nations for this World Cup — the US, Mexico and Canada — were exempt from qualifying and were already in the tournament field. And this inaugural edition of an expanded 48-team tournament made it inevitable that there would be some surprise teams getting to the World Cup.

With odds of +250,000 against on some sportsbooks, Curacao was the longest of long shots in the field. And on the island, it does understand the reality of what that means.

"We know there is a big chance that we don't win the World Cup, but that we (made it) there ... for Curacao, a very, very, very good moment," said Remko Bicentini, a former pro player and Curacao's former national team head coach. "We are proud of that.

"It is a party for the whole of Curacao. It's a big level and all the players ... we worked years, for years, for years, very hard to get where we now are."

Curacao's sports history is sometimes masked by its Dutch ties.

The island was part of the Netherlands Antilles until October 2010, when it became a more autonomous "constituent country" of the Netherlands. The Dutch monarchy still reigns, the citizens remain Dutch nationals and the Netherlands government oversees defense and foreign affairs. And this week, Curacao's World Cup preparations are happening in the Netherlands — a nine-hour direct flight away, but a place where the team was greeted with "welcome home" signage.

The sense is clearly that the results at the tournament won't mean much. Winning a match would be magical. Tying one would be cause for celebration. Just being there, for those from Curacao, is a victory in itself.

"I always saw other countries play the World Cup," said Michael Stokkel, a policeman. "I was a fan of Brazil, but now I will be a fan of my own country. It's an incredible feeling."

He's going to the World Cup, but by himself. It's just too expensive to bring others, he said.

It's not unheard of for athletes from Curacao to compete on the international stage. The rare part here is that they're doing it actually as "Curacao". There have been unsuccessful attempts for the nation to be recognized as its own Olympic team; athletes compete in the Summer Games either for the Netherlands or as independent athletes. At the World Baseball Classic earlier this year, players played for the Netherlands.

Ozzie Albies of the Atlanta Braves, a native of Willemstad — the island's capital and biggest city — said his nation getting to the World Cup is "history for the guys and the accomplishment is super special for Curacao."

"Soccer has always been a sport we play but never made it to the World Cup," said Albies, one of three Curacao natives currently on a Major League Baseball roster. "So, to be able to do it is very, very, very special."

The Dutch are a World Cup contender with their own national team. Curacao, which will have its base camp at Florida Atlantic University in Boca Raton, Florida, when it shifts its full operation to the US in the coming days, is simply savoring its moment.

"I think it's been amazing for the whole island," said Tahith Chong, one of the national team's top players. "Just seeing how the island has lived with it and just knowing, I think that a lot of people don't know about Curacao. It loves soccer and it's quite big here. So, to be present this year at the World Cup is obviously something amazing for the island."

Blue Wave: unifying force

The hope, politically, is that the team will be a unifying force.

At 171 square miles (443 square kilometers), Curacao has roughly as much land mass as New Orleans. There are at least 125 US cities with larger populations than the entire island. Its population is about the same as Hollywood — no, not the one in California, but the city in Florida that sits between Miami and Fort Lauderdale.

Curacao's Prime Minister, Gilmar Pisas, sees this World Cup as an opportunity. The team is known as the Blue Wave — a nod to the shimmering turquoise water that surrounds the island — and blue is a theme for everything in the country, right down to the Blue Curacao liquor that is popular around the world (even though it has an orange flavor).

For the next few weeks, Pisas wants the nation to be the Blue Nation as well.

"We will become part of something larger than ourselves, something that, despite our differences, brings us together," Pisas said. "We share a single anthem and a single flag ... rather than being divided into separate camps. We are, finally, truly united. It is a project dedicated to the construction of a nation. It acknowledges that your people, and you yourself, are an integral part of this collective mission — the 'Blue Nation'."

This will not require Brenton Balentien to change much about his regular day-to-day routine.

If you see a bald, bearded, muscular man with his head and face painted blue for Curacao games, you've likely found Balentien — simply known around the island as "Blue Face". He's a longtime soccer fan who took notice of how fans in Brazil, Colombia and other places would show up at matches in wigs and elaborate costumes.

"I said, 'Curacao needs that,'" Balentien said. "Curacao is a very passive island. We watch the games and clap, sure, but we're not the kind of fans who go out there and scream for the full 90 minutes. And I said, 'No, we have to change that.'"

So, in 2015, Blue Face — someone who began chanting in largely empty stadiums and now has a huge following — was born.

Above: Curacao coach Dick Advocaat reacts during the international friendly match against Scotland on May 30. **Right:** Curacao's Juninho Bacuna poses for a selfie with fans after the Scotland match. REUTERS

He applies the paint himself before every match. He's basically a national mascot; a bartender, influencer and event organizer in real life, a soccer superfan when the paint comes out. He's become a motivational speaker, someone whose home overlooking Willemstad has Curacao's flag waving in the wind and whose car has two more flags attached to that.

"We do this for this island," Balentien said, "so the world knows who we are."

Underdog hopes to be giant

If the world doesn't know yet, they'll see soon enough.

Curacao, currently ranked No 82 in FIFA's global rankings, opens World Cup play against global power and 10th-ranked Germany. It then plays No 23 Ecuador in Kansas City on June 20 and finishes group stage play against No 34 Cote d'Ivoire on June 25 in Philadelphia.

It will be the underdog in all three matches, barring something very unusual.

No problem. The Blue Wave is coming, the pressure is off and confidence is high.

"For us, this is the biggest World Cup because our flag will be there in America," said Ricardo Martinez, a radio broadcaster who calls the matches. "Germany, watch out. Curacao is coming. We are small — but giants in the World Cup."

LETTERS FROM AFAR

Young voyagers encouraged to continue quest

In reply to students, Xi urges more youths in China, US to take up baton of friendship

By **MO JINGXI** and **ZOU SHUO**

Twelve days of living and learning together in China added a new item to the bucket lists of Sun Linlin and Adrian Castillo — to explore more of each other's home country.

The journey, called "A Shared Voyage: China-US Youth Friendship Program", began in late March, when Sun and Castillo, with 18 other students, set sail from the Hong Kong Special Administrative Region aboard a research vessel and traveled via Ningbo, Zhejiang province, to Shanghai.

The 10 US students, the majority of whom had never been to China before, came to the country under the initiative proposed by President Xi Jinping in November 2023 to invite 50,000 young people from the US to visit China for exchange and study programs over the following five years.

In a reply letter dated May 23 to students participating in the program, Xi encouraged them to make new contributions to the stable, healthy and sustainable development of China-US relations.

"I am delighted to know that the students from both countries had embarked on an unforgettable friendship voyage aboard the China-US Youth Friendship vessel," Xi said in the letter, which was published on Thursday.

Xi noted that the story of China-US friendship is written by the people, and the future of China-US relations will be shaped by youths.

More than 50,000 young people from the US have visited China since the launch of the "50,000 in Five Years" initiative, achieving the target two-and-a-half years ahead of schedule, he said.

Through these interactions, young people from both countries have reached out to each other, deepened mutual understanding, forged profound friendships and opened a new chapter in friendly exchanges between the two peoples, Xi said.

Noting that young people, who are full of vitality and dreams, represent the future and hope of China-US relations and of the world, Xi called on more Chinese and US youths to take up the baton of friendship, learn from each other, progress together and become "envoys of friendship".

Sun, a master's student majoring in ocean engineering and technology at Zhejiang University, said the students came up with the idea of writing a letter to the Chinese president on the second day of the trip.

As the program was drawing to a close, the Chinese and US students finished the letter together at their hotel, thanking Xi for the "50,000 in Five Years" initiative, which provided a valuable opportunity for young people from the two nations to learn from and interact with each other.

For Sun, the initiative had been an abstract concept. It was not until she took part in the exchange program that she realized she, too, had the ability — and responsibility — to serve as a bridge of friendship between China and the US.

She said she strongly identified with Xi's message in the reply letter, in which he expressed the hope that more young people from China and the US would learn from each other and make progress together.

Castillo, a doctoral student majoring in aquatics and fisheries science at State University of New York, said that the reply letter "really is so surprising and makes our program feel very important in the greater global stage. Of course, reflecting back on our time on board, I feel as though it was the simple personal connections that made it so important to me."

Sun said that Castillo taught her the phrase "bucket list". He told her that returning to China had been added to his bucket list — whether to go hiking, try rock climbing or simply reunite with friends.

Xu Jingtong, majoring in marine science at Tongji University in Shanghai, said the reply letter brought back memories of the voyage.

Xu recalled a moment on the ship when the wind was strong and the waves high, yet the students danced on deck, exchanged gifts, waved their national flags, sang songs and shared stories about their hometowns and campus life.

"That was when I realized that although we live on opposite sides of the Pacific, we have so much in common," Xu said.

Business leaders hail nation's intelligent manufacturing

By **ZHANG CHENXU** and **ZHOU LANXU** in Tianjin and **WANG KEJU** in Beijing

China's stepped-up push to advance intelligent manufacturing is reinforcing corporate confidence and opening broader opportunities for enterprises at home and abroad to innovate, expand and share in the growth of the world's second-largest economy, economists and business executives said on the sidelines of the 2026 World Intelligence Expo in Tianjin, which opened on Thursday and runs through Sunday.

The rise of intelligent manufacturing in China is expected to accelerate global industrial upgrading and inject fresh impetus into world economic growth, they said.

This optimistic outlook was reflected at the "CEO: Grow with China" roundtable, which was held on Thursday as part of the expo, with participation of executives from sectors ranging from green development to smart manufacturing and consumer technology.

The roundtable was jointly organized by the Publicity Department of the Tianjin Municipal Committee of the Communist Party of China and China Daily.

"China is not just a huge market — it is a global engine for innovation and manufacturing," said Rainer Kern, CFO of Karcher Greater China.

The Germany-based cleaning solutions provider sees China's complete industrial supply chain, rapid adoption of new technologies, and vast market as key strengths in the large-scale deployment of artificial intelligence across manufacturing and the real economy, Kern said.

The positive sentiment is showing as China moves quickly to create new forms of a smart economy, with this year's Government Work Report calling for advancing and expanding the "AI Plus" initiative, promoting faster application of new-generation intelligent terminals and AI agents, and encouraging large-scale commercial application of AI in key sectors and fields.

Sun Xuegong, director-general of the department of policy study and consultation at the Chinese Academy of Macroeconomic Research, said the policy push is aimed at building a broader ecosystem to support the smart economy.

"AI is rapidly expanding the production frontier and has great potential to improve efficiency," he said, adding that the initiative is expected to remain an important part of China's economic policy.

Australia should foster greater trust to improve ties

WORLD WATCH
By Colin Mackerras

Australia-China relations reached a low point during COVID-19, when the Liberal Party's Scott Morrison was prime minister (2018-2022). But Anthony Albanese, the Labor Party prime minister who defeated Morrison in 2022, has been much more positive in promoting good relations between the two countries.

Albanese, who visited China in July last year and had a successful meeting with President Xi Jinping, has encouraged trade, educational and cultural relations and overall people-to-people relations. The atmosphere is certainly much brighter and more optimistic than it was.

However, the role of national security is too strong in the relationship and has long diminished mutual trust.

There is a school of thought that believes mutual trust doesn't matter in a bilateral relationship. Nevertheless, a relationship with mutual trust is stronger, better and more durable than one without, and I would like to see such a relationship between Australia and China.

The fact is that many in Australia still regard China as a threat to their country's security. Under the AUKUS (Australia-United Kingdom-United States) security partnership agreement, signed in 2021, Australia agreed to buy high-class nuclear-powered submarines at the cost of up to A$368 billion ($263.6 billion) over the next three decades or so. And it is not even certain that they will be built. In my view, Australia mistakenly chooses to overrely on the UK and the US, unwisely prioritizing trust in the US to the point of sacrificing its own national sovereignty.

In May, Japanese Prime Minister Sanae Takaichi visited Australia, and extensive trade, energy and defense agreements were reached. Of course, good relations between Japan and Australia are desirable, but I am very nervous about buying military hardware from a Japan that has eroded the spirit of its postwar pacifist Constitution and constantly and unfairly criticizes China.

JINGDEZHEN DISHES UP UNFORGETTABLE MEMORIES

Experiential and cultural tourism offerings are tempting greater numbers of visitors to China's porcelain capital

By **ZHAO RUINAN**
in Jingdezhen, Jiangxi
zhaoruinan@chinadaily.com.cn

For centuries, Jingdezhen in Jiangxi province has provided some of the world's finest porcelain. Today, it is drawing the world back to its kilns.

Adhamjonov Ayubkhon, a 20-year-old from Uzbekistan, arrived expecting a museum. What he found was living, breathing history and craftsmanship, baked into the rhythm of everyday life — not locked behind glass, but resting on dining tables, glinting in shop windows, lining old stone streets and spinning in the hands of young potters, shaping clay into everyday art.

"The city was amazing. Porcelain is everywhere," he said.

Now living in Nanchang, the capital of Jiangxi, Ayubkhon has visited Jingdezhen three times. During those visits, he has shaped his own cup and plate from raw clay, wandered through Jingdezhen Ceramic University and stood speechless before the treasures at Jingdezhen China Ceramics Museum.

"When I visited the university in November, I saw many students learning how to make porcelain by hand. I also tried it myself, and I liked it," he said.

At the ceramics museum, the weight of centuries settled around him. "I saw many beautiful pieces there — vases, ancient works and blue-and-white porcelain from the Ming Dynasty (1368-1644). The exhibits were breathtakingly beautiful."

By January, the pull of the porcelain capital brought him back a third time — this time as a collector, filling his bags with souvenirs for his family and friends.

In today's Jingdezhen, faces like Ayubkhon's are no longer a rare sight.

The ancient ceramic production center is transforming into a destination where overseas visitors don't just come to admire porcelain — they touch it, shape it, paint it and carry home their own piece of the story.

Last year alone, Jingdezhen welcomed 150,800 inbound visits, a leap of roughly 40 percent from the year before. Spending by inbound tourists reached 89.96 million yuan ($13.27 million), up about 45 percent.

For many, the magic lies in moving beyond mere sightseeing and stepping into the craft.

Insomnia mirrors youth mental health struggles

Rise in sleeplessness reveals underlying anxiety, depression of younger generation, experts say

By **WEI WANGYU**
weiwangyu@chinadaily.com.cn

Cheng Jingyang sets his phone aside at midnight, closes his eyes, and waits to fall asleep. Nothing happens.

The 23-year-old student of Hangzhou Dianzi University who is finishing fieldwork in Beijing for his thesis, recently spent more than 1,000 yuan ($146) on a memory-foam "deep sleep pillow" recommended on social media. He had already cut out caffeine and set a screen curfew. None of it had worked.

"I know it probably won't fix anything," he said. "But I wanted to try at least."

His mind endlessly drifts, he said — first to his thesis, then to the job market, then to a comment a professor made weeks ago that he cannot stop replaying in his head.

"It's not that I'm not tired. My body is exhausted, but my brain won't stop. It's like a browser with 30 tabs open and you can't find which one is playing the sound," he said.

Cheng's restless nights are part of a national pattern that researchers say is slowly worsening. A new study by the Chinese Center for Disease Control and Prevention, drawing on a nationwide survey of more than 100,000 residents conducted in 2024, found that people age 15 and above now sleep an average of just 7.24 hours a night.

Two decades ago, similar surveys put that figure closer to 7.5 hours. The drop of roughly 15 minutes sounds small, but spread across a population of 1.4 billion, the researchers warn, it adds up to a substantial public health concern.

A closer look at the numbers tells a sharper story. On average, Chinese adults now lie awake for approximately half an hour before falling asleep — a figure that climbs further among younger respondents, who tend to go to bed later, take longer to drift off, and increasingly reach for products or pills to try and fall asleep.

For many young Chinese, the findings only confirm what they already know from their own bedtime restlessness. Sleep has become a struggle — and for a growing number, a medical condition.

A 2024 white paper published by the China Sleep Research Society, which surveyed more than 10,000 people, found that college students born after 2000 spent an average of eight hours a day on screens, with many not putting their phones down until well past midnight.

> "They understand that the daytime belongs to their parents — to school, to tutoring, to adult supervision. But the night is theirs. Staying up late is the one act of self-governance they have left. It is the only territory in which they feel free. And so they expand it, night after night, at the expense of sleep."
>
> **Shi Yu,** founder of Beijing's Mentaverse Psychological Service Studio

Turning to pills

When all else fails, some of the sleep-deprived turn to stronger measures.

A 28-year-old office worker in Guangzhou, Guangdong province, who asked to be identified as Li, has been struggling with chronic insomnia for more than two years. After special pillows and supplements made no difference, he began seeking pharmaceutical help — cycling between zopiclone and zolpidem, two prescription sleep medications, and trying to find a balance between effectiveness and side effects.

"Zopiclone knocks me out, but I wake up with a metallic taste in my mouth and feel groggy the whole next day," he said.

"Zolpidem works faster, but I have read about people doing things in their sleep without remembering. That scares me," he added.

Li said he also tried traditional Chinese medicine, including herbal formulas prescribed by a TCM practitioner and a course of acupuncture sessions targeting what his doctor described as liver *qi* stagnation. The results, he said, were negligible. "I went for six weeks, but was still staring at the ceiling at 2 am."

He now takes zolpidem two or three nights a week, a pattern he knows is unsustainable but feels unable to break. "I'm not sleeping well with the pills. But I'm not sleeping at all without them," he said.

Pan Jiyang, director of the Sleep Medicine Center at the First Affiliated Hospital of Jinan University in Guangdong, said the demographic shift in sleep problems is visible at his own clinic. Sleep medicine departments, which a decade ago treated mostly middle-aged and elderly patients, are now seeing a surge of people in their 20s and early 30s. Appointments that were once easy to book are now difficult to secure, with waiting times stretching to weeks at major hospitals.

"Our department used to be one of the quieter corners of the hospital," he said. "Now it is fully booked. The age of our patients has dropped, and their conditions are often tied not to physiological decline, but to anxiety, career pressure, and emotional exhaustion."

'Constant craving'

For clinicians working with adolescents and young adults, insomnia is rarely the illness itself — it is the most visible trace of something deeper happening.

Ni Zhe, an associate chief physician at the Social Psychological Service Department of the Mental Health Center affiliated with Zhejiang University School of Medicine, also known as Hangzhou Seventh People's Hospital, said the rising visibility of sleep complaints among young patients reflects a broader deterioration in adolescent mental health. Rates of school refusal and medical leave from school have climbed sharply, he said, and both typically indicate underlying anxiety and depression.

"In our clinical work, we see three phenomena that almost always appear together," Ni said.

"Disturbed sleep, overuse of the internet, and social disconnection. They form a vicious cycle. The patient falls out of the ordinary rhythm of life — they stop eating to a schedule, they barely exercise, and then of course they cannot sleep normally either."

Ni explained that the prefrontal cortex in adolescents is still developing, and its job is to "inhibit, control, coordinate, and organize".

"When young people are exposed to high-intensity stimulation — short videos, mobile games — over long periods, the stimulation threshold rises significantly," he said. "They live in a state of constant craving, and that craving does not dissipate on its own. Daily self-regulation fails. And at night, when the body is supposed to lower that threshold in order to sleep, it resists."

Double stigma

Shi Yu, founder of Beijing's Mentaverse Psychological Service Studio, said that among the adolescents she treats, sleep disorders are almost always a surface expression of conditions that deserve direct psychiatric attention — depression, anxiety, and bipolar disorder. But many of these patients never reach the psychiatric clinic in the first place.

"A lot of children end up at sleep clinics because their parents refuse to take them to the psychiatric department where they actually belong," Shi said. "For many parents, a psychiatric visit is a double stigma — evidence of the child's illness, and evidence of their own failure as educators. They cannot accept it. So the family settles on insomnia as the acceptable diagnosis."

Shi described a second layer of the problem that she said is routinely underestimated: a generation of Chinese adolescents who have grown up chronically short of sleep, never meeting the hours recommended for their age.

"Their bodies and minds are in a prolonged state of fatigue. Insomnia is just one of many symptoms."

A third factor, she said, is how sleep has become entangled with adolescents' search for autonomy. With weekends consumed by tutoring and extracurricular activities, real social life has shrunk, and phones have filled the gap.

"They understand that the daytime belongs to their parents — to school, to tutoring, to adult supervision. But the night is theirs. Staying up late is the one act of self-governance they have left. It is the only territory in which they feel free. And so they expand it, night after night, at the expense of sleep."

The fourth factor is the atmosphere inside the contemporary Chinese household, Shi said. "There is a lot of insecurity. Repetitive drills, crowded schedules, parents who do not trust their children, children who cannot see a clear future. Internal conflict grows. Over years, this produces a subclinical mental state — not quite illness, but nowhere near health. Sleep problems settle into that space and cycle on their own."

Setting targets

Policymakers have begun to respond, and largely through the school system rather than the mental health system.

In 2021, the Ministry of Education issued a sleep management directive setting targets of 10 hours of sleep for primary school students, 9 hours for middle school students, and 8 hours for high school students, and requiring that middle schools begin classes no earlier than 8 am and primary schools no earlier than 8:20 am.

The policy was tightened in October 2025, when the Ministry of Education tied academic stress, internet overuse, and sleep deprivation to adolescent mental health outcomes. The ministry called for a national student mental health monitoring and early-warning system, "exam-free weeks" at schools, a ban on ranking students by test scores, and a requirement that all students engage in at least two hours of daily physical activity.

The effects have begun to reach classrooms. In the spring 2026 semester, a wave of schools across Chengdu, Ningbo, Nanjing, Nantong, Huizhou, and Dongguan canceled mandatory morning reading sessions and pushed arrival times later.

But researchers and clinicians caution that school-hour adjustments, while welcome, cannot resolve a crisis whose roots lie elsewhere.

Yin Fei, deputy director of the Family Education Research Institute at Nanjing Normal University, has argued that delaying school start times without meaningfully reducing academic load risks producing a generation that arrives at school later and still goes to bed just as late.

She called for a more systemic approach, including greater investment in campus mental health services, stronger regulation of work hours for young professionals, and better screening for sleep disorders — and for the psychiatric conditions behind them — in primary care settings.

For young adults like Cheng, the pillow arrived a few weeks ago. Some nights are slightly better, he said, but most are about the same.

"I think what I really need is less stress," he said. "But that's not something you can buy."

Shenzhou XXI crew completes space mission

Astronauts hand over charge of Tiangong to Shenzhou XXIII team and prepare for return

By ZHAO LEI
zhaolei@chinadaily.com.cn

Crew members of the Shenzhou XXI mission, who have spent nearly seven months on board the Tiangong space station, will return to Earth very soon, according to a statement released on Thursday by the China Manned Space Agency.

The three Shenzhou XXI astronauts — mission commander Senior Colonel Zhang Lu, spaceflight engineer Major Wu Fei and payload specialist Zhang Hongzhang — have completed all their assigned tasks and will fly back aboard the Shenzhou XXII crew ship, the statement said.

Ground recovery personnel at the Dongfeng landing site in the Inner Mongolia autonomous region, along with other relevant systems, are preparing for their return, it added.

On Thursday, the Shenzhou XXI astronauts handed over control of the space station to their successors from the Shenzhou XXIII mission — commander and spaceflight engineer Colonel Zhu Yangzhu, spacecraft pilot Colonel Zhang Zhiyuan and science payload specialist Lai Ka-ying — who arrived at Tiangong on Monday.

A video clip published by the agency showed the two groups holding a simple handover ceremony on board the space station.

Zhang Lu said that he and his crew have been impressed by the teamwork and skills displayed by Zhu's team over the past three days, and he wished them great achievements. "We will wait for your triumphant return, and see you in Beijing," the Shenzhou XXI commander said.

In response, Zhu said that he and his crew are grateful to the outgoing astronauts for sharing every detail of their experience.

"We also appreciate your professionalism and dedication very much. You guys did your jobs very well. We will learn from your hard-working spirit and valuable experience, and will faithfully carry out our duties," he added.

The Shenzhou XXI team arrived at the space station on Nov 1 as part of China's 16th manned spaceflight and the 10th crewed mission aboard Tiangong.

Zhang Jingbo, a spokesman for the China Manned Space Agency, said the Shenzhou XXI astronauts have achieved good results in several fields, including space life science, materials science, microgravity physics, space medicine and new spacecraft technologies, with cooperation and support from scientists and engineers.

The Shenzhou XXII mission was originally designated to be a manned flight, but was changed into an unmanned emergency response mission in late November after space debris damaged the Shenzhou XX crew ship.

Jingdezhen: Ceramics center now a cultural attraction

From page 1

"Nepal also has ceramics, but the porcelain here is much richer and more colorful," said Arjun Gurung, a tourist from Nepal, who was standing inside the Ancient Kiln and Folk Customs Museum.

Under the guidance of local artisans, Gurung and fellow travelers from a Nepali tour group sat at the potter's wheel, their hands learning the quiet patience required for a lump of clay to gradually take shape.

"It was only after experiencing the process of making porcelain myself that I truly understood more about Chinese culture and history," he said.

At major scenic spots and studios across Jingdezhen, visitors are not just watching artisans paint delicate patterns on porcelain. Some are also invited to add elements from their own cultures to the craft.

A Turkish visitor, who asked to be identified only as Nikos, spent an entire afternoon in a studio learning to paint blue-and-white porcelain under the guidance of a local master.

"I tried to include an olive branch pattern in the design," Nikos said. "For me, it felt like bringing a little bit of the Aegean Sea into Jingdezhen's porcelain tradition."

Clear trends

According to the Jingdezhen Culture, Radio, Television and Tourism Bureau, inbound tourism is seeing two clear trends: Visitors are staying longer, and they are seeking deeper cultural encounters.

The city's appeal is shifting from quick photo stops to hands-on, experience-based travel.

Major inbound markets now include Malaysia, the United States, Singapore, South Korea and Japan, with independent travelers making up roughly 30 to 40 percent of overseas arrivals.

For those who return again and again, porcelain shopping has become something of a ritual.

"This is my third time in Jingdezhen, and every time I bring back dozens of porcelain items," said a tourist from Malaysia, as she carefully selected blue-and-white plates at Taoxichuan Ceramic Art Avenue. In her basket, tiny porcelain fridge magnets sat beside collectible ceramic pieces — a small portrait of how Jingdezhen's porcelain industry is touching visitors at every level, from everyday keepsakes to objects of art.

US, Iran reach deal to extend ceasefire by 60 days, but need final approval

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

The United States and Iranian negotiators have reached an agreement on a memorandum of understanding to extend the ceasefire by 60 days, but US President Donald Trump has yet to give his final approval, Axios reported citing officials.

Earlier on Wednesday, Trump threatened to "blow up" Oman, a long-term ally in the Persian Gulf, complicating delicate diplomacy in the Middle East amid fresh strikes in the region.

Trump's threat followed reports that Oman was discussing joint control of the Strait of Hormuz with Iran despite an existing US blockade of the critical maritime corridor.

Omani Foreign Minister Sayyid Badr Albusaidi met with Kazem Gharibabadi, Iranian deputy foreign minister for legal and international affairs, who visited Oman this week.

Oman's Muscat Daily reported that a significant part of the dialogue was dedicated to the critical need to ensure safe and sustainable freedom of navigation through the Strait of Hormuz.

In a social media post on Monday, Albusaidi said that his discussions with Gharibabadi were good, and that they reflect the constructive nature of the Oman-Iran dialogue.

"We reaffirmed the importance of diplomatic engagement on all fronts. Oman will continue supporting efforts to reduce tension, advance peaceful regional coexistence, security and freedom of navigation," Albusaidi said in the post.

On Wednesday, the US Department of State posted a video on social media of Trump fielding questions from reporters during a Cabinet meeting in the White House.

Trump said that the Strait of Hormuz "is going to be open to everybody", emphasizing that it is part of international waters. "We'll watch over it, but nobody's going to control it. ... Oman will behave just like everybody else, or we'll have to blow them up," he added.

Iranian Foreign Ministry spokesman Esmaeil Baghaei slammed repeated US violations of the ceasefire, its military aggression against regions near the southern Iranian port city of Bandar Abbas, and its threatening rhetoric against Iran and other countries in the region, including Oman, Iran's semiofficial Mehr News Agency reported on Thursday.

While condemning the threatening rhetoric of US officials, Baghaei also expressed Iran's solidarity with Oman. He said that Trump's threat to destroy a United Nations member state, which "has always played a constructive, effective and responsible role in regional peace and security" and used its "noble service" as a mediator in diplomatic processes for many years, was a violation of a fundamental principle of the UN Charter, which imposes an absolute prohibition on the threat or use of force in international relations.

Baghaei said it was "also another dangerous sign of the normalization of lawlessness and bullying in international relations".

Meanwhile, the US military carried out fresh strikes overnight in Iran, targeting a military site and shooting down four Iranian one-way attack drones that posed a threat around the Strait of Hormuz, Reuters reported on Wednesday, citing a US official who spoke on the condition of anonymity.

The official said the military site that was struck was an Iranian ground control station in Bandar Abbas, which he alleged was about to launch a fifth drone.

The Islamic Revolutionary Guard Corps issued a stark warning that this US aggression against Iran would not go unanswered, Mehr News Agency reported.

The Revolutionary Guard said that it carried out strikes targeting the US air base from which the attack originated in the early hours of Thursday, and warned of a "more decisive" response to repeated acts of aggression. It added that the aggressor bears the responsibility of the consequences of its response.

The statement was issued after the IRGC Navy forced a US tanker to turn back on Thursday. The tanker was trying to "illegally cross the Strait of Hormuz after it had switched off its tracking system, despite Iran's restrictions", the news report said.

"Following a swift and decisive response by the IRGC Navy, including warning fire directed toward the vessel, the tanker was forced to stop and retreat," it added, citing another report from Iran's semiofficial Tasnim News Agency.

Mehran Kamrava, a professor of government at Georgetown University in Qatar, noted that Trump's statements do not always reflect the official US policy. "His shocking threat to bomb Oman does not appear to represent the US' formal position on the matter," Kamrava said. "Clearly, the US is getting a lot of pressure from the Arab states to ensure that there is free navigation through the Hormuz Strait."

Relations: Future of bilateral ties optimistic

From page 1

During the Sino-US summit in May in Beijing, China put forward the vision of "constructive strategic stability". That suits Australia fine. The positive stability that should emerge in China-US relations can only benefit Australia's relations with China.

Of course, there are many other positives. China remains by far Australia's largest trade partner. China's exports to Australia include electric vehicles, and this brings the potential to save a lot in fuel costs, not to mention benefiting the environment. Australia in turn sells iron ore and agricultural products to China.

But investment is not doing so well. Although China buys 30 percent of Australia's exports, it now accounts for less than 3 percent of Australia's total foreign direct investment stock, according to a report by the Australia-China Relations Institute at the University of Technology, Sydney.

Japan, on the other hand, provides 13 percent of Australia's foreign direct investment but buys only 10 percent of Australia's exports. Why the difference? Why is Chinese investment in Australia so low? One major answer is lack of trust. In other words, many consider Chinese investment a national security threat. This is ridiculous.

Fortunately, the business community in Australia is realizing how much it is missing out on by the lack of investment from China. Whether there will be an increase is uncertain, so we'll have to wait and see. I certainly hope there will be.

According to Australia's Department of Education, there were 192,225 international students from China in Australia in October last year, which was about 23 percent of the total of 833,041 international students. Of course, there is recovery from the COVID-19 days, but it could be faster. It seems that many Chinese students are choosing to stay at home and not come to Australia, because of the rising international status of Chinese universities and the greater expense of going to Australia.

On the other hand, there are some very active programs, at Australian National University and elsewhere, for Australian students to study in China. The government-funded National Foundation for Australia-China Relations is sponsoring projects to increase the knowledge that Australians, especially young Australians, gain about China. This can only be a good thing and, together with Chinese students going to Australia, can only increase people-to-people relationships between the two countries.

There are still many problems, and I am worried by the lack of trust. But the direction is definitely upward, so we should still be optimistic about the future of Australia-China relations.

The author is an Australian Sinologist and professor emeritus at Griffith University. The views do not necessarily reflect those of China Daily.

Innovation: Application of AI in key sectors encouraged

From page 1

Dr Christoph Schrempp, vice-chair of the European Union Chamber of Commerce in China's Tianjin chapter, said that China's shift toward intelligent manufacturing will reshape the business environment, as its AI capabilities are expected to mature further over the next five to 10 years.

"The speed of China's transition toward highly automated production is impressive," he said, adding that emerging technologies will create fresh room for European and Chinese collaborations.

His remarks were echoed by a survey released on Wednesday by the European Union Chamber of Commerce in China and consultancy firm Roland Berger, which showed "signs of an uptick" in confidence among European businesses operating in China.

China remains "the heavyweight champion of efficient and cost-effective supply chains", the survey said, with 75 percent of respondents saying their China-based production is more efficient than operations elsewhere.

"If you want to learn how to manage your business in a dynamic and fast-developing environment, come to China and learn from the fastest," Schrempp said.

John Markmann, president of Grundfos China, said that China serves as both a vital testing ground and a launchpad for cutting-edge industrial innovations that can benefit global markets.

Markmann, also vice-chair of the Danish Chamber of Commerce in China, North Board, said Grundfos, the Danish pump and water solutions provider, is proud to "ride this wave" by leveraging local AI talent and smart technologies to optimize manufacturing.

Chinese manufacturers are also putting these advantages into practice. Jamie Erin Wood, head of investor relations at home-robotics and smart-appliance maker Dreame Technology, said that China's long-established industrial strengths are being amplified by AI-enabled production.

Buoyed by the optimism shared by domestic and global businesses, Tianjin is also strengthening its role in advanced manufacturing, innovation and intelligent industries, supported by its industrial base and growing AI ecosystem.

Schrempp of the European Union chamber said Tianjin's AI-related industries generated more than 300 billion yuan ($44.2 billion) in operating revenue.

Neruda's China ties echo in a precious seashell

A special gift from Peking Museum to the famous poet points to a forgotten chapter in Sino-Chile relations.

By **JIMENA ESTEBAN**
in Buenos Aires, Argentina

Inside a main building at the University of Chile, visitors can see a seashell that carries a story far bigger than its size.

It is displayed among marine specimens linked to Pablo Neruda (1904-1973), the Nobel Prize-winning Chilean poet who famously loved seashells, describing them as "small countries of mother-of-pearl". In 1954, he donated his private collection of thousands of shells to the university.

The shell stands out for what it reveals about a time when culture often moved ahead of diplomacy.

In his memoir, Neruda describes receiving a rare shell during a visit to China: "I remember that in the Peking Museum the most sacred box of mollusks from the China Sea was opened to give me ... the *Thatcheria mirabilis*." He said it was one of only two known specimens of that particular mollusk.

Long before Chile and China established formal diplomatic relations in 1970, Chilean writers and artists were already making their own routes across the Pacific. They traveled, wrote and helped build institutions that turned curiosity into exchange. Their encounters helped shape a relationship that now runs through trade, education and tourism.

"The Chinese are among the people in the world who smile the most," Neruda, who may be Chile's most famous poet, wrote in his memoir, *I Confess I Have Lived*, published in 1974, a year after his death.

The gift of the seashell in the early 1950s tied the visiting Latin American poet to a newly founded country.

Renzo Soto, a historian and former professor who retired from the University of Chile, told China Daily in an exclusive interview that Neruda was part of a small but active group of Chilean writers and artists drawn to China well before embassies and official visits became routine.

"I don't know how widely his visits to China are discussed. There are several Chilean authors and artists who visited China before the formal establishment of diplomatic relations in 1970," Soto said.

"In the 1950s it was Neruda, Pablo de Rokha, Jose Venturelli, Gonzalo Rojas," Soto said.

The list spans different art forms and temperaments. De Rokha was a major poet with fierce politics of his own. Venturelli was a painter and activist with long ties to China. Rojas became one of Chile's leading poets. Each, in different ways, helped build early cultural contact.

Their visits came at a particular moment. The People's Republic of China was still in its early years, and knowledge of it among foreigners remained limited. Soto said that made it even more compelling for Chileans looking for new ideas in a postwar world.

"There was a genuine curiosity to learn about an ancient society that was relatively isolated and very difficult for foreigners to access," Soto said.

In 1954, Neruda published *The Grapes and the Wind*, a long work that moves through places and political causes with the voice of a committed poet. Editors and translators have noted that the poem ranges from Chile's coast to New China, using geography to imagine new nations and new futures.

ZHOU JIAYI / XINHUA

Before long, the exchange was working both ways. China also embraced Neruda as a major literary figure.

During his visits, he met poets such as Ai Qing (1910-1996), and the two formed a friendship. Ai later traveled to Chile and joined the writers who gathered in Chile for Neruda's 50th birthday in 1954. Their exchanges show the relationship was more than political.

Li Zhen, a poetry critic and professor at Shaanxi Normal University, said that Neruda liked Ai Qing a lot and described him as "charming" and a "prince of Chinese poets".

A contestant performs during the "Chinese Bridge" Chinese Proficiency Competition in Santiago, Chile, on Tuesday. JORGE VILLEGAS / XINHUA

"His trips to China, especially the deep friendship he formed with the poet Ai Qing, are evidence that this rapprochement was not simply a matter of political convenience but rather a genuine human bond," said Barbara Fernandez Melleda, an assistant professor at the University of Hong Kong.

Those ties soon took institutional form. In 1952, Chileans formed a Chile-China cultural association in Santiago, one of the earliest organized efforts in Latin America to build cultural links with the People's Republic. The Chilean-Chinese Institute of Culture was a prime "example of what we call 'cultural diplomacy'," Melleda told China Daily.

The institute brought together figures from across Chile's intellectual and political life, including Neruda, Venturelli, and the future president of Chile, Salvador Allende. For nearly two decades, it served as a steady meeting point for discussion, exchange and learning about China within Chile's academic and cultural circles.

"The (institute) was the concrete platform that channeled all the interest and affinity that already existed," said Melleda. "They created a legitimate space for encounter."

Neruda travelled to China in 1951 and 1957, extending his own links and those of the institute, and shaping his world view. During his last visit to China in 1957, Neruda celebrated his birthday on a cruise along the Yangtze River. Ai Qing, the head of the Chinese delegation, accompanied him on this journey.

"Neruda was never a mere repeater of slogans," Hernan Loyola, the poet's former personal secretary and a friend who edited his *Complete Works* and currently edits the Nerudiana magazine, told China Daily.

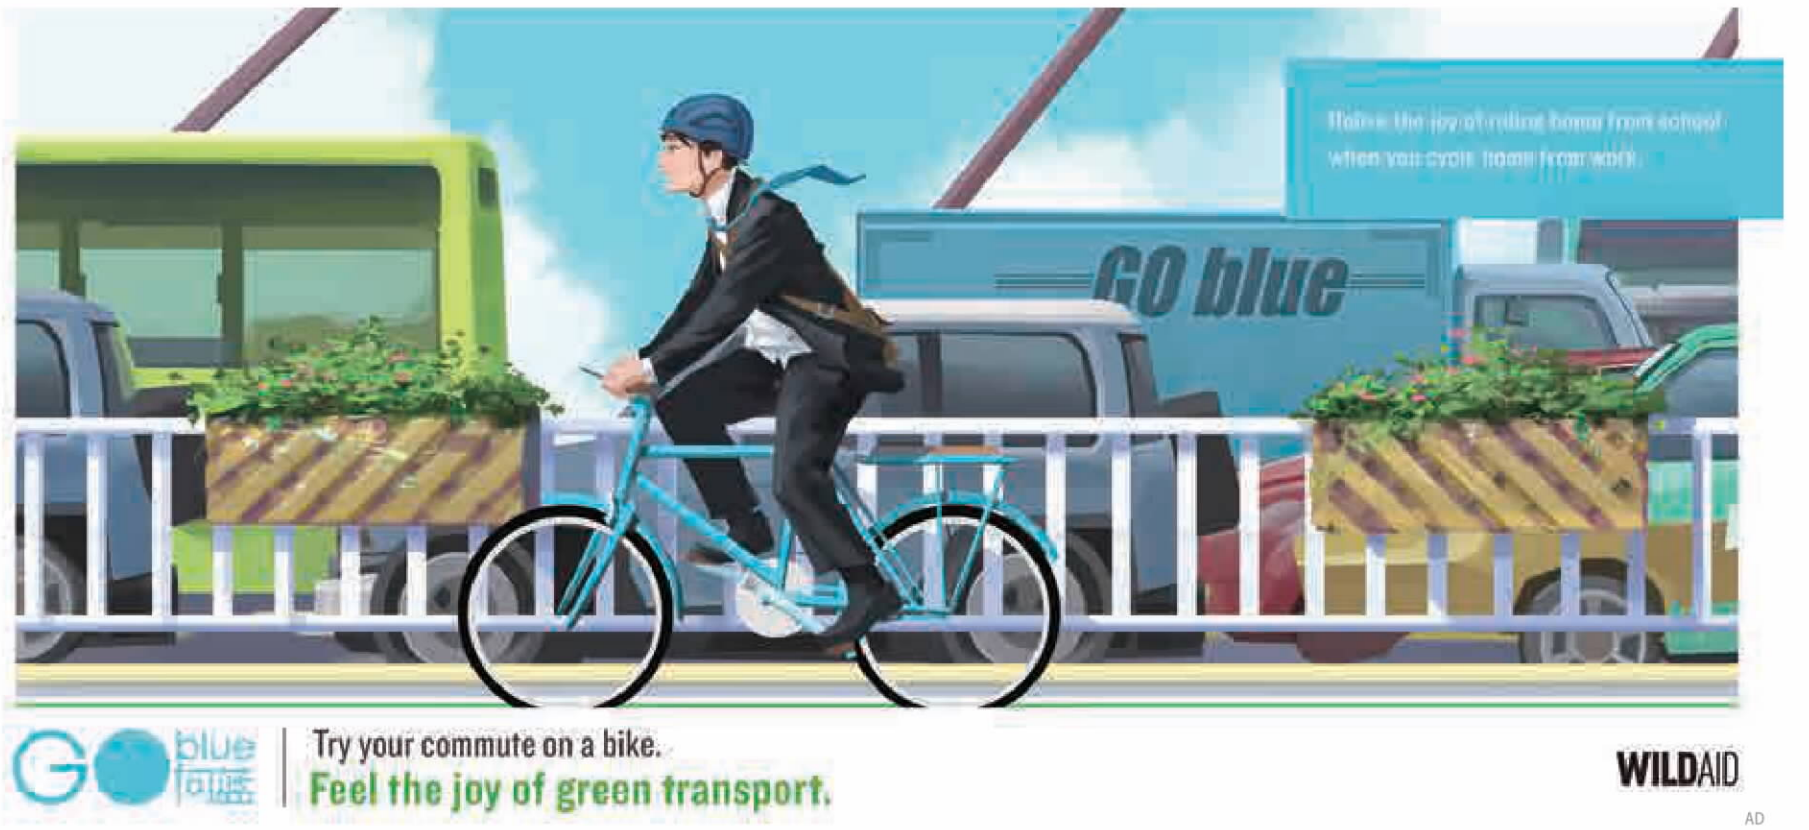
"The Neruda of the 1960s was no longer the poet who simply praised. He was a man who had learned to look with different eyes," Loyola said.

If he was able to build a bridge with China, Loyola said, "it was because his interest was genuine".

"He was not a career diplomat but a poet who had written verses dedicated to the country and had forged personal ties," Loyola said.

Neruda's legacy remains alive today.

His cultural diplomacy led to closer links between Chile and China. Those links expanded through the 1950s and 1960s. When Allende became president in 1970, he took office "with 18 years of accumulated knowledge, personal contacts and trust forged through the (institute)", said Maria Montt Strabucchi, an associate professor at the Pontifical Catholic University of Chile.



"That's why, when he took office, one of his first foreign policy decisions was to establish diplomatic relations with the People's Republic of China on December 15, 1970," Strabucchi said. "It was not an improvised or purely ideological decision: it was the culmination of a process of rapprochement that the institute had sustained for nearly two decades."

Since 1970, the economic relationship between the two countries has expanded into one of Chile's most important bilateral trade ties. Chile's trade with China had grown to about $8 billion in 2005 and exploded to almost $59 billion by 2024, according to the Chilean government. China is now firmly established as Chile's largest trading partner.

The relationship deepened further through the free trade agreement framework, under which 98.7 percent of Chilean exports now enter China with zero tariffs.

But even though trade and investment may define Chile-China ties today, it was writers and artists that laid the groundwork for the relationship long before that.

The seashell at the museum is a timely reminder that diplomacy is shaped not only in ministries, but also in poems, journeys and the stories people bring home.

California panelists emphasize resilience, reliability

Panelists discuss global trade, supply chain resilience and international cooperation during the centennial celebration of World Trade Week hosted by the Los Angeles Area Chamber of Commerce in Los Angeles on Wednesday. RENA LI/ CHINA DAILY

By RENA LI in Los Angeles
renali@chinadailyusa.com

Trade and transportation leaders in Southern California said the region's ports, airports and logistics infrastructure continue to play a critical role in global commerce despite mounting geopolitical tensions, shifting trade patterns and economic uncertainty.

The remarks came during the centennial celebration of World Trade Week held in Los Angeles on Wednesday, where officials and business leaders reflected on the region's century-long role as a gateway for international trade and discussed challenges facing global supply chains.

This year's theme, "Celebrating a Century of Global Partnership, Innovation and Prosperity", highlighted the importance of trade in economic growth and international cooperation, according to Maria Salinas, president and chief executive officer of the Los Angeles Area Chamber of Commerce.

Panel discussions focused on how Southern California can maintain its position as a global trade and innovation hub amid disruptions ranging from geopolitical conflicts to shifting tariff policies and supply chain restructuring.

Noel Hacegaba, chief executive officer of the Port of Long Beach, said continuing instability in global trade and energy markets has added new pressures on logistics and transportation systems.

"There hasn't been a normal year in our industry for quite a while," Hacegaba said. "Every year seems to introduce a new layer of complexity."

He pointed to conflicts in the Middle East, rising fuel prices and evolving US trade policies as major factors reshaping shipping and manufacturing costs. According to Hacegaba, the ports of Long Beach and Los Angeles have worked to remain a "safe harbor" amid uncertainty by investing in infrastructure and maintaining operational flexibility.

Hacegaba said China continues to remain a major trading partner for Southern California ports even as regional supply chains across Asia become increasingly diversified.

