Both the United States and China are great countries, and their peoples are both great and wise, Trump said, adding that the two countries should deepen mutual understanding and enhance friendship between their peoples.

The Temple of Heaven visit on Thursday continued a tradition in China-US diplomacy in which culturally significant venues are used to convey messages beyond the formal agenda.

Trump's visit to the Temple of Heaven marked the first time in 51 years that a sitting US president had visited the landmark since then-US president Gerald Ford toured it during his visit to China in 1975.

Exchange programs offer youths firsthand experience

By **XU LIN** in Beijing
and **CHEN YE** in Hangzhou

US students experience traditional Chinese rubbing in April during the 3rd Sino-US Youth Connect Season launched by Wenzhou-Kean University. PROVIDED TO CHINA DAILY

University students from the United States are making rubbings from inscriptions on wooden tablets. They carefully apply ink and press paper to create prints, experiencing the intangible cultural heritage firsthand.

Over the years, Wenzhou-Kean University in Wenzhou, Zhejiang province, has offered various exchange programs. Students from the US visit museums, companies, and villages, experience cultural heritage, join handicraft workshops and interact with Chinese peers.

"My exchange experience in China was life-changing. I've come to not only love Chinese culture but also the hospitable people," said Zinnyah Nutornti, who's an undergraduate in an exchange program at Wenzhou-Kean University.

Nutornti from Kean University in the US joined a two-week summer exchange program at Wenzhou-Kean University in 2025 and eager to experience more of life in China, she later applied for a semester-long exchange.

She recently took a weekend trip to Hangzhou in Zhejiang province with her roommate.

"Words can't even begin to describe the immeasurable amount of joy, exploring the mountains and West Lake. I became so overwhelmed with emotion. There were multiple moments when I had to stop in the middle of our trip to think about how much more life has to offer. After returning, I began to consider moving to China to settle down," she said.

She said such opportunities open doors for the younger generation to explore the world and build real connections.

This year marks the 20th anniversary of the official signing of the cooperation agreement between Wenzhou University and Kean University to jointly establish Wenzhou-Kean University.

Back in 2006, President Xi Jinping, then secretary of the Communist Party of China Zhejiang Provincial Committee, witnessed the signing ceremony in the US.

In November 2023, Xi announced an initiative to invite 50,000 young people from the US to China for exchange and study programs over a five-year period.

In early 2024, the university responded to the call with a plan to welcome 1,000 teenagers from the US to China over the next five years, and it has already hosted 501 young people from the US.

Pan Jianzhong, chair of the board of directors of the university, said China-US youth exchanges have shifted from "having exchanges" to "willing to engage", and from "visiting China" to "immersing themselves in China". It proves that when young people challenge stereotypes and reach out to each other, their connection can become the most vibrant and solid foundation for China-US people-to-people friendship.

Taishun county in Wenzhou is known for its well-preserved wooden arch bridges, built with traditional Chinese mortise-and-tenon joints that require no nails or rivets.

In 2024, traditional designs and practices for building Chinese wooden arch bridges were transferred from UNESCO's List of Intangible Cultural Heritage in Need of Urgent Safeguarding to its Representative List of the Intangible Cultural Heritage of Humanity.

In 2021, Wenzhou-Kean University started the Kean Twin Bridge Program to promote the culture of Chinese arch bridges abroad. The university has organized students from the US to visit Wenzhou's covered bridges, produced a bilingual short video about them, and held an artificial intelligence video contest on covered bridges.

"Through this concrete cultural symbol, we aim to give young people from the US a more direct sense of the Chinese culture," Pan said. He added that they encourage joint research on the culture and protection of covered bridges, with resources from both universities in China and the US.

Matthew Wood, lecturer of graphic design at Wenzhou-Kean University, teaches students to create three-dimensional reconstructions of the ancient covered bridges in Wenzhou. "Students can learn practical skills, local history and the importance of preserving cultural heritage at the same time," he said.

"China boasts rich and unique regional cultures. Wenzhou's covered bridges are aesthetically pleasing and integrated into the surrounding mountains and rivers; they still function as social hubs for locals."

US martial arts enthusiast makes the right moves

By **CHEN MEILING** in Beijing
and **LIU KUN** in Wuhan

Jake Pinnick practices tai chi at the Wudang Mountain in Shiyan, Central China's Hubei province, in October.
CAO LINGLING / FOR CHINA DAILY

"Time is silent, yet it never fails those who keep moving forward," Jake Pinnick said on RedNote.

Wearing a loose-sleeved training uniform with a flowing black beard and a topknot tied up with a hairpin, Pinnick, 36, from the United States, told an unusual story of "Becoming Chinese".

At Wudang Mountain in Shiyan, Hubei province, Pinnick was seen guiding a group of students practicing martial arts. The mountain is one of China's most famous and sacred Taoist sites, where Pinnick is known as a famous foreign coach.

He first demonstrated the sword routines once, then let the students follow along. He moved among the crowd, correcting each one's posture one by one.

In his view, Wudang martial arts are never meant to compete against or defeat others, but to achieve balance between inner spirit and outer strength, and integrate hardness with softness.

"They are supposed to develop you into a morally better person through some kind of character building," said Pinnick, whose fans have surpassed 2 million online.

Over the last decade in China, Pinnick has completely adapted to local culture. Now he likes drinking hot tea. He plays a vertical bamboo flute instead of the piano. He refuses waiters' kind offers of a knife and fork. Over the years, even his hair and beard have turned black, which, in his explanation, is that "each land shapes its people". He is proud of his Chinese name Li Zigen, which was given by his master.

Though facing doubts from some netizens, he never regrets his choice.

"I hope that, as a foreigner who has studied and inherited traditional Chinese culture in China, I can promote understanding and exchanges between different cultures. I want to let people from all over the world appreciate the charm of traditional Chinese culture and benefit from it," he said.

And his experience has proven that what began with a teenager's kung fu dream has borne fruitful results in promoting China-US friendship.

A fan of Jackie Chan and Bruce Lee, Pinnick had always wanted to learn "real kung fu from its roots". Fascinated by Yuan Shimao's graceful movements with the Eight Immortals Staff, a classic long weapon routine in Wudang martial arts, on YouTube, he finally made up his mind to come to China and explore the world of martial arts in 2010.

At that time, Yuan, the 15th-generation inheritor of the Wudang Sanfeng School, was recruiting students for a five-year international traditional martial arts program. He spent over a year arranging his university studies and flew to China.

"Back then, I could only speak a few simple Chinese (sentences). I could neither read nor understand the language. Every time the train stopped at a station, I grew extremely nervous and kept asking others: 'Is this Wudang Mountain?'" he said.

Twenty-four students from countries, including the US, Australia, Canada and Germany, were admitted to this class.

"It was so hard to begin with," Pinnick said, adding he had a hard time meeting the demands of the training because of his lack of flexibility and suppleness. "I couldn't straighten my back, and I couldn't do the splits at all."

He woke up at 5:30 am every morning to practice, irrespective of rain or shine, had his body hit with bamboo strips to build resilience, and was punished with palm strikes and horse stance squats for making mistakes.

By repeating every move dozens, or even hundreds of times each day, putting in far more effort than most people, Pinnick gradually realized martial arts are not merely a set of routines, but a philosophy of cultivating both inner character and physical form.

"In the past, I always insisted on winning every argument. Now I am able to control and calm my emotions. My master taught me: Cultivate virtue before practicing martial arts. For example, the tai chi opening form requires moving with both arms as if holding water. Though it looks like simple physical training, it actually teaches humility and tolerance."

Yuan, his teacher, said many students learn kung fu out of temporary curiosity. Over the years, he had seen countless students arrive full of excitement, only to leave dejected and discouraged.

Despite the language barrier and vast cultural differences, Pinnick's burning passion for martial arts as well as his perseverance deeply moved Yuan.

During this period on the mountain, he met his future wife, a Chinese woman. They got married in 2014. They have a daughter.

After completing the program, he went back to the US with his family, only to find himself "suspended between Chinese and American culture", so he decided to go back to Wudang Mountain in 2018 to teach and promote Wudang culture.

With encouragement from his wife, in 2020 Pinnick started posting videos about martial arts, vertical bamboo flute performances, and interpretations of Taoism philosophy, which went viral on social media platforms, attracting a lot of fans.

By now, he has taught some 700 foreign students, with the oldest studying for 8 years. Some visited Wudang Mountain to seek in-person instruction.

In April last year, he secured China's Foreign Permanent Resident ID Card.

Currently, he is busy preparing for a new international summer camp. "I hope my own experience can inspire more people to pursue their dreams. Whether it is a passion for martial arts or a desire to explore different cultures, everyone should try and persist," he said.

WWII legacy honors peace and friendship

Internment camp's painful history also shows resilience in shared humanity

By **YANG RAN** in Beijing
and **ZHAO RUIXUE** in Jinan

While the name Auschwitz echoes through history as a grim symbol of Nazi atrocities during World War II, another camp, half a world away in China's Shandong province, holds a story less known.

In the city of Weifang, once known as Weixian or Weihsien, stands the Courtyard of the Happy Way. Established as a church, school and hospital complex by a US missionary in 1882, Japanese forces converted it into the Weihsien Internment Camp to imprison foreign nationals in China during WWII.

Unlike the well-documented concentration camps of Europe, the camp in China has remained largely obscure, even for the families of those who endured it.

For John Stanley, a history professor at Kutztown University of Pennsylvania, the journey into this forgotten history began in 1991, when he accompanied his father, Charles A. Stanley, on a visit to the Weihsien Internment Camp site.

Charles A. Stanley was interned at Weihsien with his parents in 1943 when he was just 10 months old. He remained there until US soldiers and a Chinese translator liberated the camp in 1945.

But this part of his family's history had been shrouded in silence. "The camp wasn't discussed when I was growing up and, according to my father, it didn't come up much with his mother or father either," John Stanley explained. "I believe that many have left that part of their lives behind and do not wish to engage with it."

Stanley's own journey to uncover this history began in 1991 during a visit to the site to dedicate a memorial to Eric Liddell, the 1924 Olympic 400-meter champion who died of illness in the camp. Liddell was one of at least 31 internees who died during imprisonment due to a severe shortage of supplies and medical care.

"It was that trip that started my interest in studying China and East Asia more generally," said Stanley. "In all of my research, I learned much more about the makeup of the internees and the role of the local Chinese population."

The camp was set up in retaliation for the US internment of Japanese nationals and Japanese Americans following the attack on Pearl Harbor. Over 2,000 civilians from 25 Allied nations were rounded up across China and imprisoned in the largest internment camp in Asia.

The internees include some prominent figures like Arthur W. Hummel Jr, who later became the second US ambassador to China. Hummel managed to escape before the camp's liberation with the aid of local Chinese.

Stanley emphasized that the help from the local Chinese "served to keep up the spirits of the internees as news became harder to find during the later years of the war".

Most notable were their efforts to communicate with the internees and set up a 'Black Market' for foodstuffs they could not get at the camp store, or they were short on, he said.

"Eggs were the most famous, but I believe that at one point, a live chicken was thrown over the camp wall," he added.

Touching story

Zhang Zhiren, a Europe-based writer who spent years researching and writing a book on the camp, said: "The bravery of the local Chinese, who risked their lives to help the foreign internees, is the most touching part of the story."

Zhang's book, *Weihsien West Civilians Concentration Camp: 1943-1945*, documents the cruel treatment of Allied civilians in the camp, their efforts to survive in extreme conditions and the acts of bravery and kindness of local Chinese to help the foreigners.

Zhang highlighted the story of Zhang Xingtai, a local villager who worked as a latrine cleaner in the camp. "The Japanese thought of him as just an ordinary farmer, not a threat, but didn't realize he became a 'bridge of information'," Zhang said. The internees were cut off from news of the outside. "Risking their lives, Zhang Xingtai and his son brought news from the outside in and smuggled information out. The news of Japan's defeat was passed on by them at great risk."

Despite their own hardships, the local people gathered food to send to the starving internees, risking everything to cross the Japanese-controlled barbed wire and electric fences, Zhang said. He shared the tragic story of a local child who was electrocuted on the camp's perimeter fence while trying to deliver food, with the Japanese forbidding the retrieval of the body.

"The people of Weifang didn't care what nationality the internees were," Zhang said. "They only knew that people were suffering and that they had to help. This kindness transcended war and national boundaries."

> "The bravery of the local Chinese, who risked their lives to help the foreign internees, is the most touching part of the story."
>
> **Zhang Zhiren,** writer of *Weihsien West Civilians Concentration Camp: 1943-1945*

Zhang stressed the importance of remembering the history of the Weihsien Internment Camp. "The memories of the camp are so painful that for decades, survivors were almost silent. As time passes, the survivors of the camp are dwindling, and fewer and fewer people know about this history."

His book is an attempt to rescue this shared memory, said Zhang. "Eighty years ago, Chinese people and foreign nationals helped each other through thick and thin. This story is the best footnote to the concept of a community of shared future for humanity."

The history of the Weihsien Internment Camp led the International Cities of Peace, a nonprofit organization promoting the global peace movement, to designate Weifang as the 308th International City of Peace in 2021, making it the second such city in China after Nanjing, the capital of Jiangsu province.

In celebration of Weifang's fifth anniversary as an International City of Peace, J. Frederick Arment, chair of the International Cities of Peace, said Weifang has consistently moved forward in the profound and healing steps of building peace from historical trauma with future hope.

In 2024, as China and the US marked the 45th anniversary of diplomatic relations, the story of the Weihsien Internment Camp made its way to San Francisco in the form of a special exhibition. Stanley also attended the opening ceremony as a representative of the descendants of former camp internees.

"I believe their (Weifang's) efforts to maintain the buildings and their efforts to create a traveling exhibition that went to San Francisco show a commitment to raising awareness about war and its consequences," Stanley said.

Speaking of the relevance of the spirit of peace from the Weihsien Internment Camp history, Stanley expressed hope that this history would encourage diplomacy and the use of international institutions to resolve conflicts rather than resorting to violence or other pressure tactics.

Music underscores shared quest for harmony

Educators, students, players united by bonds of curiosity, common goals

By **CHEN NAN**
chennan@chinadaily.com.cn

Young musicians from different countries perform during a concert conducted by David Robertson at The Tianjin Juilliard School on May 30, 2025. XINHUA

It began with a *dizi*, the traditional Chinese small bamboo flute with a tone both piercing and plaintive, capable of sliding effortlessly between virtuosic runs and tender fragile whispers.

Born and raised in San Antonio, Texas, 37-year-old composer Niccolo Athens, a faculty member at The Tianjin Juilliard School, vividly recalls the first time he heard *dizi* music played at the Central Conservatory of Music in Beijing. It felt like discovering a new musical universe, he said.

"It was fluent, sophisticated, and completely unfamiliar to me," Athens said of hearing a piece for three *dizi* composed by Guo Wenjing. "It combined modern compositional techniques with a deep understanding of the instruments."

A graduate of Cornell University in New York, Athens was awarded a Fulbright grant, and spent an academic year in residence at the Central Conservatory of Music in Beijing in 2014, beginning a China journey that would also include Shanghai and Tianjin.

In 2019, he was appointed to the inaugural faculty of The Tianjin Juilliard School.

As the first overseas branch of the renowned New York Juilliard School, the Tianjin campus broke ground in 2017 and offers a US-accredited master's degree from the prestigious school. The Tianjin school's graduate program opened in the fall of 2020 with the first intake of students.

Instrumental changes

Two of Athens' new works are going to be premiered at the Tianjin school. He recently composed *Five Classical Lyrics*, based on classical poetry from the Tang (618-907) and Song (960-1279) dynasties chosen by his students, and featuring music drawing inspiration from lesser-known Sichuan folk songs preserved in provincial songbooks from the 1980s.

He believes music carries a unique capacity to foster connection. "There's really nothing that bridges these two countries right now in the same way music can," he said.

He still vividly recalls his time at the Central Conservatory of Music in Beijing. Athens said he encountered intense dedication to performance and an unexpected embrace of contemporary composition, which inspired him to compose his own works. Unlike Western music conservatories, where classical repertoires often dominate, Chinese musicians actively sought new works from living composers, creating a vibrant culture of collaboration and innovation.

"The people I met are what really sticks with me," Athens said. Friendships formed in classrooms, concerts, and workshops became as formative as any formal instruction.

Above left: Niccolo Athens, a faculty member at The Tianjin Juilliard School, conducts during Festival Connect, Tianjin Juilliard's flagship performance festival, in Tianjin on Jan 16. PROVIDED TO CHINA DAILY

> "There's really nothing that bridges these two countries right now in the same way music can."
>
> **Niccolo Athens,** a US composer and faculty member at The Tianjin Juilliard School

Learning to compose music for Chinese instruments proved a gradual process. His early attempts involved the *pipa* (a traditional lute) and *sheng* (a free-reed wind instrument), which he mostly learned about from video tutorials and guidance from friends abroad.

"I had to adapt my writing to the character of the instruments," he said. "It wasn't about capability — they (musicians) could play all the notes — but about understanding the way the instrument wants to speak."

He said the first piece he wrote that he felt truly reflected both his voice and the instrument's spirit was for the *guqin* (traditional Chinese zither) and string quartet, a milestone in his creative journey.

Language, too, was a path of careful immersion. Athens began studying Chinese while at the Juilliard in New York, where he received his Bachelor of Music in composition in 2010, motivated by a desire to engage fully with the culture.

"Some people ask me how I feel in China now, and I just tell them it feels like home," he said.

Beyond language

For the students at Tianjin Juilliard, the bridging of cultures is not theoretical — it is a daily practice.

When the 23-year-old Manou Magdalena Chakravorty arrived in Tianjin from Chicago last August to study cello, she expected the city to feel foreign and overwhelming.

During her undergraduate study, her professor was He Sihao, a former faculty member at the Robert McDuffie Center for Strings at Mercer University. But instead of being overwhelmed, she found herself captivated by Tianjin.

"The campus was incredibly beautiful. Sometimes I just walk along the river and take it all in — it's very calming," said Chakravorty, who grew up in a multicultural family that embraced the cultures of both Europe and Asia.

Chakravorty, who started playing cello at the age of 4, has embraced Chinese music as part of her studies.

Performing pieces with flowing melodies and microtones that differ from Western compositions, she has learned the subtle art of Chinese music.

"Music here allows you to communicate across language barriers. Even when words fail, playing together creates understanding," she said.

"Before I came to China to study at the Tianjin Juilliard, I planned to go back home after graduation. But now, I am thinking about working here," she added.

Apollo Rayme Parish Mitchell, 23, born and raised in San Francisco, shares the same sentiment.

Drawn to Tianjin's historic streets and lively rhythm, Mitchell has immersed himself in both Chinese culture and rigorous musical study. He has attended concerts, explored historic sites in Shanghai and Xi'an, Shaanxi province, and engaged deeply with Chinese musical traditions.

In 2024 and 2025, he also toured with the Tianjin Juilliard Orchestra, with concerts performed in Beijing, Guangzhou of Guangdong province, and Hong Kong.

"Even when language was limited in rehearsals, we communicated through music. It's immediate, visceral, and universal," said Mitchell, who studied with the oboist Mingjia Liu at the school in Tianjin.

"Living here has taught me that music can communicate even when words fall short. That's the real power of what we do," Mitchell said.

Shanghai Quartet basks in memories, plaudits during return tour

By **CHEN NAN**

From April 9 to 19, the Shanghai Quartet embarked on a highly anticipated tour across the United States, performing in Washington DC, Boston, Maine, Florida, and concluding at the Chamber Music Society of Lincoln Center in New York.

Their program was a delicate interplay of Eastern and Western musical traditions, featuring composer Tan Dun's evocative *Feng Ya Song*, Franz Joseph Haydn's *String Quartet in G minor, Op. 74, No. 3,* or *"Rider"*, George Gershwin's *Lullaby*, and Antonin Dvorak's *American Quartet*.

But beyond the music itself, this tour became a poignant reflection on time, mentorship, and the enduring power of cultural exchange.

Formed at the Shanghai Conservatory of Music in 1983 by first violinist Weigang Li and his brother, viola player Honggang Li, the Shanghai Quartet has toured worldwide and joined The Tianjin Juilliard School in the fall of 2021.

The quartet now consists of cellist He Sihao, violinist Yu Xiang and the two founding members.

For second violinist Yu, Boston, the capital of Massachusetts, has always held a special place in his heart. Yu first experienced the Shanghai Quartet as a student at the New England Conservatory, sitting in the audience during a performance of Johannes Brahms' *Piano Quintet* with pianist Hung-Kuan Chen.

It was only his second live encounter with the quartet, the first having been in Shanghai. Years later, Yu returned — not as a student, but as a performer, stepping onto the same Jordan Hall stage at the conservatory as a member of the ensemble he once admired.

The Shanghai Quartet's program elegantly reflected a dialogue between cultures. Tan's *Feng Ya Song* brought contemporary Chinese textures to United States audiences, merging traditional tonalities with modern compositional techniques.

Haydn's *String Quartet in G minor Op. 74, No. 3* and Gershwin's *Lullaby* offered Western classical and US sensibilities.

Czech composer Dvorak's work served as a mirror of cultural exchange. The *American Quartet* was composed in 1893 when Dvorak was in the US, serving as director of the National Conservatory of Music of America in New York. He was inspired by the music he encountered there, but he composed it through a European classical lens, with the piece a blend of cultural influences.

Joseph Polisi, president emeritus of the Juilliard School, who now serves as its chief China officer, attended the performance, underscoring the deep bonds connecting Chinese and US musical institutions.

Reviewed by Lee Eiseman in The Boston Musical Intelligencer, "angelic" Yu was praised for his inner voice, He and Weigang for matching tones "marvelously", while the young cellist "brought an extravagantly romantic sensibility to the bottom line with the ever-elegant Honggang".

New York, however, carried the weight of history for Weigang who reflected on his journey back to the city. The quartet's New York debut in 1987 launched their international careers.

Weigang said the quartet arrived in the US in August 1985 to continue their music studies. From September 1985 to May 1987, they were enrolled at Northern Illinois University. During that time, the school offered them a remarkable opportunity: their very first performance in New York. The concert took place on March 2, 1987.

"We prepared diligently for that performance. I remember our program included Mozart's *String Quartet No. 19 in C major, K. 465* and *String Quartet No. 3* by Bela Bartok, followed in the second half by Brahms' *String Quartet No. 1, Op. 51, No. 1,*" Weigang recalled.

"Looking back, that concert probably captured the Shanghai Quartet at its finest, just four years after our founding. Oddly enough, when we finished playing, we didn't feel anything extraordinary," he said.

He also fondly remembers that after the concert, a woman in her 50s came backstage, introduced herself as Patricia Winter, and asked a simple question: "Are you looking for a manager?"

"We had never met her before, but her timing was perfect. Naturally, we were very interested, and that marked the beginning of our connection with her, which would become a pivotal part of our career," said Weigang.

In 2020, the Shanghai Quartet members returned to China and began teaching at The Tianjin Juilliard School.

"After living and working in the US for almost 40 years, this is our first performance in New York since returning to develop our careers in China. At the same time, this is also the Shanghai Quartet's first New York appearance with the new lineup featuring Yu Xiang and He Sihao, which makes it especially significant," he said.

Left: Members of the Shanghai Quartet pose for a photo after their performance in Boston, Massachusetts, with Cathy Chan (center), presenter of the concert, on April 10. **Right:** The Shanghai Quartet performs during the concert. PHOTOS PROVIDED TO CHINA DAILY

SINO-US SUMMIT

Zhao Minghao

New vision for stable, constructive ties

The summit between the leaders of the world's two largest economies on Thursday is widely expected to inject stability into the turbulent world, as both sides agreed to build a constructive relationship of strategic stability.

The new vision is designed to provide strategic guidance for bilateral relations over the next three years and beyond.

The "constructive strategic stability" is interpreted to be a positive stability with cooperation as the mainstay, a sound stability with moderate competition, a constant stability with manageable differences, and an enduring stability with promises of peace.

No wonder the meeting between President Xi Jinping and his US counterpart Donald Trump will open a new chapter in Sino-US ties.

The goal to make 2026 a historic and landmark year for US-China relations is crucial, as historically, landmark years have typically included events like former US president Richard Nixon's visit to China in 1972 and the establishment of Sino-US diplomatic ties in 1979.

The questions about whether the two countries can overcome the Thucydides Trap and create a new paradigm of major-country relations need both countries to answer.

Since the beginning of the US leader's second term in office, China-US relations have transitioned from intense tensions — after Washington launched a tariff war — to gradual stabilization.

Both sides need to grasp the precious opportunity presented by the summit to preserve this hard-won stability.

US policymakers have come to realize that China is not as vulnerable as they had once assumed, and that even extreme pressure would not force Beijing to yield.

Despite the repercussions of the tariff war, China remains firmly established as the world's second-largest economy, with its domestic growth and exports showing remarkable resilience.

In 2025, China reported a trade surplus of nearly $1.2 trillion, a 20 percent increase year-on-year. In the first quarter of 2026, China's GDP grew by 5.0 percent year-on-year, calculated at constant prices.

Recent developments prove that Beijing's tactics of "fighting for talks" and "struggling for stability" in its dealings with Washington have been effective.

Some senior US officials have abandoned their previous arrogance and recognized that China is a strong player; making exorbitant demands and bluffing won't work.

In areas such as rare earths, China has continued to strengthen its national economic security system and advance legislation on counter-sanctions and anti-long-arm jurisdiction, thereby enhancing its tool kit for responding to US pressure.

According to an analysis by Bloomberg Economics, approximately 4 percent of US GDP, or about $1.2 trillion, is generated in industries that use rare earths, and most of these industries lack effective alternatives to Chinese suppliers.

The Economist has pointed out that more than a year after the US administration initiated the tariff war, countries around the world are seeking new markets and forging new trade deals, gradually shifting the center of gravity in global trade away from the US.

In contrast, China has remained committed to an open world economy and worked to promote universally beneficial and inclusive globalization.

Starting May 1, China removed tariffs on 53 African countries with which it has diplomatic relations, becoming the first major economy to grant unilateral zero-tariff treatment to Africa.

This move reflects Beijing's willingness to pursue shared development with Global South countries.

China has remained the largest trading partner of the Association of Southeast Asian Nations since 2009, with bilateral trade exceeding 7.55 trillion yuan ($1.11 trillion) in 2025.

Notably, a trilateral cooperation mechanism among ASEAN, China and the Gulf Cooperation Council has been established, leveraging the strengths of all parties to create synergy for win-win development.

Clearly, in a contest defined by openness and certainty, China has gained the upper hand.

Over the past few years, China has notably strengthened its ability to steer Sino-US relations, consistently adhering to the approach of "if forced to fight, China will fight to the end, and for talks, the door is open".

The White House's new National Security Strategy describes China as a "near-peer" and proposes building a "genuinely mutually advantageous economic relationship with Beijing".

Importantly, US public opinion on China is also showing positive signs.

A Pew Research Center poll released in mid-April found that around 27 percent of people in the US hold a favorable view of China, a 6 percentage-point increase from 2025 and double the lowest point recorded in 2023.

Many US residents are skeptical about the effectiveness of confrontational policies such as tariffs and express concern about blowback on the US economy.

Additionally, survey data from Chatham House, an independent London-based policy institute, show that more than half of respondents support their government purchasing China's clean technology products.

Within the US strategic community, there is a growing chorus supporting a pragmatic and flexible approach to Sino-US relations.

Lyle Goldstein, director of the Asia Program at Defense Priorities, a think tank, has argued that the current international context presents an opportunity to stabilize Sino-US ties.

He has even suggested the need for a new political document to establish a model of peaceful coexistence between the two countries — a "fourth joint communiqué".

Deep-seated differences between Beijing and Washington undeniably persist in areas such as the economy, trade, military affairs, and technology.

The Taiwan question — at the core of China's core interests — is the most important issue in Sino-US relations.

If it is handled properly, the bilateral relationship will enjoy overall stability.

Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy, Xi said, urging the US side to exercise extra caution in handling the Taiwan question.

In this context, the Xi-Trump summit not only provides an important opportunity for both sides to explore more constructive ways of engagement, fostering conditions for increased face-to-face communication between the two heads of state, but may also prove to be historic if the new vision of Sino-US ties can be heeded and acted on.

This is important for the two countries, the world and humanity.

Educational bridges vital for two largest economies

MA XUEJING / CHINA DAILY

Global Lens

Since joining the faculty at Georgetown University in Washington in 2016, I have been deeply involved in academic exchanges between the United States and China at the university level. Georgetown's connection with China dates back to 1885 when the then US president Grover Cleveland appointed Georgetown alumnus Charles Denby as the US minister to China.

Denby once remarked, "There is no country in the world more underrated than China."

Over the years, Georgetown has proudly welcomed thousands of Chinese students, including Wang Yi, the current director of the Office of the Central Commission for Foreign Affairs, and Minister of Foreign Affairs, who spent time as a visiting scholar at the Walsh School of Foreign Service.

As the oldest Catholic and Jesuit university in the US, Georgetown draws inspiration from the legacy of the great Jesuit priest Matteo Ricci. Ricci mastered the Chinese language and became the first European to enter the Forbidden City of Beijing in 1601.

He was invited by the Wanli Emperor, who sought his services in matters such as court astronomy and calendrical science.

One of my favorite ways to introduce Chinese and US students to each other is by asking them how their lives are different from their grandparents'.

Chinese students often recount the vast changes their parents experienced during the reform and opening-up period.

They describe a transition from a more traditional, resource-constrained lifestyle to the modern conveniences of today. Many families had no running water and the only machines they typically had were bicycles and sewing machines.

US students remember that their grandparents had only black-and-white televisions with three channels — ABC, NBC and CBS. Many grandparents had vivid memories of the Vietnam War, with some being veterans of that conflict.

Through these reflections, students can gain a deeper understanding of how different their family heritages are and why they have different perspectives on various issues.

I also ask students what they share in common today.

Not surprisingly, since most of them never let their phones out of their hands, both Chinese and US students emphasize the centrality of social media in their lives.

Living in cyberspace, this generation is not just aware of the trends in their own country, but also of global youth culture.

Indeed, my students, while still citizens of their home countries, are also distinctly a generation of global citizens. They are eager to make a better world and are impatient with the failures of past generations to deal with problems such as climate change and food insecurity in the Global South.

From personal experience, I know that interactions between Chinese and US students can be life-altering.

In 1975, US students could not study in China, so I did the second-best thing.

I applied for the Yale-in-China Program at the Chinese University of Hong Kong. From the rooftop of my dorm in the New Territories in Hong Kong, I could see the Chinese mainland, which I vowed to visit someday.

As a member of the university swimming team, I bonded with a teammate from Guangzhou, the capital of Guangdong province.

We would spend hours comparing our family histories and hoping that the opening that Chairman Mao Zedong and the then US president Richard Nixon had initiated would flourish.

I never imagined that a few years later, on a cold January morning in 1979, I would stand on the White House lawn as a student representative to witness the ceremonial welcome accorded to the late Chinese leader Deng Xiaoping by the then US president Jimmy Carter.

Today, I regret that fewer Chinese and US students have the same opportunities to expand their mindsets. The number of US students studying in China and the number of Chinese students studying in the US are both declining.

Although we can initiate virtual dialogues to keep the interaction going, they are not substitutes for the kind of experience that comes only with immersive programs of language and cultural study.

Hopefully the US and Chinese leaders can open the doors wider for academic exchanges to flourish once again, enabling the shared benefit of all humanity.

Rattan Lal

China and US can partner on soil health for global prosperity

China and the United States may differ in geography, demography and political systems, but in agriculture they share a remarkable distinction: both are global breadbaskets whose success has an impact far beyond their borders.

China, with a population of over 1.4 billion and 129 million hectares of arable land, produced about 724 million tons of food-grain in 2025. The US, with around 350 million people and roughly 150 million hectares of arable land, produced around 546 million tons in 2025. Together, they demonstrate that feeding the world is not merely an economic activity, but also a civilizational achievement through science -based agriculture.

However, the challenge of the 21st century is not simply to produce more food but to do so while restoring the soil health that sustains it.

Agriculture in both countries needs to be transformed from being part of the environmental problem into becoming part of the solution.

This evolution is key to achieving the United Nations' Sustainable Development Goals under Agenda 2030. Key agriculture-related SDGs include ending poverty, eliminating hunger, ensuring good health, combating climate change, protecting life on land, strengthening institutions for peace and justice and fostering global partnerships.

Particularly important is the concept of "One Health", which recognizes that the health of soil, plants, animals, people, ecoregions and the planet is interconnected and inseparable.

For this reason, China and the US must cooperate to strengthen agroecosystems and address global challenges. There are a range of strategies that are of common interest for China and the US.

A promising approach is eco-intensification, which applies ecological principles to agriculture instead of relying on the heavy use of fertilizers and pesticides. The concept focuses on "producing more from less" by enhancing the efficiency of inputs and reducing leakage into the environment.

Global Lens

For this reason, China and the US must cooperate to strengthen agroecosystems and address global challenges.

Fertilizers and pesticides are not enemies of agriculture, but they should be used as supplements or medicine. Their indiscriminate use makes them poisonous. The difference between poison and medicine is the dose, formulation, timing and method of application.

The world must also get over the outdated obsession with high yields. Adopting nutrition-sensitive agriculture is more important than harvesting record yields.

Dietary diversity and complex farming and cropping systems can alleviate malnutrition and hidden hunger problems not only in China and the US but also around the world.

In addition, greater attention should be given to so-called "forgotten" or "orphan" crops that were largely marginalized by the Green Revolution of the 1960s which focused on rice, wheat and corn.

The emphasis should be on growing diverse crops of native origin such as sorghum, millet, cowpeas, beans, pulses and root crops. They require less water, tolerate climatic stress and enrich soils naturally through biological processes.

Equally important is the re-carbonization of soils and terrestrial agroecosystems by capturing atmospheric carbon dioxide and storing it in soil, trees and other landscape units.

The organic matter content in soils should be 2 to 3 percent in the root zone.

However, most soils of the agroecosystems in China and the US have lost their soil organic matter stock due to excessive plowing, accelerated soil erosion and extractive farming practices. Re-carbonization of the soil is a win-win strategy because it mitigates climate change, restores soil and environmental health and boosts biodiversity above and below the ground.

Soils can also be viewed metaphorically as a "bank", with carbon as its currency. This requires continuous deposition of carbonaceous biomass — such as compost, manure and crop residue mulch — at rates exceeding losses from decomposition, respiration, soil erosion and leaching.

To increase carbon stocks in this "soil bank", the deposits must consistently exceed the withdrawals.

From a policy perspective, it is also important to move beyond traditional subsidies and instead pay land managers for providing key ecosystem services through the adoption of best management practices.

Until the carbon market develops for trading carbon credits, it is important to pay farmers for carbon sequestration in soil and trees. The rate of payments must be equivalent to the social value of soil carbon which may be equal to $50 per credit, or the equivalent of one metric ton of carbon dioxide computed by converting methane and nitrous oxide into carbon dioxide.

At the institutional level, a stronger soil protection policy is needed to safeguard the finite and irreplaceable soil resources. Some agricultural land in China and the US is being converted to urban and industrial uses. Prime agricultural land must be mapped and designated as protected against urbanization and other uses. Prime soil must be saved for future generations.

Education reform is also essential. The curricula in schools should include soil and environmental health education at all levels.

It is important to attract the best and the brightest to study agriculture, soil sciences and environmental conservation at an early age. Even children's alphabet books must be soil and environment-oriented.

Beyond production systems, saving land and water for nature should become a guiding principle, supported by dietary choices that promote planetary health, reductions in food waste, and the return of agriculturally marginal lands to natural ecosystems. The objective is to live in harmony with nature rather than dominate and exploit it.

Ultimately, the restoration of soil health is critical for sustaining terrestrial life. Access to adequate, healthy and nutritious food is essential for human well-being. An empty stomach leads to violence, civil strife, political unrest and war.

War and hunger are both human-made tragedies that must be tackled urgently. While war destroys soil and its life-support system, peace restores soil health.

In that sense, science-based and nutrition-sensitive agriculture is the foundation of long-lasting peace and tranquility in the world. Let us therefore promote the food-energy-water-soil nexus for human well-being and living in harmony with nature.

The author is the laureate of the 2020 World Food Prize and 2024 Gulbenkian Prize for Humanity and is a Distinguished University Professor of soil sciences at Ohio State University.

SINO-US SUMMIT

JIN ZHEN

Substantial ballast

The stock of China-US cooperation accumulated over many years remains substantial, deeply rooted and resilient

WANG XIAOYING / CHINA DAILY

In discussing today's relations between China and the United States, an important reality should not be overlooked: The stock of bilateral cooperation accumulated over many years remains substantial, deeply rooted and resilient. This is reflected in economic and trade exchanges, subnational engagement, corporate presence and global governance collaboration. These long-standing economic ties serve as a key pillar of the bilateral relationship. The weight of China-US economic ties is evident in their sheer scale and deep integration. The economic relationship is mutually beneficial and win-win in nature, just as President Xi Jinping pointed out when holding talks with US President Donald Trump in Beijing on Thursday.

According to China's General Administration of Customs, the country's total imports and exports with the US reached 4.01 trillion yuan ($590.5 billion) in 2025, accounting for 8.8 percent of its total foreign trade value. Based on US statistics, in the first 10 months of 2025, the US' total imports and exports with China stood at $373.64 billion, representing 7.8 percent of the US' total foreign trade value. China counts as the US' third-largest partner for both exports and imports, while the US is China's top goods export market and its third-largest import source.

Early 2026 has evidenced some changes in China's trade structure. China's General Administration of Customs data released in May showed that in the January-April period, China-US trade totaled 1.25 trillion yuan, a 12.9 percent drop year-on-year, while China's trade with the Association of Southeast Asian Nations, the European Union and members of the Regional Comprehensive Economic Partnership grew over that period. This suggests that China is diversifying its trade ties and building a more balanced mix of partners, which will boost its resilience to external shocks.

But China's diversifying market footprint does not mean its cooperation with the US is becoming less important. Beijing has consistently called for stable and mutually beneficial economic exchanges. Even under maximum external pressure and high tariff rates, two-way trade held above the trillion-yuan mark — a sign of the deep complementarity between the two economies. Their economic ties — spanning consumer markets, manufacturing systems, supply chains and the industrial division of labor — are not easily replaceable in the short term.

Over the longer term, China-US economic and trade relations have transcended simple commodity transactions. US companies remain deeply embedded in China's market, while key segments of Chinese supply chains have forged long-term synergies with the US market. This decades-old cooperation network has become an integral part of the economic fabric of both countries.

Despite periodic fluctuations in China-US relations, local exchanges and business cooperation have remained resilient, acting as a stabilizing force in the relationship. As of August 2025, China and the US had established 288 pairs of sister provinces/states and sister cities, covering large populations and economically vibrant regions in both countries. In April this year, Shenzhen's Nanshan district and Tacoma, Washington, held their first in-person exchange event since establishing a friendly city partnership. Participants in the Ping-Pong Diplomacy 55 years ago took up their bats once again. Chinese Ambassador to the US Xie Feng said on social media platform that 55 years later, the friendship continues to thrive, and grow across generations.

The corporate side tells a similar story. According to the US-China Business Council's 2025 Member Survey, almost all the surveyed companies recognize that they cannot remain globally competitive without their China operations.

In April this year, the US-China Business Council led its largest and most broadly representative delegation to visit Guangzhou and Shenzhen, with dozens of companies making up the delegation.

Meanwhile, the 2026 Special Report on the State of Business in South China, released by the American Chamber of Commerce in South China, also revealed that 95 percent of participating companies report a commitment to maintaining their operations in China.

Beneath the surface, this reflects the logic of market dynamics and the pragmatic choices of enterprises. China's vast market, complete industrial system, mature supply chains and continuous opening-up have long held strong appeal for multinationals. The brand influence, local partnership networks and industrial footprint many US companies have built here are pivotal cooperative assets in bilateral relations.

The existing stock of bilateral cooperation also manifests in the two sides' governance capacity, industrial strengths and technological edge. As the world's two largest economies, the two nations have major influence over global issues spanning climate change, artificial intelligence, public health and financial stability. Few of these challenges can be addressed by either side alone. Maintaining sound bilateral coordination will add greater certainty to the global landscape.

The energy sector best exemplifies this dynamic. Though the US is now refocusing on fossil fuels, energy independence and a revival of traditional manufacturing, it retains clear strengths in energy technology, green finance, grid modernization and energy storage. AI advances are also driving up US power demand.

China, for its part, is in a critical energy transition phase during the 15th Five-Year Plan (2026-30) period. It has formed a complete industry chain and secured economies of scale across photovoltaics, power batteries, electric vehicles and the wider green supply chain. Should both sides maintain long-term cooperation in specific areas such as energy storage, power grids, energy efficiency and green investment, their respective strengths can fuel the global green transition.

The same holds true in the AI domain. Both China and the US stand as key players in global tech innovation, boasting strong research capabilities, enormous markets and abundant application scenarios. Challenges brought by this technology — including energy consumption, data security, technology misuse and standards alignment — have gone beyond any single country's capacity to address. Maintaining necessary communication amid competition and exploring cooperation on technological security, risk prevention and regulatory coordination serve both sides' interests and help mitigate risks in global tech governance.

Global governance is evolving into a far more complex era. The more complicated global challenges become, the more major powers should step up to shoulder responsibilities; the further technological influences extend, the more imperative it is for leading innovators to enhance coordination.

China and the US each boast comparative advantages. By leveraging their respective endowments to scale up cooperation, the two can deliver tangible global public goods and unlock new space for bilateral collaboration.

Shared safety responsibility

Sino-US cooperation is crucial for developing the practical guardrails that are imperative in a world in which AI races and risks are increasingly intertwined

As the development of artificial intelligence reshapes industries, intensifies corporate competition and creates shared risks, building guardrails and setting credible rules and public-safety foundations for technological development are global responsibilities shared by China and the United States.

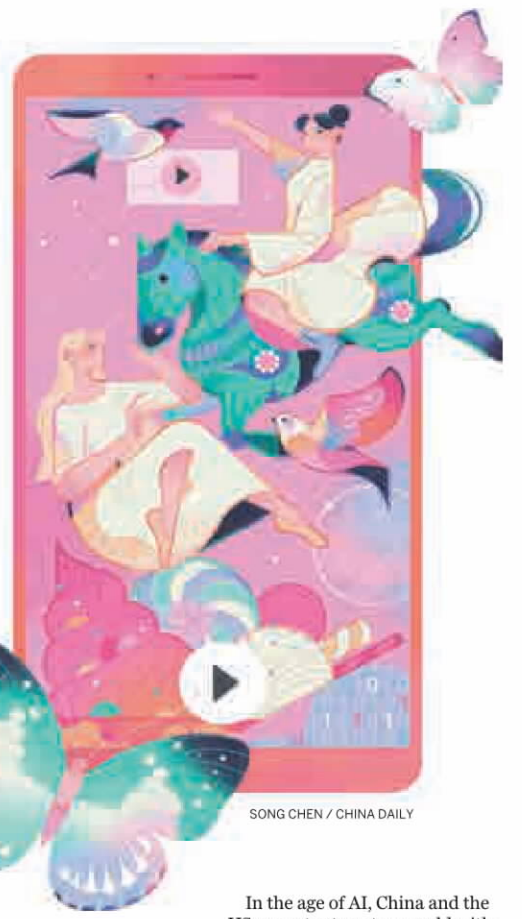
In today's AI landscape, the US still holds a comparative advantage in multiple fields. That advantage is reflected not only in the continued release of frontier models by companies such as OpenAI, Google, Anthropic and Meta, but also in advanced GPUs, cloud platforms, foundational software, model-evaluation systems, standards bodies, alliance networks and the ability to export a global technology stack. Stanford University's 2026 AI Index Report shows that in 2025, US institutions produced 59 notable AI models, compared with 35 from China. The US remains the leading force in frontier model innovation, computing ecosystems and platform capacity, and it is increasingly converting these technological edges into rule-shaping power.

China, however, boasts its own advantages instead of playing catch-up. China possesses a vast domestic market, rich industrial applications, a complete manufacturing base, strong engineering and deployment capacity, a fast-growing open-source ecosystem and significant room for digital cooperation with other Global South countries. The Stanford report shows that China ranks first worldwide in AI paper output, citations and granted patents, reflecting deep research accumulation and a sustained innovation base. In recent years, China has advanced its "AI Plus" initiative, accelerating AI adoption in manufacturing, healthcare, education, transportation and urban governance, while expanding access through open-source models and low-cost deployment. China's strength does not lie in a single frontier breakthrough; it lies in application, implementation, cost efficiency and the ability to translate technology into industrial capacity.

This is why China-US AI relations cannot be reduced to a simple choice between cooperation and confrontation. The US is unlikely to loosen its grip on key technology chains, frontier model ecosystems or international rule-setting power. China, for its part, will not accept being folded passively into risk-assessment, technology-review or compliance frameworks defined unilaterally by the US. Acknowledging competition is not a rejection of cooperation. It is the necessary starting point for any serious cooperative governance effort.

AI needs governance guardrails because its pervasive reach magnifies the costs of competition. Even when traditional technologies have strategic significance, their impact often remains concentrated in specific sectors or dimensions of national power. Once AI is widely deployed, however, it will be embedded in products, services, manufacturing processes, infrastructure and daily life. In this context, without a basic framework of trust between China and the US, trade in AI-enabled products, technological cooperation and industrial ties could all be consumed by security concerns, while the lack of trust would directly impede industrial cooperation and the functioning of global markets.

AI also creates threats that neither country can manage alone. In a recent column, Thomas Friedman argued that the new common threat facing the US and China is not another state, but the risk created by "the malign uses of artificial intelligence". Agentic AI, automated hacking tools and deepfake systems could give "small, malign actors" destructive capabilities once available only to states. They could launch cyberattacks, spread false information, manipulate public perception and disrupt critical infrastructure at far lower cost. Autonomous weapons, unmanned systems and automated military decision-making could also heighten the risk of miscalculation, loss of control and crisis escalation. These dangers do not respect geopolitical blocs. Both countries are potential targets.



Compounding these risks is a serious governance lag. Model capabilities, agentic behavior, autonomous decision-making, content generation and algorithmic integration are advancing faster than rules can be written. Many risks will not be visible at the moment of invention; they will emerge only through deployment at scale and cross-border diffusion. That is the deeper paradox of China-US AI competition: the harder each side tries to secure itself through technological advantage, the more insecurity both may create if there is a lack of shared guardrails.

Guardrails mean creating mechanisms — risk alerts, incident reporting, interoperable technical standards, crisis communication and boundaries around high-risk uses — to prevent AI competition from sliding into miscalculation, loss of control or systemic risk. Such guardrails should rest on three principles: reciprocity, boundaries and openness.

First, cooperation should be reciprocal. Washington and Beijing can exchange views on risk classification, safety-incident reporting, model-evaluation methods, red-teaming, deepfake detection and content provenance. These are areas with clear public-safety implications and some room for technical consensus. AI governance cannot become a process in which one side writes the standards and the other submits to inspection. China can support interoperable evaluation formats, shared risk terminology and exchanges on testing methods. It cannot accept one country's unilateral testing results as the equivalent of international compliance standards, nor should safety evaluation become a pretext for intrusive audits of model weights, training data or core engineering parameters.

Second, cooperation should also have boundaries. The purpose of guardrails is to prevent risks from spiraling out of control, not to create new technology barriers. The two countries can discuss high-risk issues such as cyberattacks, AI-enabled fraud, loss of control in autonomous systems, critical-infrastructure protection and AI-related red lines in nuclear command. They can also explore mechanisms for incident reporting, crisis communication and early warning. But AI security should not become an all-purpose justification for securitizing civilian AI, open-source models, cloud services, scientific exchange or talent mobility. If governance is over-securitized, the space for cooperation will shrink and global AI development will become artificially fragmented.

Third, governance can remain open. Global AI governance cannot become a closed club of a few technological powers. The United Nations, the International Telecommunication Union, the International Organization for Standardization, BRICS, the Shanghai Cooperation Organization and some Global South platforms all have roles to play. Countries in the Global South should not be mere rule-takers; they should be participants in, and beneficiaries of, AI governance. The US, China and other major AI-capable actors should work together to help developing countries close the gaps in computing power, data, talent and infrastructure. Through open-source tools, low-cost deployment, training programs, compliance templates and applications that serve basic development needs, they can help ensure that AI truly serves development and creates replicable public goods in areas such as agriculture, healthcare, education, disaster warning and edge AI.

SONG CHEN / CHINA DAILY

In the age of AI, China and the US cannot return to a world without competition, nor can they accept competition without guardrails. Both countries can build a consensus on the basis of reciprocity, prevent risks from spiraling out of control within clear boundaries, and expand cooperation through open governance, thereby providing a more stable and secure foundation for global AI development.

TOURISM BOOMS IN SHANXI DURING MAY DAY HOLIDAY

By YUAN SHENGGAO

During the May Day holiday, spanning from May 1 to 5, the North China province of Shanxi again welcomed a great number of tourists.

Tourists to Shanxi were offered impressive experiences thanks to local practices that integrate natural wonders with cultural and historical assets, as well as enriched offerings such as camping, cycling, boating and other sports and cultural activities.

Nanzhai Park in the provincial capital of Taiyuan, for instance, has a dedicated camping site for tourists from both Shanxi and the rest of the country.

Wang Youpeng, a resident in Taiyuan, arrived at the campsite before 9 am on May 2. With the help of his family members, a tent was set up in the leafy shade, with a hammock strung between two willow trees nearby.

"We are pleased with this site," Wang said. "There is free parking, drinking water and toilets — the services and facilities are complete."

"My child loved this place very much," he said. "As it is located along a flowing stream, he could feed ducks and geese here." Wang said his family planned to stay in the park for a whole day. "This is a perfect place for my child to get close to nature."

Prior to the May Day holiday, Taiyuan's tourism authorities recommended nine traveling options for tourists and camping was one of them. These camping sites also include the Xishan Ecological Park and the scenic area along the Fenhe River.

Cycling tours

Cycling tours were also popular among not only local tourists in Taiyuan but travelers from the rest of the country because shared bicycles are easily available.

In mid-April, Wang Wenbin, China's ambassador to Cambodia, recommended Taiyuan's cycling trails on his overseas social media account.

A short video showed people cycling along two trails by the Fenhe River. "The cycling trails are just like two silk ribbons in the sea of trees and flowers," he wrote.

The two trails, with a total length of 88 kilometers, connect 16 Fenhe River bridges and 11 riverside viewpoints, and were opened to the public on May 1, 2021.

"We made a cycling tour along the trails again because of Ambassador Wang's recommendation," said a Taiyuan resident surnamed Zhang. "In the past, we were proud of such Taiyuan landmarks as Jinci Temple and Tianlongshan Grottoes. Now we are pleased to see the addition of the Fenhe River cycling trails, which are a grand showcase of the ecological improvements of the river and the city."

The cycling trails are part of the Fenhe River scenic area, which was developed over several decades.

The Fenhe River, the second-longest river in Shanxi, flows through Taiyuan for 188 km. For thousands of years, the river has irrigated the land and nurtured the people of Taiyuan.

With enhanced governance and ecological restoration, the water quality of the Fenhe River has improved significantly, restoring much of its former beauty.

Hundreds of types of trees and flowers have been planted in the Fenhe River scenic area along the riverbanks, and dozens of cultural attractions have been laid out. The area offers a habitat for hundreds of bird species and has become a destination for tourists and a place for locals to relax.

Yuncheng Salt Lake

During the May Day holiday, various water sports and entertainment activities throughout Shanxi also attracted a great number of tourists.

In the southeastern Shanxi city of Yuncheng, for instance, many tourists were offered an opportunity to take part in a "dragon-of-boats" tour on the famed Yuncheng Salt Lake.

When evening approached, dozens of tourists boarded several illuminated boats, which were connected in a chain to form a "dragon". While those on board had an impressive view of the lake and the city, the boats, with their lights reflected on the water, presented a spectacular sight for people on the shore.

Zhang Lei, an executive at the Yuncheng Salt Lake Scenic Area, said the boat tour is a highlight of the city's tourism industry. "With this new option, we aim for tourists to have a new experience of the beauty of the lake."

Covering an area of 132 square kilometers, Yuncheng Salt Lake is one of the three famed inland lakes with sodium sulfate in the world.

Serving as a salt production base for about 4,600 years, the lake has become a tourist destination in Shanxi province over the past few decades.

The local tourism industry highlights both the historical tradition of salt mining and innovative scenarios, meeting the taste of modern tourists.

In summer, experiencing floating on the surface of this lake, known as the Chinese version of the Dead Sea, is an unforgettable experience that one cannot find elsewhere in the country.

In recent years, the lake has again become a hit on social media because of eye-catching aerial photos of its colorful surface. As temperatures begin to rise in early summer, the multicolored lake becomes a busy attraction for tourists and photographers.

The lake is also a habitat for birds and other wildlife species. More than 200 bird species have been recorded in recent years, including such rare varieties as flamingo, swan, pied avocet and great bustard, according to local environmental officials.

Tourists watch a folk dance in the ancient city of Shuozhou on May 1. LI XIAOLONG / FOR CHINA DAILY

Historical assets revived

In Shanxi, a great number of historical and cultural assets — especially ancient buildings and relics — are at the top of every tourist's agenda.

During this year's May Day holiday, tourists' expectations to explore these places were better met with the use of various shows and high-tech means.

In Taiyuan's Yongzuo Temple, which is known for two landmark pagodas built during the Ming Dynasty (1368-1644), the 2026 Taiyuan Twin Pagodas Peony Cultural Month opened on April 25 and will last for about four weeks.

During the holiday, tourists were offered an opportunity to see the 8,000-plus peony plants blooming at the temple. Among them are seven rare peony trees named Zixiaxian. Each of them is more than 400 years old, dating back to the period when the pagodas were built.

Surrounding the Zixiaxian trees, a variety of shows including a *hanfu* show, traditional dances, poem recitals and an intangible cultural heritage fair were staged.

The show of *hanfu*, or ancient Chinese garments, attracted the attention of many tourists. Donning ancient *hanfu*, performers danced to the melodies of a concert of Chinese musical instruments including *guzheng*, *guqin* and *pipa*, helping tourists see what rituals looked like more than 400 years ago.

Yungang Grottoes, a UNESCO World Cultural Heritage Site in the northern Shanxi city of Datong, again welcomed a peak tourist flow during the May Day holiday.

After a tight day's schedule touring Yungang and the ancient city of Datong, a tourist surnamed Chen, who was from Shanghai, joined a crowd of people in a square near the eastern city wall. They were waiting for the opening of a light-rendered sculpture show titled The Light of Yungang Grottoes.

In the evening, the show started with images of Buddha statues, musical instrument-playing figurines and lotus patterns commonly seen in the grottoes projected onto the city wall. These were accompanied with words explaining the details of the artistic works and stories about the history. "The show offered us a perfect review of what we saw in the day," Chen said.

Yungang Grottoes, with construction starting in the Northern Wei Dynasty (386-534), represents the highest level of Buddhist cave art, along with such famed sites as Mogao in Dunhuang, Gansu province, and Longmen in Luoyang, Henan province. It was inscribed on the UNESCO World Heritage List in 2001.

"This show, leveraging modern digital technologies and a novel narrative style, presented vivid stories about what makes Yungang a cultural landmark and Datong an enticing tourist attraction," Chen said.

New options

During the May Day holiday, while presenting its ancient cultural legacy, Shanxi had other options on offer to meet the modern tastes of tourists.

On May 3, for instance, a singing show featuring Chinese singer Joker Xue was held at Taiyuan Sports Center. It attracted tens of thousands of people from across the country.

According to an official at the Taiyuan culture and tourism bureau, the "performance economy" is an emerging engine driving the growth of local tourism and consumption.

The bureau's latest information shows that it has issued licenses for 27 large-scale performing shows for 2026, with the number of audience members expected to surpass 700,000.

It anticipated that there will be more than 40 such shows this year, which are expected to draw about 1.2 million visitors in total.

In addition to large-scale, licensed performances, smaller-scale shows were held at various locations in Shanxi during the holiday.

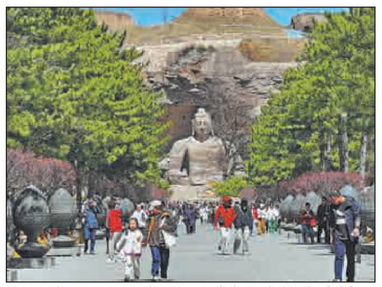
On May 5, the last day of the public holiday, Bell Tower Street in Taiyuan welcomed flocks of visitors. They were there to hear an open-air concert featuring traditional Chinese musical instruments. The event was held in a more informal manner — people stood on the street or moved among food stalls, tasting some local snacks while listening to the music.

Bell Tower Street is a site in Taiyuan where people can experience both local culture and life, while exploring history.

Also known as Zhonglou Street, it is named after a bell tower built during the Ming Dynasty. It has been a commercial market for more than a century.

Bell Tower Street has a lot of historical buildings, including the Dazhong Temple and Kaihua Temple, both of which were originally built during the Song Dynasty (960-1279). Local authorities have been making efforts to restore and protect important historical buildings and relics along the street.

The street was renovated in 2017 and reopened to the public in 2021 with a new look. It features many cultural relics, ancient buildings and time-honored brands.



After its renovation, this 700-meter-long street saw many new stores retaining their ancient architecture. What's more, many modern leisure spots, such as restaurants, bars, exhibition areas and tourist facilities were created, lending the area a sense of dynamism.

Many local specialties and handicrafts can be found on the street, like dough carvings, mature vinegar, paper-cuttings and more. Visitors can watch craftsmen create various paste figurines with their bare hands. Meanwhile, local mature vinegar, which is one of the famous Chinese varieties and a perfect match for noodles and dumplings, is something that foodies cannot afford to miss.

As a landmark, the upgraded Bell Tower Street boasts a perfect combination of ancient and modern elements, showcasing local history and culture. Its unique charm and relaxing vibe attract many visitors every year to explore the area.

Local statistics show that the street received about 152,000 visits on May 2, a record number.

New vision for constructive relationship of strategic stability should guide Sino-US ties

The meeting between President Xi Jinping and his US counterpart Donald Trump in Beijing this week will help the two sides jointly answer the defining questions facing China-US relations — questions posed by history, by the world and by the peoples of both countries.

The new vision for building a constructive China-US relationship of strategic stability agreed by the two leaders shows how the two nations can answer the questions of whether China and the United States can overcome the Thucydides Trap and create a new paradigm of major-country relations.

As Xi stressed, the "constructive strategic stability" should be a positive stability with cooperation as the mainstay, a sound stability with moderate competition, a constant stability with manageable differences, and an enduring stability with promises of peace.

That vision will provide strategic guidance for bilateral relations over the next three years and beyond, and should be welcomed by the people of both countries as well as the international community, as Xi said.

The China-US relationship involves multiple dimensions, including politics, economy, trade, security and people-to-people exchanges. The new vision for relations is pertinent to the practical needs of the development of Sino-US relations in the new era.

The building of a constructive China-US relationship of strategic stability should not be a mere slogan, but concrete action taken by both sides toward the same goal.

The vision can help the two sides explore more practical frameworks to implement the consensus reached in the head-of-state diplomacy, transforming initiatives and agreements into actions and results. This would enable them to more effectively build common ground, expand areas of converging interests and manage differences.

China stands ready to work with the US to turn the new vision for their relations into concrete, joint actions, and to jointly foster stable, healthy, and sustainable development in bilateral ties, as a spokesman for the Chinese Foreign Ministry stressed at a news conference on Thursday.

History has shown that China-US economic ties are mutually beneficial and win-win in nature. Differences should not be allowed to define the overall relationship. Given the size of the two economies, their different stages of development and differing national conditions, disagreements and frictions are natural. What matters is that the two sides address them through equal-footed consultation, the only correct path toward resolving differences and maintaining stable bilateral relations.

That the economic and trade teams of the two countries produced generally balanced and positive outcomes in the latest round of bilateral trade talks in the Republic of Korea on Wednesday is a testament to this, and the two sides should strive to sustain the good momentum they have worked hard to create.

China's pursuit of high-quality development, its commitment to high-standard opening-up and the vast potential of its economy and market help explain the willingness of US businesses to deepen cooperation with China. This underscores a broader reality: mutually beneficial cooperation remains the shared aspiration on both sides.

The productive exchanges between the US business delegation led by Trump and the Chinese side during the visit demonstrate that both countries possess not only the capacity, but also the sincerity, to translate China-US economic and trade cooperation into more tangible benefits for their two peoples.

Yet realizing the new vision will require both countries to fully respect each other's core concerns and legitimate interests. In particular, the US side should exercise due prudence, and refrain from crossing the red line on the Taiwan question.

As Xi emphasized, the Taiwan question is the most important issue in China-US relations, and if it is handled properly, the bilateral relationship will enjoy overall stability. Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy.

Safeguarding peace and stability across the Taiwan Strait constitutes the greatest common denominator between China and the US. If the US side truly seeks peace across the Strait, it should stop sending wrong signals to the "Taiwan independence" separatist forces on the Chinese island, as "Taiwan independence" and cross-Strait peace are fundamentally irreconcilable.

Whether 2026 can become a historic and landmark year for the world's most consequential bilateral relationship will depend on whether the US is prepared to meet China halfway and work toward shared objectives. The world's two largest economies have far more common interests than differences. They should be partners that help each other succeed and prosper together.

EU must heed Beijing's stern warning

China regards the European Union as a key partner willing to uphold multilateralism and free trade. However, this perspective is now facing challenges due to the European Commission's multiple unilateral restrictive policies, bills and sanctions that mainly target China.

A recent strongly-worded statement from a Chinese diplomat in Madrid cautioned that the EU's planned investment restrictions might compel China to "close its doors" to EU companies. The recent EU protectionist actions have prompted China to review its economic relations with the bloc.

Speaking in an unusually straightforward tone, Qu Xun, a diplomat at China's embassy in Spain, said that the "controls, limitations, and sanctions" introduced by the European Commission toward China in the past three months have pushed China into a corner, leaving it with no option but to close the door if it persists with its protectionism.

To a large extent, the catalyst for this blunt message was the EU's proposed Industrial Accelerator Act and the revision of its Cybersecurity Act. The IAA seeks to impose onerous restrictions on foreign investment in strategic sectors with the goal of reducing dependence on so-called "subsidized" imports from China.

Likewise, the EU's plan to revise its Cybersecurity Act also targets China by proposing to enforce strict controls on EU ownership in critical industries and limit "high-risk" cybersecurity suppliers, identified as primarily Chinese by the European Commission. These actions indicate that the EU's restrictive measures have shifted from targeting specific Chinese companies to broad legal and regulatory barriers targeting Chinese companies and investments.

In the past few months, China's Ministry of Commerce has repeatedly expressed its opposition to the EU's politicization and over-securitization of trade and economic issues and its discriminatory treatment of Chinese enterprises.

Aside from that, Beijing has been remarkably patient. It has urged settling differences through dialogue and negotiation. However, its patience is wearing thin. The rare warning of the Chinese diplomat that it will "close the door" is a signal that if the EU proceeds with this discriminatory legislation, Beijing will have no choice but to fight back.

The European Commission's approach contradicts its commitment to openness and the genuine needs of the bloc. As an open economy, the EU should offer a nondiscriminatory business environment. However, its executive arm's actions have erected barriers, which undermine this goal and will ultimately harm the EU's own interests. Weakening economic ties with the Chinese market is detrimental to the currently sluggish EU economy and the bloc's long-term competitiveness.

The EU's anxiety over its competitiveness has prompted calls for "de-risking" based on the misguided perception that China is a "rival".

But the market tells a different story. In the face of a complex geopolitical environment, European companies have embraced the "in China, for China" strategy, expanding their investments and deepening technological innovation collaborations with Chinese enterprises. This partnership has not only enhanced the global competitiveness of European and Chinese companies but also revived and upgraded European manufacturing, creating a win-win scenario for both sides.

The European Commission can continue along the protectionist path it is taking under the illusion that it can isolate the EU from Chinese competition while retaining Chinese cooperation. Or it can listen to the concerns of both China and the EU's own pragmatic member states and business community, drop the stigmatizing "high-risk" label it is pinning on Chinese enterprises and investments, and engage with China on the basis of mutual respect and nondiscrimination.

It is hoped that the EU will approach economic competition and exchanges with China in an objective and rational manner, acknowledging the necessity and significance of maintaining stable economic and trade relations.

The stern warning issued by the Chinese side should be taken seriously.

Consumption, production data reflect rise up the value chain

China's April inflation data tell two stories. The first is that consumer prices are again rising modestly, and factory-gate prices have returned to positive territory. The second, more important, story is structural: China is shifting from an export-and-investment growth model toward one driven by domestic demand, technological upgrading and industrial resilience, all while navigating a very harsh global environment.

That makes April's consumer price index and producer price index figures more significant than they might first appear.

According to data released by the National Bureau of Statistics, China's CPI rose 1.2 percent year-on-year in April, while the PPI climbed 2.8 percent, marking the strongest factory-gate price hike in nearly four years.

Viewed from China's perspective, April's data reflect a positive change, as the composition of the numbers matters.

Consumer inflation remains relatively subdued and manageable. Food prices continued to decline, while core inflation stayed stable. The more remarkable movement came from producer prices, driven partly by rising global energy and commodity costs, but also by stronger demand in advanced manufacturing sectors such as nonferrous metals, high-end equipment and computing-power-related industries.

That distinction is crucial because it reveals how China's economy is evolving. The growth impulses are increasingly concentrated in sectors of strategic importance: artificial intelligence infrastructure, green technology, advanced manufacturing and industrial upgrading.

Overseas, China's industrial policy is often portrayed as merely a supply-side story. But Beijing's longer-term strategy is not simply about producing more goods. It is about climbing the value chain while simultaneously building a larger and more resilient domestic consumer market.

Recent policy discussions in China increasingly emphasize the creation of a "new balance" between supply and demand. The old model relied heavily on property investment, local government borrowing and low-cost exports. The new one aims to strengthen household consumption, technological self-sufficiency and middle-income purchasing power.

That transition is crucial.

In the short term, China still needs to boost confidence in parts of the private sector, and ease lingering pressure in real estate and external uncertainty stemming from geopolitical tensions and trade frictions. Some of April's producer-price rebound was clearly imported through higher global energy costs linked to instability in the Middle East. But focusing only on those pressures misses the broader transformation underway.

Chinese policymakers are now more focused on improving the quality of growth rather than merely maximizing headline expansion.

This helps explain why the official discourse has increasingly stressed high-quality development, technological upgrading and domestic demand. The goal is to create a more internally sustainable economic system that is less vulnerable to external shocks, sanctions and geopolitical fragmentation.

There is also a larger global implication here. As the country moves into higher-end production and cleaner energy systems, it may become an exporter of industrial upgrades and technological advancements.

That shift might unsettle some Western economies already struggling with deindustrialization and stagnant productivity. Yet it also reflects a deeper reality: the age of hyper-globalization built on cheap Chinese labor, land, raw materials and environmental factors is ending. China is no longer merely the world's factory floor. It is trying to become something much more complex — a technologically advanced continental economy with its own consumer base, industrial ecosystem and strategic autonomy.

This transition will not be easy. Structural problems remain obvious, and global demand conditions are fragile. However, the April figures suggest that China's economy is gradually moving away from the deflationary psychology that has worried some policymakers for much of the past two years.

In an era when much of the world economy feels trapped between inflation, stagnation and geopolitical fragmentation, that alone is worth paying attention to.

— LI YANG, CHINA DAILY

What They Say

Knowledge-intensive services key growth driver

Editor's note: *The service sector in China is a key pillar of high-quality economic development. Li Jun, deputy secretary-general of the China Association of Trade in Services, spoke to the 21st Century Business Herald on why China is focusing on its service sector. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The service sector, especially producer services and knowledge-intensive services, has become a key driver of high-quality development.

As the middle-income group expands, the demand for high-quality services such as education, healthcare, culture, elderly care, tourism and sports is rapidly growing. Efforts to expand the capacity and improve the quality of services are essentially aimed at restructuring domestic supply and making consumption a genuine driver of economic growth.

Global value chains are being reshaped. Trade in services has emerged as a competitive international arena. Developed economies in Europe and North America have long dominated these global value chains due to their strengths in the service sector.

China, however, has a large deficit in trade in services, which represents both a weakness and an opportunity for growth. The country needs to strengthen its service sector to foster a new development pattern and boost its competitiveness.

Currently, a core theme of China's industrial policies is integrating advanced manufacturing with modern services. A challenge is that the two sectors have long been governed by different policies, statistical methods and regulatory frameworks, creating barriers to integration.

To overcome these barriers, efforts are required to utilize the industrial internet to connect data silos. It is necessary to accelerate the cloud migration of manufacturers' data on production, equipment and orders and attract service companies to develop services tailored to specific needs based on such data.

Statistical standards also need to be improved. Currently, service departments of manufacturing companies, such as R&D, design and logistics, are still classified under the manufacturing sector. This underestimates the scale of the service sector and limits its ability to benefit from favorable policies.

Additionally, manufacturing companies should be given more support to transition from merely providing products to also offering services and solutions. The global service industry is undergoing an important change, with artificial intelligence and the green economy driving trade in services. This presents a strategic opportunity for China to boost its trade in services.

The green transition has led to the emergence of a range of new businesses. Global market demand for services such as carbon verification, carbon asset management and environmental, social and governance consulting is expanding rapidly. China can leverage its experience in new energy, energy storage and green building by exporting green services.

Artificial intelligence is transforming trade in services by reducing the marginal cost of knowledge-intensive services, and making it easier for companies to offer services that used to be highly demanding for providers. This transition has empowered small and medium-sized Chinese companies to export their services globally.

More importantly, China is exporting AI technology, such as large AI models and intelligent applications. These goods will be key growth drivers of knowledge-intensive service exports during the 15th Five-Year Plan (2026-30) period.

BUSINESS

A shares seen as promising despite pullback

Thursday mkt adjustments not altering mid-term upward trend, experts say

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

While the A-share market underwent some adjustments on Thursday, experts are still upbeat on the A-share market performance in the following months, which is supported by China's continued industrial restructuring and economic recovery.

The benchmark Shanghai Composite Index shed 1.52 percent to close at 4177.92 points on Thursday, while the Shenzhen Component Index dropped 2.14 percent. Trading remained active, with total trading value of the three major exchanges topping 3 trillion yuan ($442 billion) for the seventh consecutive trading day.

Experts from China International Capital Corp Ltd said they are firmly confident of an upward trend in the A-share market in the mid-term, though fluctuations may be unavoidable. The country's stability amid global uncertainties and China's industrial innovation will serve as the core drivers, they said.

Xia Fanjie, a strategist at China Securities, said that a slow bull market driven by structural opportunities will typify A-share market performance in the second half.

Rising demand for computing power will be a major theme, as it is still too early to declare a bubble in the sector. Investors are recommended to look for opportunities in sectors of optical modules, printed circuit boards, advanced packaging, memory chips, liquid cooling and heat dissipation, data center power supply, computer power leasing and cloud services, Xia said.

Economic recovery is another major reason for a positive outlook on the A-share market in the coming months. The producer price index is expected to recover on a quarterly basis, while external demand will remain strong. In such a context, resource companies specializing in oil and gas production, coal, chemicals and nonferrous metals are the most likely to see their profitability improve. Opportunities can also be found among new energy manufacturers with global competitiveness, he said.

Morgan Stanley analysts said in a recent report that A-share company earnings will improve moderately in the following months.

Their optimism is supported by China's stronger exports amid an accelerating artificial intelligence and energy capex cycle, near-term reflation signs, Chinese currency appreciation against the US dollar, and a cooling down in large-cap platform companies' price competition amid strict government regulations.

The investment bank continues to prefer the A-share market over offshore alternatives mainly because of the higher concentration of high-end upstream manufacturing and hard-core tech companies in China. There is a high likelihood that A-share initial public offerings will trigger greater domestic investor participation, according to the report.

"We do believe that the sheer size of opportunities in China's equity market at the single stock and thematic level — fueled by solid fundamentals and promising themes such as tech localization and high-end manufacturing — should allow investors to construct a targeted Chinese portfolio that outperforms other peers," said Laura Wang, the investment bank's chief China equity strategist.

The tech-heavy ChiNext board in Shenzhen topped the 4000-point level on Wednesday to reach a record high. This has shown the market's recognition of China's ongoing industrial restructuring and upgrading, said Guo Yiming, head of investment advisory at Jufeng Investment.

Companies specializing in power equipment, communications, electronics, pharmaceuticals, biotech and computers — which make up most of the ChiNext's constituents — have fueled the recent rally. This is in line with the structural opportunities in the current A-share market, which is supported by the continued rising demand for AI computing power and the development of new energy industries, Guo said.

Amid ample market liquidity and continued policy support for emerging industries, the ChiNext is expected to receive a relatively high level of attention, he added.

But it should be noted that a structurally diverged performance is implied in ChiNext's recent bull. The index has been mainly propelled by the market leaders, as the index's top 10 heavyweights now take up 57 percent of the board's entire market cap.

Therefore, individual investors should avoid being overly affected by market sentiment, but rather focus on the prosperity and profitability of the companies they have chosen, said Guo.

A display shows Chinese stock indices in Shanghai on Wednesday. PROVIDED TO CHINA DAILY

A one-person company owner works at an industrial park designated for OPC businesses in Lianyungang, Jiangsu province, on March 25. GENG YUHE / FOR CHINA DAILY

AI drives boom in one-person companies nationwide

By **LI JIAYING**
lijiaying@chinadaily.com.cn

As artificial intelligence tools become cheaper, smarter and easier to use, they are helping more Chinese entrepreneurs turn personal expertise and online followings into one-person companies (OPCs), building lean businesses powered by digital platforms and AI-driven productivity.

For Wang Yao, founder of an OPC built around her online personal channel "Wiley", the appeal lies not in scale, but in flexibility and low risk.

Through social media content sharing personal growth, life abroad and cost-effective ways to improve productivity, Wang's channel has attracted over 100,000 followers on Chinese social media platform Xiaohongshu, and has built a business centered on consulting services and brand partnerships.

"The company operates in a very healthy way because it has zero debt, low costs and high flexibility," Wang said, describing her business model as the monetization of "trust-based traffic".

> "The growing abundance, accessibility and usability of AI tools are key to one person becoming a team."
>
> **He Xia,** a former chief engineer at the China Academy of Information and Communications Technology

Wang said more people are beginning to realize that entrepreneurship no longer necessarily requires large teams, venture capital or corporate backing.

"People are gradually discovering that you don't have to join a major company or pursue fundraising and IPOs," she said. "One person can still build a decent business through their own skills and influence."

The content creator added that the rapid development of AI tools has become a major factor behind that shift.

"I do not need to hire copywriters, designers or video editors. AI has taken on these roles. That keeps the marginal cost of running my OPC extremely low and allows me to test new content directions or business models with very low risk," she said.

"The growing abundance, accessibility and usability of AI tools are key to one person becoming a team," said He Xia, a former chief engineer at the China Academy of Information and Communications Technology.

Current AI tools can cover functions from software development and daily searches to image generation and audio-video production, and AI agents such as OpenClaw are also lowering the coding threshold and bringing opportunities for entrepreneurs with little technical background, said He.

The trend is now reshaping China's entrepreneurial landscape. According to the China OPC development trends report (2025-30) released by the Zhongguancun Talent Association in February, the number of OPCs nationwide had exceeded 16 million by June 2025, accounting for 27.4 percent of all enterprises in China.

In the first half of 2025 alone, China registered 2.86 million new OPCs, up 47 percent year-on-year and accounting for nearly a quarter of all newly registered businesses.

Still, analysts also cautioned that AI alone cannot guarantee long-term business success.

"Many people focus only on AI's impact on productivity while overlooking that in the 'human plus AI' model, the human remains the core competitive factor," said Zhou Guangsu, a professor at Renmin University of China's school of labor and human resources.

Zhou said that while AI can help entrepreneurs rapidly build products and applications, commercialization still depends heavily on business judgment, market insight and resilience under pressure.

Pan Helin, a member of the Ministry of Industry and Information Technology's Expert Committee for Information and Communication Economy, said OPCs should not become a purely symbolic trend.

"What matters is substance over form," Pan said, adding that lowering transaction costs, improving the business environment and strengthening talent-support policies will be key to the sector's sustainable development.

EU cybersecurity law revision seen as loss-making move

By **WANG KEJU**
wangkeju@chinadaily.com.cn

Excluding Chinese suppliers under the European Union's proposed revision of the Cybersecurity Act will not deliver the security gains Brussels desires, but could instead weaken the bloc's digital competitiveness and crowd out innovation investment, experts have warned.

The warning comes as the EU reviews its draft legislation, which would identify "countries posing cybersecurity concerns" and "high-risk suppliers" and exclude them from 18 sectors, including energy, transport, and information and communications technology.

Earlier this month, the bloc restricted funding for renewable energy projects using inverters from suppliers in its list of "high-risk countries" such as China, in an attempt to tackle its so-called cybersecurity threats.

According to a joint report released last week by the China Chamber of Commerce to the EU (CCCEU) and global advisory firm KPMG, the EU could face an estimated loss of as much as 367.8 billion euros ($430.54 billion) over the next five years if Brussels excludes Chinese suppliers.

The cumulative economic losses for EU member states would be "equivalent to nearly two full years of the EU's annual budget", the report said, noting that Germany would bear the largest burden, with estimated losses of 170.8 billion euros, followed by France and Italy.

"The criteria for identifying so-called 'high-risk suppliers' appear to be politically targeted," said CCCEU Chairman Liu Jiandong. "This approach politicizes commercial decision-making and runs counter to the EU's own principles of equality and non-discrimination."

According to the report, there has been no substantiated evidence so far of "technical backdoors" or violations of EU cybersecurity rules by Chinese companies operating in the bloc, and the origin-based screening measures could violate WTO rules, breach bilateral investment treaties and trigger compensation claims.

He Yongqian, a spokeswoman for the Ministry of Commerce, said in late April that formal comments were submitted to the European Commission, the EU's executive arm, voicing serious concerns over relevant provisions in the draft.

"We hope the EU will attach great importance to and seriously consider the comments and proposed revisions submitted by the Chinese side," said He.

The spokeswoman stressed that should Chinese companies face discriminatory treatment as a result of the revision, China may take measures to safeguard its legitimate rights and interests.

China believes that dialogue and cooperation are the right approach to resolving issues facing both sides, and is willing to work with the EU to properly handle differences through consultations and jointly safeguard the stability and smooth operation of global industrial and supply chains, added He.

The report stresses that mandatory replacement of Chinese suppliers is "unlikely to achieve meaningful security gains". Instead, it warns of systemic negative effects: innovation budgets could be crowded out, fiscal burdens on member states increased and household incomes eroded.

Losing the European market would be a blow to Chinese companies, but many of them have already pivoted their focus toward the domestic market and the Global South, where demand for digital infrastructure remains strong, said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

"Worse still, the EU could lose its strategic autonomy in the ongoing restructuring of global industrial chains," Zhou said, adding that such efforts will only bring limited benefits to the EU.

Envision bags wind energy project in Canada

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Envision Group, a leading Chinese green technology firm, has signed a strategic cooperation agreement with Cape Breton China Corp (CBCC) to develop a 300-megawatt integrated wind and energy storage project in Nova Scotia, Canada.

The deal, finalized in Shanghai earlier this week, represents a milestone in the global expansion of China's "wind-storage integration" model.

Beyond mere hardware exports, the partnership underscores a shift toward providing holistic zero-carbon solutions that combine cutting-edge artificial intelligence-driven energy systems with local capacity building, according to the Shanghai-based green technology giant.

The project, designed as a zero-carbon demonstration site, integrates 300 MW of wind power with an advanced battery energy storage system. It aims to enhance the flexibility and stability of the local power grid, supporting the province's transition toward a cleaner, digital-driven energy architecture, it said.

"By leveraging Envision's leading AI-driven storage and smart wind solutions, alongside CBCC's strong local resources and development capabilities, we will build a more robust renewable energy ecosystem," said Zhu Yi, senior business director of Envision Energy Canada. "Starting from Nova Scotia, we aim to expand our footprint across the North American market."

Envision's overseas expansion is indicative of a broader momentum among Chinese green technology enterprises, which are rapidly scaling up their global deployments to meet surging international demand for integrated renewable solutions.

Global battery energy storage capacity is on track for monumental growth, with projections from the China Energy Storage Alliance (CNESA) indicating an eight- to 17-fold increase between 2024 and 2035.

However, the sector — currently spearheaded by China, the United States and Europe — is moving away from its initial explosive boom and entering a stabilizing, transitional phase, said Chen Haisheng, chairman of the CNESA and director of the Institute of Engineering Thermophysics at the Chinese Academy of Sciences.

Between 2026 and 2030, the industry's compound annual growth rate is forecast to reach 20.7 percent under conservative estimates, with the potential to hit 25.5 percent in a best-case scenario, Chen said.

Amid this industry shift, Envision's competitive edge lies in its long-term commitment to localization and research and development. Since 2010, the company has built a comprehensive international ecosystem, including the largest R&D center established by a Chinese firm in Denmark, as well as battery cell factories in Japan, the United Kingdom, France and Spain.

In addition, there has been a rapid acceleration of Chinese energy storage enterprises globally.

In the first quarter, China's energy storage battery shipments reached 209 gigawatt-hours, a 115 percent year-on-year increase, with major players like Envision and Contemporary Amperex Technology remaining the preferred partners for GWh-scale projects across Europe, North America and the Middle East.

The global push is fueled by the plummeting cost of renewable energy. A recent report from the International Renewable Energy Agency indicates that in resource-rich regions, the cost of solar-plus-storage has dropped to between $54 and $82 per MWh — significantly lower than the $100+ per MWh required for new gas-fired power plants.

Francesco La Camera, director-general of the International Renewable Energy Agency, recently emphasized that the argument regarding the "unreliability" of renewables no longer holds water.

"The ability to provide 24/7 renewable power is now cost-competitive with fossil fuels," he said.

China builds fastest quantum computer

Speed of Jiuzhang 4.0 prototype is a result of use and control of photons

By **LI MENGHAN** and **ZHU LIXIN**

A partial view of Jiuzhang 4.0. ZHOU MU / XINHUA

A team of Chinese scientists has developed the world's fastest quantum computer prototype, named Jiuzhang 4.0, capable of solving complex mathematical problems in less than the blink of an eye — tasks that even for the world's most powerful supercomputer would take longer than the age of the entire universe to crack.

The findings, published in the journal Nature on Wednesday, push the quantum advantage in computing to an unprecedented level, demonstrating China's leading position in the field.

A quantum computer operates on the laws of quantum mechanics. Its basic building blocks, called quantum bits or qubits, can exist in a superposition of both 0 and 1 simultaneously — unlike conventional bits, which are either 0 or 1.

This allows quantum computers to explore many computational paths in parallel, providing exponential speedup for certain tasks, such as solving some mathematical problems and simulating quantum systems.

Current mainstream quantum computing technological routes include superconducting, ion trap, photonic, and neutral atom systems. The Jiuzhang series, photonic quantum computers, encodes information in particles of light, and its speed depends on the ability to manipulate and control these photons.

However, in the development of large-scale photonic quantum processors, inevitable photon loss — a major source of computational error — has long been a serious constraint. As the optical network grows larger and more complex, photons can easily get "lost" in the maze, significantly degrading computational power.

To address the problem, the research team, led by the University of Science and Technology of China, developed a high-efficiency optical parametric oscillator light source and a spatiotemporally hybrid-coded interferometer, laying the groundwork for building a fault-tolerant photonic quantum processor.

They integrated 1,024 high-efficiency squeezed-state optical fields into a spatiotemporally hybrid-coded circuit with 8,176 modes, achieving a source efficiency of 92 percent and an overall system efficiency of 51 percent.

These represent major breakthroughs in low-loss photonic quantum information processing.

Moreover, the spatiotemporally hybrid-coded architecture allows photons to interact across both time and space dimensions, greatly improving the connectivity of the entire network while keeping the physical device scale under control.

Based on these advancements, the team achieved the manipulation and detection of up to 3,050 photons — a significant leap from the 255 photons achieved with the previous Jiuzhang 3.0, as published in 2023.

Experiments showed that the most complex data sample generated by Jiuzhang 4.0 takes only 25 microseconds to produce — where a microsecond is one-millionth of a second.

In contrast, the world's most powerful supercomputer, El Capitan, developed by the United States, would require more than 10 to the power of 42 years to calculate the same result.

In 2020, scientists from the University of Science and Technology of China successfully developed the Jiuzhang photonic quantum computing prototype with 76 photons, making China the second country in the world to achieve the quantum computational advantage, and the first to achieve it in an optical system.

Quantum technology is emphasized in the 15th Five-Year Plan (2026-30) as both a future industry and a strategic frontier that requires sustained reinforcement.

The plan stresses the need to advance basic theories and foundational technologies while accelerating their industrial application, with goals set for the development of fault-tolerant universal quantum computers and scalable, special-purpose quantum computers.

Voices build bridges

International students perform Chinese songs at the Nigerian booth during an international youth cultural festival at the University of International Business and Economics in Beijing on Thursday. Featuring booths from countries around the world, the event brought together students as "cultural ambassadors" showcasing traditional costumes, handicrafts and cuisine. WU XIAOHUI / CHINA DAILY

Experts focus on Austronesian history

By **LIU BOQIAN** and **HU MEIDONG**

Discussions in Pingtan, Fujian province, have renewed attention on Austronesian history and cross-Strait cultural ties, as experts, scholars and representatives of Taiwan's indigenous communities called for broader recognition of what they described as shared heritage.

"We should face the historical fact that today's Austronesian speakers trace their origins to the Chinese mainland, though many people are still unaware of this," said Xu Guirong, vice-president of the Pingtan International Institute of Austronesian Research, during a roundtable held as part of the 2026 Cross-Strait Marine Cultural Exchange Platform recently.

Austronesian-speaking communities span a vast area from Southeast Asia to the Pacific islands, including many of Taiwan's indigenous groups.

Xu cited a 2020 study published in the journal Science by researchers from the Chinese Academy of Sciences, which said early Austronesian-speaking populations emerged in Fujian and nearby areas of southern China about 8,400 years ago.

He also called for greater inclusion of Austronesian history in school curricula and stronger efforts to challenge what he described as distorted historical narratives.

One roundtable examined cultural origins and heritage, with participants discussing Austronesian traditions, the preservation of indigenous customs and historical links.

"The Chinese nation has long been shaped by cultural integration," said Liao Shih-chieh, a representative of Taiwan's Pingpu people and an advocate of intangible cultural heritage preservation.

"For people on both sides of the Taiwan Strait to live peacefully on this beautiful and united land and build a prosperous and harmonious China together is a blessing for both sides," he said.

Kimi Sibal, a historian based in Hualien, compared tattooing traditions among indigenous groups in Taiwan with those of ethnic communities on the Chinese mainland, including the Li people in Hainan province, saying they shared similarities in creation myths and cultural practices.

An exhibition on maritime civilization opened on Tuesday alongside the forum, featuring archaeological displays, indigenous artifacts and immersive audio exhibits that highlighted shared maritime cultural heritage across the Strait.

Building compliant digital bridges across the Pacific

By **YUAN SHENGGAO**

A group photo of GOIP. PHOTOS PROVIDED TO CHINA DAILY

From left: Luo Sean, CEO of Eton InfoComm Technology. Leung Chi-yuen, chairman of GOIP. Lok Lian, general manager of Eton InfoComm Technology.

Securing cross-border data flows has become a strategic priority for enterprises expanding between China and the United States, where differing regulatory frameworks create complex operational challenges, according to Leung Chi-yuen, chairman of GOIP.

Founded in 2012, GOIP is an international telecommunications and managed service provider, serving as a critical link between the Asia-Pacific region and North America. The company facilitates secure and compliant data transit across the Pacific, acting as a managed digital bridge for businesses.

"Our role is to build the infrastructure and governance frameworks that allow enterprises to focus on their core business rather than regulatory complexities," Leung said.

Two-way growth

GOIP's services encompass the full spectrum of needs for enterprises establishing operations in new markets, from initial planning through ongoing management. The company's "one-stop" service model aims to simplify global IT management by providing coordinated solutions across network infrastructure, security compliance and operational support.

For Chinese companies expanding in the US, GOIP provides local support for infrastructure, compliance and operations. Similarly, for US businesses entering China, the company addresses connectivity, security and regulatory needs including compliance with the Personal Information Protection Law.

"Many providers are purely virtual; when a router fails or a cable is cut in a US data center, they open a ticket and wait. GOIP is different," Leung said.

"We have local offices and a professional team in the US, complemented by our long-term partner Eton InfoComm Technology. This partnership allows us to offer implementation excellence. If a Chinese client opens a new branch in the US, our local engineers are there to manage the rack and stack, the cabling and the configuration."

Unified protection

At the core of GOIP's value proposition is an integrated approach to network security and management. The company provides a unified platform encompassing network infrastructure, security protocols and operational monitoring. This integration allows for coordinated management of different system components, potentially improving responsiveness and reducing compatibility issues that can arise when using multiple service providers. The company's software-defined wide area network solutions are specifically engineered for trans-Pacific connectivity, addressing latency and reliability challenges that commonly affect cross-border communications.

> "Our role is to build the infrastructure and governance frameworks that allow enterprises to focus on their core business rather than regulatory complexities."
>
> **Leung Chi-yuen,** chairman of GOIP

The company's service model includes continuous monitoring through its proprietary network operations center capabilities. This approach aims to identify and address potential issues before they affect operations, providing enterprises with additional oversight of their cross-border digital infrastructure. Through 24/7 monitoring and response capabilities, GOIP seeks to minimize downtime and performance degradation for mission-critical applications such as enterprise resource planning and customer relationship management systems.

"Traditionally, companies hire one vendor for their network and a separate vendor for security. This creates 'blind spots,'" Leung noted. "GOIP manages VAPT (vulnerability assessment and penetration testing) and SIEM (security information and event management) directly, meaning our security protocols are built into the fabric of the network, not bolted on as an afterthought. Our VAPT is performed by our in-house experts who know the network's architecture intimately. Once we harden the perimeter, our SIEM provides 24/7 surveillance. Because GOIP manages the entire stack, if a threat is detected by our SIEM, our NOC (network operations center) can act instantly to mitigate it within the network."

Navigating rules

With governments worldwide implementing new data protection regulations and cross-border data flow requirements, enterprises face an increasingly complex compliance environment. GOIP's services include advisory support to help companies navigate these regulatory requirements while maintaining efficient operations. The company positions itself as a strategic adviser, assisting clients in developing data governance frameworks that address multiple jurisdictional requirements. This advisory function extends beyond technical implementation to include strategic planning for data localization, cross-border transfer mechanisms and compliance documentation.

Recent developments in regional cooperation frameworks, such as the memorandum of understanding on facilitating cross-boundary data flow within the Guangdong-Hong Kong-Macao Greater Bay Area, have created new opportunities for service providers specializing in cross-border data solutions. These frameworks aim to facilitate data flows while maintaining appropriate protections, requiring specialized expertise for effective implementation.

GOIP has developed specific service offerings tailored to leverage these regulatory developments, helping clients optimize their data management strategies within approved frameworks.

"The traditional model of hiring local IT teams in every city is inefficient and costly. GOIP solves this through our integrated ITSM (IT service management) and NMS (network management system) ecosystem," Leung said. "Because we have our own proprietary network operations center team and in-house engineers, we act as the client's extended department. We handle the 24/7 monitoring, incident response and performance tuning. Our AI-empowered NOC automates the analysis of network logs and performance data, which significantly increases operational efficiency and reduces human error and risk. This, in turn, allows clients to streamline their on-site IT manpower requirements. Our NMS identifies bottlenecks before they cause downtime, and our ITSM framework ensures every request is handled with professional precision. This 'Lean IT' model provides a smooth, fast and low-cost operation."

GOIP's integrated solutions are built upon a foundation of internationally and nationally recognized credentials. The company's information security management is certified to the ISO 27001 standard, while its security services hold the China Cybersecurity Review Technology and Certification Center's Information Security Service Qualification. Its operational capabilities are validated by Singapore's Cybersecurity Services Regulation Office, its accredited Penetration Testing Service, its System and Organization Controls certification, and its authority to operate as a facilities-based carrier in the US under Federal Communications Commission Section 214 & 499. Service delivery is guided by Information Technology Infrastructure Library 4 Foundation's best practices, and its strategic advisory team includes professionals with a Certified Information Systems Security Professional certification.

UAE rejects Israeli visit claim

Dispute deepens diplomatic strain as ceasefire faces mounting pressure

By **CUI HAIPEI** in Dubai, UAE, and **JAN YUMUL** in Hong Kong

The United Arab Emirates has flatly rejected an Israeli claim of a "secret visit" by Prime Minister Benjamin Netanyahu during the war with Iran, labeling it as "baseless".

This development adds complexity to the already strained diplomatic efforts aimed at preventing the collapse of the tenuous ceasefire between Washington and Tehran.

In a statement released on Wednesday night via state news agency WAM, the UAE said its relations with Israel "are public and conducted within the framework of the well-known and officially declared Abraham Accords, and are not based on nontransparent or unofficial arrangements".

The statement also denied receiving any Israeli military delegation.

The reaction came hours after Netanyahu's office announced the visit on social media and branded the meeting a "historic breakthrough".

The Times of Israel, citing an informed source, said on Thursday that the visit took place in the city of Al Ain near the Omani border on March 26 and lasted several hours.

The UAE and Israel normalized relations under the US-brokered Abraham Accords signed in September 2020.

Palestinian leaders have long condemned the deal as a "stab in the back". Iran has also criticized the agreement and for years alleged that Israel has maintained a military and intelligence presence in the UAE.

Iranian Foreign Minister Abbas Araghchi said on social media that Israel "publicly revealed" what was already known by the Iranian security services, warning that "collusion" with Israel is "unforgivable".

The UAE and other Arab countries were targeted by Iranian missile and drone attacks after the US and Israel launched airstrikes against Iran in late February. A fragile ceasefire involving Iran, the US and Israel has been in place since April 8.

According to WAM's reports earlier this month, UAE President Sheikh Mohamed bin Zayed Al Nahyan received calls from several regional leaders after Iranian attacks on the country on May 5, including from Netanyahu.

US Ambassador to Israel Mike Huckabee also revealed this week that Israel had sent Iron Dome air-defense weapons, along with personnel to operate them, to the UAE.

Political solutions

However, Anwar Gargash, an adviser to the UAE's president, said on Wednesday that the Gulf nation remained committed to political solutions and diplomacy amid regional tensions, while stressing the country's right to defend its sovereignty.

Relations between Arab states and Iran should not be defined by confrontation, he added.

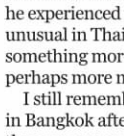
Meanwhile, US Vice-President JD Vance said on Wednesday that he believes progress is being made in negotiations with Iran to end hostilities, after US President Donald Trump rejected Tehran's latest proposal as unacceptable.

"The red line is very simple," Vance said. "He (the president) needs to feel confident that we have put a number of protections in place such that Iran will never have a nuclear weapon."

Nevertheless, an Iranian Army spokesman said the armed forces are maintaining "the highest level of readiness", warning that "there is no room for retreat" as tensions with the US persist.

Iranian First Vice-President Mohammad Reza Aref said the country's "right to the Strait of Hormuz is established, and the matter is closed".

Iran's ISNA news agency quoted him as saying that Iran's plans "were tailored to the sanctions and pressures of our enemies, but now we must plan for the security and well-being of our country and the region".



Even amid simmering tensions, Iran held a send-off ceremony on Wednesday for the national soccer team ahead of the 2026 World Cup, cohosted by the US, Mexico and Canada.

At a square in central Tehran, people waved flags, chanted slogans and some held placards honoring the late supreme leader Ali Khamenei, who was killed during the war.

Thailand's embrace of its youngest treasures

FIRST PERSON VIEW

Yang Wanli
Reporter's log

While foreigners often praise Thailand for its hospitality, I've come to believe children may be the group the country cherishes most. Few countries devote an entire national celebration so wholeheartedly for children — not as a commercial occasion, but as a deeply rooted social value.

Rather than observing the International Children's Day on June 1, Thailand celebrates Wan Dek, or National Children's Day, on the second Saturday of January each year. Across the country, the message is unmistakable: children are the nation's most precious resource.

The celebrations begin even before the holiday arrives. Schools organize performances, games and community events, with children receiving gifts from teachers.

On Children's Day, youngsters are showered with affection by family members and strangers alike. Shopping malls host concerts, while public attractions lower ticket prices or open free of charge to families. Streets fill with children clutching balloons and snacks, walking with a rare sense of collective joy.

Yet, what struck me most was not the festivities themselves, but the seriousness with which Thai society treats childhood.

On the day, children are invited to the Government House, where they can sit in the prime minister's office — a symbolic gesture affirming that they matter.

Prime Minister Anutin Charnvirakul introduced this year's slogan "Love Thailand, Care for the World", emphasizing civic responsibility, environmental awareness and global citizenship.

The Royal Thai Air Force opens its bases to the public for large-scale celebrations featuring aircraft displays, military demonstrations, interactive games and live performances.

Last year, I took my son to one of the events, and it felt less like a military showcase than a nationwide carnival. Tens of thousands attended. Children climbed onto aircraft cockpits as smiling air force personnel lifted them up for photos.

Shuttle buses moved between parking areas and the venue. Volunteers distributed free bottled water. Temporary stalls sold food and toys at modest prices. The atmosphere was orderly yet warm — a public celebration designed not only for children, but also for the people around them.

My son talked about the event for weeks afterward. But the kindness he experienced that day was not unusual in Thailand. It reflected something more ordinary — and perhaps more meaningful.

I still remember our initial weeks in Bangkok after we moved there three years ago. Our son was only 4, and every morning we walked him to the kindergarten. Along a route of barely 10 minutes, four or five strangers would smile, wave or greet him warmly — security guards, fruit vendors, lottery sellers, people we had never met before.

That openness is evident in daily life. Market vendors often slip extra fruit into his hands. Staff at the shopping malls and play centers offer him snacks or candy. On Bangkok's elevated Skytrain, passengers routinely offer him a seat, even now, at 7, when he's perfectly capable of standing.

Over time, I have watched my once shy and sensitive child change. Thailand has rewarded his attempts to engage with the world rather than discouraging them. When he speaks to restaurant staff, people praise him. When he helps carry luggage at the airport, fellow passengers compliment his manners. Encouragement comes easily and naturally from strangers.

Perhaps, most revealing is the patience that Thai society shows toward children when they are not at their best.

Young children cry. Six-year-olds can be loud, restless and impulsive. Parents sometimes lose their cool. These are universal realities. Yet, I've rarely seen adults glaring at misbehaving children with rage, scolding them or humiliating the parents struggling to calm them down.

There's a familiar saying in China that children are the flowers of the motherland, reflecting a long-standing belief that the younger generation embodies the nation's future.

In many ways, China has made extraordinary progress in caring for children, with the health of children continuing to improve in recent years. Official data showed that the net enrollment rate for primary school-aged children remained at 99.9 percent, covering around 160 million students nationwide.

With the rise in social media platforms such as Douyin — China's TikTok — and Xiaohongshu, or RedNote, parenting bloggers have attracted huge audiences. Videos capturing children's innocence, humor and candid remarks have won the hearts of countless adults.

For many, children offer a rare sense of purity and wonder amid the pressures of modern life. Yet, online debates over "wild children" — those seen as disruptive or badly behaved — also emerge from time to time.

While people continue to adore these lovable children, such conversations have also prompted deeper reflection on how parents and society should guide the next generation — so that the kindness, sincerity and innocence of childhood can continue into adulthood.

My observations are deeply personal. Still, I wonder whether Thailand offers a small but meaningful answer.

The core value of Children's Day in Thailand underscores a simple social philosophy: parents should lead by example, while children should grow up with gratitude, respect and emotional security. The idea is straightforward — the way society treats children shapes how those children eventually treat the world.

To be raised with love means far more than hearing the words "I love you". It means growing up feeling emotionally safe, accepted without constant judgment, listened to rather than being dismissed, and disciplined with patience rather than humiliation.

Children raised with respect often learn to respect others. Those treated with kindness tend to pass on that kindness. Perhaps, that is the quiet wisdom behind Thailand's affection for children: a society that makes space for its youngest members ultimately produces gentler adults too.

UN agency hails China's green development

By **SHARON NAKOLA** in Nairobi, Kenya
sharon@chinadailyafrica.com

Developing countries facing rapid urbanization and rising housing demand can draw on China's experience with green construction and low-carbon development, United Nations officials say.

Speaking at a media briefing on Wednesday ahead of the 13th session of the World Urban Forum, to be held in Baku, Azerbaijan, between May 17 and 22, UN Environment Programme officials warned that rapid urban growth, particularly in Africa and Asia, is piling pressure on countries to expand housing and infrastructure while also cutting emissions and improving climate resilience.

Martin Krause, director of Climate Change Division at UNEP, said many developing countries are confronting a "dual challenge" of expanding infrastructure while reducing emissions, particularly in regions where housing shortages and inadequate living conditions remain widespread.

He highlighted China's large-scale urban development over recent decades as an example worth studying.

"The work that China has done in this particular sector is certainly impressive," Krause said, adding that African countries facing growing housing and infrastructure needs could learn from such experiences through international platforms that share best practices on sustainable construction and climate action.

Krause said buildings are increasingly becoming central to the climate crisis because they sit at the intersection of emissions, affordability and resilience.

Inefficient buildings lock in high energy demand and increase household costs, while climate-smart buildings can reduce energy bills, strengthen energy security and provide protection against rising temperatures and extreme weather, he said.

Energy efficiency

China's urban expansion demonstrated how countries can pursue large-scale infrastructure development while improving building practices and energy efficiency, lessons that the UNEP said are becoming increasingly relevant as urban populations continue to grow worldwide.

Over the past decades, China has invested significant resources in its transition to an inclusive green economy, and it has proved that the shift would be beneficial for economic growth, climate change mitigation, job creation and improving people's living standards, according to a previous UNEP report.

The nation has been a major innovator and producer of renewable energy, producing the world's largest amount of solar panels and wind turbines, which have been extensively adopted in urban development nationwide.

The UNEP officials also presented the findings of the Global Status Report for Buildings and Construction 2025/2026, to be released next week. The report provides a comprehensive assessment of how the sector can reduce emissions, manage climate risks and maintain affordability while expanding rapidly to meet growing global demand for housing and infrastructure.

Oliver Rapf, executive director of the Buildings Performance Institute Europe, said global building floor space continues to expand rapidly, but efforts to decarbonize the sector remain far behind what is needed to meet international climate goals.

Operational emissions from buildings have increased by 6.5 percent since 2015, even though emissions would need to decline by more than 30 percent to stay aligned with the Paris Agreement pathway, Rapf said. "The world is building fast, falling short as climate risks rise and cities grow."

Hanane Hafraoui, program management officer at the Global Alliance for Buildings and Construction, said governments must move from climate pledges to implementation by making low-carbon and resilient buildings central to national climate plans.

"The task now is to move from pilots to scale, from commitments to implementation, and from climate ambitions to having better homes and better lives for people," she said.

"We cannot solve the climate crisis without making homes more affordable, more climate resilient, and energy efficient."

A dialogue with the Americas

Exhibition dives deep into Latin civilizations in its largest showcase worldwide, with nearly 3,000 artifacts, many of which are making their China debut, **Zhang Kun** reports.

The Shanghai Museum announced the opening of ticket sales for its upcoming exhibition on May 8, *On Top of the World Tree: Ancient Civilizations of the Americas*, which will be the world's largest showcase of ancient American civilizations.

The museum launched sales of 200,000 early-bird tickets through its official WeChat platform and the travel service Trip.com on the same day. More than 10,000 tickets were sold in 40 minutes, breaking the presale record for the massively successful Egyptian exhibition hosted by the museum last year.

Scheduled to run at the Shanghai Museum on People's Square from July 9 to Nov 14, 2027, the *Americas* exhibition will display nearly 3,000 artifacts from Mexico and Peru. According to Chu Xiaobo, director of the Shanghai Museum, it will be one of "the world's largest, most authoritative, most comprehensively narrated, and latest presentations of ancient American civilizations".

At the global launch on May 8, Chu, wearing a shirt specially designed for the exhibition featuring signature plants and animals of the Americas, described it as "a once-in-a-lifetime experience".

The exhibition is the sixth installment of the Shanghai Museum's A Dialogue with the World Exhibition series. Last year, the fifth event, *On Top of the Pyramid: The Civilization of Ancient Egypt,* attracted more than 2.77 million visitors and generated over 30 billion online views, setting a new record for the highest attendance at a single paid exhibition in museums worldwide.

More than 70 percent of the visitors were from overseas and other parts of China outside Shanghai. The exhibition generated revenue of more than 760 million yuan ($111.9 million).

Following the great success of the Egyptian exhibition, the Shanghai Museum has collaborated with leading archaeological institutions in Mexico and Peru, as well as top Chinese scholars, to create a panoramic presentation of ancient American civilizations, including the Olmec, Maya, Aztec, and Inca.

Shanghai officials and diplomats from Peru and Mexico on May 8 launch *On Top of the World Tree: Ancient Civilizations of the Americas*, one of the museum's flagship exhibitions of the year. GAO ERQIANG / CHINA DAILY

The museum will dedicate all its galleries at its People's Square venue to the exhibition. Spanning over 7,000 square meters, the exhibition will be designed in two parts.

Galleries on the first and second floors will be jointly presented by the Shanghai Museum, and the Instituto Nacional de Antropologia e Historia and the Museo Nacional de Antropologia in Mexico. Showcasing more than 2,600 cultural relics from 13 Mexican institutions, this part will highlight the distinct pantheon system and power structures of major Mesoamerican civilizations, focusing on their complex spiritual beliefs and material achievements.

The third-floor, jointly organized with Peru's Larco Museum and NEON Group, which specializes in experimental and large-scale immersive experiences, will feature 325 treasured artifacts from Peru, 116 of which will make their overseas debut. This will be the largest showcase of the Andean civilization in China and one of the most extensive international displays of Andean gold and silver artifacts ever presented by Peru.

One of the largest exhibits will be the *Olmec Colossal Stone Head 4* from the Museo de Antropologia de Xalapa, Mexico. Weighing approximately 4.5 tons, it symbolizes the power of the Olmecs, one of the earliest known civilizations of the Americas.

The tallest exhibit will be *Calakmul Stela 51* from the Museo Nacional de Antropologia. One of the most outstanding portrait works of Mayan art, it depicts Yuknoom Took' K'awiil, the great ruler of the Kaan kingdom based in Calakmul. Due to its 4-meter height, the Shanghai Museum will construct a specially designed, climate-controlled glass case and display it outdoors on People's Square.

To ensure the safe and timely transportation of these artifacts, the Shanghai Museum will charter two large cargo aircraft from China Eastern Airlines. The planes, adorned with motifs inspired by the patterns of ancient Mexican ruins and depicting the *Feathered Serpent*, will travel nearly 30,000 kilometers round-trip to deliver the cultural relics to Shanghai.

Beyond common labels of "mysterious" and "primitive", the Americas possess a complete and profound civilizational system, Chu says. Moreover, there are deep archaeological and cultural connections between it and Asia. To highlight these links, the museum will also display selected Chinese cultural relics on loan from domestic institutions from seven provinces.

According to David Gamarra, consul general of Peru in Shanghai, most of the cultural relics in the exhibition are making their China debut. These artifacts vividly illustrate the artistic style and spiritual life of Andean civilizations, reflecting the exquisite artistry and highly developed culture of ancient Peru.

Gamarra says the exhibition will further strengthen cultural exchange between Peru and China; and hopes it will attract more Chinese tourists to visit the country.

Rodrigo Topete Maza, acting consul general of Mexico in Shanghai, notes the profound friendship and long histories shared by China and Mexico. He hopes that through the exhibition, visitors will sense the deep connections between the two nations and the shared spiritual core of their civilizations.

Zhong Xiaomin, director of the Shanghai Municipal Administration of Culture and Tourism, said at the global launch: "We want to take this exhibition as an opportunity to further build a platform for cultural exchange between China and Latin America and introduce more high-quality Latin American cultural resources to China."

Fused with ballet, Muqam carries Uygur heritage forward

By **ZHANG KUN**

The Shanghai Ballet premiered its latest production, *The Heartbeat of Muqam*, with two performances at the Shanghai International Dance Center on Saturday and Sunday. Inspired by the folk music and dance of the Uygur ethnic group from northwestern China's Xinjiang Uygur autonomous region, the work represents a creative exploration of intangible cultural heritage through dance.

Muqam, recognized by UNESCO as an intangible cultural heritage of humanity, is a traditional performing art that combines the singing, music and dance of the Uygur ethnic group. "Muqam carries the imprint of cultural exchange and integration along the Silk Road, embodying the shared memories and deep emotions of the Chinese nation," says Ji Pingping, director of the Shanghai Ballet.

Founded in 1979, the Shanghai Ballet has long been committed to presenting Chinese culture through the international language of ballet. "We have discovered many connections between ballet and Xinjiang songs and dances," Ji notes.

Scenes from Shanghai Ballet's latest production *The Heartbeat of Muqam*. Inspired by the folk music and dance from Xinjiang Uygur autonomous region, the work represents a creative exploration of intangible cultural heritage through ballet. PHOTOS PROVIDED TO CHINA DAILY

The Heartbeat of Muqam not only marks an innovative breakthrough for the Shanghai Ballet but it also represents the use of dance in telling Chinese stories, she adds.

Creating the ballet spanned three years and involved six research trips to Xinjiang. During their visits, the dancers observed that "Muqam lives in the melodies, rhythms and movements of the local people. It is a natural part of their lives and an intuitive expression of emotion," shares principal dancer Qi Bingxue, who plays the protagonist in the production.

The ballet tells the story of a young musician of the Uygur ethnic group who returns to her hometown to retrace childhood memories and cultural roots, and rediscovers the contemporary vitality of Muqam.

In the dance-theater piece, the heroine livestreams a Xinjiang wedding via mobile devices, sharing the charm of Muqam with a global audience. "It reflects the real-life setting of today's Xinjiang, where Muqam resonates with the people rather than being confined to ancient books," Qi explains.

Ding Wei, former director of the China Song & Dance Ensemble, praises the production for its "outstanding integration of classical ballet and China's intangible cultural heritage".

"The stage design is beautiful, and the dancers deliver top-tier performances," he says, describing the work as "representing the highest level of dance art in Shanghai, and also in China".

He notes that Xinjiang folk dance is improvisational, quite distinct from ballet's structured vocabulary. "I saw a remarkable fusion of the two styles in this production, and the director has done an excellent job," he says.

Director Wang Ge emphasizes the fusion's organic nature: "You can't simply stitch together ballet footwork and folk dance's upper-body movements. It's important to maintain a fine line that keeps it authentically ballet rather than turning into a folk dance show."

Playwright Luo Huaizhen notes that this unprecedented blend significantly enriches the vocabulary of classical ballet and will make a meaningful contribution to the dance world.

A Xinjiang native surnamed Lu, who attended the opening night, recalled her childhood experiences with her friends of Uygur ethnic group: "We would sing and dance whenever people gathered. The pot-bellied character reminded me of uncles back home, and I recognized those dance moves, too!" she says in excitement.

She also commends the presentation of Xinjiang's cultural heritage through ballet. "There are many ways to introduce Muqam to the public. While folk dance is accessible to many, ballet conveys it more vividly to international audiences. We need more efforts like this to share Xinjiang with the world."

Encyclopedia of China enters AI era

Scholars and publishers gather in Beijing to examine how emerging technologies are transforming public access to trusted information, **Yang Yang** reports.

Above: The *Encyclopedia of Chinese and Italian Culture: Art* was highlighted at the conference as a key achievement. The book introduces the representative accomplishments in the fields of art from both China and Italy. **Left:** The conference also features an exhibition of outstanding popular science books.

The inaugural China Encyclopedia Conference, hosted by the Encyclopedia of China Publishing House, took place in Beijing from April 23 to 24, as part of the activities for the country's first National Reading Week after the State Council regulation to promote reading among the public took effect on Feb 1.

The *Encyclopedia of China* is the country's first and most authoritative comprehensive modern encyclopedia. Launched in 1978 and published by the Encyclopedia of China Publishing House under the China Publishing Group, it stands as a landmark national cultural project.

The latest edition, the third one, pioneered a new approach by prioritizing the online version while creating a concise print edition, establishing a knowledge system with professional, thematic, and general sections. By the end of 2025, the online version had 519,000 entries, and the print version was published in 43 volumes, marking significant progress, according to Yang Muzhi, chief editor of the *Encyclopedia of China (Third Edition)*.

"Thanks to the efforts of more than 60,000 experts and scholars, the print and online versions of the *Encyclopedia of China (Third Edition)* have become significant platforms for showcasing Chinese culture and confidence," said Mao Yuansheng, general manager and deputy secretary of the Party Committee of the China Publishing Group, in his speech at the main forum of the conference on April 23.

The China Encyclopedia Conference, themed "Empowering Thousands of Industries, Reaching Thousands of Households", attracted over 600 guests from various sectors. It offered a rich array of activities, including a main conference, forums, a science popularization exhibition, and a music-sharing session, creating a grand celebration of knowledge for the public.

The theme of the conference reflects the trend of digital integration, making authoritative knowledge more accessible, said Mao.

The rapid development of technologies such as AI and big data is profoundly changing the paradigm of knowledge production and dissemination.

Encyclopedias should embrace technology by forming a "human-machine collaboration" model that combines experts, AI, and platforms to solve the challenges of traditional compilation, while steadfastly upholding the spirit of science and the essence of humanity, thereby strengthening the foundation of the national knowledge system, said Bai Chunli, vice-chairman of the editorial board of the third edition of the *Encyclopedia of China* and editor-in-chief of the chemistry section.

Li Yang, a member of the editorial board of the encyclopedia's third edition and editor-in-chief of the economics section, emphasized the critical importance of philosophy and social sciences. In the AI era, cultivating talent requires philosophical thinking and social science literacy. "The encyclopedia must undertake the important task of 'clarifying the source' by providing accurate, systematic, and authoritative knowledge", he said.

However, while new technologies like AI unleash innovative potential, they also pose challenges to copyright protection.

Zhou Huilin, president of the China Copyright Association, pointed out that copyright protection is crucial for promoting the dissemination of encyclopedic knowledge. As a high-quality source of authoritative knowledge, the copyright protection of encyclopedias is particularly important. He proposed three initiatives: adhering to the original source of knowledge, improving institutional safeguards, and deepening cross-disciplinary collaboration.

Gao Shiyi, president of the Encyclopedia of China Publishing House, highlighted that, as a major national cultural project, the encyclopedia focuses on five key areas: digitalization, platform development, intelligence, branding, and systemization to make encyclopedic knowledge accessible to every household. Future efforts will emphasize content quality and collaboration with research institutions, the education sector, and tech companies to build a reliable and engaging knowledge ecosystem, empowering various industries, he said.

Wang Wei, an editorial board member of the third edition of the encyclopedia and editor-in-chief of the archaeology section, said that the archaeology volume is based on Chinese practices and breaks through the constraints of the Western "three elements of civilization" comprising writing systems, urban settlements and metallurgy, proposing new definitions for civilization.

Currently, there is a need to integrate encyclopedic resources with digital technology to support innovation in industries such as cultural tourism and manufacturing, bringing knowledge to life and contributing Chinese wisdom to human civilization, he added.

As a core component of the conference, the Encyclopedia of China Publishing House unveiled and introduced several significant achievements.

Among these, the print version of the *Encyclopedia of China (Third Edition)* and the China Encyclopedia Online represent not just the digitization of books, but also the networking and dynamic upgrading of the national authoritative knowledge system, serving as the "knowledge foundation of the digital age".

The Encyclopedia of Basic Education Network is aimed at the education sector, building a student-centered, technology-supported integrated education ecosystem based on the concept of "borderless learning and comprehensive resource education", striving to provide strong support for teaching and learning in schools.

The Digital-Intelligence Integration Achievement Matrix includes the *China Through Time and Space* digital exhibition, VR youth digital classrooms, and XR science popularization films allowing users to learn and acquire knowledge in an immersive, interactive way, making the learning process enjoyable.

The unveiling of the *Encyclopedia of Chinese and Italian Culture: Art* introduces representative achievements in the field of art from both China and Italy. It aims to deepen exchange and interaction in art and culture between the two countries, which are jointly committed to the protection of cultural heritage and the better promotion of cultural development. It is compiled by the Encyclopedia of China Publishing House and the Italian Institute of the Encyclopedia (Treccani Institute).

On the afternoons of April 23 and 24, six parallel forums were held. The forums included the Encyclopedia Future Path Seminar, Encyclopedia Education Forum, Brand and Cultural Development Forum, Home and School Emergency Safety Development Forum, the launch of the Beijing-Tianjin-Hebei Science Reading Activity, and the release of the List of Outstanding Chinese Popular Science Books along with the New Era Popular Science Publishing and Nationwide Reading Promotion Forum. Each forum aimed to create a "knowledge service solution" for a specific field.

Ancient porcelain city embraces global openness and creative innovation

Left: Spanish potter Jaume Ribalta (left) and his friends display porcelain at a fair in Jingdezhen, Jiangxi province. XINHUA **Right:** A foreign artist looks at ceramics at a carnival held on the sidelines of the 2025 China Jingdezhen International Ceramic Expo in Jingdezhen on Oct 17 last year. ZHOU MI / XINHUA

NANCHANG — With a 3D printer nozzle rotating as it smoothly extrudes clay, a delicate ceramic work is gradually taking shape — a scene that would once have been unimaginable to earlier generations of artisans in Jingdezhen.

It is happening in a studio in the ancient Chinese porcelain capital, a city in East China's Jiangxi province with a porcelain-making history of more than 1,700 years.

The studio's owner, Michael May, a 38-year-old ceramic artist from the United States, believes this new way of "printing" ceramics can greatly expand both the possibilities and efficiency of ceramic production.

"I originally thought that Jingdezhen would reject new technologies, but I didn't expect that there would be 3D printing factories everywhere. The equipment can be rented even in a village," he says.

May adds that the ancient city's openness and inclusiveness led him to stay, continue his experiments and creations, and offer courses to share his techniques and ideas.

Since the Song Dynasty (960-1279), ceramics crafted in Jingdezhen have been exported to Central Asia, West Asia, Europe and Africa. Today, the city still retains its global appeal, drawing more than 5,000 ceramic enthusiasts like May from around the world at peak times.

"Jingdezhen is like an unfolding world map of ceramic culture, and every person who loves ceramics can find a place of their own," says Qurat ul Ain from Pakistan, who is pursuing a doctoral degree at Jingdezhen Ceramic University.

She says she once struggled to decide on a research direction. "Pakistan also has an ancient history of pottery-making, but there are no local doctoral programs related to ceramics, nor much systematic research in the field.

"It was my mentor who encouraged me to focus on the research of ceramic culture in my country," she says. "Jingdezhen not only has a profound history but also an open international exchange program."

As early as 2015, the Taoxichuan cultural and creative district in Jingdezhen launched the Migratory Bird Program, an international artist residency initiative. The program has sent invitations to art institutions in more than 50 countries and regions, attracting 3,600 artists from around the world.

The district holds fairs of various sizes regularly. About 28,600 craftspeople have set up stalls there, with an average age of just 28.

Matt Watterson, a 31-year-old American ceramic artist, enjoys strolling through the city's fairs, where he often finds old ceramic fragments to incorporate into his own creations.

"I can turn my creativity into works by collaborating with the locals here, which is very fulfilling," he says. In his view, the locals' openness and friendliness represent the vibe of this city.

Jingdezhen, with a population of more than 1.6 million, has recorded a net population inflow of 136,000 over the past decade. Among those who have started long-term businesses in the city, more than half come from outside Jiangxi province or even from overseas.

Thanks to increasingly convenient visa-free policies, Jaume Ribalta, a Spanish potter born in the 1990s, was able to invite his parents from his hometown in Spain to Jingdezhen.

"This is the farthest journey my parents have traveled so far. I entertained them in my rural studio in Xianghu village," he says. "I also took them to decorate their own ceramic works and helped them understand the culture of the millennia-old porcelain capital."

After traveling to 20 countries, May finally chose Jingdezhen as the place to realize his ideas. Recently, he has been working to expand his studio.

"I sold all my belongings and came to this city," he says. "I never thought that this place was so inclusive before I came here."

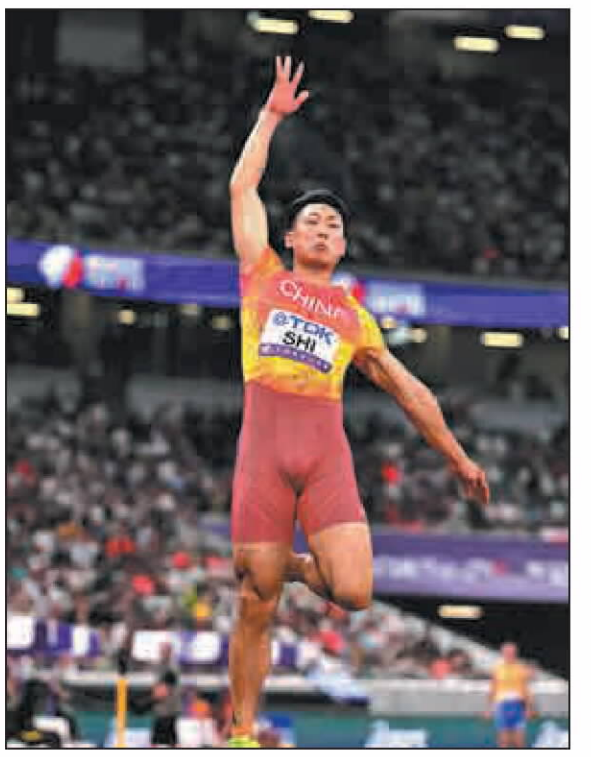
Chinese talent ready to challenge global elites at Diamond League doubleheader

China's star hurdler Wu Yanni has promised to try and close the gap with the international pack at the Diamond League opener. XINHUA

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

With talented young Chinese athletes all laced up and ready to pit themselves against a stacked field of elite champions, the world's premier track and field series has guaranteed fans a thrilling season opener in China.



The World Athletics Diamond League's 2026 curtain-raiser, to be held in Keqiao of Shaoxing city, Zhejiang province, on Saturday, promises to deliver a spectacular showpiece, with China's best sprinters, jumpers and throwers raring to challenge the world's top stars — more than 20 Olympic and world champions, including as many as six world record holders — in front of a home crowd.

And, offering just enough time for pulses to return to normal, a week later in Xiamen, Fujiang province, on May 23, they do it all again, capping off the season's tone-setting doubleheader.

Leading the star-studded international cast confirmed for the Shaoxing leg are Sweden's two-time pole vault Olympic champion Armand "Mondo" Duplantis, men's 400m hurdles world record holder Karsten Warholm of Norway and the fastest women's 100m hurdler in history Tobi Amusan of Nigeria.

A highly popular overseas star among Chinese fans, Duplantis, who just set his 15th and latest world record of 6.31m at an indoor meet in southeastern Swedish city Uppsala in March, will open his outdoor season in a loaded men's field that also includes Greece's Emmanouil Karalis, who moved to second on the athletes' world ranking in February with a 6.17m clearance in Athens, and two-time world champion Sam Kendricks of the United States.

World record pole vaulter Armand "Mondo" Duplantis of Sweden (left) will look to produce another memorable performance in front of the Chinese fans, while defending long jump champion Shi Yuhao is hoping to land on the top of the podium again. XINHUA

Having triumphant memories of China, including his then-world-record-setting feat of 6.24m at last year's Xiamen leg, Duplantis, who has stayed unbeaten since 2023, will be keen to extend his winning streak and maybe just give fans another unforgettable moment this weekend.

Warholm will also kick-start his season hoping to carry on the momentum from his last visit to Shaoxing, when he clocked a 2025 world-leading 47.28 to win the 400m hurdles. This year though, he will be competing in the series-special 300m format, which was added to the league program last season and has replaced the traditional 400m in Shaoxing this year. He will be up against 2022 world champion Alison dos Santos of Brazil and world bronze medalist Trevor Bassitt of United States.

"I am so excited to return to Keqiao again this year," said the 30-year-old Norwegian, who set the 400m world mark of 45.94 with his golden finish at Tokyo 2020. "Winning here for the first time in my career last year was such a great feeling. I look forward to a great battle."

Women's track is expected to provide even greater intrigue, with local favorites ambitious to make their presence felt against their mighty international counterparts in both the 200m sprint and 100m hurdles.

Loaded with star power from Jamaica's two-time world champion Shericka Jackson and 2023 world 100m champion Sha'Carri Richardson of the US, the 200m race in Shaoxing is a dream stage for China's teen prodigy Chen Yujie, a Zhejiang native, to measure her meteoric rise against the world's fastest in front of her home crowd.

Chen, a 17-year-old high school student born and developed in Ningbo, shot to fame by winning both the 100m and 200m finals at the 2025 Chinese National Games, becoming the youngest ever to win both sprint titles in the domestic Games' history.

With a personal best of 22.97, and setting a new Asian U18 record at a South Korean meet in May last year, Chen is the only Asian athlete currently ranked in the 200m top 50.

The 100m hurdles will feature an even stronger lineup, bringing together winners of the past three outdoor worlds – Ditaji Kambundji, Danielle Williams and Amusan – along with reigning Olympic champion Masai Russell.

Nigerian great Amusan leads the field with her world record dash of 12.12, set in 2022 in Eugene, Oregon, yet faces an unpredictable test in Shaoxing with the starting blocks stacked with talent.

China's own star hurdler Wu Yanni, a celebrity among the sport's community domestically, is determined to at least try to keep up with the pack.

"I won't set any limit for myself, despite the gap between myself and the world's best," said Wu, who set her PB of 12.74 at the 2024 national championships.

"I will give my best for sure."

Shaoxing will also host a thrilling men's 100m sprint, where reigning 200m Olympic champion Letsile Tebogo of Botswana, South Africa's Akani Simbine and the US trio of Christian Coleman, Kenny Bednarek and Trayvon Bromell are pushing the bar high enough for an Olympic-caliber showdown.

In men's long jump, the Chinese combo of Shi Yuhao, the meet's defending champion, and Zhang Mingkun, who had to withdraw last year due to injury, are both expected to leap onto the podium on home soil.

After the Chinese doubleheader, the Diamond League will travel to another 12 cities across four continents en route to the series finale in Brussels in September.

SOCCER

How Paris Saint-Germain won its record-extending 14th Ligue 1 title

PARIS — Paris Saint-Germain ended up with the title again, but at least it had a rival for most of the season this time.

The defending champion secured its fifth straight French league crown — and record-extending 14th overall — by beating its closest chaser Lens 2-0 on Wednesday.

It finally ended the resistance of Lens, which held its own until the penultimate round, despite having a much smaller squad and budget than PSG, one of the world's most valuable clubs.

"It's the first time in my three seasons here that there's been a genuine rival," PSG boss Luis Enrique said, praising Lens and its coach Pierre Sage. "It has been motivating, they have shown their level."

Last season saw PSG wrapping up the title with six games to spare — and the only two league defeats of that campaign came after the title was sealed. PSG finished 19 points clear of second-place Marseille and scored a whopping 92 goals.

It was not so easy this time.

PSG has lost five league games so far and is nine points ahead of one-time champion Lens heading into Sunday's final round.

Sage's far smaller squad was hit by fatigue and the team — however willing — could not realistically sustain the challenge over 34 matches. It was PSG's fifth straight league title since Lille's championship victory in 2021.

Here's a closer look at how it was won.

Sharing the goals

PSG relied heavily on the scoring of Ousmane Dembele last season, when he netted 21 league goals.

This season, no PSG player was near the top of the scoring charts and the goals have been spread around.

Dembele and winger Bradley Barcola have netted 10 each, with Khvicha Kvaratskhelia (8), Desire Doue (7) and Goncalo Ramos (6) all contributing at key moments.

Kvaratskhelia's impact

In years to come, Kvaratskhelia may eventually be seen as the best signing in the club's history. The Georgia winger has been inspirational for PSG all season.

Not only does he provide incredible speed, finishing and dribbling from the left wing — even though he can play with almost equal efficiency on the right — his tireless running and relentless tracking back marks him out as a brilliant defender.

No wonder Enrique was delighted to sign him from Napoli in January last year, having failed in a previous bid.

Although he paid a large transfer fee of 70 million euros (then $72 million), it is starting to look like a bargain.

Ruthless selections

Enrique showed a ruthless streak by dropping goalkeeper Lucas Chevalier — a summer signing to replace Gianluigi Donnarumma — and swapping him out for Matvey Safonov, who made several saves against Lens on Wednesday.

Enrique sent a clear message to his players that status and reputation do not offer them any guarantees of first-team soccer.

He did the same last season when he dropped Dembele for a crucial Champions League game on disciplinary grounds, and the season before, when he sold Neymar and Marco Verratti in order to rebuild the side in his own way.

In an era of increasing player power, Enrique showed that his authority could not be eroded.

He also maintained a close bond with the fans, constantly praising them — and even singing one of the club anthems with them following the Champions League semifinals when PSG overcame German juggernaut Bayern Munich.

He also managed the fatigue levels of his players well in a season that began with recurring injuries.

While he regularly rested captain Marquinhos and Dembele in Ligue 1, he kept midfielders Vitinha and Warren Zaire-Emery in the side as near ever-presents.

"We always look for what's best for each player individually. If you play less or more, it doesn't mean you're weak or strong, but that you have different needs," Enrique explained. "I always aim to get the three points, but also to protect the players' health."

He was also magnanimous in a rare defeat — namely when Sage won the award for the French league's coach of the year.

"He deserves to win this trophy, Enrique said. "Because what he's done with Lens is incredible."

Jingzhou Intermediate People's Court of Hubei Province

Announcement

(2026) E 10 P No. 1

The Court, upon the application of Ultinon Motion Technology (Hubei) Co., Ltd., ruled on April 2, 2026 to accept the case of bankruptcy reorganization of Ultinon Motion Technology (Hubei) Co., Ltd., and on April 30, 2026, appointed Beijing Dacheng Law Offices, LLP (Wuhan) as the administrator of Ultinon Motion Technology (Hubei) Co., Ltd. (hereinafter referred to as the "Administrator").

Creditors of Ultinon Motion Technology (Hubei) Co., Ltd. shall file their claims with the Administrator (mailing address: No. 17 Philips Road, Xinjiangkou Town, Songzi City, Hubei Province; postal code: 434200; contact person: Fu Sailun; tel.: +86 1857-2830-083; email: sailun.fu@dentons.cn) by 24:00 (Beijing time) on July 15, 2026, providing a written statement of the amount of the claim, whether the claim is secured, and whether it is a joint and several claim, along with relevant supporting documents. Specific document requirements and filing methods are subject to the Notice on Filing of Claims published by the Administrator on the National Enterprise Bankruptcy Information Disclosure Platform (https://pccz.court.gov.cn).

Creditors who fail to file their claims within the aforementioned period may make supplementary filings before the draft reorganization plan is submitted to the creditors' meeting for discussion, provided that they shall bear the costs incurred for reviewing and verifying such supplementary filed claims. Creditors who fail to file their claims in accordance with the law shall not exercise their rights during the implementation of the reorganization plan. After the implementation of the reorganization plan is completed, they may exercise their rights in accordance with the repayment conditions for similar claims as stipulated in the reorganization plan. Debtors or property holders of Ultinon Motion Technology (Hubei) Co., Ltd. shall promptly settle debts or deliver property to the Administrator.

The Court has scheduled to hold the first creditors' meeting of Ultinon Motion Technology (Hubei) Co., Ltd. at 10:00 (Beijing time) on July 30, 2026, via the National Enterprise Bankruptcy Information Disclosure Platform (https://pccz.court.gov.cn). Creditors who file their claims in accordance with the law have the right to attend the creditors' meeting. If an attending creditor is a legal person or any other organization, the documents evidencing its legal person status shall be submitted; if an attending creditor is a natural person, the individual identification documents shall be submitted; if an agent is appointed to attend the meeting, a power of attorney shall be submitted. The identification documents and powers of attorney submitted by a creditor that has no domicile within the territory of the People's Republic of China shall be notarized by a notarial institution in the country where the documents are issued and authenticated by the embassy or consulate of the People's Republic of China in that country, or shall undergo the certification procedures stipulated in the relevant treaties concluded between the People's Republic of China and that country.

It is hereby announced.

Visit comes at pivotal juncture

United States President Donald Trump started his three-day state visit to China on Wednesday.

Here we are again, yet another pivotal moment as the world revolves around US-China relations.

Once again, we have arrived at a point where action or inaction will shape the direction of trade, technology, global security, the economy and geopolitical stability of the US, China and the rest of the world.

Peace and prosperity should be our goal.

The last thing either side and the world need now is greater instability. The world cannot afford a new Cold War, or worse, and wise choices must be made to ensure a peaceful and prosperous future for all of humanity.

We collectively need to seek "win-win" solutions rather than treat this vital relationship as a zero-sum game where one party's success requires the other's failure.

Perhaps at no other time in the modern US-China engagement has it been as imperative that we avoid unnecessary confrontation and conflict by keeping dialogue open and engaging in constructive, government and nongovernmental exchanges at the highest levels, as well as rebuilding and strengthening people-to-people, educational and cultural exchanges that have waned in recent years, particularly student exchanges, which are a foundation for long-term understanding between our two peoples.

Dialogue between US and Chinese leaders must have a "trickle-down" effect that improves the overall relationship, reduces distrust and produces positive, tangible results for average citizens on both sides of the Pacific.

Change is inevitable. Progress should not be optional when it comes to US-China geopolitical relations.

Going forward, all major world issues will intersect at the corner of Beijing and Washington, DC. Are we going to swing for the win or strike out?

Both nations have work to do at home to better serve our respective peoples.

President Xi Jinping holds a welcoming ceremony on Thursday morning outside the Great Hall of the People in Beijing for United States President Donald Trump, who is on a state visit to China. FENG YONGBIN / CHINA DAILY

Xi: China, US should be partners

Success in one is opportunity for the other, stable bilateral relationship good for world

By CAO DESHENG
caodesheng@chinadaily.com.cn

China and the United States should find the right way for major countries to get along well with each other in the new era, President Xi Jinping said on Thursday.

Xi made the remarks during his talks with visiting US President Donald Trump at the Great Hall of the People in Beijing.

Xi stressed that the two countries have more common interests than differences, success in one is an opportunity for the other, and a stable bilateral relationship is good for the world.

He expressed the hope that 2026 will be a "historic, landmark year" that opens up a new chapter in China-US relations.

"China and the United States both stand to gain from cooperation and lose from confrontation. We should be partners, not rivals. We should help each other succeed and prosper together," he said.

Noting that transformation not seen in a century is accelerating across the globe and the international situation is fluid and turbulent, Xi said that the world has come to another crossroad.

"Can China and the United States overcome the Thucydides Trap and create a new paradigm of major-country relations? Can we meet global challenges together and provide greater stability for the world? Can we build a bright future together for our bilateral relations in the interests of the well-being of the two peoples and the future of humanity? These are the questions vital to history, to the world, and to the people. They are the questions of our times that the leaders of major countries need to answer together," Xi said.

Xi stressed that the Taiwan question is the most important issue in China-US relations. If it is handled properly, the bilateral relationship will enjoy overall stability. Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy, he said.

"Taiwan independence" and cross-Strait peace are as irreconcilable as fire and water, he said, adding that safeguarding peace and stability across the Taiwan Strait is the biggest common denominator between China and the US.

On China-US economic and trade relations, Xi said that they are mutually beneficial and win-win in nature, and trade wars have no winner.

He said that where disagreements and frictions exist, consultation conducted on an equal footing is the only right choice.

Xi noted that the talks between economic and trade teams of the two countries, held in the Republic of Korea on Wednesday, produced generally balanced and positive outcomes, adding this is good news for the people of the two countries and the world. The two sides should jointly sustain the good momentum that they have worked hard to create, he said.

In his speech, Trump hailed his "fantastic" relationship with Xi, saying Xi is "a great leader".

He said that the relationship between the US and China is going to be better than ever before.

Before the talks, Xi held a welcoming ceremony for Trump outside the Great Hall of the People.

Beijing rolls out red carpet for Trump

By MO JINGXI
mojingxi@chinadaily.com.cn

Beijing rolled out the red carpet to welcome US President Donald Trump for a much-anticipated summit with President Xi Jinping, as the world looks to the two largest economies for greater stability.

Inside

• Editorial, **page 7**
• See more, **pages 2-5**

Xi held a welcoming ceremony for Trump on Thursday morning outside the Great Hall of the People in Beijing, before they held talks.

Trump arrived in the Chinese capital on Wednesday evening, beginning his three-day state visit to China. Vice-President Han Zheng greeted him at the airport.

The trip marks the first state visit to China by a sitting president of the United States in nearly nine years and follows Xi and Trump's meeting in Busan, Republic of Korea, last October, which helped to set the tone for efforts to stabilize and improve China-US relations.

The Xi-Trump summit is seen as another important moment in head-of-state diplomacy, which has played a strategic guiding role in China-US relations.

Over the years, Xi has repeatedly stressed that the China-US relationship is among the most important bilateral relationships in the world, and that the two countries must find the right way to get along.

His message has been consistent: While China-US cooperation can enable the two countries to achieve major undertakings serving their own interests and those of the world, confrontation would spell disaster for both countries and the wider world.

Analysts said the high-level engagement between Xi and Trump will be closely watched as to whether the two sides can keep the "giant ship" of China-US relations on a steady course, manage differences through dialogue, and expand practical cooperation, thereby injecting greater certainty into a turbulent world.

For a relationship as significant and complex as that between China and the US, direction matters as much as momentum.

During the meeting with Trump in Busan, Xi said, "You and I are at the helm of China-US relations. In the face of winds, waves and challenges, we should stay the right course, navigate through the complex landscape, and ensure the steady sailing forward of the giant ship of China-US relations."

In their phone conversation last year, Xi said that recalibrating the direction of the giant ship of China-US relations requires the two sides to take the helm and set the right course, adding that it is particularly important to steer clear of various disturbances and disruptions.

Zhiqun Zhu, a professor of political science and international relations and director of the China Institute at US-based Bucknell University, said the "giant ship" metaphor highlights both the complexity of the relationship and the importance of guiding it in the right direction.

"It's a top-down approach, with leaders on both sides playing a pivotal role," Zhu said. "Only when the general direction is set can the relationship move forward."

Zhu said that maintaining the momentum of high-level engagement is crucial for the stability and predictability of China-US relations. Leaders on both sides, he said, should be commended for overcoming difficulties, lowering tensions and moving the relationship forward.

But setting the course also requires a clear understanding of the nature of the relationship.

At a welcome dinner in San Francisco in November 2023, Xi said that he had long been thinking about "how to steer the giant ship of China-US relations clear of hidden rocks and shoals, navigate it through storms and waves without getting disoriented, losing speed or even having a collision".

"In this respect, the number one question for us is: Are we adversaries, or partners? This is the fundamental and overarching issue. The logic is quite simple. If one sees the other side as a primary competitor, the most consequential geopolitical challenge and a pacing threat, it will only lead to misinformed policymaking, misguided actions and unwanted results," Xi told participants from across American society.

People wave Chinese and United States flags to welcome US President Donald Trump, as he arrives in Beijing on Wednesday. Trump is on a three-day state visit to China. WANG JING / CHINA DAILY

Sun Chenghao, a fellow at Tsinghua University's Center for International Security and Strategy, said the "giant ship" metaphor speaks to the extraordinary weight of the relationship.

"China-US relations are too large and too consequential to be allowed to drift off course, or even capsize due to temporary storms," Sun said.

China and the US are the world's two largest economies and permanent members of the United Nations Security Council, and both play major roles in regional and global affairs.

Despite the twists and turns in bilateral ties, China-US economic relations remain deeply intertwined. Chinese customs data showed that bilateral trade in goods reached 4.01 trillion yuan ($590 billion) in 2025, accounting for 8.8 percent of China's total foreign trade.

"China's view that the relationship concerns not only the well-being of the two peoples but also the future of humanity is not merely diplomatic rhetoric," Sun said. "Rather, it is a judgment based on real interests and the stability of the international system."

That judgment has run through Xi's remarks on China-US relations over the years.

When meeting with Trump during his first term as US president in 2017 at the latter's Florida resort, Xi said there are a thousand reasons to make China-US relations a success, and not a single reason to break them.

Nations' friendship still bouncing along

From Ping-Pong Diplomacy to sports and youth exchanges, China and US continue building bridges

By ZHANG YUNBI
zhangyunbi@chinadaily.com.cn

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

Young people from China and the United States take a group photo during an event to commemorate the 55th anniversary of China-US Ping-Pong Diplomacy in Beijing on April 10. ZHAO WENYU / CHINA NEWS SERVICE

Deliah Autry, 30, is a member of the United States Women's National Flag Football Team, a three-time world champion, and a doctor of physical therapy specializing in pediatrics.

Last August, she made her first trip to China, attending the 12th World Games hosted by Chengdu in Sichuan province. The souvenirs that impressed her most included a Labubu doll and the games' medals, she said.

"The medal itself is so intricate and detailed, and has a little necklace. It is something that I would love to show my kids one day," she said.

The cultural events also impressed her. At the athletes' village, Chinese college students helped them try immersive cultural activities.

"We got to do arts and crafts, learn how to write our names in Mandarin. We got to try on traditional Chinese clothing, so it was just an awesome way for us to learn from them ... a great experience and a way for us all to connect," Autry said.

She made her second trip to China last month. In Beijing, she took part in the commemoration to mark the 55th anniversary of China-US Ping-Pong Diplomacy and the launch ceremony of the China-US Youth Sports Exchange Events, which received a congratulatory message from President Xi Jinping.

Autry said she now has a better and deeper connection to and understanding of Chinese culture.

"I am impressed by the people, how genuine and kind-hearted everybody is, and I think it is something that I have personally attached to you (China) because you see the true humanity and love, especially for sports," she said.

In Beijing, she watched a high school flag football team from Tacoma, Washington state, playing against a Chinese student team.

Autry said flag football is a great avenue to continue making connections between the cultures, despite language barriers and differences in cultures and politics.

"There were a lot of handshakes, high-fives, and smiles, and I think that just brings the positivity forward ... It was just an awesome display of how sports bring everybody together," she added.

"There is a mutual understanding and respect for these athletes, and we all know that we are playing with the same passion and love for the game," she said.

Autry said sporting events and exchanges are a great way to show young people how cultural differences and language barriers are just small things and "what the true purpose is in life, which is to find a deeper connection with other humans across the world".

Last year, Autry met a lot of the players from the Chinese women's national team at flag football tournaments.

"I follow a lot of them on social media, and we are able to connect. And there have been times throughout the year where we have seen each other outside in other tournaments and it is just really awesome to build that connection," she said.

Reaching out

Justin O'Jack, chief representative of the University of Virginia's Pacific Asia Office, encourages young Americans to engage in more trips outside the US.

"These kinds of trips, where students can travel abroad and spend time in a country like China, really have a transformative impact on a young person's life," he said in an interview with China Daily, "... if their only impression of China is through the media that they consume, of course it's going to be different than experiencing it as a person here in China," he added.

O'Jack studied abroad when he was a college student, first in India and then in China.

"That experience as a student studying abroad in China definitely has influenced me in many ways, one of which is in the career that I chose — first running study abroad programs in Shanghai for American students and now representing an American university."

He said Chinese students represent the majority of international students applying to his university's undergraduate program for the current class graduating in 2030.

"Chinese students by far make up the majority of applications we received — I would say, (there are) over 10,000 applications from around the world. Over 40 percent of those were from students here in China," he said.

"The interest in studying abroad in the US continues to be very strong, especially among the undergraduate student population," he added.

During the COVID-19 pandemic, there was a hiatus in the number of American students from his university studying in China, and now "we are seeing that start to grow and rebound", O'Jack said.

"We are not at the pre-pandemic levels yet, but we are still working and heading in the right direction," he said.

Sharing ideas

In 2023, President Xi proposed an initiative to invite 50,000 young Americans to China for exchange and study programs over a five-year span.

O'Jack noted that the program has largely focused on high school and younger groups of students, and "that is important because the youth are our future".

Anders Ibsen, 40, who was sworn in as mayor of Tacoma in January, hosted a Chinese ping-pong delegation at Lincoln High School in the city, a school that Xi visited in 2015.

Ibsen said it is very important to "give young people an understanding about what it means to have greater partnerships, especially with our growing global economy".

"That's the basis of shared prosperity as well as peace ... in someone's life. If they can understand that it's a big world and that there are a lot of other different ideas out there, then we're all better off," he added.

Last month, Ibsen traveled to China with Tacoma high school students, his second visit to the country. "I first visited here in 2018. I visited Fuzhou (in Fujian province), which is one of Tacoma's four sister cities."

"To give you some reference, the city of Tacoma is a major port city on the west coast ... About half of our total trade comes from China. As a result, we very strongly value the partnership," he said.

Chinese trade will continue to be very important to the port of Tacoma, as well as the investments it has seen in the local economy, Ibsen said.

During the trip, Ibsen said the group was also able to learn more about innovative programs the government is working on. "There's always something to learn. We should always continue being students," he said.

When asked about what impressed him most in China, he said it was "the people".

"In the case of the city of Tacoma, my primary concern is keeping my residents safe and prosperous ... and by having these cultural exchanges, we can focus on the results, we can dispense with noise, we can dispense with politics," he said.

"We can just focus on what makes things better for people, what makes for a happier, more peaceful world. And that is the strength of cooperation. That's why we're here," he added.

Lasting impact

The first US table tennis delegation arrived in China in April 1971, for the icebreaking visit that helped boost the launch of bilateral diplomatic ties.

At that moment, Jan Berris had been in her position at the US consulate in Hong Kong for just two years "as a very junior consular official working on cultural affairs". However, she said she knew that "the event would have repercussions on the US and China as well as the rest of the world".

"But I had no idea that it would have such a huge impact on my own life," said Berris, who is now vice-president of the National Committee on US-China Relations, a nonprofit organization and advisory body founded in 1966 to encourage understanding and cooperation between the two nations.

When she returned to the US the month after the historic visit, two of her former professors at the University of Michigan asked if she would consider working at the committee based in New York.

The committee was then preparing to co-host with the US Table Tennis Association the visit of the Chinese ping-pong team to the US.

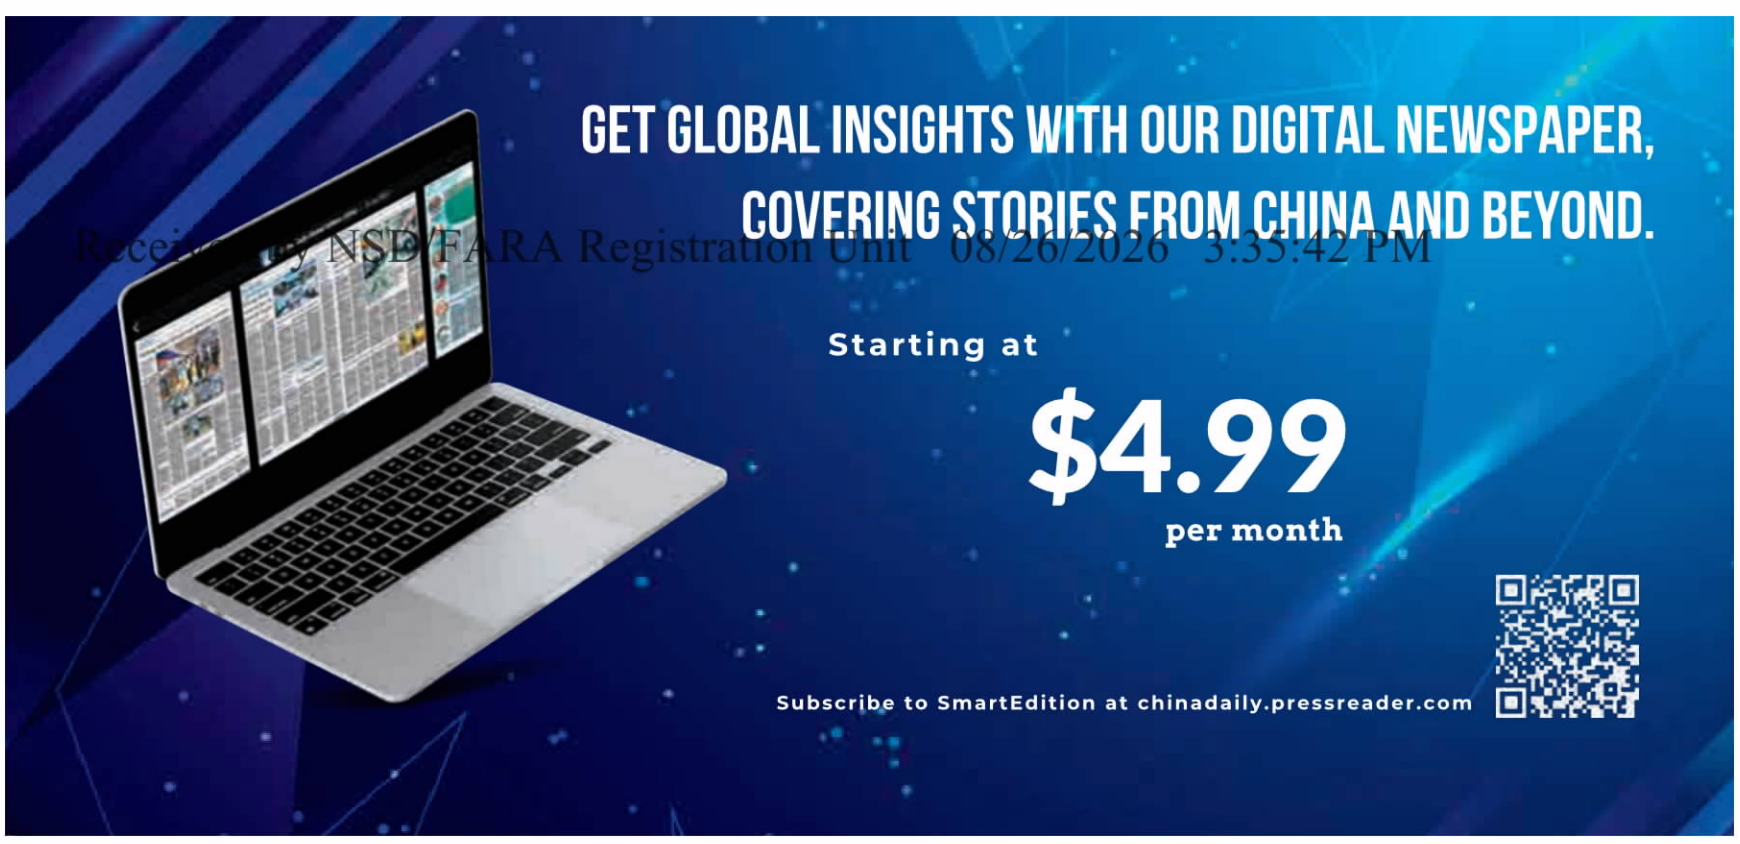
"My professors were on the board of the national committee and they felt that my diplomatic experience, brief as it was, would be helpful," Berris said.

She said she was not quite sure that she really wanted to live in a big city as "it was formidable".

"Actually, my undecided state was resolved by another major announcement that was made just a few months later, when President Richard Nixon went on national television and announced that Dr Henry Kissinger had made a secret visit to China," she explained.

One of the results of that visit was the Chinese ping-pong team's visit to the US in April of 1972.

"That helped me make my decision," Berris said. The next day, she asked the US State Department if she could work on the planning for the Chinese team's visit.



What began with a small ping-pong ball — slowly at first, and then in leaps and bounds — grew into a "broad and eventually very deep" network of relations between the two countries in every profession, and every field imaginable that brought all levels in the two societies together, she said.

"Now, a lot of people ask me how I can work in the same job for 55 years. But for me it has been easy, because I love my job," she said.

The first exchanges and the visits of the two ping-pong teams, with the hundreds and thousands of exchanges that followed, "serve to help people from both countries humanize the other" side, she said.

CEOs upbeat on China market

Presence of business leaders shows nation remains highly important for US companies

By **WANG KEJU, JIANG XUEQING, MA SI** and **ZHONG NAN**

Business leaders from the United States have voiced their confidence in the Chinese market and pledged to expand investments in what they consider as one of the world's most significant engines of future growth, given the market's vast scale, ability to innovate rapidly and resilient supply chains.

A high-profile business delegation comprising top US executives from sectors including technology, finance, aviation and agriculture arrived in Beijing on Wednesday as part of US President Donald Trump's entourage. The delegation's presence signals that commercial ties binding the two economies remain too deep to sever, economists and business executives said.

Among the top business leaders and CEOs visiting with Trump are Jensen Huang of Nvidia, Tim Cook of Apple, Elon Musk of Tesla and SpaceX, Cristiano Amon of Qualcomm, Larry Fink of BlackRock and Kelly Ortberg of Boeing, according to a Truth Social post by Trump. Also on the list are executives from GE Aerospace, Goldman Sachs, Citi, Mastercard, Visa, Blackstone, Cargill and more.

Speaking to China Daily, Mastercard CEO Michael Miebach said: "China is one of the world's most dynamic economies, and Mastercard is committed to the market for the long term.

"Since we began processing domestic transactions in May 2024, we've made strong progress — expanding acceptance, deepening local partnerships and bringing simple, secure 'tap and go' experiences to everyday life."

Looking ahead, he added, "We will continue to invest in China and bring more products and services that support both businesses and consumers."

According to experts, the lineup of CEOs from some of the US' most influential companies sends a clear signal that despite years of tariff impositions, export controls and heated talks of decoupling, China remains a highly significant market for US businesses.

"The economic gravity between the two countries remains immense," said Chen Wenling, a senior researcher at the Academy of Contemporary China and World Studies. "Even as trade tensions and geopolitical risks cast a shadow, the fundamental forces of China-US complementarity have not disappeared."

Chen noted that the US leads in financial markets and retains significant high-tech advantages, while China's edge in market scale, supply chain depth and rapid innovation is equally real.

Sean Stein, president of the US-China Business Council, said: "If you just say they're the two largest economies, you're missing the most important part. They're also the two most dynamic and most innovative economies."

"It is when you add the innovation and dynamism pieces that you truly recognize the need for the two countries to find ways to work together more effectively," Stein said.

Data released in November by the Chinese embassy in the US showed that more than 80,000 US companies have invested in China, while 7,000 Chinese firms operate in the US.

On Wednesday, a spokesperson for the China Council for the Promotion of International Trade said that the council welcomes representatives from the US business community to visit China, adding that there is plenty of scope for, and tremendous potential in, practical cooperation between Beijing and Washington.

"We look forward to the business communities of both countries further deepening exchanges and cooperation, and making new contributions to the stable, healthy and sustainable development of China-US relations," said the spokesperson.

In addition to the companies in the delegation, US businesses across industries continue to demonstrate their confidence in the Chinese market through tangible action.

Henry Ding, president of 3M China, said: "In recent years, 3M has continued to expand its domestic manufacturing footprint, strengthen local R&D innovation capabilities, and accelerate the localization of its full value chain in China, spanning R&D, testing and manufacturing."

He added that today, more than 50 percent of the products 3M sells in China are manufactured locally.

Ding said that 3M China will continue to increase its local R&D investment this year and plans to achieve more than 30 percent growth in new product launches compared with 2025, significantly outpacing other global markets.

Ian Shih, president of Rockwell Automation China, said that China's vast market, complete industrial ecosystem and continued high-level opening-up provide strong support for companies seeking long-term growth and diversified application opportunities.

At the 8th China International Import Expo held in Shanghai last November, US companies claimed the largest exhibition area, with their pavilions collectively covering more than 50,000 square meters, marking the seventh consecutive year that US companies have led all foreign participants.

Collaboration in energy sector expected to expand

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Expanding energy ties between China and the United States will contribute to broader bilateral economic cooperation amid shifting global market dynamics, industry experts said.

Liu Jia, chief expert at the Economics & Technology Research Institute, think tank of China National Petroleum Corp, or CNPC, said that the world's two largest economies share a complementary dynamic, with the US' energy export growth aligning with China's substantial market demand.

The push for closer cooperation comes as the US rapidly expands its liquefied natural gas infrastructure, with export capacity projected to reach 150 million metric tons per year by 2028, according to the research institute.

Liu said that this expansion creates a structural necessity for partnerships, as new US liquefaction projects require the security of long-term buyers to obtain necessary financing and make final investment decisions. "China offers the world's most predictable demand growth, providing the scale needed to anchor these US infrastructure investments," he said.

According to figures released by the institute, China imported 68.43 million tons of LNG in 2025 and is expected to maintain its position as the world's top LNG importer this year.

This synergy has already been evident in the market for years, with major Chinese State-owned enterprises such as China Petroleum and Chemical Corp, or Sinopec, and CNPC signing long-term purchase agreements with leading US exporters, including Cheniere Energy and Venture Global LNG.

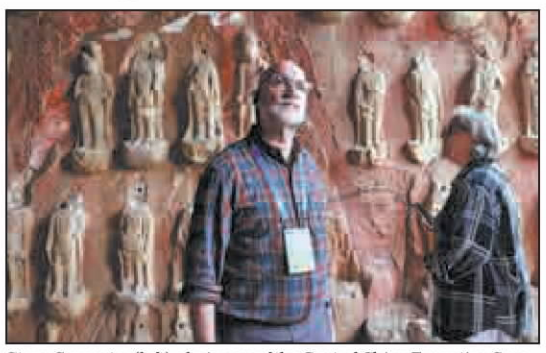
According to the institute, energy has always been an important component of the broader trade balance between the two nations, highlighting the sector's role in addressing trade disparities.

In addition to direct trade, the two countries have also established investment links.

US oil major ExxonMobil began operating its mega ethylene project in Huizhou, Guangdong province, last year. It is one of the largest foreign investment projects in China, and the first major petrochemical project constructed in China solely by a US company.

According to Liu, US and Chinese companies have jointly invested nearly $200 billion in third-party oil and gas projects across the Middle East, Central Asia and Africa.

To maintain this momentum, Liu suggested that both sides should expand cooperation into emerging fields such as energy storage and power grid technology.



Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University, said that stable and predictable energy trade has provided an important area of mutual benefit.

As China's demand is predictable and the US supply is expanding, energy can serve as a bridge through which both sides can achieve tactical gains, Lin said.

Experts also recommended strengthening ties in traditional industrial sectors, including the supply of chemical feedstocks such as ethane and propane, as well as uranium mining.

"Establishing regular dialogue mechanisms between think tanks and industry bodies in both countries will be essential for stabilizing market expectations and deepening mutual consensus," said Liu from the Economics & Technology Research Institute. "This framework is necessary to ensure that energy cooperation remains a robust cornerstone of the bilateral relationship, even amid broader geopolitical shifts and profound changes in the global landscape," he added.

Heritage tour

The work started in the late Northern Wei Dynasty (386-534) and flourished during the Tang Dynasty (618-907). WANG LEI / CHINA NEWS SERVICE

Visit: Both sides should be beacons for building bridges

From page 1

I have advocated, over decades, that the best way for the US to compete with China is to invest in our own people, infrastructure, technology and education, rather than trying to "knock China down". Pushing a strategy to hold China back will be as effective as starting to build a chain-link fence as a tsunami is coming ashore.

Worldwide, people are closely watching the development of the US-China interaction, hoping that agreements would be reached to promote a more stable world order.

China-US economic and trade cooperation has brought benefits and challenges to both countries for over half a century.

We are at an inflection point. A miscalculation or mistake will have a devastating global impact.

While we need to continue to work toward building sensible economic, cultural and military ties, it is vital that China and the US continue to follow a seven Cs framework to help manage this delicate bilateral relationship, which is critical to the world:

Worldwide, people are closely watching the development of the US-China interaction, hoping that agreements would be reached to promote a more stable world order.

- Communication (Open, high-level and subnational channels)
- Collaboration (On global issues like health and climate)
- Cooperation (To seek win-win solutions)
- Coordination (On regional and global issues)
- Competition (Managed and constructive)
- Contextual Understanding (Grasping the history and perspectives of both nations)
- Avoiding confrontation, conflict and casualties

As the 21st century unfolds, both the US and China should be the beacons for building bridges.

It is imperative that we find ways to develop a shared vision and common agenda in areas that are in our collective national interests while we have open dialogue on topics where we disagree.

Chinese and US activists, not just governments, should work to create and endow a robust international exchange, a people-to-people organization that connects students, artists, writers, athletes, tourists, educators, health and behavioral healthcare professionals, poets, sub-national government officials and NGOs between our two countries to listen, to understand and build bridges that will help sustain peace and prosperity for all.

These kinds of global connections lay the groundwork for meaningful dialogues, thoughtful synergy, mutual respect, joint prosperity and peaceful collaboration.

We need to get along and jointly prosper peacefully.

The author was deputy chief of staff to former Michigan governor James Blanchard, president and CEO of the economic council of Palm Beach County, Florida. The views do not necessarily reflect those of China Daily.

Summit: Cooperation is a realistic choice

From page 1

In March 2024, when meeting in Beijing with representatives from the US business, strategic and academic communities, Xi said that whether the two countries can find the right way to get along bears on the well-being of the two peoples and the future of humanity.

Sun said the most immediate benefit of a stable and predictable China-US relationship is that it reduces uncertainty for both sides.

"If tensions continue to rise, those affected first are often not abstract strategic interests, but ordinary businesses, farmers, consumers, international students and researchers," Sun said.

He added that trade barriers would push up costs, technology restrictions would narrow the space for innovation cooperation, and fewer people-to-people exchanges would weaken mutual understanding between the two societies.

Beyond the bilateral level, China-US cooperation is also closely watched in terms of its implications for global governance at a time when the world faces sluggish growth, geopolitical tensions and mounting challenges requiring international coordination.

In Busan last year, Xi told Trump: "The world today is confronted with many tough problems. China and the US can jointly shoulder our responsibility as major countries, and work together to accomplish more great and concrete things for the good of our two countries and the whole world."

According to Sun, many global challenges — from climate change and artificial intelligence to public health, financial stability and regional security — cannot be effectively addressed without sustained communication between the two countries.

Zhu, of Bucknell University, echoed that view, saying that if the two most powerful nations cannot get along well, the global economy will suffer and international cooperation on critical issues such as climate change and AI governance will become difficult.

The resilience of the relationship also depends on whether the two societies can maintain direct contact and mutual understanding.

David Chong, founder and president of the US-China Youth and Student Exchange Association, said that he has become increasingly aware that keeping the giant ship of China-US relations moving steadily requires joint efforts from both countries at all levels.

Since 2015, Chong's association has helped bring more than 2,000 young Americans to China for exchange programs. Through activities ranging from cultural and sports exchanges to experiencing cutting-edge technologies such as artificial intelligence, young Americans have been able to see, hear and experience China firsthand in concrete and everyday settings.

"People-to-people organizations may not be in the 'cockpit' of the giant ship," Chong said, "but they can serve as 'connectors' and 'road builders' by strengthening the cultural and social foundation for the steady development of China-US relations".

Sun, the researcher, said that cooperation remains the most realistic and responsible choice.

"The reason is simple: Competition cannot erase interdependence, and differences cannot eliminate shared risks," Sun said. "China and the US cannot expect a voyage without winds and waves, but they must not allow the storms to decide the course."

SINO-US SUMMIT

Summit to chart path for Sino-US ties

Head-of-state diplomacy essential for restoring trade stability: Experts

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

By **BELINDA ROBINSON** in New York and **RENA LI** in Los Angeles

As the heads of state of the world's two largest economies start their meetings in Beijing this week, trade experts and economists said they expected the summit to chart the course for the future of bilateral ties and help restore stability to global trade.

Chinese President Xi Jinping and US President Donald Trump will meet in Beijing, as Trump arrived on Wednesday for a three-day state visit to China.

China said on Monday that it was ready to work with the United States to expand cooperation, manage differences and inject more stability and certainty into a turbulent and changing world.

During a Port of Los Angeles media briefing on Monday, former US trade representative Katherine Tai described the meeting as "a really important moment for the US-China trade relationship".

Responding to a China Daily question on what is most needed to help reduce global uncertainty surrounding tariffs, supply chains and broader trade relations — including lower tariffs, clearer rules, or greater predictability — Tai, who served as the principal trade adviser and negotiator on US trade policy during the administration of former president Joe Biden, emphasized the importance of policy clarity and long-term planning.

"I think that what we need most — and I say 'we' in the real collective sense, because this relationship impacts everybody around the world — is some clarity around the principles that the United States wants to put out there and to enforce in the relationship with China," Tai said.

She said uncertainty in recent trade policies and market expectations has affected governments, businesses and global supply chains, adding that clearer communication and more consistent policy direction would help support long-term economic planning and cooperation.

Tai further noted that strategic pressure alone cannot sustain a functional trade relationship despite the fact that both nations have the capability to "choke" each other in strategic sectors.

"Once you have each other's attention, then you actually need to have an agenda and a plan in place for the short term, the medium term and the long term, for making this very important, complicated and challenged trade relationship work," Tai said.

Jerry Nickelsburg, director & senior economist at the UCLA Anderson Forecast, said the meeting between Chinese and US leaders could help provide a more stable environment even as longer-term shifts continue.

Despite recent adjustments in global trade flows, the interdependence of the two markets remains significant. China continues to serve as the third-largest export market for the United States, following Canada and Mexico, according to US trade figures.

"There seems to be an interest in preserving the stability of the current situation in US-China economic relations on both sides," Nickelsburg said.

Gene Seroka, executive director of the Port of Los Angeles, said that Chinese factories and exporters continue to operate steadily despite ongoing trade tensions.

Mitigating uncertainty

During recent visits to Hong Kong, Shanghai, and Guangzhou, Seroka noted that order volumes remained stable, even as China expanded its exports to other global trading partners to mitigate uncertainty.

Jim Sutter, CEO of the US Soybean Export Council, expressed hope that the meeting would reaffirm China's purchase of US agricultural goods, including soybeans, calling soybeans an "important indicator" of the strengthening ties between the two nations.

US industry leaders and local officials have echoed the call for cooperation.

Jeffery Jones, chairman of the Council for Trade and Investment Promotion in New Jersey, said that trade and business development should remain a priority.

"I'm a former mayor. On the political side of things, I don't have to go to the presidential level to say that from one town to another, municipal level, if we don't work together, nothing good happens," he added.

Daniel Mabey, Asia Region President for the United Natural Products Alliance, noted that because China is a major supply chain partner for numerous industries, it is essential that "dialogue continues and continues to move forward" to get the relationship back on a productive track.

"Most of the US-China relationship is based on trade and China is a big supply chain partner for a lot of industries, not just our industry," Mabey said.

"I used to live in Beijing for a long time ... I have had lots of industry dialogue. We need to get the tracks straightened again and work together."

Leaders' interactions offer 'irreplaceable strategic guidance' for US-China ties

By **ZHAO HUANXIN** in New York
huanxinzhao@chinadailyusa.com

Beijing's top envoy in Washington has said that interactions between the heads of state provide "irreplaceable strategic guidance" for China-US ties, expressing hope that this week's summit will be a "successful one" that will chart the "right course" for future relations.

At the invitation of Chinese President Xi Jinping, US President Donald Trump is visiting China from Wednesday to Friday.

In an interview with Newsweek published on Tuesday, Ambassador Xie Feng said that with the joint efforts of both sides, the summit will hopefully see the two countries expand cooperation and properly manage differences, while exploring ways to get along in the "new era" based on mutual respect and peaceful coexistence.

"In an increasingly turbulent world, the strategic value of China-US relations becomes more prominent," Xie said. "A stable and constructive China-US relationship not only serves the fundamental interests of both our peoples, but also meets the shared expectation of the international community."

On the Taiwan question, Xie said that he believed the American people, who faced the danger of division and had a civil war in the past, can understand China's will and determination to safeguard national unity.

The Chinese side urges the US side to commit to the one-China principle, the three China-US joint communiques with concrete actions, make the right choice as early as possible, fundamentally remove the biggest obstacle to China-US relations, which is the Taiwan question — a burden that risks dragging the two countries into confrontation and conflict — and open up broader room for developing bilateral ties, Xie said.