Gene Seroka, executive director of the Port of Los Angeles, also emphasized the importance of maintaining stable international relationships and adapting to rapidly changing trade conditions.

"It's been a roller coaster, and even for the most seasoned professional, it's a lot to keep up with," Seroka said, referring to policy changes, tariffs and global market shifts.

Seroka said businesses are shortening planning horizons because of economic uncertainty, while inflation and weaker capital investment continue to affect both companies and consumers.

At the same time, he noted that long-established international relationships have helped Southern California adapt to changing trade patterns more smoothly.

Referring to recent visits to Hong Kong and cities in the Chinese mainland, Seroka said long-term international partnerships remain essential for sustaining trade cooperation and adapting to shifting global trade flows.

"The ability to really put this into another gear and get those relationships going in places where we haven't had normal trade flows has been almost seamless," Seroka said.

John Ackerman, chief executive officer of Los Angeles World Airports, said geopolitical conflicts are increasingly affecting aviation routes and transportation costs.

"The war in Iran is adding hours and hours to the journeys of the airplanes that come in and out of the airport and go to the Gulf region," Ackerman said. "That changes the economics for goods."

Ackerman emphasized the importance of maintaining resilient transportation systems and stable international connectivity.

Dilpreet Sidhu, deputy mayor of international affairs for the City of Los Angeles, said Los Angeles intends to remain a stable and reliable global trade partner despite continuing geopolitical and economic uncertainty.

"LA is going to continue to be a stable and reliable partner," Sidhu said. "We're open for business, and we will welcome the world."

Sidhu also emphasized the importance of maintaining ties with China and other international partners.

Reforms urged to AI, global governance

Foreign minister calls for enhancing voices of developing countries at United Nations

By MINLU ZHANG
at the United Nations
minluzhang@chinadailyusa.com

Chinese Foreign Minister Wang Yi on Thursday called for stronger multilateral cooperation on issues including United Nations reform, artificial intelligence regulation and global development.

Wang, also a member of the Political Bureau of the Communist Party of China Central Committee, made the remarks during a meeting of the Group of Friends on Global Governance while in New York to preside over a UN Security Council high-level meeting.

Speaking at United Nations headquarters, Wang said reforming and improving global governance is a historic mission for this generation. Such a task demands strong conviction and unremitting efforts, he said.

China's proposals for reforming and improving global governance include promoting reform and greater efficiency at the United Nations, enhancing the authority and capacity of the Security Council, advancing peacekeeping operations, and strengthening global consensus on development.

"The purpose of UN reform is to enhance the world body, not weaken it. UN reform should be led by member states and carried out in a fair, inclusive and transparent manner," Wang said.

He stressed the importance of enhancing the voice of developing countries, and small and medium-sized countries, particularly by addressing the historical injustice faced by Africa.

Wang also called for improving international human rights governance, reforming the international economic and financial system, and establishing rules for artificial intelligence governance.

"China supports the United Nations playing a central role" in preventing the widening of the digital divide and establishment of safeguards for the military application of artificial intelligence, he said.

Wang said China has proposed establishing a World Artificial Intelligence Cooperation Organization and will host the World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai in July.

He also called for strengthening governance in emerging areas such as cyberspace, outer space and artificial intelligence.

The GGI is another major initiative proposed by China in September last year, following the Global Development Initiative (GDI), the Global Security Initiative (GSI) and the Global Civilization Initiative (GCI).

Wang added that Groups of Friends on Global Governance have been established in New York, Geneva and Vienna, with membership expanding to more than 60 countries.

Representatives from more than 60 countries attended Thursday's meeting, including the foreign ministers of Pakistan, Turkmenistan, Kyrgyzstan, Cuba and Zimbabwe. UN Deputy Secretary-General Amina Mohammed briefed the participants.

Wang said China will host a forum on global governance in the Xiong'an New Area in North China's Hebei province this autumn. He called Xiong'an a "city of the future" and said China hopes countries can work together there to advance global governance reform and improvement.

The meeting issued a joint communique of the Group of Friends on Global Governance calling for safeguarding the authority of the United Nations, upholding international law, strengthening solidarity and cooperation, and improving global governance.

The Group also reached consensus on five key points regarding global governance, said Wang.

He said members of the group support democratizing international relations and giving all countries equal rights to participate in and benefit from global governance, regardless of their size or level of development.

Wang said the group also supports upholding the purposes and principles of the UN Charter, safeguarding the central role of the United Nations, practicing multilateralism, and opposing unilateralism and power politics.

Wang said all members support "reforming and improving global governance and narrowing the North-South divide to ensure that all countries share the benefits of development and that no country is left behind".

He said members also called for addressing the most pressing challenges facing the international community through concrete actions and practical results to "ensure global governance meets the needs of the times and the people".

Xinhua contributed to the story.

Egypt Special

From left: The grand opening ceremony of Red Sea Container Terminals is attended by Egyptian Prime Minister Mostafa Madbouly (ninth from left in the first row) and Egyptian Minister of Transport Kamel Al-Wazir (eighth from left in the first row). Hutchison Ports Abu Qir is built to handle the mega-vessels of the future. PHOTOS PROVIDED TO CHINA DAILY

Hutchison Ports boosts Egypt's development

By YUAN SHENGGAO

In line with the Belt and Road Initiative, Hutchison Ports, one of the world's leading port investors and operators, is enhancing Egypt's position as a strategic trade hub, according to the company. By operating technologically advanced terminals in the country, the company is not only advancing Egypt's Vision 2030 but also fortifying the historic 70-year diplomatic relationship between China and Egypt.

Enduring partnership

Inspired by the historical exchanges linked by the Silk Roads, China and Egypt have built a strong modern partnership. This partnership is marked by significant commercial collaboration, with bilateral trade reaching $20.79 billion in 2025. Established in 2008, the China-Egypt TEDA Suez Economic and Trade Cooperation Zone has become a prominent industrial hub in Egypt, hosting 185 companies with $3 billion in foreign investment and total sales of over $5.3 billion by June 2025.

Egypt's strategic location at the crossroads of the Mediterranean and Red Seas, with the Suez Canal serving as a vital artery for global shipping, makes it a critical partner for supply chain reliability across Africa, the Middle East, Europe and Asia. This, combined with a young and dynamic workforce, positions the nation as an attractive destination for investment and growth.

Terminals' modernization

With two decades of experience in Egypt, Hutchison Ports is keen to prioritize the market for further development and investment, reinforcing its support for the BRI and regional connectivity. Hutchison Ports currently manages several key terminals in Egypt, including Hutchison Ports Alexandria, Hutchison Ports El Dekheila, Hutchison Ports Abu Qir, or AQCT, Red Sea Container Terminals, or RSCT, as well as the El Dekheila Container Terminals, or EDCT.

On the Mediterranean, AQCT, developed in partnership with the Egyptian Navy, is the first terminal in Egypt to deploy a mixed-traffic fleet of autonomous trucks and electric trucks, significantly boosting operational efficiency. AQCT is built to handle the mega-vessels of the future and is well connected to major industrial zones, with 100 hectares reserved for future expansion.

At the southern entrance of the Suez Canal, the new RSCT in Ain Sokhna announced its official opening as Egypt's first semi-automated container terminal in January. This new facility marks a significant milestone in Egypt's maritime development, backed by a 30-year concession agreement with the Egyptian government, reinforcing Egypt's attractiveness for international trade and investment, according to Hutchison Ports.

RSCT is equipped with advanced remote-controlled cranes, electric internal terminal tractors and electric reach stackers to deliver faster, smarter and more environmentally friendly container services.

As part of Hutchison Ports' integrated Egypt network, the soon-to-open EDCT will enhance national container throughput, improve reliability of goods movement, and tap into smoother, lower-cost trade flows driven by improved connectivity to logistics corridors and industrial zones. In addition to remote-controlled technology and electric vehicles, EDCT will incorporate renewable energy bunkering, aiming to become a smart and green port.

Advancing the BRI

As Egypt pursues its Vision 2030 initiative, Hutchison Ports' investment portfolio of over $1.5 billion in the country is playing an important role in economic development, job creation and modernization of maritime infrastructure. These efforts align with broader national strategic interests in diversifying trade routes and strengthening global economic partnerships.

Positioned as a leading operator in Egypt's evolving logistics landscape, Hutchison Ports is committed to supporting Egypt's rapid growth and enhancing economic ties along BRI trade routes. As these investments come online, the outlook for Egypt's maritime trade remains positive with smoother trade flows and reduced operational costs, bringing greater attractiveness for Chinese businesses looking to expand their footprint across Africa and beyond.

China tariff initiative fuels export growth

By HAO NAN
haonan@chinadaily.com.cn

China rolled out a comprehensive zero-tariff initiative for 53 African diplomatic partners on May 1 while accelerating negotiations on economic partnership agreements to promote shared development.

The initiative makes China the first major global economy to offer unilateral, comprehensive zero-tariff treatment to all African nations with diplomatic ties to China, as well as to all least developed countries with diplomatic relations worldwide.

Egypt, the first Arab and African nation to establish diplomatic relations with the People's Republic of China in 1956, has seen overwhelmingly positive responses to China's landmark zero-tariff policy.

Experts from the Political Academy Research Institute under Egypt's State Information Service said the policy transforms close political ties into institutionalized economic gains, forging an even stronger bond between China and Egypt. Amid rising global trade protectionism, China's initiative also carries significant political implications.

Egyptian officials said the policy provides a unique opportunity to boost Egypt's exports to China. It also aligns closely with Egypt's Vision 2030, the country's national development strategy, which identifies export expansion and the development of Egypt as a regional trade hub among its core goals.

The zero-tariff policy is widely viewed in Egypt as a major advantage and an institutional upgrade for future China-Egypt economic and trade relations.

Chinese economic experts said the policy not only helps African nations expand export capacity but also supports China's imports of agricultural products, mineral resources and manufactured goods from Africa. It strengthens supply chain resilience and supports China's food security and industrial productivity growth.

Statistics showed China remained Egypt's largest trading partner for a 14th consecutive year, serving as Egypt's largest source of imports and a major source of investment.

Saturday marks the 70th anniversary of China-Egypt diplomatic relations. The two countries established a comprehensive strategic partnership in December 2014 and have maintained strong bilateral relations since then.

Against a backdrop of deepening political trust and booming trade ties, industrial park cooperation has emerged as a key pillar and vivid example of practical bilateral engagement.

Located on Egypt's Red Sea coast, Ain Sokhna is home to the China-Egypt TEDA Suez Economic and Trade Cooperation Zone, which was approved by the Chinese government in 2008. Factory buildings line the zone while container trucks move constantly along its roads.

A view of the China-Egypt TEDA Suez Economic and Trade Cooperation Zone in Egypt, 2025. YAO BING / XINHUA

Since the inauguration of its expansion area in January 2016, the zone has recorded steady growth. It hosted more than 300 domestic and international business delegations in 2024. That number rose to more than 500 in 2025, including delegations from Arab countries, Russia and Uzbekistan.

As a flagship Belt and Road Initiative cooperation project between China and Egypt, the zone has attracted a cluster of world-class companies. Jushi Egypt has helped the country become a global leader in fiberglass production, while XD-EGEMAC, a Chinese-Egyptian joint venture, has localized the manufacturing of high-voltage electrical equipment.

Those investments have helped fill Egypt's technological gaps in key industries. Their products are sold worldwide and have significantly increased Egypt's export revenue.

The zone now hosts industrial clusters in bonded logistics, new building materials, petroleum equipment, high- and low-voltage electrical appliances, machinery manufacturing, textiles, chemicals, renewable energy and household appliances.

"From just two or three initial enterprises to today's industrial agglomeration, I am filled with pride," said Nahla Emad, CEO of Egyptian TEDA Special Zone Development Company.

She said the thriving China-Egypt TEDA Suez Economic and Trade Cooperation Zone demonstrates the deepening relationship between China and Egypt, as well as the high level of trust and cooperation between the two governments.

By the end of 2025, the zone had attracted nearly 200 companies, with actual investment exceeding $3.8 billion and creating around 10,000 local jobs.

Editorials

South China Sea not the arena for extra-regional actors to flex muscles

The recent incursion by the Dutch frigate HNLMS *De Ruyter* into waters around China's Xisha Islands, compounded by the violation of China's airspace by a helicopter, necessitated a firm response from the Chinese People's Liberation Army Southern Theater Command. Through verbal warnings and electronic jamming, the Chinese side effectively expelled the vessel, demonstrating its resolve to defend its sovereignty and territorial integrity.

As a spokesman for China's Ministry of National Defense said, the blatant provocation and meddling by the extra-regional country in the South China Sea deserve serious condemnation. The Dutch side's behavior infringed on China's territorial sovereignty and sea and air security, violated international law and the basic norms of international relations, undermined the peace and stability of the South China Sea, and could have caused a serious misunderstanding and misjudgment.

Yet, the latest incident was merely the tip of the iceberg. The Report on the Military Activities of Non-US Extra-Regional Countries in the Western Pacific in 2025, released on Tuesday by the South China Sea Strategic Situation Probing Initiative, paints a troubling picture. Extra-regional countries, including the United Kingdom, France, Canada and Australia, increased the frequency of their military activities in the Western Pacific last year.

The report said about 200 warships from 18 external countries operated in the region last year under the excuse of exercising "freedom of navigation" or safeguarding a "free and open Indo-Pacific", with their military aircraft flying over 20,000 sorties. One does not have to be a military expert to recognize that such a high frequency raises the risk of escalation.

The South China Sea is increasingly used as a venue for geopolitical posturing, where countries from outside the region present a show of force to align with the "Indo-Pacific" strategy of the United States with the aim of containing China.

The involvement of countries from outside the region, such as the Netherlands, is not a demonstration of naval prowess; it is a provocative act aimed at undermining the trust and cooperation that regional countries are painstakingly trying to maintain.

Extra-regional countries may not fully grasp the risks of their aggressive behavior, but their actions have the potential to set off a chain of events that escalate into conflict, which no party desires.

There is a glaring hypocrisy in the actions of these countries. While they claim their missions are about promoting "freedom of navigation" and "maritime security", their intrusion into China's territorial waters is intended to weaken international maritime cooperation. Instead of fostering a collaborative environment to maintain peace, these extra-regional actors are creating divisions and mistrust among regional countries. This divisive approach seeks to hamper efforts to build a cohesive regional framework for addressing the myriad challenges facing the South China Sea.

China and the Association of Southeast Asian Nations member countries are accelerating their steps in negotiating a Code of Conduct in the South China Sea, aiming to usher in lasting peace and stability in the waters. On May 21, they convened the 26th ASEAN-China Senior Officials' Meeting on the Implementation of the Declaration on the Conduct of Parties in the South China Sea in Kuala Lumpur, Malaysia.

The parties attending the meeting affirmed the positive progress made in the consultations on the COC and agreed to work toward its early conclusion. To continue advancing the COC consultations, China and ASEAN countries also held the 55th meeting of the Joint Working Group on the Implementation of the Declaration on the Conduct of Parties in the South China Sea last week.

The provocative actions of non-regional countries in the South China Sea will only consolidate China's resolve to defend its rights and interests. If they continue the dangerous moves, the cost will be borne not only by themselves but also by regional countries.

Peace and stability in the South China Sea can only come from dialogue and cooperation, not from reckless showboating that risks tripping the wire of confrontation.

Secessionists' 'word game' belies their anxiety

Recent remarks and actions by the secessionist-minded Democratic Progressive Party authorities of China's Taiwan region once again reveal their persistent attempts to distort history, confuse public understanding and advance their separatist agenda under various guises.

From the repeated claim that "Taiwan has never been ruled by the People's Republic of China" to renewed rhetoric advocating "Taiwan independence", the essence of these moves remains unchanged: seeking to undermine the one-China principle and obstruct the historical trend toward China's national reunification.

At a recent news conference, Chen Binhua, spokesman for the State Council Taiwan Affairs Office, reiterated the unequivocal truth that Taiwan has been an inseparable part of China since ancient times. Although the two sides of the Strait have yet to achieve reunification, China's sovereignty and territorial integrity have never been divided. The two sides of the Taiwan Strait belong to one China with the Government of the People's Republic of China as the only legitimate representative of the whole of China.

Historical facts and international law provide no room for distortion. The Cairo Declaration, the Potsdam Proclamation and United Nations General Assembly Resolution 2758 all confirm China's sovereignty over the Taiwan region.

Any attempt by the DPP authorities to confuse the concepts of "jurisdiction" and "sovereignty" is merely a political trick designed to fabricate a false basis for separatist activities.

The recent separatist rhetoric by Lai Ching-te, head of the DPP authorities, as evidenced by his May 20 speech marking the second anniversary of his tenure, in which he falsely portrayed his authorities as the "protector of regional peace and stability", further exposes the dangerous nature of the DPP authorities' agenda. These remarks appear to be less an expression of confidence than an anxious attempt to test the boundaries of external support, particularly from the United States.

These performances by Lai — including his brazen denial that he is pursuing "Taiwan independence" — are all reactive responses to external shifts. US President Donald Trump's recent remarks concerning the Taiwan region might have shattered the fantasy of some "Taiwan independence" seekers, as some observers say. "We're not looking to have somebody say, 'Let's go independent because the United States is backing us'," Trump said in an interview following his state visit to China from May 13 to 15. After that, the US suspended certain arms-sale arrangements to the island, leading to a sense of strategic unease among the Lai authorities.

Against this backdrop, the so-called "Formosa Alliance", a political group long advocating "Taiwan independence" on the Chinese island, issued an open letter indicating its willingness to consider participation in cross-Strait negotiations under conditions such as "Taiwan people govern Taiwan" and "a high degree of autonomy".

Such rhetoric does not represent a genuine embrace of national reunification. Rather, it reflects the growing anxiety among some separatist groups, as they realize that the space previously granted to them by external forces is narrowing. Their proposal attempts to disguise separatist intentions with new packaging while continuing to challenge the one-China principle by imposing political preconditions.

As Chen emphasized, any proposition that seeks to pursue "Taiwan independence" under the banner of "autonomy", "two Chinas", or "one China, one Taiwan", fundamentally runs counter to the shared interests of the Chinese nation. No matter how such ideas are repackaged, they cannot alter the reality that "Taiwan independence" is a dead end.

Beneath the great lengths the separatist forces go to in a bid to disguise their agenda lies a recognition that, amid the overwhelming comparative strength and development momentum of the Chinese mainland, their secessionist fantasies lack both legitimacy and practical viability.

Under the political foundation of adhering to the one-China principle and upholding the 1992 Consensus, the Chinese mainland remains willing to strengthen cross-Strait economic and trade cooperation, expand people-to-people exchanges and deepen integrated development to benefit compatriots on both sides of the Strait.

The future of Taiwan lies in China's national reunification, and the well-being of Taiwan compatriots depends on the rejuvenation of the Chinese nation. No external force can stop the historical trend toward China's reunification, and no separatist scheme can shake the common aspirations of the Chinese people on both sides of the Strait.

Takeaway from Sino-German economic relations for Brussels

When Germany's Economic Affairs and Energy Minister Katherina Reiche arrived in Beijing this week with a 40-member business delegation, she carried a message Brussels would do well to heed before its Friday debate on new trade restrictions targeting China's alleged "overcapacity".

Germany, Europe's largest economy and its industrial engine, understands something increasingly lost in Brussels' geopolitical rhetoric: Europe's prosperity is deeply intertwined with China's market, supply chains and innovation ecosystem.

The European Union cannot safeguard against what it deems "unfair practices" by damaging its own export industries or blocking channels of cooperation with the world's second-largest economy. It is arithmetic. China and Germany conducted roughly 250 billion euros ($290.20 billion) in goods trade in 2025 — accounting for about 33.2 percent of China-EU trade that year, with China remaining Germany's largest trading partner for several consecutive years. Around 5,000 German companies operate in China. German investment in China exceeded 7 billion euros in 2025, reportedly up nearly 50 percent from the previous year and the highest level in four years. At the same time, Chinese investment projects in Germany surpassed those from the United States. These are the numbers of two major economies adapting to a more competitive but still mutually beneficial relationship.

Chinese Vice-Premier He Lifeng and Commerce Minister Wang Wentao used their respective talks with Reiche on Wednesday as opportunities to deepen industrial integration. Both emphasized the compatibility between China's 15th Five-Year Plan (2026-30) priorities — digitalization, green development and industrial upgrading — and Germany's Industry 4.0 ambitions and low-carbon transition.

That convergence is real. Europe's green transition, from electric vehicles to renewable energy grids, depends heavily on access to competitively priced Chinese technologies and critical materials. Reiche acknowledged what many European politicians hesitate to say publicly: China has become one of the world's major industrial and innovation centers in robotics, artificial intelligence, batteries and renewable energy. Europe can either engage with that reality or try to fence it off. Some people in Brussels seem tempted to do the latter.

The European Commission's toolbox — from expanded safeguards to broader trade-defense mechanisms and restrictions on Chinese technology suppliers — risks confusing competitiveness with protectionism. Such measures may offer short-term political advantages, but they will inflict long-term economic costs on Europe itself, especially on export-oriented economies such as Germany.

European restrictions on high-tech exports to China artificially suppress European exports while inflating the "imbalance" Brussels now condemns.

Nor should China's manufacturing strength be reduced to "overcapacity" or "subsidies". Much of the cost-performance advantage of Chinese products comes from scale, relentless competition, infrastructure efficiency and rapid innovation cycles that benefit European consumers and industries enormously at a time of high energy costs and sluggish growth.

Europe did not become a technological powerhouse by shielding itself from competition. It succeeded by embracing openness, fostering industrial ecosystems and competing vigorously. If the EU hopes to remain relevant in the ongoing tech revolution, it must rediscover that confidence rather than retreat behind regulatory walls.

That requires reciprocity from both sides. China is committed to providing a fair and nondiscriminatory business environment for European companies operating in China, something the German business leaders accompanying Reiche acknowledged. Similarly, Chinese companies deserve nondiscriminatory treatment in Europe.

Reiche's visit, following German Chancellor Friedrich Merz's earlier trip to China, suggests that Berlin still sees dialogue as preferable to confrontation. The broader EU should resist allowing strategic anxieties to override economic self-interest.

Europe does not need to agree with China on everything to trade successfully with it. But it does need to remember that prosperity, especially in difficult economic times, is usually built through win-win cooperation and managed competition, not through fear of either.

— LI YANG, CHINA DAILY

What They Say

New rule to support settled migrant workers

Editor's note: *The State Council has issued a new guideline aimed at gradually increasing basic public services for residents without a local household registration. Shi Yulong, director of the Research Center on Xi Jinping's Economic Thought, and Gao Guoli, director of the China Center for Urban Development, explained why such measures are necessary. Below are excerpts of their comments as reported by the People's Daily. The views don't necessarily represent those of China Daily.*

This guideline helps better align the allocation of public service resources with the scale, structure and needs of permanent residents. It will also help rural populations who migrated to cities integrate into the urban environment.

It outlines measures across key areas such as education, housing, social security, medical insurance, employment and social assistance, addressing the pressing concerns of permanent residents without a local *hukou*. This initiative is important for promoting these people's equal access to basic public services and advancing the people-centered new urbanization strategy.

By the end of 2025, some 130 million rural migrant workers were residing in urban areas. Some of them live with their children and elderly family members. Their primary concerns are stable employment, children's education, housing and social insurance.

A large number of such people live and work in cities for extended periods while their household registrations remain elsewhere. Ensuring that they have equal access to basic public services where they live is essential for improving the quality of urbanization.

The implementation of the guideline will help stabilize these people's expectations, allowing them to settle down and pursue a promising future, thus translating the vitality generated by population mobility into stronger domestic demand.

Cities and counties that see a net inflow of population generally have sound economic foundations and abundant job opportunities. They host a large number of rural migrant workers and people moving between cities, leading to a strong demand for public services, including basic education and housing. But the supply of these services often falls short.

These regions need to balance the fairness, accessibility and sustainability of public services that are short in supply, and work toward their tiered supply. The duration of a person's employment and residence in the area should be a main criterion for the provision of these public services.

On the other hand, cities and counties witnessing a decline in their population usually have weaker industrial bases and insufficient capacity to create jobs. In some of these regions, public service resources are at risk of underutilization.

These areas should focus on forecasting the total number of permanent residents, the demographic structure and mobility trends, and on continuously improving the construction, operation and management of service facilities to ensure that resources are efficiently allocated.

Given the varying fiscal capacity and the number of migrants across regions, authorities should take proactive but measured steps when expanding basic public services to residents without local household registration. This approach will help them maximize their efforts without overstretching their resources.

VIEWS

Hun Kim

Mobilizing private capital to scale digital infrastructure

Digital infrastructure is the backbone of economic growth, but investment in this space has been uneven.

Many developing economies are struggling to expand basic digital connectivity while preparing for the artificial intelligence era, resulting in a double digital divide: inadequate basic access for hundreds of millions, compounded by growing gaps in AI readiness.

Limited affordable broadband connectivity, unreliable digital services, insufficient access to essential devices, and unstable electricity supply are long-standing challenges faced by developing economies.

Despite increasing investment in AI infrastructure worldwide, the foundational connectivity network needed for AI readiness remains underfunded.

Internet access directly correlates with national development levels.

High-income economies have achieved near-universal internet access, at around 94 percent, but low-income countries have reached only about 23 percent. This disparity not only slows AI adoption but also exacerbates inequity by denying AI's benefits to those without basic connectivity.

Investment tends to focus on capital-intensive, top-tier digital assets such as data centers, cloud and AI infrastructure while foundational connectivity remains underfunded. This gap risks widening rather than narrowing societal and economic inequality.

Multilateral development banks should view digital infrastructure not as a discrete asset class but as an interconnected ecosystem with multiple layers: the foundational layer, the enabling layer, the cloud layer, and the application layer.

Private capital naturally gravitates toward segments with predictable demand, scalable operations and bankable returns, such as the cloud layer.

However, in rural and low-income areas, there is not enough commercial incentive for network expansion, a problem exacerbated by fragmented regulation, uncertain licensing and limited institutional capacity.

Thus, digital inclusion becomes more of a financing and coordination challenge.

Development stakeholders must structure risk frameworks that enable private capital to scale while strategically and efficiently deploying public resources to support segments currently unviable for market investment.

A credible enabling environment requires stable and transparent rules, predictable licensing and reliable legal protection.

Multilateral development banks, or MDBs, help borrowing members build this credibility by standardizing fragmented regulations, strengthening local institutional capacity and reducing political and regulatory risks.

When the enabling environment is credible and sustainable digital service demand is secured, the private sector can deliver impact at a scale far exceeding investments traditionally led by the public sector.

Without these conditions, even well-designed projects may remain unbankable, leading to underinvestment in regions with the greatest development needs.

India and Indonesia illustrate how infrastructure sequencing and capital structure design can drive inclusive digital expansion. India prioritized foundational connectivity, leveraging state-directed and quasi-public models to build nationwide infrastructure, including rural broadband access.

As market scale deepened and digital adoption accelerated, the government rolled out incentives, including long-term central tax exemptions, state electricity duty exemptions, concessional power tariffs, and single-window fast-track regulatory clearances to mobilize private investment.

This created a virtuous cycle: broad connectivity fueled adoption, adoption strengthened demand, and demand directed private capital to higher-return digital assets.

In Indonesia, where terrestrial networks incur high marginal costs to reach remote communities and project economics deteriorate rapidly beyond major urban corridors, catalytic development finance played a pivotal role in early connectivity expansion.

A notable example is the Asian Infrastructure Investment Bank's non-sovereign support for Indonesia's Multifunctional Satellite Public-Private Partnership project, which connected underserved regions overlooked by commercial financiers.

As Indonesia's digital market matured, data-center expansion shifted toward more bankable sites and structured partnerships that derisked investments.

These instances show that success depends less on choosing a "one-size-fits-all" technology and more on aligning infrastructure sequencing, incentive frameworks and risk allocation across the entire digital ecosystem.

Three dimensions will shape the future of digital infrastructure scaling in Asia: expanding beyond bankable segments to close the access gap, building enabling ecosystems and enhancing collaboration between MDBs.

Robust regulatory frameworks are essential for scaling digital public infrastructure.

MDBs should align efforts to catalyze private investment, not compete with it. By pooling expertise, resources and risk appetite, MDBs can accelerate the development of bankable projects and expand access to digital infrastructure for the next billion users.

The Asian Infrastructure Investment Bank adopts a layered, ecosystem-driven approach that prioritizes technology-enabled infrastructure for the AI era while advancing inclusive growth.

It supports commercially viable backbone networks, broadband expansion and data centers and attracts private investment to underserved communities.

It also partners with governments to build digital public infrastructure through policy modules and implementation templates.

Asia's digital infrastructure gap should be seen as an investable opportunity, not a cost burden.

The central problem is not a lack of investor interest in digital infrastructure but a concentration of capital in the compute layer that overshadows foundational connectivity.

To bridge this gap, it is essential to align the roles of different stakeholders.

Governments should establish credible, inclusive regulatory frameworks and strategically invest in segments unviable for market delivery.

The private sector needs to innovate and scale investments where demand exists and risks are priced transparently. MDBs have to convene stakeholders, derisk projects, and reduce transaction costs to accelerate the development of bankable projects.

With coordinated action, Asia can narrow the double digital divide and expand digital opportunities to the next billion users, unlocking inclusive and sustainable growth for decades to come.

MA XUEJING / CHINA DAILY

Chen Xiancai

DPP disguising separatist agenda as democracy

Taiwan leader Lai Ching-te has recently been peddling his so-called "green democracy" rhetoric.

By placing "democracy" at the center of his narrative, he is trying to inject an ideology-driven binary framework of confrontation into cross-Strait relations and the geopolitical situation in the Taiwan Strait.

This exposes his intention to involve external forces in manipulating the Taiwan question on the international stage.

A closer look at Lai's rhetoric shows that the Democratic Progressive Party's "green democracy" is essentially "Taiwan independence" in disguise.

In a recent speech, he repeatedly claimed that Taiwan stands at the "frontline of democracy", thus creating an atmosphere of confrontation across the Taiwan Strait.

By bypassing the core legal issue of national sovereignty and territorial integrity, and drawing ideological lines in the name of "democratic values", the DPP authorities are once again using their familiar tactic of attempting to "internationalize" the Taiwan question.

Lai's actions are nothing but an attempt to pursue separatism under the banner of democracy. In doing so, he hollows out the true meaning of democracy itself.

His "green democracy" rhetoric, a political trick long used by the DPP, is riddled with double standards.

The DPP authorities present Taiwan as a vulnerable party in order to win international sympathy.

For example, in his speech, Lai mentioned the so-called flight obstruction incident during his recent visit to Eswatini, using it to portray himself as a "victim" of "rule-breaking", while accusing the Chinese mainland of "interfering with civil aviation order".

But the DPP authorities ignore the fact that the international community widely upholds the one-China principle. Their attempt to create "two Chinas" or "one China, one Taiwan" is itself a challenge to the existing international order.

Lai not only unilaterally tests the red line broadly recognized by the international community, but when his attempts meet resistance, he turns around and accuses others of breaking the rules.

In other words, when rules serve its political interests, the DPP loudly calls for respect for order.

But when those same rules stand in the way of its separatist schemes, it labels them political pressure. If this is not double standards, what is?

"Green democracy" is harmful to Taiwan. In his speech, Lai dragged the semiconductor and artificial intelligence industries into political confrontation and called for the building of so-called "democratic supply chains". Technological development and global trade have always depended on market rules and comparative advantage. Yet Taiwan's core industrial strengths are now being forcibly tied to specific political camps in an attempt to build exclusive technology barriers.

This move not only violates the principles of free trade, but also drags the global semiconductor supply chain into geopolitical rivalry.

The DPP authorities claim they are contributing to global economic prosperity, but in reality they are making the global technology industry bear the cost of tensions in the Taiwan Strait.

Worse still, they are turning the economic lifeline on which Taiwan residents depend into a bargaining chip against reunification.

Using bloc confrontation to interfere with market operations will inevitably weaken Taiwan's long-term industrial competitiveness. In the end, it is the Taiwan economy and residents of the island who will pay the price.

"Green democracy" is also deeply hypocritical. Lai loudly promotes Taiwan as a "beacon of democracy" and talks about "freedom", but since taking office, the DPP authorities have deliberately stirred up social conflict and division on the island.

They have even imposed "green terror" on groups and individuals who support cross-Strait exchanges, dialogue and peaceful development.

By creating social division and targeting political opponents, the DPP is seeking to consolidate its power base.

The outside world can see the true nature of its so-called "green democracy". Once the rhetorical disguise of Lai's "green democracy" is stripped away, the historical context of cross-Strait relations is clear, and the direction of development is beyond doubt.

The one-China principle is the political foundation for peace and stability in the Taiwan Strait. Once this foundation is removed, no amount of military equipment or "democracy" rhetoric can bring lasting security to Taiwan.

People on both sides of the Taiwan Strait are bound by blood. Only by promoting the peaceful development of cross-Strait relations and deepening integrated development in various fields can the real interests of Taiwan residents be served.

Separatist schemes that go against the trend of history have no realistic support. Blind faith in external promises and polished rhetoric will ultimately collapse before the tide of history.

It is time for the DPP's "green democracy" farce to end.

China-Serbia ties a good example for the world

The five-day state visit to China by Serbian President Aleksandar Vucic from May 24 to 28 was the best reflection of China's diplomatic principles, including the long-standing Five Principles of Peaceful Coexistence — mutual respect for sovereignty and territorial integrity, mutual non-aggression, non-interference in internal affairs, equality and mutual benefit, and peaceful coexistence.

The grand reception Vucic received in Beijing shows that China is committed to treating all countries, regardless of size, with equal respect.

This was further highlighted when President Xi Jinping awarded Vucic the Friendship Medal at the Great Hall of the People, the highest honor bestowed on foreign nationals by China.

Vucic is a deserving recipient of the medal for his significant contributions to promoting China-Serbia friendship and advancing bilateral ties.

The medal is also an appreciation for Serbia's independent foreign policy as a sovereign nation in international affairs.

Having spent nearly seven years in Brussels covering the European Union, I understand the pressure Serbia faces from the EU.

Maintaining an independent foreign policy that does not fully align with Brussels is challenging for any national leader, especially for Serbia, an EU candidate country since 2012.

Unlike some other major powers, China has never interfered in the internal affairs of Serbia or any other country, always treating them with full respect and equality.

Unlike many EU leaders, Vucic has consistently urged diplomatic solutions to end the Russia-Ukraine conflict. He has also advocated closer cooperation with China.

He used Serbia's positive experience to illustrate how the partnership with China has brought concrete benefits to ordinary people, workers and families.

It sends a clear message to other European countries that de-risking or protectionist strategies do not serve anyone's interests.

During my visits to Serbia, I witnessed the active participation of Chinese companies in the construction of the Belgrade-Budapest railway and various other infrastructure projects.

The more than 20 cooperation documents signed this week between the two governments will take bilateral cooperation to a higher level.

The two countries aim to tap the huge potential by aligning China's 15th Five-Year Plan (2026-30) and the Serbia 2030 national development agenda.

Unlike some other major powers, China has never interfered in the internal affairs of Serbia or any other country, always treating them with full respect and equality.

The same principle is reflected in China's decision to grant zero-tariff treatment from May 1 to exports from 53 African countries with which it has diplomatic relations.

It is worth noting that the agreement signed between China and Serbia to promote the implementation of China's four global initiatives — on global development, global security, global civilization and global governance — is extremely significant not just for the two countries but also for the entire world.

These initiatives aim to rally the international community to address many acute challenges facing the world today and make it a better place for every country.

That is also why Chinese Foreign Minister Wang Yi, in his address at a meeting of the United Nations Security Council in New York on Wednesday, emphasized the need to reinvigorate global development cooperation to strengthen mobilization, and revitalize global governance platforms to enhance their capacity for effective execution.

It's no secret that China and Serbia are quite different in culture, history, religion, political systems, and the size of their territory, population and economy.

They are also more than 7,000 kilometers apart. But that does not prevent the two countries from developing a strong mutually beneficial relationship based on equality and mutual respect.

It's a partnership that serves as an exemplary model of international relations.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

GAO HAIHONG

Transition of finance

Cooperative efforts are required to build a diverse and stable international monetary system

In 1971, former US president Richard Nixon closed the gold window, effectively ending the Bretton Woods system and absolving the United States of its obligation to convert dollars into gold at a fixed rate. This marked a pivotal shift in the global monetary landscape. That same year, former US treasury secretary John Connally's famous remark, "The dollar is our currency, but your problem", reflected Washington's confidence in the dollar's dominant position, despite long-standing criticisms from Europeans.

The early 1970s saw the first major test of the dollar's dominance with the onset of floating exchange rates, which introduced significant uncertainties. However, the dollar retained its supremacy, bolstered by strong network externalities and the US military and political influence.

Today, the dollar accounts for 57 percent of official foreign exchange reserves, down from 70 percent more than two decades ago, albeit at a gradual pace. The dollar still dominates the global foreign exchange market, as it is involved in 89 percent of transactions (on "net-net" basis) and holds a 51 percent share of the global payment system. It also remains preeminent in international banking loans and debt securities markets.

However, the dollar system faces mounting challenges. The US debt crisis undermines the dollar's status as a safe asset, and policies such as the US administration's "America First" have further shaken its credibility. The "triple whammy" of falling US Treasury bonds, stock markets and the dollar index in early April 2025 highlighted the vulnerabilities of the dollar's safe asset status. Increasing geopolitical risks and trade fragmentation further signal the unsustainability of the dollar's dominance, prompting a shift toward diversification.

First, non-dollar currencies are gaining significance in the international reserve system. The euro, as the second-largest international currency, is seeing increased calls for developing euro-denominated sovereign bonds, especially as rising defense expenditures boost the euro financing market. This could challenge the long-standing inertia that there is "no alternative to the dollar".

Non-traditional reserve currencies such as the Australian dollar and the Canadian dollar are also rising, while the renminbi is gaining ground, particularly in trade finance. The recent preference for gold underscores the confidence crisis facing the dollar system.

Second, geoeconomic factors are influencing currency networks. The fragmentation and restructuring of trade relations are creating new opportunities for currency choice, potentially shifting third-party currency pricing to local-currency settlement.

Third, in the payment system, low-cost transactions will no longer be the dollar's exclusive domain. New payment platforms and regional payment systems are increasing network choices, and the rapid development of digital currencies is transforming the payment ecosystem.

The transition period for the international monetary system is fraught with potential crises and disruptive currency competition, threatening global economic and financial stability. As the US retreats from multilateral systems, a leadership vacuum is emerging in the international monetary system, raising the specter of the Kindleberger Trap — the risk that the existing world power lacks the ability, while the ascendant power lacks the will, to provide the world with vital public goods, such as a stable anchor for the international monetary system.

In the 1930s, the collapse of the gold standard and power transitions between the United Kingdom and the US led to monetary chaos, attributed by Charles Kindleberger to a lack of international leadership. Joseph Nye later used the Kindleberger Trap in 2017 to discuss US-China power dynamics.

Currently, the Federal Reserve acts as the global lender of last resort. Despite its policies being US-centric, the Fed plays a crucial stabilizing role during crises. Its actions in providing liquidity and initiating dollar swap lines are vital tools for mitigating liquidity crunches and stabilizing markets.

Today's international monetary system shows similar danger signs. While the Fed maintains its leadership in providing global financial stability, its future willingness is uncertain. In January 2026, 10 national monetary authorities, including the European Central Bank, and the Bank for International Settlements issued a statement supporting the Fed, emphasizing central bank independence as a cornerstone of price, financial and economic stability. This reflects global concerns about financial stability. The Fed's absence would destabilize the dollar system.

Avoiding international monetary chaos requires enhanced cooperation and more countries providing global financial stability as a public good. Central banks need to take joint action, which remains a viable option for maintaining financial stability despite its challenges. Since 2008, the People's Bank of China has signed over 40 bilateral currency swap agreements, which enable it to play a larger role in supporting global financial stability.

Moreover, international financial cooperation should strengthen the Global Financial Safety Net, a multi-layered network of international financial institutions, regional financial arrangements and central bank currency swaps, so as to maintain global financial stability during turbulent times.

In conclusion, the international monetary system is at a crossroads, with opportunities and risks unfolding at the same time. Embracing change and fostering cooperation to build a diverse and stable international monetary system is the direction for the years ahead.

A global strategic awakening

The transition to green energy must be understood not as a cost but as an investment in stability, independence and long-term prosperity

The global energy crisis is driven not by a scarcity of resources but by a dangerous reliance on a geopolitically volatile fossil fuel system. Europe's vulnerability — a result of passive dependence on imported hydrocarbons — has turned energy insecurity into a recurring crisis, with households and industries bearing the brunt of price volatility and supply chain disruptions. This is not merely a market inefficiency; it is a structural flaw in the architecture of modern economies. The transition to new energy is, therefore, no longer only a climate policy option, but a strategic imperative for national and economic security.

Unlike fossil fuels, whose supply chains are hostage to choke points and political instability, as can be seen in the Strait of Hormuz, renewable energy offers a paradigm of inherent resilience. Sunlight requires no naval escorts; wind power is not subject to embargoes. By investing in and scaling these technologies, nations can reclaim energy sovereignty, insulating themselves from the zero-sum geopolitical contests that have long defined resource competition. The shift is already underway: Every installed solar panel and every commissioned wind farm reduces exposure to external volatility and strengthens domestic industrial foundations.

The evidence is clear. Countries that have moved decisively to deploy renewables are not only cutting emissions — they are building more resilient, self-reliant and economically competitive societies. The green transition, therefore, must be understood not as a cost but as an investment in stability, independence and long-term prosperity. In a world of mounting uncertainty, new energy is the only credible answer to the oldest question of how to secure a nation's future.

Amid this global strategic awakening, China's choices and actions stand out. China's energy endowment — "rich in coal, poor in oil, and short on gas" — is both an objective reality and a constraint it must face. As a country where oil dependence on imports has long exceeded 70 percent, China's sensitivity to energy security is self-evident. However, instead of pinning its hopes on geopolitical gambles, China has pursued its own path of green transformation with unwavering strategic resolve. As a result, China's energy mix can now be updated to "rich in coal, poor in oil, short on gas, but abundant in green power".

China has become a leading force in the global energy transition, boasting comprehensive advantages in installed capacity, technological sophistication, industry chain control and market application. Led by wind and solar photovoltaic, China's new energy installed capacity and power generation rank first in the world, placing it in an absolute top tier all by itself. Since the beginning of the 14th Five-Year Plan (2021-25) period, China has built the world's largest and fastest-growing renewable energy system. By the end of 2025, China's total installed capacity of wind and solar power reached 1.84 billion kilowatts, 3.4 times that of 2020, surpassing thermal power for the first time in history. The share of wind and solar power in total electricity consumption reached 22.2 percent, providing strong support for the green and low-carbon transition of China's energy structure.

Through platforms such as the Belt and Road Energy Ministerial Conference and the International Forum on Energy Transition, China has released initiatives such as the Suzhou Vision 2030 for Global Energy Low-Carbon Transition and Development, promoting an open and inclusive international energy market order.

What is even more commendable is that China is not only expanding its volume but also strengthening its quality. China's new energy industry has achieved a historic leap from running alongside global leaders to taking the lead, building the world's largest and most complete new energy industry chain. Offshore wind turbines and blade lengths are the largest in the world, and photovoltaic conversion efficiency has repeatedly broken world records. Over the past decade, the global average cost per kilowatt-hour for wind and solar PV projects has fallen by over 60 percent and 80 percent, respectively — a feat made possible in no small part by China's new energy industry. From PV modules to electric vehicles, China's products have been exported to more than 200 countries and regions, offering affordable solutions for the world's energy transition.

Looking ahead, China will continue advancing along the path of its green transformation drive. The outline of the 15th Five-Year Plan (2026-30) states that during this period, China will continue to increase the share of its new energy supply, promote a safe, reliable and orderly substitution of fossil fuels, focus on building a new-type power system and develop a strong energy nation. It aims to establish green and low-carbon production and lifestyles, achieve its carbon peak goal on schedule, and build a clean, low-carbon, safe and efficient new energy system.

Energy security is a vital component of national security. The strategic thinking underpinning China's energy strategy is to hold the "rice bowl" of energy firmly in its own hands. On this basis, China has actively advanced its green transition and achieved remarkable accomplishments, reflecting a profound strategic philosophy with Chinese characteristics.

First, leveraging its socialist market economy, mega-scale market, complete industrial system and its ability to "pool resources to accomplish major tasks", China has achieved coordinated green transitions across energy, industry, transportation, urban and rural areas.

Second, by focusing on breakthroughs in key technologies such as new energy development, energy storage and carbon capture, utilization and storage, China is fostering a green and low-carbon industry as a new engine of economic growth. This has nurtured the "new trio" of exports — new energy vehicles, lithium-ion batteries and photovoltaic products — as new growth poles.

Third, China emphasizes that the green transition must simultaneously advance carbon reduction, pollution control, green expansion, and economic growth, while coordinating ecological protection, livelihood improvement, job creation and common prosperity. It avoids a one-size-fits-all approach or sacrificing development.

Fourth, as the world's largest developing country, China has built the world's largest and most complete new energy industry chain. It supplies 80 percent of the world's PV modules and 70 percent of its wind power equipment, and through South-South cooperation, it supports other developing countries in enhancing their climate resilience.

The green transition is not a zero-sum game but a new opportunity for global cooperation. Through platforms such as the Belt and Road Energy Ministerial Conference and the International Forum on Energy Transition, China has released initiatives such as the Suzhou Vision 2030 for Global Energy Low-Carbon Transition and Development, promoting an open and inclusive international energy market order.

Chinese firms in Gulf focus of new biz ties

Ewpartners, Sohar International Bank team up with $1b deal signed in Oman

By **REN QI**
renqi@chinadaily.com.cn

Enhanced financial connectivity and localized support are becoming increasingly vital for Chinese enterprises deepening their presence in the Gulf region, a trend expected to unlock massive cross-border market opportunities, experts said.

As cross-border businesses transition from early-stage market expansion to a new phase of supply chain localization, project construction, local operations and long-term financing, the financial support required by these enterprises has become more diversified. It extends beyond basic account opening or settlement to comprehensive scenarios such as cross-border supply chain finance, project financing and multicurrency capital management.