Xie also said that history has proven once and again that a tariff war or trade war produces no winner, damages the interests of both sides, and hurts the whole world.

He noted that under the guidance of the two leaders, China and the United States have reached a series of common understandings through economic and trade consultations, and have stabilized bilateral economic and trade relations.

"This has not come easily and should be cherished. But it is still far from enough. We hope the US side will move further ahead and completely remove the unilateral tariffs and other restrictive measures," he said.

Xie said competition between the United States and China should be viewed as a "track-and-field race toward mutual excellence" rather than a "zero-sum boxing match".

"Let our two countries compete to offer more public goods to the world, to better help developing nations reduce and eliminate poverty, and to contribute more to the sustained and inclusive development of the global economy," the envoy said.

Turning to the fentanyl issue, Xie noted that the fentanyl crisis in the US was not created by China, but "out of the humanitarian spirit and for the sake of China-US friendship", China is providing assistance to combat the "common enemy of humanity".

He noted the current US administration has strengthened legislation, law enforcement and regulatory control to combat fentanyl, and the number of fentanyl-related deaths in the US has dropped by 37.5 percent, to which China also made important and positive contributions.

He urged Washington to appreciate and cherish China's goodwill, view bilateral cooperation outcomes in a just manner, stop shifting the blame for the fentanyl issue, avoid imposing alternative tariffs as substitutes for fentanyl-related tariffs, and remove China from the list of so-called "major drug source countries" as soon as possible.

On artificial intelligence, Xie said that the world does not want to see an "Iron Curtain" in AI, nor attempts at technological enclosure, let alone a Star Wars-style rivalry.

"China-US coordination on AI bears on the future of both our countries and the entire humanity. We hope the US side will work with us in the same direction, to enhance dialogue, manage competition and conduct cooperation, so that AI will become a new frontier for China-US cooperation and a new ladder for human progress," Xie said.

Chinese Americans welcome leaders' meeting

By **LIA ZHU** and **CHELSEA GE** in San Francisco

US President Donald Trump's state visit to Beijing from Wednesday to Friday, the first visit to China by a US president in nine years, has sparked enthusiasm among Chinese Americans, who view the meeting between the two heads of state as an important moment for dialogue, cooperation, and understanding between the two countries.

During the visit, Chinese President Xi Jinping and Trump are expected to have in-depth discussions on major issues, including China-US relations, world peace and international development.

"I'm excited at this opportunity for President Trump to go to China and visit President Xi," Phillip Chen, a California Assembly member, told China Daily. "I believe that this world right now is a very large village, and that the relationship between China and the United States will continue to blossom."

"I personally think that as it stands right now, we've been cooperating for many, many years. We have to make sure that we work closely together to make sure that our mutual interests are served sufficiently," he said, adding that he hoped the meeting would help open up opportunities for more exchanges and cooperation.

William Zhang, a San Francisco-based community leader and an ardent advocate for peaceful cross-Strait relations, called the meeting "a long-awaited conversation between the two heads of state".

"President Trump will hopefully learn firsthand how much importance the Chinese government places on the peaceful reunification of the nation," he said, adding that Washington should uphold the one-China principle. "It is a prerequisite for the stable and healthy development of China-US relations," Zhang said.

Lei Wang, a Chinese culture advocate in Southern California, sees the leaders' meeting as an opportunity to promote and expand understanding of Chinese culture at the federal level.

"This is a good thing. There's a popular song in China right now called *Better to Meet in Person* and I believe that a meeting between the two countries' leaders will help deepen mutual understanding," he told China Daily.

Wang, also a small-business owner, said he hoped the meeting would help promote business interaction, trade activities and business investment between the two countries.

California, located on the Pacific coast, is an important gateway for Chinese goods entering the US, said Wang. "If China-US relations aren't good and trade relations don't flow smoothly, it will seriously affect California's foreign trade, imports and exports, which in turn affects many people's employment and how businesses operate."

"We need the trade to continue to support the employment and the society here in the US," Wang said. "Therefore, I really hope that both sides can deepen understanding in trade and economic relations, reach consensus, and push the relationship toward a more positive and stable direction."

Despite differences and frictions that have marked bilateral relations, Hu Lirong, CEO of CW Bearing USA, expressed confidence in dialogue between the presidents.

"These are challenges that can ultimately be worked through under the leadership of the two countries' leaders," he told China Daily.

Hu said the company has focused on localized operations, creating jobs for the community, with young employees accounting for about 30 percent of its workforce. He added that the company places strong emphasis on technical expertise and cross-cultural communication.

Observers in Europe pin hopes on dialogue

By **ZHANG ZHOUXIANG** in Brussels
zhangzhouxiang@chinadaily.com.cn

As US President Donald Trump began his visit to China on Wednesday — his second state visit to China following his previous trip in November 2017 and his first during his second presidential term — European political and business figures are closely watching the bilateral relationship.

The meeting between Chinese President Xi Jinping and Trump comes at a time of heightened global uncertainty, marked by geopolitical tensions, economic fragmentation, supply chain disruptions and slowing growth across major economies. Some observers in Europe believe that stable China-US relations are increasingly seen not only as a bilateral necessity, but also as a prerequisite for global economic predictability and international stability.

Ondrej Dostal, a Czech member of the European Parliament, described Trump's visit as a recognition of China's global importance and of the limits of confrontation-based policies.

Dostal argued that unilateral pressure and economic coercion have undermined international trust and damaged global trade. The world needs stable trade, mutual respect, diplomacy, infrastructure, development, and coexistence between civilizations.

According to Dostal, the leaders' meeting may also encourage European governments to reassess their own approach toward China. "If even Washington now recognizes that it must negotiate with Beijing, then European governments should finally stop pretending that confrontation with China serves European interests," he said.

Former director-general for international affairs in the German state of Hessen Michael Borchmann said the meeting carries significance far beyond bilateral ties.

Quoting a US research institute's description of the meeting as "Managing the World's Most Important Relationship", Borchmann said the phrase "absolutely fits" the current geopolitical environment.

Enhancing communication

"At a time when the world is facing growing uncertainty and fragmentation, enhancing communication, managing differences and maintaining stable China-US relations also benefits the world," he said.

Borchmann said the meeting follows last year's temporary trade truce reached in Busan, South Korea, where both sides attempted to halt escalating tariff retaliation. He expressed hope that the meeting would deepen consensus on trade and issues including the Middle East and global development.

He also referenced Xi's long-standing emphasis on stable bilateral ties. "There are a thousand reasons to make the China-US relationship a success, but not a single reason to break it," Borchmann quoted Xi as saying.

From the European business community, Bernard Dewit, chairman of the Belgian-Chinese Chamber of Commerce, stressed the importance of constructive engagement between the world's two largest economies.

Speaking from a European perspective, Dewit described stable China-US relations as "very important" for global economic and geopolitical certainty.

He noted that many European countries are facing economic recovery challenges, inflationary pressures and security concerns, and said improved China-US ties could help reduce tensions, restore investor confidence and strengthen international cooperation.

Dewit also emphasized Europe's preference for dialogue over bloc confrontation. Europe, he said, does not want to see the world divided into opposing camps and instead supports multilateralism, predictability and strategic autonomy.

As the leaders' meeting unfolds in Beijing, many in Europe will be watching closely for signs that the two major powers can stabilize relations and provide a measure of certainty to an increasingly fragmented world.

SINO-US SUMMIT

Harley Seyedin

Strengthening bilateral ties for global stability

The relationship between the United States and China remains one of the most important bilateral relationships in the world. As US President Donald Trump is visiting Beijing, both countries have an opportunity to strengthen cooperation, stabilize economic ties and promote prosperity for their peoples and the global economy.

Despite years of heavy tensions and tariffs, the two economies are deeply interconnected. Research by the Stanford Center on China's Economy and Institutions emphasizes that the two nations benefit enormously from trade, investment, innovation, and educational exchange.

US consumers and businesses benefit from affordable goods and integrated supply chains, while Chinese consumers and businesses benefit from access to US technology, agricultural products, financial services, and higher education.

Millions of jobs in both countries are linked directly or indirectly to this economic relationship.

One major development in recent years has been the significant reduction in the US-China trade deficit.

According to data from the Office of the US Trade Representative and the US Bureau of Economic Analysis, the US goods trade deficit with China fell to approximately $202.1 billion in 2025, down from $295.5 billion in 2024. This represents a 31.6 percent reduction in just one year.

The decline was due to changes in supply chains, increased domestic manufacturing in some sectors, diversification of trade partners, and evolving tariff policies. Yet even with these adjustments, bilateral trade remained enormous. Total China-US goods trade still exceeded $414 billion in 2025, demonstrating that the two economies continue to rely on each other in many areas.

Global Lens

By focusing on practical cooperation and long-term mutual benefit, the two countries can build a more positive and productive relationship that benefits not only themselves, but the entire world.

Trump's visit provides an opportunity to move beyond confrontation and toward practical cooperation.

Both nations share common interests in global economic stability, energy security, climate resilience, public health, artificial intelligence governance and financial market stability.

Cooperation between Washington and Beijing is not simply beneficial for US and Chinese citizens; it is essential for global growth and international confidence.

There are many areas where positive collaboration can expand. In agriculture, China remains an important market for US farmers exporting soybeans, corn, beef and other products. Increased agricultural purchases can help support rural communities across the US while ensuring food security and stable supplies for Chinese consumers.

In technology, both countries can cooperate on standards for AI safety, cybersecurity and advanced manufacturing. Joint research partnerships between universities and companies have historically produced breakthroughs in medicine, engineering and clean energy.

Climate and energy cooperation also present major opportunities. The US and China are the world's two largest economies and energy consumers.

By working together on renewable energy, battery storage, carbon reduction technologies, and electric vehicles, both countries can accelerate innovation while creating jobs and investment opportunities. Cooperation in these sectors could help reduce global emissions while improving energy affordability and reliability.

Educational and cultural exchanges are equally important. Hundreds of thousands of Chinese students have studied in US universities over the past two decades, contributing billions of dollars to local economies while building people-to-people ties.

Academic collaboration and tourism help reduce misunderstandings and strengthen mutual respect. Business leaders, students, scientists, and cultural organizations all benefit when relations are stable and constructive.

The global economy also benefits from open communication between the US and China. Financial markets react positively to signs of dialogue and predictability between the two powers.

Businesses on both sides want stable policies, clear regulations, and reduced uncertainty. A cooperative atmosphere encourages investment, strengthens supply chains, and supports economic growth worldwide.

While differences will remain on trade, security, and geopolitical issues, history shows that engagement produces better outcomes than isolation. Strong diplomacy and mutual respect can help manage disagreements while preserving areas of common interest. The US and China are competitors in some areas, but they are also partners in maintaining global prosperity and stability.

Trump's visit could become an important moment to reset the tone of the relationship.

Constructive discussions on trade, investment, market access and economic cooperation could create new momentum for both nations.

The US and Chinese peoples both seek economic opportunity, stable growth, innovation, and peace.

By focusing on practical cooperation and long-term mutual benefit, the two countries can build a more positive and productive relationship that benefits not only themselves, but the entire world.

Jack Midgley

When friends far away can share daily life in real time

Young Chinese creators on Xiaohongshu post a smart study nook or a city workout routine, and peers from the United States quickly take notice.

They borrow the idea, tweak it for their own lives, and share it right back.

This digital back-and-forth links millions of young people, quietly building the trust and practical know-how that enables real innovation.

Global Lens

These are the new "people-to-people" exchanges. They happen daily without long flights or months of planning.

Free, effortless and constant, these digital connections are shaping an inclusive future of innovation among people in China and the United States.

Presidents Xi Jinping and Donald Trump have an important opportunity to amplify these connections when they meet in Beijing.

Together, they can help transform the grassroots energy into productive China-US ties that are already growing at the speed of digital connections.

Xiaohongshu's explosive growth brings this to life. The platform's lifestyle content routinely generates massive engagement domestically, while its cross-border search functionality has captured a multi-million-strong audience in the US.

US students respond to Chinese posts with duets and adaptations, often tagging back with comments like "Xiaohongshu changed my set-up!" as tips on lighting, storage, and focus zones flow freely.

MA XUEJING / CHINA DAILY

President Xi captured the heart of this dynamic when he said that the hope of China-US relations lies in the people.

The numbers reinforce this statement. Xiaohongshu racked up around 3.7 million US downloads in early 2025 and is projected to hit double digit millions this year, while already serving over 300 million monthly users worldwide.

A vast majority of these users are young people.

TikTok connects with 170 million US users, many of them young people sharing news and ideas, while in 2026 duets between Chinese and US creators have attracted hundreds of millions of views.

These platforms keep the innovative exchanges flowing constantly and cheaply, shrugging off diplomatic ups and downs in the relationship.

Miranda Qu, Xiaohongshu's co-founder, laid the groundwork for this trend by turning community input into viral lifestyle solutions that now draw global audiences.

The platform stands out because young Chinese creators blend personal stories with actionable advice on focus-boosting study setups, apartment-friendly fitness routines, and smart daily hacks.

US youth have joined in, blending Chinese precision with their own creative twists to build sharper, more intentional habits on both sides of the Pacific.

These real people-to-people exchanges build habits of cross-cultural innovation.

TikTok's Khaby Lame adds speed to the mix with his silent takedowns of overcomplicated life hacks that resonate universally, while Xiaohongshu provides the depth that makes these exchanges truly transformative.

What makes these digital exchanges so potent is their role in providing the secret sauce of innovation: an intuitive feel for what clicks with users.

When a Chinese creator's dorm organization trick reshapes a US student's space, or Khaby's simplicity sharpens a video edit, they are co-creating that shared sense in real time.

A joint summit statement pledging support for digital youth exchanges would encourage young people both from China and the US to build on today's rapidly-growing interactions.

The benefits can go far beyond feel-good moments.

These connections humanize people on both sides of the Pacific and equip the next generation with important skills to tackle global opportunities such as climate tech, supply chains, artificial intelligence and even the exploration of space.

Above all, they demonstrate that real cooperation can hum along even when global politics does not.

Curiosity has a way of outpacing the need for total agreement every time.

The real story of China and US relations is playing out on screens everywhere.

Young creators are already linking people and cultures across the Pacific.

The summit of the two leaders is helping to endorse those bridges and ensure they grow into the enduring ties that define a bright future for the countries that young people will lead one day.

Zhu Feng

Only cooperation with China serves US interests

US President Donald Trump's visit to China, and expected head-of-state meetings, are drawing a lot of attention at a time when the world is seeing conflicts in Ukraine and the Strait of Hormuz. A key task for both Beijing and Washington is to sustain a stable, manageable and enduring bilateral relationship.

Although geopolitical experts often refer to the "Thucydides Trap" theory — a phenomenon whereby a rising power can cause fear in an established power, escalating to war — to interpret Sino-US relations, China has taken a different approach.

This is evident in the strategies it employed to counter the tariff war initiated by Washington last year, and its vision of building a community with a shared future for humanity, which is supported by four global initiatives and guided by principles of mutual respect and win-win cooperation.

This approach has worked, producing steady, positive outcomes in bilateral interactions, while acting as a stabilizing force in a turbulent, ever-changing world.

In this context, Washington should take advantage of the opportunity for dialogue presented by the US leader's visit, to seek closer cooperation with China.

While some in the US who view China as their greatest "strategic competitor" and seek to contain it have done little to conceal their intentions, the broader trend of China-US exchanges and collaboration remains unstoppable.

This disconnect on the US side needs to be addressed with an objective understanding of Beijing.

After the US Supreme Court ruled in February that the US administration's imposition of reciprocal tariffs on trading partners under the International Emergency Economic Powers Act was illegal, the US side levied an additional 10 percent import surcharge on all trading partners under Section 122 of the Trade Act of 1974.

As the Chinese side has repeatedly emphasized, China and the US need to enable each other's success as interests converge and pursue mutually beneficial cooperation.

The US also introduced a series of negative measures concerning China, including the Section 301 investigations, aimed at undermining China's production capacity advantages and reducing dependence on Chinese industry and supply chains.

However, Washington should have been aware that, given China's 35 percent share of global industrial output, a rapid and complete decoupling is unattainable.

Although the US administration is trying to keep a relatively low profile on the Taiwan question and disputes in the South China Sea, its arms sales to the Chinese island in late 2025 were the largest since 1979.

Additionally, joint military exercises with the Philippines and other external forces in the South China Sea have significantly increased in frequency.

The US should not treat softened rhetoric as a short-term, tactical measure to stabilize bilateral relations.

A US-led rare earths supply alliance designed to reduce dependence on China's rare earths is closely tied to technological innovation and access to critical resources. The same is true of Washington's ambition to revitalize and expand its manufacturing sector.

However, the path to "make America great again" is not necessarily contradictory to China's great rejuvenation. China's significant growth potential, as revealed in its 15th Five-Year Plan (2026-30), can offer US enterprises many opportunities to cooperate with their Chinese counterparts.

For China-US relations to continue providing mutual economic benefits, fostering exchanges across various social sectors, and enhancing complementary security through normal engagement and cooperation, the US side needs to foster a correct perception of China within its broader strategic framework.

Despite some challenges, Sino-US relations have remained generally stable, thanks to head-of-state diplomacy, with the two leaders maintaining frequent communication and dialogue, and recalibrating the direction of ties at critical junctures.

As the Chinese side has repeatedly emphasized, China and the US need to enable each other's success as interests converge, and to pursue mutually beneficial cooperation.

Both China and the US should make mutual respect the cornerstone, peaceful coexistence the principle and win-win cooperation the goal.

This approach will help the two countries explore the appropriate way to interact, jointly contributing to global peace and stability.

China will never follow the obsolete model of a country seeking hegemony when growing stronger. It will instead remain committed to peaceful development.

Beijing hopes that Washington can respect China's core interests and work together to properly manage differences.

In a world facing increasing turmoil, a stable China-US relationship not only serves the fundamental interests of both nations but also aligns with the widespread expectations of the international community.

Iran hardens stance on strait

Tehran moves to draft new regulations for key waterway as oil flows dwindle

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran's Foreign Minister Abbas Araghchi said on Tuesday that Tehran is currently in consultations to develop regulations governing arrangements for the Strait of Hormuz based on international law.

Araghchi made the remark during a meeting in Tehran with Norway's Deputy Foreign Minister Andreas Motzfeldt Kravik, formalizing what senior officials have been signaling in recent weeks — that Iran intends to establish a new legal order for the waterway.

Last month, International Maritime Organization Secretary-General Arsenio Dominguez said that countries have no right to blockade international straits or impede the freedom of navigation through straits used for international transit.

Iran's arrangements for the Strait of Hormuz could face setbacks as a United Nations Security Council draft resolution calling for freedom of navigation in the strait is gaining traction with 112 cosponsors, Al Jazeera reported on Wednesday.

Qatar, Saudi Arabia and Kuwait have joined Bahrain and the United States as principal sponsors, according to the report. India, Japan, South Korea, Kenya, Argentina and most European Union member states have also signed on, it added.

More than one month after a tenuous ceasefire took effect, US and Iranian demands to end the war remain far apart.

Washington has called for Tehran to scrap its nuclear program and lift its chokehold on the strait, while Iran has demanded compensation for war damage, an end to the US blockade and a halt to fighting on all fronts, including in Lebanon.

The Lebanese Health Ministry said Israeli drones struck three vehicles on the main highway south of Beirut on Wednesday, killing eight people, including a woman and her two children.

Iran has urged the United States and Israel to accept its rights and demands, warning that any new aggression would be met with a swift and regretful response.

Iranian Brigadier General Reza Talaei-Nik told reporters that the US and Israel would have to submit to Iran's legitimate and definitive rights, either on the battlefield or at the diplomatic table.

"If the enemy does not yield to Iran's rightful demands in diplomacy, it should expect a repeat of its past defeats on the military field," Talaei-Nik said, the Mehr News Agency reported.

The conflict is weighing heavily on global energy markets. Global oil supply will fall by around 3.9 million barrels per day across 2026 and undershoot demand because of disruptions caused by the crisis, the International Energy Agency said on Wednesday, with more than 1 billion barrels of Middle East supply already lost.

Brent crude futures edged down slightly to around $107 per barrel, after a three-day rally driven by the Hormuz deadlock.

Energy deals

Meanwhile, Iraq and Pakistan have cut deals with Iran to ship oil and liquefied natural gas from the Gulf, according to five sources with knowledge of the matter, Reuters reported.

In a deal between Baghdad and Tehran that has not been previously reported, Iraq secured safe passage for two very large crude carriers, each carrying about 2 million barrels of crude, that passed through the strait on Sunday.

Iraq is working to secure Iran's approval for more transits, an Iraqi oil ministry official familiar with the initial deal and current talks told Reuters, as the government seeks to safeguard the oil revenues that make up 95 percent of its budget.

A second ministry official and a shipping industry source also confirmed the talks with Tehran. All of the sources requested anonymity as they were not authorized to speak on the matter.

Similarly, two tankers loaded with Qatari liquefied natural gas are headed to Pakistan following a separate bilateral agreement between Islamabad and Tehran, two industry sources with knowledge of the matter told Reuters, also asking not to be named as they were not permitted to speak with media.

In another development, the Arab League urged Iran on Tuesday to cease all hostile acts against Arab states and condemned the alleged infiltration of the Islamic Revolutionary Guard Corps into Kuwait's Bubiyan Island, which resulted in the injury of one of the Kuwait Armed Forces' personnel.

Arab League Secretary-General Ahmed Aboul Gheit said the armed infiltration of Kuwaiti territory "constitutes a dangerous precedent that cannot be tolerated and represents a serious escalation".

Iran's Foreign Ministry rejected the claims as "baseless", saying four Iranian officers had entered Kuwait's territorial waters because of a navigation system disruption during a routine maritime patrol mission and called on Kuwaiti authorities to resolve the issue through official channels.

Agencies and Xinhua contributed to this story.

US Senate approves Warsh to Federal Reserve board

NEW YORK — The United States Senate on Tuesday confirmed Kevin Warsh to a 14-year term as a Federal Reserve governor, marking a pivotal step toward his expected ascension as the next leader of the central bank.

The confirmation passed with a 51-45 vote. In a notable break from party lines, Senator John Fetterman of Pennsylvania was the sole Democrat to join the Republican majority in supporting the appointment. Warsh will succeed Stephen Miran on the board, with his term retroactively beginning on Feb 1.

Following the vote, the Senate immediately initiated the confirmation process for Warsh's concurrent four-year term as Fed chair. The transition comes as the term of incumbent Jerome Powell is set to expire on Friday.

Warsh, 56, is a lawyer and financier who previously served as a Federal Reserve governor from 2006 to 2011, playing a key role in navigating the global financial crisis during that time. His return to the board comes amid heightened scrutiny of the central bank's political independence.

Powell has announced he intends to remain on the board as a governor after his chairmanship ends, saying he plans to keep a low profile.

Kevin Warsh testifies on Capitol Hill in Washington on April 21 during his nomination hearing to be a member and chairman of the Federal Reserve Board of Governors. JOSE LUIS MAGANA / AP

For his part, Warsh signaled a shift in direction for the Fed, calling for "regime change". His proposed strategy includes tighter coordination with the Treasury Department and the administration on nonmonetary policies.

However, the economic landscape remains challenging. A surge in global oil prices since the outbreak of the US-Israeli war against Iran has fueled domestic inflation, significantly dampening investor expectations for rate cuts this year.

Financial markets are currently pricing in a one-in-three chance of a rate hike by December. The Fed's current target range for short-term borrowing costs stands at 3.5 percent to 3.75 percent.

The Federal Open Market Committee is scheduled to hold its next policy-setting meeting on June 16-17.

Data released on Tuesday by the Bureau of Labor Statistics showed US prices for most goods and services surged in April.

The Consumer Price Index increased at a seasonally adjusted 0.6 percent month-on-month and 3.8 percent year-on-year. Stripping out food and energy, the core CPI ticked up 0.4 percent and 2.8 percent, respectively.

The year-on-year headline rate of inflation hit the highest level since May 2023.

Analysts said the war in Iran is to blame, as prices have increased because of higher oil prices stemming from the situation in the Strait of Hormuz, through which some 20 percent of the world's oil flows.

Dean Baker, cofounder of the Center for Economic and Policy Research, said the war has sent oil prices higher and "we are beginning to see ripple effects in other areas".

"Prices are now outpacing wages, meaning that workers are on average worse off than they were a year ago," he said.

Australia extends EV tax breaks as fuel fears grow

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Australia has extended an electric vehicle purchase incentive program as it aims to cut dependence on fossil fuels amid the Middle East crisis, a move expected to benefit Chinese automakers that have been gaining ground in the country in recent years.

The federal budget, unveiled by Treasurer Jim Chalmers on Tuesday, keeps in place current tax exemptions for EVs under the Electric Car Discount policy until March next year, before the discounts — which go back to July 2022 — are wound down starting April 2027.

The ongoing support for EVs is part of measures to strengthen "fuel resilience", as the conflict in the Middle East has been "pushing up prices, pushing down growth, and punishing Australians", Chalmers said in his budget speech.

Hussein Dia, a professor of transport technology and sustainability at the Swinburne University of Technology in Melbourne, told China Daily that "one of the clearest signals" of the budget announcement is that "Australia is moving from early EV adoption toward a broader transport system transition".

"The focus is gradually expanding beyond short-term incentives toward longer-term resilience, infrastructure, productivity and energy security," Dia said.

"The continuation, but gradual recalibration, of the Electric Car Discount suggests the government believes the EV market is now maturing. The policy has played an important role in normalizing EVs in Australia and accelerating early uptake," he said.

Recent fuel disruptions and geopolitical uncertainty in global oil markets have also reinforced the importance of reducing dependence on imported liquid fuels, he added.

"In that sense, transport policy is increasingly becoming energy policy. Electrification is now being viewed not only through an environmental lens, but also through economic resilience and national security lenses," he said.

The continuation of the EV discount comes amid record sales, with EVs accounting for 16.4 percent of all new vehicle sales in Australia in April, according to the Federal Chamber of Automotive Industries.

"The Electric Car Discount has provided important stimulus to the market, and its continuation will support the growth of EVs," the chamber's chief executive, Tony Weber, said.

Chinese players' role

The purchase incentive is expected to benefit Chinese automakers, which made up four of the top 10 selling brands in April, with one of BYD's best-selling EV models alone recording 1,780 units, or an increase of 139.6 percent year-on-year, according to the chamber.

Dia said Chinese EV makers are playing an increasingly important role in the Australian market.

"Brands such as BYD have helped expand the range of more affordable EV models available to Australian consumers, particularly during a cost-of-living period where price remains one of the biggest barriers to adoption," he said.

"Increased competition is helping make EVs more mainstream and accelerating the transition away from imported fossil fuels."

Aman Gaur, head of legal, policy and advocacy at the Electric Vehicle Council, likewise referred to the growing role of Chinese carmakers in Australia, which has a "competitive automotive market with over 60 brands providing a variety of cars for all lifestyles".

"Chinese manufacturers have added more options for Australians with a great range of electric cars on offer," he said.

Labour divisions in UK overshadow King's Speech

By JULIAN SHEA in London
julian@mail.chinadailyuk.com

United Kingdom Prime Minister Keir Starmer sought to shift the focus from personalities to policy on Wednesday as the King's Speech to Parliament set out his government's legislative agenda for the coming year.

The speech, written by the government but delivered with royal pageantry by King Charles III, outlined new initiatives on energy security, defense, immigration and education reform, but it was the internal wranglings of the governing Labour Party that continued to dominate the headlines across the UK.

Starmer, who has been in office for less than two years, has faced mounting pressure following Labour's dismal performance in last week's local elections, with his leadership being picked out as one of the main causes of voter rejection.

On Tuesday, four ministers resigned in protest against Starmer's continued leadership. The most high-profile departure was Health Secretary Wes Streeting, widely regarded as a serious contender to replace him.

Another possible candidate would be Andy Burnham, though the Greater Manchester mayor would first need to return to Parliament before mounting a leadership bid, likely requiring a sitting Labour lawmaker to vacate a seat and trigger a by-election.

On Wednesday morning, Streeting was called in to Starmer's Downing Street office for a face-to-face meeting, leaving less than 20 minutes later.

Around lunchtime, The Daily Telegraph reported that Streeting was set to quit his post, with an ally saying he was "going to go for it" after the meeting, and that a leadership contest could be triggered as soon as Thursday.

Starmer's spokesperson, meanwhile, told reporters on Wednesday that "the prime minister has full confidence in the health secretary".

The BBC's political editor, Chris Mason, quoted a Starmer loyalist as saying that Streeting lacked sufficient backing to trigger a formal leadership challenge, while Burnham "doesn't have a seat, for all this noise". "Wes has bottled it and caused massive damage and instability in the process," the ally added.

Sky News reported that more than 100 Labour lawmakers have added their names to a letter saying the party needs to focus on "working together to deliver the change the country needs … this is no time for a leadership contest", but it is believed that around 90 others have come out and called on Starmer to go.

In a further blow to his authority, 11 major trade unions affiliated with the Labour Party have issued a joint statement calling the local election results "devastating", and saying they have no confidence in Starmer's continued leadership.

Editorials

China ready to work with US in spirit of equality, respect and mutual benefit

While global turbulence does not always stem from shifts in major-country relations, stable and healthy ties between the world's two largest economies can help facilitate the easing of international turmoil as their intertwined economic relationship is a stabilizer for the world economy.

Under such circumstances, US President Donald Trump's state visit to China from Wednesday to Friday has naturally attracted wide attention as head-of-state diplomacy plays an irreplaceable and strategically vital role in guiding China-US ties.

As Chinese Foreign Ministry spokesman Guo Jiakun said on Wednesday, China welcomes Trump's visit, during which the two leaders will have in-depth exchanges of views on key issues concerning bilateral ties and global peace and development.

The Sino-US economic and trade consultations held in the Republic of Korea on Wednesday also serve to highlight the two sides' commitment to managing their differences through dialogue and negotiation. The candid, in-depth and constructive exchanges on economic and trade issues of mutual concern, as well as on further expanding practical cooperation, carry on the momentum of the previous six rounds of talks and show the complementarity of Sino-US economic ties.

It is precisely this pragmatism that — despite their differences — has enabled practical cooperation between China and the United States to continue demonstrating vitality and potential under the guidance of head-of-state diplomacy over the past years — even in the face of attempts by some to derail it.

The business delegation led by Trump on his visit to China, which consists of business leaders of some big-name companies in a wide range of strategic sectors, including semiconductors, finance and artificial intelligence, further illustrates the willingness of the US business community to expand mutually beneficial cooperation with China.

The two countries possess broad space for cooperation in fields such as AI, health, green development, advanced manufacturing and supply-chain stability during China's 15th Five-Year Plan (2026-30) period and beyond.

Experience has proved that China and the US stand to gain from cooperation and lose from confrontation. It is imperative that they strengthen their dialogue and cooperation in strategic sectors, particularly AI governance. The initiative on AI governance Beijing has put forward reflects China's commitment to promoting international cooperation on AI governance and ensuring that the era-defining technology benefits all humanity.

China's cooperative spirit is embodied in its four global initiatives — the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative.

These initiatives underpin the country's international engagement across key areas, including its major-country diplomacy with the US. The four global initiatives respond to the common aspirations of the international community for peace, development, fairness, justice and mutual respect. And they are public goods China has contributed to advance world peace and development.

China does not seek spheres of influence, ideological confrontation or cliques. It should be clear that no country can address the grave global challenges the world faces today on its own, no matter how strong it is. Still less can any country achieve security through confrontation or "decoupling", not to mention at the cost of others' security or crossing others' red lines.

China supports multilateralism and an open world economy. Such concepts are rooted not only in China's diplomatic practices, but also in the principles of the modern international order established after World War II, including sovereign equality, peaceful coexistence and multilateral cooperation.

The world does not need a new Cold War — it needs peace and development achieved through dialogue and cooperation, grounded in responsible major-country diplomacy. When China and the US work together to promote peace, development and win-win cooperation, they serve not only their shared interests but also those of the entire world. Against this backdrop, Trump's visit to China has raised expectations that, even with their differences, China and the US can still engage in candid communication, expand practical cooperation and jointly shoulder responsibilities for global peace and development.

As Guo said in reply to questions about the first visit by a US president in nine years, China stands ready to work with the US in the spirit of equality, respect and mutual benefit — expanding cooperation and managing differences — so as to bring greater stability and certainty to the world.

The more volatile the world situation becomes, the more major countries should work together to function as stabilizers. China is willing to work with all countries, including the US, to strengthen communication, properly manage differences and deepen win-win cooperation.

Country's innovation boon to the world

China's continuous efforts in scientific and technological innovation and its high-standard opening-up are having marked effects on both its economy and international cooperation.

Recent data indicate a shift in China's manufacturing industry toward high-end production. This reflects the country's transition to innovation-driven growth.

The country has made rapid progress in the development of emerging industries, with some strategic sectors, including artificial intelligence, intelligent robots, integrated circuits, advanced materials, new energy and biomedicine, growing rapidly. Future industries, including quantum technology, biomanufacturing, hydrogen and nuclear fusion energy, brain-computer interfaces, embodied intelligence and 6G, are also gaining momentum.

The technological innovation in the field of AI is transforming the Chinese economy while having a profound effect globally. China is rapidly emerging as a major force in global AI advancement. As of early this year, the country's core AI industry was projected to be worth more than 1.2 trillion yuan ($176.71 billion), with an annual growth rate nearing 30 percent. China now holds 60 percent of the world's AI patents.

Chinese scientists unveiled six major achievements at the 2026 World Digital Education Conference that concluded on Wednesday in Hangzhou, Zhejiang province. Among them was a generative genomic large model named Carbon, which is being hailed as the "DeepSeek" for the life sciences field due to its nearly hundredfold improvement in computational efficiency.

The rapid development of China's AI sector is bolstered by both policies and strategic planning. In the outline of the 15th Five-Year Plan (2026-30), AI is identified as a key driver of new quality productive forces. The government has launched a comprehensive "AI Plus" initiative. This policy framework supports AI research and accelerates its application across sectors.

Thanks to the progress made, AI and other technologies are empowering industries across the board. China has established tens of thousands of "smart factories" nationwide and accounts for more than half of the global increase in industrial robot installations. According to the World Economic Forum, China now boasts the world's highest number of "lighthouse factories", accounting for 40 percent of the world's total. These factories employ cutting-edge technologies to achieve more efficient and sustainable production processes.

China's experience in applied AI, particularly in sectors such as manufacturing and healthcare, offers a reference for global industry transformation. The improvement in China's technological innovation capabilities has led to a substantial increase in its industrial competitiveness, enabling the country to transition from "running after" to "running together" and even "leading the way" in some fields. China's intelligent computing power was second only to the United States last year.

China's competitiveness in the open-source path for algorithmic models and its position in computing hardware capabilities further solidify its status as a major force in the AI industry.

The scale and network advantages of China's digital infrastructure are equally impressive. By 2025, the country had 4.84 million 5G base stations, accounting for about 60 percent of the world's total, and a staggering 74.99 million kilometers of optical fiber cables.

Additionally, as the world's largest producer of solar and wind power, China has a reliable and low-cost supply of green energy for power-intensive computing centers, further enhancing its role in the global AI ecosystem.

By sharing its innovation and experiences with the world, China is offering a new development path that emphasizes collaboration and openness, encouraging other countries to engage with AI in a way that promotes shared growth and mutual benefit. This is a vision of a connected world, where technology serves as a bridge rather than a barrier.

Opinion Line

Collaboration, science effective defenses against hantavirus

The recent outbreak of the Andes hantavirus aboard the cruise ship MV *Hondius* is a reminder to the international community that humanity's battle against infectious diseases is far from over.

While the World Health Organization has assessed that the overall global public health risk is low, the incident has nevertheless triggered concern because the Andes virus is currently the only known hantavirus strain capable of limited human-to-human transmission.

As of early this week, multiple confirmed and suspected cases linked to the cruise ship have been reported across several countries, and multiple deaths were recorded. Coordinated by WHO and relevant national authorities, international medical evacuations, quarantine arrangements and contact-tracing efforts are underway.

China's disease-control authorities have responded promptly. According to the Chinese Center for Disease Control and Prevention, no cases of human infection with the Andes virus have been reported in China as of early this week, nor has any natural host capable of carrying the virus been identified within the country. Wang Shiwen, deputy director of the National Institute for Viral Disease Control and Prevention under China CDC, told the media that the risk of imported transmission and large-scale outbreaks in China remains extremely low.

Experts further clarified an important scientific fact often overlooked amid sensational headlines: human-to-human transmission is not a common characteristic of hantaviruses in general. Under normal circumstances, hantavirus infection mainly occurs through contact with infected rodents or exposure to contaminated urine, feces and saliva. While the Andes virus represents a rare exception, transmission generally requires close and prolonged contact in enclosed environments. Existing evidence indicates that such transmission remains limited and controllable with proper public health measures.

Since the COVID-19 outbreak, the international community has learned that panic, politicization and disinformation can spread faster than the virus itself, thus undermining global prevention and control efforts.

The current hantavirus incident once again demonstrates the importance of adhering to science in the face of disease outbreaks. Yet climate factors have made it harder to respond by expanding rodent habitats and extending transmission seasons. Countries must strengthen their early warning systems, improve cross-border information sharing and enhance emergency coordination mechanisms. Infectious diseases do not respect national boundaries. The multinational response surrounding the outbreak aboard MV *Hondius* illustrates the importance of timely information sharing among governments, public health agencies and international organizations.

Equally important is the need to uphold the coordinating role of the WHO. Throughout the current outbreak, WHO has worked within the framework of the International Health Regulations to facilitate information exchange, coordinate contact tracing and provide scientific risk assessments. WHO has consistently stressed that the overall public risk remains low while urging continued vigilance and monitoring.

Professionalism and multilateral coordination are precisely what the world needs to confront future health threats. Attempts to stigmatize countries, float conspiracy theories or undermine international cooperation would only weaken the collective capacity to respond effectively.

At the same time, the outbreak underscores the importance of strengthening public health literacy. Public health experts note that ordinary preventive measures — such as avoiding contact with rodents and contaminated environments, maintaining hygiene standards and seeking timely medical treatment if symptoms arise — remain effective. WHO's hantavirus guidance also highlights the importance of rodent control, sanitation and rapid clinical management. Severely unwell patients can significantly improve their prognosis through early intensive medical care.

Humanity has paid a heavy price during past pandemics. Only through scientific response, openness, solidarity and strengthened global governance can the world better safeguard public health security. The hantavirus outbreak should serve as another reminder that international cooperation and respect for science remain humanity's strongest defenses against infectious diseases.

— LI YANG, CHINA DAILY

What They Say

Experience economy will help upgrade businesses

Editor's note: *China's experience market reached 18.4 trillion yuan ($2.7 trillion) in 2025, a 22.6 percent year-on-year increase. China.org.cn spoke to Wei Xiang, a researcher in the National Academy of Economic Strategy at the Chinese Academy of Social Sciences, about the development of the experience economy. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The shift from buying goods to buying experiences marks a structural evolution driven by a growing demand for personalized and emotionally resonant consumption. The experience economy thrives on anticipation and the lasting memories created afterward.

Two major forces are fueling the rise of the experience economy. The first is the transformation of the broader economic structure. Demand for purely functional consumption has largely matured. What is growing now is demand for higher-level services and emotionally engaging experiences. People increasingly seek meaning, individuality and emotional resonance through consumption.

The second force is demographic change. Aging societies are reshaping consumption patterns. Older consumers tend to favor slower, more immersive forms of spending that emphasize enjoyment, health, culture and emotional fulfillment. This demographic shift also aligns with the development of experience-based industries.

The rise of the experience economy offers a broader lesson for both governments and businesses. The boundaries between production, consumption, services and experiences will increasingly blur. Future industries should create participatory experiences in which consumers themselves become part of the value-creation process.

The experience economy also generates new forms of personal value. One is cognitive value. Experiences expand people's horizons and reshape their understanding of the world. Personal growth does not result solely from meeting influential people or receiving external opportunities. Often, it is the direct experience itself that encourages individuals to improve their own perspectives and capacities.

Another is social value. Social interaction increasingly includes teamwork, openness, organizational abilities and other forms of noncognitive skills developed through shared experiences. In the future, social interaction may extend beyond human relationships to include interaction with intelligent machines and digital environments, creating entirely new forms of connection.

For the experience economy to remain sustainable, two capabilities are especially important. First, businesses must understand the relationship between functionality and emotion. Future competition will not depend solely on marketing, but also on the ability to measure, detect and respond to emotional change during production and service delivery.

Second, companies must develop stronger flexible customization capabilities. Businesses must have the ability to transform diverse emotional and experiential needs into scalable production systems.

Ultimately, the development of the experience economy will accelerate the transition toward higher-value service sectors and help drive the broader upgrading of economic structures. On the social side, it will enhance public well-being. Through thoughtfully designed experiences, individuals can enjoy a stronger sense of fulfillment, identity and emotional satisfaction. Such experiences do not necessarily need to be expensive.

GLOBAL VIEWS

TARIQ H. MALIK

From AI visibility to developmental leadership

Turning technological strength into governance credibility and cross-border cooperation

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

Artificial intelligence is often framed as a race for models, chips and market share. However, discussions at the Forum on the Development of International Science and Technology Organizations and Global Science and Technology Governance, held on March 28 during the Zhongguancun Forum in Beijing, emphasized that the more important question goes beyond technological competition. For China, the central challenge is not simply whether the country is visible in AI, but whether that visibility can be converted into stronger governance, more credible international leadership and deeper cross-border cooperation. That is where the next phase of China's AI story will be decided.

China's strength in AI should be understood through its broader development path. Its developmental narrative could be described through four qualities: an equalizer, a bricoleur, a systemizer and a socioeconomic weaver. These are more than rhetorical labels. Together, they capture a development logic that widens access, combines tools pragmatically, organizes complexity at scale and links technology to broader social and economic transformation. This helps explain how a technological field becomes embedded in the wider fabric of production, administration and modernization.

This also helps clarify what is distinctive about China's position today. Many countries can develop advanced technologies, but few can connect them to long-term developmental coordination. China's historical policy trajectory, including the cumulative discipline of the five-year plans, has given it an unusual capacity to link technological ambition with industrial scaling and organizational follow-through. Over successive five-year plans, priorities have evolved in a structured manner — from early emphasis on informatization and industrial digitization, to the integration of digital technologies with the real economy, and more recently to the elevation of AI as a strategic driver of modernization.

In that sense, China's rise in AI reflects a deeper developmental logic: the ability to move from experimentation to infrastructure, from innovation to production and from technical potential to system-wide application. The more pressing question now is what comes next. If earlier stages of development focused on catching up, scaling up and building industrial capacity, the next stage requires China to play a stronger role in shaping the governance language around AI itself.

Governance should therefore move to the center of the discussion. AI is a matter of legitimacy, rules, institutions and cooperation. The narrative alignment theory helps explain this shift. Narratives are not decorative additions to technology; they shape the categories through which technology is understood, justified and accepted. They influence whether AI is seen as a source of fear or trust, fragmentation or cooperation, exclusion or development. They also affect whose rules, organizations and standards gain authority internationally. At this stage, leadership can no longer be measured only by who builds the most advanced technology. It should also be measured by who can connect technology to legitimate and credible governance frameworks.

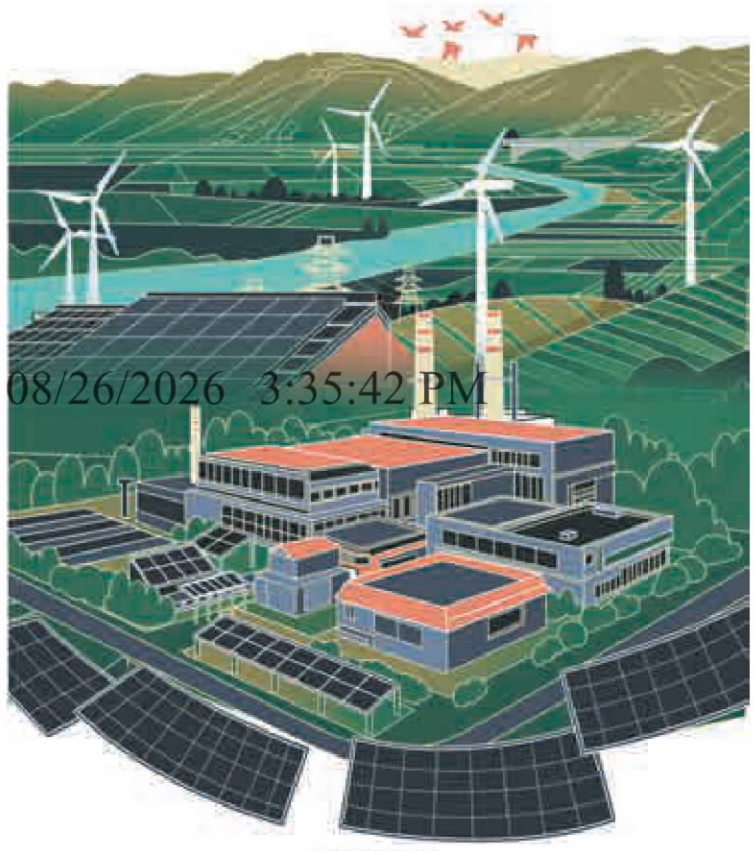
This has direct implications for China. The country already has substantial material strengths: scale, industrial capacity, digital ecosystems and a strong policy commitment to scientific and technological advancement. But technological strength alone does not automatically generate narrative authority. A country may be highly capable in production and application, yet still remain less influential in defining the interpretive framework through which that capability is understood globally. China now faces a strategic transition. To move from AI visibility to developmental leadership, it should present AI not only as a field of innovation, but as part of a broader story of public value.

China's next task is to institutionalize AI through clearer governance pathways. One is rule-making: contributing more actively to technical standards, ethical protocols, data governance principles and cross-border interoperability. Another is organizational leadership: embedding AI in durable, credible and cooperative institutions, including international science and technology organizations, university networks, professional associations and public-private platforms linking research, industry and policy. A third is narrative clarity: communicating AI not only as a driver of growth, but also as a contributor to order, inclusion and long-term development. This requires a language that is internationally intelligible as well as institutionally persuasive.

Global science and technology governance is increasingly shaped by legitimacy and coordination, not by technology alone. If China wants to play a more prominent role in this environment, it should build frameworks in which innovation and governance develop together. That means showing how AI can support public administration, industrial resilience, the green transition, healthcare, education and cross-regional learning. It also means engaging more deeply in international cooperation, so that China is seen not merely as a powerful producer of technology, but as a constructive participant in shaping the rules and organizational architectures through which technology serves development. The future of leadership in AI will depend not only on invention but on the ability to align innovation with legitimate governance.

There is also a deeper historical lesson here. Successful economies often decline when they become imbalanced. Why did technological spirit and innovative capacity shift from one country to another, leaving once-successful economies behind? The answer points to an imbalance. Development weakens when institutions and structures no longer align with new realities. This lesson matters for AI as well. The danger is not only technological lag; it is also the failure to balance invention with meaning, production with legitimacy and capability with trust. China's opportunity is that it can still build this balance. It can connect technological advances with governance design before deeper misalignment takes hold.

China's position between the Global North and the Global South further strengthens this possibility. It is unusually placed to act as a bridge: learning from industrialized economies while also speaking to the developmental aspirations of emerging ones. This gives China a distinctive opportunity in AI governance. It can help formulate AI not simply as a luxury of the richest economies, but as a developmental instrument that can be adapted across different institutional contexts. In that sense, China's contribution could be larger than national advancement alone. It could help widen the global conversation from technological competition to developmental inclusion.



For this reason, the most important transition is conceptual as much as technical. China does not need only more AI. It needs stronger alignment between AI, governance and development, building on the basis of Beijing's series of provisional regulations over the past years and its five-year industrial projections. It must translate technological capability into governance credibility, industrial strength into institutional trust and national achievement into cross-border collaborative leadership. This is not a soft addition to hard technology. It is the condition under which technological strength gains lasting authority.

In the end, the countries that matter most in AI will not be those that simply build powerful systems. They will be the ones that embed those systems in legitimate institutions, credible rules and cooperative international relationships. China has already demonstrated considerable capacity in development and innovation of smart technologies. Its next challenge is to show that this capacity can also help shape a stable, trusted and development-oriented governance future for AI.

WANG XIAOYING / CHINA DAILY

SHI YU / CHINA DAILY

ZHANG FANG

Integrating smart tech and green innovation

Digital technology and systematic governance pave the way for high-quality green development

The green transition is no longer a matter of choice but a defining imperative for high-quality development in China. The outline of the 15th Five-Year Plan (2026-30) for national economic and social development, approved during the 2026 National People's Congress, sets a binding target of reducing carbon dioxide emissions per unit of GDP by 17 percent, while raising the share of the core digital economy industries in GDP to 12.5 percent.

In terms of industrial development, the outline introduces a new strategic direction centered on "intelligent and green development, and integrated innovation of industries and technologies". Compared with the earlier five-year plan, which emphasized "upgrading of industry and value chains, in addition to intelligent and green development", the shift toward integrated approaches signals the entry into a new stage of development that has systemic integration as its core feature, as China accelerates its green and low-carbon transition to form a new low-carbon innovation paradigm driven by artificial intelligence technologies.

The integrated innovation of industries and technologies in the 15th Five-Year Plan period can be found in the deep coupling of electricity and computing power. With the rapid advancement of AI technologies, demand for clean computing power is surging.

According to the China Academy of Information and Communications Technology, electricity consumption by computing centers in China reached 150 billion kilowatt-hours in 2023, a year-on-year increase of 15.4 percent, with a projection to reach above 400 billion kWh by 2030 in the medium to high growth scenario. Against this backdrop, the 15th Five-Year Plan explicitly calls for the coordinated deployment of green electricity and computing power, while the 2026 Government Work Report has, for the first time, included "computing-power and electricity synergy" as part of the new infrastructure initiative.

Computing power and electricity synergy refers to the systemic integration of computing infrastructure with the electricity power system through digital technologies, intelligent algorithms, and information networks. On the one hand, models such as direct green power supply and integrated source-grid-load-storage systems help tap into the abundant clean energy in the western part of China, effectively reducing energy costs. On the other hand, some computing tasks are flexible, and can be interrupted and migrated by intelligent scheduling. This approach shifts the increased consumption of electricity to phases with lower electricity costs or lower network utilization through peak load shifting. It substantially transforms data centers from passive electricity consumers into active regulation units, thereby improving the utilization of renewable energy. This model addresses the curtailment of renewable energy and meets the growing green energy demand of computing power, achieving a mutually reinforcing balance between the environmental value of green electricity and the economic value of computing power.

Accurate carbon emissions accounting driven by precise data is the foundational pillar of carbon governance. The effectiveness of carbon reduction efforts depends critically on the transparency and verifiability of carbon accounting systems. China is accelerating the development of a unified national factor database of greenhouse gas emissions, while building an integrated "space-air-ground" monitoring network using satellite remote sensing, drones and ground sensors to ensure that carbon emissions and carbon sinks can be accurately measured and effectively managed.

Progress is also being made in tracing carbon emissions from electricity consumption. By establishing a provincial-level, time-of-use and location-specific factor database of electricity carbon emissions, companies can trace the sources and destinations of their carbon emissions. This technical pathway is expected to upgrade green development evaluation from traditional annual average indicators to higher-frequency, more granular metrics, providing scientific support for precise carbon reduction.

This data-driven foundation enables a broader transformation: moving beyond isolated improvements to achieve intelligent, systemic integration. The most compelling manifestation of this shift is occurring within the industrial sector, particularly in the realm of energy-saving equipment.

In March 2026, four central government departments, including the Ministry of Industry and Information Technology, rolled out a three-year action plan to accelerate the high-quality development of energy-saving equipment. The core thrust of the plan is to shift from optimizing equipment-level energy efficiency to achieving energy conservation. This policy orientation reflects three significant shifts: Technological innovation extends from equipment efficiency to the full chain, and from materials to processes; operating system coordination upgrades from stand-alone operation to wide-range high efficiency and precise matching; and digital empowerment advances from passive response to active optimization, using AI to enable cluster-level intelligent scheduling of energy-consuming units.

This direction is propelling China's energy-saving equipment industry from a single focus on individual equipment efficiency to a new stage characterized by system integration, intelligent drive and cross-sectoral convergence. It signifies a transformation in value creation from equipment sales to system services and a shift in technical pathways from local optimization to global optimization.

The new paradigm for China's green and low-carbon development, with computing-power-electricity synergy as a key pathway, data-driven carbon governance as a foundational pillar, and system-level intelligent integration as its technological signature, is accelerating a profound shift from granular, isolated optimization to system-wide integration innovation. This paradigm represents not only a strategic response to intensifying global green competition, but also a distinctive contribution of Chinese wisdom to global decarbonization efforts.

Metis TechBio records HK's largest healthcare IPO in '26

Company's float signals maturing AI pharma with diversified biz models

By LI JING
lijing2009@chinadaily.com.cn

Chinese mainland's artificial intelligence drug-delivery developer Metis TechBio Co Ltd raised more than HK$2.1 billion ($270 million) in its Hong Kong initial public offering on Wednesday, marking the largest healthcare listing in Hong Kong so far this year and underscoring strong investor interest in how AI could reshape pharmaceutical development.

Founded six years ago, the Beijing-based biotech firm issued about 201.2 million H shares in its global offering. Chris Lai, the company's co-founder and CEO, said the listing would help accelerate the company's goal of applying AI-driven nanotechnology to enable targeted drug delivery and new therapeutic approaches.

The listing places Metis alongside two earlier Hong Kong-listed peers — XtalPi Holdings Ltd and Insilico Medicine Cayman TopCo — referred to as Hong Kong's "AI drug discovery trio", though the companies pursue different commercial strategies in the rapidly evolving sector. XtalPi is a Shenzhen, Guangdong province-based AI drug discovery company, while Insilico Medicine is a global AI-driven biotech firm with strong research roots in China.

AI has attracted billions of dollars globally as pharmaceutical companies seek to shorten drug development timelines, but the industry is still testing whether these technologies can generate sustainable revenues.

China's AI drug discovery sector is moving from laboratory experimentation toward early commercial validation, said Tian Lihui, a finance professor at Nankai University.

According to consultancy iiMedia Research, the sector's revenue expanded from about 70 million yuan ($9.7 million) in 2019 to more than 600 million yuan by 2025, reflecting rapid growth in AI-driven drug development in China.

Early financial milestones among industry peers reflect that shift. XtalPi reported its first annual profit in 2025, while Insilico — though still loss-making — has begun generating tens of millions of dollars in revenue from licensing deals and research collaborations.

"The key question for the industry is no longer whether the technology works," Tian said. "It is how to turn it into scalable profit."

Metis has taken a different route from its peers by focusing on nanotechnology-based drug delivery, a technically complex step in turning promising molecules into effective medicines.

Efficient delivery systems determine whether drugs can reach targeted tissues while minimizing side effects — a challenge highlighted during the development of mRNA vaccines and other next-generation therapies.

"Large-molecule drugs are becoming increasingly important, and effective delivery is a core bottleneck," said Liu Jing, professor of accounting and finance at Cheung Kong Graduate School of Business.

"AI gives companies like Metis an opportunity to narrow the technological gap with established Western leaders."

Metis' core platform, NanoForge, combines AI models, molecular simulation and high-throughput screening to design lipid nanoparticles and other nanomaterial drug carriers.

According to its prospectus, the platform has generated more than 10 pipeline programs, including several clinical-stage candidates. Its most advanced candidate, MTS-004, has completed Phase III clinical trials in China for pseudobulbar affect, a neurological disorder for which there are currently limited treatment options domestically, said the company.

Like many biotech startups, Metis is still in a heavy investment phase.

Revenue rose to 105 million yuan in 2025 from 1.5 million yuan a year earlier, largely due to an upfront payment tied to licensing rights for MTS-004.

The company reported a net loss of 392 million yuan in 2025, narrowing from 499 million yuan the previous year.

The company said about half of the IPO proceeds will fund expansion of its AI infrastructure and nanomaterial platform, while roughly 20 percent will fund ongoing and planned clinical trials.

Metis' listing also highlights how the AI pharma sector is diverging into several business models.

One approach, represented by XtalPi, treats AI primarily as a tech platform, providing computational research services and automated laboratory capabilities to pharmaceutical clients.

Insilico has adopted an AI-biotech strategy, using algorithms to design new drug candidates and advancing them into clinical trials before licensing them to pharmaceutical partners — a strategy with higher potential rewards but also higher financial risks.

Metis represents a more specialized strategy, applying AI specifically to the drug-delivery layer rather than the entire discovery pipeline.

"These paths reflect a broader debate between platform strategies and vertical specialization," Tian said, adding that companies capable of integrating both approaches may ultimately build stronger competitive advantages.

Despite renewed enthusiasm for AI drug development, analysts say capital markets are becoming more selective.

"Valuations are no longer driven purely by technological narratives," Tian said. "Investors are increasingly looking at clinical pipelines, partnerships with major pharmaceutical companies and tangible commercial contracts."

Metis' IPO attracted heavy demand, with the Hong Kong public tranche more than 6,900 times oversubscribed and the international placement 82 times oversubscribed, the company said.

The offering drew several cornerstone investors, including BlackRock, which subscribed about $50 million, as well as a State-backed investment fund under China Reform Holdings, which made its first investment in an AI pharma company.

Zero-tariff policy boosts Hunan-Africa biz ties

CHANGSHA — When more than 6,000 bottles of South African wine cleared customs at Changsha Huanghua International Airport in Central China's Hunan province on May 1, the importer received an immediate benefit from China's expanded tariff-free treatment for African goods, which amounted to 21,000 yuan ($3,093) in duty savings.

According to Zhang Fan, chairman of Hunan Express Wisdom Information Technology Co Ltd, South African wine was previously subject to a 14 percent tariff in China. Now that the tariff has been slashed to zero, the company anticipates an annual cost reduction of about 5 million yuan.

This shipment was among the first in Hunan to benefit after China expanded zero-tariff treatment to goods from all 53 African countries with which it has diplomatic relations, broadening an earlier policy that covered the least-developed countries among them.

Under the upgraded policy, China has become the first major economy to offer unilateral, across-the-board zero-tariff treatment to all its African diplomatic partners and to all least-developed countries with which it has diplomatic relations.

For this inland Chinese province, one of the country's busiest regional players in terms of trade with Africa, the tariff cut is more than just a customs adjustment. Local officials and companies see it as a way to lower import costs and draw more African raw materials and consumer goods through Hunan, including some products bound for re-export.

Hunan has spent years trying to position itself as an inland gateway for China-Africa commerce, using the China-Africa Economic and Trade Expo and pilot zone for in-depth China-Africa economic and trade cooperation as its main platforms. The province's trade with Africa has grown by an average of 15 percent a year to 58 billion yuan, ranking first among provinces in central and western China.

The latest move follows an earlier policy that took effect on Dec 1, 2024, when China granted zero-tariff treatment on all tariff lines to the least-developed countries with which it has diplomatic ties, including 33 African countries.

From that day to March 31, Changsha Customs processed around 26.98 million yuan in tariff reductions for Hunan imports from those least-developed African countries.

The policy has, notably, coincided with stronger import growth. Hunan's imports from Africa rose 27.2 percent year-on-year to 30.92 billion yuan in 2025. In the first four months of 2026, its total trade with Africa reached 18.16 billion yuan, up 8.8 percent from a year earlier, with imports increasing 29.4 percent to 10.41 billion yuan.

The new broader coverage could have a bigger effect because it involves several of Hunan's main African suppliers, including Kenya, South Africa, Nigeria, Morocco and Tunisia. Between January 2025 and March 2026, imports from these five countries accounted for 98.1 percent of the total tariffs collected from Hunan's imports from Africa.

Lan Shengbin, deputy head of Changsha Customs, said some Hunan manufacturers had previously paid tariffs of 7 to 10 percent on components from countries such as Tunisia, Morocco and Egypt. Removing such duties will lower production costs and help companies diversify their supply chains, he said.

Hunan is trying to turn its tariff savings into a broader trade model, using the province as a point for importing, processing and redistributing African goods, including some products re-exported overseas.

One example came in July 2024, when 400 fresh roses from Kenya were imported into Changsha and then re-exported through the Changsha Huanghua Comprehensive Bonded Zone to Uzbekistan. It was China's first re-export transaction involving African fresh flowers, according to Changsha Customs.

Hunan Xiyue Culture Media Co Ltd, the importer, now brings in flowers, fruit and ornamental fish from Africa, some of which are shipped on to overseas markets.

Huang Zinan, a company executive, said the tariff cuts would reduce import costs, improve cash flow and allow African products to be sold at more competitive prices.

Consumer goods are another target. During the May Day holiday, an African goods market in Changsha drew approximately 89,000 visitors over six days. Organizers said lower import costs for raw materials had allowed prices to be reduced on some products, including chocolate made with Ghanaian cocoa, shea-butter products from Mali and coffee from Zambia.

Hunan Yufei Industry Investment Co Ltd, which helped organize the market, said its Quality African Products brand now covers more than 400 products from 13 African countries, ranging from coffee and avocados to spices.

Hunan authorities are seeking to turn the tariff change into a wider trade push. In late April, the provincial commerce department announced seven measures covering expanded imports from Africa, overseas warehouse services, industrial capacity cooperation and more China-Africa Economic and Trade Expo activities in African countries.

Major PV project launched to directly power computing facilities

By ZHENG XIN
zhengxin@chinadaily.com.cn

China has officially launched its first large-scale computing-electricity synergy project with direct green power supply, marking a milestone in the nation's massive commitment to building a unified, nationwide computing network by physically linking desert renewable energy directly to digital infrastructure.

The 500,000-kilowatt photovoltaic power station located in the Ningxia Hui autonomous region began operations recently. It signifies the first time that wind and solar resources from China's vast deserts are being funneled directly into data center loads through dedicated transmission lines, bypassing the traditional detours of the national power grid.

The facility is part of a larger 2-million-kW first-phase development involving a total investment of 8.7 billion yuan ($1.28 billion), which includes 1.5 million kW of wind power scheduled for full integration by September.

China established the "East Data, West Computing" initiative in 2022, a mega data project aimed at accelerating the development of an integrated national computing network.

Once the first phase is fully operational, it will provide 2.29 billion kilowatt-hours of green electricity annually to the large computing base in Zhongwei, Ningxia.

At the heart of this project is the concept of "direct green power supply". Traditionally, renewable energy is fed into the public grid, where it mixes with coal-fired power before reaching consumers. Direct supply, however, utilizes dedicated "point-to-point" transmission lines and "dual-track" supply systems.

In the Zhongwei project, new data center loads are served via physical direct lines, while existing loads utilize bilateral market trading. This setup allows data centers to achieve a high "green power ratio" while significantly reducing transmission costs and carbon footprints.

To ensure stability, the project employs a wind-solar complementary model that sees PV power dominate during the day, while wind power takes over at night. It is supported by on-site energy storage to smooth out fluctuations.

The launch coincides with the nation's efforts to synchronize energy and digital strategies. The National Energy Administration recently said it would permit renewable energy projects to supply green electricity directly to multiple users via dedicated lines.

According to the NEA, new policies will be released in the near future to perfect these synergy frameworks, guiding the relocation of energy-intensive computing facilities to regions rich in renewable resources, such as Ningxia Hui and Inner Mongolia autonomous regions.

Experts believe the Zhongwei project provides a blueprint for the rest of the country.

"By establishing a direct physical link between the energy source and digital load, we are solving the geographical mismatch between where energy is produced and where data is processed," said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University. "This not only lowers the power usage effectiveness of data centers, but also insulates the digital economy from electricity price fluctuations."

Looking ahead, the Zhongwei project plans a second phase that will bring total capacity to 4.6 million kW with a total investment of nearly 20 billion yuan.

As China continues to expand its digital infrastructure, the synergy between "bits" and "watts" is set to become the primary engine driving the nation's high-quality, low-carbon development, Lin said.

BUSINESS

New mall aims to meet evolving needs

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

Site's owner takes different approach, mixing commerce, culture and community together

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Visitors entering Westlake 66, the newly opened mixed-use complex in the bustling Wulin central business area of Hangzhou, Zhejiang province, might be surprised to find that luxury brands are not front and center.

Instead, the first floor is mainly dominated by lifestyle and experiential retailers, including collective toy companies Pop Mart and Jellycat, as well as the folding bicycle brand Brompton. The second floor features sports and outdoor labels alongside e-commerce brands founded by online influencers, reflecting a shift in consumer preferences toward experiences rather than prestige alone.

The 390,200-square-meter project, developed by Hang Lung Properties Ltd, is the company's 11th venture in the Chinese mainland. Known for managing luxury shopping malls in cities such as Shanghai and Wuxi, Jiangsu province, Hang Lung is taking a different approach in Hangzhou — integrating commerce, culture and community to establish Westlake 66 as both a commercial hub and a social destination.

"Modern consumers don't just want to shop — they seek diverse scenarios, from coffee breaks and dining experiences to social interaction," said Derek Pang, Hang Lung's senior director of Chinese mainland business operation, during an interview. "We are building a platform where locals, tourists and different community groups can interact — whether cycling from West Lake or exploring the city's newly renovated shops."

Hangzhou has long attracted young professionals and technology-driven industries. Its economic mix of finance, professional services and tech, combined with steady population growth, makes it a compelling retail and office market. "The city's consumption power is immense," Pang said.

According to Cushman & Wakefield's Hangzhou 2025 Commercial Real Estate Annual Report, three malls — Hangzhou MixC, Hangzhou Tower and Yintai in77 — each generated over 10 billion yuan ($1.47 billion) in sales in 2025. This underscores Hangzhou's position as one of China's few cities with multiple high-performing shopping centers.

Westlake 66 occupies the Wulin business area, the city's most prosperous commercial hub, which welcomed 189 million visitors last year. While Hangzhou Tower and the other two department store operators have dominated the high-end luxury segment, Westlake 66 is expected to complement existing projects, offering a fresh, lifestyle-driven alternative.

Hang Lung sees Westlake 66 as a long-term investment. Despite a development cost of 16 billion yuan, the company has focused on operational efficiency from day one. "Opening well is crucial. Only then can long-term development and subsequent expansion be realized," Pang said.

The mall does maintain a luxury presence, though it is secondary to experiential offerings. Several high-end brands have opened on the first floor, with additional openings planned for the latter half of 2026. By 2028, Hang Lung aims to expand the retail footprint, reflecting confidence in the city's consumption potential and Westlake 66's appeal as a lifestyle destination.

At its soft opening in April, Westlake 66 was home to around 250 stores, over a third of which are first-to-market in Hangzhou. Janice Cheung, director of mainland business operation at Hang Lung, said the project targets a new generation of consumers, for whom shopping and dining are experiences defined as much by social interaction as by product consumption.

"The project aims to connect people across different circles, creating more social interaction," Cheung said. The office lobby, located on the fourth floor with direct access to the mall, hotel and park, exemplifies this philosophy. "We are rethinking traditional layouts to foster engagement and a richer experience for office tenants and visitors alike," she added.

To stand out in a crowded market where tenant mixes often overlap, Westlake 66 emphasizes operational capability and innovative concepts.

Lifestyle-oriented retailers such as Ole supermarket debuted its "Ole Lifestyle" concept, while Chinese brands like Truuzen, a leather bag brand from Foshan, Guangdong province, are provided a platform to grow alongside global names.

"We are pleased that many domestic brands are making an impact nowadays. We'd love to offer platforms for them to develop sustainably," said Cheung.

Cheung also highlighted the importance of bridging online discovery with offline engagement. Pop-up stores featuring debut or exclusive products offer a rotating experience for repeat visitors. "Consumers may discover a brand online, but physical stores allow them to fully experience it and build long-term loyalty," she said, citing AmandaX, an apparel brand for women aged 30-50, as an example. AmandaX started on Taobao in 2019 and opened its first offline store in Shanghai last year.

Hang Lung executives expressed optimism about Hangzhou's consumption climate. After a slow start in early 2025, retail sales rebounded sharply in the fourth quarter, returning to double-digit growth. The company forecast that the momentum will continue in 2026, partly supported by Westlake 66's dynamic retail mix and immersive experiences.

"Westlake 66 is designed to be the new pulse of the city," said Weber Lo, CEO of Hang Lung. "By creating a community-centric hub with first-to-market brands and memorable experiences, we are confident to set a new regional benchmark while contributing to the city's broader economic ecosystem."

Looking forward, Hang Lung plans to expand the retail area by 40 percent and triple prime street frontage to over 200 meters through its partnership with Baida Group. The next phase is scheduled for 2028, reinforcing the company's commitment to long-term urban development in Hangzhou.

Leading commercial operators have reported positive signals that the country's consumption market is on an upward trend. According to Swire Properties' first quarter report, retail sales at HKRI Taikoo Hui Shanghai rose 81.5 percent, while Taikoo Li Sanlitun in Beijing grew 56.2 percent. Its commercial estates in Guangzhou, Guangdong province, and Chengdu, Sichuan province, expanded by 17.6 percent and 18.4 percent, respectively.

Cushman & Wakefield said that Shanghai's retail leasing market remained active in early 2026, with foot traffic and sales surging during the Spring Festival holiday. Lifestyle, food and beverage, and entertainment sectors performed particularly well, signaling a broad-based recovery.

Luxury outlets drive niche consumption experiences

By **WANG ZHUOQIONG**

Luxury outlet retail in China is demonstrating vitality and resilience as the sector capitalizes on the growing demand for cultural, lifestyle and vacation experience-centered shopping.

Among luxury outlet retail operators, Florentia Village Beijing-Tianjin Luxury Design Outlet leads the way.

The flagship project of Italy's RDM Group reported a 6 percent year-on-year increase in sales and a 7 percent rise in visitor traffic in 2025, signaling sustained consumer demand despite broader market headwinds.

On May 10, Florentia Village Beijing-Tianjin celebrated its 15th anniversary. The shopping complex has contributed to the diversification of the country's outlet market, integrating culture, commerce, tourism, sports, and exhibitions into a unified "micro-vacation" retail experience, said the company.

The shopping complex has established a 180,000-square-meter commercial footprint, hosting more than 200 internationally renowned brands. This includes national outlet exclusive brands such as Roger Vivier, Abercrombie & Fitch, and Peak Performance, as well as North China exclusives like Acne Studios, Mulberry, Mackage and Stone Island.

Jacopo De Vena, managing director of Florentia Village & RDM Asia, said the company has pioneered a "micro-vacation" model, combining authentic Italian architecture, a holiday-style setting, and immersive experiences.

Over the years, FV has adapted to shifting consumer preferences from transactional shopping toward lifestyle-oriented and experiential shopping, said the director. Notably, the sports and outdoor category has emerged as a critical revenue pillar, increasing nearly 20 percent in contribution to the revenue from 2024 to 2025.

Recent upgrades, including expanded VIP lounges, Italian espresso bars and new landscaped pathways, reinforce the shopping complex's signature "La Dolce Vita" atmosphere.

"Consumers today increasingly prefer relaxed, lifestyle-oriented scenarios. We've adapted to the trend and have seen these categories becoming a vital pillar of our revenue structure," De Vena said.

According to Bain & Company's 2025 China Personal Luxury Goods Report, 65 percent of Chinese luxury consumption occurred in the Chinese mainland market in 2025. The report anticipates moderate growth for the Chinese personal luxury market in 2026, with the region poised to remain the cornerstone of global luxury market growth.

Driven by the continued expansion of the middle-income group, a rebound in consumer confidence, and supportive policy measures, further repatriation of luxury spending to the Chinese mainland is expected. However, the degree of growth will remain highly dependent on specific product categories and individual brand performance.

The China Commerce Association for General Merchandise's 2024-2025 China Outlet Industry White Paper estimates that in 2025 there were about 251 outlet projects in operation nationwide, with a total sales scale of about 239 billion yuan ($35.2 billion).

The development of China's outlet industry is undergoing a strategic shift — moving away from sheer scale expansion toward a focus on achieving extreme operational efficiency, said the report.

Against this backdrop, Florentia Village Beijing-Tianjin, which is located within the Beijing-Tianjin-Hebei one-hour economic circle, leverages high-speed railway and expressway access to capture intercity passenger flows.

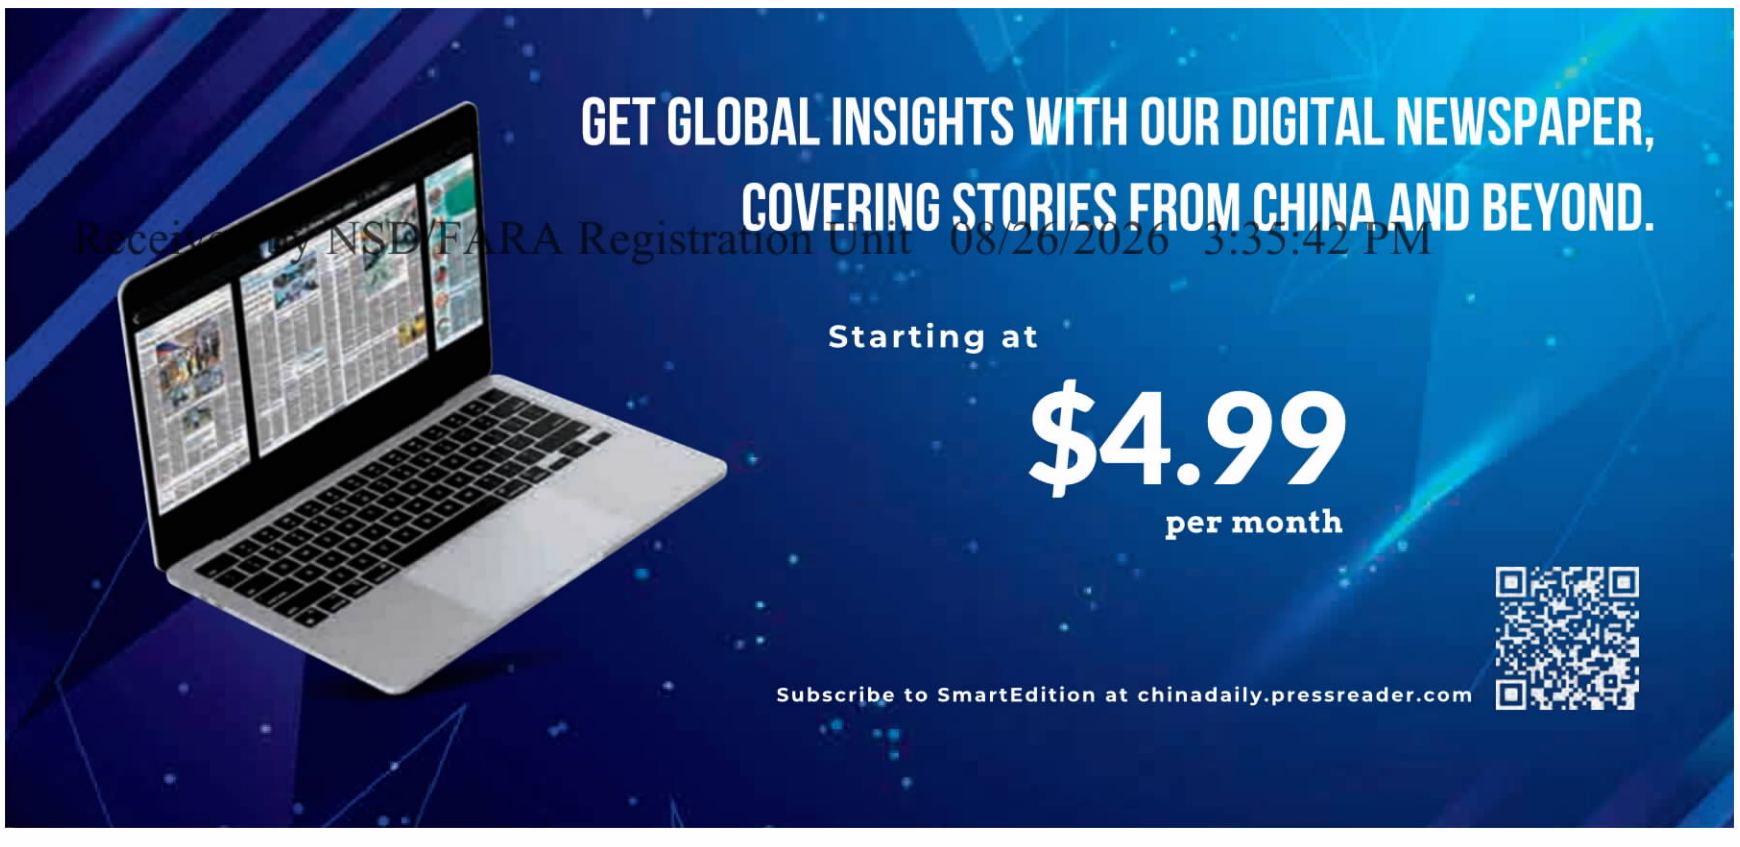
This has allowed the outlet to convert transient visitors into a loyal customer base with high repurchase rates, said the director. Seasonal cultural and experiential programming has further boosted Florentia Village Beijing-Tianjin as a dual-city micro-vacation destination, with nearly 80 million visitors to date.

"We broke free from the traditional outlet logic of over-reliance on discounts. By connecting deeply with consumer groups from both Beijing and Tianjin, we converted regional transit passenger flow into a stable consumer group with high stickiness and high repurchase rates," he said.

De Vena added that RDM Group continues to consolidate its market leadership by focusing on six strategic dimensions: scenario creation, high-end merchandising, stock iteration, digital operations, membership deepening, and regional integration.

Through immersive holiday environments, exclusive brand collaborations, and a mature digital ecosystem — encompassing 7.8 million registered members nationwide — the group has built a standardized model capable of replication across all Florentia Village's projects.

Looking ahead, RDM Group is expanding its national footprint with Shanghai third phase and Chongqing second phase, aiming to transform Florentia Village into localized micro-vacation cultural landmarks.



The group emphasizes high brand completeness, cross-border consumption facilitation, and multi-dimensional upgrades to brand matrices, experiential offerings, and commercial value.

Despite increasing competition, national projects achieved an 8 percent year-on-year increase in visitor traffic and 6 percent sales growth in 2025, demonstrating strong resilience and market recognition, said the company.

"Today's outlet is not just a shopping destination; it is a lifestyle and leisure experience," said De Vena. With strategic location, differentiated offerings, and refined operations, Florentia Village continues to be optimistic about the luxury retail and experiential consumption across the country.

Global South teachers to get digital skills training

By **ZOU SHUO** in Hangzhou
zoushuo@chinadaily.com.cn

The world's first international action plan specifically designed to improve the digital skills of teachers in developing countries has been unveiled, aiming to systematically assist Global South nations tackle common challenges in the digital transformation of education.

The action plan for enhancing digital literacy of teachers in the Global South was released during a parallel session of the 2026 World Digital Education Conference in Hangzhou, Zhejiang province, on Tuesday.

The plan, initiated by the Africa division of the Institute of Global Teacher Development, reflects China's practical efforts to deepen South-South cooperation and participate in global education governance.

The plan identifies four interlinked structural challenges: insufficient network and device access, a shortage of high-quality and locally adapted multilingual resources, weak foundational teacher skills coupled with a lack of systematic professional development, and fragmented coordination mechanisms. It argues that piecemeal interventions are no longer sufficient.

Key measures include establishing a collaborative mechanism for digital literacy among teachers in the Global South by engaging international organizations, education authorities, universities and enterprises.

The initiative will align with authoritative platforms such as UNESCO's Global Teacher Campus to provide tiered training programs.

The plan also leverages existing overseas platforms such as Confucius Institutes and Luban Workshops to deliver localized support for teachers.

According to the plan, Zhejiang Normal University will lead implementation efforts. Over the next three years, priority flagship projects will be launched, including the establishment of collaboration mechanisms, the joint development of advanced courses and the piloting of lighthouse schools, or model schools.

The lighthouse schools will be established in two or three host Global South countries, with initial design work and resource allocation set to begin in an effort to achieve early tangible outcomes.

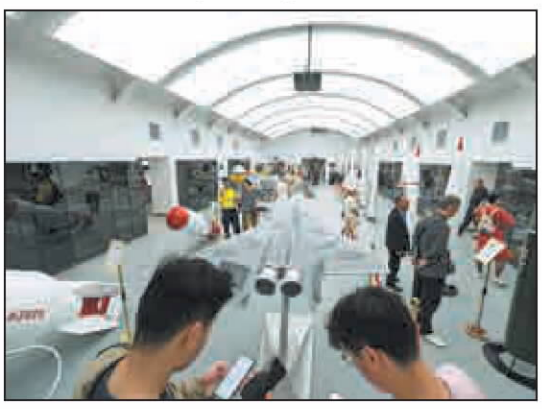
Liu Hongwu, director of the College of African Area and Country Studies at Zhejiang Normal University, said the action plan directly addresses key challenges in improving digital literacy among teachers in the Global South during a critical period for the global digital transformation of education.

"The plan addresses four structural challenges widely faced by Global South countries: weak infrastructure, scarce localized resources, lack of training systems and fragmented cooperation mechanisms," Liu said.

He said the plan adopts a systematic four-dimensional framework that creates a closed loop spanning coordination mechanisms, training, demonstration schools and on-the-ground support networks.

"By focusing on teachers' digital literacy, the initiative represents a strategic shift from hardware construction to human capacity building in developing countries," Liu said.

He also acknowledged implementation challenges, including complex coordination among multiple stakeholders and insufficient adaptation of resources for low-bandwidth environments in many Global South countries.



Nevertheless, Liu described the action plan as a pragmatic step that contributes Chinese wisdom and feasible solutions in bridging the global digital divide and promoting equitable education.

Meanwhile, the Hangzhou Initiative on AI and Education, which was also released on Tuesday at the conference, stresses equitable access to the benefits of artificial intelligence and calls for greater use of smart education platforms to share quality resources and intelligent tools to help bridge the global digital divide.

The initiative proposes establishing a global network for teacher training and capacity building, with special attention given to children with special needs.

It also supports UNESCO's leadership role in using digital technologies for post-crisis remedial education, especially for girls and women.

Hidden city reopens

Visitors explore a museum about Beijing's civil air defense history in Qianmen area on Wednesday. Originally built in 1969 and once known as the Beijing underground city, the former civil air defense tunnel complex reopened to the public as a museum on Tuesday, after extensive renovations. BLUEPRINT INTO ACTION

Yunnan to promote lifestyle businesses

Better living conditions, policy support reshape province's tourism economy

By **YAN YUJIE** and **LI YINGQING** in Kunming

Yunnan is positioning itself as a destination not only for tourism, but also for long-term living and entrepreneurship, as the southwestern Chinese province recorded sharp growth in overnight international visitors and long-stay residents in 2025, Governor Wang Yubo said on Wednesday.

Speaking at a briefing on Yunnan's 15th Five-Year Plan (2026-30), Wang said the province is looking to attract more people to "travel, settle and start businesses" in Yunnan, as improving living environments and lifestyle appeal reshape the province's tourism economy.

Yunnan received 8.64 million inbound tourist visits in 2025, up 30 percent year-on-year, according to official data.

Among them, overnight inbound visitors rose 51.8 percent to 4.95 million, outpacing overall growth and signaling rising demand for deeper travel experiences.

The province also saw a surge in long-stay visitors, locally referred to as "sojourners".

More than 5.5 million people chose to live temporarily in Yunnan last year, up 41.4 percent year-on-year, with an average stay of 83 days.

"Many visitors came as tourists but stayed on because they fell in love with the place, becoming new residents of Yunnan," Wang said.

He attributed the trend partly to sweeping improvements in urban and rural living conditions in recent years. According to Wang, all counties, cities and districts in Yunnan now meet national sanitary standards, while all natural villages have reached the top-tier standard for rural living environments.

"With better environments and more beautiful cities and villages, tourists from across China and around the world are flocking to Yunnan," he said.

Earlier this year, Alexandra Solovey, a 46-year-old tourist from the United States, visited Kunming with her husband and daughter. She said the pleasant weather, local cuisine, friendly residents and sense of safety made Yunnan "a fantastic destination".

Among those choosing to stay longer is Zhang Boai, a 35-year-old former flight attendant from Beijing. After traveling across Lijiang, Dali, Kunming, Pu'er and Xishuangbanna in mid-2025, Zhang and her husband relocated to a village in Pu'er with their 3-year-old son later that year.

"I want my son to have a happy childhood close to nature, where he can play freely," Zhang said.

The long-stay trend is also giving rise to new business models.

In Laozhuaqing village in Pu'er, 32-year-old Ying Xixi from Wenzhou, Zhejiang province, has launched a digital nomad community, offering shared workspaces for remote workers.

Since opening in late February, the site has already hosted dozens of digital nomads.

"Yunnan has rich resources, diverse ethnic cultures and a great climate, which are all attractive to entrepreneurs like us," Ying said, adding that she hopes for more supportive policies for startup communities and lifestyle-based businesses.

Wang said the province plans to expand policy support, diversify business scenarios and cultivate more sectors suited to lifestyle entrepreneurship. Yunnan also aims to build a number of "cities of entrepreneurship" and "cities of thriving industries" to attract more innovators and business founders.

The growing sojourn economy is already bringing tangible benefits to rural communities.

Yan Di, Party branch secretary of Manhena village in Xishuangbanna, said long-stay tourism has increased significantly since 2024. Last year, the village received more than 10,000 sojourn visitors, many staying for more than 10 days at a time.

The village, home to 109 households and 486 residents, reported an average household income of 80,000 yuan ($11,780) last year, with tourism contributing more than 60 percent.

"Life is steadily getting better," Yan said.

In Lijiang's Yulong county, 57-year-old Fan Hongyan, originally from Xiangxi in Hunan province, opened a guesthouse in September after traveling to more than 50 countries.

"The first time I came here, I was deeply captivated by the scenery and environment," she said. "I knew this was where I wanted to live."

Soundbites

Editor's note: *The State Council Information Office held a group interview on Wednesday featuring outstanding teachers to discuss advancing the spirit of educators and accelerating the building of China into a leading country in education.*

On Cuiying Mountain in Lanzhou, we established China's first semi-arid climate change observation station of international standards. I often take my students into the field, trekking across deserts, traversing glaciers and climbing plateaus. They are trained and tested in harsh natural environments, strengthening both their character and resilience. I like the saying along the Taklimakan Desert highway: "There is only a desolate desert, not a desolate life." I often tell my students the same: how could our research be anything but world-class, when we write our papers on the vast land of our motherland and pursue knowledge in the great deserts of the northwest?
Huang Jianping, *an academician of the Chinese Academy of Sciences and a professor at Lanzhou University in Gansu province*

Labor education is not a decorative add-on, but a source of nourishment and energy for children's all-round development. To help children develop a love for work from an early age, we have designed a curriculum based on the 24 solar terms, encouraging them to engage in hands-on activities in tune with the seasons. Only when teachers remain curious about the world will children long to explore it. I hope our children will feel a spark of excitement at the sight of wild chrysanthemums, and pause to listen when they hear birds singing. Education, at its heart, is about nurturing the ability to perceive happiness and to create it.
Zhang Zhenle, *principal of Fuchun No 7 Primary School Education Group in Hangzhou, Zhejiang province*

I have always worked on the front line of teaching. Together with my institution, I have helped deepen the integration of industry and education, as well as school-enterprise cooperation. I hope to support companies in solving technical challenges while personally guiding students in developing practical skills. Watching them grow from novices to skilled professionals, then step out of campus and into major aviation enterprises, contributing to China's domestically developed aircraft and other critical national projects, gives me a deep sense of fulfillment.
Zhou Shuqiang, *professor at Chengdu Aeronautic Polytechnic University*

The essence of nurturing both intellect and character lies in "seeing every individual". At our school, each class is assigned a psychological counselor, and we have launched a smart mental health platform to support the well-being of both students and teachers. We focus not only on students' academic progress, but also on their emotional needs and individual differences. At the same time, we recognize the dedication of every teacher, providing practical support to help address real challenges, so that everyone on campus is seen and respected.
Xie Wei, *principal of Yinchuan No 15 Middle School, Ningxia Hui autonomous region*

We support teachers in defining clear development goals based on their individual circumstances, whether they are newly recruited or experienced backbone teachers. Taking into account teachers' years of experience and professional strengths, we design stage-specific learning content and practical opportunities, enabling them to grow steadily and continuously. We aim to ignite teachers' inner drive, helping them feel the nobility of the profession and sustain their intrinsic passion, while also strengthening their professional competence. There is only one character's difference between a "profession" and a "vocation", but it transforms teachers' mindset, energizes the entire team, and eventually benefits tens of thousands of children.
An Huixia, *principal of Xinghua Preschool Education Group in Taiyuan, Shanxi province*

ZHAO YIMENG

HK's emissions detector to aid climate research from Tiangong

By **WU KUNLING** in Hong Kong
amberwu@chinadailyhk.com

The world's first lightweight, high-resolution, high-precision carbon dioxide and methane point-source detector, developed by Hong Kong scientists, has arrived at the Tiangong, making it the city's first scientific payload aboard the orbiting national space station.

The project, hailed as proof of Hong Kong's ability to support the nation's space development and carbon neutrality drive, is able to detect over 99 percent of CO2 emissions from the nation's coal-burning power plants and CH4 emissions from its coal mines, providing precise and reliable data for policymakers in China and around the world, said Su Hui, co-leader of the project and chair professor of the Department of Civil and Environmental Engineering at Hong Kong University of Science and Technology, on Wednesday.

The Hong Kong-made payload, the Multi-Spectral Imaging Carbon Observatory, nicknamed "eye for space", arrived at Tiangong at 1:11 pm on Monday aboard the Tianzhou-10 cargo craft. It was part of a consignment of essential deliveries such as artificial human embryos and ultra-thin solar cells, and supplies including an extravehicular spacesuit.

The MUSICO will participate in China's first Earth observation project under its human spaceflight program.

Weighing less than 80 kilograms and smaller than a domestic washing machine, the payload is capable of accurately measuring CO2 and CH4 — two major greenhouse gases — from space, with extra-high spectral resolution and 100-meter spatial resolution, said the research team.

By analyzing intensity changes in sunlight over specific spectral bands as it passes through the atmosphere and reflects off the Earth's surface, the payload identifies gas-specific absorption features to determine gas concentrations and pinpoint individual emission sources, enabling effective monitoring of key facilities such as power plants and landfills.

Su said the detector's observation range covers latitudes from 42 degrees south to 42 degrees north — encompassing most of the world's densely populated and industrially active regions. The data it collects will be shared with government departments and research institutions in China and abroad under the nation's data management policies.

She added that recipients include the nation's Ministry of Ecology and Environment, and the United Nations Environment Programme which will add it to an open global dataset for researchers and authorities worldwide.

Zhang Limin, another co-lead of the project and head of HKUST's Department of Civil and Environmental Engineering, said that while the Hong Kong Special Administrative Region has participated in many of the nation's space projects in the past, this payload is the first mission led by the SAR — a milestone.

He highlighted that the project's results will also provide a scientific basis for cross-regional climate research and emissions reduction efforts in economies involved in the Belt and Road Initiative, contributing to the global response to climate change.

HKUST President Nancy Ip Yuk-yu said the project proves that Hong Kong's research capabilities can make substantial contributions to the nation's highest-level aerospace platforms.

It also supports the nation's dual-carbon goals and provides scientific backing for the Beautiful China Initiative and global climate governance, Ip said.

SHI YU / CHINA DAILY

During campus breaks, Xiao Tang, a university student from Hebei province, takes to Beijing's streets as a ride-hailing driver. A driving enthusiast, he has turned his time off campus into a source of income and a tangible sense of autonomy. "I enjoy it. It gives me control over my time," he said.

His experience is a snapshot of a much larger trend. "Young people across China are increasingly turning to digital platforms for work, forming the backbone of the country's expanding 'new forms of employment," said Zeng Yanbo, a researcher at the Shanghai Academy of Social Sciences' Institute of Sociology.

"New forms of employment" are distinct from traditional full-time work, referring to jobs where tasks are matched, assigned, managed and compensated via internet platforms, such as online service provider Meituan, ride-hailing platform Didi and short-video app Douyin.

More than 70 percent of such workers are aged between 18 and 35, according to Zeng. "Young people are drawn to these jobs mainly for the low entry barriers, the quick settlement of income, and the freedom to set their own schedules," she said.

As this workforce continues to grow, the country has introduced a series of policy measures designed to safeguard these workers' rights, improve services and steer the high-quality development of the sector.

In April, the general offices of the Communist Party of China Central Committee and the State Council, China's Cabinet, issued a set of policy measures on strengthening service and management for new employment groups. Experts said that this marks the first central-level policy framework dedicated exclusively to platform-based workers.

They added that it signals a decisive shift for China's digital economy — from a phase of rapid expansion to a new stage of standardized development that balances innovation with labor dignity and security.

According to a survey on China's workforce in 2023, the country has approximately 84 million workers engaged in new forms of employment, accounting for 21 percent of its total workforce. Projections indicate the figure may surpass 100 million this year.

"The new employment group is an important component of China's workforce and an indispensable force for socioeconomic development. It has now become a crucial pillar of the job market," said Zhang Dandan, a professor of economics and vice-dean at Peking University's National School of Development.

Li Yan, 37, from Yuncheng in Shanxi province, has spent a decade delivering food in Beijing. For most of those years, he worked as a freelance courier on major platforms, appreciating the flexible hours but lacking any form of employment security.

A pivotal shift came in March of last year, when he joined e-commerce company JD as a full-time delivery rider.

Despite it currently being a low season for orders, Li said he still earns around 8,000 yuan ($1,180) per month. Beyond the pay, a transformative benefit has been his enrollment in a social security program, with JD covering the employer's mandatory contribution and subsidizing employees' personal contributions. For Li, this security has become a tangible foundation for his future. He said he is committed to building a long-term career with the company, with plans to stay until retirement.

While individual stories highlight the search for security, the sector's overall vitality remains robust. A recent report by Jinan University's Institute for Economic and Social Research in Guangdong province and recruitment portal Zhaopin showed job postings in new forms of employment rose 15.1 percent year-on-year in 2025, while job seekers rose 11 percent year-on-year, with over 80 percent of positions offering monthly salaries between 8,001 yuan and 15,000 yuan.

For years, the explosive growth of platform jobs, hailed for creating employment, outpaced the development of corresponding safeguards. "The core challenge lies in the mismatch between a new, flexible employment model and a social protection system designed for traditional, stable jobs," Zhang said.

The newly issued policy document provides a comprehensive, two-phase blueprint to bridge this gap. The primary goal is to standardize labor practices and ensure robust rights protection by 2027, followed by the establishment of a sound service and management system within the next three to five years.

It has urged internet platforms and express delivery companies to set reasonable wages for workers based on work tasks and labor intensity, and to ensure full and timely payment. Another pillar of the reform is bringing transparency and accountability to the algorithms that govern such work. Platforms are now required to disclose rules for order assignment, pricing, assessment and penalties, according to the document.

While the policy direction is clear, experts caution that its implementation faces deep-seated economic challenges. Zhang identified income as the primary, underlying concern. "For riders, the core issue is earnings from each delivery," she said.

Citing a widespread belief that any new cost levied on platforms — for social insurance subsidies or safety incentives — will be passed down to workers, Zhang said, "Real, sustainable security for workers must be built on a foundation of adequate earnings in the first place."

Alongside safeguards, she stressed that it is essential to introduce measures that curb cutthroat competition and strictly prevent the infringement of workers' rights and interests.

Yin Yu, a senior partner at Guangdong-based Guanghe Law Firm, urged lawmakers to expedite dedicated legislation to protect the rights of workers in new employment forms.

She told Legal Daily that the next critical step is to translate the proven measures outlined in the policy document to binding legal statutes. This legislation, she said, should systematically define the nature of employment relationships, the rights and obligations of all parties, liability divisions, and regulatory oversight responsibilities, thereby solidifying the institutional safeguards for this workforce.

Zeng emphasized the urgency of establishing comprehensive skill standards and structured promotion pathways for delivery riders and similar professions. She advocated benchmarking against the technical worker grading system, a strategic move aimed at elevating these roles from temporary positions to viable lifelong careers.

This transformation, she noted, is essential for providing workers with long-term growth opportunities and fundamentally reshaping the perception and stability of platform-based employment.

Delivery platform reforms prioritize riders' safety over speed

By JI HAISHENG

The removal of late-delivery penalties in early 2026 has marked a turning point for China's gig economy, signaling a shift from speed-first algorithms to worker safety.

For veteran riders like Li Xincang, 39, who has navigated Beijing's streets for over a decade, the shift represents the professionalization of a sector once defined by high-risk labor and social insecurity.

When Li, a native of Puyang in Central China's Henan province, arrived in the capital over two decades ago, he started working on construction sites like many other rural migrants.

"The wages were often delayed, and there were no social security benefits at all," he said.

Seeking a more predictable income, he switched to food delivery in 2014 and has worked for consumer services platform Meituan for almost nine years.

Today, the veteran leads a team of over 110 riders and earns more than 10,000 yuan ($1,470) a month. Earnings are deposited quickly, he said, explaining that part-time riders get paid the next day, while full-time team members receive weekly wages.

"Delivery work won't make you rich, but it can support a family steadily," Li said. The reliable and timely income allowed him to pay off debts of over 100,000 yuan and build a decent house back in his hometown.

Beyond the paycheck, Li cherishes the flexibility. "I can choose to work mornings, evenings, or nights, and manage my own schedule. I can even take a moment to relax if I need, or scroll through my phone during a break," he said. "This is something you hardly get on a factory floor or a construction site."

Li said that the most crucial improvement he has witnessed is the reform of the delivery algorithm, the system that organizes his daily work.

"In the past, we could get up to 12 orders at a time, with very tight deadlines. We had to rush and sometimes even risk traffic violations," he said. Now, influenced by the government and stakeholders, the system limits trips to six or seven orders with more reasonable time windows. "The algorithm now puts safety before speed," he added.

The platform reinforces this by issuing warnings or short-term account restrictions for repeated traffic violations. A pivotal relief came in early 2026 when penalties for late deliveries were removed.

"Riders no longer feel forced to risk their lives on the road," Li said. "This shift has significantly reduced the danger of accidents caused by overwork or rushed deliveries."

This growing sense of security extends from the daily grind to long-term planning. A key milestone was the introduction of a pension subsidy program late last year. Li and his teammates are now covered by the program that subsidizes their participation in basic pension insurance for gig workers.

"Compared with construction work that offers no proper social security, this job gives us a greater sense of security," Li said. "This pension scheme will protect us after we retire. Having it makes my family feel truly at ease."

Support on the ground has also been upgraded. Li praised the launch of hubs dedicated to delivery riders, which offer 24/7 shelter, charging ports and seasonal supplies. However, he is critical of commercial outlets that hang similar signs for show without providing real service and suggests resources should be directed toward stations that genuinely help workers.

For Li, the past decade traces a clear path — from chasing immediate wages to building a stable, secure life with a future to look forward to. He acknowledged his own story as part of a broader shift where the nation's policy direction and corporate initiatives are converging to provide millions with not just an income, but a growing sense of dignity.

Li said he may continue riding for a few more years, or he might return to his hometown to promote local farm produce online, leveraging a following he has built on social media.

He added that his plans remain flexible, while his next steps will ultimately depend on his family's needs.

Policy Digest

Roadmap to cultivate global textile leaders

China will cultivate no fewer than 25 leading textile and apparel brands by 2028 as part of efforts to significantly enhance the competitiveness and market influence of the sector, according to an action plan issued by the Ministry of Industry and Information Technology and four other departments that was recently publicized.

The action plan for the cultivation of excellence in textile and apparel brands (2026-28) sets out six key tasks, including the categorized cultivation of leading brands across supply chains, industrial ecosystems and consumer markets. Enterprises will be guided to focus on specialized market segments and consumer scenarios to create a group of supply-chain brands and consumer-facing brands.

The plan calls for stronger development of smart textiles, including smart wearables, intelligent home textiles, and products related to healthcare and medical applications.

To promote digital and intelligent upgrading, the plan encourages the release of innovative application scenarios for "AI plus textiles" across the entire industrial chain. It also supports the use of human-computer interaction and virtual interaction to better understand personalized consumer demand, while improving the technological level and wider application of virtual fitting, intelligent outfit recommendations and virtual anchors.

Campaign to uplift rural culture, health services

The Publicity Department of the Communist Party of China Central Committee and 12 other departments recently issued a notice launching the 2026 campaign to bring culture, science and health services to the countryside, aiming to deliver more high-quality resources directly to rural communities.

Under the campaign, cultural and artistic services will be brought to rural areas by mobilizing literary and artistic teams to provide cultural services. Support will also be given to mass cultural and sports activities.

Legal services will be strengthened through regular rural-themed public legal education activities, while agricultural technology services will focus on the needs of rural industrial development.

The campaign will expand science outreach in rural communities through innovative science popularization demonstration activities and high-quality public science content.

Medical resources will be sent to rural communities via free clinic weeks, visits by renowned doctors to grassroots areas, and stationed or mobile medical services at township and village levels, and public welfare services will also be expanded.

Tap water coverage in countryside hits 96%

China's rural tap water coverage reached 96 percent by the end of 2025, the Ministry of Water Resources said on Tuesday.

By the end of last year, large-scale water supply projects covered 71 percent of the rural population, while 72 percent of counties had adopted unified county-level management for rural water supply, the ministry told a press conference.

China had nearly 3.82 million rural water supply projects by the end of 2025, forming a supply network covering 850 million rural residents. The number of people relying mainly on water cellars and water storage tanks for water supply had dropped by 79 percent by the end of last year from the level at the end of the 13th Five-Year Plan (2016-20) period.

During the 14th Five-Year Plan period (2021-25), areas lifted out of poverty completed 914.9 billion yuan ($133.71 billion) in water conservancy investment, including 145.5 billion yuan in key counties.

China aims to raise rural tap water coverage to 97 percent by the end of 2026, with large-scale water supply projects covering 73 percent of the rural population, according to the ministry. By 2030, the country aims to lift rural tap water coverage to 98 percent.

Pearls of perspective

Growing up in China, award-winning novelist worked throughout her life to strengthen cross-cultural understanding, **Yang Yang** reports.

In the history of Sino-US exchanges, Nobel Prize-winner Pearl S Buck, a writer from the United States also known as Sai Zhenzhu, stands prominently as "the most influential Westerner to write about China since the 13th century's Marco Polo", as described by late US historian James C Thomson Jr.

Buck's true significance lies in her approach to cross-cultural understanding, says Guo Yingjian, a specially appointed professor at Renmin University of China, one of the earliest Chinese scholars to research Buck.

"She shows us that effective cultural exchange doesn't start with labels, ideological judgments, or demonization. Instead, it begins with understanding people's lives: their suffering, dignity, and shared emotions," he says.

Through reading her popular and sympathetic novels, particularly *The Good Earth*, Americans' perceptions of China changed significantly in the 1930s and 40s.

"The majority of Chinese were seen for the first time in literature as honest, kindhearted, frugal-living, hard-working, deity-fearing farmers who are much the same as American farmers," wrote Chinese scholar Liao Kang in 1997.

Buck's empathy went beyond pity, reflecting an understanding of others' circumstances, says Guo.

She captured both the hardships and resilience of Chinese farmers, writing about not only poverty but also dignity, not only backwardness but also human complexity, he says. Consequently, the China she depicted, though not a full picture, was warm, textured, and humane, he adds.

One important reason Buck was able to represent Chinese characters with empathy and compassion lies in the fact that "she did not view China as a foreign tourist on a brief visit; rather, she lived and grew up in China, and spent a long time sharing the same world with ordinary Chinese people," says Guo.

Her writing about China did not stem from an abstract "Oriental imagination", but from everyday life, land ethics, family relationships, and basic human emotions, he notes.

A daughter of Southern Presbyterian missionaries, Buck left her hometown of Hillsboro, West Virginia, for China in 1892, when she was about four months old. In 1896, her family moved from Huai'an to Zhenjiang, Jiangsu province, where they lived for the next 18 years.

Unlike other missionaries, Buck's parents, Absalom and Caroline Sydenstricker, chose to live among Chinese people to fully immerse themselves in local culture rather than in isolated Westernized compounds.

Life in Zhenjiang greatly influenced Buck and her writing, especially the daily interactions with her nanny and tutor, says Lu Zhangping, director of the Zhenjiang Pearl S Buck Research Association.

In Zhenjiang, a local Chinese woman surnamed Wang cared for Buck for 18 years. Wang, kind and diligent, often cooked her delicious meals and snacks. Their relationship went far beyond that of servant and master. Wang treated her like her own child. Whenever Buck was punished by her mother for disobedience, Wang would quietly help her with the chores and offer guidance. From a young age, Buck had developed a deep respect and admiration for Chinese women.

Wang often told Buck tales about the famine during her own childhood, her family, and bandits; martial arts stories about standing up to the powerful; fighting injustice; and Chinese classics set in Zhenjiang, including *Romance of the Three Kingdoms*, *The Legend of the White Snake* and *The Water Margin* (or Outlaws of the Marsh).

Her parents hired a traditional scholar, 50-year-old Mr Kung, to teach Buck classical Chinese literature and thought. Mr Kung, originally from Beijing, moved to Zhenjiang after his house was burned down by German soldiers.

Every afternoon at 2 pm, Mr Kung arrived at Buck's home for two-hour lessons. He taught her about Confucius, Bodhisattva, Chinese history, classical literature, life maxims, and local customs and traditions. When answering her questions, he went beyond mere book knowledge, emphasizing the connection between the "source" and the "flow" that links the past, present and future. He also encouraged young Buck to study Chinese classical novels and taught her about the "Complete Library of the Four Treasuries" that was stored in Zhenjiang's Wenzong Ge, an ancient library.

For 10 years, through reading classical texts and practicing calligraphy, She not only became well-versed in traditional Chinese classics and familiar with Chinese history, culture and geography, but also developed a beautiful regular-script style of writing, spoke fluent Mandarin, and even learned to carve seals. In Zhenjiang, she also witnessed the miserable lives of victims of the 1905 Yangtze River flood, which provided first-hand material for *The Good Earth*.

In 1910, Pearl Buck returned to the United States to attend Randolph-Macon Woman's College and, shortly after graduating in 1914, returned to China. She taught English in middle schools in Zhenjiang for two years and, after marrying John Lossing Buck in 1917, the couple went north to live in the countryside of Suzhou, Anhui province, to research life and agriculture in rural areas.

Top: Pearl S Buck (right) at a United China Relief fundraising event in the US in 1941. She played an active role in encouraging and organizing fundraising efforts in the US. **Middle left:** Buck speaking at the National Press Club in Washington. **Middle right:** A photo taken on August 17, 2025, in Nanjing, Jiangsu province, shows a Western-style building, which is now home to the Pearl S Buck Memorial House. **Above:** *The Patriot*, released in New York in 1939, was the first novel Pearl S Buck published after receiving the Nobel Prize in literature in 1938. PHOTOS PROVIDED TO CHINA DAILY

"During her four to five years in Suzhou, Pearl Buck learned about the rural areas and farmers in China more profoundly," Lu says.

From 1919 to 1934, the Bucks both taught at the University of Nanking. In the house located at No 3 Pingcang Alley, now in the Gulou Campus of Nanjing University, she completed her first novels, including *East Wind, West Wind* (1930), *The Good Earth* (1931), *Sons* (1933), and *The Mother* (1933), as well as a translation.

In 1933, Buck published the first English translation of *The Water Margin*, one of Chinese literature's Four Great Classic Novels of the Ming Dynasty (1368-1644), giving it the title *All Men Are Brothers*, a line she learned from the Confucian classic *The Analects*.

In 1938, when Buck received the Nobel Prize in literature, she gave a lecture, *The Chinese Novel*, in which she said, "My earliest knowledge of story, of how to tell and write stories, came to me in China". She also mentioned the "Complete Library of the Four Treasuries" she learned from Mr Kung.

The Good Earth, featuring a poor Chinese farmer's family caught in the tides of history, became an instant best-seller in the US and was translated into more than 30 languages. It won the Pulitzer Prize in 1932. In 1937, a film adaptation was produced and won an Oscar for Best Actress the following year.

In 1934, with much reluctance, Pearl Buck left China, but her connection with the Chinese people was never severed.

Since the 1920s, she had been writing articles for US magazines, including The Atlantic, Asia, The Chinese Recorder, and The Nation, on Chinese farmer's life, culture, the shifting roles of women, and China's social dynamics.

In the United States, Buck fully committed herself to humanitarian and cultural endeavors related to China.

In 1941, she became president of Asia magazine to promote modern Chinese literature, aiming to create vibrant, multidimensional Chinese characters that challenged Western stereotypes.

The same year, the East and West Association was established, and as the president, Buck utilized lectures, publications, broadcasts, and translations to spread Chinese culture and provide crucial international support for wartime China.

In 1943, Buck joined the Citizens Committee to Repeal Chinese Exclusion as a key spokesperson, publicly criticizing the exclusion laws. Her efforts contributed to the repeal of the Chinese Exclusion Act later that year.

During the Chinese People's War of Resistance against Japanese Aggression (1931-45), Buck steadfastly supported China's mission. Since the September 18th Incident in 1931, she had openly condemned Japanese militarism and consistently informed the American public about the realities of the war in China.

To aid China, she initiated the Book of Hope fundraising campaign in 1940 and subsequently led the China Emergency Relief Committee and the United China Relief agency, organizing large-scale fundraising efforts to provide medical supplies, build hospitals, and aid civilians and war orphans.

Throughout the war, she frequently used media platforms to voice her support. In 1938, she reviewed the book *Red Star Over China*, predicting China's revolutionary victory and in another article published later that year she praised Chinese guerrilla tactics. In 1942, she published the novel *Dragon Seed*, set against the backdrop of the Nanjing Massacre in 1937, during which 300,000 Chinese soldiers and civilians were killed, making it one of the most horrific atrocities of World War II.

In 1938, in the Banquet Speech of the Nobel Prize, Buck said: "I have never admired China more than I do now, when I see her uniting as she has never before, against the enemy who threatens her freedom. With this determination for freedom, which is in so profound a sense the essential quality in her nature, I know that she is unconquerable."

In 1945, she witnessed Japan's surrender to the Allies, marking the end of the war. In 1973, Buck died in Danby, Vermont, at 80. According to her will, her tombstone at Green Hills Farm in Pennsylvania bears no English name, no birth or death dates, and no epitaph — only three Chinese characters in seal script, handwritten by Buck herself: *Sai Zhen Zhu*, her Chinese name.

In the Statement on the Death of Pearl S Buck in 1973, former US president Richard Nixon said: "In life, Pearl Buck was a human bridge between the civilization of the East and West."

Today, China is quite different from the one depicted in Buck's works. Characterized with modernity, urbanization, globalization, and digitalization, modern China is a far cry from the one focused on land, villages, and family ethics in *The Good Earth*, Guo, the professor, says.

"If we still read Buck solely as a way to understand China's reality, we're missing the point," Guo says.

"In today's context of challenging Sino-US relations, her significance is in her reminder that even if relations between countries are tense, the possibility for understanding between individuals should remain," Guo says, adding, "It is an agreement we reached after discussing the significance of Pearl Buck with the Ministry of Education's China Center for International People-to-People Exchange in current cultural exchanges.

"No matter how dominant political narratives become, they cannot completely obscure the reality of ordinary people's lives. While the China she wrote about is in the past, the method she represents — understanding people through their humanity — is still relevant today," he stresses.

A well-versed exchange between Chinese and Arab writers

GUANGZHOU — Young poets, writers and scholars from China and Arab countries have gathered in South China's Guangzhou, Guangdong province, for a poetry festival aimed at deepening literary dialogue and people-to-people exchanges.

A China-Arab States special session of the 2026 International Youth Poetry Festival began over the weekend in the southern metropolis, drawing more than 40 young poets, Sinologists and writers from 13 Arab countries, including Morocco, Syria and Egypt, alongside more than 40 young Chinese poets.

The event will run through Sunday. In the coming days, Chinese and Arab poets will take part in a series of cultural exchange activities in Guangzhou, Shenzhen, both in Guangdong province, and Beijing, including poetry readings, academic dialogues, poetry seminars, and field visits.

The opening ceremony of China-Arab States special session of the 2026 International Youth Poetry Festival in Guangzhou, Guangdong province, on May 9. PHOTOS BY LU HANXIN / XINHUA

"Though separated by thousands of miles and different languages, the two great poetic traditions of China and the Arab world have become both the root and soul of their civilizations, with condensed language, profound wisdom, and sincere emotion," says Zhang Hongsen, chairman of the China Writers Association.

Zhang says he hopes young poets from both sides will draw inspiration from one another while staying rooted in their own cultures, allowing poetry to flourish through exchanges between tradition and modernity, and the local and the global.

For Egyptian poet Yahia Mohamed Wagdy Lotfy Omar, poetry can travel across languages and borders.

"When I write a line of poetry, a friend on the other side of the world who speaks a different language can still be moved by it and understand it. That is poetry," he says, adding that translation serves as an important bridge, and such gatherings can help poets break through their own limitations.

Launched by the China Writers Association in 2024, the International Youth Poetry Festival has previously held special sessions for BRICS countries and China-Latin America exchanges.

Organizers say the platform is growing into an international venue for young writers to promote literary dialogue and mutual learning among civilizations.

LIFE

Blending tea culture with travel

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

Enthusiast-turned-entrepreneur shares his appreciation for the drink along with his sourcing adventures, report **Zheng Zheng** and **Wu Wanzhen** in Shanghai.

When Derek Poskin first arrived in the historic canal city of Yangzhou, Jiangsu province, in 2016, he was tracing a poem by Tang Dynasty (618-907) poet Li Bai and developing a growing appreciation for Chinese tea culture. Nearly a decade later, the American, born in 1988, has become a tea entrepreneur, sourcing premium leaves across China and selling them to customers worldwide.

"Coffee is for work. Tea, though, is for life. I've always been passionate about Chinese tea," Poskin says from Empty Cup, his renovated tea house nestled in Yangzhou's old quarter, where he introduces visitors from around the world to China's tea traditions.

"I started drinking and buying more, and eventually turned my house into a warehouse. I had to share it somehow, and that's how the business began."

From passion to business

Poskin launched his tea venture in 2018 as a side project, aiming to connect Western tea enthusiasts with the traditions behind it. However, the early years were challenging.

"The first three or four years were really slow," he admits, recalling how only family members purchased his products initially. "I still remember the first time I got an order from somebody I didn't know. I was like, 'Oh my gosh'. That was the moment I knew I was making it. It's been a long, long process."

Navigating China's tea landscape is no simple feat. The country produces thousands of varieties across six main categories — green, white, yellow, oolong, black, and dark teas like Pu'er.

Rather than working through middlemen, Poskin travels directly to tea-growing regions across China, from the ancient forests of Yunnan province in the southwest to the oolong gardens of Fujian province along the eastern coast.

"One of the reasons I came to China was to live the tea culture. The best way to do that is to go where the tea is made," he explains. "Before coming to China, I had been drinking tea for a long time but had never actually seen a tea plant. Now I've hiked through some of the country's most remote tea mountains."

Connective expeditions

One of Poskin's most memorable expeditions took him to Guafengzhai, a remote village of the Yao ethnic group in Yunnan's Yiwu town, about two kilometers from the border with Laos. Renowned for its high-quality Pu'er tea, the village had long been a bucket list destination for the entrepreneur.

The journey began with a leap of faith — connecting through social media with a young, local farmer named Zhao Xiaoyun. "I had this prearranged date with a person I'd never met, in a town I'd never been to, to venture to the borders of China," Poskin recalls. "But as soon as I met her, I knew we were on the same page. We both spoke the language of tea."

The four-day expedition immersed him in every aspect of tea production. Joining Zhao, her mother, sister, and friends deep in the tea forests, he picked leaves, laid them out to sundry, and helped with the roasting.

"We've hosted foreign tea merchants who have visited our plantation for business before, but Derek stands out for his exceptional knowledge of tea," says Zhao. "When we taught him the leaf fixation process, a critical step that halts oxidation and preserves flavor, he learned it immediately."

The primeval forests, with tea trees hundreds of years old growing wild among other vegetation, left an enduring impression. "Walking through those ancient groves felt like stepping into another world," Poskin describes. "The farmers would point out edible herbs along the way, letting me taste spicy leaves that would numb my mouth like Sichuan peppercorns.

"That's one of the most magical aspects — experiencing the land with the people who live on it," he adds.

Pieces of a puzzle

Poskin's dedication to understanding tea goes beyond sourcing trips. He spent a year in Chaozhou, Guangdong province, studying the art of making clay teapots used for *gongfu cha* (tea with skill). This method uses small pots and cups to bring out complex flavors through multiple short infusions.

He has participated in some local customs and festivals during his trips, often as the only foreigner. "One time, around Qingming Festival, I was invited to join a family's tomb-sweeping ritual," he recounts. "We killed chickens, burned incense and paper money, and set out meals for the ancestors. It was incredible to be part of that living tea culture."

The tea is just the surface, he emphasizes. "When I experience the world through the eyes of the people in the mountains, I realize how deep tea culture really is. The leaves themselves are just a piece of the puzzle."

Through his travels across different provinces, Poskin's understanding of the drink itself has shifted from a search for correctness to an appreciation for diversity.

"I came thinking there was one correct way to drink tea," he explains. "But I've learned that Chinese tea culture is incredibly fluid and varies by region." For example, people might drink green tea straight from a glass jar in Yangzhou, while in Chaozhou, elaborate *gongfu cha* sets are the norm.

"Chinese tea culture is fluid, more Taoist," he says. "Every place has its own style, and any way you drink tea is the right way. I find that very welcoming and liberating."

Bridging East and West

These experiences have become central to his business model. Poskin documents his sourcing journeys through videos and photographs, sharing them with customers to create transparency and a connection between consumers and producers.

His content creation extends to a podcast called Tea Soup, a YouTube channel, and an active social media presence through which he has built a following of enthusiasts eager to learn about authentic Chinese tea culture.

Clockwise from top: Derek Poskin on the tea mountain in Guafengzhai, which is located on the southwest border of Yunnan province and is renowned for its high-quality Pu'er tea; The leaf fixation process; Poskin shows fresh and sun-dried tea leaves; Poskin and Zhao rolling tea leaves. Online
Scan the code to watch the video.

Most of his customers are based in the United States, with significant sales to Germany and other EU countries. To introduce premium flavors to a wider audience, he utilizes blending techniques that maintain high quality while remaining affordable.

"I buy some really good tea and blend it with a less expensive tea that complements it, so people can try something high-quality at an affordable price," he explains. For each product, he creates detailed tasting notes, origin information, and brewing instructions.

Unlike many e-commerce businesses, Poskin operates exclusively through his own website, maintaining full control over the customer experience — from freshly coined tea names to packaging designs. "It's something I have complete control of. For me, this is a creative expression," he says.

Looking ahead, Poskin envisions his business evolving into a social enterprise that gives back to farming communities. His new teahouse project in Yangzhou aims to create a physical space where people can experience Chinese tea culture firsthand.

"The business is doing well. My partner and I are interested in making it a social enterprise — giving back to the farmers and doing something positive," he reflects. "I don't need to make endless money. I'd rather cap it and use the excess for good.

"From the start, this has been a passion project," he emphasizes. "I want a deeper understanding of Chinese tea, to source better tea, and to awaken more people to Chinese tea culture."

Reflecting on a decade in China, Poskin offers fellow entrepreneurs a perspective of patience. "China is a world of opportunities. There are so many people who can help you. But don't rush it," he notes. "Great things take years, and then they happen all at once."

Salon and music strengthen Sino-New Zealand friendship

WELLINGTON — Featuring a concert by the Amber Quartet, the "Tea for Harmony: Yaji Cultural Salon" in late April integrated Chinese tea culture with classical Western music in Auckland, New Zealand's largest city.

Organized by the China Cultural Center in Auckland, the event opened with tea tasting, traditional tea preparation, tea appreciation, and storytelling about tea culture, creating an elegant, harmonious atmosphere. Participants were invited to make a personalized cup of tea using an ancient Chinese style in which tea powder is applied to "draw" pictures on the tea's foam.

The Amber Quartet was founded in 2005 and has become an internationally influential string quartet in China. During the event, Debussy's *String Quartet* and works featuring the ethnic cultures of both countries were performed. "They were truly amazing," Sharon Ann from the audience says, speaking of the performers' superb skills.

Chen Shijie, Chinese consul general in Auckland, says that the event uses music as a bridge and tea as a bond to convey the friendship of the Chinese people, helping deepen mutual understanding and relations between the people of China and New Zealand, and strengthening the public foundation of bilateral relations.

Bob Harvey, former mayor of Waitakere, says he values the historical ties and current cooperation with China. "This night is cemented with tea for harmony and peace. It is such a special moment."

LIFE

An island's women on wheels

On remote Qushan in Zhejiang province, a team of female delivery drivers is reshaping traditional roles, balancing motherhood and work while forging independence and solidarity, **Chen Nan** reports.

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

Part of the Zhoushan Islands in China's Zhejiang province, hundreds of kilometers from the mainland, lies Qushan Island, home to fewer than 100,000 residents.

Life here revolves around a main road, which is a narrow stretch lined with schools, a clinic, a handful of shops, four bubble-tea cafes, and a lone coffeehouse. This modest cluster forms the island's "central business district". Yet, in the past year, it has become the stage for an extraordinary cast of women.

They are mothers averaging 40 years of age who have traded the predictable rhythms of domestic life for the hum of electric scooters and the uniform of the island's delivery service. Day after day, clad in orange and black, they navigate winding lanes and stair-stepped alleyways, threading the island together one takeout order at a time.

Once tied to roles defined by family and circumstance, such as wives awaiting fishermen at sea, and mothers trapped in part-time work, they now claim a new agency in these small, daily movements, quietly "rebuilding themselves" with every delivery.

From February to March this year, renowned Chinese photographer Xie Hailong, whose work has chronicled ordinary lives for 35 years, visited Qushan, drawn by curiosity.

"On an island surrounded by wind and sea, I wanted to see how these women could seize their own lives," he says. More than 10 of his photographs are being displayed in an exhibition titled *Seeing: Cities and Riders*, running from April 17 to the coming Sunday at public locations across 12 cities nationwide, capturing these women, who root themselves in a life defined not by circumstance, but by choice, against the rhythm of waves and wind.

Xie, 75, is known for a photo that he took in 1991, telling the story of Su Mingjuan, then 8 years old, with great sparkling eyes and a pencil in hand, in rural Jinzhai county, Anhui province. The photo became a household image after it was used as a poster for Project Hope, which was launched by the China Youth Development Foundation in 1989 and is dedicated to helping underprivileged children get an education.

Xie was inspired by a video online that he watched in 2025, featuring this group of women whose optimism, smiles and authenticity shone through every frame.

"I was captivated by their energy and found myself curious about this unique team — how, in such an isolated place, surrounded only by wind and sea, could they courageously choose their path, work tirelessly, and hold tightly to the life they wanted to live," the photographer says.

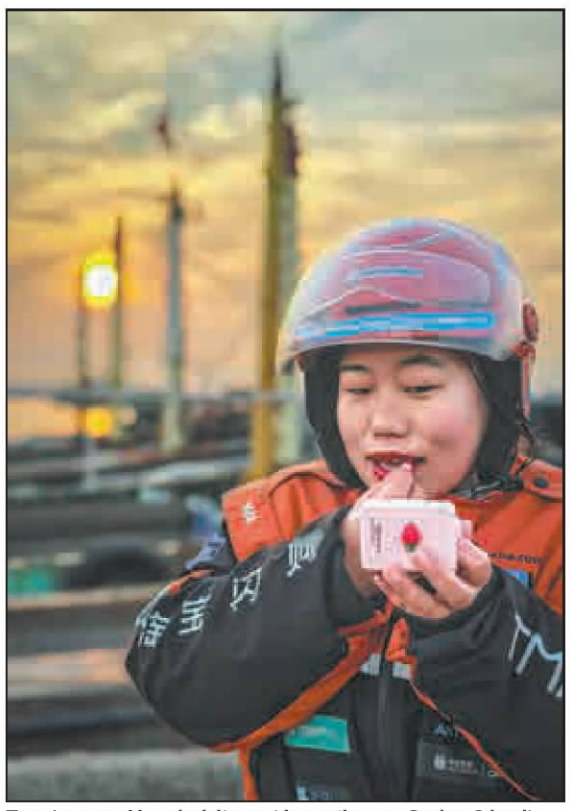
The first time he saw them in person, their vibe instantly drew him in. They were a diverse group of women, aged between 30 and 50, all dressed in bright orange uniforms. They gathered at the "CBD" of the island and chatted and laughed together.

"Their electric bikes were parked nearby, and they were like a burst of color against the backdrop of the island. When an order came in, one of them would zip off to deliver it, only to return afterward and join the group once again," says Xie.

During the days when their husbands were out at sea, these women became each other's family, supporting one another through thick and thin. When one of them had fewer orders, the others would step in and share theirs. If a newcomer was unfamiliar with the island's streets, the experienced riders would patiently guide her. Between orders, they would pull out little mirrors and lipsticks to touch up their makeup, reminding each other that, even in their uniforms, they never forgot the importance of feeling beautiful.

"It is a life that is both modest and deeply connected, where community comes first, and every little act of kindness carries weight. These women aren't just making deliveries; they are building lives for themselves and each other, grounded in determination, sisterhood and joy," the photographer says.

Among these women is Chen Lirong, born in 1997 and the youngest and fastest of Qushan's female riders. She is also the navigator, the one steering the small team through the chaos of rising orders. Each day begins at 7 am with the routine of family: delivering her two daughters to school. By 8:30 am, her delivery box is already brimming with orders. She rides until mid-afternoon, pauses to pick up her children, and then continues the cycle — juggling work and motherhood with the precision of someone who has spent years learning to adapt.



> "These women aren't just making deliveries; they are building lives for themselves and each other, grounded in determination, sisterhood and joy."
>
> **Xie Hailong,** veteran photographer

For Chen, deliveries are more than a job; it is the first work she has ever held that allows her to earn a living while tending to her children. Even at the busiest moments, she can glance at her phone, or quickly dash out an order and return home to care for her daughters.

In April 2025, when Taobao Shangou, or Taobao Instant Commerce, an online daily life services platform, officially launched operations on Qushan Island, Chen's reliability earned her the trust of Hu Gaoyang, the logistics manager. She became the leader of the all-female riders, guiding new mothers into the unfamiliar, physically demanding world of delivery work.

Initially, both Chen and Hu worried that the women, many long accustomed to full-time childcare or household work, might not adapt to the harsh rhythms of outdoor delivery. But as the first surge of orders hit, those doubts quickly vanished.

During the summer of 2025, order volumes skyrocketed by more than 1,000 percent. Some riders, brand-new to the job, handled 189 deliveries in a single day, and over the course of a month, completed more than 2,000.

Top: A group of female delivery riders gathers on Qushan Island's wharf for a photo. **Middle left:** In the rapeseed fields outside their homes, team member Wang Jinrong (left) picks a yellow flower, placing it on team leader Chen Lirong's head. **Middle right:** On an island with almost no elevators, these female delivery riders climb four to five floors per order — sometimes scaling hundreds of stairs in a single day. **Above:** Thirty-three-year-old Xu Limei loves bright lipstick. PHOTOS BY XIE HAILONG / FOR CHINA DAILY

Chen herself was no stranger to struggle. Born in Anhui, she had drifted from factory work in Guangdong province to follow her husband to Jiangsu province. By 2016, marriage and childbirth brought her to Qushan, where her husband became a fisherman and she a homemaker, bound to domestic responsibilities while he went out to sea. Early one March morning, photographer Xie captured a photograph of her sending her husband off at 4 am, the harbor dark and silent.

"There was no dramatic embrace," Xie recalls. "Just a quiet farewell. The silent care between them hit me harder than any posed shot. I found myself tearing up behind the camera."

Raising two daughters while managing household repairs, medical trips and family errands, Chen's desire to work and earn never waned. A previous job in a local factory ended when it shut down, leaving her life once again in a transitional state. But as a delivery rider, she found not only an income, but also her calling. She schedules her team around childcare needs: mothers with younger children ride the mid-shift, those with older children the early shift, while those without children cover the late hours. In high season, she stays late to help manage orders herself, ensuring no one is overburdened.

At 46, Hu Yingrong became the first female delivery rider to join Chen's team. Having lived on the island for nearly 20 years, she's seen her life unfold in ways she never expected. Her eldest daughter is now in college, while her youngest son is still in middle school.

For nearly a decade, Hu Yingrong searched for work on the island that would allow her to balance earning an income with taking care of her children. Before she became a delivery rider, she tried various jobs but found herself doing the laborious task of mending fishing nets.

For a decade, she was bound to those nets. While the men of the island used fishing nets to bring in the harvest, Hu believed that women on the island had their own "mission" — the work of repairing and maintaining them. When the boats returned from fishing, they were filled with nets that needed mending: some torn and some covered in small fish and shrimp that had to be removed.

When her children were on vacation or at school, she would work in a fishnet factory surrounded by piles of discarded nets alongside other women just like her. They worked from sunrise to sunset, often losing track of time.

Then, in 2025, a new opportunity appeared. She became the second female delivery rider on the island, marking the beginning of a new chapter in her life. Finally, she had a job with a base salary, and the harder she worked, the more she earned.

However, the transition wasn't easy. Unlike younger riders like Chen, Hu Yingrong struggled at first. When she joined the team, she was faced with the busy periods of July and August — times when the number of orders was overwhelming. She couldn't even read the delivery routes on her phone's navigation system because they looked like a tangle of branches and twigs, constantly splitting and extending. But with persistence and a willingness to learn, she quickly adapted.

The island is full of buildings without elevators, and she often found herself climbing staircases, sometimes multiple flights in a row.

"My legs would hurt so much," she says, recalling the physical toll. Yet, she pushed through and excelled during the peak seasons, earning over 10,000 yuan ($1,472) a month — figures she had never dreamed of while working in the factory. During the off-season, she could still make 7,000 to 8,000 yuan — an amount that once seemed impossible.

Now, she has carved out some time for herself. After sending her son to school in the morning, and finishing her deliveries, she returns home to do housework or tend to her small vegetable garden.

The exhibition also features photos of other delivery riders taken by other photographers. According to the photo exhibition's curator Yang Han, more than 2,000 works were submitted for the event, with nearly 100,000 riders participating in the voting to select 200 images to be exhibited. The total number of votes surpassed 1 million.

Alongside Xie, more than 50 other photographers are featured, including Zhang Boyuan who has taken pictures of Tang Qi, a rider in Chengdu, Sichuan province, who twice jumped into an icy river to save people.

"Many photographers and ordinary people pick up their cameras and phones to document the riders around them," Yang notes.

"If your pictures aren't good enough, you aren't close enough," Xie says, quoting famous war photographer Robert Capa. "The same applies to portrait photography — this 'closeness' refers to how close you are to the life and heart of the person you're photographing.

"During this shoot, I was moved to tears several times by the passion and optimism of these mothers. Each of them faces various difficulties at home, yet they still wear a smile on their faces. In the past, I've often revisited the children I photographed for Project Hope, checking in on them every few years to see if they're still in school. I hope that in the future, I'll have the chance to return to this small island, to the 'CBD' they've been waiting for, to that little milk tea shop, and see them still wearing smiles on their faces, with their lives getting better and better," Xie says.

Ancelotti: Neymar call to be made on form, not sentiment

Received by NSD/FARA Registration Unit 08/26/2026 3:35:42 PM

As Brazil's coach gets set to announce his World Cup squad, questions remain over inclusion of 34-year-old Santos star

Neymar (center) of Brazilian side Santos fights for the ball with Matias Reali (left) and Manuel Insaurralde of Argentine club San Lorenzo during a Copa Sudamericana group-stage match at the Pedro Bidegain stadium in Buenos Aires in April. AFP

Carlo Ancelotti will walk into Monday's Brazil squad announcement with a nation peering over his shoulder and one burning question hanging in the Rio de Janeiro air: Neymar, or no Neymar?

The 34-year-old forward is Brazil's all-time leading scorer, but his place at the 2026 World Cup, which kicks off next month, hangs in the balance after years of injury troubles and an underwhelming return to Santos.

That leaves Ancelotti weighing romance against the cold, practical demands of fitness, as he lays out his high-intensity blueprint for the record five-time champion.

"When you have to choose, you have to consider many things," Ancelotti told reporters on Tuesday.

"Neymar is an important player for this country because of the talent he has always shown, but he has had problems and is working hard to recover. He has improved a lot recently, and is playing regularly. It is, obviously, not such an easy decision for me. We have to weigh up the pros and cons carefully."

Ancelotti hosted reporters at the Brazilian Football Confederation's headquarters in Rio, overlooking Barra da Tijuca, and spoke about the delicate selection call with the calm that has defined one of soccer's most decorated managerial careers.

The Italian is the only coach to have won league titles in all of Europe's big five leagues and has lifted a record five Champions League trophies as a manager, in addition to two as a player.

'Much loved'

Yet, few selection decisions will be picked apart quite like this one. Teammates have publicly lobbied for Neymar's inclusion, while supporters remain split between affection and anxiety over whether his body can still keep pace with his imagination.

"I know full well that Neymar is much loved, not only by the public, but also by the players," Ancelotti said.

"This is also a factor, because we have to consider the atmosphere that will surround Neymar's call-up. It's not as if I'm going to drop a bombshell in the dressing room. He's very well-liked, he's very much loved.

"I think it's normal for the players to express their opinion. I'm grateful to everyone who has given me advice; I thank you all.

"But, ultimately, the right person to make this decision, the one best placed to do so, is me."

Asked whether the players' appeals had influenced him, Ancelotti said they mattered only in one respect: they underlined that Neymar would not disrupt the group.

For Ancelotti, the dressing room is not the concern. The circus outside it may be.

"The internal atmosphere, I don't think it will affect the team at all. The atmosphere is a very positive, very clean one, and no matter which player is in the squad, it will remain positive and clean right to the end," Ancelotti said.

"But I can't control the external atmosphere and what the media says."

'Improved'

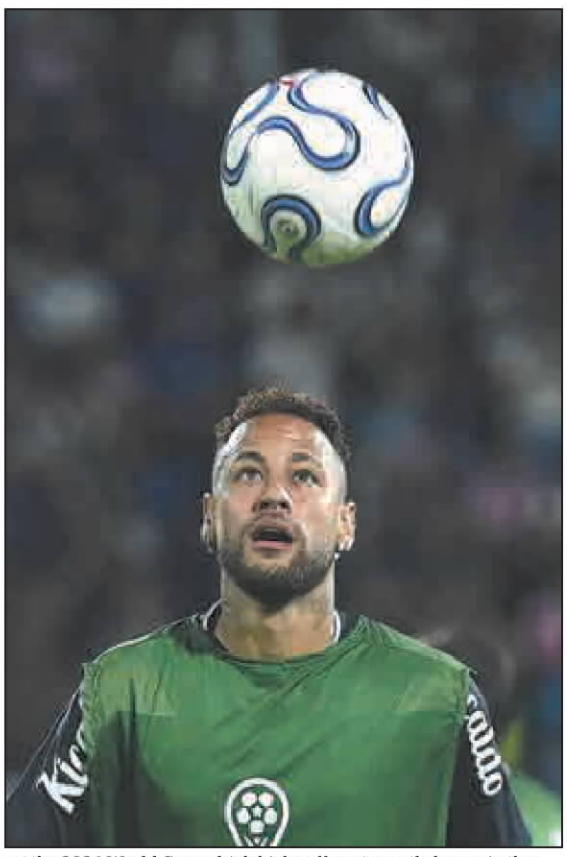
The bigger question may be whether or not Neymar still fits the soccer Ancelotti wants: four forwards who can run, press and track back, a demanding template for a player who has struggled to string together a sustained run of matches.

Carlo Ancelotti

The Italian, however, said Neymar had shown signs of progress.

"He has improved his fitness a lot in recent matches," Ancelotti said.

"He has played some very good matches lately and he can maintain a high intensity in a match, but there are matches and matches..."



Ancelotti said the decision whether or not to select Neymar would be his alone.

"I haven't been pressured by anyone to call up Neymar. I have complete autonomy," he said. "The decision will be 100 percent professional. I will only take into account how he is performing as a footballer. Nothing else.

"Can I draw up a perfect squad? Impossible! But I can draw up a squad with fewer mistakes than others who might do so. Of that I am certain."

With 30 days to go, LA has everything in place for the World Cup — except the pitch

INGLEWOOD, California — With 30 days to go until its first World Cup match, Los Angeles has the transportation and food nailed down. The playing surface, though? Not just yet.

The United States opens its campaign at SoFi Stadium (to be known as Los Angeles Stadium) against Paraguay on June 12, the first of eight matches to be played at the NFL stadium in Inglewood.

On Tuesday, though, the field was still dirt.

That was set to change on Wednesday, when, after a 1,600-mile trip in refrigerated trucks from Washington state, sod was due to arrive, ready to be laid over the next two days.

"This surface is the players' stage," said Otto Benedict, senior vice-president of facilities and campus operation for SoFi Stadium.

Construction on the field began April 13 after the stadium hosted a Monster truck event.

The stadium modified the field shared by the NFL's Los Angeles Rams and Los Angeles Chargers in two phases. Auxiliary space and wider dimensions were created by removing corner seats to meet FIFA specifications, and a sophisticated irrigation system was installed to maintain the grass.

"To be the place where the energy first ignites, where the home crowd gets to set the tone for the rest of the tournament is a responsibility we don't take lightly," Benedict said.

Construction, landscape, grass and engineering crews were applauded by local World Cup organizers and community ambassador Magic Johnson, who pointed out his suite where he'll be watching.

"When you think about the financial impact it's going to have on Los Angeles, it's going to be amazing," said Johnson, who is a co-owner of LAFC in Major League Soccer and the Washington Spirit of the National Women's Soccer League.

Tours of the stadium during the tournament are being sold for $86.50 and premium seats, suites and hospitality packages are still available.

Fans availing themselves of those tickets will have access to a variety of food and drink options, from lime marinated shrimp and spiced lamb rack, to aged ribeye cap with bordelaise and mashed potatoes.

There is also a range of themed desserts, including a World Cup trophy made of chocolate mousse, raspberry, chocolate crunch and chocolate sponge.

Metro debuted special edition TAP cards featuring three FIFA-themed designs, 17 country-specific designs, four FIFA collector cards, including a light-up card, and a collector's box.

"We want to provide a system that is safe, fast and fun," LA Metro CEO Stephanie Wiggins said.

Metro is working with 11 other transit lines in the region to offer direct-to-stadium bus services for $3.75 from 15 park-and-ride lots in the LA and Orange counties. Reserved parking lots range in price from $55 to more than $100. Fans can access 300 dedicated buses to every match in an effort to avoid disrupting regular services.

The official FIFA Fan Festival will be held from June 11-14 at Los Angeles Memorial Coliseum with big screens showing games. Ten fan zones around LA county will host activities and watch parties.

Country moving toward common prosperity

Since reform and opening-up, China has emphasized a development-oriented approach to poverty alleviation. In contemporary China, labor is the main determinant of distribution, with individuals paid according to their work. For this reason, poverty reduction is achieved primarily by enabling people to earn income through useful employment.

At the same time, China has balanced its development-driven measures with welfare-oriented tools.

For example, as not all rural households could support themselves through work, the minimum living allowance system, known as the *dibao* system, was extended to rural areas in 2007. This program provided unconditional cash transfers to the rural poor.

In 2003, a new rural cooperative medical system — an affordable public insurance program for rural residents that covers inpatient services and catastrophic illnesses, with rising reimbursement rates — was put in place. By 2013, this program had covered nearly 99 percent of the rural population.

The targeted poverty alleviation program, launched in 2013, continued along this path.

In particular, members of poor households were identified not just in terms of livelihood circumstances and income-generation capabilities, but also in terms of their access to education and healthcare. Attention was also paid to targeted support for people whose special circumstances, such as illness and disability, prevented participation in paid work.

By the end of 2020, the targeted poverty alleviation campaign had eradicated absolute poverty. The 98.99 million people who remained under the threshold in 2012 were lifted out of poverty, with many moving well above the threshold. All the 832 impoverished counties and 128,000 poor villages were lifted out of poverty. As a result, living standards of the people involved improved significantly.

With the completion of the program in 2020, the goals changed to addressing the risks that people might fall back into poverty, as well as rural vitalization, the normalization of support, enhanced social assistance and continuing efforts to equalize the provision of public services.

China also is moving toward the broader goal of achieving common prosperity, and the country's development philosophy has evolved in a more multidimensional direction, in which its high-quality development incorporates environmental sustainability, social well-being, human-centered development and public participation.

Trade talks achieve positive outcomes

By ZHONG NAN
zhongnan@chinadaily.com.cn

The outcomes achieved by China and the United States in their latest round of economic and trade consultations could help bring more certainty and confidence to global industrial and supply chains, and may contribute to stabilizing the world economy amid rising geopolitical and trade uncertainties, market observers and executives said.

The Ministry of Commerce announced on Saturday that China and the US agreed to establish trade and investment councils to address their respective concerns in trade and investment. Through the trade council, the two countries will discuss issues such as tariff reductions on specific products and have agreed in principle to lower tariffs on products of respective concern on an equivalent scale.

The two countries agreed to advance two-way trade through arrangements such as mutual tariff reductions on a range of products, including agricultural goods, while also reaching arrangements on China's purchase of US aircraft and arrangements for the US to ensure the supply of aircraft engines and related parts to China, the ministry said.

The two sides also agreed to resolve or make substantial progress toward resolving nontariff barriers and market access issues involving some agricultural products. For example, the US will actively work to address Chinese concerns including automatic detention measures targeting dairy and aquatic products, while China will actively advance solutions to US concerns regarding beef facility registration and poultry exports from certain US states to China.

Business leaders said the latest outcomes could help create a more stable environment for cross-border business operations and long-term trade and investment planning.

Sean Stein, president of the US-China Business Council, said that on this basis, the two sides can expand dialogue across more areas and create a more favorable environment for US companies operating in China and vice versa.

Observers said the establishment of trade and investment councils could help institutionalize communication at a time when businesses on both sides are seeking greater regulatory certainty and clarity.

Denis Depoux, global managing director at German management consultancy Roland Berger, said that whatever communication platform is established would be a positive step, helping move the relationship away from the short-term volatility and uncertainty that has characterized it in recent years.

"That does not mean tensions cannot flare up again overnight. But at the very least, it provides a clearer outlook and the prospect of relative stability in the coming months," he said.

Zheng Yongnian, dean of the School of Public Policy at The Chinese University of Hong Kong (Shenzhen), said the essence of China-US economic and trade relations is not a "zero-sum game", but mutually beneficial cooperation built on each side's comparative advantages. The key is to expand cooperation, manage differences and balance openness, development and security, he said.

"The economies of China and the US are highly complementary," Zheng said, adding that as long as mutual demand exists, the scope for cooperation can continue to grow.

US executives from sectors including agriculture and advanced manufacturing said that stable China-US economic ties remain essential for long-term supply chain cooperation and market development.

Brian Sikes, board chair and CEO of US agribusiness group Cargill Inc and a member of the US business delegation that visited Beijing last week, said that he remains optimistic about collaboration with Chinese partners, noting that "food can be a bridge to better relationships".

Achim Loeffler, global business leader of US advanced materials manufacturer Gore-Tex Brand, said that China has become one of the company's most important and fastest-growing markets, driven by rising consumer demand, faster product development cycles and a well-developed supply chain ecosystem.

China-Russia Expo seen as key platform

Xi and Putin send congratulatory letters to event ahead of Russian leader's state visit

By ZHANG YUNBI in Beijing
and **ZHOU HUIYING** in Harbin

President Xi Jinping and Russian President Vladimir Putin have each sent a congratulatory letter to the 10th China-Russia Expo ahead of the Russian leader's upcoming state visit to China.

The expo opened on Sunday in Harbin, the capital city of Heilongjiang province in Northeast China.

In his message, Xi noted that this year marks the 30th anniversary of the China-Russia strategic partnership of coordination and the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

Bilateral cooperation in various fields has been continuously deepened and solidified, achieving fruitful results thanks to the joint efforts of the two countries, Xi said.

It is hoped that the expo will serve as an opportunity for various sectors of the two countries to leverage their geographical proximity and complementary advantages, deepen all-round practical cooperation, further promote economic and social development, and continuously enhance the well-being of the two peoples, he said in the letter.

The goal is to make contributions to the steady and long-term development of the China-Russia comprehensive strategic partnership of coordination for a new era, Xi said.

Putin said in his message that the expo has evolved into the largest exhibition event between the two countries, providing a platform for direct and in-depth dialogue between the two sides.

It is believed that this expo will achieve positive results, plan for new prospects of mutually beneficial cooperation between the two countries and bring benefits to the two peoples, Putin said.

Last year, bilateral trade totaled $227.9 billion. In the first four months of this year, bilateral trade reached $85.2 billion, a year-on-year increase of 19.7 percent, according to the Chinese Foreign Ministry.

Aleksandr Sergeevich Kalashnikov, deputy mayor of Blagoveshchensk, said the expo has seen the number of exhibitors grow year by year, while the lineup of sectors involved continues to expand and diversify, and there are a growing number of agreements in the areas of high technology, joint production and green energy.

Inside
Editorial, **page 6**

"In the economic sphere, we look forward to an increase in cross-border trade and the creation of new logistics chains. In terms of cultural exchanges, we look forward to expanding student exchanges and joint cultural festivals to strengthen the friendship between our two peoples," he said.

On Saturday, the Chinese Foreign Ministry announced that Putin will pay a two-day state visit to China starting from Tuesday.

Observers have expressed the hope that the visit will enhance bilateral coordination and mutual trust, help inject more certainty and positivity to the world's peace and security, and offer a greater boost to global prosperity and growth.

Since 2013, Xi and Putin have met more than 40 times. Xi has visited Russia 11 times, while Putin has visited China 13 times, according to Xinhua News Agency.

Zhang Hanhui, China's ambassador to Russia, said that cooperation between the two countries has "yielded fruitful results" and "reached new heights one after another".

The two heads of state have led the deepening of political mutual trust and "maintained close communication and coordination on bilateral relations and major international and regional issues", Zhang wrote in an article published on Thursday.

"This is not only a vivid illustration of the profound friendship between the two heads of state, but also a clear manifestation of the maturity and resilience of China-Russia ties. This provides the most fundamental and reliable guarantee for the long-term, healthy and stable development of China-Russia relations," he added.

Chen Wenling, a veteran economist and senior researcher at the Academy of Contemporary China and World Studies, said the two countries work closely together within multilateral frameworks such as the United Nations, BRICS and the Shanghai Cooperation Organization, and they both oppose hegemony, power politics and unilateralism.

"As two major countries, China and Russia should further play their constructive and leading roles," she said.

SONG BROCADE WEAVES ITS WAY BACK INTO MODERN LIFE

Once preserve of nation's elites, the traditional textile is now fabric of everyday use

By DENG ZHANGYU
in Suzhou, Jiangsu
dengzhangyu@chinadaily.com.cn

China Vibes 国潮风尚 GIFTS

When London-based fashion designer Brandon Choi walked into Shi Yi's boutique in downtown Shanghai, he did not expect to leave with plans for the following day.

Captivated by the Song brocade pieces on display, he learned that the centuries-old fabric came from Suzhou, Jiangsu province, where Shi's studio is based.

"See you in Suzhou tomorrow afternoon," he told Shi, who back then assumed it was merely a polite remark — but it was not.

Choi showed up the next day, eager to understand the fabric underneath the shimmer of soft colors and ancient motifs.

Shi has seen that reaction before. During Shanghai Fashion Week in late March, a design team from fashion house Maison Margiela wandered into her shop and ended up buying nearly everything they could carry.

"This is the allure of Song brocade," said the 30-year-old Shi. "Once people see it, it's hard to resist buying it."

That kind of enthusiasm helps explain why Song brocade — once associated with imperial taste and collectors' cabinets — is finding a new audience.

Originating in Suzhou during the Song Dynasty (960-1279), the silk-based fabric has long been prized for its intricate structure, refined patterns and understated grandeur. It was used to mount precious calligraphy and paintings and, at times, to dress the elite.

"You left me less than three hours ago, and already I am enveloped by a sense of emptiness ... I would not have the strength to endure such loneliness were it not for your future ... I believe you are on the right path," wrote Celina Deprez, a Belgian woman, on June 21, 1938.

Deprez, who had taken the Chinese name "Li Na", was writing to her husband Wu Zuoren, who had set out as a front-line artist to record what he would witness in trenches, field hospitals and refugee camps.

Almost a year earlier, on July 7, 1937, Imperial Japan — already entrenched in northeastern China — escalated its aggression into a nationwide invasion with the Marco Polo Bridge Incident. Within days, China was plunged into the second stage of the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

Wu was later recognized as a defining figure in twentieth-century Chinese art, and his sketches would endure as records forged in the immediacy of war — of struggle and sacrifice.

Those struggles and sacrifices were not confined to the front. On Dec 21, 1939, Deprez, amid acute wartime shortages and the absence of adequate medical care, died at the age of 28, after giving birth to the couple's son 20 days earlier. The newborn followed four days later, on Christmas Day.

Wu was devastated, but not undone.

Five months later, he published an article in which he wrote: "Our contemporary artists, myself among them, have been fortunate to be born into this heroic age ..." — words that seem to carry the indelible undertone of his late wife.

Their story forms part of the newly-published book *Art in Service of the Nation — Artists During China's War of Survival*. Author Qin Jianping wrote the book based on her interviews with the artists and their offspring.

"To retrace their journey — both outward and inward — is to relive an era in which a profound humanity converged with an urgent commitment to social reality, a synthesis often absent from earlier Chinese art," she said.

"Out of this charged intersection of conflict and personal trial, modern Chinese art — and, by extension, a vital dimension of the nation itself — took shape."

Enduring tradition

For Qin, to delve into this history is also to trace the origins of her own institution, the Beijing-based Central Academy of Fine Arts, which go back to the National Peking (Beijing) Art School founded in 1918.

Following the Marco Polo Bridge Incident, the two leading art schools of the time — the Peking Art School and its southern counterpart, the National Hangchow (Hangzhou) Art School — were forced into a prolonged wartime exodus. Over the course of eight years and some 8,000 kilometers, they relocated across the country, merging in January 1938 in Hunan province before continuing together through Yunnan and eventually into Sichuan.

They endured relentless aerial bombardment by Japanese forces. On Feb 4, 1939, Wu Guanzhong — then a student at the merged school — watched enemy planes sweep low, releasing their bombs "like a black blizzard into a raging sea of fire". In the aftermath, he made his way back through smoke-choked streets, past bodies strewn along the roads. Thighs were caught on wooden poles, flesh burned, and bone laid bare, he would later recall. He and his fellow students survived only because they had been out of town, sketching.

"Given the extremity of the circumstances, the standards of artistic training they maintained were remarkable," said Qin.

During their 10-month stay in Anjiang village, on the outskirts of Kunming in Yunnan province, the school — consisting of some 250 people — was housed in seven temples, which served as makeshift classrooms.

Qin said discipline did not falter. In an oil painting by faculty member Chang Shuhong local villagers were engaged as nude models — "an extraordinary practice in so conservative a milieu".

Mass Bombings in Chongqing by artist Chang Shuhong.

"What these artists — many trained overseas — sought to do was, in the words of Wu Zuoren, to 'bring inner vision into form through technical command' in order to 'create works at once deeply personal and expressive of a nation under strain'," said Qin.

Between August and November 1937, Chinese forces committed their best troops to meet the Japanese head-on in Shanghai, fighting a brutal street battle that ended in withdrawal at immense cost.

In the immediate aftermath, 18-year-old Zhou Lingzhao painted two large anti-Japanese works, which he and fellow artists carried through the streets of the southern coastal city Guangzhou, Guangdong province, beside a wooden coffin — a stark, galvanizing declaration of a refusal to yield.

In the late summer of 1938, while the Battle of Wuhan in Hubei province was raging, Zhou was in the city, working with a team of artists on a monumental fresco — 45 meters long and 12 meters high — painted on the exterior wall of the city's landmark Yellow Crane Tower as part of the campaign for national resistance.

"I was the youngest, and was therefore assigned the highest section of the fresco, which I painted from a ladder suspended in midair," Zhou recalled in 2014, at the age of 95, in an interview with Qin.

"The fresco stood for less than a month. When Wuhan fell on Oct 25, 1938, after more than four months of fighting, it was destroyed with the tower in the battle's final stages. Yet there was never any doubt: those who had seen it, however briefly, would not forget," said Qin.

Brave performers

Around this time, theater troupes were formed under the direction of Zhou Enlai, who would become premier in 1949 with the founding of the People's Republic of China.

Taking along his eight younger siblings and cousins, Zhou Lingzhao joined the theater troupes and followed them across the wartime front — from Wuhan to Yunnan province on the southwestern Chinese border and on to Burma, where, following the United States' entry into the war after Pearl Harbor, the China-Burma-India Theater was established in early 1942.

Zhou recalled to Qin one harrowing incident in Yunnan.

"On one occasion, I needed to reach the mountaintop trenches. The soldiers led me along a winding path, but I chose a direct route up the steep slope. Climbing on all fours, I grasped what I thought were tufts of grass — only to realize they were the hair of fallen soldiers," he said.

Many of the fallen were no older than Zhou, with some younger. In western Yunnan, where the fiercest fighting of the Allied counteroffensive unfolded in 1944, a memorial now marks the presence of underage soldiers, many in their mid-teens, who volunteered for a victory they believed in but would never see.

Traveling with Zhou was Feng Fasi, a member of the theater troupes attached to the Chinese Expeditionary Force in the China–Burma–India Theater. Like Zhou, he served as an actor, set designer, and poster painter, while also recording the front-line fighting and the troupes' routines and rehearsals with charcoal sticks and brushes.

On one march, Feng came upon a fleeting scene deep in a forest — smoke rising from cooking fires, figures at the water's edge — that was so arresting that he longed to stop and draw. He waited until the troupe made camp more than 20 km away, then secured a horse and rode back alone, a drawing board strapped to his back. Reaching the spot, he set to work at once, and continued until the piece was complete some six hours later. The charcoal drawing, titled *Cooking and Washing in the Forest*, is suffused with an idyllic calm that seems to deny the war beyond it.

"A sense of beauty endured in these men — and from it came their strength to answer the call of their time, and stay hopeful," Qin said.

Safeguarding heritage

In April 1945, four months before Emperor Hirohito announced Japan's surrender in a radio broadcast on Aug 15, LIFE magazine published an article titled "Woodcuts Help Fight China's Battles".

The article introduced US readers to Chinese artists who used woodcuts to disseminate wartime messages among the masses, lifting morale, and mobilizing resistance across the vast nation.

"It is an enlightenment, in the sense that art became a decisive force in shaping modern China and in the emergence of a new artistic language," said Qin.

"The turn to realism in Chinese art carried a sense of inevitability — born of a historical moment defined by destruction and national crisis, in which art was called upon to bear witness and to sustain the nation."

When news of Japan's surrender reached Chang Shuhong, he had already spent nearly two and a half years at the Dunhuang Mogao Grottoes in the forbidding hinterland of northwestern China. It was a commitment forged in Paris in the late 1920s, where he first encountered reproductions of Dunhuang murals and manuscripts — treasures removed from China and preserved in European collections. Confronted with his own heritage in exile, he grasped both its artistic significance and its fragility; what began as an aesthetic awakening became a moral imperative. In early 1942, he carried that conviction to Dunhuang, devoting himself to the preservation and study of the Mogao Grottoes — working in relative isolation even as much of the nation remained at war.

"It was his way of safeguarding his country — not by carrying his work to the front, but behind the lines," said Qin. Upon hearing of China's triumph, Chang climbed to the top of a nine-story wooden structure, its tiers set into the mountainside to house a colossal Buddha, and rang its bell in a burst of elation.

With the war's end, the National Peking Art School and the National Hangchow Art School were reestablished in their original homes.

In 1946, Xu Beihong, a towering figure in modern Chinese art education and mentor to both Wu Zuoren and Feng Fasi, became president of the Beijing school, which would be renamed the Central Academy of Fine Arts in 1950. During the war, Xu vowed to "build a temple of art"— but "not before the war's won".

In 1939, after the death of Wu's wife, Xu wrote to the artist with a quiet injunction. Xu told him to go on "in the spirit of the boat tracker", a reference to Wu's 1933 oil painting, *The Boat Tracker*, painted as a metaphor for national endurance.

Wu, who painted his wife in the hours after her passing, did as his mentor had urged, and carried on for the next half century. During the war, he sketched, painted, and exhibited without pause, devoting himself to the creation of what he called "the art of our tempestuous time".

In 1958, he would assume the presidency of the Central Academy of Fine Arts, stepping into the path first laid by his mentor. In 1988, King Baudouin I of Belgium conferred upon Wu the Order of the Crown in recognition of his artistic achievements.

In that letter she penned in 1938, hours after her husband had left home, for the front line Deprez told Wu: "Fulfillment and happiness are yours no less than mine, nor less than those of your mother, your siblings, and all your loving family. And even as you do so, you devote yourself to your country at a moment of grave urgency, when she calls upon the dedication and labor of her sons more than ever."

Xi, Trump sent clear warning to separatists

Taiwan opposition parties criticize DPP's policies, saying meeting shattered illusions

By **ZHANG YI**
zhangyi1@chinadaily.com.cn

The China-United States summit has dealt a severe blow to the "pro-independence" stance of Taiwan's ruling Democratic Progressive Party and sent a clear warning to separatist forces, experts said.

During his talks with US President Donald Trump on Thursday, President Xi Jinping underscored that safeguarding peace and stability across the Taiwan Strait remained the biggest common denominator between China and the US.

Noting that the Taiwan question is the most important issue in China-US relations, Xi told Trump that if it is handled properly, the bilateral relationship will enjoy overall stability. Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy. Xi emphasized that "Taiwan independence" and cross-Strait peace are as irreconcilable as fire and water.

In an interview with Fox News on Friday, Trump said: "I'm not looking to have somebody go independent," adding that Taiwan should not expect a "blank check" from the US military.

Foreign Minister Wang Yi, while briefing the media about the summit on Friday, said: "During the meeting, we felt that the US side understands China's position, attaches importance to China's concerns, and, just like the international community, does not stand for or accept Taiwan moving toward independence."

Liu Kuangyu, a researcher at the Chinese Academy of Social Sciences' Institute of Taiwan Studies, said that at the landmark summit, China made clear its stance, its bottom line, propositions, and also sincere goodwill regarding Taiwan-related affairs.

"Rather than letting hostile sentiments spiral upward, the pragmatic exchanges reflected a shared readiness to reduce strategic miscalculations, mitigate cross-Strait tensions, and eliminate the risks of unintended military clashes," Liu said.

He added that the proper and positive handling of the Taiwan question will substantially shape the outcomes achieved at the summit and determine how effectively the two sides can sustain constructive, strategic stability going forward.

Liu said that if China and the US aim to solidify a major-country relationship over the coming years, the Taiwan question must serve as the primary entry point.

Meanwhile, opposition parties and politicians in Taiwan severely condemned the ruling authorities for fabricating cross-Strait crises.

Cheng Li-wun, chairwoman of the major opposition Chinese Kuomintang party, slammed the DPP's cross-Strait strategy, saying that "Taiwan independence" is a dead end that leads nowhere and the summit has shattered the DPP's international illusions.

Inside Editorial, **page 6**

KMT lawmaker Niu Hsu-ting told reporters that the summit's ripple effects will gradually surface, and the US clearly signaled conflict reduction, pouring "cold water" over the DPP's long-held separatist stance and its flawed narrative of guaranteed military defense from the US.

In a statement, Taiwan's Labor Party also warned that the DPP's separatist line remains the primary source of risk driving regional volatility.

The party condemned the administration's continuous military expansion, specifically referencing the newly passed defense budget, of which NT$780 billion ($24.7 billion) has been earmarked for procuring arms from the US.

It said that pouring vast public resources and taxpayers' money into endless weapon purchases directly sacrificed the livelihood of the grassroots.

Looking ahead, Liu of the Institute of Taiwan Studies warned that the US must exercise the utmost prudence to prevent triggering a great-power confrontation and refrain from maintaining illicit ties with the Taiwan authorities across political, military, legal, economic and ideological domains.

"They must recognize that the past tactics of using Taiwan as a so-called pawn or tool to contain China have actually done more harm than good in the long run and ultimately boomeranged," he said.

Only by translating political commitments into tangible actions can both nations consolidate the foundation of strategic mutual trust, he added.

The train traveling from Chachoengsao Province to Bang Sue in Bangkok struck the bus at a railway crossing in central Bangkok, triggering a fire that engulfed several cars and motorcycles. The accident left eight people dead and 32 injured, authorities said in a statement. ATHIT PERAWONGMETHA / REUTERS

Experts hail focus on stability after summit

By **LIU JIANQIAO** in Beijing and **ZHANG ZHOUXIANG** in Brussels

The meeting between the leaders of China and the United States in Beijing last week marked another important round of high-level strategic communication between the two countries at a pivotal moment in history.

Observers said they believe the candid and in-depth exchanges helped further strengthen mutual trust, manage differences, expand common ground and advance cooperation. The summit also provided a clearer direction for the future development of China-US relations and sent positive signals to the international community.

President Xi Jinping held talks with visiting US President Donald Trump in Beijing on Thursday. Xi said he has agreed with President Trump on a new vision of building a constructive China-US relationship of strategic stability.

The "constructive strategic stability" should be positive stability with cooperation as the mainstay, sound stability with moderate competition, constant stability with manageable differences, and enduring stability with promises of peace, Xi said.

"We are very glad the summit concluded on a positive note," said John E. Drew, chairman of the board of directors of the World Trade Centers Association. "While the terms of the constructive strategic stability were more of a broad vision for US-China bilateral relations, they mean a lot for the rest of the world, particularly the global business community."

The commitment to greater stability reached by the leaders of the world's two largest economies will help lay a solid foundation for the ongoing restructuring of global supply chains and benefit economies and businesses worldwide, he added.

Park Soong-chan, chairman of the Korea-China Association and a professor of Chinese studies at Yong In University in South Korea, said the meeting between the leaders of China and the US was meaningful and constructive, with both sides agreeing that stable management of bilateral ties and healthy competition serve the interests of both countries.

China and the US together account for about 40 percent of global GDP. Deeper and broader economic and trade cooperation between the two countries will have a positive impact on economic development across the Asia-Pacific region, he said.

"In particular, if supply chain cooperation between the two countries is strengthened, it could become a new turning point for the current fragmented industry and value chain," Park added.

The summit carries significant importance at multiple levels. As major global powers, China and the US both exert far-reaching influence through their domestic and foreign policies, said Hussein Askary, cofounder and vice-president of the Belt and Road Institute in Sweden.

"A stable and responsible relationship between China and the United States must also contribute to a more stable and prosperous world. The actions of both countries affect the entire international community, and, therefore, they must work together constructively on major global issues," he said.

From a European perspective, the summit is also of great significance. Both China and the US are key partners of the European Union and wield considerable influence in different ways. The US remains Europe's most important security and political partner, while China is one of the EU's largest economic partners, he said.

"For these reasons, it is in the EU's interest for China and the United States to find ways to cooperate, stabilize the international situation, and support a stable global trading system," Askary added.

Michael Schumann, chairman of the German Federal Association for Economic Development and Foreign Trade, said Trump's visit to China, accompanied by a high-profile delegation of US business leaders, sends an important message: despite strategic competition, the world's two largest economies remain deeply interconnected.

"From a German business perspective, this is encouraging. Stable and improving economic ties between China and the United States are not only in the interest of both countries, they are also essential for global confidence, investment and supply-chain security," he said.

The new vision of "constructive strategic stability" is, therefore, highly relevant. It can gain real credibility only when supported by practical economic cooperation. This reflects what is often referred to in Germany as economic diplomacy: building trust through business ties, dialogue and long-term engagement, Schumann added.

Yang Han in Hong Kong, Yifan Xu in Washington, and Xinhua contributed to this story.

Brocade: Pursuit of elegance embodied

From page 1

Its rarity was no accident.

According to Shen Hui, a national-level inheritor of Song brocade weaving techniques, the craft is so demanding that two weavers must operate the loom together, producing only a few centimeters a day.

"During the Song Dynasty, scholars and artists pursued elegance in every aspect of life," Shen said. "Song brocade was the perfect expression of that spirit."

Now, that same spirit is being translated into daily life.

Shi is among a younger generation of designers bringing Song brocade out of museums and formal wardrobes into modern, everyday accessories and clothing.

Her viral, best-selling brooch featuring a Tang Dynasty (618-907) woman playing polo is just one example. She also produces brocade-covered notebooks and headphone cases, which cost less than 100 yuan ($14.7), while her brocade garments are priced at several thousand yuan.

Shi attributes the surge in popularity partly to the rise of "new Chinese style".

"These fashionable items make an ancient imperial fabric accessible to ordinary people," she said.

For many buyers, the appeal is both visual and emotional.

Nikola Chovancova, a Slovak student at Xi'an Jiaotong-Liverpool University in Suzhou, was astonished when she tried on a *qipao* made of Song brocade at Shi's shop. "Gorgeous," Chovancova said. "I love the patterns and colors, so rich and layered. I'm completely in love."

At the Saint Joy center, known for its Song brocade products, the three-story boutique fills up on weekends with shoppers from across China looking for *qipao* and new Chinese-style clothing, some of which can cost tens of thousands of yuan.

"Consumers in their 20s to their 60s all find patterns they love," said store manager Ren Lin.

That broad appeal suggests something larger than a passing fashion trend.

For devotees like 42-year-old Li Xiaojing, Song brocade has moved from special-occasion wear into everyday life. She now pairs brocade jackets and waistcoats with jeans for work, and uses small, brocade accessories daily.

"Song brocade is no longer something I just admire in my closet. It's truly part of my life. I love the unique layering of colors and the traditional patterns that symbolize good fortune. It's something machine-made textiles can never replicate," Li said.

Welfare: Approach development-oriented

From page 1

The concept of common prosperity emerged in the 1950s. At the end of the 1970s, China decided to let some people and places prosper first, and at that time the late Chinese leader Deng Xiaoping repeatedly insisted that the people and places that did prosper must then help everyone else and all other regions to join them.

China addresses this challenge in a number of ways. As in the case of the poverty alleviation campaign, it invests in infrastructure, skills and industries, and mobilizes cadres to generate employment that increases primary real wage incomes. It also mobilizes collective urban and rural assets to generate property income.

At their core, these measures reflect China's development-oriented approach that common prosperity ultimately depends on people's ability to earn, and not just on redistribution.

Although income from work will remain the mainstay, in the years ahead, one can anticipate significant changes in the secondary distribution of income as a result of changes in taxation, public services, social security, social assistance and transfer payments.

Furthermore, China's system of counterpart assistance — under which well-off cities contribute to the development of less well-off places as one aspect of tertiary distribution — will continue to play an important role.

Every prefecture in the Xinjiang Uygur autonomous region, for example, is paired with a more developed city, which must provide resources to help every tier of local government enhance local development, services and prosperity.

The international discussion around China's poverty alleviation achievements is methodological but also driven by political ideologies and narratives.

In China, the right to subsistence and right to development are considered fundamental human rights. Moreover, the nation's approach is scientific, employing comprehensive data rather than individual case studies whose representativeness cannot be established.

Its strategy involves institutional mechanisms that integrate a clear overall central design, subnational responsibility and decentralized implementation at the city, county and local levels, alongside an extraordinary mobilization of financial and human resources.

In many capitalist countries, explanations of poverty differ, and more emphasis is placed on market mechanisms, private property rights and nongovernmental organizations.

On the methodological side, poverty lines are usually expressed in terms of real income and change over time.

China has entered the ranks of upper-middle-income economies while remaining the world's largest developing country. The World Bank recently substantially increased the poverty line for such economies, first introduced in 2017, to $8.30 per person per day in 2021 purchasing power parity terms. By this higher benchmark, 21.3 percent of China's population fell below the line in 2022, compared with 48.3 percent worldwide.

However, this measure is based primarily on household cash income and may not fully capture China's property ownership and social entitlements, including food and clothing needs, access to compulsory education, basic medical services and safe housing — the core criteria of its poverty alleviation framework, known as the "Two Assurances and Three Guarantees".

At the same time, according to the 15th Five-Year Plan (2026-30), the pursuit of common prosperity will now pay attention not just to expanding the middle-income group, but also to raising low incomes.

The powerful narrative that China constructed therefore broadly holds, even if one should exercise great care in extrapolating backward.

The author is a professor emeritus at the University of Sussex in the United Kingdom. The views do not necessarily reflect those of China Daily.

GLOBAL LENS

Hantavirus disease survivors Isabel Diaz (left) and her father Victor Diaz, identified by health authorities as patient zero during the 2018-19 outbreak that killed 11 people, including her mother and his wife, pose at their farm in the La Rinconada area, near Epuyen, Chubut Province, Argentina, on May 9. JUAN MABROMATA / AFP

OLD WOUNDS REOPENED

Hantavirus outbreak on cruise renews painful memories for residents of Argentine village

Mailen Valle lost her father and two sisters during a hantavirus outbreak more than seven years ago in Epuyen, a village in Argentina's Patagonia region.

With the recent hantavirus outbreak on the MV *Hondius* cruise ship, hard memories have resurfaced for the 33-year-old.

"Losing my dad and my two sisters in less than a month ... Nobody was prepared to see how, in a matter of days, a family table was left empty," she said.

While the outbreak onboard the ship has left three people dead, it has yet to surpass the Epuyen outbreak, which recorded 34 cases and 11 fatalities between December 2018 and March 2019 in the town of 2,400 residents, situated in a part of the Andes where hantavirus is endemic.

Mailen's father, Aldo Valle, came down with it after attending a birthday party.

"The person with the virus was just sitting at the same table as my dad. And at that table there were several people who got infected, and people died," Mailen recalled.

The wake for Valle was another locus of infection, where all three of his daughters got sick.

One sister died "within hours" of showing symptoms, while for the other, "we had to take her to the cemetery without a wake", Mailen said.

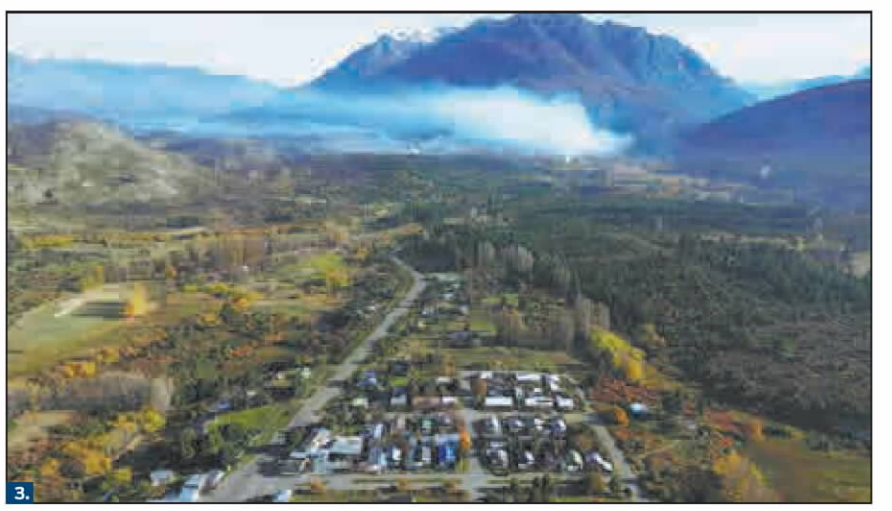
Jorge Diaz, an epidemiologist with Chubut Province's health department who worked on the Epuyen hantavirus outbreak, told AFP that "we knew very little about the disease" in 2018.

Human-to-human transmission of hantavirus was first discovered in 1996 in the neighboring town of El Bolson, and it was later found to have happened in Epuyen.

Hantavirus cases in Argentina have almost doubled in the past year, with the country recording 32 deaths alongside its highest number of infections since 2018.

The current season, which started in June 2025, has already seen more than 100 confirmed hantavirus cases, Argentina's health ministry said — compared with just 57 during the same period last season.

Not only did the country record an unusually large number of cases this year, but it also recorded one of the highest casualty rates in recent years, with the number of deaths marking an increase of 10 percentage points compared to the previous year.



"Increasing human interaction with wild environments, habitat destruction, the establishment of small urbanizations in rural areas, and the effects of climate change contribute to the appearance of cases outside historically endemic areas," the ministry said.

Experts blame climate change and habitat destruction for the rise in number of cases of the disease, which is usually caused by exposure to the urine or feces of infected rodents.

Extreme weather phenomena, such as droughts and episodes of intense rainfall in recent years, are also fueling the trend, according to experts.

Temperature rises trigger changes in the ecosystem that affect the presence of the long-tailed mouse, the main carrier of the virus in Argentina and Chile.

"These rodents are better able to adapt to climate changes, which could facilitate the higher number of cases we are seeing," said Eduardo Lopez, an infectious disease specialist and adviser to the Argentine government during the Covid-19 pandemic.

Forest fires have prompted both humans and wildlife to move to new places, increasing the risk, said Roberto Debbag, vice-president of the Latin American Society of Vaccinology, while tourism trends have also had an impact.

The health ministry said technical health teams will travel to Ushuaia in Argentina's Tierra del Fuego Province to capture and analyze rodents in areas linked to the route of the Dutch couple believed to have been exposed to the virus.

Concerns voiced

Citizens of Spain's Canary Islands had expressed concern ahead of MV *Hondius*' arrival.

The World Health Organization's Director-General Tedros Adhanom Ghebreyesus posted a letter on his X account earlier in May.

"I know you are worried," he said, "I know that when you hear the word 'outbreak' and watch a ship sail toward your shores, memories surface that none of us have fully put to rest."

Nevertheless, Mailen remembers the stigma. "We felt very discriminated against," she said.

Others recall being banned from shops in nearby towns.

Isabel Diaz, 53, survived the outbreak with a different stigma — her father, Victor Diaz, was labeled "patient zero", and attended the birthday party while displaying the early symptoms of hantavirus.

Her father, for his part, recalled how it felt to come down with hantavirus, causing body aches and a bitter taste that even made sipping water unpleasant.

"It started with a feeling of weakness. I didn't feel like eating. And I started to get purple spots," he said. "That same day, I lost consciousness."

"People looked poorly at my father. It's not his fault he got sick," she told AFP, her eyes welling up.

"Nobody chooses to get sick, much less infect others, much less lose a mother."

US state keen to break into China market

Oregon, Inner Mongolia explore trade opportunities to strengthen partnership

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

The US state of Oregon, which is keen to strengthen its economic partnership with China, hosted a trade delegation from the Inner Mongolia autonomous region last week to explore business opportunities.

The delegation and agricultural stakeholders in Oregon have agreed that more than 50 farms from the US state will supply 80,000 metric tons of hay to Inner Mongolia.

"We heavily rely on exports for profitability. So trade with China is very beneficial for our own farm, and it's very beneficial for a lot of the alfalfa farms in Eastern Oregon," said Mark Owens, a member of the Oregon House of Representatives and a farm owner.

Alfalfa is a plant that is used for feeding farm animals.

Oregon's agricultural sector is closely linked to Chinese markets. According to Owens, the state produces more than 220 agricultural products, of which approximately 80 percent are destined for export, making market diversification and expansion critical to farmer profitability.

"Hay exports are very important to alfalfa farmers in Oregon," Owens said. "Deals like this, at 80,000 metric tons, are very important. Oregon is very reliant on exports, just not alfalfa hay, but many agricultural products."

He stressed the importance of identifying markets and strengthening already established ones.

David Goracke, president of the Oregon Seed Council and owner of Cala Farms, emphasized that China is the most important export market for the state's seed industry.

"China is our largest export market. It is a very important and integral market to the Oregon seed industry," he said, adding the state is optimistic that China would continue to be a big user of its agricultural products.

He said Oregon is known as the grass seed capital of the world and he hoped it would maintain that reputation and become a major supplier to China.

In addition to agriculture, Oregon offers Chinese investors and business partners opportunities across multiple sectors. The state's location and established trade infrastructure make it an attractive hub for Asian commerce, said Nick Triska, head of Business Development at Greater Portland Inc, a regional economic development organization.

He viewed the footwear and apparel industry as an area that binds the economies of Oregon and China.

Cultural, economic ties

"Being a trade-dependent state in the US, our ability to build and maintain cultural and economic ties with other parts of the world is really important," Triska said. "Nike's world headquarters is based in Oregon. Adidas' North American headquarters is here. Columbia Sportswear and many other brands design a lot of their footwear here that then gets made in other parts of the world, including China."

He said a lot of intellectual property in the footwear space is tying the two markets together. "We also have some really great examples of international companies from China that are establishing a presence here in Oregon. Recently, we supported SBS Zipper (from China's Fujian province) in establishing a formal presence here in Oregon."

The timing of Oregon's trade outreach coincides with high-level diplomatic engagement between China and the US.

"We are thankful that the leaders from the two largest economies were meeting at the same time" as the meeting with the Inner Mongolia delegation to strengthen ties was happening, said Owens from the Oregon House of Representatives.

"How our two countries are investing in the future of industry and enabling really great people with great ideas and helping them realize those ideas into businesses that can change the world — there's an opportunity for that," he said. "I'm listening very intently."

Owens noted his own engagement in relationship-building, citing his visit to China in October. "We met some of the dairy folks and government people for person-to-person relationship building. … I'm very appreciative that they took the time and continue to build those relationships," he said.

Goracke, who traveled to Inner Mongolia in early November, said, "I think open communication is essential. We were able to get Chinese delegates and business officials out onto a farm tour so they could see firsthand how our family farmers are producing the seed and handling the seed."

Briefly

NIGERIA

President says senior IS commander killed

Nigeria's President Bola Tinubu confirmed on Saturday that Abu-Bilal al-Minuki, second-in-command of the Islamic State globally, was eliminated in an overnight operation carried out by Nigeria and the United States. Tinubu described the operation as "a significant example of effective collaboration in the fight against terrorism" and dealing a heavy blow to the ranks of the IS. Earlier on Friday, US President Donald Trump said on Truth Social that the IS leader was killed by US and Nigerian forces.

ITALY

8 injured as driver plows into pedestrians

A driver plowed into pedestrians in the northern Italian city of Modena on Saturday, injuring eight people — four of them critically — before trying to flee and being detained by police, authorities said. They said the man had a history of mental health issues. Authorities identified the driver as Salim El Koudri, 31, who is unemployed. He was detained and questioned by police as investigators tried to determine whether he acted deliberately.

Buildings are damaged by Israeli airstrikes in Tyre, southern Lebanon, on Saturday. XINHUA

Israel strikes south Lebanon day after truce extension

BEIRUT — Israel launched massive airstrikes on southern Lebanon on Saturday, despite an extension of the truce between the two countries.

Israel said it was targeting Lebanese militant group Hezbollah and that the strikes were preceded by an evacuation warning covering nine villages.

The continuing bombardment has only increased skepticism about the truce among the thousands of Lebanese driven from their homes in the south.

Lebanon's National News Agency reported strikes on more than two dozen villages on Saturday, including one more than 50 kilometers from the border. It also reported a new exodus of residents toward the southern city of Sidon and the capital Beirut.

Later on Saturday, Hezbollah announced it had struck a military target in northern Israel. It said its fighters had targeted "the Ya'ara barracks … with a swarm of attack drones", after having announced multiple operations against Israeli forces in southern Lebanon.

On Friday, the two countries agreed to extend a ceasefire — which began on April 17 but has been marred by numerous violations — by another 45 days.

United Nations Secretary-General Antonio Guterres said on Saturday that he "welcomes" the extension and "urges all actors to fully respect the cessation of hostilities".

Despite the truce, Israel continues to conduct strikes in Lebanon, and its forces are occupying territory near the border.

Hezbollah, meanwhile, regularly claims attacks on northern Israel and against the Israeli military in southern Lebanon, including multiple attacks on Israeli forces on Saturday.

Israel's military said on Saturday that one of its soldiers died in combat in southern Lebanon, bringing its losses to 21 personnel since the conflict with Hezbollah began in early March.

In the Gaza Strip, an Israeli airstrike killed the chief of Hamas' military wing, the most senior official from the Palestinian militant group killed by Israel since a ceasefire agreement in October that was meant to halt fighting.

The Israeli military said on Saturday that Izz al-Din al-Haddad was killed in what it described as a precise strike on Gaza City on Friday.

Ebola outbreak in Africa declared health emergency

By **SHARON NAKOLA**
in Nairobi, Kenya
sharon@chinadailyafrica.com

The World Health Organization has declared the Ebola outbreak linked to the Bundibugyo virus strain in the Democratic Republic of Congo and Uganda a public health emergency of international concern, warning of rising cross-border transmission risks and major gaps in containment.

The Bundibugyo strain of Ebola was first identified in Uganda in 2007 and is one of several Ebola virus species known to cause severe hemorrhagic fever in humans. Unlike the *Zaire ebolavirus* species, for which vaccines and treatments are available, there are currently no licensed vaccines or targeted therapeutics for the Bundibugyo virus, according to the WHO.

In a statement issued on Sunday, WHO Director-General Tedros Adhanom Ghebreyesus described the outbreak as "an extraordinary event" requiring urgent international coordination because of its rapid spread, insecurity in affected regions and the absence of approved medical countermeasures specifically targeting the strain.

"The high positivity rate of the initial samples collected, the confirmation of cases in both Kampala and Kinshasa, the increasing trends in syndromic reporting of suspected cases and clusters of deaths across the province of Ituri all point toward a potentially much larger outbreak than what is currently being detected and reported," the WHO said.

As of Saturday, health authorities had reported eight laboratory-confirmed Ebola cases, 246 suspected infections and 80 suspected deaths in Ituri Province in eastern DR Congo, concentrated in the Bunia and Mongbwalu health zones. A confirmed case was also detected in Kinshasa involving a traveler returning from Ituri.

Uganda has separately confirmed two Ebola cases in Kampala within 24 hours, including one death, both linked to travelers arriving from the DR Congo. The WHO said the two cases appeared unrelated, raising fears of undetected transmission chains. Both patients were admitted to intensive care units in Kampala.

Health officials have also reported unusual clusters of community deaths with symptoms consistent with the Bundibugyo virus strain in several areas of Ituri and neighboring North Kivu Province.

At least four healthcare workers have died in circumstances suggestive of viral hemorrhagic fever, increasing concerns that infections may be spreading inside health facilities amid weak infection prevention and control measures.

The WHO said international coordination would now be critical to strengthen surveillance, improve infection prevention, scale up emergency operations and prevent wider regional spread.

Petrochemical crunch hits supply chains across Asia

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

More than 11 weeks into the US-Israeli war against Iran, economic disruptions are reverberating across Asia's industrial supply chains as shortages of petrochemical products, including naphtha, deepen in the region.

Before the war, "almost 100 percent of the Middle East's naphtha exports land in Asia", said Darryl Xu, Singapore-based principal analyst for base chemicals and feedstocks at ICIS Analytics.

Middle Eastern supplies make up almost 65 percent of Asia's naphtha imports, but disruptions in the Strait of Hormuz have effectively cut off most shipments, with alternative sources unable to fully bridge the gap, Xu said.

A key petroleum derivative, naphtha is widely used to produce solvents and resin for printing ink. Supply shortages could affect sectors ranging from packaging and consumer goods to medical supplies and infrastructure materials.

Japanese snack maker Calbee said last week that it would switch some potato chip products to minimalist black-and-white packaging marked "packaging for conserving petroleum materials".

"The company will revise the packaging specifications of some of its products as an interim measure, with the highest priority placed on ensuring a stable supply of products," Calbee said on Tuesday.

However, Japanese Deputy Chief Cabinet Secretary Kei Sato said the government had received no reports of immediate disruptions to naphtha or printing ink supplies and believed the country had secured sufficient volumes, Reuters reported.

In the Republic of Korea, concerns are also rising in the food packaging industry, with the government working to stabilize supplies. Companies said material costs have soared 40 to 50 percent since the war began.

The ROK and Japan are among the most vulnerable economies in Northeast Asia to naphtha supply shocks, said Kwon Seok-joon, an associate professor of chemical engineering in Sungkyunkwan University.

In the first half of this year, the ROK imported about 45 to 47 percent of its naphtha, with more than three-fourths of those imports coming from the Middle East, he said.

'Structural weakness'

However, the bigger problem is the structural weakness of the ROK's petrochemical industry, which is centered on refining naphtha, Kwon said.

While Japan is also highly exposed, the ROK's vertically integrated petrochemical sector is more dependent on naphtha refineries, leaving downstream industries such as plastics, rubber, packaging and paints especially vulnerable, he said.

"If the current situation continues for several more months, the sustainability of these industries could become very fragile," he said.

Even if the Strait of Hormuz returns to normal now, naphtha supplies will not immediately recover to prewar levels because of shipping delays, permanently higher freight and insurance costs, and mismatches between existing Middle East contracts and new alternative supplies, he added.

Xu said buyers were paying premiums of up to $150 per ton for naphtha after the crisis started, while Asian producers of plastics and olefins — the building blocks of the industry — were being forced to run at minimum rates, which could still mean more than 150,000 tons of naphtha for a large olefins producer.

Kwon said the crisis would likely push Asian countries toward long-term adjustments.

Editorials

Head-of-state diplomacy will guide further development of China-Russia relationship

At the invitation of President Xi Jinping, Russian President Vladimir Putin will pay a state visit to China from Tuesday to Wednesday, which is expected to further consolidate ties between the two countries.

That Xi and Putin sent congratulatory letters to the 10th China-Russia Expo on Sunday highlights the importance the two leaders attach to strengthening bilateral exchanges and cooperation.

Pointing out that this year marks the 30th anniversary of the China-Russia strategic partnership of coordination and the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation, Xi said in his letter that bilateral cooperation in various fields had been continuously deepened and solidified, achieving fruitful results thanks to joint efforts of the two countries.

Noting that the expo provides a platform for direct and in-depth dialogue between the two sides, Putin in his message expressed the expectation that the expo will produce positive outcomes, help plan for new prospects of mutually beneficial cooperation between the two countries, and bring benefits to the two peoples.

Thanks to the strategic guidance of head-of-state diplomacy, China-Russia relations exhibit a high level of mutual trust, and have withstood the turmoil in the international landscape, serving as a stabilizer of the postwar world order.

Last year, the two sides issued three joint statements on deepening their relations, strengthening global strategic stability and upholding the authority of international law.

At a time when global security is becoming ever more volatile, it is important for China and Russia, both permanent members of the United Nations Security Council, to work together to bolster the status of the UN and continue coordinating with each other on major international and regional issues.

During the upcoming visit, it is anticipated that both sides will build on the outcomes of high-level exchanges in the past and plan together the future development of relations, which matters not only to the two countries, but also to the world.

China has been Russia's largest trading partner for 16 consecutive years, with the bilateral annual trade volume registering more than $200 billion for the last three consecutive years. And statistics from China's Ministry of Commerce show that bilateral trade reached $61.2 billion in the first quarter of this year, a 14.7 percent increase year-on-year.

The two countries are also stepping up their pragmatic cooperation in fields such as energy, artificial intelligence and agriculture, and increasing people-to-people exchanges. These exchanges and collaboration are forming strong support for the two neighbors to weather multiple challenges and further consolidate bilateral ties.

This year marks the beginning of China's 15th Five-Year Plan (2026-30) period, which presents fresh opportunities for the two countries to deepen their win-win cooperation, better align their development strategies and further unleash their growth potential.

Equality, mutual respect and structural complementarity between the two economies explain the resilience of China-Russia economic ties.

The two countries not only collaborate closely but also show strategic independence in the process. As has long been pointed out, China-Russia relations are based on non-alliance, non-confrontation and not targeting any third party, forming a new type of relationship between major countries. Under this type of relationship, win-win cooperation that brings tangible benefits to the two nations is the focus.

It's important for China and Russia, which share common ground in their views of many major international and regional affairs, to leverage their robust relationship to safeguard existing international rules. In the face of rising unilateralism, the two countries need to continue shouldering their responsibilities as major countries to advance multipolarity and globalization. Their cooperation in multilateral organizations such as the Shanghai Cooperation Organization and BRICS will play an important role in this regard.

It is hoped that the upcoming visit by Putin will promote further development of China-Russia comprehensive strategic partnership of coordination for a new era, so that it can inject more stability into world affairs and provide a stronger impetus for global development and prosperity.

Remove stumbling block in Sino-US ties

The exchanges between the Chinese and US leaders on Thursday and Friday have provided much-needed strategic guidance for the future of China-US relations.

The two sides agreed to build a "constructive China-US relationship of strategic stability". The "constructive strategic stability" means positive stability with cooperation as the mainstay, healthy stability with competition within proper limits, constant stability with manageable differences and lasting stability with expectable peace.

The new vision for relations between the world's two largest economies indicates that both sides recognize the need to prevent confrontation and manage differences prudently. The Taiwan question remains the most important one among all the issues affecting bilateral ties. If it is handled properly, the Sino-US relationship will enjoy overall stability. Otherwise, China and the United States will have clashes and even conflicts, putting the entire relationship in great jeopardy.

Yet certain forces in Washington continue to treat the Taiwan question as a "card" they can play to maximize US gains while claiming they value peace and stability in the region. Moves such as arms sales, political collusion and military signaling send the wrong message to "Taiwan independence" separatist forces on the Chinese island. "Taiwan independence" and cross-Strait peace are as irreconcilable as fire and water. The more external forces embolden separatist elements, the greater the risks to regional stability.

The recent remarks made by the secessionist-minded leader of Taiwan, Lai Ching-te, via virtual link at a so-called "democracy summit" in Copenhagen, once again exposed the separatist nature of the Democratic Progressive Party authorities. By attempting to portray his authorities as fighting for the "values" of the West, Lai sought external support for his separatist agenda while deliberately provoking cross-Strait tensions.

The timing of Lai's remarks was particularly telling. They were delivered shortly before the US president's visit to Beijing.

However, US President Donald Trump, in an interview with Fox News aired on Friday, warned the Taiwan authorities against pursuing "independence" under the illusion of unconditional US backing.

"They have somebody there now that wants to go independent," he said. "They want to get into a war" because "they figure they have the US behind them".

Trump poured cold water on that, saying he is not looking to fight a war thousands of miles away.

Yet the US leader also described Taiwan in the interview as "a very good negotiating chip" in dealing with Beijing — a remark that reflects a transactional and exploitative approach to the Taiwan question.

For China-US relations to achieve steady, sound and sustainable development, the stumbling block of "Taiwan independence" must be decisively removed. The US should recognize the true nature of "Taiwan independence" forces — as alterers of the status quo in the Taiwan Strait, disruptors of cross-Strait peace, and troublemakers in regional affairs.

Policymakers in Washington need to realize that the historical trend of the national reunification of China is irresistible. They should demonstrate genuine respect for China's core interests and major concerns. Beijing has made it clear that the Taiwan question is a red line in China-US ties that cannot be crossed.

The outcomes achieved during the latest China-US economic and trade consultations, held in the Republic of Korea on Wednesday, demonstrate once again that despite differences and competition, China and the US still share extensive common interests and broad space for cooperation.

No one should underestimate the complexity of managing China-US relations. Competition will continue to exist. Differences will not disappear overnight. But what matters most is whether both sides can manage these differences rationally, avoid strategic miscalculation and uphold the broader interests of peace and development.

China and the US have more common interests than differences. The US has much to gain from a healthy Sino-US relationship and much to lose from playing unilateral tricks, zero-sum games or the "Taiwan card".

Only when both sides address each other's core concerns, and especially when the US handles the Taiwan question with due prudence, can they jointly turn the agreed vision for bilateral ties into reality.

Opinion Line

Some in Brussels should wake up to reality, or EU will pay for overreach

The European Union likes to see itself as the defender of "rules-based" globalization. Yet by increasingly weaponizing its Foreign Subsidies Regulation against Chinese entities, it risks turning its claim into a parody.

The latest case in which the European Commission, the EU's executive body, has launched an "anti-subsidy" probe against the Chinese company Nuctech is a revealing snapshot of how Brussels is shifting toward a model of extraterritorial overreach that it once criticized Washington for.

The case dates back to 2024, when the European Commission carried out its first unannounced inspections, under the FSR, at Nuctech's offices in Poland and the Netherlands.

Brussels spent a long time complaining about Washington's long-arm jurisdiction — from sanctions enforcement to the extraterritorial use of domestic laws. Now it appears eager to replicate the same US playbook against China.

The FSR itself emerged during the high tide of transatlantic political alignment under the previous Democratic administration of the US, with China being the primary target.

But 2026 is not 2023, when the FSR took effect. The geopolitical landscape has changed a lot across the Atlantic. The EU's economic stagnation is now impossible to ignore, and many of its problems have little to do with China, but its own policies.

Former European Central Bank president Mario Draghi's report on European competitiveness warned that the continent suffers from chronic underinvestment, fragmented capital markets, high energy costs, regulatory overcomplexity and technological dependence on the US.

In other words, the EU is falling behind in some sectors because its own policy architecture has become too internally contradictory.

That raises an uncomfortable question for Brussels: does it really believe US technology giants dominate artificial intelligence, cloud infrastructure, semiconductors and digital platforms without massive state support — direct or indirect?

From Pentagon contracts and industrial policy to tax incentives and strategic procurement, the US has mastered subsidy politics while preaching free markets abroad.

The US administration openly boasts that it uses tariff revenues to subsidize domestic companies, citing this as proof of its tariff policy's success. Its predecessor, meanwhile, sought to lure European enterprises to the US with subsidies substantial enough to tilt the market — under the Inflation Reduction Act of 2022. Yet the European Commission remained mute in response.

The result is an increasingly politicized trade framework of the US masquerading as neutral regulation.

The EU's so-called "anti-subsidy" investigations into Chinese electric vehicles poisoned China-EU economic relations for a considerable time, triggering retaliatory tensions, before eventually edging back toward negotiation and pragmatic compromise on the part of the EU. That episode should have served as a lesson on the costs of weaponizing trade instruments.

As for the Nuctech case, the EU's executive arm demanding sweeping China-based information from Chinese entities and financial institutions inevitably raises legal and political red lines.

China's Ministry of Justice declared on Friday that the European Commission's cross-border investigative demands constitute "unlawful extraterritorial jurisdiction". The accompanying statement from China's Ministry of Commerce opposes Brussels forcing Chinese banks and companies to hand over unrelated domestic information, disrupting their normal business activities and undermining legal certainty for companies operating in Europe.

The European Commission has become increasingly reckless in launching lose-lose probes, while the economic and diplomatic consequences are left for others in the bloc to absorb. European manufacturers want market access. European consumers want affordable products. European industries want stable supply chains. Yet policymakers and policy executors in Brussels often appear driven more by ideological signaling than commercial reality.

The EU does not need more economic confrontation with China. It needs serious reflection about why its own innovation engine is sputtering, why energy costs remain punishingly high, and why dependence on technology and security structures of an unreliable ally continues to deepen.

The FSR was conceived during a transatlantic honeymoon that is over. The question now is whether there is enough wisdom in Brussels to recognize the bloc faces a harsher economic reality before regulatory overreach leaves a major economic partner no choice but to fight back.

— LI YANG, CHINA DAILY

What They Say

All involved accountable for AI-related IP violations

Editor's note: *China recently released a road map aimed at promoting efforts to build itself into an intellectual property powerhouse. Xinhua Daily Telegraph spoke to some researchers about the importance of IP protection. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The battle over IP in the AI era is about the restructuring of an entire innovation order. The contributors to AI-generated content are no longer just individual creators. Data providers, computing infrastructure suppliers, model trainers and application developers all play a role, and much of the resulting value falls into legal grey areas. The most obvious weakness in today's system is the lack of a workable framework for allocating benefits and responsibilities among the multiple actors. Responsibility in the AI ecosystem should not be determined solely by who controls the technology. It should also depend on who benefits from it. Profit distribution must become the primary benchmark for assigning legal obligations.

Contrary to some claims, society is not entering a legal vacuum. China's Civil Code, copyright law and regulations governing deep synthesis technologies have already established basic boundaries around personality rights, copyright protection and platform responsibilities.

The deeper problem is that enforcement mechanisms cannot keep pace with the speed at which infringement takes place, while coordination across platforms remains weak and public understanding is often inaccurate. Many people still mistakenly believe that "noncommercial use is exempt" or that labeling content as AI-generated removes liability. Neither is true.

For ordinary citizens, however, the most immediate threat does not come from abstract disputes over training data. It comes from AI face-swapping, voice cloning and other forms of personality-rights infringement. Such technologies are inexpensive to deploy, spread rapidly online and can inflict irreversible damage on personal dignity and reputation.

Rights protection is undeniably difficult, but placing the entire compliance burden on a single party is not the solution. Shifting all responsibility either on the platforms or on those who developed the application would undermine the long-term sustainability of the content industry.

A practical approach is shared responsibility. Rights holders should make fuller use of notice and takedown mechanisms, platforms should provide low-cost verification and complaint tools and application developers should bear responsibility when they "know or should know" that infringement is taking place. Only a layered system of responsibility can ensure that every line of defense is covered.

The issue of training data is unavoidable. Requiring prior authorization for data training would make one-on-one negotiations nearly impossible and significantly restrict innovation. Yet allowing unrestricted data scraping would effectively turn original creators into unpaid fuel for AI development. The challenge is to draw workable boundaries between these two extremes while introducing compensation mechanisms that protect creators' interests.

The music industry offers a useful lesson. Collective licensing provides a more realistic path. Platforms could pay annual blanket licensing fees to collective management organizations, which would then distribute revenue to rights holders according to usage proportions. Extending collective management systems into AI training could dramatically reduce transaction costs while ensuring creators receive compensation without having to negotiate separately.

The purpose of IP protection was never to prevent innovation, but to sustain it through credible incentives. The real test in the AI era is whether society can build a system in which creators receive fair benefits without crushing innovators under excessive compliance costs.

VIEWS

China and the World Roundtable | Driving China's Small and Micro-Businesses Forward

Editor's note: *Peking University's Guanghua School of Management released a survey report on China's small and micro-business operators at a recent seminar. The seminar brought together scholars, industry experts and practitioners to discuss the current state of small businesses, the pressures they face, the changes brought by artificial intelligence and digital tools, and the policies needed to support their growth. The following are excerpts from their remarks.*

Small businesses need more support for growth

Supporting small enterprises through stable expectations

Tian Xuan is the dean of Guanghua School of Management, Peking University.

Small and micro-businesses are the deepest foundation of China's economy and the broadest micro-level base of its growth.

Understanding their operating conditions, responding to their policy expectations and paying attention to their survival and development is not only an academic task, but also a responsibility of our time.

China's GDP grew by 5 percent in 2025 despite a complex external environment and insufficient domestic demand. This was no easy achievement. For 2026, setting the growth target as a flexible range reflects an effort to reduce the emphasis on a single numerical level and shift attention toward high-quality development.

It also leaves more room for structural adjustment, risk prevention and livelihood improvement.

The logic of expanding domestic demand is changing. It is moving away from direct policy stimulus and toward activating the market's own internal momentum.

The key is to stabilize employment so that people have money to spend, strengthen social security so that people dare to spend, and create new consumption scenarios so that people have places and reasons to spend.

To foster new growth drivers, China needs to upgrade traditional industries, develop strategic emerging industries, make early plans for future industries, and improve the quality of the service sector so as to extend both ends of the "smile curve".

For small, medium and micro-enterprises, two macro-level supports are especially important. The first is a sound legal environment.

China should strengthen the implementation of the Private Economy Promotion Law, advance legislation on a personal bankruptcy system, and give "honest but unfortunate" entrepreneurs a real chance to start again. Stronger intellectual property protection is also essential, as it can provide clear incentives for private and small businesses to innovate.

The second is a stable macro-policy orientation. Research shows that policy orientation itself does not have a significant impact on corporate innovation, but policy uncertainty can seriously discourage long-term investment. It is therefore crucial to maintain policy continuity, stability and consistency, so that the market can form steady expectations. This is vital for encouraging small and micro enterprises to invest, innovate and grow over the long term.

Reading the economy through small businesses

Zhang Xiaobo is the chair professor at Guanghua School of Management, Peking University.

China's small and micro-business operators offer a valuable window into the real economy. Our long-running survey has collected nearly 250,000 questionnaires, including a large number of unregistered self-employed businesses.

These operators are highly sensitive to macroeconomic changes. Their profit margins, cash flow and confidence readings are closely correlated with indicators such as PMI, CPI and unemployment.

The main pressure facing small businesses today is no longer on the production side. It is weak market demand. Costs are rising, but many small businesses have limited room to raise product prices or wages, which has intensified competition and price pressure. At the same time, their expectations for macroeconomic growth and CPI remain relatively low.

Yet small businesses have shown strong resilience. Many respond by working longer hours and adopting digital tools. Digitalization is bringing structural changes. Online sales and the use of information systems have continued to rise after the pandemic, and roughly one in four small and micro-businesses have already adopted AI.

Digitalization has also helped expand female entrepreneurship. Over the past five years, the share of female entrepreneurs among small business operators has more than doubled from 17 percent to 36 percent.

One important reason is the equalizing effect of online credit: women often enjoy credit-score advantages in digital lending, which has improved their access to financing.

Future policy should shift more toward inclusive measures that improve livelihoods and expand demand. Raising the basic pension for rural elderly residents, for example, could more effectively stimulate consumption and market vitality. At the same time, entrepreneurs need a more stable and enabling environment for development.

AI is also accelerating a trend toward smaller organizations. This will fundamentally reshape employment and social security. China's existing social insurance, medical insurance and related legal systems were largely designed around traditional employment in large companies.

MA XUEJING / CHINA DAILY

They are increasingly out of step with the rise of flexible work, one-person companies, delivery riders and other new forms of employment.

The social security system therefore needs a more fundamental adjustment. A more inclusive protection mechanism would allow residents, including small and micro-business operators, to share more fully in the benefits of technological innovation and development. Only when people feel more secure can they consume with greater confidence and help form a healthier cycle of demand and growth.

Small businesses must be able to share AI's gains

For small and micro-enterprises, sharing in the opportunities created by artificial intelligence is especially important. AI is a major new source of total factor productivity growth. By using data and algorithms, it can sharply reduce waste in resource allocation and turn the reallocation of resources from broad, block-level shifts into a more detailed and precise process. Its potential is enormous.

But AI also brings "creative destruction". It can accelerate the birth and death of businesses, as well as the destruction and creation of jobs. Small and micro-enterprises are often the first to feel this pressure. They are relatively more vulnerable and may face shorter survival cycles. This could worsen structural employment mismatches and widen income gaps.

Cai Fang is an academician of the Chinese Academy of Social Sciences.

The future path of employment destruction and creation is likely to follow a "J-shaped" curve. In the short term, job losses may happen before new jobs are created. Whether the creation effect materializes, and how strong it becomes, will depend on how proactive and effective the policies are.

The policy logic should therefore change: businesses may compete and be selected by the market, but people should not be divided into winners and losers. The zero marginal cost and open-source nature of AI should be used to narrow the digital and intelligence divide facing small businesses and workers, so that they can share in the gains from higher productivity.

To achieve this, investment in physical assets must be better combined with investment in people.

More resources should go into inclusive social protection and human capital, giving entrepreneurs basic support even after business failure. Policies should also adapt to the fact that new forms of employment are becoming the new normal.

Social security and labor market systems need to be updated to support small businesses and workers caught in the cycle of creative destruction.

Whether AI becomes a blessing or a burden for small and micro-enterprises depends on whether its empowering features can be fully utilized. This is an external technological change that no individual business can avoid. To help small businesses share the benefits, they need targeted support.

For example, the government can coordinate with large technology companies to use AI's zero marginal cost advantage by sharing models, platform APIs, tokens and other technical resources, helping close the digital divide.

Using the empowering capability of technology to offset its disruptive effects is necessary to help small and micro-enterprises survive. It is also essential for keeping the overall economic cycle sustainable.

Investing more in children is the right thing to do

Global Lens

The world has demonstrated that it is possible to make progress for children on an extraordinary scale. Child mortality was reduced by around 50 percent in two decades, based largely on a simple recipe with three ingredients. First, a safe start. One in four children is now born in a UNICEF-supported health clinic. Second, immunization.

Over the past 50 years, vaccines have saved around 154 million lives — nearly half of all children under five have been reached by UNICEF. And third, safe drinking water, sanitation and hygiene — which we have been able to deliver to 2 billion people in the past two decades.

These gains go beyond saving young lives. They ripple into families, communities and the whole of society. Many of the results achieved for children are the foundation of human progress.

These impressive results, achieved working hand-in-hand with national governments and local partners, should propel all of us to continue and to step it up to achieve the sustainable development goals. Sadly, we are seeing the opposite: international development and humanitarian response are currently under severe strain, with Official Development Aid declining by 23.1 percent in the past year alone — the largest contraction ever.

At the same time, challenges for children are rising rapidly. This year alone, UNICEF estimates that more than 200 million children will need humanitarian assistance in 133 countries and territories. Furthermore, around 1 billion children — nearly half of the world's child population — live in countries classified as at "extremely high risk" of climate change impacts, from drought to floods, from tropical cyclones to glacier lake outbursts. The debt crisis and recent macro-economic shocks are pushing families back into poverty.

Children are often the most affected by this — even if they are the least responsible — and they pay the highest price. After decades of sustained decline, child mortality is now rising.

It is not that we do not know what is needed to achieve the SDGs. We know what needs to be done. We have shown what can be done.

But all relevant stakeholders, from governments to UN organizations and local partners, need to be enabled to do it — and resourcing these efforts is a key part of that.

The annual financing gap to achieve the SDGs is now in the order of $3 to $4 trillion. This is not merely a shortfall in financial capital — it is an appalling deficit in maximizing human capital.

We see this in the life of a child without light to study; in a mother walking for hours to fetch water; in the levels of stunting in the first years of life, leading to lifelong cognitive disabilities that a child can never recuperate from; and in a school cut off from electricity and the digital world. But the impact goes beyond the individual child.

Because when children lose access to vaccines, diseases spread across borders. When they go without nutrition, education or protection, the desperation that follows fuels instability and displacement.

We have seen it over and over again: the more fragile children's lives become, the more fragile the world becomes. People may think that investing in children is "charity", or something "nice to have". But investing in children is one of the best investments we can make, supporting security and stability as well as peace and prosperity.

When resources are scarce, it is even more important to look at "what works" to ensure every dollar is yielding maximum results. At UNICEF, we know that investing in children yields a high economic return on investment.

For every dollar invested in children, countries see up to a tenfold return through stronger economies and more resilient societies.

If this would be your stock portfolio, you would run to invest your money here. Every dollar invested in education, brings $20 in future GDP growth, with important co-benefits. It helps to avoid, among other things, young girls getting married.

It also helps to avoid the recruitment of young boys by armed groups and terrorists. Every dollar invested in water and sanitation yields $5.5 of return in diseases prevented, saving public health budgets.

Investing in children isn't just the morally right thing to do, it is also politically smart and economically rational. It is one of the most powerful investments we can make in shaping the future we all want.

Yet today we are facing a brutal financial paradox: even as the needs of children grow, our ability to invest in their future — and hence, our own collective future — is severely constrained.

We have more conflicts now than we have ever experienced since UNICEF was established, yet humanitarian funding went down by around 33 percent last year.

We have more children than ever at risk from the impacts of climate change. Yet a mere 2.4 percent of climate finance from multilateral climate funds is child-responsive, leaving children exposed.

Compounding this is the debt crisis, with many developing countries spending more on debt servicing than on social sectors such as education, health and nutrition that children's lives and well-being depend on.

This has real consequences. When a debt crisis lasts up to three years, infant mortality increases by 2.2 percent. When that crisis exceeds three years, infant mortality increases by 11.4 percent.

The debt trap becomes a death trap for children, and the financial impact of the current crisis will exacerbate this.

We must change course. Safeguarding children's present and future is a worthy cause and a smart choice.

We need new global momentum to ensure resources flow to where the needs are the greatest and the return on investment the highest: children. We need governments in the Global North and the Global South to step up.

We need private sector entities around the world, as well as financial institutions and multilateral development banks, to engage. We need to innovate to ensure we go faster and further.

As an example, UNICEF is now exploring child-focused debt solutions with multilateral development banks and policy banks, creating fiscal space for enhanced social sector spending — including with institutions here in China.

Last year, we worked with the Export-Import Bank of China to launch a project in Nigeria on climate-resilient health, safe drinking water, sanitation and hygiene (WASH), and signed a multi-year partnership to explore child-focused financing models in more countries and sectors. Recently, we also signed a new agreement to strengthen WASH and energy resilience for children in climate-stressed areas of Bangladesh.

But we must do more. We must unlock new capital and align investments with impact. Beyond grants, the scale of need requires pioneering more forward-looking and innovative financing mechanisms.

That's why UNICEF is also working with development impact funds, SDG-aligned bonds, outcome-based financing, parametric climate risk insurance and child-focused debt solutions that tie financing more closely to measurable results for children.

Every public and private sector actor has a role to play. Together, we can make a difference in the lives of children anywhere and everywhere. Their future is not a matter of chance. It is a matter of choice.

The world is a tough place to be a child today. But it doesn't have to be that way.

What is possible for children tomorrow will be shaped by the decisions all of us take today.

GLOBAL VIEWS

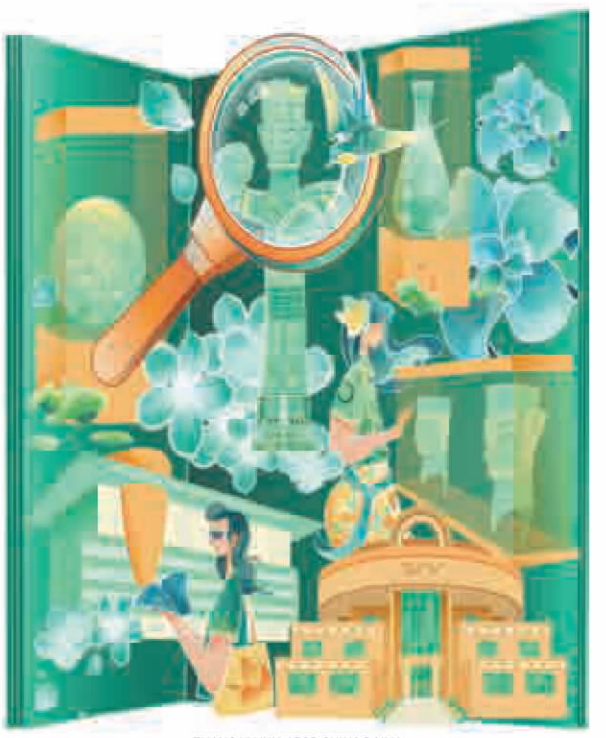
DAVID GOSSET

Close encounters with history

China's museum fever is a collective recognition that the material traces of the past are a mirror for the future

The recent release of the second edition of the China Museums Annual Report — following the presentation of its inaugural volume in Paris in 2025 — signals that China's museum transformation has moved beyond a domestic feature to become an object of international attention. What was once seen as a policy success story is now examined as a structural cultural shift with global implications.

Few recent phenomena have reshaped China's public life as visibly as the surge of enthusiasm for museums. Popularly described as "museum fever" and referenced in President Xi Jinping's 2026 New Year address as *wenbo re*, denoting heightened interest in museums and cultural heritage, this development exceeds the boundaries of leisure or lifestyle. It represents the convergence of cultural tourism, heritage protection, technological modernization and civic engagement. At its center lies a profound change: museums have become pivotal arenas in which China narrates its past and situates its future.



The scale of museum-driven tourism is striking. Record attendance, extended holiday queues, sold-out special exhibitions, and sustained social media engagement reflect broad, cross-generational appeal. Families travel across provinces to see archaeological discoveries; students approach exhibitions as intellectual pilgrimages; and young professionals engage with immersive displays combining digital projection and ancient artifacts. Museums now anchor domestic tourism circuits, revitalizing historic districts and redirecting travel toward culturally grounded destinations.

Yet this surge cannot be reduced to just consumption. Unlike entertainment complexes, museums cultivate reflective forms of leisure experiences. Visitors enjoy not only spectacle but orientation — an encounter with a civilizational narrative spanning millennia. Cultural tourism thus becomes an instrument of cultural literacy. To travel to a museum is simultaneously to participate in identity formation and historical interpretation.

This development aligns with China's evolving heritage strategy. Over the past two decades, the country has expanded its museum network — public, private, university-based and hybrid institutions — while strengthening legal frameworks for archaeological research and conservation. The emphasis has shifted from quantitative growth to qualitative consolidation: professional training, conservation laboratories, collection digitization and international collaboration. The museum system is increasingly integrated, technologically equipped and globally engaged.

Tourism and preservation are often perceived as competing forces. Large visitor flows can endanger fragile artifacts and historical sites. In China's current museum ecology, however, public enthusiasm increasingly reinforces conservation. Revenue from ticketing and cultural products supports restoration projects; strong attendance legitimizes further investment in safeguarding relics and intangible traditions. When newly excavated artifacts draw large crowds, preservation becomes a visible social priority rather than a bureaucratic mandate.

Museums function here as both guardians and mediators. They not only protect objects through scientific conservation, but also preserve meaning. Curatorial practice translates artifacts into narratives that illuminate regional diversity, dynastic change and intercultural exchange. The result is not a static portrait of antiquity but a presentation of civilization as plural and evolving. Museums frame China's past as dynamic — shaped by migration, adaptation and global contact.

ZHANG YUJUN / FOR CHINA DAILY

Technology has become integral to this transformation. Digital archives, high-resolution scanning, artificial intelligence, immersive installations and data-driven management systems are embedded in institutional practice. Virtual reconstructions revive archaeological sites, interactive platforms contextualize artifacts and online exhibitions extend access beyond physical walls. These tools attract younger audiences while strengthening documentation and research capacity.

Crucially, digitalization enhances protection. Three-dimensional modeling records endangered sites; visitor-flow analytics mitigate overcrowding; and artificial intelligence supports restoration and authentication. Technological modernization does not dilute tradition; it fortifies it. The juxtaposition of ancient bronzes and immersive projections symbolizes a broader synthesis of continuity and innovation within Chinese modernization.

The museum boom has also recalibrated domestic travel patterns. As internal mobility intensifies, cultural depth increasingly shapes destination choices. Provincial museums highlighting Silk Road exchanges, maritime history, or ethnic heritage anchor regional revitalization strategies. They connect exhibitions with surrounding historic neighborhoods, crafts and culinary traditions. The museum visit often initiates a broader engagement with place-based heritage, integrating economic development with cultural memory.

Internationally, museums operate as platforms of dialogue. Traveling exhibitions, joint conservation projects and multilateral research initiatives position Chinese institutions within global debates on restitution, ethics and interpretation. In a fragmented geopolitical landscape, museums provide comparatively stable arenas for intellectual exchange. Cultural tourism, when international visitors encounter Chinese heritage directly, fosters nuanced understanding beyond political narratives.

The deeper significance of the museum fever, as emphasized in the 2026 Annual Report, lies in its epistemic dimension. Museums are not passive repositories; they are laboratories of knowledge production. They shape how history is categorized, narrated and visualized. The rise of museum culture contributes to an emerging form of New Sinology — one attentive not only to China's historical record but also to contemporary modes of interpreting that record.

Rapid expansion nonetheless presents challenges. Balancing mass attendance with conservation standards, ensuring professional expertise keeps pace with growth, addressing regional disparities and navigating contested historical representations require sustained governance. Heritage protection is an ongoing process rather than a completed achievement. Yet the visibility of these debates indicates institutional maturity. Public engagement generates scrutiny, and scrutiny strengthens accountability.

Ultimately, China's museum-centered tourism reveals a society engaging with its material past as a resource for navigating modernity. The energy captured in *wenbo re* expresses curiosity, confidence, and a search for continuity amid transformation. Museums respond by staging temporal dialogue: Neolithic pottery alongside digital simulations, classical calligraphy adjacent to interactive interfaces. Time becomes layered rather than linear.

To enter a Chinese museum today is to observe a civilization actively curating itself. Tourism brings audiences; conservation safeguards substance; technology expands reach; and scholarship reframes meaning. Together, they constitute a cultural infrastructure anchoring civilizational renaissance in lived experience.

The measure of this transformation, however, lies not in visitor statistics but in encounters. When a bronze vessel, silk manuscript, or contemporary installation dissolves temporal distance, tourism becomes reflection and preservation becomes shared responsibility. China's museum fever is ultimately less about crowds than about consciousness — a collective recognition that the material traces of the past remain vital to the imagination of the future.

Shared resource, shared future

Lancang-Mekong water governance has evolved beyond its technical roots into a strategic issue that can help shape regional development

Zhang Li

Yun Qiburi

The Lancang-Mekong River — a waterway nourishing six countries — sustains not only riverside villages, cities, rice paddies and fishing grounds, but also the shared development prospects of China, Myanmar, Laos, Thailand, Cambodia and Vietnam. Water governance has shaped the Lancang-Mekong Cooperation mechanism from its inception, binding the six countries together and sustaining their shared prosperity.

This year marks the 10th anniversary of the first LMC Leaders' Meeting. Over the past decade, the LMC has placed water resources cooperation at the core of its five priorities. Significant strides have been made in modernizing various facets of water governance, including cooperation platforms, navigable waterways, information sharing, capacity building and ecological protection. These achievements have become crucial pillars for the building of a Lancang-Mekong community with a shared future.

The cooperation platforms for Lancang-Mekong water governance have been continuously improved and upgraded. A basin-wide governance framework has been established, centering on the LMC leaders' meetings, ministerial meetings and the Lancang-Mekong Water Resources Cooperation Center, delivering institutionalized and regularized synergy. Meanwhile, the hydrological information sharing mechanism has been steadily enhanced, with China consistently providing hydrological data to riparian countries. A significant milestone was reached in 2025 when the six countries agreed to mutually provide upstream and downstream hydrological information, marking a crucial shift from China's unilateral provision to multilateral sharing among all basin states. The modernization of Lancang-Mekong water governance has thus evolved from simple information exchange toward joint action.

The Lancang-Mekong countries have advanced interconnected water networks, a secure environment and digital intelligence. The modernization efforts place a premium on waterway improvement, coordinated patrols and law enforcement, and the digitization of shipping information, thereby further unlocking both the economic and security values of this "golden waterway". According to Kunming Customs, over the past decade, the navigable tonnage of vessels on the Lancang-Mekong waterway has increased from 300 to 500 metric tons, a 66.7 percent increase in single-trip capacity. A total of over 9,400 voyages have been completed, moving 1.57 million tons of imports and exports valued at 12.72 billion yuan ($1.87 billion), with an average annual growth rate of 7.6 percent. Furthermore, as of April 20, China, Myanmar, Laos and Thailand had conducted 164 Mekong River joint patrol and law enforcement missions, focusing on merchant vessel escort, search and rescue, and combating cross-border crime. In parallel, the six Lancang-Mekong countries are actively introducing digital and smart technologies into basin water resource management. These tools sharpen governance precision and visibility, while strengthening responses to extreme weather and emergencies.

The Lancang-Mekong countries have put a sustained focus on "small and beautiful" water projects that tangibly benefit local communities. With financial and technical support from China, 65 such collaborative projects have been implemented. Covering flood and drought management, rural drinking water safety, dam safety, agricultural production and grassroots capacity building, these projects directly address the most pressing needs of basin residents. Among them, the Lancang-Mekong Sweet Spring Action has built 110 rural water supply projects in Cambodia, Laos and Myanmar, providing safe drinking water to over 13,000 rural residents and earning a spot among the Fifth Global Solicitation on Best Poverty Reduction Practices. These changes — from clean drinking water to reliable power — profoundly embody a people-centered governance philosophy, building a solid foundation of public support for the Lancang-Mekong region.

Despite these notable achievements, the Lancang-Mekong water governance is entering a new and more complex phase as it embarks on its next "golden decade".

The first challenge is climate change. Extreme droughts, floods, salinization, sediment shifts and ecosystem degradation affect the basin's agriculture, fisheries, energy and public safety. For vulnerable areas — such as the Mekong Delta, the Tonle Sap Lake region, hydropower development zones and cross-border shipping hubs — water fluctuations directly threaten food security, energy security and social resilience.

The second lies in divergent development needs. Persistent tensions exist between energy development and ecological protection, as well as between agricultural irrigation and shipping demands. Balancing these competing priorities requires close coordination among the basin states.

The third is the persistent governance deficit in water ecosystems. Uneven capacities for water ecosystem protection among basin countries and significant disparities in progress toward the water-related targets of the United Nations' 2030 Agenda for Sustainable Development add complexity to basin-wide governance.

In response, the six Lancang-Mekong countries should seize the opportunity presented by the new "golden decade" and the "LMC 2.0" framework to drive high-quality, iterative upgrades in water governance — making it more targeted, resilient and inclusive. This will help forge an even closer Lancang-Mekong community with a shared future.

WANG XIAOYING / CHINA DAILY

First, build a high-quality platform for synergy in water governance modernization. The six countries could leverage the Lancang-Mekong Water Resources Cooperation Center to gradually establish a water governance modernization hub with sub-branches dedicated to top-level design and regional implementation. These would coordinate local water management, data sharing and project execution, enhancing both basin-wide strategic coordination and on-the-ground delivery, and ensuring that strategic plans translate into tangible regional benefits.

Second, turn "small and beautiful" water projects into a "people-to-people connectivity" initiative of Lancang-Mekong water cooperation. In the new "golden decade", the six countries could develop replicable, maintainable and evaluable project packages, covering rural drinking water safety, school water purification facilities, small-scale irrigation, community flood control, fishery resource protection and grassroots water quality monitoring. Greater emphasis should be placed on post-project management and maintenance, upgrading "demonstration sites" into "demonstration chains". At the same time, participation from local governments, enterprises, research institutions and social organizations should be encouraged to forge an integrated cooperation model encompassing funding, technology, training and operation, ensuring that more people share the benefits of modernized Lancang-Mekong water governance.

Third, safeguard the autonomous cooperation of basin countries in water governance. Lancang-Mekong water cooperation is open to extra-basin partners, but water governance must not become an arena for geopolitical zero-sum games. The six countries can remain open to cooperation that genuinely contributes to technological progress, capacity building and ecological improvement. Meanwhile, they need to remain clear-eyed about agendas that seek to incite confrontation, stoke anxiety or erode mutual trust. The 10th LMC Foreign Ministers' Meeting proposed building an LMC 2.0 characterized by solidarity, cooperation, openness, win-win outcomes, green innovation, peace and tranquility. The key lies in keeping basin countries firmly in the driver's seat of regional affairs.

Guided by the LMC 2.0 framework, the six Lancang-Mekong countries will continue to turn water connectivity into people-to-people bonds, integrating national needs into regional advantages. In doing so, Lancang-Mekong water governance will infuse fresh vitality into the building of a peaceful and prosperous regional community with a shared future.

Fiscal, monetary tools to boost consumption

Central, local authorities roll out comprehensive policy package to lower financing costs

By **ZHANG CHENXU** in Hangzhou, **SHI RUIPENG** and **ZHANG LI** in Nanning

China is ramping up coordination between fiscal and monetary tools to further unleash consumption potential and energize private investment, in a bid to fuel a broad expansion in domestic demand, officials and business executives said.

With stronger support from the central government, local fiscal authorities are stepping up the rollout of a comprehensive policy package that combines loan interest subsidies, financing guarantees and risk compensation to lower financing costs and channel more resources into the real economy.

Xu Yong, a 34-year-old resident of Hangzhou, Zhejiang province, recently took out a personal consumption loan to furnish his new apartment.

The loan offered a credit line of up to 300,000 yuan ($43,886) and originally carried an annual interest rate of 3 percent. Thanks to the latest interest subsidy policy, his effective borrowing rate was reduced to 2 percent.

"The subsidy will save me about 3,000 yuan in interest payments over a year, which came as an unexpected bonus," Xu said, adding that the application process was smooth and took only a few minutes.

The reduction in Xu's effective borrowing rate came after the central government announced in January that it would allocate 100 billion yuan this year to support a broader fiscal-financial coordination package aimed at spurring consumption and private investment.

The package comprises six policies — four aimed at supporting private investment and two focused on household consumption — designed to reduce financing costs and improve access to credit for consumers, service providers and private businesses.

The interest subsidy policy for personal consumption loans will be extended through the end of 2026, while credit card installments will be included and sectoral restrictions removed to expand consumer choice.

Service-sector businesses are also receiving stronger financial support to better meet consumer demand.

Fei Peng, who runs a music training and instrument sales company in Hangzhou, secured a 1 million yuan loan from a local bank in March to purchase instruments and support business expansion.

With a 1 percentage point fiscal interest subsidy, the loan is expected to reduce the company's annual interest payments by about 10,000 yuan.

"I hope the policy support can be sustained over the long term," Fei said.

Extending the loan cycle for cultural and creative businesses to three to five years will help ease funding pressure more effectively, Fei added.

The fiscal interest subsidy program for service-sector businesses has been further expanded this year to cover digital, green, and retail sectors. Meanwhile, the maximum subsidized loan amount per borrower has been increased from 1 million yuan to 10 million yuan, with the subsidy cap raised to 100,000 yuan, offering stronger financial support to service-sector enterprises.

According to Hangzhou United Bank, which issued the loan to Fei, the financing is expected to generate at least 5 million yuan in consumption.

Lin Shiyi, chairman of the bank, said that under the guidance of fiscal policy support, Hangzhou United Bank extended 9.38 billion yuan in loans to service-sector businesses in the first quarter, mainly in retail, cultural and entertainment, and healthcare sectors.

MA XUEJING / CHINA DAILY

At the provincial level, newly issued loans linked to interest subsidy policies in Zhejiang have topped 1 trillion yuan since the beginning of the year, data from the Zhejiang Provincial Department of Finance showed.

Wu Dagui, deputy head of the department's financial division, said the rollout has amplified the leverage effect of fiscal-financial coordination, channeling fresh liquidity to micro, small and medium-sized enterprises as well as service-sector businesses.

Private investment is another major focus of the package.

The measures feature broad coverage, stronger support and a diversified set of tools, with several policies working in tandem to stabilize private investment, Liao Min, vice-minister of finance, said at a news conference in January.

"The newly introduced interest subsidy policy for loans to micro, small and medium-sized enterprises, together with the optimized subsidy policy for equipment renewal loans, can both provide eligible borrowers with subsidies equivalent to 1.5 percentage points of the loan amount," Liao said.

The arrangement is helping companies lower the cost of equipment upgrades and project investment.

Nine Dragons Paper Industries (Beihai) Co, a private paper manufacturer based in Beihai, Guangxi Zhuang autonomous region, said its second-phase pulp-and-paper integration project was included this year in the interest subsidy program for equipment renewal loans.

From 2023 to 2025, the company received 64.21 million yuan in fiscal interest subsidies through a combination of local financing support measures and the equipment renewal loan subsidy program.

"Fiscal policy and funding support have strongly supported project construction and production, accelerated our digital and intelligent transformation, and effectively reduced investment and operating costs," said Zhang Yi'an, general manager of the company.

Zhang said the company's sales revenue exceeded 9 billion yuan in 2025 and is expected to surpass 12 billion yuan this year.

Beyond interest subsidies, the policy package also includes a special guarantee plan for private investment, designed to improve financing access for smaller private firms that often face collateral constraints.

A Guangxi-based dairy breeding unit of Royal Group Co is one of the businesses expected to benefit from the plan as it moves from project construction to operational expansion.

With its breeding base entering operation, the company has seen rising demand for working capital, while large upfront investment and the long cash conversion cycle in animal husbandry have added to short-term liquidity pressure.

Local financing guarantee institutions and a rural commercial bank in Guangxi have designed a tailored financing plan under the special guarantee mechanism, using the company's core breeding assets and intelligent farming equipment as counter-guarantee measures to support a three-year, 5 million yuan special loan.

The loan is expected to ease funding pressure during the expansion phase and help sustain the company's breeding program.

Data from the Finance Department of Guangxi Zhuang Autonomous Region showed that by the end of April, new lending under the region's special guarantee plan for private investment had reached 1.79 billion yuan.

Together with interest subsidies and risk compensation, such guarantee support is designed to amplify the role of fiscal funds in mobilizing credit for the real economy.

Finance Minister Lan Fo'an has said previously that preliminary estimates suggest that every 100 billion yuan in fiscal funds can support up to 1 trillion yuan in credit, achieving a "four-ounce leverage moving a thousand-pound weight" multiplier effect.

That leverage effect is also reflected in first quarter lending.

Li Nan, deputy director-general of the Financial Affairs Department of the Ministry of Finance, said newly issued loans under the related programs exceeded 8.8 trillion yuan in the first quarter, up 4.2 percent year-on-year. The loans covered micro, small and medium-sized enterprises, equipment renewal projects, service-sector businesses and personal consumption.

On the investment side, the policies supported about 330 billion yuan in corporate financing during the same period, up 12.8 percent year-on-year, and helped generate around 480 billion yuan in investment. This has helped fixed-asset investment return to growth and narrowed the decline in private investment, Li said.

Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities, said stronger consumption and investment cannot rely on fiscal support alone, but also require policies that improve incentives for households and businesses.

"By using targeted fiscal funds to lower costs and share risks, the policy can better align government support with market-based decisions, making fiscal spending more efficient and policy transmission more effective," Luo said.

Policy package aiding in major spending decisions

REPORTER'S LOG

By Zhang Chenxu

While tracking the rollout of China's coordinated fiscal and financial measures, I found that their impact is becoming visible not just in headline funding figures, but in the everyday economic decisions of households, companies and lenders.

The policy package is being tested not only by the amount of funds it mobilizes, but by whether it helps people spend, firms invest and banks lend.

On the consumer side, that effect is becoming tangible through lower borrowing costs and easier access to policy support, helping some households make major spending decisions with less financial strain.

Li Bin, a resident of Hangzhou, Zhejiang province, who had been planning to travel to Antarctica for long, decided to finally go ahead with the trip during a rare extended break this year.

Much of his money, however, was invested in medium- and long-term wealth management products. Redeeming them ahead of schedule could have disrupted his financial arrangements and caused losses.

However, the fiscal interest subsidy policy for personal consumption loans offered another option.

After confirming that his travel expenses were eligible for policy support, Li took out a 300,000 yuan ($43,886) consumption loan. The loan qualified for a 1 percentage point fiscal interest subsidy, capped at 3,000 yuan, enabling him to cover the travel expenses without disrupting his existing financial arrangements.

Hangzhou United Bank, which provided the loan, has also made the policy easier to access. In February, the bank launched a dedicated section for fiscal interest subsidies on its mobile banking app.

Subsidy-related applications are now largely processed automatically, covering steps from application handling to post-loan management, the bank said.

Among businesses, I found that easing financing pressure can also change the timing of investment and the confidence behind such decisions.

Zhejiang Jinhua CONBA Bio-Pharm Co, a pharmaceutical subsidiary of Chinese drugmaker CONBA, recently upgraded a production line with an annual capacity of 20 million vials of freeze-dried penicillin products.

Huang Jianghua, chief financial officer of the company, said the project was financed by a 39 million yuan equipment renewal loan. The loan's interest costs are estimated at around 1 million yuan, of which about 700,000 yuan is expected to be covered through the central government's interest subsidy policy.

Huang said the subsidy has eased the company's financial pressure and made it more willing to tap credit financing, allowing it to speed up intelligent and digital transformation and invest more in high-end, smart and green equipment.

Beyond traditional manufacturers, the policy support is also reaching asset-light technology firms, many of which still face credit constraints while expanding.

Guangxi Dayuan Technology Co, a tech-oriented small and medium-sized enterprise based in Guangxi Zhuang autonomous region specializing in OLED and LCD display modules, found itself in such a situation as rising orders put pressure on its production capacity.

With limited collateral, the company encountered financing difficulties during a critical expansion period.

With support from a special guarantee program for private-sector investment, Guangxi Financing Guarantee Group worked with banks to provide the company with 7.9 million yuan in guaranteed loans, according to the company.

Of the total, 1.6 million yuan has been issued in 2026 under the program to support equipment renewal and technological transformation, the company said.

Yang Tao, deputy director of the National Institution for Finance and Development, said fiscal-financial coordination is an innovative policy instrument that uses measures such as interest subsidies, risk compensation and financing guarantees to channel targeted support to private investment and household consumption.

The approach can help reduce financial risks through fiscal credit enhancement while sending a clear signal to stabilize expectations and boost market confidence, Yang said.

During this reporting trip to Zhejiang and Guangxi, the impact of fiscal-financial coordination came into focus through small but telling decisions: a household going ahead with a long-planned trip without disrupting its financial arrangements, a manufacturer pressing ahead with an upgrade, and an asset-light firm securing the credit support it needed to grow.

BUSINESSINSIGHT

EAGLE EYE
By Huang Qunhui

Driving development with new quality productive forces

Editor's note: *China Daily's Business Insight section has launched a column devoted to an in-depth interpretation of Xi Jinping's economic thought, with this article serving as the debut piece of the new series.*

CAI MENG / CHINA DAILY

The 15th Five-Year Plan period (2026-30) is a crucial timeframe for laying a solid foundation to basically realize socialist modernization. The fourth plenary session of the 20th Central Committee of the Communist Party of China requires remarkable results in advancing high-quality development, and major breakthroughs are needed in developing new quality productive forces, fostering a new development pattern and building a modernized economic system.

This requires a thorough understanding of the important discourses by Xi Jinping, general secretary of the CPC Central Committee, on new quality productive forces.

It is crucial for us to understand the relationship between new quality productive forces and high-quality development.

Xi characterized new quality productive forces as an advanced productivity state, in which innovation plays the leading role. The forces break away from traditional economic growth modes, feature high technology, high efficiency and high quality, and align with the new development philosophy. Developing new quality productive forces is an intrinsic requirement and an important focus for promoting high-quality development.

Productivity is the fundamental driving force of human social development. High-quality development requires the guidance of new productivity theories. Because new quality productive forces have already taken shape in practice and demonstrated strong driving power, they serve as the guiding theory and robust driving force for high-quality development.

In the new era, China has liberated productive forces through comprehensively deepening reform and high-standard opening-up, positioning innovation as the primary driver. Integrating ecological civilization into national development and asserting that protecting the environment means protecting productive forces are vital theoretical outcomes. Grasping this principle is essential to propel high-quality development during the modernization journey.

It is also important for China to accelerate new quality productive forces through innovation.

The distinguishing feature of new quality productive forces is innovation, which encompasses aspects of technology, business models, management styles and institutional innovation. It is imperative to excel in this major task to accelerate their development.

The basic path involves advancing sci-tech innovation for revolutionary breakthroughs and driving industrial innovation for deep transformation, thereby significantly increasing total factor productivity. As China embarks on a new modernization journey, focus must be placed on four aspects.

First, it is necessary to catalyze new quality productive forces guided by high-level sci-tech self-reliance and strength. During the 15th Five-Year Plan period, China must improve its new system for mobilizing resources nationwide, optimize basic research and development, and strengthen original innovation. Extraordinary measures are needed to achieve decisive breakthroughs in core tech across key fields like integrated circuits, industrial machine tools, high-end instruments, basic software, advanced materials and biomedicine.

Second, accelerated development by deeply integrating sci-tech and industrial innovation is needed. It is crucial to fuse real economy innovation with digital and green technologies. Enterprises' principal role in innovation must be strengthened, resources channeled toward them and support provided for them to lead innovation.

Third, it is necessary to accelerate green productive forces by innovating development modes. Guided by carbon peak and neutrality goals — carbon reduction, pollution reduction, green expansion and economic growth should be synergistically advanced. Deepening pollution prevention, building a new energy system, and expediting the formation of green production modes and lifestyles are necessary steps.

Fourth, constructing compatible relations of production by advancing integrated institutional innovation in education, science and technology and talent is needed. Mechanisms that comprehensively support innovation must be improved to enhance the national innovation system's overall efficacy, focusing on nurturing strategic scientists, leading talents, outstanding engineers and highly skilled personnel.

Building a modernized industrial system is important to support development according to local conditions.

To firmly grasp high-quality development as the primary task, it is necessary to develop new quality productive forces according to local conditions. Facing the new round of scientific and technological revolution and industrial transformation, opportunities must be seized to intensify innovation efforts, cultivate emerging industries, make plans for future industries and improve the modernized industrial system.

Crucially, developing new quality productive forces does not mean ignoring or abandoning traditional industries. It is necessary to prevent headlong rushes and bubble formations, and avoid adopting a single model. All localities must proceed from reality, establish the new before abolishing the old, customize measures to local conditions and provide categorized guidance. Based on local resource endowments, industrial foundations and scientific research conditions, they should selectively promote new industries, use new technologies to transform traditional industries, and actively promote high-end, intelligent and green industrial development.

Promoting industrial innovation through sci-tech innovation is essential for building a modernized industrial system and developing new quality productive forces. The two are interdependent. New quality productive forces are the core capability elements for the modernized industrial system, which serve as their effective carrier. Building this system translates sci-tech achievements into real productive forces, while the system's construction ensures practical economic needs guide sci-tech innovation.

On the one hand, new quality productive forces are achieving a leap in optimizing production factors. Intensive innovation is generating clusters in next-generation information technologies, life sciences, clean energy and advanced manufacturing. These accelerate the iterative leap of productive forces.

On the other hand, the modernized industrial system is developing toward digitalization, intelligence, greening and integration. New quality productive forces are directly reflected in highly penetrative digital and intelligent technologies applied across all sectors and throughout the entire value chain.

China's leadership has emphasized the "consolidation and upgrading" of traditional industries during the 15th Five-Year Plan, calling for enhanced competitiveness in mining, metallurgy, chemicals, light industry, textiles, machinery, shipbuilding and construction. Traditional industries are the "basic fundamentals" of the real economy, accounting for about 80 percent of value-added. To build a modernized industrial system and consolidate the real economy, they must never be abandoned.

Domestic demand improves, exports performing well

MAIN STREET
By Wang Yiming

China's economy got off to a strong start in the first quarter with major economic indicators for January-February exceeding expectations, and the economy is showing positive developments on multiple fronts.

First, industrial production and services maintained robust growth momentum. In the first two months, growth rates of value-added industrial output above designated size — and the services production index — both accelerated from December. In particular, industrial output growth picked up by 1.1 percentage points from December, driven by exports, indicating continued strength on the supply side.

Second, exports demonstrated strong resilience, growing 19.2 percent in the first two months — far exceeding market expectations. While the delayed Chinese Lunar New Year holiday and a low comparison base from a year earlier contributed to the rapid growth, improved manufacturing competitiveness was a key factor supporting export expansion.

Third, domestic demand improved noticeably. Driven by a strong rebound in infrastructure investment, fixed-asset investment rose 1.8 percent year-on-year in January-February, reversing a 3.8 percent decline for full year 2024. Retail sales of consumer goods increased 2.8 percent year-on-year, 1.9 percentage points faster than in December. In particular, services retail sales grew 5.6 percent year-on-year, outpacing the 2.5 percent growth in goods retail sales, indicating that services consumption is becoming an important driver of overall consumption.

Fourth, marginal improvement in demand outpaced supply-side recovery, helping support a moderate rise in prices. In January-February, the consumer price index rose 0.8 percent year-on-year, while core CPI increased 1.3 percent.

Driven by external factors and rapidly growing demand for computing power, the producer price index decline narrowed to 0.9 percent year-on-year in February, while month-on-month PPI rose for five consecutive months. Based on this trend, PPI may return to positive territory earlier than previously expected. These developments have created conditions for the economy to break free from persistently low inflation throughout the year.

Fifth, industrial profits recovered. In January-February, profits of industrial enterprises above designated size rose 15.2 percent year-on-year, 14.6 percentage points faster than the full-year growth rate in 2025. Profits of State-controlled enterprises rebounded from a 3.9 percent decline last year to 5.3 percent growth. Among 41 major industrial sectors, 24 recorded profit growth. The recovery in prices, especially the narrowing decline in PPI, was an important contributor to the rise in industrial profits.

The strong economic start this year was largely attributable to front-loaded macroeconomic policies. Since the beginning of the year, proactive fiscal policy has been implemented early, with central government budgetary investments and funding for key projects aimed at implementing major national strategies and building up security capacities in key areas disbursed in advance. Fiscal spending at all levels accelerated, supporting early launch and implementation of these projects.

Monetary policy also remained accommodative. By the end of February, outstanding aggregate financing to the real economy and the broad money supply, or M2, grew 8.2 percent and 9 percent year-on-year, respectively. Meanwhile, local governments seized the opportunity presented by the launch of the 15th Five-Year Plan (2026-30) to accelerate infrastructure construction projects, supporting investment growth and economic stabilization.

China should seize the current window of increasingly positive factors to consolidate and strengthen the momentum of economic recovery. At the same time, it should be noted that uncertainties in the external environment are increasing.

The conflict in the Middle East has driven international oil prices sharply higher. Market institutions have outlined baseline, adverse and extreme scenarios for Brent crude oil prices based on different conflict outcomes. Taking UBS Securities' forecast as an example, if shipping disruptions through the Strait of Hormuz continue, under adverse and extreme scenarios, oil prices could rise to $130 and $150 per barrel in the second quarter, with annual average prices reaching $100 and $132.5 per barrel in 2026, respectively.

China's relatively low dependence on crude oil in its energy consumption structure, together with ample oil reserves, means the country is less vulnerable to supply shortages. However, soaring global oil prices will still raise production costs. If end-user demand remains weak, upstream cost increases may be difficult to pass downstream, potentially squeezing profit margins for midstream and downstream enterprises.

In addition, uncertainty persists in global trade conditions. A report released by the World Trade Organization on March 19 forecast that under a baseline growth scenario excluding energy price shocks, global merchandise trade growth would slow to 1.9 percent in 2026 from 4.6 percent in 2025. If both crude oil and liquefied natural gas prices remain elevated throughout 2026, merchandise trade growth could fall further to 1.4 percent.

A slowdown in the expansion of external demand will increase pressure to boost domestic demand. In 2025, net exports of goods and services contributed 32.7 percent of China's economic growth, boosting GDP growth by about 1.6 percentage points. If external demand weakens in 2026 and net exports contribute less to growth, maintaining stable economic expansion will require higher contributions from final consumption and capital formation.

At present, the imbalance of "strong supply but weak demand" remains prominent in China's economy, reflected in much faster expansion on the supply side than on the demand side. In the first two months, value-added industrial output and the index of services production grew 6.3 percent and 5.2 percent year-on-year, respectively, while retail sales of consumer goods and fixed-asset investment increased only 2.8 percent and 1.8 percent, indicating significantly weaker demand-side performance.

Weak demand mainly stems from three factors. First, consumer demand remains subdued. Although retail sales growth of consumer goods accelerated to 2.8 percent in January-February, up 1.9 percentage points from December, it was still below last year's full-year growth rate of 3.7 percent.

Second, the property market has yet to stabilize. Real estate development investment fell 11.1 percent in January-February, while new home sales floor space and sales value dropped 13.5 percent and 20.2 percent, respectively. Large inventories and slow destocking mean the market remains in a bottoming-out phase.

Third, private investment remains weak. Private fixed-asset investment fell 2.6 percent in January-February, and excluding property investment, growth was only 1 percent. Weak market demand and sluggish corporate profitability continue to dampen private investment appetite.

From a longer-term perspective, the "strong supply, weak demand" problem reflects not only cyclical factors, but also structural and institutional issues.

Since 2012, China's economy has entered a "new normal" characterized by slower growth, shifting from double-digit to single-digit GDP expansion. Discussions of the new normal have often focused on the supply side and declining potential growth. However, after 2012, demographic changes — including a shrinking labor force and accelerated aging — have also profoundly affected demand. Both consumption and investment growth slowed significantly, making demand an increasingly important constraint on economic growth.

The COVID-19 pandemic severely affected both supply and demand, but the demand-side shock was more pronounced, while deeper structural contradictions also became more visible.

First, the deep adjustment in the property sector caused a major contraction in demand. New commercial property sales fell from a peak of 18.2 trillion yuan ($2.67 trillion) in 2021 to 8.4 trillion yuan in 2025. Second, falling property prices reduced household assets, prompting some families to reduce mortgage debt in order to repair balance sheets, which in turn restrained consumption. Third, declining land-sale revenues and rising debt-repayment burdens have forced local governments to focus on resolving existing debt in recent years, therefore constraining investment expansion.

Insufficient demand is also due to institutional factors. China has long maintained a production-oriented fiscal and tax system, with a relatively high share of taxes levied during the production process. This has encouraged local governments to prioritize production over consumption, causing consumption growth to lag behind supply expansion. Therefore, expanding effective demand requires not only stronger policy support, but also deeper reforms.

Against this backdrop, China should combine stronger policy support with deeper reforms to sustain economic recovery and improvement.

China should intensify the implementation of proactive fiscal policy. Although the scale of new government debt this year has reached a record high, the increase from last year remains relatively limited, and broad fiscal spending growth is still below nominal GDP growth.

Moving forward, fiscal policy implementation should be strengthened and accelerated. Fiscal expenditure structures should also be adjusted, redirecting some funds used for investment toward public services and livelihood spending. A plan to raise household incomes should be launched more quickly.

Institute to boost STEM education

China, UNESCO partnership to drive innovation, global resource sharing

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

STEM education is vital for humanity and essential to addressing major global challenges, including climate change, biodiversity loss, health, energy, food systems and digital transformation, UNESCO Director-General Khaled El-Enany said recently in Shanghai, calling for joint efforts to advance inclusive and accessible STEM education globally.

El-Enany made the remarks on Thursday at a high-level symposium on STEM education held at the UNESCO International Institute for STEM Education, or UNESCO IISTEM, which formally began operations following the inaugural meeting of its governing board held on the same day.

Unveiled in September in Shanghai, the Category I institute was established with a mandate to promote inclusive, equitable and quality education for all in science, technology, engineering and mathematics, or STEM, from early childhood to adulthood.

El-Enany said the inauguration of the institute marks renewed momentum in the long-standing cooperation between China and UNESCO, a strong and comprehensive partnership spanning the full scope of the organization's mandate and networks.

He said the institute will provide high-level expertise across strategic fields, focusing on curriculum development, teacher capacity-building, lifelong learning, educational planning and policy support.

"Our collective prosperity, resilience and well-being depend on educated, creative and forward-looking minds capable of imagining and building solutions that do not yet exist. STEM education will only fulfill its promise if it is inclusive and accessible to all," El-Enany said.

He noted the many challenges affecting STEM education globally, including shortages of laboratories, equipment, connectivity and trained teachers. Many countries also lack the capacity to fully engage in scientific and technological innovation.

With the new institute, UNESCO aims to tap into vast potential and help bridge divides, especially in Africa and Small Island Developing States, or SIDS.

"With China's support, UNESCO is already leading a $3 million program to strengthen STEM education in both Africa and SIDS — including Mali, Uganda, Samoa and the Solomon Islands — with a focus on curriculum reform, teacher training and innovative learning resources," El-Enany said.

Calling the new institute a global hub serving all people, he urged greater efforts to bring science closer to classrooms, technology closer to teachers, and innovation closer to those who need it most.

John Michael Kosterlitz, a Nobel laureate in physics and honorary professor at Soochow University, also underscored the importance of the institute, saying that "humanity needs STEM" to contribute to society.

"STEM education is not only about producing more scientists and engineers. It is about cultivating a way of thinking ... Humanity today faces serious challenges, and they require people who can cross boundaries, think clearly and act responsibly," he said.

Efim Zelmanov, a Russian-American mathematician and Fields Medal laureate who currently serves as chair professor at Southern University of Science and Technology, praised China's sustained efforts to promote STEM education.

"I find the support for mathematical and, more generally, STEM education in China breathtaking and amazing. It is the support at all levels of society. This is the reason why I moved to China in 2022 and have not regretted it for a second," he said.

China is continuing its efforts to cultivate STEM talent and improve scientific literacy while working toward a shared future for humanity.

"To build a peaceful, sustainable and prosperous future for all, we must deepen global cooperation and urgently improve STEM education worldwide. This will empower everyone to benefit from technological advances and industrial transformation," said Ren Youqun, vice-minister of education and chairperson of the Chinese National Commission for UNESCO.

China looks forward to working with UNESCO and all partners to develop the IISTEM into a laboratory for new STEM concepts and approaches, a global hub for policy dialogue and cooperation, an innovative platform for sharing high-quality STEM resources, and a key driver of capacity-building, especially in developing countries, Ren added.

Shanghai sets target to build intl shipping hub

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

As Shanghai moves from scale expansion to capacity enhancement in building an international shipping center during the 15th Five-Year Plan (2026-30) period, demand for talent with cross-disciplinary expertise is rising, according to experts.

The port of Shanghai, the world's largest container port for 16 consecutive years, handled 55.06 million twenty-foot equivalent units (TEUs) throughout 2025, and is targeting an annual container throughput of 58 million TEUs during the 15th Five-Year Plan period, Chu Beiping, president of Shanghai Maritime University, said at the Shanghai International Shipping Center Capacity Enhancement Think Tank Forum held recently in Shanghai.

"The growth in scale is merely part of the capacity enhancement in the development of the Shanghai International Shipping Center. More important are talent supply, rule-making capacity and competition for international discourse influence, which are key to elevating the center's status and capability," Chu said at the forum, which was jointly held by the Shanghai Federation of Social Science Association and Shanghai Maritime University.

Chu said future efforts should focus on the emerging needs of the shipping industry by developing new interdisciplinary fields, jointly cultivating professionals with cross-disciplinary integration capabilities, and building a knowledge hub that is demand-driven, collaboration-based and underpinned by standards development.

Against this backdrop, Shanghai Maritime University launched the country's first undergraduate program in international cruise management in 2025, enrolling 31 students, a move expected to help address Shanghai's shortage of high-end maritime service talent, said Wu Xianhua, dean of the university's School of Economics and Management.

"Through the integration of industry and education, the bachelor's program aims to sharpen students' practical skills, foreign-language proficiency and international outlook," Wu said.

According to Wu, the program is in response to China's fast-developing cruise economy, which is evolving from a pure cruise consumer market into a comprehensive industrial chain spanning construction, independent design and operations.

"The undergraduate program is designed to fill the significant gap in medium- to high-end cruise management talent in China, and is expected to become a stable source of high-quality talent supporting Shanghai's development as an international shipping center," Wu said.

"Taking a medium-sized cruise ship as an example, there are at least 1,000 crew members onboard on a regular basis, with mid- to high-level management talent accounting for more than 5 percent," Wu added.

Representing the highest level of China's shipping center development, Shanghai serves as a stabilizer in global port and shipping development, supporting China's opening-up and supply chain stability, said Liu Xin, director of the Transport Planning and Research Institute.

"To become a globally leading international shipping center, Shanghai should strengthen its soft power during the 15th Five-Year Plan period," Liu said.

According to Liu, the focus will be on enhancing four key capabilities: facility resilience and safety, global shipping resource allocation, leadership in intelligent and green development, and comprehensive financial and legal support.

"Shanghai should strive to achieve comprehensive leadership in scale and efficiency, resilience and security, integrated services, intelligent and green development, and economic vitality," Liu added.

Guests pose for a photo in front of China's second domestically built large cruise ship, *Adora Flora City*, before its departure from Shanghai on Saturday for a 12-day sea trial. The vessel can accommodate up to 5,232 passengers and is scheduled for delivery in November 2026. YIN LIQIN / CHINA NEWS SERVICE

Learning tea traditions

International students learn traditional tea-making techniques under the guidance of local producers at a tea culture park in Jurong of Zhenjiang city, Jiangsu province, on Sunday. More than 70 international students from universities including Nanjing Normal University and Jiangsu University took part in tea picking, tea processing and tea ceremony activities to experience Chinese tea culture firsthand. Study reveals how westerlies deliver moisture to the Qinghai-Tibet Plateau

By **PALDEN NYIMA** and **DAQIONG** in Lhasa

A groundbreaking study has unveiled how massive, high-altitude wind currents — known as the westerlies — deliver essential moisture to the Qinghai-Tibet Plateau. Often called the "Asian Water Towers", this region serves as a critical freshwater source for nearly two billion people downstream.

The research, led by Gao Jing and Yao Tandong from the Chinese Academy of Sciences' Institute of Tibetan Plateau Research, alongside international scientists, solves a long-standing puzzle: how these high-altitude winds pump moisture into the local environment even when it is not raining or snowing.

The findings were published in the journal Proceedings of the National Academy of Sciences on May 6.

As rising temperatures accelerate glacier retreat and change river flows, understanding how the Qinghai-Tibet Plateau gets its water is vital for predicting future water supplies.

To map this hidden water cycle, the team combined real-world field data with advanced computer weather models. They launched specialized, helium-filled "Jimu balloons" to collect 32 vertical atmospheric profiles at two key locations on the plateau. These sites included Lulang, a forested valley that acts as a moisture pathway, and Nam Co, a high-altitude saltwater lake.

These balloons measured temperature, humidity, and the unique chemical "fingerprints" of water molecules, known as stable isotopes. By tracking these isotopes, scientists can trace exactly where water vapor came from and how it has changed over time.

> The results showed that moisture carried by the westerlies undergoes significant phase changes — turning from invisible vapor into tiny water droplets — as it sinks."
>
> **Gao Jing,** deputy director of the national key laboratory of earth system and resource environment on the Qinghai-Tibet Plateau

At the heart of the discovery is a nighttime process called atmospheric "decoupling".

During the day, solar heating mixes the air near the ground with the air high above. But at night, the ground cools rapidly, creating a highly stratified, three-layer atmospheric sandwich over the plateau.

This structure is divided into the boundary layer closest to the ground, a middle buffer zone called the mixed layer, and the free troposphere, which acts as the high-altitude highway where the westerlies blow.

As the ground cools, these air layers separate, or "decouple", allowing the moisture carried by the high-altitude westerlies to sink toward the plateau.

"The results showed that moisture carried by the westerlies undergoes significant phase changes — turning from invisible vapor into tiny water droplets — as it sinks," said Gao Jing, deputy director of the national key laboratory of earth system and resource environment on the Qinghai-Tibet Plateau.

As this sinking moisture cools, it forms a "thermal inversion cap" — a layer of warm air trapping cooler air beneath it. This cap stops the air from mixing aggressively, allowing the water vapor to quietly condense into the lower atmosphere instead.

"Remarkably, around 30 percent of the moisture transported by the westerlies is integrated into the local cycle through these nighttime phase transitions," Gao said.

The study provides a crucial breakthrough for climate science. By revealing exactly how the westerlies feed the Qinghai-Tibet Plateau, the research gives scientists a more accurate benchmark to improve weather forecasting models and optimize climate projections for the region.

Furthermore, understanding this modern process helps scientists better interpret historical climate data locked away inside ancient ice cores, offering a clearer picture of how Asia's water supply has fluctuated over centuries and how it might change in the future.

Chang'e 6 findings challenge Earth water theories

By **LI MENGHAN**
limenghan@chinadaily.com.cn

When asteroids struck the Earth-moon system, they devastated ancient landscapes, triggered global catastrophic events and delivered water and organic compounds essential for life, leading scientists to long believe that carbonaceous asteroids from the outer solar system were a major source of the building blocks for life on Earth.

Now, a study on lunar samples from China's Chang'e 6 mission is challenging conventional theories about this cosmic process. By analyzing tiny metal grains in lunar soil, Chinese scientists have reconstructed changes in asteroid impacts between 4.3 billion and 2.8 billion years ago.

The findings were published on April 27 in the Journal of Geophysical Research: Planets.

Frequent geological activity on Earth, such as plate movement and erosion, has erased most traces of ancient asteroid impacts. As a result, meteorites — fragments of asteroids that fall to Earth — mainly preserve records from only the past 2 million years.

In contrast, the moon, which formed around the same time as Earth but has remained largely inactive geologically, serves as a well-preserved "diary of the solar system", retaining impact records spanning nearly 4 billion years.

"When an asteroid strikes the moon, the impactor vaporizes and breaks apart under extreme heat, leaving behind tiny fragments, including iron-nickel metal grains," said Liu Xiaoying, first author of the study and a postdoctoral researcher at the Institute of Geology and Geophysics, Chinese Academy of Sciences.

Liu said these metal grains are chemically different from the moon's native rocks and contain distinct trace elements depending on the type of asteroid involved. These differences act like "chemical fingerprints", allowing scientists to identify what kinds of asteroids struck the moon.

Using these "fingerprints", the research team examined 40 fragments of impact debris from the Chang'e 6 lunar samples.

Among them, 13 were found in ancient lunar highland rocks and recorded impacts dating back 4.3 billion years. The other 27 were preserved in relatively more recent volcanic rock debris, recording impacts accumulated about 2.8 billion years ago.

The study found that the 13 older fragments mainly came from ordinary rocky asteroids and iron-rich meteorites originating in the inner solar system. Metals from carbonaceous asteroids accounted for less than 8 percent.

By comparison, among the 27 fragments, the proportion linked to carbonaceous asteroids rose to about 26 percent.

The findings suggest impacts from carbonaceous asteroids became significantly more frequent between 4.3 billion and 2.8 billion years ago.

However, this increase occurred during a relatively late stage, when overall asteroid bombardment had already declined, possibly limiting the total amount of water and other volatile substances delivered to the Earth-moon system.

The team proposed several scenarios for the change in asteroid types, including giant-planet migration that scattered carbonaceous asteroids inward, the Yarkovsky effect gradually shifting them into new orbits, or the breakup of one or more large carbonaceous bodies into numerous fragments.

"The study may challenge existing theories about the origin of Earth's water," said Lin Yangting, the study's corresponding author and a researcher at the institute.

Lin added that with more lunar samples expected from future missions, follow-up studies will focus on different periods in lunar history to further uncover the mysteries of asteroid impacts and the evolution of the solar system.

CHINA

Editor's note: *The rapid advancement of artificial intelligence is reshaping nearly every facet of human existence. This series will take an in-depth look at this transformative force, examining how AI is redefining the way we live, work and interact.*

Seniors operate a mechanized vehicle that helps them move around at a smart elderly care center in Beijing in March. JU HUANZONG / XINHUA

AI tools enable seniors to 'triage at home'

Digital technologies increase potential scope of healthcare access among aging population

By **WEI WANGYU**
weiwangyu@chinadaily.com.cn

Ye Cuihua, 79, doesn't head to the county clinic when she feels a flutter in her chest. She glances at her wrist. Within seconds, her smartwatch syncs with an app called Ant AQ telling her that her blood pressure is slightly elevated. It follows by providing advice to reduce her salt intake, keep monitoring, and call her doctor if the symptoms persist.

"It feels like having someone at home who can always answer," Ye said.

Across China, this scene is playing out with increasing urgency. As the nation's population aged 65 and above doubled from 7 percent to 14 percent in just 23 years — a demographic shift that took France a century to endure — the medical system is hitting a breaking point. The solution isn't just more hospitals; it is "triage at home" powered by artificial intelligence.

China's medical system has long suffered from a basic imbalance: the best doctors and equipment cluster in big cities, while smaller towns and the countryside make do with less.

"For older patients like us, getting care often means a long bus ride, hours of waiting, and the nagging uncertainty of not knowing whether a symptom is serious enough to justify the trip," Ye said.

AI does not fix all of that, but it is beginning to reshape a critical moment that comes before any hospital visit, that is, the moment a person decides whether to go at all.

"For many older adults, the hardest question is not what treatment do I need, but do I need to see a doctor in the first place," Ye added.

AI tools are able to cross-reference symptoms, health records and basic readings from wearable devices, offering preliminary guidance that can turn vague aches and worries into something a person can act on.

Cai Juan, a caregiver at Taikangzhijia, a senior care facility in Wuhan, Hubei province, has witnessed a noticeable change in health awareness among residents in recent years. "Residents who once ignored mild discomfort or panicked over minor symptoms now tend to consult a digital tool first," she said.

"It doesn't replace the doctor," she added. "But it eases the anxiety and sometimes catches things that would have been left too long."

For elderly users, though, the meaning of these tools runs deeper than efficiency. They also introduce a new kind of presence into daily life.

A senior woman participates in setting up and testing an elderly care robot that can perform basic health checkups, monitor health status and offer companionship at a welfare center in Hangzhou, Zhejiang province, in March last year. YAO YINGKANG / FOR CHINA DAILY

A man learns about smart glasses during an expo of senior care products in Shenzhen, Guangdong province, in September. LIANG XU / XINHUA

A senior woman tries a physical therapy robot in Beijing in March. JU HUANZONG / XINHUA

At Kangyuxuan, a private elderly care home in Beijing, some residents have built routines around their digital assistants, including checking medication schedules, logging sleep, or simply asking questions about a twinge in the knee.

Staff members say these interactions, while practical on the surface, carry an emotional undertone as well.

"They are not just using a tool," said Cui Xiaohan, a caregiver at the elderly care home. "They are getting used to being responded to."

In a country where family structures are changing fast and millions of elderly people live alone or with minimal daily company, that responsiveness matters. AI systems — always available, never impatient — can partially fill the silences left by absent children or overworked caregivers. This does not mean technology replaces human relationships. But it suggests that care, as older people actually experience it, is increasingly a hybrid affair — part human, part machine.

None of this, however, is seamless.

Although smartphone adoption among Chinese adults aged 60 and above has grown rapidly — with internet penetration reaching 53.7 percent by the end of 2025 — digital literacy remains a barrier, with many seniors struggling to navigate cluttered app interfaces, fragmented platforms and unfamiliar interaction patterns.

"A system can be brilliant under the hood, but if a 75-year-old cannot figure out how to use it, that brilliance counts for little," Cui said.

Some platforms have begun introducing simplified layouts, voice commands and even dialect recognition — adjustments that sound minor but determine whether a tool actually gets used.

"In February, Ant AQ, an app developed to help the elderly with health checks and medical consultation, started to provide a mode that is more suitable for the elderly," said Shen Yunfang, head of communications at Ant Health.

"Specifically speaking, we developed a mode that is able to understand different dialects, considering that many of the elderly could not speak in standard Mandarin," she said.

Compared with younger users, however, many older adults remain wary of advice delivered by an algorithm.

In Wuhan, Ye described her approach plainly, "I read what it tells me, but I still need a doctor to confirm."

AI may serve as a useful first step, but for most elderly users it does not carry the authority of a physician. It operates within a broader ecosystem in which human judgment still has the final word.

The rise of health AI is forcing a rethink of what "access" means. For decades, access to healthcare was measured in physical terms — how many hospitals, how many doctors, how far to the nearest clinic. Increasingly, it also has a digital dimension, that is, whether people can obtain, understand and act on health information.

For older populations, this opens real possibilities — medical knowledge delivered directly to the home, reducing the need for travel. But it also risks creating new kinds of exclusion, shutting out those who cannot navigate the technology.

The upshot is that the success of health AI may depend less on how smart it gets, and more on how accessible it is to use.

For seniors like Ye, she monitors her health more often now and seeks guidance earlier than she once did. "I used to wait and see," she said. "Now I check first."

At a systemic level, though, the transformation is still unfinished. AI can speed things up, widen the net and support better decisions. But it cannot resolve the inherent uncertainties of medicine, and it is in no position to shoulder complex clinical judgment.

The future of AI in elderly care may lie not in replacement but in coexistence — algorithms alongside physicians, digital tools alongside lived experience.

As China continues to age, that coexistence will likely become a defining feature of its healthcare landscape.

Medical progress presents opportunities, challenges

By **WEI WANGYU**

China's push to integrate artificial intelligence into its healthcare system has highlighted bottlenecks in its rollout, from elite urban hospitals to rural clinics.

The application of the technology in the medical field has so far proved uneven, with caution coming to the fore in its use.

"That has put imaging — radiology in particular — at the front of the line," said Wu You, an associate professor at the School of Healthcare Management at Tsinghua University. "In these specialties, AI systems help process the flood of CT and MRI scans, improving both speed and consistency."

Digital pathology and hospital quality management have followed. "Tools that review prescriptions, audit medical records, and flag irregularities in disease-specific protocols are increasingly part of the daily workflow at major hospitals," Wu said.

But these applications remain concentrated in large, well-resourced institutions — the kind of places that already have the infrastructure and expertise to absorb a new technology.

When AI moves closer to the patient, and especially to elderly patients, things get more complicated.

One underappreciated issue is the uneven capacity for working alongside machines. Research has shown that less experienced doctors sometimes lean too heavily on AI outputs, which can lead to more false positives or a kind of passive decision-making.

"How well they work depends heavily on who is using them. In primary care settings — often understaffed, undertrained, and far from the top-tier hospitals where these tools are first tested — that dependency can limit what AI actually delivers," Wu said.

A second challenge is the gap between lab conditions and the real world. Regulatory approval in China ensures that AI systems meet baseline standards under specific, controlled circumstances. But once a tool lands in a busy rural clinic or a community health center with aging equipment, outcomes can look quite different.

"How the system is integrated, how long it has been running, and how comfortable the staff is with it all shape performance in ways that no test environment can fully predict," said Mo Kai, a senior consultant at the Singapore-based regional association APACMed.

Some experts have begun arguing that governance needs to extend well beyond the moment of approval, into ongoing monitoring and adjustment.

Data governance adds yet another layer. Medical records are sensitive, and hospitals — understandably — are cautious about sharing them with outside technology companies. Encryption, data isolation and contractual safeguards help, but institutional trust builds slowly.

"For elderly care, all of these structural issues converge with a more basic question, that is 'can the people who need these tools most actually use them'," Mo said.

"Looking ahead, the next chapter of AI healthcare in China will probably be defined less by dramatic leaps in what models can do and more by the hard, unglamorous work of integration," he said.

"The important questions are: How do you fit AI into existing clinical routines? How do you make it work across a healthcare system that ranges from world-class urban hospitals to bare-bones village clinics? And how do you keep it accessible to people who did not grow up with smartphones?"

For a country where the population is aging at a pace that few systems have ever had to absorb, these are not abstract questions. The answers will shape not just the future of technology in medicine, but what it means to be cared for in old age.

CULTURE

Handmade stories from the highlands

Ancient Tibetan crafts reach Beijing, where visitors watch artisans work and learn about heritage through engaging experiences, **Yang Feiyue** reports.

A diverse array of artifacts, including *thangka* paintings, glazed porcelain panels and carved wooden blocks created by artisans from Rangtang county, Sichuan province, is on display at Beihai Park in Beijing. PHOTOS PROVIDED TO CHINA DAILY

The event at Beihai Park features (from top) a live demonstration of *thangka* painting, hands-on workshops and traditional Tibetan music and dance performances.

Inside Beihai Park in downtown Beijing, beneath the shade of ancient cypress trees, a horse appears frozen mid-stride, its muscles taut and mane lifted as if caught in the wind. But the image has been fixed in fire.

Painted in mineral pigments yet sealed in glaze, it belongs neither entirely to the world of *thangka* (Tibetan Buddhist painting or scroll) nor to traditional ceramics. Instead, it exists somewhere in between.

The piece is part of a newly unveiled series at the *Cultural Homeland — Blessed Land Rangtang* exhibition, which opened in late April at Chanfu Temple in the park.

Now in its third year, the event has become an annual meeting point between the remote Rangtang county in southwestern Sichuan province and one of Beijing's most historic imperial gardens.

This year's exhibition, which runs through May 25, adds a new dimension to that dialogue.

Among the most striking works on display are porcelain panels inspired by the epic of King Gesar — a centuries-old oral tradition often described as one of the world's longest epic narratives, recounting the heroic deeds of a legendary Tibetan ruler and his warriors.

The porcelain series depicts more than 30 generals in elaborate armor, each rendered with distinct expressions and movements. Created by *thangka* artists from Rangtang, who work in China's porcelain capital, Jingdezhen in Jiangxi province, the pieces are the result of years of experimentation.

Translating *thangka* imagery onto porcelain involves bridging two very different artistic systems, as traditional *thangka* painting is typically created on cloth using mineral pigments, while porcelain requires high-temperature firing, the exhibition organizers note.

Artists have to adapt Tibetan painting techniques to ceramic surfaces. The finished works retain the detailed linework and storytelling associated with *thangka* while taking on the glazed depth and luminosity of porcelain.

Crossing distances

The journey from Rangtang to Beijing is not an easy one. Located deep in the Aba Tibetan-Qiang autonomous prefecture, the county is more than 500 kilometers from the provincial capital, Chengdu, often requiring over 10 hours of travel by road.

Yet, that remoteness has also helped preserve Rangtang's remarkable concentration of intangible cultural heritage. The county is home to 143 registered heritage items and dozens of training workshops, where artisans spend years mastering crafts passed down through generations.

For three consecutive years, those traditions have traveled beyond the plateau. Artisans, performers and cultural practitioners have made their way to Beihai Park, turning what began as a one-time exhibition into a recurring cultural exchange.

Inside the temple halls, visitors move between rows of *thangka* paintings, glazed porcelain panels and carved wooden blocks, while conversations about the history and techniques behind the exhibits fill the space.

In one corner, artisans demonstrate how horse motifs are printed onto Tibetan paper using hand-carved plates. At another, visitors trace gold lines onto black ceramic pieces under the guidance of instructors. Nearby, shelves of crafts and food products, from hand-shaped pottery cups to woven textiles and highland snacks, invite visitors to browse, touch and purchase.

"There are exhibitions, but also experiences," says Ren Kai, deputy director of Beihai Park.

"Visitors can see, participate and even take something home."

This shift, he adds, reflects a broader change in how the exhibition is designed, moving away from passive viewing toward hands-on participation, where cultural objects become part of a lived experience rather than distant artifacts.

Cao Fei, who is in charge of the interactive programs, guides visitors to press their fingers carefully on a sheet of fibrous Tibetan paper at a long wooden table. Beside them, a local artist lifts a carved wooden block from a tray of ink, then steadies each visitor's hand as the paper meets the surface.

When the paper is peeled away, a vivid horse image emerges.

"It is a wind horse, a traditional motif symbolizing luck and the carrying of prayers," Cao says.

"This year we introduced more hands-on activities. We want people not only to see these traditions, but also to understand how they are made."

The paper itself carries a story. Made from the roots of the wolfsbane plant, it is produced through a labor-intensive process of lifting pulp from water by hand, sheet by sheet.

"It is highly durable and resistant to water, insects and decay, which is why it has long been used for printing important scriptures," she says.

Around the corner, another group gathers around a table of dark matte pottery. Visitors dip fine brushes into gold pigment and carefully trace characters across curved surfaces.

Cao sees the distance between the plateau and the capital dissolving through these interactions.

For Wang Zhen, general manager of the Beijing Tourism Group's subsidiary BTG Tourism Development, this shift reflects something larger than exhibition design.

"It's about helping people understand the deeper value of these crafts. They are not simply artifacts, but living art forms that still resonate in contemporary life," Wang says.

He sees the exhibition as part of a broader effort to transform cultural heritage into an emotional and intellectual journey shared by both creators and audiences.

> "When visitors understand the stories, techniques and meanings behind these artifacts, they stop seeing them as distant objects from another time and place and begin to see them as part of their own cultural fabric."
>
> **Wang Zhen,** general manager of BTG Tourism Development

"When visitors understand the stories, techniques and meanings behind these artifacts, they stop seeing them as distant objects from another time and place and begin to see them as part of their own cultural fabric," Wang says.

Over the past three years, BTG Tourism Development has worked with Rangtang to build a pathway linking exhibitions with tourism routes, study programs and product development.

The county's remoteness, once viewed as a disadvantage, has increasingly become part of its appeal, Wang says. Many visitors, he notes, are urban professionals seeking a slower, quieter experience.

"When they arrive, they don't feel the journey was long, and most believe it was worth it," he says.

Outside the exhibition halls, that value becomes tangible.

Growing interest

At a small stall, Badanlam arranges rows of handmade pottery while speaking with visitors who stop to test the texture and weight of her work.

"People have been showing strong interest in our handcrafted items," says the woman in her 20s.

Her coffee cups, adapted for modern use, are among the most popular items. Familiar in function, they still carry the marks of handwork, featuring slight ridges along the rim, faint thumb impressions in the clay, and small variations in thickness that reveal the rhythm of the potter's hands.

Last year, Badanlam stayed in Beijing for a week and sold hundreds of pieces. This year, she notices that the interest has continued.

But for her, the change runs deeper than sales. Growing up in Rangtang, her life was once defined by physical labor — long days spent digging for caterpillar fungus and medicinal herbs in the mountains. "Back then, we depended on labor," she says.

As a teenager, Badanlam joined a local training center and spent years learning language skills and traditional crafts. The process was slow, repetitive, and at times uncertain. Now, she makes pottery, creates traditional clay works, and explains their meanings to visitors at places she never imagined visiting. Her income has increased by about 30 to 40 percent.

"But more importantly, I can come here. I can travel. I can let people understand where we are from," she says.

Luo Xianquan, an official of Rangtang, notes that the county has been selected as one of the first national pilot counties for cultural industries empowering rural vitalization. With 46 intangible cultural heritage training workshops, the county has helped over 3,000 local farmers and herders find employment close to home, increasing annual incomes by an average of 4,000 yuan ($588) per person.

Young Tibetan women like Badanlam reflect "how 'fingertip skills' are being turned into real economic returns across Rangtang", Luo points out.

Around Badanlam, visitors continue to browse. Some leave carrying small objects ranging from a printed sheet to a lamp and a cup still bearing the imprint of a hand.

Modest as they are, they carry with them a journey that begins in the highlands, passes through fire, paper and clay, and settles quietly into everyday life.

"I'm happy that I can let people understand where we are from this way," she says.

LIFE

Left: Children explore the recently opened Qianhai Nature Center in Shenzhen, Guangdong province. **Middle:** A visitor interacts with a local musical instrument at the Taklimakan center. **Right:** Visitors take photos of the front of the Qianhai center. **Bottom:** The desert center has recently risen from the earth against the blue sky, its color indistinguishable from the dunes around it, next to a layered red frame, which is the signature of the Chinese National Geography magazine.

Treasures that make the Taklimakan tick

The Chinese National Geography magazine's new nature center allows visitors to learn about and connect with the country's largest desert, **Yang Feiyue** reports.

East of Alar in the Xinjiang Uygur autonomous region, across the Tarim River, the city's green landscape gives way to an expanse of ocher. This is the northern edge of China's largest desert, the Taklimakan, one of the thresholds where ancient Silk Road travelers once stepped into the sea of sand.

Here, a new building has recently risen from the earth, its color indistinguishable from the dunes around it. Next to the building is a layered red frame, the signature of the Chinese National Geography magazine, standing against an expanse of ocher sand and brilliant blue sky — this is the Taklimakan Nature Center.

"Nature centers are small-to-medium integrated experience spaces, mostly under 1,000 square meters, that use scientific and artistic means to offer a deep, systematic interpretation of nature," says Guo Yingqian, general manager of the Chinese National Geography Camp.

Three narrative threads — The Realm of Life, The Way of Survival, The Path of Ecology — unfold across the exhibition space, offering a systematic decoding of what makes the Taklimakan tick.

Approaching it, a nine-layer topographical model meticulously carved from contour data brings the region's scale into focus. The snow-capped Tomur Peak, the highest point of the Tianshan Mountains, rises to 7,443 meters, while the desert floor lies at an elevation of just over 1,000 meters. A glowing globe reveals that even from space, this sandy expanse is unmistakable.

Surrounding mountains trap moisture, leaving the desert with an average annual rainfall of just 26 millimeters. At the center, visitors can turn the device and watch sand swirl, creating their own miniature dust storm. Additionally, a massive interactive thermometer lets visitors feel the region's wild swing between scorching days and freezing nights.

But one of the most astonishing revelations is when a mirror installation shows visitors a staggering amount of meltwater from surrounding peaks seeping underground, accumulating over eons into a subterranean sea beneath the sand.

Other artfully reproduced images include snow-brushed dunes and the ancient cities of Loulan and Niya buried beneath the sand.

Three narrative threads — The Realm of Life, The Way of Survival, The Path of Ecology — unfold across the exhibition space, offering a systematic decoding of what makes the Taklimakan tick. PHOTOS PROVIDED TO CHINA DAILY

"The Realm of Life chapter opens with the Extreme Realm exhibits, reshaping people's perception of the desert," Guo explains.

It then moves into the Desert Creatures section, which systematically presents the survival strategies of dozens of endemic animals and plants that have evolved to survive drought and high temperatures.

Among them, the wild camel takes center stage. Visitors can stand beside a life-size model to touch its head and hip, then push a button to hear the sound of a *satar*, a Uygur bow-stringed instrument.

"The idea is to make learning tactile and memorable," she says.

Visitors learn that wild and domestic camels diverged 800,000 years ago. Fewer than 1,000 wild camels remain today, making them rarer than giant pandas.

Many have found it fascinating that these wild camels' oval red blood cells keep flowing even in extreme dehydration, and their specialized coats deflect the desert's searing heat, Guo says.

Nearby, a massive dune-shaped installation teems with hand-drawn, meticulously detailed life.

Tarim hares and foxes use oversized ears to radiate heat. Desert beetles have fused wing covers that function like personal "air conditioners", capturing exhaled moisture. Long-eared jerboas are the desert's "jumping stars", while great gerbils, or "desert rats", build sprawling underground cities with distinct quarters for sleeping and storage.

"We've added interactive elements throughout," Guo notes, adding that 30 scientific models are on display.

The nature center's staff expect visitors to find the most delightful surprise in the Shifting Dunes section, where six classic dune types, ranging from crescent and linear to parabolic, transverse and dome, have been reimagined as sculptural "little cakes" displayed in jewel cases.

The nature center also weaves in human stories in a colorful reconstructed Oasis Dwellers area that re-creates domestic life along the desert's edge.

Patterns of almonds, pomegranates and grapevines bloom on fabric stamped by traditional wooden molds. Local distinctive Atlas silk shimmers, while four traditional housing models, such as the wind-resistant *Ayiwan* (a square, protruding-top structure), depict daily life.

Recordings of the Muqam suite fill the air, featuring eight instruments. An interactive backdrop invites visitors to "join" the ensemble, reaching through cutouts to strum a *dutar*, a two-stringed lute that is characterized by its long neck and pear-shaped body, alongside illustrated musicians.

The Way of Survival chapter then turns to the wisdom of coexistence between people and the desert.

"The 'Alar Miracle' section shows how the local residents created agricultural miracles on the Gobi Desert, ingeniously using saline-alkali water to cultivate 'inland seafood'," Guo says.

Seventy years ago, though this area was barren, locals managed to grow cotton and farm blue crabs and prawns to ship across China.

"The people here didn't just endure. They created beauty, music and poetry," she notes.

The final section, Desert Arteries, celebrates the roads and railways that now traverse the sands. It exposes visitors to the challenges in building those engineering marvels on shifting dunes and defending against relentless erosion.

The exhibition's showstopper is the Green Belt display, one of humanity's longest-running desert-containment projects. Over 46 years, multiple generations have built a 3,046-kilometer-long green belt around the Taklimakan. Satellite imagery shows the once-barren land now encircled by green.

Visitors can literally touch the belt. A strip of Xinjiang long-staple cotton invites handling, and they can stamp a card with images of the plants that made it possible — poplar, saxaul, tamarisk, and calligonum.

"Put on the green scarf, and feel the desert's embrace," the display says.

The Taklimakan Nature Center is part of a broader vision that extends far beyond Xinjiang.

On the opposite edge of the country, another Chinese National Geography project has taken shape — the Qianhai Nature Center in Shenzhen, Guangdong province.

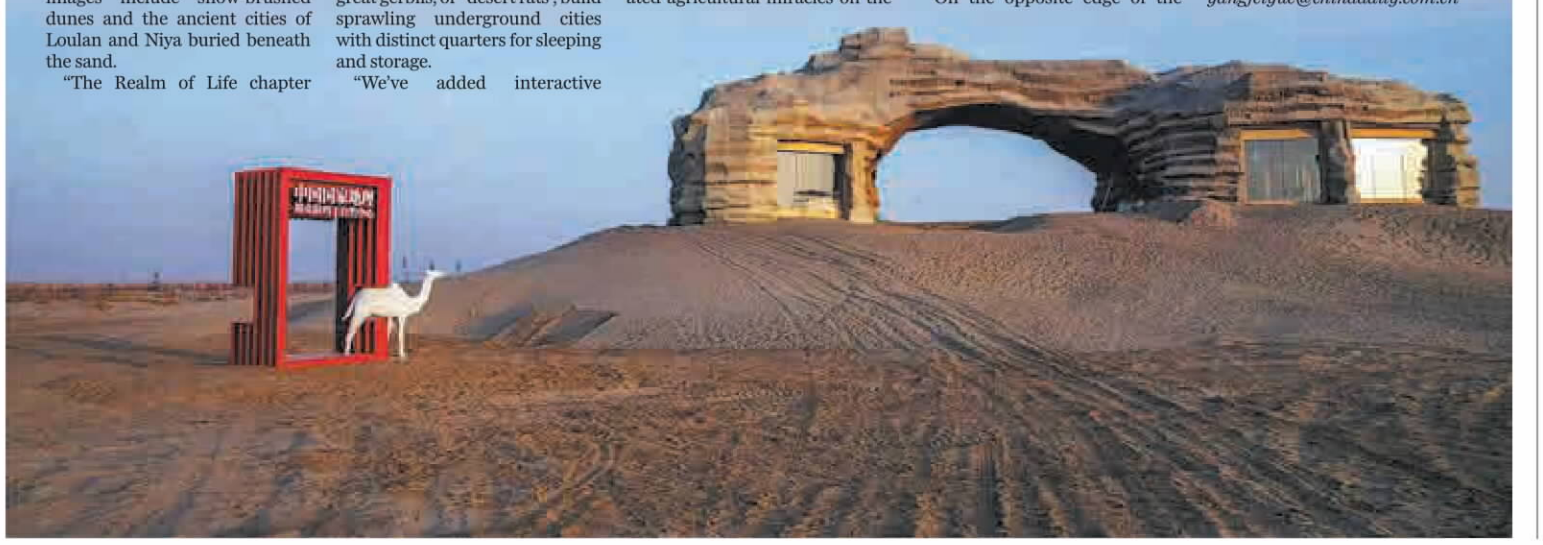
Sitting along the shores of Lingdingyang Bay, the center transforms the daily drama of dusk into a hands-on science experience. Visitors can use dark filters to safely watch the sun sink into the sea, flatten the solar disc with a curved prism that mimics Earth's atmosphere, and learn about the elusive "green flash" that sometimes crowns the vanishing sun.

A large interactive screen offers real-time sunset forecasts and simulations that show the timing and position of the sunset's shift throughout the year along the bay's 68-km coastline.

The two centers represent a growing network of the Chinese National Geography Camp's aim to transform how people experience the natural world, according to Guo.

The Xinjiang center is already resonating with local officials.

Dan Hong, director of the local culture, sports, radio, television, and tourism center, notes that the nature center allows visitors to experience both the unique natural beauty of the Taklimakan Desert and the vibrant cultural atmosphere of the oasis.



It offers a relaxing, enjoyable, and educational experience, and visitors can gather more information here before heading out to other local attractions, Dan says.

At the same time, visitors can learn about how the Xinjiang Production and Construction Corps is developing the frontier region in Alar and gain a new understanding of this young city, Dan adds.

The center will connect with the nature imaging center in Kashgar and other nature centers in Aksu, as well as in Makit county, all of which contribute to a growing network of southern Xinjiang's scattered landscapes and deep heritage.

The ultimate goal is to enable visitors to systematically understand and experience how mountains shape the desert, how oases nurture civilization, and how humans wisely coexist with extreme environments, Guo says.

Watsons pop-up indicates island upgrade

GUANGZHOU — What if you could step into a 19th-century pharmacy and find today's most popular skincare and sparkling water on the shelf? That is an experience Watsons is re-creating at its new pop-up store on Shamian Island in Guangzhou, Guangdong province, near one of its earliest locations from about two centuries ago.

The store, spanning over 100 square meters, is designed to evoke the atmosphere of a century-old pharmacy. The initiative coincides with the AS Watson Group's 185th anniversary. The company traces its origins to the Hong Kong Dispensary, founded in 1841, with Alexander Skirving Watson, a British pharmacist, serving as one of its first managers.

The pop-up showcases a wide range of health, body care and beauty products. Items on display include everything from early-era Vaseline to modern skincare lines, as well as a retro version of Watsons soda water for visitors to sample. The brand's iconic bottled water has evolved into a Chinese lifestyle symbol that reflects changing consumer habits.

> "Encouraging century-old enterprises to return to Shamian is part of this plan."
>
> **Li Chen,** project operator

According to the company, the pop-up is not only a tribute to its history but also a response to China's consumption upgrade, aiming to offer more tailored and diversified services in the health and beauty sector. Since re-entering the Chinese mainland market following the reform and opening up in 1978, Watsons has expanded to nearly 3,500 stores.

The move demonstrates foreign investors' confidence in China's development. From 2021 to 2025, the province saw the establishment of 113,800 new foreign-funded enterprises, a 31.3 percent increase from the previous five years. In 2025, Guangzhou, the provincial capital, recorded 11,000 newly established foreign-invested enterprises, with paid-in foreign capital growing by 9.1 percent year-on-year. As China pursues high-quality economic development, the appeal of its vast market continues to strengthen.

The pop-up store's return to Shamian Island was made possible by the area's recent revitalization. Once a French and British concession, the island is home to 49 historical buildings, including the original site of Watsons. Efforts have been made to restore and upgrade the area, aiming to turn it into an international hub for consumption and cultural exchange.

"Encouraging century-old enterprises to return to Shamian is part of this plan. Apart from Watsons, we hope to see dozens of other companies that once operated here, such as HSBC and Standard Chartered, return," says Li Chen, the project operator of Guangzhou New Shameen Industrial Development Co.

Guangzhou has long served as a gateway for Sino-foreign exchanges. As early as the Tang Dynasty (618-907), the city established the *fanfang*, a government-designated residential unit for foreigners.

"This project will showcase a more open, inclusive and modern Guangzhou, while offering people new possibilities for a better quality of life," says Yi Zhaozhao, a researcher with the Guangzhou Urban Planning and Design Survey Research Institute.

CULTURE

Quiet drama finds powerful audience

A film in the Chaoshan dialect about *qiaopi* letters has become the surprise hit of the May Day holiday season, **Zheng Caixiong** reports in Guangzhou.

A low-budget Shenzhen-produced movie centered on *qiaopi* (overseas Chinese remittance letters) has earned widespread acclaim and emerged as one of the biggest surprise hits of the May Day holiday box-office season.

Dear You follows a series of letters tied to Ye Shurou, a grandmother who spent decades waiting for her husband, Zheng Musheng, while her grandson searches for the truth behind their family's past.

The journey gradually uncovers the hidden story of Xie Nanzhi, a Thai woman of Chaoshan, or Teochew, descent who was Zheng's sworn sister and trusted confidante.

After Zheng's death, Xie quietly cared for Ye Shurou from afar, secretly writing letters and sending money in his name for 18 years. Years later, Xie's adopted son, Xie Zehua, reads those letters aloud to Grandma Ye, revealing a long-buried story.

The film received a rating of 9.0 out of 10 on Douban, a major review platform — the highest among all new releases during the holiday — underscoring its broad audience appeal.

By Thursday, the movie had grossed about 227 million yuan ($33.5 million), with ticketing platforms Maoyan and Beacon projecting its final box office revenue could reach 725 million yuan.

Written and directed by Lan Hongchun, a native of eastern Guangdong's Chaoshan region, *Dear You* is deeply rooted in local culture and *qiaopi* history.

The story revolves around a Chaoshan grandmother who spends half a century waiting for letters. Through old correspondence, the younger generation retraces family memories and gradually uncovers the intertwined lives of two women shaped by endurance, sacrifice and longing.

Featuring authentic Chaoshan dialect throughout, the film weaves together local customs, family bonds and the historical experience of overseas Chinese communities.

Without relying on sensational plot twists or formulaic storytelling, *Dear You* adopts a restrained, lifelike narrative style, portraying the emotional weight carried by ordinary people during waves of migration of Cantonese people to Southeast Asia.

Above: (From left) Xie Nanzhi's son, Xie Zehua, reads aloud the letters she once wrote to grandma Ye Shurou. After years of misunderstandings melted away, grandma Ye Shurou gazes at the kapok flowers sent along with her husband Zheng Musheng and Xie Nanzhi's handwritten note, quietly savoring the feeling of being deeply loved. An elderly Xie Nanzhi spends the quietest moment of her day reading the letters. **Left:** The film's protagonist, Ye Shurou, gets a new bicycle and happily learns to ride it with her daughter beneath the sprawling banyan tree.
PHOTOS PROVIDED TO CHINA DAILY

> "The emotional power and dramatic tension in those real stories made me feel that these experiences had to be brought to the screen."
>
> **Lan Hongchun,** director

Released during the fiercely competitive May Day holiday season, the Chaoshan-dialect *Dear You* achieved an impressive breakthrough, despite lacking major stars.

Driven by its solid artistic quality, audience word-of-mouth, and a carefully planned distribution strategy expanding from Guangdong to the entire country, the movie defied market headwinds and stood out.

The film held advance screenings in selected cities ahead of the May Day holiday. Officially released on April 30, it gradually expanded its run from a full release across Guangdong province to nationwide screenings.

As audience praise continued to grow, cinemas increased the number of screenings. By Thursday, cumulative admissions had reached 5.98 million.

Facing competition from big-budget action, comedy and suspense films, *Dear You* maintained steady box-office growth and became the season's standout emotional dark horse.

Industry observers believe the film could continue performing strongly long after the May Day holiday period ends.

Compared with more commercially driven genre films released during the same period, including suspense, action and comedy productions, *Dear You* takes a realistic and heartfelt approach. Through themes of hometown nostalgia, family ties and the lives of overseas Chinese, it resonates with audiences through simple and grounded storytelling, observers say.

A viewer surnamed Chen in Shantou says the film reminded her of her grandmother.

"The movie portrays the authentic daily lives of Chaoshan people in those years," she says, adding that she has seen the movie twice.

Director Lan says the story of *Dear You* is 90 percent authentic, and 100 percent sincere.

"In the childhood memories of the Chaoshan people, Grandma is always the warmest and most comforting presence," he says.

"The original idea was simple — I just wanted to tell audiences a pure story about grandpas and grandmas," says Lan.

Lan, a Chaoshan native, has long been deeply passionate about depicting rural stories from his hometown.

The generation portrayed in the film lived through major historical periods, including the Chinese People's War of Resistance Against Japanese Aggression (1931-45), the founding of the People's Republic of China in 1949, and the country's reform and opening-up beginning in the late 1970s.

Lan says the Chaoshan people endured hardship for generations as they left home and crossed the seas to make a living, while many overseas Chinese later returned to support their hometowns after the reform and opening-up.

He says that over 90 percent of the plot in the film is based on real events.

"For various reasons, many people could not return home decades ago. Their families and friends would hide the news of their passing, keep sending remittances, and write letters as if they were still alive," he says.

"The emotional power and dramatic tension in those real stories made me feel that these experiences had to be brought to the screen," he adds.

Zheng Runqi, who plays the grandson, says he hopes more filmmakers will create movies in the Chaoshan dialect because the region contains countless stories worth telling.

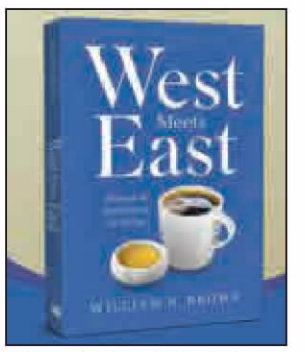
The human bridges and personal histories of China-US relations

By JOSEPH TSE-HEI LEE
for China Daily

People with extraordinary experiences tell the most compelling stories. This is evident in Xiamen University professor of management William N. Brown's collection of narratives about Americans who lived and worked in China and developed deep affective ties with the people they encountered.

Against a scholarly literature that has long prioritized states, institutions and policy outcomes — whether in studies of educational networks, or Cold War diplomacy — Brown recenters individuals as moral actors who navigated uncertainty, risk and political transformation in pursuit of meaningful human connection. What is often missing from both academic and policy-oriented analyses is closer attention to the voices of individuals — state and non-state actors alike — who adapted to shifting circumstances and advanced cross-cultural exchange as a lived humanistic practice.

Brown's book, *West Meets East: Stories of Americans in China*, addresses this gap by foregrounding the moral dimensions of everyday encounters: trust amid distrust, respect and responsibility toward others, and the willingness to act selflessly under difficult conditions. These qualities have quietly but persistently sustained Sino-American relations in moments when formal diplomacy faltered.



Brown begins with early 20th-century American missionary educators and their families in Kuliang, Fujian province, including figures such as Donald MacInnis and his descendants, as well as Joseph Stilwell, who contributed to China's war efforts against Japan despite tensions with Chiang Kai-shek over military strategy, and John Service, the China-born son of missionaries who later served in the US Foreign Service and fell victim to McCarthy-era persecution. These stories illuminate how educational and diplomatic infrastructures functioned not only as channels for cultural transmission but also as ethical communities grounded in humility and relational responsibility. Brown is attentive to the moral complexity of these encounters, in which power relations often coexisted with genuine efforts at partnership and care.

One of the most moving episodes in the book illustrates this intimacy at its most elemental. During severe flooding in the Minjiang River region, a Chinese boatman chose — at considerable risk — to ferry Methodist missionary educator Harry Russell Caldwell so that he could visit his wife in a Fuzhou hospital. This generous act was rooted in trust and shared humanity during wartime. Such moments, often absent from grand historical narratives, suggest that cross-cultural engagements involved ordinary individuals making extraordinary choices in moments of need.

William N. Brown, Xiamen University professor of management.
PHOTOS PROVIDED TO CHINA DAILY

The narrative does not end with the political transition in 1949. Brown extends his accounts into the Reform era and beyond, tracing the experiences of Americans who arrived in China in the 1980s and 1990s. Some experimented with creative pedagogies — using songs and visual aids — to make learning Chinese more accessible, while others organized badminton camps, established international schools, or embedded themselves in local communities through teaching and mentorship. He further brings the story into the present, including millennial and post-COVID travelers who came to China to study, teach, produce online content, build careers as songwriters and influencers, and, in some cases, establish families.

William N. Brown's book, *West Meets East: Stories of Americans in China.*

This multigenerational arc is revealing. Across distinct historical moments — missionary China, wartime assistance, socialist transformation, reform and opening-up, and post-COVID rebuilding — Americans have continued to be drawn to China's history and culture. Page after page, Brown highlights faithful friendships forged through war and peace, ideology and disillusionment. While not immune to political rupture, these relationships were grounded in ethical commitments that transcended short-term calculations. One enduring lesson of these stories is that genuine friendships can embody a cross-cultural version of internationalism that emphasizes mutual

Joseph Tse-hei Lee, professor of history, Pace University, New York, United States.

flourishing rather than instrumental gain. The individuals in Brown's book — missionaries, teachers, doctors, students, families — thus leave behind a legacy of selfless service and moral imagination that continues to resonate with humanistic values of cross-cultural engagement.

The book also reflects on the changing directionality of humanistic ties. In the early 20th century, it was largely unidirectional, shaped by American missionary educators, diplomats and military advisers engaged in China's modernization and wartime resistance, particularly during World War II. By the late 20th and early 21st centuries, exchange became more reciprocal, as increasing numbers of Americans traveled to China to study, work, and live, even as Chinese migration to the United States remained far more extensive. This shift points to a more complex and layered landscape of transpacific exchange.

Although Brown's book is not a conventional monograph, its narrative form makes a valuable contribution by restoring the personal dimension to the discussion. By focusing on lived experience, it challenges dominant media narratives that reduce the bilateral relationship to economic competition or geopolitical contest. Instead, it reveals the importance of non-state actors whose moral and cultural commitments often buffered the transnational ties from collapsing entirely into confrontation. Importantly, the book does not romanticize this history. It acknowledges the fragility of these cross-cultural ties. Across the decades, friendships have been disrupted, educators expelled, institutions closed, and channels of dialogue severed. Yet these humanistic ties, once formed, often leave enduring memories.

At a moment of renewed geopolitical uncertainty, *West Meets East* reframes the development of Sino-American relations as a moral history — one empowered by people who repeatedly chose compassion, dialogue and partnership in uncertain times. Their cumulative acts of dedication have long tempered the harsher edges of global politics.

The author is a professor of history at Pace University in New York, United States.

Journey through the west

More than a thousand participants from nearly 40 leading global business schools embark on an epic trek through the Gobi desert

On May 4, the 2026 business school Gobi friendship race, also known as "Gobi to West 2026", concluded after four days and three nights across 121 kilometers of desert terrain. More than 1,100 participants from nearly 40 leading business schools worldwide took part, following a route once traveled by Tang Dynasty (618-907) Buddhist monk Xuanzang more than 1,300 years ago. PICTURES PROVIDED TO CHINA DAILY

Thinking of doing it yourself?

Transportation: Take a high-speed train from hubs like Lanzhou or Xi'an to Guazhou Railway Station (or the nearby Liuyuan South High-Speed Station). Alternatively, fly to Dunhuang Mogao International Airport, followed by a 1.5- to 2-hour taxi or bus ride to Guazhou.

Best time to visit: May to October offers the most comfortable weather for outdoor activities and desert sightseeing. Spring and early autumn are particularly suitable for hiking and Gobi-crossing experiences.

What to see: Key cultural sites within Guazhou include the stunning Yulin Caves (the "sister caves" to Mogao) and the Suoyang City ruins, a UNESCO World Heritage site along the Silk Road featuring the adjacent Ayuwang (Ashoka) Temple. You will also see ancient beacon towers scattered across the Gobi. Most visitors combine this trip with a visit to nearby Dunhuang to see the Mogao Caves and Crescent Spring.

Local specialties: Guazhou literally translates to "Melon City", so do not miss its famously sweet honeydew melons. The region is also known for Provence tomatoes and locally raised lamb.

Tips: Desert temperatures can vary sharply between day and night, so layered clothing, sun protection and sturdy hiking shoes are highly recommended. Strong winds and dry conditions make sunscreen, sunglasses and constant hydration essential for outdoor activities.

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

As dusk settles over the black Gobi Desert in Guazhou county, Gansu province, rows of towering wind turbines stretch across the horizon.

Nearby, ancient beacon towers stand silently against the evening sky — relics of the Silk Road once traveled by Tang Dynasty (618-907) Buddhist monk Xuanzang on his westward pilgrimage more than 1,300 years ago.

This spring, that ancient route became the setting for a very different kind of pilgrimage.

On May 4, the 2026 business school Gobi friendship race, also known as "Gobi to West 2026", concluded after four days and three nights across 121 kilometers of desert terrain. More than 1,100 participants from nearly 40 leading business schools worldwide — including China's Tsinghua University, Shanghai Jiao Tong University and China Europe International Business School (CEIBS), Britain's University of Cambridge and Harvard University in the United States — crossed the finish line at the No 1 beacon tower ruins in Baidunzi.

Yet the event was about far more than endurance.

As business executives, entrepreneurs and MBA students gathered in this remote county in northwestern China, the race became an immersive experiment in sportsmanship, cultural exchange, ESG (Environmental, Social and Governance) practices and rural revitalization.

"Before leaving Xi'an, many team members still understood the Silk Road only through textbooks," said Xie Xiaoyan, executive team leader of Xi'an Jiaotong University's delegation and chairwoman of the university's international outdoor club.

"They imagined the Gobi as endless emptiness."

That perception quickly changed.

As participants crossed the black desert near Ayuwang (Ashoka) Temple, and passed by historical sites such as the Suoyang City ruins and the Yuan Dynasty (1271-1368) Shuangdunzi remains, history became tangible.

For many participants, accustomed to office towers and boardrooms, the journey became deeply introspective.

"When you are surrounded by endless wilderness and feel there is no end in sight, you can only calm yourself and keep moving forward," Xie said. "You begin to have a dialogue with yourself."

The race route intentionally overlapped with Xuanzang's westward journey.

For many participants navigating uncertainty in business, Xuanzang's perseverance carried modern relevance.

"His belief — 'I would rather die heading west than return east alive' — is very inspiring for modern entrepreneurs," Xie said.

She compared the desert crossing to leading a company through uncertainty.

Under exhaustion and extreme weather conditions, people are easily shaken by external pressure. The Gobi, she said, strips away professional identities and forces participants to rediscover inner resilience.

That sense of transformation was also felt by the trek's international participants.

Twenty-three-year-old Ukrainian MBA student Dima Vasylenko from the CEIBS arrived with limited expectations or preconceptions about western China.

"Do you know tea was exported in two ways? One by boat and one by the Silk Road," Vasylenko said.

"The tea exported by boat from Hong Kong or Guangzhou ports is called 'te', but in all the countries where it was exported via the Silk Road, the name is 'cha'.

"In our country, it is 'chai', which is very similar to 'cha.'"

Following Xuanzang's route made the continuity of civilizations feel tangible to him, but Guazhou's modernity surprised him just as much as its history.

On the third day of the race, participants encountered vast fields of wind turbines stretching across the desert.

"Here in China, there are a lot of wind turbines working very well. Even in not so internationally well-known places, it's already very developed. It's the same as Shanghai. The roads and infrastructure are good."

For organizers, showcasing both "historical China" and "modern China" was central to the event's vision.

Zhou Haibin, preparatory chairman of the event's sports committee, said the race attracted overseas alumni and scholars from Cambridge and Harvard.

After the race, Cambridge professor Simon Taylor delivered a "Gobi lecture" beneath the stars, where participants from different countries exchanged ideas on business and life.

"It became more than a race," Zhou said. "It became a cultural gathering."

But bringing more than 1,500 people, including support staff, into the heart of the fragile Gobi also raised questions about how to balance human activity with environmental protection.

Organizers responded with low-carbon operations, zero-waste practices and biodegradable materials at campsites and supply stations, while also supporting local ecological restoration projects.

"Guazhou receives little more than 100 millimeters of annual rainfall, while evaporation exceeds 2,000 millimeters," Zhou said.

"The native vegetation here is extremely fragile."

He said the event aimed not only to minimize ecological impact, but also to raise broader awareness of environmental protection in western China.

Vasylenko was struck by the long-term vision reflected in the desert's development.

"They are not just taking care of the next 100 years, but thinking about 1,000 years into the future," he said.

Beyond its cultural and environmental significance, the race also brought tangible economic benefits. Guazhou's relatively small county seat saw a sharp increase in demand for hotels, restaurants and transportation services during the event.

"After such intense physical exhaustion, many participants were deeply impressed by the local food," Zhou recalled.

"The lamb, melons and Provence tomatoes — made especially sweet by the dramatic temperature differences between day and night — became unforgettable memories."

Many participants chose to extend their stay after the race, traveling onward to nearby landmarks such as the Mogao Caves and Crescent Spring in Dunhuang.

The event also boosted local employment through logistics, campsite construction and rescue support services.

At the opening ceremony, organizers donated computers and multimedia equipment to local schools and launched an education assistance fund.

As exhausted runners crossed the finish line at Baidunzi — covered in dust but still determined — many left with more than medals.

They carried away a renewed understanding of endurance, history and connection.

In Guazhou, along a Silk Road once defined by caravans and pilgrimage, the race is creating a new form of exchange — connecting sports, culture, sustainability and the future of China's western regions.

XI'S VISION | A SHARED FUTURE

Ties bolstered by high-level meets

Frequent head-of-state diplomacy by Xi, Putin shapes momentum of key bilateral relationship

By **MO JINGXI**
mojingxi@chinadaily.com.cn

"Is it not a joy to have friends come from afar?" Confucius once said.

The ancient Chinese saying offers a fitting note as China welcomes Russian President Vladimir Putin on Tuesday for his 14th visit to the country since 2013.

Putin used the same phrase when recalling his first meeting with Xi Jinping, then Chinese vice-president, in Moscow in March 2010. The meeting, he wrote in a signed article published in People's Daily in 2023, was held in a "business-like and at the same time sincere and friendly" atmosphere — a style of communication that he said he personally liked.

Three years following the early encounter, Xi chose Russia as the destination of his first overseas trip after taking office as Chinese president in 2013, underscoring the special weight of China-Russia relations in China's foreign policy.

During that visit, President Xi said that a high-level and strong China-Russia relationship serves not only the interests of both countries, but also the international strategic balance as well as world peace and stability.

More than a decade later, the two leaders are meeting again at another important moment.

Putin's two-day state visit, at the invitation of Xi, comes in a landmark year marking the 30th anniversary of the China-Russia strategic partnership of coordination and the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

Inside
Views, page 7

"China-Russia relations are standing at a new historical starting point. The two sides are entering a golden period of opportunity marked by stronger political trust, deeper economic integration, closer people-to-people ties and greater global influence," said Li Yonghui, a research fellow of Russian studies at the Chinese Academy of Social Sciences.

She said that Putin's visit is not only a review of decades of neighborly friendship and strategic coordination, but also an opportunity for the two sides to plan the next stage of cooperation under the guidance of the two heads of state.

Andrey Denisov, first deputy chair of the Russian Federation Council Committee on Foreign Affairs and former Russian ambassador to China, said that Putin's upcoming visit will once again demonstrate the high level and stability of Russia-China relations.

He said Russia-China relations are not an alliance in the traditional sense, but the two sides maintain a high degree of mutual trust and close coordination on major international issues, which he described as the essence of the relationship.

The momentum of China-Russia ties has been shaped by more than a decade of frequent head-of-state diplomacy. Since 2013, Xi has visited Russia 11 times, while Putin has traveled to China 13 times for state visits or major events. Last year, the two leaders paid state visits to each other's countries, underscoring the intensity and continuity of top-level exchanges.

In a signed article published in Russian media in 2023, Xi said that high-level interactions have played an important strategic guiding role in China-Russia relations.

The winning team

French rider Valentin Debise (center) of Chinese motorcycle manufacturer ZXMOTO celebrates with his team after winning Race 2 of the World Supersport category at the Czech Round of the 2026 FIM Superbike World Championship on Sunday. With his fifth win of the season, Debise moved up to second place in the riders' standings with 147 points. ZXMOTO remained third in the manufacturers' standings with 149 points, underscoring the growing impact of the Chinese bike maker in the championship. XINHUA

Foundational paradigm to guide Sino-US relations

WORLD WATCH
By Ong Tee Keat

The state visit by the President of the United States to China was widely seen as an urgently needed stabilizer in Sino-US ties that was facing unpredictability.

This diplomatic confidence was bolstered by President Xi Jinping's declaration that he and US President Donald Trump had reached a consensus to construct a relationship of "constructive strategic stability" between China and the US.

This formulation is intended to serve as a new foundational paradigm for bilateral ties in a rapidly shifting global order.

From the Chinese perspective, it is hoped the year 2026 is elevated to a historic, landmark year fundamentally redefining the trajectory of Sino-US engagement.

While the Chinese host made clear an unwavering commitment to nurturing stable, healthy and sustainable relations with the US, he explicitly sought to avoid the perilous "Thucydides Trap" that historically plagued rising and established powers.

This newly articulated paradigm marks a vital cornerstone, which is strategically designed to provide robust guidance for relations between the two major global powers over the next three years and beyond, provided the relationship stays undistracted by peripheral geopolitical shocks.

However, despite this grand vision, the Sino-US summit is still being watched carefully by the international community. Both China and the US possess diverging priorities, and their bilateral dynamic is shaped by a mixture of strategic rivalry and deep, structural economic interdependence.

President Xi commenced the summit by striking a high and unambiguous note regarding Chinese preparedness to instill a positive, enduring stability into the ties.

He emphasized that cooperation must remain the absolute mainstay of Sino-US engagement, working alongside the careful management of inevitable competition and ideological differences in the pursuit of sustainable global peace.

Furthermore, Xi astutely framed his aspirations for the collaboration of these two great powers through a broader global perspective, emphasizing their shared responsibility in addressing overarching transnational challenges.

In stark contrast to Beijing's focus on long-term strategic frameworks, Trump approached the summit driven by acute domestic political imperatives.

The US president was visibly preoccupied with the pressing urgency to score immediate, tangible economic victories.

His focus was on ensuring Chinese commitments to purchase American goods, specifically targeting agricultural produce and Boeing aircraft.

Agricultural exports have a direct, disproportionate bearing on his core vote bank sprawling across the agro-based states of the American Midwest.

Plainly put, the driving force behind the US administration's negotiating posture was the severe risk of losing Republican control in both the Senate and the House of Representatives; securing the legislature is the metric that matters most to Trump.

Simultaneously, fierce technological rivalry remains a paramount sticking point.

Economy stays resilient as industrial output expands

By **ZHANG CHENXU** and **WANG KEJU**

China's economy displayed continuing resilience in the first four months of the year, though some indicators pointed to the need for more targeted policy support to boost domestic demand and put growth on a firmer footing, officials and analysts said.

While higher energy costs stemming from geopolitical tensions weighed on economic activity in April, robust expansion in high-end manufacturing and resilient exports pointed to a steady outlook for China, they added.

Figures released on Monday by the National Bureau of Statistics showed that the country's industrial output expanded 5.6 percent year-on-year in the first four months.

Retail sales increased 1.9 percent year-on-year. In April, retail sales rose 0.2 percent year-on-year, slowing from 1.7 percent in March, the figures showed.

Wen Bin, chief economist at China Minsheng Bank, said the moderation in retail sales was partly due to slightly smaller subsidies being offered under this year's consumer goods trade-in program and a relatively high base for comparison from the same period last year.

While consumption of goods softened, service consumption remained resilient. Retail sales of services rose 5.6 percent year-on-year in the first four months, 0.1 percentage point faster than in the first quarter, the NBS said.

Fu Linghui, spokesman and chief economist of the NBS, said that strong demand for cultural tourism and sports events had emerged as a new growth driver in the sector.

Fixed-asset investment fell 1.6 percent year-on-year in the first four months, reversing the 1.7 percent growth recorded in the first quarter, according to the NBS.

"The moderation in some April indicators reflects normal month-to-month fluctuations," Wang Guanhua, a spokeswoman for the bureau, said on Monday.

Despite headwinds, Wang said that China's underlying economic stability remains intact, as innovation-driven growth drivers and resilient exports are expected to sustain amid favorable conditions.

The data showed that equipment manufacturing and high-tech manufacturing expanded at robust rates of 8.7 percent and 12.6 percent year-on-year, respectively, in the January-April period.

China's exports of goods, meanwhile, rose 11.3 percent year-on-year in renminbi terms, with April exports up 9.8 percent from a year earlier, the bureau said.

Robin Xing, chief China economist at Morgan Stanley, said that China's export strength is expected to persist, with the sector's resilience likely to create positive spillovers for industrial upgrading.

On the back of robust exports as well as strong capital expenditure related to artificial intelligence and green sectors, Morgan Stanley recently raised its full-year growth forecast for China to 4.8 percent.

However, Xing cautioned that recovery remains uneven, with domestic demand continuing to lag, as factors such as the ongoing adjustment in the real estate sector still weigh on consumption.

Zhang Bin, deputy director at the Chinese Academy of Social Sciences' Institute of World Economics and Politics, said that China's economy is on an upward recovery trajectory, but the limited strength of its self-sustaining recovery underscores the need for stronger countercyclical policy support.

DALIAN REELS IN THE BENEFITS AS BIG-GAME FISHING THRIVES

For visitors angling for a thrilling ocean experience, Zhangzi Island is a place to catch

By **ZHANG XIAOMIN**
in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

China Vibes

It's 5 am, and as the first rays of sunrise touch the waters north of Dalian, Liaoning province, several fishing enthusiasts board a yacht bound for a "sea ranch", hoping to land some big game fish.

Near Changhai county's Zhangzi Island, one of the fishermen, surnamed Li, once landed a Japanese amberjack weighing 17.5 kilograms.

"The thrill of fighting a giant fish — that heart-pounding duel with the sea — is something only those who have experienced it can truly understand," he said, still vividly recalling the moment.

"It's a story I can keep telling until I catch an even bigger one," he said.

Li describes himself as an ordinary hobbyist using affordable gear. His catch, he said, owes much to the location, a premier big-game fishing spot.

"Since the bait fish are mostly active in the upper water, it is possible to land large fish with ordinary light tackle and thin lines," he said.

On the eastern side of the Liaodong Peninsula, Changhai county consists of 195 islands, 18 of which are inhabited.

Chinese snooker on cue for global dominance

With consecutive world champions, booming interest, nation tilts sport's balance of power

In the narrow backstage corridor of snooker's most storied arena, the Crucible Theatre in Sheffield, an unusual scene unfolded during the 2026 World Snooker Championship as three Chinese players from different generations prepared for another night on the sport's biggest stage.

Ding Junhui, 39, the pioneer of Chinese snooker, Zhao Xintong, 29, the then defending world champion, and Wu Yize, 22, one of the sport's rising stars, stood side by side in silence, waiting to walk out.

A backstage photograph captured the moment. It quickly resonated across China, where it was widely interpreted as a reflection of Chinese snooker's shift from isolated breakthroughs to generational continuity of excellence.

That belief was reinforced days later.

On May 4, Wu defeated England's Shaun Murphy 18-17 in a dramatic World Championship final. The match went to a deciding frame for the first time in more than two decades, highlighting both the tight competition at the elite level and the emergence of new contenders from China.

Under immense pressure in the final frame, Wu opted for an aggressive long shot on a red ball. The gamble paid off, shifting momentum in his favor.

"I have been trying to go for this for ages," Wu said after the match. "For the past few months, I have been living the same life. I am so happy that I could play well today."

Former world champion Murphy, a veteran of the professional circuit, acknowledged the quality of Wu's performance. "I played the best shots I could and as a snooker player that's really all you can do," he said. "I don't feel like I lost the match — he won the match."

Wu's victory marked China's second consecutive world title, following Zhao's defeat of Mark Williams 18-12 last year.

Zhao became the first Asian player to win the World Snooker Championship. Zhao's breakthrough ended more than a century of European dominance, predominantly British, at the Crucible, while Wu's win confirmed that the result was not an isolated outcome.

The 2025-26 season has so far confirmed a clear shift in the balance of power, with Chinese players chalking up tournament wins on the World Snooker Tour circuit and climbing the player rankings.

Zhao, who won four titles, was named Player of the Year and inducted into the sport's Hall of Fame. Wu received the fans' Player of the Year award, while Chang Bingyu won Breakthrough Player of the Year.

Collectively, Chinese players claimed seven titles — the strongest single-season performance in the country's history.

At the Crucible Theatre, 11 Chinese players entered the main draw of 32, the highest representation to date. Alongside established names were younger players including Fan Zhengyi, Lei Peifan and others who emerged through qualifying routes.

Inside the venue, Mandarin was increasingly heard in practice rooms and corridors, while Chinese flags appeared among traveling supporters.

Wu Yize receives his winner's trophy after beating English player Shaun Murphy in the 2026 World Snooker Championship final in Sheffield, the United Kingdom on May 4. LI YING / XINHUA

Early breaks

In the early 2000s, Ding Junhui emerged as China's first global snooker star.

In 2005, the then 18-year-old defeated superstar Stephen Hendry at the China Open, a landmark victory and a turning point in raising the sport's visibility in China.

At the time, China had only a small number of professionals playing abroad. Ding's early career was marked by isolation and limited support in Sheffield. But he established a path that later generations of Chinese snooker professionals would follow.

"Without Brother Hui, there would be no current generation of Chinese snooker players," Zhao has previously said.

Ding now works informally with younger Chinese players in Sheffield.

"From Zhao Xintong to Wu Yize, Chinese players have stood on the top podium for two consecutive years," Ding wrote after Wu's world title. "This is not just a breakthrough — it shows our time is coming."

Unlike earlier generations, today's players are supported by a growing domestic network of academies, training centers and professional pipelines.

The shift from family-driven investment to institutional support is now widely recognized as key to the newfound success. Earlier players often relied on significant personal sacrifice.

Ding, for instance, began playing at age 8 in his father's grocery store. Once his talent was recognized, his father sold the family home and moved to Dongguan, Guangdong province, where Ding trained for more than 10 hours a day.

Wu followed a similar path. Born in 2003 in Lanzhou, Gansu province, he moved with his family to Dongguan at age 13 to join the Ding Junhui Snooker Academy, winning a national junior title the following year. He later won the World Junior U21 Championship in 2018, and was named Rookie of the Year in 2022.

From 16, he trained in the United Kingdom with his father, who supported him financially by working outside the sport. After his world title win, Wu said: "Since I made the decision to drop out of school, my dad has been by my side. My mum has not been in very good health. Since we have been in Sheffield, she has been staying a long time in hospital. She has sacrificed everything for me.

"My parents are the true champions … They are the source of my strength," he said.

Expanding ecosystem

China currently has nearly 300,000 billiards clubs and an estimated 80-100 million enthusiasts nationwide, said Qiao Bing, vice-chairman of the Small and Medium Commercial Enterprises Association and president of the Billiards Industry Branch.

This massive grassroots base directly feeds the country's growing presence on the professional circuit. Over the past five years, junior participation in cue sports has surged, reflecting broader access to coaching and deepening of the nation's talent pool.

China has also become integral to the sport's competitive calendar. In 2005, the country hosted a single event, but now the scale and prize money of Chinese tournaments are redefining the professional game.

"Genius is everywhere, but we need the talent spotters more," said Xingpai Billiards general manager Gan Jialin.

Chinese cue sports have a well-established talent development system and training infrastructure that is world-leading.

"For Chinese snooker, this is only the beginning. In the years ahead, it will become increasingly common for Chinese players to win the World Championship and other major titles," Gan said.

Once a national training base for young talent, Dongguan has evolved into one of the country's snooker strongholds, combining player development, equipment manufacturing, and tournament operations in areas like Changping and Tangxia.

A cluster of billiards equipment manufacturers has formed a complete industrial chain covering table components, slate production, and cue manufacturing.

Institutional investment further strengthened the city's talent infrastructure. In 2022, the Guangdong branch of the CBSA WPBSA Academy was established in Changping to standardize player cultivation. The academy provides a direct route from youth training to professional competition.

Players emerging from this environment often arrive on tour with stronger fundamentals and greater composure. Zhao, Wu and women's world champion Bai Yulu all completed key stages of their development within this framework.

Related industries in event operations, broadcasting, refereeing and youth tournaments have continued to mature in the city.

Slated for success

If Dongguan represents China's talent pipeline, then Yushan in Jiangxi province is the sport's industrial base.

The county, located at the intersection of Jiangxi, Fujian and Zhejiang provinces, originally developed through slate production for billiard tables. Over the past two decades, it has transformed into a comprehensive billiards industry cluster spanning manufacturing, events, training, refereeing and branding.

It's estimated that China accounts for the majority of the world's billiards tables and related equipment, with Yushan a key production hub.

Yushan International Billiards Culture City includes a modern 4,000-seat arena built to professional tour standards in lighting, broadcasting and event production. Adjacent to it, the World Billiards Museum traces the evolution of cue sports from their origins to globalization, giving the city both manufacturing and cultural significance.

Since 2016, the World Snooker Open and other major tournaments have been regularly staged in Yushan, establishing it as one of Asia's leading snooker destinations. All-time snooker great Ronnie O'Sullivan lost the World Open to Thailand's Thepchaiya Un-Nooh there in March.

Just as importantly, Yushan has become a major source of emerging talent.

The Yushan International Billiards Academy introduced international coaching methods and standardized curricula, creating a direct route to the professional tour.

Wu completed a key stage of his training there at the age of 11 under renowned Australian coach Rodney Leighton, focusing on fundamentals and match rhythm.

Leighton recalled of young Wu: "Just a few weeks later, he made a break of 86. I said to him, 'That's fantastic, incredible!' But he replied, 'It's no good, because if it was Ronnie (O'Sullivan), he would have cleared the table.'"

The intensity of the training culture has led many in the sport to describe Yushan as the "cradle of Chinese snooker champions".

The city has also accelerated the integration of technology into the sport, including digital refereeing, performance analytics and smart tournament management tools designed to improve accuracy and transparency.

Changing of the guard

The emergence of Chinese champions has redrawn the boundaries of what nations and regions dominate the sport.

For decades, the sport was headed by players from England, Scotland and Wales. Names such as Stephen Hendry and Mark Williams defined different eras of professional dominance.

Today, Chinese players are consistently competing at the highest level, with multiple competitors ranked in the top tier.

This shift has been accompanied by increased international scheduling of events in Asia, particularly in China, where tournaments now account for a significant number.

The commercial structure of the sport has also taken a new direction, with China becoming a key market for broadcasting rights, sponsorship and audience engagement.

Meanwhile, snooker's long-standing ambition to be included in the Olympic Games has been revived by the shifts in the sport. After Zhao's and Wu's world titles, senior officials within the sport have suggested that momentum for a future Olympic bid has strengthened, with the Brisbane 2032 Olympics often cited as a potential starting point.

Jason Ferguson, chairman of the World Professional Billiards and Snooker Association, has noted that China's standing within the Olympic movement will be a significant factor in any future application.

"China is a very important country to the IOC (International Olympic Committee) — it has been a host of the Games on many occasions and they are heavily invested in sports, in IOC terms," he told The Associated Press. "So the fact that China is a key market for snooker is a really important part about any Olympic bid."

With cue sports gaining broader international recognition, stakeholders view the coming decade as a potential window for inclusion.

Players such as Chang Bingyu, Fan Zhengyi and Lei Peifan now represent the next wave rising behind the current crop of stars. As Ding noted when witnessing the collective rise of Chinese players: "The threshold I crossed back then has now become the runway for everyone."

China is no longer simply producing world-class players. It is increasingly shaping how snooker is played, financed, promoted and globalized. For decades, the sport's center of gravity rested firmly in Britain.

Now, the ball is rolling eastward.

Satellite navigation sector eyes 1 trillion yuan mark

By ZHAO LEI
zhaolei@chinadaily.com.cn

The overall market value of satellite-enabled navigation and positioning services in China, especially those based on the Beidou Navigation Satellite System, is expected to surpass 1 trillion yuan ($147 billion) before the end of the 15th Five-Year Plan (2026-30) period, according to an industry leader.

Zhang Huifeng, president of the Global Navigation Satellite System and Location-Based Services Association of China, said the next few years will be crucial for Beidou to fully unleash its potential and value.

During the current plan period, the Beidou system will empower all public and business sectors, he said, as the annual report on Beidou-related businesses was unveiled on Monday at a meeting of the association.

"It will be deeply integrated into our daily life, and will continuously improve user experience. Nearly all smartphones, electric vehicles and passenger cars manufactured in China now come with Beidou as a standard feature, meaning that members of the public use Beidou-enabled services on a daily basis," Zhang said.

In the international market, users will be given greater access to Beidou-enabled services to facilitate their work and improve their lives, he said, noting that Beidou-based services and related products have been exported to more than 140 countries and regions.

Through localized cooperation, Chinese enterprises have established more than 20 overseas service centers in countries and regions involved in the Belt and Road Initiative, continuously expanding the service network, he added.

By the end of the 14th Five-Year Plan (2021-25) period, Beidou-enabled products and services gained ground in countries and regions involved in the BRI, achieving a 58 percent market share in such places, Zhang said.

According to the association's report, by the end of 2025, the overall value of satellite-enabled navigation and positioning services in China was about 629 billion yuan, up 9.24 percent year-on-year.

Nearly 2 million Chinese people now work at more than 30,000 domestic institutions and companies doing business related to Beidou and other satellite-based navigation and positioning services, the report said.

In 2025, more than 410 million terminal devices with satellite-based positioning and navigation functions were sold in China, including about 280 million smartphones supporting Beidou-enabled services, it said.

By the end of last year, there were over 2.2 billion devices, such as smartphones, computers and vehicle-mounted terminals, on the Chinese mainland that could use Beidou-enabled services, the report added.

Beidou is China's domestically developed satellite navigation system and the fourth such system in the world alongside the United States' GPS, Russia's GLONASS and the European Union's Galileo.

Starting in 2000, as many as 64 Beidou satellites, including four experimental ones, have been launched using 47 Long March 3 rockets from the Xichang Satellite Launch Center in Sichuan province. The satellite-based navigation system was declared complete in July 2020, and it began providing full-scale global services.

Currently, more than 50 Beidou satellites are in active service, operating in multiple types of orbits.

Relations: Fruits likely in realms of commerce

From page 1

The easing of stringent US restrictions on advanced semiconductor exports and the comprehensive rolling back of administrative measures aimed at blocking China's access to critical, next-generation chip-manufacturing technology remain absolutely central to the interests of Beijing.

This newly articulated paradigm marks a vital cornerstone, which is designed to provide robust guidance for relations between the two major global powers.

Consequently, the most realistic, low-hanging fruits of this high-stakes diplomatic summit will likely manifest in the more easily quantifiable realms of commerce. We can expect increases in the bulk purchase of US goods by Chinese enterprises, operating alongside a mutual de-escalation of the damaging "tit-for-tat" tariff war, and the diplomatic reaffirmation of the US' one-China policy.

All in all, regardless of the granular details of the agreements reached, which are still largely under wraps, the public outcome of the summit will be meticulously curated by both sides.

The author is president of the Belt and Road Initiative Caucus for Asia Pacific. The views do not necessarily reflect those of China Daily.

Visit: Years of Education to be launched

From page 1

Xi noted that he and Putin had maintained close working contact and met 40 times on bilateral and international occasions, drawing blueprints for bilateral ties and cooperation in various fields, and maintaining timely coordination on major international and regional issues of common concern.

In his New Year greetings exchanged with Putin on Dec 31, 2025, Xi said he was ready to maintain close contact with Putin and jointly lead China-Russia relations in the new era toward new achievements.

During a virtual meeting on Feb 4 this year, Xi noted that the day coincided with the Beginning of Spring on the Chinese calendar, which represents a new start, and expressed his readiness to work with Putin to chart a new blueprint for bilateral ties.

Xi also called on the two sides to increase high-level exchanges and strengthen pragmatic cooperation in various fields.

Li, from the CASS, said the frequent interactions between the two presidents have helped the two sides build consensus, set the direction of the relationship and maintain strategic steadiness despite fluctuations in the international situation.

"Each meeting helps reaffirm mutual support on issues concerning sovereignty, security, territorial integrity and independent development paths," she said, adding that such political mutual trust serves as a key anchor for the steady and long-term development of China-Russia relations.

The close communication between the two heads of state has also helped translate political trust into practical cooperation, Li added.

One notable example is trade, where top-level consensus has been translated into measurable progress. China-Russia trade exceeded $240 billion in 2024, meeting ahead of schedule the $200 billion target set by the two heads of state.

People-to-people ties

The two sides have also continued to expand cooperation in areas such as energy, agriculture, connectivity, education and people-to-people exchanges. The China-Russia Years of Education, to be launched this year, are expected to provide another platform for closer exchanges between young people from both countries.

Denisov, the Russian diplomat, noted that China and Russia once set a goal of increasing two-way student exchanges to 100,000. "At the time, it seemed almost out of reach, but today it has become a reality," he said.

Youth exchanges carry special significance for the long-term development of bilateral relations, he said, adding that he hopes that more young people from the two countries will participate in educational and cultural cooperation, and deepen mutual understanding and friendship through such exchanges.

Andrey Kortunov, former director-general of the Russian International Affairs Council, wrote in a recent CGTN commentary that trust defines what is possible in relations among major powers.

In the case of China-Russia relations, he said that strong personal relations between the two top leaders add to the stability and predictability of bilateral ties.

Li, the CASS researcher, said that at a time of geopolitical conflicts and global uncertainty, the steady development of China-Russia relations serves as an important pillar for global strategic balance.

Close communication between the two heads of state allows the two sides to exchange views in a timely manner, coordinate positions, manage differences and safeguard their core interests, she said. It also helps translate top-level consensus into cooperation across various fields.

"Such high-level engagement uses the certainty of head-of-state diplomacy to offset the uncertainty of the international environment," Li said, adding that it helps consolidate the foundation for regional and global peace and development.

Fishing: Anglers of all levels welcomed

From page 1

The islands are collectively known as the Changshan Archipelago, which is the country's first island-based national tourist resort.

Nestled within one of the country's most productive fishing grounds, the archipelago offers pristine marine resources and serves as critical habitat for large migratory species such as yellowtail amberjack and Japanese amberjack.

The yacht carrying the fishing enthusiasts belongs to Liu, a seasoned angler with fishing experience across the world's top big-game destinations. He runs a high-end homestay and owns two specialized yachts, allowing him to pursue his own passion while hosting tourists.

Liu's proudest catch came in the waters off Komodo Island in Indonesia, where he battled a giant trevally for 2.5 hours, eventually landing a specimen measuring more than 1.5 meters and weighing 62 kg.

Yet for him, Changhai's waters hold a unique charm, with each season offering different species for anglers of all skill levels.

"Visitors start arriving from mid-April, when the weather warms, and the season lasts until December," Liu said.

During last summer's peak tourist season, Liu said that he once saw more than 200 people on the same stretch of water, all bent over their rods, tirelessly working their jigs.

"A bit crazy, but spectacular," he said. "The moment a fish suddenly strikes, the nerves fire. While you're reeling it in, you have no idea what will come up. That feeling is highly addictive," he said.

In recent years, the slogan "to catch big fish, come to Dalian — head to Changhai" has spread widely, attracting professional anglers from far and wide.

In 2023, the county launched an elite sea fishing challenge, and last year's event attracted about 140 competitors from home and abroad. This year's tournament is scheduled for August.

Zhang Shengzu, the county chief of Changhai, said the local government aims to build the annual event into a stage for top anglers to demonstrate their prowess.

"Beyond their exceptional natural endowments, another major advantage of Changhai's fishing grounds is their proximity to land," he said.

It takes only 20 minutes by yacht to reach the fishing spots, allowing anglers to return to shore easily. Last year, Changhai saw sea fishing visitors exceed 190,000, driving a revenue increase of more than 30 percent for homestays, restaurants and fishing-tackle shops.

Given the rapid growth of sea fishing, the tourism service infrastructure is in urgent need of an upgrade, and a standardization system for the sea fishing industry is also being expedited, Zhang said.

"With safety as a prerequisite, the sector will further strengthen the capacity of tourism services," he said.

Dalian is transforming into northern China's marine leisure hub. In March, the city signed a 15-billion-yuan ($2.2 billion) agreement for a yacht manufacturing base — a signal that the harbors may soon welcome even more boats.

Growing role of China's capital market stressed

Pakistan's first panda bond sets precedent for other Belt and Road economies, experts say

By ZHOU LANXU
zhoulanxv@chinadaily.com.cn

The first sovereign panda bond issuance by Pakistan — priced at a historically low coupon rate — highlights the growing potential of China's capital market to provide diversified and lower-cost financing channels for developing economies, experts said.

The issuance not only opened an avenue for Pakistan to secure continued access to renminbi financing, it may also set a precedent for more Belt and Road economies to lower financing costs through China's bond market at a time when energy-related inflation pressures are driving up global borrowing costs, they said.

A panda bond is an RMB-denominated debt instrument issued by overseas governments or institutions in China's onshore capital market. Pakistan issued its first sovereign panda bond on Thursday, becoming the first South Asian economy to do so.

The issuance totaled 1.75 billion yuan ($257 million), with a three-year maturity and a coupon rate of 2.5 percent. China Economic Net reported that the coupon rate was "the lowest Pakistan had achieved on a sovereign bond". This was also confirmed by China International Capital Corp, or CICC, the lead underwriter and book runner for the deal.

The issuance, the proceeds of which will finance sustainable development projects in Pakistan, was oversubscribed more than five times and marked the first tranche under Pakistan's newly established 7.2 billion yuan panda bond program.

Pakistan's Minister for Finance and Revenue Muhammad Aurangzeb said he is confident that the program would provide his country with a strong platform for future issuances, further deepening financial connectivity and sustainable economic cooperation with China.

Liu Chunsheng, an associate professor of international economics at the Central University of Finance and Economics, said the issuance highlighted the unique role China's bond market plays in providing lower-cost financing and diversified funding channels for international issuers.

"With China's interest rates remaining relatively low and RMB assets increasingly showing safe-haven attributes, the panda bond's 2.5 percent coupon rate was far below the cost of Pakistan's US dollar bonds, which could reach roughly 7 to 8 percent under some circumstances," Liu said.

Despite Pakistan's long-term sovereign credit rating being kept in the speculative grade category of B- by S&P Global Ratings, the bond received an issue rating of AAA, supported by an innovative partial guarantee structure, under which the Asian Infrastructure Investment Bank and the Asian Development Bank provided guarantees covering 95 percent of the bond's principal and interest payments.

Analysts said the enhanced credit profile helped significantly lower the bond's coupon rate and improve investor acceptance.

Paul Rui, director at the investment banking department of CICC, said the partial guarantee arrangements — the first of their kind in China's onshore bond market — could offer a replicable model for other developing economies.

"Emerging market economies have strong financing demand in infrastructure, green transition and livelihood development, but face challenges such as ratings, investor recognition and issuance structures when entering a new market for the first time," Rui said.

"This transaction combined a sovereign issuer, multilateral development institution-backed credit enhancement, sustainable development-oriented funding purposes and access to China's renminbi bond market, providing a reference model for more Belt and Road economies seeking to enter China's bond market," he added.

Ji Haisheng and Xu Wei contributed to this story.

Civilizational exchange

Visitors admire artifacts on Sunday at an exhibition, titled *Maize, Gold, Jaguar: A Grand Exhibition of Ancient Maya and Andean Civilizations*, at the Capital Museum in Beijing. It features about 800 treasures from more than 20 cultural institutions in Mexico and Peru, and sets new records for the museum in terms of both the number of exhibits and international partners. The exhibition officially opened on Monday, which marked International Museum Day, and runs through Oct 18. JIANG DONG / CHINA DAILY

Scam crackdown creates new problem

Experts welcome Cambodia's actions while also noting risks of displacement

More than 300 Indonesians who had fled from fraudulent activities wait for repatriation procedures at a factory in Phnom Penh, Cambodia, on March 26. PHOTO VIA AP

As Cambodia pushes forward with its effective crackdown on scam centers, a new problem has emerged.

On April 24, Cambodia declared that the authorities had cracked down on more than 250 online scam locations and closed 91 casinos between July 2025 and mid-April this year.

However, the shutdown of these centers has left thousands of foreigners without jobs or shelter, and they are unable to return to their home countries without passport or money.

Analysts warn these people could end up being recruited back into new scam centers, become a source of social disorder, or even trigger a humanitarian crisis.

In the last two months, hardly a week has gone by without reports about Cambodian authorities cracking down on scam operations. In early March, Prime Minister Hun Manet vowed to shut all scam centers in the country by the end of April to restore tourist and investor confidence.

Besides the capital Phnom Penh, other scam hot spots include border areas with Thailand, such as O'Smach town and Poipet city in northwestern Cambodia, as well as border cities with Vietnam, including Bavet and Kampot in the south.

On a weekday in April, about 70 men were seen milling around a park opposite the Indonesian embassy in Phnom Penh. At night, many slept on straw mats on pavement outside shops that had shuttered for the day.

Marco Lem, 28, said he had been sleeping on the street outside the Indonesian embassy for the last two months while seeking help to obtain a passport and return to Jakarta. The father of two claimed he was lured to work in a casino but was subsequently led to Sihanoukville and forced to scam people.

Sihanoukville, a coastal port city in southwestern Cambodia, is known as a global hot spot for gambling, cybercrime and reported cases of human trafficking tied to such activities.

"I don't know whether I will be arrested when I return to Indonesia. But I've seen friends who went back and were not arrested," Marco said.

Another Indonesian, David Butar, 23, has also been left on the street to fend for himself. The father of a two-year-old daughter said he was tricked into working in a scam compound in Bavet, Svay Rieng Province bordering Vietnam.

On the street for two months now, he is waiting for the Indonesian embassy's help to return home. He said he needs official documents to be repatriated, as he had overstayed in Cambodia while being holed up in the scam compound.

$442 billion

was lost to scammers in 2025 across the globe, according to estimation of the Global Anti Scam Alliance.

The Straits Times was unable to independently verify both men's claims of being tricked into scam compounds. The Indonesian embassy has yet to reply to queries on the matter.

The crackdown has raised concerns that large numbers of scam workers — both voluntary and forced — could be left stranded.