> "Our partnership with Sohar International Bank strengthens Ewpartners' local financial cooperation platform in Oman."
>
> **Jerry Li,** founder and managing partner of Ewpartners

Highlighting this shift, Sohar International Bank and Ewpartners — formerly known as eWTP Arabia Capital — recently signed a strategic partnership agreement in Oman. The collaboration, expected to generate over $1 billion in financial cooperation, aims to fill this market gap by combining Ewpartners' Asia-Gulf cross-border investment network with Sohar International Bank's local banking capabilities to facilitate cross-border business flows.

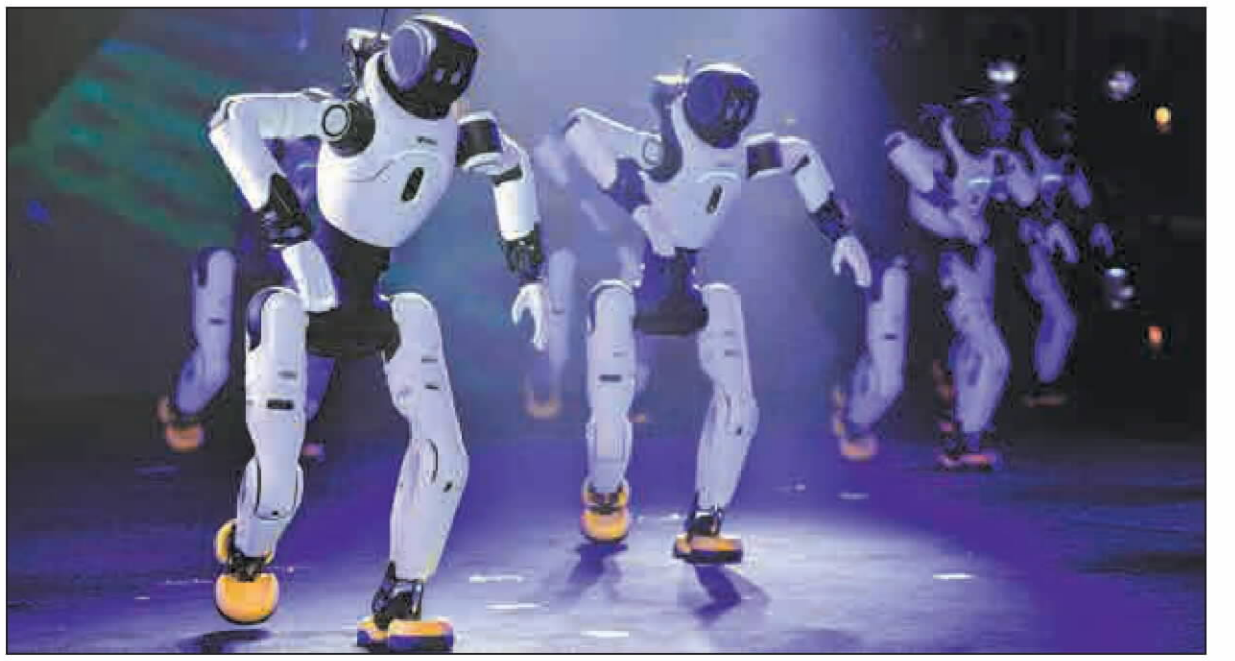
"Our partnership with Sohar International Bank strengthens Ewpartners' local financial cooperation platform in Oman," said Jerry Li, founder and managing partner of Ewpartners.

"By combining Sohar International Bank's banking capabilities with Ewpartners' Asia-Gulf investment network, we can better support our portfolio companies, ecological partners and industrial projects, while helping Oman's financial ecosystem participate more deeply in the commercial flows of the Asia-Gulf region."

Li said the decision to launch this partnership in Oman is consequential. Facing the Arabian Sea and connecting to Indian Ocean shipping routes, Oman's ports — including Sohar, Duqm and Salalah — are located outside the Strait of Hormuz, offering a natural logistical alternative when regional transit risks rise. Meanwhile, Oman has long maintained political stability and neutral diplomacy, providing an open trade environment for cross-border enterprises through the US-Oman Free Trade Agreement, the Pan-Arab Free Trade Area and connections to the Gulf Cooperation Council (GCC) market.

As Oman attracts foreign investment and builds industrial clusters relying on its ports, free trade zones and industrial parks, its value as a stable node and regional platform for Chinese enterprises entering the Middle East market is further highlighted.

The collaboration will initially prioritize Ewpartners' portfolio companies and partners. Ewpartners will be responsible for connecting enterprise needs and providing industry localization experience, while Sohar International Bank will offer financial services such as trade settlement, project financing and local capital management. The two parties said they will bridge the gap through corporate financing, project financing, trade financing, private credit and structured financing, while exploring sectors including logistics, industrial assets and income-generating real estate.



Abdul Wahid Mohamed al Murshidi, CEO of Sohar International Bank, said the partnership reflects a shared vision to enhance financial connectivity between Oman, the broader Gulf region and the rest of Asia. The joint effort will support enterprises, industrial projects and trade flows, reinforcing Oman's role as a regional platform for commercial connectivity, he said.

In April, Sohar International Bank received approval from the Hong Kong Monetary Authority to establish its first overseas representative office, while Ewpartners opened its Hong Kong office in May 2024. In the future, the cooperation between the two parties will extend from Oman to Hong Kong, further connecting with the Chinese market.

Ewpartners has been proactively establishing its presence in Oman since 2023. In 2024, the Oman Investment Authority (OIA), together with the Future Fund Oman, committed $150 million as cornerstone investors in Ewpartners' US dollar fund, focusing on advanced manufacturing, renewable energy and the biomedical industry.

By the end of the same year, Ewpartners invested in the United Solar Polysilicon project in Sohar, Oman, with a total investment of $1.6 billion. In November, Ewpartners established its second Middle East office in Muscat, adjacent to the OIA and other core institutions.

Popping routine

Humanoid robots perform a synchronized routine at the Intelligent Robot Carnival, which kicked off Thursday evening at the Tianjin Cultural Center in Tianjin's Hexi district. Held on the sidelines of the 2026 World Intelligence Expo, the four-day carnival, running through Sunday, features cutting-edge humanoid robots from leading Chinese manufacturers such as Unitree Robotics and Galileo. As a core component of the 2026 WIE, the carnival is designed to bring cutting-edge robotic technologies to the general public, integrating exhibition zones, robot sports competitions and immersive interactive experiences for visitors of all ages. PROVIDED TO CHINA DAILY

Weixin Pay, PayPal tie up on payments

By **CHENG YU**
chengyu@chinadaily.com.cn

Tencent said on Wednesday that United States users of PayPal will be able to pay at tens of millions of Weixin Pay merchants across China by scanning QR codes, marking one of the most extensive integrations yet between China's mobile payment ecosystem and foreign digital wallets.

The integration between Tencent's cross-border platform TenPay and US fintech firm PayPal marks one of the first large-scale international applications of China's unified cross-border QR code gateway system.

Under the partnership, US PayPal users visiting China will be able to pay directly at Weixin Pay merchants nationwide using familiar PayPal wallet accounts, without opening Chinese bank accounts. The service will initially launch for US PayPal users before expanding to other markets in phases, Tencent said.

The partnership will run through China's unified cross-border QR code gateway — a payment infrastructure system designed to standardize links between domestic and overseas wallets.

Otto Williams, senior vice-president of PayPal and regional head for PayPal World's Middle East and Africa, said: "China is home to one of the world's most sophisticated digital payment ecosystems, and for international travelers, the ability to pay seamlessly is integral to the experience of being here. Through PayPal World's partnership with TenPay Global, we are committed to ensuring international visitors can enjoy seamless payments using a wallet they already know and trust."

Tencent said the launch is part of a broader inbound payment service enhancement initiative built around product upgrades, overseas wallet integration and multilingual services ahead of the upcoming APEC.

Daniel Hong, vice-president of Tencent's fintech group, announced a series of measures including a 90-day waiver of the 3 percent international card transaction fee for first-time users linking overseas bank cards, covering daily spending of up to 1,000 yuan ($139).

Tencent also said Weixin Pay's in-app payment guidance has been expanded into 16 languages including English, Korean, Thai, Russian, Spanish and Arabic, while multilingual offline service desks have been established at Shenzhen, Guangdong province, airports, border checkpoints, hotels and major commercial districts.

Tencent said overseas transactions through Weixin Pay rose nearly 80 percent year-on-year between January and April.

Dong Ximiao, chief economist at Merchants Union Consumer Finance and deputy director of the Shanghai Institution for Finance and Development, described the coordination of the two major payment platforms' services as a landmark moment for China's cross-border payments infrastructure.

"The launch of Weixin Pay support for PayPal users in China, beginning with US users, is a symbolic event in the interconnection of China's cross-border payment systems," Dong said.

He said the unified cross-border QR code gateway, which launched trial operations in July 2025 under guidance from China's central bank and other authorities, solved a long-standing fragmentation problem in China's digital payments sector.

Previously, overseas wallets and Chinese payment systems had to negotiate and connect individually, resulting in high technical costs and inconsistent standards, Dong said.

"The PayPal integration marks a substantive shift from simple interconnection toward actual interoperability in China's cross-border payment infrastructure," he added.

Rockit apples to blossom in nation

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

China has become Rockit's largest global market, accounting for more than half of the brand's total revenue, Grant McBeath, global CEO of New Zealand's miniature apple brand Rockit, told China Daily in an exclusive interview.

McBeath added that the company will continue to channel its core resources and highest-quality produce to the Chinese market going forward.

"China is the key pillar in our global growth strategy," said McBeath, noting that it is the world's largest and most dynamic apple market with consumers who have an exceptional eye for quality and taste. "We focus our energy, innovation and resources to provide our best-quality apples to the China market."

Rockit now operates eight growing regions worldwide, ensuring year-round fresh supply to over 30 countries and regions.

Industry data underscore the high-stakes strategic opportunity. According to Beedata, an agriculture data provider, China accounts for over 50 percent of global apple consumption. New Zealand Trade and Enterprise (NZTE) 2025 annual data show China's apple imports surged 24 percent year-on-year to 1.84 billion yuan ($271 million) last year, with New Zealand dominating about 81 percent of the market.

Rockit alone accounts for about one-third of New Zealand's apple exports to China, leading the imported apple segment. To deepen the brand's presence in China, Rockit has launched its largest-ever brand upgrade.

From May 21 to Sunday, the brand opened its limited-time immersive pop-up "Rockit Every Moment" at Yuyuan Road in Shanghai, and officially announced popular idol Wang Yibo as its global brand ambassador.

"Rockit is a consumer brand, not a commodity apple brand. We take inspiration from other consumer categories, inject creativity into every link, and break through category limits to amaze people," said Julian Smith, Rockit's global marketing general manager.

He further proposed the core "Consumer Art" strategy to address the homogenization pain point in the agricultural industry. According to Smith, Chinese consumers are highly digitally savvy, more sensitive to brand authenticity and content innovation than most markets, and have a growing demand for healthy eating and quality consumption.

"This positioning helps us reach younger consumers and redefine choices for health-conscious Chinese consumers," he added.

As Zhang Chitao, general manager for Rockit Greater China, explained, Wang Yibo was chosen for his healthy, athletic image that aligns with the Rockit brand, as well as his cross-industry influence that will significantly boost brand awareness.

The online conversion data following Wang's appointment has validated Rockit's localized digital marketing strategy, while the offline pop-up combined with online social sharing has effectively amplified the brand story.

"We always align with local cultures and lifestyles, becoming an approachable brand that understands consumers. This is the core of Rockit's 'Consumer Art' strategy," Smith added.

Zhang further detailed Rockit's on-the-ground layout and future plans in China. On the channel front, the brand has established deep strategic partnerships with leading domestic fruit retailers including Pagoda, Goodfarmer and Fruitday, with over 20,000 local distribution stores nationwide.

While consolidating its core position in first- and second-tier cities, Rockit is accelerating its expansion into smaller cities through wholesale channels, Zhang said.

Over the next three to five years, the brand will roll out nationwide roadshows and in-store tasting events, paired with omnichannel exposure on platforms such as Douyin and Xiaohongshu to enhance brand awareness and household penetration, Zhang added.

McBeath also outlined that the brand might launch new products in the future, but for now, they would focus on expanding the miniature apple's market presence by increasing consumer trial rates, boosting household penetration, expanding store coverage across China, and launching new packaging formats and innovative marketing campaigns.

"Once consumers taste our apples, they will make repeat purchases," McBeath said.

Beverage companies thirsty for expansion

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Chi Forest, one of the fastest-growing beverage companies in the country, has started construction on its seventh wholly owned production facility, a move aimed at bolstering its supply chain nationwide and boosting delivery to central and western regions of the country.

The plant, based in Xuchang, Henan province, was launched with an agreement signed on Wednesday. Covering 223 *mu* (14.9 hectares), the project represents a total investment of over 1 billion yuan ($147.5 million).

The facility is expected to enhance the company's logistics response in Henan and neighboring regions, expand the logistics radius to within 300 kilometers, and reduce the reliance on deliveries from production units in other regions, Chi Forest said.

The expansion comes two months after the company opened in Xianning, Hubei province, a 200 million yuan "one-stop R&D innovation test base" — a 20,000-square-meter facility dedicated to research, pilot production and product incubation.

The center integrates laboratories, mini-factories and pilot lines, allowing the company to validate innovations such as liquid nitrogen fresh-lock processing and non-artificial coloring before scaling them across production.

The Xianning base serves as Chi Forest's innovation center. Its pilot lines can switch among 11 major beverage categories and 49 subcategories, enabling rapid validation of new products and technologies.

Since the launch of its factory program in 2019, Chi Forest has opened six smart manufacturing plants across China. The addition of the Xuchang plant completes the company's supply chain footprint nationwide.

Chi Forest's product portfolio spans sparkling water, electrolyte water, traditional Chinese medicine-inspired herbal tea, iced tea and vitamin water, with sales extending across China and exports to more than 40 countries and regions in Europe, North America and Southeast Asia.

So far, the company has invested nearly 8 billion yuan in infrastructure projects to bolster its manufacturing and research and development.

"The new facility allows Chi Forest to consolidate its competitive advantage in high-quality beverage production and rapid regional response," said Wang Pu, co-founder of Chi Forest.

Beating the heat

Medical workers from a Shanxi provincial hospital provide free health screenings for frontline railway employees at Taiyuan North Railway Station on Wednesday. As a key freight hub handling over 150 daily trains and critical summer thermal coal shipments, the station launched the initiative to enhance workers' health awareness and ensure safe operations amid rising temperatures that can push rail surfaces to nearly 50 C.

China monetizes computing power via tokens

Wuxi building 'token factory', taking lead to accelerate AI services into market

BEIJING — Behind every artificial intelligence breakthrough lies raw computing power. China, staying true to its characteristically pragmatic approach, is now racing to industrialize it.

Recent developments offer a striking glimpse of this trend. In Jiangsu province's Wuxi — a manufacturing powerhouse near Shanghai — electronics firm HON-Flex signed an agreement with the local government to build what they call a "token factory". Days later, China Telecom and China Mobile, the country's two telecom giants, began selling "token packages" directly to consumers, with entry-level plans starting at just 9.9 yuan ($1.46) a month.

The ambition runs deeper than merely expanding data centers and stockpiling AI accelerators. China is methodically converting computing power into measurable and priceable commodities — much like water, electricity or bandwidth. By leveraging the vast subscriber networks of traditional telecom operators that already reach billions of users, this push is poised to accelerate AI services into the marketplace.

Wuxi is helping serve as the physical anchor for this shift. HON-Flex has declared it will build a large-scale, high-performance supernode computing cluster in the city, powered by domestic chips and models.

This industrial-scale facility, which is built on AI accelerator clusters and combines power supply, liquid cooling systems, high-speed networks and large model inference optimization technologies, is intended to mass-produce AI tokens, the fundamental units of large language model output.

The "token factory" will initially deploy four Huawei Ascend 384 supernode servers, each packing the computing power of Ascend 384 AI accelerator cards.

The bureau of science, technology, industry and information technology of Wuxi National High-tech District said the new "token factory" will directly provide low-cost and high-efficiency intelligent computing power services to AI enterprises in Wuxi and the broader Yangtze River Delta region. Meanwhile, it will drive the agglomeration of chip adaptation businesses, model optimization industries and industrial application sectors in the city.

Visitors view supernode servers at the debut exhibition area for computing infrastructure and applications during an event in Tianjin on March 18. TONG YU / CHINA NEWS SERVICE

The project utilizes green power generated in Northwest China's Qinghai province, with an abundance of solar and wind power. Integrating basic clean energy-powered computing resources transmitted from the province to the supernode cluster in Wuxi, the project will convert raw "computing power" into standardized "tokens" that can be directly utilized by AI applications.

This approach makes full use of low-cost western green energy to reduce token production costs while ensuring consistent computing service provision.

The National Data Administration said China's average daily token calls had exceeded 140 trillion in March, which represented a surge of more than 1,000-fold compared with 100 billion at the beginning of 2024, and an increase of over 40 percent compared with 100 trillion at the end of 2025.

While the emergence of the "token factory" is reshaping the supply side of AI infrastructure, the distribution side is now moving just as quickly.

China Telecom on May 17 launched a series of trial commercial token packages, becoming the first Chinese telecom operator to announce such packages at the group level. Following the move, China Mobile on May 20 expanded the market with the launch of its own nationwide token packages.

The actions taken by China's leading telecom carriers point to a broader strategic shift — from selling connectivity to retailing access to foundational AI computing resources for consumers and businesses alike.

China Telecom's token package system mainly targets three groups — individual and household users and developers; micro, small and medium-sized enterprises; and token ecosystem partners.

In addition to major telecom operators, companies such as Alibaba Cloud and Tencent Cloud have also launched token service products. The rollout of these new packages and services is expected to speed up the spread of AI applications among consumers and make token prices more affordable.

The move will not only open a new gateway to inclusive AI services for ordinary consumers, but also promote deeper integration among communications, computing power and AI, creating new opportunities and space for the digital economy, industry experts said.

Zhou Guijun, editor-in-chief of telecom industry news portal C114, told 21st Century Business Herald that such products are expected to have greater market potential on the enterprise side. In his view, the real logic behind the telecom operators' push into the token economy is not tokens themselves, but the value chain behind them.

According to Li Fei, vice-president of Guochuang Software, token packages will help remove the twin hurdles that have dogged smaller businesses — high computing costs and technical barriers.

Micro, small and medium-sized enterprises no longer need to invest in their own servers or build models from scratch. By buying tokens as needed, they can quickly roll out AI applications like digital workers and content-generation tools, which will facilitate AI-driven upgrading for industries across the board, Li said.

XINHUA

Lightweight entrepreneurship a window into nation's innovation vitality

TIANJIN — Early morning at a science park in Tianjin, groups of young people streamed into the shared office space, booted up their laptops and kicked off their workday. Among them is Wang Haoquan, an entrepreneur in his 20s and founder of a cultural technology company.

His company is a typical one-person company. Empowered by artificial intelligence tools, Wang handles the entire business chain from video creativity, editing and production to online promotion single-handedly, providing digital marketing services for local merchants.

"Not long after its establishment, the company had already secured clients and achieved preliminary profitability," he said.

In recent years, youth entrepreneurship in China has taken on the characteristics of "light asset and high intelligence". Represented by OPCs, the lightweight entrepreneurship model has emerged in large numbers, becoming a key window into China's innovation vitality.

Differing from the traditional solo startup model, OPC refers to a business form where individuals can complete the full closed commercial loop from product research and development to market launch with the support of AI tools. AI agents help individual entrepreneurs complete multiple work processes that previously required team collaboration. Their joint efforts greatly reduce the barriers to entrepreneurship, allowing more young people to participate.

Since the end of 2025, more than 20 new OPCs — covering fields such as cross-border e-commerce, software development and AI content production — have been registered in the Huayuan science park in Tianjin Binhai High-tech Industrial Development Area.

Though run by individual founders, these companies form a collaborative network in the shared space, where individuals from different backgrounds can exchange technologies and creative ideas in real time to complement each other's resources.

A drone photo taken on June 21 shows a camping base at a seaside park in Binhai New Area in Tianjin. ZHAO ZISHUO / XINHUA

"I majored in art and lack sufficient knowledge in programming and other technical fields, but the OPC founder at the desk opposite is a senior programming expert. When encountering tricky technical problems, we can just look up and communicate face to face," Wang said, noting the vibrant entrepreneurial atmosphere in the community.

"This model retains the flexibility of individual entrepreneurship while possessing certain collaborative advantages," said Sun Lei, head of the park's operator. The platform has formed a service system from initial incubation to enterprise acceleration, providing support for enterprises at different stages of development.

This new trend has caught the attention of local governments across China, with Shenzhen, Guangdong province, Shanghai, Nanjing, Jiangsu province and other cities rolling out supportive policies. Longgang district of Shenzhen has issued a policy consultation document for OPC development, with "zero-cost startup" as the core highlight, attracting global AI agent developers and OPC entrepreneurs.

Tianjin Binhai High-tech Industrial Development Area has introduced policies such as office space subsidies and computing power cost support, providing a maximum annual subsidy of 300,000 yuan ($44,250) for OPCs to offset certain costs.

"The development of AI is reshaping the entrepreneurial landscape and we must seize this new track," said Chang Xinyue, director of the new economy bureau of Tianjin Binhai High-tech Industrial Development Area.

The "high intelligence" feature of Chinese youth entrepreneurship is becoming more prominent as a result of technological advancements. In the industrial system of the Haihe laboratory of brain-computer interaction and human-machine integration at Tianjin University and Tianjin Huanhu Hospital, enterprises are developing cutting-edge technologies such as brain-computer interfaces, combining neuroscience and AI for applications in health and other fields.

Industry insiders point out that the new generation of entrepreneurs relies more on knowledge and technological innovation. The technical content and growth potential of the enterprises are substantial, despite their modest size. This innovation-centered entrepreneurship model is becoming a driving force in industrial upgrading.

SPP hikes protection for disabled minors

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

China's procuratorial authorities are strengthening legal protection for minors with disabilities by using case-based supervision and cross-departmental coordination to address difficulties in accessing education, medical assistance, compensation and long-term development.

The Supreme People's Procuratorate and the China Disabled Persons' Federation recently released seven typical cases related to protecting the rights and interests of minors with disabilities. The cases cover issues such as traffic accident compensation, access to education, abandonment and relief, and medical damage claims.

The SPP said the cases show how procuratorial organs can use legal supervision to protect vulnerable minors and respond to public concerns with stronger rule-of-law support.

One case highlighted cross-departmental coordination. In April 2024, a county procuratorate in Jiangxi province received a tip-off that the local education bureau had improperly distributed subsidies for students with disabilities.

After inspecting records with education authorities and the disabled persons' federation, prosecutors found that 52 eligible students had not received subsidies, while three ineligible students had received more than 10,000 yuan ($1,470) in subsidy funds.

Prosecutors filed an administrative public interest litigation case and issued a pre-litigation recommendation. The bureau soon recovered the improperly paid funds, and worked with the local disabled persons' federation to review the subsidy program.

The 52 eligible students later received 156,000 yuan in subsidies. A follow-up review in September found no further problems.

The cases also show that prosecutors are looking beyond immediate relief to the long-term development of minors with disabilities.

In one sexual assault case, a girl, who was 13 at the time and had an intellectual disability, was assaulted by a man surnamed Li in April 2023. A county procuratorate in Fujian province prosecuted Li in October that year, and the local court sentenced him to prison for rape the following month.

While handling the case, prosecutors visited the victim's family and learned that she had athletic talent. The local county's disabled persons' federation worked with her special education school to design a tailored training plan and arrange professional coaching. After two years of training, she won a silver medal at the National Games for Persons with Disabilities in 2025.

Marine pharma and bio products sector boosted

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

The central government has rolled out a series of measures to boost China's marine-derived medicines and biological products industry, according to a document published on Thursday.

The document, jointly issued by eight central departments including the Ministry of Natural Resources, the National Development and Reform Commission and the Ministry of Science and Technology, outlines guidelines on accelerating the high-quality development of marine-derived medicines and biological products. It marks the first time China has issued specific measures to advance the industry.

According to the document, the guidelines cover all businesses engaged in developing medicines and biological products using marine organisms, including their metabolites, minerals and other substances as raw materials. They aim to promote technological and industrial innovation.

The document also sets multiple goals for the industry to achieve by 2030, such as the launch of several new marine drugs, an overall industrial added value of at least 130 billion yuan ($19 billion), major progress in innovation capacity and industrial clustering, and positioning China as a global leader in the field.

A total of 15 specific measures are listed in the guidelines, including consolidating resource supply, strengthening technological innovation, optimizing industrial development orientation, promoting consumption of marine medicines and biological products, and improving policy support.

Shen Jun, a senior official in charge of marine strategic planning and economy at the Ministry of Natural Resources, said marine biomass accounts for 87 percent of the total biomass on Earth, making the oceans a vast repository of medicinal resources.

She noted that the Chinese government attaches great importance to the development of the marine pharmaceutical and biological products industry.

"Since the 18th National Congress of the Communist Party of China, our marine biomedicine industry has achieved substantial progress. Last year, the industrial added value in this country reached 99.6 billion yuan," the official said.

Shen said the guidelines emphasize coordinated planning and collaboration among government authorities, improved government services and supervision, besides encouragement for local governments to develop relevant industries based on local conditions.

Zhang Donghua, executive president of the Marine Biomedical Research Institute of Qingdao, said the marine environment is marked by extreme conditions including high pressure, high salinity, low light and oligotrophic, poor plant nutrients, surroundings. Such unique habitats drive marine organisms to produce secondary metabolites with novel structures and distinctive biological activities.

"Globally, marine biomedicine has become a strategic emerging industry prioritized by major maritime nations. The implementation of the new guidelines will help improve resource supply, optimize investment and planning, and advance research in core technologies, thus strengthening the overall competitiveness of China's marine biomedicine industry," he said.

Birthday for Maodou

Students run their own stalls during a campus market at an elementary school in Suining, Sichuan province, on Thursday. Through hands-on buying and selling activities ahead of International Children's Day, children learn teamwork, budgeting and the value of work. LIU CHANGSONG / FOR CHINA DAILY

BLUEPRINT INTO ACTION

Henan to strengthen role as strategic hub

Upgrading logistics key to province's goal of serving domestic, intl markets

By **SHI BAOYIN**
and **QI XIN** in Zhengzhou

Provincial leaders in Henan have outlined key plans for hub construction, industrial upgrading and high-level opening-up during the 15th Five-Year Plan (2026-30) period at a news conference in Zhengzhou, the provincial capital, on Thursday, laying out clear paths to build an opening-up highland.

Governor Wang Kai said Henan aims to strengthen its role as a national strategic hub and develop a high-quality inland opening-up area.

In the coming years, Henan will seek to build a circulation hub for the national unified market and create a dual circulation hub serving both domestic and international markets, he said.

"The biggest characteristic and advantage of Henan is its ability to connect the East and West, the South and North. This unique geographical and transportation advantage makes Henan stand out in the construction of a unified national market," Wang said.

Wang emphasized that Henan would focus on upgrading transportation and logistics by promoting integrated, safe, digital and green transformation of its transportation system.

"Henan plans to enhance international connectivity, reduce logistics costs and expand network coverage, while strengthening modern logistics corridors and hubs," Wang said.

According to Wang, targeted efforts will include improving the Zhengzhou-Luxembourg Air Silk Road dual-hub model and upgrading the Zhengzhou-Europe Railway Express assembly center.

The province will also create a pivot for promoting foreign trade by upgrading the pilot free trade zone, expanding the functions of the comprehensive bonded zone, strengthening goods, service and digital trade, as well as enabling more goods and high-quality products from Henan to enter global markets, he said.

Zhang Min, executive vice-governor of Henan, said the province has achieved significant opening-up results in recent years, noting that Zhengzhou airport has achieved a 1-million-metric-ton air cargo throughput, ranking fifth nationwide in international air cargo.

Zhang emphasized that Henan will seize new opportunities in the second golden decade of the Belt and Road Initiative and advance efforts in several areas.

While strengthening the role of the Air Silk Road and building a dense intercontinental air route network, Henan plans to optimize land transportation channels, promote the expansion of China-Europe and Central Asia freight trains, develop multimodal transport, and achieve coordinated development of air, land, data and sea routes.

Zhang added that the province will further develop international markets, rely on industrial upgrading and technological innovation, enhance product competitiveness, and promote global sales of its brand products, including high-end equipment and characteristic light industry goods.

The province will also deepen two-way cooperation, optimize the business environment based on platforms such as the pilot free trade zone and Zhengzhou Airport Zone, actively attract foreign investment, and support local enterprises in expanding overseas markets to achieve win-win cooperation, according to Zhang.

"Henan aims to enhance the quality, innovation and green value of local products," she said.

While accelerating opening-up, Henan will further integrate its culture and tourism industries. "As an important birthplace of Chinese civilization, the province will strengthen the protection and innovative use of cultural heritage," Zhang added.

The province also seeks to advance the creative transformation and innovative development of its traditional culture, allowing cultural heritage to thrive in the new era.

Briefly

13 dead, 3 injured in traffic accident

Thirteen people have been confirmed dead and three others injured after an overloaded passenger van rear-ended a semi-trailer truck on an expressway section in Central China's Henan province early on Thursday morning, according to local authorities. The crash took place at around 2:40 am at a section in Nanyang city. The nine-seat passenger van was carrying 16 people at the time of the accident. The Ministry of Public Security has dispatched a work team to Nanyang to guide the investigation and response efforts.

Mainland, SARs legal seminar held

The 14th Mainland, Hong Kong and Macao Legal Seminar was held in Xiamen, Fujian province, on Thursday, with emphasis on strengthening talent education and promoting economic development. Jointly organized by the China Law Society, the Department of Justice of the Government of the Hong Kong Special Administrative Region, and the Secretary for Administration and Justice of the Government of the Macao Special Administrative Region, the event aims to better leverage rule of law as a key safeguard for advancing various fields of cooperation between the mainland and the SARs, while also seeking to inject strong legal momentum into the high-quality growth of the Greater Bay Area and the promotion of high-level opening-up.

Fraud verdict against criminal gang upheld

The Chongqing Higher People's Court on Thursday rejected the appeal of members of a criminal gang led by Xu Faqi while upholding the first-instance verdict pronounced on Jan 30 this year. The court also approved Xu's death sentence with a two-year reprieve. The first-instance judgement for the syndicate members, delivered by the Fifth Intermediate People's Court of Chongqing Municipality, determined that the defendants' actions constituted six crimes, including fraud, intentional injury, and drug smuggling and trafficking. In addition to the verdict against Xu, defendants Zhang Longlong, Luo Yujun, Xi Kangqiang and Liu Shibing were sentenced to terms ranging from life imprisonment to up to 25 years, along with additional penalties like property confiscation and fines. Zhang, Xi and Liu appealed against the verdict, which was dismissed by the second-instance court. The court ruled that the first-instance verdict was based on sufficient, true evidence and legitimate procedures.

CHINA DAILY—XINHUA

Top court clarifies rules on estate administration

By **CAO YIN**
caoyin@chinadaily.com.cn

China's top court has reaffirmed the importance of the proper handling of estates following a person's death, disclosing five landmark cases that clarify who can serve as an estate administrator and what duties the role entails.

The Supreme People's Court last week highlighted the importance of correctly applying the estate administrator system under the Civil Code, which took effect in January 2021, and instructed judges nationwide to strictly implement the law.

The estate administrator system is considered a major innovation under the code. It serves as a legal tool to balance the secure management of a decedent's assets, the protection of inheritance rights and the lawful settlement of creditors' claims, according to the top court.

The system also helps resolve disputes, limit conflicts, prevents the concealment or misappropriation of assets, and maintains family harmony and social stability, the court said, adding that "it should be used to address public concerns such as estates left unmanaged, assets being damaged or lost, and challenges posed by an aging population".

Under the code, if there is no heir or if all heirs renounce their inheritance, the civil affairs authority or the village committee where the deceased lived before death can serve as the estate administrator. Chen Yifang, chief judge of the top court's First Civil Division, highlighted the necessity of the arrangement, but described it as a form of public service and an alternative option.

"If an heir provides a written renunciation of inheritance — whether to avoid managing the estate or to evade the deceased's debts — but continues to possess or dispose of the estate's assets in practice, that renunciation is invalid," she said.

One of the disclosed cases illustrates the point. An individual surnamed Yang died in 2024, owing 100,000 yuan ($14,700) to two individuals surnamed Hua and Ma. The creditors sued Yang's father, mother and daughter.

During the trial, all three heirs submitted written renunciations of their inheritance, so the court did not support the creditors' claims.

However, after the ruling, the three heirs collected more than 200,000 yuan in funeral subsidies, pension benefits and social insurance payments belonging to the deceased. The creditors, meanwhile, asked the court whether it could appoint the local civil affairs bureau as the estate administrator, given that the heirs had renounced their inheritance rights.

"Although the heirs had formally renounced their inheritance, they had in fact taken control of the deceased's assets, making the renunciation invalid. The heirs therefore must repay the debt," the court said, adding that the civil affairs bureau could not step in as a fallback administrator.

Chen cited the case as an example of "fake renunciation to evade real debt". She emphasized that such behavior must not be tolerated and warned that the rule allowing civil affairs authorities or village committees to act as administrators should not be abused.

She also clarified how an estate administrator should be selected under the code. If the deceased had designated an executor in a will, the court can appoint that person or entity as the administrator in accordance with the deceased's wishes.

If no executor was named, the heirs should choose an administrator. If they cannot reach an agreement, all heirs must serve as joint administrators, according to Chen.

"Only when there is genuinely no heir or when all heirs have validly renounced their rights should civil authorities step in," she said.

Once a person or organization is named estate administrator, they must fulfill duties including taking inventory of the estate, listing all assets and debts, and providing a full and accurate accounting to heirs, banks, property registration authorities and creditors, Chen said.

She added that administrators must also take reasonable measures to protect the estate from damage or loss and must not abuse their authority.

The estate administration system has drawn greater attention following the death of a 46-year-old woman in Shanghai. The deceased, surnamed Jiang, lived alone, had no spouse or children, and had lost both parents. After suffering a cerebral hemorrhage in October, she was cared for by a distant relative before her death in December.

Her case sparked public concern after local authorities encountered difficulties locating her next of kin to make key medical decisions and handle funeral arrangements.

At the end of 2025, the Hongkou district civil affairs bureau was appointed Jiang's estate administrator by a local court after it determined that she had no legal heirs and had left neither a will nor a support agreement.

Towering Beijiang bridge takes shape

By **QIU QUANLIN** in Guangzhou
qiuquanlin@chinadaily.com.cn

The main section of the Beijiang Grand Bridge, a key project of the Qingxin-Huadu Expressway in Guangdong province, has been successfully linked, laying a solid foundation for its opening by the end of the year.

Construction of the 1,440-meter cross-river bridge, currently the largest four-tower, double-cable-stayed, two-way directional prestressed concrete girder bridge in China, began in October 2022.

Following 48 hours of continuous monitoring of elevation changes, tower cranes and mobile cranes extended their long arms as nearly 56 cubic meters of concrete were poured over a four-hour period in the early morning of May 20, culminating in the successful joining of the bridge.

After the operation, the bridge spanning the Beijiang River, a tributary of the Pearl River, began to take shape, showcasing its four cable towers shaped like phoenix tail feathers.

The project has faced an uphill battle due to complex geological conditions, according to Zhou Wei, director of the Qingxin-Huadu Expressway management office.

"The bridge site is characterized by extremely well-developed karst formations," Zhou said, adding that construction had to pass through multiple bead-like caverns. "Any slight misstep could lead to a cave-in or flooding."

The main piers consist of 120 piles with an average length exceeding 80 meters, with the longest reaching 102 meters, according to Zhou.

The project team implemented a one-plan-for-one-pile scheme for meticulous management, developing targeted pretreatment plans for the caverns.

"The scheme helped ensure a 100 percent success rate in achieving the required standards for the initial drilling of all 120 pile foundations for the main piers," Zhou said.

As all four main towers of the bridge are located in the water and are nearly 150 meters tall, alignment control has proved extremely difficult, with the structures affected by strong winds, floods and ship traffic, Zhou said.

"It's more like embroidering in mid-air at a height of 100 meters," he added.

High-tech platforms and intelligent systems were adopted during the bridge linking process, according to Xu Lu, project manager of the TJ3 section of the Qingxin–Huadu Expressway at China Railway Major Bridge Engineering Group.

"Linking the bridge was particularly challenging due to its considerable width of 37.6 meters," said Xu.

During the linking operation, a cable-stayed form traveler was used as a mobile working platform to pour concrete segment by segment. In addition, technologies including digital building information modeling, Beidou positioning, and comprehensive stress-strain monitoring systems were applied to continuously track bridge deck elevation and stay cable tension.

An intelligent closed-loop system integrating construction, monitoring, feedback and adjustment was also established, with more than 300 sensors embedded in the main beam to continuously monitor concrete stress, cable tension and temperature.

"We independently developed a universal tensioning and anchoring mechanism to fully adapt to the spatial position changes of the cable-stayed anchorage points," said Liu Wang, chief engineer of the expressway's TJ2 section project team at CCCC Road & Bridge International Co.

The expressway, approximately 54 kilometers long, starts in Qingxin district of Qingyuan, in the northern mountainous part of Guangdong, and ends in Tanbu township of Huadu district in Guangzhou, the provincial capital.

Welcome to ethnic art

A performance greets guests attending the exhibition of paintings and calligraphy in Huangshan, Anhui province, on Wednesday. The event showcases outstanding artworks created by ethnic Chinese artists within RCEP member nations, blending traditional Chinese artistry with diverse cultural elements.

Top nature conservation body lauds natl progress

Ecological civilization concept gains global recognition in Guangzhou

By **LI WENFANG** in Guangzhou
and **LI MENGHAN**

A senior official of the world's leading conservation body has praised China's progress in nature conservation and ecological restoration, saying the country is offering the world a new paradigm of coexistence between humanity and nature, underpinned by its concept of an ecological civilization.

"I believe that in the 21st century, we will see global conservation leadership coming more and more from East Asia, particularly from China," said Stewart Maginnis, deputy director-general of the International Union for Conservation of Nature.

He made the remarks on Wednesday in Guangzhou, Guangdong province, at the ongoing Nature-based Solutions Summer School — an event that brings together more than 40 experts from different countries and will later move to the Hong Kong Special Administrative Region.

First coined by the World Bank in 2008, the concept of nature-based solutions was formally defined and issued with a global standard by the IUCN in 2016, proposing the use of nature and healthy ecosystems to address societal challenges and benefit both people and nature.

Reflecting on his multiple trips to China since 1999, Maginnis pointed

Stewart Maginnis

to visible changes over the years, including cleaner water and bluer skies, and attributed his frequent visits to the country's role as a hub for developing and applying nature-based solutions.

"China has applied, walked the talk, and set a good example," Maginnis said, highlighting that the country has met its target of placing 15 percent of its terrestrial area under protection, with steady, continued growth, while taking a leadership role in marine and coastal conservation and spearheading the shift to renewable energy.

He mentioned the restoration of the Loess Plateau — some 50,000 square kilometers of severely degraded land that has been brought back to vibrant biodiversity and productivity — and the coastal wetland restoration in Yancheng, Jiangsu province, where the removal of the invasive alien species, smooth cordgrass, has revived a critical habitat for migratory birds.

Maginnis also cited the Haizhu National Wetland Park in Guangzhou, which, without visionary leadership, would have been turned into a commercial development that could have harmed biodiversity. He said the park is certified under the IUCN's Green List, the highest standard for effectively and equitably managed protected areas, noting that China now has the most Green List sites worldwide.

"It is not an accident that we are making so much collaboration and so much progress on nature-based solutions here in China," Maginnis said. "The framing and context, driven right from the top, create perfect conditions for each of these solutions."

China is bringing much-needed conceptual frameworks to the world — especially the idea of coexistence, which does not separate nature from society. This is reflected in the philosophy of ecological civilization and the concept that lucid waters and lush mountains are invaluable assets, he added.

This conceptual leadership, Maginnis added, is complemented by a mutually beneficial partnership in which IUCN helps recognize and disseminate good practices, while China provides real-world, large-scale application of such cases. Some of China's practices have already been replicated in other countries.

"China becomes more and more prominent in extending technical assistance to other countries. I am very hopeful that we will start to see nature-based solutions as a key part of that technical assistance," he said.

Fujian casts net deeper to bolster aquaculture

By **HU MEIDONG**
and **ZHANG YI** in Fuzhou

Construction of two massive intelligent deep-sea aquaculture platforms named *Yunhai*, or "farming the sea", will be completed by the end of this year in the waters of Fuzhou, adding to the city's existing fleet and bringing the total number of smart platforms in the marine-resource-rich capital of Fujian province to 15 units.

Data from the Fuzhou Ocean and Fisheries Bureau shows that the city's smart platforms encompass 270,000 cubic meters of water, yielding more than 2,200 metric tons of seafood annually with an output value of 300 million yuan ($44.25 million), placing Fuzhou among the national leaders in deep-sea aquaculture.

In recent years, a fleet of advanced deep-sea platforms, dubbed the "Iron Men of the Sea", has been intensively deployed across Fuzhou to cultivate high-quality seafood such as large yellow croakers and abalone. These platforms use automated feeding and monitoring systems, significantly reducing labor while supporting the development of modern marine ranches.

Among the deployed fleet, platforms named *Qiandong*, which hold nearly 50 patents and copyrights, are scaling up commercial large yellow croaker production in Dinghai Bay, Lianjiang county of Fuzhou.

Featuring 20,000 cu m of breeding water each, the zero-carbon system integrates four core subsystems, including an automatic rotating cage powered by complementary solar and wind energy, and operates nearly 20 smart sensors for digital management.

Li Xiaoping, assistant to the chairman of Qiandong Marine Granary, said the equipment features a 360-degree floating cage that can withstand super typhoons above wind scale 16+, requiring only one or two crew members for routine maintenance.

"The cage integrates automated rotating and lifting technologies, turning above the water level every three days for sun-drying to clear biofouling," Li said. "This effectively resolves historical harvesting and biofouling bottlenecks faced by earlier models, eliminating the need for frequent service vessels."

The upcoming *Yunhai* platforms represent a 130 million yuan investment with a combined capacity of 170,000 cu m, scheduled for completion by the end of this year.

Chen Jinwen, a technical employee of Marine Granary (Fujian) Technology Co, said the *Yunhai* platforms achieve an 80 percent digitization rate across the entire production life cycle, featuring 10 feed silos with a capacity of 10 tons each for smartphone-controlled feeding.

"Because open-ocean currents are rapid, the high activity level of the fish ensures superior meat quality that closely resembles wild-caught species," Chen said.

Chen added that local government support, including the provision of sea areas free of charge, has boosted industry confidence. "Moving forward, we will invite traditional local fish farmers to become shareholders to help manage the assets," he said.

"This initiative will help traditional fishermen transition into shore-based fishermen, managing advanced marine ranches directly from their smartphones," Chen said.

According to the Fujian provincial government work report, the province's deep-sea aquaculture scale ranks first in the country. Fujian is deepening its "Maritime Fujian" initiative to push aquaculture further into the deep sea.

Provincial leaders attended a meeting in Fuzhou on Thursday to discuss accelerating the development of distinctive rural and agricultural industries, transforming agriculture into a modernized sector, and further improving farmers' livelihoods.

China-Serbia bond forged in steel as 2 breakthroughs achieved

By **ZHANG YU** in Shijiazhuang
zhangyu1@chinadaily.com.cn

China-Serbia cooperation in green steelmaking has achieved two major breakthroughs, with researchers successfully trial-producing a high-end automotive steel panel and confirming that Serbian iron ore can meet green steel standards through hydrogen metallurgy, HBIS Group, one of China's largest State-owned steelmakers, said.

During a meeting with HBIS Group Chairman Liu Jian in Beijing on Tuesday, Serbian President Aleksandar Vucic praised the Chinese steelmaker for revitalizing the Smederevo steel plant and benefiting the Serbian people over the past decade.

Vucic said the company's investment had strengthened the "iron-clad friendship" between China and Serbia.

The meeting, attended by Chinese Ambassador to Serbia Li Ming and Serbian ministers, came 10 years after the Hebei province-headquartered steelmaker acquired the struggling plant and transformed it into HBIS Group Serbia Iron & Steel.

> "I deeply realized that precision and efficiency are crucial to success. All innovations are planned in advance, with clear goals, step-by-step implementation, and strict attention to detail."
>
> **Dusan Kostic,** an employee at HBIS Serbia

The technological advances were achieved by a China-Serbia joint laboratory established by HBIS and the University of Belgrade. Approved by China's Ministry of Science and Technology in October 2024, it is the first national-level Belt and Road joint laboratory in China's steel sector.

In late April, researchers successfully trial-produced high-image-clarity dual-phase steel for outer automotive panels at a production line of HBIS in Hebei province. The breakthrough overcame a long-standing challenge in applying high-strength dual-phase steel to outer body panel forming, marking a step toward higher-end and lower-carbon steel production.

Separately, the laboratory verified that Serbian iron ore achieved a reduction degree of 99.74 percent through hydrogen metallurgy, meeting standards for green steel production, according to Hebei Daily.

Researchers said the result suggests that large quantities of Serbian iron ore could potentially be processed locally at the HBIS Serbia plant, supporting the production of green steel products compatible with the European Union's Carbon Border Adjustment Mechanism.

Vladan Mihailovic, chief operating officer of HBIS Serbia, said the joint laboratory had become an important platform for optimizing production processes, improving steel quality and enhancing energy efficiency.

On environmental projects, Mihailovic said the company had made substantial progress in environmental monitoring and optimization, emission-reduction technologies and energy-efficiency improvements, with efforts focused on dust control, water treatment upgrades and reducing resource consumption.

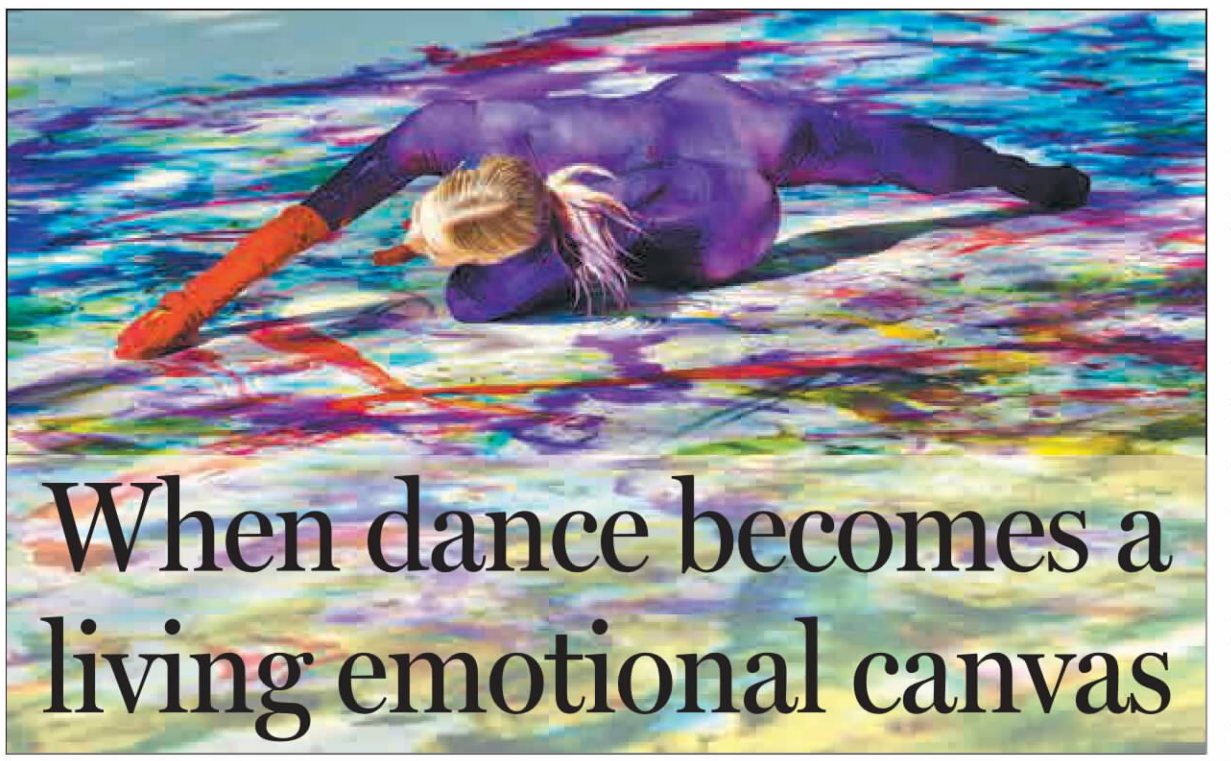
"These results fully demonstrate the company's firm commitment to sustainable development," he said.

The laboratory is currently running eight joint research projects, including two at the national level. Since its establishment, it has organized 34 personnel exchanges and 53 person-times of training between the Chinese and Serbian sides, while providing 72 instances of research collaboration and technical guidance for Serbian partners.

Dusan Kostic, deputy head of the heating furnace and slab yard at the hot-rolling mill of HBIS Serbia, said training in China exposed him to a work culture that "never waits for tomorrow".

"I deeply realized that precision and efficiency are crucial to success. All innovations are planned in advance, with clear goals, step-by-step implementation, and strict attention to detail," Kostic said.

He said he plans to apply new organizational methods learned in China to improve operational efficiency, adding that the patience and dedication to quality shown by Chinese colleagues had left a deep impression on him.



Mihailovic said he hoped the joint laboratory would continue serving as both an engine for innovation and a bridge connecting different knowledge systems, cultures and working styles, helping HBIS Serbia remain a modern, responsible and competitive industrial enterprise.

During the meeting in Beijing, Vucic pledged the Serbian government's full support for HBIS Serbia's green energy projects, while Liu said the company would continue advancing technological upgrades and strive for more landmark achievements in green and high-end steelmaking.

CULTURE

When dance becomes a living emotional canvas

Artists from two countries perform in a work that draws from ancient philosophy while embracing modern artistic expression, **Chen Nan** reports.

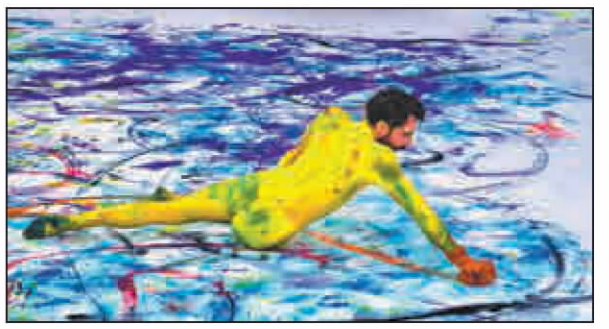
In the luminous spaces of the Guangzhou Grand Theatre, internationally acclaimed artist Shen Wei will unveil his latest work, *MindScape*, a collaboration between the Guangdong Modern Dance Company and Shen Wei Dance Arts. The work will premiere on June 5 and 6, before traveling to the American Dance Festival at Duke University in Durham, North Carolina, in July and later to Lincoln Center's Summer for the City in Dance Encounters, a new outdoor series, during Chinese Arts Week in New York from July 22-25.

MindScape is the latest chapter in Shen's decades-long artistic exploration, blending modern dance with poetry, painting, calligraphy, and live music.

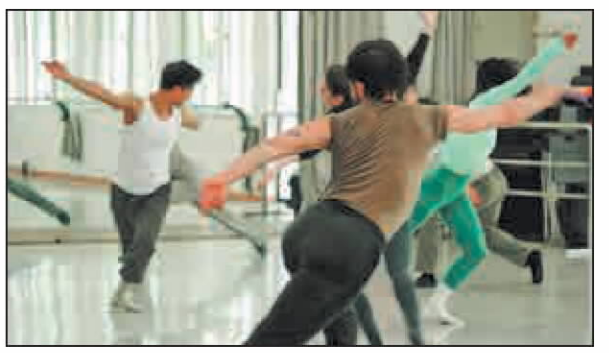
But this work is perhaps one of his most introspective yet, drawing on the philosophical ideals of Chinese literati and the spiritual pursuit of harmony between humanity and nature.

"*MindScape* is about my inner landscape," says Shen, a choreographer, painter and visual artist. "It reflects how I face life — success, hardship, and the balance needed to keep moving forward. This series is about the power of thought and spirit over material concerns."

The production merges traditional Chinese music with contemporary soundscapes, featuring *guqin* (a seven-stringed Chinese zither) virtuoso Zhao Xiaoxia, *xiao* (Chinese vertical bamboo flute) player Liu Xiaogang, percussionist Chen Shijie, and electronic music.



"I want people to feel happy, uplifted," Shen says. "This project is about making traditional instruments, like the *guqin* and *xiao*, feel contemporary, fresh and pleasurable."



The genesis of the work spans two continents. Last year, Shen began experimental workshops in the United States, developing movement vocabularies with American dancers while collaborating with Chinese musicians on an original score.

This year, five dancers from the US joined seven from China and worked together in the studio in Guangzhou, while the traditional instruments were reimagined in a modern context. "I've long been exploring contemporary expression of ancient instruments," Shen notes. "This is an international project — artists from China and the US collaborating to create a shared vision."

The choreography reflects Shen's signature approach, encouraging movement to emerge organically from dancers' internal impulses. But this time, the work also incorporates live painting and calligraphy: the stage floor will be covered in canvas, allowing dancers to leave traces of color and ink through movement. "Every performance becomes a 'mindscape' painting," he says. "It's about life, joy, struggle, and the energy we create together."

Traveling around the world to work with international artists on diverse art projects, Shen, a New York and Paris-based artist, is known for his work at the opening ceremony of the 2008 Olympic Games in Beijing. He choreographed the breathtakingly beautiful dance piece, *Scroll Painting*, in which dancers performed on a constantly changing LED scroll of Chinese ink-and-wash paintings, depicting the evolution of China since ancient times.

PHOTOS PROVIDED TO CHINA DAILY

> *MindScape* is rooted in Eastern philosophy, expressed through an international dance language. Its essence is inward observation — moving with restraint, guided by breath and emotion."
>
> **Guo Fan,** Guangdong Modern Dance Company dancer

Shen's relationship with the Guangdong Modern Dance Company is deeply personal. "This is my mother troupe," he says. "I arrived here over 30 years ago, in 1989. Returning to create this work is both a homecoming and an opportunity to reconnect tradition with the present."

The costumes in *MindScape* reflect the same philosophy. Inspired by southern Chinese craftsmanship, the designs incorporate bamboo elements that merge heritage with contemporary aesthetics.

"I once received a gift from Yang Meiqi, a founding member of the Guangdong Modern Dance Company. It was a vest made from small bamboo pieces instead of fabric," recalls Shen.

Bamboo, naturally breathable and cooling, suits the humid climate of southern China such as Guangdong province. Symbolically, it also represents resilience, flexibility and the moral integrity of a scholar in Chinese culture — qualities central to the philosophy behind *MindScape*, Shen says.

The work is also accompanied by Shen's own writings and visual art. Eight texts written over decades in China, the US and Europe will be released alongside the premiere, reflecting on resilience, joy and observation.

Shen will also release a new book, *When the Rose Kisses the White Cloud*, named after a poem he wrote in Paris, which reflects his fascination with fleeting beauty and enduring optimism.

"Life contains both pain and joy," he says. "I want people to feel the energy of living fully, to be inspired by the spirit rather than material concerns."

Born in Xiangyin county, Yueyang, Hunan province, in 1968, Shen began training in local opera at age 9, studying singing, dancing, acting, and martial arts. He had already started traditional Chinese painting at 7. In 1989, he turned to modern dance at the Guangdong Dance Academy and became a founding member of the Guangdong Modern Dance Company in 1991. After winning a national choreography award in 1994, he moved to New York on a scholarship and founded Shen Wei Dance Arts in 2000, while continuing to innovate across dance, painting, and filmmaking.

American dancer Zak Ryan Schlegel, 36, who has worked with Shen for 11 years, reflects on the premiere of *MindScape*: "Bringing this work to the stage feels like opening a collective dream state — a common consciousness." The piece, described by Schlegel as a culmination of Shen's visual, physical, and spiritual vocabularies, expands the choreographer's legacy into a deeply human exploration of interconnectedness.

During rehearsals, dancers were encouraged to explore their inner worlds — memory, emotion, perception, and imagination — to build a shared dimension onstage.

"From feeling sunlight on our faces to recalling memory-triggered visions with closed eyes, the challenge was in meeting ourselves through new lenses and returning to our most intimate perceptions," Schlegel says. "This process shaped the work's living spaces, evolving with each performance."

One moment that resonates deeply with him came during a sextet set to a flute solo. "We become the wind. I feel transported to the New Mexican desert of my ancestors, moving in harmony with the other five. Though we are six onstage, we are one in landscapes of memory," he says.

Collaboration lies at the heart of *MindScape*. "Connection is the oxygen the dance must breathe. Shared breath and intuition allow us to harmonize emotionally and physically, meeting one another through all our different experiences," he explains. The work becomes not only a performance but also an act of humanity.

Guo Fan, 30, a Guangdong Modern Dance Company dancer since 2019, says: "*MindScape* is rooted in Eastern philosophy, expressed through an international dance language. Its essence is inward observation — moving with restraint, guided by breath and emotion. Eastern subtlety meets Western physicality; Chinese and international dancers inspire each other, letting philosophy flow beyond borders. For the audience, it's not spectacle — it's a space for reflection, resonance and the quiet power of shared humanity."

"After more than 30 years abroad, Shen Wei returns to the Guangdong Modern Dance Company to create *MindScape*," notes Xiong Jian, the troupe's director. "This is not only an emotional homecoming but also a reconnection with artistic spirit and history. The production blends movement with poetry, music and visual design into a 'total art' experience. Young dancers, aged 24 to 30, represent a new generation, building a uniquely Chinese contemporary dance language grounded in cultural experience and global awareness."

Preserving Chinese Australian voices

SYDNEY — In Haymarket Chinatown, one of Sydney's best-known Chinese enclaves, the aroma of Chinese food, glowing shop signs marked with Chinese characters, and voices speaking dialects from across China fill the air.

Amid the busy crowds, the Museum of Chinese in Australia quietly watches people pass by.

Housed in the former Haymarket Library, the museum opened on Feb 22 during the celebrations for the Chinese New Year of the Horse, poised to tell the stories of Chinese Australians across more than 200 years of history.

"A lot of the stories out there used to be told from someone else's perspective," says Daphne Lowe Kelley, chair of MOCA. "It's really important that we — people of Chinese descent — start telling our own stories."

The theme of this year's International Museum Day on May 18 was "Museums Uniting a Divided World". The museum hopes to become a place for connection, reflection and celebration. As the first museum in New South Wales dedicated to Chinese Australian history, it focuses on preserving and presenting the community's heritage and contributions to Australian society.

The first recorded Chinese migrant to Australia was Mak Sai Ying from Guangdong province in South China, who arrived in Sydney in 1818. Today, that young man who stepped off the ship, the *Laurel*, has a lane named after him — Sai Ying Lane — near Circular Quay, about half an hour's walk from the museum.

Since his arrival, Chinese communities have spread across Australia for more than two centuries. According to the Australian Bureau of Statistics' 2021 census, people of Chinese ancestry make up 5.5 percent of the population, making them the country's fifth-largest ancestry group.

The early Chinese in Australia are often remembered as gold miners, market gardeners, hawkers, cooks or cabinet-makers. But the inaugural exhibition at the MOCA goes beyond these familiar images to explore a lesser-known chapter of Haymarket Chinatown's history.

Using old objects, vintage photographs and historical stories, the exhibition traces the lives of early Chinese merchant families over the past century. One oil painting re-creates the tearoom of businessman Mei Quong Tart, who worked to bridge cultural divisions during a period of strong anti-Chinese sentiment. In the painting, he stands at the entrance surrounded by people from different backgrounds, smiling warmly.

Visitors can also see an abacus once used at Kwong War Chong & Co, a menu from the Modern China Cafe, stamps and letter sheets from Wing Sang & Co, and promotional materials from Simpson Lee & Co, offering glimpses into the lively commercial world of early Haymarket.

"There was discrimination against the Chinese under the White Australia policy," Lowe Kelley says. "But the Chinese community did not simply accept it quietly. Some people petitioned authorities and wrote to government officials. They pushed back." She hopes visitors will recognize not only the hardships faced by earlier generations, but also their resilience.

"The most important message I want to convey to Chinese Australians is that though we are roughly 1.5 million people of Chinese descent, I want them to realize that we are proud. We call this place our home, but also not to forget where we came from and our culture, to maintain that, and also to rise above the image that was projected in the past and the difficulties that one faced earlier," she says.

Lowe Kelley says the inaugural exhibition focuses on the local history of Haymarket, but the museum's vision extends far beyond. Future exhibitions will reach into other parts of Australia, telling Chinese Australian stories from across the country. The museum also plans to strengthen exchanges and cooperation with overseas Chinese museums and Chinese communities in other parts of the world.

"There's an old saying: you have to know the past to understand the present," she says. "For many of the early Chinese, life here was not easy. There were many restrictions. Understanding that, and yet seeing the fact that the Chinese community has now significantly grown — that makes it all the more meaningful."

Daphne Lowe Kelley, chair of the Museum of Chinese in Australia, introduces exhibits in Sydney, Australia, on May 4. XUE YANWEN / XINHUA

LIFE

Making artifacts an easy, in-depth read

New book helps the layperson learn more about a milestone excavation site in Changsha and its contents through text, images, and interactive elements, **Yang Yang** reports.

The book *Archaeological Report for Everyone: The Mawangdui Han Tombs in Changsha* was launched on May 18, the 50th International Museum Day. Created by Hunan Museum in partnership with a cultural creative team from Beijing Muse Museum Education Technology, the book has been published by Yilin Press.

As the first official popular science version of the Mawangdui archaeological report, the book uses a reader-friendly combination of text and images to re-create the excavation site and explain the artifacts' historical context.

"This book, designed for readers of all backgrounds, transforms detailed archaeological reports into an engaging and easy-to-read narrative, taking readers directly to the excavation site to uncover the secrets of ancient artifacts," says Wang Lei, editor of the book.

It provides a comprehensive view of Western Han (206 BC-AD 24) nobility and their cosmological beliefs, featuring items such as a T-shaped silk painting, plain gauze gowns, lacquerware, wooden figurines, and silk maps.

Additionally, the book includes a puzzle game where readers can scan a code to embark on a historical journey across Han Dynasty (206 BC-AD 220) Changsha and uncover long-hidden stories of love and conflict.

Half a century ago, in the eastern suburbs of Changsha, the capital of Central China's Hunan province, there were two large, saddle-shaped mounds known as Mawangdui.

On Jan 16, 1972, a significant archaeological dig began (till 1974), unearthing the incredibly well-preserved body of Lady Xin Zhui, buried in the tomb more than 2,000 years ago, a landmark discovery in the world of archaeology.

Mawangdui is the burial site of Li Cang, the chancellor of the Changsha Kingdom during the Western Han Dynasty (206 BC-AD 24), his wife Xin Zhui, and their son Li Xi.

According to Hunan Museum, they completed a systematic inventory in 2024, after decades of effort, of all the artifacts unearthed from the Mawangdui Han Tombs No 1, 2, and 3.

In total, 26,937 items have been cataloged, covering a wide range of artifacts, including clothing, food, housing, transportation, rituals, music, military affairs, astronomy, geography, medicine, health, and philosophical texts, effectively creating a complete underground world of the Western Han Dynasty.

"The artifacts unearthed from the Mawangdui Han Tombs are remarkably well-preserved and diverse, showcasing exquisite craftsmanship and rich cultural significance. Even today, they serve as a key benchmark for understanding the development of early Han society," said Yu Yanjiao, director and research curator at the Mawangdui Han Tombs and Collections Research and Exhibition Center, Hunan Museum, in a previous interview.

The *Changsha Mawangdui Han Tomb Exhibit* is a must-see for every visitor to Hunan Museum. The exhibit showcases the daily life of Lady Xin Zhui and her family, offering a complete picture of Western Han society.

According to Xinhua News Agency, by 2024, which marked the 50th anniversary of the excavation of the Mawangdui Han Tombs, the number of visits to view the tomb artifacts had exceeded 100 million.

The most common label associated with Lady Xin Zhui is "uncorrupted female corpse". However, in this newly released book, she is presented first and foremost as a real person.

According to the archaeological report, she stood 1.54 meters tall and weighed 34.3 kilograms. Her body was remarkably well-preserved, with light brown skin that remained moist and elastic. She had a square-round face with high cheekbones and clearly defined features. Her head, neck, torso, and limbs were all intact. The soft tissue in her upper arms and thighs was plump and retained some elasticity.

As for her cause of death, archaeologists believe she suffered a coronary heart attack triggered by biliary colic after eating a melon. The discovery of 138 melon seeds in her esophagus, stomach and intestines provided key evidence for this theory.

But what allowed her body to remain so well-preserved over more than 2,000 years? The book highlights three main factors: a deep burial, sealing, and preservation.

Her tomb was buried deep underground and tightly sealed. Multiple layers of coffins provided protection, while the use of charcoal and white clay for sealing, along with liquid preservatives, created an environment that was consistently cool, humid, sterile, and oxygen-free. This environment protected her body from physical, chemical, and biological damage. Additionally, the high levels of mercury found in her body helped delay decomposition.

In the book, readers can also learn about the T-shaped silk painting found in the tomb, depicting a journey from heaven to the underworld and featuring divine birds, mythical beasts, and celestial beings, offering a glimpse into the Han Dynasty's fascinating views on life and death.

Additionally, readers can explore over 130,000 words of silk manuscripts, including one of the world's earliest extant military maps, one of the first known comet charts, one of the oldest medical texts, *Recipes for 52 Ailments*, and one of the earliest copies of *Laozi* (Lao Tzu).

The book provides a detailed map of the burial artifacts, accurately re-creating how items were originally arranged in the four-sided tomb chambers.

Throughout the book, readers can also find interactive features, including fold-out pages, pop-ups, and folders, each offering opportunities to engage more deeply with the artifacts.

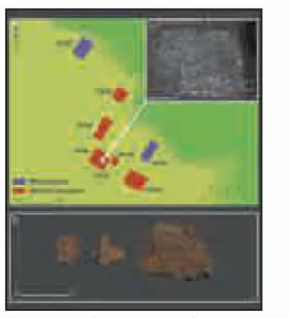
Finding fragile fragments of iron



By PENG CHAO in Chengdu
pengchao@chinadaily.com.cn

Archaeologists have confirmed that the iron fragments unearthed from Sanxingdui, a renowned archaeological site in Guanghan, Sichuan province, are made of pure meteoritic iron — the earliest such discovery in Southwest China.

The study, conducted by Sichuan University's School of Archaeology and Museology in collaboration with the Sichuan Provincial Institute of Cultural Relics and Archaeology, was recently published in the international academic journal Archaeological Research in Asia.

The three iron fragments, dating back to the late Shang Dynasty (c. 16th century-11th century BC), can be pieced together into a complete axe-shaped artifact measuring about 20 centimeters long and five to eight cm wide.

Li Haichao, a professor at Sichuan University's School of Archaeology and Museology, says these fragments were found in 2021 in Sanxingdui's No 7 sacrificial pit, but severe corrosion had left their shape unrecognizable.

From top inset: Top-down view of the artifact-bearing deposit in No 7 sacrificial pit at Sanxingdui archaeological site in Guanghan, Sichuan province. Relative location of the iron fragments within the pit. The three iron fragments unearthed from the pit. PHOTOS PROVIDED TO CHINA DAILY

Given their fragile condition, the excavation team block-lifted the fragments with the surrounding soil and transferred them to a lab for conservation, he says.

Metallographic and compositional analyses reveal that the fragments are high in nickel — approximately 20 percent — and have a uniform alloy composition, features that cannot be achieved by any known smelting technology from the late Shang period. These characteristics, however, align perfectly with meteoritic iron.

To date, 13 meteoritic iron artifacts have been identified in China, most of which were found in the Central Plains and northern regions, including Beijing, Hebei and Henan provinces. The meteoritic iron artifact excavated from Sanxingdui, the first in Southwest China, is also the largest of its kind in the country, according to the study.

Unlike the Central Plains, where meteoritic iron was commonly used only as inserts in bronze objects, Sanxingdui crafted an entire artifact from meteoritic iron, highlighting a distinctive metallurgical practice, Li says.

"The discovery not only fills a critical gap in the region's metallurgical records, but also provides new insights into early iron use both regionally and globally," he adds.

While the axe-shaped artifact's discovery in a ritual pit suggests cultural significance, its precise function remains uncertain, according to the researchers.

Cut marks on many Sanxingdui bronzes, including masks and vessels, indicate the use of high-hardness tools. This suggests that meteoritic iron objects were used to modify bronze items, though further evidence is needed.

"The specific type of meteorite the artifact came from is also unknown," Li says, adding that further study will focus on high-resolution characterization to determine its exact classification.

CULTURE

The musician who preserved Muqam

A new biographical film revisits ethnomusicologist Wan Tongshu's extraordinary efforts to save a tradition and legacy from disappearing, **Xu Fan** reports.

In the spring of 1951, Wan Tongshu, a 28-year-old teacher at the Central Conservatory of Music, was entrusted with an urgent mission: to preserve the fading melodies of the Xinjiang Uygur Muqam, a centuries-old musical tradition then on the brink of disappearance.

Wan set off for Xinjiang with his wife and infant daughter, embarking on a grueling journey of nearly 3,000 kilometers by train, truck and military aircraft. After arriving in Urumqi — then known as Dihua — he met Turdi Ahun, a folk artist in his 70s believed to be the only person in Xinjiang capable of performing the complete Twelve Muqam, a major regional style among different schools of the Muqam tradition.

Hailed as the "mother of Uygur music", Muqam is a vast artistic system that blends singing, dance, folk music and classical composition. It has been inscribed on UNESCO's Representative List of the Intangible Cultural Heritage of Humanity.

But in the early 1950s, the tradition faced an uncertain future. Before the founding of the People's Republic of China in 1949, many folk artists lived in poverty and occupied a low social status, leaving traditional art forms vulnerable to decline. Against that backdrop, Wan devoted himself to preserving what would later become one of the most treasured expressions of Uygur cultural heritage.

Recently, the biographical film *Wan Tongshu* was released nationwide, drawing renewed attention to the ethnomusicologist's decades-long dedication to safeguarding Muqam — a story that had long remained little known outside musical circles.

Structured through modern-day flashbacks, the film primarily unfolds between 1951 and 1960, chronicling how Wan, assisted by his wife and fellow experts, overcame obstacles to record and notate the music scores. One of the greatest challenges was securing one of only two wire recorders then available in China — a request that ultimately received special approval from Premier Zhou Enlai after appeals were made to the central government.

The hardships extended far beyond difficult living conditions. During his years in Xinjiang, Wan suffered the devastating loss of his three-month-old child to measles. Yet even after completing the notation of scores of the full set of the Twelve Muqam — which comprises around 300 melodies, 4,000 lines of lyrics and more than 20 hours of music — he chose not to leave.

Driven by his passion for the art form, Wan continued traveling across remote parts of Xinjiang, from Qira county to Kashgar and Hami, documenting melodies, lyrics and performance styles before they vanished.

Jiang Hong, the film's screenwriter, told China Daily that the project began in 2023, the year Wan died at the age of 99 in Xiamen, Fujian province, prompting widespread mourning within China's music community.

A Xinjiang native himself, Jiang said he had never heard Wan's name until then, despite being 49 years old — a realization that revealed how easily such stories can fade with time.

To reconstruct Wan's life, the creative team combed through archival documents, old photographs and interviews with people connected to that era. One of their most valuable sources was Wan's wife, Lian Xiaomei, who moved with him to Xiamen in 1999 to live closer to their children.

Lian, then 93, spent a week sharing memories with the production team in a hotel room in Xiamen. "Her memory was still remarkably sharp. She had a special charm that captivated listeners, even when recounting painful experiences from the past," Jiang recalls.

Many details in the film came directly from those conversations. Jiang recounts how the couple once used a hand-cranked generator to power a wire recorder because Xinjiang's electricity supply was unstable at the time. The machine relied on an extremely thin recording wire that frequently tangled, forcing the couple to untwist it by hand, sometimes cutting their fingers in the process.

From top: A scene from the biopic *Wan Tongshu* features the titular ethnomusicologist hugging Turdi Ahun, a folk artist who was then the only person in 1950s Xinjiang capable of performing the complete Twelve Muqam, one of the major regional styles of the Xinjiang Uygur Muqam. Wan and his wife Liang Xiaomei work on recording the melodies of the Twelve Muqam. A premiere of the film was held in Beijing with actor Li Jian (second left) and actress An Dong (left), who respectively portray Wan and his wife in the movie. A still from the film portrays the friendship between Wan and Ahun.
PHOTOS PROVIDED TO CHINA DAILY

To better re-create Wan's journey and the dissemination of Muqam across Xinjiang, the crew retraced the ethnomusicologist's footsteps, traveling more than 17,000 kilometers across 17 locations.

"When Wan first heard the Muqam, he was astonished," Jiang says. "He described it as a musical world he had never encountered before. He once said that piano keys only have black and white notes, but Muqam exists somewhere in between — making it difficult to record accurately at the time."

The film has since received a warm response in Xinjiang, with audiences from multiple ethnic groups, such as Han, Uygur and Kazakh viewers, expressing deep emotion after screenings.

"The friendship between Wan and Ahun transcended differences in age, ethnicity and lifestyle. That long-lasting bond — the way they cherished each other through their entire lives — is precisely the artistic value and emotional core of the film," shares Jiang.

Director Xirzat Yahup says many viewers have told him they were fascinated by the poetic singing style of Muqam, which explores various themes like love and life. "Some audience members said they wanted to hear more after the film ended. Fortunately, thanks to Wan's recordings and research, many Muqam troupes and institutions have been established across Xinjiang. Today, audiences can travel there and experience complete live performances," he adds.

Rao Shuguang, president of the China Film Critics Association, praises the production for naturally depicting the harmonious coexistence of different ethnic groups. "The movie serves not only as a cinematic tribute to Muqam, but also as a vivid reflection of Xinjiang's social and cultural history," comments Rao.

Veteran author's Xinjiang story set for the screen

By FANG AIQING and **MAO WEIHUA** in Urumqi

A film project adapting a short story by veteran writer Wang Meng was launched on May 18 at Tianshan Film Studio in Urumqi, the capital of Northwest China's Xinjiang Uygur autonomous region. The film, *In Ili*, draws on Wang's six-year experience in the region's Ili Kazak autonomous prefecture.

Born in October 1934, Wang is a recipient of the national honorary title "People's Artist" and a former minister of culture. From the ages of 29 to 45, he spent 16 years in Xinjiang, mostly in Urumqi and Ili. In 1965, he went to what is now the Bayandai town of Ili's Yining city, where he lived and worked with local farmers, learned the Uygur language and became drawn to the local culture. Those six years became the basis for his short story collection *In Ili*, written from 1983-84.

According to The Writers Publishing House, the work's publisher, it's set for global translation and publication. Projects for foreign-language editions, including English, Spanish and French, have already been approved.

The film will adapt one piece from it, titled *Pale Gray Eyes*. The story is told from the first-person perspective of a writer named Lao Wang — a surname he shares with the author himself. It follows his observations of and interactions with a young carpenter and his wife, as well as various villagers. In their shared life and emotions, the community supports one another.

At the launch ceremony, Wang expressed hope that the film would be grounded in life and would create rich, well-rounded personalities. "The people of Xinjiang's various ethnic groups are diverse, yet they share warmth, vitality, wisdom, optimism, romance and imagination," he said, adding that they have their own unique ways of understanding and solving problems.

Wang said his characters have distinct personalities and wisdom that fit their time. They're friendly, harmonious and tolerant. For him, the work vividly shows how different ethnic groups in Xinjiang share a common destiny, a common life and common emotions, as well as how their cultures exchange, integrate and interact.

According to Jing Luzhou, Party secretary of Tianshan Film Studio, the production team conducted field research in Ili in September 2025, and the script has been through several rounds of revisions. Shooting is scheduled to begin in the second half of this year, with release expected by the end of 2027.

Xirzat Yahup, the film's director, noted that the crew's goal is to capture the optimism and wisdom of the people who are deeply rooted in the land. "They are optimistic. They talk with pride. There's a lot of philosophy about life in Wang's writing, and I believe this will leave room for the audience to reflect on life's truths," he said.

"That requires careful thinking about how to translate these ideas onto the screen through cinematography."

While refining the script, he said, they are scouting various filming locations in Ili and considering re-creating village scenes of the 1960s, as decades of development have brought tremendous changes to Bayandai.

> "They are optimistic. They talk with pride. There's a lot of philosophy about life in Wang's writing, and I believe this will leave room for the audience to reflect on life's truths. That requires careful thinking about how to translate these ideas onto the screen through cinematography."
>
> **Xirzat Yahup,** film director

Xirzat Yahup's biographical film *Wan Tongshu* is currently in theaters. It tells how musicologist Wan Tongshu (1923-2023) and his wife Lian Xiaomei, both from the Central Conservatory of Music, dedicated their lives in Xinjiang to preserving Muqam, a traditional performing art form combining music, dance and poetry. The Uygur Muqam of Xinjiang was inscribed on UNESCO's intangible cultural heritage list in 2005.

From 1951 to 1960, Wan and his wife recorded, transcribed, collated and published the musical scores for Muqam, helping to pass down and promote the art form. Wang, a former colleague of Wan in Urumqi, has recently written a film review highlighting Muqam and reminiscing about his old friends.

EAGLES SWOOP TO 1ST EURO TITLE

Crystal Palace wins cagey Conference League final, setting up a possible sweep for English clubs in Europe

Crystal Palace didn't want to be in the third-tier Conference League and Jean-Philippe Mateta nearly left the club. On Wednesday, it was Mateta's goal that won Palace the title.

A season that began with pleas to play in a higher competition ended with Palace's first-ever European trophy as Mateta's goal lifted his team to a 1-0 win over Rayo Vallecano in the final.

The French forward, who was close to leaving in January before a transfer to AC Milan collapsed, scored on a rebound in the 51st minute after Rayo goalkeeper Augusto Batalla parried Adam Wharton's long-range shot.

"I feel fantastic! ... First time in Europe, we did it! Now I just want to celebrate, I just want to party," Mateta told TNT Sports.

"It's incredible. We did everything. I told you about the intensity we were going to bring. I'm tired right now. I gave everything."

As well as with providing outgoing coach Oliver Glasner with the perfect send-off, Palace's win keeps English teams on track for a sweep of the three main European men's club competitions.

Aston Villa lifted the Europa League trophy last week and Arsenal will face Paris Saint-Germain in the Champions League final on Saturday.

From appeals to celebrations

It was a triumphant end to a season that began with Palace in court, appealing in vain against being demoted from the second-tier Europa League, the competition it had originally qualified for by winning the FA Cup, in a dispute over ownership rules. Palace fans spent the season chanting against UEFA and getting fined for it.

Mateta said of the traveling Palace fans at Red Bull Arena: "I'm always with them. They support me as a player a lot, and the team. They're always behind us and we did that for them, too."

Palace's win lands it a Europa League spot for next season, much to the delight of Glasner, who said Wednesday he wanted to watch the team's progress on TV next season.

Palace fans set the tone before kickoff with a giant banner like an airport departures board. "Europa League: Boarding" it read.

Glasner announced in January he'd leave at the end of the season when his contract expires. The Austrian has been in charge since February 2024 and led Palace to its first major trophy last season in the FA Cup. It's not clear yet where he'll go next.

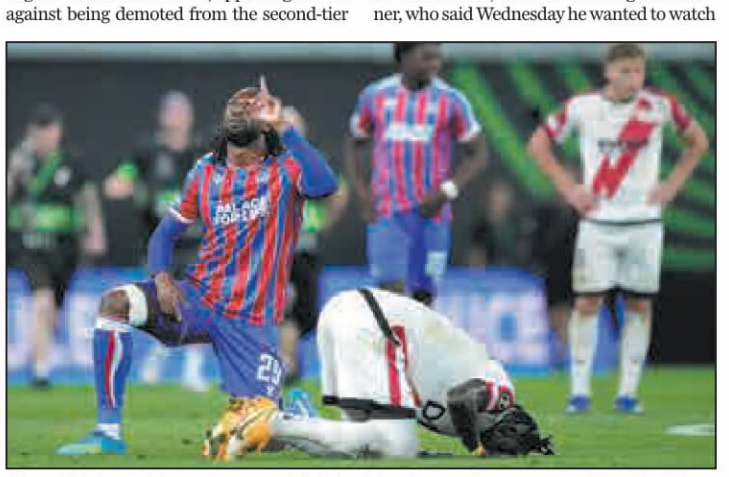
It was the third time in the Conference League's five-season history that an English team has lifted the trophy after West Ham in 2023 and Chelsea a year ago. Some Rayo fans were seen in tears at the final whistle. It was a first major final for a team so often in the shadow of its neighbors Real Madrid and Atletico Madrid.

A shot bouncing off both posts

Mateta's goal lit up the final after a cagey first half didn't produce a single shot on target.

He showed lightning-quick reactions to knock in the rebound after an initial long-range shot from Wharton, who was a commanding presence in midfield.

Yeremy Pino came within a whisker of making it 2-0 soon afterward when he hit a freekick that bounced off one goal post, along the goal line and away off the second post.



Rayo's best chance came early on, when Alexandre Alemao skewed a volley wide off a cross from Pep Chavarria. Tyrick Mitchell missed the target with a diving header for Palace at the end of the first half.

Fan clashes ahead of game

German police said earlier Wednesday that there had been clashes between Palace and Rayo fans. Two people were detained and two police officers sustained minor injuries, police added.

Team where it belongs after yearlong 'detour', says Glasner

Departing Crystal Palace manager Oliver Glasner toasted Wednesday's UEFA Conference League final victory by saying the club was back where it belongs after a "year's detour".

Jean-Philippe Mateta's second-half goal took Palace to a 1-0 win over Rayo Vallecano and a maiden European triumph. It also earned it a place in the Europa League.

Palace's FA Cup win last season qualified it for this season's Europa League, but UEFA revoked its place in the second-tier competition due to multi-club ownership rules.

"I said to the players, get now what you deserve after winning the FA Cup — the Europa League," Glasner said.

"Now, after a one-year delay, the club, the fans, the players get what they deserve.

"Sometimes you have to take a detour, and, now, we're there."

In January, Glasner announced he would leave the club in the summer. Palace had never won a trophy when he arrived, but he leaves having lifted the FA Cup, Community Shield and now a first European trophy.

"We hear a lot when the fans say thank you to us for giving them the best day of their lives and all these emotions. And I said thank you to the players, because it's the same for me," Glasner said.

"Because they gave me great, incredible days in my life, and that's what I really appreciate."

Glasner said his time at Palace was "a good chapter to read in the Crystal Palace book, but other chapters will follow".

He said he had made no plans for his future other than "flying back to London with a hangover" after taking charge of his last match with the club.

Speculation has swirled about the Austrian's future since he announced his departure in January, with reports of a move to another Premier League club or a potential return to Germany.

Glasner though said his only plan was to celebrate.

He said he does not have the "desire or the energy to speak with another club, because I felt duty bound to give 100 percent of Oliver Glasner (to Palace)."

"I haven't even thought about anything past tomorrow," he continued.

"Today's a day for celebrating, and anyone who knows me, knows I'm completely focused on this and haven't been able to do anything else except concentrate on the final.

"And, now, I can really let loose, and I'm going to do that with the players today. Then, tomorrow, I'll fly back to London with a bit of a hangover. And then it's time to get settled in and go back to my family."

Glasner added: "Everything I say today will be wrong tomorrow. That's why all I know for sure is that I'll be celebrating with the players today, drinking a few beers, and flying back to London tomorrow."

Defender Tyrick Mitchell said winning the Conference League felt like "pure delight" after a decade at the London club.

"It's amazing, it's the same feeling that we had when we won the FA Cup."

Top scorer Depay included in Netherlands World Cup squad despite injury worries

ZEIST, Netherlands — The Netherlands' top scorer Memphis Depay recovered from injury just in time for coach Ronald Koeman to include him in his 26-man squad for the World Cup next month.

Depay was one of three players who have recently returned from injury to be selected Wednesday by Koeman. That was despite his limited playing time leading into soccer's global showcase, being hosted by the United States, Canada and Mexico.

Depay, the Netherlands' all-time leading scorer with 55 goals, on Sunday made his first appearance in several weeks for his Brazilian club Corinthians after recovering from a thigh injury.

"I'd have preferred ... it happened earlier," Koeman said, adding he'd have to "wait and see" just how fit Depay is.

If Depay struggles for fitness, Koeman also has in-form Roma forward Donyell Malen at his disposal.

Justin Kluivert, the son of Dutch great Patrick Kluivert, has also just returned to fitness after surgery to repair a knee injury and was picked along with defender Jurrien Timber, fresh from winning the Premier League with Arsenal, but also only recently returned to fitness. Timber's brother Quinten also was named in the squad.

Koeman called up one debutant — West Ham winger Crysencio Summerville — and surprisingly left out Liverpool wingback Jeremie Frimpong, saying he often struggles with injuries.

Asked about his qualities, Koeman hailed Summerville's "speed, action and his play without the ball in defense", adding: "(He's) very trustworthy."

Midfielder Xavi Simons was ruled out of the tournament in April after rupturing his anterior cruciate ligament in a match for Tottenham against Wolverhampton, and defensive stalwarts Stefan de Vrij and Matthijs de Ligt are also absent due to injury.

Memphis Depay made his return for Corinthians on May 24 after recovering from injury, just in time to make the Netherlands World Cup squad. AFP

In a bubble

The Netherlands is a three-time World Cup finalist, but has never won international soccer's greatest prize. It lost in 1974 to then West Germany, in 1978 to host Argentina and to Spain in 2010, when Andres Iniesta scored a goal late in extra time.

Koeman was realistic about his seventh-ranked team's chances in North America.

"Well, we're competing to win, but I'm well aware of the reality and what other countries can bring. So, yeah, nothing is impossible, and that's what we're going for," he said. "I'm convinced that we can go far, and that we have a team that is hard to beat. But, to win a few matches against big countries, that is still a long way off."

Koeman said he was going to avoid the news and social media during preparations and throughout the tournament.

"You are in a bubble, focused on performance ... everything else that comes from outside is a distraction," he said.

And Koeman doesn't want to get involved in activities outside his team's media commitments at the tournament — regardless of who is asking.

"Don't think that I'm going to a photo opportunity with the team because (US President Donald) Trump, (FIFA president Gianni) Infantino want us to stand in front of a church or some water for a picture," he said. "No, that's not going to happen."

Koeman captained the Netherlands when the US last hosted the World Cup in 1994, when the Dutch lost 3-2 to eventual champion Brazil in the quarterfinals. He also was in the team when the Netherlands won its only major international title, the 1988 European Championship.

GLOBAL EDITION 中国日报 TUESDAY, JUNE 9, 2026

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, inspects the honor guard of the three services of the Korean People's Army, accompanied by Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the Democratic People's Republic of Korea, in Pyongyang, the capital of the DPRK, on Monday during a grand welcoming ceremony held by Kim for Xi. DING LIN / XINHUA

Xi calls for deeper China-DPRK ties

He says in meeting with Kim that the two sides should pool wisdom, strength for greater progress of relations

Inside

• See more, **pages 2,3**
• Editorial, **page 10**

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, said on Monday that the firm stance of the CPC and the Chinese government on highly valuing the traditional friendship with the Democratic People's Republic of Korea will not change, and he pledged to work with DPRK top leader Kim Jong-un to keep bilateral relations advancing with the times and achieve greater progress in bilateral ties.

Xi made the remarks in Pyongyang, the capital of the DPRK, during his talks with Kim, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK.

Xi arrived in Pyongyang on Monday for a two-day state visit to the DPRK, his first to the neighboring country in seven years and his first overseas trip this year.

During talks with Kim, Xi said that after seven years, he was very pleased to once again visit the beautiful city of Pyongyang, and felt especially warm and familiar.

He expressed his readiness to work with Kim to take this visit as an opportunity to strengthen top-level planning and strategic guidance for China-DPRK relations in the new era, keep bilateral relations advancing with the times and achieve greater progress in bilateral ties, in order to better benefit the two countries and peoples, and make positive contributions to peace, stability, development and prosperity in the region and the world.

Stressing that China and the DPRK are both socialist countries led by communist parties, Xi said that the traditional friendship between the two countries is rooted in their shared ideals and beliefs as well as their common goals, and is backed by a profound historical foundation, a solid political basis and strong emotional bonds.

Xi noted that friendship passed down from generation to generation, a shared future and mutual support have always been the defining features of China-DPRK relations.

No matter how the international situation changes, the CPC and the Chinese government's firm stance on highly valuing China-DPRK traditional friendship will not change, the firm support for Kim in leading the DPRK's socialist cause will not change, and the firm commitment to safeguarding the shared interests of the two countries and preserving a favorable strategic environment will not change, Xi said.

He pointed out that, in the face of profound changes unseen in a century that are accelerating across the world, the two sides should take a broad and long-term view, build on past achievements and open up a new future, draw wisdom from the development process of the relations between the two parties and the two countries, seize opportunities in the prevailing trend of human history, inject new contemporary connotations and strong impetus into the traditional friendship between China and the DPRK, and open up a brighter prospect for the socialist cause of the two countries as well as regional peace and development.

Mega dam expansion to boost Yangtze economic belt

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China launched a colossal infrastructure project on Monday to expand the Three Gorges Dam's navigation system in Yichang, Hubei province, marking another milestone effort designed to eliminate chronic shipping capacity bottlenecks and supercharge the industrial arteries of the nation's vast economy.

With a total investment of approximately 77.2 billion yuan ($11.39 billion), the mega project comprises two core components: a new channel at the Three Gorges Hub and a shipping capacity expansion at the downstream Gezhouba Dam.

At the Three Gorges Hub, two new ship locks will be built after excavating the mountain on the left bank, parallel to the existing dual-line locks. Once completed, the hub will boast a four-lane lock configuration, according to operator China Three Gorges Corp.

Combined with the existing ship lift, the hub's total annual throughput capacity will surge to 336 million metric tons, the operator said. In 2025, the total freight volume passing through the Three Gorges Hub stood at 173 million metric tons.

The concurrent Gezhouba expansion involves dismantling its No 3 lock to construct two new single-stage locks on the left side, thus expanding the approach channels. This will take Gezhouba's total capacity to 360 million tons annually, it said.

The Yangtze River Economic Belt, spanning 11 provinces and municipalities, accounts for over 40 percent of the nation's population and GDP. Its industries, ranging from metallurgy and automotives to high-tech manufacturing, rely heavily on the river for transportation of 85 percent of the region's iron ore and foreign trade goods, as well as 83 percent of its coal.

Su Fengming, a researcher at the National Development and Reform Commission's Institute of Comprehensive Transportation, highlighted the waterway's indispensable economic role.

"In 2025, the Yangtze River Economic Belt's GDP exceeded 65 trillion yuan, with mainline port cargo throughput hitting 4.2 billion tons — surpassing the national railway cargo throughput total by over 80 percent," Su said.

Su noted that water transportation costs a mere one-fifth of rail transit, solidifying the river's position as the economic "main artery" as manufacturing and industrial bases increasingly shift toward the inland geographic center.

According to Niu Xinqiang, an academician of the Chinese Academy of Engineering, mainline freight volume on the Yangtze River has grown continuously over the past two decades, rising from 650 million tons in 2005 to 4.2 billion tons by 2025 — ranking first among global inland rivers for 20 consecutive years.

This rapid growth has strained the existing infrastructure's ship handling capacity, he said.

Niu said he believes that the new channel will elevate the hub's one-way design capacity from roughly 50 million tons to 168 million tons by 2050. This will accelerate the flow of key production factors and help bridge the gap between the nation's eastern and western regions, he said.

Upgrading RCEP can help ASEAN partnership

WORLD WATCH
By Ong Tee Keat

Against a somber backdrop of global volatility — characterized by the resurgence of protectionist tariffs, fractured supply chains and persistent conflicts in the Middle East — the necessity for closer collaboration among Asian economies has never been more acute.