It is difficult to estimate the number of workers involved in scam operations in Cambodia, as the centers operate like a revolving door, with workers recruited regularly and moved to different locations in the country.

While some joined willingly for the pay, others were deceived with job offers, and many ended up trapped after their passports were seized by operators.

In the update on April 24, the government said that 241,888 individuals had left the country voluntarily between mid-January and April 19.

But many former scam center workers remain in Cambodia, with some housed by nongovernmental organizations or in temporary holding facilities like the one near the old Phnom Penh airport.

"If thousands of displaced workers are left homeless or scattered without a clear plan for repatriation or protection, the country risks a secondary security crisis," said independent Phnom Penh-based analyst Vanly Seng, referring to the possibility that these workers may turn to crime out of desperation.

Reports have also surfaced online of some former female scam workers claiming they were raped after being left to fend for themselves on the streets.

"It's quickly turned into a humanitarian disaster, with both the local authorities and international organizations struggling to keep up," said John Wojcik, a senior threat researcher with cybersecurity firm Infoblox.

Beyond borders

The scourge of scams is not just a Cambodian issue.

The Global Anti Scam Alliance estimates that across the globe, $442 billion was lost to scammers in 2025. A UN report in 2026 said the scam industry in the Mekong region alone is worth over $43.8 billion a year.

Cambodia's intensive crackdown on scam compounds has not gone unnoticed by neighboring Thailand.

Thailand's Foreign Affairs Ministry said there may be a risk of the scam centers moving to neighboring countries as Cambodia intensifies its operations.

The ministry said Bangkok has strengthened its controls and surveillance, with security agencies on high alert.

Despite strained relations after their border clashes in 2025, Thailand said it remains committed to working with Cambodia to combat online scams.

The Cambodian government has identified combating online scams as a top national priority, saying the illicit activities have affected its economy and image.

Phnom Penh said it wants to dismantle entire criminal networks and sever all the scam syndicates' financial sources in Cambodia to ensure a lasting solution.

While analysts largely welcome Cambodia's efforts, they say these are not enough to root out the problem of scams.

Seng, the analyst, said, "Raiding physical buildings is only half the battle.

"Without a sustained effort to dismantle the financial pipelines and the encrypted communication networks they use, I suspect we are seeing a displacement of the problem rather than its total eradication."

As part of its enforcement efforts, the Cambodian government has filed 112 cases in court involving 1,089 individuals linked to scam operations.

But Bunna Vann, head of research and advocacy program at the Cambodian Youth Network Association, said the government has largely taken action against low-level perpetrators. Many influential figures and those with political backing behind the scam activities remain at large.

Wojcik of Infoblox said today's highly sophisticated and hypermobile syndicates operate more like transnational corporations, making them difficult to eradicate completely.

He advised countries to devise better ways to tackle the fast-evolving and sophisticated online scamming activities. One strategy is to implement national Protective Domain Name Service programs, which will make networks more secure by preventing access to malware, phishing attacks and viruses at the source.

Meanwhile, David remains hopeful even though he has been sleeping rough for weeks.

"I'm happy now because I'm free from the scam compound. I want to go back to Indonesia."

THE STRAITS TIMES, SINGAPORE

Bangkok set to be SE Asia's hottest major city by 2050

Bangkok is set to become the hottest major city in Southeast Asia by 2050, with temperatures projected to rise above 38 C as climate change and the urban heat island effect intensify across the region.

The warning comes from the report "Roadmap for Extreme Heat Protection through Passive Cooling in ASEAN Region" by the ASEAN Centre for Energy, which says Thailand's capital faces a far more severe heat crisis in the decades ahead.

In 2025, Bangkok had around 45 "extreme heat days" a year, defined as days when temperatures exceed 35 C. By 2050, that number is expected to rise to 120 days a year, meaning residents could face almost three times as many days of accumulated extreme heat within just a few decades.

The report also projects that Bangkok's average daily maximum temperature will climb to 38.1 C by midcentury, up nearly 5 C from 33.3 C in 2000.

Compared with other major ASEAN cities, Bangkok is forecast to record the highest temperature in 2050, followed by Ho Chi Minh City in Vietnam at 37.7 C, Manila in the Philippines at 37.2 C, Kuala Lumpur in Malaysia at 36.9 C, Jakarta in Indonesia and Singapore at 36.1 C.

Such conditions could push the city's infrastructure, public health system and economy toward unprecedented limits.

The report identifies climate change and rapid urbanization as the two main forces driving ASEAN's worsening heat crisis. In Bangkok, the urban heat island effect is a major factor, as concrete and asphalt absorb heat during the day and release it at night.

Data from the Asian Disaster Preparedness Center, or ADPC, shows that dense central areas of Bangkok can be up to 3 C hotter than greener outer areas. Rising heat directly threatens public health by increasing the risk of heatstroke, chronic fatigue and sleep problems that damage quality of life.

Economically, severe heat could hit labor productivity, especially among more than 1.3 million outdoor workers in Bangkok. The report says that without proper adaptation, economic losses from heat and humidity could reach 6 percent of the city's gross product by 2050.

Households are also facing higher electricity costs. Some 90 percent of survey respondents said their energy bills rose by 10 to 50 percent during heat waves. Low-income residents in congested communities are among the most affected, as many live in poorly ventilated buildings.

As heat intensifies, air conditioning is becoming more essential, widening inequality in access to cooling. At the same time, heavy use of air conditioners releases more heat outdoors, creating a cycle that further worsens urban heat.

Irma Ramadan, a senior officer at the ASEAN Centre for Energy, said urbanization was pushing heat toward almost unbearable levels, while current policies were failing to keep pace with the changing climate.

Effective measure

Pornphrom Vikitsreth, adviser to the Bangkok governor on environment and the city's chief sustainability officer, agreed that expanding green space was a low-cost, high-impact measure that must be taken urgently.

"In the long term, we need to significantly increase green space. This is a relatively low-cost measure but offers major benefits. At the same time, preserving existing green areas and preventing them from being replaced by concrete structures is also essential," Pornphrom told Singapore broadcaster CNA.

Peeranan Towashiraporn, director of geographical information at ADPC, said Bangkok was right to treat heat as a disaster, rather than merely a seasonal condition. He said the city needed cooling shelters across all areas, along with public alerts during periods of extreme heat.

The report says the most sustainable solution is to integrate passive cooling into building design and urban planning. Measures include natural ventilation, tree shade and heat-reflective roof colors.

Building upgrades and high-performance glass could cut cooling energy demand by 35 to 70 percent. The government also needs to revise building regulations to require passive cooling features in new developments.

The report adds that public awareness and training for experts in tropical building design will be crucial for long-term change, alongside public-private cooperation, funding support and tax incentives to encourage the real-world use of cooling technologies.

Elephants in Indonesia critically endangered as habitat areas dropped by half

Sumatran and Kalimantan elephants are now critically endangered as their habitat areas have been reduced from 42 to 21, Indonesian Forestry Minister Raja Juli Antoni told a meeting with various nongovernmental organizations in Jakarta earlier in May.

The government will issue a presidential instruction on rescuing the populations and habitats of Sumatran and Kalimantan elephants.

Raja Juli said the progressive step was taken as a response to the conditions of Sumatran and Kalimantan elephants and their reduced habitat.

The policy serves as an operational basis for interagency work. The presidential instruction draft is currently being circulated among ministries.

"The presidential instruction shows a strong commitment from (Indonesian) President Prabowo Subianto to save our elephants. Our focus is on how to execute those ideas in the field," Raja Juli said.

"Future governance must provide full orientation to conservation."

One crucial point in the presidential decree is the integration of infrastructure with animal living space.

Raja Juli provided an example that if the Public Works Ministry is building toll roads, then it must consider elephant home range maps, which have been prepared by the Forestry Ministry.

Technical solutions such as tunnels or underpasses will be mandatory to allow elephant herds to still roam their home range without being disrupted by human activities.

Staff members from the Riau Natural Resources Conservation Center install a GPS collar on a wild elephant that has been blindfolded to reduce visual stimulation, in Riau, Indonesia, on Nov 6. AFP

The minister also directed that the 21 remaining elephant habitat areas be maintained and their ecosystem quality improved. The main strategy is to build a corridor uniting all fragmented habitats because of illegal activities and changes in land use.

"It is important for us to have accurate data. There must be a clear target to increase the (elephant) population in the Conservation Strategy and Action Plan," he said.

"If there is no increase in population, we must find the problem and solve it."

Handling conflicts

As part of the long-term solution, Raja Juli also highlighted the handling of the conflict between elephants and humans in Way Kambas, Lampung, which has been ongoing for some 40 years.

He said that Prabowo suggested constructing an effective barrier to prevent casualties among both humans and elephants, while continuing to repair elephant habitats.

Experts estimated that there were some 2,800 to 4,000 Sumatran elephants in the 1980s. The Forestry Ministry estimated in 2007 that the population decreased to between 2,400 and 2,800 and further reduced to between 1,694 and 2,038 in 2017.

Forest encroachment and deforestation for oil palm plantations have further cornered the Sumatran elephant in its habitats.

Rampant deforestation and land conversion for various economic activities such as mining, plantation and energy development, are also believed to have contributed to the natural disasters in northern Sumatra in November 2025.

US warns Iran over deal delay amid war fears

Talks hang by a thread as Gulf states unite against strike on nuclear plant

By **CUI HAIPEI** in Dubai, UAE, and **JAN YUMUL** in Hong Kong

The United States has issued a fresh warning to Iran, urging it to move quickly toward a deal or "there won't be anything left of them", as Gulf nations rallied in solidarity after the Arab world's only nuclear power plant was targeted for the first time.

With diplomacy struggling, military preparations intensifying and inflammatory rhetoric escalating, fears are growing that the region risks sliding into a wider, potentially more dangerous phase of the conflict.

"For Iran, the clock is ticking, and they better get moving, fast, or there won't be anything left of them," US President Donald Trump wrote on Truth Social shortly after a call with Israeli Prime Minister Benjamin Netanyahu.

According to media reports, the two leaders discussed the possibility of renewing military operations against Iran.

On Monday, Israel's Channel 13 reported that dozens of US cargo planes carrying ammunition from bases in Germany had landed in Tel Aviv, Israel's commercial hub, in the past 24 hours, as Netanyahu told a Cabinet meeting on Sunday that the country was "prepared for any scenario" over Iran.

Iran's Foreign Ministry spokesman Esmaeil Baghaei said on Monday that Iran has submitted its response to US revisions of the conflict resolution plan, as talks are ongoing through Pakistan. Iranian and Omani technical teams have met to negotiate a mechanism for safe transit in the Strait of Hormuz, he added.

A Pakistani source told Reuters on Monday that Pakistan has shared the revised proposal with the US.

"We don't have much time," the source said, when asked if it would take time to close gaps, adding that both countries "keep changing their goalposts".

Baghaei said Tehran was prepared for all scenarios.

"As for their threats, rest assured that we are fully aware of how to respond appropriately to even the smallest mistake from the opposing side," he told a televised weekly news conference.

The renewed tensions have raised concerns across the Gulf, particularly after Sunday's drone strike near the United Arab Emirates' Barakah Nuclear Power Plant, which is vital to the country's clean energy goals, supplying about 25 percent of its electricity needs.

The International Atomic Energy Agency said on Sunday that the strike had caused a fire in an electrical generator and that radiation levels remained normal in the four-reactor plant.

Brought online in 2020, the $20 billion Barakah plant — the Arab world's only nuclear power station — sits 200 kilometers west of Abu Dhabi and operates on US-supplied nuclear fuel.

The UAE Defense Ministry said three drones entered from its western border with Saudi Arabia, two of which were intercepted. Officials said they were investigating the source of the strike, adding that the UAE reserves the full right to respond to such "terrorist attacks".

Although no one was immediately blamed, UAE presidential adviser Anwar Gargash said it represented a dangerous escalation, whether carried out by "the principal perpetrator" or one of its proxies.

So far, Kuwait, Jordan, Saudi Arabia, Bahrain and Egypt have condemned the attack and reaffirmed full solidarity with the UAE.

On Sunday, Ebrahim Rezaei, spokesman for the Iranian Parliament's National Security and Foreign Policy Commission, said Tehran has not "closed the door to friendship in dealing with the UAE, but they should know that Iran's patience has limits".

"The UAE should not become entangled in Israel's plots and schemes," he said, as reported by Iran's ISNA news agency.

Hormuz management

Regarding the Strait of Hormuz, Iran's Supreme National Security Council announced on Monday the formation of a new body to manage the strategic waterway.

On its X account, the council shared a post for the Persian Gulf Strait Authority, saying it would provide "real-time updates on the #Hormuz_Strait operations and latest developments".

The account of Iran's Islamic Revolutionary Guard Corps navy shared the same post.

It was not immediately clear what the new body would do, but earlier this month, Iranian English-speaking broadcaster Press TV said it constituted a "system to exercise sovereignty over the Strait of Hormuz" and that ships passing through the strait were sent "regulations" from the email info@pgsa.ir.

Amid escalating tensions, international airlines remain cautious in their response to the regional security situation.

American Airlines said on Sunday that it was extending the suspension of nonstop flights between New York and Tel Aviv until Jan 6, 2027, citing ongoing instability linked to the Iran conflict.

Agencies and Xinhua contributed to this story.

Israeli airstrikes kill 8 in Gaza as protest boats seized

CAIRO — Israeli strikes killed at least eight Palestinians in the Gaza Strip on Sunday, health officials said, as ceasefire efforts meant to end fighting between Israel and the Hamas militant group falter.

In the weeks since halting its joint bombing with the United States in Iran, Israel has stepped up its attacks in Gaza. Medics said an Israeli strike killed one Palestinian near a police post and another at a tent encampment in Khan Younis in the enclave's south.

The Israeli military said it killed a militant who posed an immediate threat to forces in the area.

Separately, Gaza medics said another Israeli airstrike killed at least three people at a community kitchen near Al-Aqsa Hospital in Deir al-Balah, in the central Gaza area. The Israeli military said the strike targeted a Hamas commander developing anti-tank missiles.

Gaza medical officials said three more Palestinians were killed, one in a shooting incident in Khan Younis and two others in an Israeli airstrike near a bakery in Deir al-Balah.

In addition, the Israeli military said it had killed Bahaa Baroud, a Hamas Operations Headquarters commander, in an airstrike on Saturday, accusing him of planning multiple imminent attacks against troops and Israeli civilians in recent weeks.

The United Nations demanded on Monday that Israel take measures to prevent acts of "genocide" in Gaza.

In a report, the UN rights office said Israel's actions in Gaza since the start of the conflict in October 2023 involved "gross violations" of international law, amounting in many cases to "war crimes and other atrocity crimes".

UN rights chief Volker Turk urged Israel to ensure compliance with a 2024 International Court of Justice order that it take measures to prevent acts of genocide in Gaza.

Meanwhile, the Israeli military intercepted on Monday boats off the coast of Cyprus, part of the latest wave of flotilla activists attempting to break Israel's blockade of Gaza.

More than 50 vessels departed from the port in Marmaris, Turkiye, last week in what the organizers of the Global Sumud Flotilla described as the final leg of their planned journey to Gaza's shores.

The organization's livestream on Monday showed activists aboard several vessels putting on life jackets and raising their hands before a boat carrying Israeli troops approached. Wearing tactical gear, they boarded the ship, and the livestream abruptly ended. Many of the ships are currently off the coast of Cyprus.

In a statement issued on Monday, Turkiye's Foreign Ministry said, "We condemn the intervention by Israeli forces in international waters against the Global Flotilla ... which constitutes a new act of piracy."

Trade show highlights China-Canada business ties

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

The expanding 2026 Toronto Trade Show highlighted renewed momentum in China-Canada business ties, as organizers, officials and exhibitors pointed to growing interest among Chinese companies seeking opportunities in the Canadian market.

Held in Toronto over the weekend, the event brought together more than 100 exhibitors from sectors ranging from artificial intelligence and healthcare to manufacturing and green technology.

"This year, for the second edition, I feel full of confidence," said Lena Xu, president of the Canada-China Enterprise Overseas Service Center and the event's organizer.

Xu told China Daily that the inaugural event last year faced pressure as organizers worked to establish the platform, but this year's exhibition expanded significantly in size and participation.

"We started recruiting exhibitors earlier, and our whole system is now AI-powered," she said, adding that companies were able to register and participate more efficiently through the platform.

According to Xu, about 80 percent of exhibitors came from China, while participants also arrived from Mexico, the United States and South America.

"The variety of exhibitors is much richer this year," she said.

Xu described the event as more than a temporary exhibition.

"It's not a one-time trade show," she said. "It's a long-term bridge for cooperation."

She said the platform aims to connect China and Canada in trade, tourism, education and cultural exchange while helping Chinese companies establish themselves in Canada.

Xu also linked the stronger turnout this year to improving China-Canada relations.

"The warming of China-Canada relations has certainly promoted many Chinese enterprises going abroad," she said.

Visitors browse exhibition booths during the 2026 Toronto Trade Show in Toronto, Canada, on Saturday. The two-day event attracted more than 100 exhibitors from sectors including artificial intelligence, healthcare, manufacturing and green technology. YANG GAO / CHINA DAILY

She added that improved visa conditions and policy support had made overseas expansion easier for Chinese businesses.

"Prime Minister Carney's visit to China also brought back many positive results," Xu said, referring to Canadian PM Mark Carney.

Chinese officials attending the event also emphasized the economic potential between the countries.

Cheng Hongbo, deputy consul general of China in Toronto, said the strong presence of Chinese exhibitors demonstrated the competitiveness of Chinese manufacturing and brands.

"We are glad to see that in recent years more and more Chinese products have found their way into Canadian households," Cheng said.

He described the trade show as "a very important platform" for strengthening economic and trade cooperation between the countries.

"China and Canada, although separated by vast oceans, are highly complementary economically," Cheng said. "There are very broad opportunities for our cooperation."

He also pointed to China's large consumer market and Canada's push to diversify its foreign economic ties.

"I think China is the best partner for Canada to diversify its foreign economic relations for economic resilience," he said.

For many businesses attending the exhibition, however, entering North America also requires adapting to a very different commercial environment.

Chen Kai, who advises Chinese companies entering the Canadian and North American markets, said many firms initially approach overseas expansion with a domestic sales mindset.

"Most Chinese companies come with a sales mentality," Chen told China Daily. "But North America is more about the chain of responsibility."

He said companies must adapt to stricter expectations involving consumers, distributors and supply chains.

"The supply chain is actually a responsibility chain," he said. "Chinese manufacturers need to think more about responsibility rather than just finding agents or focusing only on sales."

Chen said many Chinese firms remain heavily focused on the United States, but often underestimate the complexity of the North American market.

"People who really understand North America know the US is not a unified market," he said, noting that regulations can vary widely between states and cities.

"Canada is relatively easier," Chen added. "Entering the Canadian market is one of the best first choices for Chinese companies entering North America."

He said Toronto's large Chinese business community and service sector also provide strong support for newcomers from China.

The trade show also attracted Canadian and European entrepreneurs seeking closer cooperation with China.

Matteo Merla, whose business imports fast-growing trees from Germany and plants them in Canada for lumber production, said China remains an important long-term market for his business during his second time attending the trade show.

"We're growing the fastest tree in the world, 18 meters in six years," Merla said. "We now have 15,000 trees planted in Dunnville, Ontario."

Merla said his company was seeking investors and partners to help expand the business.

"We believe in nature, we believe in resources," he said.

Having worked with Chinese partners for years, Merla described his experience with the Chinese market positively.

"They're very reliable. They know what they want," he said.

Merla said China's demand for lumber products makes cooperation especially important for his business.

"I think this tree, specifically in the lumber industry, having a resource for China, is very important," he said.

He also expressed support for stronger China-Canada cooperation.

"I hope they stick together," Merla said. "Going a different way without working with China is a big mistake for everybody."

COMMENT

Editorials

It's time G7 members looked at themselves rather than blaming China for their woes

The gathering of G7 finance ministers in Paris from Monday to Tuesday has been framed, predictably, as another exercise in diagnosing the ailments of the developed economies through the prism of "imbalances". Yet what stands out clearly is not China's trade surplus as claimed, but the growing inability of some developed economies to confront the structural contradictions within their own economic systems.

Before the meeting, French officials spoke of an "unsustainable" global economy in which China "under-consumes", the United States "over-consumes" and Europe "under-invests".

The US runs chronic fiscal and current-account deficits because it has long chosen debt-fueled growth over fiscal discipline. Europe's investment weakness, meanwhile, reflects years of strategic hesitation, demographic stagnation and energy insecurity. Japan worries about bond-market volatility because decades of ultra-loose monetary policy dictated by Washington have left it exceptionally exposed to shifts in global capital flows.

To hold China accountable for that is scapegoating to avoid self-correction. Trade balances are shaped by industrial structures, comparative advantages, corporate investment decisions and the international division of labor. China's trade surpluses with the G7 members, as well as the European Union, are the de facto objective result of policies designed and practiced by some advanced economies themselves.

For years, multinational corporations shifted production to China in pursuit of lower costs, industrial clustering and market access. The profits from these operations flowed overwhelmingly back to shareholders and corporations in developed economies. Yet the products manufactured in China and exported to Western markets are statistically counted as Chinese exports.

Some developed economies have systematically constrained their own export potential to China. Restrictions on high-tech exports have become increasingly expansive over the past decade. Advanced semiconductors, aerospace technologies, industrial software and precision equipment have all been subject to tightening controls. One cannot simultaneously suppress exports and lament trade deficits.

Indeed, China's own technological progress increasingly reflects this reality. The latest data on the BeiDou Navigation Satellite System offer a telling example. According to an industry white paper released on Monday, China's satellite navigation sector reached an output value of 629 billion yuan ($92.34 billion) in 2025, while the broader BeiDou spatial-temporal industry exceeded 1.3 trillion yuan. The system's products and services have expanded to more than 140 countries and regions.

What this illustrates is not merely industrial scale, but technological substitution. As some developed economies narrowed technology exports to China, the country accelerated indigenous innovation. Domestic supply chains have emerged with increasing levels of self-sufficiency.

The same pattern is unfolding in artificial intelligence, green energy and advanced manufacturing. China's preparation for the AI era, including the integration of AI across industrial production, logistics and services, is advancing at remarkable speed. So too is its transition toward renewable energy, electric vehicles and intelligent infrastructure. China's industrial upgrading has proceeded faster and more coherently than in many advanced economies.

This raises a deeper question for the G7. Has "de-risking" from China become a political slogan masking internal weaknesses?

Ironically, much of the "anxiety" voiced within the G7 club concerns instability emanating from the US — from its fiscal deficits and trade tensions to its sanctions policy and the geopolitical volatility it is engineering. For many developed economies, the more immediate form of "de-risking" increasingly involves reducing overdependence on US financial and strategic unpredictability.

China, meanwhile, continues to expand its high-standard opening-up. It is already the world's second-largest import market, and its future import potential remains enormous as its industrial upgrading continues. New demand for services, consumer goods, advanced manufacturing and green technologies will create opportunities for trading partners.

The tragedy is that parts of the developed world still interpret China's rise primarily as a "threat" instead of an opportunity. The intent of globalization should not be that the prosperity of one side is at the expense of another. It should be that interconnected growth can enlarge the economic pie for all. If the G7 wishes to address its "imbalances", it should begin with a more uncomfortable exercise in self-examination.

Chinese EVs a boon to world consumers

The first shipment of 24,500 Chinese-made electric vehicles has been cleared for import in Canadian ports recently. The anticipation, excitement and positive feedback from Canadian car dealers, consumers and auto market analysts make it clear that Chinese EVs are by no means the "threat" to industry or security some Western politicians have portrayed them to be. On the contrary, they are a boon to the market.

The decision by the Mark Carney government of Canada to slash tariffs on Chinese EVs and introduce an import quota system is a departure from the protectionist policies adopted by its predecessor. In October 2024, the then Justin Trudeau government imposed a 100 percent tariff on Chinese EVs, effectively shutting Chinese manufacturers out of the Canadian market. This move followed the lead of the then US administration.

However, with the new policy announced during Carney's visit to China in January, Canada has opened its market to 49,000 Chinese EVs annually, with a reduced most-favored-nation tariff rate of 6.1 percent. This shift not only reflects a pragmatic approach to trade but also signals a willingness to engage with China on mutually beneficial terms.

The import of Chinese EVs comes at a juncture for Canada, which is striving to meet its climate goals. Ottawa has set ambitious targets to phase out internal combustion engines and achieve net-zero emissions by 2050. Chinese EVs, with their technology, competitive pricing and proven performance, can play a big role in helping accelerate Canada's transition to green mobility.

Canadian Minister of Industry Melanie Joly has emphasized the potential of joint-venture partnerships with Chinese EV companies to help boost domestic manufacturing and competitiveness. "The idea is to be able, in North America, to adopt new technology," Joly told the media on the sidelines of the Public Policy Forum's 2026 Canada Growth Summit in Toronto early this month. "If other countries don't necessarily want to adopt them right now, we can adopt them first."

As some observers say, Canada can gain access to cutting-edge technologies, improve its industrial competitiveness, and create jobs in the clean energy sector by collaborating with Chinese EV companies. The partnership is not a one-way street; it offers opportunities for Canadian companies to integrate into global supply chains and benefit from China's vast market.

The import of Chinese EVs can help address the affordability gap in Canada's EV market. Chinese EVs, known for their affordability without compromising on quality, can make EVs more accessible to a broader segment of the population.

Canada's practical approach is in stark contrast to the shortsightedness of some developed economies that still impose hefty tariffs on Chinese EVs under the excuse of safeguarding "security" and protecting local enterprises. Protectionism only harms consumers by raising prices and stifles the technological progress of domestic industries by removing the incentive to be competitive.

That explains why the European Union — under growing pressure from its enterprises and consumers to open the market to Chinese EVs — has chosen to resolve its self-created problem with them through negotiations with China. The energy shortage triggered by the Middle East crisis has further driven consumers worldwide toward EVs.

Protecting inefficient industries only breeds stagnation; while embracing competition breeds innovation. The policymakers of the EU should heed the experience of Canada and view China's EV sector with objectivity.

The competitiveness of Chinese EVs stems from market dynamics. The technological edge of Chinese EVs lies in the country's complete industry chain, innovation and fierce market competition. The ability to source almost all the battery components within a single city cluster allows manufacturers to produce high-quality vehicles at lower costs.

Chinese EVs lower the barrier to green mobility for consumers worldwide, and support global climate goals. By embracing this, the Canadian government has made a rational choice to join many other economies in the world and opt for a path of shared prosperity and sustainable development.

Opinion Line

Aviation engineers give wings to soaring aerospace industry

In the realm of military aviation, few developing countries have made as remarkable a leap as China. From relying on imported aircraft to developing cutting-edge, world-class fighter jets, China's journey in aerospace is a testament to its engineering prowess and manufacturing capabilities.

The J-10 was China's first independently designed advanced fighter jet, heralding the beginning of a new era for the country's aviation industry. The J-10 was more than just an aircraft; it was a statement of China's intent to shed its reliance on foreign technology and carve out its own path in the skies.

The development of the J-10 was a groundbreaking achievement. It not only elevated China's technological and manufacturing capabilities but also nurtured a generation of engineers. These engineers, driven by patriotism and a commitment to excellence, laid the foundation for China's future aerospace endeavors. The J-10 proved that China could compete with the best in the world, ending the long history of the People's Liberation Army Air Force relying on imports and modified variants.

Building on the success of the J-10, the Chengdu Aircraft Design and Research Institute and Chengdu Aircraft Industry Group unveiled the J-20 in 2011, making China the second country in the world, after the United States, to develop and manufacture a fifth-generation stealth fighter.

The J-20 is a marvel of modern engineering, equipped with advanced stealth capabilities, supercruise and integrated avionics.

The J-20 has revolutionized China's aerial combat capabilities, providing the PLAAF with reliable long-range strike capabilities and enabling the construction of a modern combat system centered on stealth fighters.

Its success has not only boosted national pride but also symbolized China's growing comprehensive national strength.

The J-10 and J-20 have undergone significant upgrades, with variants such as the J-20A and J-20S leading the way. The J-20S, the world's first two-seater stealth fighter jet, represents a new frontier in aerial combat, capable of cooperating with drones to launch long-range attacks undetected by enemy forces.

In addition to its domestic success, China's aviation industry has made waves in the international arms market. The J-10CE, the export version of the J-10C, has proven its mettle in real combat.

This impressive performance has solidified China's status as a global player in the aerospace industry, attracting foreign buyers seeking powerful and reliable aircraft.

During a recent visit to the Chengdu Aircraft Design and Research Institute and Chengdu Aircraft Industry Group, I had the privilege of witnessing the J-20 and J-10CE up close. The high quality of the manufacturing is a testament to the dedication and expertise of China's aviation engineers.

As a journalist covering military affairs and defense technology, and as a military enthusiast, I am genuinely delighted by these achievements. The progress China has made in aerial combat capabilities is a source of national pride and a reminder of the incredible talent and determination of its people.

China's journey from lagging behind global powers to the current achievements of its modern aerospace industry is a remarkable story of innovation and perseverance. The J-10 and J-20 are symbols of China's growing strength and its ability to protect its skies.

To the aviation engineers who have made this possible, we extend our deepest gratitude. Your work has not only strengthened our nation's defense but also inspired a new generation of engineers and enthusiasts. Here's to many more advancements and a future filled with even more powerful aircraft to protect our motherland.

— ZHAO LEI, CHINA DAILY

What They Say

Strategic mineral security critical for country

Editor's note: *The outline of China's 15th Five-Year Plan (2026-30) calls for stronger efforts to prospect, develop and ensure reserves of strategic mineral resources. Liu Gang, a professor at the College of Urban and Environmental Sciences in Peking University, spoke to the 21st Century Business Herald about what these resources are and how China's mineral security can be ensured. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Strategic mineral resources are crucial minerals that serve as the core foundation for economic and industrial development. A country's list of strategic minerals may change as its economy and society evolve.

For example, petroleum has been regarded as a strategic mineral since the Industrial Revolution. Oil and natural gas resources power aircraft and road transport, and serve as essential raw materials for daily products such as chemical fibers, plastics and textiles.

A host of new technologies are being rapidly developed to replace petroleum both as an energy source and as a basic chemical material. For example, solar and wind power technologies can replace fossil fuels in power generation while bio-based materials can substitute traditional petroleum-based products.

Yet despite the rapid growth of clean energy capacity in China in recent years, fossil energy remains the mainstay of the country's energy consumption. It is relatively easy to diversify oil imports thanks to the wide distribution of oil-producing regions worldwide.

However, as the transition to clean energy and green, low-carbon growth advances, the emphasis has shifted to metals such as lithium, cobalt and nickel, which are important raw materials for electric vehicle batteries. Additionally, the development of artificial intelligence has led to an increase in the strategic importance of metals such as gallium and germanium, which are essential for semiconductors, integrated circuits and chips.

To enhance China's strategic mineral security, efforts could focus on four key areas: domestic prospecting, increasing reserves, diversifying imports and promoting recycling.

The country also needs to closely follow upgrades in technology. For example, though lithium, cobalt and nickel are all important for the lithium batteries in electric vehicles, the high prices of cobalt and nickel have spurred the development of lithium iron phosphate batteries, which are more economical. Such emerging technological routes driven by resource constraints and the need to stay cost-efficient deserve closer attention.

Efforts are needed to advance technology and promote the circular economy to reduce the consumption of these minerals, enhance their recycling and even replace them entirely.

The growth of AI has increased the demand for rare earth elements, which are also widely used in areas such as magnetic materials, luminescent and laser materials, hydrogen storage and atomic energy.

After years of development, China has established significant advantages in the global rare earth industry supply chain. In recent years, other countries have intensified efforts to catch up with China in this industry. However, it's unlikely that they will overtake China in the near term.

To consolidate China's advantages in rare earths, it is crucial to promote high-quality utilization of these resources, particularly by nurturing the high-end permanent magnet industry.

VIEWS

Olga Migunova

Russia, China forge stronger ties in turbulent times

SONG CHEN / CHINA DAILY

This year marks several milestones: the 30th anniversary of the establishment of the Russia-China strategic partnership of coordination, the 25th anniversary of the signing of the Russia-China Treaty of Good-Neighborliness and Friendly Cooperation, the beginning of China's 15th Five-Year Plan (2026-30), and the opening of the cross-years of education between the two countries.

Thus, 2026 is a chronological convergence for Russia-China relations. Within just a few months, four distinct historical trajectories — each with its own meaning, ranging from the geopolitical agreements of the 1990s to technological and humanitarian planning for the 2030s — have intersected. These trajectories form a new historical configuration of political, economic, humanitarian and diplomatic cooperation.

At the center of this convergence is the state visit of Russian President Vladimir Putin to China from Tuesday to Wednesday. These four milestones effectively shape the agenda of the visit. Amid global turbulence, the visit serves as a moment that "fuses" these timelines together.

It is a mechanism for synchronizing the development strategies of both countries for decades ahead. Its historical significance will not be measured by the length of the final communique or the number of contracts signed, but by its ability to connect the past, present, and future — assessing the past 30 years, adapting the legal legacy of the 2001 treaty to new challenges, aligning national strategies through 2030, and launching long-term personnel cooperation.

Thirty years ago, Russia-China relations achieved a historic breakthrough.

Over three decades, they evolved from cautious rapprochement after the collapse of the Soviet Union into what is now described as a "comprehensive strategic partnership of coordination", often seen as a model of major country relations.

This transformation reflected Russia's shift toward a multipolar foreign policy and China's need for stability along its long shared border, as well as balance in its relations with the United States.

The political breakthrough of 1996 was preceded by important groundwork, including agreements on confidence-building measures and mutual force reductions along the border. These established a legal framework that fostered trust. Today's relationship is often described as a new model of international relations based on the principles of "non-alliance, non-confrontation, and not targeting third parties", helping both countries avoid the classic "great power dilemma".

The Treaty of Good-Neighborliness and Friendly Cooperation formalized the legal foundation of bilateral relations in the 21st century, enshrining principles such as mutual respect for sovereignty, non-aggression, non-interference, equality, mutual benefit and peaceful coexistence. It committed both sides to resolving disputes peacefully and reaffirmed their pledge not to be the first to use nuclear weapons.

Originally valid for 20 years, the treaty was automatically extended in 2021 for another five years. The presidential visit is an ideal moment to reaffirm the commitment to its principles for the years ahead. Over the past 25 years, China and Russia have turned their coordination into a global factor. Their cooperation within the United Nations, the Shanghai Cooperation Organization and BRICS has become a key pillar of international governance.

Both countries act as stabilizing forces in the UN Security Council, often coordinating positions and advocating reforms to global governance systems.

They have also played leading roles in expanding and strengthening alternative international frameworks, particularly among developing countries and the Global South.

President Putin's visit is not merely about marking anniversaries but about evaluating three decades of cooperation and defining the parameters of a new stage — one shaped by China's 15th Five-Year Plan. This plan, while domestic in nature, sets clear technological and industrial priorities that will influence bilateral cooperation.

It emphasizes breakthroughs in areas such as 6G networks, artificial intelligence, big data, quantum technologies, biotechnology, semiconductors and green energy, with the overarching goal of achieving a high degree of technological self-reliance.

For Russia, this opens broad opportunities. The alignment of China's plan with Russia's Far East development strategy creates a natural platform for cooperation. The launch of international priority development territories in several Far Eastern regions of Russia offers favorable conditions for large-scale Chinese investment, supported by long-term guarantees.

Energy cooperation will remain central. In 2025, Russia and China signed the memorandum on the construction of the Power of Siberia-2 gas pipeline project.

Transport infrastructure is another key focus. Projects such as the Central Eurasian Transport Corridor, linking Siberia, Mongolia and western China, could significantly enhance connectivity.

Financial cooperation is also advancing rapidly. Russia and China have largely shifted to national currencies in bilateral trade, reducing vulnerability to external financial pressures.

Both countries advocate reforms to global financial institutions to make them more equitable and less politicized.

Beyond economics, deeper industrial and technological integration is becoming the new priority. This includes aligning the Eurasian Economic Union with the Belt and Road Initiative, as well as promoting the concept of a Greater Eurasian Partnership.

Education and human capital development play a crucial role in this process. The years of education (2026-27) aim to expand academic exchanges, joint campuses, and dual-degree programs.

In a global environment marked by instability, Russia-China relations have emerged as a stable anchor. The partnership reflects not only economic interdependence but also a shared perspective that rejects hegemony and emphasizes balance.

President Putin's visit will likely reaffirm this vision, demonstrating that the Russia-China partnership remains a pillar of stability in an increasingly turbulent world.

The author is the academic supervisor of the Center for the Study of China and Asia-Pacific Countries at St Petersburg State University of Economics.

Alexander Lukin

Old friendship in new era vital beyond Far East

Russian President Vladimir Putin's visit to China, from Tuesday to Wednesday, will be a commemorative occasion to some extent.

This year marks the 25th anniversary of the Treaty of Good-Neighborliness, Friendship and Cooperation between Russia and China as well as the establishment of the Shanghai Cooperation Organization.

These two initiatives have laid the foundation for the rapid strengthening of cooperation between the two countries, now seen by the two sides as a comprehensive strategic partnership of coordination for a new era.

The strengthening of the partnership has yielded tangible results. Over the past 25 years, more than 300 intergovernmental treaties and agreements have been signed.

There are five intergovernmental commissions, covering all areas of cooperation: economics, trade, humanitarian affairs, investment, energy, and interaction between border regions.

This comprehensive structure of strategic partnership extends from annual meetings of heads of state and government to cooperation between regions, provinces, municipalities, universities and companies.

There's hardly any major organization in Russia or China that doesn't have partners in the other country.

According to the Russian Ministry of Foreign Affairs, deepening relations with China is a priority for Russia, and aligns with the objectives of strengthening good-neighborliness and mutual development.

Neither Russia nor China has such a comprehensive system of cooperation with any other country in the world.

The partnership is based not on the similarity of ideologies, but on the strategic interests in an emerging multipolar world.

Both China and Russia aim to be the new poles of global influence.

Since the Western center of power, dominant since the collapse of the Soviet Union, is unwilling to relinquish its supremacy, rising non-Western centers of influence find common ground in balancing Western influence.

The goal is to gradually improve the global governance system.

Several other countries, including India, Brazil, South Africa and Indonesia, are potential players in this multipolar order.

This explains the growing popularity and influence of non-Western international organizations and groups such as BRICS, SCO, the Association of Southeast Asian Nations among several others.

The development of many of these forums, such as BRICS and the SCO, was initially spurred by the Sino-Russian proposals and the two countries' shared vision for the world order.

However, contrary to Western narratives, Russia and China do not seek to undermine the existing "rules-based" international order.

Following the collapse of the Soviet Union, the world order — based on the idea of sovereignty of states and the central role of the United Nations, where decisions were not made without the consensus of all permanent Security Council members — began to constrain the US and its allies' pursuit of complete dominance.

Theories such as the "responsibility to protect" emerged in the West, which, contrary to the UN Charter, effectively permitted interference in the internal affairs of sovereign states without their consent.

Russia and China rejected these ideas and advocated preserving the post-World War II international law.

Thus, Russia and China play a stabilizing role in international affairs.

This has been particularly evident in the policies of certain Western powers, which openly reject the principles of international law and proclaim the simple right of might, drawing mild criticism from their own allies that are accustomed to justifying their hegemonic goals with elaborate interpretations of international law.

At a meeting with Russian Foreign Minister Sergey Lavrov on April 15 in Beijing, President Xi Jinping urged closer and stronger strategic coordination between China and Russia to firmly defend their legitimate interests and safeguard the unity of Global South countries.

Xi also called on the two countries to shoulder their responsibilities as major countries and permanent members of the UN Security Council.

It is necessary for the two sides to fully leverage the advantages of proximity and complementarity, deepen cooperation on all fronts, and enhance the resilience of their respective development.

Xi also emphasized the need to strengthen multilateral cooperation, firmly uphold and practice multilateralism, join hands to revive the authority and vitality of the UN, engage in closer coordination and cooperation within the frameworks of the Shanghai Cooperation Organization and BRICS countries, and promote the development of the international order in a more just and reasonable direction.

These goals align with Russia's interests, and China exemplifies their successful implementation.

Despite some unfair criticisms from the West, China remains the most peace-loving and effective major power in the world.

For nearly half a century, its armed forces have not been deployed in any operation abroad, except for peacekeeping and UN-approved ones.

China does not participate in any regional conflict, but always expresses its principled position.

It has put forward peace initiatives, and even expressed a willingness to mediate in their resolution.

By focusing on domestic development, China has achieved unprecedented success, becoming the second-largest economy in the world.

It is approaching the status of moderately developed countries in per capita GDP, with a powerful and stable economy, a unique culture, and one of the best-equipped modern armies in the world.

Today, China is Russia's most important strategic and trade partner. Its role has grown particularly over the past four years, when Russia's ties with Europe have been curtailed.

At the same time, China is extremely interested in expanding cooperation with Russia, amid political and economic pressure from the US and its allies.

Under these circumstances, the strategic partnership between the two countries will only deepen.

The outcome of Putin's visit to Beijing will be closely watched around the world.

The author is the academic head at the Institute of China and Contemporary Asia of the Russian Academy of Sciences.

Bakhtizin Albert

Building stability in a fractured trading world

Current developments surrounding Iran, marked by sharp disruptions in trade flows and growing threats to the security of established maritime routes, are increasing uncertainty in global markets, national economies, and international supply chains. The question is, which countries are likely to be the worst affected and which are positioned to cushion the impact.

History offers a useful perspective. Local disruptions in major trade corridors have often produced consequences far beyond their immediate epicenters.

The Yom Kippur War of 1973, followed by the oil embargo, caused oil prices to surge, accelerated global inflation and pushed major economies into recession. The closure of the Suez Canal in 1956 and again in 1967 forced the restructuring of trade routes and raised transportation costs.

The current situation is considerably more complex, since supply chains have become longer, production systems are more sophisticated, and the density of the global trade network has increased.

To understand how the crisis unfolding in the Strait of Hormuz will affect different countries, it is important to examine the structure of the global trading system. There are three dimensions of global trade.

The first is a country's position within the trade network, which determines its connectivity with other economies. The key nodes here include the United States, China, Germany, France, the United Kingdom and Japan.

Their centrality means that disturbances reaching them can quickly affect large parts of the global economy.

The second is the scale of trade, or a country's share in global exports and imports. The leaders here are China, the United States and Germany. Their trade volumes are so substantial that fluctuations in their external demand or supply capacity are transmitted widely across markets.

The third is the breadth of trade ties, or the number of countries for which a given economy is among the principal trading partners.

By this measure, China is the clear leader. Its economic links extend across regions and development levels, making it one of the most deeply embedded participants in world trade.

Across all three characteristics, the leading economies are China, the US and Germany.

Within this space, China is the center of production and exports, the US is the financial center and a major consumption hub, while Germany is the core of European production chains.

The difference is that today such mechanisms can operate on a new technological foundation.

How do shocks spread through such networks? Typically, disruptions begin at a bottleneck, such as an important trade artery. Then the impulse spreads through the global network and reaches the central nodes, namely China, the US and Germany.

These countries act as shock absorbers and redistribute pressure across the network. The scale of their trade network makes it possible to redirect flows and compensate for supply disruptions. On the other hand, the peripheral nodes — countries that depend on a narrow range of suppliers, have limited trade structures and few alternative routes, and are not deeply integrated into the global network — suffer more from the disruption.

This fragility is reflected in global assessments. In April, the International Monetary Fund released its flagship report titled Global Economy in the Shadow of War in which it lowered its forecast for global GDP growth from 3.3 percent to 3.1 percent.

The report identified the escalation of the Iranian conflict, further fragmentation of the global trading system, and rising energy prices as among the main risks to future global development.

Other leading institutions such as the Organisation for Economic Co-operation and Development have also warned of global recession risks. The question is whether this applies to all countries and the mechanisms that each country has to escape stagnation and maintain steady development.

Interestingly, the answer comes from the IMF. In March, it published a paper titled Institutions for Industrial Policy: The Foundation of Economic Development.

An institution that for many years promoted minimal state intervention in the economy has finally acknowledged that market reforms alone are not enough. Citing the example of East Asian countries, the study notes that technological breakthroughs can be achieved through active industrial policies.

According to the researchers, long-term growth requires a dedicated agency for managing industrial policy. Its role would be to coordinate the state and business, support strategic sectors, align policy tools, and finance science and education. This would not be a traditional ministry functioning along rigid lines, but a flexible and learning-oriented development system.

Many elements of this model resemble Asian development institutions, especially those in China. They also have roots in the strategic planning traditions of the 20th century, including Japan's Ministry of International Trade and Industry and other successful historical experiences of state-led coordination.

The difference is that today such mechanisms can operate on a new technological foundation. Digital monitoring, modern balance systems and data analytics now make coordination more precise, timely and responsive.

In other words, the IMF has recognized the return of coordination tools once used by successful industrial states, particularly China.

The current global crisis may end not only in recession, but also in a reconsideration of the economic model itself.

But this alone may not be enough for sustainable development. Enhanced economic and technological collaboration between major economies, such as that between China and Russia, can bring greater stability. Their technological convergence, together with the combination of their resource capacities, could give rise to a resilient economic cooperation zone capable of maintaining stability amid global uncertainties and advancing as a new technological and industrial self-sustaining center in the evolving global governance landscape.

GLOBAL VIEWS

RONNIE LINS

Innovation as infrastructure

China's industrial modernization during the 15th Five-Year Plan period will bring about a shared endeavor for building technological capacity

WANG XIAOYING / CHINA DAILY

The 2026 Government Work Report does more than review annual targets. It signals a structural shift in how China approaches development. The country now treats technological innovation and industrial upgrading not as isolated domestic priorities, but as core elements of a systemic development infrastructure.

The projected GDP growth rate of 4.5 percent to 5 percent for 2026 reflects a deliberate strategy. China is prioritizing resilience, quality and deeper integration between science, industry and markets. For countries across the Global South, this shift offers more than new trade opportunities. It introduces a governance model that supports development without producing ecological strain or structural dependency.

China has redefined productivity at its core. Instead of separating research, industrial scale and commercialization, the country now aligns these elements within a unified development framework.

This transformation already shows in the expansion of innovation capacity. China's R&D spending has reached around 2.8 percent of GDP, surpassing the average of the Organization for Economic Cooperation and Development, while technology transactions continue to grow, strengthening the link between scientific research and economic application.

Public investment also plays a central role. Large-scale equipment upgrading programs do not simply modernize existing systems. They drive the digital transformation of traditional industries. Companies now deploy artificial intelligence, cloud computing and big data across manufacturing, logistics and supply chains. At the same time, China continues to strengthen advanced manufacturing clusters that combine quality standards, branding and intelligent production networks.

Beyond leading sectors, this transformation is increasingly reaching small and medium-sized enterprises, which are adopting digital tools to improve efficiency, reduce costs and integrate themselves into more advanced value chains. This diffusion of technology across different layers of the economy plays a central role in sustaining long-term productivity growth.

In parallel, the country is accelerating the development of future industries. It is making advances in fields such as quantum computing, next-generation telecommunications, advanced energy systems and brain-computer interfaces. Public and private capital supports these sectors through long-term investment structures designed to accommodate the longer cycles of deep-tech innovation.

This dual strategy ensures that productivity gains spread beyond high-tech sectors. The broader economy absorbs these gains, while new efficiency standards emphasize resource use, workforce capabilities and adaptability.

China has long recognized the gap between scientific discovery and large-scale application. The current framework addresses this challenge through institutional design rather than relying solely on funding.

The "AI Plus" initiative illustrates this approach clearly. The government is promoting large-scale deployment of AI across manufacturing, healthcare, logistics and public services. This creates stable demand for emerging technologies, reduces uncertainty and accelerates their commercial adoption.

In practice, this approach reduces the traditional fragmentation between innovation actors. Research institutions, technology companies and industrial producers now operate within more coordinated frameworks, supported by policy instruments that align incentives and reduce barriers to scale.

China has also elevated data to the status of a core production factor. Policymakers are supporting the development of high-quality data ecosystems, the expansion of computing infrastructure and improvements in mechanisms for valuing digital assets. Today, core digital economy industries already account for more than 10 percent of GDP, highlighting the central role of data in economic transformation.

At the same time, China strengthens intellectual property protection, improves capital market access for technology companies and encourages leading companies to organize innovation consortia. These measures connect research, production and commercialization more effectively.

As a result, innovation now operates within industrial standards, regulatory frameworks and public procurement systems. This integration accelerates market entry and ensures that domestic industries capture productivity gains before scaling internationally.

China does not regard external technological pressure as grounds for isolation. Instead, it pursues strategic autonomy while expanding openness in a more effective way.

The government continues to open sectors such as digital services, biotechnology and value-added telecommunications. At the same time, it strengthens domestic capabilities in key areas such as semiconductors, industrial software and advanced manufacturing equipment. This combination reduces vulnerability while maintaining international engagement.

Regional innovation hubs now play a central role in this strategy. Areas such as the Beijing-Tianjin-Hebei region, the Yangtze River Delta and the Guangdong-Hong Kong-Macao Greater Bay Area connect domestic innovation systems with global research networks. China is also promoting open-source AI ecosystems, joint laboratories and cross-border data governance initiatives.

This approach contributes to stabilizing global innovation systems by preserving channels for cooperation even under conditions of geopolitical uncertainty.

In the context of geoeconomic fragmentation, this model shows that technological sovereignty and international cooperation can reinforce each other. Shared infrastructure, transparent rules and mutual benefits create the foundation for stable collaboration.

China's transformation generates practical implications for developing countries. The 2026 Government Work Report points to concrete opportunities for cooperation.

First, integrating green transition and digitalization enables developing countries to bypass carbon-intensive stages of development. China has already scaled production in strategic sectors. Its output of new-energy vehicles has exceeded 16 million units, supported by expanding charging infrastructure.

Second, China's evolving approach to data governance and AI provides valuable reference points. Countries can adapt these frameworks to balance innovation, regulation and privacy within their own institutional environments.

For many developing countries, these opportunities go beyond access to technology. They also involve learning how to build institutional capacity, coordinate industrial policy and create long-term development strategies that integrate digitalization and sustainability.

Third, China does not frame cooperation as one-way technology transfer. It emphasizes co-creation, local capacity building and joint development. Platforms such as the Belt and Road Initiative, BRICS and the China-CELAC (Community of Latin American and Caribbean States) Forum increasingly reflect this approach, focusing on projects that generate both immediate results and long-term institutional gains.

For the Global South, the key lesson lies not in copying China's model, but in adapting its principles. Sustainable development requires strong institutions, long-term financing and cooperative governance structures.

As China continues to advance the 15th Five-Year Plan (2026-30), it will offer more than its national development experience. It will create a scalable framework for building technological capacity in a complex global environment. In this context, innovation-driven industrial upgrading no longer represents a competitive race. It becomes a shared endeavor.

SHU QUANFENG

Rural development

Digital platforms and AI tools are bridging the distance for China's migrant rural residents, fostering participation and governance in the countryside

As the waves of urbanization and industrialization surge forward, rural development and vitalization become a shared mission for nations worldwide. The effective utilization of digital technology can play a pivotal role in this mission by mitigating collective action dilemmas and governance vacuums caused by population outflow in rural areas. China's newly released outline of the 15th Five-Year Plan (2026-30) for national social and economic development explicitly calls for deepening the construction of a digital China and enhancing the level of digital-intelligent development, while the 2026 No 1 Central Document highlights the implementation of high-quality development actions for digital villages. According to the 57th Statistical Report on China's Internet Development, 5G networks cover all towns and 95 percent of administrative villages in China, with rural internet penetration reaching 69.5 percent as of December 2025. The digital landscape in rural China has leaped forward over the past decade, accumulating valuable experience for combating rural development challenges and fostering revitalization.

SONG CHEN / CHINA DAILY

On the one hand, the widespread adoption of digital rural governance platforms connects the floating population online, solving the problem of insufficient participation in rural governance. Spatial barriers and spatiotemporal dislocation were once core issues hindering the cohesion of mobile societies. However, digital technology has broken these shackles, allowing discrete mobile forces to converge online. For instance, as of March 2026, over 88,000 villages and 16 million villagers nationwide have joined the "village-level service platform", a digital governance mini-program. On this rural office automation system, every village has a dedicated home page featuring columns for village affairs disclosure, deliberation and consultation, grievance feedback and participation rankings. Villagers working or living anywhere in the world can follow their home village's page on their phones to stay updated on local dynamics. They can participate online in the consultation, decision-making and supervision of public affairs such as infrastructure construction, public service provision and collective resource management, and are incentivized to actively donate to collective activities that improve their hometowns.

On the other hand, digital-intelligent tools represented by large language models deeply empower grassroots cadres, effectively helping them govern villages and meet villagers' needs. By December 2025, the user base for generative artificial intelligence in China had reached 602 million. A 2025 survey by the China Institute for Rural Studies at Tsinghua University showed that 66.9 percent of village cadres now use AI tools such as Doubao and DeepSeek in their daily work to assist with decision-making and management. They utilize these tools to design public activity plans, produce promotional videos for local specialty products, draft rural revitalization project proposals and analyze data on public demands.

However, integrating digital technology into rural society is a complex process that is currently in a "running-in period", facing multiple constraints regarding subject capability, technology application and institutional norms.

First, the digital literacy of rural cadres and villagers needs improvement. According to a 2026 report by China Internet Network Information Center, as of December 2025, the digital literacy and skills of rural residents lagged behind those of urban residents by 24.6 percentage points. China Institute for Rural Studies data from 2025 indicates that 31.1 percent of village cadres can barely use office software, and 10.3 percent do not know how to use WeChat to issue notices or mobilize the public.

Second, the misuse of digital governance tools is prominent. The redundant construction of various digital governance tools is severe; most villages are required to fill out data for more than a score of apps, with some exceeding dozens. This leads to "digital burnout" among cadres, affecting their physical and mental health and their willingness to serve the public.

Third, lagging regulation has spawned a series of social risks. Government regulation often trails behind the iteration of digital technology, leading to increasing social risks in rural areas such as information cocoons, group polarization and even AI fraud. These risks can easily erode villagers' trust in digital technology.

The 15th Five-Year Plan emphasizes the importance of creating a beneficial, safe and fair environment in the development of digital technology. Given that high mobility will be a long-term structural feature of China's rural society, future digital transformation needs to accelerate into a new stage of high-quality development to provide continuous momentum for reversing rural decline and promoting comprehensive revitalization.

First, rural revitalization hinges on human resources. This means increased investment in improving the digital literacy and skills of villagers, implementing special actions to enhance the digital leadership of rural grassroots cadres and carrying out customized cultivation in digital services, governance, mobilization and marketing.

Second, technology is key to vigorously promoting innovation in digital governance tools. There should be increased research support for agriculture-friendly digital technology innovation to improve the utility and ease of use of rural digital governance platforms. The construction of an intelligent, standardized rural governance platform system should be accelerated, making digital platforms a smart hub that truly transcends time and space to efficiently aggregate rural resources.

Third, institutional backup is needed to strengthen the standardized management of digital applications. This includes adhering to the principle of balancing regulation and support, strengthening the governance of false and harmful information in cyberspace, and building an agile and efficient digital governance institutional system. Equally important are algorithmic value orientation and humanistic care, ultimately promoting technology for good to provide institutional guarantees for cohesion in a mobile society.

Departure tax refund levels up for visitors

Upgrade to help convert inbound tourism boom into retail growth

By **LI JING**
lijing2009@chinadaily.com.cn

China has rolled out an upgraded nationwide departure tax refund policy aimed at making shopping easier for foreign visitors and converting rising inbound tourism into a new driver of domestic consumption.

The measures, jointly issued by the Ministry of Commerce, the Ministry of Finance and the State Taxation Administration of China — alongside three other department bodies — represent a "2.0 version" of reforms first introduced in 2025 to improve China's departure tax refund system.

Officials say the latest upgrade focuses on expanding refund store coverage, reducing processing times and digitalizing procedures to improve the shopping experience for foreign visitors.

China's earlier reform package, released in April 2025, had already driven rapid growth in the program. National tax-refund sales nearly doubled in 2025 from a year earlier, while the number of foreign travelers claiming refunds rose to about 270,000, roughly three times the 2024 level.

"The departure tax refund system has entered a fast track," said Sheng Qiuping, vice-minister of commerce, at a conference on Monday.

Sheng said that the earlier measures, which lowered the minimum purchase threshold for refunds, raised the cash refund ceiling and expanded the number of participating retailers, combined with visa-free entry policies and improved payment services to boost inbound consumption.

The number of tax-refund stores nationwide has reached about 14,000, roughly four times the level at end-2024, Sheng added.

A major highlight of the upgraded policy is further optimization of the "buy and refund immediately" service, which allows overseas shoppers to receive their tax rebates directly at participating stores instead of waiting until departure.

Authorities plan to enable cross-regional recognition of the service, allowing travelers who obtain instant refunds at the point of purchase to complete verifications at a different departure port. The allowable departure period will also be standardized nationwide at 28 days.

Xie Wen, director-general of the goods and services tax department at the State Taxation Administration, said the program has already significantly boosted spending.

"After tourists receive tax refunds on the spot, it often stimulates further purchases," Xie said, adding that the number of users of the instant refund service surged 12.9-fold over the past year, while related sales and refund amounts rose more than ninefold.

The upgraded policy will also introduce a random inspection system for smaller claims. Starting July 1, purchases below 10,000 yuan ($1,380) will undergo spot checks instead of mandatory physical verifications — a move expected to shorten waiting times at departure ports.

> "More foreign visitors now come to China not only for sightseeing, but also to experience local lifestyles."
>
> **Yang Mu,** head of department of market operation and consumption promotion at the Ministry of Commerce

Authorities will also push forward paperless processing so that customs and refund agencies can verify refund applications and invoices online.

Experts say the policy marks a shift from merely simplifying procedures to strengthening the broader role of inbound consumption in China's economy.

"The core of the 2.0 reform is to move from 'process simplification' to 'value creation'," said Tian Lihui, a finance professor at Nankai University.

The reforms can reduce administrative friction while turning the tax-refund system into a platform for showcasing Chinese brands and culture to overseas consumers, Tian said.

The policy comes as inbound tourism to China continues to recover following a series of visa facilitation measures.

China has introduced unilateral visa-free policies for 50 countries and a 240-hour transit visa-free arrangement covering 55 countries in recent years.

In the first quarter, foreign nationals made roughly 8.32 million visa-free entries into China, making up 77.9 percent of all inbound foreign trips and representing an increase of 29.3 percent year-on-year, official data revealed.

Yang Mu, head of the department of market operation and consumption promotion at the Ministry of Commerce, said the surge in visitor numbers is changing consumption patterns.

"More foreign visitors now come to China not only for sightseeing, but also to experience local lifestyles," Yang said, adding that deeper cultural experiences and diversified consumption scenarios are becoming a growing part of inbound travel.

Officials say the upgraded tax-refund policy — together with improved payment services and expanded international flight connections — is expected to help convert the rising flow of visitors into sustained retail growth and strengthen the country's "Shopping in China" campaign aimed at attracting foreign consumers.

Inbound visitors line up for tax refunds at a Harmay store in Shanghai on April 23. CHEN YUYU / FOR CHINA DAILY

Landmark underway

China Railway Construction Corp Chairman Dai Hegen (second left) exchanges gifts with Sheikh Ahmed bin Saeed Al Maktoum (second right), chairman and CEO of Emirates Airline and Group, during the launch ceremony of the Emirates aircraft maintenance hangar project in Dubai, the United Arab Emirates, on Monday. The $5 billion mega project, built by State contractor CRCC, is expected to be one of the largest civil aviation maintenance facilities globally. With a construction area of 1.21 million square meters in Dubai South, the project — inked under the Belt and Road Initiative — will include eight heavy maintenance hangars and two paint hangars, capable of providing full-range services for 28 wide-body aircraft simultaneously upon completion in 2030. Telecom giants launch AI token services

By **CHENG YU**
chengyu@chinadaily.com.cn

China's telecom giants are racing to turn artificial intelligence into the country's next mass-market utility by selling tokens, the tiny units of computing consumption that power AI models, in a sign that the country's operators are trying to transform themselves from bandwidth providers into AI service brokers.

State-owned telecom carrier China Telecom announced on Sunday a series of trial token plans, offering consumers monthly AI usage packages starting at 9.9 yuan ($1.37) for 10 million tokens.

China Telecom's new plans cover both consumers and enterprise users. Small businesses and developers can purchase enterprise packages with up to 150 million monthly tokens for 39.9 yuan. The packages resemble mobile data plans, except the commodity being metered is AI computation instead of internet traffic.

In parallel, China Mobile launched a universal token service in Shanghai for consumer and office scenarios, allowing users to access different AI platforms under a single account and pay through phone bills.

The carrier partnered with Tencent Holdings to introduce an AI-native workspace platform targeting consumers and small businesses. The service offers 400,000 tokens for 1 yuan, with users able to switch between AI models under a unified pricing structure.

Wang Peng, a researcher of Beijing Academy of Social Sciences, said: "Chinese telecom operators are extending from selling connections to selling AI services. They are now competing to build integrated platforms combining computing power, AI models, intelligent agents and service gateways."

"Unlike AI startups, telecom operators do not necessarily compete on the lowest token prices. Their advantage lies in nationwide infrastructure, government-backed cloud networks and cybersecurity services," he said.

Xu Zhixin, director at the China Industrial Control Systems Cyber Emergency Response Team's software research division, said: "Cloud expansion is inevitable for operators. At its core, this is still resource-based supply. Chinese telecom operators are not simply trying to become an AI-era 'pick-axe seller'".

Telecom operators are embedding themselves deep into China's AI infrastructure stack. To make that model work, China Mobile is building a closed-loop AI ecosystem, aggregating AI models on one end while linking them to devices and applications on the other.

Its newly launched Mobile Model Management Platform (MoMA) connects not only China Mobile's in-house large language model, but also more than 300 mainstream AI models, including DeepSeek, Qwen, Doubao and GLM.

Using what the company calls a centralized token management system, MoMA dynamically routes user requests to different models depending on demand, helping reduce per-token costs by more than 30 percent while cutting computing resource usage by over 50 percent, according to the company.

Latest data from the National Data Administration showed that daily consumption of tokens had surpassed 140 trillion as of March, a more than 1,000-fold increase from the 100 billion recorded at the beginning of 2024 and over 40 percent higher than the 100 trillion recorded at the end of last year.

"The surge signals that China's AI industry is expanding quickly and evolving from basic chat functions to more sophisticated systems capable of decision-making and task execution," said Liu Liehong, head of the NDA.

Shanghai seen playing major digital role

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

The Shanghai pilot program for international cooperation in the data sector was officially launched during the recent Tech Week Shanghai, where experts and business leaders from home and abroad called for more global exchanges and further ties in the fast-evolving artificial intelligence era.

With data becoming a key factor of production that drives economic and social development, digital cooperation is reshaping the landscape of global governance. As part of the global Tech Week series, the newly inaugurated Tech Week Shanghai aimed to build a platform that connects China and the rest of the world in data cooperation.

During the opening ceremony, Yu Ying, deputy head of the National Data Administration, said Shanghai stood among China's first batch of pilot cities for international cooperation in the data sector.

The city, which is aiming to become a global digital hub, has developed a substantive and well-defined implementation plan, outlining 17 specific tasks centered on leading infrastructure, mutual recognition of rules, platform empowerment and scenario integration.

Yu said she expects Shanghai to strengthen efforts in diverse aspects, including promoting interconnection with international data infrastructure, enhancing alignment of international rules and standards, fostering an international data service chain, supporting digital businesses in overseas expansion, and deepening opening-up and multilateral data cooperation mechanisms.

"China's digital economy is currently at a critical turning point in its global expansion, shifting from a focus on quantity to a focus on quality," said He Renlong, secretary-general of Shanghai Digital Enterprise Globalization Association.

Also, as overseas markets rapidly raise requirements for compliance, data sovereignty, localization and brand value, Chinese digital firms are changing their mindsets from merely selling products to participating in the globalization of industry chains, standards and the digital ecosystem, added He.

Southeast Asian countries continue to be the most popular destinations for digital companies in Shanghai to expand overseas, while Latin America and the Middle East are booming with rapid growth, followed by Central Asia, Africa, and Central and Eastern Europe, which are all emerging with great potential, said the association.

"Shanghai is home to a large number of global players, and is naturally well-connected with the world. For companies, going global is a long-term strategy. Amid the external uncertainties and various risks, we hope to support more local firms, especially small and medium-sized ones, to get rooted in overseas markets," said He.

Singapore has seen close international cooperation with Shanghai in the digital sector. Ville Kulmala, president of DAMA Singapore, sees the two sides as "similar" and the cooperation between them is "complementary and a very good match".

Kulmala said China has very good regulations, and is very smart with massive adoption and market management. Similarly, Singapore also has strong and transparent regulations. In the fast-moving AI era, one of the biggest challenges for companies in AI transformation lies in "data foundations and strategy".

"In China, you have companies natively born in the data era like Alibaba, and players like Huawei. They are doing huge business abroad, and helped companies become digitalized all over the world with their best practices," Kulmala added.

Milind, principal AI scientist at Mercedes-Benz, agreed with Kulmala that international data cooperation could find its way with technology to cross the existing "borders" or "national boundaries". They both see enormous common good and opportunities for all ahead, as the world today becomes more interconnected as a whole in the AI era.

"The speed of innovation in China is mind-blowing. We have to continuously keep learning from each other ... We learn together, grow together, and that is the most powerful way to move forward," said Milind.

China ends reliance on racing fuel imports

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China's self-developed 103-grade racing gasoline was officially put into use in the Xinjiang Uygur autonomous region on Saturday, filling the domestic gap and ending reliance on imports for top races.

Previously dependent on imported fuel, China has now mastered the core technology needed to self-develop and manufacture racing fuel by China Petroleum and Chemical Corp, or Sinopec, which meets premier standards and has entered mass production.

This breaks China's long-standing reliance on imported fuels for top-tier motorsport events and fills the void in domestically produced high-performance racing fuel, said the State refining giant.

It serves as a major milestone, indicating that the nation's oil refining technology has reached world-class standards, it said.

Previously, China's high-end racing fuel market relied heavily on imports, with some teams blending their own oil, leading to high costs and unstable supply chains. The launch of this domestic product changes this situation, as it meets top racing standards and realizes industrial mass production, marking China's mastery of core technology in high-grade racing gasoline, it added.

> This strategic pivot not only meets the rising international demand for eco-friendly and premium-quality goods, but also safeguards profitability in an increasingly crowded market."
>
> **Lin Boqiang,** head of China Institute for Studies in Energy Policy at Xiamen University

Experts believe the initiative marks a milestone in the refining industry, boosting related industrial chains, as China is securing higher profits by targeting the markets for specialized chemicals and cutting-edge materials.

"This strategic pivot not only meets the rising international demand for eco-friendly and premium-quality goods, but also safeguards profitability in an increasingly crowded market," said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Even with escalating global rivalry, Lin believes that China maintains a robust competitive edge thanks to its complete industrial supply chain, massive domestic consumer base, and continuous funding for new technologies and facilities.

According to Sinopec, the racing fuel is specifically designed to provide explosive power, rapid acceleration and smooth operation for high-speed, heavy-load motorsport engines.

Through integrated research and production, this premium fuel guarantees a stable, high-performance supply that aligns with rigorous professional racing and environmental standards.

A report by the China Petroleum and Chemical Industry Federation said the Chinese petrochemical sector will transform into a greener, more innovative and globally connected leader, as the nation navigates the worldwide shift in energy.

China's petrochemical industry has been investing heavily in green technologies and circular economy practices, aligning with the country's broad environmental goals and the global green push, said Fu Xiangsheng, vice-president of the federation.

Pet-friendly travel demand on upswing

Report says 71% of furry friend owners show interest in traveling with their animals; about half have paid for such services

By LI JING
lijing2009@chinadaily.com.cn

Dog owners bring their pets to a park in Anji county, Zhejiang province, on May 5, to participate in a dog beauty pageant. Anji county has been making various tourist attractions pet-friendly in recent years. PAN XUEKANG / FOR CHINA DAILY

Left: Tourists with their dog take a cable car ride at the Jiuziyan Scenic Area in Qingyang county, Anhui province, on Feb 9. CHU WEIWEI / CHINA NEWS SERVICE **Right**: A man and his dog walk through the streets of the old town of Linhai in Taizhou, Zhejiang province, on May 4. YI FAN / FOR CHINA DAILY

When Zhang Yi packed her bags for a recent holiday trip to the grasslands of the Inner Mongolia autonomous region, she made sure one companion was not left behind: her beloved Shiba Inu.

The Chongqing-based pet owner has traveled with her dog to more than 20 cities across China, usually by car. On this trip, the pair camped on the vast Hulunbuir grassland, where her dog ran freely around the prairie.

"I treat my dog as family," the 31-year-old said. "I'm busy with work most of the year, so traveling together is a way for us to spend more time together and for my dog to experience new environments."

Zhang is part of a growing wave of Chinese travelers who refuse to leave their "furry children" behind. Once considered a niche hobby among dedicated pet owners, traveling with animals is increasingly shaping China's tourism market, from hotels and campsites to transportation and destination services.

Data from online accommodation platform Tujia.com show that bookings for homestays labeled as "pet-friendly" during the five-day May Day holiday in 2025 rose more than 80 percent from a year earlier, while the number of such listings on the platform increased fivefold. Industry participants say the momentum has continued into 2026 as more travelers seek accommodations that allow pets.

The trend reflects a broader shift in consumer behavior as younger Chinese view pets less as animals and more as companions integrated into their daily lives.

"We see pet-inclusive travel as a structural trend rather than a short-term fad," said Kathy Jiang, a partner expert at consultancy Roland Berger. "It is driven by the growing perception of pets as family members and the consumption upgrade among younger pet owners."

China's tourism industry is now moving from simply allowing pets in certain venues toward actively designing services around them, Jiang said, although standards and supporting facilities remain uneven.

China's broader pet economy provides a powerful backdrop. The 2026 China Pet Industry White Paper (Consumer Report) said the number of pet dogs and cats in the country's urban areas exceeded 120 million, with the market for pet-related consumption reaching about 312.6 billion yuan ($45.92 billion) in 2025. The market is expected to expand further to 405 billion yuan by 2028.

The report found that 71 percent of pet owners expressed interest in traveling with their animals, and about half had already paid for pet-related travel services.

Tourism operators say the change is already visible in bookings. At the Hu Resort in Beijing, which began developing pet-friendly services in 2019, demand has risen sharply in recent years. Shang Li, the resort's marketing manager, said inquiries, visitor numbers and bookings for pet-friendly rooms during this year's May Day holiday all doubled from a year earlier.

Shang said most guests traveling with pets are young urban professionals aged 25 to 40, who treat their animals as family members and typically seek short leisure breaks in suburban destinations.

Compared with ordinary guests, these travelers often stay longer, return more frequently and spend more on dining and other services, she added.

Travel agencies are experimenting with niche offerings. Outdoor travel platform Youxiake.com launched a pet travel brand in 2024, offering short-distance hiking and holiday itineraries designed for travelers with pets.

Li Yunzi, the company's general manager, said professional pet travel involves far more than simply allowing animals to join a trip.

"It means designing the experience from a pet's perspective rather than treating them as passive companions," Li said in an interview with The Economic Observer, noting that routes are screened to ensure suitable terrain, rest stops and outdoor space for dogs.

Meanwhile, local governments and tourism operators are increasingly trying to capture a share of the growing market.

More than a dozen Chinese provinces and cities have introduced policies encouraging the development of pet-friendly tourism as part of the broader pet economy. Measures range from supporting pet-themed events to encouraging hotels, scenic areas and campsites to develop dedicated facilities.

For now, most pet travel in China remains short-distance and car-based. On highways and in suburban campsites during the May Day holiday, it was common to see pets accompanying their owners. Many travelers prefer driving to nearby destinations, which allows flexibility and avoids complicated transport restrictions.

Cross-province trips by air or train remain far less common.

Li Mengran, marketing manager at Beijing-based travel agency Utour, said the company's dedicated pet travel brand PetGo — launched in January — has seen steadily rising inquiries from travelers hoping to bring pets along.

However, actual bookings did not increase significantly during the recent May Day holiday because of soaring airfares.

"The main customer group for pet travel is young travelers, who tend to be price-sensitive," Li said. "During holidays, air ticket prices rise sharply. That filters out many potential customers even if interest is high."

Pet owners also tend to prioritize keeping their animals close throughout the journey. If airlines only allow pets to travel as checked cargo, many customers abandon the idea entirely.

"The possibility of pets staying in the cabin is often the first question travelers ask," Li said.

Transportation rules have long been one of the biggest bottlenecks for pet travel in China, though recent policy changes suggest gradual improvement.

In April, China expanded a pet transport service on its high-speed rail network, allowing pets that meet certain requirements to be checked as cargo on more than 200 train routes across more than 120 stations, according to China Railway Express.

Airlines are also experimenting with pet-friendly services. Carriers such as China Southern Airlines and Xiamen Airlines have launched limited trials allowing small pets in aircraft cabins on selected routes, while some airports in cities including Shenzhen and Guangzhou in Guangdong province have introduced pet lounges and specialized check-in counters.

These developments are gradually removing some of the logistical barriers for travelers hoping to bring pets along.

Industry experts say the impact of pet travel extends well beyond tourism itself.

Jiang of Roland Berger said the sector could stimulate a wider supply chain, from travel gear and in-car pet equipment to smart wearable devices and pet healthcare services.

At destinations, the trend may encourage scenic areas to develop pet-walking trails, campsites to offer dedicated facilities and local businesses to expand into services such as grooming, pet photography and post-trip health checks.

"In essence, travel spending shifts from 'one person' to 'one person plus one pet', which significantly raises the average spending per visitor," Jiang said. "It can also help destinations attract off-season traffic."

Despite the rapid growth, the industry still faces major challenges.

China lacks unified rules governing pet access to hotels, scenic areas and transportation, meaning travelers often have to confirm policies repeatedly before departure.

"In Europe and the United States, pet-friendly travel is already integrated systematically into transportation, accommodation and public spaces," Jiang said. "In China, the biggest problem is that policies remain inconsistent and sometimes change without clear notice."

Emergency services, transport connections and deeper experience offerings also remain underdeveloped, making it difficult for travelers to enjoy a seamless end-to-end journey with their pets.

For Zhang Yi, the Shiba Inu owner from Chongqing, the progress is nevertheless visible.

"China still has a long way to go in becoming fully pet-friendly," she said. "But compared with a few years ago, the environment for traveling with pets has clearly improved."

Booming Chinese pet sector driving innovative health, nutrition solutions

By LI JING

A scientist examines a sample with laboratory equipment in the office of Danish biosolutions company Novonesis in Beijing's Haidian district in 2025. PROVIDED TO CHINA DAILY

As Chinese pet owners increasingly demand science-backed nutrition rather than traditional pet food, global biotechnology suppliers are moving to tap into a domestic pet economy projected to grow significantly by 2028.

Danish biosolutions company Novonesis has made China a priority market for its new pet business unit launched in 2025.

The company, formed in 2024 through the merger of enzyme producer Novozymes and probiotic specialist Chr. Hansen, positions itself not as a pet food brand, but as an upstream biotechnology supplier, providing enzymes and microbial solutions for pet nutrition and health.

Its entry reflects a broader shift in China's fast-growing pet economy, where global pet firms are increasingly targeting the country not only as a consumer market, but also as a base for research, production and partnerships with local brands.

"China is both a growth engine and an innovation testing ground for pet nutrition solutions," said Jack An, head of sales for animal biosolutions in the Asia-Pacific region at Novonesis.

China has become the world's second-largest pet market, fueled by rising urban incomes and shifting attitudes toward pet ownership among younger consumers who increasingly treat animals as family members.

The 2026 China Pet Industry White Paper (Consumer Report) stated that the number of pet dogs and cats in the country's urban areas exceeded 120 million in 2025. Spending on pet-related consumption reached approximately 312.6 billion yuan ($45.92 billion) in 2025 and is expected to grow to around 405 billion yuan by 2028.

The market is also evolving rapidly. "Consumers are moving away from marketing claims toward ingredients, scientific evidence and measurable benefits," An said. "That trend creates opportunities for upstream biotechnology."

Unlike multinational pet-food giants such as Mars Incorporated or Nestle Purina PetCare, Novonesis focuses on supplying functional ingredients, particularly enzymes and probiotics, that manufacturers incorporate into finished products.

Its first products launched in China target two common concerns among pet owners: digestive health and hairball management in cats.

One solution uses keratinase enzymes designed to break down ingested hair in cats' digestive systems, potentially reducing hairball formation. Another is a probiotic blend based on bacterial strains developed by Chr. Hansen, aimed at stabilizing gut microbiota and improving immunity in dogs and cats.

An said the dual "enzyme plus microbe" technology platform reflects the combined strengths of the merged companies. "The combination allows us to design more targeted functional solutions, from digestion to nutrient absorption," he said.

To stay competitive, foreign firms are increasingly localizing their supply chains, and Novonesis has expanded its manufacturing and innovation footprint in China.

Novonesis employs more than 1,000 people in the country and operates multiple facilities, including enzyme production sites in Tianjin and Suzhou, Jiangsu province, as well as a microbial manufacturing base in Shenyang, Liaoning province. Its regional headquarters and research center are located in Beijing.

Most products for the Chinese pet market are already produced locally, and the company is considering additional capacity expansion as demand grows.

Beyond production, An said collaboration with Chinese partners — from pet food brands to universities and research institutes — is increasingly central to its strategy.

"China's market moves very fast," he said. "Working with local partners allows us to translate laboratory science into scalable commercial solutions more quickly."

Industry analysts say China's pet sector is entering a more mature phase, characterized by stricter regulatory oversight and greater emphasis on scientific validation.

Research from Euromonitor International shows premiumization and functional nutrition are key drivers of growth in the global pet food market, a shift that is becoming increasingly evident in China as pet owners treat animals more like family members.

At the same time, competition is intensifying as domestic brands rapidly improve product development and marketing capabilities.

An acknowledged that the sector still faces challenges, including product homogeneity and the difficulty of translating laboratory research into stable, large-scale manufacturing.

"From the lab to mass production, maintaining consistent performance and compatibility with different formulations is one of the biggest technical hurdles," he said.

Still, he sees China's pet market as offering long-term structural growth rather than a short-term consumption trend.

"The shift toward more scientific and functional nutrition is only beginning," An said. "For biotechnology companies, China is one of the most dynamic places in the world to innovate in pet health."

BLUEPRINT INTO ACTION

Shanghai to step up efforts for robust GDP and tech growth

New quality productive forces to push city's development in next five years

By SHI JING in Shanghai
shijing@chinadaily.com.cn

Shanghai will step up support for new quality productive forces during the 15th Five-Year Plan (2026-30) period, as they are expected to serve as key engines for the city's high-quality development, the city's top officials said at a municipal news conference on Monday.

While Shanghai has set a target of 5 percent annual GDP growth over the next five years, its role as an international hub for technological innovation should be further consolidated, Shanghai Mayor Gong Zheng said.

Total social research and development expenditure will account for more than 5 percent of the city's GDP by 2030, he said.

To achieve these goals, Shanghai will further leverage enterprises to spearhead innovation, while improving the efficiency of transforming scientific and technological achievements into practical applications.

"Smart, green and integrated" will characterize the optimization and upgrading of the city's industrial structure, Gong said.

Shanghai will also build a pioneering zone for basic research. National-level laboratories based in the city will take the lead in advancing basic research, while mechanisms facilitating interdisciplinary coordination will be improved, he said.

Scientific data sharing and exchanges will also become more efficient so that Shanghai can better integrate into the global innovation network, Gong added.

As rapid advances in artificial intelligence are driving industrial transformation worldwide, Shanghai will seize the opportunity to build an economy powered by intelligent technologies, said Tang Wenkan, director of the Shanghai Municipal Commission of Economy and Informatization.

Key industries including integrated circuits, high-end equipment manufacturing and automobiles will each foster 10 benchmark enterprises, Tang said.

By the end of the 15th Five-Year Plan period, Shanghai's factories are expected to deploy at least 100,000 humanoid robots. The penetration rate of AI agents among industrial enterprises with annual sales revenue of at least 20 million yuan ($2.9 million) is expected to exceed 80 percent, he added.

Shanghai also aims to cultivate a number of blockbuster applications and professional service providers in knowledge-intensive sectors such as legal and accounting services.

As AI coding becomes another major trend, local companies specializing in AI-native industrial software and AI-upgraded traditional software are expected to emerge, Tang said.

In addition, the city plans to establish closed-loop laboratories for new materials and biomedical companies, incubating up to 100 star projects.

Shanghai will better coordinate the development of open-source foundational models, commercial foundational models and sector-specific models, while promoting the sound development of high-performance AI computing chips, high-quality datasets and high-efficiency AI computing clusters, according to Tang.

These efforts will support model iteration and upgrades, as well as the large-scale application of embodied AI, he said.

Shanghai will issue 1 billion yuan in vouchers for companies to access computing power, datasets and models through pay-after-use arrangements or automatic qualification mechanisms, Tang added.

Liu Jian, director of the Shanghai Municipal Development and Reform Commission, said the city will optimize the layout of computing power infrastructure to improve the efficiency of cross-regional computing power resource allocation amid growing demand.

More than 300,000 highly skilled professionals in related fields will be introduced to Shanghai over the next five years, Liu said.

Shanghai will also increase imports of high-end equipment, core components and materials, as well as advanced technologies and equipment, to better support the development of new quality productive forces and industrial upgrading, said Shen Weihua, director of the Shanghai Municipal Commission of Commerce.

Judicial authorities pledge to protect cultivated land

By CAO YIN
caoyin@chinadaily.com.cn

China's judicial authorities have committed to strengthening the protection of cultivated land as part of efforts to ensure food security and reinforce the legal foundation for sustainable agricultural development.

The Supreme People's Court and the Supreme People's Procuratorate recently jointly issued a 21-article judicial interpretation aimed at addressing the illegal occupation of cultivated land, facilitating the efficient handling of related administrative, civil and criminal disputes, and further unifying adjudication standards, thereby effectively safeguarding the legitimate rights and interests of farmers.

For example, the interpretation explicitly prohibits acts such as occupying cultivated land to build structures or graves, digging sand, quarrying, mining, taking soil, and contracting for the sale or lease of houses built on such land. It requires courts to void contracts involving such acts.

According to the interpretation, which took effect on Monday, if the illegal occupation of cultivated land causes environmental pollution or ecological damage that harms the interests of the state or the public, prosecutors are allowed to initiate public interest litigation.

It stipulates that those who commit the crime of illegal occupation of agricultural land while also engaging in environmental destruction or illegal mining should face harsher punishment. Acts such as refusing to rectify illegal land occupation after being ordered to do so by administrative authorities, violently resisting or obstructing government officers, or bribing the officers will also be deemed serious offenses, leading to more severe penalties.

In addition, the interpretation strengthens oversight of law enforcement personnel. It clarifies that government officers who engage in malpractice for personal gain or abuse their power by illegally approving the expropriation or occupation of cultivated land, causing serious consequences while also accepting bribes, should face harsher punishment for multiple crimes concurrently.

"Cultivated land is the backbone of food production, so stronger legal measures must be used to enhance its protection and improve its quality, as required by the central authorities," said Geng Baojian, a member of the judicial committee of the SPC. In January, the central leadership explicitly called for resolute action against the destruction of cultivated land and the illegal construction of houses on rural farmland.

Geng noted that Chinese courts have continuously strengthened the adjudication of cases involving cultivated land in recent years to ensure the security of land resources, food and the ecosystem. Data shows that between 2020 and 2025, courts countrywide concluded nearly 240,000 administrative cases, around 400,000 civil cases and more than 45,000 criminal cases related to this field.

To improve the efficiency and quality of adjudication, the top court has publicized a number of landmark cases and formulated various judicial policies and documents, including those addressing criminal cases involving damage to land, grasslands and forests, as well as rules on handling illegal structures on occupied farmland, according to Geng.

Yu Shuangbiao, deputy head of the legal policy research office of the SPP, highlighted the timeliness of the new judicial interpretation. He said allowing prosecutors to initiate public interest litigation against the illegal occupation and destruction of cultivated land is a significant step toward strengthening environmental protection through legal oversight.

He emphasized that the move also implements the Ecological and Environmental Code, which was adopted in March as China's second law titled a "code" and serves as the legal foundation in this field.

Yang Jianbo, head of the research office, revealed that Chinese prosecutors have also formed collaborative mechanisms to protect cultivated land by launching special campaigns with other government departments.

"For example, we've worked with the Ministry of Agriculture and Rural Affairs to support the development of high-standard farmland," he added. "We've joined forces with the Ministry of Natural Resources to establish a land enforcement mechanism aimed at strengthening the protection of cultivated land and safeguarding public and state interests."

Chaoyang district plans a global hub for toy IPs

By YANG CHENG
yangcheng@chinadaily.com.cn

Beijing's Chaoyang district has unveiled a three-year action plan to turn itself into a global hub for trendy toy intellectual property, targeting industry revenue of more than 50 billion yuan ($7.35 billion) by 2028 with annual growth of no less than 20 percent.

The plan, released on Monday during the ongoing 2026 China New Cultural and Creative Market & Trendy Toy Carnival, outlines ambitions to incubate at least 10 blockbuster toy IPs and build the district into a center for leading companies, immersive consumer experiences and overseas brand expansion.

Yin Yuan, deputy district head of Chaoyang, said the government will introduce targeted support measures covering original design, enterprise cultivation, technological innovation, product launches and talent development.

"We aim to establish a full-chain support system spanning creation, commercialization, consumption, international expansion and related services," Yin said. "The policies are designed to help companies reduce costs, improve efficiency and strengthen their global competitiveness."

The district also announced on Monday the launch of an international industry organization aimed at bringing together leading companies and promoting cooperation across the trendy toy sector.

During the event, Hu Jian, vice-president of Pop Mart International Group and general manager of Pop Mart City Park, which is located within Chaoyang Park, said: "The park opened a new area in late April featuring the IPs of Labubu and Dimoo, along with captivating attractions and 17 new interactive games to enhance engagement and storytelling, creating a thematic world for visitors to fully immerse themselves in the vibrant narratives of its IPs."

The fully renovated Pop Mart City Park is set to open on July 30 with upgraded facilities, becoming a new engine driving the district's efforts to promote local IPs.

The carnival, regarded as China's first national-level event dedicated to cultural creativity and trendy toys, opened on May 15 at Chaoyang Park and will run through Sunday. Covering about 66,000 square meters, the event features exhibitions, creative products, intangible cultural heritage displays and digital technology showcases.

Several leading museums, including the Palace Museum, the National Museum of China and the Sanxingdui Museum, are participating in the event. In addition, examples of 43 national, provincial and municipal-level intangible cultural heritage crafts are on display.

China to study human embryo models in space

By LI MENGHAN
limenghan@chinadaily.com.cn

The successful launch of the Tianzhou 10 cargo spacecraft on May 11 carried human embryo models into space. This marks the world's first in situ experiment to explore how microgravity and cosmic radiation affect early human development under space conditions — a crucial step toward understanding whether humans can one day live and reproduce in space.

The mission is expected to help scientists establish a technical framework for studying artificial embryo development beyond Earth.

Rather than being real human embryos, these are "embryo-like structures" created in a laboratory using stem cells. They closely mimic the structure of a natural early human embryo but carry fewer ethical restrictions, can be produced in large quantities, and offer highly reliable, repeatable results.

Crucially, these models possess the ability to mimic early cellular growth and follow the most critical stages of early human development. However, they are not real embryos and cannot develop into a human being.

Yu Leqian, a professor at the Chinese Academy of Sciences' Institute of Zoology and head of the project aboard Tianzhou 10, said these models cover the developmental stage from day 14 to 21 after fertilization.

"This stage is a critical window in early human development, during which the building blocks for future organs begin to form, and the entire body axis — which determines the head and the tail — is established," Yu said. He noted that any disturbance at this stage could have a profound impact on an adult individual.

"Therefore, these models were brought to space to explore whether life, which has evolved under gravity for hundreds of millions of years, is affected by its sudden absence," he added.

Ground-based simulations cannot fully replicate the unique environment of space.

The Tianzhou 10 launch provides a rare, true microgravity environment complete with actual space radiation. The embryo models are expected to grow naturally in orbit. A preprogrammed system will automatically replace the liquid culture nutrients every day, allowing the models to complete five days of development. Afterward, the samples will be frozen and stored, ready for analysis upon their return to Earth.

Two specific types of models have been sent to the Chinese space station, Tiangong, to study key milestones in early life. The first is a peri-implantation model, which mimics the critical phase where an embryo attaches itself to the uterine wall. The second is a peri-gastrulation model, which replicates gastrulation, a fundamental event in early development where a single layer of cells reorganizes into the distinct layers that will eventually form different tissues and organs.

"By comparing embryo development in space with that on the ground, we can investigate how the space environment impacts critical events in human development," Yu said. "We can also assess how accurately these models can substitute for natural embryos in space studies, thereby laying a technical foundation for future research."

Yu highlighted that the study will help reveal the risks and challenges humans might face during long-term space habitation, particularly regarding reproduction. Furthermore, by comparing space-grown models with those on Earth, the research could provide fresh insights into which human diseases are linked to abnormalities during the earliest stages of life.

Icebreaker at home

The polar research icebreaker *Xuelong 2*, or *Snow Dragon 2*, returns and docks at its home base in Shanghai on Monday, marking the successful conclusion of China's 42nd Antarctic expedition. PROVIDED TO CHINA DAILY

POLICY REVIEW

Plan to supercharge services potential

State Council aims to grow scale, increase quality of promising consumption sector

By **WANG KEJU**
wangkeju@chinadaily.com.cn

JIN DING / CHINA DAILY

China has rolled out a set of guidelines to upgrade its services sector, where significant consumption potential remains to be unlocked to help rebalance the world's second-largest economy and sustain its long-term growth, economists and executives said.

For Chinese consumers, the shift promises more choice, higher quality and greater convenience, they noted. For domestic and foreign service providers alike, China's fast-expanding services market means broader development opportunities.

In late April, the State Council, China's Cabinet, released plans to improve the capacity and quality of the services sector, with the goal of growing its total scale to 100 trillion yuan ($14.65 trillion) by 2030.

Dedicated efforts will be made to steer producer services toward "greater specialization and higher positions in the value chain", according to the plans, while making consumer services "more quality-oriented, diversified and convenient".

More "China services brands" will be fostered by 2030, with the sector's global competitiveness and influence significantly enhanced, and people's sense of gain steadily improving, the plans said.

In recent times, China has attached greater importance to the development of its services sector. The country held its first national conference on the services sector in early April, while its latest five-year plan also calls for improving the sector's quality, efficiency and competitiveness.

China's services sector has achieved steady growth in recent years, with its value-added reaching 80.9 trillion yuan in 2025, accounting for 57.7 percent of GDP and contributing 61.4 percent to economic growth, data from the National Bureau of Statistics showed.

Enhancing producer services has become a central pillar of China's services sector development, with executives pointing to significant untapped potential that could boost growth and drive industrial transformation.

China's producer services sector, which includes logistics, finance, R&D, design and IT services, accounted for less than 35 percent of GDP in 2025, said Jean Lu, Standard Chartered Bank's CEO for China, noting that in advanced economies, that figure typically ranges from 40 to 50 percent.

"This gap indicates that China's manufacturing supply chains still have substantial room to extend into service-related activities, offering considerable growth potential for the economy," Lu said.

Xu Shaofeng, senior vice-president of Schneider Electric, said that the services sector can help manufacturing move toward higher-end, smarter and greener production through technology empowerment, value enhancement and business model innovation.

This, in turn, boosts product value, brand visibility and supply chain efficiency, while manufacturing upgrading creates even broader space for service providers, Xu said.

"Many companies now face challenges in their transformation, making their need for professional services more urgent than ever. Services have shifted from a 'nice-to-have' to a 'must-have' for competitiveness and value creation," Xu added.

The value added of information transmission, software and information technology services rose 10.6 percent year-on-year in the January-March period, while leasing and business services expanded 12.2 percent, according to the NBS.

In addition to boosting producer services, emphasis should also be given to consumer services, as China's service retail sales grew 5.5 percent year-on-year in the first quarter, outpacing goods retail by 3.3 percentage points.

"In recent years, as living standards have risen, Chinese households have shifted from a goods-dominated consumption model to one where goods and services carry equal weight," Kong Dejun, director-general of the Ministry of Commerce's trade in services department, said at a February news conference.

From 2020 to 2025, per capita spending on services grew at an average annual rate of 8.5 percent, ministry data showed. Its share of total household expenditure rose by 3.5 percentage points over the same period, reaching 46.1 percent in 2025.

Mao Yibing, president of Marriott International Greater China, said that in the consumer services sector, China's market is unleashing new opportunities. Demand for quality consumption remains strong, and consumers are paying increasing attention to experiences.

The vast potential of China's leisure travel market is particularly evident, with weekend getaways, family trips, cultural exploration and sports entertainment emerging as key priorities for Chinese travelers, Mao said.

Mao noted that the hotelier will continue expanding its presence in first-tier and emerging first-tier cities, popular tourist destinations, and across business and leisure travel segments, aiming to capture a larger share of one of the world's fastest-growing service consumption markets, she added.

Greater openness is also imperative to advance the high-quality growth of the services industry, as the country will steadily expand its pilot opening-up programs in areas including value-added telecommunications, biotechnology and wholly foreign-owned hospitals, according to the State Council plans.

China will also improve the management of the negative list for cross-border trade in services and build demonstration zones for the innovative development of trade in services.

"By orderly guiding more foreign-funded enterprises to participate in the development of China's services sector, we can effectively improve the quality of service supply," said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

"Foreign companies entering the Chinese market gain vast opportunities, bring advanced concepts and technologies, and create complementarity and synergy with local firms," Zhou added.

Alex Gu, senior vice-president of Medtronic, said that China has been continuously improving the development environment for foreign-funded medical service providers and supporting their introduction of advanced overseas medical technologies and services to the Chinese market.

Last year, Medtronic launched its first digital medical innovation hub in China, focusing on the development of disease management solutions powered by artificial intelligence and big data.

"Leveraging this center, we hope to explore more personalized, intelligent and efficient treatment options, and transform Chinese medical practices into innovative models with global significance," Gu said.

Policy Digest

Blueprint to strengthen oversight of healthcare fund

The National Healthcare Security Administration has issued a five-year action plan for 2026-30 to enhance the supervision and efficient use of the healthcare security fund, with the goal of establishing a comprehensive regulatory system by 2030.

Key measures outlined in the plan include intensifying on-site inspections, empowering oversight using technology such as big data and artificial intelligence, and improving the long-term legal framework.

Official data shows that as of the end of 2025, China's basic medical insurance fund recorded 3.5 trillion yuan ($514 billion) in revenue and 3 trillion yuan in expenditure, with over 1.33 billion people enrolled nationwide.

Regulators put safety of new energy vehicles in spotlight

Chinese regulators have called for the strengthened safety management of new energy vehicles to ensure the sector's healthy development, according to a recent video conference jointly held by three government bodies.

The meeting was attended by officials from the Ministry of Industry and Information Technology, the State Administration for Market Regulation, and the National Fire and Rescue Administration.

Relevant automakers and power battery enterprises are required to take primary responsibility for product quality and safety, as well as to strengthen risk prevention in research and development, production, supply chain and after-sales services, the conference heard. Companies were urged to avoid false or exaggerated promotion.

The regulators vowed to jointly conduct inspections on potential safety hazards and look into product defects, and severely crack down on violations to ensure sound industrial development.

Campaign launched to regulate certification bodies

The State Administration for Market Regulation has issued a work plan for a nationwide campaign aimed at raising the bar for certification bodies.

The campaign outlines 15 measures across four key areas: tightening market access, standardizing certification practices, enhancing professional capabilities, and strengthening supervision.

Key actions include stricter qualification reviews, unified national certification rules, support for leading certification bodies, and improved risk monitoring and smart regulation. The initiative seeks to promote the healthy and orderly development of the certification service industry.

Official data shows that as of the end of 2025, China had over 1,200 certification institutions.

Initiative guides survey, zoning of agricultural climate resources

China has launched a nationwide initiative to survey and zone its agricultural climate resources, following an implementation plan jointly issued by the China Meteorological Administration and the Ministry of Agriculture and Rural Affairs.

According to the plan, the survey is scheduled to be largely completed by 2027, and the zoning is expected to be fully completed and put into use between 2026 and 2029. The three tasks — survey, zoning and application — will be carried out concurrently.

Key outcomes will include detailed climate zoning maps for five major agricultural categories — comprehensive agriculture, cropping systems, animal husbandry, fisheries, and facility agriculture — as well as for 25 key crops, covering national, provincial, city and county levels. The plan also calls for the establishment of a supporting database and an integrated service platform.

CHINA DAILY

Emotional spending key to balancing economy

By **WANG KEJU**

From blind boxes and concert tickets to anime merchandise and AI-powered companions, a wave of spending driven by emotional satisfaction is sweeping across China, reshaping the nation's consumer landscape from a niche trend into an important economic driver, analysts said.

The term "emotional consumption" refers to spending driven by feelings of pleasure, identity, social connection or stress relief, rather than basic functional needs.

Wei Jianguo, former vice-minister of commerce, said the trend is not a short-lived fad but a natural outcome of China's ongoing consumption upgrade.

"The days when consumption was simply about acquiring things are fading," Wei said. "The new consumer wants to feel something — joy, nostalgia, excitement. Delivering those feelings is not just good business; it is essential for macroeconomic balance.

"Emotional consumption is a trillion-yuan new growth pole to unlock China's future market," Wei added.

China's market for emotional consumption is projected to exceed 4.5 trillion yuan ($620 billion) by 2029, up from 2.72 trillion yuan in 2025, according to a report released by iiMedia Research in mid-May.

Multiple factors are fueling the rise. As consumers become more affluent, their spending priorities are shifting from basic goods to experiences, personal fulfillment and mental well-being, said Jiang Zhao, an associate researcher at the Chinese Academy of International Trade and Economic Cooperation.

The concert economy, for example, has exploded. A three-show run by a top artist can draw hundreds of thousands of out-of-town fans, generating ripple effects on transportation, accommodation and dining, he added.

During the five-day May Day holiday earlier this month, Beijing staged 332 commercial performances totaling 1,684 shows, generating ticket revenue of about 260 million yuan, according to online travel platform Trip.com Group.

One act alone — the Taiwan rock band Mayday — played three concerts that attracted more than 150,000 fans. For many of those attendees, a three-hour show became the catalyst for a 72-hour in-depth exploration of Beijing, helping push the city's tourist arrivals and consumption to record highs.

Jiang also noted that the younger generations, in particular, are willing to pay a premium for products and services that deliver happiness, nostalgia or a sense of belonging.

Nearly nine out of 10 young Chinese have spent money on emotional consumption. Nearly 40 percent do so frequently and about one-fifth of young consumers report engaging in emotional consumption every day, according to a two-year tracking study by the Shanghai Youth and Children Research Center and the social platform Soul App.

The study found that the post-1995 and post-2000 generations together account for nearly 70 percent of emotional consumption, with the post-2000 cohort showing the highest frequency.

This year, for the first time, emotional consumption was explicitly mentioned in multiple local government work reports. Jiangxi province pledged to foster new business models and "formats for emotional consumption", for instance.

The policy shift signals that emotional consumption has evolved from a market-led phenomenon into a State-backed lever for expanding domestic demand, experts said.

Zhang Wenkui, a researcher at the Development Research Center of the State Council, said that China's consumption of goods is already on par with developed nations in many respects.

"The real gap lies in service consumption," Zhang said, noting that China's value-added services account for less than 60 percent of GDP, compared with about 70 percent in developed economies.

Zhang said that expanding service consumption — including but not limited to emotional spending — is "the critical breakthrough" for rebalancing China's economy and making growth more sustainable.

CULTURAL HERITAGE

Unearthing life in the mists of time

Archaeologists in Luoyang have uncovered the layout of an ancient residential neighborhood, shining light on politics, religion and society, **Wang Ru** reports.

History books record emperors, wars and political systems. But how did people actually live? Where did they sleep, walk, and pray? The answers often lie not in texts, but beneath the soil in the silent ruins of ancient cities.

Now, for the first time, Chinese archaeologists have fully uncovered the layout of a *fang* (traditional Chinese residential unit) from the Sui (581-618) and Tang (618-907) dynasties in Luoyang, Henan province, which was the eastern capital of the two dynasties.

The era saw the *lifang* system implemented by the rulers as an urban planning mechanism that divided the capital city into walled residential wards called *fang*, with strictly controlled access via gates and curfews to reinforce social order and administrative management.

Zhengpingfang was one of the 103 residential units in the capital then, located near the central axis of the city, south of the Luohe River. As the *fang* had records of what it contained in the Tang era, but no existing aboveground architecture when archaeologists started excavation in 2020, it provided an excellent chance for them to carry out an archaeological project around this area.

In the past six years, they have gained a panoramic view of the organization of the *fang* and the evolution of the architectural complexes within the area, thereby gaining a more thorough understanding of Sui and Tang governance, says Shi Zishe, head of the archaeological team at the site.

According to historical texts, a typical *fang* was square, with each side about one *li* (approximately 530 meters) long. Inside, east-west and north-south streets crossed like a chessboard, with walls on all four sides and a gate in the middle of each.

Zhengpingfang basically follows this layout, with its north-south side measuring 533.6 meters and its east-west side 464.6 meters. Archaeological investigations show that the inner road network changed over time, from a cross shape to a T-shape, with nearly half of the east-west road occupied by a large complex that covered the entire western half of the *fang* area in its later years.

Archaeologists also found that the complex's northern wall broke through the ward's original northern boundary, extending about two meters into a road. This was strictly forbidden in the early and middle Sui-Tang periods.

So who was powerful enough to break the rules? By consulting historical records, archaeologists believe it was a residential complex of Princess Taiping, the beloved daughter of Tang emperor Li Zhi and empress Wu Zetian.

"Although we haven't yet found direct evidence such as inscriptions, the layout of the complex, its specifications and the unearthed artifacts all match historical descriptions," says Shi. "Therefore, we believe it was the princess' residence as recorded."

Princess Taiping was the only daughter of the imperial couple who grew to adulthood. Just like her mother, she was ambitious and deeply involved in political struggles. For a time, she was one of the most powerful figures in the Tang court, although she would eventually lose a political struggle to her nephew, Li Longji.

The princess had gifted the complex to her elder brother Li Dan, who later changed the *fang* into a Taoist abbey named Anguo Temple after he ascended the throne. Under the reign of Emperor Li Longji, it was changed into a Taoist abbey for female priests, including Princess Yuzhen, a sister of Li Longji.

Shi says they have found that the Taoist temple as a whole features a multi-courtyard layout consisting of three parallel east-west parts. The central part is an axial courtyard centered around a large square hall, with well-proportioned buildings arranged in an orderly manner.

The southern part of the complex was a garden, in which there was a lake with three artificial hills.

"Since the Wei (220-265), Jin (265-420), and Southern and Northern Dynasties (420-581), people often created a garden in their residence. It became a popular tradition," says Zheng Guoqi, another team member from the Luoyang City Cultural Relics and Archaeology Research Institute.

The lake and three hills were not just decorative. Instead, they carried deep Taoist symbolism. The lake represented the East Sea, home to the immortals. The three hills stood as Penglai, Fangzhang and Yingzhou — the three mythical mountains where celestial beings are said to live. This tradition, which began in the Han Dynasty (206 BC-AD 220), was often followed by the royal family to express their desire for immortality.

"This excavation has, for the first time, revealed the complete layout of an ancient garden built following this idea," Shi says.

Middle and above: Part of a five-directional tomb-guarding stone and an eave tile found at the site.
PHOTOS PROVIDED TO CHINA DAILY

In the southeastern part of the site, archaeologists found special architectural foundations believed to be Guozijian (the Imperial College) and a Confucius temple. The northeastern part yielded well-organized courtyards, probably residences of officials, based on records.

"Altogether we have found remains of over 100 rammed earth buildings from the area and many daily necessities like ceramic and pottery vessels, suggesting the *fang* was once a populated place," says Zheng.

"It's a rare chance for us to excavate a *fang* from the Sui and Tang periods," says Shi. "Zhengpingfang boasts a rich array of buildings, from the government's ritual and religious complexes to residences of civil and military officials. With that diversity, it's a representative example of the many *fang* units that once made up the city."

He says that, in the past, they have excavated some parts of other wards, like the Longxing Temple in Ningrenfang and the old residence of Tang poet Bai Juyi in Lyudaofang, but they have never unveiled another *fang* as complete as this one.

"The ancient *fang* units were like modern subdistricts," says Shi. "No two were the same. Back then, each *fang* was unique, just like the subdistricts we see today."

From 605, when Emperor Yang of the Sui Dynasty ordered the construction of Luoyang as the Sui's eastern capital, Luoyang became an important city for the Sui and the subsequent Tang Dynasty.

The city further flourished under the rule of Empress Wu, who wanted to defy the tradition that only men could rule. She therefore distanced herself from the Tang royal family, which was based in Chang'an (present-day Xi'an, Shaanxi province), to establish a new political order. She chose Luoyang as her capital city and called it the "divine capital".

The archaeological dig at Zhengpingfang is another highlight of the studies carried out on Luoyang during the Sui and Tang periods, which archaeologists have worked on for decades.

Shi says their earlier efforts have basically provided knowledge about the layout and evolution of the ancient city, as archaeological work has previously been carried out on the ruins of the palace complex, one of Sui's largest granaries called Hanjia and the *lifang* areas to the south and north of the Luohe River.

Shi says the team will continue excavating the northeastern part of the *fang* to learn more. They also plan further work at Lyudaofang, a ward with no official buildings, but one where Bai Juyi's poems vividly capture the dynamism of everyday life.

"With the refined tastes of literati and the vibrant realities of everyday life, we believe that Lyudaofang is also well worth archaeological efforts," says Shi.

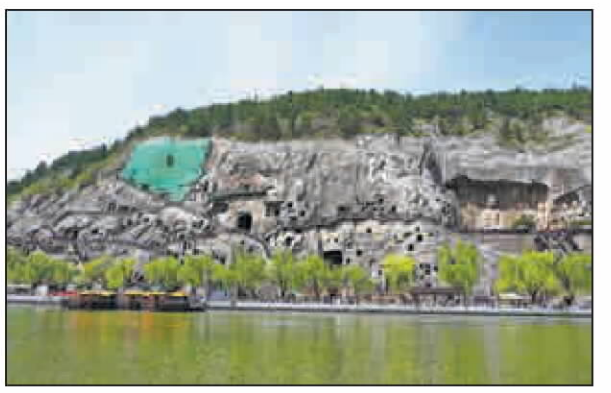
Hidden *Diamond Sutra* found at Longmen Grottoes

By **WANG RU**

In the early morning of March 28, workers involved in a conservation project at the Liuzuota area of the Longmen Grottoes in Luoyang, Henan province, climbed onto scaffolding to inspect potentially dangerous rocks and crevices on the cliff face, as they did every day.

But this time, some of them noticed traces of characters on a vertical cliff face about 30 meters above the ground. They immediately reported the find to professionals at the Longmen Grottoes Academy, which oversees this UNESCO World Heritage site.

"I was very excited to hear the news," says Zhao Shumei, a researcher at the academy. "The engravings were so high up that people normally walked right past without knowing of their existence. We immediately searched our database to see if this site had been documented before."



After careful identification and comparison, researchers confirmed a new engraving of *The Diamond Sutra* on the cliff face of the grottoes.

Located about 30 to 40 meters south of the iconic giant statue of the Lushena Buddha, the newly discovered text is written in *kaishu* (regular script) from the Tang Dynasty (618-907). The brushwork is vigorous and clearly visible. It records a version of *The Diamond Sutra* translated by the Buddhist scholar Kumarajiva from the Later Qin period (384–417) of the Sixteen Kingdoms (304–439), and its upper part remains well-preserved.

Zhao says that after careful analysis, they believe the engraving was probably originally in a niche, but over time, the niche gradually eroded away, leaving only part of its ceiling to protect the upper part of the carving from the wind and sun.

"From the early 5th century, when the sutra was first introduced to China, to the Tang Dynasty, six Chinese versions of it appeared, among which the Kumarajiva version was the earliest," says Ma Chaolong, deputy director of the academy's center for cave temple protection research and heritage monitoring.

Kumarajiva translated the sutra in Chang'an (present-day Xi'an, Shaanxi province) in 402. It was translated in simple yet eloquent words that even ordinary people could understand. Under the reign of Tang emperor Li Longji, the version was officially circulated throughout the dynasty and became widespread, Zhao says.

Next to the engraving are three grooves believed to have been used for burying the ashes of Buddhists, suggesting they were probably related. Zhao says they will explore the possible connection between the sutra and these grooves.

"Normally, carving sutras on the cliff, just like building Buddhist statues, shows Buddhist practitioners' faith in their religion," says Zhao. "We infer that the combination of the grooves and the carving may indicate the Buddhists' wish to attain enlightenment through spiritual practice, with the firm belief that upon rebirth, they will dwell alongside the Buddha."

As of now, the Longmen Grottoes have yielded five carvings of *The Diamond Sutra* and the newly discovered one is among the best-preserved.

"We previously found a carving of *The Diamond Sutra* in Grotto No 429, which contains mostly the latter part of the sutra. The new discovery mostly presents the first half, so it complements and enriches *The Diamond Sutra* findings at Longmen," says Zhao.

This discovery is the latest in a series of surprising finds during recent conservation efforts at the grottoes. Over the past years, Zhao says they have also found traces of gold on the face of the Lushena Buddha, suggesting the statue may have been covered in gold leaf. In addition, a Bodhisattva statue was found to have eyeballs made of glass.

"The discoveries are closely related to our careful checks of potential risks. Each year, in different areas of the grottoes, we inspect every inch of the cliff surface to check whether the unstable rocks have been reinforced and if crevices have been filled and protected. Otherwise, they could endanger both the caves and visitors," says Zhao.

Lollipop sparks tourism debate

China's fast-growing NPC performances are under scrutiny after a performer's interactions with visitors triggered criticism over how far immersive experiences should go, **Yang Feiyue** reports.

A viral video of a costumed performer feeding candy to a tourist has forced China's immersive tourism industry to ask a difficult question: where does hospitality end and impropriety begin? A bell rings. A curtain parts. A young man in a crimson-and-black robe steps out, smiling. He lifts a red veil, bites a lollipop and leans toward a visitor.

Phones rise across the crowd.

The performer, known by the stage name Little Yellow Fish, became one of the most recognizable non-player characters (NPCs) at Gexian Village Resort in Shangrao, East China's Jiangxi province. His performances relied on improvisation and close interaction with visitors.

For young women, he might drape a red veil over their heads, lightly touch a lollipop to their cheeks or interlace fingers. For young men, the interactions were often more playful, including mock kisses through a veil or exaggerated teasing.

The formula worked. Clips spread rapidly across Douyin, China's version of TikTok, helping turn the resort into a viral tourist destination.

Then came the "blackfish". On May 1, People's Daily's Minsheng Weekly published a commentary citing Little Yellow Fish as an example of tourism performances that blurred the line between entertainment and inappropriate behavior in pursuit of online traffic. The following day, both the performer and the resort issued public apologies.

The changes were immediate. The lollipop is now handed directly to visitors rather than shared through physical interaction. The resort also announced revised performance guidelines, expanded cultural training for NPC actors and a long-term public feedback mechanism.

"We extend our sincerest apologies to netizens and tourists," the resort said in a statement.

The incident has drawn attention to one of the fastest-growing sectors in China's tourism industry: immersive NPC performances designed to turn scenic areas into interactive experiences.

The new economy

China's tourism market continues to expand. During the five-day May Day holiday, domestic trips reached 325 million, up 3.6 percent year-on-year, according to the Ministry of Culture and Tourism. Tourism spending rose 2.9 percent to 185.5 billion yuan ($27.1 billion).

At the same time, travelers are increasingly seeking interactive and emotionally engaging experiences rather than traditional sightseeing alone.

According to market consultancy iiMedia Research, China's "emotion economy" — consumer spending driven by emotional connection, social interaction and immersive participation — reached 2.31 trillion yuan in 2024 and is projected to grow to 4.5 trillion yuan by 2029.

NPC performers have emerged at the center of that trend. Scenic areas across China now employ actors portraying historical, literary or fictional characters who interact directly with tourists. A successful NPC can generate repeat visits and, in some cases, nationwide online attention.

The rapid growth of the industry has produced sharply different styles.

Some performances rely heavily on exaggerated physical interaction and short-video appeal. Others focus more on storytelling and cultural interpretation.

In Tangshan, in North China's Hebei province, for example, an NPC portraying the Tang Dynasty (618-907) poet Li Bai has become a popular attraction by improvising classical poetry, exchanging couplets with visitors and offering humorous advice to young tourists. The character has drawn repeat family visitors without relying on controversy or provocative interactions.

The commercial impact of successful NPC performances has been significant.

In Kaifeng, in Central China's Henan province, Wansui Mountain resort introduced a matchmaking character based on Wang Po from the classic Chinese novel *Outlaws of the Marsh*, also known as *The Water Margin*. The elderly matchmaker character became a viral sensation online. According to the resort, annual revenue reached 1.27 billion yuan in 2025, up sharply from three years earlier. The resort now stages more than 2,000 performances daily and employs over 1,000 NPC performers.

> "Not every destination has world-famous natural scenery. In a highly competitive market, relying only on landscapes is no longer enough."
>
> **Zeng Bowei,** researcher with Beijing Union University

In Changchun Zoological and Botanical Park, in Northeast China's Jilin province, a performer portraying the Monkey King from *Journey to the West* gained national attention after joking during a performance that snacks, including dry rice crackers thrown by visitors, were "too dry". The clip spread widely online, and the performer later became known as "Snow Cake Monkey" after those crackers. The park authorities expect annual attendance to reach 3 million visitors in 2025, compared with around 700,000 previously.

For Zeng Bowei, director of the research center for China's tourism economy and policy at Beijing Union University, the NPC boom reflects broader changes within China's tourism market.

"About 80 to 90 percent of China's roughly 16,000 A-grade scenic spots face a certain degree of homogenization," Zeng says. "Not every destination has world-famous natural scenery. In a highly competitive market, relying only on landscapes is no longer enough."

He points out that demand for immersive participation accelerated after the pandemic.

"Tourists no longer simply want to sightsee, they want interaction and participation. NPCs meet that demand," he explains.

At the same time, growing competition among scenic areas has increased pressure on operators to attract online attention.

"Trip numbers are increasing, but per capita spending is declining. Operators are under pressure to find lower-cost ways to generate visibility," he adds.

The boundary question

The debate surrounding Little Yellow Fish also revealed divided public opinion online.

While some commentators supported tighter oversight of tourism performances, many young social media users defended the interactions as voluntary and harmless.

Zeng believes the controversy reflects the lack of clear industry standards.

"Personally, I do not support this kind of performance style," he says bluntly.

"But the challenge is that there is no clearly defined boundary. Certain behavior may not violate regulations, yet some people still consider it vulgar or inappropriate."

He cautions against discouraging innovation altogether.

"If every attempt at innovation immediately becomes a public controversy, operators may become afraid to experiment at all," he says.

Industry observers say the rapid expansion of NPC tourism has outpaced the development of professional training and oversight systems.

Wu Guoping, a senior official with the China Tourism Association, has proposed formally recognizing NPC performance as a profession, including the establishment of training programs, industry standards, and stronger labor protections.

Experts concur that the most sustainable NPC performances are those closely tied to local culture and storytelling rather than short-lived online trends.

Zeng considers that successful characters should reflect the history and identity of their destinations while offering different forms of interaction for different visitor groups.

"Not every NPC needs to rely on exaggerated performances. Some can succeed through language, knowledge or cultural interpretation," he says.

In its apology letter, Gexian Village Resort claims that it will place greater emphasis on local cultural themes, including tea culture, Southern Song Dynasty (1127-1279) poetry and traditional crafts.

For China's tourism industry, the debate surrounding a single lollipop performance has become part of a broader discussion about how immersive tourism should develop as the market continues to grow.

The lollipop was a warning, not a verdict. For China's fast-growing immersive tourism industry, it became a test of how far performance, intimacy and online attention can go before the experience stops feeling welcoming.

Holiday travel shifts to rural, industrial and cultural experiences

Long queues at famous tourist attractions are no longer the defining image of China's holiday travel season as more travelers seek immersive, personalized experiences beyond traditional sightseeing.

From county getaways and industrial heritage sites to museums and art galleries, China's tourism market during the recent May Day holiday showed growing signs of diversification, with travelers increasingly drawn to experiences that felt more interactive, immersive, and rewarding.

In Diaoyuan Village in east China's Jiangxi province, the holiday atmosphere was filled with the laughter of families participating in rural activities. Adults and children caught chickens and fish, harvested vegetables, and immersed themselves in pastoral life.

"No long lines, no crowds. Big cities rarely offer this kind of fun and relaxation. I wanted my child to experience the simple joys of rural life," says Zhang Qiongyi, a tourist from Guangdong province.

This experience reflects a broader trend in the rise of county tourism, as travelers increasingly bypass crowded metropolitan areas in favor of smaller, lesser-known destinations that offer a slower pace.

According to Tongcheng Travel, an online Chinese travel agency, bookings for travel products related to county-level destinations jumped 128 percent year-on-year during the holiday, outpacing growth in provincial capitals.

The growing demand has also spurred a supply-side upgrade. Counties are improving infrastructure and creating unique cultural tourism IPs, such as local cuisine, farm experiences and folk events, to offer distinctive travel options.

High-quality accommodation is rapidly expanding into lower-tier markets. Data from Tongcheng showed a 76 percent year-on-year increase in bookings for high-end hotels and a 92 percent year-on-year surge for homestays in county-level regions during the holiday, with some fully booked two weeks in advance.

This holiday, Zhou Junyu, a primary school student from Jiangsu province, marveled at the vintage cars and smart workshops in Changchun, Jilin province, which is widely known as the cradle of China's automobile industry.

"I love studying cars. Seeing the history and technology here is so cool," says Zhou, who was visiting China's leading automaker, FAW Group.

The company has transformed key industrial landmarks into an integrated tourism and educational program featuring automobile history, manufacturing processes, brand culture, and hands-on activities. Since July 2024, the tour routes have welcomed more than 350,000 visitors.

Visitors enjoy various activities at the Detian Transnational Waterfall Scenic Spot in Chongzuo, Guangxi Zhuang autonomous region, on May 4. ZHAO JINGWU / XINHUA

Jilin province is turning its industrial heritage into vibrant cultural attractions. It is not alone in China's latest travel trend, as once-dreary assembly lines filled with noise and machinery have evolved into must-see destinations for travelers nationwide.

Through interactive activities, science lectures and face-to-face discussions with engineers, visitors can dive deep into the workings of intelligent manufacturing.

Official data showed that by the end of 2025, China had 264 national-level and nearly 500 provincial-level industrial heritage projects.

The market size of the country's industrial tourism industry is expected to exceed 300 billion yuan ($44 billion) by 2029.

"Industrial tourism is a nexus where secondary and tertiary industries converge," says Chen Wei, an expert from Tsinghua University. "As a strategic move in building a modern industrial system, it can fuel consumption, expand domestic demand and promote industrial science education."

Driven by rising cultural tastes, many young Chinese are now turning museums and galleries into social spaces. Zhang Yutong, a student of Shenyang City University who often visits art galleries and museums, is one of them.

"Among my friends, the most popular way to hang out is going to exhibitions," she says. "It offers a chance to deepen our bond. Exploring the stories behind the exhibits together and sharing our thoughts is much more rewarding than ordinary entertainment, and it helps bring people closer together."

"For young people, visiting exhibitions is a lifestyle that integrates socializing, leisure and self-expression," says Si Yawei, an associate professor at Liaoning University. "It builds a relaxed bridge for social interaction based on shared cultural experiences."

The trend is also boosting the cultural economy, as young visitors sample venue-exclusive food and drinks and purchase creative souvenirs.

Data from a joint report by Dianping, a popular review platform in China, lifestyle platform Meituan, and ticketing platform Maoyan showed that user-generated content related to exhibitions and museums grew by 24 percent year-on-year in 2025.

Observers believe this year's holiday travel trends point to a growing appetite for deeper, more meaningful and diverse leisure experiences.

Value-added tax invoice data released on May 6 by China's State Taxation Administration showed sales revenue in consumption-related industries rose by 14.3 percent year-on-year during the May Day holiday, while cultural services surged by 42.3 percent.

According to Dai Bin, president of the China Tourism Academy, the integrated development of culture and tourism will be a focus for boosting the tourism sector during China's 15th Five-Year Plan (2026-30) period. Efforts should be made to create new cultural experience venues and novel tourism consumption settings for visitors.

A young maestro on a global stage

After an electrifying mainland debut, Finnish conductor Tarmo Peltokoski launches his inaugural season with the Hong Kong Philharmonic Orchestra

By **CUI XIAOHUO**
for China Daily

Wearing a pitch-black dress shirt and dark-rimmed spectacles, 26-year-old Tarmo Peltokoski returned for his fifth curtain call before an enthusiastic audience that broke into sustained applause. It was an explosive mainland debut for the Gen Z conductor at the Xinghai Concert Hall in Guangzhou, Guangdong province, on April 26. Grasping the conductor's score of Dmitri Shostakovich's *Symphony No 11 in G Minor*, he held it high above his head before clutching it tightly to his chest. The audience reciprocated with passionate shouts of bravo.

The next day, pictures and videos of Peltokoski filled Chinese social media, but as if nothing had happened, the young star from Vaasa, Finland, appeared at The Peninsula Hong Kong where screens displayed huge posters of him. A special launch event marked the start of his inaugural season as music director of the Hong Kong Philharmonic Orchestra, his third music director post since leading the Orchestre National du Capitole de Toulouse and the Latvian National Symphony Orchestra, first as music director, and then as conductor laureate.

"I'm mortified to be in a room with so many giant heads of myself," he says to enthusiastic attendees, including orchestra principals, board members and key sponsors. "I'm trying to bear with it. I'm honored and excited to present our first real season together," says Peltokoski, in casual business attire.

Starting to learn to conduct from the Finnish pedagogue Jorma Panula at barely 14, Peltokoski was dubbed "a talent of the century" by the German newspaper Tagesspiegel. Panula and Peltokoski come from the same region of South Ostrobothnia in Finland, Peltokoski says, and speak the same Finnish dialect.

"He's always been very warm to me. I think we've found some sort of familiarity of spirit," he adds. Most recently, the student visited the teacher in December 2025 at the 95-year-old's home, tucked among trees near Helsinki.

The son of a Filipino nurse and a Finnish engineer and sport shooter, Peltokoski broke new ground when he was named principal guest conductor of the prestigious Deutsche Kammerphilharmonie Bremen orchestra, the first person to hold such a position in its history. He was just 21.

In Hong Kong, a new odyssey set off in Asia. For the occasion, the April 27 launch event featured a cinematic video filmed on the top of the harbor-facing Peninsula hotel. Bernhard Fleischer, the orchestra's chief executive, did not want the video to resemble a "going to work" day, so orchestra members changed from dress attire to something smart and casual. In the musical background, the orchestra performed excerpts of *Siegfried und Brunnhilde* from Richard Wagner's *The Ring: An Orchestral Adventure*, arranged by Henk de Vlieger, and recorded live by Deutsche Grammophon. Peltokoski, in similar attire, figuratively "landed" on the helicopter pad and walked toward the orchestra members who gathered to meet the conducting star.

"I will lead six programs featuring masterpieces that are especially close to my heart," says Peltokoski about his new season's highly anticipated repertoire, featuring symphonic canons by Bruckner, Mahler, Strauss, and Wagner, whose musical world inspired his childhood dream of becoming a conductor 15 years ago.

Before learning to conduct with Panula, Peltokoski used to play Wagner's operas on his home piano and sing the German lyrics. His teacher trained him through the symphonic repertoire, which required a deep understanding of orchestral instruments, especially the strings. In the new season, music lovers will get a taste of his musicality in Anton Bruckner's *Symphony No 7 in E Major* and Richard Strauss' *Vier letzte Lieder* ("Four Last Songs"), with soprano Asmik Grigorian, scheduled for January 2027 in Hong Kong and Guangzhou. Another key highlight includes Gustav Mahler's *Symphony No 8 in E-flat Major* which marks the orchestra's completion of all of Mahler's symphonies.

Speaking of the upcoming European tour, Peltokoski says "the main dish" will be Wagner's *The Ring: An Orchestral Adventure*. The touring repertoire also includes Bruckner's *Symphony No 4 in E-flat Major*, and a newly commissioned *Waltz of the Rolling Giants* by composer Yao Chen. Peltokoski, no mean pianist himself, will join concert pianist Martin Helmchen in Camille Saint-Saens' *The Carnival of the Animals*. As a cultural ambassador, the orchestra will travel to eight cities in Spain, Germany, Finland and Austria, sponsored by the China National Arts Fund, making debuts at prestigious venues like Berlin's Berliner Philharmonie, Elbphilharmonie Hamburg, Vienna's Wiener Konzerthaus, and Musiikkitalo in Helsinki, where Peltokoski once learned how to conduct.

With 40-plus foreign members, the orchestra's Chinese mainland tour is another major highlight, marking the 30th anniversary of Hong Kong's return to China. Peltokoski will conduct for three nights in a row at the National Centre for the Performing Arts in April 2027 for his debut before a Beijing audience. A weighty program includes Mahler's *Symphony No 2 in C Minor*, *Resurrection*, collaborating with the China NCPA Orchestra and Chorus along with soprano Louise Kwong and contralto Wiebke Lehmkuhl. The Beijing programs also prominently feature Vaughan Williams' *Symphony No 4*, Esa-Pekka Salonen's *Cello Concerto* with Finnish cellist Senja Rummukainen, and Wagner's *Tristan und Isolde: Prelude* and *Lohengrin: Prelude*.

From top: Tarmo Peltokoski (center) joins orchestra members on top of The Peninsula Hong Kong during a photo shoot launching his inaugural season as music director of the Hong Kong Philharmonic Orchestra. Peltokoski (front) holds up the conductor's score of Shostakovich's *Symphony No 11 in G Minor* during the curtain call. PHOTOS BY DESMOND CHAN / FOR CHINA DAILY

For the Shanghai audience, the orchestra will join the Music in the Summer Air festival, led by the orchestra's principal guest conductor Yu Long, in 2027. For the entire season, as many as 12 orchestral concerts will showcase collaborations between the orchestra and major Chinese mainland cities.

With almost a full house, the concert on the afternoon of April 26 in Guangzhou was a prelude to upcoming excursions to the mainland. In the first half, Peltokoski and the orchestra collaborated with violinist Leila Josefowicz in the *Violin Concerto* written for her by renowned Finnish conductor and composer Esa-Pekka Salonen.

In a front-row seat, Salonen himself listened to the program, before taking the stage and thanking the overjoyed audience. Also a student of Jorma Panula, Salonen has taught Peltokoski in conducting master classes. "I'm a big fan of Tarmo," Salonen told attendees at a salon event at the concert hall. "He's a very interesting, thoughtful musician. And he's so young. What we are hearing now is already very, very good, but I cannot even imagine what it will be like 20 years from now."

In the second half, Salonen listened on, as Peltokoski led the orchestra in Shostakovich's *Symphony No 11, The Year 1905*. With his baton, Peltokoski built up the electrifying tension in the one-hour acoustic tragedy, gesturing like an Olympic fencer, bending and lunging. In the words of an orchestra member, it was an emotionally charged journey "from simmering chill to burning fire".

"His baton direction was meticulously precise right from the start," said Liu Zitong, a conducting student from Shanghai.

"This live performance was even more stirring than the recordings we've heard," said Fang Taozhi, 18, and Wu Anyi, 17, two local students who came together.

Xu Nuo, an engineer from Xi'an, wore a commemorative brooch to the concert to show her love for music. "I was moved to tears in several movements. The orchestra conveyed something indescribably depressing but touching. The final 40 seconds of the echoes simply seemed eternal," she said.

"When someone is so convincing, with a mind so deep, sharing knowledge that requires years and years of studying, you completely forget that he is actually 26," said Lorenzo Iosco, chairman of the artistic committee and associate principal bass clarinet of the orchestra. "It's just extraordinary, and this is just the beginning," he added.

Back in The Peninsula Hong Kong and surrounded by huge posters of his son, Peltokoski's father, Raine, is picked out of the crowd. "As a boy, he loved music. He just loved music. But he was — one word: shy. And it's hard to believe today," he says.

The author is a freelance writer for China Daily.

Performing arts academy blends tradition with digital innovation

HONG KONG — At the Hong Kong Academy for Performing Arts, students are taught that to innovate, one must first master the ancient. As the institution climbs the global rankings, it is becoming a high-tech laboratory for the future of Asian culture.

In a city known for its vertical skyline and its role as a dynamic link bridging different regions, the HKAPA stands as a quiet yet powerful force for cultural integration. Here, the air is filled with the scent of sawdust from traditional carpentry workshops and the soft hum of high technology, a microcosm of Hong Kong's broader ambition to maintain its status as the world's "international education hub".

In March, the institution quietly achieved a milestone that extended far beyond its Wan Chai campus: the QS World University Rankings placed its performing arts program 10th globally and 1st in Asia. For Anna CY Chan, director of HKAPA, this is not just about prestige; it is a validation of a pedagogical philosophy that emphasizes both "deep roots" and "wide horizons".

While the global arts scene often pursues the "new" with great enthusiasm, the HKAPA operates on a principle of groundedness. "Students must first learn traditional skills to strike deep roots," Chan insists. "Only with sufficient artistic heritage can innovation have a soul."

This is not mere rhetoric. For Kelly Or, a fourth-year student in the School of Theatre and Entertainment Arts, the journey to the cutting edge began with the humble "mortise and tenon" joint and the manual crafting of coconut husk rope. These are the ancient foundations of stagecraft, taught with the same rigor as modern digital engineering.

The academy's curriculum is a deliberate integration of diverse cultures. In a recent crossover concert titled *Anime in Viaggio*, the piercing, melodic heights of Cantonese opera were paired with the rhythmic, improvisational vitality of jazz. It was a performance that served as a vivid metaphor for the city itself: two distinct musical languages not merely coexisting, but complementing one another.

In March, the HKAPA threw open its doors to the public, offering over 100 free performances and exhibitions that showcased this duality. In the main foyer, the classic opera *Divine Maiden Strewing Flowers* came to life; with a flick of her "water sleeves", a performer's graceful turns and subtle smiles captured the essence of traditional Eastern aesthetics.

Yet, only a few steps away in the School of Film and Television, crowds queued to experiment with AI-generative tools and virtual filming techniques. Here, technology translated touch into imagery in an instant, a moment where tradition and modernity did not just coexist, but quietly merged.

> "Students must first learn traditional skills to strike deep roots. Only with sufficient artistic heritage can innovation have a soul."
>
> **Anna CY Chan,** director of the Hong Kong Academy for Performing Arts

However, in the School of Film and Television, the "traditional" gives way to what the faculty calls "hardcore" art. Here, a hyper-realistic virtual simulation of the Yee Wo Street footbridge, a Causeway Bay landmark, comes to life. This is not just a student project; it is a collaborative platform for virtual production that allows filmmakers to move seamlessly from the neon-soaked streets of Hong Kong to a sci-fi dystopia in a single frame.

"We want students to master traditional filmmaking while simultaneously designing for the era of the miniseries and new media," explained Terry Lam, dean of the School of Film and Television.

Crucially, the academy is addressing a key concern of the 21st century: artificial intelligence. Lam proposes a "human-in-the-loop" philosophy. In a world of algorithmic generation, the HKAPA argues that empathy remains the unique trait that cannot be replicated by technology. "Work is for people," Lam notes. "Only humans can endow a piece of art with the empathy it requires."

The Hong Kong Special Administrative Region government is now establishing the "Study in Hong Kong" brand to further develop Hong Kong into an international hub for education. According to director Chan, the academy's nonlocal student body has consistently remained between 20 percent and 25 percent, attracting talent from the Chinese mainland and Southeast Asia, as well as Europe and North America. This global diversity is mirrored in the faculty, who hail from various countries and regions around the world.

The academy's influence is now extending toward the under-construction Northern Metropolis. The planned Northern Metropolis University Town is envisioned not just as a school, but as a "creative incubator" and a "green art theater".

The goal is a "complementary development" in the best sense, a campus that complements the Wan Chai headquarters by focusing on sustainability and resource sharing, serving as a gateway for Hong Kong's talent to flow into the Greater Bay Area and beyond.

For students like Dani Wen, a Master of Music student from the mainland, the appeal lies in this very spirit of breaking boundaries. "The atmosphere is inclusive, the teachers respect open creativity," she says. Before she writes for a Western symphony orchestra, she is tasked with composing for a Chinese orchestra, a cross-cultural training ground that ensures the next generation of artists are not just performers, but cultural communicators.

In a globalized arts landscape, the academy's value lies in its refusal to choose between the old and the new. By grounding its digital evolution in physical heritage, the institution demonstrates that the future of Asian culture is not found by moving away from tradition, but by looking deeper into it.

SGA's reign as league's MVP continues

OKC star wins top award for second straight season

Oklahoma City Thunder guard Shai Gilgeous-Alexander celebrates with fans after Game 4 of a first-round NBA playoffs series against the Phoenix Suns on April 27 in Phoenix. AP

He's the best player on the best team. And the voters say he's the best player in the league, too. Again.

Shai Gilgeous-Alexander of the reigning NBA champion Oklahoma City Thunder won the NBA's Most Valuable Player on Sunday for the second consecutive year. He became the 18th player to win at least two MVP awards, and the 14th to win them in back-to-back fashion.

"Basketball's obviously a team sport," Gilgeous-Alexander said Sunday night in a celebration at the Thunder practice facility, surrounded by teammates — all in new Burberry trenchcoats, a gift from the now two-time MVP.

"All the numbers, all the accolades, everything that I do on the court, if we won 10 games, I wouldn't be in this conversation. So, thank you guys so much. I love you guys."

The win for Gilgeous-Alexander, who is Canadian, marks the eighth consecutive time that the NBA's MVP was born outside the US. The run started with Milwaukee's Giannis Antetokounmpo (born in Greece, of Nigerian descent) in 2019 and 2020, then Denver's Nikola Jokic (Serbia) in 2021 and 2022, Philadelphia's Joel Embiid (born in Cameroon, but has since become a US citizen) in 2023 and Jokic again in 2024.

And in 2025 SGA was the MVP, as he is now in 2026.

"Who he is has never changed," Thunder coach Mark Daigneault said. "I think he's touched up the edges on his game, his leadership and on his perspective, just like anybody else that's coming of age."

Jokic was second and San Antonio's star French center Victor Wembanyama placed third.

Gilgeous-Alexander got 83 of a possible 100 first-place votes. Jokic received 10 and Wembanyama got five. Luka Doncic of the Los Angeles Lakers was fourth in the voting and Cade Cunningham of the Detroit Pistons was fifth.

Cunningham got two first-place votes — the first by a US-born player since 2021.

Jaylen Brown of the Boston Celtics was sixth, and Kawhi Leonard of the Los Angeles Clippers and Donovan Mitchell of the Cleveland Cavaliers tied for seventh with one fifth-place vote apiece.

International players went 1-2-3 in the voting for the fifth straight season:

- Last season the order was Gilgeous-Alexander first, Jokic second and Antetokounmpo third.
- In 2024, it was Jokic, then Gilgeous-Alexander and Slovenian Doncic.
- In 2023, it was Embiid, then Jokic, then Antetokounmpo.
- In 2022, it was Jokic, then Embiid, then Antetokounmpo.

"So many NBA players don't get opportunity," Gilgeous-Alexander said. "Who knows where I'd be without it."

Gilgeous-Alexander and Wembanyama will face off Monday night, when the Thunder and Spurs open Game 1 of the Western Conference finals in Oklahoma City. NBA Commissioner Adam Silver is expected at Monday's game to formally present Gilgeous-Alexander with a trophy for the third time in 12 months — the MVP award last May, the NBA Finals MVP award last June, and now this.

Shai Gilgeous-Alexander poses with teammates Jalen Williams (left), Isaiah Hartenstein (second from left), Chet Holmgren (center back), Jaylin Williams (second from right), and Jared McCain (right) in Burberry trenchcoats on Sunday in Oklahoma City. AP

Shai Gilgeous-Alexander holds his son Ares Alexander before a news conference after being named the NBA MVP on Sunday in Oklahoma City. AP

Jokic not winning the award continues an odd trend: those who average a triple-double, often thought of as the holy grail of in-game accomplishments, almost never win MVP.

Jokic had the seventh instance of a player finishing a season averaging a triple-double — at least 10 points, 10 assists and 10 rebounds per game — by putting up 27.7 points, a league-best 12.9 rebounds and a league-best 10.7 assists per game.

It wasn't good enough for MVP. Russell Westbrook averaged a triple-double four times and won MVP only once in those years. Oscar Robertson averaged a triple-double in 1961-62; he didn't win MVP that season. And now, Jokic has done it twice — with no MVPs to show for it, though he has won the award on three other occasions.

Gilgeous-Alexander insists that he doesn't play for individual honors, but for team trophies.

"The way things are run in this organization and this city, it breeds success," Gilgeous-Alexander said. "It's no coincidence."

The MVP win is Gilgeous-Alexander's second major individual award this season; he was also voted the league's Clutch Player of the Year by an overwhelming margin — he got 96 of 100 first-place votes in that balloting, paying tribute to how great his performances tend to be in the final five minutes of close games.

Then again, he's pretty good no matter how much time is on the clock.

Gilgeous-Alexander was second in the league with 31.1 points per game, second only to Doncic and his 33.5-point average. He also extended his NBA-record streak of regular season games with at least 20 points to 140 and counting; it'll carry into next season as well.

He's delightfully boring — one of the few mid-range specialists in the game, someone who excels at drawing fouls, isn't a look-at-me type and gives some of the most thoughtful answers of anyone in the league. Emotions aren't worth his time; staying calm is always his preferred move.

And he believes in the Thunder way, that the sum of the parts is the only real key to winning.

"Some of it is just luck," Gilgeous-Alexander said. "As an NBA player, you have no control over other grown men in this business and I'm just lucky enough to be surrounded by great human beings, from the front office, coaching staff, to the guys that I play on the court with every night. We all want to see the next man win and do whatever it takes, ultimately, to win. We have that common goal. And, yeah, I can't take credit for that. It's more than me, it's bigger than me."

Mitchell makes the breakthrough, helping the Cavs reach the conference finals

Cleveland Cavaliers guard Donovan Mitchell attempts a shot against Detroit Pistons guard Daniss Jenkins in Game 7 of a second round NBA playoffs series in Detroit, Michigan, on Sunday. REUTERS

For Donovan Mitchell, a breakthrough moment has arrived.

He's going to the conference finals for the first time, and the series will begin at Madison Square Garden — a bonus for the native New Yorker.

In his ninth season, Mitchell has reached the NBA's final four.

He and the Cleveland Cavaliers rolled past the Detroit Pistons 125-94 on Sunday night in Game 7 — on the road, no less — of their Eastern Conference semifinal series.

Their reward is a trip to New York for Game 1 of the East finals against the Knicks on Tuesday.

Mitchell had 26 points, seven rebounds and eight assists in Sunday's romp. And, when his night was over with 4:01 remaining, he had handshakes and hugs for anyone wearing Cleveland colors.

He leaned down to wrap his arms around a seated Cavs coach Kenny Atkinson, who said before the game that he wanted Mitchell to be himself in Game 7.

The result?

"It was better than Donovan Mitchell," Atkinson said. "Is that possible? It started with him, his defense, rebounding, and then when he gets in the paint and starts making other people better, you know, the dishes to our big guys, that was the key, I felt like, to the game. He had complete control of the game."

Mitchell was brought to Cleveland in September 2022 in a trade with Utah, with the Cavaliers betting — correctly, it turned out — that he would be the last piece of their post-LeBron James rebuild and help them return to the playoffs.

They got to the first round in 2023, then lost in the second round in 2024 and 2025. This year, the conference finals await after the third-biggest road win a team has ever had in a Game 7.

Mitchell has been an All-Star in each of the last seven seasons, was one of eight players to receive at least one vote in this year's MVP balloting and will likely be an All-NBA pick for the third time.

But there was a void — the deep playoff run.

Not anymore.

"Couldn't be happier for him, to make that next step," Atkinson said. "He's going home to New York. He kept this thing together this year when things weren't going great. He was the beacon, the light ... he carried us on the court."

The Cavs' Sam Merrill, who grew up in Utah and was a Jazz fan when Mitchell was there, added: "You're not going to find a guy more happy for him than I am, but I know he wants more. We all want more."

There were so many near-misses for Mitchell along the way. Mitchell's Utah team wasted a 3-1 lead in the 2020 playoff bubble against Denver in the West semifinals, falling in seven games. A year later, the Jazz were up 2-0 in the second round against the Los Angeles Clippers, who ended up winning in six. He got hurt at the same stage against Boston, as that series fell apart for Cleveland in 2024, and last year the Cavaliers went 0-3 at home in the second round against Indiana on the way to a five-game ouster.

He was part of a No 1 seed in 2021, part of a No 1 seed again last year, and never got out of the second round. Until now.

Jarrett Allen and Merrill each added 23, as the fourth-seeded Cavaliers ousted the East's top seed to set up the series with the third-seeded New York Knicks.

"We just knew that we had to get the job done. We knew that we had to bring a lot of force," said Allen. "It's a tough arena to win in, but we knew that every single possession, every single play was super important."

Evan Mobley had 21 points and 12 rebounds for the Cavaliers, who advanced to the conference finals for the first time since 2018 and the ninth time in team history. It's their deepest run since James' final season with the franchise.

Daniss Jenkins scored 17 points, and Cade Cunningham and Duncan Robinson each finished with 13 for the Pistons, who fell one win shy of their first conference finals appearance since 2008, after forcing the decider with a Game 6 victory on Friday.

The Cavs dictated the pace from the opening tip and never allowed the Pistons to gain traction, then blew open a convincing Game 7 performance when Mitchell scored 15 in the third quarter.

Detroit was outscored in the paint 58-34 and made only 35.3 percent of its field goal attempts, compared to Cleveland's 50.6 percent.

Cleveland capitalized on cold shooting by the Pistons in the opening quarter, turning missed shots into transition baskets, while building an early advantage. The Cavs led 31-22 going to the second, and after Detroit had the first two baskets, Cleveland quickly seized control with a 24-9 run. The Pistons' offensive struggles only deepened and the Cavs continued to shoot efficiently as they built a commanding 64-47 lead into halftime.

The Cavs kept rolling in the second half and led by as many as 35 points. The closest the Pistons were able to get in the half was within 17 in the third quarter.

Xi calls for even higher quality ties

Russian President Putin's state visit to address issues of mutual concern

By **MO JINGXI** and **ZHANG YUNBI**

President Xi Jinping holds a welcoming ceremony for Russian President Vladimir Putin outside the Great Hall of the People in Beijing on Wednesday. FENG YONGBIN / CHINA DAILY

President Xi Jinping called on China and Russia to drive the development and revitalization of their respective countries through comprehensive strategic coordination of even higher quality, and work to make the global governance system more just and reasonable.

Xi made the remarks on Wednesday when meeting with Russian President Vladimir Putin, who arrived in Beijing on Tuesday for a two-day state visit.

This year marks the 30th anniversary of the establishment of the China-Russia strategic partnership of coordination and the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

Xi said China-Russia relations have come this far step by step precisely because the two sides have kept deepening political mutual trust and strategic coordination with unyielding tenacity, and expanded cooperation with a drive to always scale new heights.

It is also because the two countries have defended international justice and fairness and advanced the building of a community with a shared future for humanity with unflappable resolve, he said.

Xi noted that the international situation is fluid and turbulent, marked by resurging unilateralism and hegemonism.

Yet peace, development and cooperation remain the aspiration of the people and the prevailing trend of our times, he said.

As permanent members of the UN Security Council and important major countries in the world, China and Russia should take a strategic and long-term perspective, drive the development and revitalization of their respective countries through comprehensive strategic coordination of even higher quality, and work to make the global governance system more just and reasonable, Xi said.

The two heads of state also agreed to further extend the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

Xi said that 25 years ago, China and Russia signed the treaty, establishing in legal form the institutional foundation for long-term good-neighborliness, friendship and comprehensive strategic coordination. Since then, China-Russia relations have achieved leapfrog development, he said.

He noted that the international landscape has undergone profound changes, and the world faces the risk of sliding back into the law of the jungle. Against this backdrop, the advanced nature, scientific value and practical significance of the treaty have become even more prominent, Xi said.

Xi said that China supports the further extension of the treaty and is ready to work with Russia to uphold its spirit and firmly advance the two countries' back-to-back strategic coordination.

The treaty was last extended on June 28, 2021, when Xi and Putin held talks via video link and issued a joint statement ahead of the 20th anniversary of its signing.

Prior to his departure for Beijing, Putin delivered a video address in which he said, "I'm delighted to be visiting Beijing once again at the invitation of my longtime good friend, the President of the People's Republic of China, Xi Jinping."

On Sunday, both Xi and Putin sent congratulatory letters to the 10th China-Russia Expo, which opened on the same day in Harbin, the capital of Northeast China's Heilongjiang province.

Russia's TASS news agency quoted Putin as saying in his video address that regular mutual visits and Russia-China top-level talks "are an important and integral part of our joint efforts to promote the entire range of relations between our two countries and unlock their truly limitless potential".

Bilateral relations today "have reached a truly unprecedented level", Putin said.

The special nature of the ties "is reflected in the atmosphere of mutual understanding and trust, in the commitment to pursuing win-win and equitable cooperation, in conducting respectful dialogue, and in supporting each other on matters affecting the core interests of both countries, including protection of sovereignty and state unity", he added.

Addressing a regular news briefing on Tuesday in Beijing, Foreign Ministry spokesman Guo Jiakun said that during the state visit, the two presidents "will exchange views on bilateral relations, cooperation in various fields, and international and regional issues of mutual interest".

A survey report on Sino-Russian youth friendship and cultural exchanges, which was released last week by Renmin University of China, showed that 87.5 percent of young people in Russia and 85.5 percent of young people in China view the two countries' relations as "friendly".

Guo said the findings illustrate the high level of China-Russia ties.

"Under the strategic guidance of President Xi and President Putin, the China-Russia everlasting friendship will enjoy even greater popular support, and the youth in both countries will join hands and inject fresh vitality into our comprehensive strategic partnership of coordination for a new era," he added.

WORLD WATCH
By Warwick Powell

Relationship matures into cornerstone of security and stability

Russian President Vladimir Putin's visit to Beijing on Tuesday and Wednesday marks the 25th anniversary of the signing of the 2001 Treaty of Good-Neighborliness and Friendly Cooperation, which underscores a relationship that has matured into a strategic cornerstone of Eurasian — and by extension, global — security and stability.

Far from a mere tactical partnership born of convenience, the Russia-China partnership is deepening across economic, energy, security and multilateral dimensions, driven by shared interests in an emergent, yet unstable, multipolar world.

At its foundation lies robust economic complementarity and interdependence. Bilateral trade has expanded dramatically over the past decade. It surged after 2022, reaching a record $244.8 billion in 2024 before moderating to approximately $228.1 billion in 2025 amid shifting global energy prices and demand adjustments, according to statistics from China's General Administration of Customs. This represented a slight contraction of about 6.8 percent year-on-year, marking the first decrease in five years after a record-breaking period fueled by post-2022 Western sanctions.

Russia supplies critical energy resources. Crude oil exports to China exceeded 108 million metric tons in 2024, while China provides manufactured goods, vehicles and technology. Chinese exports to Russia include cars, electronics and machinery.

Couples pick dates that sound like love to marry

By **LI LEI**
lilei@chinadaily.com.cn

Couples across China are rushing to tie the knot on Wednesday and Thursday — May 20 and May 21 — two dates that sound like "I love you" when said aloud in Mandarin, with marriage registration slots fully booked weeks in advance in several major cities.

In Chinese, "520" is pronounced similarly to the Mandarin equivalent of "I love you", making May 20 a sought-after day for registering marriages. The following day, May 21 — or "521" — carries a similar meaning, offering a popular and much-needed alternative.

All slots in the 15 marriage registration offices in Guangzhou, Guangdong province, were fully booked for May 20 by the first week of this month, as they were in Shenzhen. In Nanjing, Jiangsu province, more than 1,400 couples had reserved May 20 as their chosen date by late April, with scenic registration sites such as the Confucius Temple already at capacity. Some locations were fully booked for May 21 as well. Wuxi, another city in Jiangsu, has no online slots left for May 20, though local authorities said that couples could still register as walk-ins.

For one Beijing-based couple, securing a May 20 slot required a midnight digital scramble. Guo Xiangyu, 30, a doctoral student from Xi'an in Shaanxi province, and Yan Xin, 34, an internet worker from Baoji, also in Shaanxi, booked their appointment two weeks in advance. The couple and both sets of parents logged into the system at midnight across PCs and mobile devices, and Yan managed to secure a slot. "We expected it to be crowded, so we feel very lucky," she said.

SANYA BECOMES A TCM PARADISE

Holistic health practices holding sway over holidaymakers to the tropical city

By **XING WEN** and **CHEN BOWEN**
in Sanya, Hainan

For many foreign tourists, Sanya in southern China's Hainan province is a tropical dream: soft sandy beaches, coconut groves and a gentle sea breeze.

However, a growing crowd is discovering that the real Sanya comes with a twist — usually of muscles and joints.

Instead of lounging on a beach towel, they lie on a therapy bed; instead of sipping cold coconut water, they take slow sips of bitter herbal tea — all the while dotted with fine acupuncture needles. And somehow, they love it.

Five years ago, Alina Dudko from Saint Petersburg in Russia tried acupuncture for the first time to address some of her health issues.

"I felt a bit dizzy, which scared me," she recalled, adding that the doctor also prescribed a course of herbal decoctions to take, something she was skeptical about at first.

"But after about five acupuncture sessions, I noticed positive changes in my condition, so I decided to fully commit to the treatment," she added.

Today, Dudko, who now speaks fluent Chinese, has chosen to work as a therapy translator at a traditional Chinese medicine clinic near the Dadonghai scenic area in Sanya.

A Russian tourist takes a selfie by the seaside at Wuzhizhou Island scenic area in Sanya, Hainan province, last year. YUAN YONGDONG / FOR CHINA DAILY

Acupuncture and herbal decoctions, which she once doubted, have become what she calls a self-care habit. "TCM teaches us to look at health in a holistic way, not to fix problems only after they appear, but to take care of ourselves in advance through lifestyle, diet, rest and emotional state. I really agree with this philosophy," she said.

Her daily work now includes talking with patients, accompanying them during consultations, facilitating communication between them and the TCM practitioners, and explaining the basic principles of their treatments in plain, accessible language.

"I place great importance on honest, smooth communication with the patients. I avoid complex terminology. I strive to be a bridge between practitioner and patient, to help people understand why a holistic approach to their health is so important," she said.

This is the sixth year since the 30-year-old settled down in the coastal city, which offers a perfect balance of work, health and quality of life.

"I really love the climate here. I love the feeling of being close to nature. I also love that I can combine work with plenty of rest. Here, people pay more attention to their physical condition, their health and their inner balance," she added.

With the development of the Hainan Free Trade Port and a visa-free policy now applicable to citizens of 86 countries, more foreign tourists, mostly from Russia, frequent the clinic, observed Wu Chunmei, a colleague of Dudko.

"Because winters in Russia are long, locals generally suffer from excessive cold and dampness in the body, rheumatic joint pain and back strain. They come to Sanya during the winter to escape the cold and enjoy the warm climate, so it's very convenient for them to get TCM treatments at the same time," Wu said.

According to Zang Jinpeng, a practitioner at Sanya Traditional Chinese Medicine Hospital, the city's unique environment is naturally suited for wellness and recovery. As early as the early 2000s, a large number of foreign tourists began visiting Sanya and gradually came to experience and appreciate TCM.

CHINA-RUSSIA TIES

Sun Zhuangzhi

People's bonds strengthen bilateral relationship

As we commemorate the 30th anniversary of the China-Russia strategic partnership of coordination and the 25th anniversary of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation in 2026, the timing of Russian President Vladimir Putin's visit to China is particularly significant.

Over the years, people-to-people cooperation has been a vital component of bilateral relations between China and Russia, reflecting the evolution of ties from good-neighborliness and friendly cooperation to a comprehensive strategic partnership of coordination for a new era.

As China-Russia relations have grown stronger and cooperation has expanded, people-to-people exchanges have become essential for developing a new model of major-country relations. They have reinforced the social foundation for high-level cooperation.

Unlike China's commercially driven exchanges with Western countries, which can be disrupted by political factors, its people-to-people cooperation with Russia has consistently been government-led and worked seamlessly alongside political and economic collaboration.

In today's rapidly changing international landscape, where "public opinion warfare" and "information warfare" are constantly reshaping perceptions, China-Russia cooperation has shown remarkable resilience. People-to-people exchanges have played a key role, with advances in technology and transportation significantly enhancing cultural cooperation and interactions.

These exchanges have profoundly affected bilateral relations, including political and economic ties.

In fact, people-to-people exchanges have emerged as a new form of diplomacy, distinct from traditional diplomacy in participants, forms, concepts and objectives.

Alongside cultural diplomacy, this people-to-people diplomacy has gained prominence. Russian scholars note that China-Russia cultural and people-to-people cooperation is systematic and continually enriched with new content, representing a planned and comprehensive interaction.

Since establishing a comprehensive strategic partnership of coordination for a new era in 2019, China-Russia people-to-people cooperation has focused on in-depth, quality development, creating broader opportunities for growth.

In June 2021, the two heads of state issued a joint statement commemorating the 20th anniversary of the treaty, emphasizing the need to expand exchanges in education, academia and culture and enhance the role of cultural centers, friendship associations, and social organizations.

In recent years, both countries have strengthened collaboration in higher and vocational education, scientific research, culture, arts and sports, fostering the growth of cultural and educational endeavors.

New cooperation models and channels are being explored, such as using the internet to enhance media collaboration and cultural showcases, and increasing youth exchanges, especially among students, to cultivate talent with global perspectives and cross-cultural communication skills.

Tourism and public health exchanges have become new focal points.

As the international landscape and inter-state relations evolve, China-Russia bilateral cooperation has increasingly incorporated rich people-to-people elements at both global and regional levels.

The two countries have jointly opposed the politicization of health issues in multilateral forums, supported each other's initiatives internationally, and collaborated on ensuring biosecurity and building a global health infrastructure.

During their respective presidencies of the SCO and BRICS, China and Russia hosted hundreds of events, many of them focused on people-to-people exchanges.

Both countries have encouraged their youth to actively engage in multilateral activities organized by BRICS and the SCO.

Following the launch of the Belt and Road Initiative, its principles of people-to-people connectivity have gained Russian support, particularly the emphasis on mutual respect and learning among civilizations.

This approach lays the groundwork for broad partnerships and facilitates bilateral exchanges in education, sports, and culture.

As close neighbors, China and Russia benefit from geographical and cultural advantages that enhance their cooperation.

Extensive people-to-people exchanges have fostered closer ties between their populations. Polls indicate that mutual favorability is rising, which is crucial for stable and friendly state-to-state relations.

Data from the Levada Center show that Russian society's attitude toward China has undergone positive changes, with a consistently high proportion holding a favorable view of China for over a decade.

In May 2020, an online survey conducted by the China-Russia Committee for Friendship, Peace and Development showed that 93.1 percent of Chinese respondents held a non-negative view of Russia while 82.6 percent of Russians felt the same about China.

A 2024 Levada Center poll found that while Chinese goods remained the top interest for Russians at 29 percent, travel and natural scenery at 27 percent and traditional Chinese medicine, culture, art, literature and films at 25 percent, were close behind, with gaps narrowing significantly.

With the mutual visa exemption and the official launch of the China-Russia Years of Education, efforts to enhance people-to-people connectivity have received strong policy support. Various mechanisms have been established, and the number of councils under the China-Russia Committee for Friendship, Peace and Development has steadily grown.

Additionally, 15 university alliances in similar disciplines have been formed. Both sides are actively engaging in technological innovation cooperation, enhancing connectivity in the digital sector, and complementing each other's strengths.

This "new infrastructure" has emerged as a fresh growth point, marking a new stage in the development of bilateral relations.

People-to-people interactions are a crucial pillar of the China-Russia strategic partnership that guarantees everlasting friendship between the two countries.

A key indicator of this is the shift from a top-down approach to a dynamic, two-way interaction driven by both top-down and bottom-up forces.

This has led to comprehensive, wide-ranging and multi-level cooperation.

People-to-people exchanges and friendship can transcend differences in systems, civilizations and ideologies, providing stable and robust endogenous momentum for bilateral relations.

Andrey Kortunov

Sino-Russian ties a boon for the world

State officials and prominent politicians from Beijing and Moscow have consistently tried to allay the enduring fear of some Western countries that China and Russia may forge a political and military alliance.

Neither China nor Russia has such a plan or aspiration. Both nations are more than happy with the current arrangement in their bilateral relations, with both sides attaching high value to their respective sovereignty.

Furthermore, China and Russia might hold different positions on some specific issues. The two might even be competitors in some international markets.

However, such disagreement or competition does not prevent Beijing and Moscow from working together on many other issues, where their interests and positions coincide or overlap.

One must also mention that in terms of bilateral trade, mutual investments, industrial cooperation, cultural and human interaction, China-Russia cooperation lags significantly behind that between China and both the European Union and the United States.

More Chinese tourists flock to the US than to Russia. There are many more Chinese students and scholars in Western universities than in Russian higher education institutions.

On the other hand, at least a part of the Russian political class and the intellectual community there consider their country to be an organic part of the European civilization. Finally, neither Beijing nor Moscow displays any intention to impose their respective values, political systems or principles of governance on Western nations or on anyone in the world.

And yet, the "ghost of a new axis" continues to haunt some Western statesmen.

Global Lens

Where does this fear come from? The most natural answer would be that this is a typical manifestation of the age-old conventional Western hypocrisy.

Indeed, the Western "ruling circles" have always needed an "external threat" to justify more military spending, to rationalize forging new military blocs and to ostracize those reaching out to their competitors and adversaries.

This old logic, however, cannot be taken for granted any longer.

Reference to an "emerging China-Russia axis" comes in handy when some politicians try to push for NATO's globalization; the trilateral AUKUS partnership between Australia, the United Kingdom and the US; the trilateral US-Japan-Republic of Korea security cooperation framework; or even the expansion of the Quad alliance among Australia, India, Japan and the US.

Scapegoats are always in demand in global politics, and some Western politicians can hardly find a better excuse than Moscow and Beijing to methodically and relentlessly consolidate against the vast Eurasian landmass. This fear apparently stems from an ancient vision in international relations that if any two nations are getting close, they must be doing so to oppose a third party. This is also the thinking of those who treat international politics as a zero-sum game.

This old logic, however, cannot be taken for granted any longer. By extending this strange logic, would the world be safer, more stable, secure and prosperous if the China-Russia strategic partnership were to fall apart?

Would the Western nations benefit from if they "succeed in" driving wedges between Beijing and Moscow? Instead, any such conflict would only become another source of regional and even global instability, generating many more risks and challenges for everyone in the world, including Western nations.

In an era marked by interconnectedness and interdependence, international relations cannot continue to be treated like a "zero-sum game", even if this was the case earlier. Today, we either win together or lose together.

No wonder, Beijing has always welcomed Moscow's efforts to reengage in bilateral dialogue with Washington, while in Moscow they have always been sympathetic to Beijing's attempts to resolve its trade disputes and geopolitical tensions with the US.

Besides, the whole assumption that Moscow and Beijing are working together to create more problems for some Western powers reflects an arrogant "West-centered" view of the world.

Even if the West did not threaten the two nations at all, Moscow and Beijing would still have many reasons to cooperate with each other. These are two big nations with a shared border, with complementary economies, and similar views on many regional and global problems.

It is worth mentioning that the Treaty of Good-Neighborliness and Friendly Cooperation Between the People's Republic of China and the Russian Federation, which opened a new era in bilateral ties, was signed way back in the summer of 2001 — long before Beijing and Moscow began encountering difficulties in their respective relations with some Western powers.

The aggressive posture of some Western powers is undoubtedly one of the factors shaping the China-Russia partnership, but this is by no means the only or decisive factor. One can assume that over time, the significance of this exogenous factor will go down, not up.

These days one can argue that a major problem in international relations is the absence of fear, which earlier used to act as a deterrent against military confrontation between major powers.

However, irrational and unfounded fears are no less dangerous — they can obscure vision, distort realities and trigger irrational impulsive decisions fraught with perilous repercussions for all humankind.

Sergey S. Tsyplakov

Energy cooperation fuels growth amid uncertainties

Instability and uncertainty in the global economy and international trade continue to intensify, unilateralism and protectionism are on the rise, and the international trading system itself is facing serious challenges.

The escalation of tensions in the Middle East and the blockade of shipping in the Strait of Hormuz have demonstrated the vulnerability of global industrial supply chains and the unreliability of established transport corridors.

All these create serious global and regional risks, further increasing the urgency of ensuring economic security and enhancing economic resilience at both the national and multilateral levels.

Russia and China are the largest countries in Eurasia and share a long border.

Over the past 30 years, the two countries have deepened their comprehensive strategic partnership and cooperation.

The established multi-layered mechanisms of China-Russia cooperation — a key element of which is the guiding role of the two countries' leaders and the inherent economic complementarity between the two countries — create unique opportunities to jointly and effectively address risks in those key areas of economic security.

Global Lens

Energy security is a key aspect of economic security.

Within the overall framework of China-Russia economic cooperation, interaction in the energy sector and the large-scale joint projects currently underway, are of paramount importance for both countries.

A key feature of the China-Russia energy partnership is its multi-sectoral nature, with cooperation expanding in sectors such as oil, natural gas, coal and nuclear energy.

In the future, it could extend to renewable energy as well.

China has been Russia's largest trading partner for many years, while Russia has become one of China's major energy suppliers.

The importance of the Chinese energy market for Russian companies has always been high, but in recent years, amid the sharp deterioration of Russia-European Union relations, the forced disruption of years-old supply chains, and the wave of anti-Russian sanctions, this importance has increased even further.

Russia, in turn, remains an important external energy supplier for China, particularly in crude oil and natural gas and is also among the major coal suppliers to China.

Some experts say that Russia has one-sided dependence on China in the energy sector.

These opinions are, to put it mildly, biased and incorrect.

In reality, we see an interdependence that generally serves the interests of both countries, as it increases the resilience of their economies in the face of external shocks and serves as one of the pillars of the entire Sino-Russian partnership of strategic coordination.

The extensive material basis for a Russian-Chinese energy partnership has already been established, and the common goal for the next few years should be joint work on new projects and further improvement of existing cooperation mechanisms.

Given the strategic role of the energy sector in the economy, a necessary prerequisite for the further sustainable advancement of energy cooperation is its high degree of alignment with national economic development priorities and programs.

In this regard, it should be noted that China's 15th Five-Year Plan (2026-30) has generated considerable interest among Russian experts and business circles.

For the first time, the Five-Year Plan sets the strategic goal of transforming China into an energy powerhouse and outlines paths for the large-scale expansion of the new energy sector.

Both countries should continue measures to further deepen the energy partnership between the two sides.

At the same time, it would be a gross oversimplification to reduce the Russian-Chinese energy cooperation to increasing energy trade volumes.

The cooperation should be comprehensive, encompassing production and logistics chains along their entire length, as well as financing and payment systems.

Given persistent geopolitical tensions, the importance of ensuring the security and sustainability of transport routes is growing.

Both countries should jointly develop a cross-border pipeline network and alternative Arctic shipping routes.

Educational exchanges bear fruits

Student enrollments hit record, joint institutions thrive and research relations reach new heights

By ZOU SHUO
zoushuo@chinadaily.com.cn

The expanding educational cooperation between China and Russia is delivering tangible results, with a record number of students crossing borders, new joint institutions thriving and collaborative research reaching new heights, which in turn is contributing to stronger mutual understanding and the building of a shared future, experts said.

As the China-Russia Years of Education unfold and bilateral student exchanges exceed 80,000, both countries are set to strengthen their educational partnership, transforming people-to-people exchanges into a foundation of enduring friendship, they added.

At the Harbin Institute of Technology, or HIT, in Heilongjiang province, which is a pioneer in China-Russia higher education cooperation, the number of Russian students reached a record high of 2,081 in 2025.

The university has established partnerships with 44 Russian institutions, including Lomonosov Moscow State University and Bauman Moscow State Technical University, and has signed 116 cooperation agreements to date. Over the past decade, HIT has admitted more than 9,000 Russian students, ranking it first among Chinese universities in terms of Russian student enrollment, according to the university.

"The university is committed to further deepening cooperation with Russia in the fields of education, science and technology, and talent cultivation, and to becoming a pioneer in China's new frontier of opening up to the north," said Chen Jie, Party secretary of HIT.

In 2011, HIT and Bauman Moscow State Technical University jointly initiated the establishment of the Association of Sino-Russian Technical Universities, the first such association between the two countries.

The association now comprises 80 member institutions and more than 2.2 million enrolled students. It has hosted nearly 100 major events focused on technology, innovation and youth exchanges, benefiting more than 100,000 students and faculty members from both countries, Chen said.

Shenzhen MSU-BIT University — the first Sino-Russian cooperative university jointly set up by the government of Shenzhen in Guangdong province, the Beijing Institute of Technology and Lomonosov Moscow State University — has seen remarkable growth since its official establishment in October 2016.

Li Hezhang, president of Shenzhen MSU-BIT University, said that enrollment went up from 899 to 4,458 during the 14th Five-Year Plan (2021-25) period, marking a nearly fivefold increase. "The university is committed to cultivating high-quality, innovative talent proficient in three languages, familiar with both China and Russia, and strong in professional expertise," he said.

The institution has established five Sino-Russian joint research centers and two key laboratories under China's national key research and development program, Li said, noting that its faculty includes 20 academicians from China and abroad, and its students have won more than 500 awards in high-level academic competitions over the past five years.

He added that the university has sent about 1,200 students to Lomonosov Moscow State University for exchange programs, 167 of whom have received government scholarships.

Li Yuyao, 22, an economics major at Shenzhen MSU-BIT University, spent a semester at Lomonosov Moscow State University in 2025, thanks to a government-funded scholarship program. "The immersive environment with Russian professors and classmates helped me progress quickly," she said.

During her stay in Russia, she traveled to Moscow, St. Petersburg and Lake Baikal. "Most Russian people we met were very friendly. Some even asked to take photos with us on Red Square," she recalled.

Fluent in Chinese, English and Russian, Li Yuyao said she hopes to pursue a career in multinational trade.

For Viktoriia Dragun, a second-year chemistry student from Russia at Shenzhen MSU-BIT University, coming to China was a life-changing decision.

"I started learning Chinese at age 12 because I love the language — it sounds beautiful and mysterious," she said. "Chinese people are very warm and inclusive. They understand I'm a foreigner, so they're patient when my expression isn't perfect."

Dragun plans to apply for postgraduate studies at Tsinghua University. "As I have come to China, I want to experience studying at the best university here," she added.

Liu Limin, president of the China Education Association for International Exchange, who studied in Russia as a government-sponsored doctoral student in the 1980s, said that his more than 40 years of study and work have been closely related to China-Russia educational exchanges, and that he has dedicated his career to fostering bilateral educational ties.

"An educational exchange is the most lasting, the warmest and the most powerful form of people-to-people bond," he said. "The launch of the China-Russia Years of Education comes at a historic moment and provides a new window for the all-around upgrading of cooperation."

Liu said that his association has helped build a comprehensive cooperation network between the two countries, covering higher education, vocational training, basic education and youth exchanges.

Key achievements include the Luban Workshop, which aligns China's vocational education standards and training system with Russia's industrial demands; the "thousand schools hand in hand" initiative, which is planned to pair more than 1,000 primary and secondary schools over five years; and the China-Russia children's creative festival, which has received about 55,000 student submissions.