As the traditional pillars of global trade face unprecedented strain, the East Asian region is increasingly being looked upon as the world's primary engine of growth and stability.

In this context, China continues to serve as the regional economic stabilizer. Its performance in the first quarter of 2026 manifested remarkable resilience, defying the "decoupling" narratives that have dominated Western discourse. With solid year-on-year GDP growth of 5 percent in the first quarter, underpinned by a significant 15 percent surge in total exports and imports, China has injected much-needed momentum into the regional economy. This growth provides a vital anchor, offering a sense of predictability in a landscape otherwise rattled by geopolitical tensions and supply chain shifts.

From the Chinese perspective, Malaysia is always well remembered for its proactiveness in bridging China with the Association of Southeast Asian Nations by inviting China to the ASEAN Foreign Ministers' Meeting in 1991. This laid the foundation for the China-ASEAN dialogue partnership.

Continuing the legacy of inclusive multilateralism, Malaysia's rotational chairmanship of ASEAN last year saw the historic inauguration of the Gulf Cooperation Council-China-ASEAN tripartite summit. This milestone further corroborated Malaysia's role as a bridge builder, linking diverse economic groupings to promote a more integrated Global South.

As China has remained Malaysia's top trading partner since 2009, the bilateral relationship is poised to ascend to a "high-value and regional strategic phase". The catalyst for this elevation is the imminent fruition of the China-ASEAN Free Trade Area (CAFTA) 3.0, ratified under the Malaysian chairmanship, thus making Malaysia a natural entry point for deeper regional integration.

YALU RIVER'S UNENDING FLOW

Decades after war scarred its banks, the waterway remains a living conduit of blood-forged camaraderie and the quiet, everyday friendships bridging China, DPRK

The Yalu River Broken Bridge (front) and the China-DPRK Friendship Bridge are seen from Dandong, Liaoning province, in February. PROVIDED TO CHINA DAILY

By **LIU JIANQIAO** in Dandong, Liaoning, and **WU YONG** in Shenyang

Every morning, residents of Dandong, in Northeast China's Liaoning province, stroll along the banks of the Yalu River. Across the water is Sinuiju, a city in the Democratic People's Republic of Korea, close enough to see apartment buildings and passing vehicles.

For generations, the river has served not only as a border, but as a witness to friendship, the resistance to war, and everyday exchanges between the two peoples.

More than 70 years ago, the Chinese People's Volunteers, or CPV, crossed the Yalu River into the Korean Peninsula, marching to fight alongside the Korean people against the United States' aggression.

At that time, Dandong, then named Andong, played a strategic role, with residents mobilizing every possible resource to support the War to Resist US Aggression and Aid Korea (1950-53). Their efforts gave rise to countless stories of sacrifice and solidarity that continue to resonate to this day.

Established in 1958, the Memorial Hall of the War to Resist US Aggression and Aid Korea in Dandong serves to safeguard a collective memory, housing more than 20,000 artifacts and over 30,000 documents and materials related to the war.

The artifacts preserve stories of soldiers, workers and residents whose efforts supported the war, inviting visitors to reflect on the enduring legacy of a time that shaped the course of nations.

During this intense conflict, Dandong emerged as a vital rear base, said Zhang Xiaoying, deputy director of the memorial hall.

"The city then became a crucial lifeline, offering unwavering support to the front lines. Residents and resources were mobilized to provide whatever was needed — be it manpower, supplies or even blood — demonstrating remarkable dedication and sacrifice," she said.

"This collective effort played a pivotal role in securing victory, marking the city's extraordinary contributions."

The Yalu River Bridge (China-DPRK Friendship Bridge) and the Yalu River Broken Bridge span the river, both of which served as crucial transport routes for supplies during wartime.

"The Broken Bridge, originally the first road bridge across the Yalu River, witnessed the ravages of conflict when the US Air Force destroyed the DPRK's side in the 1950s," Zhang said. "Meanwhile, the Yalu River Bridge, initially constructed as a railway bridge, was converted into a combined road-rail bridge to meet wartime demands."

Although the bridge was repeatedly bombed, the steadfast people of Dandong continuously repaired it, ensuring its role as a lifeline for the war effort, she said.

Zhang stressed that the spirit of sacrifice and dedication from those days continues to inspire generations.

Above: A martyrs' monument stands in Anju, DPRK. **Left:** An inscription by the late DPRK leader Kim Il-sung is displayed at the former Chinese People's Volunteers Headquarters in Hoechang, DPRK, honoring the CPV's wartime sacrifices.

"Even today, many people in Dandong contribute their efforts to the friendship between China and the DPRK," she said.

Zhao Fengqi, a faculty member at Liaodong University in Dandong, is a prime example of this spirit. He worked for a year at the Representative Office for the Commemoration of Martyrs of the Chinese People's Volunteers in the DPRK, responsible for honoring the fallen Chinese soldiers.

"In 1950, my grandmother enlisted as a medic with the CPV, treating the wounded in the rear areas of Dandong," Zhao said. "Her spirit of dedication and the example she set have given me a deeper understanding of the history of the CPV."

Last year, after a rigorous selection process, Zhao was assigned to Pyongyang to undertake commemorative work for the martyrs of the CPV, an assignment he gladly accepted.

"In regular interactions with DPRK counterparts, we've found them to be extremely meticulous and friendly," he said. "They place great importance on our efforts to honor the martyrs of the CPV and have demonstrated a high degree of dedication and responsibility in the maintenance and management of the memorial parks."

He recalled his initial visit to the CPV Martyrs' Cemetery in Kangdong County, east of Pyongyang, during the Tomb Sweeping Day last year, which left a profound impression on him.

Inside the cemetery, four joint burial tombs hold the remains of 1,383 CPV martyrs who bravely laid down their lives in the war.

"It was only when I was there that I truly felt the indomitable fighting spirit of the CPV, who fought valiantly in the heat of battle," Zhao said. "It made me realize that the friendship between the Chinese and DPRK people is a bond forged in blood."

A native of Dandong, Zhao described life in the DPRK as very familiar and comforting to him, emphasizing the strong similarities between the two places in terms of cuisine and daily habits.

"Flowing between China and the DPRK, the Yalu River has long served as a shared lifeline for communities on both sides," he said. "Beyond its natural role, it has borne witness to pivotal moments in history while nurturing sustained cultural, economic and people-to-people exchanges between the two countries."

Spanning the river are not only physical bridges, but individuals like Zhao — living links who connect the two countries.

In September 2007, professors Huang Li and her husband Lei Huisheng, both from the College of International Education at Liaodong University, departed from Dandong by train, crossed the China-DPRK Friendship Bridge, and arrived in Pyongyang.

"We worked there for a year," Huang recalled. "We returned in 2010; Lei stayed for two years, and I stayed for three. Our third stint began in 2014 and lasted until January 2020. During that period, Lei worked there for over five years, while I was there from March 2017 to January 2020."

Huang, who is also director of the Chinese Language Center at Pyongyang University of Foreign Studies, said that in daily communications with DPRK students, the questions they ask most often center on contemporary China, reflecting their strong curiosity about the country's rapid development.

"Topics ranging from architecture, fashion and sports to music, internet slang and trending expressions frequently come up in class," Huang said. "What interests them most, however, is China's economy."

Over the years, their interactions with students and colleagues extended far beyond the classroom. Through daily work and ordinary moments of life, they developed deep and enduring friendships with their DPRK colleagues.

Lei recalled an experience that left a lasting impression on him and reflected the close relationships he developed with his DPRK colleagues.

One of his colleagues, surnamed Park, headed the foreign affairs department of the publishing house, which was responsible for international publications. He fractured the top of his femur bone in a serious car accident.

"At the time, he had already purchased an artificial femoral head, but he still lacked bone cement and other necessary medical and sterilization supplies," Lei said. "Since I was in China at the time, I offered to help him obtain what he needed."

Lei contacted a former classmate with a medical background, who helped procure the supplies that were later delivered to Park through the Chinese embassy.

"The surgery was a success," Lei said. "Park was extremely grateful afterward."

Looking back on their years in the DPRK, Huang and Lei said the friendships they formed remain among their most treasured memories.

The Yalu River has witnessed war and peace, tears and laughter, and generations of exchanges between neighboring peoples. Along its banks, countless ordinary individuals have played their own small but meaningful roles in bringing the two sides closer together.

Like the river itself, those bonds continue to flow across borders, connecting hearts and carrying forward a friendship forged over decades.

DANDONG, A CITY MORE THAN A GATEWAY

Liu Jianqiao
Reporter's log

As dawn breaks over the Yalu River, the Weihao Farmers Market in Dandong, China's largest border city in Liaoning province, is already coming alive with the bustle of early-morning trade.

The air is filled with the salty smell of fresh seafood, the earthy aroma of just-harvested vegetables, and the constant hum of morning trade.

Alongside piles of bright red Dandong strawberries and baskets of fresh yellow clams are neatly packaged pollack and specialty foods imported from the Democratic People's Republic of Korea located across the river.

The scene offers a vivid glimpse into the close economic and cultural ties that continue to shape everyday life along the border.

"This is simply everyday life for us," said a resident while selecting fresh produce. "Dandong and Sinuiju (in the DPRK) face each other across the river. We share similar climates, so naturally our food, customs and ways of life also have much in common."

A nearby vendor, arranging goods at his stall, said the similarities on both sides of the river are a major draw for visitors.

"Many people come here because they are interested in the border culture," he said. "You can see those connections in the products people buy, the food they eat and the stories they share."

A tourist from Shanghai, browsing the market, highlighted "a unique atmosphere that you can't find anywhere else".

"You can see products from both sides of the river, and it gives you a better sense of how closely connected the communities are," he said.

Another visitor from Guangzhou said she had originally come to see the Yalu River Broken Bridge and learn more about the history of the area.

Beyond its commercial role, the market reflects the enduring people-to-people links that have developed over decades of interaction between communities along the Yalu River.

"The market was a pleasant surprise," said the visitor from Guangzhou. "You can experience the local culture firsthand, talk to people and see what daily life is like. It makes the city feel very vibrant."

The sense of familiarity that can be found in the market also extends into everyday life in Dandong.

A short walk from the market reveals storefronts where Chinese and Korean characters appear side by side.

Restaurants, grocery stores, trading companies and pharmacies alike often feature bilingual signs, reflecting the city's long-standing connections with the DPRK.

For professors Huang Li and Lei Huisheng from Liaodong University in Dandong, a couple who spent years teaching Chinese in Pyongyang, that connection often brings them to Songtaoyuan, a Korean-style restaurant in the city.

"When we miss our days there (in the DPRK), we come here for cold noodles and other traditional Korean dishes," Huang said. "The flavors are very authentic and remind us of our time there."

For the couple, the restaurant is more than a place to dine. It offers a familiar cultural experience and a chance to reconnect with memories of the years they spent working in the DPRK.

Such everyday experiences, they said, reflect the close cultural ties and people-to-people exchanges that have long linked communities on both sides of the river.

Dandong's significance extends far beyond trade and cuisine. It has long served as both a witness to and a participant in the evolving relationship between China and the DPRK.

The bustle of the Weihao Farmers Market, the familiar flavors of places like Songtaoyuan, and visitors' observations all offer glimpses into the close ties that connect communities on both sides of the Yalu River.

Drawing on its unique geographical location and deep historical ties, Dandong remains an important gateway for cross-border exchanges.

As the river flows quietly, it carries not only memories of a shared past but also the enduring connections among the two peoples that continue to bring the two neighboring countries closer together.

XI'S VISIT

Xi says China-DPRK relations face new opportunities, missions

Strategic communication, mutual learning, practical cooperation, multilateral coordination highlighted

Relations between China and the Democratic People's Republic of Korea currently stand at a new historical starting point, facing new development opportunities and shouldering new missions of the times, Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, said on Monday.

Xi made the remarks in a signed article published in Rodong Sinmun, the official newspaper of the DPRK, ahead of his state visit to the country on Monday and Tuesday, his first in seven years.

Xi said that he looks forward to meeting with Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK, to discuss the traditional friendship between the two countries and exchange views on the overall development of bilateral relations.

Xi said that China and the DPRK are friendly socialist neighbors who stand by each other and share a common future.

No matter how times change or how the international landscape evolves, the traditional friendship between China and the DPRK remains unbreakable and enduring, constantly demonstrating vigorous vitality, Xi said.

Noting that top-level strategic guidance is the greatest strength of China-DPRK relations, Xi said that in recent years, he and Kim have held six meetings, maintaining close strategic communication and jointly drawing up a blueprint for the development of China-DPRK relations.

Xi also said that a shared socialist ideal is a defining feature of China-DPRK relations, and that the traditional friendship between the two countries, rooted in a shared future, forms the solid foundation of bilateral ties.

"High-level strategic coordination gives China-DPRK relations their contemporary significance," Xi said. "Promoting long-term peace and stability in the region, as well as world peace and stability, is a common pursuit of the two parties, the two countries and their peoples."

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, and his wife, Peng Liyuan, pose for a photo with Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the Democratic People's Republic of Korea, and his wife, Ri Sol-ju, at a welcoming banquet on Monday evening in Pyongyang, the DPRK. SHEN HONG / XINHUA

The two sides firmly support each other in safeguarding national sovereignty, security and development interests, and work together to uphold regional peace and tranquility, international fairness and justice, and the postwar international order, Xi said.

Noting that maintaining, consolidating and developing China-DPRK relations has always been an unwavering policy of the CPC and the Chinese government, Xi said that China stands ready to work with the DPRK to steer bilateral relations from a strategic perspective, keep China-DPRK relations abreast of the times and achieve greater development of the relationship.

The two sides should deepen strategic communication and firmly steer China-DPRK relations in the right direction, Xi said, calling for upholding the fine tradition of high-level exchanges between the two parties and the two countries, and maintaining close contacts like relatives.

The two sides should take the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance as an opportunity, strengthen exchanges at all levels and across party, government and military institutions, implement the important consensus reached by the two sides, and add fresh impetus to the development of bilateral relations.

Xi said the two countries should strengthen communication and mutual learning to jointly promote the steady development of the two countries' socialist cause.

China and the DPRK should support each other in pursuing socialist paths suited to their own national conditions, firmly safeguard the political security of both nations, continue to expand exchanges and cooperation between the two parties, and deepen exchanges of experience and mutual learning on party and state governance, Xi said.

The two countries should expand practical cooperation and continuously enhance the well-being and friendship of the two peoples, Xi said, adding that the two sides should enhance the alignment of development strategies, tap the potential for cooperation in various fields, share opportunities and promote development together, in order to better benefit the two peoples.

Xi also called for close multilateral coordination and firmly safeguarding international fairness and justice.

The two sides should strengthen strategic communication and coordination, and jointly uphold the international system with the United Nations at its core and the international order based on international law, Xi said, adding that the two sides should oppose hegemonism and power politics, and reject any scheme or action aimed at reviving militarism and undermining regional security and stability.

The two countries should jointly promote an equal and orderly multipolarization of the world and a universally beneficial and inclusive economic globalization, implement the four major global initiatives put forward by China, and work together to build a community with a shared future for humanity, he added.

XINHUA — CHINA DAILY

Visit: Further expansion of exchanges encouraged

From page 1

During the meeting, Xi put forward four proposals on developing China-DPRK relations.

The two sides should remain guided by the high-level exchanges and consolidate the foundation of political mutual trust, Xi said.

The strategic guidance by the top leaders of both nations is the greatest strength of China-DPRK relations, Xi added, noting that he stands ready to maintain close strategic communication with Kim and guide China-DPRK relations to continuously reach new heights.

Noting that this year marks the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, Xi said that both sides will hold grand commemorative events.

The relations between the two parties play an important guiding role in the development of China-DPRK relations, Xi said, calling for further expansion and invigoration of friendly exchanges at various levels and in various fields between the two parties, as well as the deepening of exchanges of experience and mutual learning on party and state governance.

Both sides should enhance exchanges in diplomacy, law enforcement, military affairs and other areas, implement the important consensus reached between the two leaders, and pool wisdom and strength for the development of China-DPRK relations, Xi said.

The two sides should stay committed to the goal of delivering benefits to the people and elevate the level of practical cooperation, Xi said.

China stands ready to work with the DPRK to strengthen the alignment of development strategies, and to expand practical cooperation in areas such as economy and trade, agriculture, construction, science and technology, and healthcare, to bring greater benefits to the two peoples, he added.

Left: President Xi Jinping and his wife, Peng Liyuan, are welcomed by Kim Jong-un, the top leader of the DPRK, and his wife, Ri Sol-ju, at the airport in Pyongyang, the DPRK, on Monday. XIE HUANCHI / XINHUA
Above: People from all walks of life in Pyongyang hold flags and flowers to welcome President Xi Jinping on Monday. SHEN HONG / XINHUA

Xi called on both sides to leverage the opportunity of the full reopening of border crossings and the resumption of civil aviation flights and international passenger trains to increase people-to-people exchanges and foster mutual interaction.

The two sides should uphold the inheritance of friendship as a driving force and strengthen the bonds between their peoples, Xi said, noting that the traditional friendship between China and the DPRK, forged in blood, is a valuable shared asset of the two peoples.

China stands ready to work with the DPRK to preserve and properly manage the memorial facilities dedicated to the Chinese People's Volunteers martyrs in the DPRK, carry out distinctive programs on revolutionary traditions and youth education, and pass on the red legacy and traditional friendship between the two countries, Xi said.

China is also ready to work with the DPRK to make full use of each side's strengths and resources, enhance exchanges and cooperation in education, culture and the arts, tourism, sports, media, youth affairs, subnational engagement and sister-city relations, and ensure that the traditional friendship between China and the DPRK takes deeper root in the hearts of the two peoples, Xi said.

The Chinese president also called for upholding fairness and justice as a guiding principle to enrich the substance of strategic coordination. Xi said that, in response to the major question of where humanity is headed, he has proposed the vision of building a community with a shared future for humanity and the four global initiatives, which aim to steer global governance toward greater fairness and justice and have won broad support and positive responses from the international community, including the DPRK.

Noting that Asia is the common home where countries including China and the DPRK, thrive, Xi said that the two countries should strengthen strategic coordination, firmly safeguard their respective sovereignty, security and development interests, and jointly uphold regional peace and development.

Calling Xi the most respected guest of the DPRK people, Kim said that his country extended the warmest and most cordial welcome to Xi, who is visiting the DPRK after a seven-year interval. Xi's choice of Pyongyang for his first overseas trip this year fully reflects the great importance he attaches to DPRK-China relations and the profound friendship between the two countries, which is a tremendous encouragement to the DPRK, Kim said.

The visit once again clearly demonstrates that the DPRK-China relationship is unbreakable, Kim said. Calling the bilateral ties time-tested, Kim said that the relations have always stood on the right side of history and championed autonomy and justice.

The special nature of the bilateral relations lies not only in the fact that the two countries are close neighbors, but also in the deep traditional friendship and shared ideals and convictions, which both sides cherish and are committed to carrying forward from generation to generation, Kim said.

He also recalled his meeting with Xi in Beijing last September, noting that since then, bilateral relations have achieved positive progress in various fields, bringing tangible benefits to the two peoples.

He voiced sincere appreciation for the important proposals put forward by Xi on advancing DPRK-China relations in the new era, adding that relevant departments of the DPRK will work closely with their Chinese counterparts and make every effort to fully implement the proposals, and promote new progress in bilateral exchanges and cooperation in areas such as economy and trade, infrastructure, science and technology, education, and people-to-people and cultural exchanges.

Kim noted that the concept of a community with a shared future for humanity and the four major global initiatives proposed by Xi carry profound significance for promoting world peace and development, and have won the support and appreciation of people around the world.

He also said that the international community has been undergoing unprecedented and profound changes in recent years, stating that the DPRK will unwaveringly uphold the one-China principle and firmly support China's policies and positions on safeguarding core interests.

On Monday evening, Xi and his wife, Peng Liyuan, attended a welcoming banquet hosted by Kim in Pyongyang. In his remarks at the banquet, Xi said that the relationship between China and the DPRK stands at a new historical starting point. He said that he reached an important consensus with Kim during the visit.

Following the banquet, Xi and Peng, along with Kim and his wife, Ri Sol-ju, watched an artistic performance at the Pyongyang Gymnasium.

Upon Xi's arrival earlier in the day, Kim and Ri welcomed Xi and Peng at the airport. After Xi walked down the stairs from the plane, Kim shook hands with him warmly.

Kim also held a grand welcoming ceremony for Xi at Kim Il-sung Square in Pyongyang. The top leaders of the two parties and the two countries jointly ascended the review stand. Amid a 21-gun salute, the military band played the national anthems of China and the DPRK.

CHINA

Carrying on the legacy

The new *Dongpo* dragon boat cruises through a river channel in Chebei village, Guangzhou, Guangdong province, on Monday. To celebrate the upcoming Dragon Boat Festival, the village held a ceremony called *caiqing* to "awaken the spirit" of a dragon boat, allowing it to regain its "soul" and be ready for the upcoming races. Chebei boasts a rich dragon boat history, with its 158-year-old *Dongpo* being one of the city's oldest and best-kept boats. To preserve it, the original boat was sent for maintenance, with an identical replica, the new *Dongpo*, carrying on its legacy.

CHEN JIMIN / CHINA NEWS SERVICE

Classical studies can bridge civilizations, experts say

Second World Conference of Classics in Athens to enhance East-West dialogue

By **XU LIN**
xulin@chinadaily.com.cn

The world's talented minds gather again to seek inspiration from ancient wisdom.

The second World Conference of Classics will be held in Athens, Greece, on Tuesday and Wednesday as a landmark platform for dialogue between Eastern and Western scholars of classical studies.

Inside
See more, **pages 8-9**

Experts believe Chinese classical studies embrace a vision of mutual learning among civilizations and the integration of Chinese and foreign perspectives.

On Nov 7, 2024, Chinese President Xi Jinping sent a congratulatory letter to the inaugural World Conference of Classics held in Beijing.

Xi expressed the hope that experts and scholars would embrace the responsibility of advancing classical studies, contribute to the preservation and development of civilizations, and enhance exchange and mutual learning among them.

Guided by the spirit of the congratulatory letter, classical studies in China have achieved remarkable progress in disciplinary development, talent cultivation, academic research and international exchange.

Over the past decade, institutions of higher learning like Peking University have launched experimental programs in classical studies. About a dozen universities have established research centers for classical studies. These efforts have laid the groundwork for the discipline's development in China.

In March 2025, Sichuan University established China's first fully independent Department of Classics with a complete institutional setup, offering a full training system covering bachelor's, master's and doctoral programs.

"Our department features an interdisciplinary framework that bridges Eastern and Western classical studies and integrates literature, history and philosophy," said Liu Juan, deputy director of the department.

Beyond courses in classical languages, the department offers Chinese classical studies focusing on classical texts of the pre-Qin period (before 221 BC) and the Qin (221-206 BC), as well as the Han (206 BC-AD 220) dynasties, Western classical studies rooted in Greek and Roman texts, and comparative classical studies centered on cross-civilization dialogue and mutual learning between China and the world.

"Establishing classical studies as an independent major helps train young scholars with solid professional grounding and a broad academic vision. It promotes interdisciplinary integration and innovative development, and is a forward-looking arrangement that meets the needs of the new era," said Li Changchun, an associate professor in the Department of Philosophy at Sun Yat-sen University in Guangzhou, Guangdong province.

In 2025, the National Social Science Fund of China listed classical studies as an independent first-level discipline. The Chinese Academy of Social Sciences also included classical studies in its funding program for endangered and less-studied disciplines.

Li noted that this is a crucial step in building the discipline of classical studies. Before that, classics researchers mainly relied on funding from other disciplines, and their research topics were often constrained by those fields. "Thanks to these policies, classics scholars are motivated to pursue more in-depth research and set research topics based on the needs of classical studies itself," Li added.

In his 2024 congratulatory letter, President Xi also emphasized China's commitment to the preservation and development of civilizations and said China is dedicated to enhancing international people-to-people exchanges and fostering global dialogue among civilizations.

He said China stands ready to work with other nations in implementing the Global Civilization Initiative, addressing shared challenges facing humanity and promoting the advancement of human civilization.

Such advocacy for cross-civilization communication and mutual learning is reflected in exchange programs for both academic scholars and young people.

The Center of Chinese and Greek Civilizations, or KELKIP, initiates an annual student exchange program under which Chinese students travel to various parts of Greece while Greek students visit different regions of China.

"Such exchanges enable classical civilizations to nourish and inspire future generations," said Wang Yong, secretary-general of the Chinese KELKIP, whose secretariat is based at Southwest University in Chongqing.

Wang further clarified the contemporary mission of Chinese scholars of classical studies, arguing that they should absorb and integrate the essence of human civilizations — including Chinese civilization — to foster dialogue between China and the world, deepen mutual understanding across civilizations and advance a community with a shared future for humanity.

Roger T. Ames, a humanities chair professor in the department of philosophy at Peking University, shares a similar perspective.

"In the plural, classical studies provide the opportunity for one culture to grow in its relationship to another — harmony in diversity," he said.

Ames said the classics move the international conversation from geopolitics to geocultural concerns, from an economic and political discourse to a dialogue on civilization. "Classics are quite simply the basis of human civilization, and areas of cooperation such as the Belt and Road Initiative are dependent upon respect for our different and yet complementary values."

He pointed out that Confucian values of inclusion, optimizing symbiosis, civility and interdependence, are needed to address human predicaments such as climate change and environmental degradation.

"Civilizational differences do not necessarily trigger conflicts. The key lies in continuous communication and mutual understanding, which transforms cultural divergences into starting points for cooperation and integrates others' experiences into elements that enrich one's own civilization," said Wang Huan, deputy director of the Institute for the Global History of Civilizations at Shanghai International Studies University.

Xing Yi in London and Tan Yingzi in Chongqing contributed to this story.

Growth: Success of any regional framework rests upon bedrock of trust

From page 1

From a macro-regional perspective, ASEAN serves as the central platform for East Asian economic integration. However, the region currently navigates a complex web of overlapping trade agreements — often referred to as the "spaghetti bowl" effect. While the Regional Comprehensive Economic Partnership — an ASEAN-led initiative — is the world's largest free trade group, it has yet to unleash its full potential.

The primary hurdle lies in the discrepancy between declaratory rhetoric and pragmatic utilization. Despite steady progress in tariff reductions and the harmonization of "rules of origin", the RCEP's utilization rates remain surprisingly low. For instance, in 2024, when China-Malaysia bilateral trade hit a record $212.4 billion, the utilization rate of RCEP rules was a mere 0.7 percent. Similarly, Vietnam's utilization rate stood at 1.8 percent, dwarfed by the 40.5 percent average for its various ASEAN+1 free trade agreements.

This disparity stems from the fact that entrepreneurs, particularly small and medium-sized enterprises, favor the familiar and simpler procedures of the China-ASEAN Free Trade Area over the more complex RCEP framework.

To make the RCEP relevant, there is an urgent need to review and upgrade its rules to ensure that they are complementary to, rather than at odds with, CAFTA 3.0.

The upcoming RCEP general review presents a critical window for its 15 signatories to "upgrade" the framework. The goal should be to match or exceed the standards set by CAFTA 3.0, specifically by tightening rules on digital data transfers and streamlining administrative hurdles.

In reality, the two core challenges confronting regional economic cooperation will always lie in the conundrums of translating macro-level visions into deliverable actions, in addition to rendering rules that truly serve the needs of businesses.

The RCEP framework includes a chapter on "Standards, Technical Regulations and Conformity Assessment Procedures" that seeks to reduce "technical barriers to trade" by enhancing transparency, encouraging international standards and promoting mutual recognition of conformity assessments.

This regulatory cooperation, intended to lower compliance costs and technical bottlenecks for businesses across the RCEP, provides an opportune dimension for Sino-Malaysian collaboration. By synchronizing standards in sectors such as electronics, automobiles, pharmaceuticals and halal food products across the RCEP, such cooperation helps reduce the non-tariff costs that often negate the benefits of free trade for smaller businesses.

However, a sobering reality check reveals that efforts to establish mutual recognition agreements for conformity assessment results and reducing duplicate testing are not easy. Such efforts require serious political will and concerted multilateral action across the 15-member RCEP to make the agreements enforceable.

The RCEP's stakeholders, notably China and Malaysia, which are ready to harness the dividends of the RCEP's unified rules of origin — which dictate the economic nationality of a product and affect how goods are treated in terms of tariffs and restrictions — could envision creating a seamless manufacturing corridor where raw materials from China are processed in Malaysia for duty-free export across the entire RCEP.

From the development perspective, amid the converging trend of Malaysia's Madani Economy framework and China's high-quality development goals, the bilateral cooperation is well poised to move beyond traditional trade in goods and into artificial intelligence-powered logistics, cross-border digital payments and electric vehicle manufacturing in Malaysia.

By leveraging the RCEP's tariff preferences and trade facilitation measures, the model of "Two Countries, Twin Parks" in both Qinzhou in China's Guangxi Zhuang autonomous region and Kuantan, Malaysia, provides a timely template to showcase an early triumph for the RCEP in the high-tech and new energy sectors.

Under the RCEP framework, deepening collaboration in fields such as 5G networks, smart cities, interoperability of cross-border payment systems, and the new energy vehicle industrial chain are the ready deliverables that can help jointly secure commanding heights for future development.

In the final analysis, the success of any regional framework rests upon the bedrock of trust. The "weaponization" of unilateral tariffs and the use of economic coercion are existential threats to the architecture of regional integration. Malaysia and its ASEAN neighbors are currently facing a test of their resilience.

However, the choice is clear. It is not a choice between global powers, but a choice between fragmentation and integration. Southeast Asian nations must maintain the liberty to decide what is best for their own economic destinies. This principle of strategic autonomy is enshrined in the ASEAN Treaty of Amity and Cooperation, a document to which both the United States and China have acceded.

As the China-ASEAN partnership seeks to deepen continuously amid the prevailing global tumult, it remains the most viable path toward a stable, prosperous and interconnected Asia, through optimization of the RCEP and implementation of CAFTA 3.0.

By translating macro-level visions into deliverable actions, we can ensure that the regional economy remains a beacon of growth in an otherwise uncertain world.

The author is president of the Belt and Road Initiative Caucus for Asia Pacific. The views do not necessarily reflect those of China Daily.

CLIFFSIDE VALLEY LEAVES A LASTING IMPRESSION

Away from the glittering towers and LED light shows of the nation's metropolises, lantern-lit villages in Jiangxi are offering visitors a different view of China

By **ZHAO RUINAN**
in Shangrao, Jiangxi
zhaoruinan@chinadaily.com.cn

Once upon a time, a traveler's first taste of China would begin with the glittering towers of Shanghai, the imperial echoes of Beijing or the cuddly charm of Chengdu's pandas in Sichuan province.

But for a fast-growing tribe of young adventurers, that very first glimpse now comes steeped in mist and legend — a cliffside valley deep in rural Jiangxi province.

They didn't find it flipping through a guidebook. They found it through soaring drone footage flickering across online travel posts, passed along in viral recommendations on social media.

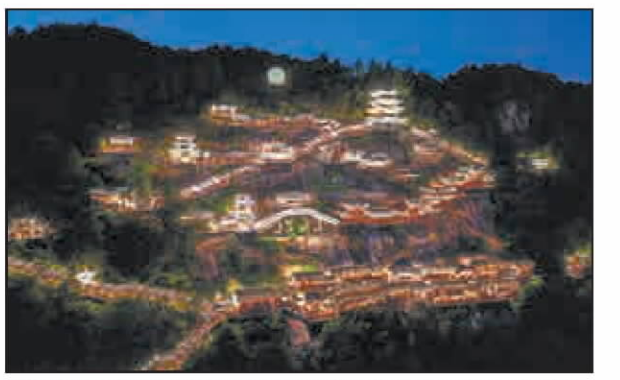
In Wangxian Valley in Shangrao, timbered pavilions seem to cling to sheer cliff faces by nothing more than ancient magic as waterfalls carve silver ribbons through emerald gorges. And, when dusk spills over the mountains, thousands of lanterns glimmer along the streets and bridges, transforming the valley into what many visitors describe as a fantasy version of traditional China — a living, breathing scroll painting.

"We saw a lot of pictures and drone shots on social media like TikTok," said Symeon Theocharous, 32, a visitor from Greece. "But in real life, it's even more amazing. It's more breathtaking."

Nestled in Wangxian township, Guangxin district, this realm of wonder carries an unlikely origin story. The valley was once tied to stone quarrying and processing, its slopes scarred by industry. After years of painstaking ecological restoration and a cultural tourism renaissance, the former mining site has been reborn — as a retreat where dramatic natural beauty meets folk-style streets, cliffside architecture, night tours, live performances and the soulful flavors of local cuisine.

The numbers tell a tale of enchantment. Wangxian Valley welcomed 180,000 overseas visitors in 2025, a year-on-year increase of 76 percent. In the first five months of this year alone, more than 100,000 international travelers have walked its lantern-lit paths, with over 30,000 visitors arriving in May.

The valley's ethereal waterfalls, its lantern-lit nights and its tableaux of Jiangxi-style intangible cultural heritage offerings have cast a spell across overseas social media platforms, weaving the irresistible image of a "real-life *xianxia* world" — the kind of mythical realm known from Chinese fantasy tales where immortals dwell among clouds and cliffs.



Some videos of Wangxian Valley have garnered over a million likes, and its dreamlike scenery has been shared by Chinese Foreign Ministry spokeswoman Mao Ning on her own social media channel.

For 26-year-old French national Johan Rapetti, Wangxian Valley had appeared on social media feeds before he came to China. His itinerary also included Shanghai, Beijing, Chengdu and Chongqing, but the valley offered a different view of the country.

"We saw a lot of things on social media in France about this place, and we are so happy to be here in reality," he said.

Marion Letourneur, 24, from Paris, said Wangxian Valley gave her a different impression after Shanghai. "It's really beautiful because it's not something we can see in France," she said. "It's a way to see China in a different way."

For Elyse Mazenier from New Zealand, the contrast with China's major cities was part of the appeal. "It's really cool and it's nice to see the two different sides of China," she said. "I feel like this is what traditional China would look like."

Hillside pavilions of the Wangxian Valley illuminate the night sky in Jiangxi province on July 11, 2025. LIU JINHAI / XINHUA

CHINA

Intl cooperation key to environment regulation

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

As environmental crimes increasingly cross borders and threaten ecosystems, communities and sustainable development, prosecutors and experts called for stronger cooperation to close enforcement gaps and improve global environmental governance at a roundtable meeting in Beijing on Monday.

The meeting, themed "The Role of Prosecutors in Global Environmental Governance", gathered prosecutors and experts from more than a dozen countries and organizations for discussions on strengthening environmental enforcement, combating environmental crimes and protecting the public interest.

Participants said climate change, biodiversity loss, pollution and the illegal exploitation of natural resources are interconnected global challenges that cannot be solely addressed by any one country or institution. They called for closer judicial cooperation, information sharing and professional exchanges among prosecutors, courts, law enforcement agencies, civil society as well as international organizations.

Zhang Xueqiao, deputy prosecutor general of the Supreme People's Procuratorate, said building a clean and beautiful world is both a Chinese initiative for global ecological civilization and an essential requirement for sustainable human development.

China has advanced ecological civilization through legislation, enforcement and judicial practice in recent years, he said, noting that the country's top legislature adopted the Ecological and Environmental Code in March.

Chinese procuratorial organs have placed ecological and environmental protection high on their agenda, using criminal, civil, administrative and public interest litigation functions to strengthen judicial protection. The SPP has launched public interest litigation campaigns involving major river basins, including the Yangtze, Yellow and Pearl rivers, and carried out supervision campaigns on hazardous waste crimes and green, low-carbon development.

In complex cross-regional cases, procuratorial organs have strengthened integrated case handling, cross-regional cooperation and the use of technologies such as satellite remote sensing, drones and rapid testing to improve evidence collection and damage assessment, he said.

Xu Xiangchun, head of the SPP's public interest litigation department, said procuratorial organs have handled more than 608,000 public interest litigation cases involving ecological and resource protection since July 2017, accounting for 47 percent of all such cases.

More than 90 percent of administrative public interest litigation cases were resolved before trial, he said, helping reduce judicial costs while encouraging administrative authorities to perform their duties.

Xu said procuratorial organs have also strengthened coordination with courts, the public and administrative departments including those responsible for water resources, ecology and environment, agriculture and rural affairs and forestry. The SPP also promoted public participation through a volunteer platform that has recruited 126,000 volunteers nationwide.

International participants said environmental governance requires stronger cross-border cooperation and more effective legal enforcement.

Hindenburgo Chateaubriand, deputy prosecutor general of Brazil, said environmental crimes do not stop at national borders and enforcement cannot be carried out by any single institution alone, making transnational judicial cooperation an important priority for prosecutors.

He said China is currently Brazil's largest export market for agricultural and livestock products, with large volumes of trade in key commodities such as beef, adding that the deep economic ties between the two countries also create favorable conditions for closer cooperation in social development, environmental protection and sustainability.

Trade growth should go hand in hand with ecological and climate protection, he said. Brazil has taken steps to strengthen regulation in the beef industry and plans to extend supervision to supply chains such as soybeans to build greener and more resilient systems.

Elizabeth Mrema, assistant secretary-general of the United Nations, said China has made inspiring progress in environmental legislation, enforcement and jurisprudence. She said China's public interest litigation system offers important innovations and lessons, with prosecutors playing a key role in closing the gap between environmental laws and their implementation.

She also noted that China's Ecological and Environmental Code is an important development not only for China but also for the region and the world, as it reflects a broader trend of modernizing environmental legal frameworks to respond to increasingly complex environmental challenges.

Adam Weiss, chief programmes and impact officer at environmental law organization ClientEarth, said China's experience has become an important reference model for many countries seeking more effective legal and institutional responses to environmental challenges.

While environmental laws and policies continue to develop around the world, effective implementation and enforcement remain essential, he said. Prosecutors have a unique role in ensuring compliance, pursuing accountability for environmental harm and safeguarding the public interest.

Participants noted that dialogue among prosecutors and other justice actors can help countries share good practices, improve enforcement capacity and better implement international environmental commitments.

Zhang said Chinese procuratorial organs will continue to actively perform their duties, make full use of the public interest litigation system and strengthen exchanges and cooperation with international partners to build a fair, reasonable and mutually beneficial global environmental governance system.

Haven for migrants

A staff member cleans a crane rehabilitation enclosure at a migratory bird rescue center in the Hengshui Lake national nature reserve, Hebei province, on Sunday. Located along the East Asian-Australasian flyway, the reserve is home to diverse ecosystems and has recorded 337 bird species, making it an important refuge for migratory birds. YANG WENBIN / XINHUA

CCG holds ops east of Taiwan island

China terms Japan-Philippines delimitation talks illegal and invalid

By **JIANG CHENGLONG**
jiangchenglong@chinadaily.com.cn

China conducted law enforcement and maritime traffic patrols in waters east of its Taiwan island in early June, moves that are believed to demonstrate the country's jurisdiction, capability and resolve to safeguard its rights in the area following the Japan-Philippines unilateral delimitation move.

The Ministry of Transport organized a special maritime traffic law enforcement operation on Saturday in waters east of Taiwan island, fully exercising China's maritime administrative law enforcement jurisdiction, according to the ministry.

The operation was carried out by maritime safety administrations in Fujian and Guangdong provinces, as well as navigation support and rescue authorities in the East China Sea. It aimed to strengthen long-range offshore patrol and law enforcement capabilities, improve traffic management in key waters, ensure maritime traffic safety and safeguard national interests, the ministry said.

On June 1, China Coast Guard spokesman Jiang Lue said a CCG vessel fleet conducted law enforcement patrols in accordance with the law in waters east of Taiwan island.

Both the CCG and the Ministry of Transport stressed that the operations were "necessary actions" in response to Japan and the Philippines' unilateral announcement of launching maritime delimitation talks regarding waters east of China's Taiwan island, which they said seriously infringed upon China's territorial sovereignty and maritime rights and interests.

Jiang urged the two countries to immediately stop all illegal actions that undermine China's sovereignty and rights, noting that the CCG will continue to strengthen control and management over relevant waters and resolutely safeguard national territorial sovereignty and maritime rights and interests through "concrete actions".

Zhang Junshe, a former researcher at the Naval Research Academy, said the operations were not only the most direct response to the so-called delimitation talks by Japan and the Philippines, but also demonstrated China's jurisdiction over relevant waters east of Taiwan island.

The operations came after Foreign Ministry spokeswoman Mao Ning said at a regular news conference on May 29 that the so-called delimitation talks between Japan and the Philippines are "completely illegal and invalid" and will have no impact on China's rights claims in waters east of Taiwan island or China's exercise of its lawful rights.

On May 28, following a meeting between Japanese Prime Minister Sanae Takaichi and visiting Philippine President Ferdinand Marcos Jr, Tokyo and Manila announced the launch of formal negotiations on the delimitation of their exclusive economic zones and continental shelves. According to the joint statement, the proposed delimitation areas include overlapping waters east of Taiwan.

Mao said that under China's domestic law and international law, including the United Nations Convention on the Law of the Sea, China has an exclusive economic zone and continental shelf in the area.

She added that Japan and the Philippines' unilateral launch of so-called maritime delimitation talks seriously infringes upon China's maritime rights and interests, and violates international law, including the United Nations Convention on the Law of the Sea, as well as the basic norms governing international relations, expressing strong dissatisfaction and firm opposition to the move.

Zhang said the latest operations showed that China's maritime law enforcement forces have not only the determination, but also the capability and strength to safeguard the country's rights.

He said the waters east of Taiwan island are complex and pose a major test for vessel performance and law enforcement capabilities.

Those operations proved that China's coast guard and maritime safety forces are already capable of conducting regular law enforcement patrols, control and management in waters east of Taiwan island, he said.

More importantly, Zhang said, they show that China has effectively established a relatively complete system for protecting sovereignty and maritime rights and interests, as well as governing waters around Taiwan island.

New tech surgery aids recovery of vision

By **CHEN MEILING** in Beijing and **HE CHUN** in Changsha

A blind woman in China has recovered partial vision after receiving a brain-computer interface surgery in Changsha, Hunan province, bringing new hope to patients suffering from degenerative retinal diseases.

Chen, 61, was diagnosed with retinitis pigmentosa at the age of 40, a condition that eventually left her completely blind in both eyes. On April 23, she was selected for a clinical trial and underwent an implantation surgery at Xiangya Hospital of Central South University.

During the surgery, an electrode array measuring 6 millimeters by 10.8 mm — roughly the size of a fingernail — was implanted onto the retinal surface of the macular region inside the eyeball.

Following the procedure, the patient wears a pair of glasses equipped with a miniature camera and a wireless transmission module. The camera captures environmental images, which a video processor analyzes and encodes. The encoded data is then transmitted via radio frequency wireless technology to the implant, which converts the data into electrical stimulation signals that act on retinal nerve cells. This visual information is ultimately relayed to the brain.

"If we compare the eyeball to a camera, the retina is the film. When the film is damaged, we directly use electrical signals to 'tell' the intact nerve cells behind what is being seen, which is equivalent to building a bypass for the visual system," said Xu Huizhuo, who conducted the surgery and leads the clinical trial project called the IMIE intelligent retina system.

Once the system is activated, patients initially experience phosphenes — a visual phenomenon manifesting as bright pinpoint lights against a dark background. Through systematic training, patients learn to assemble these light spots to identify object outlines, obstacles, directional markers and simple letters.

Xu explained that bionic vision functions more like a low-resolution visual system delivering light and dark outlines, and cannot yet match the rich, colored vision experienced by people with normal sight.

"Nevertheless, for patients who have been blind for a long time, such visual information can greatly improve their ability to live and move around independently," Xu said, emphasizing that artificial vision helps patients regain a degree of visual perception rather than restoring normal eyesight. Patients usually require several months or longer of rehabilitation training to interpret the new information.

At present, Chen's visual acuity has recovered to 0.1. During tests, she was able to recognize striped patterns in specific orientations and complete tasks such as indoor directional walking.

Degenerative retinal diseases like retinitis pigmentosa are major causes of irreversible blindness. Among advanced-stage patients, conventional medicines, surgeries and gene therapies often fail. The new method bypasses impaired photoreceptor cells to reconstruct an artificial visual pathway.

Remarkably, China's self-developed IMIE intelligent retina system boasts 256 stimulation channels, marking a more than fourfold improvement in data capacity compared with comparable overseas products featuring 60 channels.

"If artificial vision is compared to an electronic display screen, the number of stimulation channels is equivalent to 'pixels'. A 60-channel system is like a very blurry black-and-white image, whereas the 256-channel version delivers far more details," Xu said.

The team has already completed the development of 512-channel flexible electrode technology, aiming for future iterations ranging from 1,024 to 2,048 channels. The technology is applicable to patients whose optic nerves and brain visual pathways remain functional. As the system is still in the clinical research stage, relevant costs will be finalized following subsequent regulatory approvals.

2025 data shows marine conditions remain stable

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China's marine ecological protection and restoration efforts yielded preliminary results, with overall marine conditions remaining stable and localized improvements observed last year, according to a bulletin released on Monday by the Ministry of Natural Resources.

Coral reefs, seagrass beds, mangroves and island ecosystems remained in good condition, the ministry said in its 2025 bulletin on China's marine ecological early warning and monitoring.

Released to mark the 18th World Oceans Day, the bulletin drew on monitoring data from 14 standard offshore transects, 1,579 monitoring stations, 126 typical ecosystem areas and 350 islands across China's jurisdictional waters.

The report showed that biodiversity indicators for plankton and large benthic organisms in nearshore waters remained consistent with the five-year average. Surface seawater salinity, pH levels, inorganic nitrogen concentrations and dissolved oxygen levels in bottom waters also remained close to the 10-year average.

According to the bulletin, key bays and estuaries maintained stable biological community structures, with no significant shifts in dominant species groups. Sediment conditions remained sound, although localized eutrophication persisted in some areas.

The bulletin also warned of marine ecological risks linked in part to global climate change. Last summer, nearshore surface water temperatures in China were 0.7 C above the long-term average.

Although both the frequency and affected area of red tides declined compared with the 10-year average, risks from Ulva prolifera, or green tides, localized biological outbreaks and estuarine hypoxia remain, it said.

The ministry also released the second batch of its marine data open-sharing catalog on Monday, providing data support for marine economic development, disaster prevention and mitigation, resource exploitation and scientific research.