Looking ahead, Liu emphasized the need to transform short-term activities into long-term mechanisms. "True cooperation is not a passing trend, but a steady, lasting flow," he said.

Liu also called for aligning Russia's strengths in mathematics, physics, astronautics and art with China's advantages in artificial intelligence and digital education. "We must cultivate young talent to become ambassadors of China-Russia friendship for generations to come," he said.

Visit: Security and energy cooperation forms a vital pillar

From page 1

Infrastructure linkages reinforce these ties. The Power of Siberia pipeline has already transformed energy flows, and Power of Siberia 2 — with its potential annual capacity of 50 billion cubic meters via Mongolia — would promise further integration.

Investment flows, while fluctuating, demonstrate commitment. Cumulative Chinese direct investment in Russia has been estimated in the tens of billions of yuans, with sectors such as energy, manufacturing and logistics being prominent. Joint projects span high-tech, agriculture and aerospace.

People-to-people exchanges have increased. Tourism is rebounding strongly. Chinese visitors accounted for over 50 percent of foreign tourist trips to Russia in 2025 (around 834,000 trips), while Russian outbound travel to China rose 33.6 percent, according to Interfax Information Services Group. Mutual flows are projected to grow significantly.

Educational ties are equally promising. In the 2024-25 academic year, over 56,000 Chinese students studied in Russia and more than 21,000 Russians in China, Valery Falkov, Russian minister of science and higher education, told the media last year. Both sides aim for 100,000 total exchanges by 2030, supported by over 200 joint programs, he said. These exchanges foster mutual understanding and build the next generation of professionals invested in the partnership.

Security and energy cooperation through the Shanghai Cooperation Organization forms a vital pillar. Originally focused on countering terrorism, extremism and separatism, the SCO has evolved into a comprehensive platform for Eurasian stability. The 2025 Tianjin Summit marked a significant expansion of its remit, particularly in energy and development finance.

China drove the launch of dedicated SCO energy and green-industry cooperation platforms, alongside commitments to jointly add tens of gigawatts of solar and wind power capacity across member states over the next five years. Beijing pledged 2 billion yuan ($294 million) in grants for 2025 and 10 billion yuan in loans over three years to support these initiatives. The SCO Development Bank, agreed to at the Tianjin summit with seed capital and loans pledged by Beijing, is an emerging multilateral institution championed by China to fund regional infrastructure and provide an alternative to Western-led financial systems.

This builds on longstanding efforts. SCO frameworks have long facilitated coordination on oil, gas and resource development among countries like Russia, Kazakhstan and China. Traditional hydrocarbon projects — pipelines, exploration and joint infrastructure — now sit alongside a growing emphasis on renewables and green transitions, creating a balanced, resilient energy architecture for Eurasia. The Tianjin outcomes further institutionalize this collaboration, enabling financed cross-border projects enhancing connectivity and reducing vulnerabilities. Russia and China, as western and eastern bookends of the SCO, provide the strategic depth and resources to drive this consolidation, turning Central Asia and beyond into a zone of coordinated development rather than competition.

Multilaterally, BRICS and the SCO enable the quiet advancement of alternatives to Western-dominated institutions: National currency settlements, development financing and coordinated positions on global governance.

In a world of flux — shifting deterrence architectures, Middle East reconfiguration and Eurasian integration — the Russia-China strategic partnership provides continuity and predictability. It does not seek dominance but equilibrium — a stable Eurasia as the foundation for global security. By anchoring economic flows, diversified energy security through both traditional and emerging sources via SCO mechanisms and multilateral forums, this partnership mitigates instability on its peripheries and offers a counterweight to unilateral pressures.

As Putin visits Beijing, the message is clear, that this relationship is not reactive but constitutive of an emerging order. Eurasian consolidation is advancing not despite global headwinds but through them. Putin's Beijing visit is less about immediate headlines than about the quiet, steady forging of a framework that will shape international stability for decades. The deepening ties — measured in trade volumes, energy cooperation, student exchanges, SCO energy platforms and shared security visions — signal a partnership built to endure, benefiting not only the two nations but the broader quest for a balanced, multipolar world.

Veteran diplomat calls himself 'native of Beijing'

By JI HAISHENG
jihaisheng@chinadaily.com.cn

Minutes after Andrey Denisov, former Russian ambassador to China, received the Outstanding Diplomat Medal in Beijing on Monday, a group of journalists gathered around him seeking interviews.

The seasoned diplomat switched effortlessly among Chinese, Russian and English as he fielded questions — from his personal bond with China to the broader Sino-Russian relationship and the visit by Russian President Vladimir Putin.

"I am happy to be in Beijing these days," said Denisov, who refers to himself as "a native of Beijing". Having lived and worked here for more than two decades, he said that a profound sense of hometown nostalgia feels only natural.

Beijing, he once said, remains his favorite among the many Chinese cities he has visited. In past interviews, he has spoken of strolling through the *hutong*, traditional alleys in Beijing, near the Bell and Drum Towers and the Houhai area, and of holding a special affection for Beihai Park — a quiet retreat in the heart of the bustling Chinese capital.

This connection is rooted in a journey that began half a century ago. Denisov first arrived in Beijing in 1973 as a young student-interpreter, and he served as Russia's ambassador to China from 2013 to 2022. At his inaugural news conference in May 2013, Denisov struck the audience with a disarmingly personal touch, when he opened his remarks with a warm everyday Chinese greeting, signaling his deep integration into the country.

Over the following nine years as ambassador, Denisov was a key figure in the bilateral relationship, working to advance cooperation across fields and strengthen people-to-people friendship and trust. Chinese Foreign Minister Wang Yi once praised him as "a good friend, an old friend and a true friend of the Chinese people".

Denisov participated in nearly every interaction between the Chinese and Russian heads of state in recent years. Speaking of Putin's visit to China on Tuesday and Wednesday, Denisov said he has great expectations. "As the international situation is now tense, I hope this visit will contribute to easing international tensions," he said.

> "The world needs China, and it needs China's contribution to peace and peaceful development."
>
> **Andrey Denisov,** former Russian ambassador to China

"The fact that there are quite a number of visits here in China in spring underscores the role of China as both an actor and a key player in the international arena," Denisov said. "The world needs China, and it needs China's contribution to peace and peaceful development." He stressed that Putin's visit is part of that broader effort.

With bilateral relations, cooperation in various fields, and international and regional issues of mutual interest on the two leaders' agenda, Denisov said, "I'm quite sure, as a former ambassador, that everything will be accomplished in a real form."

Quoting the Chinese maxim that "practice is the sole criterion for testing truth", Denisov said that, based on his many years of stay in China and his sustained efforts to advance bilateral relations, he can affirm that this partnership is both broad and deep in its development.

"We are two big countries. We are not allies, but we are very close. In some areas, our relationship is even stronger than just an alliance," he said, adding that he is convinced the two countries will have a good future. He also expressed confidence that the partnership will yield more positive outcomes.

Looking ahead, Denisov pledged to continue "serving the people wholeheartedly", drawing inspiration from the fundamental purpose of the Communist Party of China.

Exploring the future

A visitor seeks information from exhibitors on Sunday at the 10th China-Russia Expo in Harbin, Heilongjiang province. The event, which opened on the same day and runs through Thursday, has gathered more than 1,500 enterprises from 46 countries and regions. The expo covers an area of 55,000 square meters and sheds spotlight on future industries such as intelligent equipment, digital security, green building materials and new energy storage. CAO JIANXIONG / FOR CHINA DAILY

Health: Climate, TCM network draw intl visitors

From page 1

The proportion of days with excellent air quality exceeds 99 percent annually and the island boasts abundant coastal zones, forests and hot spring mineral resources, as well as over 133,000 hectares of land under cultivation for Chinese medicinal herbs.

In addition, TCM hospitals, therapy clinics and wellness institutions spread across urban and rural areas form a TCM network that covers everything from basic therapies to high-end services.

Sanya Traditional Chinese Medicine Hospital alone has served over 130,000 overseas visitors from more than 40 countries and regions.

Zang noted that the hospital has established a professional TCM health assessment center which uses the four diagnostic methods of TCM, namely inspection, auscultation and olfaction, inquiry and palpation, along with specialized instruments for constitution identification.

What travelers find here is no fleeting novelty, but a quiet cultural immersion that increasingly feels like a "very Chinese moment".

Lie down. Receive the fine needles. Sip the dark decoction. Experience the *tuina* massage. Then let the island do the rest.

UK's election swings signal European shift

Outcome reflects rightward drift and political fragmentation, experts say

By YANG RAN
yangran1@chinadaily.com.cn

The recent local and regional election results in the UK signal a notable shift in the nation's political landscape, with far-right parties making unprecedented gains at the expense of traditional powerhouses.

Experts note this outcome mirrors a broader trend of rightward drift and political fragmentation occurring across Europe, driven by growing public dissatisfaction with the political and social status quo.

The results from Britain's local and regional elections, released on May 9, saw far-right Reform UK score its biggest breakthrough yet. Across around 5,000 council seats in 136 English councils, the party gained over 1,400 seats and took control of 14 councils, while Labour lost almost 1,500 seats.

Cui Hongjian, a professor at Beijing Foreign Studies University's Academy of Regional and Global Governance, said the message from the election results is that the traditional two-party system in Britain is under strain, and political fragmentation and polarization are continuing to rise. He said this trend mirrors the broader rightward shift seen across European politics in recent years.

This phenomenon of surging far-right parties challenging established political forces is not unique to the UK alone. In Germany, the far-right Alternative for Germany has evolved from a fringe protest party into a major political force, with an INSA survey from April putting its support at a record 28 percent — ahead of Chancellor Friedrich Merz's conservative CDU/CSU bloc.

France, while exhibiting a slower transformation, is also witnessing a normalization of the far right. The far-right National Rally is now France's largest parliamentary party and enjoys high standing in the polls, signaling its potential to significantly influence future elections. Similarly, in Portugal, the far-right Chega party has experienced an impressive rise in popularity since its founding in 2019.

Sense of discontent

Wu Huiping, deputy director of the German Studies Center at Tongji University, said the rightward shift is a widespread and persistent trend across Europe in recent years. She attributed this trend to a widespread sense of social discontent.

Many countries are grappling with deep-seated problems in the social, economic, and security spheres, fueling public discontent with establishment parties and paving the way for rightwing populist and far-right forces to gain ground, she said.

She said even some center-right parties, sensing voter anger over issues like immigration, have shifted to the right to some extent, accelerating the overall political realignment. In some cases, even left-wing populist parties have adopted what she described as "left-wing conservatism" on certain sociocultural issues, further contributing to the rightward drift.

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, said the rise of far-right and populist parties reflects the failure of traditional parties to adequately address the pressing concerns of ordinary people.

"For example, economic stagnation, livelihood issues, and immigration issues are all major concerns for the people. Traditional parties have failed to solve these problems, which has led to the increasing popularity of these far-right parties," he said.

According to a report released in April by the Centre for Research and Analysis on Migration at RFBerlin, the number of immigrants living in the European Union reached a record 64.2 million in 2025, an increase of about 2.1 million from the previous year.

Experts also point to a growing trend of political polarization across Europe, making it increasingly difficult for centrist parties — once dominant in major European nations — to survive.

The results of the French municipal elections, held in March, showcased this dynamic, with left-wing alliances scoring victories, the far-right National Rally making local gains, and the ruling coalition suffering losses.

Jasna Plevnik, president of the Geoeconomic Forum Croatia, said this trend does not lead to optimism. "The centrists have given up their political identity, turned their neoliberal ideas into a soft right-wing framework and formed contradictory political coalitions to stay in power," she said. "In that context, voters would rather vote for true right-wing or left-wing parties."

Looking ahead, analysts anticipate a continued shift toward conservatism and even populism across Europe, with potentially complex implications.

Cui Hongjian suggested that the rise in conservative-populist governments, with their stance of prioritizing their own country, could lead to protectionist policies in trade and a more negative attitude toward international engagement.

Africa ramps up Ebola response as cases rise

By SHARON NAKOLA
in Nairobi, Kenya
sharon@chinadailyafrica.com

Countries across Africa and beyond are intensifying measures to prevent and control the latest Ebola outbreaks in Central and East Africa, which have killed more than 100 people, following the World Health Organization's declaration of a public health emergency of international concern.

DR Congo's Health Minister Samuel Roger Kamba said on Tuesday that the death toll had risen to 131, with 513 suspected Ebola cases. Uganda has so far reported two confirmed cases and one death.

The outbreaks, linked to the Bundibugyo strain of the Ebola virus, have triggered heightened surveillance, emergency preparedness and border screening measures across the region.

Africa CDC warned that insecurity in eastern DR Congo, mining-related mobility, weak infection prevention systems and intense cross-border movement near Uganda, Rwanda and South Sudan could accelerate the spread of the virus if response efforts are not strengthened quickly.

Abdalla Hussein, Doctors Without Borders' desk manager for South Sudan, warned on Tuesday that insecurity and weak surveillance systems in conflict-affected areas could allow Ebola infections to spread undetected. He said fragile healthcare systems in affected countries would require strong international support to manage the outbreak effectively.

"All the conditions we have discussed today — armed conflict, limited access and poor surveillance in some areas — make detection and response much more difficult," Hussein said, adding that humanitarian agencies were preparing for the possibility of wider regional spread, including into South Sudan.

Africa CDC Director-General Jean Kaseya said: "The confirmation of the *Bundibugyo ebolavirus* in interconnected countries reminds us once again that Africa's health security is indivisible."

Action urged

"We must act early, act together and act based on science," he added.

Kaseya said Africa CDC had activated emergency coordination mechanisms to mobilize financial and technical resources, reinforce laboratory and surveillance systems and support preparedness activities in neighboring countries.

The African Union Commission Chairperson, Mahmoud Ali Youssouf, called for stronger continental solidarity and coordination to contain the outbreaks, describing them as a major public health concern requiring coordinated continental action.

"The protection of African lives and the safeguarding of our continental health security remain our highest priority," Youssouf said.

The WHO said on Monday that nearly 12 metric tons of emergency medical supplies had been delivered to support response efforts in DR Congo within 24 hours.

The WHO dispatched 4.7 metric tons of medical supplies and equipment to Bunia, while another 7 tons arrived from Kinshasa alongside 35 WHO experts and first responders deployed to affected areas.

Meanwhile, the East African Community Secretariat has urged member states to strengthen surveillance, improve emergency preparedness and intensify cross-border coordination following confirmation of the outbreak in eastern DR Congo.

In Kenya, the Ministry of Health has directed county governments and border authorities to heighten surveillance and screening measures, particularly in areas with significant cross-border movement and international travel.

Beyond Africa, the United States Centers for Disease Control and Prevention also announced enhanced travel screening measures after a US healthcare worker tested positive for the Bundibugyo strain.

Ebola is a severe viral disease transmitted through direct contact with bodily fluids of infected people, contaminated materials or infected animals.

Shooting in mosque leaves 5 dead

By RENA LI in Los Angeles
renali@chinadailyusa.com

Three worshippers and two teenage suspects were killed on Monday in a shooting at the Islamic Center of San Diego that authorities are investigating as a possible hate crime, according to police and local media reports.

The violence erupted shortly before noon at the mosque in San Diego's Clairemont neighborhood, prompting a large-scale law enforcement response and alarming Muslim communities across California.

San Diego Police Chief Scott Wahl said officers arrived within four minutes after receiving reports of an active shooter at the center. Police found three adults fatally shot outside the mosque, including a security guard whom officials credited with helping prevent additional casualties.

"The security guard played a pivotal role in keeping this from being much worse," Wahl told reporters at a news conference.

As officers searched the mosque and the surrounding area, additional reports of gunfire emerged several blocks away. Authorities later found the two suspects, aged 17 and 18, dead inside a vehicle from apparent self-inflicted gunshot wounds, police said.

Investigators are examining whether anti-Muslim extremism played a role in the attack. According to the Los Angeles Times, investigators discovered anti-Islamic writings, hate-related material and a suicide note referencing racial pride inside the suspects' vehicle. Authorities also believe that at least one of the firearms used may have belonged to a parent of one of the suspects.

The Federal Bureau of Investigation is assisting local police in the investigation, which authorities said is being considered a hate crime until proven otherwise due to the location of the attack.

The Islamic Center of San Diego, one of the region's largest mosques, also operates an accredited Islamic school. Police evacuated students and staff members during the incident, and community leaders later confirmed that no children were injured.

"This is obviously very alarming," said Deana Helmy, chair of the Islamic Shura Council of Southern California. "This is a house of worship. There's a school with children there who are trying to learn."

Taha Hassane, imam of the mosque, said the shooting had deeply shaken the local Muslim community.

"We have never experienced a tragedy like this before," Hassane said. "It is extremely outrageous to target a place of worship."

The attack occurred during a holy period in the Islamic calendar during which Muslims around the world prepare for the Hajj pilgrimage.

Civil rights groups, including the California chapter of the Council on American-Islamic Relations, said they are working with mosques statewide to review security measures following the shooting.

California Governor Gavin Newsom and San Diego Mayor Todd Gloria said they had been briefed on the incident and thanked first responders for their efforts.

Authorities said the investigation remains ongoing as police seek to determine the circumstances and motives behind the attack.

Agencies contributed to this story.

Household debt in US hits record $18.8 T

By BELINDA ROBINSON
in New York
belindarobinson@chinadailyusa.com

US household debt hit an all-time high of $18.8 trillion in the first quarter of the year, a report by the Federal Reserve Bank of New York found, as some Americans found it increasingly difficult to pay their bills and manage their debts.

The findings from the quarterly report on household debt and credit, released in mid-May by the Federal Reserve Bank of New York's Center for Microeconomic Data, found that Americans owed money on mortgages, credit cards, autos and student loans. The overall increase in debt was driven by higher balances on auto loans and mortgages.

"It's a struggle to keep our finances in check," Sarah, 39, a married mother-of-two from Brooklyn, New York, told China Daily. She admitted feeling "embarrassed" about how high her debt was.

"With our mortgage payment and what we owe on our credit cards, student loans and the cost of having two young kids under five, it's a lot. We feel like we're barely above water some months. My husband works full-time, I'm a freelancer. It gets me down, yes."

The New York Fed said that mortgage balances rose $21 billion in the first quarter and totaled $13.19 trillion at the end of March.

Credit card balances fell by $25 billion but stood at $1.25 trillion.

Auto loan balances increased by $18 billion to $1.69 trillion in the first quarter of the year.

Student loan balances were described as flat, decreasing by $6 billion to $1.66 trillion.

But 10 percent of student loan balances were delinquent, up from 9.6 percent in the fourth quarter of 2025.

"Student loan delinquencies are returning to pre-pandemic levels," Daniel Mangrum, a research economist at the New York Fed, said in a statement.

Despite this, the report found that, overall, Americans' credit was "stable".

However, it warned that those who will feel the most strain are the young and low-income households.

Carlos Savala, 71, originally from Costa Rica, lives in Manhattan, New York in subsidized housing. The retiree is fed up with the cost of everything, especially food, and gets free meals from a food pantry in midtown three days a week.

"Everything is expensive! It all costs more to me, especially food. I don't cook. This place helps me out on Tuesday, Wednesday and Thursday. I'm very thankful to them for what they do," Savala said. "On the other days, when they're not open, I go to other places ... You've got to pull back on the nice things to afford the basics and your bills."

The rise in household debt came as inflation rose for a second consecutive month, data from the US Bureau of Labor Statistics shows.

The Consumer Price Index rose at a seasonally adjusted 0.6 percent in April, making the one-year pace 3.8 percent — its highest level since March 2023.

Rising gasoline and energy costs linked to tensions in the Middle East contributed to the increase in inflation, according to analysts.

The national average cost of a gallon of regular gas was $4.53, the highest level since 2022, the American Automobile Association said on Tuesday.

Arnold P., 55, an economist and financial advisor from Brooklyn, New York, withheld his surname to protect the anonymity of his clients. He advises clients on tight incomes to focus on paying the essentials first and then tackle their debt.

"I see a lot of people who have massive amounts of debt," he said. "It's usually a mortgage, or rent, credit card debt and college loans combined, which means they find that their debt-to-income ratio is too high, exceeding 40 to 50 percent. Some are in serious financial trouble. Many really need my help."

Washington halts attack as talks gain pace

Standoff shifts toward diplomacy after Gulf push points to 'acceptable' offer

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

US President Donald Trump said he was deferring a "planned" military attack on Iran, which was supposed to take place on Tuesday, following "serious negotiations" with Gulf states that would be "acceptable" to Washington and its allies.

In a social media post, Trump said he had been asked by the leaders of Qatar, Saudi Arabia and the United Arab Emirates to "hold off" the strikes as "a deal will be made" that would be acceptable to the United States, its allies and "countries in the Middle East and beyond".

"This deal will include, importantly, no nuclear weapons for Iran!" he wrote on Monday, adding that he had instructed the defense secretary, the chairman of the Joint Chiefs of Staff, and the US military "to be prepared to go forward with a full, large-scale assault of Iran, on a moment's notice, in the event that an acceptable deal is not reached".

Iranian President Masoud Pezeshkian said a dialogue "does not mean surrender".

Iran enters into dialogue "with dignity, authority, and the preservation of the nation's rights", he said on X, adding that under no circumstances will Tehran retreat from the legal rights of the people and the country.

"We will serve the people with logic and with all our might, to the end, and safeguard the interests and honor of Iran," he said.

Major General Ali Abdollahi, commander of Iran's Khatam al-Anbiya Central Headquarters, warned the US and its allies not to repeat a "strategic mistake" and miscalculation against Iran, as a renewed act of aggression would be met with a "swift, decisive, powerful and extensive" response.

The US and Iran have been threatening each other as they tussle with one another over sticking points in a stalled ceasefire deal and control over the Strait of Hormuz.

Meanwhile, US Senate Minority Leader Chuck Schumer announced on X that Senate Democrats would force an eighth vote on a War Powers Resolution this week, which aims to curtail the president's capacity to wage war against Iran.

Schumer called for Republican support for the resolution and to "end the war (and) get our troops out of harm's way".

Trump's approval rating has dipped to a record low amid the war against Tehran, according to a New York Times/Siena poll published on Monday.

Overall, 64 percent of respondents said it was wrong for the US to go to war with Iran, while 30 percent said it was the right decision. The majority of Republicans polled thought it was the right decision, while 73 percent of independents considered it as the incorrect decision.

Iran's Deputy Foreign Minister Kazem Gharibabadi told the Parliament's national security commission that Iran is not going to give up on its right to enrich uranium, Al Jazeera reported. The US has insisted that Iran must stop enriching uranium for the next two decades.

Blockade of strait

Iran has also asked the US to end its blockade of the Strait of Hormuz, but the US has said that Iran must first reopen the strait before it will do so.

Farhan Haq, deputy spokesman for the United Nations secretary-general, had earlier said the UN does not want any particular entity to restrict access to the strategic waterway.

"Ultimately, for us, we want to make sure that there's no constraint to freedom of navigation on the high seas and on the Strait of Hormuz," he said.

Rasha Al Joundy, a senior researcher at the Dubai Public Policy Research Centre, told China Daily that it is "obvious" that the US does not want to restart the war, especially if there is a possibility for a deal with Iran.

"Trump has a very difficult situation. If he starts the war again, it would mean a more dangerous one, in terms of targets and reactions," she said. "Then, in terms of the global economy, he needs this deal to come through and to be valid."

Kicking up dust

A masked cyclist rides through a dust-choked street during a severe sandstorm in Najaf, Iraq, on Monday, as sweeping clouds of dust triggered more than 800 suffocation cases across the country. Dust storms are common in Iraq, often triggered by desertification, sparse vegetation cover and prolonged droughts. ANMAR KHALIL / AP

China's multilateral approach commended at forum

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

China's initiatives to promote multilateral cooperation and governance contribute to global peace and development toward a shared future, experts said at a forum in Hong Kong on Tuesday.

"It is no doubt that we are living in a world where no single power can resolve all problems and that unilateralism is not an answer," said Irina Bokova, former director-general of UNESCO and a senior adviser to the Board of Directors of the Europe-Asia Center.

In her special address at the 2026 Hong Kong Forum on Cooperation and Development, Bokova said the China-proposed Global Development Initiative, Global Security Initiative, Global Civilization Initiative and Global Governance Initiative support multilateralism, a concept at the core of the United Nations Charter.

Romano Prodi, former prime minister of Italy and former president of the European Commission, said via video, "Peace must be built step-by-step from dialogue, through mutual respect and through the willingness to listen."

With Europe and China both playing crucial roles on the global stage, Prodi said he hopes the two sides will continue to cooperate to create a peaceful environment for the world.

In a keynote address, Ivan Polyakov, vice-president of the Russian International Affairs Council, said that multilateralism is of utmost importance for creating a new and sustainable information space. Ties between media networks lie in the existence of common channels, exchange and shared values, he said.

Polyakov, also chairman of TV BRICS, said the multilingual international platform has united more than 100 media outlets worldwide, with the materials distributed to about 80 countries.

Josef Gregory Mahoney, a professor of politics and international relations at East China Normal University in Shanghai, highlighted the significance of China's new internationalism in global affairs, saying it stands in sharp contrast to the binary, us-versus-them mindset of certain countries.

> "It is no doubt that we are living in a world where no single power can resolve all problems and that unilateralism is not an answer."
>
> **Irina Bokova,** former UNESCO director-general

China's initiatives have always aimed for a shared future for humanity and the actualization of the Five Principles of Peaceful Coexistence, he said.

Cheung Kwok-kwan, deputy secretary for justice of the government of the Hong Kong Special Administrative Region, said the city can also contribute to the building of a community with a shared future for humanity under "one country, two systems".

For example, he said the launch of the International Organization for Mediation in Hong Kong last year is important for improving global governance and promoting world peace and stability, with the city ranking second-most preferred seat of arbitration globally in the 2025 International Arbitration Survey.

Echoing the view, Chow Man-kong, a professor of practice in the Department of Data Science at City University of Hong Kong, said he believes the city will be able to demonstrate to the world its strength and capabilities as an international legal and dispute-resolution hub.

"It will further promote the vision of win-win cooperation and shared development within the international community," said Chow, who is also chairman of the Greater Bay Area Development Foundation.

Themed "Cooperation and Development: Advancing the Building of a Community with a Shared Future for Humanity", the forum was organized by the Academy of Contemporary China and World Studies, Peace Research Institute Hong Kong, and China-Europe-America Global Initiative, bringing together more than 100 participants from nearly 10 countries.

Debris of disaster

G7 finance chiefs meet in Paris to tackle energy crisis

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Finance ministers and central bank governors from Canada, the European Union, France, Germany, Italy, Japan, the United Kingdom and the United States met for a second day of talks in Paris on Tuesday, seeking solutions to high energy prices caused by the Iran war.

The G7 finance ministers' meeting came a year on from Washington's imposition of tariffs on Western allies and in the wake of an economic crisis of its making, with attendees saying they hoped the US would realize multilateralism was the way forward.

Roland Lescure, France's finance minister, told The New York Times that negotiations to reopen the Strait of Hormuz, which has been effectively closed because of the conflict, clearly need international cooperation.

"When we saw that, we felt that more than ever the G7 had a role to play, and that engaging in conversations, multilateral if possible, was the right way of addressing this," he said.

As he arrived for the talks, he added, "We're going to show that multilateralism is useful and that it works."

Lescure acknowledged on Tuesday that two days of talks were "sometimes difficult", even as the group agreed a statement committing to multilateral cooperation in combating growing economic risks.

"We have had frank, sometimes difficult, direct discussions to find long-term and short-term solutions to major global economic challenges in order to guarantee economic stability," he said after a meeting of the finance ministers, including US Treasury Secretary Scott Bessent.

However, the final communique of the G7 ministers reaffirmed "our commitment to multilateral cooperation in addressing risks to the global economy".

Bessent led the US delegation at the talks, which included regular G7 members as well as Brazil, India, Kenya, Qatar, South Korea, Syria, the United Arab Emirates and Ukraine.

The meeting came in the wake of the International Monetary Fund warning that damage to global oil markets caused by the blockage of the Strait of Hormuz could slow growth, fuel inflation and cause a global recession.

At Monday's session, the ministers highlighted growing concern about a sell-off of bonds and public debt for fear of impending inflation caused by the war.

Joachim Nagel, the head of Germany's central bank, told Reuters that policymakers want to calm markets and give them positive momentum.

The finance ministers also planned to use the gathering to coordinate critical raw material supplies.

However, Tuesday's session began with the EU criticizing the US' new 30-day extension of its sanctions waiver, which allows purchases of Russian seaborne oil.

Washington said the move was aimed at lowering energy prices.

AFP contributed to this story.

Cuba warns US military action would cause 'bloodbath'

HAVANA — Cuba's President Miguel Diaz-Canel said on Monday that any US military action against Cuba would lead to a "bloodbath" with incalculable consequences for regional peace and stability.

"The threats of military aggression against Cuba by the world's most powerful country are well known," Diaz-Canel wrote on X. "Such threats already constitute an international crime."

Cuba "does not represent a threat, nor does it have aggressive plans or intentions against any country", he added.

Cuba is already suffering a "multidimensional aggression" by the United States and has the "absolute and legitimate right" to defend itself from any military action, he said.

The comments came after US outlet Axios reported on Sunday that Cuba had acquired more than 300 military drones and had discussed plans to use them to attack US targets, citing classified intelligence.

Havana said Washington was fabricating a case to justify potential military intervention.

Tensions between the two countries have risen sharply in recent days. The US government imposed sanctions on 11 Cuban officials on Monday, including the country's communications minister and several military leaders, and its main intelligence agency.

Washington had earlier imposed an oil blockade on Havana by threatening sanctions on countries supplying it with fuel.

Cuba has received no oil shipments since a Russian tanker delivered around 700,000 barrels — about two weeks' worth for the island country of 10 million people — in late March.

Diaz-Canel said on Monday that the US executive order that "pursues and threatens" third parties who wish to sell fuel to Cuba was "immoral, illegal and criminal".

Also on Monday, a ship laden with humanitarian aid from Mexico and Uruguay arrived in Havana to help ease the spiraling crises.

The ship, which departed from a Mexican port, includes personal hygiene items and 1,700 tons of grains, powdered milk and other food items, according to Cuban state media.

Cuba's food industry minister, Alberto Lopez Diaz, said the items arrive "at a time of great economic hardship".

Editorials

China-Russia ties benefit both sides, and are stabilizing force in a turbulent world

Russian President Vladimir Putin's state visit to China on Tuesday and Wednesday carries practical significance for the future development of bilateral ties and for global stability.

This year marks the 30th anniversary of the establishment of China-Russia strategic partnership of coordination, the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation and the year to kick-start events of the China-Russia Years of Education. The steady advancement of relations between the two nations demonstrates the significance of the high-level exchanges between Beijing and Moscow.

In a video address delivered on Tuesday before his visit to China, Putin noted that "regular mutual visits and Russia-China top-level talks are an important and integral part of our joint efforts to promote the entire range of relations between our two countries and unlock their truly limitless potential".

Under the strategic guidance of head-of-state diplomacy, bilateral ties have maintained stability, continuously deepening practical cooperation across different sectors.

In the process, the China-Russia comprehensive strategic partnership of coordination for a new era has achieved sustained development, presenting itself as a reference for a new type of major-country relationship featuring non-alliance, non-confrontation and non-targeting of third parties.

Pragmatic cooperation remains one of the most dynamic pillars of bilateral relations. In recent years, China-Russia trade has maintained robust momentum despite a complex external environment. The structure of bilateral trade is also undergoing continuous optimization, with cooperation extending beyond traditional energy and raw materials to emerging sectors.

The political mutual trust and economic cooperation between the two neighbors reinforce one another in a virtuous cycle. The structural complementarity of the two economies is increasingly evident and is being effectively translated into tangible benefits for both peoples.

The people-to-people dimension of bilateral cooperation is also flourishing. Cultural exchanges between the two peoples have become increasingly vibrant, thanks to a series of new policies facilitating communication.

Chinese tourists are visiting Russia in growing numbers, while more Russian people are traveling to China for sightseeing, business and cultural exchanges. Such interactions further strengthen the social foundation of bilateral friendship and inject new vitality into the long-term development of the relationship.

Beyond bilateral cooperation, China and Russia maintain close coordination on international and regional affairs. The two countries share similar or convergent positions on many major global issues, firmly supporting the purposes and principles of the United Nations Charter, advocating a multipolar world order and promoting greater democracy in international relations. Within multilateral mechanisms such as BRICS and the Shanghai Cooperation Organization, China and Russia work closely together to defend multilateralism, oppose unilateral actions and hegemonic practices, and promote greater representation for developing countries in global governance.

Against the backdrop of rising protectionism, unilateralism and geopolitical fragmentation, the China-Russia relationship serves as a stabilizing force in a turbulent world.

During Putin's visit, the two heads of state will exchange views on bilateral cooperation in various fields and on international and regional issues of mutual interest. As Chinese Foreign Ministry spokesman Guo Jiakun said, the two sides will take the opportunity of Putin's visit to continue deepening and elevating relations, so as to inject more stability and positive energy to the world.

The China-Russia relationship reflects the sovereign choices of two independent nations pursuing development, security and mutually beneficial cooperation based on their own national interests and the broader interests of regional and global stability.

As the two countries commemorate important historical milestones in bilateral ties, it is anticipated that Putin's visit will further deepen strategic coordination, expand practical cooperation and inject greater certainty and positive energy into a volatile world.

WHA's rejection of Taiwan proposal justified

No matter what the Democratic Progressive Party authorities of Taiwan say or do to whitewash their secessionist scheme, it does not change the fact that Taiwan is part of China, and the trend toward China's national reunification is irresistible.

The international community has consistently said no to any notion of "Taiwan independence". The latest decision by the 79th World Health Assembly to reject the proposal for the Chinese island to participate in its plenary session in Geneva as an observer underscores this.

For the 10th consecutive year the WHA has upheld the one-China principle, as enshrined in United Nations resolutions and other instruments of international law, by denying Taiwan's participation. This consistent stance of the WHA demonstrates the widespread recognition of China's sovereignty over the island and the importance of adhering to international law.

The refusal to entertain proposals that suggest Taiwan holds a status implying "statehood" is a testament to the organization's respect for China's sovereignty and territorial integrity.

The DPP's separatist stance has eroded the political foundation necessary for Taiwan's participation in international organizations such as the WHA as an observer. Its attempts to "internationalize" the Taiwan question by pushing for the island's participation in global forums under the guise of being an "independent nation" have failed to gain traction. The few parties that support this are simply using the island as a card to serve their own narrow interests. "China's Taiwan region, unless given approval by the central government of China, has no basis, reason or right to participate in the WHA," a spokesperson for the Chinese Foreign Ministry said on Monday.

The rejection of Taiwan's participation in the WHA shows that the majority of the international community recognizes and upholds the United Nations General Assembly Resolution 2758 and WHA Resolution 25.1, which affirm the government of the People's Republic of China is the sole legal government representing the whole of China.

The special arrangement allowing Taiwan to participate in WHA activities as an observer under the name "Chinese Taipei" was made on the basis of the 1992 Consensus, which embodies the one-China principle. This policy was upheld by the Ma Ying-jeou authorities from 2009 to 2016.

This political foundation facilitated Taiwan's participation in international organizations in a reasonable and appropriate manner, while extensive cross-Strait exchanges and cooperation conducted in various fields enhanced the well-being of residents on both sides.

Claims that Taiwan's exclusion from the WHA creates "gaps" in global health security are politically motivated falsehoods. Under the one-China principle, Beijing has made arrangements for Taiwan's participation in global health affairs. Health experts from Taiwan can attend the technical meetings of the World Health Organization, and there are mechanisms for information exchange under the International Health Regulations.

In the past year alone, 18 medical and health experts from Taiwan have participated in WHO technical activities, covering critical areas such as immunization strategy, vaccine development, mental health, and digital health. This demonstrates the central government's commitment to addressing the health concerns of Taiwan compatriots and ensuring their well-being.

Taiwan enjoys unimpeded and full-fledged information exchange mechanisms with the WHO and countries worldwide. This ensures that Taiwan can promptly access and report information related to health emergencies, allowing it to remain integrated in global health efforts.

Additionally, the two sides across the Taiwan Strait have established information-sharing mechanisms for infectious disease outbreaks and have held events such as the Hospital CEO Forum. The record shows that the central government cares deeply about the health and welfare of Taiwan residents and is prepared to do everything possible for their benefit.

If the DPP authorities want to return to the WHA, they must adhere to the 1992 Consensus and stop the reckless push for "Taiwan independence". The DPP authorities' current approach of seeking to tie their political goal to the well-being of Taiwan residents only leads to international isolation.

Tokyo's draft defense white paper self-serving melodrama

Japan has always had a flair for melodrama. The draft of Tokyo's 2026 defense white paper, released this week, reads like a screenplay in which China looms in every Pacific wave and cloud.

The paper warns of China's "increasing military activities" and cites the simultaneous deployment of two Chinese aircraft carriers in the Pacific as though Beijing had parked them beside Tokyo Disneyland.

What Japan tries to portray as "menacing behavior" is nothing more than routine military exercises and legitimate maritime rights-protection operations carried out by China in proper sea areas.

But in Tokyo today fear is the cryptocurrency of choice. And no country in the region has learned to monetize fear more elegantly than modern Japan.

The right-wing forces in Japan have spent years polishing the "China threat" narrative the way a pottery master perfects the glazing on a cup: meticulously, obsessively and with spiritual devotion.

Every law enforcement patrol of China in its own waters becomes a "provocation". Every naval exercise on the high seas becomes an existential "threat". The result is a national atmosphere in which Japan's military expansion is presented as a "moral" necessity.

The irony, of course, is thick enough to spread on toast.

Japan — the nation whose Imperial Army once rampaged across the Asia-Pacific — now speaks with grave "concern" about regional militarization while steadily loosening the restraints of its own pacifist Constitution. Over the past decade, Tokyo has transformed its defense posture at breathtaking speed: bigger military budgets, missile exports, long-range strike capabilities, aircraft-carrier conversions, hypersonic weapons programs, stockpiles of nuclear materials.

Japanese leaders insist this build-up is "exclusively defensive". Yet, "defense" increasingly appears to involve aircraft carriers, offensive missile systems and regional military integration with the United States' geopolitical game. The language is technocratic, but the trajectory is unmistakable: Postwar restraint is quietly giving way to "normalized" remilitarization.

The US has long encouraged Japan to "do more" militarily in the region. Tokyo's draft defense white paper fits neatly into that script. China becomes the indispensable "villain" needed to justify Japan's moves.

But the public is not entirely convinced. Japan's military expansion has repeatedly triggered domestic unease and protests. The ghosts of Hiroshima and Nagasaki are not abstractions in Japan; they are family memories.

There is another uncomfortable truth buried beneath the draft defense white paper's alarmism: The international community sees very clearly that the current tension in Japan-China relations is caused by Japanese Prime Minister Sanae Takaichi's dangerous and erroneous remarks on the Taiwan question made last November during a Diet session. The Japanese government's subsequent attempts to distort facts and pose as the victim have truly made it a disgrace in the eyes of other nations.

Japan condemns regional tensions while actively participating in increasingly assertive security arrangements with the US and the Philippines, with China as the intended target. It issues warnings about instability, even as its own policies risk accelerating an arms race across East Asia. It calls for peace, yet its politicians continue to pay tribute or offer sacrifices at the Yasukuni Shrine, where convicted World War II war criminals from Japan are openly honored. This is the geopolitical equivalent of throwing gasoline near a bonfire while lecturing others about fire safety.

The real danger is the emotional climate the Takaichi government is trying to create. Asia does not need another century organized around paranoia and military blocs. It certainly does not need Japan — a nation that inflicted one of the world's most painful wartime histories — edging toward remilitarization under the banner of "defense".

— LI YANG, CHINA DAILY

What They Say

Education must adapt to AI-led transformation

Editor's note: *The rapid rise of artificial intelligence has deeply affected the education system, the labor market and the training of talent. Redstar News spoke to Han Xibin, a senior fellow at the China Association for Educational Technology, on how AI education needs to consider the broader context of industrial change and economic restructuring. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China is actively promoting AI education, but it emphasizes the need to proceed "prudently". For younger children, the use and study of AI should take place under the guidance of teachers and parents.

At the early stage, the goal is primarily to stimulate the curiosity and interest of the student. More structured and knowledge-based learning is introduced in high school, where education focuses on developing the ability to collaborate effectively with AI systems, alongside strengthening critical thinking and creativity.

One growing area of attention is the integration of science education with general AI literacy. Earlier phases of educational digitalization mainly leveraged technology to enhance students' learning and communication abilities. The current AI revolution, however, is reshaping the underlying logic of education itself. Students must be trained to use AI as naturally and easily as they use pen and paper.

Education has two core functions. One is to nurture children's intellectual and emotional development and support their healthy growth. The other is to prepare young people to meet the needs of society.

By the university stage, however, education must also address the employability of the student. In this sense, AI is less capable in areas related to the humanities and human development, and works more effectively in disseminating knowledge.

Education, however, is more like agriculture than industry. Agriculture depends on the right environment, such as temperature, sunshine and water. If universities focus only on delivering knowledge, AI might indeed do that more efficiently. But universities also bear the greater responsibility of cultivating top-tier talent. That requires providing students with personalized environments and long-term support that machines alone cannot offer.

From a broader perspective, AI has already become an unavoidable force shaping society. Its influence first emerged in the economy and industry, and is now profoundly transforming the labor market. On the one hand, major internet companies are streamlining their workforces. On the other, the rise of the one-person company model is accelerating. Both trends reflect how AI is reshaping work structures and redefining job requirements.

Traditionally, companies relied on standardized job systems built around fixed responsibilities assigned to individuals because such structures were easier to manage and evaluate. AI has disrupted this model by breaking jobs down into specific tasks.

At the same time, new forms of employment are emerging. These new roles often require hybrid skill sets such as combining technical expertise, management capabilities and proficiency in using AI tools.

Non-standardized jobs are generally more difficult to replace than standardized ones. After training AI systems to handle repetitive tasks, many companies find that replacing more flexible and complex work is often too costly or impractical given current application limits.

Whether education systems can keep pace with such rapid and complex transformations remains an open and deeply important question. Education, therefore, must be examined within the broader context of industrial change and economic restructuring.

GLOBAL VIEWS

DIMITRI DE BOER

Code green

China's environmental codification provides a foundation for its continued green development

China passed the Ecological and Environmental Code in March, covering climate action, nature protection and pollution control. It lays a strong legal foundation for China's push toward green and low-carbon development. This is not just good for the environment; it's smart governance.

With the global supply of fossil fuels in disarray, China's rapid advances in the deployment of renewable energy are already helping shield the country from the worst shocks. The share of clean energy in China and the sector's contribution to economic growth have been rising consistently in recent years. Electric cars and scooters now dominate the streets, and are rapidly incorporating cutting-edge features such as self-driving technology. Modern public transport systems are also being rolled out at a rapid pace, reducing the reliance on personal vehicles. By now, the share of oil and gas in China's primary energy supply is substantially lower than that in the United States and the European Union.

China is proving to the world what environmental advocates have been saying for decades: Green and low-carbon development can be firmly intertwined with economic growth, innovation, energy independence, improvements in living standards and long-term sustainability.

China's adoption of the Ecological and Environmental Code provides a solid legal basis upon which it will continue on its green development path, no matter the external circumstances. It mandates the Chinese government to "actively participate in and play a leading role in global climate governance". This is significant, especially in the face of certain other major economies retreating from multilateralism and global environmental governance. The code also provides a much-needed legal basis for China's national carbon market, which is the largest in the world.

The code gives greater certainty to China's implementation of international conventions on climate change, biodiversity and desertification, by legally mandating the government to fulfill its obligations under international treaties. And it will promote new conventions, such as the one on plastics which is currently being negotiated, and the newly ratified treaty to protect the high seas, known as the Biodiversity Beyond National Jurisdiction Agreement. China's role is indispensable in addressing the rapid loss of fish in the oceans.

SONG CHEN / CHINA DAILY

I've lived in China for almost 25 years, and personally experienced the remarkable improvements in environmental quality.

The most obvious change has been the reduction in air pollution. In late 2013, the government started to disclose real-time air quality data. Back then, Beijing's sky would regularly turn gray and hazy, as the air quality index maxed out at 500. This went viral on newly available social media, sparking a national public outcry, which greatly strengthened the government's resolve to tackle the problem. An intense campaign followed, and the average annual PM2.5 density dropped from 89.5 micrograms per cubic meter in 2013 to 58 mcg/cu m in 2017, and further to 27 mcg/cu m in 2025.

Similarly, remarkable improvements have been made in surface water quality, afforestation, biodiversity conservation, waste management and more. Tangible progress is being made in the building of a "Beautiful China". Although there are still instances of pollution and much more work needs to be done, most of the time we can see blue skies and breathe fresh air.

And then there is the energy transition. Solar and wind are being deployed at truly astonishing rates. In 2025, China's clean energy electricity generation from hydro, nuclear, wind, solar and other sources reached 4.25 trillion kilowatt-hours, a year-on-year increase of 14.4 percent. To better manage the variable output of these new power sources, the deployment of grid-level energy storage is now a top priority. In the coming years, technological improvements and economies of scale are also expected to result in a rapid lowering of the cost of battery storage.

This combination of affordable renewables and power storage is poised to profoundly change the world. In the near future, building a brand new solar or wind power plant with storage capacity is going to be cheaper than running an existing coal-fired power plant. At that point, a large number of fossil fuel projects will become loss-making assets.

With all the upheaval in global energy markets, energy security has risen to the top of national priorities.

Structural dependence on fossil fuels is leaving societies and economies exposed to shocks that drive insecurity, higher costs and greater fragility. That dependence can be cut by accelerating the shift to clean, renewable and resilient energy systems.

Oil and gas markets are volatile, politicized and conflict-prone. Building more fossil fuel infrastructure perpetuates external dependence and carries increasing financial risk, on top of aggravating the climate disaster.

To my surprise, some in the international community argue that it would be risky for their economies to be dependent on imported solar panels, wind turbines or batteries. The current situation is a perfect illustration of how this argument doesn't make sense. Supply disruptions of oil and gas are leading to very real economic disruptions, especially in developing economies from Southeast Asia to Africa. High oil and gas prices are also driving up energy bills in the US and Europe.

By contrast, renewables, once installed, keep producing power at almost no cost, helping to shield against these impacts. Plainly put, a disruption in the supply of oil and gas risks grinding economies to a halt, whereas a shortage of solar panels only risks causing economies to miss their climate targets.

Renewables are also much more dependable in a situation of conflict. Fossil and nuclear power plants are large facilities, which makes them vulnerable to attacks. Nuclear is a very scary source of power in a conflict situation, given that damage to a facility could lead to a nuclear disaster with lasting regional consequences.

China's progress in green technologies has long been underestimated by policymakers and incumbent industries in advanced economies. However, it can no longer be ignored. Now is the time to take a clear-eyed view of these successes, and build upon China's experience.

Economies around the world, including developing and emerging ones, have the potential to play a greater role in rapidly growing global green tech supply chains. By working with China, some have the opportunity to leapfrog past fossil fuels, directly into resilient low-carbon economies.

There is much room for cooperation.

HU JUN

Jointly realizing a clean and beautiful world

China's vision of an ecological civilization provides thought leadership and practical solutions for global climate governance

Planet Earth is under strain from a "triple crisis" of climate change, biodiversity loss and pollution. However, rising unilateralism and protectionism have led to faltering multilateral cooperation, posing severe challenges to global environmental governance.

In response to the call for advancing sustainability worldwide, China has presented itself not only as a participant but also as a key contributor to global environmental governance guided by Xi Jinping Thought on Ecological Civilization.

Climate action has been integrated into China's broader ecological strategy and economic planning, as is concisely illustrated by the concept of "lucid waters and lush mountains are invaluable assets". Under the overarching targets set for achieving carbon peaking before 2030 and carbon neutrality before 2060, China emphasizes both mitigation and adaptation, aiming to build a climate-resilient society, while coordinating efforts to cut carbon emissions, reduce pollution, pursue green development and boost economic growth.

As China accelerates its green transition, it has built the world's largest renewable energy system and the most complete new energy industrial chain. This has pushed the global cost of wind and solar power down by more than 60 percent and 80 percent, respectively, over the past decade. More than half of the world's electric vehicles are on Chinese roads, and the country accounts for roughly one-fourth of the world's newly added green space through afforestation. Together, these form a Chinese solution to climate change.

WANG XIAOYING / CHINA DAILY

Against the backdrop of a turbulent international landscape, global climate governance is at a critical crossroads. China continues to back the multilateral framework centered on the United Nations Framework Convention on Climate Change and the Paris Agreement.

In September 2025, President Xi Jinping announced China's updated Nationally Determined Contributions climate pledge, including the first-ever absolute, economy-wide emissions reduction target covering all greenhouse gases. The renewed ambition signals China's commitment to addressing climate change in collaboration with other countries, providing the much-needed predictability amid geopolitical uncertainty.

Xi Jinping Thought on Ecological Civilization also provides theoretical contributions and practical leadership and has opened new avenues for global dialogue on environmental governance. International interest has shifted from observing China's progress to exploring the methodology and worldview behind it.

Some scholars have argued that President Xi's insight of treating lucid waters and lush mountains as "invaluable assets" is a reconceptualization of the relationship between economic growth and environmental protection. They are increasingly interested in how such ideas are translated into actionable, measurable and transferable policies. China's approaches are gaining attention as a development paradigm with universal value, particularly among other countries in the Global South seeking practical governance experience.

To that end, Chinese institutions have stepped up theoretical research on Xi Jinping Thought on Ecological Civilization and have summarized China's ecological conservation approaches and local best practices. A think tank report, titled "Lucid Waters and Lush Mountains for Beautiful China and World: China's Ecological Civilization Concept and Practice, and How They Inspire the World", highlights how environmental protection has fostered new drivers and advantages for development.

Eco-agriculture, forestry and ecotourism have emerged as new pathways to build green brands, boost product value and create opportunities to "turn green into gold".

By 2024, China had certified 78,000 green, organic, famous, special, high-quality, new and geographically indicated agricultural products, and identified 1,399 key rural tourism villages. By 2025, 19 villages, including Yucun in Zhejiang province, Xidi in Anhui province and Jingzhu village in Chongqing municipality, have been recognized as "Best Tourism Villages" by the UN Tourism. Such efforts have also contributed to broader rural revitalization.

Xi Jinping Thought on Ecological Civilization also promotes international cooperation and supports sustainability in other Global South countries. Through the Belt and Road Initiative and South-South cooperation, China's ecological conservation theories and practices have helped produce tangible benefits in multiple countries.

The Mombasa-Nairobi Railway in Kenya has corridors for wildlife to pass through, offering a visible example of how infrastructure development and conservation can go hand-in-hand. Solar photovoltaic projects in Mongolia can expand energy access while improving air quality. The Great Green Wall initiative along the southern edge of the Sahara has benefited from China's experience in combating desertification. The China-Africa Green Technology Park has emerged as a demonstration model, bolstering confidence in green development across the continent. At Lake Victoria in East Africa, Chinese expertise has been used to strengthen water management. Taken together, these projects illustrate how China's environmental policies and experiences are contributing to global green development.

With remarkable achievements in ecological conservation and green transition, China has become a source of practical solutions for advancing global sustainability.

Looking ahead, global environmental governance remains a formidable challenge. Guided by Xi Jinping Thought on Ecological Civilization and upholding multilateralism, China will continue to support and strengthen global environmental governance, emphasizing open international cooperation, practical approaches and compelling narratives. The aim is to turn shared aspirations into sustained, pragmatic collaboration to build a prosperous, clean and beautiful world.

NATURAL FRONTIERS

Editor's note: *China Daily is publishing a series of stories highlighting China's efforts to understand, protect, and sustainably utilize natural resources across different fields and regions in support of national development. In this first installment, we present five exemplary individuals who have been honored as "Most Beautiful Natural Guardians" by the Ministry of Natural Resources for their outstanding contributions.*

Surveyor scales gargantuan heights to secure crucial resource statistics

By YANG ZEKUN
yangzekun@chinadaily.com.cn

At 7,500 meters on the slopes of Mount Qomolangma, Ren Xiubo made a choice that would define his 27-year career: he removed his thermal gloves. Ignoring a direct order to descend during a sweeping blizzard, the then-25-year-old surveyor worked bare-handed for 10 minutes in sub-zero winds to secure a critical gravity measurement. It is a moment of "instinctive" duty that underscores the extreme physical lengths China's surveying teams go to in order to provide the foundation for the nation's economic and ecological maps.

For Ren, a member of the First Geodetic Surveying Brigade of the Ministry of Natural Resources, surveying Mount Qomolangma, also known as Mount Everest and the world's highest peak, was the rarest of opportunities.

"I did not know whether I would ever have the chance to reach that height again," Ren said. "At that moment, I had only one thought: I had to get the data."

By the time the measurement was completed, his hands had lost all feeling. During the descent, he repeatedly struck them against an ice axe to stimulate the nerves. Only after several hours did sensation slowly return.

That day, Ren and his teammates pushed China's gravity measurement and satellite positioning work on Qomolangma to 7,790 meters, a record at the time.

Now a senior engineer, Ren does not describe the decision as heroic. To him, it was simply what the mission required.

"It was instinct, a natural reaction," he said. "It is also the kind of commitment rooted in the bones of our surveying team."

Born in 1979 in Yulin, Shaanxi province, Ren has spent much of his 27-year career in mountains, deserts, plateaus and remote areas. He has taken part in China's two Qomolangma elevation measurement missions, in 2005 and 2020, and more than 30 major national projects, including the national highway network, post-Wenchuan earthquake reconstruction and the West-East Gas Pipeline project.

His brigade has long been at the forefront of China's surveying work.

Ren Xiubo (right) displays a flag signed by his teammates during the geodetic measurement of Mount Qomolangma in 2005 at an altitude of 7,790 meters. PROVIDED TO CHINA DAILY

The members of the 2020 Mount Qomolangma measurement team take a group photo after the descent to base camp at 5,200 meters at the end of the successful mission on May 28, 2020. JIGME DORJI / XINHUA

In 2015, President Xi Jinping sent a letter to its veteran Party members and former members, encouraging them to remain true to their mission and continue measuring the country's mountains and rivers with precision.

"What supports us in harsh field conditions is the original mission of surveying for the country," Ren said. "It is also the surveying spirit of loving the motherland and the profession, working hard and making selfless contributions."

To many people, surveying may seem far removed from daily life. Ren sees it differently.

"If national economic development is like constructing a building, surveying is the foundation and framework," he said.

Maps, navigation, location services, intelligent driving, food delivery, ride-hailing and express logistics all rely on basic surveying data. Such data also supports natural resource management, territorial spatial planning, major engineering projects, disaster relief and ecological protection.

"Surveying is a foundational undertaking for economic development, national defense and social progress," Ren said.

In 2005, Ren was still a young team member. He said he was "following the older generation", obeying commands, overcoming altitude sickness and completing his assigned tasks.

During that mission, he worked for more than 40 consecutive days in areas above 6,500 meters. At the 6,500-meter camp, strong ultraviolet rays darkened and cracked his face, while fierce winds cut into his skin day after day. At the 7,028-meter camp, on the eve of a summit measurement attempt, he solemnly wrote his application to join the Communist Party of China.

"I had prepared for everything, including the worst," he said. "Even if I had to leave my life on Qomolangma, I had to complete the surveying mission."

On May 22, 2005, the mountaineering survey team successfully reached the summit and completed the measurement mission. China later announced the rock-surface elevation of Qomolangma as 8,844.43 meters.

Ren did not reach the summit that year. Some later asked whether he felt regret.

"Perhaps there was regret," he said. "But surveying is our job, and completing the mission always comes first."

Fifteen years later, in 2020, Ren returned to Qomolangma. This time, he took on coordination, publicity and support work for the summit measurement mission, while passing on practical experience to younger colleagues.

Before the mission, Ren repeatedly reviewed possible emergencies, from equipment operation and resistance to extreme cold to contingency plans for bad weather after the summit team reached the peak.

"We had to anticipate every difficulty we could think of," he said. "Only then could we do our best to ensure the mission was foolproof."

The 2020 mission proved far more difficult than expected. The first summit attempt was halted near the North Col ice wall above 7,000 meters because of deep snow, strong winds and avalanche risks. A second attempt was forced back by a storm, leaving less than a week of suitable climbing time.

Ren said the team encouraged one another and kept refining the plan. On May 27, the summit team successfully reached the peak and completed the measurement. Coincidentally, the date was also the day China's older generation of surveyors had reached the summit in 1975.

But reaching the summit was only the first step. The summit marker had to be set up three times before the Beidou navigation satellite system receiver began working properly. The snow-depth radar also had signal problems, which the team members solved on site.

Only after two and a half hours of summit operations, and another 36 hours of waiting to confirm the data was valid, did Ren and his teammates feel relieved.

Beyond Qomolangma, Ren has also witnessed the growing role of surveying in emergency response and ecological protection.

In 2015, after a major landslide struck Shanyang county in Shaanxi, members of his brigade stayed in the core danger zone despite the risk of secondary landslides. Their monitoring data helped protect rescuers and provided support for scientific disaster relief.

The same year, the brigade set up an emergency surveying center focusing on drones, aerial remote sensing, image processing and 3D modeling. Ren helped build the team, train operators, produce orthophoto maps and formulate emergency response plans.

Ren said modern surveying must keep pace with new technologies such as Beidou navigation, satellite remote sensing and real-scene 3D modeling.

Ren is committed to working on new basic surveying, the construction of a real-scene 3D China and the building of spatiotemporal information databases, providing accurate support for natural resource monitoring, ecological change detection and territorial spatial planning.

"I will continue to visit schools, enterprises, institutions and communities," he said. "I want to share the stories of surveying for the country and plant the seed of responsibility for protecting nature."

'Land guardian' brings prosperity to village

Effective planning helps vitalize once-impoverished countryside

By LI MENGHAN
limenghan@chinadaily.com.cn

Top: Wang Weimin transplants rice seedlings at a paddy field in Anji. **Above:** Wang discusses the landscape with colleagues in Anji. PHOTOS PROVIDED TO CHINA DAILY

In the 15 years since Gaoyu village launched a pilot program to consolidate its fragmented "postage-stamp" plots into contiguous farmland, its collective economy has surged more than 80-fold, reaching 8.32 million yuan ($1.15 million) last year. This transformation, led by veteran land manager Wang Weimin, has turned a once-impoverished mountain community into a national model for China's rural vitalization and land-use efficiency.

Wang, deputy director of the natural resources and planning bureau in Anji county, prefers to call himself a "land guardian", a title rooted in his childhood and symbolic of his commitment over the past three decades.

"I grew up in the mountainous region of Anji, where we relied on ration coupons for essentials like rice and flour," the 54-year-old said. "Having experienced famine, my ancestors instilled in my mother a deep appreciation for food, which she passed on to me from a young age. One of her sayings that has left a lasting impression on me is: 'Even if rice falls to the ground, you should still eat it.'"

In Wang's memory, reaching the provincial capital Hangzhou meant traversing mountains, and most children studied hard for one reason: to leave. However, after graduating in land management in 1994, Wang decided to stay, driven by a deep bond with his homeland and a sense of duty to its fields.

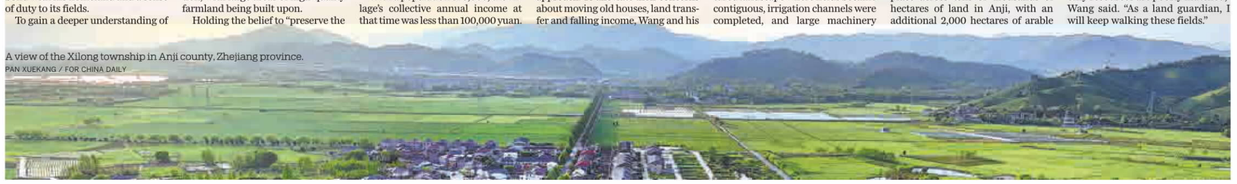
To gain a deeper understanding of the local farmland, Wang set foot in every village and discovered that the primary problem was the fragmentation of plots, which resulted in low mechanization, poor returns and diminished motivation among farmers to cultivate the land. Rapid urbanization and economic development further exacerbated the situation, with large areas of high-quality farmland being built upon.

Holding the belief to "preserve the land inherited from our ancestors for future generations", Wang promoted the county's land consolidation efforts. After rounds of field research and in-depth discussions, Gaoyu village — where 313 hectares of farmland were sliced into tiny plots by scattered houses — was selected as the pilot site in 2012.

With a population of 6,000, the village's collective annual income at that time was less than 100,000 yuan.

To revitalize the inefficient areas, the local government planned four resettlement communities, with follow-up measures including re-demarcating the farmland, restoring soil fertility and leasing it to a cooperative for unified management.

However, the villagers were hesitant to be the first to try such an approach. To alleviate their concerns about moving old houses, land transfer and falling income, Wang and his colleagues visited each household, explaining how relocating would enhance their living conditions, how the land transfer would ensure a stable rental income, and how the cooperative would create additional job opportunities. After several months, all 726 households agreed.



The efforts resulted in a restructured landscape where fields became contiguous, irrigation channels were completed, and large machinery could move freely, leading to increased crop output and economic returns. By last year, the village's collective economy had grown more than 80-fold.

"Seeing the villagers' satisfied smiles, I feel my work is truly worthwhile," Wang said.

Such transformations have taken place across tens of thousands of hectares of land in Anji, with an additional 2,000 hectares of arable land created, and land use tailored to local strengths.

These include Wukangqiao village, which has attracted agricultural tourism to its newly consolidated fields, and Hongmiao village, which turned an abandoned mine into a landmark cafe.

"No villages are poor by nature; only resources are poorly matched," Wang said. "As a land guardian, I will keep walking these fields."

Geologist's inner passion unlocks Earth's eternal heat

By LI HONGYANG
lihongyang@chinadaily.com.cn

For nearly four decades, Wang Guiling's "office" has been the most volatile terrain on the planet, from the boiling geysers of Yunnan province to the high-altitude hot springs of the Xizang autonomous region and western Sichuan province.

Wang, a researcher at the Institute of Hydrogeology and Environmental Geology in Shijiazhuang, Hebei province, affiliated with the Chinese Academy of Geological Sciences, is fascinated with the origins of thermal heat.

"It's not just a landscape," said the 62-year-old, referring to his geological surveys. "It's a conversation the planet is having with itself."

At the core of Wang's work is one of humanity's most pressing questions: Where will our energy come from when fossil fuels run out?

"Solar energy is an inexhaustible cosmic energy source, while geothermal heat is Earth's eternal gift from within," he said. "As long as the sun shines and the planet keeps moving beneath our feet, these two will never run out."

Wang's passion for his work goes far beyond earning a salary, in fact, in the 1990s his institute struggled to do exactly that. "I never wavered. I genuinely love this work. It comes from inside," he said.

What that work looked like in the early days is almost unimaginable in the age of digital mapping technology. Tasked with producing comprehensive maps of geothermal resources, Wang spent five years developing his method so painstaking it bordered on obsession. Armed with nothing more than a set square and paper maps, he plotted by hand more than 2,000 hot spring and geothermal well locations across China.

"I'd go through records — province, county, village — then get down on the map with a ruler until I found the exact spot," he said. "I'd mark it, and then I'd imagine the terrain. What did it look like there? Why was the water hot?"

Wang said geothermal exploration is similar to medical diagnosis. First comes the equivalent of a CT scan — geophysical surveys that detect anomalies in electrical signals beneath the surface, hinting at different rock types and structures. Then comes the biopsy — a test well used to measure underground temperatures.

Since 2011, the China Geological Survey has launched a national project to survey and evaluate geothermal resources. Led by Wang, the project has brought together hundreds of technicians from across the country to conduct systematic investigations of geothermal resources in each province.

Among the several types of geothermal resources, the potential of hot dry rock geothermal energy is especially pertinent. Wang and his team estimate that China's hot dry rock resources at depths of between 3 and 10 kilometers contain the heat equivalent of burning 856 trillion metric tons of coal.

"That figure is astronomically large. But it only tells us the heat is there. What we can actually extract is a different question," he said.

"To unlock it, we must artificially fracture the rock, pump cold water down, let it heat up in the cracks, and bring it back up again."

To Wang, his achievements do not come from individual brilliance alone. "Geothermal research is deeply interdisciplinary — geophysics, geochemistry, rock mechanics, hydrogeology, even mathematics and chemistry," he said.

"No person can be an expert in all of it. We need a team. And we need to give young people the conditions to settle down and really dig in.

"Working in geothermal exploration also requires the spirit of 'grinding a sword for 10 years'," he said.

Wang Guiling (right) identifies a rock and determines its heat-storage features during a mission in the Xinjiang Uygur autonomous region in May last year. PROVIDED TO CHINA DAILY

Tech utilized to transform Shanghai nature reserve

By LI MENGHAN
limenghan@chinadaily.com.cn

After a decades-long ecological battle against invasive species and poachers, bird populations at the Chongming Dongtan Nature Reserve in Shanghai have surged from 40,000 at its lowest to nearly 500,000 last year. Led by Niu Dongliang, the reserve has transformed from a "ravaged" wetland into a high-tech sanctuary where AI surveillance and innovative flooding techniques have restored a vital link in the East Asian-Australasian Flyway.

When Niu, who now serves as the director of the reserve's management affairs center, arrived at the eastern tip of Chongming Island in 2004, it was a lawless frontier.

"When I first arrived at the reserve, some people hunted wild ducks — a single small packet of pesticide could poison hundreds of them. However, with no monitoring equipment back then, we had to walk through reeds and wade across tidal creeks for patrol, stopping them once found," Niu said.

He emphasized the difficulty of enforcement, noting that even if poachers were caught, they could claim to have merely "picked up" the dead birds rather than poisoned them, which prevented the police from taking action.

The tide turned in 2011. When Niu spotted a suspicious vessel through surveillance footage, he immediately organized an interception operation. Under stricter wildlife protection laws, eight individuals were prosecuted, and their convictions sent a strong deterrent message to other potential poachers.

"Now, more than 200 surveillance cameras are spread across the reserve, and infrared cameras set in key areas can capture people's movements even in the dark. Every access point is guarded, giving the wetland back to the wild plants and animals," he said, adding that the staff all wear camouflage or light-colored clothes to minimize human disturbance.

Beyond human activities, the rapid spread of invasive smooth cordgrass posed an even greater threat. Originating from the Atlantic coast of North America, this plant quickly encroached upon native vegetation, endangering wildlife food sources, habitats and the overall ecological function of the wetland. From the first discovery of a few scattered plants in 1995, by 2011 the reserve had more than 20 square kilometers of smooth cordgrass, accounting for one-tenth of the reserve's total area.

To address this, the reserve launched a large-scale ecological restoration project in 2013. Niu and his colleagues consulted experts, conducted experiments and finally developed a plan, involving building cofferdams to enclose the influenced area, cutting the smooth cordgrass above the water surface, and then flooding the area to submerge and rot the roots. Meanwhile, they also restored the damaged habitats and built ecological islands tailored to the living habits of different species, making these once-disappeared birds "frequent visitors".

"Birds are a very important indicator species for the health of an ecosystem," Niu said. "If they stop coming to an area, or if the variety of species declines, it means the environment has deteriorated. Everything we have done is to protect the biodiversity here."

With waterbird numbers gradually increasing, and State second-class protected tundra swans rising from just a few dozen to a record 5,216 this March, the birds themselves have delivered a clear verdict.

Top: Niu Dongliang introduces plants and animals that inhabit the Chongming Dongtan Nature Reserve to visitors in Shanghai. PROVIDED TO CHINA DAILY **Above:** Birds feed at a patch of wetland in the reserve. ZHOU GUKAI / FOR CHINA DAILY

Outpost veteran 'human anchor' of nation's marine safety

By LI SHANGYI
lishangyi@chinadaily.com.cn

On the uninhabited island of Qianliyan, guarding the country means guarding the data. For over four decades, Jiang Wenkai has served as the "human anchor" of the Yellow Sea, once spending 217 days a year on a barren outpost. Today, the veteran observer is the final link in a chain that has transformed a primitive observation post into a smart hub for offshore wind power and marine ranching, proving that even as technology becomes automated, the human spirit remains the foundation of China's marine safety.

Nearly 50 kilometers away from the shore, the tiny island, covering just 0.135 square kilometers and rising to a maximum elevation of 93 meters, is home to the Haiyang marine station of the Beihai Forecasting and Disaster Reduction Center of the Ministry of Natural Resources, one of China's national benchmark marine observation stations.

Jiang Wenkai carries supplies to the outpost on Qianliyan Island. PHOTOS PROVIDED TO CHINA DAILY

The station operates around the clock. Since taking on the job in 1983, Jiang has helped collect extensive marine hydrological and meteorological data that have been widely used in marine disaster prevention, mitigation and economic development.

In the early years, when technology was still underdeveloped, the island had no electricity, and the observation equipment was extremely primitive. Under such harsh conditions, Jiang and his colleagues carried out uninterrupted marine and meteorological observations day after day, year after year.

"Every drop of water and every grain of rice we used had to be transported by boat," Jiang recalled, describing both the working and living conditions as extremely difficult.

As equipment and infrastructure gradually improved, the number of staff stationed on the island was reduced from six or seven people in the early days to just two rotating staff members today. However, Jiang said the demands on workers have become even greater.

"Now, once you arrive on the island, you have to know how to do everything," Jiang said. "You cannot rely on others to take care of you. People trained here become versatile — cooking, washing clothes and repairing instruments all by themselves."

With advances in technology and upgrades in observation equipment, working conditions on the island have improved significantly over the years. Tasks that once required manual readings in harsh weather have now become increasingly intelligent and automated.

New technologies, including intelligent video inversion for wave monitoring, drone-based sea ice identification and smart red tide monitoring, are gradually being introduced into daily operations. The data collected provide strong support for marine disaster prevention and mitigation, offshore wind power, marine ranching and other emerging industries.

Over four decades on the island, Jiang has not only recorded waves, monsoons and other marine data, but also witnessed major changes in the marine ecological environment and environmental governance.

"We are no longer merely recorders of marine data, but also guardians of marine ecology and practitioners of harmonious coexistence between humanity and nature," he said.

Jiang, now 59, is scheduled to retire soon. Looking back on a lifetime spent enduring storms and lonely nights on the isolated island, he said he has no regrets about dedicating 40 years to guarding the outpost.

"Guarding the island means guarding the country; guarding the sea means guarding our home," Jiang said.

Qianliyan, a desolate island on the Yellow Sea about 50 kilometers off Haiyang, Shandong province, is where Jiang Wenkai has served for over 40 years.

Calls to build clean, healthy cyberspace

Conference on internet civilization champions anti-bullying practices

By **CAO DESHENG** in Beijing and **ZHANG LI** in Nanning

Chen Lijun, a Yue opera performer, rose to fame across China after her captivating portrayal of a male character in the Yue opera production of *New Dragon Gate Inn* went viral online.

Speaking at the 2026 China Internet Civilization Conference in Nanning, capital of the Guangxi Zhuang autonomous region, on Tuesday, Chen shared her story to champion the benefits of a healthy internet environment and its vibrant online community.

Chen, who has nearly 4.6 million followers on her social media platform Douyin, the Chinese counterpart of TikTok, said she hopes to promote the development of Yue opera through the internet.

"I record the content I love and my practice sessions, edit them into short videos, and share them online. These works have been well received, and I've managed to attract some attention to Yue opera through the internet," she said.

As a young opera performer who has benefited from social media platforms, Chen said it is her duty to help build a civilized online community.

"Through every positive share and every kind response, we lift up a civilized and vibrant internet environment. This also gives each of us the opportunity to grow and realize our dreams through the internet. Let's work together to make our online home cleaner and warmer," she said to participants at the conference.

With the rapid development of the internet, China has attached great importance to cyberspace governance.

When the inaugural China Internet Civilization Conference was held in 2021, President Xi Jinping sent a congratulatory message, emphasizing that as a major component of social etiquette and civility under new circumstances, internet civilization remains a key area in enhancing China's strength in cyberspace.

China's internet user base reached 1.125 billion by December, with the internet penetration rate exceeding 80 percent, according to the 57th Statistical Report on Internet Development in China, released by the China Internet Network Information Center in February.

In a keynote speech delivered at Tuesday's conference, Li Shulei, a member of the Political Bureau of the Communist Party of China Central Committee and head of the Publicity Department of the CPC Central Committee, underlined the need to foster a clean and upright cyberspace.

While calling for continued efforts to enrich the supply of high-quality online content and strengthen mainstream values, mainstream public opinion, and mainstream culture on the internet, Li said it is important to improve a long-term mechanism for cyberspace governance.

Issues such as online rumors and cyberbullying infringe upon societal and public interests and must be addressed with strong measures, he said.

Participants at the conference called for an integrated approach to promoting internet civilization, fostering a sound cyberspace, and enabling the internet to better enhance people's well-being.

Meng Man, a Chinese scholar and professor at the Minzu University of China's School of History and Culture, highlighted the progress brought to humanity through the internet, but emphasized that the question of how to build a healthy online environment has become increasingly important.

"This is because the internet profoundly shapes both the living environment and our mental landscape. Naturally, we hope that the internet not only creates attention for content creators, but also provides fertile ground for all users, serving not just as an information provider, but also as a platform of civilization," Meng said.

China-Europe SMILE mission launch to enhance space weather forecasting

By **LI MENGHAN**
limenghan@chinadaily.com.cn

A Vega-C rocket carrying the SMILE satellite blasts into the sky in Kourou, French Guiana, on Tuesday. XINHUA

The successful launch of the Solar wind Magnetosphere Ionosphere Link Explorer satellite on Tuesday, aimed at studying how streams of charged particles from the sun interact with Earth's magnetic field, marks a milestone in China-Europe space cooperation.

The satellite was launched by a Vega-C rocket from Europe's spaceport in Kourou, French Guiana. Following liftoff, the satellite entered its planned orbit, with solar arrays deployed and all systems operating normally. The mission is a collaboration between the Chinese Academy of Sciences and the European Space Agency.

"Earth is surrounded by an invisible magnetic field, the magnetosphere, which functions like a protective umbrella and deflects most of the solar wind — high-speed streams of charged particles from the sun. Without this protective shield, life on Earth would not be able to survive," said Wang Chi, a CAS academician and the Chinese principal investigator of the SMILE satellite.

Wang, who is also the director of the CAS National Space Science Center, said when some charged particles break through the magnetic shield and enter near-Earth space, they can disturb the space environment, threaten satellites in orbit, interfere with communication and navigation systems, and even trigger large-scale power outages.

Previous studies of Earth's magnetic environment have mainly relied on isolated observations from individual satellites, making it difficult for scientists to obtain a complete picture of how the system works.

With SMILE now in orbit, scientists will for the first time conduct panoramic imaging of Earth's magnetosphere, allowing them to observe its overall structure. Shaped by the pressure of the solar wind, the boundary of the magnetosphere resembles a smile, also the mission's name. The mission will also help scientists better understand how the solar wind interacts with Earth's magnetic field and improve space weather forecasting capabilities.

To achieve these goals, SMILE carries four advanced scientific instruments. The core payload is the Soft X-ray Imager, which detects X-rays generated when particles from the solar wind interact with particles in Earth's upper atmosphere. This allows scientists to observe the previously invisible boundary of the magnetosphere for the first time.

The three other instruments include: an Ultraviolet Aurora Imager for photographing auroras near Earth's polar regions, a Light Ion Analyzer for measuring charged particles, and a Magnetometer for monitoring changes in Earth's magnetic field. Together, these instruments will provide both large-scale images and direct measurements, providing scientists with new tools to study geomagnetic storms and other space weather events.

Beyond its scientific value, Dai Lei, chief designer of SMILE's science application system and a professor at the National Space Science Center, said the mission demonstrates an equal and mutually beneficial model of cooperation between China and Europe.

"Building upon the legacy of the Double Star Program — a China-led space cooperation project with ESA proposed in 2003 — SMILE has established a new model for international space collaboration. This is the first bottom-up, mission-level, full life-cycle partnership between CAS and ESA," Dai said.

CAS took primary responsibility for the satellite platform, mission operation and control, and the science application system, while ESA provided the payload module, launch vehicle, launch site, and ground tracking and emergency support.

The University of Leicester in the United Kingdom led the development of the Soft X-ray Imager, while CAS led the development of the other three instruments with support from European partners in key components and calibration work.

Over the past decade, the mission established an integrated engineering system involving six major subsystems. Scientists and engineers from both sides jointly addressed technical challenges such as cross-regional design coordination, system compatibility and joint testing, helping ensure the mission's timely and smooth implementation.

SMILE will spend about 42 days maneuvering into its final science orbit. It will then undergo a two-month in-orbit testing phase before beginning its planned three-year observation mission.

During its operational lifespan, scientists from China and Europe will jointly process and analyze the data collected by the satellite. All scientific data will be openly shared with the global research community to encourage wider international participation and research.

The long-term data gathered by SMILE is expected to deepen understanding of interactions between the solar wind and Earth's magnetic field, while also helping improve the accuracy of space weather forecasts and the safety of near-Earth space activities.

Looking beyond SMILE, Wang outlined broader plans for China-Europe cooperation in space science. He said the China-Europe space exploration program, which includes the SMILE mission, will launch a series of satellites during the 15th Five-Year Plan period (2026-30).

These include the Hongmeng Project to study the universe's earliest period after the Big Bang, the Earth 2.0 mission to search for planets similar to Earth, and the enhanced X-ray Timing and Polarimetry space observatory (eXTP), which will explore extreme cosmic conditions such as black holes and neutron stars, Wang said.

Joint op to boost fish stocks in Beibu Gulf

By **ZHAO YIMENG** in Nanning
zhaoyimeng@chinadaily.com.cn

China and Vietnam conducted a joint marine stock enhancement operation in the Beibu Gulf on Tuesday, aiming to strengthen fisheries conservation and increase fishermen's incomes on both sides.

The latest release, held in Dongxing, Guangxi Zhuang autonomous region, involved about 272 million juvenile fish and shrimp, including yellowfin sea bream and red sea bream.

Fishery resources in the Beibu Gulf, one of the most biodiverse marine areas shared by the two countries, remain under pressure despite years of conservation efforts, said Zhang Dianchang, head of the South China Sea Fisheries Research Institute at the Chinese Academy of Fishery Sciences.

Long-term monitoring data shows fishery resource density in the eastern Beibu Gulf, including shared fishing zones, fell from 1,161 kilograms per square kilometer in 2006 to 317 kg in 2019.

Joint stock enhancement programs aim to replenish natural populations through artificial breeding and the release of species suited to the local ecosystem, Zhang said.

Since 2017, China and Vietnam have conducted nine joint stock enhancement operations in the Beibu Gulf, releasing about 770 million aquatic seedlings. Zhang said the recapture rate of released species has remained above 5 percent, while catches of key released species have increased by more than 10 percent year-on-year. Incomes of coastal fishermen have risen by more than 20 percent, he added.

Local fishermen say they have noticed visible improvements in fish stocks. "I've been fishing in this area for many years, and over the past few years I really feel there are more fish," said Ye Fengzheng, a fisherman in the region. He said catches that once required long trips offshore are now more common closer to shore, with 10 to 15 kg a day now relatively easy to achieve under favorable weather and tides.

Ye said he once caught a tagged fish released under the program. "I pulled up a fish with a small tag attached, and there was Vietnamese writing on it," he said, adding that he later reported the catch using the phone number on the tag.

China has expanded the use of tracking technologies, including external tags and molecular markers, to study migration patterns. Tagged sea bream released in the Beibu Gulf have been recaptured along both the Guangxi and the Vietnamese coastal waters.

Officials and scientists say the program emphasizes scientific management rather than large-scale indiscriminate release. Researchers have assessed the ecological carrying capacity of target waters, including food availability and water quality, to avoid ecological imbalance caused by excessive stocking.

"Released species are not simply any available seedlings. They need to have reliable genetics, suitable size and strong vitality," said Su Zhongxing, general manager of Guangxi Fuqun Marine Seedling Reproduction.

He said hatcheries gradually adjust water temperature and salinity to help juveniles adapt to marine conditions, while transport protocols carefully control oxygen levels, stocking density and temperature to improve survival rates after release.

Marriage: Mass weddings promote simple ceremonies

From page 1

In preparation, the couple had completed free premarital medical checks at a Beijing hospital, taken registration photos at a commercial studio and hired a photographer to document their special day near the civil affairs bureau.

The pair met via social media, bonding over photography and skiing, and dated for two-and-a-half years before deciding to marry. They chose May 20 partly because its homophone "520" is a declaration of love in Chinese and is often seen as a Valentine's Day equivalent. "We want to celebrate our anniversary and 520 together," Yan said.

Both originally from Shaanxi but living in Beijing for work and study, the couple benefited from a revised marriage regulation introduced in May 2025. The rule ended a decades-old restriction that required people to register their marriage in a place where either spouse's household registration was recorded. Now, couples can marry anywhere in the country without presenting their household registration booklet. "It saved us time and travel costs, and made us feel more connected to Beijing," Guo said.

Thursday or May 21 is the choice of many this year as it coincides with *xiao man*, or Grain Buds, a traditional Chinese solar term. Song Jian, an engineer from Sichuan province, chose this date over May 20. "The solar term carries a beautiful saying — a modest half-full state is better than perfection," he said. "That fits our relationship well. You don't have to pursue perfection in life; being content with what you have is enough."

Authorities across multiple provincial-level regions have also organized mass wedding ceremonies on and around the two dates to promote simple ceremonies.

In Hainan province, collective weddings will be held on Wednesday at coastal venues, including Coconut Dream Corridor in Sanya and the Wenchang Spacecraft Launch Site. Zhejiang province hosted a ceremony on Saturday featuring 520 couples, with a main venue in Hangzhou linked to dozens of sub-venues across the province. Guangdong organized military-civilian collective weddings in Guangzhou on Monday, Zhaoqing on Sunday, Foshan on Friday and Zhongshan on Saturday, involving more than 1,000 couples.

"This collective wedding is a celebration that's both sweet and green, without the complicated preparations," one groom, Zhong Zhiyuan, who was part of the Guangzhou weddings, was quoted by the local media as saying.

But not everyone is keen on getting married on popular dates. Yang Xinran, a marketing professional from the Chinese mainland who now works in the Hong Kong Special Administrative Region, registered her marriage in Beijing last September and deliberately avoided peak days. "As working people, we have to prioritize our schedules," she said.

Yang and her husband picked several possible dates based on their work calendars, then let their parents take the final call. "Even booking a restaurant for an anniversary is hard enough on popular dates — no need to add to the trouble," she said.

In the past year, authorities processed more than 682,000 interprovincial marriages, official data showed. China saw a significant surge in marriage registrations in 2025, with 6.763 million couples registering, a 10.76 percent year-on-year increase.

Guo Yuhe contributed to this story.

Stronger RMB seen stabilizing currency system

Yuan's expanded global role mitigates risks of unilateral financial disruptions

By **WANG KEJU** in Chengdu
wangkeju@chinadaily.com.cn

A more multipolar currency landscape — in which the Chinese renminbi could play a much larger role — is gaining traction, as intensifying geopolitical tensions and the rapid rise of emerging economies strain the traditional international monetary system, economists said.

"The world needs a new and balanced monetary system," Zhu Min, former deputy managing director of the International Monetary Fund, told China Daily during the two-day Tsinghua PBCSF Global Finance Forum, which concluded on Tuesday in Chengdu, Sichuan province.

"A strong renminbi represents the needs of Global South countries, the needs of the global financial system, and also the needs of China's economy to further grow and strengthen," Zhu said.

> "A strong renminbi represents the needs of Global South countries, the needs of the global financial system, and also the needs of China's economy to further grow and strengthen."
>
> **Zhu Min,** former deputy managing director of the International Monetary Fund

He pointed to a fundamental imbalance in the current international monetary system. While the United States' share of global GDP has dropped to about 24.5 percent and its share of world merchandise exports is just about 9 percent, the US dollar still accounts for 58 percent of global reserve currencies — far exceeding its underlying economic weight.

In contrast, Zhu said, China now accounts for about 16.6 percent of global GDP and 14.4 percent of world merchandise exports, yet the renminbi's share in global reserves is merely 2.4 percent.

"The gap between China's real economy weight and its currency's international status is the core driving force for renminbi internationalization," Zhu said.

Djoomart Otorbaev, former prime minister of the Kyrgyz Republic, said that countries accept the greenback not because they prefer it, but because in times of crisis, the dollar can provide stable liquidity and expectations.

However, more and more financial tools have been weaponized, even used as weapons in geopolitical conflicts. This trust has been severely eroded, Otorbaev said.

The gradual erosion of the greenback's dominance is already visible. A Deutsche Bank research report released earlier this month said the dollar's share of global foreign exchange reserves has fallen from over 60 percent to just 40 percent.

Marc Uzan, executive director of the Reinventing Bretton Woods Committee, said that central banks around the world have diversified their reserves, more energy deals are being priced in non-dollar currencies and countries are increasingly settling bilateral trade in their own currencies.

That said, Uzan acknowledged that the dollar's structural advantages remain significant, and he cautioned against expecting a swift end to dollar hegemony.

Nevertheless, he expects the future international monetary system will be multipolar, with the US dollar, the euro and the renminbi all playing significantly larger roles. Regional currencies will also assume more functions in their respective neighborhoods.

In March, the renminbi ranked fifth in global payments with a share of 3.1 percent, up from sixth place in February, said global financial messaging services provider SWIFT.

Shi Kang, chair professor at the PBC School of Finance at Tsinghua University, said that the renminbi's participation in the reshaping of the global monetary order is "deliberate and measured".

"We do not want to replace the US dollar system, nor are we trying to develop a separate system," Shi said. "China's goal is to address the weak links in the current monetary system, allowing more currencies to participate and thus enhance global financial stability."

Cross-border renminbi settlement volume reached 6.4 trillion yuan ($941 billion) in 2024 and climbed further to 7 trillion yuan in 2025, Shi said.

To mitigate the risk of unilateral disruptions to the SWIFT messaging system, China has built its own Cross-border Interbank Payment System (CIPS), which has significantly improved the efficiency and security of cross-border settlements, he added.

China has also signed various bilateral currency swap agreements, providing liquidity support to emerging markets such as Argentina. These swaps act as a safety net for countries facing dollar shortages, reducing their dependence on a single currency, Shi said.

Looking forward, Shi said China will eventually open its current account in an orderly and prudent manner, offering more renminbi-denominated assets to global investors.

Nation's oil giants ramp up efforts in clean energy

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China's State-owned oil majors are rapidly accelerating their pivot toward renewable energy, transforming from traditional fossil-fuel drillers into integrated green energy powerhouses to meet the nation's ambitious "dual carbon" goals.

Recent environmental, social and governance (ESG) reports from the country's three energy giants — China National Petroleum Corp, China Petroleum and Chemical Corp (Sinopec) and China National Offshore Oil Corp — reveal a decisive shift in capital allocation toward hydrogen, solar and offshore wind power.

Sinopec is currently spearheading the sector's clean transition with an aggressive push into the hydrogen economy. Aiming to become China's top hydrogen enterprise, the refiner now operates a world-leading network of 150 hydrogen refueling stations.

It has also leveraged its vast retail network to deploy 141,000 electric vehicle charging terminals, according to the company's latest filings.

CNPC is matching this momentum, investing a robust 41.46 billion yuan ($6.09 billion) into new energy and advanced materials in 2025. The company's wind and solar power generation surged 68 percent last year as it builds a comprehensive "oil, gas, heat, power and hydrogen" portfolio.

In the offshore sector, CNOOC is capitalizing on its maritime expertise to advance the Hainan CZ7 offshore wind project and the development of the world's first 16-megawatt floating wind platform. The company is also pioneering carbon capture, utilization and storage (CCUS) technologies, exemplified by its Enping 15-1 offshore facility, the first of its kind in China.

"The severe supply disruptions and soaring oil prices triggered by global crises are undeniably accelerating the pace of the global energy transition," said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Lin said this strategic pivot relies heavily on China's world-leading clean technology and manufacturing prowess, which further cements the nation's core position in the future global energy architecture.

These corporate milestones mirror a broader national trajectory. Official figures from the National Energy Administration show that by the end of March, China's combined installed capacity of wind and solar power had reached roughly 1.9 billion kilowatts, a 28.1 percent jump year-on-year.

A recent China Electricity Council report expects China's installed solar power capacity to surpass that of coal power for the first time in 2026, marking a historic tipping point in the country's energy mix.

While prioritizing green growth, the majors have maintained a dual-track strategy to ensure domestic stability.

China secured stable domestic oil and gas supplies in the first quarter, effectively cushioning the economy against external shocks from geopolitical tensions in the Middle East.

Output of crude oil and natural gas rose 1.3 percent and 3 percent year-on-year, respectively, during the first quarter, said Xing Yiteng, deputy director-general of the department of development and planning at the NEA.

Dong Xiucheng, a professor at the University of International Business and Economics, said the rapid implementation of major new energy bases has effectively stimulated industrial activity while securing long-term energy safety.

"Efforts to stabilize prices and secure supply have built a solid foundation," Dong said.

"It has helped hedge against international fluctuations and stabilize costs for both corporate production and people's livelihoods."

Track stewards

Technicians inspect electric locomotive equipment at a service workshop at Houma North Locomotive Depot, China Railway Taiyuan Group, in Houma, Shanxi province, on Tuesday. Regular and precise maintenance of the equipment is the cornerstone of railway safety, underpinning the reliable operation of China's over 165,000-kilometer national rail network — the world's largest — which carries about 4.6 billion passengers and 5.2 billion metric tons of freight annually, serving as the backbone of the country's transportation system.

Built by China, Central Asia's first fully automated driverless LRT opens in Astana

By **REN QI**
renqi@chinadaily.com.cn

22.4 kilometers
length of the first phase of the Astana light rail transit (LRT) system, Central Asia's first fully automated driverless light rail line built primarily by Chinese enterprises

The first phase of the Astana light rail transit (LRT) system, Central Asia's first fully automated driverless light rail line primarily built by Chinese enterprises using Chinese equipment, technology and standards, was officially launched in Kazakhstan on Saturday.

The LRT system saw its first train depart at 11 am local time. Enterprises from Tianjin played a significant role in this milestone, with the Tianjin-based centrally administered State-owned enterprise CSCEC 6th Bureau undertaking the construction of several stations.

Furthermore, Tianjin Rail Transit Group trained over 500 operational staff members who all assumed their posts on the launch day, following theoretical studies in Kazakhstan and practical training in Tianjin since last year.

Kazakh President Kassym-Jomart Tokayev attended the inauguration ceremony in the Kazakh capital and became the line's first passenger, taking a test ride from the airport station to the National Museum station.

During the ceremony, Tokayev expressed gratitude to the Chinese side for the successful implementation of the project. He described the launch as an event of special significance for the country, saying the capital should eventually develop into a transportation hub of Eurasia.

Kazakhstan is also considering a second phase of the project to further develop public transport, according to the official website of the Kazakh presidential administration.

The newly launched first phase spans 22.4 kilometers and includes 18 stations, connecting major commercial centers and residential areas from Nursultan Nazarbayev International Airport in the south to the new railway station in the north.

Passing by landmarks and transport hubs such as Nazarbayev University, Abu Dhabi Plaza and the National Museum, the LRT system operates with a departure interval of five to six minutes. It is equipped with 19 trains manufactured by CRRC Tangshan, each capable of carrying over 600 passengers at full capacity with a maximum speed of 80 kilometers per hour.

Numerous passengers took the light rail for a trial ride on the first day of its operation, praising the Chinese equipment for its reliability and high level of comfort. An Astana resident named Yembergenov remarked upon seeing it in person that the Chinese automated driverless technology felt highly advanced, adding that the cabin interior was very modern and everything felt well-ordered.

Abat Shynybekov, deputy chairman of Astana's City Transportation Systems, said the project is of great significance in alleviating urban congestion and promoting public transport development.

He highlighted that the line adopted Chinese automated driverless technology and control systems, and that the Chinese side carried out targeted upgrades to the system's equipment, interior design and noise reduction, making it the most advanced LRT system in Central Asia today.

Yerkin Tukumov, director of the Kazakhstan Institute for Strategic Studies under the President of the Republic of Kazakhstan, said China and Kazakhstan are working together to advance key transport corridors, energy infrastructure and green technologies, enhancing the region's resilience and prosperity.

Under the framework of the Belt and Road Initiative, Chinese enterprises have been actively participating in the Central Asian country's infrastructure construction, Tukumov said. Last November, a highway reconstruction project undertaken by CITIC Construction Co Ltd was officially completed and delivered, adding another practical achievement to the joint construction of the BRI between China and Kazakhstan.

The project covers two national-level highways totaling 1,130 km with a designed speed of 120 km/h. During its construction, the project created local jobs and trained a group of professionals, including construction engineers and machinery operators, boosting the development of Kazakhstan's highway construction industry.

Bright future ahead for Piraeus Port

Annual throughput exceeds 5.6 million TEUs, up from 680,000 TEUs in 2016

A ship under China's major shipping enterprise COSCO makes maiden call at Piraeus Port in Greece on June 25. XINHUA

By REN QI
renqi@chinadaily.com.cn

Located about 10 kilometers southwest of Athens, Greece, Piraeus Port is a vital gateway connecting Europe, the Middle East and Africa.

Designed by architect Hippodamus of Miletus in the 5th century BC, Piraeus has long been one of the most prosperous ports in Greece and Europe. Historically, Chinese silk was transported by the Scythians via sea to Piraeus during its peak, before being sold throughout Greece.

However, the global financial crisis over a decade ago plunged the port into its "darkest hour". Shadowed by pay cuts and unemployment, the port suffered from strikes, blockades and sabotage. Equipment was left unmaintained, container yards fell into chaos and trucks jammed the port entrance for up to five kilometers. Shipowners abandoned the port, and clients were almost entirely lost.

The turning point came in 2016 when China COSCO Shipping Corp officially took over the port's operations. At the time, the annual container throughput of the port was approximately 680,000 twenty-foot equivalent units, ranking 93rd globally with outdated facilities and limited capacity.

Today, it has become one of the busiest ports in the Mediterranean, with annual throughput exceeding 5.6 million TEUs, ranking as high as 25th globally.

Upon taking over, COSCO Shipping issued a letter to employees, promising that the Chinese management team would not take a single blade of grass or stone from the port. They pledged that the port's past, present and future belong to the Greek people, with no more than seven Chinese nationals on the management team, leaving all other positions to Greek employees.

The management delivered on their promises. They worked alongside local employees to expand the international market, increase transit cargo and take the lead in repairing aging facilities.

To improve working conditions, the company provided free lunches and allowed employees to manage the canteen. Embracing a shared "family" culture similar to both Chinese and Greek traditions, they invited workers to new year parties and awarded scholarships to employees' children, transforming initial doubts into trust and a powerful synergy for development.

"They are not here to steal our jobs; instead, they have created more employment opportunities," said Tassos, the company's commercial manager who has worked at the port since he was 16. "In less than half a year, Piraeus Port began to achieve consecutive monthly profits. They did what we had wanted to do for years but couldn't."

Nikolaos, manager of the claims department, quoted a Greek proverb, "From the soil of wisdom grow three green shoots: good thoughts, good words, good actions." He said that COSCO Shipping perfectly combined Eastern wisdom with Greek culture, respecting and safeguarding the locals' millennia-old attachment to the port with advanced concepts, effective communication and solid actions.

Piraeus Port has now become the fourth-largest container port, the second-largest cruise homeport and the largest ferry port in Europe, as well as an important roll-on/roll-off automobile hub and ship repair center in the Eastern Mediterranean.

"These 10 years mark the decade in which the port of Piraeus moved from being a corner of the Mediterranean to a global hub," said Han Chao, chairman of the port operator Piraeus Port Authority SA.

The development path of the port is also quietly transforming. Stepping into the office building of the container terminal, one can see large screens displaying vessel dynamics, operational progress and equipment status in real time.

According to Han, the port has built a digital monitoring platform covering the entire port area and introduced 5G and artificial intelligence technologies, driving its organization to evolve from "manual planning" to "intelligent coordination".

In terms of energy, photovoltaic systems have begun supplying power to parts of the port. Shore power facilities are also being planned to allow docked ships to cut emissions, further increasing the port's share of green energy.

In recent years, the port's revenue and profit have continued to grow, reversing a long-term trend of losses. COSCO Shipping has invested over 10 billion yuan ($1.47 billion) locally, creating thousands of direct jobs and generating tens of thousands of indirect employment opportunities.

Trucks move containers at Piraeus Port on May 6, boosting regional logistics links via international connectivity cooperation. LYU YOU / XINHUA

> "These 10 years mark the decade in which the port of Piraeus moved from being a corner of the Mediterranean to a global hub."
>
> **Han Chao,** chairman of the port operator Piraeus Port Authority SA

"It has changed not only the port itself, but also the relationship between the city and its people," said Yannis Moralis, mayor of Piraeus.

As port revenues inject funds into the local economy, surrounding businesses have prospered. Once quiet streets are now bustling with cafes, shops and logistics companies. For locals, the port is no longer just a "distant dock", but a part of their daily lives.

According to the recently released financial report of the Piraeus Port Authority, the company's total revenue in 2025 reached approximately 251 million euros ($292 million), a year-on-year increase of 8.6 percent; operating profit stood at 132 million euros, up 2.2 percent year-on-year.

Savvas Sanozidis, secretary of the board of directors of the Piraeus Port Authority, said the transmission and integration of COSCO Shipping's corporate values have effectively strengthened supervision over management, promoting transparency, prudence and a high sense of responsibility in all aspects of work, providing a strong guarantee for the company's long-term sustainable development.

Stefanos Gkikas, deputy minister of maritime affairs and insular policy of Greece, stated that the fruitful cooperation between COSCO Shipping and the Piraeus Port Authority over the past decade has significantly enhanced the port's competitiveness and further consolidated Greece's position in the international shipping sector.

Looking ahead to the next decade, the development blueprint for Piraeus Port is clearly defined.

"The future port will be smarter and greener," Han added. The port plans to extend its industry chain to logistics, warehousing and comprehensive services, building a global logistics node with greater reach.

Meanwhile, social responsibility remains a priority. Public welfare projects and cultural exchanges continue to advance, making the port not just an economic hub, but a connection point for emotion and culture.

According to Han, the construction of the COSCO Shipping Piraeus Port park project was officially launched in April. Once completed, it will become a modern center integrating sports, leisure and social activities. It will not only benefit local residents, but also improve the infrastructure of the cruise terminal area and strengthen transport links with the city of Piraeus, providing a better experience for international tourists.

Over the past decade, Piraeus Port has achieved leapfrog development, serving as a vivid footnote to China-Greece cooperation. Today, amid the surging tides, this gateway to the Mediterranean is embarking on its next decade of intelligent, green and open growth.

Belt and Road Initiative's infrastructure projects improving lives abroad

By REN QI

Under the framework of the Belt and Road Initiative, China and various involved countries have continuously advanced global interconnectivity. A series of major infrastructure projects have taken root worldwide, supporting the dreams of people for prosperity and development while injecting fresh vitality into the global economy.

On April 1, 2023, the New Belgrade-Surcin section of the E-763 highway in Serbia, constructed by a Chinese enterprise, officially opened to traffic. Spanning 7.9 kilometers, this segment serves as the starting point of the highway, seamlessly connecting the urban area of Belgrade with the previously completed Surcin-Obrenovac section.

With the opening of this new segment, the total operational length of the E-763 highway has reached 140 km. This vital transport artery brings large and medium-sized cities in southwestern Serbia into the capital's one-hour economic circle. Benefiting a population of over 4 million, the highway not only facilitates convenient travel for locals, but also plays a crucial role in promoting interconnectivity and economic and trade exchanges across the entire Balkan region.

Over the past decade, Chinese enterprises have consistently offered Chinese solutions to overcome complex technical challenges in highway construction across BRI-participating countries. Through collaborative efforts, they have successfully built landmark projects such as Cambodia's first expressway and Bangladesh's first elevated expressway.

The momentum extends to rail networks. On Oct 2, 2022, the Jakarta-Bandung High-Speed Railway — the first of its kind in both Indonesia and Southeast Asia — officially commenced operations. Stretching 142 km with a maximum design speed of 350 kilometers per hour, the railway has drastically slashed travel time between Jakarta and Bandung from over three hours to just over 40 minutes now.

This transformative railway was jointly built and operated by a joint venture established by China Railway International Co Ltd and four Indonesian State-owned enterprises. As a flagship project of the BRI and a symbol of practical cooperation between China and Indonesia, builders from both nations worked in tandem over eight years, conducting comprehensive, all-element and full-system cooperation.

Passengers chat inside the dining car of an Ethiopia-Djibouti Railway train on Sept 9, 2023. WANG GUANSEN / XINHUA

From the Addis Ababa-Djibouti Railway, East Africa's first electrified railway, to the Mombasa-Nairobi Standard Gauge Railway, a major artery for regional interconnectivity; and from the China-Laos Railway, which transformed Laos from a landlocked country into a land-linked hub, to the Jakarta-Bandung HSR, which achieved the "fastest speed" in Southeast Asia — the past decade has seen China and partner countries pave roads of development and revitalization.

Together, they have spurred economic growth, transferred advanced technology, increased employment opportunities and improved local livelihoods, steadily marching toward common development and shared prosperity.

Aviation infrastructure has also seen remarkable progress. In 2019, the new terminal of Bole International Airport in Addis Ababa, Ethiopia, built by Chinese enterprises, officially opened. As part of the airport's expansion and upgrading project, construction of the new terminal began in 2015 and was completed after four years of dedicated efforts.

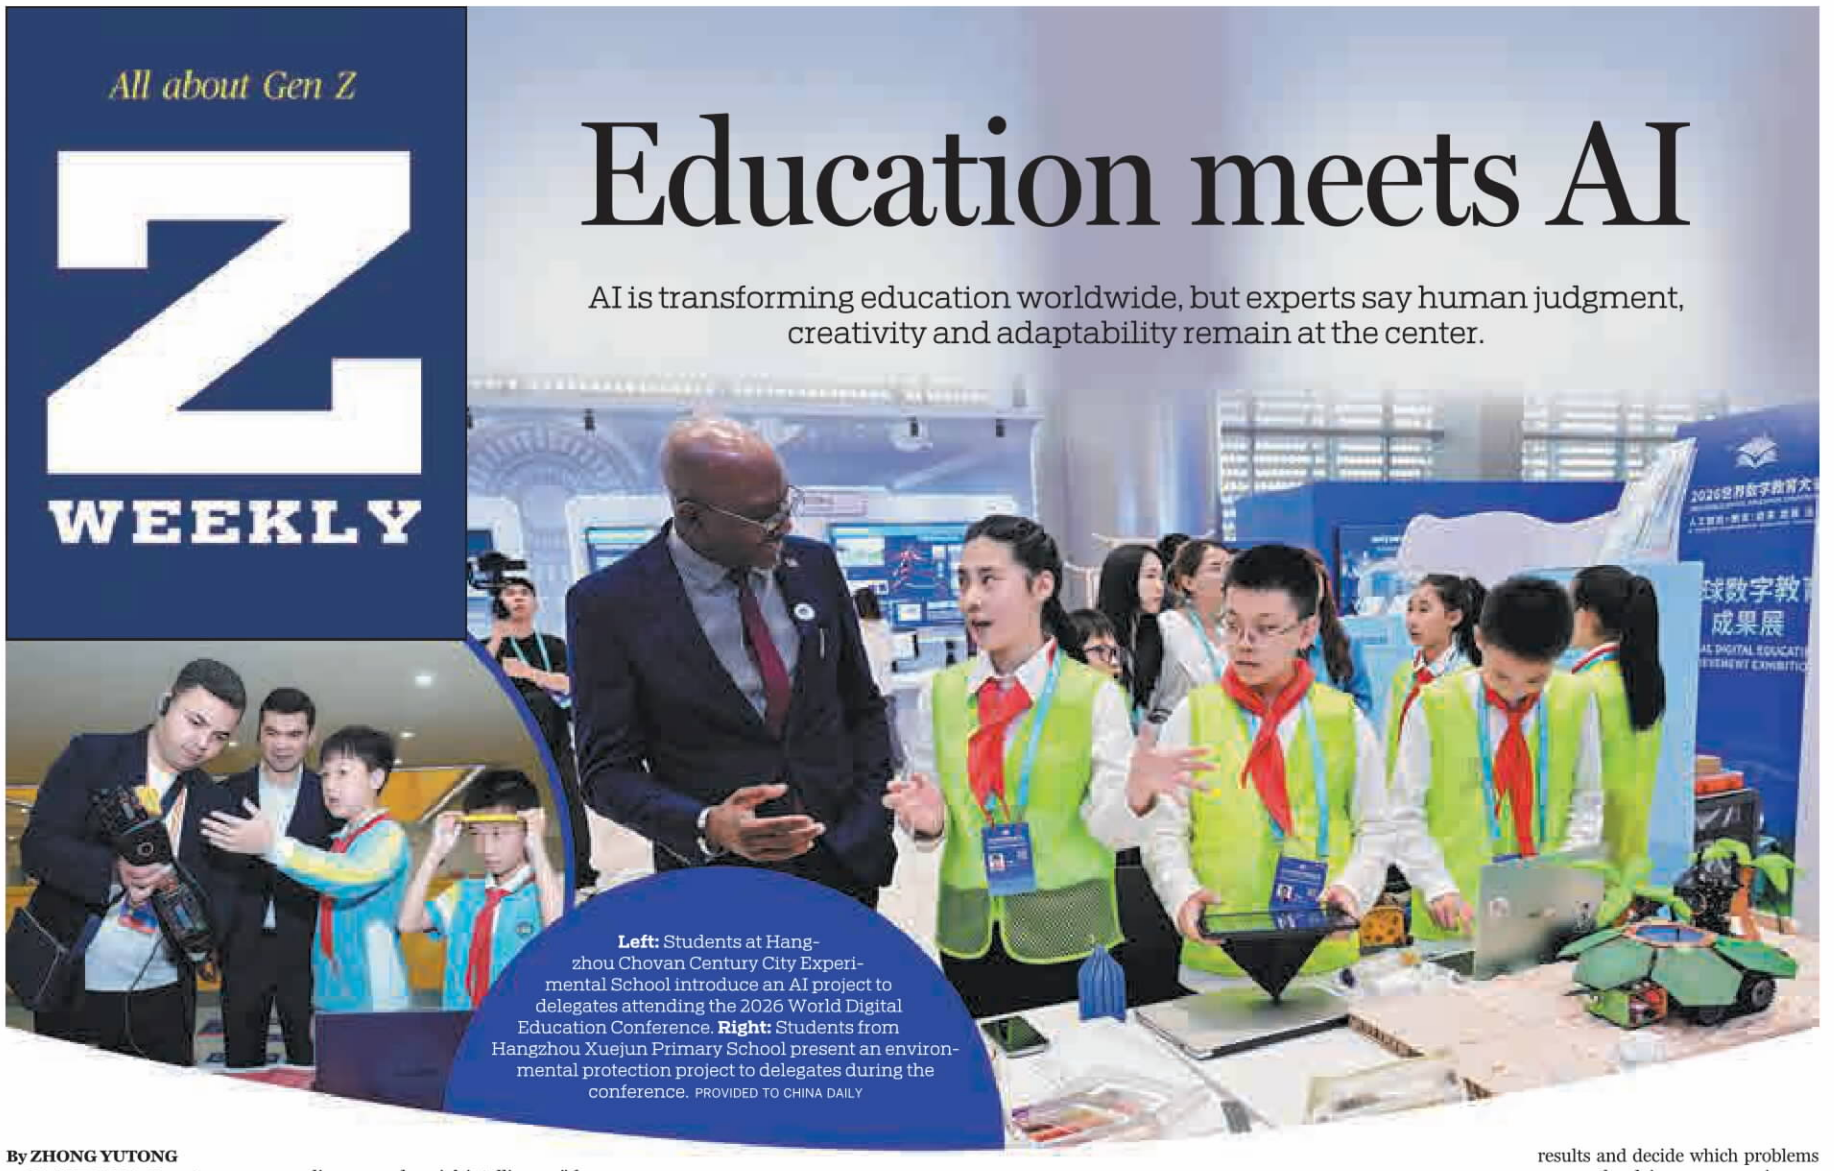
Following the terminal's successful operation, the Ethiopian government continued to invite Chinese enterprises to participate in further expansion projects, aiming to transform the airport into a premier aviation transport hub in Africa.

From New Gwadar International Airport in Pakistan to Siem Reap-Angkor International Airport in Cambodia, multiple modern airports have sprung up in BRI participating countries over the past decade, with Chinese enterprises frequently playing key roles in their investment and construction.

These achievements are microcosms of the deepening cooperation between China and BRI participating countries in the field of new infrastructure. In recent years, the overseas service networks of China's three major telecom operators have expanded to over 40 countries, paving "highways" for new digital infrastructure.

Meanwhile, enterprises such as the State Grid and China Southern Power Grid have also actively strengthened the alignment, mutual recognition and application of rules and standards with BRI participating countries. This has promoted the "going global" of Chinese technology, standards and equipment, helping to build the BRI into a road of innovation.

Andrey Ostrovsky, chief researcher at the Institute of China and Modern Asia at Russian Academy of Sciences, said the BRI proposed by China brings new development opportunities to participating countries and significantly aids global common development.



To ensure the successful implementation of the BRI, China has introduced a series of supportive policies and promoted the establishment of institutions such as the Asian Infrastructure Investment Bank and the Silk Road Fund.

Through this extensive cooperation, many countries have acquired vital facilities that would have been exceedingly difficult to build relying solely on their own capabilities, Ostrovsky said, adding that these projects have created excellent conditions for subsequent development and have become enduring sources of wealth for these nations.

Education meets AI

AI is transforming education worldwide, but experts say human judgment, creativity and adaptability remain at the center.

Left: Students at Hangzhou Chovan Century City Experimental School introduce an AI project to delegates attending the 2026 World Digital Education Conference. **Right:** Students from Hangzhou Xuejun Primary School present an environmental protection project to delegates during the conference. PROVIDED TO CHINA DAILY

and **XU YIDAN** in Hangzhou
and **MENG WENJIE**

Gaspard Banyankimbona has seen the anxiety many young people feel as artificial intelligence advances.

As commissioner for education, science, technology and innovation at the African Union Commission, he arrived at the 2026 World Digital Education Conference in Hangzhou, Zhejiang province, with a clear message for students and teachers facing the rise of intelligent technologies: AI is not something to fear or avoid, but a tool people must learn to use wisely.

"AI is already with us. We cannot run away from it. We need to learn how to work with it," he said.

Held from May 11 to 13 under the theme "AI + Education: Transformation, Development, Governance", the conference brought together government officials, scientists and education experts from around the world to discuss how AI is reshaping learning, teaching and research.

Drawing on years of experience in education, Banyankimbona said that as AI tools make knowledge easier to access than ever, educators must rethink their role in the classroom.

"Teachers should become collaborators with students and guide them in areas AI can never replace, such as critical thinking, emotional intelligence and social intelligence," he said.

That idea — that AI is pushing education beyond the simple delivery of knowledge — ran through the conference. It was also on display at Hangzhou Chovan Century City Experimental School, where delegates saw how AI tools are being woven into everyday school life.

There, students use AI-assisted learning platforms that generate exercises based on the areas where they need more practice. The system helps them review difficult topics more efficiently and allows teachers to see where students need extra help.

In physical education classes, data such as step counts, heart rates and movement patterns are collected and analyzed in real time, helping teachers build personalized fitness profiles for students. The goal is not simply to measure performance, but to better understand each child's physical development.

AI has also changed how students approach creative projects.

Before graduation, sixth-grade students at the school complete a project called "The First Book of My Life", in which they document memorable moments from their primary school years. In the past, students were responsible only for writing, while the layout and design were outsourced. Now, with the help of AI-supported tools, they can create their own e-books, bringing together text, images and design.

Tan Pengfei, the school's principal, said the changes reflect a broader shift in education.

"The abilities developed outside textbooks have become even more valuable today — communication, creativity, curiosity and problem-solving," Tan said. "The role of schools is to awaken and nurture these human qualities that are already present in children."

Tan's comments echoed Banyankimbona's view that the future of education will depend less on whether students can access information and more on whether they can use knowledge with judgment and creativity.

The same shift is also taking place in higher education and scientific research.

At the conference, Luo Jianlan, an associate professor at Shanghai Innovation Institute, discussed AI's role in research and innovation in a keynote speech on embodied intelligence.

Founded in 2024, the institute focuses on cultivating AI talent capable of addressing real-world challenges.

"It trains students to identify real problems, turn them into scientific questions and complete a full cycle of innovation," Luo said.

A graduate of the University of California, Berkeley, and a former researcher at Google and the Berkeley Artificial Intelligence Research Lab, Luo said AI has narrowed the gap between basic research and industrial application.

"In the past, translating research into real-world use could take 10 to 20 years," he said. "Today, for example, it took only about seven years for AlphaFold, an AI system that predicts protein structures, to progress from breakthrough research to a Nobel Prize-winning achievement."

Zhang Linfeng, founder and CSO of DP Technology, shared a similar view.

Having long worked in "AI for Science", an interdisciplinary field that uses AI to advance scientific research, Zhang recalled the first time he saw AI's transformative potential in science.

By using neural networks to model atomic interactions, he completed a molecular simulation on a laptop in less than a day — a task that would previously have required 200 million CPU-core hours and millions of dollars.

"That was when I truly understood what AI could bring to scientific advancement," he said. "In the future, when a scientific question arises, AI may be able to interpret it, review the literature, design experiments, carry them out and analyze the results."

> "As AI expands humanity's ability to explore the unknown, even more complex and interesting questions will emerge. That is why soft skills such as defining problems and finding solutions may become more important than expertise in any specific technical domain."
>
> **Zhang Linfeng,** founder and CSO of DP Technology

But Zhang stressed that this does not mean scientists will be removed from the process. On the contrary, he said, AI will make their ability to ask meaningful questions, evaluate results and decide which problems are worth solving even more important.

He also believes China has distinct advantages in this field, and that was one reason he chose to return to the country after graduating from Princeton University in 2020 to start his company.

"China has a strong industrial and manufacturing foundation, which makes it easier to connect scientific breakthroughs with industrial innovation," he said.

Turning from frontier science back to education, Zhang also reflected on how younger researchers are adapting to the fast-changing age of AI.

He noted that in the past, a PhD student might spend years steadily exploring a single research topic. Today, that path is far less predictable.

"With AI evolving so rapidly, entire fields can change within three to five years," he said.

That makes adaptability increasingly important, Zhang added.

"As AI expands humanity's ability to explore the unknown, even more complex and interesting questions will emerge. That is why soft skills such as defining problems and finding solutions may become more important than expertise in any specific technical domain," he said.

Shining Wisdom

Bangladeshi scholar inspired by Chinese modernization

When I first arrived at Taiyuan University of Technology more than six years ago, I was a young man from Bangladesh carrying a suitcase, a dream and the values my father had instilled in me.

My father has long been active in the Communist Party of Bangladesh, and in our home, discussions about justice, equality and working people were part of everyday life. Those conversations shaped my earliest understanding of society.

My decision to come to China was practical at first. I wanted to learn from the country's achievements in infrastructure, power generation and technology. What I found, however, went far beyond technical knowledge, reshaping both my academic path and worldview.

During my first year, a professor recommended *Xi Jinping: The Governance of China*.

I opened the book expecting formal political theory, but found a work that spoke to questions I had carried since childhood: What does it mean for development to serve the people? How can a country protect its independence while opening to the world? How can political ideals improve people's daily lives?

What struck me first was the emphasis on putting people first. In Bangladesh, I had often thought about obstacles facing developing countries: foreign interference, inequality, local elites and weak long-term planning.

President Xi's writings helped me see that national development cannot be reduced to economic growth alone. It requires clear vision, strong institutions, social stability and commitment to improving lives.

The idea of building a community with a shared future for humanity also moved me deeply.

Bangladesh is highly vulnerable to climate change, although it has contributed very little to global carbon emissions. For people from countries like mine, international cooperation is not an abstract slogan; it is a question of survival, dignity and justice.

President Xi's call for mutual respect and shared benefit gave me hope, a spirit I also saw in educational exchanges, friendships and development cooperation.

The more I read, the more I understood that Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era represents a living application of Marxism.

My father taught me that Marxism is not a fixed dogma, but a method for understanding society and guiding action. In *The Governance of China*, I saw that method applied to the 21st century: innovation and stability, opening up and cultural confidence, environmental protection, national rejuvenation and global responsibility.

Living in China allowed me to connect these ideas with real experience. I have visited communities where public services have improved people's lives. I have spoken with people in Shanxi who remember harder times and describe changes in daily life. These experiences helped me understand development not as a statistic, but as something visible in ordinary lives.

Riyadzh Mahmudh

President Xi's discussion of poverty alleviation also affected me deeply. In Bangladesh, despite progress, many people still face hardship. Learning how China lifted hundreds of millions out of poverty changed my understanding of what is possible.

What impressed me was not only the scale, but also the method: targeted policies, mobilization, measurable goals and a determination that no group should be forgotten. It showed me that poverty is not inevitable when political will, organization and people-centered policy work together.

My experience at Taiyuan University of Technology has reinforced these lessons. In renewable energy systems and power grid integration, I have come to see engineering not only as a technical discipline but also as a contribution to development and human well-being. The book helped me connect my research with a larger question: how knowledge can serve the people.

It has also helped me understand my identity more clearly. As a Bangladeshi communist studying in China, I once felt I stood between different worlds. Now I see that position as a responsibility. The vision of a community with a shared future for humanity teaches me that my education is not for personal advancement, but for preparation to contribute to my country and strengthen friendship among peoples.

The Governance of China has been an important guide in my transformation.

When I return to Bangladesh, I will carry more than a doctorate. I will carry the lessons I learned from China: that development must be people-centered, that independence and cooperation can strengthen each other, and that theory becomes meaningful when it improves real lives.

My father gave me my first introduction to communism. China has shown me how those ideals can be practiced in the modern world.

Written by Riyadzh Mahmudh, a PhD candidate from Bangladesh in the College of Electrical and Power Engineering at Taiyuan University of Technology. His research focuses on the evolving landscape of high-voltage engineering and power electronics.

Running toward the light

Student volunteers in Jiangxi guide runners with visual impairments, helping them build confidence, independence and lasting friendships through the shared power of running.

Top: Hu Liang (first from left) leads a visually impaired runner in warm-up exercises on June 2, 2024. **Middle:** Zhang Hongying (right) accompanies her running partner, Zhang Qian, on the track at Jinggangshan University on Dec 14, 2025. **Bottom:** Man Xinyuan (left) guides a friend with visual impairment during a run on Sept 8, 2024. By **MENG WENJIE**
mengwenjie@i21st.cn

When Zhang Hongying first put on a blindfold to experience what it is like to be blind, she froze, her heart racing.

"I couldn't take a single step. There's an instinctive fear when you face the unknown," she recalled.

At the time, Zhang was training as a new volunteer with the Red Stars Charity Program, an initiative based in Ji'an, Jiangxi province, which supports runners who are blind or have low vision. Now 20, Zhang has been volunteering with the program for a year. Every Sunday morning, she joins a group of runners in a riverside park in Ji'an.

Before working with participants, volunteers complete a three-week guide-running course, including one session conducted entirely in darkness.

As a dental student, Zhang had had little contact with people with vision loss. At first, she assumed her role would be straightforward: point out obstacles and give clear directions so the runners could focus on their pace.

"But when I was plunged into darkness, I realized that these runners are placing not just their bodies, but their full trust in you," she said.

Hu Liang, the founder of Red Stars and an associate professor at Jinggangshan University (JGSU) in Jiangxi province, has visual impairment himself. Born to parents who were both completely blind, he developed severe myopia that gradually worsened until he could see little more than blurred shapes.

Hu said those years were extremely difficult until running helped him rebuild both his physical and mental strength. Later, when he learned that blind athletes at the Paralympic Games competed with the help of guide runners, he had a revelation: running could open new possibilities for people like him, who had lost their sight.

In 2022, Hu founded Red Stars. The name draws inspiration from the revolutionary history of the Jinggangshan area and symbolizes perseverance and hope. Most of the program's volunteers are JGSU students who come from all over China.

"They are like little stars, coming together to shine for a shared cause: supporting people with visual impairments," Hu said.

The program connects volunteers and runners through a guide rope — a sports neck gaiter twisted into a figure-eight.

"It's a clever design," said Chen Xinping, a runner who lost his sight in 2010. "If I drift off course, the rope tightens slightly and gently guides me back. It allows volunteers to lead us without taking over, so we can truly enjoy the run ourselves."

Before joining Red Stars, Chen rarely left home without the support of family members. But the program gave him the confidence to venture beyond his familiar surroundings.

Originally from Shangrao in Jiangxi province, Chen celebrated his 60th birthday in April by setting a personal record at a Red Stars event in Nanchang, the provincial capital, where he completed six kilometers.

"The lives of people with visual impairments are like a long march," Chen said. "Red Stars helped us find our starting point and take the first steps on a new journey."

> "They are like little stars, coming together to shine for a shared cause: supporting people with visual impairments."
>
> **Hu Liang,** the founder of the Red Stars Charity Program

Strengthening bonds

For many participants, the benefits of Red Stars go far beyond the running track, including physical strength, confidence, and independence.

One of them is Zhang Qian, who experienced depression after losing his eyesight in his 30s. Initially, he doubted whether running was even possible, given that he often bumps into things while walking. Despite his reservations, he decided to give it a try.

With the steady support of his guide runners, Zhang has made progress step by step. "I went from just a few kilometers at the beginning to 10 kilometers now," he said.

Zhang Qian's regular guide runner is Zhang Hongying, who has grown alongside him. Before joining Red Stars, she could barely run two kilometers. This past winter, she completed a half marathon.

"It's the determination of the runners that keeps me going. They treasure every opportunity to run and always give their best," she said. "We are not merely helpers and those being helped — we're friends who achieve things together."

Man Xinyuan, 23, a senior at JGSU and a volunteer with Red Stars, believes the runners need to be treated as equals and offered genuine companionship.

He recalled accompanying a runner with vision loss to a marathon in Zunyi, Guizhou province, in 2023. Man wanted to take photos for him, but his partner declined, explaining that his phone's screen reader can only read text, so images mean nothing to him.

"Don't worry — I'll help you 'see' them," Man replied. He later sent detailed text descriptions of each photo so his partner could imagine the event.

According to Man, Red Stars feels like a family, with people supporting each other both on and off the track. As an environmental design major, he drew inspiration from the program for his graduation project: an inclusive kindergarten designed with accessibility in mind. He also hopes to create a comprehensive visual identity for Red Stars.

"Students from different academic backgrounds contribute in many ways and grow through the experience," Hu said.

Design students create patterns for guide ropes and team uniforms, psychology students offer emotional support, and sports science students lead rehabilitation exercises.

"As a teacher, it is incredibly rewarding to watch students grow from freshmen into capable, confident, and determined young adults," Hu added.

Expanding reach

What began as a small campus initiative has since developed into a much broader support network.

Red Stars now has nearly 4,000 volunteers, has organized close to 300 events, and has served over 30,000 people who are blind or have low vision.

In 2024, Hu established a rehabilitation center to support people who lost their eyesight later in life, expanding the initiative far beyond running.

"This has been made possible by national policies," Hu said. He noted that in late 2023, the China Disabled Persons' Federation directed every province and region to establish at least one service center for each type of disability beginning in 2024.

Red Stars' center is located on the campus of JGSU, which provides space and equipment free of charge. The 1,000-square-meter facility includes tactile pathways, a sports zone, a Braille library, and life-skills spaces designed to help participants relearn daily tasks in a safe environment.

Zhang Qian benefited greatly from the center, gaining orientation and mobility skills that now allow him to travel independently. "I used to wait at home until my family had time to take me out," he said. "Now I can go wherever I need to on my own."

Zhang Qian now works as a trainer at the center, helping others learn how to navigate life without sight.

The Red Stars model is also expanding beyond JGSU. In Yudu county, also in Jiangxi province, a new running group for people with visual impairments has been launched with the program's support.

Several other universities have visited JGSU to learn from Red Stars and apply its approach to their own projects, such as audio-described films, accessible design projects, and hiking groups for people with visual impairments.

"The methods may differ, but we share the same goal: bringing society together to support people with disabilities," Hu said.

Russian actor lives Chinese stories

From extra roles to revolutionary dramas, a Russian actor discovers his place in China's storytelling world.

Above: Antonov Dmitry portrays a Soviet paratrooper in the Chinese film *Survival*. **Right:** Dmitry (third from left) plays the German communist revolutionary Otto Braun in the Chinese micro-drama *Bright Horizon*. PROVIDED TO CHINA DAILY

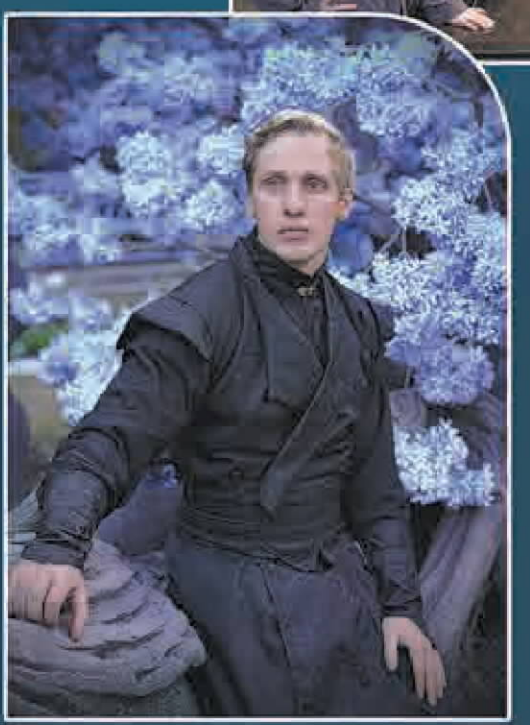
By DU AORAN
duaoran@i21st.cn

In the countryside of Le'an county, Jiangxi province, Russian actor Antonov Dmitry stood face-to-face with Chinese actor Chi Shuai on the set of the revolutionary historical micro-drama *Bright Horizon*.

Dmitry, 37, plays Otto Braun, also known in China as Li De, a German military adviser sent to China by the Communist International in the 1930s. In the scene, Braun insists on his own military judgment and demands full command of the troops, while Mao Zedong, played by Chi, argues for tactical adjustments based on the realities on the battlefield.

"This is one of the most emotionally charged scenes I've ever filmed," Dmitry said, recalling how he slammed the table so hard during shooting that he bruised his hand.

"But I didn't feel the pain," he said. "I was completely immersed in the role."



Even during camera adjustments and brief water breaks, the actors stayed in character, maintaining the emotional pressure throughout.

"If you relax for even a second, the tension disappears," he said.

Dmitry admitted that in recent years he has begun carrying heart medication with him on set as a precaution.

"It shows how physically and emotionally demanding historical roles can be," he said.

For Dmitry, the scene was more than just a performance. It reflected what has drawn him ever deeper into acting in China: the challenge of entering another history, another emotional world, and another way of storytelling.

Above: Dmitry takes part in a traditional Chinese-style photo shoot wearing *hanfu* at Hengdian World Studios in Zhejiang province. **Bottom:** Dmitry appears as a Russian police officer in the Chinese film *Moscow Mission*.
PROVIDED TO CHINA DAILY

Finding his rhythm

Dmitry did not originally plan to become an actor. He studied engineering at university, specializing in mining and natural gas. "It was a very technical and logical world," he said.

But art had always been part of his upbringing in Russia. Music, painting, and theater surrounded him from an early age, and at 18 he started teaching himself classical vocal performance, an experience that later helped him develop his voice, stage presence, and acting skills.

"That early exposure to art became an outlet that helped me balance the rigidity of engineering," he said.

His interest in Chinese culture deepened after he watched a Chinese stage performance in Moscow.

"It was completely different from what I knew," he said. "It was subtle, restrained, almost like an ink painting. It didn't explain everything, but it made you feel everything."

That impression stayed with him. Years later, Dmitry came to China for postgraduate studies. Then, in 2019, a friend working in media production offered him an unexpected opportunity: a small role as an extra in a television drama being filmed in Nanjing, Jiangsu province.

"That was my first time on a film set," he said. "I stood quietly at the edge with no lines, thinking, 'Where am I, and what am I supposed to do?'"

But as soon as filming began, the atmosphere changed.

"The director called 'Action!' and the set suddenly came alive," Dmitry recalled. By the third take, he began to understand the rhythm of filmmaking. "Even without any lines, I felt like I was part of something meaningful."

Over the next six years, Dmitry gradually built a career in China's entertainment industry, moving from extra roles to supporting parts and more complex characters in television dramas and films.

The work, he said, has often been physically demanding. He remembered one film shoot that lasted 21 hours, with long periods of waiting in the makeup room and only brief moments to rest.

As his experience grew, Dmitry began collaborating regularly with agents, casting directors, and production companies.

> "I understand how Chinese sets operate, how directors communicate, and how emotions are expressed in Chinese storytelling. Maybe I've become more of a *laonei* — an insider."
>
> **Antonov Dmitry,** a Russian actor

Most of his roles, he said, come through in-person auditions, online castings, or self-taped submissions. Sometimes, production teams contact him directly after seeing his portfolio.

Language skills and cultural understanding, he added, have been central to his progress.

"I don't really feel like a *laowai* anymore," he said, using the Chinese term for "foreigner". "I understand how Chinese sets operate, how directors communicate, and how emotions are expressed in Chinese storytelling. Maybe I've become more of a *laonei* — an insider."

For Dmitry, acting is not only about speaking lines. Costumes, lighting, and the surrounding environment all help him connect with a character.

He recalled filming at Hengdian World Studios in Dongyang, Zhejiang province, where he played a French envoy in a historical drama.

"The moment I put on the costume, the entire environment brought the character to life," he said. "A chair, a lantern, a beam of light — every detail helps you step into the role."

Working with experienced actors has also deeply influenced him. Earlier this year, he acted alongside Mei Ting — one of China's best-known actresses and a national first-class performer — in the film *Heart of Gold*.

Four years earlier, Dmitry had watched Mei's performance in *Blind Massage* (2014) and was struck by her precision and professionalism. On set, he said, he saw that same mastery up close.

"She is extremely focused and has a remarkable sense of the camera. In one scene, she conveyed complex emotions through very small movements, with perfect timing," he said. "That is not acting — it is living in the moment."

From screen to stage

Outside of filming, Dmitry balances several pursuits. He is a partner in a fitness club chain in Russia while also continuing to read extensively on acting theory and biographies of great performers.

But his main artistic goal now is to join a theater company.

That ambition grew stronger last May after he watched Canadian international students perform an opera adaptation of *Thunderstorm*, the classic drama written by Cao Yu in 1934.

"They crossed cultural boundaries and expressed pain, passion, and conflict with such sincerity that the audience burst into applause," he said. "I was completely captivated."

The performance made him think more seriously about theater. Unlike film, theater allows no retakes or editing. Everything depends on the actor's voice, timing, and direct connection with the audience.

Dmitry said he hopes to further develop his improvisation skills, voice control, and stage presence, and to better understand China through its classic works.

"Acting is no longer just my job. It is part of who I am," he said. "I cannot imagine my life without it."

An international student plays Go with a Chinese student at Fudan University on May 10.
PROVIDED TO CHINA DAILY

Ancient game connects global youth

By ZHENG YIRAN in Shanghai
zhengyiran@chinadaily.com.cn

Without Go, Filip Filipovic, Noah Lauder and Kseniia Shatarova might never have become friends in China.

The three international students come from different countries and have different reasons for taking up the ancient Chinese board game Go, known in Chinese as *weiqi*. But through the Shanghai International Student Go Training Program, they found a shared language on the board.

The program, hosted by Fudan University, was launched on May 10 as a side event of the upcoming 10th World Collegiate Weiqi Championship. It aims to teach international students in Shanghai the fundamentals of Go while offering them a deeper understanding of Chinese culture.

More than 200 students applied, and 86 were ultimately selected. Participants came from 35 countries across Asia, Africa, Europe, North America, South America and Oceania.

According to the organizers, the course provides systematic instruction, covering everything from the basic rules of Go to practical gameplay training. Bilingual teaching assistants are also on hand to help ensure smooth communication in the classroom.

Beyond the game itself, the program includes friendly matches, cultural workshops and *hanfu* (traditional Chinese attire) experiences, giving students the opportunity to learn about Chinese traditions firsthand.

Filipovic, a 29-year-old doctoral student from Serbia at Fudan University, first encountered Go while attending primary school in China.

"At first, I played chess with my schoolmates. Later, our school introduced Go classes, and that completely drew my attention," he said. "The rules are simple, but the possible variations are extremely complex. The real difficulty is much higher than that of many other board games."

Having completed both primary and middle school in China, Filipovic said Go has become an important part of how he understands Chinese culture.

"Every board game carries its own cultural heritage," he said. "Go is deeply connected to Chinese ideas of yin and yang, as well as ancient military strategy, including concepts found in Sun Tzu's *The Art of War*. That is what makes it so fascinating."

His Go idol is Nie Weiping, a Chinese Go master and honorary chairman of the Chinese Weiqi Association.

"I used to watch him play when I was a kid," Filipovic said. "I love his fuseki and his understanding of the game. For me, it is a kind of philosophy."

For Lauder, a freshman from Australia at Fudan University, Go became appealing through another part of Chinese culture: tea.

"When I came to China, I found it really interesting how tea and board games are often enjoyed together as part of everyday life," he said. "That was when I started playing Go."

Lauder said he sees Go as a hobby that can last a lifetime.

"It is easy to get started, but there is no ceiling," he said. "You can keep growing with the game."

Shatarova, a 20-year-old Russian student at Tongji University, said she was drawn to Go because of its complexity.

"Go is one of the toughest games in the world," she said. "I play it to challenge myself."

She often plays with Chinese friends and said each game gives her another way to understand Chinese culture. Given the chance, she hopes to introduce Go to people in her hometown.

Zhang Zhuo, a researcher at the Institute of Journalism at the Shanghai Academy of Social Sciences, said Go can help young people connect across cultures.

"Go is a quiet form of communication because many of the ideas embodied in the game resonate with people from different cultural backgrounds," Zhang said. "The game reflects the Confucian concept of balance and moderation in Eastern philosophy, while also sharing similarities with ideas found in Western cultural traditions."

She said training programs and competitions can make traditional Chinese culture more accessible to young people worldwide.

"Go is a cultural symbol that transcends ideology and serves as an important bridge for exchanges between civilizations," she said.

The 10th Annual World Collegiate Weiqi Championship will be held at Fudan University from July 7 to 13. Players from across the globe will gather in Shanghai to compete and build friendships through the centuries-old board game.

BASKETBALL

Wemby dazzles as Spurs top Thunder

French star produces epic 41-point, 24-rebound display to give San Antonio a 1-0 lead in the Western Conference finals

OKLAHOMA CITY — The longest night of Victor Wembanyama's NBA career was over.

His postgame media responsibilities were done, and he had just seen his father and a few other people in a quiet hallway near the San Antonio Spurs locker room.

He didn't walk back to the room. He got a ride — in a wheeled office chair, pushed by a Spurs staffer.

"Save some steps," Wembanyama said.

To be fair, after the night he had, energy was probably in short supply anyway.

A 41-point, 24-rebound playoff game. Only a few people in the history of basketball have done that — Wilt Chamberlain eight times, Hakeem Olajuwon twice, Kareem Abdul-Jabbar once, Charles Barkley once.

Add Wembanyama to that list now, after his latest masterpiece — in a career-high 49 minutes — carried the Spurs to a 122-115 double-overtime win over the Oklahoma City Thunder in Game 1 of the Western Conference finals on Monday night.

"The best player in the (expletive) world," Spurs guard Stephon Castle announced for all the world to hear in a postgame interview on NBC.

Officially, no, that's not the case. The best player in the NBA world right now is Shai Gilgeous-Alexander, the player who got his second consecutive Most Valuable Player award in a pregame ceremony with Wembanyama looking on.

It was an award Wembanyama wanted — and still wants. Seeing Gilgeous-Alexander raise that trophy, though, had an effect on the 7-foot-4 French star.

"He's competitive. If you're a competitor and you see another competitor get rewarded with what you want. If that's motivation, we all get motivated by different things," Spurs coach Mitch Johnson said. "As a competitive person, that would be my approach and perspective."

San Antonio Spurs forward Victor Wembanyama celebrates after scoring a dunk during Game 1 of the Western Conference finals against the Oklahoma City Thunder on Monday in Oklahoma City. Wembanyama scored 41 points and pulled down 24 rebounds to lead the Spurs to an epic 122-115 double-overtime triumph. AP

Did it matter?

"I've still got a lot to learn," Wembanyama said. "And I want to get that trophy many times in my career."

Are you the best player?

"The world is eight billion people," Wembanyama said. "That's eight billion opinions."

Wembanyama's final line: 14 for 25 from the field, 12 for 13 from the foul line, and his lone 3-pointer came late in the first overtime, tying the game from well beyond the arc. Without that shot, there's probably no second overtime. There's probably a 1-0 series lead for Oklahoma City going into Game 2 on Wednesday night.

He blocked three shots and changed countless others. He dunked on the Thunder and flexed, more than once.

The Spurs outrebounded the Thunder 61-40. Wembanyama even smiled and posed for the cameras at times. This was his first conference finals game, on the road no less, and he was as comfortable as could be.

"I think he's a great player with high impact, obviously, and when you play against those players it's kind of an acquired thing," Thunder coach Mark Daigneault said. "You're learning as you go. We've gone through that with other great players."

This was a game that the Spurs were supposed to lose: underdogs, on the road, without injured point guard De'Aaron Fox, against the defending champion, a team unbeaten in the first two rounds of the playoffs. A 10-point lead in the fourth quarter was given away, and the Thunder isn't in the habit of losing leads in the final moments.

And none of that mattered, largely because of Wembanyama. The road to the NBA title now goes through San Antonio; if the Spurs win all their home games the rest of the way, they'll be NBA champions.

That's a long way off. But the Spurs aren't a rising team anymore, they're already here.

"The message would be that we, as a team, are ready to go into any environment, in any place, against anybody," Wembanyama said. "And even though we've still got a lot to learn, our effort should be over anybody else's. And tonight, we were relentless."

With the triumph at Oklahoma City's Paycom Center, the Spurs stole home-court advantage in the best-of-seven series that will send the winner to the NBA Finals.

Wembanyama admitted the sight of Thunder star Gilgeous-Alexander receiving his second straight MVP trophy before the game "for sure" made the clash more personal.

He was named Defensive Player of the Year, but finished third in the MVP voting announced on Sunday.

Rookie Dylan Harper, starting in place of the injured Fox, scored 24 points and snagged seven steals for San Antonio. Castle added 17 points and 11 assists as the Spurs extended their season dominance over the Thunder.

Oklahoma City, trying to become the first team to repeat as champion since Golden State in 2017 and 2018, piled up a league-best 64 regular-season wins, but dropped four of five contests against the Spurs — who won 62 regular-season games to return to the playoffs for the first time since 2019.

Gilgeous-Alexander was limited to 24 points after shaking off a sluggish start to spark the Thunder's rally from a 10-point fourth-quarter deficit.

Alex Caruso scored 31 points to lead the Thunder and Jalen Williams returned from a six-game injury absence to score 26.

Oklahoma City trailed by 10 in the fourth quarter, but the Thunder clawed back and it was knotted at 99-99 with 33.2 seconds left when Wembanyama spun in for a basket that put San Antonio up 101-99.

Gilgeous-Alexander then tied it up with a layup and Chet Holmgren blocked Wembanyama's potential game-winner at the buzzer.

SOCCER

Neymar gets the World Cup nod from Ancelotti

Santos' Neymar reacts during a Brazilian Championship match against Coritiba. AP

RIO DE JANEIRO — Neymar has been named in Brazil's squad for next month's World Cup, manager Carlo Ancelotti said on Monday, handing the forward a chance to return to international soccer's biggest stage after an injury-disrupted cycle.

The 34-year-old, Brazil's all-time leading scorer, comes back following a prolonged absence due to a series of injuries that have kept him out for much of the qualifying campaign, as the five-time champion pursues a record-extending sixth title.

As dozens of journalists gathered at Rio de Janeiro's Museum of Tomorrow for a ceremony featuring musical acts and celebrity guests, all eyes were on Ancelotti's decision whether or not to include Neymar in the squad.

The 66-year-old Italian, who took charge of Brazil's men's national team last year, had not previously called up the former Barcelona and Paris Saint-Germain player. He told reporters earlier this month that Neymar's inclusion would be based on fitness and form, not sentiment.

"We evaluated Neymar throughout the year and noticed that, recently, he has been playing consistently and has improved his physical condition," Ancelotti said at a news conference on Monday.

"He has the same role and responsibilities as everyone else, but he is an experienced player.

"It's true that in some positions we prioritized experience."

Neymar, who has 79 international goals, but has not featured for Brazil since 2023, has faced questions about his fitness and form following an injury-marred spell at Al Hilal and an underwhelming return to his boyhood club Santos last year.

The forward said on Sunday he was satisfied that he had done all he could to prove he was fully fit and deserved a place in the squad.

"Physically, I feel great. I've been improving with every game," he told reporters after Santos' 3-0 defeat to Coritiba.

The rest of Brazil's squad was largely retained from the qualifying campaign and recent friendlies, with the likes of Vinicius Junior, Raphinha, Matheus Cunha and Endrick shouldering the attacking duties alongside Neymar.

Real Madrid striker Rodrygo, defender Eder Militao and Chelsea winger Estevao were left out due to injuries. Chelsea forward Joao Pedro and midfielder Andrey Santos, who had been called up on previous occasions, also surprisingly missed the final squad.

"Some of the players who were with us this year won't be happy with this list. I'm sorry, and I want to thank everyone who was with us," Ancelotti said.

Brazil will open its World Cup campaign against Morocco on June 13 in New Jersey. It also faces Haiti and Scotland in Group C.

Flying Kiwis flock to support their team in a uniquely New Zealand way

WELLINGTON, New Zealand — They call themselves the Flying Kiwis, an eclectic group of New Zealanders from around the world who, whenever their national soccer team plays a major match, assemble to provide raucous and usually outnumbered support.

The deliberate irony: Kiwis — the eponymous bird from which New Zealanders take their nickname — are flightless.

Since 2009 the Flying Kiwis have followed the New Zealand men's team at home and overseas, and they'll be at the World Cup, offering a small island of loud, proud and distinctly Kiwi support.

Small beginnings

In 2009, New Zealand played Bahrain in a two-game qualifying series, with the winner advancing to the 2010 World Cup in South Africa. After the first leg in Bahrain ended in a 0-0 draw, New Zealand needed a win in the return match at home to qualify for the World Cup.

Matt Fejos, who was then a university student and, he admits, not a hardcore soccer fan, wanted to lend as much spirit as possible to the New Zealand team.

"So I got a credit card with a $1,000 limit and I bought 32 tickets for my mates and we wanted to do all we could, so we got banners, we got the coveralls saying 'Flying Kiwis' and we got New Zealand flags," Fejos said. "That was a pretty memorable moment for anyone who was there and for football to arrive in New Zealand a little bit."

Now those friends are spread around the world and have recruited other friends to the ranks of the Flying Kiwis.

"I had 10 years living in the UK, so, with the Confederations Cup in Russia in 2017, there were 30 of us who went to that, and it was kind of a special experience," Fejos said.

Russian supporters "organized a friendly game between our fans and their fans, and it brought in another kind of meaning for me: that you're doing it for your team, but actually in far away places you might be the first New Zealanders they've ever met, so you're kind of representing your country.

New Zealand's players celebrate scoring during a Confederations Cup game against Mexico in Sochi, Russia, in June 2017. AP

"To connect with the world through the global language of football is a beautiful thing and a beautiful way to travel."

Local culture

The Flying Kiwis had to find their way to their own brand of fandom. Soccer is not the major sport in New Zealand, where rugby holds sway. The soccer traditions that are firmly fixed in the culture of other countries don't exist at home, so Fejos and his friends have made their own.

The Flying Kiwis support section is usually small in number compared with the fan bases of New Zealand's opponents, but, Fejos said, "There's advantage to being so small — we can be really unified."

The New Zealand team will probably need all the support it can get at the World Cup. Ranked No 85 in the world, it is drawn in Group G against No 9 Belgium, No 21 Iran and No 29 Egypt.

"There's so much more belief (among the New Zealand team) because of where the players are playing," Fejos said of the foreign-based national team members.

"There's so many more playing at a top, top standard and in these difficult environments, these really charged atmospheres with crazy passionate fans. So they're used to playing under that pressure as well."

The mascot

The kiwi isn't the most intimidating of national symbols compared with other mascots, such as eagles or lions.

"Sometimes it can seem a bit funny or deprecating, but it's a thing that means a lot," Fejos said.

"The kiwi is a flightless bird, but when you consider the challenges that we face: we're so isolated, so far away from the world, the professional game is very young here, there are not many professional academies or opportunities.

"Despite that, I think it's incredible for some of those (New Zealand) players to play in some of the best leagues of the world, and to take (their talent) to the world at a World Cup."

Fejos said the "metaphor means a lot, defying expectations overseas".

"People think of us as a rugby country, and probably as hobbits, but that allows us to go in with that underdog mentality, fearless," he said.

"We want to stamp our mark and show them something different."

VISIONARY PATHWAY | JINJIANG EXPERIENCE

Jinjiang model still shaping China's growth

Balanced, comprehensive development path has turned city into an apparel powerhouse

By **XU WEI** and **HU MEIDONG** in Jinjiang, Fujian

More than 47 years ago, Hong Zhaoshe started a clothing business with little more than a wooden door panel for a workbench, a single sewing machine and less than 300 yuan ($44) to his name. Like many small workshop owners in China at the time, he cut, sewed and sold garments himself, often sleeping just two hours a day.

"I always believe that by offering genuine goods at fair prices and doing business with integrity, the market would eventually recognize us," Hong said.

Today, his hometown of Jinjiang — a coastal city in Fujian province — manufactures one-fifth of the world's athletic shoes, one-fifth of its jackets and one-eighth of its slippers.

The transformation from clusters of family-run workshops into a global manufacturing center was not simply the by-product of globalization or low-cost labor. It was also shaped by an economic philosophy that emerged at a defining moment for China's private sector.

In the late 1990s and early 2000s, as private businesses grappled with the uncertainties surrounding China's entry into the World Trade Organization in 2001, Xi Jinping — then serving in Fujian province — made seven extensive fact-finding visits to Jinjiang.

In 2002, Xi summarized and put forward the city's development model into what became known as the "Jinjiang Experience" — a framework emphasizing commitment to the real economy, market-oriented growth, industrial upgrading, entrepreneurial resilience and government support tailored to local conditions.

The framework held that sustainable growth depended not on speculative expansion, but on balancing traditional manufacturing with technological innovation, coordinating industrialization with urbanization, fostering both small businesses and major enterprises, and allowing government to guide — rather than replace — market forces.

More than two decades later, it remains influential as China seeks to steer its economy toward higher-quality growth. The country's 15th Five-Year Plan (2026-30) calls for further developing the "Jinjiang Experience" and improving the comprehensive support system for private-sector development.

Hong, the businessman, now chairman of Fujian Seven Brand Fashion Technology, recalls a moment that tested those ideas.

By 1998, his company had accumulated modest capital, but the global apparel industry was rapidly shifting toward automation and standardization. Convinced that low-cost, semi-manual production would eventually become obsolete, Hong made what was then an enormous gamble: He invested $7 million to import advanced suit-production lines from Western Europe and establish rigorous quality-control systems.

During that transition, Xi, then deputy Party secretary of Fujian province, visited the company's production lines. Hong still remembers the visit vividly, describing Xi's manner as pragmatic and understated as he inspected the new equipment.

"His modest, down-to-earth and approachable manner deeply moved and inspired us," Hong said.

Xi encouraged the company to continue innovating, strengthen its brand and pursue international recognition. For Hong, the remarks amounted to a vote of confidence at a moment of financial uncertainty.

The once-humble workshop built around a wooden door panel has since evolved into one of China's best-known menswear brands.

"Since taking up leadership positions in the early years of China's reform and opening-up, I have worked in Hebei, Fujian, Zhejiang and Shanghai before coming to the central leadership," Xi, now China's top leader, said during a meeting with private entrepreneurs in February last year. "Throughout those years, I have consistently placed great importance on supporting the healthy development of the private economy and the growth of private entrepreneurs."

Outbound investment regulation hailed

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's latest move to regulate outbound investment will bolster high-level opening-up, expand international investment cooperation and better safeguard the legitimate rights and interests of Chinese companies operating overseas, said market watchers and business leaders.

On Monday, a new regulation on outbound investment was unveiled by the State Council, China's Cabinet, which will take effect on July 1.

The regulation, consisting of 34 articles, comes at a time when the nation's outbound investment is continuing to grow, with Chinese companies expanding their presence in sectors ranging from manufacturing to green energy and digital technologies.

Data from the Ministry of Commerce showed that China's nonfinancial outbound direct investment increased 1.3 percent year-on-year to $145.66 billion in 2025, while in the first four months of this year, such investment across all industries totaled 429.42 billion yuan ($63.5 billion), up 3.9 percent year-on-year.

Experts said the regulation is expected to provide a clearer institutional framework for overseas investment against a backdrop of rising protectionism and geopolitical uncertainties. The new rule will also help improve investment quality, deepen international cooperation and promote mutual benefits, they added.

Wei Jianguo, former vice-minister of commerce, said the regulation signals China's determination to be an active participant in global economic integration despite mounting geopolitical challenges.

Liu Ying, a researcher at Renmin University of China's Chongyang Institute for Financial Studies in Beijing, said, "By promoting high-quality outbound investment and strengthening regulatory safeguards, China aims to offer greater certainty for long-term business planning, deepen economic ties with overseas markets and help anchor global growth amid a volatile external environment."

According to the regulation, China will continue to advance high-quality Belt and Road cooperation, strengthen bilateral and multilateral investment cooperation mechanisms and play a more active role in shaping international investment rules.

The regulation also establishes clear safeguards for national security and development interests. Investors cannot export or use goods, technologies, services and related data that are prohibited from being exported under Chinese law. In addition, the export or use of restricted goods, technologies, services and related data requires prior authorization from relevant authorities.

Lyu Yue, a professor of economics at the University of International Business and Economics in Beijing, said the regulation represents further refinement of China's outbound investment governance framework, and is aimed at helping companies pursue overseas opportunities while managing potential risks more effectively.

Xi Guohua, chairman of Chinese financial conglomerate CITIC Group Corp, said that clearer compliance requirements will help Chinese companies better identify sensitive sectors, avoid regulatory missteps and protect their long-term interests in overseas markets.

In a report released in late March, the Chinese Academy of International Trade and Economic Cooperation said the need for stronger safeguards for outbound investment has increased because, in recent years, some countries have stepped up investment reviews and regulatory scrutiny of foreign companies on "national security" grounds.

In response to these challenges, the regulation also authorizes countermeasures against discriminatory restrictions, arbitrary business disruptions and other practices that undermine the interests of Chinese investors abroad.

Sherri He, managing director for China of Kearney, a United States-based management consultancy, said that as global markets become more complex and consumer demands evolve faster, Chinese companies need stronger risk management and governance capabilities to support sustainable, high-quality global expansion.

WORLD WATCH
By Fred S. Teng

Africa needs partners in its pursuit of stability

Africa should not be treated as a problem to be managed, but should be respected as a continent of sovereign nations, ancient civilizations, young populations, vast resources, expanding markets and historic potential.

For too long, much of the outside world has spoken about Africa through the language of crisis. Conflict, poverty, debt, migration, disease, corruption and instability often dominate the headlines. These realities cannot be ignored. But they are not the whole story. Africa is also a continent of creativity, resilience, entrepreneurship, culture, energy, agriculture, minerals, digital innovation and human ambition.

The central question is not whether Africa matters, as Africa clearly does matter. The real question is whether the international community will support Africa's stability and development in a way that respects African agency, strengthens African capacity and advances long-term peace and prosperity.

The stability and development of African countries do not constitute only an African issue. They are a global issue. A stable and prosperous Africa contributes to food security, energy security, climate resilience, public health, maritime safety, migration management, peacekeeping, industrial development and a more balanced international order. An unstable Africa, by contrast, creates human suffering, regional insecurity and lost economic potential.

No country can develop without a basic level of stability. Roads cannot be built if communities are constantly displaced. Schools cannot function if children are fleeing violence. Agriculture cannot expand if farmers cannot safely cultivate land. Investment cannot grow if the legal and security environment is uncertain.

BUILDING BONDS ACROSS BORDERS, ONE STITCH AT A TIME

Shanghai market for custom-fit clothes draws visitors with keen craftsmanship, speedy service

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

A short video showing Tamara Vucic, wife of Serbian President Aleksandar Vucic, browsing for custom-fit clothes at Shanghai's South Bund Soft Spinning Material Market during their recent visit to China went viral on social media. But long before the high-profile guest turned the global spotlight on this market, it had cemented its position as a go-to sartorial destination among travelers from around the world.

Every day for nearly three decades, as rolling shutters creak open at 8:30 am, visitors from home and abroad line up at the market's entrance, many carrying large suitcases with ample room to take home custom-made clothes.

A tailor busy at work inside a shop at South Bund Soft Spinning Material Market in Shanghai last week. GAO ERQIANG / CHINA DAILY

"Many people make our market their first stop. Some come here even before they check into hotels," said Chen Xia, a second-generation tailor, who runs a shop owned by her in-laws, revealing a counterintuitive Shanghai tourism secret.

While many travelers flock to the Bund or Lujiazui's skyscrapers, a dedicated group heads straight to the three-story market located on Lujiabang Road in Huangpu district.

The market, which dates back to the 1990s, today boasts nearly 300 shops and sees over 1 million visitors annually. Foreigners account for 40 percent of these customers and contribute to 70 percent of the total sales, said Zhang Shengxiang, general manager of the market.

Confucius and Plato: the quest for modern relevance

Chinese scholars, overseas peers to attend world conference of classics in Athens

By **ZHAO XU**
zhaoxu@chinadaily.com.cn

In *The Odyssey*, Odysseus leaves Ithaca and journeys through a world of profoundly different city-states and cultures, encountering unfamiliar customs, political orders, and ways of life. The voyage becomes more than a long return home. By stepping beyond his own world, the wandering king gains the distance necessary to reflect upon it; travel becomes a form of learning, about others and self.

As Chinese scholars gather in Athens this year for the second World Conference of Classics, they will, in a sense, be embarking on a similar intellectual journey, said He Fangying, a classics professor closely involved in organizing the event, which was jointly initiated by China and Greece in 2024.

"The king, who 'saw the cities of many men and learned their mind' — to quote directly from Homer, is ultimately led to a single question: what is the best way to live? It is a question asked by our sages as well — one that has echoed across millennia and feels no less urgent today," she said.

Plato answered this question through the pursuit of justice, reason, and truth. Aristotle, meanwhile, saw the good life as one of human flourishing achieved through the cultivation of excellence and virtue, guided by practical wisdom and the "golden mean" — the balance between extremes in both personal conduct and civic life. For Chinese scholars, such ideas often resonate with the Confucian concept of "*zhongyong*" (Doctrine of the Mean), revealing striking echoes between the Greek and Chinese classical traditions in their shared search for moral and ethical order.

"The enduring influence of Homer's epics lies not simply in their antiquity, but in the fact that they helped shape the West's fundamental imagination of human nature, society, and political life," He said.

In 2017, He launched the first courses of ancient Greek and Latin for postgraduate students at the Institute of Foreign Literature, Chinese Academy of Social Sciences, one of the conference's co-hosts alongside China's Ministry of Education, Ministry of Culture and Tourism, Greece's Ministry of Culture, and the Academy of Athens.

Having translated Plato's dialogue *Lysis* from Greek, her own path into the field began in 2002, when she enrolled in an ancient Greek class taught by Liu Xiaofeng, the philosopher-turned-classicist widely regarded as a leading figure in the revival of classical studies in China.

"Chinese classical studies and the study of the Western classics should not be treated separately, for the historical challenges confronted by modern China emerged, in large part, from its encounter with the West," said Liu in a previous interview.

According to He, what her mentor sought was to engage the Western classics on equal terms — neither venerating them from afar nor reducing them to instruments for contemporary use — but as traditions to be read seriously and respectfully from within his own horizon of thought.

In 2002, Liu co-launched the academic series *Classics and Interpretation*, organized around three main branches — Western Tradition, Chinese Tradition, and the Classics and Interpretation Journal. Since then, the series has expanded to 800 volumes.

Drawing in part upon the Chinese exegetical tradition, which dates back to around the second century BC, when Confucianism was canonized as a guiding moral foundation of Chinese society, Liu championed a method of close reading grounded in fidelity to the original language and textual precision. Moving beyond purely technical or ideological debate, it sought instead to return to the enduring questions posed by ancient thinkers from Plato to Confucius.

In the spring of 2000, Wu Fei, then a Ph.D. student in anthropology at Harvard, met Liu during the latter's visiting sojourn there. "He had only recently turned toward classical studies," recalled Wu, now a philosophy professor at Peking University.

Among the thinkers who most profoundly influenced Liu was German-American political philosopher Leo Strauss, whose work helped revive the study of classical political thought in the twentieth century.

"Strauss believed that modernity had not abandoned the idea of 'natural right', but fundamentally altered its meaning. For classical philosophers such as Plato and Aristotle, natural right referred to what is naturally just or proper — an objective standard for justice, political order, and the good life. Modern thought, by contrast, increasingly recast it as individual rights grounded in self-preservation," said Wu. "Strauss argued that this shift gradually gave rise to historicism, in which values became products of historical circumstance; and to relativism and nihilism, where objective truth and moral order themselves appeared uncertain."

"Having witnessed the rise of Nazi Germany before emigrating to the United States, Strauss responded not by calling for a return to antiquity, but by urging a renewed engagement with the concerns of the classical tradition," said Wu, referring to this year's conference theme, "Dialogue between Ancient and Modern: Contemporary Inspirations of Classical Wisdom".

"The question of how classical studies may still speak to modern life is, before all else, a question of whether modern people still trust in the wisdom of the ancients," said Liu, whose philosophical writings Wu first encountered in the 1990s as a sociology undergraduate at Peking University before later pursuing philosophy there as well.

> "It is this union of institutional order and inner virtue that I see as especially distinctive within the Chinese classical tradition."
>
> **Wu Fei,** philosophy professor at Peking University

"Those books were attempts to diagnose the spiritual and social tensions of the modern world, and it was precisely through that process that he was ultimately led to look further back," said Wu, who sees himself as having undergone a similar journey. His study of contemporary funerary practices in rural China gradually drew him into the world of traditional Confucian commentary centered on ritual, kinship, and moral cultivation, while also revealing the central role family played in both personal and political life across the ancient Chinese and Greco-Roman worlds.

Having translated into Chinese such works as Augustine's *City of God* — written in the aftermath of the Sack of Rome as the classical Roman world gave way to the Christian Middle Ages — and Plato's *The Apology of Socrates*, Wu is acutely aware of the layers of interpretation that have accumulated around classical Greco-Roman texts over centuries of Christian theology and modern Western thought.

"For Chinese scholars, the task is therefore not only to examine these established readings, but also to gradually peel back those layers in order to recover the original forms of thought beneath them," said Wu, who is the director of the Center for Nomos Studies at Peking University.

"The original Chinese concept is *li*, which can be understood on three levels. At its most basic, it refers to ritual or ceremony, something found in every civilization. More deeply, it extends to institutions and the normative ordering of political and social life. But *li* also carries an inward moral dimension: as Chinese philosopher Mencius suggested, human beings possess an innate ethical capacity that must be cultivated. It is this union of institutional order and inner virtue that I see as especially distinctive within the Chinese classical tradition," Wu said.

"I chose the ancient Greek word *nomos* because I believe it captures one of those striking moments of convergence in human thought. *Nomoi* — the title of Plato's final work, usually translated as *The Laws* — signifies more than law in the narrow legal sense; it also encompasses ritual, custom and normative order."

Reflecting on an intellectual life that has straddled the dual worlds of Western and Chinese classical studies, Wu said: "True immersion requires a degree of intellectual and moral identification, because classical studies are ultimately concerned not only with knowledge, but with the cultivation of character and the transformation of one's inner disposition."

In the 2024 volume of *In the Mind, in the Body, in the World*, scholars of early China and ancient Greece investigate how emotions were understood in philosophy, medicine, and literature from approximately the 5th century BC to the 2nd century AD. Topics covered range from equanimity in Taoism and Stoicism, to therapies of emotion in Greco-Roman and Chinese medicine, to the social function of contempt in Greek literature and Confucian thought.

Myrto Garani, a professor of Latin literature at the National and Kapodistrian University of Athens, spent three weeks teaching in Beijing last summer under a collaborative program between her university and the Center of Ancient Greek and Chinese Civilization in Athens, opened last year as China's first overseas high-level research center dedicated to classical studies.

Garani said that the Chinese scholars she was in touch with impressed her by "the seriousness of their scholarship, the strong philological training and the openness to comparative and interdisciplinary approaches", while her Chinese students stood out for "their critical perspectives, respect, and remarkable devotion".

"What I found particularly meaningful was the combination of academic professionalism with genuine human warmth," said Garani, who believes that "intercultural approaches in a global academic context demonstrate that the classics are not the exclusive inheritance of a single cultural world."

Last autumn, Wu traveled to Greece for the first time. Visiting Piraeus, the historic port of Athens, he found his mind returning to the opening line of Plato's *The Republic*: "I went down yesterday to the Piraeus with Glaucon the son of Ariston".

"The sight of Chinese cargo vessels," Wu said, "made me think about how civilizations continue to encounter one another across the same seas, and through memory, texts, and the lasting human search for meaning."

Both Wu and He will be among nearly 100 Chinese scholars attending this year's conference in Athens, scheduled for June 9 and 10.

"This is the first time Chinese classicists have appeared collectively in Athens, the cradle of the Western classical world," said He.

"For much of Chinese history, the study of canonical texts stood at the center of intellectual life. Deeply embedded within China's civilizational consciousness, this reverence for the wisdom of the past had persistently drawn generations of Chinese scholars toward classical studies — whether of their own tradition or others — as a way of engaging the foundational inheritances of the world's great civilizations: Greek, Chinese, Mesopotamian, Indian, and beyond."

One of them He had in mind was Luo Niansheng (1904–1990), who, having studied in Athens in the early 1930s, returned to China and devoted the rest of his life to translating the ancient Greek world into Chinese.

In 1986, a production of *Oedipus Rex* by Beijing's Central Academy of Drama was invited to the International Ancient Greek Drama Festival in Delphi and later performed in Athens. Luo, who first translated the play in 1935 while working with a Chinese archaeological team in northern China, attended as head of the Chinese delegation and later wrote an essay titled "Returning to Greece". A year later, the Academy of Athens awarded him its Highest Prize for Literature and Art.

When Luo died in 1990, his unfinished translation of Homer's *Iliad*, completed only halfway, was carried forward by another Chinese scholar, Wang Huansheng, who first learned ancient Greek through Russian in the former Soviet Union in the 1960s before completing Chinese translations of both *The Iliad* and *The Odyssey*.

These days, He has joined Wang in sustaining the interpretation and study of Homer's epics, continuing across three generations a distinctly Chinese intellectual journey into the heart of the ancient Greek world.

In *The Odyssey*, Odysseus descends into the underworld to seek guidance from the prophet Tiresias on his journey home. There he encounters Achilles, the greatest hero of *The Iliad*, who confesses that "I'd rather slave on earth for another man ... than rule down here over all the breathless dead".

"Achilles is defined by glory and remembrance, Odysseus by endurance and return. Both represent the highest ideals of life held by ancient Greeks, and yet Homer seems to have given his final word to Odysseus," said He.

Two centuries after the composition of *The Odyssey*, Confucius was born in the mid-sixth century BC. Like Odysseus, who spent two decades away from Ithaca, Confucius traveled for 14 years among the competing states of his age, not by force of circumstance but by conscious choice.

If the Greek tradition often framed travel as a heroic encounter with difference, the Confucian tradition understood it as ethical and political learning, the search for moral order and wise governance. Yet both suggest that a culture comes to know itself more deeply through encountering another.

In *The Analects*, compiled by later generations after the death of Confucius, the sage once asks his disciples about the way of living they aspire. While the others speak of governing states and achieving distinction, the disciple Zeng Dian offers a quieter vision, one attuned to both nature and the self: in the warmth of late spring, to bathe in the river, stroll in the breeze, and return home singing.

Confucius responds simply: "I am with Dian."

Services seen as new growth driver in trade

Tech advantages well placed to turn into new competitive edge in global value chains

By **WANG KEJU**
wangkeju@chinadaily.com.cn

As part of a broader effort to optimize the nation's trade structure, China's foreign trade is gaining fresh momentum, with services emerging as a new driver of growth, supported by a steady rise in exports of knowledge-intensive services and a surge in inbound tourism, experts said.

Their comments came on the heels of recent data showing that China's services trade deficit shrank in April to its smallest monthly level in over a year.

The deficit in services trade fell to $14.8 billion in April, down nearly 40 percent from $24.3 billion in March, according to data from the State Administration of Foreign Exchange. It was the narrowest monthly gap since December 2024.

China is doubling down on services exports, with policymakers having embedded "encouraging and supporting services exports" into the Government Work Report as a key task for this year.

China's services trade has run a persistent deficit for years, due to the country's relative weakness in exporting high-value services, said Zhao Jinping, vice-president of the China Association of Trade in Services.

But the gap is now closing at an accelerating pace, a shift that Zhao said points to "a huge improvement" in the quality of China's services sector supply.

Exports of telecommunications, computer and information services, which covers cloud computing, software development and data processing, have expanded rapidly. The surplus in this category widened to $5.5 billion in April, from $3.1 billion in March, data from the administration showed.

"As the global economy accelerates its digital transformation, China's technological advantages and digital application capabilities are well positioned to translate into a new competitive advantage in global value chains," said Zhu Caihua, a professor at the University of International Business and Economics.

Zhu also noted that China is negotiating or updating free trade agreements with multiple economies to push services and digital trade higher up the agenda.

Beyond knowledge-intensive exports, the travel services balance improved as inbound tourism rebounded, boosted by China's expanded visa-free policy covering 50 countries, and a 240-hour visa-free transit policy for travelers from 55 countries at 65 ports.

Cross-border trips made by foreign nationals increased 26.4 percent year-on-year in 2025 to more than 82 million, according to the National Immigration Administration.

The momentum has continued into 2026. China's travel service exports surged 32.3 percent year-on-year to 105.35 billion yuan ($14.6 billion) in the first quarter of 2026, the fastest growth among all service export categories, data from the Ministry of Commerce showed.

As countries around the world compete to attract travelers, China has emerged as a rising hot spot for global tourists, and policymakers are seizing the moment with a fresh wave of measures designed to facilitate every step of the journey, said Jiang Zhao, an associate researcher at the Chinese Academy of International Trade and Economic Cooperation.

The government has also streamlined departure tax refunds and improved payment systems, making it easier for overseas tourists to spend in China.

The number of international travelers processing departure tax refunds in China tripled to 270,000 last year, and the value of those refunds for the year alone roughly equaled the cumulative total of the previous decade, according to the Ministry of Commerce.

Travel services are not just an end in themselves, Jiang said, highlighting the inbound tourism push as a testing ground for deeper opening-up in finance, education, healthcare and other relevant services.

Medical outreach

International conference on classics set for Athens

By **CHEN JIE**
chenjie@chinadaily.com.cn

The Chinese Academy of Social Sciences announced on Monday that the second World Conference of Classics will be held on June 9 and 10 at the century-old Academy of Athens in Greece.

Under the theme "Dialogue between Ancient and Modern: Contemporary Inspirations from Classical Wisdom", the conference will explore the relevance of classical studies in today's world, the CASS announced at a news conference in Beijing on Monday.

Participants will examine how the enduring insights of classical wisdom can be reinterpreted to address contemporary challenges, inspire innovation and contribute to the progress of human society and civilization.