Fishermen dry seaweed on a beach in Qionghai, Hainan province, on Monday. Processed into high-quality feed for marine creatures, the seaweed industry helps support both marine conservation efforts and local livelihoods. MENG ZHONGDE / FOR CHINA DAILY

Building on 37 data products included in the first batch released in June 2024, the updated catalog adds 10 global three-dimensional ocean datasets covering temperature, salinity, currents, waves and atmospheric pressure, as well as seven new statistical analysis products for global marine hydrological and meteorological data.

Since the first catalog was published, marine data services have been accessed more than 600,000 times by more than 100 government departments, research institutes and maritime enterprises, delivering more than 600 million data records, the ministry said.

China's marine monitoring capacity has expanded significantly in recent years, forming an integrated observation network that combines coastal stations, radar systems, buoys, research vessels, drones and satellite remote sensing.

The outline of the 15th Five-Year Plan (2026-30) calls for enhancing the protection and sustainable use of marine resources and accelerating the building of a maritime power.

In line with the plan, the ministry said it will continue advancing marine ecological protection and restoration, using high-level environmental protection to support the high-quality development of the marine economy.

Shopping with your heart, not your head

Emotion-driven, experiential consumption the new retail driver

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

Left: Visitors enjoy themselves at the Shangxiahang historical and cultural street in Fuzhou, Fujian province, on May 2. LIN SHANCHUAN / XINHUA **Above:** Tourists visit the "scruffy dog" topiary in Jing'an district, Shanghai. PROVIDED TO CHINA DAILY

Shanghai recently witnessed the birth of an unlikely internet sensation — a 5.2-meter-high "scruffy dog" topiary in central Shanghai's Jing'an district.

Originally designed for the 2026 Shanghai International Flower Show from April 18 to May 5, the West Highland White Terrier-shaped shrubbery, made up of more than 20 types of flowers and plants, has become so popular that the city decided to keep it on display for another three months. In less than a month, more than 30 million people have flocked to see it.

The local government has also invited people to give it a name based on its shape and the rapidly growing greenery it is made of.

The cute attraction, located in the outdoor area of Shanghai Suhe MIXC World, is also being credited with triggering skyrocketing sales in the vicinity.

Retailers located around the topiary reaped over 2 billion yuan ($295 million) in sales during the official exhibition period. Total sales revenue has jumped 49.22 percent year-on-year to nearly 61.6 million yuan since "scruffy dog" was unveiled. A total of 1.7 million consumers visited the mall over the period, up 192.53 percent from a year earlier.

"People have come for the scruffy dog. They linger, take pictures, then find themselves grabbing a coffee, sitting down for a meal, and strolling through the nearby shops. Wrapped in a sense of calm, consumption unfolded as a natural afterthought," officials from the commerce bureau of Jing'an district said.

Han Meiyi, a human resources specialist in Shanghai, is one of the many fans of the topiary puppy. She made a trip to the mall on a rainy day to attend an ongoing bread festival. Despite the weather, she encountered flocks of people wanting to see the novel attraction.

Han described the day as a "sweet memory", with the aroma of bread wafting in the air.

"I bought bread from five different bakeries, enjoyed two milk teas while shopping for bread, and of course, took pictures with the iconic scruffy dog, and loved every minute of the day," she said.

Emotional value

The topiary dog is now being considered for cultural and creative product development, according to Jing'an district officials.

At a news conference in mid-May, Shen Weihua, director of the Shanghai Municipal Commission of Commerce, defined the retail boost associated with the popular attraction as "emotion-driven consumption". The city will come up with more unconventional scenarios to provide new consumer experiences, he said, adding that stimulating consumption would be a major mission for the municipal government in the coming years.

The Chinese consumer market has entered a new age, according to Joanna Lu, a partner at consulting company Bain & Co. "The core of consumption is 'love'. People are looking for meaning and emotional value from different experiences. That is why consumption is more driven by scenarios, social groups and sentiments," she said.

> "When people have time, they can become easily bored. In other words, they are more willing to pay for experiences like studying abroad, making their life more colorful while fulfilling their childhood dream."
>
> **Wu Mianqing,** CEO of data service provider BigOne Lab

Liu Gongrun, deputy director at the CEIBS Lujiazui International Institute of Finance, said the Chinese consumer market has been undergoing a revolution, moving from buying tangible goods to savoring intangible services. Consumer satisfaction has been upgraded from goods to value, Liu said.

In 2025, China's sales of services grew 5.5 percent from a year earlier, 1.7 percentage points higher than that of goods, according to the National Bureau of Statistics.

Moreover, service consumption has consistently outpaced goods consumption for years.

A look at the consumption habits of wealthy Chinese also provides an insight into the changing consumer market, as industry figures predict future lifestyle trends.

Consumption in China has been rapidly transforming from "possessing things" to "prioritizing experiences", the Hurun Research Institute, which has been researching affluent Chinese for nearly three decades, said in a report in January.

The size of the Chinese high-end consumer market contracted 5 percent year-on-year to 1.56 trillion yuan in 2025. In addition, the super rich plan to cut their annual expenditure on luxury watches and jewelry by 10 percent over the next three years. However, they have increased their budgets for experience-based consumption, such as travel and health management, by 12 percent.

"The super rich no longer consider consumption as a tool to demonstrate their identity. Life quality and emotional satisfaction are of greater value to them," said Rupert Hoogewerf, founder and chief researcher of Hurun.

Worthiness wins

A similar consumption trend is happening among younger Chinese.

Guochao, or China chic, reflects their close connection to Chinese culture with aesthetic value and shopping experiences overtaking brand cachet, said Liu from the institute of finance.

The younger generation's greater demand for experiences is making the focus of domestic brands more international, as younger consumers are well-educated with a global outlook. This means brands will have to be more innovative to provide "extraordinary" experiences, Liu said.

Purchasing domestic brands can evolve from a one-time shopping spree to repeated purchases, he added.

"The core targets of the *guochao* brands, which are younger consumers aged between 20 and 30, are more rational and less easily drawn to the traditional internationally well-established brands. To them, consumption is an expression of their own value. The product's worthiness outweighs affordability when they buy something," Liu said.

According to market consultancy iiMedia Research, the *guochao* market size reached 2.5 trillion yuan in 2025, with the figure expected to top 3 trillion yuan in 2028.

The rise in China chic has also been boosted by inbound travelers looking for different consumer experiences in China, iiMedia analysts added.

The pursuit of new shopping experiences, however, is not restricted to categories or age groups.

China's domestic tourism market is a good example. It hit record numbers last year in both the number of trips taken and total spending, according to the Ministry of Culture and Tourism.

Domestic tourists made 6.52 billion trips throughout 2025, up 16.2 percent from a year earlier. Their travel spending jumped 9.5 percent year-on-year to 6.30 trillion yuan. "Immersive experiences" were listed as top priorities for traveling.

The elderly, those age 60 and above, were important contributors to the travel industry. According to the Chinese domestic travel agency HopeGoo, they accounted for over 70 percent of tourists who booked outbound luxury cruise trips and over 90 percent who took polar cruises. Their average expenditure on a single trip exceeded 12,000 yuan, higher than all other age demographics.

Their demands for tailored travel experiences have also increased.

International language training institution EF said it has seen elderly Chinese people's rising interest in overseas study programs. In 2019, only 3 percent of the program participants were aged above 50. But that ratio rose to 20 percent in 2023.

Retired doctors, engineers, teachers and company executives aged between 55 and 65 make up most of the participants.

The two- to four-week programs, priced at 20,000-70,000 yuan per person, are affordable for well-off people, EF said.

"When people have time, they can become easily bored. In other words, they are more willing to pay for experiences like studying abroad, making their life more colorful while fulfilling their childhood dream," said Wu Mianqing, CEO of data service provider BigOne Lab.

Importantly, the purchase of language courses by elderly Chinese travelers was preceded by the experience of overseas travel. "Based on my parents' experiences, they expressed strong willingness to learn English after several overseas trips. Now they have become loyal subscribers of a paid language-learning application. It forms a perfect loop for such travel service providers," Wu said.

A recovery in the capital market is likely to generate more income for Chinese consumers, making them more optimistic and confident to buy, he added.

Experiential, it's a thing

Some financial analysts argue that the Chinese consumer market has slowed down, but Qin Shuo, a Shanghai-based financial commentator, explained that this is only one side of the coin.

In certain situations, consumers see value-for-money purchases as the priority. However, when it comes to experience or sentiment-related consumption — such as travel or raising pets — they spend generously.

A "K-shaped" economy, where growth and decline are taking place simultaneously across different segments, has been used to describe the current Chinese consumer market.

But Qin believes that is an oversimplification of the bigger picture. It is true that the consumer price index has not been rising significantly, he said, but that is a reflection of prices, not the size of consumption. In addition, low prices are a result of strong supply, he said.

A more important factor is the maturity of Chinese consumers, who are looking for "high-quality and fair shopping experiences", according to Qin.

Online retailers, for example, have made products once only sold in first-tier cities available to consumers in lower-tier cities and counties.

Lu of Bain & Co said the current maturity of Chinese consumers should be measured against the development of consumerism in the country over the last five decades.

Before the 1980s — which was the age of scarcity of goods — consumption was all about "having it or not". Brands barely mattered. The market was driven by supply, which meant that if a company could make the product, someone would definitely buy it, Lu said.

Entering the 1990s, Chinese consumers began to tell the world who they were with what they had bought.

Between 2000 and 2010, there was an abundance of supply and Chinese consumers shopped for products to fit their taste, style and identity. Self-expression was the key reason for consumption during this period, Lu said.

"Chinese consumers now have a 'value awakening'," she said.

"More and more consumers are willing to pay for emotional value and spiritual satisfaction. Consumers are no longer buyers. They wish to express their emotions, seek out experiential scenarios, participate in culture and even co-create brand stories with each purchase," she said.

"All these demands have posed higher requirements on brands, pushing them to come up with deeper insights into human nature and more refined crafting of experiential settings," she added.

CULTURE

Ancient wisdom for global challenges

Sinologists explore the relevance of China's experiences to international issues, **Hu Yumeng** and **Ma Jingna** report in Lanzhou.

In a city where the ancient Silk Road still lingers in stone and wind, the Third World Conference of Sinologists unfolded not merely as an academic gathering, but as a lived encounter between civilizations.

Bringing together more than 300 Sinologists, policymakers and cultural practitioners from nearly 70 countries and regions, the conference on Wednesday in Dunhuang, Gansu province, explored how Chinese cultural values and development experiences can offer fresh perspectives on some of today's shared global challenges.

"Today, the world needs more dialogue than confrontation and more understanding than prejudice," said Joel Mikael Walker, a German content creator and practitioner of traditional Chinese medicine. "What Chinese culture addresses are some of the most universal questions facing humanity.

"Chinese culture has much to contribute to addressing these challenges. It is not a relic in a museum, but a living system of wisdom that continues to speak to the modern world."

Walker's perspective echoed one of the recurring themes throughout the conference: that Chinese culture is increasingly being viewed not only as a subject of historical study, but also as a source of contemporary insight.

"We live in a time of conflict, environmental pressures and growing anxiety," he said. "Concepts from Chinese philosophy offer valuable perspectives on many of the challenges facing the world today.

"The balance of yin and yang teaches us that differences can coexist. The idea of harmony between humanity and nature reminds us to reconcile with the environment. The concept of preventing disease before it occurs emphasizes foresight rather than remedy," Walker said. "These ideas are not only China's treasures. They belong to humanity."

Many Sinologists extended that discussion beyond culture to China's broader development experience.

Andrey Kortunov, former director-general of the Russian International Affairs Council, said one of the distinctive features of China's engagement with the world is its ability to understand the needs of other countries, particularly those in the Global South.

"There is a great deal of empathy in the Chinese approach to international engagement," Kortunov said. "China tries to understand what other nations need in terms of development and security, and how it might assist them."

He also highlighted flexibility and continuity as defining features of this approach.

"Consistency means predictability, and predictability brings trust," he said, noting that many countries regard China as a reliable long-term partner.

For Indian scholar Saheli Chattaraj, associate professor of China studies at Somaiya Vidyavihar University, China's experience offers practical lessons for other large developing countries facing complex governance challenges.

Having conducted research on local governance and environmental management in Zhejiang province for years, she said many of the challenges China has confronted, from urbanization to pollution management, are familiar to India.

"China and India share many similarities as populous and diverse countries," she said. "What interests me is how different regions in China have explored solutions and adapted policies to local conditions."

Chiara Romagnoli, director of the Interdepartmental Center for Studies and Documentation on China and East Asia at Roma Tre University, said the outside world often overlooks China's diversity and complexity.

"Many people think China is a homogeneous society, but in fact it is diverse and complex. That is where its richness lies," she said.

Romagnoli added that China's development philosophy also carries a broader message.

"Development should not belong to one country alone. More countries should benefit from it. Development is for all humanity," she said.

For Taing Mengchhong, the Cambodian director of the Confucius Institute at the Royal Academy of Cambodia, one of the most significant contributions of Chinese modernization is that it has expanded the global imagination of what modernization can look like.

"Chinese modernization has reshaped the picture of modernization in the world," he said. "Modernization was once associated mainly with a small number of developed countries with relatively small populations. China has shown that a country with more than 1.4 billion people can achieve modernization, changing the global landscape of development."

He noted that China's experience demonstrates that modernization is not synonymous with Westernization.

"Developing countries should explore modernization paths that fit their own national conditions, cultures and realities," he said.

Taing Mengchhong pointed to the Phnom Penh-Sihanoukville Expressway, Cambodia's first expressway and a flagship Belt and Road project, as an example of how China-Cambodia cooperation has improved people's lives. The project has shortened travel times, improved logistics and strengthened regional connectivity.

"The achievements of Cambodia-China cooperation must be visible to ordinary people," he said. "Only when people can see and experience the benefits in their daily lives can they truly understand the value of our partnership."

Sinologists also highlighted that people-to-people exchanges matter most in the current era for promoting civilizational dialogue.

"Without people-to-people exchanges, any policies, strategies, decisions or initiatives cannot work," said Iljaz Spahiu, former minister-counselor at the Albanian embassy in China. "This is a foundational pillar of enhancing international relations."

"We're living in a difficult time, faced with many shared challenges," said Mohamed Rasheed, chairman and founder of the China-Maldives Cultural Association. "Chinese philosophy, which advocates peace, coexistence and dialogue, is highly valued today by humanity for its contribution to prosperity. When you promote Chinese culture, it encourages openness to coexist with other cultures and to appreciate the strengths of others."

Yang Mingze contributed to this story.

The man taking Yuju Opera to audiences across the world

By ZHANG KUN in Shanghai
zhangkun@chinadaily.com.cn

Scenes from the Yuju Opera production *Cheng Ying Rescues the Orphan*. It was one of 10 productions staged in Shanghai from May 21 to last Wednesday by winners of the Plum Blossom Award, China's highest honor in theater. PHOTOS BY CHEN ZUDE AND ZHOU SHUNLIANG / FOR CHINA DAILY

Ten winners of the Plum Blossom Award, China's highest theatrical honor, gathered in Shanghai from May 21 to last Wednesday to showcase their masterpieces to industry professionals from around the world.

Among them was Li Shujian, a veteran of Yuju — a folk opera originating from Central China's Henan province. On May 27 and 28, Li and the Henan No 2 Yuju Opera Theater staged two performances of *Cheng Ying Rescues the Orphan* at Wanping Theater. Based on Yuan Dynasty (1271-1368) playwright Ji Junxiang's classic, the opera is often dubbed "China's *Hamlet*", as it highlights themes of sacrifice and loyalty that resonate across cultures.

Commenting on the production's raw power, Guillaume Soulard, director of France's Le Grand Angle theater, said, "The story is so strong that five minutes after the show, you are still in it ... It becomes part of your life."

Dagmar Bednarikova, a member of the Presidium of Czech ITI (International Theater Institute) Centre, said she would really recommend the show to her friends. She added, "Because it is original ... we do not see it in Europe very often, so it's great to be able to come to China to see it here."

Han Jihua, a Chinese opera enthusiast and middle school teacher from Nanjing, Jiangsu province, took the high-speed train to Shanghai for the opera. Li is his favorite artist, Han told China Daily on the opening night.

"He is particularly good at integrating singing with his spoken lines. He masterfully blends his singing with clear narrative delivery and as such has a strong emotional impact. His powerful performance is widely beloved among folk opera lovers all over the country, and he is especially admired for his portrayal of tragic heroes," he said.

With a history of just 300 years, Yuju Opera is relatively new compared to Peking Opera or Kunqu Opera. Yet, Li explained, it is one of China's most widespread local operas, boasting 163 professional troupes and over 2,000 private ones. In rural Henan, Li recalled performing for crowds exceeding 50,000. "People bring their own stools and packed lunches," he told China Daily. In one scene, as Li portrays an elderly beggar walking through the crowd, "people put food and even cash in my basket. That is how they express their love".

Now 64 and a troupe leader for 34 years, Li has taken this regional art form global. Since its premiere in 2002, *Cheng Ying Rescues the Orphan*, with scripts by Chen Yongquan, has been performed over 2,100 times and adapted into more than 20 other folk opera styles. It has toured 30 countries, from Broadway to the Chinese-built cruise ship *Adora Magic City*.

Taking a dialect-based opera internationally posed challenges. During a 2006 tour of Italy, poor translations led to comical errors, such as rendering "my wife" as "my old woman". To solve this, Li enlisted Wang Shaojun, director of the Performance Department at the National Academy of Chinese Theatre Arts, to refine the scripts. Today, the opera features subtitles in seven languages.

To attract younger audiences, Li has also embraced the digital age. A pioneer on Douyin (the Chinese TikTok), he once earned 160,000 yuan ($22,000) from a single three-hour livestream. "He who does not embrace the internet will be abandoned by the times," he said.

CLASSICS KEEP ENDURING IN MODERN TIMES

Scholars are finding new relevance in the study of time-honored texts as technology reshapes societies across civilizations, **Wang Ru** reports.

Retold for centuries, the story of Prometheus has evolved from a tale of power struggle into a symbol of revolution and enlightenment. In some interpretations, Prometheus, the Titan who stole fire from the gods, reflects tensions between migrants and locals.

Later, poets such as Percy Shelley (1792-1822) recast him as a tragic hero who defied authority.

That image resonated with Chinese intellectuals in the early 20th century, who invoked Prometheus as a metaphor for pioneering revolutionaries introducing Marxism to China.

"Mythological stories are an important focus of classical studies," says Huang Yue, a professor of comparative mythology at Beijing University of Posts and Telecommunications.

"Prometheus remains widely known because generation after generation has continued to tell his story. People have interpreted and shared it in different ways. That process is important because classics provide intellectual resources that can inspire modern people. This is the value of classical studies today."

Traditionally defined as the study, translation and interpretation of ancient Greek and Roman texts, classical studies have gained renewed momentum in recent years, particularly following the World Conference of Classics held in Beijing in 2024.

The event brought together more than 400 scholars from over 30 countries and regions to discuss the contemporary relevance and global significance of classical studies.

The second edition of the event is taking place on Tuesday and Wednesday in Athens, Greece.

He Fangying, director of the Research Center for Classical Civilization at the Chinese Academy of Social Sciences, says the field can be traced back to the Hellenistic Period, when philosophers from across regions that were once dominated by Alexander the Great reinterpreted ancient Greek works. As a formal discipline, however, it was established at the University of Goettingen in Germany in 1777.

"In the past, Western scholars didn't include the study of other ancient civilizations in their definition of 'classical studies'. For example, research on Mesopotamian, ancient Egyptian and Chinese classics was categorized under 'Oriental studies'," she says. "That reflected a perspective that viewed these cultures through a Western lens."

Today, however, the definition of classical studies has broadened, particularly among Chinese scholars.

Li Xinwei, director of the Chinese School of Classical Studies at Athens, says, "We believe that every ancient civilization has its own classical period, one that continues to exert a profound influence on its modern development ... Therefore, the scope of classical studies should include the classical works of all civilizations."

The expanded definition raises a further question: Why do the classics still matter in the modern world?

According to Huang, ancient texts offer wisdom that remains relevant to contemporary challenges.

"Throughout history, people have confronted many of the same issues — ecological crises, regional conflicts, or tensions between civilizations," Huang says.

"Can we learn from how earlier generations responded to these challenges? Classics provide the source code of a culture, or more precisely, the foundational elements of a nation's cultural identity."

He, director of the Research Center for Classical Civilization, adds that classical studies also offer a broader perspective on current affairs. Modern disciplines are increasingly specialized, often separating literature, history, philosophy, and politics into distinct fields. Classical studies, by contrast, help reveal the connections among them, providing a more panoramic understanding of the human experience.

Material progress

Lou Lin, a professor of classics at Sichuan University in Chengdu, Sichuan province, reflects on the role of technology in shaping the modern world.

"Strictly speaking, the modern world is largely defined by technology. It gives us the impression that humanity is constantly progressing because our material lives continue to improve," he says.

"But when it comes to complex questions such as human nature, philosophy and social order, it is difficult to argue that our understanding is deeper than that of people who lived 2,000 years ago."

Lou is particularly drawn to the ideas of French philosopher Simone Weil (1909–43). While technology and systems can help people understand the world in objective ways, Weil says, essential aspects of humanity remain beyond their reach.

"Such elements, I guess, refer to the relationship between humans and nature, a theme explored extensively in classical texts," says Lou.

One example can be found in *Zhuangzi*, a foundational Taoist text in ancient China. Philosopher Zhuangzi (369-286 BC) wrote: "Heaven and earth are born with me; all things are one with me." The idea emphasizes the inseparable bond between humanity and nature.

In a world where many people experience isolation and alienation, Lou believes such reflections can help balance society's heavy emphasis on technology.

"That sense of disconnection can lead to genuine inner emptiness," he says. "The reflections on human nature and humanity's relationship with nature found in classical texts remain valuable today."

Lou also recalls a story from the Southern Song Dynasty (1127-1279).

Philosopher Zhu Xi (1130-1200) once invited fellow thinker Lu Jiuyuan (1139-93) to lecture at the Bailudong Academy in present-day Jiangxi province. Lu highlighted the idea that "a man of virtue is guided by righteousness; a petty man, by personal gain" from *The Analects* (*Lunyu*), a compilation of the ideas of Confucius.

According to Lu, the lesson was not simply about choosing between right and wrong. Rather, it encouraged learners to clarify the purpose of their studies from the outset.

"I think this offers an important lesson for our time. In an era dominated by artificial intelligence, we still need to ask fundamental questions: What are my aspirations? What gives my life meaning? Technology alone cannot answer such questions, but classics offer valuable insights," Lou says.

He Fangying notes that concerns about technology are not unique to the modern age.

She points to a story in *Homer's Epics* in which Odysseus passes through the island of Scheria, where advanced technology allows fruit to ripen automatically and ships to navigate according to people's thoughts. Despite such prosperity, the kingdom declines after being punished by Poseidon, the god of the sea. The story has been interpreted as a warning against excessive reliance on technology while neglecting human virtues.

"It reminds us that while we enjoy the convenience technology brings, we should also remain aware of its potential risks," says He.

Mutual learning

Beyond helping individuals navigate modern challenges, ancient texts also encourage cultural exchange and mutual learning — forces that have long driven the development of civilizations.

In *Timaeus*, a book of dialogues written by the ancient Greek philosopher Plato (427-347 BC), Athenian statesman Solon travels to Egypt and discovers records preserving knowledge that had long been lost in Greece.

"This is a story Plato heard and recorded. Maybe it's not historical fact, but it probably contains traces of reality," says Lou, adding that in *The Lives and Opinions of Eminent Philosophers*, one of the most important accounts of the lives of the West's best-known philosophers, author Diogenes Laertius (flourished in the third century) also mentioned that philosophy was influenced by ancient Egypt.

Evgenios Kalpyris, the Greek ambassador to China, highlights the value of communication between Greek and Chinese civilizations, mentioning that their differences can lead to positive results.

"Historical records indicate that the earliest encounter between Chinese and Greek civilizations dates back at least 2,400 years," says Kalpyris.

"We have learned to seek common ground while respecting differences. We do not view differences as barriers. On the contrary, they can promote coordination and harmony. Differences create opportunities for remarkable outcomes."

He points to differing views on human nature. Chinese philosopher Mencius (372-289 BC) believed human nature is good, while another philosopher, Xunzi (313-238 BC), believed it is inherently evil. Ancient Greek philosophers generally viewed human nature as neutral. Despite these differences, all believed that education and moral cultivation could help individuals grow.

Education and moral development are still among the most effective ways to address many of the world's challenges, Kalpyris says.

Inspired by such lessons, modern societies increasingly recognize the value of dialogue among civilizations. One example is the establishment of the Chinese School of Classical Studies at Athens following the inaugural World Conference of Classics in 2024.

According to Li, the school's director, researchers from the school visited more than 50 sites across Greece during the past year, selected the Aggelokastro site for a joint excavation project with Greek archaeologists, and organized exhibitions, lectures and academic events in Athens.

"In the past, Chinese researchers often relied on existing Western scholarship without access to first-hand materials," Li says.

"Therefore, we established this school to gain firsthand knowledge through archaeological research and the study of Greek civilization, including its history, philosophy and art. This will lay a foundation for further study. Only on that basis can equal dialogue with Western scholars generate new ideas."

The second World Conference of Classics is another effort to deepen exchanges among civilizations in a new era.

He Fangying hopes the conference will encourage further discussion on topics such as virtue, social order, friendship and technology.

"This time, Chinese classical studies will be presented at the very birthplace of Western civilization. This is a milestone in the history of world civilizations," says He.

Soundbites

Huang Yue, *a professor focusing on comparative mythology at Beijing University of Posts and Telecommunications*

Mythical studies not only provide us with evidence of the lives and environments of ancient people, but also allow us to see how our civilizations have gradually advanced to the present day. ... By tracing the earliest versions of a myth, we can then examine how it undergoes minor adjustments under the pens of different writers and across various books and narratives. In doing so, we feel as if we have found mirrors through which we can view the spiritual history of a nation.

Li Xinwei, *director of Chinese School of Classical Studies at Athens*

When we talk about classical studies in China, they extend beyond the traditional concept of ancient Greek and Roman classics.
We believe that every civilization has its own classical era. China's classical era has had a profound and lasting influence on its entire historical path, its modern development, and the formation of its identity. It has also deeply shaped China's cultural confidence and the modernization process with Chinese characteristics. Its present and future are inseparable from the inheritance of its own traditions.

Lou Lin, *a professor of classics at Sichuan University*

The core concept of classical education is learning to become a fully realized human being. It is difficult to say that classical teachings can provide ready-made solutions to modern problems. However, when it comes to a person's cultivation, the classics may help one grow into a more complete, more aspirational, and more capable individual.
Such a person should be better able to solve problems. This may well be one of the most important applications of classical studies in modern times.

He Fangying, *director of the Research Center for Classical Civilization at the Chinese Academy of Social Sciences*

Each generation has its own ancient past, and every ancient generation responded to the challenges of its time, as well as those of earlier times. From this perspective, classical studies are constantly being renewed.
We are always preceded by earlier generations, and we always look toward the future. ...
Whether it is Homer from more than 2,000 years ago or China's Confucius, they were figures from distant eras, yet they can also be our friends in the modern age.

Evgenios Kalpyris, *the Greek ambassador to China*

The theory of yin and yang has extensive influence on Western countries.
Although yin and yang are different in nature, they complement and connect with each other, culminating in harmony. ... We have witnessed wisdom in the two civilizations, seeing how we have sought common ground while preserving our differences.
We have never considered differences as negative or barriers, but rather as opportunities to boost coordination and harmony.
Differences can create exceptional results.

Strategic guidance keeps China-DPRK ties advancing with times, achieving new progress

General Secretary of the Communist Party of China Central Committee and President Xi Jinping's state visit to the Democratic People's Republic of Korea on Monday and Tuesday presents an opportunity to strengthen top-level planning and strategic guidance for China-DPRK relations in the new era.

The visit has not only preserved the legacy of China-DPRK relations as good neighbors, good friends and good comrades but also helped lay out the practical priorities for the future development of relations.

During his meeting with Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK, in Pyongyang on Monday, Xi put forward four proposals for advancing bilateral relations: The two sides should be guided by the high-level exchanges and consolidate the foundation of political mutual trust; stay committed to the goal of delivering benefits to the people and elevate the level of practical cooperation; uphold the inheritance of friendship as a driving force and strengthen the bonds between their peoples; and uphold fairness and justice as a guiding principle to enrich the substance of strategic coordination.

This provides strategic guidelines for the healthy and stable development of China-DPRK relations.

High-level exchanges have long played an important role in the development of China-DPRK relations. As the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance is commemorated this year, increased interaction at all levels between the two sides will help consolidate political trust and generate sustained momentum for bilateral cooperation.

Both countries are pursuing their respective development goals and have broad opportunities to deepen cooperation in economic and social fields. China stands ready to work with the DPRK to strengthen the alignment of development strategies, and expand practical cooperation in such areas as economy and trade, agriculture, construction, science and technology, and health care, to bring greater benefits to the two peoples.

Xi called on both sides to leverage the opportunity of the full reopening of border crossings and the resumption of civil aviation flights and international passenger trains to increase people-to-people exchanges and foster mutual interaction.

Equally significant is the emphasis placed on carrying forward the traditional friendship between the two peoples. The traditional friendship between China and the DPRK, forged in blood, is a valuable shared asset of the two peoples. Today, educational cooperation, youth exchanges, cultural programs and academic engagement are helping ensure the friendship continues to flourish.

As regional and global dynamics become increasingly complex and volatile, it is imperative that the two sides strengthen their strategic coordination on international and regional affairs to safeguard their common interests and promote stability. In doing so, the two countries can better safeguard their respective sovereignty, security and development interests, and jointly promote regional peace and development.

Xi said in a signed article published by Rodong Sinmun, the official newspaper of the DPRK, ahead of his visit, that the two sides should uphold the international system with the United Nations at its core and the international order based on international law. In the process, they should oppose hegemonism and power politics, and reject any scheme or action aimed at reviving militarism and undermining regional security and stability.

No matter how the international situation changes, the CPC and the Chinese government's firm stance on highly valuing the China-DPRK traditional friendship will not change, the firm support for Kim in leading the DPRK's socialist cause will not change, and the firm commitment to safeguarding the shared interests of the two countries and preserving a favorable strategic environment will not change, Xi said in the meeting.

The two sides should make concerted efforts to translate the important consensus reached by the two leaders during the visit into concrete actions and tangible outcomes to keep bilateral relations advancing with the times and achieve greater progress.

Drawing from the past for the future

The second World Conference of Classics is being held in Athens, Greece, on Tuesday and Wednesday. With the theme "Dialogue between Ancient and Modern: Contemporary Inspirations from Classical Wisdom", it brings together leading scholars in classical studies, as well as experts in civilization, culture and archaeology from China and other countries, to discuss issues related to classical civilizations and promote academic exchanges and consensus-building in global classical studies.

The event serves as a timely reminder of the importance of cultural exchanges and mutual learning among civilizations in an era marked by geopolitical tensions and deep-seated mistrust.

It has long been realized that ancient Eastern Mediterranean civilization is not the only form of civilization, nor is it the best. There is a heritage of civilization all over the world, and the acceptance of that heritage is important for countries to get along.

There is a misconception about classics that we study ancient times to gain certain wisdom or practices that can be directly borrowed. But the real significance of classics is that they help us understand the causes of some of the most consequential decisions in history. They provide practical food for thought for political theory and political thinking today.

For instance, the Thucydides trap is much talked about today. Knowing its origins helps us better understand if it is relevant today and, if so, how it can be avoided.

Civilizations are wellsprings of wisdom, embodying a vast repository of rational and practical knowledge about understanding and transforming the world. They have always thrived through exchanges and interaction. The ancient Silk Road, for instance, was not merely a trade route but a conduit for cultural, technological and philosophical exchanges between the East and the West.

All this underscores the potential of civilizational dialogue to foster mutual understanding and cooperation, two things the world is in dire need of today.

The public goods China has put forward in recent years — such as the Global Development Initiative, Global Security Initiative, Global Civilization Initiative and Global Governance Initiative that are foundational for the building of a community with a shared future for humanity — are frameworks deeply rooted in the traditional Chinese notion that common challenges require collective action and shared solutions. Their resonance comes from the belief in ancient times in an ethical community — a group of individuals who share common ethical values and principles, working collectively to maintain social harmony and justice. In ancient times, these communities were often localized, such as within a village or kingdom, where shared values and norms governed behavior.

The importance of an ethical community lies in its ability to foster cooperation, mutual respect and a sense of belonging among its members, which are essential for societal stability and well-being. It is thus easy to see why China's proposals have been widely accepted by those countries hoping to build a more harmonious world. From the Belt and Road Initiative to the Global Governance Initiative and through mechanisms such as the Shanghai Cooperation Organization, China is steadfastly striving to foster a sense of interconnectedness and a more ethical and collaborative global community based on mutual respect and the pursuit of shared development.

Mutual understanding and respect are crucial for the success of a harmonious global community. By engaging in cultural exchange and dialogue, nations can gain insights into different civilizational frameworks and work toward common goals. China's emphasis on harmony and reciprocity in international relations, influenced by Confucian values such as the importance of moral and righteous behavior and the cultivation of virtues, can serve as a foundation for building trust and cooperation among diverse nations.

Such classical wisdom offers inspiration for enriching societal values and addressing pressing global issues, as the cultivation of mutual understanding and respect is essential for building a harmonious world and finding solutions to the common challenges humanity faces.

As scholars from different countries convene in Greece, they will walk where Plato taught and Aristotle spoke. But their deeper task is to make it clear that ancient wisdom can still guide modern action. As we look to the future, the lessons of the past can continue to illuminate the path to a more harmonious and interconnected global community.

Who bears cost for unbearable weight of resource-hungry AI?

Given the boom in artificial intelligence, the industry has been made to look like it is weightless and comes without cost. But there is no such thing as a free lunch.

A growing body of research is shedding light on the uncomfortable reality that AI is emerging as one of the world's most resource-hungry industries. According to a recent report by the United Nations University Institute for Water, Environment and Health, by 2030, AI-driven data centers could consume 945 terawatt-hours of electricity annually — roughly triple the combined electricity consumption of Pakistan, Bangladesh and Nigeria. Their water use could also reach levels equivalent to the basic needs of 1.3 billion people.

For years, Silicon Valley sold the digital economy as a cleaner alternative to heavy industry. The internet was supposed to dematerialize economic activity. Instead, AI is rematerializing it. The cloud turns out to be made of steel, concrete, copper, electricity and water.

The challenge is that AI companies currently enjoy a remarkable privilege: they are allowed to externalize a significant portion of their environmental costs.

When a data center is built in a drought-prone region, local residents often pay the price through strained water supplies and higher utility bills. When electricity grids require upgrades to accommodate massive computing clusters, the costs are frequently socialized while the profits remain private. Gains accrue to shareholders and technology executives; infrastructure burden falls on everyone else.

It is astonishing that many AI companies disclose model capabilities in meticulous detail while revealing comparatively little about the electricity, water and land footprints of their systems. The European Union is already moving toward mandatory sustainability disclosures for large data centers. That should become the global norm. People have a right to know how much water a chatbot consumes, just as consumers know the fuel efficiency of a car.

Economists have long argued that markets work best when costs are visible. If an AI model requires vast computing resources, that expense should be reflected in its business model rather than hidden in public utility bills. By extension, AI companies should pay the full costs of grid expansion, water extraction and environmental mitigation associated with their operations. Governments should reward efficiency rather than scale alone. The industry's current incentive structure resembles an arms race in which larger models automatically attract more investment. Yet UNESCO research suggests that smarter design and model optimization can dramatically reduce energy consumption without sacrificing performance. The future of AI should be measured not only by intelligence per parameter, but by intelligence per watt.

Policymakers should resist the temptation to frame this as a choice between innovation and regulation. It is neither. Aviation did not flourish because governments ignored safety. The pharmaceutical industry did not gain legitimacy by avoiding oversight. The most successful technological revolutions have always combined entrepreneurial dynamism with public guardrails.

AI's environmental footprint is not an argument against AI. Indeed, the technology may help optimize power grids, accelerate scientific discovery and improve climate forecasting. But those benefits will lose legitimacy if communities conclude that they are sacrificing water, land and affordable electricity so that technology companies can train ever-larger models.

The defining question for the next decade, therefore, is not whether AI will become more powerful. It almost certainly will. The question is whether society can ensure that the industry's resource bill is paid by those generating it, rather than by everyone else. If AI is to become humanity's most transformative technology, it must first learn a very human lesson: there is no such thing as a free kilowatt-hour.

— LI YANG, CHINA DAILY

What They Say

SCO cooperation narrowing regional digital divide

Editor's note: *The inauguration of the China-Shanghai Cooperation Organization joint laboratory for digital and intelligent applications and the China-SCO computing power industry alliance in Tianjin marks a significant step forward in the SCO's digital development. People's Daily Overseas Edition spoke to Zhu Shuai, a researcher at the China Center for Information Industry Development, and Xiao Bin, a researcher at the Institute of Russian, Eastern European and Central Asian Studies in the Chinese Academy of Social Sciences, to discuss this development. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The establishment of the laboratory and the alliance addresses two critical elements of the global digital transformation: computing power and scenario applications. This is not only an upgrade in technological cooperation, but also the materialization of a new generation of regional digital infrastructure.

The SCO's digital cooperation initiatives increasingly focus on data and computing power, strengthening the foundation for regional industrial collaboration. Progress in digital infrastructure has accelerated, with cross-border fiber-optic networks, big data centers and 5G facilities extending further into Central and South Asia. This helps narrow the region's digital divide.

At the same time, thanks to the integration of industries and trade, technologies such as smart customs systems, electronic clearance services, Silk Road e-commerce platforms and digital freight train services are making cross-border trade more efficient and reducing transaction costs.

Years of security and economic cooperation have fostered a high degree of political trust within the SCO, creating favorable conditions for cross-border data flows and cybersecurity cooperation.

Also, the diversity of SCO members generates strong complementarities. China has emerged as a major player in areas such as computing power, large artificial intelligence models and embodied intelligence, while countries in Central and South Asia have rapidly growing markets, pressing digital transformation needs and demographic potential.

The SCO's digital cooperation is guided by the principles of equal consultation and respect for the data sovereignty of its member states.

Additionally, the SCO's digital agenda is increasingly aligned with the Belt and Road Initiative, gradually forming a cooperation framework that combines platforms, laboratories, alliances and projects. This model promotes coordinated progress in areas ranging from data connectivity and regulatory alignment to talent development.

For regional economies, digital and intelligence cooperation can help modernize traditional sectors such as energy, agriculture and logistics, foster new drivers of growth and enhance the resilience of regional industry and supply chains.

From a broader international perspective, this cooperation reflects an open, inclusive and mutually beneficial approach to digital governance. It demonstrates that countries at different stages of development can work together through consultation and cooperation to build a secure and transparent digital ecosystem, offering valuable experience for global digital governance.

Efforts will continue to strengthen regional digital infrastructure connectivity and develop data markets. Greater emphasis will be placed on integrating digital technologies into economic and social development and advancing coordination on cross-border data governance.

Cooperation in digital talent cultivation and green digital transformation is also likely to expand, ensuring that digitalization and sustainable development progress in tandem. By focusing on practical cooperation and enhancing technological capabilities, the SCO can support economic growth, regional prosperity and long-term development across its member states.

Sophia Papaioannou

From argument to accord in ancient debates

The rhetorical traditions of ancient China and ancient Greece are among the most influential systems of communication in world history. Although both cultures developed sophisticated theories of persuasion during the same periods in history, they differed significantly because they emerged from distinct philosophical, social and cosmological assumptions.

The study of Pre-Qin (221-206 BC) rhetoric of Wei Yongkang, a scholar from the University of Texas Rio Grande Valley, identifies three defining features: harmony, self-effacement and paradox.

These characteristics contrast sharply with the argumentative, individualistic and logical orientation of Greek rhetoric associated with Aristotle, Plato and later Roman theorists such as Quintilian.

A major difference between the two traditions concerns the purpose of discourse. Greek rhetoric was fundamentally agonistic, developing within democratic city-states where public debate, legal disputes and political competition shaped civic life.

Aristotle defined rhetoric as the ability to discover the available means of persuasion in any situation, emphasizing effectiveness, argumentation and intellectual victory.

Pre-Qin Chinese rhetoric, by contrast, sought primarily to preserve harmony rather than to win debates. It focused on expressing one's position without creating disruption or social conflict.

Rooted in Confucian and Daoist thought, communication was understood as part of a broader ethical and cosmic order. The rhetor's task was therefore not simply to persuade but also to maintain proper social relationships and align discourse with the Dao.

These differing aims produced contrasting ideals of the speaker. Greek rhetoric elevated the individual rhetor, stressing visible authority, confidence and personal distinction. Aristotle's concept of ethos emphasized the persuasive force of character, while Roman rhetoric celebrated the eloquent statesman. Public speaking in the Greco-Roman world was often performative and self-assertive.

Chinese rhetoric instead cultivated humility and restraint. Wei describes this quality as "self-effacement", with the speakers avoiding overt self-assertion and minimizing the intrusion of personal ego into the discourse. Scholars such as Geoffrey E. R. Lloyd have contrasted the "agonistic Greeks" with the "irenic Chinese".

Whereas Greek and Roman rhetoric encouraged individual advancement, Chinese rhetoric prioritized social harmony and collective stability. Legitimacy depended less on originality than on alignment with accepted moral and cosmological principles.

The distinction also appears in rhetorical structure. Greco-Roman rhetoric generally favored deductive organization: a thesis was stated clearly and supported through systematic argument. This reflected the Greek commitment to analytical reasoning and logical progression.

Chinese rhetoric, on the other hand, was indirect and inductive. Ideas emerged gradually, and their meaning depended heavily on context, implication and shared cultural assumptions.

Direct confrontation risked damaging social harmony, so the discourse tended to appear subtle, elliptical, or understated from a Western perspective.

The philosophical foundations of the two traditions also diverged. Greek rhetoric developed alongside formal logic and philosophical inquiry. Thinkers from the Sophists to Aristotle explored questions of truth, reason and epistemology, and persuasive speech was judged according to coherence and argumentative rigor.

Pre-Qin Chinese rhetoric did not reject logic — Mohist thinkers demonstrated considerable logical sophistication — but it did not treat logic as the highest source of knowledge. Chinese thought emphasized holistic and relational understanding rather than strict deduction. Consequently, rhetoric relied heavily on analogy, paradox and contextual meaning. Daoist texts such as the *Dao De Jing* illustrate this tendency through statements that challenge linear reasoning.

The idea that "good men do not argue" reflects a rhetorical ideal in which persuasion can arise through non-assertion.

This paradoxical approach marks one of the clearest contrasts with Greek rhetoric. Greek practice generally assumed that persuasion required active argument and explicit proof.

Daoist rhetoric, however, promoted the principle of *wu-wei*, or "action through non-action". In rhetorical terms, this meant persuading indirectly rather than overwhelming audiences through forceful reasoning. Ambiguity and openness were treated not as weaknesses but as deliberate strategies encouraging reflection and participation.

The two traditions also differed in their understanding of truth and authority. Greek rhetoric often centered on discovering or defending the truth through debate.

Chinese rhetoric, especially within Confucianism, linked effective speech to sincerity, ritual propriety and moral trustworthiness. Pivotal is the principle that rhetoric should be oriented toward establishing trust.

Credibility depended less on individual reputation than on one's place within a moral and social network.

Despite these differences, the traditions shared important similarities. Both recognized language as a powerful force capable of shaping society and influencing human behavior. Both attached ethical significance to communication and viewed rhetoric as more than ornamental language.

Both traditions also emerged during periods of political instability and intellectual pluralism. The Warring States Period (475-221 BC) in China and the democratic experiments of classical Greece each stimulated reflection on persuasion, governance and social order. In both civilizations, rhetoric developed as a practical response to conflict and the need to influence others.

Ultimately, the comparison reveals two complementary visions of communication.

Greek rhetoric privileges individuality, logical demonstration and persuasive mastery, while Chinese rhetoric emphasizes harmony, contextual sensitivity and relational balance. Greek rhetoric seeks victory through argument; Chinese rhetoric often seeks understanding through subtlety and restraint.

In today's globalized world, studying these traditions together offers valuable insights into intercultural communication.

Greek rhetoric highlights the importance of clarity, reason and public debate, whereas Chinese rhetoric emphasizes humility, relational awareness and the ethical responsibilities of discourse.

Together, they broaden our understanding of rhetoric and demonstrate the diversity of human communicative practices.

Civilizations illuminating one another through dialogue

The second World Conference of Classics is being held in Athens, Greece, on Tuesday and Wednesday, under the theme "Dialogue between Ancient and Modern: Contemporary Inspirations from Classical Wisdom".

Since the inaugural conference convened in Beijing in 2024, the joint hosting of this event by China and Greece, together with the establishment of the Chinese School of Classical Studies at Athens, has created a new platform for the exchange and mutual civilizational learning between China, Greece and the broader international community alike.

A joint initiative titled "Illuminating Humanity's Path Forward with Classical Wisdom" is to be announced at the conference, alongside the launch of the "Global Scholar Residency and Exchange Program" of the Chinese School of Classical Studies.

Following the conference, participants will be invited to visit the Angelokastro archaeological site, the first joint Sino-Greek archaeological project, moving from discursive dialogue toward substantive collaboration in joint archaeology and youth exchange programs.

Classical studies is an epistemological and methodological key capable of moving civilizational exchange from surface-level dialogue to genuine mutual understanding.

But to achieve this depth of mutual learning, Chinese classical scholarship must go beyond the passive acceptance of existing academic frameworks and establish a comparative discourse that reflects China's own scholarly subjectivity.

Comparative research between ancient China and ancient Greece is precisely the arena in which such a discourse can be built, tested and refined.

The World Conference of Classics is reshaping the overall landscape of comparative and mutual learning research between ancient China and ancient Greece in the following respects.

First, testing comparative discourse through joint archaeology and substantive collaboration.

One of the most defining transformations of the Second World Conference of Classics has been the forging of a closer bond between academic discourse and fieldwork practice.

The Angelokastro Archaeological Project was officially launched in April, marking the first time Chinese scholars have taken a leading role in an archaeological project at the very heart of Western classical civilization.