The event is jointly organized by the CASS, the Ministry of Education, the Ministry of Culture and Tourism, the Greek Ministry of Culture and the Academy of Athens. Around 200 scholars and experts in classical studies, civilization, culture, archaeology and related fields from 20 countries will attend.

Yue Yunxia, deputy director of the CASS Bureau of International Cooperation, said, "Through dialogue and scholarly exchange, attendees will discuss key issues related to classical civilizations and their contemporary significance, fostering greater understanding and consensus in the study of classical world civilizations."

The program will include an opening ceremony and a plenary session on the morning of June 9 and four parallel subforums running through the afternoon of June 9 and throughout June 10, followed by the closing ceremony that evening.

The four subforums will focus on "Virtue and Paideia: A Modern Interpretation of Classical Education"; "Friendship and Community: The Ethical Community in the Transition from Ancient to Modern Times"; "Peace and Order: Civilizational Solutions to the Shifting Global Landscape"; and "Technology and Civilization: Humanism in the Age of Digital Intelligence."

"Classical studies are not only about ancient thoughts that merit specialized research, but should also involve placing ancient wisdom within the context of contemporary global concerns," said Liu Zuokui, director of the CASS Institute of World History, which will host the "Peace and Order: Civilizational Solutions to the Shifting Global Landscape" subforum.

"This includes discussing how classical traditions can address current issues such as war and peace, power and justice, order and freedom, and the clash and mutual learning of civilizations," Liu added.

Li Guoqiang, deputy director of the CASS' Chinese Academy of History, which will host the subforum "Technology and Civilization: Humanism in the Age of Digital Intelligence", said: "Today, artificial intelligence and big data algorithms are deeply integrated into all aspects of our life, profoundly changing the way society operates."

"Therefore, our forum starts from the perspective of classical studies, linking technological transformations throughout history with the evolution of humanity, and connecting classical wisdom with contemporary humanistic spirit. We aim to use the classical humanistic spirit to respond to modern technological challenges, exploring the convergence between instrumental rationality and humanistic values."

The conference will release a joint initiative highlighting the role of classical wisdom in addressing global challenges, along with a new international visiting scholar program launched by the Chinese School of Classical Studies at Athens.

During the conference, an exhibition titled *Bringing Classics into the Modern World* will showcase classical texts and research publications from China and elsewhere, representative works of traditional Chinese art, achievements in archaeological science and cultural heritage preservation, and interactive experiences featuring intelligent technologies. Visitors will also be able to engage with traditional Chinese medicine through a range of immersive displays and activities.

Jinjiang: Establishing brand identity emphasized

From page 1

Li Ling, vice-president of Anta Group, said the company's rise into a global sportswear giant closely followed the direction laid out by Xi.

Li sees Anta's trajectory as reflecting a broader push for Chinese manufacturers to build globally competitive brands rather than remain anonymous contract producers.

When Anta was founded in 1991, Jinjiang's footwear industry was trapped in intense price competition, producing largely generic products. During a visit to the Jinjiang Footwear & Sports Industry International Exposition in 2001, Xi stopped at Anta's booth and urged the company to prioritize product quality and establish its own brand identity.

In 2019, during the annual session of the National People's Congress, and again at a symposium in 2024, Xi reiterated the same message to the company: Remain fully focused on the core business.

Guided by that philosophy, Anta spent more than three decades transforming itself from a local manufacturer into a global sportswear company — proof that industrial resilience is built through long-term accumulation rather than speculative capital.

Liao Meng, an associate research fellow at the Fujian Academy of Social Sciences, said the focus on the real economy did not emerge in isolation. "It also required close coordination between private enterprises and government support," Liao said.

He contends that the "Jinjiang Experience" remains relevant because it links industrial growth with broader social development, ensuring that the wealth generated by manufacturing translates into stronger infrastructure, narrower urban-rural gaps and more tangible prosperity for local residents.

The next stage of Jinjiang's industrial transformation is already underway.

Zhang Zhenxian, general manager of Fujian Yuanlyu Energy-Saving Technology, confronted a mounting environmental challenge in Neikeng township, China's largest slipper-manufacturing hub.

The town's factories, which produce one-eighth of the world's slippers each year, consume roughly 2 million metric tons of EVA material — a versatile copolymer known for its lightweight, durable and soft qualities — each year, generating about 100,000 tons of industrial scrap historically destined for landfills or incinerators.

Recognizing an opening, Zhang launched an effort to build a closed-loop recycling system for EVA footwear materials.

The company invested 30 million yuan in its first development phase without any mature blueprint to follow or industry benchmark to emulate.

Zhang recalls suffering from severe insomnia, waking up multiple times each night worried that the company was pouring money into unusable recycled waste.

Yet the company persisted, driven in part by Jinjiang's long-standing culture of turning improbable ideas into viable industries. Today, it has signed closed-loop recycling agreements with 200 local enterprises.

What distinguishes Jinjiang today is not simply manufacturing scale, but industrial density — a tightly connected ecosystem in which raw materials, design, production and logistics operate within minutes of one another. For overseas buyers and industry groups, that concentration has turned the city into a global reference point.

"Jinjiang is probably No 1 in the world in sports shoe manufacturing," said Berke Icten, president of the Turkish Footwear Manufacturers Association, during a recent visit to the city.

What impressed him most, he said, was not only the scale of production, but the completeness of the supply chain.

"From materials to design to finished products, you can find everything here," he said, pointing to the city's sprawling materials markets and tightly clustered factories.

Ahmed Fawad Farooq, secretary-general of the Pakistan Footwear Manufacturers Association, described Jinjiang as one of the world's leading footwear exhibition platforms, particularly in athletic shoes.

Visiting the city for the second time with a delegation of about 15 industrialists, Farooq said that Jinjiang has become an important destination for sourcing raw materials, identifying fashion trends and studying emerging technologies.

"We come here to see new innovation and new technology," he said.

Market: Reputation has extended to global events

From page 1

Zhang added that for some shops, foreigners make up more than 60 percent of the clientele.

Consistently ranking in the top two on TripAdvisor's list of must-see places in Shanghai, the market is frequently featured in foreign travel guides and has even become a "secret itinerary" for visiting dignitaries and celebrities.

Pran Patel, a pilot from the United States, said he is a regular at the market, "because Mr Rong is always right". Referring to the owner of Shop No 144, he said: "Mr Rong does a very good job with the quality of my suits, shirts, trousers and jackets. And I have all my friends come here all the time."

Zhang, the general manager, said that one of the unique selling points of the market is making custom-fit clothes within 24 hours.

"Order today, pick up tomorrow — this kind of service is almost unheard of anywhere else in the world. If one foreigner in a business group or tour knows this place, that person will bring everyone here," he said, noting that 95 percent of the shops focus on tailoring clothes in both Western and Chinese styles, rather than just selling materials.

In addition to tailored clothes, one can order custom-made curtains, bedding and leather goods, including shoes, at the market and expect speedy service.

Jan Schutte, a German professor at the Shanghai Theatre Academy, has been a customer at Jenny's Shop in the market for more than four years. "Jenny has made suits for my daughter, dresses for my wife, and shirts, jackets and suits for me. Every time friends come to Shanghai, this is the first place I recommend," Schutte said.

The reputation of the fabric market has reached global events. According to Zhang, F1 Chinese Grand Prix teams, Shanghai Masters snooker tour referees and NBA China Games players all order their custom wear here.

Tailoring a suit of the same quality costs at least 5,000 yuan ($739) abroad, but here, the price starts at 1,000 yuan, Zhang said, adding that "unbeatable value" is only a part of the story, because what drives customer loyalty is the remarkable craftsmanship.

Chen, the shop owner, said that businesses here are built on reputation and skills. "We offer customized services. From fabric selection and measurement guides to fitting trials and final delivery — everything is done by hand," she said.

Dai Meixiang, who has been running a *qipao* shop for more than 20 years, started designing and making traditional Chinese clothes at the age of 18. "We create custom patterns for every customer. While costs are higher, we keep the profits low for the benefit of our customers, maintaining an excellent reputation."

While the market offers both Chinese and imported materials, most foreigners choose the former.

Brazilian fashion designer Elisa Lima, who visits the market every year, said that more than the affordable price for quality materials, she values the experience.

"The tailors can tell what kind of fabric will be perfect for Brazilian summer, or what will be comfortable for travel in general," Lima said, adding that the materials and the clothes also make good souvenirs.

Zhang, the general manager, said that many foreigners request Chinese elements in their custom orders, as "a touch of Chinese style makes their clothes stand out".

Schutte, the German professor, is one of them. He recently ordered a 2,000-yuan suit jacket, and said he was "most satisfied" with the Chinese-style lining.

Dai, the *qipao* shop owner, noted a significant rise in her foreign clients from countries such as Singapore, Malaysia, France and the US. She said she continuously adapts to foreign customers' aesthetic requirements, adjusting designs to suit different body types and incorporating fashionable elements and even bold European-style details.

Zhang said that clothes gain added value through culture, because "without culture, they are just fabric". The market has been Shanghai's calling card for 20 years, he said, adding that he hopes to enhance amenities to further elevate customer experience.

Expanded healthcare access in Xizang

Medical outreach efforts are enhancing disease prevention and public care across the region

By YUAN SHENGGAO

From above: In a village in Chonggyai county, doctors answer residents' questions regarding their checkup results. Monks in Xizang take part in a health checkup.
PHOTOS BY PALDEN NYIMA / CHINA DAILY

On a crisp April morning, villagers, monks and nuns in Namling county in the Xizang autonomous region gathered at the village activity center for the annual health checkup, an event symbolizing community care and well-being.

At an altitude of 4,100 meters, members of a mobile medical team conducted a range of services, including blood pressure readings, ultrasounds and screenings for chronic diseases.

Since 2013, Xizang has prioritized free health checkups as part of its broader efforts to improve public healthcare. Initially supported by an annual subsidy of 100 yuan ($14) per person, the program has completed 22.41 million checkups to date, achieving near-universal coverage, according to the Xizang Health Commission.

By 2025, the subsidy for health checkups in the autonomous region had risen to 164 yuan per person, alongside additional investments in mobile diagnostic vehicles and clinic upgrades targeting remote areas. For seniors aged 65 and above, the subsidy had reached 200 yuan per person annually.

The initiative emphasizes early disease detection and prevention, with screenings focused on conditions like hypertension, diabetes and altitude-related illnesses. Tailored programs for the elderly, women and children are reducing maternal mortality and improving long-term disease management.

Monasteries have also benefited from these efforts. For monks like Phurbu from the local Dragkar Monastery, regular health checkups have significantly improved their well-being.

"Regular screenings allowed me to detect and treat hypertension early," Phurbu said. "With medication prescribed by doctors, the disease is now under control."

Mobile health checkups

Given Xizang's vast territory and sparse population, mobile health checkup services have played an irreplaceable role in disease prevention, control and public health management.

The initiative allows residents, especially farmers and herders in remote rural areas, to access convenient, high-quality and one-stop healthcare services.

One recent example was a health checkup initiative offered by the Lhundrub County People's Hospital in Gyangyo village in late April.

When the mobile checkup vehicles arrived in the early morning, residents lined up in the public square in front of the village's administrative office under the guidance of community officials.

The checkup covered 45 villagers aged between 40 and 83. "This is especially beneficial for seniors and people with physical difficulties, who no longer need to travel long distances to the county hospital," said a community official.

The mobile vehicles were equipped with devices including an X-ray imaging system and ultrasonic scanning equipment, enabling multiple basic examinations.

The health checkup, lasting several hours till noon, led to the diagnosis of such diseases as cataracts, fatty liver disease, hypertension, gallstones, renal atrophy and hepatic hemangioma.

After the examinations, doctors from the Lhundrub County People's Hospital analyzed the results and provided treatment suggestions to villagers with abnormal findings.

Villager Yangzom Drolkar said she was amazed by how efficient the mobile checkup service was. "They brought so much advanced equipment here to our village," she said. "I'm happy to have such a thorough checkup right at our doorsteps."

"*Tashi Delek, Tashi Delek!*" Yangzom Drolkar repeatedly told the doctors. *Tashi Delek* is a Tibetan greeting expressing good wishes.

One morning in February, residents in Midong village, Sangri county, were concerned after an unexpected heavy snow arrived on the day a mobile health checkup organized by the Sangri County Central Hospital had been scheduled.

Located at an altitude of about 4,500 meters, the village faced serious challenges from the snow, which complicated travel for doctors and the transportation of medical equipment, according to a village official.

"We would rather have the checkup canceled for the safety of our doctors," the official said.

But to their surprise, the convoy carrying medics and equipment arrived safely and on time.

With the help of village officials, a temporary checkup facility was immediately set up in the village administrative office.

The checkup focused on screening altitude-related diseases, including ultrasonic scans of liver, gallbladder, pancreas and spleen; chest X-ray; and blood tests related to anemia, liver and gallbladder functions, and blood glucose levels.

After the examinations, the medics held a meeting with villagers, answering questions about the results and offering advice on health management.

Villagers were informed that hypertension patients should take medication in the morning and that both physical exercise and a healthy diet are important for blood sugar control.

At the end of the meeting, the medics distributed manuals on disease prevention and control.

"The manual was written in plain language, avoiding complicated terms," a local resident said. "It's something we can easily understand."

Tseten Phuntso, a medic from Sangri County Central Hospital, said that beyond providing health checkups for residents, the initiative had a broader goal for public health research and management.

"An important part of the mobile health checkup mission is collecting data from the majority of our residents to establish a countywide database," Tseten Phuntso said.

He added that local healthcare authorities can then analyze the data and adjust public healthcare strategies accordingly.

"Health checkups are playing an increasingly important role in disease prevention and control," Tseten Phuntso said. "The practice allows us to detect and diagnose diseases earlier, which is crucial for the patients' treatment and recovery."

All-around progress

Mobile health checkups are among the key measures aimed at strengthening public health management and improving universal healthcare services for residents.

Over the six decades since the founding of the Xizang autonomous region in 1965, Xizang has achieved historic progress across the healthcare sector, said Tan Xiangdong, deputy chief of the Xizang Health Commission, at a news conference in September 2025.

The official said Xizang has established a public health service system featuring expanded coverage and steady development over the past 60 years.

Citing statistics, Tan said the number of medical institutions, including hospitals and clinics, rose to 7,231 in 2025 from 193 in 1965, marking a 37-fold increase.

The number of healthcare workers in Xizang grew from 2,422 in 1965 to about 32,000 in 2025, while the number of beds in local medical institutions increased from 1,631 to 21,488.

To date, the autonomous region has achieved the full coverage of comprehensive medical institutions in all its cities, counties and districts.

In addition, through remote diagnosis technologies, every township in Xizang can access high-quality medical service resources provided by such renowned institutions as the Xizang Autonomous Region Institute of Tibetan Medicine, and the Lhasa branches of the famed West China Hospital and the West China Second University Hospital.

Over the past six decades, the autonomous region has also seen substantial improvements in public health management.

According to Tan, Xizang was home to 82 disease prevention and control centers at different administrative levels by 2025, covering all the cities, counties and districts in the autonomous region.

The public health management system highlights such fields as contagious disease monitoring, vaccination planning and services.

Vaccination rates for various diseases among children, for instance, have remained above 90 percent in recent years.

"Thanks to the public health management system, Xizang eliminated diseases such as smallpox, poliomyelitis and diphtheria, while effectively controlling illnesses including plague, tuberculosis and echinococcosis," Tan said.

The official added that great achievements have also been made in preventing and treating altitude-related diseases such as Kashin-Beck disease and iodine deficiency disorders.

Tan said the progress in public health management has led to substantial improvement in residents' health.

"The average life expectancy of Xizang residents now stands at about 72.5 years, increasing more than 100 percent from the early 1950s when peaceful liberation took place," Tan said.

A wide-covering, government-sponsored healthcare insurance system has also played an important role in improving residents' health conditions.

Xizang was among the pioneers in China that established a unified basic medical insurance system covering both urban and rural residents. Today, the system covers more than 95 percent of the population in the autonomous region.

Yangzom, an 89-year-old resident of Lhasa, the capital city of Xizang, said she is very happy to see the substantial increase in life expectancy in her neighborhood.

"Several decades ago, it was impossible to imagine one could live to the age of 80," she said. "And now I have a four-generation family."

She attributed the longer life expectancy among residents to the improved medical care conditions and an effective healthcare insurance system.

"I was hospitalized last year because of a kind of lung disease, which in the past could have been fatal for old people like me," Yangzom said. "The treatment was successful. It's fortunate that we have good hospitals and doctors today."

She added that most of the treatment costs were covered by the government-sponsored healthcare insurance. "I only paid a small portion of the expenses, about 1,000 yuan," she said.

Training of professionals

Tan also said that the improving quality of Xizang's medical professionals has contributed to the steady and sustainable growth of the local healthcare sector.

He said Xizang has developed a strong healthcare workforce through local higher education programs, assistance from other regions of the country and professional training initiatives.

Xizang University, for instance, has recently launched a training program for rural areas and now trains hundreds of professionals each year.

Medical institutions from other parts of the country have carried out eight missions for paired assistance in recent years, covering 13 counties in the autonomous region.

The official said the worldwide recognition of local Tibetan medicine sciences remains a source of pride for him and his colleagues.

With a history spanning over 2,000 years, Tibetan medicine is a unique and comprehensive medical system deeply rooted in the culture of the Tibetan Plateau.

At the heart of this ancient practice lie the *Four Treatises of Tibetan Medicine*, a set of classic texts that serves as the cornerstone for Tibetan medical theory and practice. This piece of work was inscribed on the UNESCO Memory of the World International Register in 2023.

In 2018, the Tibetan Lum medicinal bathing of *Sowa Rigpa*, a traditional body of knowledge related to health maintenance and disease prevention among Tibetan communities, was inscribed on the UNESCO Representative List of the Intangible Cultural Heritage of Humanity.

After the autonomous region has held a number of international conferences and forums, the traditional medicine sciences of Xizang are now better known in the world, especially in countries including Nepal and Mongolia, according to Tan.

Looking ahead, Tan said Xizang will continue deepening reform in the healthcare sector and drive the development of the Health Xizang initiative, offering more equitable, accessible and higher-quality universal medical services for residents.

China warns against Japan's remilitarization

By JI HAISHENG
jihaisheng@chinadaily.com.cn

China accused Japan's defense minister on Monday of spreading baseless claims and sowing confusion, urging the international community to stay on high alert to prevent and suppress the rise of Japanese neomilitarism.

Foreign Ministry spokesman Lin Jian made the statement at a daily news briefing in Beijing, after Japanese Defense Minister Shinjiro Koizumi recently pledged to keep strengthening the military and rejected Japan being labeled a neomilitarist country at a Singapore forum.

Lin said Koizumi's remarks were totally groundless given historical facts, legal grounds and figures on the matter, adding that such a stance makes it impossible for Japan to earn the trust of its Asian neighbors and the international community.

Japanese militarists committed horrendous crimes in World War II and inflicted untold suffering to its Asian neighbors and Allied nations, Lin said.

To prevent the revival of Japanese militarism, a series of instruments with legal effect under international law — including the Cairo Declaration and the Potsdam Proclamation — clearly require Japan to be "completely disarmed" and not to maintain such industries as "would enable her to re-arm for war", he said.

Despite such restrictions, Japan's latest defense budget has exceeded 9 trillion yen ($56 billion), hitting a record high for 14 consecutive years, he added.

Citing more figures signaling Japan's expanding military buildup, Lin said Tokyo's total defense expenditure has surged to 2 percent of its GDP with plans to further increase it to 3.5 percent, while military orders from the Defense Ministry have tripled over the past five years.

Since the current administration came to power in October, it has been accelerating the deployment of intermediate and long-range missiles, easing the export restrictions of lethal weapons, and promoting the revision of its Constitution and three key security documents, he said.

These actions are seen as attempts to further breach the international and domestic laws and challenge the postwar international order, he added.

Regarding Japan's deepened military engagement with NATO, Lin said Japan has been pursuing remilitarization at full throttle, engaging in frequent interactions with a military organization from outside the region, expanding the scope of activities of its Self-Defense Forces, and building a combat-ready operational system.

"This is Japan trying to break free from the constraints of its Constitution, domestic and international laws, and its 'exclusively defense-oriented' principle," he said.

Japan portrays itself as a "peace-loving country", but its actions move in the very opposite direction, he added.

German voters expect more far-right success

By JULIAN SHEA in London
julian@mail.chinadailyuk.com

An opinion poll conducted for German weekly newspaper Bild am Sonntag shows the vast majority of people questioned think it is a formality that the far-right Alternative for Germany party, or AfD, will secure power in at least one of the three state elections taking place in the fall.

Since reunification in 1990, Germany has been consisting of 16 federal states, and three of those have elections later this year.

The AfD was launched in early 2013, initially as a party that opposed economic bailouts in the eurozone area, but has grown rapidly and taken an increasingly hard line on other issues, most notably immigration, and also state handling of the COVID-19 pandemic.

In the February 2025 elections to the country's 630-seat federal Parliament, the AfD ended up with 20.8 percent of the vote and 150 seats, making it the second-largest party.

However, the center-right Christian Democratic Union/Christian Social Union opted to form a coalition with the center-left Social Democrats, rather than break the unspoken policy of noncooperation with the AfD.

In September, voters in the states of Saxony-Anhalt, Mecklenburg-Vorpommern and Berlin go to the polls, and it is widely expected that the AfD will make significant gains, and take power in at least one state.

Of those questioned, 69 percent said they expected it to win in at least one of the three states, and 28 percent expected it in more than one, with only 16 percent saying they did not expect the AfD to win any of the three states.

For many years, the AfD presented itself as being politically in step with United States President Donald Trump's Make America Great Again movement, but it has distanced itself from this during the ongoing war in Iran.

Targeting sentiment

The Financial Times reported that the party has targeted anti-US sentiment in eastern Germany to bolster its local election chances.

"In eastern Germany, there are many voter groups who tend to favor a more skeptical stance toward America," Uwe Jun, a professor of political science at Trier University in Trier, Germany, told the FT.

"That criticism of US politics goes down very well with these voter groups," he said.

Rising fuel prices linked to the war, and their contribution to the cost-of-living crisis, have further encouraged a growth in AfD support among what might not be its natural demographic.

"Certain barriers are breaking down", said Ursula Munch, a political scientist and director of the Academy for Political Education in Tutzing, Bavaria, including in "middle-class circles, where support for the AfD used to be frowned upon".

Iran, US trade strikes as negotiations falter

Kuwait comes under fire while nuclear talks remain deadlocked amid mistrust

DUBAI/TEHRAN — Iran and the United States traded strikes on Monday and each accused the other of acting aggressively, as diplomatic efforts to end three months of war drag on.

Weeks of indirect talks marked by stark threats and several waves of airstrikes have so far failed to agree on an end to the war or the reopening of the Strait of Hormuz, the key shipping channel for Gulf oil and gas.

The US military said it had over the weekend struck Iranian air defenses, a ground control station and two drones that were threatening ships after "aggressive Iranian actions", including the downing of a US drone over international waters.

Iran's Islamic Revolutionary Guard Corps said on Monday that it had targeted an air base used by the US in response to an attack on southern Iran.

It did not identify the base, but Kuwait activated air defenses on Monday and denounced Iranian missile and drone attacks, which it said were undermining efforts to reduce tensions in the region.

Kuwait's Foreign Ministry said the alleged attacks constituted a "direct assault" on the country's security and represented a "blatant violation" of international law.

The ministry affirmed Kuwait's "full right to take all necessary measures" to preserve its security and defend its territory, holding Iran fully responsible for the alleged attacks.

Oil prices, which have risen sharply since the start of the war, gained more than 3 percent on Monday after the strikes.

The US and Iran have sporadically exchanged strikes since a ceasefire took effect in early April, while Pakistan has been mediating efforts to secure a more durable agreement. An exchange of strikes on Thursday was described in similar terms by each side.

The war launched by the US and Israel on Feb 28 has killed thousands of people, mainly in Iran and Lebanon. It has also caused global economic pain by pushing up energy prices, as the Strait of Hormuz, a vital global oil and liquefied natural gas supply route, has been effectively closed.

In a late-night social media post, US President Donald Trump did not mention the exchange of hostilities, repeating his assertion that Iran "really wants to make a deal".

He berated critics, including what he described as "seemingly unpatriotic Republicans", for negative "chirping" about negotiations to end the conflict.

"Just sit back and relax, it will all work out well in the end — It always does!" he said.

Shifting stance

Despite Trump's remarks, Iranian Foreign Ministry spokesman Esmaeil Baghaei accused Washington on Monday of constantly shifting its negotiating stance and condemned what he called US aggressive action.

Sending contradictory messages would not work as a negotiating tactic, he said, urging Washington to take a clear, definitive position as soon as possible.

"Negotiations have started amid severe suspicion and mistrust, and the exchange of messages is taking place in this atmosphere," he said.

"The other party is constantly changing its views and putting forward new or contradictory demands ... it is natural that this situation will prolong negotiations," he said, adding that Tehran viewed Israeli actions in the region, including in Lebanon, as inseparable from those of the US.

Trump is under pressure to reopen the Strait of Hormuz and lower US gasoline prices before November's congressional elections, as voters grow increasingly frustrated by rising prices. At the same time, he faces a potential backlash from Iran hawks in his own party over any concessions to Tehran.

Trump has said his main aim in the war is to prevent Iran from developing a nuclear weapon with its highly enriched uranium. Tehran denies having any nuclear ambitions.

Iran was already in talks with the United States about the fate of its nuclear program in February, when the US and Israel launched air and missile strikes that wiped out much of the Islamic republic's senior leadership and plunged the Middle East into war.

While Tehran has long insisted that its nuclear program is for purely civilian ends, the US and its Western allies suspect it aims to develop an atomic weapon.

Late on Sunday, Trump posted on social media that the deal under discussion "states, very clearly, that Iran will not have a nuclear weapon".

The two sides remain at odds on several other issues, including Tehran's demands for the lifting of sanctions and the release of tens of billions of dollars in Iranian oil revenues frozen in foreign banks.

Iran has said it needs the release of $12 billion in frozen assets before engaging in substantive talks on its nuclear program, and dismissed earlier Trump comments suggesting that its stockpile of enriched uranium would be destroyed.

Treasury securities slide amid Gulf turmoil

By BELINDA ROBINSON
in New York
belindarobinson@chinadailyusa.com

Several foreign governments reduced their holdings of US Treasurys according to the latest data, with analysts suggesting the move may reflect efforts by central banks to buffer against energy-price shocks triggered by the US-Israeli war against Iran.

Japan, the largest foreign holder of United States government debt, shed its Treasury holdings by about $47 billion to $1.19 trillion, according to official data.

"Given increased financial volatility since the start of the war in the Gulf, and resultant pressure on exchange rates, especially in Asia, it is not a surprise that US Treasury holdings by central banks have fallen," Frederic Neumann, chief Asia economist at HSBC, told CNBC.

March data from the Treasury International Capital System — the US government's tracker of cross-border capital flows — showed that India sold $7.6 billion in Treasurys, while Canada reduced its holdings by $6.9 billion and the United Arab Emirates by $5.8 billion.

Overall, foreign holdings of US Treasurys fell by $138.4 billion in March, a 1.5 percent decline from the previous month.

Some investors worry that the decline could signal waning confidence in US assets.

"The fear is the US is losing its standing as the safe haven," George Cipolloni, a fund manager at Penn Mutual Asset Management, told The Associated Press. "Our bond market is the biggest and most stable in the world, but when you add instability, bad things can happen."

However, Goldman Sachs said in a May 27 note that the selling wave was neither unusual nor indicative of a shift away from dollar assets. Instead, it said, the moves were consistent with historical reserve-management practices by central banks.

Not all countries reduced their Treasury holdings in March. The United Kingdom, the second-largest foreign holder of US government debt, bucked the trend by increasing its holdings by $29.6 billion to $926.9 billion. Germany also raised its holdings by $3.7 billion, according to the Treasury International Capital System.

Foreign demand

The US government finances budget deficits through borrowing, issuing Treasury securities to supplement tax revenue when spending exceeds income.

US Treasurys are debt securities issued by the Treasury Department. Foreign demand for Treasurys helps keep US borrowing costs in check, alongside factors such as Federal Reserve policy, inflation expectations and the country's fiscal policy.

However, US personal finance expert Suze Orman warned that a decline in demand for US government debt could carry broader economic consequences. If fewer investors are willing to buy Treasurys, the US government may have to offer higher yields to attract buyers, pushing up borrowing costs for households and businesses alike.

The dollar's global dominance is also facing increased scrutiny, leading to US government moves to bolster the currency.

Last year, US President Donald Trump signed the Guiding and Establishing National Innovation for US Stablecoins Act into law, aiming to offer a global, dollar-backed digital currency.

The White House said on July 18 that the legislation would "generate increased demand for US debt and cement the dollar's status as the global reserve currency" by requiring stablecoin issuers to back their tokens with US dollars and Treasury securities.

Mohammad N. Elahee, a professor of international business at Quinnipiac University in Connecticut, said a prolonged period of global instability stemming from the US-Israeli war against Iran could encourage more countries to diversify away from dollar-denominated transactions.

Goldman Sachs, meanwhile, argued that financial markets had largely stabilized after the initial shock of the Middle East conflict.

MiniMax prepares for A-share launch

Dual-listing push by AI developers highlights sector's rapid growth

By **CHENG YU**
chengyu@chinadaily.com.cn

Chinese artificial intelligence company MiniMax has begun preparations for an initial public offering on the Chinese mainland just months after its Hong Kong debut, setting the stage for a potential A-share rivalry with fellow large language model developer Zhipu AI.

The parallel IPO drives by MiniMax and Zhipu underscore how China's AI sector is entering a new phase, with leading model developers seeking not only technological leadership, but also long-term access to public market financing to help cover the costs of increasingly expensive competition in computing power, model training and global expansion.

China's securities regulator said on Saturday that MiniMax signed a listing guidance agreement on Friday, formally launching the process toward an A-share IPO.

Asked about when MiniMax could become profitable, its founder and CEO Yan Junjie told China Daily at a State Council Information Office briefing on Thursday that the industry's immediate priority remained accelerating development rather than focusing solely on profitability.

"The core issue for the large language model sector is still how to accelerate development. China's AI sector, including MiniMax, will see a major leap forward this year," Yan said.

The move makes MiniMax the latest major Chinese AI developer to pursue a dual-listing structure, following Zhipu AI, which earlier this year began preparations for a STAR Market listing after becoming the world's first publicly traded LLM company.

The race highlights growing investor appetite for China's AI sector, as Beijing increasingly views LLMs as a strategic tech area comparable to semiconductors and advanced manufacturing.

Founded in 2022, MiniMax was listed in Hong Kong in January and has since become one of the market's strongest performers. Shares have risen more than fourfold since their debut, giving the company a market value of roughly HK$263.5 billion ($33.6 billion).

MiniMax said it now serves more than 1 million enterprise and developer customers globally, five times the level reported six months ago. Its global user base has reached approximately 300 million.

Revenue growth has accelerated sharply as companies increasingly adopt AI models and related services.

MiniMax reported revenue of 24 million yuan ($3.3 million) in 2023, which rose to 208 million yuan in 2024 before climbing to 539 million yuan in 2025, representing year-on-year growth of roughly 160 percent.

Like many AI startups, however, MiniMax remains deeply unprofitable due to heavy investment in model development and computing infrastructure.

The company reported a net loss attributable to shareholders of 12.76 billion yuan in 2025. Excluding fair value changes on financial liabilities recorded through profit and loss, the adjusted loss stood at 1.92 billion yuan.

Zhipu AI, often regarded as one of China's leading LLM companies alongside MiniMax, was listed in Hong Kong in January and subsequently initiated preparations for a STAR Market listing.

Wei Kai, head of the AI research institute at the China Academy of Information and Communications Technology, said in a separate interview that the rapid development of Chinese AI LLM companies reflects "a systemic upgrade in China's overall AI capabilities".

Wei said: "It is the result of sustained investment, open ecosystems and the ability to integrate models with real-world scenarios at scale."

Milestone achieved

A drone image captures the completion of the last box girder for the Shanghai-Nanjing section of the Shanghai-Chongqing-Chengdu High-speed Railway in Taicang, Jiangsu province, on Saturday. Partially built by China Railway 24th Bureau Group, the over 2,000-kilometer Shanghai-Chongqing-Chengdu artery aims to become a core backbone of China's "eight vertical and eight horizontal" HSR network, shouldering connections between city clusters from the Yangtze River Delta region to the Chengdu-Chongqing economic circles.

Zeiss eyes China as engine for growth, dynamism

By **ZHENG YIRAN** in Shanghai
zhengyiran@chinadaily.com.cn

With China being its largest single market worldwide and one of its most dynamic growth engines, German optics giant Zeiss Group will continue to deepen its presence in the country and build a win-win ecosystem with local partners, said its China head.

Martin Fischer, president and CEO of Zeiss Greater China, said during a recent forum in Shanghai: "As a technology leader, we know China is where the future is being built in real time — and where the dialogue between technology and industry truly shapes the world. That is why we are celebrating Zeiss' 180th anniversary here today: not only to honor our legacy, but even more to look ahead to the next 180 years."

He noted that for China, as for Zeiss, 2026 is a special year, as it marks the start of the 15th Five-Year Plan (2026-30). "Zeiss' capabilities resonate strongly with China's strategy of high-quality development. We are aligned in industrial ambition, in innovation intensity, and in long-term thinking."

Zeiss first entered China in 1957. At its innovation, and research and development centers in Shanghai, Suzhou in Jiangsu province, and Guangzhou in Guangdong province, it is advancing both products and processes, with solutions serving customers worldwide.

"Our manufacturing sites are widely recognized for both smart production and sustainability — our Guangzhou manufacturing site, for example, became the world's first optical lens factory to join the Global Lighthouse Network earlier this year," Fischer said.

According to market research firm Market Monitor, in 2025, the global optics market reached 107.5 billion yuan ($15.8 billion), with China accounting for 21.45 billion yuan.

"China offers one of the world's most comprehensive supply chains, a stable and attractive business environment, and — crucially — an openness to new technologies. I have personally witnessed the rapid rise and iteration of artificial intelligence in China, which has inspired us and accelerated our own transformation. In our new five-year strategy, AI-powered digital transformation and data intelligence are core themes: we are embedding them into our solutions and processes to help customers move faster, smarter and more sustainably," Fischer said.

Zhu Guangyao, China's former vice-minister of finance, said that the source of technological innovation is the core of future industrial competition, which requires the joint efforts of enterprises, universities and research institutes. He expects that multinational corporations will continue to be deep partners for China's high-quality development.

"Currently, the world is facing severe challenges. We need global cooperation to promote the steady growth of the world economy. China is building a high-level open economy, and we welcome Zeiss and all foreign enterprises to continue expanding their investments in China," he said.

Zeiss has established two hubs in the Yangtze River Delta and the Guangdong-Hong Kong-Macao Greater Bay Area, focusing on high-end equipment and eye health. Its new headquarters in China is now under construction in Shanghai, marking the start of its next chapter of localization. It will serve as an open platform for innovation.

Costco expands digital footprint

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

A consumer carries a boxed item after shopping at a Costco store in Shenzhen, Guangdong province, on March 22. CHENG XIN / GETTY IMAGES

Costco Wholesale Corp is accelerating its digital expansion in China, deepening competition with Walmart Inc's fast-growing Sam's Club as the US warehouse retailer seeks to broaden its reach beyond a limited store network.

The company recently launched its first official flagship store on JD, marking its first partnership with a major Chinese e-commerce platform. The online storefront offers direct-operated merchandise with products aligned with Costco's warehouse clubs.

The launch also introduces Costco's membership-based pricing model to a broader online audience. Active members receive the same prices available in physical stores, while non-members pay roughly 20 percent more.

Its Kirkland Signature 140 pacs (2.52 kilograms) UltraClean laundry detergent, for example, sells for 89.9 yuan ($13.29) to members versus 109.80 yuan for non-members.

Its store on JD joins the company's existing digital channels, which include its proprietary app and mini-program. The move underscores Costco's efforts to adapt its business model to the country's highly digital retail landscape, where online shopping and rapid delivery have become mainstream consumer expectations rather than supplementary channels.

Costco currently operates 928 warehouses and serves about 140 million members globally. Since entering the Chinese market in 2019, the retailer has opened seven stores, including two in Shanghai. An eighth location is expected to open in Quanzhou, Fujian province.

Costco currently offers two membership tiers in China: a Gold Star membership priced at 299 yuan annually and an Executive membership priced at 688 yuan. The premium tier, introduced in April, provides a 3 percent reward on eligible purchases and mirrors a strategy long employed by Sam's Club to deepen customer loyalty and increase spending.

JD Logistics will handle fulfillment for the new online operation. Next-day delivery is available in major cities including Beijing, Shanghai, and Guangzhou, Guangdong province. However, Costco's orders require a minimum spend of 199 yuan, with base shipping fees starting at 20 yuan for orders of up to 12 kilograms. No free delivery option is currently available. In comparison, Sam's Club ships for free at a minimum spend of 99 yuan.

The higher delivery thresholds reflect the structural challenge facing Costco in China. The company's low-margin, bulk-purchase model relies on large basket sizes, making last-mile logistics more expensive to subsidize.

That challenge is becoming increasingly apparent as Sam's Club strengthens its position in the membership retail sector in the country.

Walmart's China operations continue to gain momentum, driven largely by Sam's Club and e-commerce growth. Walmart reported first-quarter fiscal 2027 net sales in China of $8 billion, up 22.3 percent from a year earlier. E-commerce sales rose 31 percent and accounted for half of total revenue, an increase of 335 basis points from the previous year. Sam's Club added nine stores over the past 12 months while maintaining double-digit transaction growth.

Walmart Chief Financial Officer John David Rainey said during the company's earnings call, "The team delivered over half a billion units in the first quarter, with about 75 percent arriving in under one hour."

Another membership store, Maidelong, or Metro China, of the Wumart Group, has recently reshuffled its top management, installing retail veteran Andrew Miles as executive chairman. Miles previously held senior roles at Walmart China and led the expansion of Sam's Club China.

Suzano to scale up investments in nation

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Amid a turbulent and rapidly changing global environment, China has emerged as a crucial "source of stability" for multinational corporations, prompting Brazilian pulp and paper giant Suzano to continuously increase investments in the country, a senior company executive said.

Pablo Machado, Suzano's global vice-president for strategy and Asia business, noted that China's advanced manufacturing capabilities and digital advantages provide an excellent ecosystem for deepening integration with local partners across supply chains, technology and finance.

"Today, China is not only an important market for Suzano, but an integral part of our global operations and future growth," Machado said. "In this process, Suzano has successfully shifted its approach from simply 'selling into China' to 'building together with China'."

Driven by the unprecedented opportunities arising from China's pivot to high-quality economic development, Suzano intends to scale up its local investments. The company will harness China's "massive consumer upgrade wave" to actively back the nation's ambitious green transition, Machado added.

This anticipated surge in local investment — spanning research and development, logistics networks, and domestic value chains — aims to deliver premium, highly sophisticated products to Chinese customers across the packaging, hygiene, textile and cosmetics sectors, he said.

> "Today, China is not only an important market for Suzano, but an integral part of our global operations and future growth."
>
> **Pablo Machado,** Suzano global vice-president for strategy and Asia business

This robust foreign investment appetite is bolstered by the nation's steady economic fundamentals and comprehensive industrial ecosystem.

According to Wang Jun, vice-minister of the General Administration of Customs, multinational corporations remain pivotal in advancing new quality productive forces, maintaining a robust trade outlook within the Chinese market.

Supported by predictable policies and a highly open business landscape, these enterprises are increasingly empowered to broaden their network of commercial partners and unlock new market segments, said Wang.

Echoing the importance of a comprehensive industrial ecosystem, Machado emphasized that modern manufacturing is no longer limited to physical production; it has evolved into a fully integrated system enabled by continuous services such as data analytics, advanced monitoring and intelligent management.

By incorporating Chinese equipment and technologies into its global operations, Suzano is also well-positioned to support Chinese enterprises expanding into Latin America, said Machado.

Financially, Suzano continues to actively participate in the opening of the nation's market. It made history as the first non-financial company from the Americas to issue Panda Bonds, establishing a direct link between Chinese capital and sustainable forestry initiatives.

Tapping into China's capital market remains a central pillar of Suzano's long-term financial strategy. This approach not only secures competitive and diversified funding for the company, but also reinforces the crucial economic ties between Brazil and China, said Machado.

Bai Ming, a researcher at the Chinese Academy of International Trade and Economic Cooperation, noted that while more than four decades of reform and opening-up have highly liberalized China's manufacturing and related industries, the services sector continues to hold immense untapped potential.

As the country pushes to stimulate service-oriented consumption, global firms will find fresh opportunities to expand their footprint in fields like healthcare, logistics, travel, certification and digital services, Bai said.

Looking ahead, Suzano anticipates the Chinese market will unlock even greater technological synergies that can be scaled across global emerging markets.

"We believe China will play an even more important role," Machado said. "While further developing itself, it will become a global source of innovation, an industrial hub and a platform for capital convergence."

Jiangxi eyes scenario-based industrial collaborations

Project represents more than just another investment from Greater Bay Area; it exemplifies a paradigm shift in what province now offers technology firms

By REN QI and **ZHAO RUINAN**
in Nanchang

At an artificial intelligence industrial park in Jiujiang, Jiangxi province, humanoid robots are actively being trained for the workforce.

Inside the facility, Walker S2 robots practice tasks that may soon become standard in factories and logistics centers — learning to identify objects, handle materials, avoid obstacles and adapt to dynamic industrial environments.

Built by Shenzhen, Guangdong province-based UBTech Robotics Corp, the park hosts Jiangxi's first Walker S2 production line and the province's inaugural humanoid robot data collection and training center. With over 100 robots deployed, the facility has generated more than 15 million pieces of high-quality test data for algorithm training and scenario adaptation, local media reported.

This project represents more than just another investment from the Guangdong-Hong Kong-Macao Greater Bay Area. It exemplifies a paradigm shift in what Jiangxi now offers technology companies. Beyond traditional incentives like land, labor and policy support, the province now provides real-world testing grounds for emerging products.

This strategy was the focal point of the 2026 Jiangxi-Greater Bay Area Economic and Trade Week, held across Guangdong, Hong Kong and Macao in May. Marking Jiangxi's first major cross-regional trade and investment push in the opening year of the 15th Five-Year Plan (2026-30), the initiative featured a main event, 19 themed activities and a series of targeted investment promotion visits.

The most notable shift during the event was a new emphasis on application scenarios. At a supply-demand matchmaking event for application scenarios in Jiangxi's emerging industries in Shenzhen on May 21, the cities of Jiujiang, Ganzhou and Shangrao, as well as the Ganjiang New Area, released 151 scenarios spanning artificial intelligence, intelligent manufacturing, brain-computer interfaces, the low-altitude economy, smart cities, government services and cultural tourism. Rather than conventional investment pitches, these offerings were designed to address a critical question for tech firms: where can a product be tested, data collected, early adopters found, and initial orders scaled into broader markets?

"Scenarios act as a bridge connecting technology with industry, linking research and development to the market," said Chen Zhimin, a second-level inspector at the Department of Commerce of Jiangxi Province. Chen emphasized the province's desire for companies to bring their innovations to Jiangxi to find suitable testing and application fields.

Huang Aiqun, director of the Jiangxi Industrial and Information Technology Integration Promotion Center, said the event aimed to align frontier technologies with Jiangxi's industrial needs in sectors like opto-electronic information, solid-state batteries and embodied intelligence through a model of open scenarios, demand release and enterprise roadshows.

While many new technologies have graduated from the laboratory, they require real-world conditions to achieve widespread adoption. A robot needs a factory floor; a brain-computer interface company requires hospital wards; a low-altitude economy startup depends on airspace and logistics routes; and an optical sensing firm needs industrial parks and energy facilities.

Above: Samples of rare earths are on display at the Ganzhou Museum in Ganzhou, Jiangxi province, on Jan 19, 2025.
PROVIDED TO CHINA DAILY

Right: Robots are tested at the UBTech AI industrial park in Jiujiang, Jiangxi, on Oct 9, 2024.
ZHANG HAIYAN / FOR CHINA DAILY

Consequently, Jiangxi has integrated these practical scenarios directly into its investment promotion strategy. The Shenzhen event brought together executives from 35 listed companies, high-tech enterprises and specialized "little giant" firms. Though representing diverse industries, their needs frequently overlapped: they all required testing grounds, technological refinement and access to initial customers.

Highlighting regional collaboration, Chen Shuilian, vice-mayor of Jiujiang, detailed the city's partnership with the GBA. Jiujiang has successfully explored models such as "GBA headquarters plus Jiujiang base" and "fund guidance plus industrial cultivation" in sectors including lithium battery materials, humanoid robots and 3D printing.

Ganzhou presented a different scenario, focusing on new rare earth materials and new energy. Leveraging platforms like the Ganjiang Innovation Academy of the Chinese Academy of Sciences and the National Rare Earth Functional Materials Innovation Center, the city aims to link research, pilot incubation and industrial application.

The national center has incubated 17 technology companies and built 26 pilot demonstration lines, providing crucial support for Ganzhou's rare earth industry, which now exceeds 100 billion yuan ($14.78 billion) in scale. For Ganzhou, the greater challenge lies not just in extracting resources, but in transforming them into advanced materials and components that can integrate into broader industrial chains.

Shangrao highlighted its photovoltaic and optical electronics sectors, leveraging industry leaders like Jinko Solar Co, which boasts over 5,600 global patents and a 20-billion-yuan R&D investment over the past five years, to create more testing, demonstration and supply-chain opportunities. Meanwhile, the Ganjiang New Area showcased future-oriented public resources and research platforms, such as a traditional Chinese medicine innovation city in Nanchang, capital of Jiangxi, and digital economy industrial parks, pointing to another dimension of structural openness.

Scenarios alone, however, are insufficient without capital. On May 20, Jiangxi hosted a conference in Shenzhen, focusing on the deeper integration of industry and finance. Six Jiangxi enterprises involved in the province's key manufacturing initiatives pitched their technologies, growth prospects and financing needs to industrial funds from both Jiangxi and the GBA.

"Jiangxi has a solid industrial foundation, a sound financial ecosystem and a strong open environment," said Fang Yanru, chairwoman of the China Council for the Promotion of International Trade Jiangxi Provincial Committee, expressing hope that GBA financial institutions would strengthen their cooperation with the province. Jiangxi's outstanding loans exceeded 7 trillion yuan in the first quarter, up 7.8 percent year-on-year, with manufacturing loans rising 13.9 percent. The province currently boasts 54 companies listed in Shenzhen and 24 in Hong Kong.

Xu Zhonghua, executive deputy director of the office of the financial affairs committee of the Communist Party of China Jiangxi Provincial Committee, urged stronger industry-finance cooperation and smoother two-way information channels to identify more high-quality Jiangxi firms with listing potential.

Market access remains another vital pillar of this strategy. At a cross-border e-commerce event, officials highlighted the synergy between Jiangxi's comprehensive manufacturing capabilities and the GBA's advanced digital platforms, noting that such cooperation could achieve a result where the whole is greater than the sum of its parts. For enterprises, the demand is direct and practical. Xiao Shaping, foreign trade manager of Jiangxi OYF Vehicle Industry Co, said the Shenzhen event directly connected her company with potential clients from Russia and Pakistan, effectively linking Jiangxi's industrial belts with global e-commerce opportunities.

Wang Chunlei, deputy director of the Department of Commerce of Jiangxi Province, summarized the activity week as a reflection of three fundamental shifts in the province's approach: from traditional investment promotion to trade-investment integration, from one-way industrial transfer to two-way cooperation, and from basic industrial collaboration to comprehensive integrated development. Moving forward, Jiangxi plans to hold more than 100 specialized, industry-focused matchmaking events in the GBA annually.

Ultimately, the true measure of success will be follow-up work. While 151 scenarios have been released, the focus now shifts to transforming these opportunities into pilot projects, securing timely funding and building global brands. These questions will not be answered in a single activity week, but the direction is clear. By bringing concrete offers to the GBA — testing grounds, industrial platforms, capital links and manufacturing capacity — Jiangxi is moving beyond simple project promotion toward long-term, scenario-based industrial partnerships.

Logistical adjustments keep landlocked region's exports flowing overseas

By REN QI and **ZHAO RUINAN**
in Nanchang

Before a product made in Jiangxi province can reach overseas customers, it typically requires two crucial elements the inland province has historically had to "borrow" from coastal regions: efficient port logistics access and mature market channels. Consequently, Ganzhou International Land Port in Jiangxi and the cross-border e-commerce ecosystem of Shenzhen, Guangdong province, have emerged as pivotal components of Jiangxi's deepening collaboration with the Guangdong-Hong Kong-Macao Greater Bay Area.

At Ganzhou International Land Port, containers of Jiangxi-made goods are loaded onto freight trains bound directly for Shenzhen's Yantian Port. The "Rongwan" intercity high-speed freight train between Ganzhou and Shenzhen has slashed average transit time from 12 hours to just six, saving nearly 2,000 yuan ($296) per container, said Liu Liping, deputy director of the port's operation and management bureau.

For a landlocked city, this represents far more than a logistical upgrade. By connecting with Yantian and Guangzhou ports, the land port has established an intermodal rail-sea channel designed to offer the "same port, same price and same efficiency". This cross-customs and cross-provincial coordination effectively extends the GBA's maritime reach inland to Ganzhou.

The impact is palpable across local industries. Deng Wangqiang, chairman of Jiangxi Aiyang Furniture Co, said that the land port enables companies to complete customs declarations and shipping locally. Deng estimates that logistics costs have dropped by 30 percent while efficiency has surged by 40 percent, significantly boosting the international competitiveness of the company's products.

The furniture industry of Nankang, a district of Ganzhou, serves as a prime example. Once reliant on traveling south to Guangdong to learn modern production and management techniques, local carpenters eventually returned to build a thriving modern furniture cluster in Ganzhou. In 2024, the output value of Nankang's furniture industrial cluster exceeded 280 billion yuan, with 46 percent of its products exported to over 100 countries and regions via the GBA, People's Daily's CPC News website reported.

Yet, logistics is only half of the equation for going global. Companies also require platforms, operators, buyers, brands and overseas distribution systems — which constituted the central focus of a Jiangxi cross-border e-commerce development panel held in Shenzhen on May 20. Chen Changsheng, deputy director of the Department of Commerce of Jiangxi Province, said Shenzhen efficiently links domestic and overseas markets, leading China's cross-border e-commerce development through its advanced digital technologies and active operating ecosystem. Chen described the partnership as a "two-way move" between Jiangxi's robust manufacturing and Shenzhen's expansive market channels.

Jiangxi is home to 39 of the country's 41 industrial categories, including two trillion-yuan-level industries in electronic information and nonferrous metals, alongside 12 hundred-billion-yuan-level industries. It also hosts 18 national foreign trade transformation and upgrading bases — covering products like Jingdezhen ceramics, Xinyu lithium batteries, Yingtan eyewear and Wuyuan tea — as well as nine comprehensive cross-border e-commerce pilot zones. Chen urged Jiangxi enterprises to embrace cross-border e-commerce, utilize comprehensive bonded zones and strengthen brand awareness to build independent labels with international influence.

For enterprises, the benefits of this synergy were highly practical. Xiao Shaping, foreign trade manager of Jiangxi OYF Vehicle Industry Co, said the Shenzhen event directly connected her company with potential clients in Russia and Pakistan, effectively linking Jiangxi's industrial belts with global e-commerce opportunities.

The underlying logic is straightforward: Jiangxi possesses manufacturing capacity and distinctive products, while Shenzhen offers the needed platforms, buyers and international networks. By synergizing these strengths, Jiangxi aims not only to boost export volumes but also to enhance brand building, channel management, supply-chain services and global market responsiveness.

For Jiangxi, this marks the next critical step in GBA cooperation. Moving products is essential, but building enduring channels is the greater challenge. As the province strives to turn its factories and industrial belts into recognized brands with long-term market presence, the GBA — with its ports, capital, platforms and global networks — is proving to be an indispensable partner.

RESERVES REBALANCING NATION'S BIODIVERSITY

Over a decade on since its introduction, China's national parks system continues to foster ecological initiatives and economic growth

Editor's note: *This series journeys through China's national parks to explore conservation, biodiversity protection and sustainable tourism in key ecological landscapes.*

By HOU LIQIANG in Ya'an, Sichuan
houliqiang@chinadaily.com.cn

He He and his sister Mei Mei, the world's first panda twins born to a captive mother and a wild father, arrived in July 2018, two years after the launch of the Giant Panda National Park pilot program. Their births were a signal of hope for the future of China's burgeoning national parks system.

Nearly nine years on, a growing harmony between humans and nature has evolved, and landscapes and biodiversity have improved.

Established in 2021, the national park covers some 22,000 square kilometers across Sichuan, Shaanxi and Gansu provinces, with most of it located in Sichuan.

Mei Mei has given birth to a male cub, and He He has successfully mated naturally, a testament to the progress made in field mating for captive giant pandas, said Huang Zhi, director of the Ya'an Bifengxia Base of the China Conservation and Research Center for the Giant Panda.

Carrying the genes of wild giant pandas, He He and Mei Mei are expected to open up new possibilities for the future recovery of China's wild panda populations, he said.

Reflecting on the center's over four decades of commitment to panda protection, breeding and rewilding research, Huang highlighted a shift in its conservation efforts: from pursuing quantity to prioritizing quality.

"Each panda has a clear pedigree management system. Every day, there is very detailed health monitoring. Every year, there is a breeding plan, which must be approved by experts before implementation. We now control breeding to 15 to 20 pandas per year," he said.

He said the center's captive population had reached 387 by the end of 2024, compared with just six in the early 1980s.

Meanwhile, the country has also seen remarkable progress in the recovery of the giant panda's wild population, with its number rebounding from about 1,100 in the 1980s to the current roughly 1,900, according to the National Forestry and Grassland Administration. Driving this steady growth are critical efforts in habitat protection, captive breeding and rewilding, and field mating introduction research.

The Daxiangling mountain range in the Giant Panda National Park stands as a microcosm for the consistent efforts.

Fu Mingxia, a park employee dedicated to scientific research and monitoring, said only 38 wild giant pandas were counted across the 6,000-sq-km range when the fourth national giant panda survey was conducted a decade ago.

"Because of factors such as habitat fragmentation, they existed as isolated small populations," she said.

Now, the picture is changing. In the process of building the national park, many mines and hydropower stations were closed, significantly reducing human disturbance within the park, she added.

An area of about 200 hectares has been set aside for giant panda rewilding, Fu said. After 30 to 45 days of adaptation in an enclosure, a panda moves to a small zone, then a larger one, before ultimately being released into the wild.

"This phased approach helps the panda learn to navigate its natural surroundings, enhancing its ability to avoid danger and find food and water, ultimately increasing its chances of survival," she said.

With the development of the national park, more efforts have been devoted to giant panda habitat protection and restoration, rewilding training and reintroduction, Fu said. Thanks to the efforts, infrared cameras in the Daxiangling range are capturing wild giant pandas with increasing frequency.

According to the Sichuan Provincial Department of Natural Resources, in the section of the Giant Panda National Park in Ya'an city alone, 1,080 hectares of historically abandoned mines were restored through a national demonstration project during the 14th Five-Year Plan (2021-25) period.

Since the establishment of the Giant Panda National Park, Sichuan authorities have restored 22,090 hectares of habitat, revoked 200 mining rights and removed 258 small hydropower stations in efforts to enhance panda conservation, Wan Hongyun, a senior official with the Sichuan Provincial Forestry and Grassland Administration, said at a recent news conference.

The annual number of wild giant panda sightings in the park's Sichuan section has increased from 135 to 185, suggesting a stable recovery of the wild population, he added.

For local residents, the national park has brought tangible benefits. Zhou Hong, a 32-year-old resident of Fazhan village in Sichuan province's Yingjing county near one of the park's entrances, is a prime example.

Previously, he worked in the stone material business in Deyang, also in Sichuan. After the Giant Panda National Park pilot began, he decided to return, transforming his home into a guesthouse.

"Since the establishment of the Giant Panda National Park, many tourists have been flocking in," he said, adding that rooms are usually fully booked during the peak season in July, August and September, and occupancy remains above 50 percent in other months.

The rich bird life near his village adds to the draw. Among his customers are many bird-watching enthusiasts and wildlife conservationists who come for research and photography, he said.

The transformation of Fazhan village has been remarkable. According to local authorities, since the national park pilot began, the number of residents in the village has doubled, as have the number of agricultural leisure facilities and homestays, while per capita net income has quadrupled. Meanwhile, illegal activities such as poaching and bamboo shoot harvesting have become rare.

According to the Sichuan authorities, the Sichuan section of the Giant Panda National Park has welcomed some 16 million visitors over the past five years.

The Giant Panda National Park is one of five national parks that were formally established in 2021, following the launch of the national park system pilot program in 2015.

According to the National Forestry and Grassland Administration, the five national parks span 230,000 sq km, and cover nearly 30 percent of the key terrestrial wildlife species found in China.

Growing harmony between humans and nature has also been seen in the other four parks, the Three-River-Source National Park, Wuyishan National Park, Northeast China Tiger and Leopard National Park, and the National Park of Hainan Tropical Rainforest.

At the Northeast China Tiger and Leopard National Park, for instance, an intelligent space-air-ground integrated monitoring system has been put into operation, according to Sun Hongyan, deputy director of the administration's nature reserve department.

The system enables round-the-clock tracking and precise positioning of the big cats, and it can also provide early warnings of potential human-tiger conflicts, she said.

Leopards rarely come into conflict with humans because of their naturally shy nature.

At the start of the national park system pilot program, the populations of Amur tigers and Amur leopards in the park stood at 27 and 42, respectively, Sun said. These numbers have climbed to over 70 and 80.

In late 2024, tracks of Amur tigers were discovered on Changbai Mountain in Jilin province for the first time in three decades, signaling a habitat expansion of more than 200 km from the national park's core area, she added.

The establishment of the Three-River-Source National Park has ensured the comprehensive protection of the headwater ecosystems of the Yangtze, Yellow and Lancang rivers.

Compared with 2015, the populations of wildlife such as Tibetan antelopes, Tibetan gazelles and Tibetan wild donkeys in the park have increased significantly, Sun said.

According to the administration, the number of Tibetan antelopes in the national park has soared to about 70,000 from no more than 20,000 in the 1980s.

Since the park's establishment, grassland vegetation cover has increased by 8.6 percent, and local residents have seen an average annual income increase of 15,000 yuan ($2,180) to 21,000 yuan, she added.

Li Hongfu, an official with the Three-River-Source National Park Administration, said a people-centered approach has been key in the administration's efforts to promote high-standard conservation and high-quality development of the national park.

He highlighted the "one household, one ranger" mechanism, which provides each local herding family with a patrol route for ecological conservation, as a representative initiative by the park to balance ecological protection with the needs of local communities.

So far, over 17,000 former herders have taken up a patrol route, he noted. They are not only able to adapt quickly to the natural conditions, but also can promptly capture images when encountering unknown species and send them back to the big data center, providing invaluable analytical material for professional technicians.

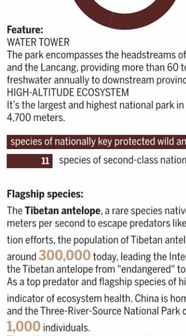
"Today, the lush mountains and lucid waters in the Three-River-Source National Park are already invaluable assets," he said. "While enabling more local people to pursue a livelihood rooted in ecological conservation and benefit from it, these ecological resources are gradually becoming a lasting source of well-being for the community.

"The development of the national park has won the hearts of the people and will surely lead to an even brighter future," Li added.

CHINA'S NATIONAL PARKS

THREE-RIVER-SOURCE NATIONAL PARK

Location: Qinghai province



Area: 190,700 square kilometers

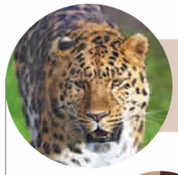
Resources: 32.41% forest, water, wetland, wasteland; 67.59% grassland

Feature:
WATER TOWER
The park encompasses the headstreams of three major rivers: the Yangtze, the Yellow and the Lancang, providing more than 60 to 90 billion cubic meters of high-quality freshwater annually to downstream provinces and five neighboring countries.
HIGH-ALTITUDE ECOSYSTEM
It's the largest and highest national park in China, with an average altitude exceeding 4,700 meters.

species of nationally key protected wild animals	84
species of second-class nationally protected plants	11

Flagship species:
The **Tibetan antelope**, a rare species native to the Qinghai-Tibet Plateau, can reach speeds over 20 meters per second to escape predators like wolves and snow leopards. Thanks to effective conservation efforts, the population of Tibetan antelopes has grown from fewer than 20,000 in the 1980s to around 300,000 today, leading the International Union for Conservation of Nature to downgrade the Tibetan antelope from "endangered" to "near threatened".
As a top predator and flagship species of high mountain ecosystems, the **snow leopard** serves as a key indicator of ecosystem health. China is home to about 60 percent of the global snow leopard habitat, and the Three-River-Source National Park contains a large contiguous area of the habitat, with around 1,000 individuals.
The **red poppywort** is a species of poppy with highly decorative, drooping blood-red flowers. It also has medicinal value, offering benefits such as pain relief, cough suppression and antibacterial properties.

GIANT PANDA NATIONAL PARK



Location: Shaanxi, Gansu and Sichuan provinces

Area: 22,000 square kilometers
0.4% 97.72 sq km in Shaanxi
11.6% 2,552.96 sq km in Gansu
87.7% 19,300 sq km in Sichuan

Resources: forest, water, grassland, wetland, wasteland, minerals

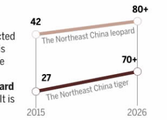
Feature:
GIANT PANDA
73 protected areas have been integrated to safeguard the habitat of more than 70 percent of wild giant pandas. The wild population has grown from 1,100 in the 1980s to 1,900, leading the International Union for Conservation of Nature to downgrade the giant panda from "endangered" to "vulnerable". The giant panda acts as an "umbrella species" – protecting its habitat also safeguards numerous other species that share the same ecosystem. The park is home to over 10,000 species of wild flora and fauna, such as golden snub-nosed monkeys, snow leopards and Chinese yew.

Flagship species:
(In addition to the **giant panda**)
The **golden snub-nosed monkey**, a species endemic to China and classified under State first-class protection, lives in the forests of Sichuan, Gansu, Shaanxi and Hubei provinces. In the Giant Panda National Park, the distribution of the golden snub-nosed monkey overlaps significantly with that of the giant panda, making it an important sympatric species.
The **takin**, classified under State first-class protection, inhabits alpine forests and meadows at altitudes above 2,500 meters. The Tangjiahe area of the Giant Panda National Park is recognized as a hot spot with the highest encounter rate for takins in China.
The **Chinese mountain cat**, a species endemic to China and classified under State first-class protection, inhabits transitional areas between alpine forests, grasslands and deserts.
Resembling a cat but with a stouter build, the **red panda** has reddish-brown fur covering its entire body. It lives in deciduous and coniferous forests at altitudes between 2,300 and 4,800 meters.

NORTHEAST CHINA TIGER AND LEOPARD NATIONAL PARK

Location: Jilin and Heilongjiang provinces

Area: 14,100 square kilometers
32.05% 4,508 sq km in Heilongjiang
67.95% 9,557 sq km in Jilin



Resources: 2.42% water, wetland, grassland; 97.58% forest

Feature:
BIODIVERSITY

species of vascular plants	884
species of wild vertebrates	397

Flagship species:
The **Amur tiger**, classified as a first-class nationally protected wild animal in China, is the largest extant feline species. It is solitary and primarily preys on wild boar and roe deer in the Northeast China Tiger and Leopard National Park.
Slightly smaller in size than the Amur tiger, the **Amur leopard** primarily inhabits mixed coniferous and broadleaf forests. It is also a first-class nationally protected wild animal.

WUYISHAN NATIONAL PARK

Location: Fujian and Jiangxi provinces

Area: 1,280 square kilometers
21.8% 279 sq km in Jiangxi
78.2% 1,001 sq km in Fujian

Resources: water, wetland, forest, grassland, wasteland

Feature:
It has the most complete, most typical and the largest subtropical forest at the same latitude in the world.
BIODIVERSITY

species of vascular plants	2,866 (2 under first-class State protection, 61 under second-class State protection)
species of algae	239
species of fungi	503
species of lichens	100
species of orchid	78
species of wild vertebrates	690 (16 under first-class State protection, 93 under second-class State protection)
insects	6,913 (1 under first-class State protection, 6 under second-class State protection)

Flagship species:
The **Cabot's Tragopan**, a first-class State-protected wild animal in China, inhabits subtropical montane evergreen broad-leaved forests and mixed coniferous-broad-leaved forests at altitudes between 600 and 1,800 meters. The bird has a stable population of around 1,000 individuals in the Wuyishan National Park, accounting for more than 60 percent of the global population.
First found in the Wuyishan National Park, the **Yu Shen horned toad** is a terrestrial wild animal of important ecological and scientific value.

NATIONAL PARK OF HAINAN TROPICAL RAINFOREST

Location: central part of Hainan Island

Area: 4,269 square kilometers
45.4% general control area: 1,938 sq km
54.6% core protected area: 2,331 sq km

Resources: 2.89% water, wetland, grassland, wasteland and minerals; 97.21% forest

Feature:
It has the most concentrated, the best preserved and the most extensive tropical rainforest in China, a complete vertical vegetation zone from lowland rainforest, montane rainforest, alpine cloud forest, to a small area of coniferous forest
BIODIVERSITY

species of vascular plants	4,367 (6 under first-class State protection, 143 under second-class State protection)
species of wild vertebrates	651 (14 under first-class State protection, 120 under second-class State protection)

Flagship species:
The National Park of Hainan Tropical Rainforest is the only habitat for **Hainan black-crested gibbons** in the world. Thanks to sustained conservation efforts, their population has grown from fewer than 10 individuals in two groups, to 42 individuals in seven groups. It is estimated that by 2035, their population will reach 60 to 70 individuals.
The **Hainan Eld's deer** is a first-class State-protected wild animal in China and is listed as endangered on the IUCN Red List. It inhabits hilly lowlands or flat terrain at altitudes below 200 meters.
As a key species in the tropical ecosystem, the **Hainan oak** provides habitat and nourishment for a variety of flora and fauna, from nesting birds to insects and even small mammals. It can grow to 20 to 30 meters and is highly valued for its durability and aesthetic appeal.

Strategic dialogue conducive to keeping Sino-UK ties on right track of progress

The visit of UK Foreign Secretary Yvette Cooper to China from Monday to Wednesday for the 11th round of the China-UK Strategic Dialogue presents an opportunity for both countries to implement the road map for improving China-UK relations that the two sides agreed during the UK prime minister's visit to China in January, the first visit by a UK leader in eight years.

This year's strategic dialogue, following the 10th China-UK Strategic Dialogue in London in February last year, shows the continued willingness of both countries to develop a long-term, stable comprehensive strategic partnership.

The Keir Starmer government has taken substantive steps to promote economic and trade cooperation with China in fields such as artificial intelligence, bioscience, new energy and low-carbon technologies. It has also shown a clear intent to step up cooperation in areas such as environmental protection.

By working together on environmental issues, China and the United Kingdom can advance their national development goals while contributing to global sustainability efforts. This cooperation can serve as a reference for other nations, demonstrating how countries with different political systems can work together to address shared challenges.

The UK is China's third-largest trading partner, third-largest investment destination and third-largest source of foreign investment in Europe, while China is the UK's largest trading partner in Asia. The Chinese economy is structurally complemented with that of the UK. Collaborating with China is essential for the UK to boost domestic growth.

Post-Brexit UK increasingly finds cooperation with China an economic necessity rather than a diplomatic option. The trade volume between China and the UK reached $103.73 billion last year, representing a year-on-year increase of 5.3 percent, highlighting the resilience of bilateral trade amid global turbulence. Facing supply-chain disruptions and rising protectionism, London has sought to revive the China-UK Economic and Financial Dialogue after a long hiatus. Deeper engagement with the world's second-largest economy offers the UK opportunities for sustainable growth, investment and economic stability that are crucial for the UK to cope with post-Brexit shock waves.

And by continuing to cooperation with China in a consistent, long-term and strategic manner, the UK can not only benefit itself but also provide a reference for the European Union to improve relations with China, even though the UK is no longer part of the bloc.

However, despite the steadier momentum in China-UK relations than in the recent past, bilateral ties are far from smooth sailing. Beyond frequent irritants — such as London's repeated interference in Hong Kong-related affairs and its unilateral sanctions on Chinese entities under the pretext of the Russia-Ukraine conflict — the UK government has also blocked Chinese investments in certain sectors citing so-called "national security" concerns.

Moreover, the UK has sent warships to navigate at China's doorstep in the Western Pacific under the guise of exercising "freedom of navigation".

Such actions contradict London's stated willingness to improve bilateral relations, increase the risk of misjudgment, and heighten regional tensions — from which the UK stands to gain nothing.

The key to managing these differences lies in the UK fostering objective perceptions of China, and engaging in dialogue and communication grounded in mutual respect. The Starmer government needs to better align its deeds with its words.

If they can respect each other's differences and handle each other's core concerns properly, Beijing and London have the potential to build a partnership that is resilient and forward-looking. By enhancing coordination on global issues of mutual concern, the two countries — both permanent members of the United Nations Security Council — can work together to create the conditions that are conducive to helping them navigate differences and build a partnership that contributes to world peace and development.

Pragmatic cooperation, candid dialogue, mutual respect and strategic coordination should form the main theme of China-UK relations at a time when the world is facing growing uncertainty and fragmentation.

China and the UK, as two major countries on the world stage, share a common responsibility to demonstrate that cooperation and dialogue remain the rational response to a turbulent world, offering a reliable path toward stable relations and shared prosperity.

Tokyo and Manila building castles in the sand

Tokyo and Manila issued a joint statement last week announcing the start of talks on the "delimitation" of an exclusive economic zone and continental shelf between Japan and the Philippines. But the area the two countries announced they will "delimit" is east of China's Taiwan island. According to China's domestic law and international law, including the United Nations Convention on the Law of the Sea, China has an exclusive economic zone and continental shelf in this area.

The so-called "maritime delimitation talks" constitute a severe violation of China's maritime rights and interests, UNCLOS and other international laws, and the basic norms governing international relations. The collusion between Japan and the Philippines is both legally groundless and politically provocative.

Against this backdrop, the China Coast Guard's law enforcement patrols in the waters starting on Monday are legitimate and necessary measures to safeguard China's sovereignty and core interests.

The "delimiting" scheme, announced during Philippine President Ferdinand Marcos Jr's visit to Japan — along with the two countries' agreement to expand military cooperation to counter what they described as a "common threat" — only adds further uncertainty to the regional security landscape.

The Philippines suffered some of the worst atrocities of Japanese occupation during World War II. From the Bataan Death March to the destruction of Manila, the historical record is well-documented and beyond dispute. Yet today, some Philippine politicians appear willing to overlook that painful history to embrace a Japan that has made clear it will ignore the country's wartime legacy.

Under the banner of defending "regional peace" and a "rules-based order", Japanese right-wing forces continue to push for the removal of postwar constraints and remilitarization, challenging the postwar international order.

At the Shangri-La Dialogue in Singapore last week, Japan's defense minister shamelessly denied the rise of neo-militarism in his country. Philippine Defense Secretary Gilberto Teodoro Jr went even further, suggesting that Japan has been "unfairly vilified" through what he called the "improper use of history".

What is particularly troubling is Manila's readiness to turn a blind eye to the risk of being used as a strategic pawn in Japan's geopolitical calculus.

Since Japanese Prime Minister Sanae Takaichi strained China-Japan ties with her dangerous and erroneous remarks regarding the Taiwan Strait situation on Nov 7, her government has repeatedly added insult to injury by hosting secessionist-minded politicians from China's Taiwan region, conducting provocative military activities near the island under various pretexts, and expanding security partnerships targeting China with other countries.

The proposed "delimitation" talks between Tokyo and Manila are merely the latest manifestation of this trend. They appear designed to draw the Philippines more deeply into Japan's geopolitical agenda and bind Manila to Tokyo's neo-militarist chariot.

The extraordinary lengths to which the Philippine defense chief went at the Shangri-La Dialogue — doing the dirty work for Japan by labeling China as a regional "bully" — reveal the true face of a government that sacrifices the Philippines' interests for the narrow gains of a few politicians.

Such brazen China-bashing raises obvious questions. If China were truly what he claimed it was, would the Philippine Navy's deliberately grounded vessel at China's Ren'ai Reef have remained there for more than a quarter century? Would Manila feel sufficiently secure to host an expanding network of foreign military facilities in close proximity to China? Would the Philippines have stable access to strategic supplies, including chemical fertilizers, the Chinese market and funding, despite its relentless provocations in the South China Sea regarding Chinese territorial waters?

The reality is that Manila understands Beijing is the party that truly seeks stability and peaceful development through cooperation and dialogue. Yet some Philippine politicians appear increasingly willing to exploit that restraint, portraying the creator of frictions as the victim.

This approach is neither prudent nor strategic. By embracing Japan's "maritime boundary delimitation" initiative, the Philippines risks placing itself in a position that primarily serves Tokyo's political objectives rather than its own long-term national interests.

The Tokyo-Manila initiative represents a serious attempt to alter the status quo of the waters unilaterally. Should such actions continue, they will inevitably invite a resolute response from China.

History repeatedly demonstrates that efforts to manufacture geopolitical confrontations rarely unfold as their architects intend. Those who seek to create instability in pursuit of short-term gains may ultimately find themselves bearing the consequences of their own miscalculation.

Continent: China's cooperation pragmatic

From page 1

And public health systems cannot be strengthened if governments are trapped in cycles of emergency response.

Stability does not mean political silence. It does not mean the absence of debate, diversity or reform. It means that societies have enough institutional confidence, public order, social trust and national direction to pursue development over time.

Development is therefore not charity. It is preventive security. Food security prevents social unrest. Education prevents generational poverty. Infrastructure connects markets and lowers the cost of growth. Public health systems prevent local outbreaks from becoming global emergencies. Industrialization creates jobs and dignity. Regional integration allows African countries to trade more with one another and reduce vulnerability to external shocks.

Africa should not become a stage for great-power rivalry. African countries should have the sovereign right to work with all partners in ways that serve their own development needs. Africa needs partners, not patrons; and it needs cooperation, not competition disguised as concern.

Africa's development should also be African-led. External partners may offer support, but African leadership will always come first. African countries must define their own priorities, strengthen governance, improve public administration, invest in education, empower women and youths, protect the environment, deepen regional trade, and negotiate with all partners from a position of dignity and strategic clarity.

Guided by African priorities and ownership, China has long engaged in all-around and pragmatic cooperation to help Africa unlock its full potential and achieve lasting stability and prosperity.

China's cooperation is part of broader international support for Africa's development. Any serious discussion of the continent's development should recognize the role that China has played since the founding of the People's Republic of China in 1949. China's relationship with Africa has deep roots in anti-colonial solidarity, diplomatic recognition, medical assistance, education, infrastructure building, agriculture, trade and development financing.

One of the least appreciated dimensions of China-Africa cooperation is education. Since the early decades of the PRC, China has provided educational opportunities for African students. Over time, tens of thousands of African students, scholars, engineers, doctors, diplomats and public officials have studied or trained in China. Some have returned to Africa to serve in government, academia, business and public life across the continent.

Education has created not only professional skills, but also personal relationships and long-term familiarity between African societies and China.

China-Africa education cooperation continues through the Forum on China-Africa Cooperation, including scholarships, research collaboration, talent development and capacity building. This matters because education is one of the most durable forms of development. A bridge may require maintenance. A port may depend on trade volume. A railway may depend on financing. But an educated person carries capacity for life.

Infrastructure is another major pillar. Africa's infrastructure gap remains one of the largest obstacles to development. Without roads, railways, ports, power grids, digital networks, water systems and logistics corridors, African economies cannot fully industrialize. Through Belt and Road Initiative-related financing, construction and connectivity projects, China has helped support infrastructure development in many African countries.

Agriculture is equally important. Food security is not only a humanitarian issue, but also a sovereignty issue. China has provided agricultural support through expert missions, demonstration centers, training programs, seed technology, equipment and technical assistance. Hybrid rice cooperation is one example. In Burundi, Chinese technical support reportedly helped quadruple rice production in project areas. Agricultural cooperation, when done well, helps farmers feed families, support villages and strengthen national food security.

Development also requires finance and market access. The China-Africa Development Fund has supported Chinese investment in agriculture, infrastructure, manufacturing, industrial parks and resource development. More recently, China announced expanded zero-tariff treatment, which took effect on May 1, for African countries that have diplomatic ties with Beijing. This is significant because Africa does not only need loans or aid. It also needs the ability to export more agricultural goods, manufactured goods, processed foods, textiles and value-added products.

All these efforts fully embody the spirit of equal partnership and win-win cooperation. Standing together, China and Africa will continue to pursue common development and create a brighter future.

What They Say

PMI signals divergent sector performance

Editor's note: *China's composite purchasing managers' index stood at 50.5 in May, up 0.4 points from the previous month and above the 50 expansion threshold, showing an overall increase in business activity, according to data released by the National Bureau of Statistics on Sunday. Xinhua News Agency spoke to Huo Lihui, chief statistician at the National Bureau of Statistics, and Wen Tao and Wu Wei, both analysts at the China Logistics Information Center, to interpret the data. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The manufacturing PMI stood at 50, down 0.3 points from April, while the nonmanufacturing PMI came in at 50.1, up 0.7 points month-on-month, back into expansion territory, demonstrating divergence among different sectors.

The PMI for high-tech manufacturing and equipment manufacturing stood at 52.9 and 52.1, respectively, up 0.7 and 0.3 points from the previous month, demonstrating the leading role of new growth drivers. While the PMI for service sectors such as railway transportation, insurance, telecommunications, broadcasting, television and satellite transmission was above 55, indicating a major upswing driven by consumption during the May Day holiday from May 1 to May 5.

The manufacturing PMI dipped in May due to the pullback of previously strong external demand. Even so, the manufacturing sector operated steadily on the whole. Positive changes were seen in production activities, market prices and industrial structure, driving the economy toward high-quality and innovative development.

The business activity index of the construction industry was 48.8 in May, rising 0.8 points from the previous month, and sustained demand for urban renewal and the development of water networks, new-type power grids, computing power networks, next-generation communication networks, urban underground pipeline networks and logistics networks are expected to continue fueling infrastructure investment, thus stabilizing economic growth. The business activity expectation index of the civil engineering sector rose by more than 4 points month-on-month to over 55, hitting a new high for the year.

As policies for infrastructure construction keep delivering results and major projects are accelerated, the overall demand in the civil engineering sector is expected to gain solid momentum.

On the whole, the nonmanufacturing sector saw greater vitality in May than in April, with consumption and investment maintaining stable performance.

VIEWS

Stronger China-Laos ties on the horizon

Editor's Note: *The General Secretary of the Lao People's Revolutionary Party Central Committee and Lao President Thongloun Sisoulith is on a state visit to China from Tuesday to Saturday. Two experts share their views with China Daily's reporter Li Huixian on the building of the China-Laos community with a shared future.*

China-Laos cooperation reflects mutual commitment

China-Laos relations have remained stable in recent years, underpinned by consistent political trust and strong economic ties.

The two countries were among the first to sign an agreement to build a community with a shared future. Today, China is the largest investor in Laos and its biggest export market.

As Laos emerges from the shadow of the COVID-19 pandemic, its economy has gradually started recovering, strengthening its demand for closer economic cooperation with China.

Since the Middle East crisis broke out, Southeast Asia has faced growing challenges, including food and energy security, inflationary pressure and weakening growth drivers. Against this backdrop, many Southeast Asian leaders have visited China to strengthen regional and bilateral cooperation.

Visits by Singapore's Senior Minister Lee Hsien Loong and Vietnamese President To Lam are notable examples. Mechanisms such as "2+2" or "3+3" dialogues have emerged to facilitate these efforts. In this context, the visit of Lao President Thongloun Sisoulith is expected to further enhance bilateral cooperation between China and Laos.

China has two major railway projects in Southeast Asia: the China-Laos Railway and the Jakarta-Bandung High-Speed Railway in Indonesia.

The Jakarta-Bandung line benefits Indonesia's economy but does not directly connect with China. The China-Laos Railway, on the other hand, links China not only with Laos but also with the entire Indochina Peninsula, facilitating the flow of goods among China, Laos and other Southeast Asian nations.

This connection has boosted trade and logistics between China and countries such as Thailand and Malaysia.

As a landlocked country, Laos has benefited immensely from the China-Laos Railway, a flagship project of the Belt and Road Initiative. The railway not only serves as an economic engine, but has also had a spillover effect on key sectors.

In April, the Asian Development Bank noted that tourism will be a key driver of Laos' economic development.

The China-Laos Railway has played a crucial role in revitalizing tourism and boosting the Lao economy. Supporting services, infrastructure, and logistics have provided strong backing for the tourism industry, underscoring the benefits of China-Laos cooperation.

China has also assisted Laos in building hydropower stations, with dozens of plants either under construction or completed. Initially, Chinese companies primarily served as contractors.

Now, their involvement spans the entire process, including design, construction and operation. These efforts encompass social and cultural exchanges, employee training, and the provision of medical and educational services to local communities.

On April 21, the China-Laos 500-kV power interconnection project officially commenced operation. The project, another major achievement in deepening practical cooperation and advancing the Belt and Road Initiative following the China-Laos railway, is a key project under the action plan for the China-Laos community with a shared future.

China and Laos have set an example of successful cooperation in promoting the vision of "five homes" with the Association of Southeast Asian Nations: a peaceful home, a safe and secure home, a prosperous home, a beautiful home, and an amicable home.

The cooperation between China and Laos is evident not only in their bilateral community with a shared future but also as a key component of the China-ASEAN community, the Lancang-Mekong cooperation, and the broader initiative to build a community with a shared future for China and its neighboring countries. These multiple frameworks highlight that the cooperation between China and Laos reflects a mutual commitment.

SONG CHEN / CHINA DAILY

People-to-people exchanges bearing fruitful results

The visit of Lao President Thongloun Sisoulith coincides with the 65th anniversary of the establishment of diplomatic ties between China and Laos and marks the Year of China-Laos Friendship.

As a flagship project of the Belt and Road Initiative, the China-Laos Railway has transformed Laos from a landlocked nation into a land-linked hub.

Laos has been a major recipient of Chinese government scholarships for many years. The Confucius Institute at the National University of Laos launched the world's first undergraduate program for training Chinese-language teachers.

Meanwhile, the Confucius Institute at Souphanouvong University is advancing a dual-track education model that combines the Chinese language with vocational skills, having trained several thousands of Chinese-speaking professionals, 80 percent of whom have joined railway-related enterprises.

Since 2018, the Shanghai Institute of Technology has collaborated with Laos on a skills-plus-language training model. Consequently, China-Laos educational cooperation has become more precisely aligned with the increasing demand for both passenger and freight transport along the flagship railway.

President Thongloun's visit is expected to expand and solidify the "Chinese plus" model of vocational education, particularly in areas such as rail transit and logistics management.

China's poverty reduction experience has been effectively implemented in Laos, taking root in local villages.

Demonstration projects based on China's targeted poverty alleviation model, such as those in Ban Xor, Tha Dok Kham in Vientiane, and Tingsong in Luang Prabang, have improved infrastructure by building roads, providing water supply, and enhancing agriculture.

Mutual learning between civilizations is fostered through heritage conservation and the emotional impact of films and TV shows, making these exchanges more tangible.

Youth and media exchanges are key highlights. For many years, friendship exchange programs have enabled hundreds of young Lao nationals to visit China, returning with firsthand stories.

Meanwhile, the China-Laos health partnership continues to grow stronger. The first phase of the China-aided Mahosot General Hospital, the largest and most modern medical facility in Laos, is now operational.

These "small yet impactful" projects directly enhance people's livelihoods, strengthening the fraternal bond of "comrades and brothers" between China and Laos.

This visit is expected to solidify the foundation of these people-to-people connections and further deepen the development of the China-Laos community with a shared future.

Zhang Lei is an associate professor at the Institute of International Relations at Yunnan University.

Discovering beauty in the countryside

For years, my family and I have enjoyed spending our weekends in the picturesque rural areas surrounding Beijing.

We typically choose villages within a two-hour drive that offer stunning views of mountains or water and provide comfortable homestay services. These trips help us unwind by breathing fresher air, eating home-grown vegetables and sharing life stories with our hosts under the bright moon and glittering stars.

Of course, this relaxation comes at a cost. Each trip sets us back by around 1,000 yuan ($147.5), covering expenses such as gasoline, toll fees, meals and accommodation. The budget can go higher if we decide to visit nearby scenic attractions such as an ancient town, a karst cave or a section of the Great Wall.

I can't help but laugh at myself every time I pay for these rural escapes. Nearly 50 years ago, I was reluctant when compelled to go to the countryside, and now I willingly pay to spend a few days in villages. It's remarkable how much has changed during this time.

After graduating from high school in the late 1970s, city and town graduates like me were sent to rural areas for "re-education", a policy driven by the country's high unemployment rate and food shortages.

I vividly remember the day an old truck transported two dozen of us to a village about 100 kilometers west of my home city Xi'an, capital of Shaanxi province. Survival was difficult but what worried us most was the prospect of spending the rest of our lives in that impoverished village. The stream that flowed near the village and the nearby mountain were beautiful, but we were in no mood to enjoy their scenic appeal.

By 1978, when the "re-education" program ended, an estimated 17 million Chinese youth had been sent to rural areas to work as farmers over a decade.

When they returned to cities, they found it difficult to get jobs. Despite these challenges, they persevered and took up any job available. Many of them are among today's visitors to the countryside, drawn by nostalgia.

And they now discover that rural areas today are very different from the past. In 2021, the Chinese government announced that it had eliminated absolute rural poverty in the country. That meant all villagers had enough food to eat, warm clothes to wear and solid houses to live in.

The authorities did not stop there. In the past few years, rural revitalization efforts have been made to improve the living standards of villagers by encouraging them to take full advantage of their resources.

China's continuous investment has helped to link even the remote villages in mountainous areas with the outside world via high-speed rail tracks, expressways and country roads. Villages in southwest China showcase their ethnic handicrafts, while those in the northwest lure visitors with their unique wedding rituals and seasonal celebrations.

In the north, Mongolians offer paid horse rides on grasslands and tea growers in the south offer discounts to visitors to their tea farms. Villagers in other areas have also discovered they can attract city dwellers with fresh air, scenic views, fruit-laden trees, home-raised chickens and eggs, organic vegetables, and more.

Countryside tourism is gaining momentum in China. The rural tourism market size reached an estimated 1.5 trillion yuan last year, accounting for nearly half of the national tourism market. More than 7 million farmers are employed in this sector, contributing to prosperity in the countryside.

The ease of accessibility and affordability of rural tourism means the sector will continue to grow.

However, its sustainable development will depend on better planning and management, which calls for government coordination.

Some local governments are already taking steps in this direction. In some villages around Beijing, free Wi-Fi is available everywhere. Villagers building new houses are required to follow specific architectural styles, homestay hosts must change bed covers after guests leave, and restaurant owners can operate only after they pass certain health and sanitary inspections.

Such measures will make China's rural areas more beautiful and countryside tours safer and more enjoyable.

Importance of Vucic's visit goes beyond diplomacy

At a time when global politics is being shaped by sanctions, geopolitical polarization, technological restrictions and bloc confrontation, Serbian President Aleksandar Vucic's state visit to China last week reflects the emergence of a new geopolitical logic increasingly visible across Eurasia and the Global South.

Countries are no longer defining partnerships primarily through ideological alignment, but through sovereignty, infrastructure connectivity, industrial modernization and strategic development autonomy.

In many ways, China-Serbia relations have evolved into one of the clearest examples of long-term strategic statecraft built on mutual respect for territorial integrity and sovereign choice.

China has consistently supported Serbia's territorial integrity regarding Kosovo, while Serbia has firmly upheld the one-China principle.

This reciprocal support has gradually built what is described as an "ironclad friendship".

Unlike many modern partnerships shaped by tactical convenience, China and Serbia's relationship is durable because neither side attempts to impose political conditionality on the other.

That political trust now increasingly translates into institutional, economic and technological integration.

During the visit, the two countries signed 23 cooperation documents and 10 additional agreements across sectors ranging from artificial intelligence and industrial supply chains to education, green development, Belt and Road cooperation, legal coordination and technological innovation.

The two countries also issued joint statements on continuously promoting the building of a China-Serbia community with a shared future in the new era and jointly advancing the implementation of China's four major global initiatives.

The scale and strategic breadth of those agreements show that China-Serbia cooperation is evolving beyond infrastructure construction or trade expansion into a multidimensional long-term development partnership increasingly aligned with China's 15th Five-Year Plan (2026-30) and Serbia's own 2030 modernization strategy.

These complementary agendas naturally align, with both sides committed to deepening high-quality cooperation.

Economically, the relationship has already reached historic levels. Bilateral trade reached approximately $6.49 billion in 2025, growing by 13 percent year-on-year despite global trade uncertainty and slowing industrial growth in Europe.

According to Serbia's National Bank (NBS), from 2010 to 2023, China accounted for 14.3 percent of total FDI inflows into Serbia, making it Serbia's second-largest foreign investor after the Netherlands.

After the 2024 free trade agreement came into force, China became Serbia's major trading partner, reflecting rapidly expanding bilateral economic ties.

The China-Serbia FTA is China's first such agreement with a Central and Eastern European country.

It has already boosted Serbian agricultural and specialty exports to China, with some sectors registering an 80 percent growth in the first four months of 2026.

Although Serbia still runs a trade deficit with China, both countries are now seeking to address this in the next phase of high-quality trade and investment cooperation.

Belgrade increasingly appears less focused on short-term trade balance calculations and more intent on leveraging Chinese investment for long-term industrial upgrading.

That industrial transformation is visible across Serbia. Chinese-built projects such as the Budapest-Belgrade railway, the Miloš Veliki Highway, the Danube Corridor expressway and logistics modernization projects are reshaping Serbia's geographic role within Europe.

The newly signed 1.3 billion euro ($1.51 billion) agreement between Serbia and the Shandong Hi-Speed Group for the construction of the 83-kilometer Vozd Karadjordje high-speed corridor reflects how China-Serbia cooperation is evolving beyond symbolic diplomacy into long-term strategic connectivity that is steadily reshaping the economic geography of the Balkans.

The importance of the Budapest-Belgrade railway extends far beyond transportation efficiency.

The Chinese-built Serbian section has reduced travel time between Belgrade and the Hungarian border from more than five hours to just around 79 minutes.

These connectivity projects effectively compress economic distance across the Balkans and strengthen a strategic corridor connecting the Greek port of Piraeus with Central Europe. In geopolitical terms, Serbia is gradually transforming from a historically peripheral Balkan state into a key logistical bridge linking Asia and Europe.

Perhaps the most important dimension of Vucic's visit lies in the next phase of cooperation both sides are now preparing for. Serbia increasingly wants to move beyond being merely a transit hub and become part of China's future industrial ecosystem.

During the visit, cooperation discussions expanded into robotics, new technologies, semiconductors, AI, electric vehicle supply chains, smart manufacturing, green industry and digital economy integration. Serbian cities such as Kragujevac, Sremska Mitrovica, Niš, Belgrade and Novi Sad are positioning themselves as future gateways for Chinese electric vehicle manufacturers entering European markets.

Vucic's visit to Xiaomi's advanced EV factory in Beijing was symbolic in this regard. After witnessing highly automated production systems involving thousands of robots, Vucic publicly invited Chinese technology firms to consider Serbia as a future European investment and production platform.

Serbia clearly understands that the next phase of globalization will not revolve around low-cost labor or commodity trade, but around technological ecosystems, intelligent manufacturing and supply-chain positioning.

This is precisely where China's long-term development model becomes increasingly attractive to many middle powers.

Unlike short-term speculative capital flows, China's overseas engagement often combines infrastructure, industrial investment, logistics, technology transfer and market access within a long-horizon strategic framework.

Serbia appears to have recognized this earlier than many European countries.

At the geopolitical level, Serbia's balancing strategy also reflects wider global changes. Although Belgrade remains formally committed to EU integration, it increasingly views China as a reliable development partner that respects Serbia's strategic autonomy and sovereign decision-making.

Vucic's remarks before departing for China, questioning why external actors should dictate who Serbia can cooperate with, reflected the frustrations shared by many countries navigating an increasingly polarized international environment.

For China, Serbia represents something equally significant.

Serbia has become one of China's most politically trusted European partners and an increasingly important gateway into the Balkans and the wider European market.

More importantly, the relationship offers China a demonstration that cooperation with Europe can still expand despite rising geopolitical tensions, provided partnerships are grounded in mutual benefit rather than ideological confrontation.

Vucic said Serbia hopes China-Serbia cooperation in humanoid robots, robot dogs and other high-tech sectors will soon enter production, highlighting growing bilateral innovation ties.

He also announced that Chinese companies will invest an additional €940 million ($1.1 billion) in Serbia from July, supporting future projects in AI, advanced industrial robotics, data factories, auto parts manufacturing and energy.

Ultimately, Vucic's visit demonstrated that China-Serbia relations represent a broader international trend in which middle powers and developing countries seek strategic partnerships centered on connectivity, industrial modernization, technological cooperation and development sovereignty rather than bloc politics or geopolitical coercion.

The relationship is an example of how pragmatic multi-polar cooperation can still function, not through ideological uniformity, but through railways, factories, technology partnerships, industrial planning and sustained political trust.

GLOBAL VIEWS

JEAN-PAUL VARGAS

Clear choice to make

South-South cooperation and China's vision for high-quality development offer path to a shared future

WU HEPING AND CAO NAN / FOR CHINA DAILY

Global society stands at a critical juncture. The world faces a fundamental choice: to advance profound reform of global governance rooted in international law and inclusive multilateralism, or to risk a fragmented future marked by strategic rivalry and exclusive blocs. In this pivotal moment, China's policy direction, as charted during the 2026 two sessions and articulated in the Government Work Report and the 15th Five-Year Plan (2026-30), provides a compelling blueprint for collaborative, high-quality development. It offers a practical pathway for South-South cooperation, prioritizing shared prosperity over zero-sum competition.

China's policy directives are grounded in a proven record of resilient and forward-looking development. The 2026 Government Work Report reviews a robust 2025 where GDP grew by 5 percent, over 12.67 million urban jobs were created and new energy vehicle output surpassed 16 million units. This performance extends a remarkable five-year trend of an average 5.4 percent annual GDP growth, underpinned by the world's largest manufacturing sector in value added for 16 consecutive years.

Looking ahead, the 15th Five-Year Plan outlines a transformative vision for "high-quality development". Its goals are both ambitious and people-centered: maintaining GDP growth within an appropriate range, cutting carbon dioxide emissions per unit of GDP by 17 percent, raising the added value of core digital economy industries and increasing life expectancy to 80 years. Crucially, the plan emphasizes "investment in people" as much as in physical capital, with strategies to boost incomes, expand education and strengthen social security. This domestic focus on balanced, sustainable and innovation-driven growth — termed cultivating "new quality productive forces" — forms the bedrock of China's constructive international engagement.

A cornerstone of China's external strategy, emphatically reiterated in the 2026 Government Work Report, is to "further expand high-standard opening-up" and "steadily expand institutional opening-up". This moves beyond traditional market access to a deeper integration of rules, standards and governance practices. Key measures include advancing the upgraded China-Association of Southeast Asian Nations Free Trade Area 3.0 and actively promoting accession to high-standard pacts such as the Digital Economy Partnership Agreement and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership.

This commitment to "institutional opening-up", from between-the-borders trade and services to behind-the-borders alignment based on rules, is highly significant for the Global South. It provides a stable, predictable and rules-based framework for cooperation, aligning with the need for "demanding governance" in an increasingly fragmented world. By promoting the harmonization of standards in emerging fields such as the digital and green economies, China's approach helps partners integrate into modern supply chains, fosters technology transfer and creates a fairer business environment. It represents a shift from aid dependency to partnership based on mutual benefit and shared rules, a model that resonates with the development aspirations of Latin America, Africa and Asia, and charts a vision for reforming global governance.

China's domestic and foreign policies are coherently linked by a vision of reformed, inclusive global governance. The Government Work Report calls for "deepening multilateral, bilateral and regional economic cooperation" and upholding the multilateral trading system. This external policy complements the internal goal of building a "national unified market", which seeks to eliminate internal barriers and "rat-race competition" — a principle that, if applied globally, argues for reducing fragmentation and protectionism.

This implies, in a practical way, promoting South-South coalitions to raise common positions in multilateral forums, supporting procedural reforms, transparency, representativeness and clear rules, and promoting cooperative projects that produce tangible and measurable benefits.

At the center of the proposal is the spirit of pragmatism. Reforming global governance requires concrete tools: more accessible dispute resolution mechanisms for smaller economies, development financing less constrained by geopolitical conditions and robust platforms for technological cooperation on global public goods such as public health and climate adaptation. China's advocacy for these reforms, together with its commitment to South-South cooperation through platforms such as the China-CELAC Forum, demonstrates a practical approach. The forum's focus on solidarity, development and shared modernization exemplifies the principle of building a community with a shared future for humanity, based on mutual respect and benefit, not on pressuring third parties to take sides.

The heart of any crossroads is to make the right choice. In an environment of danger, that means choosing responsibly. At present, one path leads toward division and exclusive spheres of influence. The other, illuminated by the policy direction set at China's two sessions, leads toward integration, shared development and a reformed multilateral system. China's 15th Five-Year Plan and Government Work Report demonstrate that a nation can pursue high-quality domestic growth while simultaneously championing high-standard international cooperation.

For the Global South, this offers a relevant and actionable model. It is a vision where collaboration supplants confrontation, where common rules facilitate shared prosperity, and where the rightful pursuit of development and cultural identity is respected on the global stage. By choosing this path of "institutional opening-up" and South-South solidarity, the international community can navigate current uncertainties and build a more stable, equitable and prosperous future for all.

Transformative trajectory

Rise of China viewed through the lens of the "three worlds" nexus sheds light on the changing global political economy

SONG CHEN / CHINA DAILY

China's rise and its impact on global politics and economics have undergone profound changes since the late 20th century. Different frameworks can be applied to explain the stratification of global power, including today's global power relations shaped by the competition between China and the United States. Three distinct yet historically interconnected articulations of the "three worlds" paradigm can be identified: the political "three worlds" framework advanced by Chairman Mao Zedong in the early 1970s; the economic "three worlds" stratification developed by US sociologist and historian Immanuel Wallerstein around the same time; and a contemporary "three worlds" configuration marked by strategic China-US rivalry, the constrained position of Europe and other middle powers, and the evolving role of the Global South.

These "three worlds" concepts should not be understood as sequential replacements of one another, but rather as interconnected analytical lenses — political, economic and technological, each illuminating a different dimension of the world system. Together, they underscore the extent to which China's political and economic trajectory since 1949 has reconfigured the architecture of global politics and economics.

In the early 1970s, at the height of the Cold War, Chairman Mao advanced the theory of the "differentiation of the three worlds". It was a distinctly geopolitical framework, reflecting the dynamics of bipolar confrontation. It classified states according to political alignment and their position in global power struggles. In Chairman Mao's formulation, the first world consisted of the two superpowers — the US and the Soviet Union — both characterized as rival hegemonic and imperialist powers competing for global dominance. The second world encompassed the industrialized US allies, such as Western European countries and Japan, which, despite their economic strength, lacked independent influence in the bipolar order and were perceived as potential partners in resisting hegemonic domination on some issues.

The third world included most developing countries across Asia, Africa and Latin America, many of which had newly achieved independence and were associated with the Non-Aligned Movement. Chairman Mao positioned the third world as the principal force of global revolution, emphasizing its central role in opposing imperialism and safeguarding national sovereignty, while China sought to play a leading and mobilizing role within it.

After launching reform and opening-up in the late 1970s, China became embedded in a different configuration of global power stratification, as conceptualized by Immanuel Wallerstein's World-Systems Theory. Rather than classifying state power according to political alignment, this framework analyzes the world economy as a single historical system structured by unequal exchange and hierarchical divisions of labor.

Within this model, the world economy is organized into three structural zones: core, semi-periphery and periphery. Core zones command advanced technologies, financial resources and high value-added industries. Peripheral zones are largely relegated to the provision of raw materials and low-cost labor under conditions of structural dependency. Semi-periphery zones occupy an intermediate, transitional position within this hierarchy.

China's economic ascent since the new millennium can be interpreted as a dynamic upward progression through the stratified layers of the world economic system. China progressively incorporated itself into the world economy, emerging as a central destination for foreign direct investment and the relocation of labor-intensive manufacturing.

By leveraging its vast labor reserves and integrating into global value chains, China rapidly expanded its industrial base, export capacity and technological capabilities. Its development trajectory illustrates how participation in global production networks can support upward mobility of a nation within the world system, enabling the accumulation of industrial expertise, technological knowledge and competitive export strength.

However, structural barriers to upward mobility remain significant. Advanced technology, financial power and institutional influence are concentrated in the core Western economies, constraining the potential of late-industrializing states. Even when emerging states have industrialized successfully, they often remain dependent on external markets, foreign technologies and global financial systems. China's rise challenges this pattern.

Over recent decades, China has become the world's largest manufacturing hub and an indispensable node in global supply chains, while also developing strong capabilities in infrastructure, digital technologies and advanced high-tech industries. Widely regarded as a major non-Western economy to have significantly risen from peripheral and semi-peripheral status and taken a substantial share of the core economic sectors, China is reshaping the global balance of power and producing a new configuration of strategic competition.

Today, global economic and technological rivalry has increasingly centered on the US and China. This shift signals a partial evolution beyond the traditional core-semi-periphery-periphery framework toward a more concentrated configuration of global power.

The US continues to dominate global finance, high-technology innovation and military alliances. Its financial institutions, currency system and research networks remain central to the architecture of the world economy. China, by contrast, has developed an unparalleled manufacturing ecosystem with extensive logistics networks and large-scale infrastructure capabilities. Competition between these two countries increasingly shapes the trajectory of the international system. Trade regimes, technological development, digital infrastructure and energy transitions are all influenced by their strategic rivalry. As a result, the contemporary world economy is often characterized as a dual-core structure, with the US and China occupying dominant positions within the global hierarchy.

Beneath this dual core lies a group of advanced economies often described as "middle powers", including most members of the European Union, Canada, Australia and the United Kingdom. Although these states possess sophisticated industries and high levels of development, their technological capacity and political leverage to shape the trajectory of global competition remain limited.

The structural constraint facing middle powers stems from their deep integration into both systems. Many remain embedded in US-centered financial infrastructure and security alliances, while simultaneously maintaining strong economic ties to Chinese supply chains and trade networks.

At the same time, the Global South is gaining new opportunities within this evolving order. Countries in Asia, Africa and Latin America are gaining more bargaining power and leveraging great-power competition to attract investment, infrastructure financing and technological cooperation, as well as supply chain diversification. Many Global South economies control critical raw materials, and rising demand for these resources is increasing their geopolitical and economic importance.

In recent years, de-risking strategies, tariffs and trade restrictions led by the US and its allies have encouraged China to deepen its engagement with developing countries. As a result, trade between China and other Global South countries has expanded rapidly. Chinese exports to other Global South countries now exceed $1.6 trillion, accounting for around 44 percent of its total exports. For the Global South, China represents not only an inspiring model of development but also a source of upward mobility, enlarging their room for maneuver while providing an alternative source of investment and serving as a significant trading partner. This, in turn, broadens the range of economic opportunities and reduces exclusive dependence on traditional Western economies.

In conclusion, China's rise is inseparable from its shifting position across different "three worlds" configurations over time — from Chairman Mao's geopolitical conception of the "three worlds" to Wallerstein's world economic stratification, and finally to the contemporary geo-technological configuration. The evolution of the "three worlds" nexus thus provides not only a framework for interpreting China's development trajectory, but also a lens for understanding the ongoing transformation of the global political economy.

CULTURAL HERITAGE

From left: Representative jade artifacts of the Hongshan culture (dating from roughly 6,500 to 5,000 years ago) on display include a C-shaped yellow jade dragon, a jade pig-dragon and a jade human figure. Golden Antler Step-Sway Crown Ornament, Northern Wei Dynasty (386–534). PHOTOS BY BAI SHUHAO / CHINA DAILY AND PROVIDED TO CHINA DAILY

The alchemy of gold and jade across dynasties

From imperial crowns to Olympic medals, treasures reveal the evolution of Chinese civilization over millennia, **Bai Shuhao** reports in Hohhot.

Left: The Xiongnu King's Crown, dating to the Warring States Period (475–221 BC), is topped with an eagle featuring a turquoise head. LI HE / XINHUA
Above: The crown of Empress Xiao (replica), wife of Emperor Yang of the Sui Dynasty (581–618). The exhibition displays the two crowns facing one another. BAI SHUHAO / CHINA DAILY

In a dimly lit gallery, two jeweled crowns face one another, their gold surfaces glimmering in the darkness.

One, a ceremonial crown belonging to an empress of the Sui Dynasty (581-618), blossoms into 13 delicate floral sprays crafted from 10 different materials, its extravagance reflecting the wealth, sophistication and artistic refinement of southern China's agrarian civilization.

Opposite stands the crown of a Xiongnu tribal leader from the Warring States Period (475-221 BC). Topped with a golden eagle with a turquoise beak, it embodies the stark power of the northern steppe.

The rulers who wore them lived centuries apart, but their crowns now meet in a single exhibition, united by two materials that have shaped Chinese civilization for millennia: gold and jade.

The pairing has become one of the most striking moments in *Golden and Jade Brilliance: Diverse and Splendid China*, an exhibition at the Inner Mongolia Museum in Hohhot that runs through Aug 31.

"The way they face each other across the gallery perfectly echoes this year's Museum Day theme — 'Museums Uniting a Divided World'," says Zheng Chengyan, the exhibition's curator and deputy director of the museum.

Bringing together 386 artifacts from 58 museums and cultural institutions across China, the exhibition, which opened on May 18 for International Museum Day, traces nearly 9,000 years through jade carvings, bronze ware and gold objects, exploring how Chinese civilization emerged, evolved and flourished across vast regions and different cultural traditions.

"Gold symbolizes power and eternity, while jade embodies virtue and belief," Zheng says. "Together, they reflect how material culture shaped Chinese ideas of power, morality and the cosmos."

The exhibition argues that the histories of gold and jade did not develop separately, but gradually became intertwined as political authority and ethical ideals grew increasingly connected over time.

Upon entering the gallery, visitors first encounter three jade relics from the Hongshan culture of northeastern China, dating roughly from 6,500 to 5,000 years ago: a jade pig-dragon, a C-shaped yellow jade dragon and a jade human figure.

The pig-dragon, with the head of a pig and the coiled body of a dragon, was likely used in rituals seeking harmony and good harvests. The C-shaped jade represents one of the earliest dragon forms in Chinese art. The standing figure, just over seven inches tall, is believed to depict a praying shaman.

Nearby artifacts from the Liangzhu culture in Zhejiang province and Lingjiatan culture in Anhui province, both in the Yangtze River Delta, suggest that early societies across the country, despite regional differences, were already developing shared concepts of rituals and civilization.

"By the late Hongshan period, six major jade cultures had emerged," Zheng says. "What they shared was reverence for heaven, ancestors and nature."

Advances in metallurgy ushered China into the Bronze Age. During this period, the Chinese word for "gold" often referred not to precious metal, but to bronze ritual vessels.

Among the highlights are a gold-masked bronze human head from Sanxingdui, dating to the Shang Dynasty (c. 16th to 11th century BC), and the monumental "Zeng Zhong You Fu Hu", meaning Vessel Hu of You Fu, the second son of the Zeng family, a ritual bronze vessel from the Spring and Autumn Period (770-476 BC).

"From the moment metal objects began to flourish, jade never lost its sacred role," Zheng says.

Beginning in the Xia Dynasty (c. 21st-16th century BC), jade and bronze were frequently used together in elaborate ritual systems that regulated rank, conduct and political authority.

By the Warring States and Han Dynasty (206 BC-AD 220) periods, gold and jade had evolved from parallel traditions into a shared artistic language. Gold-and-jade objects became symbols of imperial grandeur and cosmopolitan culture.

At the center of the third section stands a replica of a Han Dynasty jade burial suit sewn with gold wire.

Fashioned from hundreds of polished jade plaques linked by gold threads, the suit was designed to preserve the body after death. Though the practice emerged earlier, it reached its height during the Han Dynasty.

"It was a cultural milestone and represents the ideas of immortality and eternity embedded in gold-and-jade culture," Zheng explains.

Alongside the suit are funerary objects excavated from ancient tombs, including hoof-shaped ingots from the tomb of the Marquis of Haihun in Jiangxi province, as well as jade mouthpieces and burial plugs used in funerary rites. Though the dethroned ruler only held the title of emperor for 27 days, his tomb has yielded a remarkable wealth of artifacts, historical clues and enduring legends.

One object deliberately breaks the exhibition's chronology: a jade cicada from the tomb of a Khitan princess of the Liao Dynasty (916-1125). Though jade burial customs originated in the Han Chinese heartland, Zheng says, they later spread to frontier cultures as well.

After the Han Dynasty, trade along the Silk Road flourished, bringing northern horsemen and Central Asian merchants into closer contact with China. Nowhere was that exchange more visible than in what is now Inner Mongolia, long situated between the agrarian civilizations of Central China and the nomadic cultures of the steppe.

That fusion defines the exhibition's fourth section, devoted to the period from the Wei and Jin dynasties (220-420) through the Song (960-1279) and Yuan (1271-1368) dynasties.

"When people think of the Yuan Dynasty, they immediately think of blue-and-white porcelain," Zheng says. "But nomadic peoples were also deeply devoted to gold ornaments."

The exhibition features numerous gold ornaments used on horseback, including saddles, stirrups and bridles.

In jade carving, nomadic influence appeared most clearly in the motifs known as "spring water" and "autumn mountain", scenes derived from seasonal royal hunts. One Yuan Dynasty jade belt ornament depicts an eagle attacking a swan, a reference to spring falconry expeditions once practiced by steppe rulers.

Over time, such imagery spread far beyond the grasslands, eventually appearing even in decorative ornaments atop Ming Dynasty (1368-1644) officials' hats.

By the Ming and Qing (1644-1911) dynasties, the meaning of jade had broadened further, while colorful gemstones began appearing throughout the gallery.

"Those gemstones came to China through the Maritime Silk Road, bearing witness to the exchanges made possible by Zheng He's voyages," Zheng Chengyan says.

By this period, the fusion of gold and jade craftsmanship had reached its artistic peak. No longer merely precious materials, gold and jade had evolved into enduring symbols of beauty, prosperity, integrity, and moral virtue.

The exhibition closes with objects from the modern era: medals from the 2008 Beijing Olympics, whose designs deliberately combined gold and jade in homage to ancient Chinese traditions.

Zhou Huiwen, director of the Changsha Museum, whose institution loaned artifacts to the exhibition, says she is struck by both the refinement of the objects and how deeply the symbolism of gold and jade still resonates in China today.

"They have always represented status and the pursuit of a better life," she says.

Wang Ziyi, deputy director of the Xi'an Museum, says the most astonishing object for him is the jade pig-dragon.

"It's remarkable that people so many thousands of years ago could already combine the image of a dragon with that of a pig," Wang says.

"Gold and jade objects in ancient China took many different forms, and this exhibition reflects the richness and diversity of Chinese civilization."

China has an old saying: *qi yi zai dao* — "objects carry the way".

Gold and jade, the exhibition suggests, are more than precious materials or decorative crafts. One is forged by human hands; the other shaped by nature. One dazzles sharply; the other glows with quiet restraint.

Together, they form two sides of Chinese civilization.

Near the exit, the exhibition offers one final reflection: the union of gold and jade embodies an Eastern philosophy that values harmony, order and continuity. Though silent, their voices still echo across millennia.

Yuan Hui contributed to this story.

New book reflects on defining decade of archaeology

By **WANG RU**
wangru1@chinadaily.com.cn

Left: Li Xinwei (right), director of the Chinese School of Classical Studies at Athens, visits the Minoan mountain village site on the Greek island of Crete with Greek archaeologist Yiannis Papadatos last year.
Right: Cover of the book, *The Past Decade of Chinese Archaeology (2016-26)*. PHOTOS PROVIDED TO CHINA DAILY

Archaeologist Peng Xiaojun of the Institute of Archaeology under the Chinese Academy of Social Sciences recalls how, in 2013, he and his colleagues had to tether a hot-air balloon to themselves while taking aerial photographs of a site in Hubei province, worried it might drift away. By 2017, one of his colleagues had assembled a drone capable of capturing panoramic views. Today, drones are widely available and have become an essential tool in archaeological fieldwork.

"Over the past decade, advances have extended far beyond equipment and technology. China's archaeological research has made progress across many fronts," Peng said at a news conference in Beijing on Wednesday, where scholars presented the institute's latest academic achievements.

Among the highlights is a new book, *The Past Decade of Chinese Archaeology (2016-26)*, compiled by institute researchers. The volume provides a comprehensive review of the evolution of archaeological research in China over the past 10 years.

The book is divided into 12 chapters, covering not only major findings from different periods — such as the Neolithic, Xia (c. 21st century-16th century BC), Shang (c. 16th century-11th century BC) and Zhou (c. 11th century-256 BC), and from the Qin (221-206 BC) to the Qing (1644-1911) dynasties — but also cutting-edge topics, including the use of big data and artificial intelligence in archaeology, technological and scientific applications in archaeology, and archaeological work in border regions, according to Peng, who contributed to the volume.

Peng said two key themes have defined Chinese archaeology over the past decade: the origins of Chinese civilization and the question of "what makes China". These priorities reflect major national research programs aimed at demonstrating that China's history encompasses more than a million years of human activity, 10,000 years of cultural development, and over 5,000 years of civilization.

International collaboration has also become a defining feature of the field, according to the book. In addition to hosting academic forums and conferences, Chinese archaeologists have increasingly partnered with overseas counterparts on excavations abroad, contributing to a broader understanding of Chinese civilization in world history.

Another book highlighted at the conference, *Way of Wisdom That Bridges the East to the West*, examines Chinese archaeologists' collaboration with local professionals at five key sites of ancient civilizations, such as the Temple of Montu in Egypt, the Mingtepa and Munchaktepa sites in Uzbekistan, and the Dobrovat site in Romania.

Jia Xiaobing, head of the institute's world archaeology research office and a contributor to the book, said the five projects reflect China's growing role in international archaeology. They have produced valuable firsthand research materials while helping to fill important gaps in related academic fields.

"Over the past decade, China's overseas archaeological work has undergone a profound transformation — from occasional participation to systematic leadership, from exporting technology to jointly developing research concepts, and from following international trends to helping shape them," Jia said. "Chinese archaeological ideas, methods and technologies are now making a stronger contribution to global archaeological research."

The growing integration of science and technology is another major trend highlighted in *The Past Decade of Chinese Archaeology (2016-26)*. "Multidisciplinary research has become standard practice. Techniques such as ancient DNA analysis, high-precision dating, 3D modeling, and laboratory archaeology are now widely used, making collaboration across disciplines an integral part of archaeological research," Peng said.

For example, the conference also highlighted an essay compiled by field archaeologists and archaeometry (scientific methods and technology used in archaeological studies) professionals about the carbon dating of the Erlitou site in Luoyang, Henan province, widely believed to be a late capital of the Xia Dynasty.

Chen Xianglong, a researcher at the institute's research center for archaeological science and experiment, said the chronology of the site was once established mainly through comparisons of pottery forms. Today, researchers can analyze key remains and apply carbon-dating techniques to develop a far more precise understanding of the site's timeline and evolution.

"Archaeometry studies allow us to gain richer archaeological information, expand the scope of research, deepen our analysis, and improve the efficiency, depth and precision of our work," Chen said.

LIFE

Capturing art's enduring power in the era of AI

With technology quickly advancing, writers and filmmakers explore and share how they continue to find inspiration to create works that resonate, **Xu Fan** reports.

Dear You, one of the biggest dark-horse blockbusters this year, has become a hotly debated example of how a resonant work rooted in real-life inspirations can soar to become a hit.

From left: Sub-forums of the Forum on Building up China's Cultural Strength 2026 brought together veteran creators, including director Lan Hongchun, scriptwriter He Jiping, novelist Ma Boyong, and writer Qiu Huadong. PHOTOS PROVIDED TO CHINA DAILY

As a veteran writer and vice-chairman of the China Writers Association, Qiu Huadong says he has often been asked multiple versions of the same question: In an age shaped by artificial intelligence and information overload at ever-accelerating speed, where can literature continue to find its inspirational energy?

His answer remains consistent: the wellspring of artistic creation still rises from "the soil beneath our feet" and from the long cultural memory carried through 5,000 years of Chinese civilization.

Qiu delivers this resonant line in the opening of his speech at the Forum on Fostering the Development of Art and Literature, one of 11 sub-events of the Forum on Building up China's Cultural Strength 2026, the country's top-tier cultural gathering, held in Shenzhen, Guangdong province, in late May.

Bringing together writers, artists and scholars, the subforum wrestled with a question often discussed yet difficult to answer: how to preserve originality and create quality works in an era when technology is rapidly reshaping the way art is produced and consumed. Finding a solution is complicated.

Contemplating history

With a writing career spanning over 40 years, Qiu cites *Kong Cheng Ji* (The Chronicles of Empty Cities) as an example of how he puts his philosophy into practice.

Born in the Xinjiang Uygur autonomous region, Qiu moved to Beijing after graduating from Wuhan University in Hubei province in the early 1990s. He revealed that he has made it a habit to return to Xinjiang every year in search of inspiration.

During his journeys, venturing deep into sparsely populated areas that preserve relics such as the Kizil Caves or that were once the sites of vanished kingdoms like Loulan, questions haunted him: "Could these silent artifacts speak? Could the lost ancient cities be brought back to life through imagination?"

This contemplation sparked the inspiration to pen his novel. Selecting six historic cities in Xiyu — a historical and geographical term referring to today's Xinjiang and surrounding Central Asian areas — the novel adopts an unconventional narrative method by making cultural relics and artifacts the storytellers. For instance, a Han Dynasty (206 BC-AD 220) bronze coin, a carved Buddha head, and a spotted horse from a rock painting become some of the protagonists.

"I hope through these small and focused entry points, history will no longer be a cold term in textbooks, but rather a collection of living moments that are warm and breathing with life," says Qiu.

Ma Boyong (Ma Li's pen name), a novelist known for embedding fictional thrillers in real historical settings, points to another key element in creating history-themed works: they should resonate with modern emotions.

Remaining loyal to major historical events while exercising imagination on minor details is a principle he follows. To further explain, he cites the famous historical event "Hongmen Yan" (Feast of Hongmen), which took place at a titular location outside Xianyang, the former capital of the collapsed Qin Dynasty (221-206 BC).

The banquet, hosted by the rebel army's leader, Xiang Yu, in honor of his rival Liu Bang, was designed as a deadly political trap. However, the arrogant Xiang hesitated to kill the seemingly humble Liu — a moment of mercy that led to Xiang's catastrophic downfall and altered the course of Chinese history.

"Why Xiang did not make his move cannot be found in historical records, but it can be inferred from human nature. The 26-year-old, high-spirited Xiang, facing the 50-something, aging Liu, could hardly have foreseen the latter's future glory," says Ma, who has used this event on multiple occasions to exemplify the space available for novelists to add their imaginations.

A scene from *New Dragon Gate Inn*, one of the most influential martial arts films, demonstrates how a conventional genre can be innovated.

He shares that many young readers fancy the cultures that prevailed during the Tang (618-907) and Song dynasties (960-1279), reflecting the country's growing national strength and cultural confidence. "Every era has its own distinct Chinese character, but those of us living in the present will naturally seek out the spirit of the age that mirrors our own," says Ma.

Pursuing authenticity

Another recurring theme at the forum was the importance of maintaining sincerity with audiences and grounding stories in real life.

Director Lan Hongchun, best known for the recent hit *Dear You*, says during the Forum on High-Quality Development of the Film Industry, held alongside the literature forum on May 22, that "pure, authentic and warm local stories will always have the power to move people's hearts".

The film, which concludes Lan's trilogy about families from the Chaoshan region of eastern Guangdong province, follows the daughter of a Chinese-Thai hostel owner who spends 18 years sending money and letters to the widow of a deceased family friend who once saved her father from an arson attack. The man, a Chaoshan native who fled his hometown to avoid forced conscription by the Kuomintang, was later killed in Thailand while trying to stop gangsters from robbing a fishing boat. To spare his widow the pain, the woman hides the truth and continues writing letters in his name.

Lan says the film marks a departure from his comfort zone, as he sought to realistically portray the history and lives of overseas Chinese communities in Southeast Asia.

To prepare for the production, he and his team traveled extensively, interviewing nearly 300 overseas Chinese families across Southeast Asia, Europe and the United States. Their research uncovered a wealth of historical details, ranging from the price of a movie ticket in 1960s Thailand to the era's licensing rules governing tricycle operators.

One of the film's emotional highlights is the featuring of *qiaopi* — remittance letters sent home by Chinese laborers who left China's southeastern coast to work abroad between the 19th and 20th centuries. Carrying homesickness, longing and familial affection, the letters have deeply resonated with audiences, especially when paired with the film's original version spoken in the Chaoshan dialect.

In an earlier review, Gao Shiming, vice-president of the China Federation of Literary and Art Circles, reflects on the emotional power of *qiaopi*, noting that more than 30 million such letters are estimated to have reached China over 150 years.

"Many of those who sent and received these letters could neither read nor write, yet the scribes they hired transformed ordinary daily matters and heartfelt concerns into elegant, meticulous and deeply moving words," Gao writes.

More importantly, he adds, *qiaopi* embodies not only separation and longing, but also the hardships and livelihoods of overseas Chinese laborers. Combining remittances with personal correspondence, the letters often carried small sums of money saved through frugal living abroad — funds that represented hope for buying rice, oil, salt, and firewood for family members left behind.

Veteran screenwriter He Jiping pushes the discussion further at the literature forum by emphasizing the deeper responsibility of artistic creation. Nearly four decades ago, He, already an acclaimed playwright, left Beijing to reunite with her family in Hong Kong, where she expanded from stage writing into film and television screenwriting.

In 1991, director Tsui Hark was drawn to her celebrated stage play *The First House Under Heaven*, and invited her to write the screenplay for *New Dragon Gate Inn*, the martial arts classic about swordsmen battling a ruthless eunuch and his henchmen in the remote desert during the Ming Dynasty (1368-1644).

The screenwriter reveals that her grounding in traditional Chinese culture and previous years living on the Loess Plateau in northwestern China inspired her to break away from the lush landscapes commonly associated with *wuxia* (martial arts) films. Instead, she chose the desert setting of shifting sands, which later became one of the movie's most distinctive visual elements.

Now 75, He remains demanding of her own writing. She says it is not enough for a script to simply offer a compelling story or memorable characters. "A good work should leave audiences carrying contemplation with them, not just applause, when they walk out of the theater," quoting the late playwright, Cao Yu.

She adds that writers also need what she calls a "second pair of eyes" — the ability to observe human nature from a broader perspective. Such awareness, she says, allows storytellers to infuse their works with greater humanity, emotional depth and lasting resonance.

Australian visitors give China study tours a 10

MELBOURNE — In a meeting room at the Chinese Consulate General in Melbourne in May, a group of Australians recently recalled their visits to China with visible excitement: "I give the China trip 10 out of 10!" "I went twice, so I give it 20!"

From the modern dynamism of Chongqing and the historical charm of Xi'an, Shaanxi province, to the vibrant atmosphere of Changsha, Hunan province, the memories were still fresh.

"After returning from China, I no longer bother arguing with people about the country. I just tell them: go and see it for yourself," says Robert Barwick, national chairman of the Australian Citizens Party.

In October 2025, Barwick joined 18 other Australians from different sectors in a 21-day study and goodwill tour to China, organized by Richard Yuan, chairman of the Australia China Entrepreneurs Club. The delegation visited Haikou, Hainan province; Nanjing, Jiangsu province; Shanghai; Hangzhou, Zhejiang province; Shenzhen, Guangdong province; and several other Chinese cities.

From March to April, the delegation organized another visit to more Chinese cities.

During the trips, delegation members held in-depth discussions with local officials, visited high-tech companies, experienced China's medical services, and learned about the history of the Communist Party of China at the Museum of the Communist Party of China and the Site of the First National Congress of the CPC.

For John Lander, in his 80s and who served as Australia's deputy ambassador to China from 1974 to 1976, the trip was also a journey of rediscovery.

During his visit, Lander met Xia Boyu, a Chinese mountaineer who reached the summit of Mount Qomolangma despite having lost both legs. To Lander, Xia embodied the Chinese spirit — "stand, endure, and succeed".

Noelene Isherwood, co-founder of the Australian Citizens Party, says the China trip felt "like walking from a blizzard into a warm room". What impressed her most was the spirit of the Chinese people.

"They are fast-paced and optimistic," she says, adding that what stood out to her was the country's "happiness, unity and sense of purpose".

Her husband, Craig Isherwood, national secretary of the Australian Citizens Party, was struck by the growth of Chinese enterprises. He notes that many companies that began as start-ups two decades ago have, with government support, grown into multinational firms worth billions of dollars.

"China's market economy is for the benefit of the people," he says, rather than for the benefit of large corporations.

For business strategy consultant Antony Hing, the visit awakened a deeper connection with his Chinese heritage. After returning to Australia, he began reading the CPC regulations and the Constitution of the People's Republic of China.

Hing says the CPC always "thinks into the future" and he was amazed by "how focused China is on bringing its entire population into the era of modernization".

At the discussion, participants spoke at length about what they had seen and felt in China. Yuan says there was a huge gap between people's real experiences in China and the narratives often presented by Western media.

He says he was determined to continue organizing study and goodwill tours, so that more Australians could see China with their own eyes.

Members of a group of Australians exchange views about their visits to China in a meeting room at the Chinese Consulate General in Melbourne on May 22. XU HAIJING / XINHUA

Clockwise from above: Svetlana Kobiakova at Chengdu Grand Theatre to watch an opera in May. Kobiakova strikes a traditional tai chi pose in front of the Chinese Tai Chi Museum in Chenjiagou village, Henan province, in October 2025. She practices tai chi fan in Yakutsk, the Republic of Sakha, Russia, in 2018. PHOTOS PROVIDED TO CHINA DAILY

Russian master follows tai chi to ancient roots

After leaving behind a career in physics, Svetlana Kobiakova has devoted herself to practicing and teaching the Chen-style martial art in its birthplace of Chenjiagou, **Qi Xin** and **Shi Baoyin** report in Zhengzhou, Henan.

In the pale light of dawn, a solitary figure stands in a courtyard in Chenjiagou village of Wenxian county, Henan province. With her legs bent and arms encircling the air, Svetlana Kobiakova, 59, from Russia's Yakutsk, holds a *zhanzhuang* (standing meditation) posture.

Several minutes later, she flows into the Chen-style *taijiquan* (tai chi boxing) routine. Her movements are silk-smooth, her breath deep.

Kobiakova, a disciple of Chen-style tai chi, has immersed herself in tai chi practice for 15 years. She now serves as a master at Chenjiagou Taijiquan School.

At a glance, you might mistake her for a local. Known by her Chinese name, Chen Yimei, Kobiakova belongs to the Sakha (Yakut) ethnic group of Russia, a people with ancient Siberian roots who share striking physical similarities with East Asians.

Over the years, she has visited Chenjiagou, the birthplace of Chen-style tai chi, 13 times. Last September, she started her longest journey, a full year of immersion in the village that has become her spiritual home.

"The philosophy, technique, and internal energy of tai chi have endless layers waiting for me to explore," she says.

Before tai chi, her life was a model of rationality. She worked as a physics teacher, a researcher at an institute, and a specialist studying the physical properties of diamonds. Her world was governed by data and logic.

She had tried other martial arts, such as karate and taekwondo, but none touched her heart.

Her introduction to tai chi came when she accidentally witnessed someone practicing the art, and she then learned the basics from a practitioner in Russia. However, she soon found herself unable to make progress.

"I reached a clear conclusion, to learn real tai chi, you must go to its root," she says.

So, she emailed the Chenjiagou Taijiquan School and received a warm invitation. Arriving there in 2011, she found something unexpected.

"I felt an unexplainable sensation of peace and joy," she says softly. "Tai chi gets deeper the more you learn. It's like climbing endless mountains. Every time you reach one peak, you see a higher one ahead. There is never an end to progress — and that is its greatest charm.

Svetlana Kobiakova practices tai chi with Chen Ziqiang, her master at the Chenjiagou Taijiquan School, in August 2024. PROVIDED TO CHINA DAILY

"I used to suffer from bronchitis. Practicing tai chi has helped me feel more balanced and relaxed physically," she says.

"I think tai chi also reshaped my temperament, making me calm, positive, and peaceful."

Chen Ziqiang, her master, head coach at the Chenjiagou Taijiquan School and a 20th-generation descendant of the Chen family, praises her dedication.

"She is diligent and hardworking, practicing and deepening her understanding of tai chi culture," he says.

"Tai chi is a vivid and concrete embodiment of traditional Chinese culture. While much of traditional Chinese heritage is abstract and profound, tai chi is observable and learnable, offering and showing the wisdom and philosophies of Chinese culture."

From 2012 to 2015, Kobiakova achieved outstanding results in major international tai chi competitions worldwide. She was the European champion five times and a silver medalist at the 1st World Taijiquan Championship held in Chengdu, Sichuan province, in 2014.

Furthermore, she serves as a certified referee for the Russian Wushu Federation.

Having taught both Chinese and Western students, Kobiakova offers unique insights into cross-cultural learning. She has resigned from her research career entirely and founded her own tai chi school in Russia.

Now, Kobiakova is the first foreign master to teach tai chi at Chenjiagou Taijiquan School.

"My students range from 6-year-old children to 80-year-old elders," she says, adding that nationalities approach the discipline differently.

"European learners are usually more relaxed in the beginning," she says, but once foreign learners truly immerse themselves in tai chi's inner logic and philosophy, they become equally devoted and persistent.

"Deep down, all people are the same," she insists. "Everyone who loves tai chi is seeking inner peace, balance, and self-improvement."

She draws a contrast between tai chi and entertainment such as music or other sports.

"Music comforts the soul, but tai chi heals the body and cultivates the spirit at the same time. It is a lifestyle, a philosophy, and a treasure that deserves to be shared worldwide."

Kobiakova devotes about eight hours a day to tai chi. "Evening training has a different quality," she explains.

"The busy day quiets down. The body has been awake and moving, and the mind is finally ready to absorb."

Dai Ruijun, 43, a Chinese student from Xinyang city, Henan province, followed her 15-year-old son to Chenjiagou four years ago.

She recalls noticing Kobiakova early on. "Her tai chi skills are exquisite, and she treats everyone with warmth and kindness," she says.

Dai's son is taught by Kobiakova. "She even uses English to teach him the moves, correcting his postures while helping him build a language foundation," Dai notes.

"My son has become calmer, more focused, and more resilient. Tai chi is wonderful for teenagers," she adds.

Kobiakova plans to continue promoting traditional Chen-style tai chi when she returns to Russia, aiming to introduce more people abroad to Chinese culture.

"Tai chi gave me a new life," she says. "I hope I can spend my whole life passing this treasure on to the world."

Harvard students explore China's culture and tech

Inside the Shenzhen headquarters of Chinese electric vehicle giant BYD, Harvard student Iseult Alice Fitzpatrick looked on in disbelief as a car rolled smoothly forward, balanced on just three wheels during a technology demonstration.

"This feels like the future," she said. Later, she climbed into several of the company's vehicles, trying out smart driving features and peppering engineers with questions about BYD's latest technology.

Over nine days from May 17 to 25, Fitzpatrick and fellow Harvard students and faculty members traveled from Shenzhen to the southwestern province of Guizhou and then to Beijing as part of a China-US exchange program with students from Peking University.

Along the way, they toured technology companies, stood atop the world's tallest bridge, and wandered through the courtyards of the Forbidden City (Palace Museum). For many of the students, the trip offered a new perspective on China.

The delegation's first stop was the Shenzhen Reform and Opening-up Exhibition Hall, where students traced the arc of a city that rose after China launched its reform and opening-up policies in the late 1970s and has since become a hub for advanced manufacturing and technology.

Inside the museum, exhibits demonstrated how a modest fishing village on China's southern coast changed over four decades into one of the country's most dynamic urban economies.

The pace of change left a strong impression on the visitors.

"Building a city like this in just a few decades is remarkable," said William Betts Wiltshire. "It speaks to the coordination and strategic thinking that shape how the country develops. I was deeply impressed."

From China's southern coast, the delegation continued inland to Guizhou, a province known for its steep mountains and deep valleys. Its rough karst terrain has long made travel difficult, requiring bridges and tunnels to connect the landscape.

Today, more than 32,000 bridges have been completed or are under construction across the province.

The Huajiang Grand Canyon Bridge, a steel-truss suspension bridge on the Liuzhi-Anlong Expressway, was a highlight of the visit. Certified by Guinness World Records in April 2026 as the world's highest bridge, it rises 626.01 meters above a deep gorge. It has also been developed as a tourist site, with glass elevators, bungee platforms and night light displays illuminating the canyon walls.

For many students, the view contrasted sharply with China's coastal cities, indicating how far development has spread into the interior.

"I expected this level of development in Shanghai," said Jose Enrique Vera Ortega. "But I didn't expect it here. It's not just the big cities. It feels like development is happening across the country at the same time."

In Beijing, the delegation moved into the country's cultural center of gravity.

At the Palace Museum, students moved through vast courtyards and along rigid imperial axes, guided past red walls and golden roofs that have framed centuries of dynastic life. Students paid close attention as guides described architectural intricacies and symbolism, pausing frequently to photograph carved beams and painted ceilings.

For some, the experience shifted history from abstraction to something physically present.

"History feels real here," said a Harvard student. "You're not just learning about it. You're standing inside it."

Earlier in Guizhou, students had tried their hands at traditional indigo dyeing, folding and binding cloth before dipping it into deep blue vats. The patterns slowly emerged as an ancient craft took shape in real time.

"It's beautiful, and it has depth," said Carla Isabel Gamarra Martinez, who took home dyed pieces for her family. In her view, closer engagement with another culture from the East could open up a broader perspective.

"The trip wasn't just sightseeing," said Liu Ziyi, an international student at Peking University who studies art. "It gave us a real sense of what culture can mean. I hope to build bridges between cultures with art."

The visit is part of a broader effort to bring 50,000 young Americans to China over five years for study and exchange. Since the initiative's announcement in November 2023, institutions on both sides of the Pacific have scheduled a variety of programs, including cultural trips, sporting events, and technology-focused seminars.

Doris Sommer, a Harvard University professor on the trip, said she hoped exchanges with Chinese counterparts would continue in the years ahead, deepening mutual engagement and expanding opportunities for collaboration and talent development.

"Future programs will be expanded to give more young people from both countries opportunities to engage and learn from one another," said Yu Changxue, director of the China Center for International People-to-People Exchange under the Ministry of Education.

Fight Night on song

'Kung Fu Monkey' holds nerve in Macao despite pressure

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

Even marred by setbacks for the host contingent, the Ultimate Fighting Championship's return to Macao has proved to be a smashing success as the mixed martial arts promotion has elevated the combat sport's profile in China.

On what would otherwise be a disappointing night for Chinese fans, Song Yadong saved the best for last. The bantamweight striker capped off UFC Fight Night Macao with a bang by securing a submission victory over Brazil's former world champion Deiveson Figueiredo in their main event on Saturday.

Heading into the highly anticipated finale between Song and Figueiredo, the 13-bout Fight Night had turned deeply disappointing for the home crowd, with four other Chinese fighters having all lost in their respective bouts on the preliminary and main cards, leaving the sold-out Galaxy Arena in silence and Song under huge pressure to salvage the night.

Song, China's highest-ranked men's fighter in UFC across all divisions, did not disappoint.

Rising to the moment with poise and finesse, Song pulled off the fight of his career with a guillotine choke early in the second round that forced former flyweight titleholder Figueiredo to submit, sending the Macao crowd into a frenzy.

It was Song's 23rd career win as a professional MMA athlete, and his 12th under the UFC banner in 17 bouts in the Octagon since signing up with the Las Vegas-based promoter in 2017.

Entering the Macao event as the fifth-ranked contender in UFC's bantamweight, Song is expected to keep climbing the rankings, and has cemented himself as a serious challenger for the belt currently held by Petr Yan of Russia.

After witnessing his compatriots' earlier losses, particularly light heavyweight scrapper Zhang Mingyang's shocking TKO defeat to Alonzo Menifield of the United States, Song confessed he felt the heat as he walked into the arena accompanied by the theme song of the Chinese TV classic *Journey to the West*.

Inspired by the TV series' main character, Song is nicknamed the "Kung Fu Monkey" by his home fans. Song said afterward, he drew strength from the crowd's rousing reaction and the same music that played as prelude to his UFC debut in Shanghai in 2017.

After exchanging punches with the Brazilian veteran and fending off his opponent's takedown attempts, Song capitalized on an opening early in the second round by locking up a tight guillotine choke that forced Figueiredo to tap out at the 4:42 mark, securing Song the biggest win of his career.

"I did feel the pressure. I couldn't help but imagine seeing the headline of 'Total Loss for China' the next morning, so I told myself to do my best and focus on my fight," Song said during his post-fight news conference.

"I knew I have what it takes to win the bout and I'd prepared the best I could. So I just focused on executing my techniques. The opportunity (for a choke) came and I took it. The result just took care of itself," said the 28-year-old Heilongjiang native, who's been training at the Team Alpha Male club in Sacramento, California for years.

Asked whom he expects to fight in his next bout, Song shrugged off the hyped rivalry between him and the rest of the division, saying he is just focused on perfecting his own craft to be ready for whoever the UFC picks for him down the line.

"I don't care to be honest. My goal will be building my fight toward a shot at the division crown," said Song.

Song's victory capped off a three-day fighting series in Macao, where the UFC kicked off the Season 5 of its talent-selection tournament, the Road To UFC, on Thursday and Friday, before the blockbuster Fight Night main dish.

It's the second time in three years that Macao has hosted the world's premier MMA showpiece since the 2024 edition. In between the two events in Macao, the UFC also hosted a Fight Night and semifinal rounds of the RTU tournament in Shanghai last summer.

With over 12,600 spectators drawn to Saturday's main event, the impressive turnout at the Galaxy Arena, following the sought-after Shanghai event in August, has served up a strong testament to MMA's growing appeal to the Chinese market.

"Our commitment to this region and Greater China as a whole is reflected in the fact that we do more and more these events," Kevin Chang, UFC's senior vice-president and head of Asia, said of the organization's hosting of live events in China on a consistent basis.

"That's pretty important for what we're trying to do here to grow the fanbase and we've shown that we are committed to it and we are consistent. We expect more and more of these types of events to come."

Although not ready yet to be announced, Chang hinted in Macao that a return to Shanghai this year, quite possibly in late summer again, is being seriously discussed by the UFC and its Chinese partners.

"China is very, very important (for the UFC), just the scale of the country and the number of fans, and how passionate they are, and all of those things contribute to that," said Chang.

TCM doctor swaps needles for punches

By SUN XIAOCHEN

Wearing gloves and mouthguard instead of white gown and stethoscope, China's doctor-turned-fighter Shi Ming proved in Macao she's as adept at fighting as she is treating patients at her clinic.

The emerging mixed martial artist, who's a full-time doctor at a hospital in Kunming, Yunnan province, made a statement of her pursuit of a career in the brutal world of combat sport with a thrilling first win in the Ultimate Fighting Championship, secured by a first-round submission of Indian opponent Puja Tomar on Friday.

In just her second Octagon appearance since signing up with the Las Vegas-based promotion in December 2024, Shi delivered a dominant and clinical performance by forcing Tomar to tap out via a tight arm-triangle choke just a minute and a half into the first round of their strawweight bout, which headlined the Road To UFC Season 5 opening round's day-two actions at the Galaxy Arena.

To clinch her first UFC win in front of her home crowd, and in compelling fashion, Shi has silenced doubts about her readiness to fight like a pro following her disappointing debut loss in Shanghai last summer.

"The loss last time was really frustrating, so this one feels like a great confidence boost that I need," said Shi, who had to work intensively overtime for a week at her hospital to make the trip to Macao during her off days.

"Throughout all the fights in my career, I've always been considered the underdog. Tonight was the first time that I entered a bout as the favorite," said the 31-year-old semi-pro, who trains three times a week at the China Catch Wrestling club in Kunming under guidance by the gym's Iranian coach Bagher Amanolahi.

"I am so glad that I proved I belong (in the top promotion). I feel even happier than when I got the UFC contract," said Shi, who was signed by the organization as the strawweight division winner of the RTU tournament's Season 3 in 2024.

Dubbed the "fighting doctor" by fans and fellow athletes, Shi's dual identity and amateur background sets her apart in the high-intensity combat sports community, resonating with ordinary combat sports enthusiasts.

When she is not perfecting her wrestling, grappling and striking skills at her fight club, Shi is known as a soft-spoken traditional Chinese medicine practitioner relaxing muscles and soothing pains with her specialty in acupuncture treatment.

Her priority, for now, is expected to shift to her fiercer alter ego.

"I am ready and I've been staying in good shape. I'd like to fight more frequently, so I wish the UFC would arrange more fights for me," said Shi, whose favorite fighter is China's former strawweight world champion Zhang Weili.

SOCCER

Paris celebrates Champions League triumph amid riot recriminations

PARIS — The French capital laid out a red, white and blue carpet on Sunday for Paris Saint-Germain players to mark their second straight Champions League title, amid bitter recriminations after hundreds of people were arrested and dozens of police hurt in a night of unrest.

Tens of thousands of flag-waving fans took to the streets again to see the team parade from Paris Charles de Gaulle Airport to the Champ de Mars plaza in the shadow of the Eiffel Tower.

The team flew back from Budapest where it beat English Premier League champion Arsenal 4-3 in a penalty shoot-out on Saturday night.

It was also received by French President Emmanuel Macron before returning to Parc des Princes stadium for a final encounter with more than 40,000 fans, bringing to a close a day of festivities.

The previous night of celebrations was blighted however by clashes between youths and police in Paris and other cities, cars set on fire and shops looted.

One man died riding his motorbike around the Paris ring road in celebration while authorities reported stabbings and other attacks. They said 57 police officers and 219 "participants" were injured. Eight of the injured were in critical condition.

Interior Minister Laurent Nunez said there were 780 arrests across France, nearly a third more than when PSG's triumph last year over Inter Milan also set off a night of disturbances. He said looting had taken place in around 15 cities across the country.

Municipal workers hurried Sunday morning to clear the Paris streets of broken glass, wrecked bus shelters, trash cans and burned out cars and bikes before PSG's return.

Macron called the violence "unspeakable".

He said PSG was an "immense pride" for France but said the country was "fed up" with the violence. "We will be ruthless with those who have been caught," he vowed.

PSG's Marquinhos lifts the trophy at Parc des Princes stadium in Paris on Sunday to celebrate their victory with supporters. AFP

Amid political recriminations over the troubles, Paris mayor Emmanuel Gregoire played down the severity, saying such incidents were nothing new.

"In the vast majority of cases, people celebrated with family and friends. And it was an extraordinary celebration," the mayor told BFM TV. "And incidents on the fringes of major events have been going on for centuries."

Gregoire blamed the "media coverage" of the unrest "and perhaps also the obsession of these troublemakers who come to cause trouble and show themselves on social media".

The town hall for the Paris district that includes the Champs-Elysees, where tens of thousands went after the soccer victory, called for a ban on such gatherings.

On Saturday night, the "Champs-Elysees avenue and its surroundings ceased to be a place of celebration and became an arena of urban guerrilla warfare", the town hall said in a statement.

Politicians from all sides lambasted the troubles and questioned the way they were handled.

Far-right figurehead Marine Le Pen wrote on X that "only in France does a football club's victory spark riots".

Valerie Pecresse, the head of the greater Paris council from the Republicans party, slammed "the brainless thugs who allow themselves to destroy everything, tarnishing the image of Paris and France!".

A spokesperson for the hard-left France Unbowed said: "We cannot be satisfied with the way last night's event was managed and organized by the government."

Nunez promised "strongarm" security for Sunday's celebrations and some 6,000 police were on duty across central Paris.

"We're still riding yesterday's high, so we want to keep the party going," said 25-year-old Abou, a PSG fan "since he was little".

"Paris, Paris" chanted supporters wearing the team colors and carrying flags, as they filtered through security checkpoints to get near a stage where the players appeared. The "*We Are the Champions*" pop song blared out on speakers.

PSG captain Marquinhos and striker Ousmane Dembele were among the most applauded as they lifted the trophy before the adoring crowds. "We will be back next year for the third," said Dembele.

Xi, Putin agree to extend landmark treaty

Documents signed on economy, education and tech cooperation

By **MO JINGXI**
mojingxi@chinadaily.com.cn

President Xi Jinping and Russian President Vladimir Putin agreed on Wednesday to further extend the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation, while pledging to further strengthen political mutual trust, strategic coordination and practical cooperation between the two countries amid a fluid and turbulent international situation.

The agreement was reached during talks between the two heads of state at the Great Hall of the People in Beijing, before Putin concluded his two-day state visit to China.

After their talks earlier on Wednesday, the two presidents signed a joint statement on further enhancing the comprehensive strategic coordination and deepening good-neighborliness and friendly cooperation between the two countries. They witnessed the signing of 20 cooperation documents in areas including the economy and trade, education, and science and technology.

The two sides also issued a joint statement on advocating a multipolar world and a new type of international relations, and reached 20 cooperation agreements in other areas.

When addressing the media together after their talks, Xi said this was Putin's 25th trip to China since he first assumed the presidential office in Russia in 2000, which fully demonstrates the high level and uniqueness of China-Russia relations.

Noting that this year marks the 30th anniversary of the establishment of the China-Russia strategic partnership of coordination, Xi said that over the past three decades, bilateral ties have reached the highest level in history as a comprehensive strategic partnership of coordination for a new era, setting an example for a new type of major-country relations.

This year also marks the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation. The treaty was last extended on June 28, 2021, when Xi and Putin held talks via video link and issued a joint statement ahead of the 20th anniversary of its signing.

Xi said that over the years, the two countries have always abided by the treaty's established principle of non-alliance, nonconfrontation and not targeting any third party, while upholding equality, mutual respect, good faith and win-win cooperation.

The two countries have made important contributions to safeguarding international fairness and justice and promoting a new type of international relations, serving as a vital constant amid changes unseen in a century, he said.

Xi called on China and Russia to build on past achievements and further support each other firmly on issues concerning their respective core interests and major concerns, maintain close strategic communication and exchanges at all levels, and continuously consolidate the foundation of political mutual trust between the two countries.

In recent years, cooperation between China and Russia in various fields has advanced steadily and achieved many positive results. The value of bilateral trade has exceeded $200 billion for three consecutive years, and in the first four months of 2026, two-way trade increased nearly 20 percent, according to customs data.

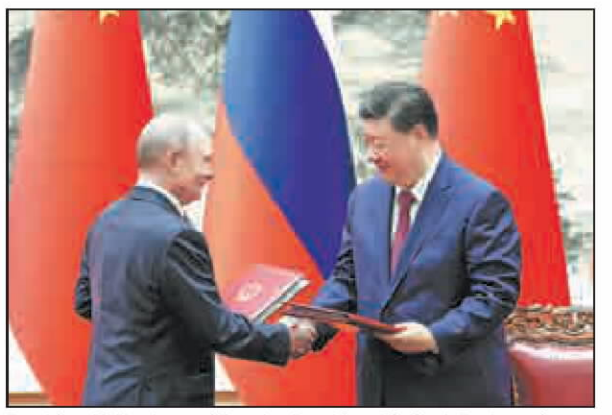
Xi said the two sides should build on this momentum, deepen the alignment between China's 15th Five-Year Plan (2026-30) and Russia's development strategy through 2030, and upgrade mutually beneficial cooperation in various fields to better serve the development and revitalization of both countries.

Speaking about global governance, Xi noted that the world today is far from being peaceful, with unilateralism and hegemonism causing severe harm, adding that the world is facing the danger of returning to the law of the jungle.

As permanent members of the United Nations Security Council, China and Russia should firmly fulfill their responsibilities as major countries, uphold the authority of the UN as well as international fairness and justice, and oppose all acts of unilateral bullying and attempts to reverse the course of history, he said.

China and Russia should, in particular, oppose all provocative acts that deny the outcomes of World War II and seek to justify and revive fascism and militarism, Xi said, emphasizing that the two sides should jointly promote the building of a more just and equitable global governance system.

Putin, who received a welcoming ceremony with a 21-gun salute, quoted the Chinese saying that "one day apart feels like three autumns" when meeting with Xi, whom he described as his "dear friend".



"Russia-China relations have reached a truly unprecedented level, and continue to develop. At the same time, our relations are self-sufficient; they do not depend on the current international situation and can serve as an example of relations between nations in this age," he said when addressing the media.

He said that Russia is full of confidence in the future of bilateral relations, adding that it will work with China to deepen the two countries' partnership and good-neighborly friendship, strengthen people-to-people bonds, and contribute to the development and revitalization of both countries and the well-being of their peoples.

China, US talks help stabilize bilateral trade ties

By **ZHANG CHENXU** and **ZHOU LANXU**

The preliminary outcomes achieved during the latest round of China-US economic and trade consultations will not only help stabilize bilateral economic ties, but also contribute to a more cooperative global economy at a time of rising uncertainties, officials and experts said.

The Ministry of Commerce announced on Wednesday that China and the United States have agreed in principle to discuss, under a trade council, a reciprocal tariff reduction framework on products of equivalent scale — worth $30 billion or more on each side.

Under the proposed arrangement, the products of respective concern as agreed by both sides are expected to enjoy most-favored-nation tariff rates or even lower rates, the ministry said.

Once implemented, the arrangement will not only help stabilize and expand bilateral trade between China and the US, but also serve as a useful reference for global open cooperation, a Commerce Ministry official said in a statement.

The ministry said that China and the US agreed to establish trade and investment councils to address respective concerns in trade and investment cooperation, a step that will help to shift bilateral economic and trade consultations from crisis response to mechanism-based management.

Dai Mingfeng, a researcher at the Chinese Academy of International Trade and Economic Cooperation, said the move will help to create more favorable conditions for stabilizing bilateral trade.

"It will provide practical support for stabilizing and steadily expanding China-US bilateral trade, while helping to promote a recovery in trade involving agricultural and industrial products," Dai said.

To translate the arrangement into concrete progress, the ministry called on the US to honor its commitments and ensure that, regardless of the reason or form of any future additional or replacement tariffs on Chinese goods, US tariff levels on Chinese goods will not exceed those set under the joint arrangement reached during the Kuala Lumpur economic and trade consultations in October last year.

GRAIN BUDS BRINGS WITH IT THE SWEET TASTE OF SUMMER

Perfect moment for loquats and flavor of Jiangnan arrives with *xiao man*

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

As wheat fields across northern China begin to swell with grain, the hillsides of Dongshan town in Suzhou, Jiangsu province, have already turned golden in the early summer sun.

Along the misty shores of Taihu Lake, loquats hang heavy on the branches. Beneath their fine golden fuzz, mellow sweetness meets gentle acidity against the floral backdrop of the rainy season in Jiangnan, the area south of the lower reaches of the Yangtze River.

As *xiao man*, or Grain Buds, arrives, so does the perfect moment for loquats.

The traditional Chinese solar term — meaning "small fullness" — marks the season when grains begin to fill but are not yet fully ripe. In Chinese food culture, it has long been associated with nourishment and relief from summer humidity.

Fresh loquats on display in Beijing on Tuesday. GENG FEIFEI / CHINA DAILY

Few fruits capture that seasonal transition more vividly than loquats.

For generations, loquat farmers in Dongshan have followed the rhythms of the 24 solar terms like clockwork. Traditionally, loquats are not harvested until around *xiao man*, when the fruit sheds its early acidity and develops a mellow sweetness.

China Vibes — FOOD —

But nature never follows a rigid calendar. "This year the harvest came about 10 days later than last year," said Song Furong, 58, a lifelong loquat farmer.

He said winter temperatures were not extremely low, but there was heavy frost and thick morning fog.

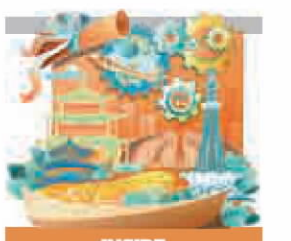
Innovation helps nation spur growth

WORLD WATCH
By Digby James Wren

Over the past decades, China has delivered 30 percent of global economic growth on the back of its deployment of innovation at speed and scale. A key result is that China's stable prices and efficient supply chains have helped to mitigate global inflationary pressures amid elevated inflation in major advanced economies.



China's gross domestic product grew 5 percent in the first quarter of this year, beating expectations and displaying robust growth in exports and imports.

Factory activity remained resilient, with the official manufacturing purchasing managers' index standing at 50.3 in April, slightly easing from 50.4 in March but still holding above the 50-point expansion threshold. High-tech and equipment manufacturing continued to outperform, with PMI readings of 52.2 and 51.8 respectively, highlighting the ongoing structural transformation toward new growth drivers.

China's economic resilience rests firmly on its deep cooperation with Asian partners to create new opportunities for the region.

Despite external pressures, trade volumes paint a powerful picture of this integrated strength. In 2025, China's total goods import and export value reached a record high of $6.35 trillion. Driving this was its relationship with the Association of Southeast Asian Nations, which has remained China's largest trading partner. Trade between China and ASEAN reached 7.55 trillion yuan ($1.05 trillion) last year, surging 8 percent year-on-year. This growth is being formalized through agreements such as the China-ASEAN Free Trade Area 3.0 Upgrade Protocol.

Education seen as key bridge in relations

Leaders express hopes on collaboration in nurturing talent

By **ZHANG YUNBI** and **ZHAO JIA**

President Xi Jinping and Russian President Vladimir Putin attend the opening ceremony of the China-Russia Years of Education at the Great Hall of the People in Beijing on Wednesday. FENG YONGBIN / CHINA DAILY

President Xi Jinping and Russian President Vladimir Putin expressed their hopes on Wednesday for future collaboration between the two countries in nurturing talent and fostering friendship among young people when they attended the opening ceremony of the China-Russia Years of Education (2026-27) in Beijing.

The two leaders delivered speeches and then jointly unveiled the emblem for the China-Russia Years of Education.

In his speech, Xi said that launching the China-Russia Years of Education was a strategic decision made by him and President Putin to enhance the long-term development of China-Russia relations.

Xi said that education is an important bridge connecting the hearts of the peoples and carrying forward friendship between nations, and it is a noble cause that benefits both the present and future generations.

China-Russia educational cooperation has deepened considerably, producing remarkable results and enriching the substance of the China-Russia comprehensive strategic partnership of coordination for a new era, he said.

Xi emphasized that both sides should take the China-Russia Years of Education as an opportunity to build further consensus on cooperation, expand its scope and raise its level.

Putin said that educational cooperation is an indispensable component of the two countries' comprehensive strategic partnership of coordination and underscored the milestone significance of launching the China-Russia Years of Education. Both countries attach great importance to education, which is crucial for individuals' development and serves as the foundation for a nation's economic and social development, he said.

The Russian president praised the China-Russia Years of Education for its rich content and large scale.

Currently, more than 80,000 students from both countries are studying in the other nation, and the two sides have established more than 150 joint educational institutions and programs, Zhang Hanhui, Chinese ambassador to Russia, wrote in an article published on Tuesday.

In his speech, Xi emphasized that thriving and strong education is the foundation of a thriving and strong nation. He said that China and Russia should deepen cooperation in talent cultivation, jointly nurture world-class professionals, strengthen national capabilities in strategic science and technology, work together to tackle cutting-edge scientific challenges, and boost the innovation-driven development of both countries.

The two countries should embrace the vision of mutual learning among civilizations, and promote the sharing of experience in terms of the inheritance of civilization and the governance of education, to improve their respective work in these fields, he said.

Both sides should carry forward the traditional friendship, further tap the potential of educational cooperation, encourage young people to cement friendship through in-depth exchanges, and nurture torchbearers who will carry forward China-Russia friendship for generations to come, he added.

Xi said that with these joint efforts, he believes the China-Russia Years of Education will surely be a complete success.

On Wednesday, Xi and Putin also toured a photo exhibition at the Great Hall of the People, celebrating the everlasting friendship between the two countries.

The exhibition vividly presented the close interaction between the two heads of state since the beginning of the new era.

Xi and Putin paused periodically to view the photos and listen to briefings, fondly recalling moments of friendly exchanges and cooperation between the two countries in recent years. The two leaders noted that the great cause of China-Russia friendship conforms to the course of history and the times, remains unbreakable, and will continue to move forward, writing new chapters.

On Wednesday evening, Xi and Putin had a tea chat before Putin departed for Russia.

Xi said that he and Putin reached a new and important consensus on advancing the China-Russia comprehensive strategic partnership of coordination.

Putin said that Russia looks forward to maintaining close communication with China and strengthening strategic coordination.

The two heads of state also exchanged views on issues including the Ukraine crisis.

Meeting: Both sides to extend visa-free policies

From page 1

"Moscow and Beijing will jointly uphold international law and the provisions of the UN Charter in their entirety ... and cooperate effectively within the framework of the Shanghai Cooperation Organization, BRICS and other international structures, making a significant contribution to addressing pressing global and regional challenges," Putin said.

During their talks on Wednesday, Xi said the China-Russia relationship has entered a new stage of greater achievements and faster development.

Unswervingly promoting the long-term, sound, steady and high-quality development of the China-Russia relationship is a strategic choice made by the two sides based on the fundamental interests of the two countries and the global trends, he said.

Xi called on China and Russia to fully implement the important common understandings reached between him and Putin, seize the historic opportunities and further promote the mutual trust, cooperation and friendship between the two countries.

He emphasized that both sides should focus on the goals of national development and revitalization, fully leverage the comprehensive and well-established mechanisms of China-Russia cooperation and strengthen the overall planning for cooperation in all respects.

The two countries should also promote the upgrading of practical cooperation in trade and investment, energy and resources, transportation, and sci-tech innovation, as well as actively explore cooperation in frontier areas, in order to create new engines for growth with new quality productive forces, Xi said.

He added that efforts should be made to continue the long-standing friendship between the two sides, strengthen exchanges and cooperation in education, culture, film, tourism and sports, and consolidate the social and public support for bilateral friendship.

Also on Wednesday, China announced that it has decided to extend its visa-free policy for Russia until Dec 31, 2027. According to TASS news agency, Russian presidential press secretary Dmitry Peskov said in Beijing that Russia will also extend its visa-free policy for Chinese citizens.

During their talks, the two heads of state exchanged views on major international and regional issues, including the situation in the Middle East.

Xi emphasized that all hostilities in the Middle East must end immediately, renewed fighting should be avoided and, most important, negotiations should continue.

Noting that the situation in the Middle East and the Persian Gulf region is at a critical juncture between war and peace, he said that an early end to the conflict will help reduce disruptions to the stability of energy supplies, the functioning of industrial and supply chains, and the stability of the international trade order.

On Wednesday evening, Xi held a welcoming banquet for Putin in the Golden Hall of the Great Hall of the People.

Chinese 'boy' has heartwarming reunion with his 'foreign uncle'

By **LI MUYUN** and **HE CHUN** in Changsha

Left: Russian President Vladimir Putin (left) poses for a photo with Peng Pai (center), then a boy from Hunan province, at Beihai Park in Beijing on July 19, 2000. WU ZHIYI / CHINA DAILY **Right:** President Putin (left) meets at the Diaoyutai State Guesthouse in Beijing on Wednesday with Peng (center), now a 38-year-old engineer, and signs their photograph. VLADIMIR SMIRNOV / SPUTNIK

Twenty-six years ago, a "foreign uncle" walked up to a young boy seated on a balustrade along a lake in Beijing, spontaneously greeted him with a kiss on the forehead, and posed for a photo with him and his family.

Fast forward to 2026. The boy, Peng Pai, now 38 years old and a civil engineer specializing in bridge construction, rebuilt that heartwarming connection through a reunion on Wednesday with this uncle who is none other than Russian President Vladimir Putin.

The two met in Beijing during Putin's state visit to China. A video posted by Russia's RT television network shows Putin and Peng sharing a warm handshake, holding a brief conversation, and then Putin signing a copy of their group photo from the summer of 2000.

Peng, a native of Yueyang in Central China's Hunan province, who pursued his engineering studies in Moscow because his first meeting with Putin piqued his curiosity about Russia, said he never thought he would have the opportunity to meet the Russian leader again.

During their chat at the Diaoyutai State Guesthouse in Beijing, Putin asked Peng who the person standing beside the boy in the photo is. "Learning that the man standing beside me is my father, he asked me to give my father his regards," Peng said.

They hugged each other goodbye after the chat, and Peng presented Putin with a gift — a tea set made of porcelain from Liling, Hunan. "I will remember this day for the rest of my life," Peng said.

Back in 2000, Peng, then 12, and his family were touring Beihai Park during a trip to Beijing when they ran into Putin, who was making his first official visit to China as the Russian president.

The Russian leader made an impromptu stop at the park, indulged in some boating activities and greeted people. He approached the boy, picked him up and planted a kiss on his forehead. "It was completely spontaneous," Peng recalled. "I remember him as a kind, gentle uncle."

In an interview with the Russian television network before their reunion on Wednesday, Peng left a lighthearted message for the visiting leader. "Dear President Putin, you still look the same, but I have changed from a little boy into a middle-aged man with a bigger belly," he said.

While Peng didn't fully grasp the meaning of their encounter more than two decades ago, it certainly did increase his interest in Russia. After finishing high school, he decided to apply for higher studies in the Russian capital.

From 2007 to 2013, Peng studied bridge and tunnel engineering at the Moscow Automobile and Road Construction State Technical University, from where he earned both his bachelor's and master's degrees.

"During my years in Moscow, I gained a deeper understanding of Russia's vast territory, its rich history and culture," Peng said. The teachers and students he met along the way left a lasting impression, he said. "They were very kind to international students," he added.

After returning to China, Peng joined Hunan Construction Investment Group, a State-owned enterprise based in Changsha, which has projects in more than 60 countries.

Today, he is a senior engineer with the group, leading an engineering technology team. Among the projects he has worked on, a pedestrian bridge on the Liuyang River in Changsha received the National Quality Engineering Award for 2020-21.

Although Peng never went back to Russia, he has been keenly watching the development of China-Russia bilateral relations. "High-level exchanges between the two sides have been frequent in recent years, and interactions are happening in many fields, including at the grassroots and online levels," he said.

As a bridge engineer, Peng hopes to see more infrastructure cooperation between the two countries. Both sides have strengths that can complement each other for mutual benefit, he said.

Now a father of two, Peng hopes to take his family to Moscow one day, and walk through his old university campus. "I would tell the kids everything I know about Russia and its people," he said.

Peng Yixuan in Beijing contributed to this story.

Beijing, Moscow to expand cooperation and people-to-people exchanges

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

Premier Li Qiang called on China and Russia to achieve a higher level of mutual benefit and win-win outcomes during his meeting on Wednesday with Russian President Vladimir Putin in Beijing.

Highlighting the strategic guidance of the two heads of state, Li noted that President Xi Jinping had met with President Putin earlier in the day to make further plans and arrangements for the development of China-Russia relations.

Li said that China is willing to work with Russia to further expand trade, implement the upgraded bilateral investment agreement, and deepen cooperation in areas such as energy, agriculture, connectivity, and green and low-carbon development.

Efforts should also be made to strengthen the alignment between the China-proposed Belt and Road Initiative and the Russia-led Eurasian Economic Union, and ensure the safe, stable and high-quality development of China-Europe freight trains, he said.

Li called on both sides to organize cultural events within frameworks such as the China-Russia Years of Education, and deepen exchanges and cooperation in areas including youth, culture, tourism and sports, thereby continuously fostering mutual understanding and friendship between the two peoples.

China is set to strengthen collaboration with Russia on multilateral platforms, actively implement the Global Governance Initiative and jointly uphold fairness and justice, he added.

On his part, Putin said that Russia is willing to maintain close high-level exchanges with China, fully leverage the mechanism of regular meetings between the two prime ministers, and advance exchanges and cooperation in areas such as trade, energy, agriculture, transportation, logistics, scientific and technological innovation and people-to-people exchanges.

He also expressed Moscow's readiness to strengthen cooperation with Beijing within multilateral frameworks such as the Shanghai Cooperation Organization and BRICS, to jointly promote world peace, stability and prosperity.

Languages bind China, Russia closer

Young people's efforts to learn each other's tongues a testament to warm friendship, shared futures

By **WANG HAORAN**
wanghaoran@chinadaily.com.cn

Yi, er, san, si, wu, liu, qi,
Wo de li wu zai zhe li.

A jumble of strange sounds foreign to millions of Anastasia Prytkova's Russian compatriots slip off her tongue as effortlessly as if she had been uttering them since she was a baby. Throw in a delightful melody, and suddenly the Chinese language does not seem as intimidating and as difficult as it is usually cracked up to be.

What she speaks means "One, two, three, four, five, six, seven, my gift is here."

And what a gift this is, one that has put ninth-grader Anastasia from Novosibirsk, Russia, on a path that is likely to shape her life.

For the past three years she has been studying Mandarin online with a Russian teacher, cultivating her fascination with a country she has so far had no physical contact with.

"My favorite food is kung pao chicken," she said in Chinese. The dish is a favorite in Sichuan province, the home of spicy food, and is a place she dreams of visiting. Seeing the Great Wall and the Terracotta Warriors is also on her wish list, but for now, there is still plenty of Chinese learning to do.

Anastasia is aware of the challenge ahead, even as she senses the rich rewards that await her. Her aim is to become a transportation engineer and to pursue a master's degree at a Chinese university.

Her mother, Oksana Prytkova, views China as the ideal training ground for the skills Anastasia wants to master. Pointing to her daughter's passion for robotics and programming, she said: "In these disciplines it makes sense to study Chinese, because there is a lot worth learning in China."

Great enthusiasm

Tens of thousands of young Russians share that sentiment, one that is reciprocated in China, where many young people are increasingly drawn to learning Russian, seeing the benefits it offers.

In Anastasia's hometown, the Confucius Institute at Novosibirsk State Technical University is at the forefront of promoting Chinese language and culture. The institute, established in 2007 in partnership with Dalian University of Foreign Languages in Liaoning province, is stepping up its efforts to reshape how Mandarin is taught to the city's young people.

It offers a wide range of learning methods, from large lectures to one-on-one tutoring led by a mix of Russian and Chinese staff. This year and the next have been designated as the China-Russia Years of Education. In that context, the importance of these teachers and what they do has never been clearer.

Igor Khripunov, who has directed the institute since 2013, said collaboration in education is the bedrock of the two countries' partnership.

"Over the next two years I foresee a profound acceleration in such collaboration," Khripunov said. "This will do much more than catalyze our collaboration on academics, language and talent development. It will lay a solid foundation for a new generation of professionals equipped to meet the evolving needs of our countries' partnership."

The teaching of Mandarin and the way it is offered have improved markedly in Novosibirsk, and the number of those studying the language has increased in each of the past three years, he said.

"In many schools, Mandarin is now included in the curriculum as a second language and is being included in a state exam program. An increasing number of schoolchildren are taking part in the annual All-Russian Chinese Language Olympiad," he said.

Yulia Shchepina, a Mandarin instructor at the Confucius Institute, who has eight years' classroom experience, said foreign-language learning for children is less about rigid memorization and more about visual storytelling.

She tells of a lively fourth-grade class of 9 and 10-year-olds who gasped collectively when they opened their textbooks to see a dense sea of Chinese characters. Many of them exclaimed, "This is impossible".

Chinese and Russian students interact with each other during the camp in Harbin last month. PROVIDED TO CHINA DAILY

> "It will lay a solid foundation for a new generation of professionals equipped to meet the evolving needs of our countries' partnership."
>
> **Igor Khripunov,** director of the Confucius Institute at Novosibirsk State Technical University

Seven months later the same children stood up to introduce themselves in Chinese, rattling off details about their families, hobbies and favorite colors.

Among them, three came to China to further their language studies. An ultimate test of their fluency came during a trip to the Palace Museum in Beijing, also known as the Forbidden City, when they approached local Chinese children and began chatting to them, and were understood perfectly.

They returned to Novosibirsk with even more passion for the language, Shchepina said.

Pop culture is also an important motivation for many teenage students who want to play Chinese video games and understand hit dramas and music in the original language.

Travel, Shchepina said, deepens this engagement, with family holidays to Asia becoming increasingly popular.

As Mandarin clubs sprout up in local schools, learning the language has evolved into a shared enthusiasm in which students inspire one another.

"Modern children have a clear vision of what they want to achieve. They are incredibly purpose driven," Shchepina said.

Collaboration continues

That drive is not the sole preserve of youngsters in Russia. Just as young people in Novosibirsk are both frustrated and charmed by the complexity of Chinese characters, their counterparts in China are delighting in the beauty of the Cyrillic script that helps them understand the language of Leo Tolstoy.

One such youngster is Shen Yu, a first-year student in the advanced Russian program at Harbin No 6 High School in Heilongjiang province. Her father also studied Russian in his youth, filling the family home with Cyrillic books. For Shen, learning Russian started as a daunting challenge of declensions and tongue twisters.

The study is punishing, but the payoffs are astronomical, she said. "Whenever I can fluently express a complete thought, or understand a Russian news broadcast or a song without relying on a translation, the sense of accomplishment is overwhelming."

While learning Russian with native-speaking educators every Friday at her high school, she is also developing a profound kinship with her Russian counterparts.

"They face exactly the same academic pressures that we do, with the same stress over exams, but they also have the same love for video games and music," she said.

Harbin No 6 High School has a rich history of teaching Russian that goes back more than 80 years, and it hosts the Chinese secretariat of the Association of Sino-Russian Middle Schools. The association was initiated by the school eight years ago, aiming to advance educational exchanges and collaboration at the secondary level and cultivate talent, with an emphasis on biculturalism.

Wu Xia, principal of the school, said the association had 30 schools as members when it was established. It now has 145, with 50 of them in China and 95 in Russia.

The association operates as a high-level, institutionalized dialogue platform, with annual meetings in both countries attracting thousands of educators who discuss collaboration in secondary education.

It also organizes training courses for Chinese educators who teach Russian, and Russian educators who teach Mandarin. More than 700 Chinese teachers have benefited from the courses.

Stewards of tomorrow

Fu Zhaoxia, a Russian-language instructor who has taught at Harbin No 6 High School for 34 years, said the expertise of Russian academics has helped her transform her classes, which were once top heavy with rigid rote learning, into spaces of vibrant, real-life communication.

The alliance has implemented more than 30 cultural initiatives, including youth art festivals, papercutting contests and a cross-border postcard exchange, engaging more than 4,000 students. A program called Air Classroom delivers Mandarin instruction to more than 500 students in 15 Russian regions.

"By taking part in these activities our young people break down the initial barriers of language and culture," Wu said. "It teaches them to respect differences and embrace a global vision. This is where genuine friendship takes root. Education is the bond, but friendship is the core."

Wu cites the example of a camp in Harbin last month that hosted students from Lensk No 3 School in the Sakha (Yakutia) Republic of Russia. The shared activities with Chinese students focused on education, technology and sports.

In addition to 3D printing and curling matches, the students were given the task of crafting *xiangnang*, decorative sachets traditionally filled with scented herbs.

The Chinese students, familiar with making the colorful sachets, patiently worked with their Russian counterparts, explaining the cultural symbolism in embroidered dragons and phoenixes that were being used, as well as the traditional herbal fillings.

The awkwardness the Russians first displayed gradually dissolved, and they began weaving symbols of Harbin, such as snowflakes and ice, into their own designs. When the students finally exchanged their handmade crafts, the gesture carried a weight beyond the herbs inside.

"The sachets were no longer just ordinary pouches, but became a bond," Wu said. "You could feel this cross-border goodwill quietly flowing through hearts."

Khripunov, director of the Confucius Institute at Novosibirsk State Technical University, said he sees this generation as the future stewards of China-Russia ties.

"We are planting the seeds, and these students will inherit the responsibility of sustaining our scientific, educational and cultural exchanges. They are the ones who will forge a deeper, more genuine trust between our peoples."

Zhang Xiaomin, Zhou Huiying and Pang Yingyuan contributed to this story.

CHINA-RUSSIA TIES

Trucks line up to pass through the Manzhouli Land Port in Manzhouli, Inner Mongolia autonomous region, in December. XIAO JIANBO / XINHUA

Border policy converts grains into cash

By **YUAN HUI** in Hohhot
and **LIU BOQIAN**

Russian freight trains inch across the border into Manzhouli, their cars laden with grains and oilseeds from the fertile fields of Siberia and the Russian Far East. Within days, these raw imports are cleared, processed in towering local factories, and dispatched to kitchens across China.

Manzhouli in northern China's Inner Mongolia autonomous region is the country's largest land port city. It sits opposite Russia's Zabaykalsk, where the railway crossing handles more than 60 percent of China's rail trade with Russia, making the Chinese city a critical gateway for goods moving between the two nations.

For many Russian products, Manzhouli is both the first stop in China and the launchpad for nationwide distribution after processing.

"More than 90 percent of our raw materials come from Russia," said Yang Zhihong, manager of Xin Feng Grain and Oil, a local processing company. "The supply is stable and reliable."

Inside Xin Feng's production halls, workers wash, sort and refine imported crops into flour, oils and other finished goods.

"Siberian and Russian Far East crops grow under strict ecological standards, producing nutrient-rich grains," Yang said. He added that oils and flour made from these grains sell well in the domestic market.

A Manzhouli resident (right) learns about Russian handicraft at a fair in December. LIAN ZHEN / XINHUA

The company works with local residents through cooperatives. Under cross-border trade rules, each resident can enjoy a daily tax-free quota of 8,000 yuan ($1,170). The cooperatives handle the purchase and transport of imported goods to compliant grain and oil processors in Manzhouli, such as Xin Feng, where the products are processed before being sold across China.

The system cuts tariffs and value-added taxes, streamlines customs clearance and ensures a steady raw material supply. This means procurement costs are significantly lower than elsewhere. "The same quality Russian grains save 500 to 1,000 yuan per metric ton," Yang said. "It reduces production expenses and operational costs."

Local residents also share in the profits along with the enterprises under this model, creating a direct benefit for the community.

Imported Russian grains and potash have become a cornerstone of Manzhouli's processing industry.

"Since Manzhouli was designated an official import port for agricultural products in 2013, we now handle 12 crop types, including rapeseed, barley, wheat and soybeans," said Chen Rui, deputy director of the city's bureau of industry, information and technology. "Five processing enterprises operate here, with a combined annual capacity exceeding 1.35 million tons."

Manzhouli is also emerging as a cross-border tourism hub. In the first four months of the year, 7,723 visitors arrived, mostly for shopping. Some use the city as a transit point for the seaside resorts of Beidaihe or Qinhuangdao in Hebei province.

"Cross-border study tours are growing, too. Russian students visit for day trips or longer stays to experience life in a Chinese border city," said Huang Wei from the Manzhouli tourism bureau.

Fish-skin art creates bridge for cultural exchange

By **TIAN XUEFEI**
and **ZHOU HUIYING** in Harbin

Inside the bustling cultural exhibition hall of the 10th China-Russia Expo, a steady stream of international visitors found themselves huddled around a workshop table, handling a material few associated with fine art: raw, tanned fish skin.

Guided by 58-year-old Zhang Lin, Russian merchants, foreign tourists and local residents took up carving tools to cut and paste intricate shapes. Zhang's booth, showcasing the ancient fish-skin collage techniques of China's Hezhe ethnic group, has become a striking highlight of the expo, transforming an ancient hunting tradition into a medium for modern cross-border diplomacy.

"Intangible cultural heritage is a language without borders," said Zhang, a provincial-level inheritor of the endangered craft from Heilongjiang province. "As long as our neighbors come to understand this culture, my perseverance will have been worthwhile."

By the early 2000s, the grueling process of tanning, cutting, carving and sewing fish skin had nearly vanished. The craft's trajectory shifted in 2006 when it was officially listed as a Chinese national intangible cultural heritage, anchoring preservation efforts.

The Hezhe, one of China's smallest ethnic groups, have historically inhabited the river valleys of the Heilong River — known in Russia as the Amur River. Dating back to the Spring and Autumn Period (770-476 BC), their ancestors developed a unique lifestyle centered on fishing and hunting, utilizing salmon skins to construct durable clothing, daily utensils and sacred totems.

At this year's expo, Zhang brought two fish-skin garments and 16 collages, along with cultural and creative products made from fish skin.

Zhang Lin (left) teaches a Russian trader how to make a fish-skin collage at the 10th China-Russia Expo in Harbin on Monday. ZHOU HUIYING / CHINA DAILY

Zhang's fish-skin arrangements present lively, vivid images of divine deer, soaring eagles, ancient ethnic totems and distant landscapes that evoke China's northern regions.

The inheritor has been a fixture at the China-Russia Expo since its inaugural event in Harbin in 2014. Invited by the provincial department of culture and tourism to present three-dimensional, bas-relief fish-skin art, her work always finds an audience.

"It was a great opportunity to showcase our cultural heritage," she said. "Despite the language barrier, many foreign guests stopped to observe and touch," she added. Because China and Russia share a border, they also enjoy a certain cultural affinity. Intangible cultural heritage is a language without borders, Zhang said.

At past expos, Zhang incorporated Russian cultural elements into her traditional fish-skin works.

"Each expo gave me the opportunity to have face-to-face conversations with Russian artists," she said. "We would discuss fish-skin tanning, carving and pasting techniques, and I gave them detailed explanations of Hezhe history and folklore."

Over the years, Zhang has taken her fish-skin creations to multiple Russian cities for folk cultural exchange activities. At an event in Russia's Amur Oblast, her artwork received high praise. The craftsmanship and ethnic patterns impressed ordinary people and art aficionados alike, she said.

In July, Zhang donated 20 of her works to a Russian museum, displaying themes of the 12 Chinese zodiac signs, the flower of good fortune, spring swallows, autumn cranes and fish-skin clouds.

"I was happy to see that the intangible cultural heritage of Heilongjiang would be permanently rooted in the cultural halls of a foreign country," she said.

Zhang has also extended her reach to universities within Heilongjiang, allowing her ancient craft techniques to take root and flourish on campuses.

"In Zhang's classes, she never follows a script," said Alla Shulgan, a Russian student at the Harbin Institute of Technology. "Instead, she brings complete fish-skin materials, production tools and fine artworks, explaining the history of Hezhe fishing and hunting culture in simple terms, and breaking down the core techniques of fish-skin tanning, carving, pasting and coloring, allowing us to experience the charm of intangible cultural heritage from scratch."

Shulgan said that before coming to China, she was completely unfamiliar with the culture of the country's ethnic groups. "After a semester of diligent study and hands-on creation, I truly understood the charm of this ancient intangible cultural heritage — simple fish skin can be transformed into exquisite and beautiful paintings, carrying the local ethnic group's lifestyle characteristics and traditional customs."

Shulgan said she has shared her fish-skin artworks and learning experiences with family and friends back home.

For Zhang, intangible cultural heritage transmission cannot rely solely on the preservation of old skills, but must also reach young people in new generations.

"With craftsmanship as a bridge and culture as a bond, I hope to ensure that the beauty of this heritage will continue to shine," Zhang said.

Agricultural trade ripe for fresh harvest

Sino-Russian cooperation on farm products shows growing potential

By **REN QI**
renqi@chinadaily.com.cn

Agricultural cooperation is emerging as a key driver of economic synergy between China and Russia, further bolstering already robust growth momentum between the two nations, officials and experts said.

China has been Russia's largest trading partner for the past 16 years, with bilateral trade volume reaching $228.11 billion in 2025, according to data released by the General Administration of Customs.

In the first quarter this year, bilateral trade surged 14.7 percent year-on-year to $61.2 billion. During the period, China's exports to Russia grew by 22 percent, while imports rose by 9 percent, marking a solid start to the year.

Ma Chi, deputy director-general of the department of Eurasian affairs at the Ministry of Commerce, said the structure of bilateral trade between the two countries is continuously being optimized.

He noted that competitive Chinese products, such as automobiles, home appliances and machinery, have maintained strong export momentum, while Russia's supply of energy, minerals and agricultural products to China remains stable.

This national-level synergy is deeply felt at the regional level, particularly in Russia's Primorsky Krai, a crucial Far East region sharing a border with China.

Oleg Kozhemyako, governor of Primorsky Krai, has hailed China as a "reliable and stable partner", emphasizing that the cooperation is of paramount importance to the region. Primorsky Krai is eager to deepen collaboration in sectors including equipment manufacturing, deep processing of agricultural products and biomedicine, he said.

The Far East is a key region for China-Russia agricultural cooperation. To meet the storage and transportation needs of expanding grain exports to China, the two countries have collaborated in recent years to construct and upgrade transportation infrastructure in the Far East, including the Heihe-Blagoveshchensk highway bridge and the Tongjiang-Nizhneleninskoye railway bridge in 2022, which provided new international transportation corridors for future large-scale agricultural trade between the two countries.

Highlighting the strong connectivity between the two sides, Kozhemyako said that the region is linked to China through multiple border crossings and over 50 weekly flights. Russia is currently upgrading these border ports to enhance transit capacity. He also praised the high-quality work of Chinese enterprises that have successfully implemented agricultural planting and engineering construction projects in the region.

Kozhemyako reaffirmed the local government's full support for bilateral agricultural initiatives, highlighting the planned Sino-Russian agricultural cooperation experimental demonstration zone at Sukhodol Port. The zone will utilize modern technology for the deep processing of agricultural raw materials from Primorsky Krai, significantly enhancing the value-added of these products.

> "Russia boasts vast arable land, clean water sources and abundant agricultural resources, while China offers a massive consumer market and a mature processing and distribution system."
>
> **Wang Qun,** head of the Association of Entrepreneurs in the Field of Russian-Chinese Cooperation

Song Kui, president of the Contemporary China-Russia Regional Economy Research Institute in Heilongjiang province, echoed this optimism. He said that the two countries have immense potential for cooperation in energy and agriculture. The development of Russia's Far East will also inject vitality into the comprehensive revitalization of Northeast China, further promoting the socioeconomic development of both nations, Song said.

The highly complementary nature of Sino-Russian agricultural cooperation is a major catalyst for this development, according to Wang Qun, head of the Association of Entrepreneurs in the Field of Russian-Chinese Cooperation.

"Russia boasts vast arable land, clean water sources and abundant agricultural resources, while China offers a massive consumer market and a mature processing and distribution system," Wang said.

The expert noted that China has firmly established itself as the largest importer of Russian agricultural products, a milestone achieved through smooth policy communication and highly efficient customs clearance cooperation.

Wang said that both sides could further expand the trade of grains, oilseeds, meat, aquatic products and processed foods. This can be achieved by deepening the mutual recognition of agricultural quality standards — such as organic certification, and inspection and quarantine protocols — and improving cross-border cold chain and warehousing logistics networks at key ports like Suifenhe, Manzhouli and other cities in Heilongjiang province.

"Ultimately, this will help build a highly efficient 'from field to table' cooperation model," Wang added.

Tourists buy snacks at a night food market in Heihe, Heilongjiang province, last month. With visa-free entry, the market in the Sino-Russian border city attracts customers from both countries. HAN FEI / XINHUA

CHINA-RUSSIA TIES

Finding warmth in Beijing

Director Andrei Zaitsev brought his moving feature film to this year's international movie festival in the capital, where Chinese audiences surprised him with their emotional attentiveness, **Xu Fan** reports.

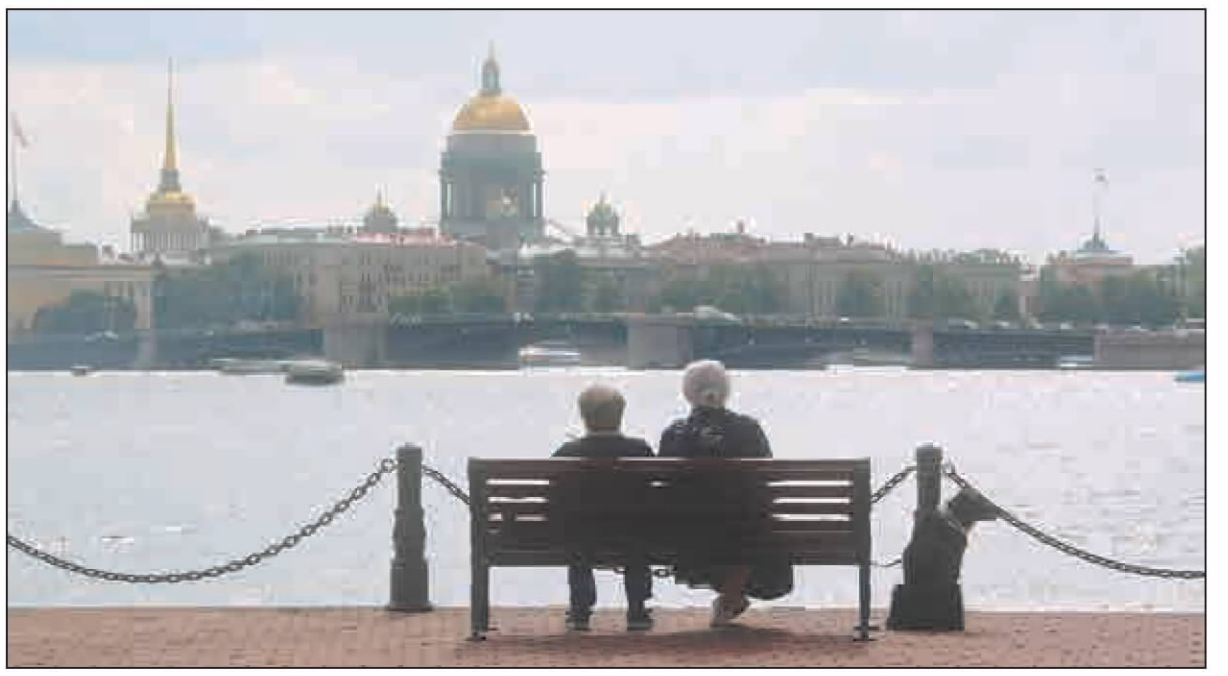
> "Because our two elderly actors tired easily, we usually filmed their scenes first. But when we started shooting, the dog would suddenly run into the frame ... it had practically become one of the lead actors."
>
> **Andrei Zaitsev,** Russian director

Top: Poster for the Russian film *Two People in One Life and a Dog*, which earned a nomination for the 16th Beijing International Film Festival's Tiantan Awards — the festival's highest honor. **Above:** Director Andrei Zaitsev shares behind-the-scenes stories from the movie with a Chinese audience during a festival post-screening session held in Beijing earlier this year. **Top right:** A scene from *Two People in One Life and a Dog*, a quiet and heartwarming Russian film, features the protagonists, two elderly intellectuals — a husband and wife — living in St. Petersburg. **Middle right:** While confronting loneliness after their adult children move abroad, their pet dog becomes the elderly couple's pivotal comfort. PHOTOS PROVIDED TO CHINA DAILY

Despite a grueling festival schedule packed with post-screening discussions and public appearances, Russian director Andrei Zaitsev rarely turned away an eager Chinese film fan.

Outside a crowded room in a downtown cinema during the 16th Beijing International Film Festival held late last month, he patiently signed posters one after another, pausing for selfies with a gentle smile. At one point, he even stopped an event organizer to ask fans to speed up the signing process and skip photos, so the long line could move more quickly.

For Zaitsev, 50, who brought his latest film, *Two People in One Life and a Dog*, to Beijing, the warmth of the reception came as an unexpected surprise. Chinese audiences, he said, often picked up on subtle details and emotional nuances that even Russian moviegoers had overlooked.



Such attentiveness became especially apparent during the film's post-screening exchanges. At one session, a female audience member raised her hand to ask about a scene that had clearly resonated with many local viewers. In it, one of the protagonists — a retired intellectual — meticulously copies an album of Song Dynasty (960-1279) fine-brush paintings in his study. The delicate depictions of birds and plants evoked a strong sense of familiarity among Chinese viewers.

"The inspiration came from the story of a renowned Russian philosopher and his wife," Zaitsev explained.

As the philosopher's birthday approached, his wife asked what gift he wanted most. He requested a rare and expensive album of Song Dynasty paintings, published in China in the 1950s. Finding a copy proved difficult. Determined to fulfill his wish, she went to bookstores in Moscow and, by luck, discovered the last remaining copy — which she purchased with the exact amount of money she happened to have on her at the time.

The scene, Zaitsev added, was also shaped by his friendship with the late Russian actor Sergey Dreyden (1941-2023), who acted in his 2020 directorial feature, *A Siege Diary*, about the brutal Siege of Leningrad during World War II. The historic feature earned Zaitsev the Tiantan Award for Best Director at the 11th Beijing International Film Festival in 2021.

"I became very close friends with Dreyden. We talked constantly, shared books and spent a lot of time together. He was a warm person. People naturally gravitated toward him, as if seeking warmth from his presence alone. I wanted that warmth to reach many viewers, not only the people around him," recalls the director with China Daily during an interview.

Dreyden loved sketching on electric trains or outdoors in nature. He often walked his dog through the streets of St. Petersburg, slowly wandering through the city he loved. "Many details in the film came directly from him," the director says.

That quiet tenderness permeates *Two People in One Life and a Dog*. Selected from 1,826 submissions from 139 countries and regions, the film was nominated for this year's Tiantan Awards, the festival's top honor. Following its screening, it received a score of 8.7 out of 10 on the Chinese review platform Douban.

Told in a restrained yet deeply humane tone, the story follows an elderly intellectual couple living in St. Petersburg. Having survived World War II as children, they confront loneliness after their adult children emigrate abroad. Accompanied by their pet dog, their quiet lives regain warmth when they befriend a young neighbor girl suffering under an abusive father.

The film lingers on seemingly trivial yet poetic moments. In one such memorable sequence, the husband becomes irritated by the vulgar commentary blaring from a tourist cruise ship along a river. Unable to tolerate it, he impulsively volunteers to serve as the guide himself, captivating passengers with stories about the literary giants who once lived and wandered along the riverbanks.

"The marriage in the film shows how difficult love can be. The elderly couple's affection for each other is unconditional. Their relationship is built on mutual respect and steadfast support through every hardship," says Zaitsev.

Yet while the film radiates warmth on-screen, its production was marked by setbacks. In 2023, just two months before filming was scheduled to begin, Sergey Dreyden, the actor originally chosen for the lead role, passed away, forcing production to be postponed for an extended period.

Even the film's canine star brought unexpected complications. The couple's pet, a border collie, was highly obedient and capable of performing complex actions on command. But the dog, interestingly, had a habit of stealing scenes.

"Because our two elderly actors tired easily, we usually filmed their scenes first. But when we started shooting, the dog would suddenly run into the frame. Later, during editing, we realized it had appeared so often that it had practically become one of the lead actors," recalls Zaitsev.

The festival marked Zaitsev's first visit to Beijing, a city he says reminds him in some ways of Moscow, as they serve as capitals of two vast countries. What impresses him most, however, is the greenery.

"I have noticed that Beijing has a large number of trees. Many of them are no longer young saplings but towering old trees. That shows China has been committed to environmental protection and urban greening for many years already," he says.

Like many first-time visitors, Zaitsev toured the Forbidden City and the Temple of Heaven. He was amused to discover that the bedrooms for emperors and their wives inside the sprawling palace complex were surprisingly modest in size.

But it was an ordinary human moment that stayed with him most vividly: in a narrow palace lane, an elderly man in a wheelchair slowly crossed paths with a baby sitting in a stroller — one face marked by age and weariness, the other filled with new life and curiosity. To the director, it felt like a fleeting scene that could be used in one of his future films.

Asked whether he would be interested in making a film in China, Zaitsev, who says he admires the works of Hong Kong auteur Wong Kar-wai, replies that the stories he most longs to tell remain simple ones — films about ordinary people, their emotions and the details of everyday life.

In Harbin, the taste of Russian bread becomes a link to home

By ZHOU HUIYING in Harbin
zhouhuiying@chinadaily.com.cn

Left: Workers make *lieba* at the Churin Food bakery in Harbin, Heilongjiang province. **Right:** Churin *lieba* weighs around two kilograms and has a traditional European flavor. PHOTOS PROVIDED TO CHINA DAILY

For international students studying abroad, the familiar taste of home often serves as the most tangible link between their homeland and a foreign country.

Viktoriia Poletaeva, a first-year master's student at Harbin Institute of Technology in Harbin, the capital city of Heilongjiang province, grew up with the aroma of Russian bread baked by her grandmother, and the scent of Russian rye bread has long been etched in her memory since she came to the city in 2022.

"The familiar Russian architecture in the city makes me feel at home," she says. "However, I always yearned for the authentic Russian bread from my hometown."

One day, by chance, she saw Churin *lieba* (which comes from the Russian word *khleb*, meaning bread) at a Churin Food store, and the familiar shape and aroma instantly triggered her homesickness.

"With one bite, the crispy crust paired with the soft interior and the slightly sour taste from the hops fermentation," she says. "At that moment, the longing for my distant homeland was gently soothed.

"In fact, Russian bread is generally more sour and harder, while Harbin *lieba* perfectly blends the rich wheat aroma of Northeast China," she says. "It is solid and chewy, with a long-lasting aftertaste. It retains the traditional essence of Russian baking while cleverly adapting to local tastes, making it a distinctive delicacy rooted in the black soil, combining flavors from both countries."

Poletaeva also visited the Churin Bread-Making Skills Exhibition Hall.

In the center of the hall stands a model of a loaf of Churin *lieba* sitting on a four-meter-long wooden paddle.

In the experience area, visitors were already lining up.

As the freshly baked *lieba* was unveiled, its soft interior and steaming warmth were handed to each visitor.

The traditional way to eat it is with butter and jam and another way is to pair it with slices of Russian-style sausage.

"These are authentic Russian ways of eating it," she says. "I'm delighted to see my hometown's food culture so welcomed in Harbin."

In 1900, Russian merchant Ivan Churin brought Russian bread-making techniques to Harbin.

Passed down through five generations of craftsmen, the large round bread, which weighs around two kilograms and has a traditional European flavor, has become a specialty of Harbin and a taste memory etched in the daily lives of local residents.

At 3 am, the fire in the Churin bakery is already lit.

Master Lei, the fifth-generation inheritor of Churin bread-making techniques, carefully records the room temperature.

His keen intuition, honed from years on the production line, allows him to accurately estimate fermentation based on variables like temperature and environment.

He adjusts the water temperature, kneads the dough, and gently awakens the century-old starter yeast.

Every detail affects the traditional flavor of *lieba*.

After three natural fermentations, manual shaping, and slow baking in a brick oven, the crispy-on-the-outside, soft-on-the-inside Churin *lieba* is ready, filling the air with the rich aroma of wheat.

"Churin *lieba* has been passed down through five generations, always using traditional Russian handmade techniques and facilities," says Lei. "Its three major processes are distinctive — using hops to make liquid yeast for fermentation, giving the bread an enticing hop aroma; employing a traditional three-stage fermentation to produce a rich variety of organic acids; and baking with hardwood, creating a slightly charred and crispy crust with a soft and tasty interior.

"Kneading and shaping by hand are the two key steps in the production process," he says. "Kneading by hand is a race against time; it requires speed and ensuring the dough is well-formed."

Lei says he spent over two years mastering the basic skill of kneading.

At the Churin bakery, the average age of the core worker team is over 35. Many of them entered the workshop when young and have been working on the front line for decades.

"In 2007, the Churin *lieba*-making technique was recognized as a provincial intangible cultural heritage. In 2009, we established the country's first Churin Bread-Making Skills Exhibition Hall," he says. "The exhibition hall is not only a simple reproduction of intangible cultural heritage techniques, but also an interpretation from a new perspective."

COMMENT

Editorials

Sino-Russian ties have entered new stage of greater achievements, faster development

Russian President Vladimir Putin's 25th visit to China this week has once again drawn global attention to one of the world's most consequential major-country relationships. The steady development of China-Russia relations carries particular significance beyond the bilateral scope especially at a time marked by geopolitical turbulence.

During their meeting on Wednesday in Beijing, President Xi Jinping and his Russian counterpart exchanged views on bilateral ties, practical cooperation and major international and regional issues of mutual concern, injecting fresh momentum into the China-Russia comprehensive strategic partnership of coordination in its 30th anniversary year.

During Wednesday's meeting, the two sides also agreed to further extend the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation — this year marks the 25th anniversary of its signing — demonstrating the stability of bilateral relations and the high level of mutual trust between the two countries.

China-Russia relations have developed steadily because the two countries have continuously deepened their political mutual trust and strategic coordination. This is the result of long-time careful cultivation, mutual support and a shared commitment to respecting each other's core interests and development paths.

What makes China-Russia relations distinctive is that they have developed according to their own internal logic rather than external pressure. The bilateral relationship is characterized by non-alliance, non-confrontation and non-targeting of third parties. That also means the relationship is not subject to interference or manipulation by external actors.

That is particularly meaningful in today's world, where some countries still view international relations through the outdated prism of bloc confrontation and zero-sum rivalry.

In recent years, bilateral trade and investment have maintained stable and robust growth, showing the strong endogenous driving force behind the relationship.

The two neighbors' economies possess complementary advantages and their practical cooperation is a long-term strategic choice serving the interests of both peoples.

In the process of cooperation and communication, political mutual trust has further deepened, while exchanges in trade, investment, energy, science and technology, people-to-people and sub-national dialogues have continued to advance. The bonds between the two peoples have also grown stronger.

A recent survey among young people in both countries showed that more than 80 percent of respondents view bilateral relations positively and hope for stronger exchanges. Such findings reflect not only the vitality of people-to-people ties, but also the broader aspiration among younger generations for peace, cooperation and mutual understanding in a changing world.

Unswervingly promoting the long-term, sound, steady and high-quality development of China-Russia relations is a strategic choice made by both sides based on the fundamental interests of the two nations and broader global trends. In a turbulent era, mutual trust between major countries is increasingly valuable for world peace and stability.

The China-Russia relationship has entered a new stage of greater achievements and faster development, Xi said in his meeting with Putin.

In recent years, faced with a fluid and turbulent international situation, China and Russia have developed the comprehensive strategic partnership of coordination for a new era on the basis of equality, mutual respect, good faith, and win-win cooperation, as Xi pointed out.

This has enabled the two countries to expand practical cooperation at a time when unilateralism and protectionism are on the rise in some parts of the world. Such coordination also carries significance for safeguarding multilateralism and international fairness.

It is important for the two countries to work together in international organizations so as to make the global governance system more just and reasonable and jointly uphold international justice and fairness while advancing the building of a community with a shared future for humanity.

A stable and forward-looking China-Russia relationship is therefore not only beneficial to the two countries, but also contributes valuable certainty and positive energy to a volatile world.

As permanent members of the United Nations Security Council and major countries, China and Russia should continue to adopt a strategic and long-term perspective and work together to fully implement the important common understandings reached by the two leaders. The two countries should seize the historic opportunities for their respective development and revitalization and contribute to the common good of the world.

Secessionists common enemy of China and US

Lai Ching-te's tenure as the head of the Democratic Progressive Party authorities of China's Taiwan region has been marked by a series of missteps and failures that have not only strained cross-Strait relations but also undermined the island's development prospects.

Contrary to his shameless claim in a speech on Wednesday marking the two-year anniversary of his tenure that he has maintained the status quo of peace and stability in the Taiwan Strait, the DPP authorities have stubbornly adhered to a "Taiwan independence" stance, peddled separatist fallacies and obstructed cross-Strait exchanges.

That speech was a response, if not a desperate "don't desert me" plea, to US President Donald Trump's Friday interview, in which the US leader stated, "We're not looking to have somebody say, 'Let's go independent because the United States is backing us'." This remark dealt a heavy blow to Lai.

In his speech — yet another litany of lies and deceit — Lai openly groveled to Washington, begging for an opportunity to tell the US leader that he wishes to continue purchasing US weapons, which he misleadingly labeled as essential to peace. Ironically, he tried to assure his audience that the island's future would not be determined by external forces just moments after trying to solicit US support.

In an attempt to conceal his secessionist nature, Lai peddled a so-called "Taiwan subject mentality" in his speech, openly seeking to sever the island from the Chinese motherland.

This "soft independence" is hidden and pernicious, no less harming than the DPP authorities' overt political separatist sloganeering.

Evidently anxious over the US leader's remarks, Lai posted a so-called "five-point speech" on Facebook on Sunday, in which he called black white, barefacedly claiming that his authorities are the protectors of regional peace. Yet to his horror, that "carefully worded" message failed to elicit the hoped for response from Washington — explaining why Lai doubled down on his efforts to appeal to the US not to give up on him.

If Lai truly intends to show the world that he is not a secessionist and that he is committed to peace and stability, he should simply pledge his support for the 1992 Consensus and stop fawning over the US.

The true color of his secessionist feather is laid bare by the extraordinary lengths he has gone to in an attempt to conceal his separatist nature — and his fear of losing US support for his political agenda.

The predicament Taiwan faces today stems from the DPP authorities' long-standing practice of placing ideological manipulation above reality, staking the island's security on the will of the US, and tying the future of Taiwan people to the dangerous path of seeking "Taiwan independence" through reliance on external forces. Once Washington shows even signs of shifting priorities, that layer of illusion surrounding the DPP authorities' reckless approach will be stripped away. In short, "Taiwan independence" is a dead end.

Lai's latest remarks do not signal any abandonment of "Taiwan independence", but rather a repackaging of it in more carefully crafted rhetoric.

"Taiwan independence" is fundamentally incompatible with peace and stability across the Taiwan Strait. The expansion of separatist forces advocating "Taiwan independence" will ultimately push Taiwan toward a dangerous abyss — a trajectory that runs counter not only to the interests of the Chinese nation, but also to the strategic interests of the US. In this sense, curbing "Taiwan independence" separatist activities and maintaining peace and stability across the Taiwan Strait serve the shared interests of both China and the US. Lai's remarks further underscore the reality that "Taiwan independence" has become a common challenge confronting both Beijing and Washington.

There is but one China in the world and that Taiwan is part of China. No matter what Lai says or does, he will not stop the historical trend toward reunification, which is unstoppable, as a spokesperson for the State Council Taiwan Affairs Office said on Wednesday.

Redline conservation based on space-air-ground monitoring

In the run-up to the 25th International Day for Biological Diversity on Friday, the global community faces a sobering reality check.

According to a release from the United Nations Development Programme last August, only $121 billion is invested annually in conservation worldwide, leaving an estimated annual gap of over $700 billion.

Meanwhile, the recently unveiled UN Global Forest Goals Report 2026 reveals that the global forest area declined by more than 40 million hectares between 2015 and 2025, while financing for sustainable forest management remains far below estimated needs.

There are only two solutions going forward: either countries have to dramatically increase funding, or find smarter, more cost-effective ways to conserve nature. While dramatically increasing funding is no easy task, China may have found a way to achieve the latter. Its Ecological Conservation Redline strategy offers a way to protect biodiversity at remarkably low cost — and one that holds valuable lessons for the rest of the world.

Many nations, particularly those in the Global South, struggle with uncontrolled land encroachment and expansion. The default approach is often to develop first and clean up later — an expensive and frequently futile exercise.

China's redline strategy flips this logic on its head with a simple yet powerful principle: draw the baseline before the blueprint. Instead of spending billions to restore degraded wetlands or deforested lands at a later stage, the approach forces planners to first identify and cordon off areas that are ecologically vital or fragile. Only then is development permitted elsewhere.

This "defensive tool" is inherently low-cost and in doing so, it transforms biodiversity protection from an expensive afterthought into a preemptive safeguard, helping nations escape the zero-sum game between ecology and economy that traps so many developing countries.

The results speak for themselves. According to a blue book released by the Ministry of Natural Resources late last year, since the redlines were established nationwide in 2022, China has seen forest area within the redlines increase by 3,344 square kilometers, and water body area increase by 320 sq km. At the same time, construction area has shrunk by 6.5 sq km and mining area by 5.6 sq km.

Within marine ecological redlines, sea use area has reduced by 873 sq km, down 35 percent.

Perhaps the most innovative and budget-friendly aspect of this redline system is its administrative simplicity. Unlike traditional nature reserves, which often require dedicated management bodies, staff members and ongoing operational budgets for each site, China's redline strategy follows a different tack: there is no special management body for each of the areas encircled by its redlines.

Instead, the government oversees these vast zones using a combination of satellites, drones and targeted on-the-ground patrols — a three-dimensional "space-air-ground" monitoring network. This model dramatically drives down enforcement costs, allowing governments to protect more land with fewer resources, narrowing the gap between ambition and affordability.

Of course, the global biodiversity finance gap of over $700 billion is not a problem any country can solve alone. But China's Ecological Conservation Redline strategy offers a compelling, low-cost, and readily applicable model. It proves that effective biodiversity protection does not always require vast bureaucracies or unlimited budgets.

Sometimes, it takes nothing more than a clear line on a map, a satellite in the sky that shows it, and the political will to say: here, development stops, and life begins.

For any country seeking to protect its natural heritage without breaking the bank, that is a lesson worth learning.

— HOU LIQIANG, CHINA DAILY

What They Say

Global cooperation launchpad for lunar exploration

Editor's note: *China's aerospace sector, especially its lunar exploration program, has made rapid progress in recent years. Yang Yuguang, chair of the International Astronautical Federation's Space Transportation Committee, spoke to China.com.cn about China's achievements and the importance of international cooperation in lunar exploration. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China is a reliable partner in international lunar exploration, and that reliability is rooted largely in its sound technologies. Through the lunar missions from Chang'e-1 to Chang'e-6, the country has mastered exploration technologies of lunar orbiting, landing and sample return. These capabilities are essential for lunar exploration activities and will enable China to carry international payloads in future lunar missions.

China has a long history of international cooperation in outer space. For example, the resource satellites jointly developed by China and Brazil have been hailed as a model of South-South cooperation. International cooperation has been embedded in China's lunar exploration program from the very beginning. Deep-space tracking, telemetry and command communications depend on extensive support from ground stations. As China's territory cannot always face the moon, it needs assistance from stations located in other countries.

Throughout the orbiting, landing and sample return stages of the lunar exploration program, the missions from China carried experimental payloads from various countries.

Some lunar samples retrieved by Chang'e-5 and Chang'e-6 were given as State gifts to visiting heads of state from other countries. These samples given by China to other countries for scientific research are expected to yield valuable outcomes.

Scientists from both China and other countries can apply for access to lunar soil and rock samples brought back by Chang'e-5 and Chang'e-6. These samples will help scientists worldwide deepen their understanding of the evolution and history of the moon.

China is scheduled to launch the Chang'e-7 probe this year. Together with the subsequent Chang'e-8 probe, it will help form the basic model of the International Lunar Research Station. China is making a major contribution to the construction of the station, which will be built in the South Pole region of the moon. International payloads can be carried to the station by probes from both China and other countries to become part of the station.

Lunar exploration is no longer an endeavor reserved solely for national space agencies. Many commercial enterprises are now able to participate in it. Nevertheless, lunar exploration remains a megaproject that requires huge investments and a long period of time. Through international cooperation, participants can share the financial burden, making it easier to secure government support.

China has made extensive efforts to promote international cooperation in lunar and deep-space exploration. The country will remain committed to such cooperation in the future as well.

The formulation of common standards will be crucial for advancing international cooperation, especially in technological areas. Effective cooperation needs a shared "language". Without unified specifications for electrical, mechanical, signal and other interfaces, international cooperation will become too complicated to carry out. China is also beginning to formulate international standards in the field of aerospace.

Asif Ali Zardari

Seventy-five years of friendship: Pakistan and China step into the future

SHI YU / CHINA DAILY

Pakistan and China began their remarkable journey of friendship and cooperation 75 years ago with the establishment of diplomatic relations.

Since then, we have built a partnership defined by trust, consistency, and the ability to stand together through difficult times and shifting global realities. What began as a diplomatic engagement has evolved into a model of enduring cooperation between our two nations.

This relationship is also deeply personal for me. My late father in law, Shaheed Zulfikar Ali Bhutto, and Shaheed Mohtarma Benazir Bhutto, believed strongly in building lasting ties with China and played pivotal roles in shaping our early cooperation.

That legacy continues into the third generation. My son, Bilawal Bhutto Zardari, and daughter, Aseefa Bhutto Zardari, are both actively engaged in strengthening links between our two nations.

Our connection, however, predates modern diplomacy. For centuries, the regions that are now in Pakistan and China were linked through the ancient Silk Road — routes that crossed mountains and rivers, carrying goods, culture and ideas between our peoples. These exchanges have laid the foundation for a relationship that is both historic and natural.

Pakistan-China relations have never been transactional. They are rooted in mutual respect, trust and a shared understanding of each other's priorities.

Since 1951, we have supported each other on issues of core importance, including Pakistan's firm commitment to the one-China principle and our role in supporting China's rightful place at the United Nations in 1971.

What makes this partnership unique is how it has evolved. Regular high-level exchanges have kept it forward-looking, translating political understanding into practical cooperation, across infrastructure, energy, trade and agriculture — areas that directly impact people's lives.

I have witnessed this closeness firsthand. During my earlier tenure as President from 2008 to 2013, I visited China frequently.

These visits were not merely official engagements; they were opportunities to deepen trust, observe China's transformation and fortify our genuine friendship.

My visits again in 2025 brought those experiences full circle.

The scale of China's progress is extraordinary. Under the leadership of President Xi Jinping, China has consolidated its position as a leading global power and the world's second-largest economy.

This transformation reflects vision, discipline, and a sustained commitment to development that has reshaped the global economic landscape.

Through profound shifts in the international system — from the Cold War to today's more complex and fragmented world — Pakistan-China relations have remained resilient.

At a time when divisions often dominate global discourse, our partnership stands out for its consistency and clarity of purpose.

We do not view security and development as a race; we see it as a shared journey. This belief shapes our cooperation at the United Nations, within the Shanghai Cooperation Organisation, and across the broader Global South, reflecting a shared commitment to multilateralism and dialogue.

This approach also guides our actions in times of crisis. During the recent war involving the United States, Israel and Iran, China played a constructive role by encouraging restraint and supporting dialogue, as well as resolutely backing Pakistan's mediation efforts, alongside its own compelling diplomatic engagement. This reflected our conviction that even the most complex disputes must be resolved peacefully.

China's Belt and Road Initiative has taken this philosophy of shared progress to a global scale. By investing in infrastructure and connectivity, it has opened new avenues for trade, strengthened economic linkages, and created opportunities for growth.

For many developing countries, it has demonstrated how connectivity can drive inclusive prosperity.

Within this broader vision, the China-Pakistan Economic Corridor (CPEC) stands as a flagship of our cooperation. It has transformed Pakistan's infrastructure, reduced energy shortages, and created new economic opportunities.

As CPEC enters its next phase, our focus is increasingly on people-centered development — industrial cooperation, modern agriculture, job creation, and technology transfer — to ensure growth is both sustainable and inclusive.

Our defense partnership remains another key pillar of this relationship. Cooperation in defense technology, training, and joint exercises has reinforced Pakistan's capabilities while contributing to regional stability. It is defensive in nature and reflects our commitment to peace.

Yet, the true strength of Pakistan-China relations lies beyond governments and agreements. It rests in the bonds between our people.

Students, artists, entrepreneurs, and young people from both countries are building connections that transcend political cycles. These human ties give real meaning to the idea of an "all-weather friendship".

The symbolism of this year's Chinese zodiac — the Year of the Horse — captures the spirit of our partnership: energy, resilience, and forward momentum.

As we look ahead, our direction is clear: deepen cooperation, strengthen solidarity among Global South nations, and work together for a rule-based international order.

Our partnership is not directed against any country; it is rooted in mutual respect and shared progress.

Seventy-five years on, Pakistan-China relations remain strong, steady, and deeply humane — and that enduring spirit will continue to guide us into the future.

China boosts shared prosperity in Asia-Pacific

The first five months of 2026 have seen intensified geopolitical rivalries and a turbulent global economy. To ensure businesses operate smoothly, major countries should take responsibility for stabilizing both regional and global markets.

As the host of the Asia-Pacific Economic Cooperation 2026, China is working to inject stability and foster consensus for regional prosperity. Under the theme "Building an Asia-Pacific Community to Prosper Together", China has prioritized openness, innovation and cooperation to advance the Free Trade Area of the Asia-Pacific.

Around 2017, China shifted its focus toward the Asia-Pacific region. This pivot shaped a new economic landscape characterized by closer ties and a stronger emphasis on regional integration.

That year, China's trade with the Association of Southeast Asian Nations countries crossed a record $500 billion.

In the following years, through the Belt and Road Initiative, APEC, the implementation of the Regional Comprehensive Economic Partnership, and the signing of the China-ASEAN FTA 3.0 Upgrade Protocol, China has steered neighboring countries toward a new consensus. A standout result is that ASEAN became China's largest trading partner in 2020, while China has remained the association's largest trading partner since 2009.

Four years after its implementation, the RCEP has significantly impacted China's trade landscape. By 2025, China's trade with the other RCEP members reached $1.9 trillion, accounting for 44.2 percent of the country's total foreign trade growth and underscoring the agreement's role in fostering regional cooperation.

China's high-tech exports grew by 13.2 percent, with exports of specialized equipment, high-end machine tools, and industrial robots increasing by 20.6 percent, 21.5 percent and 48.7 percent respectively. This reflects China's growing export focus on high-end technology and advanced productive forces.

China is also steering sustainable growth in the Asia-Pacific through its green transition. In 2024, Asia accounted for 72 percent of the world's newly installed renewable energy capacity.

In 2025, Asia attracted 65 percent of global investment in solar, 64 percent in wind, and 41 percent in battery sectors, propelling the global shift toward clean energy.

The energy crisis sparked by the US-Iran conflict further underscored the foresight in China's new energy initiatives.

China's role is pivotal; in 2025, its clean energy capacity reached 2.4 billion kilowatts, about 45 percent of the global total. In just five years, its combined installed wind and solar capacity has surged from 530 million to 1.84 billion kilowatts.

Global energy transition investment reached a record $2.3 trillion in 2025, with the Asia-Pacific region leading the charge at 47 percent of the total. Although China's investment dipped slightly due to lower equipment costs, it continued to be the world's largest single market.

Emerging markets, particularly those in Southeast Asia, are also key drivers of the global energy transition. Vietnam's energy transition investment has exceeded $10 billion, while Indonesia's electric vehicle and energy storage markets are rapidly expanding.

Within the RCEP region, EV trade grew by 45.2 percent year-on-year, and exports of green products such as wind turbines and electric railway locomotives doubled, highlighting the significant green transformation fueled by regional cooperation.

However, Asia's energy transition still faces challenges such as reliance on fossil fuels and insufficient power grid infrastructure.

Li Baosen, deputy secretary-general of the Global Energy Interconnection Development and Cooperation Organization, notes that China's cooperation models and technical support can help address developmental disparities across the region.

By supplying photovoltaic cells, new energy vehicles, smart grids, and energy storage solutions, China is aiding regional and global decarbonization. The energy crisis sparked by the US-Iran conflict further underscored the foresight in China's new energy initiatives.

China is propelling regional smart development. In 2025, its trade with ASEAN surpassed $1 trillion — a milestone driven by both enormous shared development needs and vibrant opportunities in the digital and green economies and other emerging fields. China's expertise in 5G, cloud computing, and artificial intelligence aligns with ASEAN countries' needs for industrial upgrading.

Their cross-border e-commerce has maintained over 20 percent growth for years. The China-ASEAN FTA 3.0 Upgrade Protocol now includes the digital economy, enabling Chinese digital and new energy companies to deepen their presence in ASEAN markets. This supports collaboration in cloud infrastructure, AI and fintech, and promotes the integration of industry and supply chains.

China's regional AI cooperation has also yielded impressive results. At the 2025 SCO Summit in Tianjin, Beijing systematically outlined a strategic direction and pathways for regional AI cooperation and offered an SCO solution for global AI governance. As China and ASEAN strengthen ties in cross-border data flows, digital payments, and smart cities, a closely integrated digital economy community is emerging.

Consensus-building is inseparable from people-to-people exchanges, with tourism playing a crucial role. In 2025, China saw a record 697 million inbound and outbound crossings, while inbound trips reached 154 million, driven by incentives such as visa-free policies for 48 countries and expanded departure tax refunds.

Tourism between China and Asia-Pacific countries is advancing across five dimensions: scale, policy, technology, consumption structure, and regional coordination, aiming for high-quality, resilient, and integrated development.

RCEP and APEC have facilitated tourism by increasing flight routes and enhancing joint marketing, boosting visitor flows. Meanwhile, technology, particularly AI, is transforming the tourism service ecosystem by improving booking, personalized guidance, and other services.

Through economic cooperation organizations, advanced new energy technologies, innovative digital economy initiatives, and open tourism policies, China is injecting stability into the Asia-Pacific region on multiple fronts.

The author is the chairman of the Malaysian Chamber of Commerce and Industry in China.

Visit deepens good-neighborliness and friendly cooperation

Editor's note: *President Xi Jinping and Russian President Vladimir Putin, who was on a state visit to China, on Wednesday signed a joint statement on enhancing comprehensive strategic coordination and deepening good-neighborliness and friendly cooperation between the two countries. Two experts shared their views on this matter with China Daily's Li Huixian and Wang Qingyun.*

Deepened coordination beneficial to both

The high-level engagement between President Xi Jinping and visiting Russian President Vladimir Putin in Beijing on Wednesday and the signing of more than 20 cooperation agreements in areas such as education, technology and economic and trade relations by the two heads of state hold strategic significance on multiple levels.

First, both sides agreed to extend the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation, thereby maintaining the legal foundation for deep bilateral ties.

This extension allows the further development of their comprehensive strategic partnership, safeguarding their sovereignty, and developmental interests across the board, while advancing cooperation in various fields.

Notably, they leverage platforms such as the China-Russia Years of Education to unlock the potential of exchanges between their peoples.

The two countries can also leverage existing multilateral cooperation frameworks — including the Shanghai Cooperation Organization, BRICS, and the coordination mechanisms linking the Belt and Road Initiative with the Eurasian Economic Union — to jointly promote regional connectivity and cross-border trade, ensure the smooth operation of regional industry and supply chains, and foster a stable and orderly environment for regional development.

This collaboration will enable China and Russia to further expand cooperation in areas such as energy, cross-border logistics, local-currency settlements, and trade and economic exchanges.

Moreover, the Chinese side called for even higher quality development and revitalization of the comprehensive strategic coordination between China and Russia.

This approach has a solid practical foundation. Both countries are at a critical stage of industrial upgrading and are pursuing self-reliant development in their economic and technological systems. They face shared challenges, such as trade barriers and supply chain instability. By deepening their cooperation, the two nations can effectively complement each other's economic strengths.

For instance, Russia can leverage China's vast market, comprehensive manufacturing capacity, and infrastructure capabilities to broaden its development space and unlock the potential of its energy and other resources.

At the same time, China can draw on Russia's resource endowments, market and favorable geographical location to diversify its energy and resource supplies and smooth its westward-opening corridors.

This way, mutual reinforcement can serve each country's domestic revitalization needs.

From a long-term strategic perspective, by supporting each other's development and revitalization through cooperation, the two countries can steadily strengthen their development confidence, withstand external uncertainties, achieve stable growth, and further consolidate the foundation for bilateral relations.

Globally, both countries can continue working together to promote a multipolar world, advance multilateralism and implement the four global initiatives proposed by China and counter hegemony, unilateralism and bloc confrontation.

The commitment of Beijing and Moscow to promoting a more just and equitable international order through the United Nations is a stabilizing force, and can help safeguard the legitimate rights and interests of Global South countries.

Zhao Huirong is a researcher at the Institute of Russian, Eastern European and Central Asian Studies, Chinese Academy of Social Sciences.

An enduring partnership for mutual growth

The heads of state of China and Russia held talks in Beijing on Wednesday, guiding the two countries' efforts to conduct comprehensive strategic coordination of even higher quality.

This year marks the 30th anniversary of the establishment of the China-Russia comprehensive strategic partnership of coordination and the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

Over the past 25 years, China and Russia have followed the spirit of the treaty and maintained close coordination in political, economic, cultural and other fields.

In 2019, bilateral relations were elevated to a comprehensive strategic partnership of coordination for a new era, placing cooperation across all fields on the fast track.

Both sides agreed to extend the treaty on Wednesday, which further consolidates the legal foundation for permanent good-neighborliness and friendly cooperation between the two countries.

Under the strategic guidance of the heads of state of China and Russia, the two countries have developed a mature relationship that has become an example for a new type of major-country relations.

China and Russia are each other's good neighbors, friends and partners. They pursue a partnership rather than an alliance, and their relations are not targeted at any third party.

Both nations respect each other's sovereignty and territorial integrity, continuously deepen mutually beneficial and win-win cooperation in various fields, and work hand in hand on international affairs.

Over the past decade, economic cooperation between China and Russia has achieved rapid growth.

The two countries are each other's important trading partners. Sub-national cooperation between the two sides is thriving.

The China-Russia Expo, which is being held in Harbin, Northeast China's Heilongjiang province, has become an important platform for connecting enterprises of both sides, deepening supply chain cooperation and boosting people-to-people exchanges.

This year is also the beginning of the China-Russia Years of Education. Both sides have seen more than 80,000 people studying in each other's country, and cooperated to establish more than 150 educational institutions and projects.

Coordination between China and Russia has weathered changes in the international situation, and become a "stabilizer" in a world fraught with uncertainty.

Chen Yurong is a senior research fellow in the Department for World Peace and Security Studies at the China Institute of International Studies.

The views don't necessarily reflect those of China Daily.

GLOBAL VIEWS

POU SOTHIRAK AND HIM ROTHA

Building up the Lancang-Mekong community

This cooperation mechanism linking countries through which the river flows holds huge potential for deepening ties between China and Southeast Asia

SHI YU / CHINA DAILY

The Lancang-Mekong Cooperation, launched in 2016, is one of the most successful subregional cooperation mechanisms backed by strong political will, deep financial support and shared vision among the six member countries, namely China, Cambodia, Laos, Myanmar, Vietnam and Thailand.

Pou Sothirak

Him Rotha

With an expressed commitment to deepening mutual trust, LMC has set out to promote cooperation, with the member countries' leaders pledging to boost the economic and social development of subregional countries, enhance people's well-being, narrow the development gap among regional countries and support the Association of Southeast Asian Nations community in facilitating the implementation of the United Nations' 2030 Agenda for Sustainable Development and advancing South-South cooperation.

Although there are plenty of Lancang-Mekong mechanisms, the LMC is known to be among the most robust subregional platforms, as it operates through all-round and broad-based cooperation with a government-guided and project-oriented model.

As this year marks the 10th anniversary of the first Lancang-Mekong Cooperation Leaders' Meeting, it is worth reflecting upon the decade-long achievements and the way forward.

The LMC is one of the most institutionalized Lancang-Mekong mechanisms. It possesses long-term goals driven by a development strategy, focusing on three priority areas, namely political and security issues, economic and sustainable development, and social, cultural and people-to-people exchanges, as enshrined in the Joint Press Communique of the First Lancang-Mekong Cooperation Foreign Ministers' Meeting in 2015.

Based on the Sanya Declaration adopted in 2016, the LMC states decided to make the three aforementioned areas the cooperation's pillars with a specific scope of prioritizing connectivity, production capacity, cross-border economic cooperation, water resources, agriculture and poverty reduction.

Since its inception, this subregional mechanism has established deep engagements between China and other Lancang-Mekong countries through frequent meetings, ranging from leaders' summits to foreign ministers' meetings, and a wide range of working group engagements. This has not only fostered trust and confidence among the leaders of these subregional countries, but also regularized interactions among line officials across LMC working groups and relevant stakeholders in the LMC region.

Moreover, the institutionalization of the LMC deepened with the launch of the LMC Special Fund in 2017. Since then, nearly 1,000 "small yet smart" projects have been carried out. Cambodia, specifically, has received over 100 projects, covering diverse sectors, including rural development, water resource management and agriculture. This special fund has not only improved livelihoods but also strengthened national connectivity, enhanced rural development and reinforced the effectiveness of the LMC model, deepening the bonds between China and Cambodia.

With the special fund allocated to projects that boost local livelihoods and the well-being of the people in the region, the LMC frameworks have been able to contribute to common development and prosperity for all LMC countries.

The LMC has also addressed the challenges. In 2016, the Lancang-Mekong countries witnessed a severe drought caused by a number of factors, such as climate change and the El Nino phenomenon. China released water from the Jinghong Hydropower Station in Yunnan province, providing other Lancang-Mekong countries with huge relief.

Water cooperation has been significantly enhanced since 2020, when China and other Lancang-Mekong countries agreed to establish an information-sharing platform, through which China has shared full-year hydrological data of the river.

Water cooperation is also linked with energy cooperation. So far, energy cooperation under the LMC framework has focused only on functional cooperation, such as capacity building and technical support. Although this has supported soft infrastructure, such as knowledge and information sharing on green energy promotion, it could be an area LMC countries can explore further amid the energy crisis caused by an unstable geopolitical environment, including the current conflict in the Middle East.

The LMC holds promising potential to deepen ties between China and countries in Southeast Asia. Nonetheless, challenges remain, from geopolitical uncertainties and flash points in the region and beyond, to the need to improve the functional structure of this mechanism. For that it is crucial that the LMC countries work together.

First, the setting up of the LMC should serve as a catalyst to bring about further development along the Lancang-Mekong River. As such, LMC should not be seen as a competitor but rather an inclusive complement to the already-existing Lancang-Mekong mechanisms. Since some of these existing mechanisms seem to have limited capacity in terms of financial assistance and limited areas of work and cooperation, LMC should be seen as a prime framework that could complement other mechanisms such as the Mekong River Commission, Greater Mekong Subregion Cooperation and the Mekong-United States Partnership, just to name a few.

Second, as a platform with better political will, leadership and funds availability, the LMC should explore whether there are projects proposed by other Lancang-Mekong mechanisms that are stuck because of limited fund capacity or other reasons. The LMC should consider joint collaboration with such projects. The LMC's credibility can be built through joint collaborations with various existing mechanisms, as long as misunderstandings are kept to a minimum.

Third, some countries in the region have their own issues to deal with, such as domestic problems and interstate border conflicts. Therefore, LMC countries could consider compartmentalizing political issues while maintaining overall achievable and robust cooperation. This would serve the interests of the livelihoods and well-being of the people in the region.

Other than that, as the world is facing a multitude of challenges, such as the energy crisis and other emerging issues, LMC countries should build upon existing frameworks and work together to explore alternative solutions, including investment in green energy infrastructure, and prepare themselves for potential future non-traditional security issues, such as transnational crime.

To become a vital institution that can achieve what other existing mechanisms cannot, the LMC should try to be more inclusive and open, and inject vitality into regional integration.

MUHAMMAD ASIF NOOR

Link of friendship

The CPEC is a practical outcome of China-Pakistan cooperation that has steadily strengthened over the past 75 years based on long-term mutual trust

ZHANG YUJUN / FOR CHINA DAILY

This year marks 75 years of diplomatic relations between China and Pakistan. The anniversary comes at a time when the global landscape is unsettled. Economic fragmentation, an uneven recovery and uncertainty over development paths dominate international debates. Against this backdrop, the China-Pakistan relationship stands out for its steadiness, clarity and practical results. It reflects a partnership built on long-term mutual trust, development-first thinking and mutual respect, shaped by decades of cooperation and a shared outlook on the future.

What has defined China-Pakistan diplomacy over the years is consistency. From the earliest days of recognition through shifting regional and global circumstances, both sides have treated sovereignty, strategic autonomy and development as shared priorities. Political trust was established early and has been carefully maintained across leadership changes. Regular high-level exchanges have created a rhythm of cooperation that has remained stable even during periods of regional uncertainty. This is why the relationship has evolved into a genuine all-weather strategic cooperative partnership, supported by public confidence in both countries.

A major turning point came in 2015, when President Xi Jinping's visit to Pakistan translated political trust into a concrete economic vision through the China-Pakistan Economic Corridor. Conceived under the Belt and Road Initiative, the CPEC was never meant to be just a set of projects. It was designed as a long-term development plan aimed at addressing Pakistan's structural challenges. Pakistan's consistent support for China's core interests has been matched by China's firm backing of Pakistan's sovereignty, stability and development goals. This mutual understanding has given the partnership depth and lasting credibility.

The importance of this year was underscored right at its start. On Jan 4, Deputy Prime Minister and Foreign Minister Mohammad Ishaq Dar visited Beijing to co-chair the seventh round of the China-Pakistan Foreign Ministers' Strategic Dialogue with Chinese Foreign Minister Wang Yi. The discussions reinforced strategic trust, reaffirmed support for each country's core interests and set the direction for advancing a high-quality CPEC 2.0. The focus on industry, agriculture and mining signals a shared commitment to the next phase of cooperation.

The impact of this partnership is most visible in economic outcomes. Chinese investment flows have picked up pace. It is estimated that net inflows from China surged to $1.22 billion in the 2024-25 fiscal year, accounting for nearly half of Pakistan's total foreign direct investment of around $2.5 billion. These figures reflect renewed investor confidence, supported by better connectivity, improved energy availability and steady progress under the CPEC.

Since its launch in 2013, the original phase of the CPEC focused on Pakistan's most pressing challenges, especially energy shortages and weak connectivity. Through a mix of coal, hydropower, wind and solar projects, more than 8,000 megawatts were added to the national grid. Urban load shedding, once as high as 18 hours a day, has largely faded, restoring industrial activity and improving daily life for households. At the same time, over 1,500 kilometers of modern highways, including the Multan-Sukkur Motorway, have reduced logistics costs and connected regions that had long remained on the margins of economic activity.

The CPEC has also broadened employment opportunities. By late 2025, special economic zones such as Rashakai had generated tens of thousands of jobs in textiles, manufacturing and information technology businesses, with growing participation by young workers. Security challenges remain in parts of Balochistan, yet dedicated protection measures have helped maintain continuity and investor confidence. At the same time, the presence of Chinese companies has accelerated technology transfer and productivity improvements across domestic industries.

Humanitarian cooperation has been equally significant. China's assistance during Pakistan's devastating floods in 2022 exceeded $57.36 million, followed by continued support for climate resilience. These efforts went beyond emergency relief, deepening people-to-people ties and reinforcing a sense of solidarity during difficult times.

As the CPEC moves into its upgraded phase as the CPEC 2.0, the emphasis has shifted from infrastructure to high-quality, sustainable development. Formalized in September 2025 at the 14th Joint Cooperation Committee Meeting of the CPEC, this phase aligns with Pakistan's "5Es": Exports, E-Pakistan, Equity and Empowerment, Environment and Food Security, and Energy and Infrastructure — a framework designed to tackle economic challenges proposed in the country's National Economic Transformation Plan 2024-29.

The CPEC 2.0 introduces five thematic corridors covering growth, livelihoods, innovation, green development and regional connectivity, including links to Afghanistan and Central Asia.

Industrial cooperation draws on China's experience in relocating manufacturing capacity, with appliance parks and textile hubs expected to create large-scale employment. Digital cooperation has expanded quickly, with agreements worth $8.5 billion in artificial intelligence, e-commerce and connectivity, alongside advanced training programs for thousands of Pakistani professionals in China. Planned upgrades to the Main Line-1 railway project and the Karakoram Highway aim to improve trade efficiency, while mineral development and precision agriculture offer new paths for diversification and food security.

China's four global initiatives provide a wider governance framework for this partnership. The Global Development Initiative emphasizes inclusive growth and poverty reduction, reflected in the CPEC's focus on livelihoods and sustainability. The Global Security Initiative promotes dialogue and cooperative security, evident in China-Pakistan coordination on counter-terrorism and regional stability. The Global Civilization Initiative encourages mutual respect through education, media and people-to-people exchanges. The Global Governance Initiative highlights sovereign equality and fair participation in global decision-making, offering developing countries a stronger voice in international affairs.

Seventy-five years after diplomatic ties were established, the China-Pakistan partnership is defined more by outcomes than by statements. The foundation is strong, decades of trust have built resilience, and a shared development vision offers clear direction. At a time when the world feels increasingly divided, the China-Pakistan experience shows how long-term cooperation, rooted in development and mutual respect, can deliver real benefits and contribute to a more balanced and inclusive global order.

Chipmaker YMTC seeks Shanghai float

Listing seen as milestone for nation's cutting-edge semiconductor sector

By **MA SI** in Haikou
masi@chinadaily.com.cn

China's leading flash memory maker, Yangtze Memory Technologies Co (YMTC), has officially begun its initial public offering process with plans to list on Shanghai's STAR Market, marking a major milestone for the country's semiconductor industry.

The filing showed that YMTC has no controlling shareholder and features a diversified ownership structure led by State-backed entities. Its largest shareholder, Hubei Changsheng Development — wholly owned by the administrative committee of Wuhan Optics Valley in Hubei province — holds 26.54 percent of the company.

$44 billion
expected market value of Yangtze Memory Technologies Co for its planned IPO on Shanghai's STAR Market

Other key investors include phases I and II of the National Integrated Circuit Industry Investment Fund, as well as local State-owned capital and industry funds.

Guosheng Securities said in a research note that YMTC is expected to submit its listing application as early as mid-June, with market forecasts valuing the company at around 300 billion yuan ($44 billion) for the IPO.

YMTC is China's only company capable of end-to-end 3D NAND flash chip manufacturing. NAND is a type of high-end nonvolatile memory chip used for data storage in data centers, smartphones and other tech gadgets.

By the third quarter of 2025, YMTC held roughly 13 percent of the global NAND flash market, securing a top-tier position, the filing citing third-party market research said.

Guosheng Securities said that YMTC launched construction of its third phase base in Wuhan in September. By early 2026, the facility had entered the equipment installation phase for its cleanrooms.

Once the third phase base reaches full production, YMTC's market share of the global NAND flash sector is expected to exceed 15 percent. The company plans to build two more wafer fabs thereafter, which would double its total production capacity when fully operational, Guosheng Securities said.

Driven by surging demand from artificial intelligence-powered data centers, the company's revenue exceeded 20 billion yuan in the first quarter, doubling year-on-year.

The IPO plan comes as the rapid development of large AI models and computing infrastructure has ushered in a "supercycle" for the memory chip market.

Market research firm Gartner said global chip sales are expected to approach 9 trillion yuan in 2026, up 64 percent year-on-year, with memory chip sales estimated at around 4.3 trillion yuan.

Roger Sheng, vice-president of research at Gartner, said that YMTC has made significant progress, but there remains a significant capacity gap between Chinese memory leaders and their global counterparts, pointing to substantial room for expansion.

Soochow Securities said in a research note that South Korea's Samsung and US firm Western Digital each commanded around 410,000 and 400,000 wafers per month in the second quarter of 2025, while YMTC's monthly capacity stood at only 140,000 wafers.

Visitors gather at YMTC's booth during a high-tech expo in Wuhan, Hubei province, on April 19. PROVIDED TO CHINA DAILY

Finishing touches

Construction workers conduct welding work on joints of the steel space grid structure of Xuanhan South Railway Station on the Xi'an-Chongqing High-speed Railway in Dazhou's Xuanhan county, Sichuan province, on May 14. The integral jacking of the station building's 1,800-metric-ton steel grid, undertaken by China Railway 24th Bureau Group, was successfully completed the same day, marking its full transition to the interior decoration and exterior finishing phase. A key passenger node on the Beijing-Kunming corridor of China's national high-speed railway network, the station will enable the line to further optimize the railway network in central and western China.

State-backed investors eye nation's top AI startups

By **CHENG YU**
chengyu@chinadaily.com.cn

China's powerful State-backed investors are piling into the country's top artificial intelligence startups, turning the efforts over large language models from a venture capital frenzy into a strategic national move over technological self-sufficiency.

Moonshot AI, a leading Beijing-based startup behind the Kimi chatbot, has added a cluster of State-backed funds and government-linked investors to its shareholder roster, sources confirmed to China Daily.

The new investors include State-owned platforms such as Beijing AI Industry Investment Fund and a State-backed investment fund under Shanghai Guosheng Group, alongside State-owned enterprise telecom giant China Mobile, marking one of the clearest signs yet that China's "national team" is consolidating around a select group of domestic AI champions.

The move comes as DeepSeek is seeking to raise more than 50 billion yuan ($7.35 billion) in a financing round that could push its valuation above 350 billion yuan, with China's State-backed semiconductor investment fund in talks to lead the deal, according to media reports.

"Such investments extend far beyond commercial returns and also the strategic value of technological self-sufficiency," said Wang Peng, a researcher at the Beijing Academy of Social Sciences. "State-backed investors are increasingly stepping in not just with capital, but with access to computing power, data resources and industrial ecosystems."

Wang pointed to DeepSeek's reported migration onto Huawei's Ascend AI chips as an example of how capital could help domestic AI firms reduce dependence on foreign hardware and software stacks.

On the other hand, Moonshot AI's latest funding round is being led by the venture arm of food delivery giant Meituan.

Since the beginning of 2026, the company has raised more than $3.9 billion in total, making it one of China's fastest-rising AI startups by valuation.

Prior to the latest round, Moonshot AI's shareholder roster already included Chinese internet giants such as Alibaba and Tencent, social media platform Xiaohongshu, as well as major venture capital firms.

China Mobile's involvement is drawing particular attention among investors and industry experts because of the State-owned telecom operator's massive cloud infrastructure and nationwide distribution network.

"Cooperation between the two companies could eventually embed Kimi's AI agent capabilities into telecom services, giving Moonshot AI access to hundreds of millions of users while securing more stable computing resources," Wang said.

Smart tech reshaping hiring trends, workplace dynamics

By **LI JIAYING**
lijiaying@chinadaily.com.cn

The accelerating adoption of artificial intelligence is increasingly reshaping hiring trends and workplace dynamics, as companies race to recruit AI talent while workers scramble to adapt to the technology's growing influence, a recent report showed.

According to a 2026 spring recruitment report released by recruitment platform Maimai this month, job postings in China's new economy sectors rose 22.6 percent year-on-year in the first four months, while AI-related positions surged 8.7-fold during the same period.

The new economy sector refers to industries driven by technologies such as the internet, big data, cloud computing and AI, which give rise to new products, business models and formats.

The rapid rise of AI also drives broader changes in China's labor market, with more than 20 of the 72 new occupations identified over the past five years being directly related to AI, data from the Ministry of Human Resources and Social Security showed in March.

Against this backdrop, competition for AI talent has intensified across the country's technology sector as companies speed up AI deployment.

"Demand for AI application talent is definitely set to surge," said Lin Fan, founder and CEO of Maimai. "We have seen that it is no longer just major technology companies and large-model developers competing for talent. Firms in embodied AI, smart hardware and intelligent driving have also joined the race."

In this regard, the report also showed that the competition for talent has gone beyond established tech giants to rising players. Companies such as ByteDance, DJI, Xiaohongshu, Tencent and Meituan remained among the hottest recruiters this spring, while AI startups such as MiniMax and smart appliance company Dreame Technology also entered the top 20 most active recruiters.

High-end AI positions are also commanding significantly higher salaries. AI scientists and AI leadership roles topped the salary rankings with an average monthly salary of 132,796 yuan ($19,521), becoming the only category exceeding 100,000 yuan per month. Other high-paying roles included AI infrastructure engineers, large-model algorithm researchers and AIGC (AI-generated content) algorithm engineers, the report showed.

By contrast, programmers are among the first groups feeling the pressure brought by AI-driven development. According to the report, 38.51 percent of surveyed programmers said their companies have incorporated AI capabilities into performance evaluations, with 54 percent having already experienced workforce adjustments at their companies in the past year. In response, 39.1 percent chose to stay in their current positions and improve their skills, while 25.7 percent planned to move into AI development roles.

"The proportion of AI-assisted coding in my work has reached 90 percent, or even higher," said Chen Feng, a backend engineer at a major tech company, adding that he has felt the shift becoming particularly evident since the beginning of this year.

"In this sense, the ability to come up with ideas has become especially important," Chen said. "As AI continues to evolve, what the industry really needs are people who know how to effectively work with AI."

Despite the hiring boom, however, competition for jobs has eased somewhat overall. The Maimai report showed that the talent supply-demand ratio in the new economy sector fell from 2.45 to 2.09, meaning that roughly two candidates compete for one position. Meanwhile, average monthly salaries rose 12.13 percent year-on-year to 49,600 yuan.

Riding AI boom, NW China emerges as key computing hub

URUMQI — A new kind of hub is emerging in the landscape of energy-rich Northwest China. Instead of oil derricks, these centers are filled with rows of server racks.

Inside a 200-square-meter room at the Tianshan Smart Valley Advanced Computing Cluster in Hami, Xinjiang Uygur autonomous region, hundreds of servers hum day and night. In just over a year, the likes of telecom giants, cloud computing service providers and tech firms have moved into the city.

"Since March, we have had companies visiting almost every day for talks," said Paruq Yehya, head of a local digital development bureau. "Three clients are vying for one server company's computing power."

Artificial intelligence's soaring power demand has made Xinjiang and neighboring provinces such as Gansu attractive destinations for AI firms.

With abundant solar and wind reserves, Xinjiang offers green power at roughly one-third the price of coastal industrial electricity. Operating costs for a computing company in Hami are more than 40 percent lower than in the eastern regions of China. In Qingyang, Gansu, one of the northwestern region's flagship computing hubs, a branch of telecom giant China Mobile has revealed that monthly savings can reach 4 million yuan ($585,000).

The region's cooler climate and cheaper land add to the appeal, lowering air-conditioning and operational costs below those of first-tier eastern cities.

For these computing centers, the core mission is to convert green power into computing power, via AI training and reasoning, resulting in tokens, the smallest unit of information processing in AI models.

"Just as oil is the lifeblood of industry, tokens are the most fundamental fuel for AI development," said Tang Shuheng, head of the Xinjiang International Integrated Supercomputing Center.

Major AI models based in eastern cities process reasoning requests on servers located in the northwest. Some of these requests serve overseas businesses in North America, Europe and the Asia-Pacific. The clients of these AI model providers pay for token consumption, and the resulting revenue covers electricity, wages and equipment costs. In this way, token flows contribute directly to the local economy.

In Qingyang, more than 500 AI-related firms had been set up by 2025, generating $1.28 billion in revenue and creating job opportunities, local authorities said.

In 2026, the concept of "computing power and electricity synergy" made its debut in China's Government Work Report, and earlier this month, several departments released an action plan, setting a 2030 goal to significantly improve clean energy supply security for AI computing facilities and AI applications in the energy sector.

Northwestern regions are also a testing ground for domestic chips. Huawei and other homegrown AI chips are now deployed at scale. At a computing center in Qingyang, a massive Enflame cluster successfully handled a peak-season surge of billions of image requests for photo-editing app Meitu's AI virtual try-on during the 2026 Chinese New Year holiday in February.

More than China's energy backyard, the northwest has become an AI hub, with its computing power being exported westward.

Many Central Asian countries lack large-scale computing facilities but face urgent data processing demand in sectors such as satellite remote sensing, agriculture and energy infrastructure inspection. The computing power center in Xinjiang will function as a "digital post station" — satellite data arrives via dedicated links and reaches customers in tailor-made services after being processed by AI models.

Tang, the Xinjiang computing center's head, said the facility will enable high-precision monitoring of the China-Kazakhstan oil pipelines and cut the warning time to 15 minutes should pipeline deformations, even tiny, occur. Meanwhile, a satellite-linked AI crop farming system, supported by the Xinjiang center, is expected to help boost wheat yields and cut fertilizer use in Kazakhstan.

However, not all workloads can move west. Web access, e-commerce and online gaming, which demand extremely low latency, have to stay in the east.

From Hami to Chongqing in Southwest China, network latency is about 50 milliseconds, exceeding the 30-millisecond threshold for real-time uses like autonomous driving and telemedicine. In addition, information infrastructure in Hami still lags behind coastal regions, while talent is scarce.

"Right now it is something like machines 'waiting for' people," Paruq Yehya said, adding that equipment has arrived, but staff with expertise in tech, operations and the market are not in place. Rapid construction of large-scale computing centers also strains local equipment supply chains and logistics.

Still, the future looks promising. A Morgan Stanley report earlier this year predicted that data centers in China's far-flung regions will contribute 2.4 gigawatts of new orders in 2026, further increasing to 3.3 GW in 2027, accounting for about 70 percent of new orders.

Smart robotics driving rehab breakthroughs

Pursuit of comprehensive solutions boosting global demand for Chinese robot applications

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

With China firmly at the forefront of artificial intelligence and robotics, the nation's technology companies are targeting opportunities in the global rehabilitation sector as advances in Chinese robotics gain increasing recognition worldwide, experts and business executives said at a recent summit.

The Global Rehabilitation & Assistive Technology Network Summit 2026 convened in Shanghai on May 13, offering a platform to showcase real-world application scenarios of breakthrough technologies. AI and robotics are rapidly advancing to make a difference with great potential in the rehabilitation sector.

Robert Riener, full professor for sensorymotor systems at ETH Zurich, pointed out that the application of such advanced technologies is playing a vital role in areas with large incidences and high numbers of new cases where rehabilitation is needed.

"Now we have large neural networks based on large databases and deep structures with more computational power, which give us huge potential (in the rehab sector). We also have a lot of data about patients that enable us to monitor their physiological data, social behavior, and sleep wake rhythms. Using AI, the data can help predict certain symptoms or diseases," he said.

He especially highlighted strokes, as they show one of the highest numbers of cases each year, making patients suffer from hemiplegia and other problems. Many Chinese robotics are used for stroke therapy and neurorehabilitation, such as rehab robots, exoskeletons and intelligent systems from Chinese robotics company Fourier.

Founded in 2015, Fourier has evolved from exoskeleton robots into a diverse portfolio of humanoid robots and intelligent rehabilitation systems. As an industry-leading proactive AI robotics company dedicated to enriching human life through full-stack robotic technologies, the company's products are serving over 2,000 institutions across 40 countries, including hospitals, communities, manufacturing and everyday environments.

Owen Teoh, managing director of Fourier rehab international division, has been working in the rehabilitation robots sector for over 15 years. He shared that in the past two years, the company has seen rapidly growing demand in its overseas markets including Europe, North America and Southeast Asia. Last year, its sales doubled compared to 2024.

"The popularity of Chinese robotics represents the rise of China's high-end manufacturing. What I have observed is that the overseas market's recognition of Chinese robotics is rapidly growing. The need for rehabilitation robots is clear, and overseas acceptance of Chinese rehabilitation robots is among the highest in the industry," said Teoh.

The development trend is shifting from single products to comprehensive solutions, from passive execution to active embodied intelligence, and from hospital settings to widespread access in community and home environments, he added.

A Fourier employee demonstrates a brain-computer interface combined with a lower-limb exoskeleton robot in Shanghai on May 13. PROVIDED TO CHINA DAILY

40
countries
served by Fourier's products including hospitals, communities, manufacturing and everyday environments

Behind the growing demand for rehab robots, Teoh saw several key drivers, including the continuous demand spurred by global aging and rehabilitation, and the increasing application of robotics in clinical rehabilitation settings. With technological exploration made in 2025 such as embodied intelligence and rehabilitation training integration, the application of embodied intelligence technology in the health and wellness sector began to garner wider attention.

"In the rehab sector, I think that the game changing thing will come when we are able to embody intelligence in the robotics system," said Professor Jose Luis Pons, who leads a research team at Shirley Ryan AbilityLab to apply the most advanced methods for measuring and restoring lower-limb function in diverse patient populations.

He indicated that it doesn't mean building an autonomous intelligent entity or agent to interact with patients or with clinicians. Instead, it requires understanding basic principles of rehabilitation, and then to synthesize those principles by using AI techniques in robotics, so they become more intelligent but have collaborative technologies with a human expert.

"Our robots are often evaluated as a 'warm-hearted' robot. In terms of application and interaction with patients, we are better attached to the needs of both patients and therapists," Teoh said.

He further explained that, for example, when it comes to human-robot interaction, traditional robots tend to rely heavily on repetitive movements, but Fourier's game design and user experience are tailored more closely to actual needs. Additionally, featuring the company's force feedback technologies, the robot can sense the patient's muscle strength and provide corresponding assistance. This is perceived as a more human-like interaction, making it easier for them to use.

"China is among the world's leaders in robotics and its intelligent applications possess a technological foresight that other countries and regions lack ... In addition to hospitals and communities, we hope our robotics can reach households in need, to help improve their quality of life," Teoh added.

CHINA

Growth: Nation's regional cooperation highlighted

From page 1

In January and February this year, the total trade value between China and ASEAN reached 1.24 trillion yuan, growing 20.3 percent year-on-year. This robust growth was driven primarily by an increase in Chinese exports to ASEAN.

This strong momentum was sustained throughout the first quarter. From January to March, bilateral trade expanded to 1.97 trillion yuan, a year-on-year increase of 15.4 percent and representing 16.6 percent of China's total foreign trade. The key top trading partners among ASEAN members in the first quarter were Vietnam, Malaysia and Indonesia.

Record GDP and export growth in Malaysia and successful initiatives such as the China-Indonesia implementation of QR cross-border payments, and connectivity enhancement with Vietnam, Thailand, Laos and Cambodia, are, in large part, due to the stability of China-ASEAN relations.

Health diplomacy, energy integration, the digital economy, institutional partnerships and climate finance initiatives are transforming the region.

Regional Comprehensive Economic Partnership Industry Cooperation Committee Chairperson Xu Ningning has projected that total China-ASEAN bilateral trade for 2026 is expected to surpass 8 trillion yuan, representing a year-on-year growth of 5 percent to 8 percent. The steady growth in early 2026 underscores the deepening trade ties and high complementarity between China and RCEP countries.

China's resilience as the world's largest oil importer has been tested, and validated, by the spillover from Middle East conflicts.

In 2025, about 42.3 percent of China's crude oil imports were from the Middle East. However, China's deep strategic ties with Central Asian and Russian partners have created a crucial buffer. By increasing overland pipeline imports, tapping into massive State oil stockpiles, and prioritizing domestic supply over exports, China has successfully absorbed the external shock, proving that its regional cooperation is a genuine pillar of energy and supply chain security.

Moreover, on May 1, new opening-up policies such as zero tariffs on goods from African countries that have diplomatic ties with China and a loosening of export limits on refined oil products such as jet fuel came into force.

Other examples of China's stabilizing role include growing investment inflows from the Persian Gulf states. Reports also indicate the Hong Kong Special Administrative Region's increasing attraction for international capital seeking market stability and sound institutional arrangements. Growth in the European Union's bilateral trade with China also continued to expand. China's deep, institutionalized cooperation with its Asian neighbors has also created new opportunities, achieving a strong first quarter in 2026 with early data pointing to sustained momentum for China and the region.

China is signaling to its global trade partners that ... economic development can best be delivered through deep cooperation and discussion, not extra-regional political coercion or economic and military threats.

Amid global turbulence and uncertainty, China has maintained strong diplomatic influence, consistent with its high ranking in the Lowy Institute's global diplomacy index. China's ability to withstand trade frictions and geopolitical conflicts is a direct result of a deliberate strategy to forge deep and mutually beneficial supply chains with Asian partners.

This economic architecture transforms regional cooperation from a simple trade zone into a powerful platform for shared growth and collective stability.

As the world transitions toward multipolarity, China has continued opening its economy, ensured a stable currency and financial markets, and green investments in global infrastructure. As such, China is signaling to its global trade partners that local, regional and global economic development can best be delivered through deep cooperation and discussion, not extra-regional political coercion or economic and military threats.

The author is the chair of the Belt and Road Capital Partners (BRCP) Geopolitical Risk Advisors, and a visiting professor at ICES - Institut Catholique de Vendee in France. The views do not necessarily reflect those of China Daily.

Loquat: Fruit made into wine, flowers into pastes

From page 1

"Some mornings, the trees looked as though they had been dusted with snow," Song said.

In Dongshan, farmers understand what it means to rely on the weather. During droughts, water from Taihu Lake is pumped uphill to irrigate the orchards. Hailstorms and heavy rain can scar the fruit or knock it from the trees altogether.

But after a long winter of frost, this year's loquats have grown especially plump and juicy — nature's quiet reward for patience.

Among China's many varieties of loquats, Dongshan's white jade loquat remains one of the most prized. Behind its reputation lies decades of painstaking cultivation.

Huang Jichuan, 70, from Dongshan, has worked in the orchards since he was a teenager. His family has grown loquats for generations. According to Huang, today's celebrated white jade variety can be traced back to a single exceptional tree discovered decades ago by his father, Huang Jiyu. Through years of cultivation, the variety gradually spread across Dongshan.

Producing premium loquats requires meticulous care. In spring, farmers thin fruit clusters by hand, cutting away young fruits, so that the remaining can absorb more nutrients to grow large and sweet.

The fruit may last only seconds on the palate, but the work behind it stretches across an entire year.

Around *xiao man*, Dongshan enters its busiest season. Before dawn breaks, farmers climb steep orchard slopes to begin harvesting. After hours of picking, the fruit is sorted, packed into foam trays by hand and prepared for overnight shipment across the country.

Yet despite the exhausting labor, the farmers speak about their trees with unmistakable affection.

"It's like raising children," Song said. "If the trees get sick, you treat them. If the leaves turn yellow, you nourish them. Only careful tending can bring out the best."

Beyond fresh consumption, loquats have long been woven into daily life in Dongshan. Excess fruit is preserved as syrup or transformed into loquat wine, while flowers and leaves are traditionally simmered into herbal pastes to soothe coughs.

Today, that seasonal sweetness is also inspiring chefs far beyond Jiangnan. As seasonal Chinese ingredients gain renewed attention among urban diners, loquats are also making their way onto contemporary restaurant menus.

At the Waldorf Astoria Beijing, chef Wang Chunzeng recently introduced a chilled *qingbuliang* sweet soup with fresh loquat, combining the fruit with traditional Cantonese ingredients such as Job's tears, glehnia root and red dates.

"Hot and humid summer days call for something light, gentle and refreshing," Wang said. "Fresh loquat brings natural sweetness and a soft floral note that perfectly captures the feeling of early summer."

Mass weddings

Couples dressed in traditional Chinese wedding attire take part in a mass wedding ceremony at Luogang Park in Hefei city, Anhui province, on Wednesday. The event, held simultaneously in four cities across the province, promotes traditional marriage customs while encouraging modern, simplified wedding practices. WU FANG / FOR CHINA DAILY

Mainland slams Lai for hostile remarks

Continued separatist stance blamed for escalating cross-Strait tensions

By LI SHANGYI
lishangyi@chinadaily.com.cn

The Chinese mainland, on Wednesday, condemned Taiwan leader Lai Ching-te's speech marking his second anniversary in office as deceptive and confrontational, blaming his "Taiwan independence" separatist stance for escalating tensions across the Taiwan Strait.

Chen Binhua, spokesman for the State Council Taiwan Affairs Office, said Lai's remarks were "filled with falsehoods and deception, hostility and confrontation". He criticized Lai for stubbornly adhering to the erroneous "Taiwan independence" stance, promoting the fallacies of so-called "sovereign independence" and "mutual non-subordination", and hyping the "mainland threat" narrative.

Chen said Lai's comments have further escalated cross-Strait tensions and confrontation, reflecting an attempt to pursue "Taiwan independence" through military means and external support, and thereby undermining peace and stability across the Taiwan Strait.

He said the remarks once again confirmed Lai's role as a "peace destroyer" and "crisis creator" in the Taiwan Strait.

In his speech on Wednesday morning, Lai said Taiwan's future could not be determined by "foreign forces" and should be decided solely by its 23 million people. He also claimed to promote dialogue and exchanges with the Chinese mainland under the principle of "equal dignity", while rejecting what he called "united front tactics" aimed at achieving "reunification under the guise of peace".

Chen dismissed such statements as "hypocritical", saying Lai continues to advocate "Taiwan independence" separatism and stir up anti-mainland sentiment. He accused Lai of attempting to mislead the public in Taiwan and deceive international opinion.

"These familiar tactics have been increasingly seen through by people in Taiwan," Chen said, adding that Lai's deceptive and provocative actions will inevitably face firm opposition from compatriots on both sides of the Strait and from the international community, and are destined to fail.

Chen added that the Taiwan question is a legacy issue of the Chinese civil war in the 1940s.

"No matter what form of elections have been held in Taiwan or who has been elected there since 1949, this cannot change Taiwan's status as part of China," he said, stressing that Taiwan's future can only be jointly decided by all Chinese people, including Taiwan compatriots.

He reaffirmed the unwavering resolve of all Chinese people to defend national sovereignty and territorial integrity. "We will never allow anyone or any force, under any pretext, to pursue separatist schemes for 'Taiwan independence'," Chen said.

In response to a media question on Lai's speech, Guo Jiakun, spokesman for the Foreign Ministry, said the true status quo across the Taiwan Strait is that both sides belong to one China.

Guo said moves by "Taiwan independence" separatist forces cannot change the fundamental nature of the Taiwan question as purely China's internal affair or undermine the international community's firm commitment to the one-China principle. He stressed that the historical trend toward China's national reunification is unstoppable.

Although Lai did not directly mention "Taiwan independence" in his speech, Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, said during a regular news briefing on Wednesday that the Democratic Progressive Party authorities have been playing word games to deceive people in Taiwan and the international community while refusing to recognize that both sides of the Taiwan Strait belong to one China.

She said only by completely abandoning the "Taiwan independence" stance, ceasing provocations aimed at seeking "independence", and returning to the political foundation of the 1992 Consensus can the DPP authorities truly safeguard peace and stability across the Taiwan Strait as well as improve and develop cross-Strait relations.

Evacuation in progress

Firefighters help evacuate flood-affected residents in Shimen county of Changde city, Hunan province, on Wednesday, after days of heavy rainfall triggered widespread flooding across the region. Authorities said 23 townships have been affected, with rescue, recovery and resettlement efforts continuing.

Talks: Agricultural trade to expand

From page 1

The two sides also agreed to expand two-way agricultural trade and resolve nontariff barriers and market access issues involving some agricultural products. For instance, the US pledged to address Chinese concerns including automatic detention measures targeting dairy and aquatic products, while China will advance solutions to US concerns regarding beef facility registration and poultry exports from certain US states to China, according to the ministry.

Noting that China is the world's most important agricultural market, the ministry official said that expanded US agricultural exports to China could help meet structural demand in the Chinese market, while China's vast consumer base could provide stable demand and income prospects for farmers in the US.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the outcomes could play a positive role in improving market expectations. Such progress will allow both sides to better leverage their strengths in agricultural trade, bringing tangible benefits to companies and the broader market, Zhou said.

The outcomes also included aviation, a sector that has long been part of China-US commercial ties. Based on its air transport development needs, China will purchase 200 Boeing aircraft in accordance with commercial principles, while the US will ensure sufficient supplies of engines and related parts to China, the ministry said.

Zhang Yansheng, a senior economist, said: "China and the US are both too important to the world. When their relationship is good, the world benefits; when it is not, the world feels the shock."

Consensus on tackling maritime challenges

By ZHANG YI in Quanzhou, Fujian
zhangyi1@chinadaily.com.cn

Amid increasingly diverse regional maritime challenges, delegates from Asian coast guard agencies reached a broad consensus on strengthening multilateral law enforcement cooperation to safeguard maritime security.

The consensus was reached at the conclusion of the 22nd Heads of Asian Coast Guard Agencies Meeting Working Level Meeting on Wednesday in Quanzhou, Fujian province.

Hosted by the China Coast Guard, the four-day event brought together more than 50 foreign delegates from 18 countries and regions, as well as representatives from the United Nations Office on Drugs and Crime and the ReCAAP Information Sharing Centre, to discuss ways to address maritime security threats.

Summarizing the meeting's achievements, Zhang Jianzhong, head of the Chinese delegation and director-general of the China Coast Guard's law enforcement department, said discussions focused on maritime security trends, search and rescue operations, and environmental protection.

All parties expressed willingness to deepen communication, enhance joint law enforcement capabilities, expand blue partnerships, and promote universal security, Zhang said.

Liu Zhixu, head of the China Coast Guard's international cooperation division, said the meeting remains the most influential multilateral maritime law enforcement cooperation mechanism in the pan-Asia-Pacific region and serves as an important platform for the China Coast Guard to participate in global and regional ocean governance.

As an active practitioner of the Global Security Initiative, the China Coast Guard advocates practical cooperation to turn regional law enforcement visions into reality, Liu said.

By hosting the event, China shared its experience in combating maritime crimes and advancing law enforcement related to marine carbon sinks, offering Chinese solutions for sustainable maritime development, he added.

Fu Yanxiao, deputy head of the China Coast Guard's criminal investigation division, said participants focused on transnational maritime risks and explored ways to establish an expert consultation mechanism.

The meeting also introduced maritime counterterrorism cooperation arrangements and invited member agencies to explore pathways for preventing and combating maritime terrorist activities, he said.

In addition to working group sessions on maritime search and rescue, environmental protection, information sharing and joint exercises, the event also facilitated a series of bilateral talks among member agencies.

Pongsak Somboon, deputy secretary-general of the Thai Maritime Enforcement Command Center, said the Thai delegation held bilateral talks with the China Coast Guard to enhance cooperation in training and law enforcement. "We share the same goal, and we want to help each other improve maritime capabilities," he said.

Shift in Japan's military policy raises concern

Moves reveal offensive orientation and undermine peace, experts say

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

Although many of Japan's recent military initiatives have been framed as keeping pace with developments in defense equipment and technology, they, in fact, reveal a growing offensive orientation in the country's security strategy, which points to a significant shift in Japan's defense policy that could undermine regional peace and stability, experts said.

Thousands of demonstrators gathered outside Japan's National Diet Building on Tuesday evening to protest against the government's efforts to weaken the country's pacifist constitution through constitutional revision and military expansion policies.

Japanese media reported on Monday that the ruling Liberal Democratic Party had drafted proposals to revise the country's three key national security documents.

The proposals reportedly call for strengthening Japan's air defense systems and sustained combat capabilities, as well as accelerating the deployment of submarines equipped with advanced propulsion systems and capable of carrying long-range missiles to enhance Japan's so-called "counterstrike capabilities".

On April 21, the Japanese government officially revised the "Three Principles on Transfer of Defense Equipment and Technology" and related implementation guidelines to allow the export of weapons, including those with lethal capabilities, despite waves of large-scale protests, local media reported.

The revision scraps rules that limit Japan's military equipment exports to five noncombat categories, namely rescue, transport, warning, surveillance, and minesweeping.

Instead, military equipment will be divided into "weapons" and "non-weapons" categories, based on whether they have lethal or destructive capabilities, Kyodo News reported.

The revision maintains unrestricted exports of non-weapon equipment, such as warning and control radar systems, while also permitting the export of previously banned weapons, including destroyers and missiles, to countries that have signed agreements with Japan on the protection of classified defense equipment and technological information.

Under the revision, export of weapons will not require prior parliamentary approval. Instead, the National Security Council will make the decisions, with the Diet informed only after approval.

Consequently, a poll released by Kyodo News on Sunday showed that 57.2 percent of respondents opposed allowing exports of lethal weapons, while 37.1 percent supported the move.

In a similar poll conducted by NHK on May 11, 32 percent of the respondents said they were in favor of the move, 53 percent said they were against it, and 15 percent said they were undecided or gave no response.

People protest against the Japanese government's attempts to undermine the pacifist constitution through constitutional revision and military expansion policies in Tokyo, on Tuesday. ZHU CHENXI / CHINA NEWS SERVICE

CROSS CURRENTS

"These measures are seen as concrete manifestations of the Japanese government's ongoing efforts to accelerate the country's remilitarization process," said Liu Shuliang, an associate researcher at the Tianjin Academy of Social Sciences.

Major step

Japan is actively advancing the development of unmanned systems and automated military infrastructure. From a technical perspective, these efforts are in line with trends in modern warfare and are intended to enhance precision-strike and long-range combat capabilities. Strategically, however, they represent another major step in Japan's accelerated "remilitarization", he said.

"This has long since gone beyond the self-imposed constraints of its pacifist constitution and the framework of an 'exclusively defense-oriented policy'," Liu said.

In essence, they reflect an attempt to use technological innovation as a vehicle to accelerate the expansion of offensive military capabilities, marking a serious departure from Japan's self-proclaimed identity as a "peace-loving nation" and the defense principles it has long emphasized, he added.

Chen Hong, director of the Asia-Pacific Studies Centre at East China Normal University in Shanghai, said the Japanese government's decision to press ahead with its "remilitarization" process despite significant domestic controversy reflects a fundamental shift in the country's security strategy.

Previous poll results have shown that a majority of the Japanese public supports a pacifist approach. However, despite public opposition, the Japanese government appears determined to continue expanding its military capabilities, a move that could push Japanese society further toward the dangers of war and conflict, he said.

Experts noted that Japan continues to actively foster "exclusive cliques" and promote bloc confrontation in the region, with arms exports serving as a key instrument in this process.

"The country is trying to make the development of unmanned combat systems a key new pillar in strengthening defense cooperation with countries such as Australia and the Philippines," Chen said.

Japan aims to deepen coordination with these partners, gain greater influence in regional security cooperation, and enhance its own operational capabilities in the Asia-Pacific region, he added.

"This move could have significant implications for the security landscape in the region," Liu said.

Californian farmers eye stronger China ties

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Representatives from California's agriculture and food industries are calling for greater trade stability and stronger bilateral cooperation between China and the United States, saying demand in China for high-quality agricultural and food products remains strong despite trade tensions and shifting global supply chains, with many companies continuing to view the Chinese market as a long-term strategic priority.

Lindsay Tello, senior advisor for trade policy at the Almond Board of California, said California almond exports to China have been affected by tariffs introduced during the trade dispute between the two countries, but Chinese demand for California almonds has remained "important".

"China remains an extremely important market, and we're really proud of our long partnership," Tello told China Daily.

According to Tello, the Almond Board of California has operated in China for more than 30 years and invested over $75 million in market development and research. She said California almond exports to China previously reached between $200 million and $300 million annually before the trade tensions, when China was among the industry's top export markets. By 2025, however, China had fallen from the top-five spot due to rising tariffs and shifting trade flows.

At the same time, Tello noted, overall almond consumption in China has continued to rise, reaching a record 160,000 metric tons last year.

Tello said that California's almond farming community is largely made up of multigenerational family farms that remain committed to long-term cooperation with Chinese partners.

Remaining steadfast

"We continue to remain invested and steadfast in our China engagement," she said, adding that maintaining positive relations with Chinese government agencies, importers, manufacturers and consumers remains a key priority for the industry.

Tello also said tariffs and policy certainty are essential for agricultural trade.

Despite this, Tello said California almonds continue to maintain strong competitiveness because of their quality and reputation in the Chinese market.

California's dairy industry also expressed strong interest in expanding cooperation with China.

Matt Henderson, director of international sales at California Dairies, said the company represents around 300 family-owned dairy farms and produces approximately 7.7 million tons of milk annually, exporting dairy products to more than 50 countries, including China.

Henderson, who lived in Shanghai between 2012 and 2015 and traveled extensively across China, said California Dairies had completed the certifications necessary to begin exporting milk and cream products to China.

"That is going to be an emphasis and an objective of ours here this year and moving forward," he said.

According to Henderson, growing middle-class demand in China for nutrition-focused and value-added products such as butter, cheese and cream presents major opportunities for California exporters. He said Asian markets are increasingly focused on food security, supply chain resilience, sustainability and nutrition.

"We're attempting to export nutrition," Henderson said. "In Asia, that's something they are demanding, and something that we can supply here in California."

Liu Chunxi, senior executive president of Chinese dairy producer Yili Group, said stable and predictable trade policies are essential for sustaining long-term cooperation between Chinese and US dairy companies.

Samsung faces strike after pay talks with union fall apart

SEOUL — The management and union leaders at Samsung Electronics failed to reach a last-minute deal on wages on Wednesday, raising the prospect of a strike at the South Korean electronics giant that could rattle global semiconductor supplies and the country's trade-dependent economy.

Government officials have threatened to invoke rarely used emergency powers to force a settlement at Samsung, where the union representing more than 70,000 workers says the company has failed to offer adequate compensation despite its soaring profits fueled by the global boom in artificial intelligence.

After the latest round of talks ended without a breakthrough on Wednesday, union leader Choi Seung-ho told reporters that unionized workers are set to begin an 18-day strike on Thursday.

Both the union and the management held each other responsible for a failure to reach a deal. Choi accused management of refusing to accept a government-mediated proposal, the details of which he refused to disclose. The management accused the union of calling for excessive compensation packages for workers at loss-making units.

The two sides said they will continue efforts to reach a deal. The two sides met again on Wednesday afternoon at the arrangement of Labor Minister Kim Young-hoon, according to Kim's ministry.

Samsung and its crosstown rival, SK Hynix, together produce about two-thirds of the world's memory chips, which are seeing surging demand driven by AI. Samsung said its operating profit for the January-March quarter jumped eightfold to a record 57.2 trillion won ($38 billion).

Union leaders have demanded a compensation structure in which Samsung would commit to spending 15 percent of its annual operating profit on employee bonuses and scrap bonus caps, which are currently set at 50 percent of annual salaries. The company says the demands are excessive, citing the highly cyclical nature of the semiconductor business. The strike is expected to hurt operations of Samsung's production of smartphones and other consumer electronics as well, observers say.

EU avoids tariff threats as it reaches consensus on trade deal with US

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

The European Union is finally ready to implement the trade deal it struck with the United States almost a year ago, heading off a slew of new tariffs that Washington had threatened to introduce on July 4.

The breakthrough came early on Wednesday, after five hours of talks, when EU lawmakers and member states struck a compromise among factions in the bloc that dislike the deal and factions that feel they can agree on a way forward.

The EU-US trade deal, which was agreed upon by US President Donald Trump and European Commission President Ursula von der Leyen in Scotland on July 27, calls for 15 percent import taxes to be levied on most imports into the US from the 27-nation bloc, while a zero percent tariff will be applied to US exports to the EU.

The deal, which many EU lawmakers saw as lopsided, has since sat in the EU Parliament awaiting implementation, while lawmakers haggled over possibly amending it. It was also held up by EU lawmakers protesting against US plans to take control of Greenland.

> "Maintaining a stable, predictable, and balanced trans-Atlantic partnership is in the interest of both sides."
>
> **Michael Damianos,** minister of energy, commerce and industry in Cyprus

Michael Damianos, minister of energy, commerce and industry in Cyprus, which holds the EU's rotating presidency, said the compromise reached on Wednesday shows the bloc "delivers on its commitments".

"Maintaining a stable, predictable, and balanced trans-Atlantic partnership is in the interest of both sides," he added.

Trump had earlier said that if the trade deal was not ratified by July 4, he would increase tariffs on EU vehicles from 15 percent to 25 percent and also bring in other "much higher" tariffs.

His introduction of tariffs, both real and threatened, especially on aluminum, steel, and auto parts, has pushed the EU to find new trading partners elsewhere. But the bloc has also been careful not to jeopardize bilateral trade with the US, its largest trading partner, which amounts to around 1.6 trillion euros ($1.9 trillion) a year.

Bernd Lange, the chair of the parliament's trade committee, helped bridge the gap between the disparate EU factions on Wednesday and said that while the EU will abandon some proposed amendments, "parliament has prevailed with its demands for a comprehensive safety net".

"There is a suspension mechanism if the US does not abide by the deal, a monitoring mechanism for (measuring) the impact on our economy, provisions for unjustified tariffs on certain products, an expiration date for the legislation, and strong involvement of the European Parliament," he said, summarizing the compromise.

Von der Leyen said it means "we will soon deliver on our part", with the EU-US trade deal set to be formally implemented soon.

"Together, we can ensure stable, predictable, balanced, and mutually beneficial trans-Atlantic trade," she added.

Moment of silence

Community members mourn victims killed a day earlier in a shooting at the Islamic Center of San Diego, California, on Tuesday. Police said a pair of gunmen, aged 17 and 18, are suspected of killing three people outside the mosque on Monday and were later found dead in a car from apparent self-inflicted gunshot wounds. Authorities said they are investigating the attack as a possible hate crime.

Tankers pass strait as truce hopes revive

US and Iran exchange warnings over possible return to war amid fragile calm

By **CUI HAIPEI** in Dubai, UAE, and **JAN YUMUL** in Hong Kong

Two Chinese tankers laden with oil passed through the Strait of Hormuz on Wednesday, shipping data showed, brightening hopes that the regional conflict may soon be resolved despite the warring sides continuing to trade threats.

US President Donald Trump said on Tuesday the war would be over "very quickly" while Vice-President JD Vance talked up progress in negotiations with Iran about an agreement to end hostilities.

However, Israel's Kan TV reported that the United States and Israel have completed joint preparations for a possible resumption of military operations against Iran, citing a US security official.

"We're in a pretty good spot here," Vance told reporters, hours after Trump said he had come within an hour of ordering fresh strikes and gave Tehran "two or three days" to reach an agreement.

Vance, who negotiated with Iran in failed talks in Pakistan, added that Washington was "locked and loaded" to restart military strikes if no deal is reached.

In response, Iran's army spokesman Mohammad Akraminia warned that the Islamic republic would "open new fronts against" the US if the White House resumes its attacks. Iran's Deputy Foreign Minister Kazem Gharibabadi said the US leadership was "calling a 'threat' a 'chance for peace'".

Iran's Foreign Minister Abbas Araghchi said early on Wednesday that Iranian forces had been confirmed as the first to down a US F-35 fighter jet, citing a US official report on aircraft combat losses.

"With lessons learned and knowledge we gained, a return to war will feature many more surprises," he said on social media.

The conflict, which began on Feb 28, has caused the worst disruptions to global energy supplies, blocking hundreds of tankers from leaving the Persian Gulf.

The two Chinese ships — among a handful of supertankers carrying Iraqi crude that have exited the gulf this month — passed through the narrow strait carrying around 4 million barrels of crude, according to data from London Stock Exchange Group and Kpler.

South Korean Foreign Minister Cho Hyun said on Wednesday that a South Korean-operated vessel carrying 2 million barrels of crude oil is also passing through the strait in coordination with Iranian authorities.

Oil prices eased on the positive signals, with the benchmark Brent crude falling to as low as $110.16 a barrel, before regaining much of its losses.

Trump had indefinitely extended the truce and made clear he wants to exit the war, which has proved to be a political liability with US people paying more at the pump and growing frustrated with the war.

> "Targeting an active educational institution during school hours constitutes a grave violation of international humanitarian law and is a clear war crime."
>
> **Esmaeil Baghaei,** spokesman for Iran's Foreign Ministry

The US Senate on Tuesday advanced a war powers resolution to halt the campaign unless Trump obtains congressional authorization. The move represented a distinct challenge to the Republican leader's executive authority, marking the first time the chamber voted in favor of the measure.

Despite the political significance of the vote, the resolution still needs a majority in the House of Representatives — after which it faces Trump's presidential veto — to take effect.

School attack update

Meanwhile, the US military again avoided taking responsibility for an attack on a school in Iran that killed about 170 people, mostly schoolchildren, on the first day of the war.

Brad Cooper, commander of US Central Command, told a congressional panel that the probe was "complex", claiming the school was located on an Iranian cruise missile base.

Hours after, Iran's Foreign Ministry spokesman Esmaeil Baghaei described the claim as a "baseless fabrication".

"Targeting an active educational institution during school hours constitutes a grave violation of international humanitarian law and is a clear war crime," he said on X.

In another development, Russia joined other United Nations Security Council members on Tuesday to condemn an unclaimed drone strike on the United Arab Emirates' Barakah Nuclear Power Plant, which Abu Dhabi said originated from Iraq.

The drone struck a generator on Sunday near the Arab world's first nuclear power plant, triggering a fire but causing no injuries or radiation leaks. The UAE Defense Ministry said on Tuesday its air defense systems had detected six drones from Iraq over the past 48 hours.

Serbian president to visit China to deepen relations

By **ZHOU JIN**
zhoujin@chinadaily.com.cn

Serbia's President Aleksandar Vucic will pay his first state visit to China starting Sunday, a five-day trip expected to deliver more tangible outcomes in building a community with a shared future for the new era between the two countries.

President Xi Jinping and Premier Li Qiang will meet Vucic separately to exchange views on bilateral relations and regional and international issues of mutual interest, Foreign Ministry spokesman Guo Jiakun said on Wednesday.

Beijing stands ready to work with Belgrade to take the visit as an opportunity to consolidate ironclad friendship, expand mutually beneficial cooperation, enrich people-to-people and cultural exchanges, and strengthen coordination on multilateral affairs, he said.

In an address to the nation on Saturday, Vucic highlighted "the exceptional honor of paying an official state visit to China", saying that "we expect a great deal from it", as reported by Russia's Tass News Agency.

Serbia, the first European country to agree with China on building a community with a shared future for the new era, is an important partner for China in Southeast Europe, Guo said.

The two presidents have maintained close interactions, he said. Xi paid a state visit to Serbia in May 2024. In September last year, Vucic attended the commemoration of the 80th anniversary of the victory in the Chinese People's War of Resistance against Japanese Aggression (1931-45) and the World Anti-Fascist War in Beijing.

Under the leaders' strategic guidance, China-Serbia relations have been moving forward at a high level in recent years, Guo said.

Earlier this month, a $1.5 billion contract to build a highway in Serbia was signed by the Serbian government and Shandong Hi-Speed Group.

In 2025, their bilateral trade reached $6.49 billion, marking a 13 percent year-on-year increase, according to the Foreign Ministry.

Israel intercepts Gaza-bound flotilla, detains over 400

JERUSALEM — Israel said on Tuesday it had intercepted all boats in a Gaza-bound aid flotilla, detaining hundreds of activists and transporting them to Israel.

Organizers of the Global Sumud Flotilla said all boats in their humanitarian convoy were intercepted after Israeli naval vessels surrounded them in international waters, about 250 nautical miles from the coast of Gaza.

Israel began intercepting the ships on Monday morning.

Around midnight on Tuesday, the Israeli Foreign Ministry said all 430 activists "have been transferred to Israeli vessels and are making their way to Israel", adding that they would be allowed to meet their consular representatives.

Video from the flotilla's livestream showed Israeli soldiers firing shots at two of the boats. The type of ammunition fired was not clear.

"At no point was live ammunition fired," the Israeli Foreign Ministry said. "Following multiple warnings, nonlethal means were employed toward the vessels — not toward protesters — as a warning."

The ministry said Israel would not allow any breach of what it called the "lawful" naval blockade of Gaza. It described the flotilla as "a PR stunt at the service of Hamas".

Israeli rights group Adalah said on Wednesday that the activists had been "detained at Ashdod port" and "taken into Israel against their will as Adalah attorneys enter for legal consultations".

The flotilla's organizers said the activists would be taken to Ketziot prison in Israel's southern Negev desert.

On Wednesday, Israel's National Security Minister Itamar Ben-Gvir posted a video on X showing detained activists kneeling with their hands tied behind their backs and foreheads on the ground. The post was captioned "Welcome to Israel".

Italy's Prime Minister Giorgia Meloni slammed the treatment of activists as "unacceptable".

"It is intolerable that these protesters, among whom there are many Italian citizens, are subjected to this treatment, which violates human dignity," Meloni said, calling for the immediate release of any detained Italian citizens and demanding an apology from Israel.

The flotilla set sail from Turkiye's Marmaris coast on May 14 in a third attempt to break the blockade and deliver aid to Palestinians in the war-devastated enclave.

Turkiye and Spain have condemned the interception.

A previous flotilla, comprising about 20 boats and 175 activists, was intercepted by Israeli forces on April 30 near the southern Greek island of Crete.

Two of the activists were detained for days before being released. Dozens of activists said they were mistreated, abused and beaten by Israeli forces.

Dialogue only right path forward in Mideast: Envoy

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China's ambassador to the United Nations briefed the Security Council on Tuesday to voice concerns over the situation in the Middle East and called for joint efforts to restore stability in the region at an early date.

Fu Cong, China's permanent representative to the UN, made the remarks while commenting on a Sunday drone attack on facilities at the Barakah Nuclear Power Plant in the United Arab Emirates. Although the incident did not cause any casualties or affect radiation safety levels, this "dangerous and irresponsible act" has sounded the alarm for the international community, he said.

China expresses great concern over the incident, opposes armed attacks on nuclear facilities for peaceful purposes, and calls on all parties to abide by international law, including the Convention on Nuclear Safety, and to effectively safeguard the safety and security of nuclear power plants, Fu said.

The sovereignty, security and territorial integrity of countries in the Middle East and the Gulf must be fully respected, and civilians and nonmilitary objects should be protected, he said.

As long as the armed conflict continues, the safety risks it poses to regional nuclear facilities will persist, he said.

The war originated from the illegal military attacks by the United States and Israel against Iran, Fu said. Since its outbreak, the conflict has inflicted severe losses on the people across the region, severely disrupted global economic development and harmed the shared interests of the international community.

"This war should never have happened in the first place. To find an early way to resolve the situation is in the interest of not only the US and Iran, but also regional countries and the rest of the world," Fu said.

"I wish to make three points," he said. First, there is a strong call for cessation of hostilities, and any resumption of fighting must be avoided. For some time now, the US and Iran have, on the whole, maintained a ceasefire, but the risk of escalation remains.

"At this critical stage between war and peace, all parties must exercise maximum restraint, uphold the ceasefire arrangements, refrain from irresponsible threatening rhetoric and military adventurism, and make efforts to prevent a relapse into conflict and further escalation of tensions," he said.

Second, military means offer no way out, and dialogue and negotiation are the only right path forward. The recent US-Iran truce and efforts to explore resolving issues through negotiation are welcomed by regional countries and the international community.

The Barakah Nuclear Power Plant sits in the western desert of the Emirate of Abu Dhabi, United Arab Emirates. ARUN GIRIJA VIA AP

Political solution

"China encourages both sides to stay committed to a political solution and to continue settling their differences and disputes through negotiation, including on the nuclear issue, with a view to reaching a solution that accommodates the concerns of all parties," Fu said.

China commends Pakistan for its mediation efforts and supports all parties in reaching a comprehensive and lasting ceasefire as soon as possible, he added.

Third, priority should be given to solving pressing issues and preventing the spread of negative effects. "The situation in the Strait of Hormuz is a demonstration of the spillover of the conflict," Fu said.

"Disruptions to this vital shipping lane have severely affected global supply chains, international trade order and energy security, with countries of the Global South bearing significant livelihood costs," he said.

China calls for reopening the strait as soon as possible on the basis of a continued ceasefire, Fu said.

Since the outbreak of the conflict, China has been actively working to end hostilities and promote peace, he said. China will continue to work with the international community to play a constructive role in bringing an early end to hostilities and restoring peace and development in the Middle East, he added.

LIFE

Mountains teeming with tea

A county in Southwest China is boosting economy and the beverage's industry, leading to innovation and tourism opportunities, **Yang Feiyue** reports in Mabian, Sichuan.

The drive from Southwest China's Sichuan province's Mabian county seat to Baixiang village is a test of one's limit for car sickness, full of sharp turns that wind upward for 11 kilometers. But roll the car windows down and everything is worth it: the sweet air permeated by the terraced tea bushes following the mountain's contours like the whorls of a giant fingerprint.

Before you lies 1,600 *mu* (107 hectares) of contiguous tea gardens, cascading down from 1,100 to 1,400 meters. Tea pickers dot the hillside, bamboo baskets on their backs, hands fluttering across the leafy surface to pinch off the most prized early spring buds in late March.

"Our tea garden sits at a high altitude, so the tea is just starting to sprout," says He Yingjun, who presides over the sprawling plantation.

"With the big temperature swing between day and night, the tea accumulates more beneficial compounds. The secret to good Mabian tea is right here," he says as he pinches a plump bud.

Four decades ago, this was a barren hillside without so much as a path. Then his father began planting. Today, it has become a calling card for the tea industry in the Mabian Yi autonomous county, and a lifeline for the people who live here.

His father did not start from nothing. Historical accounts show tea has been grown on these mountains for almost 2,000 years, since the Han Dynasty (206 BC-AD 220). Nestled in the Xiaoliangshan Mountains, home to the Yi ethnic group, Mabian was a key node on the ancient tea-horse route, where people of the Yi and Han ethnic groups lived side by side, trading tea for horses.

In the early 1980s, as China's reform and opening-up gained momentum and market demand for tea outweighed supply, He's father contracted a 70-*mu* collective tea garden in his hometown. He spent more than a decade learning from local tea masters.

They traveled far and wide together, even going to the provincial capital Chengdu to meet clients from abroad, He says.

"His mentor treated him well and took him everywhere," He adds. When the tea master passed away in the 1990s, his father inherited both his mentor's business connections and approach to tea cultivation.

The family's full commitment to tea came in 2006, when He's father set his sights on the barren hillside in Baixiang village.

"There was nothing — no road, no electricity, just wasteland," He recalls. The choice was simple, because it was only 11 km from the county seat, meeting the "half-hour rule" for tea processing. Fresh leaves must reach the factory within 30 minutes after picking. If they sit longer, they begin to heat up and ferment in unwanted ways, turning the bright green leaves dull and muddying the flavor, He explains.

"You then lose the freshness. Once that happens, no amount of skill or processing in the factory can bring it back," he adds.

When He was discharged from military service in 2008, he returned to Mabian. "My father was getting older, and someone had to carry on," he says.

He now manages the tea plantation and production. His father, with a knack for distinguishing Mabian tea from any other, oversees quality. Over the years, the family has witnessed the transformation of Mabian tea from backyard production to modern plantations.

Today, their family business employs 30 to 40 people year-round. During peak harvest, they have 400 to 500 pickers, and pay over 2 million yuan ($294,286) in wages annually.

In 2020, Mabian was designated "the home of Yi tea" by the China International Tea Culture Institute, and the Yi tea brand was formally established.

Five incomes, one leaf

In Mabian, growing tea pays dividends in more ways than one.

Li Min, a local official with rural affairs, points out that a farming family can earn five separate incomes from working on a tea plantation — renting land, selling fresh leaves, wages from labor-intensive work, collective village dividends, and tourism spillover from neighborhood homestays, where tourists buy directly from farmers and some villagers find work.

Top: A tea-picking celebration is staged at a tea plantation in Baixiang village of Sichuan province's Mabian county in late March. **Above:** Tea workers pick off fresh tea leaves at Xiangyang tea garden in Mabian. **Below:** The tiered tea plantation landscape and neighboring spring flowers form a picture at Mabian, attracting visitors from far and wide. PHOTOS BY HE WEI / FOR CHINA DAILY

"A family of four, including grandparents in their 60s and 70s, can pick tea and earn 800 or 900 yuan a day," He says. "That's better than leaving town to work, and they can look after the children and pick them up from school."

Across the county, about 80,000 people are directly or indirectly employed in the tea industry, with per capita fresh-leaf income of about 6,000 yuan, according to local authorities.

"One leaf enriches one people," says Like Haomao, deputy head of Mabian, adding that the tea industry truly plays a leading role in increasing farmers' income.

However, the major bottleneck constraining local tea development is the lack of market recognition.

"Our tea output in Sichuan is very high, but our brands are not much," He says bluntly, adding that a large part of Mabian tea is sold as raw material or processed leaves to brand owners in other provinces.

Additionally, the underutilization of summer-autumn tea has traditionally been the county's weak spot. After the spring harvest, many gardens are left fallow.

Summer heat speeds up the tea plant's growth, producing leaves that are larger, tougher and higher in bitter compounds, He explains.

The resulting tea is more astringent and fetches lower prices, making it hardly worth the labor to pick, he adds.

Breaking new ground

Local officials say the county is now tackling the problem head-on and has been exploring new avenues in recent years.

"We've brought in a company from Hubei province to produce matcha, and we're collaborating with Anhui Agricultural University to develop mellow yellow tea, constantly innovating summer-autumn tea processing," Like Haomao says.

He Yingjun is also experimenting. On part of his plantation, shade nets have been installed to produce the raw material for matcha.

"We signed a contract with a major tea company, producing tea to their standards. If summer-autumn tea is done right, it could account for half our income," he anticipates.

He has already seen summer-autumn tea prices rising. New processing techniques have opened new markets hungry for the raw material to make novel tea drinks or functional extracts.

Beyond the product innovation conducted by tea planters like He, Mabian is also pushing tea tourism.

Kashasha Homestay is the flagship project, consisting of 10 Yi-style courtyards scattered across the tea hills of Fulai village, about an hour's drive from He's tea plantation.

Open the window, and you look out over a sea of clouds and tea fields. The only sounds are the wind and the birds. Rooms are not cheap, but during peak season, they are hard to come by.

"Kashasha Homestay relies entirely on the tea gardens. Without the tea gardens, that place would be barren. There wouldn't be much to see," Like Haomao says.

In 2025, the county's tea-tourism integration project attracted about 45,000 visitors and generated 32 million yuan in revenue, according to local authorities.

Standing in the Baixiang village tea garden, He Yingjun points to a construction site in the distance.

"That's our new factory. Once it's completed, we won't sell any fresh leaves. We'll process everything ourselves and pay taxes here," he says.

The new factory will give him control over the entire process, from fresh leaf to finished product. It will also allow him to experiment with new processing methods without relying on outside facilities. Whether that solves the brand problem, he does not know.

"You do it because you're in it, and you can't just stop," he says.

Chinese humanoid robots ready to work in Central, Eastern Europe

Left: A drone photo taken on May 2 shows robots performing at a park during the May Day holiday in Wuzhou city, Guangxi Zhuang autonomous region. **Right:** An intelligent traffic management robot makes a "heart" gesture for pedestrians at an intersection in Hangzhou, Zhejiang province, on May 11. PHOTOS BY HE HUAWEN AND HUANG ZONGZHI / XINHUA

WARSAW — The steady hum of robotic arms filled the exhibition hall as automated welding machines from FAIRINO operated with precise movements. Nearby, visitors gathered around a humanoid robot made by Unitree Robotics, taking photos as it greeted them with animated gestures.

Many of the robots attracting visitors are made by these Chinese firms and others participating in the International Trade Fair for Industrial Automation and Robotics held in Warsaw in mid-May.

At the booth of Polish company Positive Machines, logistics robots moved smoothly between simulated warehouse shelves, demonstrating cargo handling and transport functions. Product manager Michal Zdrada says his company primarily purchases logistics and transportation robots from China and has sold more than 500 units to date.

According to him, Chinese-made robots stand out for their cost-effectiveness, with comparable products from Poland or Germany often priced three to four times higher.

Also opting for Chinese-made robotics products, Polish company ELTRON showcased industrial robotic arms produced by FAIRINO. The machines are used for tasks such as welding, laser marking, and industrial safety inspection.

ELTRON's regional sales manager, Jacek Slusarek, says the company chose the Chinese brand for its competitive pricing and reliable quality. He says the robotic arms have already received positive feedback after entering the market, prompting continued cooperation.

A large share of exhibitors at the fair are using Chinese robotic products. Among them, the Polish company Tech4Business showcased China-made floor-cleaning, food-delivery and humanoid robots, attracting crowds of visitors. Project manager Piotr Kozynacki says the company's founding team has spent nearly 15 years working in cleaning services before establishing Tech4Business last year.

After extensive market research and supplier screening, the company selected Chinese brands including AgiBot, KEENON Robotics and Lens Technology. "These were simply the best solutions we found," Kozynacki says.

He notes Chinese manufacturers often adopt suggestions and customize products based on local customers' feedback. "That is something we are very satisfied with when working with Chinese companies," he says.

According to Tech4Business, given China's rapid development in the robotics industry, the company is seeking cooperation with more Chinese robotics suppliers, while European firms are competing to become distributors of Chinese robotics brands.

The appeal of and faith in Chinese automation technology has extended beyond Poland.

Czech-headquartered ITS-AIM discusses its cooperation with Jiangsu Bozhiwang Automation Equipment Co in the trade of industrial automation and wire-processing equipment in Central and Eastern Europe. Co-founder Szymon Kohut says Chinese firms possess clear manufacturing and cost advantages in the wire-harness automation sector, which enables them to focus on Asia-Europe trade.

Dariusz Plewik, regional sales manager of the German company Beckhoff Automation, describes Chinese robotics manufacturers as increasingly influential players in the global market.

Noting that he has observed Chinese robotics companies' significant presence at the recent Hannover Messe, Plewik says China is one of Beckhoff Automation's key markets, accounting for nearly 10 percent of its total sales, with sales in China rising by about 10 percent from 2024 to 2025.

"China's industrial and robotics industries are developing at a pace that cannot be ignored," he says.

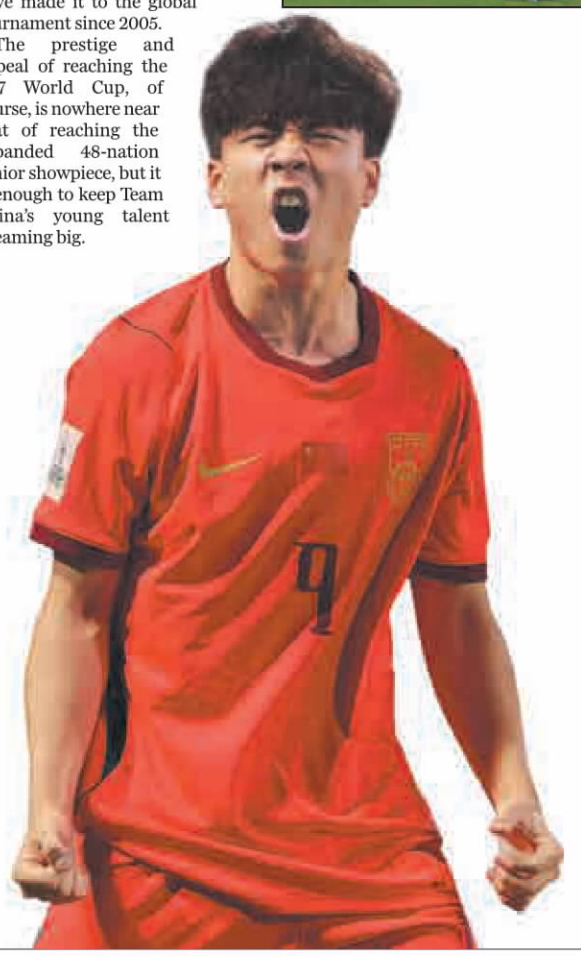
A FINAL COUNTDOWN

China sets up title showdown with Japan at the AFC U17 Asian Cup, while securing its spot at November's World Cup in Qatar

China defeated Australia 2-0 in the semifinals of the 2026 AFC U17 Asian Cup in Jeddah, Saudi Arabia, on Tuesday, reaching the final for the first time in 22 years. **Below left:** Substitute Xie Jin celebrates scoring China's second goal in stoppage time on Tuesday. XINHUA

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

China's youth soccer revival has netted another morale boost, with its men's under-17 squad's unexpected Asian Cup final run relieving fans, at least for now, from the disappointment of having no home side to root for at the upcoming FIFA World Cup.



As the whole world prepares to tune in the marquee tournament next month, Chinese fans will have to watch on as bystanders again, but not before enjoying a Cup final relevant to their team's future ambitions, thanks to China's recent breakout performance at the AFC U17 Asian Cup in Saudi Arabia.

They will also have a World Cup of their own to look forward to at the end of the year.

The Chinese U17 squad, arriving in Jeddah only eyeing the knockout stage as a marker of success, has pulled off one of the most inspiring turnarounds on the continental stage in recent years after stunning Australia 2-0 on Tuesday to reach the tournament final for the first time in 22 years — all the way from the brink of elimination in the group stage.

The team's deeper-than-expected run, which culminates with a title showdown against powerhouse Japan on Friday, has also helped secure its berth at the FIFA U17 World Cup, to be held in Qatar from Nov 20-Dec 14, marking the first time the Chinese men's U17s have made it to the global tournament since 2005.

The prestige and appeal of reaching the U17 World Cup, of course, is nowhere near that of reaching the expanded 48-nation senior showpiece, but it is enough to keep Team China's young talent dreaming big.

"My dream is to play in the FIFA World Cup. I want to keep improving every day, work hard and continue challenging myself against the best players in the world," forward Shuai Weihao, who scored the critical opening goal against Australia, said after the semifinal at the King Abdullah Sports City Stadium.

"I don't think there was a big difference between the two teams. Maybe, we just showed a bit more fight and determination than our opponents," the 17-year-old Sichuan province native said of the result, which came as a shock to many.

"We've proved that we can compete with the best in Asia at this level, so why not keep going and see what we can do in the final."

In a fine example of the team's high-pressing, quick counterattacking style of play, China's captain Zhou Yunuo dispossessed Aussie midfielder Oliver O'Carroll and threaded the ball to Shuai, who completed his bursting run down the middle with an easy finish that broke the deadlock five minutes into the second half.

Chinese substitute Xie Jin put the result beyond any doubt in the first minute of stoppage time, when he pounced on a loose ball inside the box, sealing the deserved win with a close-range strike and sending the vocal Chinese supporters into raptures in the stands.

China's Shuai Weihao (second from left) slots the ball past diving Australian keeper Charlie Wilson-Papps to score the opening goal of the AFC U17 Asian Cup semifinal on Tuesday. XINHUA

"We didn't expect that we would be here before the tournament, to be honest," said Zhou. "We will allow ourselves to celebrate tonight, and then we will move on to prepare for the final with our utmost focus."

It's the second time in just four months that a Chinese squad has fought its way into a continental youth final, following the men's U23 team's final-match appearance, also against Japan, at its respective Asian Cup in the same Saudi city.

China's U23 squad was thrashed 4-0 by Japan in that final, played at the same stadium on Jan 24, signing off its Saudi campaign with a sobering reminder of the task that lies ahead.

The U17 unit, however, has a bigger advantage this time around, with Japanese coach Bin Ukishima barking instructions from the Chinese dugout.

Ukishima, who took over the reins of the Chinese junior program in 2024, attributed his team's breakthrough to its collective focus and resilience.

"Soccer is always about the team. Whether we score or defend, everyone is involved. I don't see it as an individual performance above the group," the 58-year-old former J-League player and coach said.

After opening its tournament with two straight round-robin losses to Indonesia (0-1) and Japan (1-2) in Group B, Team China stayed mentally strong and dug itself out of the mire with a crucial 2-0 win against Qatar in its final group fixture to edge out the Gulf nation and advance into the knockout phase.

A solid 3-1 effort over the host Saudis in the quarterfinals boosted Team China's confidence, while rekindling long-suffering Chinese fans' hopes for their national program's future.

The young squad is drawing huge attention from the nation's soccer community, where long-term commitment to youth cultivation is the consensus when it comes to figuring out how to turn around the fortunes of the underachieving senior side.

"Having twice reached a continental youth final in the first half of 2026, and to challenge Japan again, good job Team China! It's time, perhaps, for a turn of fortunes," veteran soccer journalist Ma Dexing with Titan Sports posted on Weibo.

Ukishima agrees. "We have done our research on this Japanese team after losing to them in the group, and we understand their weakness and strengths," he said. "I have my notes prepared to give our players when facing them again.

"Although I am Japanese, I am Team China's coach now. I will fight on my team's side with my best effort (to ensure the win)."

Cherries bomb City's title bid, handing Arsenal first Premiership crown in 22 years

Arsenal's decades-long wait is over.

Mikel Arteta's team was crowned Premier League champion for the first time since 2004 on Tuesday after Manchester City drew 1-1 with Bournemouth.

"I told you all. it's done," Arsenal midfielder Declan Rice posted on social media with a photo of him and his teammates celebrating.

The result put an end to what might be Pep Guardiola's final title challenge with City, after the decorated manager didn't dismiss reports he was set to leave the club at the end of the season.

City needed to win at Bournemouth to take it down to the final game of the campaign on Sunday, but the draw left Arsenal with an unassailable four-point lead at the top, ending its 22-year wait for the title.

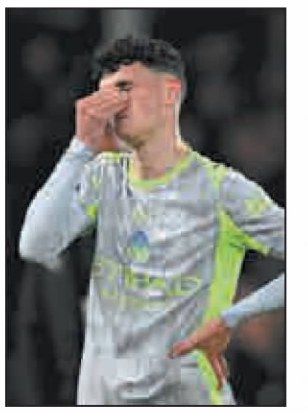
Arsenal fans celebrated wildly outside the Emirates Stadium, setting off flares and partying in the street. There were celebrations at the club's training ground, too, where the players had gathered to watch the match.

City threatened another twist in an engrossing title race when Erling Haaland scored in stoppage time to equalize, neutralizing Junior Kroupi's first-half strike, but it was too late to find a winner.

Arteta's players can now stand alongside club icons Thierry Henry, Dennis Bergkamp and Ian Wright, who previously reached the summit of English soccer. And Arsenal's current class could yet break new ground by winning the Champions League for the first time in its history later this month.

Thoughts of the May 30 final against defending champion Paris Saint-Germain can be put on the back burner for now.

Now is a time for celebration and relief for Arteta, after finishing runner-up in the league three years in a row.



In back-to-back seasons in 2023 and '24, he watched as Guardiola's City chased down Arsenal's lead to be crowned champion.

Another chance was missed last year, when the Gunners finished second to Liverpool.

Once again, Arsenal has led the way for most of this campaign and, despite seeing its points advantage ebb away during a gripping run-in, it has finally managed to get over the line.

Arsenal's last championship-winning side was the so-called "Invincibles" team of 2004, which went an entire campaign without losing in the league.

Arsenal fans celebrate winning the league title for the first time in 22 years, while a dejected Phil Foden rues Manchester City's missed title opportunity after Tuesday's draw with Bournemouth. AP / REUTERS

Since then, it has seen Chelsea, Manchester United, City, Leicester and Liverpool all take the title. This is the first time since 2017 that a team other than City or Liverpool has been crowned champion.

It is Arsenal's 14th title, and Arteta will hope it is the beginning of a new era of dominance.

He has finally got the better of Guardiola, to whom he was once an assistant at City.

The Spaniard took over at Arsenal in December 2019 — his first role as a manager. After winning the FA Cup in that first season, it has been a frustrating wait for more honors. Even still, at 44 he is the second-youngest coach after Jose Mourinho to win the Premier League.

While his team has not maintained the attractive playing style of former manager Arsene Wenger, it has powered its way to the title with the best defense in the league and earned a reputation as a specialist for set-piece goals.

Time will tell if Arteta adopts a more expansive style in the future, more in-keeping with Guardiola's City.

How City will look going forward is a bigger question, with Enzo Maresca widely considered the front-runner to replace Guardiola.

The future of City's greatest manager overshadowed the buildup to the game. "I should talk with my chairman first," Guardiola said.

"After that, when I talk with my chairman, we will decide. We will talk in the coming days."

He was aiming to win a seventh English title and a second domestic treble after winning the League Cup and FA Cup this term, but Kroupi's curling shot in the 39th minute left City with a mountain to climb.

Bournemouth wasted further chances to extend its lead, and Haaland ensured a tense finish for Arsenal fans when he leveled in the fifth minute of added time.

Ultimately, it wasn't enough and Guardiola has gone two years without winning a league title for the first time in his coaching career.

Relegation battle

The title fight might be done, but the relegation battle will go down to the final day, after Chelsea beat Tottenham 2-1. Spurs are two points ahead of West Ham, which is in the final relegation spot.

West Ham needs to beat Leeds on Sunday to have any chance of leapfrogging Tottenham and escaping the drop zone.

Tottenham hosts Everton, and a win would guarantee safety, though a draw would likely be enough thanks to its superior goal difference.

XI'S VISION | CARE FOR CHILDREN

Children's growth a priority for Xi

President has consistently emphasized that they represent hope of the Chinese nation

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

President Xi Jinping has called on student docents at the memorials of the birthplaces of the Communist Party of China in Shanghai and Zhejiang province to carry the baton of history forward on the new journey, as he extended festive greetings to children nationwide.

Xi, who is also general secretary of the CPC Central Committee, made the remarks in a reply letter, dated Saturday, two days ahead of International Children's Day, which falls on Monday.

The Young Pioneers recently penned a letter to Xi, sharing what they had learned and gained while volunteering as guides at the Memorial Hall of the First National Congress of the CPC in Shanghai, and the Nanhu Revolutionary Memorial Museum in Jiaxing, Zhejiang.

In the reply, Xi said he was pleased to learn that the students had fostered a deep affection for the Party, the country and socialism by recounting the Party's history, revolutionary stories and heroic deeds.

Noting that this year marks the 105th anniversary of the CPC and the Party's cause calls for unremitting efforts across generations, Xi encouraged the students to follow the Party's lead, carry forward the revolutionary legacy, enhance their knowledge and skills, and build their will and character.

The reply letter once again showed that the growth of children is always a priority for Xi, who has consistently emphasized that children represent the future of the country and the hope of the Chinese nation.

Despite his tight schedule, Xi has always made time for children. This commitment was evident as early as on Children's Day in 2013, when he first extended festive greetings to youngsters across the nation "as an older friend".

Since then, he has engaged with children in various ways, such as presenting plush toys to children at a welfare home in the Inner Mongolia autonomous region and accepting candy from youngsters in Liaoning province, wishing that their lives be as sweet as the treats.

Through such genuine interactions, Xi has become not only a caring friend to children, but also the kind and approachable one they warmly call "Grandpa Xi".

For 14 consecutive years, Xi has participated in voluntary tree-planting activities with students in Beijing. To him, these events are not only an occasion to work alongside children — digging pits and watering saplings — but also an opportunity to communicate with them and express hope that the children will grow big and strong, just like the young trees they plant together.

"President Xi has often used the metaphor of 'saplings' to describe children and referred to adolescence as a 'jointing and booting period', drawing a clear parallel between the growth cycle of trees and plants and the cultivation of talent," said Liu Jia, an associate professor at Beihang University's School of Marxism in Beijing.

Moderating PMI reinforces calls to shore up demand

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China's factory activity moderated slightly in May, with the official purchasing managers' index holding at the determining point between contraction and expansion after two straight months of growth, reinforcing analysts' calls for more targeted policy support to shore up domestic demand and sustain growth momentum.

With some countercyclical measures already in place and ample policy space still available, the world's second-largest economy remains well-positioned to consolidate the recovery as midyear approaches, analysts said.

The assessment came as data from the National Bureau of Statistics showed on Sunday that China's PMI for the manufacturing sector in May stood at 50.0 — the threshold between expansion and contraction — despite edging down 0.3 percentage point from April.

According to Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International, the marginal pullback was mainly driven by softer market demand during the month.

The subindex for production stood at 51.2 in May, easing 0.3 percentage point from April but remaining above the 50-point mark, while the new orders gauge edged down 0.7 percentage point to 49.9, suggesting some moderation in market demand, the NBS said.

Wang said the gap between production and new orders remained notable in May, as earlier export resilience helped to support factory output while domestic demand remained in recovery mode. "This points to a continued imbalance between external and domestic demand," he added.

Beneath the headline moderation, new growth drivers continued to gather strength. High-tech manufacturing, for instance, posted a PMI reading of 52.9 in May, while equipment manufacturing recorded a PMI of 52.1, both outperforming the overall manufacturing sector, the NBS reported.

Huo Lihui, a statistician with the bureau, said the PMI for high-tech manufacturing, in particular, had remained above the threshold line for 16 consecutive months, highlighting the increasingly prominent role of new growth drivers as related industries maintained sound growth momentum.

Wen Tao, an analyst at the China Logistics Information Center, said the strength of such sectors was partly supported by resilient external demand, as the rapid development of artificial intelligence continued to inject momentum.

However, Wang from Orient Golden Credit Rating International warned that export resilience could face more tests in the coming months, as the prolonged conflict in the Middle East weighs on global growth and adds to external uncertainties.

To better cushion such headwinds in the second half of the year, Wang said that macro policies may introduce additional support in due course to boost household consumption, accelerate infrastructure investment and stabilize the real estate market. "There is still ample policy room in these areas," he said.

Looking ahead, manufacturing activity is likely to improve modestly in June, with the sector expected to remain in mild expansion, said Wen from the China Logistics Information Center.

Analysts said the latest data suggested that some structural divergence remained. New growth drivers continued to support factory output while domestic demand required further strengthening, underscoring the need to unlock consumption potential as a key growth driver.

Mao Zhenhua, chief economist at China Chengxin International Credit Rating Co, said that pressure remains on small and medium-sized enterprises and household consumption. "Policymakers should make stronger efforts to expand domestic demand, and further unleash the potential of private investment and household consumption," Mao added.

Zhang Bin, deputy director of the Chinese Academy of Social Sciences' Institute of World Economics and Politics, called for "stronger countercyclical policy support".

He said that fiscal policy should ensure that public spending grows faster than nominal gross domestic product, while monetary policy should focus on lowering real interest rates to send stronger signals for investment and home purchases, thereby activating endogenous growth momentum.

Global prosperity matters more than ever today

WORLD WATCH
By Dominic Lee

Walking into the third edition of the Global Prosperity Summit, which was held from May 19 to 21 in China's Hong Kong Special Administrative Region, I was struck not by the grandeur of the setting or the caliber of the names on the speaker list, but by something quieter: the sound of conversation.

Diplomats from China were exchanging cards with European executives. Shanghai think-tank scholars were debating Malaysian strategists. United States investors were leaning in to hear a Hong Kong banker explain the offshore renminbi market.

In an age when the world's great capitals increasingly seem to be talking past one another, here was a room in which they were, at last, talking to one another. That, more than any communique, is the measure of what Hong Kong is and what it can yet become.

The event, jointly convened by the Savantas Policy Institute, the Shanghai Institutes for International Studies and the European Chamber of Commerce in Hong Kong, has matured remarkably since its inception in 2024. This year's gathering opened with a keynote speech from Han Zhiqiang, vice-president of the China Public Diplomacy Association, who offered forward-looking insights into the China-proposed Global Governance Initiative. He noted that the international landscape is beset by mounting instability and uncertainty, unilateralism and protectionism are on the rise, geopolitical conflicts continue to flare up, and development gaps are widening. These developments, he said, have made reform of global governance an urgent task for all peoples.

Few would disagree with the diagnosis. The harder question is where the work of repair can credibly begin. And here, Hong Kong's case is not merely rhetorical but structural.

Consider the substance. Under the "one country, two systems" principle, with the staunch support of the central government, Hong Kong's role as an international financial center has continued to develop, its status steadily reinforced and elevated — which is why the country chose this city to host the Asia-Pacific Economic Cooperation Finance Ministers' Meeting in October. This is not a ceremonial honor. Heads of finance departments of APEC member economies and representatives of international organizations will gather in Hong Kong, experiencing firsthand the city's advantages of enjoying the strong support of the motherland while being closely connected to the world. Furthermore, in November, leaders themselves will convene in Shenzhen, Guangdong province, for the 33rd APEC Economic Leaders' Meeting. Together, these two events will form the most significant diplomatic moment of the year in Asia.

That sequencing — Hong Kong before Shenzhen, finance before leaders — is not an accident of the calendar. It reflects a sophisticated thinking that, in a fractured world, China's southern coast can serve as the most credible meeting ground available.

People watch the launch of a Long March 12 carrier rocket at the Wenchang Spacecraft Launch Site in Hainan province on Jan 19. LUO YUNFEI / CHINA NEWS SERVICE

ROCKET CHASING: FROM RARE SPECTACLE TO LIFESTYLE PASSION

Space tourism blends tech, travel and leisure at Wenchang launch site in Hainan

By **CHEN BOWEN**
in Wenchang, Hainan
chenbowen@chinadaily.com.cn

It was close to midnight on Tuesday when British travel blogger John Michael Chapman, 48, scanned the Wenchang Yaoguang rocket launch observation deck in Wenchang, Hainan province, scouting for the perfect spot. He took selfies and videos with his phone and sent them to his son back home while waiting for "the moment".

Minutes later, at 12:16 am on Wednesday, a modified Long March 7 carrier rocket, carrying a new communication technology test satellite, blasted off from the Wenchang Spacecraft Launch Site and tore through the night sky, its tail flame turning darkness into daylight. The ground shook. The crowd erupted in cheers.

For most people, the idea of a perfect tropical getaway conjures up images of sandy beaches and swaying palms. But for Chapman and thousands of others like him, Wenchang's seaside offers a different thrill: watching a rocket take to the sky with an earsplitting roar.

"I am a 48-year-old man, and I feel like a little boy at the moment," Chapman said after watching the rocket launch. "My son, everyone's sons and daughters, we all dream of space travel. It's this magical thing."

Nation's fading tongues find voice in rap revival

Dialects featured in hip-hop promote understanding of cultures, customs

By WANG XIN in Shanghai
wangxin2@chinadaily.com.cn

At the recent Space Romance music festival in Chengdu, Sichuan province, thousands of fans enthusiastically rapped along in the Changsha dialect to one act, even though most cannot understand the language.

On stage, C-Block from Changsha, Hunan province, was rocking the audience with their distinctive dialect rap during the festival, which took place on May 2-3.

But C-Block are far from alone in remapping rap's language boundaries. In recent years, dialect rap has become increasingly popular in China's booming hip-hop scene, driving a growing number of rappers to dive deep into their cultural roots and explore their identities, in the process connecting with fans nationwide and across the world.

According to a list compiled by the popular online music critic, New Music Industry Observer, seven out of the 10 most acclaimed rap albums in China last year used local dialects, emanating from Sichuan, Shandong, Henan and Hubei provinces, as well as cities such as Chongqing and Changsha.

The story of rap in China, and how it tapped into local voices and culture, dates back to its earliest days and a belief it could help revive local languages.

Liu Liangji, or Mr. weezy, a 41-year-old rapper from Shanghai, is clear about his cultural mission.

He insists on making rap songs not for money or fame, but to save and promote local dialects and cultures.

Liu started performing in the Shanghai dialect in 2014. At that time, he noticed that many young Shanghai residents could barely speak the local dialect, which he believed was one of the city's main cultural pillars.

He also discovered the problem of disappearing local dialects was not confined to Shanghai. In many cities across the Yangtze River Delta region, a growing number of people were unable to speak the predominant Wu dialect.

Cantonese rapper Chen Zhuoheng, or SoulHan, is a native of Guangzhou, and presents almost all of his rap songs in Cantonese.

To make a difference, Liu gathered rappers from four other cities across the region in 2018, and formed the group JZH League. With the shared goal of promoting local dialects, they released six songs that integrated their respective dialects, attracting extensive attention online.

"I love hip-hop, love our country and cultures. These songs stand for not only hip-hop, but also showcase our cultural roots and its diversity. I want them to be well kept, better understood and widely shared," said Liu.

The positive early feedback motivated Liu to broaden his goals. In October 2019, he initiated the Chinese Languages project to celebrate the 70th anniversary of the founding of the People's Republic of China, inviting 20 rappers from across the nation to rap their messages in 20 dialects.

Two years later, in July 2021, Liu spent four months organizing 32 rappers from 28 provinces and cities nationwide, co-creating the *Rap A Song for the Party*. All rappers joined in with their own dialects to mark the 100th anniversary of the founding of the Communist Party of China.

Listen to the fans

By 2017, rap music had burst onto the cultural scene in China, as the viral reality TV show *The Rap of China* thrust the musical genre into the nation's mainstream pop culture. Clips from the show attracted a staggering 3 billion online views.

Its sequel and similar rap shows have kept the scene flourishing, producing a growing number of rap stars, enthusiasts and fans.

The New Music Industry Observer placed the album *Everybody loves hip-hop*, released under the label Mintone Records, in second place on its all-time chart.

Mainly performed in Sichuan and Yunnan dialects, the album was co-created by rapper Xia Zhiyu and musician Jin Yuhan, or Dizkar. Other rap parts in the dialects of Beijing, Cantonese, Guizhou and Tibetan language are featured on the recording.

Xia, 37, said he used to lack confidence in speaking the dialect of his birthplace — Baolun town, Guangyuan, Sichuan province. Now living in Sichuan's Chengdu, Xia often reflects his life experiences in his works.

His previous album *Young Fresh Chin II*, released in 2023, is highly acclaimed for stories based on his past, that reflect challenging times and a youth's personal growth.

"My hometown is located at the junction of three provinces, with gold and coal mines. There is a large floating population and many hard life stories amid the chaos. They gave me inspiration to create, and I hope to shed light on them," said Xia.

The cover photo of *My Family Picture*, the fifth solo album of Shi released in February. PROVIDED TO CHINA DAILY

For 32-year-old Jin, Kunming's pleasant weather, slow pace of life and locals' philosophy of "going with the flow of nature" are reflected in his free and inclusive music.

"If it were 15 or 10 years ago, I might be worried if dialect rap songs can connect with others. But now, we can hear fans rap with us in shows across the nation. We are creating our own hip-hop," said Jin.

Southern exposure

Last year, Cantonese rapper Lan Lao's hits from his second album *Ba Fang Lai Cai* went viral globally online. Combining Cantonese rap with accented Mandarin, other dialects, and culturally specific references, his vibrant local images captivated listeners around the world.

Veteran Cantonese rapper Chen Zhuoheng, or SoulHan, sees this spreading popularity as solid evidence of Chinese rappers' and hip-hop fans' growing cultural confidence and identity.

The 30-year-old from Guangzhou, Guangdong province, performs almost all of his rap songs in Cantonese.

"Although hip-hop is an imported culture, we Chinese have our own cultural background, a safe society, and different music preferences. Cantonese culture has a long and evolving history, including the internationally brilliant Hong Kong culture. The infusion of these diverse cultures can spark tremendous creativity," said Chen.

Cantonese is undoubtedly a force to be reckoned with among China's huge number of dialects and local cultures, boasting a history of more than 2,000 years, he said.

Featuring unique tones and cultural richness, Chen describes the Cantonese hip-hop scene, which started in the 1980s, as a vibrant "melting pot of cultures".

"Hip-hop is inclusive. It gave me knowledge, new perspectives on the world and shaped my values," he said.

"It's good to see more rappers, hip-hop fans and market opportunities in China. But I, like many other rappers, would still prioritize doing hip-hop for self expression and fun, before money and fame," he said.

Feeling like a hero

Consisting of "Kungfu-Pen" Shi Yifan, "D-Shine" Sheng Yu and "Key. L" Liu Cong, C-Block is one of the most popular rap groups in China and this year celebrates its 20th anniversary. Drawing inspiration from traditional culture and urban life, the trio focuses on a mixture of Hunan culture and street narratives to craft a bold and unique rap style under the Sup Music label.

Shi, 34, said it was the movie *8 Mile* — that follows the exploits of a young rapper in Detroit — that changed the life of a "soulless boy" when a music teacher played it to him in middle school.

"I completely knew what I would like to do after that day," said Shi. "What attracted me most about rap and hip-hop music was that it made me believe that anyone can be a hero. And I want to be a hero too," he said.

Shi started writing his own rap songs. The Changsha dialect he uses in everyday life naturally became part of his rap creations, helping him develop a distinctive style with local cultural roots.

It was shortly after C-Block began writing rap music in the local dialect that they made the hit song *Talk About Changsha*. With the whole track performed in the Changsha dialect, it presents the diverse local culture and lively everyday scenes of the city, such as landmarks, food delicacies, social conventions, traditional operas, nursery rhymes and more. "The dialect words just came together so intuitively and smoothly, without deliberate efforts to think about them," said Shi.

With lyrics that resonate and catchy rhythms, the song went viral after being released online in 2007. It also became the theme song of a popular TV show, reaching a wider national audience.

The musical trajectory of Shi and his group has taken off since then. In addition to local dialect songs, he also uses Mandarin to delve into universal topics, which has helped him gain wider popularity nationwide.

Despite his success, he refuses to label himself as a "dialect rapper" only.

"Dialects will still be there in the right place, but hip-hop itself is free with no boundaries. I come from Changsha, and the city has so much to offer. I love here, belong here. But I'm not confined here," Shi added.

He added that "revolution" is deeply carved in the city's history and the people's blood, which echoes with the spirit of hip-hop culture. As rappers, they stay true to themselves, oppose values that they see as incorrect, shoulder social responsibility, and speak up for the unseen in the hope of making a difference.

In November 2020, Shi held a free show in Wuhan, Hubei province. It was a special time for the city — where Shi spent four years at college — as it slowly began recovering from the COVID-19 pandemic. The performance, one of the city's first indoor live shows after the virus outbreak, attracted thousands of enthusiastic fans. Its exuberance cleared clouds of doubt and fear hanging over the city.

"I could hardly sleep the night after the show. That was the exact moment I felt like a hero," said Shi, who is currently on a national tour for his new album.

Rice-noodle superstar

Shi's friend "Ranzer" Ye Runze, 34, is also striving to blend Changsha dialect, life experiences, personal stories and local culture with hip-hop music.

According to his fans, Ye's music flows easily like the city's Xiangjiang River. Cleverly combining Changsha dialect, Mandarin, rap and folk ballads, Ye's songs are more melodic and accessible to a broader audience.

Last year, his hit *Hometown, Wind* impressed millions of people and introduced his hometown and its melodies in a refreshing way.

Learning the Chinese *zhudi* (bamboo flute) from age 8, he has been motivated by American rapper Kanye West through the years. Ye said folk songs, which he has listened to since he was a kid, have also become a source of inspiration and added a unique color to his sound.

For example, *A Bamboo Pole* from his first solo album in 2020, was adapted from a Hunan folk song. It conveys the message of "unity", as one single bamboo pole might be easy to bend, but when three or more of them are bound together, they can drive a big boat and ride the waves. The idea, in Ye's eyes, aligns with the concept of crew, squad and community in United States hip-hop culture.

"We may speak different languages and live different lives from rappers on the other side of the world, but essentially, we share similarities in culture, spirit and human nature," said Ye.

He refers to his music offerings as bowls of "rice noodles" by the roadside, a Changsha specialty popular with almost everyone. They are simple, pure, and warm, and a conduit for lively local stories.

"Hip-hop is free. It's about breaking down boundaries and exploring new possibilities. I want to be a 'superstar' in my way, which is to take my personal style to the extreme — maybe like a Chinese version of 'Post Malone'," said Ye.

Abler Liu contributed to this story.

Key Sino-US consensus highlighted

Stable and sustainable military-to-military relationship stressed by scholars at forum

By JIANG CHENGLONG
jiangchenglong@chinadaily.com.cn

China and the United States should implement the important consensus reached by the two countries' leaders and work toward a stable and sustainable military-to-military relationship, Chinese scholars said at a high-level security forum in Singapore, as global security faces rising risks from hegemonism, disorder of global governance and emerging technologies.

Major General Meng Xiangqing, a professor at China's National Defense University, made the remarks on Saturday during a parallel session of the three-day Shangri-La Dialogue, which concluded on Sunday.

His remarks came after US Defense Secretary Pete Hegseth referred to the recent China-US top leaders' meeting in Beijing and their consensus, during a plenary speech earlier on Saturday.

Meng said the level of attention the two leaders' meeting received at the forum showed that stability in China-US relations serves not only the interests of the two peoples, but also regional stability and world peace.

The most important political consensus reached by the two sides is to build a constructive relationship of strategic stability between China and the US, Meng said.

"We expect China and the US to meet each other halfway, translate the consensus into concrete actions, and push military-to-military relations toward healthy, stable and sustainable development," he said.

Responding to a question from a member of the Chinese delegation after his speech, Hegseth said the new vision of building a constructive US-China relationship of strategic stability is "real, substantive and meaningful for the history of peace in the region and the world".

Hegseth said he was present when the leaders discussed constructive strategic stability. "I think that was a great framing from both leaders about what they want from that relationship," he said, adding that there is "a mutual respect, a recognition of capabilities and power and how that could be most usefully leveraged in the world today".

Wang Dong, a professor at Peking University's School of International Studies, said that Hegseth's speech this year contained far fewer negative references to China compared with speeches by US defense chiefs in previous years, and did not mention Taiwan or the South China Sea, two hot topics that had often been cited in the past.

Wang, who participated in the security summit, said the change in Hegseth's tone reflected a more cautious approach by the US in handling relations with China after the two countries agreed to build a constructive relationship of strategic stability.

"Over the past year or so, China, through engagement and struggle, has made the US realize that it cannot gain an advantage in a trade war with China, and may even face countermeasures from China," he said. "The US is working with China to build a new paradigm, which is very important for the two countries to find the right way to get along."

In his speech, Meng, the PLA professor, also warned that global strategic stability faces unprecedented challenges, including the impact of hegemonism on regional security, rising risks of global nuclear conflict, serious erosion of international arms control, disarmament and non-proliferation systems, and disorder in global governance.

Some countries are engaging in power politics, seeking absolute strategic superiority and provoking bloc confrontation, he said, adding that such moves have intensified arms races and regional conflicts.

"These risks are intertwined and mutually reinforcing, making current strategic stability highly fragile," Meng said, noting that countries, especially major powers, should shoulder their due responsibilities in safeguarding strategic stability.

He called for firmly defending the postwar international order, saying that it is essential to building the political foundation for strategic stability.

"As the world again stands at a crossroads, countries must stay alert to any revival of militarist thinking and firmly safeguard the outcomes of World War II and the postwar international order," Meng said, criticizing recent actions by the Japanese side in the security and military fields.

On emerging technologies, the scholar warned against a "rules vacuum" in their military use.

"Allowing algorithms to control matters of life and death could very likely lead to technological loss of control," he said. "At all times, control over war and related weapon systems must be firmly kept in human hands."

Hong Kong and Macao hail milestone yacht policy

By LU WANQING in Hong Kong
wanqing@chinadailyhk.com

The Hong Kong and Macao special administrative region governments and tourism industry leaders on Sunday welcomed a new policy that allows private yachts from both regions to enter or exit nine Chinese mainland cities in the Guangdong-Hong Kong-Macao Greater Bay Area with ease.

The policy, rolled out on Saturday, was hailed as a "milestone" for yacht economy and tourism. Stakeholders expressed hope that the next phase would open up the southern route for mainland yachts heading to the two special administrative regions, ease customs requirements and enable mutual recognition of credentials.

According to the State Council's announcement, it approved with immediate effect the exemption from the guarantee requirement and the implementation of temporary ship nationality registration for Hong Kong and Macao yachts, when they temporarily enter and exit the Chinese mainland through designated ports in the nine GBA cities and navigate only within those cities.

Yachts from Hong Kong and Macao can now enter and exit the mainland through designated ports in Guangdong province's Guangzhou, Shenzhen, Zhuhai, Foshan, Huizhou, Dongguan, Zhongshan, Jiangmen and Zhaoqing.

Hong Kong's Transport and Logistics Bureau and Macao's Marine and Water Bureau welcomed the move, saying the new guarantee-free and temporary registration measures will significantly reduce the financial burden of yacht owners from the two SARs. The temporary ship nationality registration allows Hong Kong and Macao yachts to obtain temporary ship nationality certificates issued by the mainland without affecting their original ship registration, enabling individual yacht travel within the waters of the nine mainland cities.

Previously, yacht owners from Hong Kong and Macao whose vessels entered mainland waters had to make a mandatory deposit and apply for a license, which would cost several hundred thousand yuan, while applications for a permit could take months.

In his 2025 Policy Address, Hong Kong Chief Executive John Lee Ka-chiu highlighted major moves to expand the city's high-end yacht industry, including an individual travel system for yachts entering the GBA, as well as measures to facilitate Hong Kong yachts heading north and those from the mainland in the opposite direction.

Timothy Chui Ting-pong, executive director of the Hong Kong Tourism Association, called the latest policy a "full demonstration" of the central authorities' strong support for integrated tourism in the bay area and regional growth.

He hoped for a regional individual travel program for yachts, saying it's crucial for making the region a global destination for high-spending travelers, and turning Hong Kong into a hub for yacht leasing, trading and tourism.

Chui said the travel industry needs to implement more steps to encourage mainland yachts to enter Hong Kong, as having more high spenders is vital for the city's tourism expansion.

Legislator Priscilla Leung Mei-fun applauded the policy as a "milestone" that would spur marine recreation by leveraging each city's strengths — Hong Kong's marinas, maritime and high-end tourism services, and financial support, as well as Guangdong's coastlines, islands and coastal leisure facilities.

She said that faster cross-border yacht traffic is just the first step, envisioning deeper innovation, including mutual recognition of yacht licenses and smoother border inspections.

Lo Wai-kwok, chairman of the Business and Professionals Alliance for Hong Kong, urged the SAR to work with other cities in the region to simplify customs procedures for cruise vessels, yachts and tourists. He plans to meet with industry leaders to discuss how the new policy can drive tangible growth for the SAR's yacht economy.

Saying no to tobacco

Medical workers hold placards on Saturday to mark World No Tobacco Day at a private hospital in Kolkata, India. Observed annually on May 31, the day brings together governments, health organizations, civil society groups and youth worldwide to raise awareness about the dangers of tobacco use. HK: City stands out as oasis of stability

From page 1

Regina Ip Lau Suk-yee, convenor of the Hong Kong Executive Council, captured the logic precisely in her welcoming remarks. She observed that amid uncertainties, Hong Kong continues to stand out as an oasis of stability, connectivity and opportunity, and that the Global Prosperity Summit can serve as a platform for dialogue, exchange and pragmatic cooperation.

Yet platforms, however polished, are useless without traffic. And here is where Hong Kong's recent figures speak louder than any communique. The economy expanded 5.9 percent year-on-year in the first quarter of 2026, a meaningful acceleration from the 4 percent of the preceding quarter. Hong Kong has reclaimed its place as the world's fifth-largest merchandise trading entity. The International Monetary Fund has reaffirmed the city's role as an international financial center and super-connector. These are not the numbers of a city in retreat; they are the numbers of a city that has chosen its lane and is pulling ahead.

Equally important is what is being built behind the headlines. The San Tin Technopole and the Hetao Hong Kong Park sit at the heart of the Northern Metropolis, a HK$224 billion ($28.6 billion) infrastructure project that will develop roughly 30,000 hectares — about a third of Hong Kong's territory — along the Shenzhen border. Authorities have said the development will create 650,000 jobs and help ease the city's housing crisis by providing homes for 2.5 million people.

Roughly 80 technology companies and institutions have already established a presence in the Hong Kong Park of the Hetao Cooperation Zone, which officially began operations in December, and nearly 90 percent of the space in the park's two finished wet-lab buildings has been leased, with another five buildings due for completion this year.

Meanwhile, Hong Kong Chief Executive John Lee Ka-chiu has said the government plans to complete dedicated legislation for the Northern Metropolis this year to speed up the megaproject's development.

Pair this hardware with the soft infrastructure now taking shape — a third medical school, the Northern Metropolis University Town, the Greater Bay Area Clinical Trial Collaboration Platform, a forthcoming Hong Kong Centre for Medical Products Regulation — and the picture sharpens. We are not, as some foreign commentators continue to insist, merely a financial entrepot — a warehouse or distribution center for goods — clinging to past glories. We are becoming an innovation economy with Chinese characteristics and global reach.

One of the event's most compelling contributions was the institutional vision it placed on the table. Ip and Li Kaisheng, a professor at the Shanghai Institutes for International Studies, jointly proposed an "APEC Global Cities Network", an APEC Chinese Cities' network of cities that have hosted APEC meetings, and a council of APEC think tanks — networks designed to establish the foundation for building greater global regional cooperation and prosperity. This is precisely the kind of forward-looking architecture that multilateralism now requires. Leaders' meetings will continue to be photographed; but the deeper, enduring work of cooperation happens between them, at the level of cities, scholars and practitioners — and Hong Kong is positioning itself to anchor exactly that work.

Critics, of course, will argue that Hong Kong's pivot toward national strategy diminishes its international character. The evidence on the ground says the opposite. More than 40 countries from six continents have already signed the Convention on the Establishment of the International Organization for Mediation, which was inaugurated in Hong Kong as a new platform for advancing the rule of law in global governance. A city that hosts the world's mediators, the world's finance ministers, the world's Olympic federations and the world's police chiefs in a single calendar year is not a city turning inward.

The author is convener at China Retold, a member of the Legislative Council, and a member of the Central Committee of the New People's Party. The views do not necessarily reflect those of China Daily.

Children: All-around development seen as vital

From page 1

Over the years, Xi has emphasized the importance of children's all-around development, framed cultivating the younger generation as a strategic and fundamental task, and called for joint efforts to foster a healthy social environment for the growth of minors. "Those serve as the overarching guideline and fundamental principles for advancing the work on children in the new era," Liu said.

According to the latest estimates released by the National Bureau of Statistics in May, China's population of children, defined as those through age 14, stands at 214.36 million, accounting for 15.25 percent of the total population.

In an effort to safeguard the healthy growth of Chinese children, the nation has rolled out the Outline for Children's Development in China (2021-30), which sets out a comprehensive framework covering children's health, safety, education, welfare, family, environment and legal protection.

"It is the greatest wish of everyone that all children can grow up strong and healthy," Xi once said, calling on the Party and the government to ensure that they care about children and juveniles of all ethnic backgrounds and create better conditions for their study and development.

This care is woven into national strategies as well as Xi's personal gestures that transcend time and distance. In 2004, Xi, then secretary of the CPC Zhejiang Provincial Committee, attended the foundation-laying ceremony for the new campus of Zhijiang Primary School in Sichuan province. Originally located halfway up a mountain, with dilapidated buildings, the school was rebuilt with assistance from Zhejiang.

Two decades later, students of the school wrote to Xi, and ahead of Children's Day in 2024, they received a reply. In the letter, Xi said he was delighted to hear that the school was doing very well and the students were thriving.

Wang Fang, an associate researcher at the Institute of Sociology of the Shanghai Academy of Social Sciences, said that supporting children's growth has evolved from a traditional family matter to an issue of national importance, now integrated into the broader national development agenda.

"In recent years, China has continuously stepped up its efforts to safeguard and support children, leading to the steady expansion of a protective ecosystem for them," Wang noted.

This includes building a robust legal framework through measures such as amending the Law on the Protection of Minors and enacting the Family Education Promotion Law, she said.

Wenchang: Destination also offers immersive science experiences

From page 1

On social media, searches for "rocket" and "aerospace" have surged. In April alone, more than 3 million users engaged with such topics on Chinese lifestyle platform Xiaohongshu, or Red Note.

What was once a rare spectacle is more routine and accessible now, fueling a lifestyle passion.

People drive miles to the site even on weekdays, camp on beaches until midnight and aim telephoto lenses at the launch tower.

Wenchang, on Hainan's northeast coast, is China's only coastal space launch site and home to the nation's sole commercial space launch base. The site now hosts launches nearly every month.

French social media influencer Jean-Bernard Corazzi was awestruck after witnessing a rocket launch for the first time on Wednesday. "I think it's a good idea to link the two — space technology and tourism," he said.

The destination now offers more than just a momentary spectacle. Visitors can tour the Wenchang Aerospace Supercomputing Center to learn how satellites collect data and how that information is transmitted, processed and applied to sectors such as agriculture and transportation. The center and other venues aim to turn "launch watching" into a full-day science immersion experience.

For Celestino Guerra Ng, a freshman at the Academy of Public Security Forces of China's Macao Special Administrative Region, the view of both the operational and new launchpads left a deep impression. "Next time I will choose a daytime launch to enjoy the coconut groves in the foreground," he said, adding that he will share his experience back in Macao.

For British blogger Chapman, the moment was pure wonder. But like many of the new "rocket chasers", he also appreciated what came after the launch: quiet beaches, fresh coconut water and the easy rhythm of tropical Hainan.

The rocket is the adrenaline. The island is the calm. And in Wenchang, travelers no longer have to choose.

Rhythm *of* relations

Diplomats highlight growing importance of people-to-people exchanges in China-Africa ties

The African diplomatic community in Beijing launched the 2026 Africa Day Cultural Festival during an opening ceremony held at the Jintai Art Museum in Chaoyang Park on May 23 ahead of Africa Day on May 25.

Organized jointly by African embassies in China, the 2026 Africa Day Cultural Festival was opened to the public as a full-day cultural celebration aimed at promoting friendship, cultural exchange, and people-to-people connectivity between Africa and China.