The project focuses on the Aetolian region of Greece, which during the Hellenistic period served as a nexus of extensive cultural exchange across the Eurasian continent.

Archaeologists hope that excavation will bring to light early evidence of long-distance trade networks.

This collaborative venture signals a broader shift: the comparative study of civilizations is moving beyond textual analogy toward an evidence-based dialogue rooted in material remains.

It is hoped that joint archaeology will serve as a catalyst for building a comparative framework — one grounded in China's own scholarly traditions yet fully engaged with Greek and international academia — where discourse and fieldwork reinforce and validate each other.

Second, talent development in Sino-Greek comparative studies — equally versed in Confucius and Plato.

These words speak directly to the most tangible human foundations sustaining Sino-Greek comparative research.

Over more than two decades, classical education in China has established well-structured training programs at Peking University, Tsinghua University, Renmin University of China, Sun Yat-sen University and Chongqing University, among others.

A new generation of young and mid-career scholars, deeply grounded in Chinese classical literature and internationally minded, has risen rapidly, making substantial strides in their command of ancient Greek, Latin and other classical languages, as well as in the close reading of classical texts.

Third, building an equal and open comparative dialogue across civilizations.

Classical studies can serve as a powerful bridge in international cultural exchange, bringing together scholars from different countries to deepen mutual understanding through shared inquiry, built on respect for each other's heritage.

To truly achieve this, we must move beyond the long-standing practice of interpreting Chinese civilization solely through borrowed frameworks.

Building a comparative discourse that reflects China's own scholarly voice calls for the principle of "two-way interpretation" — treating the core concepts and modes of thought within Chinese civilization as an independent knowledge system, and thereby offering the global classical studies community a truly dialogic comparative framework.

This effort both enriches existing comparative paradigms and meaningfully advances the vision of civilizational dialogue.

In this sense, classical studies hold the key to deeper exchanges between civilizations precisely because it does not merely study their differences, but asks how civilizations can speak to one another across those differences — and illuminate each other through dialogue.

With this in mind, we call on the scholarly community to take a more proactive stance: systematically mapping China's existing body of Sino-Greek comparative scholarship from its own perspective; continuing to examine homegrown comparative concepts such as "the dao and the Logos" and "the Kingly Way (*wangdao*) and democracy"; and exploring diverse approaches — from broad comparisons of historical philosophy and civilizational patterns to close readings of key concepts and intellectual history.

The goal is to gradually build a comparative theoretical framework that is firmly rooted in China's own scholarly traditions yet capable of deep engagement with the international classical studies community — one that is continuously tested across different civilizational contexts and remains vital and generative over time.

To understand the civilizational character of contemporary China, one must truly grasp the unique fabric of historical China — and to grasp historical China, one must engage in dialogue with other classical civilizations, such as ancient Greece, in order to see more clearly what makes Chinese civilization uniquely its own.

As the Sino-Greek joint archaeological project and the youth exchange program advance steadily, and as the second World Conference of Classics opens in Athens, this is a moment of exceptional opportunity for the deeper development of comparative ancient civilizational studies.

Drawing on a century of Chinese scholarship in comparative ancient civilizations, and using that legacy to establish China's own voice in classical studies, this is both a timely intellectual mission and China's meaningful contribution to civilizational exchange across the world.

Turning the tide on tap water quality

China's revised Water Supply Regulations, issued by the State Council, or the Cabinet, late last year and effective from June 1, may seem like a technical policy document. Yet their impact could flow directly into the lives of ordinary people. Designed to strengthen water security and improve services, the regulations aim to ensure a safer and more reliable water supply for 1.4 billion citizens across the country.

China's history of tap water stretches as far back as that of many Western countries. British businessmen built the country's first modern tap water plant in Shanghai in the 1880s.

But for much of the population, clean water supply remained a luxury until China launched reform and opening-up in the late 1970s.

Fifty years ago, tap water was available in my home city Xi'an, Shaanxi province. Yet, hundreds of families still depended on a single public tap installed at a street corner. Lack of funds meant that water pipes could not be extended into every household.

As a result, people of my generation became skilled at carrying water home using shoulder poles fitted with baskets at either end. In rural areas, the situation was even more difficult. People had to fetch water from rivers, rainwater pools or wells. In my father's village, located 50 kilometers east of where the Terracotta Warriors were buried, residents depended on the only 100-meter deep well for drinking water. Life was hard.

Over the past decades, however, huge investments have transformed the country's water supply system. Thousands of reservoirs have been built. Massive diversion projects now carry water across hundreds of kilometers to cities facing water shortages. Deep wells have been drilled using modern technology while extensive efforts have been made to clean polluted rivers and improve water sources.

The regulations make governments at all levels responsible for water supply security and require the same standards for water quality in both urban and rural areas.

According to the Ministry of Water Resources, by the end of 2025, tap water penetration was 96 percent in rural areas and 99 percent in urban areas. The implementation of the new regulations is expected to consolidate these achievements and further improve both the quantity and quality of the water supply.

The regulations make governments at all levels responsible for water supply security and require the same standards for water quality in both urban and rural areas.

If fully implemented, these regulations could prove to be a big blessing for rural residents, many of whom get tap water of varying quality.

In cities and towns across China, tap water is usually supplied by State-run plants and subjected to strict quality control as part of municipal responsibilities. In rural areas, tap water supply is often provided by a mix of villages, towns, nearby factories and private investors. Such fragmentation can result in inconsistent standards and inadequate water security.

The new regulations seek to change that. Relevant departments of local governments will be required to inspect water quality regularly and establish full-chain management systems covering every stage of supply. With the screws tightened by administrators, stricter supervision and greater investment are expected from both governments and operators, helping ensure cleaner and safer tap water for rural residents.

Urban residents stand to benefit too. For years, disputes have arisen between consumers and suppliers over various charges.

Now that millions of residents live in high apartment buildings, insufficient water pressure has become a persistent headache for those living on upper floors. Installing high-pressure pumps costs money. But while residents on higher floors are willing to pay for more powerful pumps, those living on lower levels often see no reason to share the expense for a problem that doesn't bother them.

Another challenge lies underground. Water pipes in houses built decades ago have become worn or rusty with age.

Replacing them is the only viable solution, but such projects require cooperation from all residents. Who will organize the work? Who will pay the bill? For many urban residents, these questions have remained stuck in the pipeline.

The new regulations could help break the deadlock. They stipulate that suppliers can charge only those fees approved by local governments for water consumption and a few other services. Other costs, including the upgrading of water supply equipment and facilities, must be shouldered by suppliers.

As China shifts its focus from expanding access to tap water to improving quality and service, citizens of the country are keeping their eyes and mouths open for clean tap water.

GLOBAL VIEWS

MICHAEL E. MANN

Time to turn up the heat on action

Climate crisis leaves no room for complacency

SONG CHEN / CHINA DAILY

The past three years have been the hottest on record. Research shows that such extreme heat is virtually impossible without warming caused by humans. With modest assistance from El Nino, the continued burning of fossil fuels made this possible.

The World Meteorological Organization estimates that there is an 86 percent likelihood that this temperature record will be broken within the next five years. With another El Nino event brewing in the tropical Pacific, that new record could be set as early as next year. The planet will keep getting warmer as long as we keep releasing carbon pollution by burning fossil fuels for energy and transportation.

Global average temperature, however, is an abstract measure. We do not "feel" it. What we experience instead are the consequences of that warming, particularly the role that warming plays in intensifying extreme weather events that we are witnessing across the world.

Whether it was record-breaking stifling May heat in Philadelphia, the United States, a few weeks ago and in Europe over the past week, or the deadly floods and landslides in central and southwestern China in recent days, the consequences of climate change are now upon us.

Climate science deniers like to cite scientific uncertainty as a reason for not taking action. But the cost of inaction is far greater. Research shows that climate models may be underestimating the extent to which climate change influences extreme weather disasters. They may also be underestimating the potential impact of global warming on ice sheet disintegration, rising sea levels and the occurrence of deadly typhoons.

The question is no longer whether climate change is a threat. The question is how severe we are willing to allow that threat to become. The case for urgency is clear.

Equally important is the recognition that it's not too late to act. A recent study, which was widely misrepresented by opponents of climate action, showed that the efforts underway to transition toward clean energy are paying dividends. The world is making real progress in lowering emissions that lead to climate change.

A decade ago, worst-case emissions scenarios projected catastrophic warming of 4 C to 5 C by the end of this century. Today, those projections have reduced to 3.5 C to 4 C. Even a "business-as-usual" scenario, where no further policy action is taken, would likely lead to around 3 C warming, still dangerous but considerably less than what we faced just a decade ago. This improvement reflects the policy progress the world has made.

But even a 3 C increase is a very dangerous level of planetary warming, which could lead to potentially irreversible climate impacts. We have made progress, but it is not nearly enough.

Part of the problem is that the US, once a leader in climate action, is now backsliding under its current leadership. The bilateral climate agreement between China and the US during the Barack Obama administration set the stage for the landmark Paris Agreement in 2016.

Since then, only China has made good on its end of the bargain. In 2014, it promised to peak carbon emissions before 2030. Driven by an expansion in renewable energy deployment, including wind, solar, battery technologies, electric vehicles and high-speed rail, China's carbon emissions have entered a "flat or falling" trend well before the 2030 deadline.

In 2025, renewable energy accounted for nearly 86 percent of newly added power generation and reached nearly 50 percent of installed power capacity worldwide. The leading US scientific journal, Science, named the renewable energy surge as the 2025 Breakthrough of the Year. It singled out China's role: "China's mighty industrial engine is the driver. After years of patiently nurturing the sector through subsidies, China now dominates global production of renewable energy technologies."

In contrast, the US is moving in the opposite direction. The current US administration and its Republican supporters have rejected global climate agreements, partnered with oil-producing countries and doubled down on fossil fuel extraction, thereby sabotaging clean energy efforts.

The US once prided itself on being the hub of technological innovation. That honor has now shifted to China. Chinese automaker BYD has developed technology that charges EV batteries to 97 percent capacity in just 12 minutes even in freezing temperatures, putting the US EV industry to shame. The Chinese all-electric and now largely renewable-driven bullet trains are breaking records both for usage and speed. More than 4 billion passenger trips were made on the network in 2025, and trains routinely move at speeds of 350 kilometers per hour. Meanwhile, the US national rail service, Amtrak — long underfunded and under assault from fossil-fueled Republicans — languishes with aging equipment. Its flagship Acela high-speed service struggles to maintain an average speed of 132 km per hour.

The US is no longer the conductor of the bullet train that is the global clean energy revolution. It should decide whether to climb on board or get left behind at the station. The rest of the world, and China in particular, should remain resolute in moving toward a global clean energy economy. The stakes could not be higher.

SUI CHUAN

From heart to heart

Low-cost works outshine those of big-name directors as Chinese audiences choose authenticity over hollow spectacle

The recent phenomenon that Chinese moviegoers have been sidelining big-budget productions by celebrated directors in favor of low-budget films by amateurs may indicate epochal tendencies. *Dear You*, produced on a budget of 14 million yuan ($2.06 million), has already grossed over 1.6 billion yuan at the box office — and its popularity is still growing.

The short drama series *Enemy* has achieved over 800 million views on China's TikTok platform Douyin without the support of A-list celebrities or overwhelming marketing.

At the other end of the spectrum, some big-budget productions by renowned directors have fared poorly in recent years. *Being Toward Death* flopped at the box office, *Bureau 749* scored only 3.2 on the professional review platform Douban in contrast to 9.2 recorded at present by *Dear You*, and *Dongji Rescue* almost collapsed under public backlash over accusations of historical nihilism.

This is no coincidence. On the surface, it seems like an imbalance between budget and returns; at a deeper level, it reflects a structural misalignment in the logic of content production.

The core lies in the difference between the "othering narratives" told from a Western-prone perspective and the "cultural self-awareness" rooted in the Chinese spirit that tells emotional stories from a traditional perspective.

Many renowned directors have been deeply influenced by Western popular culture from the beginning of their careers. Their imitation of Hollywood films has led to a reliance on "Western-centrism" in narrative style, aesthetics and values. Their obsession with blending Eastern and Western cultures has ultimately rendered their films culturally out of place in China.

On the other hand, works that have embraced the spiritual essence of Chinese culture have done exceedingly well. The rise of *Dear You* is the most vivid illustration. By using *qiaopi* — the overseas Chinese remittance letters recognized as a UNESCO Memory of the World heritage — as its spiritual anchor, the film brings the sense of family and country down from grand narratives to everyday emotions, allowing audiences to find a spiritual homeland in simple values such as loyalty and righteousness. When filmmakers no longer rely on Western narrative standards, they often find a market that appreciates the enduring spiritual themes of Chinese culture.

There is a stark contrast between the sincere content of these low-budget works and the assembly-line production of the industrial machine. The strength of low-cost works lies in their story-first, emotion-driven approach, which contrasts sharply with the big-budget production model of many renowned directors.

Lan Hongchun, director of *Dear You*, spent three years interviewing over 120 elderly Chaoshan-descended overseas Chinese in Southeast Asia, all over 80 years old. Ninety percent of the film's plot is based on real stories. The film has no clear heroes or villains, no dramatic conflicts or climactic twists. Through understated cinematography and a consistent emotional tone, it tells a story of nostalgia and family bonds, elevating it to a sense of shared community — a sentiment that embodies the devotion to loyalty, compassion and mutual support of people of Chinese origin.

SONG CHEN / CHINA DAILY

The same is true of *Enemy*. The female protagonist, driven by a profound sense of loyalty to her native land, chooses to perish together with the invaders. When she changes the opera line from "the two of us" to "we, husband and wife", a fleeting gleam in her eyes feels heavier than any love confession ever could.

Meanwhile, high-budget productions spend fortunes on sweeping visual effects and A-list ensembles, yet their core narratives are perfunctorily cliched and rejected by viewers.

Ultimately, there is an irreconcilable contrast between grassroots expressions that connect emotionally and detached narratives from an elite perspective. Low-cost works excel at capturing the emotional pain points of ordinary people, striking a chord with audiences. In contrast, some films by renowned directors display an elite arrogance, underestimating or dismissing the aesthetic judgment of viewers.

Today's young audiences are increasingly avoiding cinemas. Industry research shows that the share of viewers under the age of 24 dropped sharply from 38 percent in 2019 to 15 percent in 2025. The root cause is the glut of hollow plots, heavy-handed preachiness, and stiff acting by glamorous stars, all of which alienate young audiences seeking genuine emotional depth.

A renowned director once declared during a road show that 15 million tickets are the survival line for Chinese cinema, urging audiences to support his latest film. Meanwhile, *Dear You*, with no star power, started with a mere 1.6 percent screening rate on its opening day but became one of the highest-rated domestic dramas of the decade through word-of-mouth recommendations. *Enemy* sparked in-depth discussions online with its exquisitely crafted, nuanced performances. Netizens eagerly captured and shared screenshots, created fan edits, and wrote lengthy analytical posts. Its popularity grew entirely through organic word-of-mouth.

While renowned directors lament the slump in the film industry, amateur teams with extremely low budgets have reaped market returns hundreds of times larger. Clearly, the market has not abandoned good films. It has only turned its back on works that are overly Westernized and mechanically imitative.

The true vitality of cinema lies not in budget size but in whether creators have the courage to step away from a cultural "othering" perspective, root themselves in Chinese culture and genuinely respect the emotional needs of the audience. That might help renowned directors emerge from their winter.

BUSINESS

General Mills off-loads Haagen-Dazs shops as stiff competition bites

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

General Mills Inc's recent decision to sell its Haagen-Dazs ice cream shops on the Chinese mainland to an investor group that includes Ningji, a fast-growing Chinese tea brand, signals intensifying competition in the country's ice cream market, amid consumer desire for constant relevance and innovation.

Under the terms of the deal, the buyer will receive an exclusive license to operate Haagen-Dazs-branded ice cream shops and gifting businesses on the mainland. General Mills will retain ownership and operations of Haagen-Dazs retail and food service channels in China outside of the licensed outlets. Financial terms were not disclosed. The transaction is expected to close in 2026, pending regulatory approvals and customary closing conditions.

The move aligns with General Mills' "accelerate strategy", which focuses on prioritizing brands and channels with the highest potential for profitable growth, said the company. Since 2018, the company has reshaped its portfolio, divesting nearly a third of its net sales base through acquisitions and divestitures.

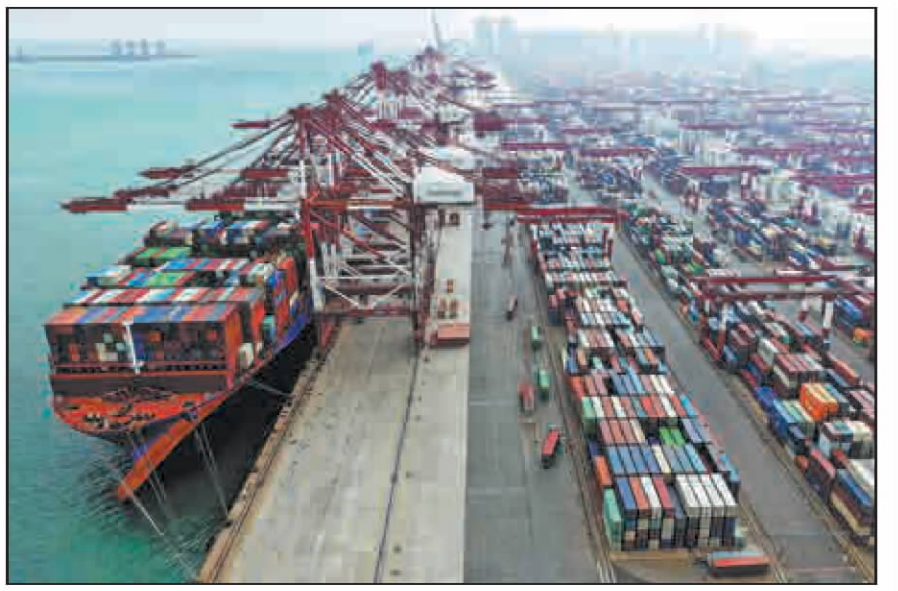
Haagen-Dazs has relied on its premium positioning in China since opening its first store in Shanghai in 1996. However, the brand has faced steady contraction: according to industry tracker canyandata.com, Haagen-Dazs operated 262 stores in May 2026, down from more than 550 locations at its 2019 peak. However, the broader Chinese ice cream market continues to expand rapidly.

Research by the Zero Power Intelligence Group shows the ice cream market size growing from 120 billion yuan ($17.69 billion) in 2020 to 200 billion yuan in 2024, with projections reaching 250 billion yuan by 2030. Despite overall market growth, Haagen-Dazs has struggled to capture a strong share of the market, being outpaced by emerging domestic competitors.

The brand remains one of the top players in China's limited-service ice cream segment, ranking third in foodservice transaction value in 2025, according to Euromonitor International. It ranks behind domestic rival Mr. Wildman and US-based Dairy Queen.

Mr. Wildman specializes in fresh gelato and operates 1,326 stores.

Ningji, founded in 2021, is primarily known for its lemon-flavored handmade beverages, priced around 15 yuan on average. The company grew rapidly with backing from investors including ByteDance, Tencent and Xiaomi, but its store count has stabilized at 1,799 outlets, according to canyandata.com.



In recent years, coffee and tea beverage chains have continuously diversified their menu, adding bakery items, desserts and recently, ice cream and gelato. Even so, integrating the premium Haagen-Dazs business into Ningji's value-oriented beverage-focused model could be a challenge for the new owners, according to industry observers.

Consumption analyst Yang Huaiyu said that Ningji's move to buy Haagen-Dazs locations is aimed at leveraging the high-end brand equity to achieve a leap, thereby breaking free from the low-price involution plaguing the tea beverage market.

"Haagen-Dazs stores come with a built-in high-net-worth customer base and prime spots in core business districts, which can quickly compensate for Ningji's shortcomings in high-end scenarios," Yang said.

Yang added that the deal would also allow Ningji to expand its product matrix, establishing a differentiated advantage in the fiercely competitive lemon tea track. "By moving beyond a single-category focus, the brand can mitigate the risks of market saturation and price wars," Yang said.

Consumers are seen at a Haagen-Dazs store in Beijing on May 15.

'Remarkable resilience' seen in China's exports

Surging demand for nation's high-tech products to spur H2 growth

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China's export sector, driven by surging global demand for high-tech products, is expected to remain robust in the second half, which will provide strong support for the country's economic growth, senior economists said.

The recent thaw in trade relations between China and the United States could also help improve market expectations and reduce uncertainty over external demand in the months to come, they added.

China's export sector is displaying "remarkable resilience", driven by a global artificial intelligence investment boom and a sustained energy super-cycle, with Chinese firms well-positioned to capture growing global market share in relevant fields, said Robin Xing, chief China economist at Morgan Stanley.

Xing said global capital spending on AI hardware continues to expand, and Chinese firms have developed "core competitiveness" in printed circuit boards, optical components and memory chips, allowing them to share in the sector's upside.

China's integrated circuit exports have entered a phase of rising volumes and prices, with monthly export value growth exceeding 20 percent for 13 consecutive months as of April, said the China Chamber of Commerce for Import and Export of Machinery and Electronic Products.

Gao Shiwang, a spokesperson for the chamber, said that in the first four months, integrated circuit export volume rose 10.6 percent, while the value of exports jumped 78.3 percent. April alone saw a 92 percent year-on-year increase in export value.

"China's mature manufacturing and supply chain capabilities give it a unique position in the global AI hardware ecosystem. We are not only a major producer, but also a vital link in the value chain," Gao said.

On the energy front, Xing said large AI data centers require massive amounts of electricity, and China has taken "a leading position" in the global energy transition from wind and solar components to grid equipment and storage batteries.

The General Administration of Customs said exports of electric vehicles surged 68.1 percent year-on-year in the first four months, while lithium battery exports rose 43.2 percent and wind power generation equipment climbed 40.7 percent.

After weathering the COVID-19 pandemic, geopolitical conflicts, trade frictions and energy shocks, China's supply chain resilience has won global recognition, and global capital looking to invest in AI hardware and the energy transition would find it hard to bypass China, Xing added.

Guan Tao, global chief economist at BOCI China, said China's export strength, especially in high-tech sectors, will be a "key stabilizer for growth" in the second half.

Guan said robust exports are driving industrial production and manufacturing investment, while imported inflationary pressures are also helping to improve the country's price trajectory — factors that could push economic performance above expectations.

The easing of trade tensions between Beijing and Washington after US President Donald Trump paid a state visit to China in mid-May could also lower the uncertainty that weighed on China's export sector and US businesses alike, experts said.

"Cooperation with the US helps reduce external uncertainties for China, which greatly contributes to the stability of the Chinese economy," said Zhu Min, former deputy managing director of the International Monetary Fund.

"For the US, working with China is beneficial to its economic development and helps boost its demand. Especially in a year marked by so much uncertainty, we are introducing a factor of certainty, which carries great significance," Zhu said.

However, Guan from BOCI China warned of the external uncertainty still remaining in the second half due to situations in the Middle East.

"Currently, the Middle East is in a state of neither war nor peace," Guan said. "If the conflict escalates or the blockade of the Strait of Hormuz is prolonged, the resulting energy supply disruptions and international logistics blockages will have an increasingly severe impact on the global economy and trade."

"If the global economy falls into recession, China will not be immune," he added.

Uruguay to roll out visa waiver for Chinese citizens

By **LI JING**
lijing2009@chinadaily.com.cn

Uruguay's announcement to grant visa-free entry to Chinese citizens makes it the second South American country after Brazil to waive visa requirements, underscoring a growing effort by countries in the region to attract Chinese tourists and business travelers as economic ties with China deepen.

Uruguayan Foreign Minister Mario Lubetkin announced on Thursday that Uruguay would implement a visa-free policy for Chinese citizens holding ordinary passports, with details to be released at a later date.

The announcement came less than a month after Brazil unveiled a similar policy allowing holders of ordinary Chinese passports to stay for up to 30 days visa-free.

Analysts say the back-to-back decisions suggest a growing willingness among Latin American governments to lower barriers for Chinese visitors following China's unilateral visa-free policies to the region.

Niu Haibin, director of the Center for Latin American Studies at the Shanghai Institutes for International Studies, said China's unilateral visa-free policies for Brazil, Argentina, Chile, Peru and Uruguay have helped build mutual trust over the past year.

> "The policy has strengthened mutual understanding and demonstrated the benefits of easier mobility."
>
> **Niu Haibin,** director of the Center for Latin American Studies at the Shanghai Institutes for International Studies

"The positive response to China's visa-free arrangements, together with Brazil's decision to grant visa-free access to Chinese citizens, has created momentum for broader policy coordination across the region," Niu said. "If the policies operate smoothly, more Latin American countries may consider similar measures in the future."

Travel agencies reported increased inquiries following the announcement, with Beijing-based travel agency UTour saying consultations related to Uruguay rose by about 15 percent.

Li Mengran, marketing manager at UTour, said Chinese tourists traveling to South America typically visit several countries on a single trip, meaning easier entry procedures in one country often have spillover effects across the region.

"Brazil and Uruguay introducing visa-free policies in succession will significantly improve travel convenience for Chinese visitors and help stimulate demand across the broader South American tourism market," Li said.

Analysts at Qunar's big data research institute said easier access to multiple destinations could help travelers spread the cost of long-haul flights across several countries, boosting the appeal of South America as a destination during the upcoming summer holiday and National Day travel seasons.

However, Li noted that visa waivers alone would not eliminate some of the structural constraints facing South American tourism.

Most routes still require multiple flight connections due to limited air links with China, while differing visa requirements across neighboring countries continue to complicate multi-destination travel planning, she said.

Visa facilitation has already helped boost travel flows between China and South America.

According to the Shanghai General Station of Immigration Inspection, more than 81,000 travelers from Brazil, Argentina, Chile, Peru and Uruguay entered China through Shanghai ports between June 1, 2025 and May 31, 2026, up 50.5 percent year-on-year. Notably, nearly 70 percent of these arrivals utilized the visa-free policy.

Niu said this experience has enabled more Latin American visitors to gain first-hand exposure to China.

"The policy has strengthened mutual understanding and demonstrated the benefits of easier mobility," he said.

According to China's General Administration of Customs, bilateral trade between China and Uruguay reached $7.19 billion in 2025, up 9.2 percent from a year earlier, with China remaining Uruguay's largest trading partner and largest export market.

Exports to China totaled $3.49 billion last year, accounting for about 26 percent of Uruguay's total exports. China is also the largest overseas market for Uruguayan soybeans and wool, and one of the leading destinations for its beef exports.

At the same time, Chinese products accounted for roughly a quarter of Uruguay's imports, including automobiles, machinery and electronic equipment.

Analysts said easier travel could also facilitate business visits, trade negotiations and investment discussions, helping support broader commercial engagement between the two countries.

The visa waiver follows a period of intensified diplomatic engagement between Beijing and Montevideo, Uruguay's capital.

In February, Uruguayan President Yamandu Orsi visited China, where the two countries issued a joint statement on deepening their comprehensive strategic partnership.

"As economic ties deepen, governments on both sides are seeking to reduce practical barriers to the movement of people," Niu said. "Visa facilitation is often one of the most visible outcomes of deeper political trust and economic integration."

Mega infra project to boost ties with UAE

By **REN QI**
renqi@chinadaily.com.cn

The Emirates airport maintenance hangar project in Dubai, undertaken by China Railway Construction Corp, and the deepening China-UAE infrastructure and industrial cooperation, will inject new momentum into the local economy and further enhance the bilateral partnership, experts said.

The megaproject, which kicked off in May, is located in the Dubai World Central area. It covers a total construction area of about 1.21 million square meters with a total investment exceeding $5 billion. Scheduled for 2030 completion, it is set to become a major global civil aviation maintenance hangar cluster, featuring top technical standards.

The facility includes eight large maintenance hangars, two specialized painting hangars and related support facilities. Once completed, it will be capable of simultaneously providing full-process services — including airframe overhauls, engine maintenance and aircraft painting — for 28 wide-body aircraft.

Sheikh Ahmed bin Saeed Al Maktoum, chairman and CEO of Emirates Airline, said the commencement of this world-class aviation engineering project marks an important step for Dubai in the future development of its aviation industry. The project will effectively integrate specialized capabilities, such as infrastructure and parts manufacturing, injecting new momentum into the UAE's economic growth, he noted.

Dai Hegen, chairman of CRCC, said that the cooperation between CRCC and Emirates is an important example of deepening good-neighborly friendship, pragmatic cooperation, and the high-quality joint construction of the Belt and Road Initiative between China and the UAE. It also serves as a demonstration project of "Chinese construction" contributing to the building of a China-UAE community with a shared future.

Relying on the construction of this aviation infrastructure project, Chinese enterprises will further demonstrate their comprehensive strength in engineering technology, construction quality and project management, Dai said. This will promote "Chinese construction" to better enter the high-end infrastructure market in the Middle East, continuously enhance international brand influence and industry competitiveness, and add new vitality to deepening China-UAE cooperation.

In recent years, with the continuous deepening of bilateral cooperation, Chinese enterprises have actively participated in infrastructure construction in the Middle East.

Data from the Ministry of Foreign Affairs show fruitful pragmatic cooperation between the two economies. The UAE is China's largest export market and second-largest trading partner in the Middle East. In 2025, bilateral trade value reached $108 billion, with China's exports at $72.88 billion and imports at $35.12 billion.

China mainly exports mechanical and electrical equipment, home appliances, vehicles and their parts, as well as steel and its products to the UAE, while primarily importing crude oil, natural gas, plastics and their products, organic chemicals and copper and its products. The UAE is China's sixth-largest source of crude oil imports, supplying 37.513 million metric tons to China in 2025.

Furthermore, Chinese enterprises are assisting Arab countries in upgrading their local industrial development levels through technology transfers, joint production and the construction of industrial parks. In the UAE, the China-UAE Industrial Capacity Cooperation Demonstration Zone focuses on high-end manufacturing, clean energy and modern logistics, with multiple projects already implemented through joint investments by Chinese and UAE enterprises.

"What we learn is not only products, but also knowledge and capabilities, which will help us achieve long-term sustainable development," said Reem Al Muhairi, an industrial project management official at an enterprise in the UAE.

Guangdong champions new industry model

Province's recent innovations in manufacturing, mobility going global, showing further growth possibilities

By LI JIAYING
lijiaying@chinadaily.com.cn

Autonomous minibuses developed by WeRide, an autonomous driving technology company, are seen in Guangzhou, Guangdong province, on March 24. DENG HUA / XINHUA

Left: A humanoid robot serves popcorn to reporters at Shenzhen Dobot Corp in Shenzhen, Guangdong province, on Oct 29. LIU LIHANG / XINHUA
Right: Staff members test industrial robots at a production base of Topstar Technology in Dongguan, Guangdong, on March 25, 2025. DENG HUA / XINHUA

A driverless robotaxi glides through the streets of Guangzhou, Guangdong province, slowing to pick up a passenger before merging back into traffic. Roughly 70 kilometers away in Dongguan, robotic arms work in harmony on an assembly line, while in Shenzhen, an engineer uploads a circuit design to an online platform, and within hours the first prototype is already entering production.

Though these technologies appear to belong to different industries, they share one thing in common: many are being developed by private enterprises from Guangdong, China's largest provincial economy and one of the country's most vibrant innovation hubs.

One year after the implementation of the Private Economy Promotion Law — the country's first comprehensive legislation dedicated to promoting private sector development — Guangdong is increasingly emerging as a testing ground where policy support, manufacturing capabilities and entrepreneurial vitality are combining to nurture a new generation of globally competitive industries.

According to the Guangdong Federation of Industry and Commerce, private businesses accounted for more than 95 percent of all market entities in the province by the end of 2025, contributing over 60 percent of its GDP and foreign trade.

More importantly, private businesses have become the backbone of Guangdong's innovation ecosystem, making up more than 80 percent of both the province's national-level "little giant" enterprises and nationally recognized high-tech companies.

Labs to real roads

Few sectors better illustrate Guangdong's push toward innovation-driven growth than autonomous driving.

Founded less than a decade ago in Guangzhou, WeRide has grown into one of the world's leading autonomous driving companies whose automobility services have been deployed in more than 40 cities across 12 countries.

Eyeing an expanded global footprint, in April, WeRide launched robotaxi operations in Singapore through a partnership with Grab, while also rolling out commercial driverless services in Dubai together with Uber, further extending the reach of Chinese autonomous driving technology overseas.

For a private company founded less than 10 years ago to compete on the global stage, "everything starts with technology", said Maeve Zhang, assistant to the president and head of marketing at the company.

Zhang said at the heart of the company's strategy is its self-developed WeRide One universal autonomous driving platform, which allows robotaxis, minibuses, autonomous sanitation vehicles and freight vehicles to share nearly 90 percent of their underlying software architecture and algorithms.

"The unified platform not only reduces development costs, but also gives the company the flexibility to adapt quickly to vastly different operating environments — from tropical downpours in Southeast Asia and extreme heat in the Middle East to Europe's stringent data privacy regulations," Zhang said.

The company's robotaxi fleet has grown from 100 vehicles in 2023 to around 1,300 today, and aims to increase that number to 10,000 by 2029 and 100,000 by 2032, she said.

"There is no finish line for a technology company," Zhang said. "Its technologies must continue to evolve, and the services must also continue to improve."

Behind WeRide's global ambitions lies the strength of Guangzhou's broader automotive ecosystem. As one of the city's three pillar industries, automobile manufacturing grew 5.5 percent year-on-year in the first quarter, while new energy vehicle output surged 36.1 percent.

Production of lithium-ion power batteries for vehicles and intelligent in-car equipment also jumped 41.7 percent and 35.3 percent, respectively, providing fertile ground for the development of next-generation mobility technologies.

Showcases to factories

If Guangzhou's private innovators are redefining how people move, manufacturers in Dongguan and Shenzhen are transforming how things are made.

Guangdong Topstar Technology Co, a Dongguan-based industrial robotics manufacturer, has spent nearly two decades evolving alongside the province's vast factory economy. Starting with automation solutions for injection molding workshops, the company later expanded into multi-joint industrial robots and intelligent manufacturing systems.

In 2025, it unveiled Xiaotuo, a humanoid robot designed specifically for injection molding applications, followed by the launch of its quadruped robot Xingzai, capable of traversing rough terrain and carrying heavy loads in firefighting, security inspection and industrial maintenance scenarios.

Yet for Topstar, the biggest challenge is not building robots, but making them reliable enough for real-world applications.

"Completing a single pick-and-place task in a laboratory is relatively easy," said Zhang Jian, a senior executive at the company. "What customers want on a production line is continuous operation without failure."

Zhang said that delivering industrial-grade reliability requires advances not only in artificial intelligence algorithms, but also in the robot's mechanical body and the precision manufacturing equipment behind it.

"Many of the high-end machine tools used to produce complex robot components once depended on imports," he said. "Today, we have achieved independent control over core technologies, giving us a much stronger foundation for large-scale deployment."

The company's recent growth is a vivid reflection of the rising demand for intelligent manufacturing upgrades across China's industrial sector. Topstar's industrial robot and automation business revenue surged more than 80 percent year-on-year in the first quarter, while revenue from the computer numerical control machine tool business expanded over 60 percent.

A similar story is unfolding about 80 kilometers south in Shenzhen, where collaborative robot maker Shenzhen Dobot Corp is helping bring Chinese intelligent manufacturing solutions to factories around the world.

As the world's largest collaborative robot supplier by shipment volume in 2025, the manufacturer now gets more than half of its revenue from overseas.

Xie Kaixuan, Dobot's marketing director, said foreign customers are no longer choosing Chinese robots simply because they are cost-effective.

"Overseas clients are no longer asking us only, 'How much does your robot cost?' They are increasingly asking, 'How long can it work, and how reliably can it operate?'" Xie said.

That trust has been earned thanks to the strong industrial foundation that Chinese manufacturers have built over years of serving the world's most complicated and comprehensive production environments, he added.

"What overseas customers value most is that we can offer a trusted solution that has been repeatedly validated in China's extensive and real industrial environments and proven capable of long-term, stable operation," Xie said.

In many ways he believes the globalization of Chinese manufacturing is entering a new phase.

"China is no longer exporting simply cost-effective machines," Xie said. "We are exporting integrated intelligent solutions that customers can truly rely on."

Ideas to businesses

What enables so many of Guangdong's private technology companies to move from an idea to a commercial product so quickly?

Part of the answer lies not only in the province's manufacturing strength, but also in a growing ecosystem that lowers the barriers to innovation itself.

For many hardware entrepreneurs in Shenzhen, innovation now begins with a simple click.

An engineer uploads a circuit design to an online platform, and within hours the first printed circuit board enters production. A few days later, a physical prototype is ready for testing and refinement.

"Whether it's a student experimenting with a personal idea or an early-stage startup producing a small batch of prototypes, our platform makes it possible to bring those ideas to life — something traditional manufacturing often cannot support," said an executive of operations at Shenzhen JLC Technology Group Co, an integrated platform covering PCB prototyping, component sourcing, assembly and precision manufacturing.

By digitalizing the entire process, it has reduced the cost of a single PCB prototype from several thousand yuan to just tens of yuan, while shortening delivery time from several weeks to as little as 12 hours.

"Our goal is to become an accelerator for global hardware innovation and technology commercialization," he said, adding that a humanoid robot can now move from design drawings to a fully assembled prototype in as little as one to two weeks.

By the end of 2025, JLC's online platform had attracted more than 9.59 million registered users, up 34.73 percent year-on-year. The company had also served customers in over 180 countries and regions and processed more than 21.08 million orders during the year.

"Foreign users increasingly value our end-to-end service model, spanning everything from electronic design automation to prototype manufacturing," he said. "What underpins that capability is China's complete industrial ecosystem. The ability to seamlessly connect design, components sourcing and manufacturing at such speed and scale is something that is still hard to find elsewhere in the world."

Ceramic tile factory embraces future with digital brain, green heart

By LI JIAYING

What does a ceramic tile factory look like in the age of artificial intelligence?

The answer, at least at Marco Polo Holdings' Shatian digital and intelligent factory in Dongguan, Guangdong province, is probably very different from what many people would imagine.

Walking through its production line, there is little of the dust-filled air, deafening noise and sweltering heat often associated with traditional ceramic production. Instead, intelligence is embedded in nearly every process.

In the raw-material workshop, an intelligent batching system enables rapid formula switching, shortening production changeovers and making it easier to handle smaller, more diversified orders. Nearby, smart continuous ball mills operate around the clock, while powdered materials are automatically transported to the molding area through an intelligent storage and delivery system.

Further along the line, ultrawide roller presses continuously feed tile bodies into towering kilns. Inside a nearby control room, engineers no longer rely solely on experience to judge firing conditions. Instead, an AI-powered monitoring system tracks the status of ceramic products in real time, helping raise the premium-product yield rate from 97.5 percent to 99.8 percent.

Once fired, the tiles move to the printing stage, where each product receives a unique anti-counterfeiting identifier.

"By checking the product's identity code, we can clearly trace where it goes and how it is used. It also helps consumers effectively identify counterfeit products," said Xu Xiaoyong, head of marketing at the group.

Before entering warehouses, every tile must pass one final test. An AI-powered inspection system scans each product for dimensional accuracy, flatness and surface defects.

"This effectively avoids missed detections and errors that can occur with manual visual inspection," Xu said.

A worker is on duty at Marco Polo Holdings' Shatian digital and intelligent factory in Dongguan, Guangdong province, in May. PROVIDED TO CHINA DAILY

For Huang Jianping, chairman of the group, digitalization is not simply about adopting fashionable technologies.

"The true value of AI lies in whether it genuinely solves problems," said Huang, adding that for the traditional manufacturing sector, developing new quality productive forces is not simply about upgrading equipment or improving efficiency, it is more about shifting from scale-driven production toward innovation-led value creation.

"At its core, this means creating a development model that is more technologically advanced, more efficient, higher in quality and more sustainable," Huang said.

Beyond its digital brain, the factory also has a green heart. Open-air collection ponds, storage tanks and a web of underground pipelines form a complete rainwater harvesting system. On the rooftop, solar panels stretch across the factory, supplying 70 percent of its electricity.

"We use the collected rainwater for production. The entire factory has achieved 100-percent recycling of industrial water, and no industrial wastewater is discharged," Xu said.

"These green technologies are especially important when building factories in overseas markets with relatively strict environmental requirements, such as the United States."

Today, the Chinese ceramic tile manufacturer operates five major production bases — four in China and one in Tennessee, US — and exports to more than 130 countries and regions, with an annual revenue of 6.5 billion yuan ($958 million) in 2025.

This plant offers a window into a broader move toward intelligent upgrades in the country's manufacturing sector.

The Ministry of Industry and Information Technology said China has so far built 15 "pilot-level" intelligent factories — representing the highest tier of global intelligent manufacturing — where AI has penetrated more than 70 percent of their business scenarios.

In addition, the country is also home to more than 35,000 basic-level, over 8,200 advanced-level and over 500 excellence-level intelligent factories. By 2025, the application rate of AI technology among industrial enterprises above designated size exceeded 30 percent, MIIT data showed.

Penn Station stabbing

New York Police Department officers are seen outside Penn Station in New York after five people were wounded on Sunday in a stabbing inside the transport hub, according to officials, who said all victims were moved to hospital and the alleged attacker was "in custody". The victims were all civilians, including one person who sustained serious injuries, the New York Fire Department said in a statement. JOHN LAMPARSKI / AFP

Sister-city summit urges enhanced ties

Ongoing collaboration strengthens Sino-US people-to-people relations, forum hears

By LIA ZHU in San Francisco
liazhu@chinadailyusa.com

Diplomats, mayors and civic leaders from both sides of the Pacific gathered in San Francisco for the eighth China-US Sister Cities Summit, renewing their commitment to the subnational partnership that national governments alone cannot forge.

Themed "Shared Efforts for High-quality City Development", the summit drew more than 150 Chinese delegates representing 15 provinces, autonomous regions, municipalities and 12 cities, alongside 160 US delegates from 21 states and 36 cities.

The gathering, held on Friday, featured exchanges on three central themes — green development and urban governance, culture and tourism, and education and youth.

"Everything depends on meeting each other, shaking each other's hand, looking each other in the eye," Carol Robertson Lopez, chair emeritus of Sister Cities International, told China Daily on the sidelines of the summit.

Gatherings like this one, she said, do something that virtual exchanges cannot fully replicate."When we have gatherings like this, it just seals the friendships that we've developed, in many cases online."

She said that hearing how cities in different countries have approached shared challenges is a form of practical benefit.

"What's really important is just bringing people together," she said. "It's interesting to hear all the different things, and we do get a lot of ideas that we can take back home."

The gathering has grown into a platform for subnational diplomacy since its launch by the Chinese People's Association for Friendship with Foreign Countries, or CPAFFC, in 2014.

China and the United States currently maintain 50 pairs of sister provinces and states, and 238 pairs of sister cities.

Yang Wanming, president of the CPAFFC, pointed to California and San Francisco as proof of what local investment in the relationship can achieve. California holds more sister-city ties with China than any other US state, he said, and both California and San Francisco have been pioneers in bilateral subnational engagement.

Yang cited two recent developments as an example of the momentum. San Francisco Mayor Daniel Lurie visited Shanghai in April, his first official overseas trip as mayor, and within two months, Shanghai had sent a delegation to San Francisco to attend the summit. "This shows the deep relations between the two cities," Yang said at the summit.

He also highlighted in October the presence of Oregon Senate President Rob Wagner, who had visited China in October and returned to San Francisco for the summit, where he met with representatives from sister partners of Fujian province and Tianjin municipality. These showed the relationship becoming closer through mutual visits and the nature of win-win collaboration, he said.

Joint collaboration

Through openness and collaboration, the people in the two countries have continued to write new chapters of friendship, Chinese Ambassador to the United States Xie Feng said in video played at the summit. For China-US relations to keep moving forward, he said, the two sides need not only meetings between the leaders, but also broad engagement across all social sectors.

He said there is still much that China and the United States can and should cooperate on and, leveraging sister-city ties as a platform, the two countries should actively expand cooperation from traditional areas such as economy, trade and agriculture to emerging fields including artificial intelligence, new energy and humanoid robots.

Lurie, the San Francisco mayor, said his city is uniquely positioned to hold this summit. "Cities are where history is lived," he said. "Cities are where people build their small businesses, raise their families and form the relationships that cross oceans and cultures."

San Francisco, he said, is home to the oldest Chinatown in North America and one of the most vibrant Chinese American communities in the country.

"For generations, Chinese Americans have helped write the story of this city, shaping our economy, our civic life and our culture in ways that are impossible to separate from who San Francisco is," he said.

It was that history that led Lurie to make China the destination for his very first foreign trip as mayor. His April visit to Shanghai marked the 46th anniversary of the San Francisco-Shanghai sister-city relationship.

Beyond Shanghai, Lurie emphasized San Francisco's friendship-city ties with Shenzhen and Guangzhou in Guangdong province, where ongoing collaboration spans innovation, trade and education.

Zhang Jianmin, China's consul general in San Francisco, described sister-city cooperation as carrying "tremendous potential as engines of economic growth" and called on both sides to broaden their ambitions as the world changes around them.

The summit concluded with the signing of five cooperation agreements, covering 31 cooperation projects and spanning sister-city partnerships, cultural and tourism exchanges and youth programs.

Chinese EVs make gains as Australia posts record sales

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Battery-electric vehicles made up one in five of all new vehicle sales in Australia in May, hitting a record high and marking a major shift away from fossil fuels on the back of more Chinese carmakers helping to power the green transition, according to latest industry figures.

More broadly, electric vehicles — which include battery, conventional hybrid and plug-in hybrid versions — accounted for nearly half or 46 percent of a total of 100,206 new vehicle sales in May, the Federal Chamber of Automotive Industries, or FCAI, said in a statement on Wednesday.

The FCAI, which is the apex industry body for the automotive sector in Australia, highlighted the considerable gains made by major Chinese makers such as BYD, Omoda Jaecoo and Geely. BYD, fueled by its popular Sealion EV series, alone achieved sales of 8,211 vehicles in May, a 155 percent increase year-on-year.

Three Chinese carmakers are among the top 10 models by sales volume for the month, according to the FCAI.

Hussein Dia, a professor of transport technology and sustainability at the Swinburne University of Technology in Melbourne, told China Daily the latest figures are significant because "they suggest Australia may be moving beyond the early adopter phase of the EV transition and into a more mainstream phase of market acceptance".

He pointed to a broader shift in consumer preference away from conventional gasoline and diesel vehicles.

Dia said the factors behind the move include the recent fuel-price volatility and concerns about energy security that remind consumers of Australia's exposure to global oil market volatility, a result of supply chain disruptions due to the ongoing conflict in the Middle East.

The growing influence of Chinese manufacturers is "difficult to ignore" amid these developments, he said.

"Their success reflects the increasing availability of competitively priced electrified vehicles and greater consumer choice. By bringing more affordable models to market, these manufacturers have helped accelerate EV adoption (rates) and increased competition across the broader automotive sector," Dia said.

"These figures also highlight how quickly the competitive landscape is changing. The transition is no longer being driven solely by traditional automotive manufacturers. New entrants, particularly from China, are playing an increasingly important role in shaping consumer choice, pricing and the pace of electrification in Australia," he said.

Similarly, Electric Vehicle Council CEO Julie Delvecchio said in a statement that the figures marked a significant milestone in Australia's transition to cleaner and more affordable transportation.

"We know Australians buy cars that save them money, suit their lifestyle and perform well. Record EV sales suggest more Australians are finding electric vehicles tick all three boxes," she said.

Cost of living pressures

Delvecchio said that cost of living pressures were continuing to drive interest in EVs. The council is the national body that represents the EV industry in Australia.

She said the record sales data and continued strong interest in EV ownership highlight the urgent need for an accelerated national EV infrastructure plan.

"While the government has rightly invested in charging infrastructure, with adoption increasing, the federal, state and local governments all need to work together to redouble efforts to meet demand," she said.

Stronger EV adoption places greater pressure on charging infrastructure, according to the FCAI.

"As the number of EVs on the road continues to grow, charging infrastructure must become more of a priority. Continued investment and enabling policy settings will be essential to ensure infrastructure keeps pace with consumer adoption," FCAI Chief Executive Tony Weber said.

Dia also pointed to vehicle supply "improving faster than charging infrastructure in some parts of the country, particularly for apartment residents, renters and regional communities".

The next phase of the green transition will depend not only on vehicle affordability but also on the accessibility of EV chargers and customer confidence, he said.

"Both government and industry have important roles to play. Governments can help ensure charging infrastructure keeps pace with adoption and provide clear long-term policy signals. Industry, meanwhile, must continue improving customer support, servicing networks and spare parts availability as EV sales grow," Dia said.

Conservation campaign

The 6.1-meter shark made of wicker is seen along a beach in Falmouth, United Kingdom, on Sunday. China calls for greater engagement to support Afghanistan's development

By MINLU ZHANG
at the United Nations
minluzhang@chinadailyusa.com

China on Monday called for continued international engagement with Afghanistan and greater support for the country's humanitarian and development needs, as the UN Security Council reviewed the situation in the country.

Addressing a United Nations Security Council meeting on Afghanistan, China's permanent representative to the United Nations Fu Cong said Afghanistan faces ongoing challenges in humanitarian assistance, economic development and counterterrorism despite an overall stable security situation.

China called for maintaining the momentum of pragmatic engagement with Afghanistan, said Fu. He noted that growing exchanges and cooperation between Afghanistan and the international community, particularly neighboring countries, have contributed to regional stability and economic development.

The envoy urged all parties to maintain dialogue and engagement with the Afghan authorities, narrow differences and build consensus.

Fu called for greater efforts to improve living conditions in Afghanistan, where nearly half of the population remains in need of humanitarian assistance. "Traditional donors should increase support for Afghanistan, and countries bearing historical responsibilities should take the lead," he said.

China also urged relevant countries to return Afghanistan's overseas assets in full, lift unilateral sanctions and support the rebuilding of the country's financial system, said Fu.

On basic human rights, Fu said China is concerned over restrictions on girls' education and called on the Afghan authorities to take positive measures to ensure girls' access to education and better protect women's rights to employment, healthcare, public services and social participation.

China also called for the removal of restrictions preventing Afghan female staff members from working in UN offices, saying such measures have seriously affected the operations of UN agencies in the country.

On counterterrorism, Fu urged Afghanistan to intensify efforts to combat all terrorist groups operating within its territory and strengthen cooperation with regional countries and the international community.

The envoy also noted China's efforts to help ease tensions between Afghanistan and Pakistan.

Representatives from China, Afghanistan and Pakistan held an informal meeting from April 1 to 7 in Urumqi, northwest China's Xinjiang Uygur autonomous region. According to Fu, the meeting reached consensus on maintaining good-neighborly relations, enhancing dialogue and exploring comprehensive solutions.

He reiterated China's support for the United Nations Assistance Mission in Afghanistan (UNAMA), whose mandate expires later this month.

Fu said China will work with UN Security Council members to build consensus and support the smooth renewal of UNAMA's mandate.

According to the UN, Afghanistan remains one of the world's largest humanitarian crises, with 21.9 million people requiring humanitarian assistance in 2026.

Georgette Gagnon, the secretary-general's deputy special representative for Afghanistan and officer-in-charge of UNAMA, said that while the de facto authorities faced "no meaningful armed or political challenge", the country remained under "increasing control by the de facto authorities without a clear end-state".

She told the Security Council that economic pressures, large-scale returns of Afghans and restrictions on women and girls continue to pose significant challenges for the country.

ZVEREV CLEARS MAJOR HURDLE

German finally crowned Grand Slam champion

Alexander Zverev lifts the coveted Coupe des Mousquetaires after defeating Flavio Cobolli in the French Open final at Roland Garros in Paris on Sunday. AFP

It all came rushing back to Alexander Zverev when he was lying on his back on the center court at Roland Garros, his hands covering his face, and sobbing on Sunday as he realized that he had — finally — become a Grand Slam champion.

It was the same court where he twisted his right ankle and crumpled to the ground, wailing in agony before being pushed off on a wheelchair during a semifinal match against Rafael Nadal in 2022.

The same court where he wasted a lead of two sets to one against Carlos Alcaraz in the 2024 championship match.

"All the emotions came out, because this court is very, very special to me. It's special in a very positive way, but also special on the negative way, because I had some of the toughest moments of my life here," Zverev said.

"I was laying on this court with an injury that I didn't know if I would ever come back from. I lost a Grand Slam final here, so all of those memories for me, they're not wiped out. They're still with me, but this one will beat all of them."

After so many missed opportunities, Zverev is no longer one of the best players never to win a major title.

In his fourth major final, Zverev beat Flavio Cobolli 6-1, 4-6, 6-4, 6-7 (5), 6-1 for the French Open title.

Without Jannik Sinner or Alcaraz across the net, it was a unique opportunity for Zverev and the third-ranked German took full advantage.

When Cobolli missed an overhead on the second championship point, after more than four hours of the five-set encounter, Zverev joined an elite group of players that captured their first major in their fourth final: Eight-time major champion Andre Agassi, 2001 Wimbledon winner Goran Ivanisevic and 2020 US Open champion Dominic Thiem.

Then, when Zverev finally got his hands on the Coupe des Mousquetaires, he turned it upside down, held it between his legs and then hoisted it above his head with both arms as he let out a loud roar.

"This trophy, for me, is very important, because if I had lost this one, this self-belief would have gone down a lot," Zverev said.

"But now that I've won it, I feel like I can do it again."

No Sinner or Alcaraz

Zverev had been an overwhelming favorite for the title ever since the top-ranked Sinner struggled in the first week's heat wave and wasted a two set and 5-1 lead against Argentine Juan Manuel Cerundolo in the second round.

A day later, 24-time Grand Slam champion Novak Djokovic was also eliminated.

Alcaraz, the two-time reigning champion, withdrew before the tournament with an injured right wrist.

Zverev also lost a lead of two sets to none in the 2020 US Open final to Thiem and was beaten in straight sets by Sinner in the 2025 Australian Open final.

It was the 25th title of Zverev's career.

Zverev poses for a picture with the Roland Garros ball boys and girls following his maiden Grand Slam title win on Sunday. AFP

Cobolli's first Slam final

The 14th-ranked Cobolli had never been past a Grand Slam quarterfinal until last week. He was attempting to become the first Italian man to raise the singles trophy at Roland Garros since Adriano Panatta 50 years ago.

Cobolli comes from the same tennis club in Rome as Panatta did, and Panatta was asked by tournament organizers to present the trophy to celebrate the anniversary of his 1976 triumph.

The honors, however, went to Zverev.

Russian teenager Mirra Andreeva won the women's singles trophy on Saturday.

Flawless start

The match was played in perfect conditions, and Zverev's game was almost flawless at the start as Cobolli appeared nervous.

A group of women in the stands held up letters to form Zverev's nickname: "Sascha".

Cobolli tends to stand way over near the corner of the court and hit big kick serves out wide into the ad court.

Zverev knew what was coming and returned one such kick serve early in the first set with a backhand that he wrapped around the outside of the net post. Cobolli ended up winning the point, but it was a message from Zverev that he knew how to handle his opponent's tactics.

The next time Zverev hit a similar return, Cobolli couldn't handle it and Zverev won the point.

Both players were treated by a physiotherapist as the match wore on, and Cobolli appeared to run out of energy in the fifth set.

"He deserved it more than me at the end of the match," Cobolli said, adding that he was slowed by cramps.

Zverev said his cramps "were more mental".

"I actually think that the cramp helped me in a way, that I let go, I kind of hit my shots a bit more and just let go," he added.

AGENCIES VIA XINHUA

Cobolli sees bright future, despite heartbreak in Roland Garros decider

Flavio Cobolli left everything on Court Philippe-Chatrier as he chased a first Grand Slam title on Sunday, but the Italian admitted the pressure of playing on the biggest stage ultimately proved decisive in a heartbreaking defeat.

The 24-year-old arrived at Roland Garros having never gone beyond the quarterfinals of a major tournament and left it as a Grand Slam runner-up, his reputation transformed, despite falling one match short of the title.

"Of course, I have a very different level of self-belief and awareness compared to when I started this tournament," he told reporters after losing 6-1, 4-6, 6-4, 6-7 (5), 6-1.

"But, I think the goals are still the same."

Those goals now include qualifying for the season-ending ATP Finals in Turin, a target Cobolli revealed had been set before the clay-court major began.

"We've set ourselves a goal that I don't want to tell you yet ... actually, it's Turin. That has been the objective since the start of the year," said Cobolli, who moved up to fourth place in the Race to Turin.

"We're working to get there. It's very difficult, because only eight players make it, but with the level I've shown over these weeks, and with all the work my team does behind the scenes, I'm sure I'll get there."

Cobolli came within touching distance of taking a two-sets-to-one lead, but believes a missed opportunity late in the third set altered the course of the contest.

"The biggest regret? Yes, that game at the end of the third set changed everything," he said.

"But, as I said before, I'm not used to this kind of pressure yet. I felt I was close, and, in the important moments, maybe I rushed a little. That's what hurt me. But you learn from those decisions."

The Italian had spent the previous two weeks playing with freedom and confidence, but the magnitude of the occasion hit him from the moment he woke up on Sunday morning.

> "I'm not used to this kind of pressure yet. I felt I was close, and, in the important moments, maybe I rushed a little. That's what hurt me. But you learn from those decisions."
>
> **Flavio Cobolli,** French Open runner-up

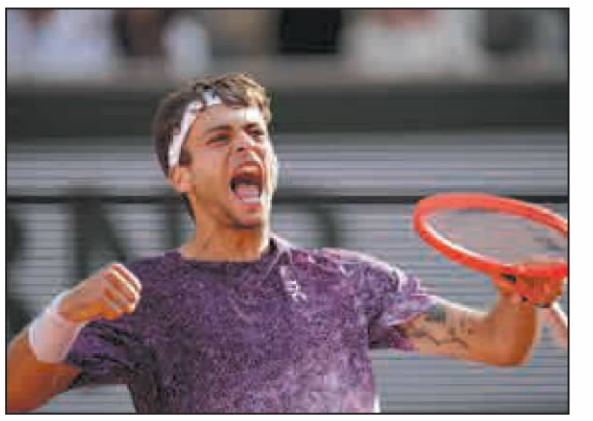
"Yesterday, I was nervous, but I handled it well and stuck to the routine we've followed for two weeks," he said.

"Today, I woke up much more nervous than I expected. I had a huge knot in my stomach, something I don't usually have, and I had to fight that feeling all day.

"You have to understand the pressure of a Grand Slam final, especially for someone who isn't used to playing matches like this."

In true Italian style, he also paid tribute to his family, particularly his mother, who rarely travels to tournaments but was present for the biggest match of his career.

"My mother raised me," Cobolli said.



"She drove me everywhere, sat through every practice session and was always there for me. She deserves to have been here."

As painful as the defeat was, Cobolli preferred to focus on what had been gained rather than what had slipped away.

"At the end of the day, they'll hug me because we've played a Grand Slam final, and nobody can take that away from us," he said.

"As I said during the ceremony, this match has to be taken with a smile. We all gave everything. I have no regrets, so I can be calm and keep moving forward."

Red clay of Paris unearths future Chinese tennis star

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

Having celebrated many historic moments in Chinese tennis, the red clay of Roland Garros might have just witnessed the rise of the nation's next big thing.

Even without any of its senior stars making a deep run, China still turned heads on the final weekend at this year's upset-laden French Open, with teen talent Sun Xinran's appearance in the girls' tournament final serving up notice of its next future star.

Fifteen-year-old Sun's breakout run in Paris made her the first Chinese player to reach a junior final at Roland Garros, and has propelled her to the No 1 spot on the International Tennis Federation's junior world rankings this week, despite her straight-sets loss to 17-year-old Alisa Oktiabreva in the championship match on Saturday.

Seeded second in the girls' draw, Sun carried on her recent hot form as she stormed through five straight matches, conceding only one set en route to the final, where the gap in strength and experience between herself and Russian-born Oktiabreva, who's already a regular on the WTA circuit, proved too great to surmount.

The Chinese prodigy, however, has taken the loss in her stride, displaying a maturity that will stand her in good stead when she faces the ups and downs of the pro stage.

"Of course, I felt a bit disappointed not being able to win it all, but I have a better understanding where I need to improve," said Sun, who's become the third Chinese player to ascend to the female junior No 1 spot, following Wang Xiyu in September 2018 and Xu Shilin in October 2014.

"I couldn't accept even a little bit of failure in the past, but playing through setbacks at the international level taught me to embrace it with a positive mindset and always set my sights on the next opportunity.

"After all, tennis will be my job in the future."

One it looks like she will be good at.

Born in Shenzhen, a hub of domestic and international tennis tournaments in Guangdong province, Sun's journey in the sport began at six years old. She started training as an amateur influenced by her mother, an avid tennis fan, who then offered her full support when, at age 11, Sun said she wanted to take it to the next step.

Sun Xinran with the French Open junior singles runner-up trophy on Saturday. XINHUA

"It was my own idea, 80 percent, give or take, and the other 20 percent was the support of my family," Sun said of her early commitment to the sport — something that could, for an ordinary family, be viewed as a bold gamble back then.

Despite the financial pressure of supporting her travel and training expenses while competing on the ITF tour and entry-level senior circuit, Sun's parents pulled out all the stops to enable their daughter to unleash her full sporting potential at every stage, while making sure her education kept up as well.

Traveling across the world on a weekly basis for competitions on ITF's tightly-scheduled junior tour, Sun has managed to stay on top of her school work at the Shenzhen Hongshan Middle School via online tutoring at restaurants, on her way to the airport or in her hotel room.

"I've actually got used to (this) life," said Sun, who's racked up 24 wins out of 26 matches on the ITF junior circuit, and an additional seven victories in 11 appearances at entry-level ITF senior events and WTA125 tournaments this year. "It is my choice. It's more than just a hobby, and I am enjoying it very much."

With the intensity of her game picking up and experience gained on all kinds of surfaces, since early last season, Sun has seen her talent and hard work pay dividends.

She wrote her name in history for the first time in October when she won her first singles title on the ITF Women's World Tennis Tour in Egypt to become the youngest Chinese winner of an international senior event at 15 years and 95 days old.

Two months later in Florida, Sun won China's first singles title at the Orange Bowl at Fort Lauderdale, a renowned cradle for future major champions, before picking up another confidence boost by winning her first match on the WTA125 circuit earlier last month, beating a world top-200 senior in Lina Gjorcheska in Istanbul to become the youngest Chinese player to secure a win at that level.

Back-to-back clay-court title runs at J300 in Plovdiv, Bulgaria, and J500 in Milan in the lead-up to the French Open kept Sun in winning form to introduce herself, big time, at Roland Garros last week.

Now, having left her own mark at the clay-court mecca where legend Li Na won Asia's first singles major trophy in 2011 and her senior compatriot Zheng Qinwen delivered Olympic gold for the nation at Paris 2024, Sun said she is daring to dream big, but is doing so by taking it one small step at a time.

"The junior world No 1 doesn't really guarantee anything," said a composed Sun. "I just hope it will earn me more wildcard entries into even more senior tournaments.

"Only by testing myself against higher-level opponents can I make a smoother transition from the junior circuit to the professional tour," said Sun. "That's what my goal will be."

CHINA DAILY

GLOBAL EDITION 中国日报 WEDNESDAY, JUNE 10, 2026

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, walks into a lecture hall of the Central Cadres Training School of the Workers' Party of Korea in the company of Kim Jong-un, general secretary of the WPK and president of the State Affairs of the Democratic People's Republic of Korea, in Pyongyang, the DPRK, on Tuesday. YAO DAWEI / XINHUA

Xi, Kim vow to carry forward friendship

Leaders pledge to promote youth education programs

The top leaders of China and the Democratic People's Republic of Korea agreed on Tuesday that the two countries should carry forward their great traditional friendship from generation to generation.

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, and Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK, made the remarks as Xi paid homage to the China-DPRK Friendship Tower in Pyongyang with his wife, Peng Liyuan, accompanied by Kim and his wife, Ri Sol-ju.

Xi and Kim also agreed that the years when China and the DPRK fought side by side in the 1950s are an eternal historical memory shared by both countries.

The two leaders pledged to jointly maintain memorial facilities dedicated to the Chinese People's Volunteers martyrs, carry out distinctive programs on revolutionary traditions and youth education, and carry forward the great spirit of the War to Resist United States Aggression and Aid Korea (1950-53).

On Tuesday morning, Xi, accompanied by Kim, also visited the Central Cadres Training School of the WPK in Pyongyang.

In the wooded area between teaching buildings, Xi and Kim jointly planted a fir tree. The fir tree remains evergreen throughout the year, symbolizing the enduring and ever-renewing friendship between China and the DPRK.

Before departing for Beijing, Xi and Peng attended a luncheon hosted by Kim and Ri.

President Xi Jinping straightens the ribbons on a flower basket while paying homage at the China-DPRK Friendship Tower with his wife, Peng Liyuan, in the company of DPRK top leader Kim Jong-un, and Kim's wife, Ri Sol-ju, in Pyongyang, the DPRK, on Tuesday. XIE HUANCHI / XINHUA

Xi said that he reached an important consensus with Kim on developing relations between China and the DPRK in the new era.

The two sides also had in-depth discussions on safeguarding peace and stability in the region and the world, Xi said.

Xi thanked Kim for the warm hospitality and thoughtful arrangements for the visit, noting that through the visit, the warmth and friendship extended by the WPK and the DPRK government and people toward the CPC and the Chinese government and people is felt even more deeply.

The mutual understanding between China and the DPRK has become deeper and more comprehensive, and the future development direction has become clearer and more definite, Xi said.

He also said that he is ready to work with Kim to jointly lead China-DPRK relations toward greater development and inject new and strong impetus into the socialist cause of the two countries.

Kim said that Xi's visit was a complete success, sending a positive message to the world that the DPRK and China are strengthening their friendly cooperation further, attracting widespread attention from various sides.

Xi's visit was of great significance to bilateral relations and the future development of the region, Kim said, noting that the DPRK stands ready to earnestly implement the important consensus reached during the visit, promote new tangible outcomes in bilateral cooperation, and advance DPRK-China relations to a new and higher level.

On Tuesday afternoon, Xi returned to Beijing after concluding his two-day state visit to the DPRK. Kim and his wife went to the airport to see Xi and his wife off, holding a grand farewell ceremony in their honor.

Scholars seek inspiration from classical wisdom at Athens dialogue

By **WANG HUAZHONG** and **ZHENG WANYIN** in Athens

Walking past the marble statues of Aristotle and Plato, classical studies scholars from around the world entered the auditorium of the Academy of Athens on Tuesday for a dialogue spanning the East and West, from the past to the present day.

The Second World Conference of Classics is being held in Athens, the capital of Greece, from Tuesday to Wednesday to seek inspiration from classical wisdom in addressing the questions of our time. The event is jointly organized by the Chinese Academy of Social Sciences, the Greek Ministry of Culture and the Academy of Athens.

"This is not only an academic gathering, but also a profound act of putting ideas into practice," said Nikiforos Diamandouros, president of the Academy of Athens and moderator of the conference's opening ceremony.

"Our goal is to ensure that classical wisdom ... becomes a living force that continually provides inspiration and guidance for the advancement of human society and civilization.

"Plato, Aristotle, Hesiod, as well as Confucius, Laozi and Sun Tzu — these great sages remain present among us today."

He added that as the two oldest civilizations in human history, Greece and China possess distinct yet mutually enriching cultural traditions, which "complement one another and can make a decisive contribution to this dialogue".

Hu Heping, deputy head of the Publicity Department of the Communist Party of China Central Committee, said that classical civilizations provide spiritual resources for human development, as well as power for the prosperity and progress of countries.

WORLD WATCH
By Arkebe Oqubay

Coherent policies seen as key to poverty alleviation

China has achieved a landmark development milestone by ending absolute poverty over the past decades and lifting approximately 800 million people out of destitution — a figure representing roughly 75 percent of global poverty reduction targets agreed upon at the United Nations. The scale and speed of this transformation are unprecedented in history.

The significance is both practical and symbolic. It shows that a large, populous nation can eliminate extreme poverty through sustained, systematic policy rather than exceptional circumstances. For the Global South — where over 80 percent of the world's population lives and where poverty reduction remains a core development imperative — China's experience is a powerful and instructive reference point.

China's achievement did not stem from a single intervention but from a coherent, mutually reinforcing set of policies. Within the overarching framework of reform and opening-up, the strategy combined high economic growth with targeted rural intervention, inclusive development principles, agricultural modernization and sustained productivity gains. These elements worked in concert: Broad growth raised average living standards, while targeted measures ensured that the most marginalized populations were not left behind.

This integration of macro-level growth strategy with micro-level targeting is arguably the most instructive aspect of China's experience. Poverty reduction was treated not as a residual outcome of economic expansion but as a primary policy objective, requiring direct administrative attention and dedicated resource allocation.

Ending poverty is one challenge; preventing relapse is another.

China has put in place several concrete mechanisms to secure the progress that has been made. A dynamic monitoring system identifies households at risk of falling back into poverty, enabling early intervention. Ongoing industrial and economic support is channeled to formerly poor regions to ensure that development is structurally embedded rather than dependent on short-term transfers.

China, Georgia jointly elevate bilateral ties

Two sides have upheld principles of mutual respect over the past 34 years

President Xi Jinping and Georgian President Mikheil Kavelashvili exchanged congratulations on Tuesday on the 34th anniversary of diplomatic ties between the two countries, and jointly announced the elevation of bilateral relations to a comprehensive strategic partnership.

In his congratulatory message, Xi said that China and Georgia, over the past 34 years, have consistently upheld the principles of mutual respect, mutual trust and win-win cooperation, promoted the healthy and steady development of bilateral relations and achieved fruitful outcomes in cooperation across various fields.

Since the establishment of the strategic partnership between China and Georgia in 2023, mutual political trust between the two sides has been further strengthened, practical cooperation has been accelerated, and multilateral collaboration has become more productive, Xi said.

No matter how the international landscape evolves, China always views its relations with Georgia from a strategic and long-term perspective, Xi said, adding that he would like to take the anniversary as an opportunity to announce, jointly with Kavelashvili, the upgrade of the two countries' ties to a comprehensive strategic partnership.

He expressed the belief that the elevation of bilateral ties will open up new prospects for the development of China-Georgia relations, write a new chapter in their traditional friendship, inject strong momentum into their mutually beneficial cooperation, and deliver more benefits to the peoples of the two countries.

Kavelashvili said in his message that over the past three decades and more, Georgia and China have established a lasting friendship, and bilateral relations have achieved remarkable progress based on mutual respect, mutual trust and constructive cooperation.

On the occasion of the 34th anniversary of bilateral diplomatic ties, the two sides have made a joint decision to lift Georgia-China relations to the level of a comprehensive strategic partnership, Kavelashvili said. He also said he believes that the elevated ties will create more opportunities for bilateral cooperation, bring greater benefits to both countries, and further strengthen the bonds of friendship between their peoples.

Xi congratulates new governor general of Canada

By JI HAISHENG
jihaisheng@chinadaily.com.cn

President Xi Jinping on Monday sent a message to Louise Arbour, congratulating her on assuming office as the 31st governor general of Canada.

In the message, Xi said that the sound and steady development of China-Canada ties serves the common interests of both countries, and is conducive to world peace, stability, development and prosperity.

He said he attaches great importance to the development of bilateral ties. Xi expressed the willingness to work with Arbour to advance the China-Canada new strategic partnership along a sound, stable and sustainable track in the spirit of mutual respect, mutual benefit and win-win results, as well as seeking common ground while shelving differences, so as to bring more benefits to both peoples.

Arbour, 79, was installed as Canada's new governor general on Monday after a swearing-in ceremony. She had previously served in a number of influential positions both at home and abroad.

Strong demand, policies fuel foreign trade expansion

By ZHONG NAN
zhongnan@chinadaily.com.cn

China's import growth outpaced export expansion by nearly 9 percentage points in the first five months of 2026, underpinned by robust domestic demand and broader market-opening measures, economists and government officials said on Tuesday.

They said two key policy initiatives will sustain strong import momentum throughout the year. The Ministry of Commerce's "Big Market for All: Export to China" campaign has broadened access to China's vast consumer and industrial markets for global exporters. The government's expanded zero-tariff treatment for all African countries that have diplomatic ties with China, which took effect on May 1, is also expected to support import growth.

China's foreign trade grew 15.3 percent year-on-year to 20.68 trillion yuan ($3.05 trillion) during the January-May period, with exports rising 11.8 percent and imports jumping 20.5 percent, data from the General Administration of Customs showed.

Wang Xiaohong, a researcher at the China Center for International Economic Exchanges in Beijing, said the strong growth in imports reflected the effectiveness of policies aimed at expanding imports, boosting consumption and advancing high-standard opening-up.

> "China's highly developed supply chains, rapid commercialization of new technologies and strong engineering capabilities continue to create opportunities for both imports and exports."
>
> **Shen Kelei,** Marelli Holdings Co's executive vice-president

For example, China's imports from Africa surged 15 percent year-on-year to 95.13 billion yuan in May alone, marking the ninth consecutive month of growth, customs statistics showed.

The faster growth in imports also underscored China's role as a key engine of global demand, creating new opportunities for overseas exporters and supporting trade flows at a time when many economies are facing slower growth, Wang said.

Lynn Song, chief economist for China at Dutch bank ING, said that both China's imports and exports exceeded expectations in the first five months. This was partly supported by rising prices of high-tech products, which lifted the value of both outbound and inbound shipments.

"The country's trade structure is also becoming increasingly tilted toward technology-intensive goods," he added.

Echoing that view, Sheana Yue, senior economist at British think tank Oxford Economics, said China's industrial upgrading, technological advances and well-established supply chains have enhanced the competitiveness of Chinese products, helping to sustain trade growth and market share gains despite external uncertainties.

Lyu Daliang, director of the GAC's department of statistics and analysis, said China has deepened practical economic and trade cooperation with its partners since the beginning of this year and continued to serve as a stabilizing force for global trade.

Beyond supporting imports, China's broader opening-up efforts and regional trade agreements are also helping both domestic and foreign businesses integrate more deeply into regional supply chains, facilitating both imports and exports.

Techtronic Industries (Dongguan) Co, a Dongguan, Guangdong province-based manufacturer of power tools and outdoor garden equipment, imported goods worth 1.44 billion yuan from other economies of the Regional Comprehensive Economic Partnership agreement between January and May, according to information released by Huangpu Customs in Guangdong.

Zheng Jiancai, the company's head of customs affairs, said the RCEP agreement has helped lower sourcing costs and improve supply chain efficiency while expanding market access across the region.

"Our lithium-ion battery packs are mainly exported to Australia and New Zealand," said Zheng.

"Since the RCEP came into force, raw materials sourced from Malaysia have been treated as originating materials under the agreement, enabling our products to qualify for preferential tariffs and enjoy tariff reductions of up to 5 percent."

In addition to importing key parts and components into China, Marelli Holdings Co, a Japanese automotive parts manufacturer, is expanding its presence in the country in areas such as smart lighting, electronics and intelligent cockpit technologies, underscoring China's growing role in the company's global operations.

"China's highly developed supply chains, rapid commercialization of new technologies and strong engineering capabilities continue to create opportunities for both imports and exports," said Shen Kelei, the group's executive vice-president.

Classics: Every civilization possesses its unique value

From page 1

Hu stressed the need to relearn, reactivate and retransform ancient great wisdom while making modern interpretations of classics, to refresh classical wisdom and lead human civilization.

"We should focus on the holistic development of individuals to nurture citizens' moral character through classical wisdom. We should focus on the prosperity and progress of the nation to strengthen the foundations of the spirit of modernization through classical wisdom. And we should focus on harmony and shared flourishing in the world, drawing on classical wisdom to address global challenges."

Lina Mendoni, minister of culture of Greece, highlighted the establishment of the Chinese School of Classical Studies at Athens in 2024, following the inaugural World Conference of Classics in Beijing.

She said the most important outcome of this cooperation demonstrates that when different cultures engage in open and sincere dialogue, seeking understanding rather than imposing their own views, "conflict is not inevitable".

"There is an ancient saying: When the winds of change blow, some people build walls, others build windmills.

"In an age of profound change, ... let us choose dialogue over isolation, understanding over prejudice, and cooperation over confrontation. This is the enduring wisdom that the classics offer us, and perhaps the most valuable legacy we can pass on to future generations."

Gao Xiang, president of the Chinese Academy of Social Sciences, said that no civilization evolves in isolation, but grows, develops and thrives through exchanges and mutual learning.

However, there exists a certain notion of "civilizational superiority", as some continue to believe that their civilization is superior to others, regarding their own standards as the only valid standards.

"This is not the right path. It only serves to deepen conflict and division," said Gao, warning that "the world must not be permitted to regress to the law of the jungle, nor should the principle that the strong prey on the weak be allowed to once again define international relations.

"I believe that every civilization possesses its own unique value, deserves respect, and should be treated as an equal."

Drawing from classical wisdom, scholars will hold discussions in four parallel subforums on virtue and paideia, friendship and community, peace and order, and technology and civilization.

Poverty: Sustained political commitment emphasized

From page 1

The social protection architecture has also been strengthened. This includes the minimum livelihood guarantee program, medical insurance subsidies for low-income households, and education assistance for vulnerable families. Together, these mechanisms are designed to mitigate the principal risks of poverty relapse — illness, natural disaster and economic shock — thereby consolidating the gains already achieved rather than treating them as permanent by default.

Broader implications

The broader implications for developing nations are clear. Poverty alleviation, equitable growth and inclusive development must be central to any national development strategy, embedded within a wider framework of structural transformation and sustained economic expansion. Poverty reduction is not a peripheral concern; it is Sustainable Development Goal 1 within the UN's 2030 Agenda — the foundational objective on which much of the broader framework depends.

China's experience shows that when a nation prioritizes this goal with sustained political commitment and institutional implementation over time, the eradication of absolute poverty is achievable. Countries will differ in their circumstances — geography, institutional capacity, historical conditions and the external environment all matter — but the underlying principle holds: Systematic, long-term effort directed at the poorest populations yields measurable and durable results.

It is equally important to note what China's model is not. It is not a transferable blueprint to be applied wholesale. Rather, it demonstrates what is possible when development strategy treats poverty reduction as a central, measurable objective rather than a hoped-for by-product of growth. Each nation must identify the interventions appropriate to its own political economy. What China offers is evidence of ambition and outcomes, not a universal template.

At the international level, China's achievement reframes the global development debate in at least two respects.

First, it challenges the assumption — prevalent in some development economics literature — that eliminating absolute poverty in large, complex economies requires generational time scales. The Chinese case has substantially compressed that timeline, with implications for what the international community should regard as achievable within the SDG framework and beyond.

President Xi Jinping's *The Governance of China*, volumes I to V, offers an authoritative source on China's opening-up and reform, and the nation's development strategies and policies provide primary insight into the strategic thinking and political philosophy behind China's poverty alleviation.

Second, the achievement shifts the center of gravity in development knowledge. For much of the postwar period, the dominant frameworks for poverty reduction originated in Western academic institutions and multilateral organizations. China's experience — increasingly documented by both Chinese and international researchers — provides an empirical basis for approaches rooted in the developmental realities of the Global South. "Four Decades of Poverty Reduction in China (2022)", a joint publication by the World Bank Group and the Development Research Center of China's State Council, the nation's Cabinet, synthesizes the process, data and outcomes with substantial academic rigor.

Finally, ending absolute poverty globally requires more than sound domestic policy. It demands renewed commitment to the 2030 Agenda, a global governance architecture that genuinely incorporates the voices of the Global South, and the conditions of peace and development, without which shared prosperity cannot take root. China's achievement demonstrates what national ambition can accomplish; the international community awaits equivalent resolve and action.

Offshore renewable energy powers nation

By **LI MENGHAN** in Fuzhou
limenghan@chinadaily.com.cn

Rows of solar panels stretch across what were once abandoned tidal flats in Dongshan county, Zhangzhou, Fujian province. Steel pillars driven into the seabed hold the panels above the waterline, allowing aquaculture activities to continue below while clean electricity is being generated above — a visible example of how coastal provinces maximize limited marine space.

The 180,000-kilowatt solar farm, built on more than 200 hectares of mudflats, is the country's first offshore solar project in a high-wind-speed zone, operated by China Three Gorges Corporation. The project exemplifies how offshore wind and coastal solar are reshaping the province's energy landscape.

Dongshan is part of a larger national effort. China has to date approved more than 200 offshore wind projects, pushing cumulative grid-connected capacity past 47 million kW — around half of the global total and the world's top ranking for five consecutive years, according to the Ministry of Natural Resources.

"Fujian has some of China's best conditions for offshore renewable energy — strong, consistent winds averaging more than 9 meters per second, long coastlines with suitable tidal flats, and deep waters just offshore," said Chen Qingsen, deputy general manager of the Fujian Three Gorges Offshore Wind Power International Industrial Park Operations Co.

Chen said solar and wind power are complementary — solar generation peaks during daylight hours while wind often strengthens at night, creating a more stable collective output. He noted that one full rotation of a 16-megawatt offshore wind turbine generates about 34 kilowatt-hours of electricity, enough to power an average Chinese household for more than a week.

"From 2019, when the first domestically produced 6.7-megawatt offshore wind turbine was unveiled here, to 2024, when the world's largest 26-megawatt offshore wind turbine rolled off the production line, we have launched turbines of 8, 10, 13, 16, 18, 20 and 26 megawatts, continuously breaking global records while achieving 100 percent domestic production of key components," Chen said, adding that these turbines are accelerating their entry into overseas markets.

Prior to 2017, China's largest domestic turbine was limited to 5 MW, with critical components reliant on overseas suppliers. The 67-hectare park, established in 2016, broke that pattern as China's first industrial cluster covering the full offshore wind power chain.

Yue Qi, director of the institute for marine resources protection and utilization of the National Ocean Technology Center, emphasized that offshore renewable energy is a strategic priority for China's energy transition.

The outline of the 15th Five-Year Plan (2026-30) sets a target of 100 million kW of offshore wind capacity by 2030.

"The target reflects the central government's commitment to scaling up clean energy while developing the marine sector as a new engine of economic growth," Yue said.

Developing offshore wind along China's eastern seaboard also carries a logistical advantage over transmitting power from the west. "Short transmission distances and proximity to consumption centers mean we can avoid the massive losses and infrastructure costs of long-distance west-to-east power transfer," Yue noted.

As nearshore waters grow increasingly crowded, the industry is pushing farther out. China's site-selection standards have evolved from the early "double-10" principle — at least 10 meters deep and 10 kilometers offshore — to the current "single-30" standard of at least 30 meters deep or 30 km from shore.

In 2023, the Ministry of Natural Resources introduced policies for the three-dimensional, layered use of marine space. Around 4,000 such multiuse projects now operate nationwide, according to Yue.

Looking ahead, China is exploring a new frontier of undersea data centers directly powered by offshore wind to support artificial intelligence and 5G infrastructure.

Qin legacy unveiled

The special archaeological exhibition, *The Qin's Unification in Archaeological Treasures*, holds its opening ceremony at the Shanghai Museum on Tuesday. The exhibition opens to the public free of charge on Wednesday and runs through Sept 7. GAO ERQIANG / CHINA DAILY

Chongqi rail and road bridge hits milestone

Main span installed, Yangtze project to be fully operational by 2027-end

By **ZHENG ZHENG** in Shanghai
zhengzheng@chinadaily.com.cn

The main span of the Chongqi Rail-Road Yangtze River Bridge is installed. GAO ERQIANG / CHINA DAILY

The main span of the Chongqi Rail-Road Yangtze River Bridge was successfully installed on Tuesday, marking a major milestone for what will become the world's largest cable-stayed bridge combining ballastless railway tracks and highway infrastructure.

The 4.09-kilometer bridge spans the northern branch of the Yangtze River estuary and features a 400-meter main span.

Its double-deck design accommodates a six-lane highway with a design speed of 100 kilometers per hour on the upper level, while the lower deck will carry two high-speed railway lines supporting trains traveling at 350 km/h, alongside intercity railway lines designed for operations at 250 km/h.

The bridge is a key component of the Shanghai-Chongqing-Chengdu high-speed railway corridor.

It is both the world's largest rail-highway cable-stayed bridge under construction and China's first rail-highway Yangtze River bridge designed to accommodate 350 km/h high-speed trains.

"This bridge is the key control project of the Qidong-Taicang section in Jiangsu province," said Yin Xueguo, commander of Chongming operations at the Shanghai State Railway Engineering Construction Management Co. "Today's milestone is of great significance to the overall construction schedule."

Construction teams will now focus on installing bridge deck systems, ballastless tracks and auxiliary electrical facilities, with the bridge expected to be fully operational by the end of 2027, Yin said.

Hu Huiyue, chief designer of the bridge at the China Railway Major Bridge Reconnaissance & Design Institute Co, said integrating highway and railway infrastructure within a single structure posed unique engineering challenges.

"The highway and railway share construction space within the bridge area before separating to facilitate rapid traffic distribution and improve the efficiency of the transportation hub," Hu said.

"Our structural innovations include integrating the main and auxiliary spans to save space while optimizing bridge height to achieve a better performance balance for the 350 kilometers per hour ballastless track system," he added.

Since drilling work began in December 2022, construction teams have overcome numerous challenges, including complex waterway conditions, ultra-large-span installation work and stringent precision requirements.

The project pioneered the use of intelligent grouting technology for both pile bottoms and pile sides in domestic railway bridge construction, ensuring secure anchoring of 152 bored piles, each with a diameter of 2.5 meters, across the two main piers.

Construction adopted a single-cantilever method using two 1,100-metric-ton beam-lifting cranes integrated with intelligent monitoring systems. The digital systems continuously tracked steel beam positioning, structural stress and deformation while automatically adjusting lifting operations.

"Our two construction approaches successfully addressed world-class engineering challenges in single-cantilever installation and long-distance launching," said Xiong Kaibing, project manager at the China Railway Major Bridge Engineering Group Co.

"More importantly, through advanced data integration and system coordination, we achieved the high-precision bidirectional convergence that made today's successful closure possible," he said.

Upon completion, the bridge will significantly improve regional connectivity, reducing travel time between Shanghai and Qidong in Jiangsu province from two and a half hours to less than 30 minutes by rail.

The project is expected to strengthen the comprehensive transportation corridor along the Yangtze River Economic Belt and support deeper integration of the Yangtze River Delta region.

China has key role in intl fisheries governance

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

China has been ramping up efforts to promote sustainable marine fisheries governance in recent years, fulfilling its responsibilities in combating illegal fishing and strengthening international cooperation to build a maritime community with a shared future, officials and experts said recently in Shanghai.

This year marks the 10th anniversary of the implementation of the Agreement on Port State Measures, or PSMA. Having come into effect in 2016 and now involving 85 parties, including the European Union, the PSMA is the first binding international framework aimed at preventing, deterring and eliminating illegal, unreported and unregulated fishing.

The agreement's effective implementation contributes to the long-term conservation and sustainable use of living marine resources and marine ecosystems.

China became a party to the agreement in April 2025, a move widely regarded as a significant step in the country's efforts to participate in global marine fisheries governance, fulfill its international obligations and protect marine fishery resources.

A themed event was held at Shanghai Ocean University on Friday to mark International Day for the Fight Against Illegal, Unreported and Unregulated Fishing.

In a video address, Matthew Camilleri, a senior fishery officer in the Fisheries and Aquaculture Division of the Food and Agriculture Organization of the United Nations, reviewed key milestones in the agreement's implementation and called for more parties to join in order to enhance its effectiveness.

Xia Liang, a professor at the university, said global fisheries governance has become increasingly complex over the past decade as a result of the combined effects of resource constraints, environmental pollution and climate change.

"While the international community once focused primarily on catch volumes and increasing production, greater emphasis is now being placed on resource conservation, ecosystem protection and sustainable development," Xia said.

"The fundamental characteristics of global fisheries governance have shifted from an emphasis on exploitation and utilization to a stronger focus on conservation, rule-based management and multilateral cooperation, attracting increasing attention worldwide," he added.

Xia, who also serves as head of China's national contact point for the PSMA, highlighted the country's progress in implementing the agreement over the past year, adding that the achievements demonstrate China's commitment to sustainable fisheries governance.

Those achievements include the establishment of interagency coordination mechanisms, revisions to the Fisheries Law, the designation of 23 ports open to foreign fishing vessels and expanded participation in international cooperation.

"The agreement represents a significant practical achievement of multilateralism in the fisheries sector," said Tang Yi, a professor at the university.

"China's accession to the agreement will facilitate deeper engagement in global fisheries governance, promote the improvement of governance rules, strengthen international law enforcement cooperation and advance the sustainable development of global fisheries," Tang said.

Tang and Xia noted that many of China's experiences and practices could contribute to global fisheries governance, including the application of advanced technologies and artificial intelligence, strict closed-season regulations, voluntary high-seas fishing moratoriums, and nationwide efforts to combat illegal fishing and ensure fishery safety.

According to the Ministry of Agriculture and Rural Affairs, China will further advance the implementation of the agreement, strengthen its port state control system and enhance efforts to combat illegal fishing, while making proactive contributions to the sustainable development of global marine fisheries.

A TWIST IN THE TAIL: SQUIRREL FISH REELS IN GLOBAL FOODIES

Suzhou dish, made famous by Emperor Qianlong, is as much a feast for the eyes as it is for the taste buds

By **DENG ZHANGYU**
dengzhangyu@chinadaily.com.cn

"Is there a real squirrel inside the fish?" That's the first question Chen Ye's foreign friends ask when she introduces them to sweet and sour squirrel fish at the dinner table.

Chen, who works at a foreign bank in Shanghai, laughs every time. But the confusion never stops her from ordering the dish. In fact, it's her go-to trump card when hosting international friends.

"No matter how many dishes we have, squirrel fish is always the first to be finished," she says. "Many people even order a second serving. And what shocks me most? They eat the head and tail down to the bones — something we Chinese usually skip."

As one of the top 10 classic dishes of Jiangsu province and the signature icon of Suzhou-style cuisine, squirrel fish stands as one of the most recognizable presences in Chinese gastronomy.

The magic of squirrel fish is in its appearance the moment it arrives at the table. The head and tail of the delicately fried mandarin fish sit upright on the plate, while in between, its flesh is splayed into fluffy, golden layers that resemble the bushiness of a squirrel's tail. The most spectacular ritual comes when the piping hot sweet-sour sauce is poured over it — the fish sizzles with a crisp, chirping sound, just like an actual squirrel's call.

China Vibes 味出中国 — FOOD —

And the taste? Pure delight: a brittle, golden crust gives way to tender, juicy meat, perfectly balanced between sweet and sour, with layers of texture that linger long after each bite.

Astrid Poghosyan, an Armenian musician working for the Shanghai Symphony Orchestra, also frequently takes her international friends to try the dish.

"When foreigners think about Chinese cuisine, the first thing that comes to their mind is that sweet and sour taste," she said.

"To many foreigners, the taste of squirrel fish kind of represents Chinese cuisine."

Jin Hongnan, president of the Suzhou Culinary Association, has spent over three decades perfecting Suzhou-style cuisine. He's also the founder of Jiangnan Delicacy, a Black Pearl restaurant chain with 30 outlets in Suzhou.

In 2025, he opened a branch in San Francisco.

There, the squirrel fish dish sells for nearly 1,000 yuan ($140) — but more than half of all diners order it.

"Kids love it the most," Jin said.

Beyond the taste, the dish carries a culturally rich story. Legend has it that, during the Qing Dynasty (1644-1911), Emperor Qianlong visited Suzhou incognito and dined at Songhelou restaurant. The chef prepared this special fish, and the emperor was so delighted with his meal that the dish became famous across the country. Today, it's still a must-order at many eateries in Suzhou.

The sauce itself, however, has evolved.

Jin explained that the original recipe used vinegar, soy sauce and sugar. But, in the early 20th century, as Western-style restaurants became popular in Shanghai, ketchup was introduced into the sauce — a fusion that made the flavor more mellow and appealing to foreign palates.

But the real star of the dish is the knife work. First, the fish must be completely deboned. Then the flesh is scored in a crisscross pattern, carefully cut without breaking the skin — allowing it to fan out like a squirrel's bushy tail during frying.