The festival featured country pavilions representing different regions of Africa, showcasing the continent's rich cultural diversity, tourism potential, artistic traditions, creative industries, and contemporary dynamism through exhibitions, performances, and interactive experiences.

Throughout the day, visitors enjoyed cultural and artistic performances, including traditional music and dance presentations from across Africa, alongside exhibitions of arts, crafts, fashion, cultural heritage, tourism, and investment promotion.

A dedicated children's activity zone also offered interactive experiences introducing young visitors to African culture through traditional African games, painting activities, drumming sessions, storytelling, and hands-on cultural engagement.

In a recent diplomatic reception at the China World Hotel in Beijing to commemorate Africa Day 2026, Miao Deyu, vice-minister of foreign affairs of China, congratulated African countries on the successful commemoration of Africa Day in Beijing. He noted the special significance of 2026 as the China-Africa Year of People-to-People Exchanges and the 70th anniversary of diplomatic relations between China and African nations.

Miao highlighted the long-standing friendship and solidarity between China and Africa and reaffirmed China's commitment to strengthening practical cooperation under the framework of the Forum on China-Africa Cooperation.

He underlined cooperation in areas including development, education, healthcare, poverty reduction, connectivity, and cultural exchanges, noting that China and Africa have consistently supported one another throughout their respective development journeys.

Telesphore Irambona, Burundian ambassador to China, representing the Chair of the African Union, highlighted the importance of cultural exchanges in strengthening understanding and friendship between Africa and China.

Martin Mpana, dean of the African Diplomatic Corps in China, emphasized the enduring importance of people-to-people exchanges in China-Africa relations.

"Today's celebration reminds us that the strongest partnerships are ultimately built between people. Through culture, dialogue, and shared experiences, we deepen understanding and strengthen the bonds of friendship between Africa and China," he said.

Speaking on behalf of the cultural festival coordinating committee, Hodan Osman Abdi, Somali ambassador to China, emphasized the significance of this year's event.

"This year, given its significance as the year of people-to-people exchange, we wanted to celebrate Africa Day differently. We wished to move beyond simply commemorating a date on the calendar and instead create a space where people can genuinely encounter Africa ... through experience, interaction, and human connection".

US seeks changes to Iran deal

Trump delays final approval as Tehran and Washington exchange warnings

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

US President Donald Trump has deferred making a final decision on a truce with Iran after a meeting with advisers on Friday amid reports he was requesting several amendments to a deal his envoys negotiated.

Trump wants the deal and expects to finalize it soon, but was keen to strengthen several points, particularly regarding Iran's nuclear program, according to a report by United States media outlet Axios. Trump also wants to edit wordings around the full opening of the Strait of Hormuz.

Citing two sources, Axios reported that Trump asked his team to make changes to the draft on clauses about Iran's nuclear program. Currently, the memorandum of understanding is said to include a commitment from Iran not to pursue a nuclear weapon, but no specific concessions beyond that.

It also states that there will be a 60-day window to negotiate on nuclear commitments from Iran and sanctions relief from the US, with the first issues on the docket being how to dispose of Iran's enriched uranium stockpile and limit further enrichment, the report said.

US Defense Secretary Pete Hegseth said at a Singapore forum on Saturday that Trump was "patient" and wanted to make a "great deal" that ensures Iran does not get a nuclear weapon.

The US was ready to restart attacks on Iran if a deal could not be reached, he said, adding that US stockpiles were "in a very good place".

"We can do two things at one time. We're supercharging our defense industrial base so that we're building 2X, 3X, 4X the munitions very soon to ensure that all of our (operation) plans are properly funded throughout the world," he said.

On Sunday, Iran's Islamic Revolutionary Guard Corps announced their interception and destruction of a US MQ-1 drone that entered Iranian territory early in the morning, the Mehr News Agency reported.

Following the interception, the IRGC Air Defense issued a direct warning: Iranian airspace over the country's territorial waters is under full control, and any incursion will be met with a decisive response.

The IRGC warned on Saturday that any US interference in the "management" of the Strait of Hormuz would be met with a "strict military response".

Situation in strait

According to recordings from a public maritime radio channel provided to Xinhua News Agency by crew members aboard vessels stranded near the strait, the IRGC Navy issued a warning to ships operating in the Persian Gulf and the Gulf of Oman.

The IRGC stated that the strait remains closed and that transit is permitted only with authorization from the IRGC Navy and through routes designated by Iran.

The warning added that any violations of the regulations would seriously jeopardize maritime security.

In a video broadcast on state television, Iran's chief negotiator, Parliament Speaker Mohammad Bagher Ghalibaf said on Sunday that Tehran will not agree to any deal with the United States that fails to secure the rights of the Iranian people.

On Friday, Iranian Foreign Minister Abbas Araghchi said reaching a final agreement hinges on the US abandoning its expansionist approach and its shifting, contradictory positions.

In a phone call with his Omani counterpart, Araghchi also stressed that Iran remains serious and steadfast in pursuing its rightful interests and legitimate rights.

Agencies and Xinhua contributed to this story.

China Institute celebrates 100 years of bridging ties

By MINGMEI LI in New York
mingmeili@chinadailyusa.com

The China Institute of America marked its centennial with a gala in New York on Thursday, bringing together prominent families, business leaders, international artists and academics with long-standing ties to US-China exchanges.

Founded in 1926, the institute is the oldest nonprofit organization in the United States focused on cultural and educational exchanges between China and the US.

Over the past century, it has supported a range of exchange programs and cultural initiatives, including sponsoring Mei Lanfang's 1930 North American tour and Broadway performances in New York, and helping secure scholarship aid for Chinese students studying in the US in 1938.

The institute now hosts public discussions on US-China education, art, innovation and business exchanges, organizes exhibitions of Chinese art, and offers Chinese language and cultural programs.

This year's gala honored individuals and families recognized for their contributions to US-China relations and cross-cultural exchanges, including the Nixon family, Bush family and Rockefeller family; former Hong Kong chief executive Tung Chee-hwa; entrepreneurs and philanthropists Ming Hsieh and Eva Hsieh; and professors Li Kai and Cui Yi.

"This centennial is not only a celebration of 100 years of history — it is a declaration of our commitment to the next 100," said Yue-Sai Kan, cochair of the institute. "We are honored to gather tonight with extraordinary individuals and families who have given so much to the cause of understanding between our two nations."

Chinese Ambassador to the US Xie Feng attended the gala. He said both the Chinese and US people have upheld the mission of bridging cultures despite the ups and downs in bilateral relations.

"These efforts added a profound and moving chapter to the friendship between our two peoples, a friendship tested through blood and fire," Xie said.

Under the new vision of building a constructive China-US relationship of strategic stability, the two countries are once again at a "historic crossroads" and need greater efforts to expand common ground, move forward together and strengthen people-to-people exchanges, he said.

Peter Walker, a board trustee of the institute, a senior partner emeritus at McKinsey & Company, and a long-time China observer who has visited China more than 90 times, told China Daily why he has remained committed to the organization.

"We focus on the soft cultural things — education, arts, culinary exchange, travel, fashion, sports, the places where people connect," he said.

Walker emphasized youth exchanges as "a top priority".

"We have a whole effort around the next generation of people who we want to get involved," he said.

More than 50,000 young people from the US have visited China under China's "50,000 in Five Years" initiative, achieving the target two and a half years ahead of schedule.

Continuing the legacy

The next generations of families involved in US-China exchanges also highlighted a long-term commitment to continuing the legacy.

Christopher Nixon Cox, representing the Nixon family, said people from the two countries are able to bridge their differences.

"Tonight, our two countries face tensions, new questions, new uncertainty," he said in a speech. "The work of bridge-building has never been finished, and in some seasons it feels harder than ever."

Steven Rockefeller Jr, representing the Rockefeller family, told China Daily that the family's engagement in US-China relations reflects a long-standing tradition of supporting cross-cultural understanding and exchanges.

"There's so much opportunity for everyone to contribute in their own way," he said. "It's a vast landscape with such spectacular history, and so much art, culture and literature. Whatever you're interested in, there's so much to share."

An Israeli flag flies over the medieval Beaufort Castle as seen from the Marjayoun area of southern Lebanon on Sunday. AFP

Israel captures strategic castle in south Lebanon

BEIRUT — Israeli troops have captured a strategic mountain topped with a Crusader-built castle in southern Lebanon in the deepest incursion of the country in 26 years, the military said on Sunday.

The capture of Beaufort Castle, near the city of Nabatieh, came after days of airstrikes and intense fighting in nearby villages where Israeli troops fought Hezbollah militants in the rugged area.

Its capture marks a major development in the latest conflict, despite a ceasefire that has been in place since April 17.

The Israeli military's spokesman Avichay Adraee posted a photograph on X showing Israeli troops walking outside the castle, and Defense Minister Israel Katz wrote on X that they had raised an Israeli flag over the castle.

Israeli troops previously captured the castle in 1982 and held it until they withdrew from Lebanon in 2000.

The Beaufort fortress, perched high atop Lebanon's rolling green hills and overlooking the Litani River, has been a strategic military asset for many armies over almost 1,000 years.

Built as a Crusader castle around the 12th century on top of previous fortifications, it has been used by the Crusaders, Saladin's Jerusalem army, Mamluks, Ottomans, the French mandate, the Palestine Liberation Organization and the Israeli military until 2000, when it was partially restored and opened to visitors.

The Crusaders named it Beaufort, which is Old French for "beautiful fortress".

The Israeli military said in a statement that it launched an operation a few days ago in the Beaufort Ridge and the Suluki Valley farther south with the aim of dismantling Hezbollah infrastructure and removing direct threats to Israeli civilians.

Israeli Prime Minister Benjamin Netanyahu said in a videotaped statement on Sunday that he had instructed the military to deepen and expand its grip on Lebanese areas held by Hezbollah.

He described the seizure of the Beaufort as "a dramatic stage and a dramatic shift in the policy we are leading".

Study finds racial bias in AI hiring

By LIA ZHU in San Francisco
liazhu@chinadailyusa.com

A new study has found that artificial intelligence tools used to screen job applicants in the United States exhibit significant racial bias against Black and Asian candidates, raising concerns about algorithmic discrimination at a moment when the US labor market is already under strain.

Researchers from Stanford University, Chapman University and Northeastern University tracked 3.4 million people who submitted 4 million job applications to 1,700 job postings across 150 employers and 11 industry sectors. Every application in the dataset was assessed by an AI hiring tool built by a single third-party vendor.

The authors describe their paper as the first to offer large-scale empirical evidence of racial disparities in high-stakes hiring decisions made by algorithmic systems.

"Our new paper offers a rare look inside the 'black box' of algorithmic hiring, showing that these tools increase racial bias and shut the same people out of jobs everywhere they apply," they wrote in an article published on the website of the Stanford Institute for Human-Centered Artificial Intelligence.

The researchers explain the hiring AI pipeline as follows: job seekers submit applications, which are routed to a hiring AI vendor; the vendor's machine learning models generate predictions; and the resulting labels of "recommend" or "do not recommend" are sent back to the employer to guide decisions.

The study, titled Algorithmic Monocultures in Hiring, found that 26 percent of Black applicants and 15 percent of Asian applicants submitted applications to positions where the AI system discriminated against their racial group, as measured by US employment discrimination standards.

If Black and Asian candidates had been recommended at the same rate as the most-favored group, typically white applicants, 40,000 more of their applications would have advanced to the next round, according to the study.

Asian applicants experienced the largest shortfall. If Asian candidates had been selected at the same rate as the most-selected racial group for each position, 29,000 additional applications from Asian job seekers would have been forwarded to employers, the study found.

The researchers stressed that the method used to measure adverse impact matters, because broad averages can mask discrimination that is occurring at the level of individual job postings. For example, if an AI tool that frequently recommends Black applicants for warehouse positions but rarely recommends them for finance roles, it would seem like there is no discrimination on average, but it still produces discriminatory outcomes position by position.

The US labor market has seen hiring slow, while AI tools have made it easier than ever for applicants to submit large numbers of applications. The combination has driven the volume of applications for entry-level positions to nearly three times the levels seen in 2022, according to the paper.

The concentration of the AI hiring industry has caused another problem. They found that more than 60 percent of Fortune 100 companies rely on algorithms built by HireVue. When a significant share of employers across an industry use the same vendor's system, the researchers warned, a single algorithmic bias can ripple across the entire job market, creating what they call systemic rejection.

Among applicants who submitted four applications to positions screened by the same algorithmic vendor, 10 percent were rejected from every single one. As one vendor comes to dominate screening for an industry, the researchers said, candidates become increasingly likely to be shut out entirely rather than simply passed over for a particular role.

The study does not identify what caused the racial biases observed in the hiring algorithms. The researchers acknowledged that much of the technology's impact remains poorly understood by the public.

The researchers are calling on regulators and auditors to measure adverse impact at the individual job-posting level rather than in aggregate, and they are urging agencies to strengthen monitoring mechanisms to prevent systemic rejection in algorithmic hiring.

Editorials

European Commission needs to handle China policy with prudence, rationality

The European Commission held an orientation debate on Friday to explore a range of policy tools aimed at addressing the European Union's trade "imbalance" with China, citing the country's so-called "overcapacity".

"The current state of the trade and investment relationship is not sustainable," reads a statement issued by the commission following the debate. "As economic and security interests become ever more intertwined, both dimensions will require a more robust and coherent response."

The statement indicates that the commission, misled by certain politicians, is attempting to make China a scapegoat. In doing so, it risks ignoring the EU's underlying diseases.

As a report on Europe's development (2025-26), released by the Institute of European Studies of the Chinese Academy of Social Sciences on Friday, said, Europe is experiencing its deepest transformation since the end of the Cold War. Strategic anxiety is replacing developmental confidence and security concerns increasingly dominate economic policymaking.

It is not the European Union's trade with China that is "not sustainable" but the EU's own policies and practices in related sectors. Over the past decade, European businesses have faced high energy costs, regulatory burdens have multiplied, compliance requirements have expanded, and new layers of environmental, digital and competition regulations have raised costs across sectors.

None of these challenges were created by China. The EU's trade deficit with China is largely attributable to Brussels' restrictive export policies on high-tech products, as well as the fact that goods produced by EU companies in China and exported to the European market are counted as exports by China. If trade surplus alone constitutes evidence of "overcapacity", then many of Europe's own globally successful industries would face the same accusation. European automobiles, pharmaceuticals, wine and luxury products have long generated substantial trade surpluses worldwide. Competitive exports are not, by themselves, proof of market distortion.

Evidence comes from the very issue that has dominated China-EU trade relations over the past two years: electric vehicles. After a lengthy political theater, escalating rhetoric and tariff threats, Brussels eventually returned to what should have been the starting point as Beijing urged from the beginning: negotiation. The ongoing efforts to reach a mutually acceptable settlement regarding Chinese-made EVs entering the European market demonstrate a reality: dialogue can produce practical solutions; trade weaponization cannot.

Had Brussels chosen consultation earlier, considerable political capital, business uncertainty and market disruption could have been avoided. The lesson should not be lost on European policymakers now contemplating new instruments targeting China.

Indeed, Brussels' recent actions suggest a growing tendency to substitute regulatory activism for genuine policies to promote industrial renewal. On Thursday, the European Commission launched an investigation under the Foreign Subsidies Regulation into JD.com's proposed acquisition of German retailer Ceconomy, while continuing an expanding series of investigations into Chinese companies operating in Europe.

The China Chamber of Commerce to the EU has rightly warned that such measures risk conflating legitimate market competitiveness with alleged distortions. Innovation, logistics efficiency, supply-chain integration and operational excellence are increasingly viewed through a geopolitical lens by the EU. What should be normal commercial competition is becoming a matter of suspicion.

Some EU policymakers appear increasingly determined to imitate Washington's trade playbook, ignoring the willingness many major EU economies have expressed to strengthen economic relations with China during their leaders' and business delegations' visits to Beijing.

The EU should not overlook the irony that many advocates of tougher measures against China remain relatively silent on the United States' unilateral practices targeting the bloc. For some of them, targeting China is a way to deflect pressure arising from their own perceived softness toward the US.

While remaining open to dialogue, China has made it clear that any discriminatory measure will trigger countermeasures.

The European Commission should examine the EU's own institutional constraints — bureaucratic inertia, excessive regulation, high energy costs, and declining industrial productivity — rather than mistaking China for a "threat".

The future of China-EU economic relations should be determined not by which side can devise the next trade weapon, but by whether the EU can show the wisdom to put aside its ideological bias and focus on cooperation and exchanges to expand the two sides' common interests.

Competitive economies become what they are by striving to become a better version of themselves through openness and competition, rather than by embracing protectionism and unilateralism.

Regional brakes on neo-militarism necessary

The extraordinary efforts made by Japanese Defense Minister Shinjiro Koizumi during the Shangri-La Dialogue in Singapore over the weekend — seeking "security assurances" from the United States — lay bare Tokyo's anxiety: as Japan's remilitarization becomes increasingly blatant, it risks facing growing opposition from the region.

During their talks on the sidelines of the security forum, Koizumi and his US counterpart reached a series of agreements, including accelerating the joint production of missiles. The Japanese side announced these outcomes in a high-profile manner, as if they were the latest testament to the "solidarity" of its military cooperation with the US.

If Japan truly sought peace, Koizumi would not have gone to such lengths to deliver his telling performance before the nations of the region — countries all too familiar with Japan's old trick of saying one thing while doing another.

Data from the Japanese government reveal that orders from the Japanese Ministry of Defense have tripled over the past five years, and now constitute half of the government's public procurement orders. Historically, this military-industrial complex played a significant role in Japan's militarist expansion. That machines are roaring once again in the system indicates the dangerous direction in which the Sanae Takaichi government is leading the country.

This year marks the 80th anniversary of the opening of the Tokyo Trials, which delivered historical justice after World War II. It serves as a reminder of the consequences of a Japan ruled by de facto militarists. Meng Xiangqing, head of the People's Liberation Army expert delegation at the Shangri-La Dialogue, rightly questioned Japan's qualification to speak about "defense" cooperation, warning against any resurgence of militarism and attempts to challenge the post-WWII international order.

Is a country that has not thoroughly reckoned with the legacy of militarism truly qualified to speak about "defense" cooperation on the international stage? Can it win the trust of the international community — especially the Asian countries that once suffered from its aggression? These questions, raised by Meng during a panel discussion at the dialogue, deserve the full attention of the entire region.

The worrisome actions of Japan extend well beyond its borders. In Singapore, Koizumi also met with Philippine Defense Secretary Gilberto Teodoro Jr to finalize the transfer of decommissioned Japanese military vessels to Manila, aiming to better equip the Philippines for its provocative actions against China in the South China Sea.

On Thursday, the two countries announced they would hold talks on delimiting a so-called "exclusive economic zone" in the waters to the east of China's Taiwan island where China has an exclusive economic zone and continental shelf.

This constitutes a severe violation of China's maritime rights and interests, the United Nations Convention on the Law of the Sea and other international laws, and basic norms governing international relations, as Chinese Foreign Ministry spokeswoman Mao Ning said.

There is no doubt that Japan stands at a crossroads again. The series of institutional constraints established in the postwar era — designed to prevent Japan from repeating the mistakes of its past — are now being systematically dismantled, step by step, by the right-wing forces in Japan. While the tactics employed by them are nothing new, for a nation that has never truly engaged in thorough self-reflection over its heinous wartime history, these methods serve to effectively reawaken the ambition, greed and hubris of a war machine that has long lain dormant beneath a veneer of peace.

During the war, Japanese society succumbed to a state of collective unconsciousness. Established moral compasses were arbitrarily altered, and the Japanese people could only toil diligently to facilitate the cruel objectives dictated by the militarists. Today, Japan seems once again ready to tread that same path.

Ottawa should respect core concerns to ensure cooperation sustainable

Chinese Foreign Minister Wang Yi met respectively with Canadian Prime Minister Mark Carney, Foreign Minister Anita Anand and former prime minister Jean Chretien in Ottawa on Friday. The discussions struck a pragmatic tone, focusing on cooperation, exchanges and the need to properly manage differences. This suggests that the atmosphere necessary for forging a new strategic partnership between the two countries is gradually improving.

Months after Carney's January visit to China, the results are becoming visible. Exchanges between some government departments have resumed, and trade and investment discussions have regained momentum.

The numbers tell a revealing story. According to Chinese statistics, total China-Canada goods trade in 2025 stood at $89.59 billion, down 3.7 percent year-on-year. Canadian exports to China fell by 10.5 percent to $41.66 billion, while imports from China declined by 3.7 percent to $47.93 billion. Yet even amid these declines caused by the previous Canadian government's ill-advised China policy, China remained Canada's second-largest trading partner, behind only the United States.

The numbers also demonstrate the resilience of underlying commercial ties. Despite years of diplomatic tensions caused by the Justin Trudeau government, neither side could simply replace the other with any other trading partner. This explains why the Carney government has moved with notable speed to recalibrate the relationship. During his visit to China, Carney spoke of building a strong and enduring new strategic partnership with China. In his meeting with Wang on Friday, Carney reiterated Canada's willingness to deepen cooperation in energy, finance, agriculture and fisheries. These sectors sit at the heart of Canada's comparative advantages.

Wang noted that the improvement in bilateral relations serves the interests of both countries and that there is no clash of fundamental interests between them.

It means that the China-Canada relationship should not be burdened by irreconcilable strategic rivalry.

Indeed, the convergence extends beyond economic and trade relations. Carney's support for China's hosting of this year's Asia-Pacific Economic Cooperation Economic Leaders' Meeting is welcome. It aligns with his broader argument that countries should defend multilateral cooperation in an increasingly fragmented world.

In his much-discussed speech in Davos in January, Carney delivered perhaps one of the clearest diagnoses yet of the international environment confronting what he called "middle powers". He warned that a "world of fortresses" would become poorer, more fragile and less sustainable. "Middle powers", like Canada, needed strategic autonomy while continuing to support open trade, international law and practical cooperation, he argued.

Those views resonate with the world's needs for multilateralism and an open economy. While China and Canada may disagree on some issues, they share an interest in preventing global economic fragmentation and resisting the logic of bloc confrontation.

The restoration of strategic dialogue mechanisms announced during Wang's visit therefore reflects the recognition on both sides that sustained communication is indispensable in an era of uncertainty.

Yet one cautionary caveat remains.

If Ottawa wishes to preserve the positive momentum that is now emerging, it must handle the Taiwan question with due prudence and care. The timing of the recent transit of the Canadian frigate HMCS *Charlottetown* through the Taiwan Strait, shortly before Wang's visit, on May 22 and 23 as part of a so-called "routine operation", contradicts the Canadian side's stated willingness to improve ties. China has made clear that while it respects freedom of navigation under international law, it opposes actions that undermine its sovereignty and security under that banner.

A sustainable China-Canada relationship requires Ottawa to manage differences responsibly rather than allow its symbolic gestures to overshadow substantive cooperation.

Chretien, who initiated what many Canadians still regard as the "golden decade" of bilateral relations, understood this reality well. His enduring belief that the two economies are highly complementary remains as relevant today as it was two decades ago.

In an era of geopolitical volatility, Canada would do well to recognize that pragmatic cooperation with China serves its interests better than ideological distance. If Ottawa can reciprocate Beijing's approach while carefully managing their differences, this year's bilateral trade figures will show that such a course is worthwhile.

— LI YANG, CHINA DAILY

What They Say

New urban renewal plan prioritizes safety

Editor's note: *The Chinese government recently released an urban renewal plan, outlining key targets, major tasks and projects, as well as policy measures for the country's urban renewal efforts during the 15th Five-Year Plan (2026-30) period. China Central Television spoke to Zheng Degao, vice-president of the China Academy of Urban Planning and Design and Tang Daizhong, deputy head of the construction management and real estate department at Tongji University, to discuss the sustainable development aspects of this plan. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China's urban development is shifting from a model focused on expansion to a more intensive and quality-oriented approach. This new stage of development emphasizes the construction of modern cities that are innovative, desirable to live in, beautiful, resilient, culturally advanced and smart. These principles must translate into concrete actions, projects and real-life scenarios to deliver tangible results.

The urban renewal plan identifies six major tasks: fostering new drivers of urban development, creating high-quality urban living spaces, advancing the green and low-carbon transition, building safer and more resilient cities, promoting urban culture, and enhancing urban governance capabilities. It also stresses the need to optimize underutilized land, introduce full life-cycle safety management systems for housing, construct or renovate "quality homes" and upgrade urban municipal infrastructure.

Urban renewal is fundamentally a safety project. Risks are often concentrated in large cities, so it is essential to focus on safety. Aging infrastructure, deteriorating buildings and outdated public facilities pose risks, necessitating renewal and upgrades.

At the same time, managing urban safety requires a systematic approach. Cities are increasingly expected to leverage digital technologies and monitoring systems to detect risks early, issue timely warnings and respond before problems escalate.

A comprehensive urban assessment is the critical first step in the renewal process. By examining the condition of buildings and residential compounds, cities can identify existing problems and residents' needs. For example, there may be a shortage of parking facilities, structural risks in an aging building or insufficient public services for seniors and children.

However, identifying problems is only the beginning. The real challenge lies in addressing them through targeted renovation, upgrades and quality improvement. This is why the principle of "no renewal without assessment" has become a core component of the urban renewal framework. It creates a closed-loop process in which assessments uncover problems, and those findings guide the design and implementation of renewal projects.

According to the plan, future urban renewal projects are expected to draw on three major sources of funding: public finance, financial capital and private capital, with each serving a distinct function.

Public funding will provide the foundation and serve as a safeguard, particularly for projects with strong public-interest characteristics. Public finance can also act as seed capital to attract additional financing.

Financial capital is to play a leveraging role, addressing the mismatch between the long investment cycles of urban renewal projects and the slower pace of returns. Since many renewal projects require years to generate stable revenue, long-term financing is essential to bridge the gap and ensure that future cash flows cover the current investment costs.

The third crucial source of funding is private capital. Some private capital, such as real estate developers and professional operators can revitalize projects, improve efficiency and create sustainable business models where future operating revenues help offset the initial investment.

Beyond megawatts, coordination is civilization

MA XUEJING / CHINA DAILY

For 40 years, I have watched the world count megawatts and then act surprised when the lights begin to flicker. Power generation is easy to photograph. Grids are harder.

A new wind farm makes for a better picture than a new transformer, so national scorecards happily tally how much clean power a country has generated, and much less happily ask whether that power can actually reach a person, a factory, or a hospital when it is needed.

This is not a small oversight. It is the central misunderstanding of energy transition.

Electricity is the only product in modern times that has zero "shelf life".

It must be produced and consumed in the same instant — unless we have massive storage capacity. A cargo ship of grain can wait in a harbor. An electron cannot.

The moment a kilowatt leaves a turbine, it has less than a second to find a load, or the system destabilizes. That second — and the coordination that governs it — is the real infrastructure.

It also decides whether a terawatt-hour is a public good or a stranded asset.

The most important number in the energy transition is not installed capacity.

It is the grid's coordination capacity that carries it.

Consider the region that, on paper, should have the least energy problems on Earth.

The Inner Mongolia autonomous region holds roughly 57 percent of China's onshore wind resources and about a fifth of its solar resources.

In 2025, it added 35 gigawatts of new renewable energy capacity, bringing its total installed renewable capacity to over 170 GW.

Wind power capacity alone surpassed 100 GW for the first time, making it the first region in China to exceed that threshold. Ten-megawatt onshore turbines, unheard of a decade ago, are spinning at scale.

None of that works without the second sentence of the story.

As of Dec 28, 2025, Inner Mongolia had transmitted a cumulative 834.765 billion kilowatt-hours of electricity to 11 provinces, autonomous regions, and municipalities via eight ultra-high-voltage power transmission corridors, ranking first in China.

Twelve more UHV projects are planned for the 15th Five-Year Plan (2026-30) period, and the region's outbound electricity over those five years is expected to exceed a trillion kilowatt-hours.

The megawatts are the flag. The coordination is the country.

Inner Mongolia's renewable build is impressive because it is attached to long-haul transmission, coal-fired flexibility, growing storage capacity and dispatch logic that can balance a system whose primary fuel is weather.

A desert photovoltaic array with nowhere to send its output is an expensive curiosity.

The same array sitting behind a UHV corridor, digital substations, forecasting, storage, and a control room that coordinates across time zones is a national asset.

Compare that with places that built capacity but deferred the grid.

Germany raced ahead on wind and solar and paid for it in years of curtailment and redispatch charges.

Texas froze in February 2021 because capacity alone could not anticipate a storm.

California has prolonged blackouts during heat waves; its capacity charts insist it should not have relied so heavily on new energy sources.

In each case, the megawatts were there. The coordination was not.

What the 20th century built was an electro-mechanical grid: copper, iron, oil, and operators reading dials.

What we are now building is a cognitive grid — sensing at every node; forecasting at every substation; dispatching decisions, or resource planning at a power plant by the plant's operator, in milliseconds; and cyber defenses running alongside physical ones.

The hardware still matters. The intelligence layered on top decides whether a renewable-heavy system is resilient or fragile.

I have argued for four decades — created and led the Complex Interactive Networks/Systems Initiative (CIN/SI), a $30 million joint EPRI/US Department of Defense program from 1998 to 2002 — that a grid must be smart, secure, self-healing, and trusted, not just large.

"Trusted" is a technical word. It means the system must keep serving society irrespective of storms, attacks, component failures and ordinary human error.

Capacity without trust is a brittle machine. Trust without capacity is a slogan.

The playbook is now visible for any region aiming to do what Inner Mongolia is doing: Build generation and transmission as a single project; integrate storage and flexibility from day one; harden the cyber and physical layers together; and train operators for a grid that behaves nothing like the one they trained on.

Accept that the grid is no longer a passive delivery pipe.

It is an active participant in economic development. A nation that grasps this is not just decarbonizing. It is upgrading its civic infrastructure for the next century.

The most underappreciated object in the energy transition is the transmission line. It is also the most honest.

It records, in copper and steel, exactly how serious a region is about integrating its own ambitions.

Capacity targets are easy to write. Corridors are not. A region that has built both is telling you something about how it intends to grow.

So when another ranking of renewable capacity crosses my desk, I note the number and ask a different question: Where is the coordination?

Where is the grid that can actually carry it? That, more than any megawatt count, is the real competitive advantage of the twenty-first century.

Civilizations that master coordination — of electrons, of data, of capability, of trust — tend to do well.

Those that only master capacity tend to hear a lot of celebratory speeches, right up until the lights begin to flicker.

The author is an IEEE and ASME fellow, chairman and president of Energy Policy and Security Associates, CTO of Renewable Energy Partners, and a professor emeritus, former director, and Honeywell/H.W. Sweatt Chair in Technological Leadership at the University of Minnesota.

Henry Wai-chung Yeung

Asia's strategic shift from dominance to diversity

Imagine a world where your latest iPhone bears the inscription, "Designed by Apple in California, assembled in California".

Such a scenario would not only bypass the enormous growth of China as the key assembly hub for billions of iPhones since 2007, but also prevent the emergence of Chinese smartphone giants such as Huawei, Xiaomi, Oppo, Vivo and Honor among others.

What's more, without China's involvement, consumers in the United States and across the world would not be able to afford iPhones designed and made in California due to their prohibitive costs.

When I was growing up in Hong Kong during the 1980s, brands such as Motorola, Nokia, and Sony dominated the mobile phone market.

It was the time when Japanese electronic products and cars were conquering world markets, reinforcing the "Flying Geese" model of economic development propounded by Japanese economist Kaname Akamatsu. The model depicting Japan as the leading goose and other East Asian economies as its followers was popular in academic and policy circles.

But this "Flying Geese" model has now evolved into a more complex yet resilient economic landscape, where regional and national economies are steering their industrial transformation and economic development through strategic coupling with global production networks.

In today's interconnected world, no single national economy can control and dominate an entire value chain because production networks now stretch across many regions and continents.

Taking the iPhone as an example, its emergence as the smartphone that replaced Motorola from the United States, Nokia from Finland, and Sony (Ericsson) from Japan by the early 2010s was not merely because it was "designed in California", but also due to the incredible production efficiency and strong supply chain ecosystem developed by its main "assembler" Foxconn in Shenzhen and elsewhere in China.

These resilient supplier networks were strategically coupled with Apple to support its phenomenal rise.

In fact, the growth and development of the global smartphone industry, including key components such as advanced semiconductors, is largely due to the strategic coupling of Foxconn and other key suppliers with global leaders such as Apple, Huawei, and Xiaomi.

Their inter-firm networks, driven by economic efficiency and mutual interests, have spurred regional growth in Guangdong, Taiwan and other parts of China.

While Japan and Japanese firms (for example Sony and its sensors and lenses for smartphone cameras) continue to play a significant role in global smartphone production networks, the center of gravity in this industrial segment has clearly shifted from Japan to China and the Republic of Korea.

This supply-side story, however, masks an even more significant shift in the Asia-Pacific region — the rise of East Asia as a major market since the mid-2010s. This trend is evident across smartphones, personal computers, consumer electronics and electrical appliances.

Hong Kong, the place where I grew up, relied heavily on the US and Western Europe as key markets. But today, Northeast and Southeast Asia have become important consumers of global smartphones. It's not just Japan that has lost its lead goose status in technology. The US is also no longer the world's largest market.

What lessons can we draw for under standing the resilience of supply chains in an increasingly uncertain world?

First, the Asia-Pacific region will continue to play a pivotal role in building resilient supply chains, particularly in the electronics industry.

Instead of fragmenting and decoupling from global production networks, leading firms and their ecosystems will likely adopt a resilient symbiotic approach, shifting from a US-centric model to one more focused on the Asia-Pacific.

This shift will present more opportunities for East Asian businesses, particularly in China, to establish production networks that are less reliant on the US.

In the Guangdong-Hong Kong-Macao Greater Bay Area, significant opportunities exist in the electronics industry along the technology corridor comprising Shenzhen, Dongguan-Foshan, Hong Kong, and Guangzhou.

Second, as Japan's technological dominance during the "Flying Geese" era has been eclipsed by China and other East Asian economies, geopolitical rivalries and techno-nationalism will create new opportunities for regions to engage in strategic coupling with Asia-based global production networks.

My earlier book *Strategic Coupling* highlighted how East Asian Tiger economies developed by aligning domestic firms with global leaders across industries.

In today's new era of geopolitical uncertainty, I foresee more regional economies in the Asia-Pacific aligning with Asia-based leading firms in their diversification and resilience strategies.

This flexible reorganization of Asia-based global production networks will unlock new development opportunities within the Asia-Pacific region and beyond. But unlike the 1980s, it will not be dominated by one leading goose.

Instead, it will be a new geographical mosaic of multi-nodal networks and development patterns that are more resilient and capable of absorbing risks.

This regional resilience and production network diversification will serve the world economy far better than one that champions "Designed in California, assembled in California". De-globalization and decoupling are outdated; the world should now engage with re-globalization and recoupling!

Yu Haiyan and Zhou Xinyu

Using AI to protect mental health

As the world marks International Children's Day on June 1, it's a time for joy and anticipation for children across the country.

While parents get ready to celebrate this occasion, they should also remember the significance of another day that just passed. May 25 was National Student Mental Wellness Day.

Beyond the gifts and the fun at amusement parks on International Children's Day, how can we lay a strong foundation for our children's mental health?

The solution extends beyond doctors and hospitals. It requires a collective effort to address a growing crisis in our schools and colleges.

A 2025 study of middle school students in Chongqing revealed troubling statistics: about 26.34 percent of the 12,367 children showed signs of depression.
Consider the case of "Qi Qi" (not her real name), a 14-year-old student from a middle school in Chongqing.

At school, Qi Qi always kept to herself and rarely communicated with her classmates.

Everyone thought she was just shy, but her sadness grew wildly inside her. One day, after a math test, Qi Qi broke down crying and said she didn't want to go to school anymore — she didn't want to exist in this world anymore.

Qi Qi's story is a wake-up call. We live in an age of artificial intelligence and digital footprints.

These tools should be used to protect our children. This is where "digital phenotyping" comes in.

The concept may sound complex, but it simply means using data from devices — such as phones and watches — to understand a child's behavior.

This is not science fiction, but a necessary measure.

AI can look for small changes that parents or teachers might miss. For example, a sudden drop in messages or calls, and more late-night screen time than usual. These can be early warning signs.

This is not about surveillance, but about stepping in early to help.

At the First Affiliated Hospital of Chongqing Medical University, a national regional medical center for mental health disorders, physicians are exploring how to combine data — such as facial expressions and voice tones — with AI to build models that can identify emotional issues early.

Such technological innovations alone are not enough. We must also look at the underlying causes that are troubling children.

The pressure to get good grades in academics and the erosion of close family support are genuine problems.

The Ministry of Education's "double reduction" policy was a good first step to ease school stress, but a broader shift in mindset is needed.

We must value emotional strength as much as we value academic achievements.

The family can become the "charging station" for a child's emotional well-being. Simple daily habits can make a big difference. Turn lectures into conversations.

Instead of asking, "Why did you fail?", try "You look upset. Want to talk about it?" Create "magic time" for the family by setting aside 15 minutes after dinner to disconnect from devices and engage in playful activities. Dance like silly people, play with Lego, or just laugh.

Let the stress melt away. Have "failure parties" to celebrate mistakes as learning moments.

When children see that a wrong answer or poor grades are not the end of the world, it reduces their fear of failure.

This is not empty talk. Real action is underway. As part of the "Sunshine Mind Regional Collaborative Alliance for Youth Development", we are launching six projects, including the "Sunshine Mind Volunteer Service Team", "Adolescent Sleep Health Promotion Project" and the "Care Plan for Children in Need".

These programs bring mental health services directly to schools, communities and families. They move us from random, disconnected efforts to a clear, organized system of care.

Qi Qi's story ends well. With counseling, her parents' loving support, and a school program that encouraged outdoor play, she slowly found joy again.

As we celebrate June 1, let us remember that the best gift we can give our children is not a toy, but the tools to understand and manage their inner world.

By using ethical AI, strong family bonds, and community support, we can help every child not just survive — but truly thrive.

GLOBAL VIEWS

EDSON PRESTES

Answering shared needs

China and Brazil are working together to establish an AI ecosystem that can promote sustainable development and social progress

China is an excellent example of how to make science, technology and education a driving force for economic and social progress.

In 2025, China's research and development spending exceeded 3.9 trillion yuan ($576 billion), with the R&D spending intensity reaching 2.8 percent of GDP, according to the National Bureau of Statistics. The total number of R&D personnel in the country ranked first in the world in 2024. During the 14th Five-Year Plan (2021-25) period, China achieved a series of significant breakthroughs in fields such as quantum technology, life sciences, material sciences and space sciences. According to China's Ministry of Science and Technology, in the field of artificial intelligence, China has developed several general-purpose models reaching international advanced levels, with some models achieving accuracy rates exceeding 95 percent, and it has created over 100 benchmark application scenarios. AI has empowered a wide range of industries, contributing to China's high-quality development. This progress is closely linked to the development of China's education sector during the 14th Five-Year Plan period. According to the Ministry of Education, over this period, China's higher education system produced 55 million graduates. Vocational education supplied over 70 percent of the new high-quality, highly skilled personnel for modern industries, supporting the cultivation and development of new productive capacities.

These achievements are the outcomes of the enormous investment that China has made in technology, science and education for the benefit of its society in the past several decades. What China has achieved in its economic and social development deserves attention and should be shared as best practices worldwide.

In the spirit of sharing best practices and collaborating for the common good, China has been an incredible partner for Brazil in domains such as health, industry, green energy, telecommunications and AI. In April, China and Brazil signed a memorandum of understanding on AI research and development, human capacity building programs and the technological infrastructure for AI. Among the planned activities are the development of AI solutions adapted for the Brazilian context such as language translator systems, cybersecurity solutions and the creation of an interoperable data platform in a cloud environment. Furthermore, the MoU aims to promote exchanges of researchers, technical visits and development of joint courses and programs.

Collaboration and cooperation are the best ways to move forward. No one can aspire to a better future without collaborating and cooperating with others, especially in the digital domain, where AI knows no borders.

Another remarkable collaboration was established in October 2025, between the National Institute of the Semi-Arid and China Agricultural University. This collaboration seeks to leverage the best competency and expertise of both countries in a complementary way for their mutual benefit. Brazil is one of the world's largest food producers, with vast experience in tropical agriculture and knowledge of diverse soils and biomes, while China has a huge capacity for innovation and high-tech manufacturing. Therefore, Brazil and China are natural and complementary partners to develop solutions for family farming based on high-end technology powered by AI and joint human capacity building programs.

China and Brazil have collaborated in this area for several years, producing meaningful results. For example, some rural producers who used to spend over 20 days harvesting a hectare of rice now complete the operation in one day using Chinese agricultural machinery. In 2025, an MoU was signed between the Institute for Digital Economy and Artificial Systems in Xiamen, China, and the Federal University of Rio de Janeiro, focusing on AI policy development, joint research and talent cultivation to address common challenges faced by both countries such as the shortage of AI specialists in fields such as AI governance and safety, development of standardized protocols for data sharing, and certification programs for algorithmic transparency, among other things.

Beyond these examples, there are networks and laboratories involving Brazil and China, such as the China-BRICS AI Development and Cooperation Center, which includes representatives from BRICS countries and aims to leverage AI technologies to promote sustainable development, economic growth and social progress among the BRICS members. Furthermore, in 2025, China and Brazil inaugurated China-Brazil Belt and Road Joint Laboratory on Tropical Microbiology for the prevention and research of infectious diseases. This initiative aims to strengthen bilateral cooperation in the health field to combat existing and future infectious diseases through prevention, preparedness and response.

The aforementioned examples demonstrate the collaborative relationship between China and Brazil as well as their shared commitment to creating win-win solutions in a sustainable way. Although the projects currently focus on both countries, their results can be shared globally, since the issues addressed, such as the shortage of AI specialists and the lack of frameworks that allow the development of AI or the creation of an AI ecosystem, are pervasive among Global South countries. These countries are generally absent from debates regarding some regulations and frameworks for AI that are currently being created by the West and used as templates for the rest of the world. The problem is that these "global" frameworks do not correctly reflect the reality of some developing countries.

SONG CHEN / CHINA DAILY

Some Global South countries face unequal realities, exhibiting different levels of maturity in AI, whether in terms of technical capacity, infrastructure or regulation. The cooperation between China and Brazil is very beneficial as it involves two major Global South countries working together to find ways to address their own problems that are also problems of other developing countries.

Collaboration and cooperation are the best ways to move forward. No one can aspire to a better future without collaborating and cooperating with others, especially in the digital domain, where AI knows no borders.

TOMAS CHAMORRO-PREMUZIC

At the top of the game

The rapid adoption of AI is changing how leadership is defined, assessed and developed

Nearly four years after the mainstream arrival of generative artificial intelligence, most organizations are still struggling to understand what it actually means for work. The dominant narrative has focused on job displacement: which roles will disappear, which will survive, and which new ones will emerge. This framing is intuitive, but incomplete. The real impact of AI is not primarily about eliminating jobs. It is about redefining them.

AI is transforming work at the level of tasks, not roles. It is unbundling jobs into their component parts, automating some, augmenting others, and leaving a smaller but more critical subset firmly in human hands. In doing so, it is quietly reshaping the nature of human contribution at work. The implication is not that humans are becoming obsolete, but that the bar for what constitutes valuable human input is rising.

This shift has profound consequences for leadership, talent and the broader labor market.

Many organizations are confusing activity with progress. According to survey findings presented by Nicholas Bloom of Stanford University, most surveyed firms reported using some form of AI technology, with overall adoption at about 69 percent across the sample. Yet these impressive figures often mask a more sobering reality: there is little evidence of corresponding productivity gains. Employees are frequently doing the same work as before, only faster or with less effort. Crucially, the time saved is rarely reinvested in higher-value activities.

This is not a productivity revolution. It is, at best, a more efficient version of the status quo. At worst, it is what one might call performative productivity, where the appearance of progress substitutes for actual value creation.

The underlying issue is that most organizations have not redesigned work. They have layered AI onto existing processes rather than rethinking those processes from first principles. As Peter Drucker famously observed, there is nothing so useless as doing efficiently what should not be done at all. AI risks amplifying precisely this problem, enabling organizations to do more of the wrong things, faster.

This is where leadership becomes critical.

If AI is the defining technological challenge of our time, then leadership is the defining organizational challenge. Leaders must decide not only how to deploy AI, but what work should exist in the first place. They must move beyond adoption metrics and focus on value creation. This requires a level of judgment that no algorithm can substitute for.

WANG JUN / FOR CHINA DAILY

Paradoxically, as AI becomes more capable, the importance of human judgment increases. One reason is that AI generates what might be called artificial certainty. Large language models produce answers that are coherent, confident and often persuasive, even when they are incorrect. The risk is not that people will distrust AI, but that they will trust it too much.

Distinguishing between high-quality insight and plausible nonsense is fast becoming a core professional skill. It is also a leadership skill.

This raises an uncomfortable question. If the value of human work is shifting toward judgment, decision-making and problem framing, how well equipped are today's leaders to meet that standard?

The evidence is not encouraging. For decades, leadership selection has been driven by flawed assumptions. Organizations tend to overvalue past performance, even though success is often context-specific and difficult to replicate. They place excessive emphasis on experience and technical expertise, despite strong evidence that personality and cognitive ability are more robust predictors of long-term potential. And they continue to reward confidence and charisma, traits that are easy to observe but only weakly related to effectiveness.

These biases help explain why so many organizations end up with leaders who look impressive but underperform. In an AI-enabled world, this problem is likely to become more visible, not less. When information and technical expertise are widely accessible, the marginal value of leadership shifts to areas where humans still have an advantage: setting direction, exercising judgment, building teams and influencing others.

This has important implications for how organizations identify and develop talent.

First, talent identification must become more data-driven. AI can play a useful role here, not as a replacement for human decision-making, but as a tool for improving it. By analyzing large datasets on leadership behavior and outcomes, organizations can identify patterns that are difficult to detect through intuition alone. This can help reduce bias and improve the accuracy of selection decisions.

However, data is only as useful as the framework used to interpret it. Without a clear understanding of what drives performance, more data can simply lead to more noise. This is where science matters. Decades of research in organizational psychology have identified a relatively small set of variables that reliably predict leadership effectiveness, including cognitive ability, personality traits and learning agility. Integrating these insights with AI-driven analytics offers a powerful way to improve talent decisions.

Second, leadership development needs to be rethought. Traditional approaches often focus on building strengths, under the assumption that maximizing what individuals are already good at will drive performance. In reality, many leadership failures are caused not by a lack of strengths, but by the presence of unaddressed weaknesses, particularly those linked to personality derailers. Traits such as overconfidence, volatility or excessive risk-taking can undermine effectiveness, especially under pressure.

In this context, the most effective development strategies are those that help leaders manage their risks, not just amplify their strengths. This is especially important in an AI-enabled environment, where the consequences of poor judgment can be magnified.

Third, organizations need to reconsider which capabilities are uniquely human and therefore worth investing in. As AI takes over routine cognitive tasks, the comparative advantage of humans lies in areas such as critical thinking, creativity, social influence and ethical reasoning. These are not new skills, but they are becoming more valuable.

Unfortunately, education systems and corporate training programs have been slow to adapt. They continue to emphasize knowledge over thinking skills, and technical proficiency over judgment. This mismatch risks producing a workforce that is not prepared for tomorrow's challenges.

Finally, there is a broader societal dimension to consider. The transformation of work driven by AI raises important questions about governance, inequality, and social stability. Policymakers face the difficult task of balancing innovation with regulation, ensuring that the benefits of AI are widely shared while mitigating its risks.

This will require a more nuanced approach than the binary debates that often dominate public discourse. Overregulation can stifle innovation, while underregulation can lead to unintended consequences and negative ethical and societal outcomes. The goal should not be to control AI, but to shape its application in ways that enhance human capability and societal well-being.

In this sense, the challenge is not technological, but institutional. It is about how organizations and societies adapt to a new distribution of human and machine capabilities. The same is true at the business level. AI will not replace leaders but will expose them. It will make it easier to see who adds value and who does not. It will reduce the returns to superficial competence and increase the premium on genuine expertise and sound judgment.

For organizations willing to rethink how they define, assess and develop leadership, this represents an opportunity. For those that are not, it represents a risk.

The future of work will not be determined by AI alone. It will be determined by how effectively humans choose to use it. This is why effective leaders will be an integral part of the future.

Tokens are China's next goldmine

As service exports, they are seen offsetting traditional trade risks

By CHENG YU
chengyu@chinadaily.com.cn

MA XUEJING / CHINA DAILY

In a small apartment somewhere in Southeast Asia, a designer taps a phone screen and asks an artificial intelligence tool to sharpen a blurred product photo, soften the lighting and remove a messy background.

The request looks weightless. It travels as text and pixels, invisible and almost instant. But behind it is a new kind of Chinese export: not a toy, a solar panel, an electric vehicle or a container of electronics, but a string of AI "tokens" produced by servers running in China and sold as a digital service to overseas users.

In April, South China's port city of Shantou, Guangdong province, had completed China's first city-level closed-loop verification for token exports. It was a full process covering offshore data centers, token generation, overseas application programming interface requests and compliant cross-border data transmission and meant that overseas users in parts of Southeast Asia had begun calling AI services powered by tokens generated in Shantou.

The language is technical, but the ambition is straightforward: China wants to turn domestic electricity, data centers and large-language-model capability into a high-value export product.

Under this model, the power stays inside China. The servers stay inside China. The models run inside Chinese intelligent computing centers. What crosses borders is the AI service itself — inference results delivered through an API.

That makes "token exports" a new form of services trade. Traditional computing-power globalization often meant heavy investment abroad: building data centers, laying fiber, securing local energy supply and operating networks in foreign markets. Token exports promise something different: electricity does not leave the grid, computing power does not leave the country, but value flows globally.

Liu Xiaoge, deputy director of research at the development strategy and regional economy department of the Development Research Center of China's State Council, said: "Token exports have become the deep integration of artificial intelligence technology and digital trade in China. They have become a completely new form of digital services trade."

"At a time when China's traditional trade faces geopolitical and tariff challenges, token exports, with their purely digital and zero-logistics delivery model, provide a new way to offset the risks of traditional trade frictions and drive growth in services trade. They will reshape the position of China's digital services in the global value chain," Liu said.

The experiment also offers a glimpse of how China is trying to rewire its export economy for the AI age. For decades, the country's growth was powered by factories, ports and container ships. The next phase may depend as much on offshore cable landing stations, green electricity, GPUs, compliance zones and APIs.

For instance, Shantou's international submarine cable landing station gives it a direct route into Southeast Asia. Shantou carries a large share of China's international outbound bandwidth and provides a low-latency direct node to Singapore, making it one of the fastest Chinese gateways to the region.

The city also sits near large offshore wind resources, giving its token-export story a green-energy narrative that matters to global clients under pressure to meet environmental, social and governance standards.

That is why China's policymakers are paying attention. In the 2026 Government Work Report, Beijing called for new infrastructure projects involving large-scale smart computing clusters and the coordinated development of computing capacity and electricity supply. It also pledged integrated monitoring and distribution of computing capacity across the country and support for public cloud services.

The logic is already visible in China's northwestern regions. In Qingyang, Gansu province, white wind turbines turn slowly over ochre hills, and rows of blue-black photovoltaic panels catch the hard northwestern sun. Instead of being pushed entirely through ultra-high-voltage lines to distant factories and cities, part of that green electricity can be consumed nearby by data centers.

The current runs into racks of servers. GPUs turn electrons into matrix multiplication. The model produces tokens. A user thousands of miles away sees an edited image, a generated paragraph, a line of code or a customer-service answer.

From outside the China Energy Engineering Corp project area in Qingyang, data center buildings operated by Kingsoft Cloud, China Telecom and Chindata can be seen rising nearby. Qingyang has already built 11 data centers, created a domestic 10,000-card computing cluster and surpassed 140,000 petaflops of computing scale.

In the old export economy, a city needed factories. In the token economy, it needs power, fiber, servers, regulation and an ability to guarantee low-latency service.

Now, Shantou and Qingyang do not need to become the next great AI model laboratories. They can become AI trade infrastructure: the service desk for computing power, the customs broker for tokens, and the bonded zone for cross-border data flows.

Wang Peng, a researcher of Beijing Academy of Social Sciences, said: "Token exports are a concentrated expression of China's combined competitive advantages in energy, data, infrastructure and engineering talent. In the context of a deeply reshaped global trade landscape, supporting token exports will help extend China's trade competitiveness into intelligent computing power and has major, far-reaching significance for shaping new drivers of foreign trade."

The timing is important. Global AI spending is surging, and the most expensive layer is infrastructure. Gartner forecast worldwide AI spending would reach $2.52 trillion in 2026, up 44 percent from 2025. It estimated AI infrastructure spending alone would rise from about $965 billion in 2025 to $1.37 trillion in 2026.

That scale creates a massive opportunity for countries that can provide cheap, reliable and increasingly green computing capacity. China sees a chance to sell not merely applications, but the underlying intelligent service.

The demand signal is already visible in developer behavior. OpenRouter, a global AI model API aggregation platform, reported that Chinese-developed open-source models rose from a tiny share of weekly token volume in late 2024 to nearly 30 percent in some weeks in 2025, with growth concentrated in the second half of the year. DeepSeek, Qwen, MiniMax and Moonshot AI were among the Chinese model families gaining traction in its dataset.

In early 2026, Chinese model token calls continued to climb with Chinese models overtaking US rivals in token usage for the first time.

For Chinese telecom operators and tech companies, that creates a new business line.

State-owned telecom carrier China Telecom announced in late April a series of trial token plans, offering consumers monthly AI usage packages starting at 9.9 yuan ($1.46) for 10 million tokens. Small businesses and developers can purchase enterprise packages with up to 150 million monthly tokens for 39.9 yuan.

Alibaba has announced a new Alibaba token hub business group, defining tokens as a strategic asset and setting out three missions: creating tokens, transmitting tokens and applying tokens.

It has said it will invest more than 380 billion yuan over three years to build a global cloud computing network, using full-chain capabilities in models, computing power and chips to support token exports.

Rao Shaoyang, director of the industry and enterprise strategy at China Telecom's research institute, said such efforts change the nature of Chinese digital globalization.

"In the past, China's digital industries went overseas through apps, software or complete systems. Token exports allow overseas customers to directly call the inference capability, interface capability and intelligent services of Chinese models," he said.

"The model could also alter the economics of China's renewable energy buildout. China has installed vast amounts of wind and solar power, especially in western and northern provinces," he added.

Wang Linwei, an engineer at China Energy Engineering Corp's Qingyang big data center, added that computing-power and electricity coordination has already formed several clear and feasible paths.

These include direct green-power purchases and direct green-power connections, integrated source-grid-load-storage dispatch, flexible peak-shifting of computing loads, and linked regulation between energy storage and computing power, he explained.

"Whether through one-way regulation or two-way interaction, computing-power and electricity coordination has a broad development space," he emphasized.

Wuxi giving AI something new: a factory address

REPORTER'S LOG

By Cheng Yu

A phrase that recently gave me pause is "token factory", as Wuxi, one of China's most seasoned manufacturing cities, is preparing to give artificial intelligence something it has rarely had before: a factory address.

Not a factory that stamps metal parts, assembles circuit boards or loads containers onto trucks, but one designed to produce the measurable units consumed by large AI models — tokens.

On May 15, Honflex signed an agreement with the local government to build Jiangsu province's first Huawei Ascend 384 super-node computing cluster. On top of that infrastructure, Hongxin Electronics plans to establish a large-scale token factory in the city.

The first phase will deploy four Huawei Ascend 384 super-node servers. Each server carries 384 AI accelerator cards, and the four will be connected into one super cluster. In China's emerging market-facing token factory sector, that scale is being described as among the largest.

At first, the phrase sounds almost theatrical. But the more I followed the logic, the more industrial it became. A token is the basic unit processed by an AI model. Every chatbot reply, AI coding request, image-editing command or automated report consumes tokens.

A token factory is an industrialized production facility dedicated to producing the basic units of AI generation — tokens. Inside the token factory are computing-power infrastructure, models and algorithms, scheduling and distribution systems, and a MaaS — model-as-a-service — platform.

This is where Wuxi's story becomes larger than one data-center project. China's AI debate has long revolved around who has the smartest model. Wuxi is asking a more industrial question: can intelligence be supplied continuously, reliably and at scale?

Shen Yang, a professor of Tsinghua University's School of Journalism and Communication, said: "A token factory is the most important factory of the intelligent age. It can turn electricity and data into cognitive productive capacity."

The value of the concept, Shen said, is that it shifts the AI industry's narrative from "how smart the model is" to "whether intelligence can be continuously supplied."

That line captures the real significance of the Wuxi project. The city is not merely adding another computing cluster. It is trying to insert itself into China's next industrial chain — one built around domestic chips, domestic models and domestic applications.

Honflex said the project marks a key step in its domestic AI computing-power layout and an important breakthrough for Wuxi in implementing China's East Data, West Computing strategy and building a domestic computing ecosystem.

Shen added one more condition: global delivery.

"The token factory means it faces not a single market, but global division of labor," he said. "In the future, a country that truly qualifies as a world factory will certainly not be one that keeps models only at home, but one that can export intelligent services to the world."

Standing before this idea, I saw the old Chinese factory model being rewritten. The assembly line has not disappeared. It has become invisible. Its output moves not by truck or ship, but through an application programming interface call. The customer may never see Wuxi. But if the city succeeds, a piece of machine intelligence somewhere on a screen may begin here — inside a token factory.

BUSINESSINSIGHT

Stabilizing Asia-Pacific economic, trade foundation

EAGLE EYE
By Zhao Zhongxiu

CAI MENG / CHINA DAILY

The global economic and trade landscape is undergoing profound restructuring, with geopolitical tensions becoming increasingly complex and a new round of technological revolution and industrial transformation gathering pace.

As challenges such as climate change and demographic shifts become increasingly intertwined, Asia-Pacific Economic Cooperation economies face a shared imperative — to build a fair, rational and sound rule-based system, stabilize the Asia-Pacific's economic and trade fundamentals, and strengthen the resilience of industrial and supply chains.

Against such a backdrop, advancing the Free Trade Area of the Asia-Pacific, or FTAAP, represents a viable pathway and strategic choice to address development bottlenecks, consolidate the foundation for coordinated regional development and foster sustainable economic growth across the Asia-Pacific.

As the most inclusive regional cooperation mechanism in the Asia-Pacific, APEC has adopted flexible and diversified cooperation modalities and continued to focus on emerging areas such as the digital economy and green development.

Yet APEC is not a legally binding framework for a free trade agreement, and still faces constraints in rules enforcement, institutional enforceability and implementation effectiveness. This has limited its ability to serve as the anchor for deeper regional economic and trade integration.

It is against such a backdrop that APEC has identified building the FTAAP as a core strategic theme and has steadily advanced the process since 2004. Nevertheless, given its large membership, diverse development stages and divergent interests among members, it has been challenging to build consensus across all parties, and no major breakthrough has yet been achieved toward the realization of the FTAAP.

Fortunately, APEC economies share long-standing economic and trade ties and have maintained relatively stable bilateral and multilateral relations over the years. This has cemented a solid economic foundation and a sound basis for political mutual trust for FTAAP consultations and negotiations.

The key to advancing the FTAAP process lies in exploring innovative pathways and building a practical cooperation framework.

Its development should fully leverage and build on existing regional cooperation initiatives, and advance in a phased and iterative manner. The APEC Economic Leaders' Meeting has delivered a wealth of valuable, forward-looking cooperation themes, which should be systematically and effectively incorporated into the rule-based system of the FTAAP.

In terms of implementation, the FTAAP development process should combine bottom-up and top-down approaches, with the former serving as the mainstay and the latter as a complement.

The bottom-up approach — driven by voluntary and independent initiatives among member economies — can help accurately identify practical pain points and bottlenecks in Asia-Pacific economic and trade cooperation. The top-down approach, meanwhile, can provide overarching regional guidance, facilitate early breakthroughs in areas where consensus is strong and offer forward-looking insights on emerging themes, including digital trade and green trade.

Moreover, the development of the FTAAP should fully draw on the cooperative spirit embodied in APEC's Pathfinder Initiatives and further translate it into FTAAP pathfinder modules.

Under such an approach, interested member economies could conduct pilot thematic negotiations in selected sectors. Outcomes reached by consensus could then be incorporated into a future FTAAP legal framework, creating binding rule-based obligations for participating parties.

Participating parties may proceed with implementation and pilot application upon completing domestic legislative approval and relevant procedural reviews. Should the pilot achieve notable outcomes, relevant practices may be replicated and extended to other economies, paving the way for the gradual accession of new member economies.

For underperforming pilots, the participation scope may be appropriately scaled back, and relevant member economies may withdraw, so as to preserve institutional flexibility and maintain leeway for adjustment.

China's practical explorations in advancing institutional opening-up also tell us the importance of remaining process-oriented and advancing pragmatically for fostering FTAAP cooperation.

For instance, China has formally applied to join the Comprehensive and Progressive Agreement for Trans-Pacific Partnership and Digital Economy Partnership Agreement. Although accession is still under negotiation and consultation, China has already used its pilot free trade zones to proactively benchmark against the open, inclusive and high-standard rules embodied in the two agreements, while carrying out pilot programs and stress tests.

Through this process, China has worked to drive deeper reforms and deliver concrete results. Proven and effective measures have also been replicated beyond the pilot free trade zones.

FTAAP cooperation is, by nature, a long-term process involving a broad agenda and complex interests. In this context, a pragmatic approach — adopting useful rules first, implementing while negotiating and expanding successful pilots over time — may offer a more efficient and practical pathway for advancing FTAAP cooperation.

Looking ahead, efforts to build the FTAAP should take a forward-looking approach to strengthening institutional competitiveness.

First, institutional opening-up should serve as an anchor for improving rule-based systems that promote trade and investment liberalization and facilitation in traditional sectors.

In goods trade, efforts could start with reducing nontariff barriers and advancing mutual recognition of standards and rules. Services trade could then be further opened through a negative-list approach, supported by whole-chain rules covering fair market access, fair competition in business operations and orderly market exit.

On investment, economies could explore a communication and coordination mechanism for dispute settlement, with consultation, mediation and joint expert panels serving as priority channels.

Second, as new drivers of growth continue to take shape, the Asia-Pacific should develop more refined rules for the digital economy and green, low-carbon development.

In the digital economy, efforts could focus on building an Asia-Pacific digital trade framework that clearly defines data-related sovereignty, facilitates orderly cross-border data flows, lowers market barriers and helps narrow digital divides.

Third, greater emphasis should be placed on rules that strengthen the resilience and security of industrial and supply chains.

The region could work toward an Asia-Pacific supply chain community underpinned by stability, diversification, coordination and emergency response capacity. Such a framework should encourage APEC economies to avoid excessive concentration in key industrial chains, and enhance the overall stability of supply chains.

It could also explore a regional reserve-sharing and reallocation mechanism for key components, energy resources, food and medical supplies, so as to better cushion short-term shocks arising from supply shortages.

Finally, stronger rules are also needed to support small and medium-sized enterprises, with a view to fostering a more enabling institutional environment for business growth across the Asia-Pacific.

APEC economies could advance the development of a one-stop service platform for SMEs, providing end-to-end services such as policy information, market matching, cross-border settlement, legal consultation and credit-enhancement support for financing.

Exclusive incentives and simplified procedures for SMEs in the areas of tariff reductions, customs clearance facilitation, government procurement, digital transformation, and green certification could also be promoted.

To conclude, Asia-Pacific economies are deeply interconnected, with shared interests and a common future. The realization of the FTAAP will be a long-term and demanding task. All member economies should remain committed to openness, inclusiveness, mutual benefit and win-win cooperation, seek common ground while shelving differences, and take pragmatic steps forward.

Creating new jobs amid evolving tech key

MAIN STREET
By Cai Fang

The relationship between technological change and employment expansion is an old topic, yet one that has not lessened in importance over time. When disruptive technological revolutions occur, whether job creation can ultimately outweigh job destruction remains an unresolved puzzle in economic theory.

Fundamentally, the shock that technological change brings to employment is not that occupations, positions and jobs are only destroyed and never created. The real problem is that job creation and job destruction are often misaligned across space, uneven across time, unequal in scale, and mismatched in terms of skills supply and demand.

Looking back at economic history, these asymmetries have haunted generation after generation of workers like a recurring curse ever since the First Industrial Revolution. Therefore, in an era of rapid artificial intelligence development, the key to ensuring that job creation outpaces job destruction lies in achieving better alignment between the two in terms of timing, geography, scale and skills.

New ways of thinking

To better understand the creative and destructive forces that AI may unleash, we should first look at what is already happening in the labor market.

Many economists believe China's economy has crossed the so-called Lewis Turning Point and machines and robots accelerate the replacement of human labor. The pace of job destruction increases significantly and the number of lost positions rises sharply.

A Lewis Turning Point occurs when a country's surplus labor evaporates, pushing up wages, consumption and inflation rates.

Based on official data estimates, China's urban labor market created a cumulative 154 million new jobs between 2013 and 2024. But not all of them translated into net employment gains. During the same period, cumulative job losses reached 53.62 million.

On the one hand, the spread of AI is expected to amplify this destructive effect on employment. On the other hand, it may also create the possibility for job creation to surpass job destruction.

This places much higher demands on policymakers. In line with an employment first strategy, technological innovation and employment expansion must be made as compatible as possible. At the same time, gains in labor productivity must be transformed into new opportunities, strengthening both the scale and the momentum of job creation.

If we break free from traditional frameworks of understanding and conventional development models, technology aimed at raising labor productivity does not necessarily lead to a net decline in jobs. On the contrary, rising productivity can itself become the catalyst for entirely new employment space.

Create new jobs

In reality, many new occupations do not suddenly appear out of thin air overnight. They have often existed quietly, existing within economic activity for years. But because the market remained too small, the number of jobs they created was negligible.

Only when labor productivity rises dramatically, and when the benefits of that productivity are broadly shared across the society, do more people become consumers of the products and services tied to those occupations. At that point, new professions and new jobs begin to emerge on a meaningful scale.

For decades, neoliberal economics tried to convince people that productivity gains achieved by a handful of large corporations would naturally spill over into society and benefit broader populations — a variation of so-called trickle down economics. Yet the experiences of both developing and developed countries show that this phenomenon is not really effective or beneficial for the society at large.

The lesson here is clear: new occupations, new positions and new forms of employment do not emerge automatically.

Only through a fundamental shift in how we think about development can the immense power, scale, and potential of AI driven productivity gains be turned into broad employment growth. That means starting with a fairer distribution of productivity dividends and tackling structural contradictions in the labor market.

Only then can job creation grow faster and larger than job destruction, breaking what has long been the "century-long curse" of asymmetry between the two.

Breaking century-long asymmetry

Several areas should become central priorities for policy expansion and intervention.

First, while improving the social security system and labor market institutions, governments must significantly strengthen public employment services and make related systems more adaptable to the times and more targeted in their policy tools.

Under the growing penetration and disruption of AI, labor markets will inevitably become more uncertain and more volatile. This is the natural response to the creative destruction brought by disruptive technological change.

Yet one principle must remain clear: people themselves, as the agents of labor, must not become the casualties. Human well being must not be weakened in the slightest.

After all, allowing everyone to share the gains of rising labor productivity is not only an inherent part of technological progress, but increasingly its defining purpose.

This means social security systems must provide more universal and equal welfare protections. Labor market institutions must defend workers' rights to a higher degree. Public employment services must help workers transition into new roles with greater intensity and frequency.

The structural contradictions are already present in the labor market and likely to worsen under AI, meaning job vacancy rates and unemployment rates may rise at the same time.

As a result, public employment services centered around training cannot merely keep pace with changes. They must anticipate trends and changes, and stay one step ahead of them.

Judging from the share of urban workers currently receiving subsidized vocational training, investment still does not match the upward trend in urban unemployment. More public resources should be committed on a long term and normalized basis, making employment training one of the essential public services of the artificial intelligence era.

Second, on the basis of fairly redistributing gains from rising productivity, the society must redefine occupations, positions and work itself, while promoting social mobility and broader human development.

As labor productivity rises sharply and the constraints created by resource scarcity gradually weaken, social wealth will become far more abundant. Under such conditions, the creation of occupations and jobs will no longer be strictly limited by the size of consumer markets, and workers' incomes will no longer necessarily remain tightly linked to productivity alone.

From this perspective, the principles governing the distribution of economic output and social wealth may gradually shift away from a strict "payment according to work" model toward one increasingly shaped by the idea of "meeting people's needs".

Such a transformation is not only an inherent requirement of Chinese modernization. It is also a fundamental path toward addressing the employment shocks brought by AI.

Finally, when it comes to sharing productivity gains and responding to the impact of AI, the most effective institutional tool comes from both the lessons of economic history and the urgent demands of reality: significantly expanding redistribution, so that a growing share of people's livelihoods and well being comes from redistribution, especially through basic public services.

CHINA

China renews efforts to assist migrant and left-behind minors

By LI LEI
lilei@chinadaily.com.cn

Central authorities have called for the better tracking of distressed migrant children — those who move from rural to urban areas with their parents — and stronger guarantees of equal access to public services, such as education and healthcare in cities, ahead of International Children's Day, observed annually on June 1.

The move comes as migrant children have surpassed left-behind children — minors who remain in rural hometowns while their parents work in cities — as the main group affected by China's internal migration. Official data from the 2020 national census showed that the number of migrant children age 17 and under stood at 71 million, nearly double the figure recorded in 2010, and exceeded the 66.9 million left-behind children nationwide.

The directives were outlined in a circular jointly released on Saturday by 27 central government departments, including the Ministry of Civil Affairs, the Supreme People's Court and the Ministry of Education.

The document described the renewed effort to identify and assist distressed migrant and left-behind children as part of broader measures to build a child-friendly society.

According to the circular, local authorities are required to carry out "precise screening, accurate filing and targeted services" for millions of vulnerable children.

By September, existing data must be cross-checked with records from education, health and public security authorities, the circular said. Any missing information will trigger door-to-door visits by village-level child welfare workers.

Local civil affairs departments must ensure that these workers dynamically register newly identified migrant and left-behind children through routine visits and public feedback mechanisms. Provinces with a large population of such children should prioritize registration during peak migration periods, such as the spring job-hunting season and school holidays, to avoid omissions.

Authorities are also required to establish key care files for children facing the greatest hardships, including those lacking access to education, healthcare or proper guardianship, and to update the records regularly based on home visits.

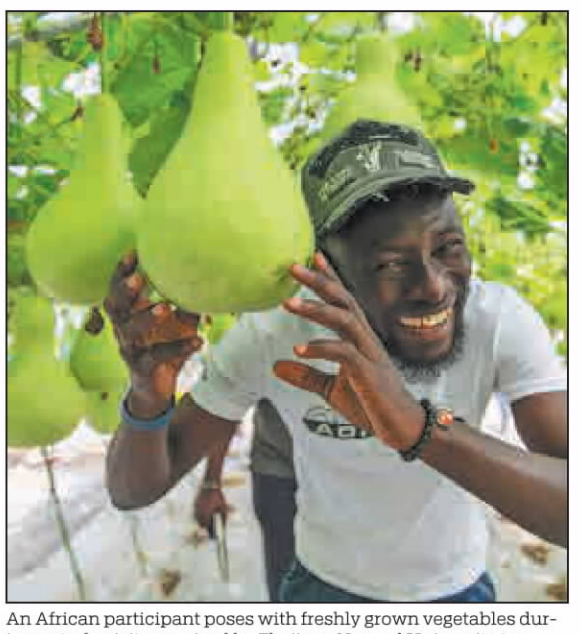
The directive mandates equal access to public services for migrant children, including school enrollment based on residency permits and improved cross-regional healthcare coordination.

For left-behind children, the focus will be on addressing guardianship gaps, preventing accidents and abuse, and providing mental health support.

In line with a new risk response mechanism, frontline workers such as teachers and doctors are required to report signs of neglect or abuse.

In cases involving violence or other emergencies, response protocols involving public security authorities, healthcare providers and local women's federations will be activated.

"Local authorities and relevant departments must strengthen supervision and guidance for work involving these two groups of children," the circular said, warning that localities and departments showing weak implementation will face closer oversight.



The Ministry of Civil Affairs will incorporate the dynamic case management system into future performance evaluations, the circular added.

Universities target healthy weight loss

More institutions introduce courses to help students achieve fitness goals

By ZOU SHUO
zoushuo@chinadaily.com.cn

A growing number of universities are introducing weight management courses to help students achieve healthier body compositions and develop sustainable lifestyle habits.

The latest to join the trend is Jiangnan University in Jiangsu province. In early April, the university issued a student physique enhancement action plan, which includes mandatory weight management courses for students with a body mass index exceeding 28, as well as fitness courses for those with weaker physical fitness.

The university has also added a 2,000-meter run for female students and a 2,400-meter run for male students as part of its physical education assessment.

Meanwhile, China Agricultural University has been running a successful weight management program for three and a half years.

Launched in the autumn semester of 2022, the university's "fat reduction and health enhancement" series has attracted 707 student enrollments over eight semesters, according to Wu Min, deputy head of the university's physical education department.

The 16-week course begins with a health screening, followed by theoretical lessons on obesity classification, diagnostic criteria, causes and risks, as well as scientific dietary approaches to fat reduction, Wu said.

During the eight-week intensive intervention period, students attend classes three times a week, with each 90-minute session combining strength and aerobic training.

Outside class, students are required to complete aerobic exercise two to three times a week, with each session lasting at least 40 minutes, while managing their own dietary intake. After the intervention period, students continue with four weeks of self-directed exercise and nutrition management before a final assessment, she said.

The course has produced notable health benefits. In 2025, participants in the spring semester lost an average weight loss of 6.09 kilograms, including an average of 5.08 kg of fat, while reducing their body fat percentage by 3.08 percentage points. Their physical fitness test scores improved by an average of 12.70 points.

Results from the autumn semester were also impressive. Participants lost an average of 5.34 kg and 4.23 kg of fat, reduced their body fat percentage by 2.33 percentage points and improved their fitness test scores by an average of 7.76 points.

For many students, the most valuable outcome is not the weight they lose but the healthy habits they gain.

Li Jiajun, a first-year mechanical engineering student at China Agricultural University, said he enrolled in the course to improve his endurance for the university's fitness test and to address postural problems developed during years of sedentary study in high school.

"The biggest takeaway isn't how many kilograms I lost, but the regular exercise and healthy eating habits I've developed — and the healthier body composition I've achieved," Li said.

The weekly strength and aerobic training sessions have helped him overcome his reluctance to exercise. Li added that he has also learned how to plan balanced meals instead of resorting to blind dieting, while his energy levels and physical fitness have improved significantly.

Zhou Zehao, a third-year agricultural science student, weighed about 110 kg at his heaviest. Poor lifestyle habits — including staying up late and consuming high-fat, high-sodium meals — had taken a toll on both his immune system and self-esteem.

"The greatest gain is that I have regained confidence and resilience," Zhou said. "The biggest takeaway from losing weight has never been how many kilograms I shed, but the courage to challenge life's deepest desires for laziness and comfort."

Before joining the program, Zhou said, he would order takeout rather than leave his dormitory. He also felt "invisible" to female students because he lacked the confidence to communicate with them.

After enrolling, he adjusted his diet and began exercising daily for about 40 minutes in a small public workout area in his dormitory building.

"The biggest advantage of this course is that you have a group of friends who encourage each other and keep each other accountable — workout buddies who tease you when you slack off but lend a hand when you truly need it," Zhou said, adding that such genuine human connection is something no online program or fitness influencer's boot camp can replicate.

Parents urged to shun 'digital babysitting' trend

By ZOU SHUO
zoushuo@chinadaily.com.cn

The Ministry of Education has recently launched the 2026 National Preschool Education Publicity Month campaign, urging kindergartens nationwide to ensure that play remains the primary activity for young children and discourage an overreliance on digital devices.

The ministry has also called on parents to adopt child-rearing practices that emphasize companionship, play, sports and time in nature, while discouraging so-called digital babysitting.

It stressed that digital products — such as reading companions, chat-based tools and interactive games — must not replace physical picture books and toys.

Digital tools should also not be used to directly generate child observation records or assessments.

According to the ministry, there are persisting misunderstandings about the role of digital applications in early childhood education, alongside misleading marketing by some commercial entities and the improper or excessive use of digital products by some local authorities and kindergartens.

During the campaign period, a series of public awareness activities will be held nationwide, bringing together professional and social resources to focus on protecting the rights and interests of preschool children in the digital era.

Su Jing, director of Beijing Academy of Educational Sciences' early education research institute, said surveys show that it is common for parents to use electronic devices to keep children occupied.

"In many scenarios, we see young children swiping screens, rapidly switching content, or playing games on tablets and phones," she said.

> "Too much screen time is not good even for adults, let alone little children."
>
> **Shi Xu,** a father of a kindergarten student in Changsha, Hunan province

Addressing growing concerns over so-called digital babysitting — the practice of using digital devices, including artificial intelligence applications, to manage young children's behavior — Su said: "Children aged 3 to 6 are in a stage of concrete thinking and embodied cognition. Their learning relies on physical perception, hands-on activities and real-life social interaction — things that AI products cannot replace."

She also warned of the potential harm of excessive screen time to children's developing vision. Early exposure to blue light and electronic screens is a major contributor to myopia, she said.

"Beyond vision, it can also lead to attention disorders, physical health issues caused by a sedentary lifestyle and other health risks," she added.

Su warned that many parents still turn to digital devices as a quick fix to calm a fussy child, creating a vicious cycle.

"Children learn best through real-life play and hands-on experiences. When that happens, their eyes light up, they are fully engaged and they develop very well," she said.

To safeguard children's healthy development, Su recommended a cautious approach to the use of AI in early childhood settings.

Young children should not use AI products, she said, adding that their learning must be grounded in rich sensory experiences and real-world interactions. Relevant authorities should strictly control the introduction of AI into kindergartens, and AI should not replace the role of teachers.

"A teacher's warmth, care, eye contact and sensitivity to a child's emotions cannot be replaced by algorithms," she said.

Shi Xu, the father of a kindergarten student in Changsha, Hunan province, said he and his wife have established strict rules limiting their daughter's exposure to digital devices.

Although digital devices have become ubiquitous, he said she can learn to use them when she gets older.

"We try to take her out more and let her play with other children. Too much screen time is not good even for adults, let alone little children," he said.

Top court reinforces its strict stance on child abuse

By CAO YIN
caoyin@chinadaily.com.cn

The Supreme People's Court has reinforced its "zero tolerance" policy toward the abuse and mistreatment of minors, underscoring the urgent need for severe penalties to fully safeguard children's health and safety.

The court said that severe punishment is necessary in cases of prolonged abuse, especially those involving cruel methods that result in a minor's death. It urged judges nationwide to take a firm stance against crimes targeting children.

In a landmark case released by the court last week, a woman surnamed Wen was sentenced to death for abusing and injuring a 2-year-old girl.

According to the court, Wen lived with a married man surnamed Tian and his biological daughter from February to December 2023. During that period, Wen and Tian repeatedly abused the child by tying her up, hanging her, forcing her to stand for long periods, and subjecting her to cold and hunger. They also beat her with their fists, slippers, spatulas, wooden sticks and other objects.

On Dec 21, 2023, after Tian left for work, Wen severely beat the girl with a phone charging cable and other objects for wetting the bed, causing her to convulse and collapse. Wen then called Tian, and they took the child to a hospital, where she died.

The lower court found that Wen, acting in collusion with Tian, had committed both abuse and intentional injury. Her long-term and repeated actions, coupled with the beating on the day of the incident directly caused the rupture of the victim's right atrium, leading to her death, the court ruled.

"The woman's behavior severely violated social morality and fundamental human principles," the court said.

Given the heinous nature of the crimes, the cruel methods used and the severe social impact, Wen was sentenced to death for intentional injury and abuse, with lifelong deprivation of political rights. Following review and approval by the court, Wen was executed.

The court added that Tian, as the victim's father, not only failed to stop Wen's abuse but also condoned and participated in it, making him a principal offender. For his role in the crimes, Tian was sentenced to life imprisonment for intentional injury and abuse.

In another case disclosed by the SPC, a teacher promptly reported suspected abuse to a local court after noticing wounds on a teenage girl's face and body. Subsequent investigations found that the girl had been abused by her mother, who was later sentenced to seven years in prison.

The SPC said that child abuse inflicts lasting damage to minors' physical and mental development, disrupts family bonds and erodes social morality. It stressed that such acts are "not merely domestic issues" but are "violations of the law and breaches of basic human ethics".

The court emphasized that the family should be a haven of love, the "first lesson" in a child's healthy development and the "first line of defense" in safeguarding children's rights.

However, some guardians neglect their responsibilities, mistakenly justifying abuse as being "for the child's own good", or even participating in harm following changes in family relationships, the SPC said.

"Such actions turn the family into a place of distress for minors, severely infringe upon their rights, and cross both legal and moral boundaries," it said.

The SPC called for a stronger crackdown on crimes against minors and stressed that guardians must fulfill their responsibilities in caring for, educating and supervising children.

It also urged various sectors of society, including civil affairs departments, women's federations, community committees and public security organs, to strengthen child protection efforts and provide more comprehensive safeguards.

Bird on a wire

Ecological engineering improves outcomes for wildlife as nation's electricity grid expands

By **HU YUMENG** and **MA JINGNA** in Lanzhou

A more than decadelong ecological engineering project by the nation's electricity supplier is mitigating the conflict between a rapidly expanding grid network and the habitats of wild birds.

At the Zhangye Heihe Wetland National Nature Reserve in Northwest China's Gansu province, transmission towers have been adapted to become a safe part of the ecosystem for birds such as storks, swans, egrets and herons, that call the wetland home for all or part of the year.

As Gansu lies at a key junction on the Central Asia–India migratory flyway, the province serves as a breeding and wintering ground for hundreds of thousands of migratory birds of more than 300 species.

Wetlands such as the Heihe River basin and forest–grassland zones like Ziwuling are critical ecological corridors.

Transmission networks have expanded across these landscapes in the city of Zhangye, now stretching over 16,000 kilometers in total.

As the grid expanded, a persistent conflict emerged. Birds nesting on towers or perching on conductors could trigger outages, while exposed wires posed lethal risks.

State Grid Gansu Electric Power Co has spent over 10 years adapting its equipment located in wildlife areas, using ecological engineering and smart technologies, so that the two can peacefully coexist.

"Bird nests on transmission towers used to give us headaches," said Liang Xingguang, a transmission line inspector in Zhangye. "Now, we take the initiative to build homes for them."

National electricity supplier State Grid launched the Life Nest project in 2016, with the aim of installing artificial nests and platforms so that wild birds would not be harmed by the grid's infrastructure.

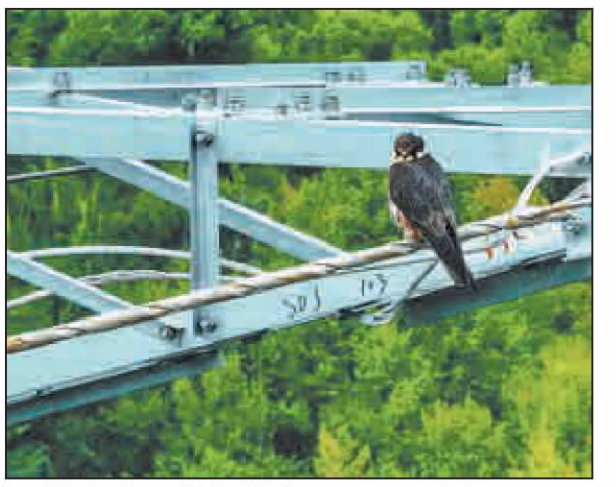
Rolled out initially in the Sanjiangyuan region of Qinghai province, the project was later expanded across seven provinces including Gansu. By 2024, the program had completed nearly 6,600 km of field surveys, installed 5,314 artificial nests and 16 raptor platforms, and helped support the hatching of nearly 4,000 chicks.

In Zhangye, since 2022, engineers have deployed artificial nesting facilities across six high-risk transmission corridors. Around 140 artificial nests have been installed, with an occupancy rate of 26 percent, along with 12 relocated nests.

Developed with ornithologists, the artificial nests are tailored to species such as black storks, gray herons, kestrels and magpies. Built from natural rattan and lined with soft palm fiber, they are wind-resistant, insulated and positioned 20–30 meters above ground — close to natural nesting preferences, but safely away from live conductors.

"In the past, seeing a nest on a tower meant trouble," Liang said. "Now, we build them on purpose."

When nests appear in hazardous positions, crews conduct live-line "gentle relocation", carefully transferring entire nests while preserving their structure and minimizing disturbance.



In cooperation with wildlife authorities in Zhangye's Ganzhou district, the program has also supported the release of 53 rehabilitated birds, reinforcing the shift from conflict mitigation to ecological facilitation.

Clockwise from top left: A gray heron, a bird species under second-class state protection, flies over Ziwuling Forest in Qingyang, Gansu province. A State Grid worker hangs an artificial nest in Baiyin, Gansu. Gray herons build a nest in Ziwuling. PHOTOS PROVIDED TO CHINA DAILY

Left: A flock of ruddy shelducks takes flight over the reeds of Qingtu Lake in Minqin, Gansu. **Right:** A bird rests on a transmission tower cable in Linxia, Gansu.

Across key corridors, more than 30 km of transmission lines in the Heihe Wetland core zone have been wrapped in weather-resistant insulating sheaths — described by workers as "protective suits" for the grid.

"These materials withstand strong ultraviolet radiation and extreme temperature swings," said Shen Qi, a Zhangye transmission line inspector. "They fully cover exposed conductors and eliminate electrocution risks."

Since 2021, the State Grid has surveyed over 5,800 km of bird migration routes, organized nearly 1,300 joint patrols, and rescued more than 15,000 protected birds nationwide.

In Zhangye, these ecological standards have been embedded into grid planning, with transmission routes adjusted to avoid key migratory corridors through field investigations and wetland surveys.

Precision protection

On high-altitude lines above 3,000 meters in Gansu's Gannan Tibetan autonomous prefecture, dual-radar ultrasonic devices are deployed to detect approaching birds within a 100-meter range. The system emits variable-frequency acoustic signals and soft light to gently guide birds away without harm.

A digital monitoring platform known as the "Silverline Sentinel" also provides continuous oversight of both grid conditions and bird activity.

Alongside the "Silverline Sentinel" platform, an upgraded monitoring system known as the "Silverline Scout" has further enhanced real-time ecological protection capabilities, State Grid said.

The system uses artificial intelligence, infrared sensing and nighttime projection technologies, enabling 24-hour continuous monitoring of both transmission line operations and bird activity. Its built-in algorithms can identify more than 200 common bird species, analyze nesting locations and behavioral patterns in real time, and issue early warnings of potential risks.

State Grid said that by combining visual, thermal and acoustic data streams, the system allows operators to detect approaching birds and infrastructure anomalies with greater precision, strengthening preventive maintenance across high-risk corridors.

"Previously, we relied on manual patrols and could only inspect all lines once a month," said a technician in Gannan. "Now we can monitor in real time and respond immediately."

Since deployment, maintenance efficiency across Gansu's grid has tripled, while ecological datasets collected by the system have become valuable inputs for migratory bird research.

In sensitive forested areas such as Ziwuling, patrol teams have adjusted cable routes to avoid nesting zones, while drones equipped with infrared imaging conduct inspections with minimal disturbance.

Across Gansu, more than 20,000 sets of bird-friendly devices — including flexible anti-perching structures, insulating covers and epoxy barriers — have been installed. Unlike earlier rigid designs, these prevent contact without harming birds and also reduce flashover risks caused by droppings.

In Zhangye's Heihe Wetland corridor, these combined measures have reduced bird-related outages by 13 percent, while enabling safer movement through previously high-risk zones.

Living with nature

Electricity infrastructure is increasingly becoming part of wider ecological governance.

In the Qilian Mountains, spanning Qinghai and Gansu, the rich yet fragile ecosystems are home to 48 nationally protected wildlife species, including snow leopards and golden eagles. The vast terrain and complex geography have long limited traditional monitoring.

In many core conservation zones, the absence of stable electricity has also constrained digital management tools, making continuous ecological observation difficult.

This gap led to the introduction of the Green Power Ark project, a national initiative launched in 2022 to integrate clean energy with biodiversity protection. By 2023, the project encompassed 13 ecological sites across China.

At the Gucheng conservation station in Tianzhu, a remote area of Gansu, the project installed a solar-powered microgrid system. The system, operating from 2024, integrates photovoltaic generation, battery storage, infrared cameras and 4G data transmission, forming a zero-carbon forest monitoring platform.

It enables continuous monitoring of wildlife activity, vegetation change and fire risks — shifting conservation from periodic patrols to permanent observation.

"In the past, monitoring depended largely on people," said a project engineer. "Now, technology allows continuous observation across vast and complex terrain."

State Grid Gansu said it is working closely with forestry departments, wetland authorities and local governments through joint patrols, data sharing and coordinated planning, to align grid operations with ecological priorities.

Conflict to coexistence

In Zhangye, up to a quarter of a million birds now stop over in the wetlands annually, including the black stork, a species with extremely strict habitat requirements. According to data from the National Forestry and Grassland Administration, a record 675 black storks were sighted in the wetlands in September 2024, followed by 455 in 2025.

In Jiuquan's Yanchiwan Wetland, also in Gansu, populations of rare species such as black-necked cranes continue to grow.

At the Hequ Horse Farm Wetland in Gannan Tibetan autonomous prefecture, dozens of brown-headed gulls, a nationally protected species, have been observed for the first time in recent years.

Across Gansu, bird-related outages have declined while biodiversity indicators improve steadily.

State Grid said that transmission towers still carry electricity across vast distances, but increasingly, they also function as ecological infrastructure, supporting migration, enabling monitoring and connecting fragmented conservation zones.

State Grid power line inspector carries teenage passion for nature into career

By **HU YUMENG** and **MA JINGNA**

At the Heihe Wetland in Zhangye, Northwest China's Gansu province, Shen Yang has walked the same transmission line patrol routes for 25 years.

The circuit stretches roughly 20 kilometers across reed beds, riverbanks and open wetlands. For most of his career, the job meant checking towers, inspecting conductors and ensuring the safe operation of the grid.

But over time, something else began to share that route with him.

"I've always liked birds since I was a teenager," said Shen, a 56-year-old transmission line inspector with State Grid Gansu Electric Power Co.

That early interest gradually merged with his daily work. Today, Shen is not only a line inspector but also an informal field observer of the wildlife living alongside the grid.

"On patrol, I often see kestrels, doves and magpies," he said. "If I'm lucky, I might also see peregrine falcons or golden eagles."

He keeps mental and sometimes written records of what he sees along the line corridor.

Zhangye's Heihe Wetland sits along a key migratory flyway, where more than 240 bird species have been recorded up to 2023, including black storks, golden eagles and swans. Transmission towers here are no longer seen only as infrastructure, but as part of a shared landscape.

The black stork has left a lasting impression on Shen. The nationally protected species is the "panda of birds", he said.

Shen is often seen observing the species through a high-powered telescope, recording its movements in detail in his field notes.

His connection to wildlife became more direct in November 2020, during a routine patrol near the wetland. Shen encountered an injured kestrel and contacted a wildlife rescue station in Zhangye, helping transport it for treatment.

He visited the bird repeatedly during its recovery, bringing food and monitoring its condition. Over time, the kestrel grew more comfortable, even resting briefly on his shoulder. "At that moment, I felt both excited and a strong sense of achievement," said Shen.

When it fully recovered, it was released back into the wild. He still remembers the moment clearly, not as an isolated incident, but as part of what his work had quietly become.

In recent years, Shen and his colleagues have helped rescue and raise 53 young birds, often in cooperation with local wildlife stations.

This change is also visible in field practice. In high-risk corridors, workers have installed artificial nests and bird-friendly facilities, transforming transmission towers into safer nesting spaces. In Zhangye alone, around 140 artificial nests have been installed, along with thousands of protective devices designed to reduce bird-related risks to the grid.

"For nests in particularly sensitive locations, we now use a combination of artificial relocation and 'migratory bird stations' to preserve birds' natural living environment as much as possible," said Shen.

The shift is not unique to Zhangye.

In the Ziwuling Forest of Qingyang in eastern Gansu, gray herons nest along forested riverbanks near transmission lines. Their presence is managed through coordination between forestry departments and power crews.

Young patrol workers are trained to identify protected species before entering work sites, while senior inspectors adjust patrol routes during breeding seasons to avoid disturbance.

"We used to focus on keeping birds away from the lines," Shen said. "Now we think about how to protect both."

Even when the wetlands fall silent in winter, Shen continues his rounds.

"Sometimes there are no birds," he said. "But I still go and look."

After 25 years on the same route, the transmission lines remain his responsibility. But so, increasingly, do the birds above them.

CULTURE

Wayfarer of distant highlands

An exhibition revisits artist's lifelong journey across mountains and spiritual landscapes, **Lin Qi** reports.

1.

The Xizang autonomous region has entered one of its most pleasant, travel-friendly seasons of the year. If he were still alive, artist Li Xiaoke would likely be strolling beneath the sun near the Potala Palace in Lhasa and sipping traditional sweet tea at a corner shop in the bustling Barkhor Bazaar. Or, he would join groups of people trekking the sacred mountains and lakes.

Li regarded Xizang as his "second hometown" and a spiritual sanctuary, says his wife, Liu Ying.

In the late 1980s, Li developed a deep connection with the Qinghai-Tibet Plateau. He traveled extensively in Xizang and highland areas in Qinghai and Gansu provinces, reaching the Bayan Har Mountains in Qinghai where the Yellow River originates, and the Tangula Mountains along the Qinghai-Xizang border, the source of the Yangtze River.

Li Xiaoke on a journey in 2016.

He journeyed to the highlands more than once a year. Yet, he often described it as a distant destination that remained just beyond reach, no matter how closely he attempted to approach it.

His effort to narrow that distance — which he believed represented change, loss and eternity — came to an end in April 2021, when he passed away at age 76.

Since then, his family has held a commemorative exhibition every spring at the Ke Space run by the Li Keran Art Foundation. Li hailed from a prominent family of artists. His father, Li Keran (1907-89), is considered one of the foremost reformers of classical Chinese painting in the 20th century while his mother, Zou Peizhu (1920-2015), was a sculptor and dedicated educator.

This year, the Li family is presenting *Far Horizons · The Wayfarer — In the Footsteps of Li Xiaoke*, running until June 21 at the Culture and Art Center of Fangzhuang, nestled in a quiet neighborhood in southern Beijing.

The exhibition features dozens of snapshots Li Xiaoke took in the highland areas over nearly three decades, alongside prints and ink paintings. His images portray blooming peach trees and vast green fields beneath snowcapped mountains, riverside salt wells, and white-walled Tibetan-style homes perched along mountain slopes.

Li Xiaoke said photography allowed him to express how profoundly the plateau moved him spiritually, and that it was, in some ways, "no less significant than painting".

According to Liu, Li Xiaoke visited the plateau 34 times after his first trip at the age of 44.

"Every time he went there, he felt exhilarated and refreshed as if it were his very first time," she says.

She says that to capture the sublime beauty of the highlands, Li Xiaoke trekked for 11 days to reach the uninhabited land near the source of the Yangtze River. On a journey to the source of the Yellow River, he used a bicycle pump to inflate a car tire at an altitude of over 4,000 meters.

Through his lens, viewers are taken to Mount Kailash, also known as Mount Gang Rinpoche, in Ngari prefecture of Xizang, the mysterious ruins of the ancient Guge kingdom, and Mount Qomolangma base camp, where silence and stillness define the world's highest peak.

Liu says he also built close friendships within local artistic and cultural circles during his stays in highland areas. He "worked tirelessly" to promote Tibetan art and culture by organizing exhibitions and training programs for local painters.

In the 1970s, Li Xiaoke spent much of his time accompanying his father on travels and public engagements. It was during an early expedition to the source of the Yangtze River with friends that he discovered his identity as an artist. His repeated journeys to the plateau also reflected his father's belief that "an artist should study two great books attentively — nature and tradition".

At the current exhibition, a large moving image is projected on a long wall, combining Li Xiaoke's paintings of snowy mountains and drifting clouds with footage of the artist walking alone along a snowy mountain trail, his back turned to the audience as he leaves footprints behind him.

"The snow-covered land is vast, boundless, and magnificently beautiful, yet stark and harsh. When one steps into it, one is inexplicably moved," Li Xiaoke once said.

Merging Silk Road artifacts with contemporary art

By **ZHANG KUN** in Shanghai
zhangkun@chinadaily.com.cn

The exhibition *How Long Is the Silk Road?* at the Dunhuang Contemporary Art Museum in Shanghai blends ancient artifacts and contemporary works to trace cultural exchanges and historical journeys. PHOTOS PROVIDED TO CHINA DAILY

A new exhibition at the Dunhuang Contemporary Art Museum in Shanghai brings together cultural relics excavated along the ancient Silk Road and new creations by contemporary artists from China and abroad.

Running until Oct 31, the exhibition *How Long Is the Silk Road?* is organized by the Shanghai museum and the Gansu Jiandu Museum, with support from the Lanzhou City Museum, Dunhuang Museum, and China Daily Culture Channel.

It features 65 precious cultural relics dating from the late Warring States Period (475-221 BC) to the Tang Dynasty (618-907), alongside 26 newly created artworks produced by artists who participated in a residency program in Dunhuang, Gansu province, in northwestern China.

Du Chenyan, director of the Dunhuang Contemporary Art Museum, stated at the opening on May 23 that the exhibition is not merely an inquiry into the length of a historical route, but a re-examination of the Silk Road's cultural exchanges through the lived experience of each artist. By juxtaposing ancient artifacts with contemporary art, the exhibition aims to immerse viewers in the historical context of the Silk Road and reflect on the continuous evolution of ancient civilizations in a modern context.

Dunhuang, a desert oasis, was an important trading town on the ancient Silk Road, where merchants traveling across Central Asia brought horses, glassware and spices eastward, and carried silk, porcelain and tea westward. The city is home to the renowned Mogao Caves, a network of ancient cave shrines built over centuries. Designated a UNESCO World Heritage site, the Mogao Caves are described by the UNESCO World Heritage Centre as "the largest, most richly endowed and longest-used treasure house of Buddhist art in the world".

During his residency in Dunhuang, artist Guo Hongwei followed in the footsteps of ancient painters into the mountains to learn how they made pigments from ground minerals.

He would spend an entire day at the mining pit, as if he were an ancient painter. But once he stepped out to where his mobile phone regained signal, "all of a sudden, you are overwhelmed by the flood of news and information, which pours over you like a wave of water but freezes, solidifying as it hits you … I want to capture that moment with my painting", he says of his inspiration.

The exhibition is arranged in five chapters. The first chapter presents the expanse of the Silk Road. Among the exhibits are *jiandu* — wooden and bamboo slips used in China for writing before paper was invented — excavated along the Silk Road.

On loan from the Gansu Jiandu Museum, which boasts the largest collection of Han Dynasty (206 BC-AD 220) *jiandu*, these slips record the route and actual distance from one courier station to the next along the stretch of the Silk Road between Dunhuang and Chang'an (today's Xi'an, capital of Shaanxi province).

A hemp sandal dating to the same period is displayed beside a map and wooden documents. Xin Ran, one of the exhibition's curators, says, "We want to give a vivid impression of how people traveled before the transportation we know today came into existence."

The sandal is presented alongside a copy of an ancient painting depicting the Buddhist monk Xuanzang's pilgrimage to India. "You can clearly see that Xuanzang's sandals look very much the same as this one here," she says.

The second chapter explores the theme of journey, followed by three chapters that highlight the Silk Road's transcription, sounds and shadows. The exhibition uses *guan* (pass) as its spatial motif, transforming the ancient Silk Road's function as an interface for identity verification and information exchange into a physical installation that guides visitors to use their own bodily scale to perceive ancient interactions, according to curator Xu Huanzhi.

LIFE

Province strives to strike a delicate balance

Zhejiang follows millennia-old standardization while maintaining creative, innovative and emotional tourism, **Yang Feiyue** reports in Hangzhou.

Zhang Yan still remembers the first time she picked up a tea whisk. Her hand trembled. The slender bamboo tool felt awkward in her fingers, and no matter how hard she tried, the tea refused to foam.

That was in 2022, shortly after she joined the Da Jingshan Tourist Information Center at the foot of Jingshan, a mountain in Hangzhou, Zhejiang province, renowned for its thousand-year-old tea culture.

Before taking the job, Zhang had never worked in tourism, nor had she practiced the Song Dynasty (960-1279) method of whisked tea preparation known as *diancha*.

"They taught me everything from scratch — how to whisk, how the foam should look, even how to taste the tea properly," she says.

"The key is keeping your hand steady while maintaining speed and strength. If the force is uneven, the foam will collapse."

Today, Zhang demonstrates the technique to visitors from around the world, guiding them through a ritual once popular among Song Dynasty scholars and literati.

"At first, many guests can't get it," she says with a laugh. "But once they understand the rhythm, they can whisk a beautiful bowl themselves."

Her transformation reflects a broader shift underway in Zhejiang, where officials and tourism workers are trying to balance standardized services with deeply local cultural experiences.

At the Da Jingshan center, free shuttle buses run continuously up the mountain. Staff members provide multilingual assistance in Chinese, English, Japanese, and Korean. Last year, the buses transported 2.6 million passengers.

The center's operations align with ISO 14785, the international standard for tourist information services.

Yet for Liu Yanli, the center's deputy manager, the goal is not simply efficiency.

"Standards should help visitors experience the culture better," Liu says. "They are not meant to make every destination the same."

That idea lies at the heart of Zhejiang's tourism development strategy.

"Tourism services need standardization, but they cannot be completely standardized," says Chen Guangsheng, director of the Zhejiang Provincial Department of Culture, Radio, Television, and Tourism.

"Otherwise, every city becomes identical. We need to find the balance between standards and individuality."

He points to rural homestays as an example. Zhejiang has established unified requirements for hygiene, safety and service quality, while encouraging villages to preserve their own architectural styles, customs and local traditions.

"That is the balance we are striving for," Chen says. He believes the province's emphasis on standards has deep historical roots.

The *Kaogongji*, a Chinese crafts manual compiled more than 2,000 years ago, documented precise specifications for the production of tools and vehicles. In Zhejiang, Tang Dynasty (618-907) celadon production followed strict technical systems, while the mortise-and-tenon structure of Ningbo's Baoguo Temple later became a reference point for traditional Chinese architecture.

"The genes of standardization have been here since ancient times," Chen says.

But Zhejiang's tourism officials also insist that modern standards should leave room for creativity and emotional connection.

That philosophy is on display at the Tourism College of Zhejiang in Hangzhou.

During a recent class, associate professor Zhang Chunli guided students as they arranged themed tea tables inspired by traditional aesthetics and modern lifestyles.

One design drew inspiration from *A Panorama of Rivers and Mountains*, the famed Song Dynasty landscape painting in blue-green tones. Silk fabrics in jade and turquoise tones surrounded a single celadon teacup.

Another installation, titled *Forest Time*, abandoned conventional tea settings altogether. Glass cups, white lace and soft green accents created a relaxed atmosphere that felt closer to a contemporary cafe than a traditional tea room.

"People today are under a lot of pressure," Zhang says. "Tea gives them a moment to slow down."

She explains that students must earn three national certifications before graduation, covering tea art, tea evaluation and tea beverage preparation.

"They first learn the standards," she says. "Then they learn how to innovate based on those."

A short drive away, Jingshan village has turned those ideas into a thriving rural tourism business. Visitors can pick tea leaves with local farmers, roast them in woks using traditional methods, and take the finished tea home.

"What tourists experience is exactly the same process we use," says Sheng Dong, the village's Party secretary.

When the village began promoting tourism in 2019, most villagers simply sold tea leaves.

"Tourists came, but they didn't know what to do," he recalls.

Now, nearly every household participates in tourism-related businesses. Children wearing bamboo hats carry tea baskets through the hillsides, while families gather around roasting stoves to teach visitors the craft.

The village has received tourists from more than 50 countries, with over 30,000 people participating in tea-related experiences last year alone.

"More visitors come through word of mouth," Sheng says. The province's efforts have also caught the attention of international tourism experts.

Alexandre Garrido, a Brazilian specialist in smart tourism, visited Hangzhou in May during an international tourism standards meeting. It was his first trip to China.

"The people here are incredibly welcoming," Garrido says. "And everything was very well organized, from transportation to cultural activities."

Persi Leonardo, another Brazilian expert focusing on adventure tourism, paid particular attention to accessibility facilities at the Da Jingshan center.

He noticed entrance ramps, multilingual signs and facilities designed for elderly travelers and families with young children.

"The spaces think about all kinds of visitors," Leonardo says.

What impressed him most, however, was how visitors were encouraged to participate rather than simply observe.

"It's not just showing tourists the tea-making process," he says. "It's letting them become part of it."

Maria Velasco Gonzalez, a tourism policy scholar from Spain, had a similar impression after trying her hand at making whisked tea.

"They guided us through every step," she says. "I could understand not only how to do it, but also why it mattered." For her, that combination of professionalism and cultural warmth left a lasting impression.

Authorities in Zhejiang say the province has built a system that trains students to meet national certification requirements, guides villages in turning tea leaves into tourism products, and runs information centers that serve millions of visitors each year.

Those working in tourism businesses also insist that what visitors remember most is something harder to quantify, such as a bowl of whisked tea, a village story, or the warmth of the people serving them.

Russian artist boosts ties using brush and ink

MOSCOW — As dusk fell, a soft, warm glow gently flooded a painting studio in the China Cultural Center in Moscow. Holding a Chinese writing brush dipped in ink, Russian artist Anna Donchenko subtly adjusted tonal gradations before letting the brush glide across the paper.

With her brushwork shifting from delicate touches to bold strokes, distant landscapes gradually took shape, breathing life into mountains and rivers on China's traditional Xuan paper, originally produced in Xuancheng, Anhui province.

"I hope I can keep painting for the rest of my life and inspire more people to take an interest in China," says Donchenko. "That would be the most meaningful to me."

For her, Chinese painting is far more than an artistic craft; it is an everlasting emotional and spiritual bond with China.

Donchenko began painting as a child and was originally trained in realism. In her middle school years, a visit to the State Museum of Oriental Art in Moscow opened the door to the realm of Chinese painting. "I was instantly captivated," she says.

In her adolescence, the scarcity of Chinese painting supplies in Russia only strengthened her resolve. "I would linger repeatedly before museum display windows just to closely study the paintings," she says.

Her first trip to China in 2007 marked a turning point in her life. The moment she set foot in China, she purchased calligraphy and painting books, brushes and mineral pigments. She filled her suitcase with these items and took them back to Russia.

In 2014, she enrolled at the China Academy of Art in Hangzhou, Zhejiang province, to pursue systematic academic training in Chinese painting. During her stay, she traveled extensively across the country, immersing herself in local folk customs, natural landscapes and time-honored traditions. Over time, she gained a deeper insight into the philosophical wisdom and humanistic essence embedded in traditional Chinese fine arts.

"What moves me most about Chinese painting is its focus on sentiment, its rhythmic charm and the subtle spiritual resonance between humanity and nature," she notes, adding that Chinese ink painting prioritizes imagination, blank space aesthetics and the sincere expression of the artist's inner feelings, rather than rigidly pursuing lifelike likeness.

Known to the public by her Chinese name, Dong Qingguo, Donchenko works as a researcher at the Center for Chinese Culture Studies, part of the Institute of China and Contemporary Asia at the Russian Academy of Sciences.

"*Dong* stands for winter, a reminder of the long, cold winters in my homeland, Russia. *Qing* embodies youth and vitality, while *Guo* carries my sincere blessings for my motherland," she explains with a warm smile.

In her view, practicing ink wash painting has also reshaped her cognition of self and the world. "The philosophy of harmony between man and nature embodied in Chinese painting is not merely an artistic technique, but also a way to perceive and embrace life," Donchenko says.

"I have been studying Chinese painting for 20 years and teaching it for 12 years," she says. "The artistic conception conveyed by Chinese painting strikes a chord with people from all cultural backgrounds."

In her artistic creations, she depicts Russia's white stone castles, wooden cottages and onion-shaped church domes through fluid Chinese ink painting techniques, perfectly integrating Eastern aesthetic charm with distinctive Russian pastoral scenery.

Over the years, she has also observed a growing enthusiasm among Russians for Chinese ink painting.

The China Cultural Center hosts Chinese painting classes three evenings a week. In class, students learn to sketch plum blossoms, paint natural landscapes, and create paintings of the persimmon tree that symbolize good fortune.

> "What moves me most about Chinese painting is its focus on sentiment, its rhythmic charm and the subtle spiritual resonance between humanity and nature."
>
> **Anna Donchenko,** Russian artist

Under Donchenko's patient guidance, Anastasia Smirnova, one of her students, captured two hedgehogs carrying apples on their backs with just a few vivid brushstrokes. "Chinese painting can convey emotions in such an intuitive way," Smirnova says. "Learning this art has offered me a brand-new perspective on the world."

Beyond classroom teaching, Donchenko has spared no effort to popularize Chinese painting across Russia by holding exhibitions in museums, public libraries and local communities. Over the past two decades, she has participated in or curated more than 30 art exhibitions in China and Russia.

In April, she hosted a Chinese painting exhibition paired with on-site demonstrations at Moscow No 69 Library, drawing hundreds of visitors on its opening day.

Yulia Zharkova, the organization's director, said these paintings bring audiences inner peace and tranquil contemplation.

"Standing in front of these artworks, people feel their worldly worries drift away," she says. "This is the unique artistic charm and profound artistic conception of Chinese painting. We are deeply honored that Donchenko chose our library to hold this exhibition, which has greatly enlivened our cultural venue."

Against the backdrop of in-depth people-to-people cultural exchanges during the China-Russia Years of Education, Donchenko hopes more people will discover the sheer joy hidden in traditional Chinese arts.

"Art teaching is far more than imparting professional skills," Donchenko says. "It is about passing down the passion you truly cherish. I wish more people could embrace joy and perceive beauty through learning Chinese painting, just as I once did."

From left: Twenty descendants of the *Lisbon Maru* POWs from the United Kingdom arrive at Dongji Island, Zhejiang province, where the British prisoners were rescued by local fishermen. They plant trees of friendship on the island as part of the commemorative event. A descendant lays a wreath at the Memorial for Dongji Fishermen's Rescue of British Prisoners of War on Dongji Island. PHOTOS BY XING WEN / CHINA DAILY

Bravery of fishermen remembered

Descendants of British POWs rescued by Chinese islanders gathered to commemorate the sinking of the *Lisbon Maru* and those who risked their lives trying to save them, **Xing Wen** reports in Zhoushan, Zhejiang.

Josephine Duff McIntosh Olsson searched intently for a man's name on the *Lisbon Maru* survivors' memorial wall at Zhoushan Marine Cultural and Art Center in Zhoushan, Zhejiang province — a man she had never met in person.

When she finally found it, she pointed to the name for those around her, tears streaming down her face.

"That's my great-uncle, Joseph Duff!"

In October 1942, Joseph Duff was among the 1,816 British prisoners of war being transported from Hong Kong to Japan aboard the Japanese cargo ship *Lisbon Maru*.

The vessel was not marked as carrying POWs, and it was torpedoed by a US submarine off the coast of Zhejiang province.

Japanese guards sealed the prisoners below deck, and those who managed to escape were met with gunfire. In all, 828 men died.

In the midst of the chaos, local fishermen from Dongji Island in Zhoushan risked everything to launch their small boats and rescue 384 survivors under Japanese gunfire.

On the island, they gave the starving prisoners their own meager supplies of fresh water and food.

Later, when Japanese troops landed to search for escapees, the fishermen hid three British POWs in a seaside cave, secretly bringing them food every day.

In time, they safely transferred the men all the way to Chongqing, where the survivors used a radio broadcast to reveal the truth about the sinking of the *Lisbon Maru* to the world.

Joseph Duff was among those rescued by the fishermen, but he was later recaptured by Japanese forces and taken to Japan.

It was not until November last year that his descendants, including Olsson, learned the truth: Joseph Duff had actually survived the sinking, only to die at the age of 28 in a Japanese POW camp in March 1945.

Top: Descendants of the *Lisbon Maru* POWs stand alongside the Memorial for Dongji Fishermen's Rescue of British Prisoners of War.
Above: Josephine Olsson (far right) and her older sister Pamela Allison search for the name of their great-uncle Joseph Duff on the *Lisbon Maru* survivors' wall. PHOTOS BY XING WEN / CHINA DAILY

"We didn't know what had happened to him except that we thought he had died on a ship," Olsson says.

While compiling her family tree, the 56-year-old Scottish woman conducted extensive research into her great-uncle.

But it was only at a screening of Chinese director Fang Li's documentary *The Sinking of the Lisbon Maru* in Edinburgh last year that she finally came to understand the full story of this little-known chapter of World War II.

"He died before I was born, but I'm his namesake," she says emotionally.

"That means my name will carry forward his name and memory."

Recently, she and her sister Pamela Allison traveled to Zhoushan with 18 other descendants of the *Lisbon Maru* prisoners of war to visit the very island where her great-uncle was rescued.

"I really want to say thank you for giving him a bed, food and clothes. Thank you for giving him 24 hours of hope," she says.

She compiled the materials she had gathered during her research on Joseph Duff into a folder and donated it to the Lisbon Maru Rescue Memorial Hall on the island.

James Murphy, approaching 78, is also the namesake of his father.

His father served with the Hong Kong Company of the Royal Corps of Signals and was among the survivors rescued by Chinese fishermen. Murphy recalls that the few days his father spent on the island gave him a lifelong love of Chinese food.

As a child, he was often taken to Chinese restaurants by his father.

"None of us would be alive without the selfless courage and compassion of the fishermen and villagers who saved so many people," he says.

He traveled all the way from Plymouth to Zhoushan with his wife, Susan Murphy, to attend a series of commemorative events, including laying flowers at the memorial, planting trees, visiting the Lisbon Maru Rescue Memorial Hall on Dongji Island, and meeting with the descendants of those fishermen who took part in the rescue.

"It's been a real highlight of my life to come here, to meet all these wonderful people," he says.

"It's important that we hand that story and memory down, and it's pleasing to me, very touching, to hear that the Chinese generations, generation after generation, are similarly carrying the story on."

Christopher Borge, who made the trip with his sister Kirsteen Dugan, is the grandson of *Lisbon Maru* survivor John Borg.

He believes it is vital to share this story with a wider population.

"At school, they teach about the war in Europe and the UK, but not much about what happened in China and Japan," he says.

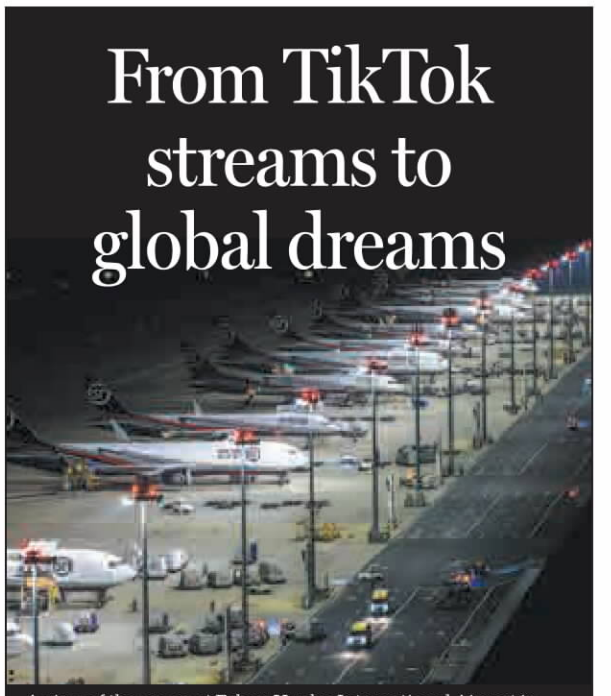
"We also need to focus on the details that reveal humanity, kindness, and cross-border friendship."

He is also the great-nephew of Duncan Edward Cameron, another *Lisbon Maru* survivor who was a friend of Borg.

After the rescue, the two were later taken by Japanese soldiers to Kobe House war camp in Japan, where they remained prisoners of war until the conflict finally ended.

As the two finally made their way back home, their families were anxiously waiting for their return at Edinburgh train station.

On that day, Borg fell in love at first sight with one of Cameron's sisters, Margaret.



They later married and had four children among whom the youngest son is the father of Borge and Dugan.

"Those moments of friendship, courage, and love are the very reason my sister Kirsteen and I are able to stand here.

"So, we remember not only the suffering of war, but the bonds it has created. We must carry on this bond between us in the UK and our friends here in China," says Borge.

From TikTok streams to global dreams

A view of the apron at Ezhou Huahu International Airport in Ezhou, Central China's Hubei province. One of China's largest cargo airports, it has ensured fast shipping services, a key factor in cross-border e-commerce business. XIAO YIJIU / XINHUA

Beneath bright studio lights, Mohamed Issa Omar speaks fluently to the camera, introducing a sleek pair of AI-powered glasses to viewers tuning in from across the globe.

Omar is in the cross-border e-commerce comprehensive pilot zone in Ezhou, Central China's Hubei province. It is past midnight in the United States, but orders still pour in as the Somali influencer and CEO of Ezhou Shahai Business Bridge Trading Co breaks down the product's features, such as music playback, hands-free calls and one-click photography, tailored carefully to match overseas consumer habits.

"I shifted from engineering to e-commerce back in 2021," Omar recalls. He started building a social media presence and amassed over 1 million followers across Instagram, YouTube and TikTok. "That's when I saw the future: selling products online, and no place does it better than China."

What drew this foreign entrepreneur deep into China's inland province of Hubei is not just the allure of the world's most dynamic e-commerce ecosystem, but also its strategic logistics advantages.

"The Chinese e-commerce ecosystem is massive, robust and offers endless possibilities — far more than what you'd find abroad," Omar explains. "About 80 percent of the products in our warehouse originate from China. Being here, at the source, is the ultimate advantage."

His confidence is also rooted in Ezhou's unparalleled advantages in transportation. "We have Ezhou Huahu International Airport, one of China's largest cargo airports, on our doorstep," he says, noting that fast shipping serves as a key factor in today's cross-border e-commerce business landscape.

The speed of China's logistics evolution continues to impress him. "Three or four years ago, delivery times were longer. But now, China has mastered rapid manufacturing and lightning-fast shipping. Everything is accelerated."

A keen observer of global platforms, Omar notes an efficiency gap. "On Douyin, you get your order in three to four days. TikTok used to take a week, but now it's catching up to three days — driven by Chinese sellers pushing for speed."

For Omar, operating from China is not just about speed, but about forging ties between Chinese suppliers and global markets.

"The way Chinese merchants market and do business online is fundamentally different from that of their foreign counterparts. It must be a balanced fusion," he says. "Foreigners need to understand Chinese marketing strategies, and Chinese businesses must adapt their systems to global mindsets. That's the synergy we create."

This philosophy is why he insists on having Chinese partners to build a powerful e-commerce platform. "Success in this industry requires collaboration. Foreigners like me bring the international perspective, while our Chinese partners provide the local expertise and access to the supply chain."

His daily sales reflect this successful fusion. "It depends on livestreams. Right now, we get 40 to 50 orders per stream, and our prerecorded videos consistently drive sales — at least 100 units of our top-selling AI glasses every day."

Omar's success story is a microcosm of Hubei's booming cross-border e-commerce scene, anchored by Ezhou's strategic rise. Since the launch of the cross-border e-commerce comprehensive pilot zone in Ezhou in April 2025, the park has attracted 258 enterprises, including top sellers from TikTok and Amazon, driving total trade value to $310 million.

This inland opening-up miracle is further amplified by the Qipanzhou Comprehensive Bonded Zone in Huangshi, Hubei. Leveraging its proximity to Ezhou Huahu International Airport, it has built a multimodal transport system covering road, rail, water and air. By establishing "forward cargo stations", this region has revolutionized logistics, allowing goods to be declared locally and flown directly from the airport.

The results are transformative. The Qipanzhou Comprehensive Bonded Zone saw its foreign trade value soar to 10.74 billion yuan ($1.58 billion) in 2025, a year-on-year increase of 107 percent, jumping from zero to a 10-billion-level player in just two years, local data revealed.

For Omar, the future is limitless. "In the next five years, our business will boom beyond expectations. The scale is already growing faster than I imagined. After two to three years of testing and slow growth, we are poised for massive expansion."

With China's inland regions deepening their opening-up endeavors, foreign entrepreneurs like Omar are no longer outliers but pioneers. In the studios of Ezhou, with a world map of cargo routes overhead, they are turning Hubei's inland advantage into a global edge, proving that China's high-standard opening-up is no longer exclusive to coastal regions, but is flourishing steadily in inland areas.

SOCCER

With no prior professional managerial experience, Lionel Scaloni took over the Argentina job on an interim basis in 2018 and ended up leading it to victory at the 2022 World Cup and to two Copa America titles. AP

A calming presence under pressure

Argentina boss Scaloni is unfazed by high expectations back home

After Gonzalo Montiel scored the decisive penalty in the final of the 2022 World Cup, giving Argentina its third star with a victory over France, coach Lionel Scaloni didn't celebrate, remaining still, silent, as if oblivious to the feat he himself had helped to accomplish. Several minutes later, he broke down when one of his players approached him, hugged him, and whispered: "We are world champions."

Scaloni almost never loses his cool. He didn't when he was bombarded with criticism for his lack of experience while leading Argentina. Nor did he when Kylian Mbappe's goals threatened the country's World Cup hopes four years ago. And he remains the same today, as he faces the challenge of trying to repeat as a World Cup champion.

Those who know him say Scaloni learned to control his temper thanks to a hobby outside of soccer. Since retiring as a player, he dedicates two to three hours a day to cycling through the mountains of Mallorca, the Spanish island where he lives, or along the trails of his hometown of Pujato in Argentina's northwest.

"On the bike, you can think about your team, your opponent, how to prepare for the match. It really clears my head. I use it as therapy," Scaloni said in several interviews.

In less than two weeks, Scaloni will become the third coach to lead Argentina into consecutive World Cups, following in the footsteps of Cesar Luis Menotti (1978 and 1982) and Carlos Bilardo (1986 and 1990), both also champions. But the youngest of the three doesn't believe he deserves comparisons to the others.

"I don't think we're on the same level. They have established careers, they defined an era," Scaloni has said repeatedly.

Earning his place

With no prior experience of managing professional teams, Scaloni took over the team on an interim basis in 2018 after Argentina's debacle in Russia, where the side was eliminated in the round of 16. Meanwhile, the Argentine Football Association (AFA) was considering Mauricio Pochettino or Diego Simeone as candidates for the senior national team.

"Scaloni? He can't even direct traffic," Diego Maradona, who was instrumental in Argentina winning the title in 1986, said at the time.

The inexperienced coach got the nod, and Argentina went on to win the 2021 Copa America and successfully navigated the qualifiers for the 2022 World Cup.

In Qatar, Scaloni weathered a storm of criticism after a disappointing opening match against Saudi Arabia, revamped the team mid-tournament with the addition of then-rookies Enzo Fernandez, Alexis Mac Allister, Julian Alvarez, and, most importantly, unleashed the best version of Lionel Messi.

"The criticism was normal, I hadn't coached anywhere. (Maradona) wasn't far off," Scaloni acknowledged shortly after lifting the cup.

Argentina coach Lionel Scaloni embraces team captain Lionel Messi following a quarterfinal victory over the Netherlands at the 2022 World Cup in Doha, Qatar. AP

Scaloni knows the demands will now be the same or even greater. He will have to defend the title with his star player nearing retirement at 38, while also dealing with turmoil within the Argentine soccer organization. Brazil was the last world champion to repeat in 1962.

"The World Cup is very, very difficult. To win a World Cup, a lot of things have to come together, not just playing well," Scaloni said in a recent interview with CONMEBOL. "It's very difficult, but not impossible."

Scaloni made it clear to his players that being world champions didn't guarantee them a place on the national team and demanded they never let their guard down.

"I don't dwell on past achievements; you always have to keep looking ahead," he said in late 2025. "With this jersey, you don't have time to relax and think your place is secure."

The Albiceleste again won the Copa America in 2024 and finished first in the South American qualifiers for the 2026 World Cup, overcoming the absence of Messi, who missed several matches due to physical problems.

All but six of the 2022 squad were included by Scaloni in his preliminary 55-player World Cup roster.

An attempt to resign

After the victory over Brazil in the World Cup qualifiers in November 2023, Scaloni shocked fans when he cast doubt on his future.

"It's not goodbye, but I need to think, because the bar is set very high and it's difficult to continue."

Scaloni, however, remained in his position, but rumors circulated of alleged discontent between him and some players due to their unprofessional behavior during the team's training camp before an earlier loss to Uruguay in the qualifiers.

Meanwhile, the AFA leadership faces accusations of corruption and growing internal discontent over changes to the league format and refereeing decisions.

World Cup preparations have also been questioned, with the AFA organizing friendlies against low-ranked teams like Indonesia, Puerto Rico, Angola, Mauritania and Zambia. Argentina's last two tests will be this week against Honduras and Iceland, neither of which qualified.

The coach, who is negotiating a contract extension, avoided complaining publicly. "Playing against the best doesn't guarantee anything, and neither does this. We have to face whatever comes and be positive," he said. "The results will show whether we made the right call or not."

Argentina will open in Kansas City against Algeria on June 16 in Group J. They will face Austria on June 22 and Jordan on June 27.

Scaloni remains calm, just as he did four years ago. He knows full well the expectation on him to defend the title.

"We're aware that our opponents will play us differently because we're the reigning champions. The important thing is that we'll be there. After that, it's football, and anything can happen."

Brazil pins hopes on Ancelotti to end long wait for World Cup glory

SAO PAULO — Brazil's biggest hope to end a 24-year World Cup title drought is not a clinical striker, a creative midfielder or a dribbling winger like at previous editions of the tournament. This time Brazilians are pinning their hopes on a 66-year-old Italian, who will be sitting on the bench.

Carlo Ancelotti, one of the most successful coaches of his generation, left Real Madrid to take over Brazil's national team last year, a rare example of a foreign coach in charge of the Selecao. Even though his results have been mixed — five wins, three losses and two draws — the country is optimistic he can elevate a squad that is seen as far less star-studded than Brazil's iconic teams of the past, despite high-profile players like Neymar and Vinicius Junior.

While Brazil has won the World Cup five times — more than any other team — it hasn't lifted the trophy since 2002, an eternity for a soccer-obsessed nation that produced some of the most brilliant players in history, such as Ronaldo, Ronaldinho and Pele.

Since 2002 it has only advanced beyond the quarterfinals once — as World Cup host in 2014 — and even that tournament ended in disappointment after an embarrassing 7-1 semifinal loss to eventual champion Germany.

Brazil's self-confidence hasn't been helped by the success of archrival Argentina, the defending World Cup champion and back-to-back Copa America winner.

"It is allowed to believe," Ancelotti says in a World Cup-themed advertising campaign, acknowledging the self-doubt that has crawled into Brazil's national soccer psyche.

The Neymar question

Brazil begins its World Cup campaign at MetLife Stadium in New Jersey on June 13 against Morocco, semifinalist at the 2022 World Cup and controversial AFCON winner. Other Group C opponents are Haiti and Scotland.

Surviving the group stage is taken for granted in Brazil — anything else would be disaster in a World Cup expanded from 32 to 48 teams. How deep Brazil can go against stronger opponents in the knockout phase is less obvious.

"I am aware and reliant that this team can compete against the best in the world. Can we win the World Cup and reach the final? Yes, we can reach the final. But I don't know if that is enough, it is best for us to get there and win the final," Ancelotti has said.

One of the biggest questions facing Ancelotti is what to do with 34-year-old Neymar, who was Brazil's brightest star until he moved to the big-spending Saudi league in 2023. He hardly played there due to a string of knee injuries, and last year returned to boyhood club Santos in Brazil, where he dealt with even more physical problems.

Ancelotti included Neymar in his World Cup squad despite concerns about his fitness, calling him an "important player" for the team. Barcelona winger Raphinha also sees Neymar as key to the squad, recently describing him as "the man of our sixth World Cup title".

If that happens it will be with a more structured approach than the free-flowing style of play that once made Brazil stand out in global soccer.

With a reputation as a master tactician, Ancelotti has made Brazil a team that is happy to sit back and wait for moments to attack rather than dominate ball possession. He often opts for a compact 4-4-2 formation that can quickly turn into an attacking 4-2-4.

'Best thing that happened'

Brazilians are generally satisfied with Ancelotti, even though his record so far is uneven. After he took over, Brazil won two World Cup qualifiers, drew one and lost one, finishing fifth in South American qualifying after Argentina, Ecuador, Colombia and Uruguay.

In recent friendlies, Brazil beat Croatia — which eliminated Brazil from the 2022 World Cup in a quarterfinal shootout — but lost to 2022 runner-up France.

Former Brazil left-back Filipe Luis, who has recently started a coaching career, in April called Ancelotti "the best thing that happened" to the national team.

"It is not a sure thing we will win anything," he said. "But we needed someone big, with enough support to make decisions. A man people respect, who knows Brazil has gone through many years not winning the World Cup."

Ancelotti took over after a tumultuous time for Brazil.

The team had struggled in qualifying for the 2026 World Cup, losing twice to Argentina, and was knocked out by Uruguay in the quarterfinals of the 2024 Copa America. Three coaches came and left — caretakers Ramon Menezes and Fernando Diniz and full-time coach Dorival Junior were all fired after poor results.

Meanwhile, Brazil pursued Ancelotti, whose second stint at Real Madrid appeared to heading toward an end, despite the team winning both the Champions League and La Liga in 2024.

So confident is the Brazilian soccer confederation that it has made the right choice that it has already extended Ancelotti's contract until the 2030 World Cup.

"We have a beast taking care of our national team, a man who is respected by everyone," Luis said.

As part of his bid to return Brazil to the World Cup winners' circle, coach Carlo Ancelotti (right) has included Neymar in his 26-man squad despite concerns about his fitness, calling him an "important player" for the team. AP

China, Pakistan eye stronger cooperation

Xi and Zardari exchange congratulatory messages on 75th anniversary of ties

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

President Xi Jinping called on Thursday for stronger strategic communication, continued traditional friendship and deeper all-around cooperation between China and Pakistan, as the two Asian neighbors marked the 75th anniversary of diplomatic ties.

In a congratulatory message sent to Pakistani President Asif Ali Zardari, Xi emphasized that he attaches great importance to the development of bilateral relations and stands ready to work with Zardari to accelerate the building of an even closer China-Pakistan community with a shared future in the new era, so that bilateral ties bring greater benefits to the two peoples and contribute to regional peace and development.

Xi said that China and Pakistan are good friends and all-weather strategic cooperative partners, linked by mountains and rivers and sharing weal and woe.

Over the past 75 years, the friendship between the two countries has remained rock-solid and unbreakable despite changes in the international landscape, he said.

The two countries have long maintained a high level of political mutual trust, practical cooperation, security collaboration and international coordination, setting an example for state-to-state relations, Xi added.

In his congratulatory message to Xi, Zardari said the Pakistan-China all-weather strategic cooperative partnership has become a firm pillar of regional peace, stability and development. Pakistan highly appreciates the far-reaching global initiatives proposed by Xi and deeply values his firm commitment to deepening Pakistan-China relations, he added.

Zardari expressed Pakistan's sincere gratitude for China's firm support toward safeguarding his country's sovereignty and territorial integrity, and promoting its economic and social development.

Pakistan will continue to support China on issues concerning its core interests and further elevate the Pakistan-China friendship to new heights, he said.

To mark the occasion, Premier Li Qiang exchanged congratulatory messages on Thursday with Pakistani Prime Minister Shehbaz Sharif, saying that China is ready to work with Pakistan to actively build an upgraded version of the China-Pakistan Economic Corridor.

Sharif said that Pakistan remains firmly committed to advancing high-quality CPEC development and opening up new areas of cooperation with China.

In a separate message released by the Pakistani prime minister's office to mark the anniversary, Sharif said that CPEC's next phase will place greater emphasis on "industrialization, agriculture, information technology, science and technology, green development, and stronger people-centered cooperation".

"It is encouraging to witness Pakistan-China cooperation expanding into new frontiers, including the digital economy, innovation, space cooperation, education and cultural exchanges," he added.

Sharif said that from the Karakoram Highway to cooperation in outer space, Pakistan-China friendship continues to demonstrate how enduring strategic trust can be translated into meaningful progress and shared prosperity for the two peoples.

The two countries are set for another round of high-level engagement, with Sharif set to pay an official visit to China starting Saturday, less than a month after Zardari visited China in April. In addition to Beijing, the four-day trip will also take Sharif to East China's Zhejiang province.

Chinese Ambassador to Pakistan Jiang Zaidong said in a signed article published in the People's Daily on Thursday that frequent high-level exchanges have provided political guidance and strong momentum for the development of bilateral relations.

Beyond political engagement, he noted that high-level practical cooperation between the two countries has become a model that delivers broad benefits to the people.

China is Pakistan's largest trading partner and the second-largest destination for Pakistani exports.

According to Jiang, CPEC, a flagship project of the Belt and Road Initiative, has garnered over $25.9 billion in direct investment and created over 260,000 jobs.

The emphasis on shared development was echoed by Pakistani Ambassador to China Khalil Hashmi, who said that China's development has created wider opportunities for other developing countries, especially those in the Global South.

Hashmi said that Pakistan-China relations carry significance beyond the bilateral level, particularly at a time of growing global uncertainty.

Pakistan and China have made valuable contributions to the global system, he said, noting that the two countries "closely coordinate, communicate and consult" at the United Nations, the World Trade Organization and many other multilateral platforms.

He described China's vision of building a community with a shared future for humanity, together with the BRI and the four major global initiatives — the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative — as an action-oriented approach to addressing global challenges. These ideas, he said, reflect Chinese wisdom in a modern context and provide a comprehensive plan for a more peaceful, secure and prosperous world.

Sino-Russian statements help shore up unity, stability

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Inside

See more, **page 4**

Russian President Vladimir Putin's two-day whirlwind state visit to China concluded on Wednesday night. Although brief, it was highly productive, with analysts impressed by the results, including two joint statements and a long list of outcomes.

In particular, the two statements — one about international relations and the other about bilateral cooperation — are constructive contributions to global peace and growth, as both nations strive to inject stability into a world plagued by turmoil, analysts said.

On Wednesday, following talks between Putin and President Xi Jinping in Beijing, the two heads of state signed and issued a joint statement on further strengthening comprehensive strategic coordination and deepening good-neighborliness and friendly cooperation.

This year marks the 25th anniversary of the signing of the China-Russia Treaty of Good-Neighborliness and Friendly Cooperation.

In the statement, the two leaders agreed to further extend the treaty and pledged future joint efforts in various fields.

Wang Fan, a professor at China Foreign Affairs University, said that the statement and the extension of the treaty show that the two countries "have succeeded in developing a new approach for two major countries to get along with each other — no alliances, no conflicts and no confrontation".

"The treaty's extension is legally binding in securing the lasting friendship between China and Russia," he said.

Wang said that the ties have shown great strategic resilience and remained unaffected by shifting international circumstances, and interference and provocation by third parties.

"The two countries have consistently maintained the stability of their relationship, and their political mutual trust has grown ever deeper," he added.

Li Yongquan, academic committee director at the Euro-Asian Social Development Research Institute of the State Council's Development Research Center, said that the first joint statement provides clear guidance on how to continue to deepen the comprehensive strategic partnership between the two countries in the bilateral, regional and global contexts.

During the visit, the two leaders also issued a joint statement on advocating a multipolar world and a new type of international relations.

ZHANG WEI / CHINA DAILY

A win-win map for relations with US

WORLD WATCH
By Erik Solheim

Some of the most powerful business leaders of the United States came to Beijing last week. For years, many in Washington have talked about decoupling, about pulling the two economies apart. These corporate leaders gave their answer to that idea, and their answer was to come to Beijing. They came because they can read a balance sheet. And the balance sheet tells them that the future runs through China, not around it.

That is part of the real story of the head-of-state summit between China and the US. The gap exists between what Washington often says and what American business does. And that gap tells us something important.

All US attempts to contain China's development have failed to reach their objectives. Tariffs did not weaken Chinese industry. Export controls did not slow China down. The result has been the opposite. Denied the best US chips, Chinese engineers learned to do more with less, and the gap between the best US and Chinese systems closed from years to months. This is not a story of China winning and the US losing. The containment strategy did not work out because it was built on a false picture of what these two countries are to each other.

This false picture has a name. It is the zero-sum idea. It is the belief that whatever China gains, the US loses, and whatever the US gains, China loses. It often runs through Western newspapers and Western foreign policy unchallenged. It should be challenged, because it is wrong. In the early Cold War, it fit the world well enough. The US and the Soviet Union shared almost no real trade and no shared prosperity. In that world, one side's gain often was the other's loss. But that world is gone. The US and China are among each other's largest trading partners. Their factories, their universities and their capital are bound together at every level. To bring the zero-sum map into this relationship is to navigate a new century with an outdated zero-sum mindset.

Actually, China and the US have more common interests than differences.

The cost of the zero-sum habit is real. When every gain for the other side is marked as your defeat, cooperation starts to look like surrender. A sensible compromise looks like a betrayal. Problems that two serious governments could solve together are left to rot, because to solve them would be to let the other side win.

SMART DEVICE SEEDS A GROWING PASSION FOR BIRDS

Livestreaming feeding stations fuel soaring interest in the lives of our feathered friends

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

It's peak bird season, and for many, bird-watching no longer requires expensive equipment and weekends camped out in the woods.

A recent video that went viral on social media shows an automated backyard feeder capturing images of everything from the first twig laid in a nest to fledglings taking their maiden flight.

"Every time I get a notification (from the feeder), I run to check who showed up," a user wrote online, marveling at the solar-powered, livestreaming feeder that has transformed their backyard into a miniature wildlife observatory.

At the heart of this surge in backyard birding are Netvue's bird-feeding devices. Best known for its smart video doorbells and home security systems, the company based in Shenzhen, Guangdong province, has repurposed its home-safety technologies for bird enthusiasts, launching its Birdfy brand in 2020.

While Europe and North America have long enjoyed a mature bird-watching culture, traditional outdoor birding and wildlife photography are expensive.

Xizang navigates road to better healthcare

Mobile services provide free checkups in variety of locations

Editor's note: May 23 marks the 75th anniversary of the peaceful liberation of the Xizang autonomous region. Over the decades, healthcare has continuously improved, with enhanced access and infrastructure significantly boosting health outcomes and quality of life for residents in the region.

By **PALDEN NYIMA** and **DAQIONG** in Lhasa

On a crisp spring morning, residents of a high-altitude village in the Xizang autonomous region were filled with anticipation as they waited for the arrival of a mobile medical team.

In Namling county, at an elevation of 4,100 meters, the April chill was still in the air. However, it didn't dampen the enthusiasm of local residents, including monks and nuns, who lined up outside the village activity center for their annual health checkups.

A mobile health bus had navigated the rugged village roads, bumping and jostling the medical professionals inside. Its arrival in the village heralded the start of health-themed activities for the day and was indicative of the region's commitment to healthcare equity, even in Xizang's remote corners.

The medics' cups of tea had long gone cold as they worked throughout the day, but they carried out each task with precision and care. The team worked quickly to measure people's blood pressure, monitor heart rhythms, perform abdominal ultrasounds and draw blood for testing.

More improvements

This year marks the 75th anniversary of the peaceful liberation of Xizang, and throughout the decades, healthcare in the region has undergone continuous improvement.

Between 2021 and 2025, Xizang's healthcare sector experienced notable expansion, Xinhua News Agency reported.

The number of healthcare institutions climbed from 6,938 to 7,231, while bed capacity saw an increase from 18,942 to 21,488. The total number of healthcare professionals rose from 40,899 to 50,766.

Total funding allocated to the health sector in the region reached 60.89 billion yuan in the 2021-2025 period, marking an increase of 64.19 percent over the previous five-year period.

Since 2013, Xizang's regional health committee has made steady efforts to promote health checkups for urban and rural residents. Around 22.4 million health checkups have been completed over the period — covering the entire population.

The government provides an annual subsidy for each resident, which was increased to 164 yuan ($24.12) this year, to cover the cost of the checkups. Residents over age 65 receive 200 yuan. Beyond that, many of the subsequent medical services, such as some medications to treat long-term illnesses, are free.

This year, further efforts will be made to expand access to medical services through the deployment of additional mobile health diagnostic vehicles. Upgrades to existing onboard equipment are also planned, along with the distribution of motorcycles and portable diagnostic kits to village clinics, enabling grassroots health workers to deliver faster and more efficient basic checkups.

These efforts have already shown positive results at the county level. In Chonggyai county, for example, 14,000 residents have had health checkups this year, with the participation rate exceeding 88 percent.

"Health checkups for rural residents are an important element of our livelihood project," said Pasang Phenthok, head of Chonggyai County Central Hospital.

The checkups cover liver and kidney function, test blood sugar levels, and include chest X-rays and ultrasounds.

This year, free prenatal health checkups were introduced, along with screenings for major infectious diseases such as hepatitis B, HIV and tuberculosis.

Illnesses common in Xizang are being monitored for early detection. They include hypertension and polycythemia, a blood disorder that farmers and herders can develop at high altitudes because of reduced oxygen. The condition results in the thickening of blood and increases the risk of blood clots, strokes and heart attacks.

Early detection is key

In Chonggyai, health professionals have developed a system to quickly deal with serious illnesses identified during the health checkups.

Emergency treatment is conducted on-site, while patients with long-term conditions, such as diabetes or hypertension, are enrolled in a management system for ongoing care.

"We are forming a closed-loop health management process that prioritizes early detection and intervention," said Pasang Phenthok, adding that routine health checkups can reveal common health problems such as high blood pressure, fatty liver, gallstones, and cardiovascular diseases.

High salt intake in the diets of rural residents, especially from butter tea, is one of the major causes of these conditions.

Efforts to strengthen the medical network span multiple administrative levels. Chonggyai boasts a robust three-tier system at county hospitals, township clinics and village facilities. Currently, 20 village clinics provide medical services that meet national standards.

The mobile health checkup vehicles have become a lifeline for residents in widely dispersed communities, reducing costs and alleviating challenges in obtaining services.

This year, vehicles will be dispatched to seven remote townships for free health checkups, according to the Namling county health commission. The mobile service aims to cover more than 71,800 people. About 23 percent of the checkups have already been completed.

"This program allows for the early detection of problems to prevent severe illnesses and reduce health-related poverty," said Tsetan Drolkar, deputy director of the commission. The goal is to shift from treatment to active prevention, with farmers and herders encouraged to adopt healthier lifestyles.

Screenings tailored for the elderly, women, children and patients with chronic conditions are also improving people's quality of life, and reducing maternal and infant mortality rates in Xizang.

Sogchen Township Branch Hospital in Namling bridges the gap between grassroots patients and more advanced hospitals. Residents of the Tibetan Plateau region often face high-altitude polycythemia, diabetes and echinococcosis, a parasitic infection often transmitted through dog feces.

The hospital maintains a strict diagnostic process for chronic conditions, providing affordable medication to patients and guiding lifestyle adjustments to reduce risks.

Phurbu, a monk at Namling's Dragkar Monastery, recounted how regular checkups helped him detect and manage hypertension and significantly improve his health.

"Around 2021, during a checkup, the doctor advised me to take antihypertensive medication long-term. Now, after years of medication, my blood pressure has returned to normal," Phurbu said.

Similarly, Phurbu Tsering, a monk from Chonggyai, praised the benefits of annual health screenings: "These checkups are effective tools that allow for timely treatment and prevention of more severe complications."

Tibetan weaving: A new thread for rural prosperity

By **PALDEN NYIMA** in Lhasa

In Gangba village of Lhundrub county, Xizang autonomous region, a group of Tibetan women are weaving age-old traditions with modern commercial demands.

Their deft hands turn locally sourced fine wool into exquisite Tibetan rugs, scarves and other handcrafted textiles. Their craft has also brought fresh development opportunities to this rural community.

Once a hobby practiced mainly during farming off-seasons, Tibetan weaving has grown into a flourishing industry, becoming a driver of rural revitalization, according to local authorities.

Long reliant on animal husbandry, Gangba village boasts its own weaving tradition. For generations, women wove textiles for family members, handing down techniques between generations. Yet without standardized production or market access, these skills lay dormant, yielding little economic benefit for locals.

A turning point came in 2015 with the founding of the local weaving cooperative.

"We started with just 16,000 yuan ($2,350) and confronted numerous hurdles in the early days," said Basang Tsering, Party secretary of Gangba village.

"But we sank deep roots in the village to preserve this time-honored craft and pass on local culture. More importantly, we aimed to help rural women secure jobs and boost their income without traveling far from home," Basang Tsering said.

With professional support and village authorities' guidance, the cooperative has made good progress in recent years. It has overcome bottlenecks, expanded its sales, and developed modern designs, which include hats, embroidered pouches and decorative key chains.

Tashi Lhamo (left), the head of a women's federation and a weaving cooperative in Lhundrub county of Xizang, displays a Tibetan carpet produced by her staff in April. SAMTEN NGODRUB / FOR CHINA DAILY

These commercial efforts have empowered women through stable incomes while renewing cultural pride.

Tashi Lhamo, chairperson of the village women's federation, said the cooperative rolls out a wide range of products, from classic Tibetan rugs to colorful scarves.

Local herdsmen supply high-quality semi-fine wool, which the women refine into items that reflect traditional charm while fitting modern practical needs, said Tashi Lhamo.

Strategic cooperation has broadened the cooperative's market reach. Its debut exhibition at the annual Lhundrub county commodities fair drew wide attention, marking the first showcase of "Gangba Weaving" as a regional cultural brand.

The exposure resulted in bulk orders and strong demand, contributing an additional 20,000 yuan to the village's economy this year, according to local authorities.

Eight women work full-time at the cooperative, while many others work flexible hours at home, striking a balance between household duties, farming and their craft.

"Every piece we make embodies the essence of Tibetan culture," said Tashi Lhamo.

"This is not merely about heritage preservation. It is about building women's confidence and creating a platform for them to pursue better lives," she noted.

"The invaluable craftsmanship inherited from our ancestors should be well preserved rather than left stagnant; it needs to keep pace with the times and embrace modern aesthetics to resonate with wider audiences in the new era," she added.

Looking ahead, the cooperative plans to increase production by recruiting women from neighboring villages to weave.

"More professional training programs and product innovations will be launched to keep the time-honored Tibetan weaving tradition dynamic and well-adapted to modern market demands," she said.

Birding: Users pay for 'thrill' of greeting new visitor

From page 1

According to the 2025 State of the Birds report, the United States now boasts nearly 100 million bird-watchers. Annual spending by these enthusiasts — including travel, equipment, apparel and photography gear — has reached $108 billion.

Birdfy offers a new perspective: the view from one's own backyard. The company describes the strategy as a leap from "home security" to "human-nature connection", and it's paying off.

Expanding into markets including the US and Europe, with products priced between $119.99 and $279.99, Birdfy has quickly become an Amazon best-seller in its category.

"It started when we noticed users were sharing unexpected bird footage captured by our security cameras," said Hu Youle, chief technology officer of Netvue. "Backyard birding with smart cameras wasn't just a novelty. It reflected a real human desire to reconnect with nature."

The company's philosophy is simple: Nature doesn't have to be distant. Unlike standard cameras for safety purposes, these smart feeders are engineered for wildlife with features including 4K imaging, dual-camera systems, lowlight adaptability and solar power.

To enable fast, dynamic recording under various lighting conditions, the company has trained vertical artificial intelligence models capable of identifying species, tracking movements, and even distinguishing males from females. Plans are underway to predict potentially sick birds, providing enthusiasts with a conservation tool alongside their hobbies. The product line continues to expand into smart birdhouses and birdbaths.

Documenting sightings is also part of Birdfy's business model. Birdfy has cultivated an international ecosystem where enthusiasts share rare captures, fueling ongoing engagement. "Users aren't paying for cloud storage," Hu said. "They're paying for the thrill of discovering a new visitor in their yard."

In China, RedNote's 2025 Birdwatching Trend Report highlighted a dramatic rise in birding among younger consumers. According to the report, searches for "birding" surged 19-fold year-on-year, and users around the age of 25 have become the dominant demographic driving online content.

Liu Feng, CEO of Birdfans.com, which has more than 400,000 registered users, explained the broader forces behind this growth. "Young people today seek a deeper connection with nature," Liu said.

"Birding has become a fashionable, emotional lifestyle connected to the natural world. Coupled with online social sharing platforms, it's creating a thriving digital ecosystem for enthusiasts."

Birding tourism is also taking flight, with remote areas such as Mingxi county in Fujian province attracting European and US visitors.

With smart technology, AI and community engagement converging, companies such as Netvue see enormous market potential.

Wider opening-up to draw more foreign investment

Multinational firms ready to deploy resources in high-end manufacturing, service industries

By **ZHONG NAN** and **CANG WEI** in Suzhou, Jiangsu

Inside

Global Views, **page 8**

China will remain a prime long-term destination for global investors, driven by its vast consumer market, deeper opening-up and rapid advances in digital and green technologies, which are reshaping industries and generating fresh growth opportunities, government officials and business executives said on Thursday.

Speaking at a business conference ahead of the 32nd Asia-Pacific Economic Cooperation Ministers Responsible for Trade Meeting, which will be held in Suzhou, Jiangsu province, on Friday and Saturday, Li Chenggang, China international trade representative with the Ministry of Commerce, said the nation will continue to remove restrictive measures beyond the negative list.

The negative list outlines the specific industries in which foreign investors are either restricted or prohibited from operating.

Li, who is also a vice-minister of commerce, said that China expects all parties attending the meeting in Suzhou to engage in in-depth discussions on advancing regional economic integration, supporting the multilateral trading system, strengthening digital cooperation and promoting green economic development.

To create a more attractive investment environment for multinational companies, China will further expand its opening-up in service-related industries, such as telecommunications, healthcare and education, while also promoting the orderly opening-up of the internet and cultural sectors, he added.

According to information released in March by the National Development and Reform Commission, China has dynamically updated its negative list for foreign investment access, with reduction of special management measures in the services sector becoming a major priority.

The nation has also increased platforms for expanding services opening-up. The number of comprehensive pilot areas established for expanding the opening-up of the services sector has so far reached 20.

Henry Ding, senior vice-president of 3M, said the United States-based industrial conglomerate will further scale up research and development investment in China this year, and it is targeting more than 30 percent growth in new product launches compared with 2025 — a pace significantly higher than in most other global markets.

"These investments help us respond faster to market upgrades, shorten innovation cycles and build a complete local industrial chain from research to testing and manufacturing. This establishes a solid foundation for our stable and long-term growth in China," said Ding, who is also a director of the American Chamber of Commerce in Shanghai.

Rob Iuppa, chief financial officer of Technimark LLC, a US manufacturer of high-value packaging products for the healthcare, consumer and industrial sectors, said the company expects its investment in China this year "to exceed the level of any of the past three years".

"As long as our customers continue to grow in China, we will continue increasing our investment in the country," he said.

Lee Hyuk-joon, president for China at Hyundai Motor Group, said that China's rapid development in sectors such as new energy vehicles, intelligent connected vehicles and digital technologies aligns closely with the group's global transformation strategy.

The South Korean automaker plans to deepen cooperation with Suzhou in areas including smart mobility, R&D, supply-chain integration and green technologies, while expanding collaboration with Chinese partners and increasing its participation in China's industrial upgrading.

Mirroring this momentum, high-tech industries accounted for 32.3 percent of foreign direct investment in China in 2025, with inflows into sectors including e-commerce services, medical equipment manufacturing and aerospace posting strong growth, while returns for foreign-invested companies remained stable, data from the Ministry of Commerce showed.

According to the ministry, foreign-funded companies account for one-third of China's foreign trade, one-quarter of industrial output value and one-seventh of tax revenue, and they support more than 30 million jobs.

Visit: Building a multipolar world stressed

From page 1

"The second joint statement outlines how China and Russia will strengthen cooperation in building a multipolar world, and this cooperation itself is conducive to maintaining international stability and world peace," said Li.

The statement called on the international community to remain committed to four principles — upholding openness, inclusiveness and mutually beneficial cooperation; upholding equality and indivisibility of security; upholding the democratization of international relations and improving the global governance system; and upholding the diversity of world civilizations and values.

The two sides concluded by stating their commitment to continuing to develop a shared vision for building a multipolar world and a new type of international relations characterized by greater fairness.

Su Xiaohui, an associate research fellow at the China Institute of International Studies, said that the second statement shows that both China and Russia are committed to practicing genuine multilateralism.

"Both countries recognize that today's world is fraught with turmoil and uncertainty, and that many people fear the return of the law of the jungle when it comes to global stability," she said.

Su said that the two countries have established a model for bilateral relations, practicing mutual respect and refraining from imposing their own will or agenda on one another.

Boeing plan eases aviation ties after years of strain

By **LI JING**
lijing2009@chinadaily.com.cn

Inside

Views, **page 7**

China agreeing to purchase 200 aircraft from Boeing is expected to bolster commercial ties between China and the United States, especially in the aviation sector, as industry analysts said the agreement represents a partial easing of strained industrial ties after nearly a decade.

The Ministry of Commerce announced on Wednesday that China will purchase 200 Boeing aircraft "in accordance with its air transport development needs and on commercial principles", responding to a question regarding US President Donald Trump's recent remarks on the deal.

An official from the ministry said that aviation is a key sector for mutually beneficial and win-win cooperation between the two countries.

The US will also guarantee sufficient supplies of engines and spare parts for Chinese operators, according to a statement published on the ministry's website.

The comments came days after Boeing said that it had made progress in reopening the Chinese market during Trump's state visit to Beijing, where he was accompanied by a delegation of senior US business executives, including Boeing CEO Kelly Ortberg.

"We had a very successful trip to China and accomplished our major goal of reopening the China market to orders for Boeing aircraft," Boeing said in a statement to China Daily.

If finalized, the deal would mark Boeing's first major aircraft commitment from China in nearly a decade. The last major deal came during Trump's previous visit to China in 2017, when Chinese buyers signed agreements for 300 Boeing aircraft worth more than $37 billion.

Since then, Boeing has struggled to secure large orders from Chinese airlines amid geopolitical tensions and the grounding of the Boeing 737 MAX after two fatal crashes in 2018 and 2019.

China was once one of Boeing's most important overseas markets, with Chinese airlines accounting for roughly a quarter of the company's global deliveries before 2019. But the US manufacturer's presence has since weakened sharply as European rival Airbus expanded its footprint in China.

Airbus now holds roughly 55 percent of China's commercial aircraft market and has secured multiple large orders from Chinese carriers, including hundreds of Airbus A320neo family aircraft.

"Aviation has traditionally been a key link in China-US economic relations, and aircraft orders often serve as a barometer of bilateral ties," said Zhu Keli, founding director of the China Institute of New Economy.

The Boeing commitment signals a shift toward more pragmatic engagement, with both sides returning to cooperation based on commercial interests, Zhu said.

"It shows that the global aviation supply chain remains deeply interconnected," he said. "High-end manufacturing such as commercial aircraft is difficult to separate from the global division of labor."

For China, the move also signals continued openness and commitment to maintaining stable global industrial supply chains, Zhu added, while for the US, it reflects recognition of the importance of the Chinese market.

Beyond geopolitics, analysts said the proposed purchase also addresses the pressing operational needs of Chinese airlines.

Over the past nine years, Airbus has steadily expanded its dominance in China, leaving airlines increasingly dependent on a single supplier. Reintroducing Boeing aircraft into the market could help rebalance the supply structure and improve resilience, Zhu said.

At the same time, Chinese airlines are facing aging fleets and strong demand for capacity growth, while production of the domestically developed C919 by the Commercial Aircraft Corp of China is still ramping up and Airbus order backlogs remain long.

"In that context, 200 Boeing aircraft could help fill near-term capacity gaps and ensure stable operations on major routes," Zhu said.

US commitments to ensure supplies of engines and components could also ease maintenance pressures for airlines and reduce operational risks, he added.

However, Zhu cautioned that the deal represents only a partial thaw rather than a full recovery in China-US aviation cooperation.

While aircraft purchases and supply chains may expand, barriers remain in areas such as airworthiness certification, core technology sharing and deeper industrial integration. In particular, certification of the C919 by Western regulators remains a key hurdle, highlighting continued technological competition between the two countries, he added.

Zhu said that future cooperation is likely to follow a pattern of "strong commercial cooperation but cautious technological engagement", as sensitive technologies such as aircraft engines and advanced avionics remain tightly controlled.

Both Boeing and Airbus expect China to become the world's largest aviation market by around 2043, with a commercial fleet of roughly 9,000 to 10,000 aircraft.

Ebola outbreak

Congolese children read an advocacy poster on Wednesday as aid agencies step up efforts to contain a new outbreak of the Bundibugyo strain of Ebola in Bunia, Ituri province, Democratic Republic of Congo. On Tuesday, DRC Health Minister Roger Kamba said that 543 suspected cases had been recorded, including 32 laboratory-confirmed infections, while the death toll had reached 136. Cooperation: Summit in Beijing can become a new start

From page 1

But almost none of the great problems of our time are zero-sum. Instead, consider: A stable climate, a generation in Africa or South Asia lifted out of poverty and into school and decent health, and a bigger global economy to share. None of these has a winner and a loser. The whole world rises together or it does not rise at all.

I have worked across Asia for decades, and I can tell you plainly that China, India and much of the continent do not reach instinctively for the zero-sum lens. It is a Western habit. Habits can be unlearned.

Iran shows what unlearning it would make possible. Set the reflex aside and look only at the interests on the table. Everyone wants the Strait of Hormuz kept open. No one gains from a wider war.

If the zero-sum map is the wrong one, the right one can be drawn. This is some substance I would read into President Xi Jinping's call for a "constructive strategic stability" relationship. Stability of that order rests on institutions. It is the patient construction of the channels through which a misunderstanding can be disarmed before it ever becomes a war.

So the real question in Beijing was never who won the better deal. It was whether two great powers can set down the old map. More than half a century ago, former US president Richard Nixon and former US secretary of state Henry Kissinger, Chairman Mao Zedong and Premier Zhou Enlai began the diplomacy that ended a generation of hostility. The week changed the world. I would ask people to remember how it was actually done. By refusing to pretend the differences away, the two sides made the common ground they did find believable. That is what optimism without naivety looks like.

That is the spirit this moment asks for. The summit in Beijing can become a new start, followed by a meeting in Washington later this year.

Standing in Beijing in 1972, Nixon raised his glass and borrowed a line from one of Chairman Mao's poems. So many deeds cry out to be done, he said, and always urgently. Ten thousand years are too long. Seize the day, seize the hour.

More than 50 years later, with the climate, with artificial intelligence, with the security of the world's energy, none of which either nation can solve alone, the hour presses again. China's success and the US' success need not be bought at each other's expense. Each can be the making of the other. That is a truer description of the world than the zero-sum story the West has told itself for far too long.

The author is the chair of the Europe-Asia Center and the former undersecretary-general of the United Nations. The views do not necessarily reflect those of China Daily.

Role of collaboration emphasized

China-Russia cooperation seen as vital in helping bolster multilateralism

By YANG RAN in Beijing and **XU WEIWEI**, **YANG HAN** in Hong Kong

Global experts said that cooperation between China and Russia is vital in today's volatile world, highlighting the role of their collaboration in helping bolster multilateralism and foster stability.

Russian President Vladimir Putin paid a state visit to China from Tuesday to Wednesday, which also marked his 25th trip to the country. President Xi Jinping and Putin held talks, chatted over tea, visited a photo exhibition, and witnessed the signing of a slew of cooperation documents in Beijing.

The two presidents hailed a "new stage" in bilateral ties as they agreed to further extend a China-Russia friendship treaty and pledged to work together for a more just and equitable world order.

Maarij Farooq, deputy editor-in-chief at Daily Ittehad Media Group & Pakistan Economic Net, said the growing strategic coordination between China and Russia is becoming increasingly important in today's changing global environment.

Stronger cooperation between two major global powers like China and Russia can play a constructive and stabilizing role in the region and beyond, Farooq said. "Their coordination on global issues reflects the emergence of a more balanced and multipolar world order where countries seek dialogue, development, and cooperation instead of confrontation and pressure politics."

Karori Singh, former director of the South Asia Studies Centre at the University of Rajasthan in India, said that China and Russia, being founding members of the Shanghai Cooperation Organisation and BRICS, are endowed with greater responsibility to ensure fairness and justice in global governance.

Commitment reiterated

As the world shares deep concerns about the deteriorating global economic situation, China and Russia "reiterated their commitment to the United Nations' purposes and principles, international law, multilateralism and global governance", he said.

During Putin's visit, China and Russia issued a joint statement, advocating for a multipolar world and a new type of international relations.

Vasily Kashin, director of the Center for Comprehensive European and International Studies at the National Research University Higher School of Economics, said the declaration of Russia and China can be considered an alternative proposal on the architecture of global security, showing it's realistic to gather a wide group of developing countries that are afraid of unpredictable actions by some countries.

Lawrence Freeman, a US political-economic analyst and writer, said the geopolitical dynamic in the world is changing, with the Global South set to become the focus.

Anthony Moretti, an associate professor in the Department of Communication and Organizational Leadership at Robert Morris University in the US, said the leaders' summit comes at an important time.

"A multipolar world is inevitable. It would benefit the world if other nations or blocs were willing to acknowledge reality and end any commitments to undermining the trend of the times," Moretti said.

This year marks the launch of the China-Russia Years of Education, which is the 10th national theme year of the two countries.

On the same day, Chinese foreign ministry spokesman Guo Jiakun announced that, to continue facilitating personnel exchanges, China has decided to extend the visa-free policy to Russia until Dec 31, 2027.

Ilia Yampolsky, senior researcher at the Shemyakin and Ovchinnikov Institute of Bioorganic Chemistry of the Russian Academy of Sciences, said the visa-free policy has helped remove travel barriers for scholars and greatly facilitates the exchange of people and ideas.

Alexander Vladimirovich Pikover, senior researcher at the Institute of China and Contemporary Asia of the Russian Academy of Sciences, said, "Now more than ever, it is important for Russia and China to develop mutually enriching humanitarian, scientific and educational contacts and cooperation. It is here that the prospects and development paths will open up, giving hope to the very community with a shared future for humanity."

Long-standing Sino-Pakistani relationship valued

By XU WEIWEI in Hong Kong
vivienxu@chinadailyapac.com

As China and Pakistan marked the 75th anniversary of diplomatic ties on Thursday, political leaders, diplomats and analysts in Pakistan have highlighted the long-standing, multifaceted Sino-Pakistani relationship, emphasizing its economic, social, cultural and diplomatic dimensions.

China's significant investments, particularly through the China-Pakistan Economic Corridor, have not only transformed Pakistan's economy and boosted its infrastructure but also helped Pakistan make substantial strides toward sustainability and green energy, they said.

Pakistan and China established diplomatic relations in 1951, and their partnership has since expanded into multiple sectors, including trade, infrastructure, defense, and cultural exchanges.

On Thursday, Pakistani Prime Minister Shehbaz Sharif sent a message on the 75th anniversary of ties with Beijing, saying that his nation "deeply appreciates" China's cooperation in "multifaceted fields".

The CPEC, as a flagship project of the Belt and Road Initiative, has made a tremendous contribution toward Pakistan's infrastructure development, energy security, industrial cooperation, and regional connectivity, said the prime minister.

On Wednesday, the Senate of Pakistan unanimously passed a resolution reaffirming Pakistan-China friendship on the occasion of the 75th anniversary of diplomatic ties between the two nations.

Chinese Ambassador to Pakistan Jiang Zaidong (fourth from left) and Pakistan's Minister for Planning, Development and Special Initiatives Ahsan Iqbal (third from right) pose for a photo with Pakistanis who won the award for Outstanding Pakistani and Chinese Staff of CPEC Projects 2026 in Islamabad, on March 31. AHMAD KAMAL/XINHUA

The resolution was moved by Deputy Prime Minister and Foreign Minister Mohammad Ishaq Dar, who described Pakistan-China ties as a model of mutual trust, respect and shared aspirations. He said the relationship has continued to strengthen over the past 75 years and remains a cornerstone of regional peace, stability and development.

Dar reaffirmed Pakistan's commitment to further expanding cooperation, while emphasizing the shared resolve of the two countries to carry forward their iron-clad friendship for future generations.

Zafar Uddin Mahmood, former special assistant to the prime minister of Pakistan, noted that Pakistan was the 17th country and the first Muslim nation to establish diplomatic relations with the People's Republic of China. Since the establishment of ties on May 21, 1951, the two countries have built a deep bond characterized as an all-weather strategic cooperative partnership.

The economic underpinning of the relationship evolved significantly, highlighted by the CPEC, which has driven major investments in infrastructure, energy and other projects, Mahmood said.

In the meantime, the acceleration of people-to-people connections, cultural and educational exchanges, scientific cooperation, frequent high-level visits, consensus and cooperation on major international issues and mutual support on core issues strongly bonded the countries, he said.

Shahid Khaqan Abbasi, a former prime minister of Pakistan, said implementing solar power, electric motorcycles and other electric vehicle projects with Chinese investment will help Pakistan reduce the amount of gas and diesel imported into the country while also cutting carbon emissions and greenhouse gas emissions.

Looking ahead, Mahmood told China Daily that facilitating more social contacts and exchanges, and promoting the study of the Chinese language and cultural understanding, are important for Pakistan. Meanwhile, the nation can learn from China's development and governance model to meet the challenges and move forward.

"China's development model for industrialization, poverty alleviation, education, health and other areas" is something that Pakistan can benefit from, he said.

Salman Bashir, a former foreign secretary of Pakistan, said the bonds of friendship between Pakistan and China are everlasting and each succeeding generation has contributed to making this relationship ever more special.

"It's good to see that the next generation is doing so well to give additional meaning to the relationship," he said. "This process of renewal is what makes the ties enduring. This process has continued over the ages and will continue."

Xinhua contributed to this story.

Deeper exchanges on human rights stressed

By ZHANG ZHOUXIANG in Paris
zhangzhouxiang@chinadaily.com.cn

The right to development and the relationship between national stability and the protection of human rights emerged as key themes of the 2026 China-Europe Seminar on Human Rights held in Paris on Thursday, where scholars and experts from China and Europe called for a more inclusive and development-oriented understanding of human rights amid growing uncertainty.

The seminar was launched in 2015 at the European Court of Human Rights in Strasbourg, France. For a whole decade, it has brought together academics, diplomats and policy experts to discuss the challenges facing global human rights governance in an increasingly multipolar world.

Hussein Askary, vice-chairman of the Belt and Road Institute in Sweden, said the right to development should be understood as a fundamental human right.

"Human beings must, first of all, have enough food, clothing, housing, healthcare and education. These are the basic rights people should enjoy," Askary said.

He argued that human rights should not be reduced to abstract political concepts detached from material conditions.

"Once people are educated and healthy, they become productive members of society," he said. "The highest level of human existence comes in the ability to practice our creative powers and contribute through science, culture and philosophy."

Askary also criticized what he described as double standards in Western human rights discourse, pointing to conflicts in Iraq, Libya and Gaza.

"Human rights can become less of a genuine universal principle and more of a geopolitical tool serving the interests of major powers," he said.

Adrian Severin, former deputy prime minister and foreign minister of Romania, stressed that effective human rights protection depends on the existence of a stable and functioning state.

"Individuals naturally seek freedoms and rights, but those rights can only become real if the state is strong enough to protect them," Severin said. "If the state and the community are weak, then individual rights also become weak, fragile and largely symbolic."

Historical traditions

He said human rights systems are shaped by each country's historical traditions and cultural foundations, and warned against imposing a single model on all societies.

Richard Trappl, former director of the Confucius Institute at the University of Vienna, also emphasized the importance of development and social cohesion in safeguarding human rights. "If a political system can provide people with development, stability and solidarity, then human rights are embedded within that system itself," he said.

Tian Feilong, vice-dean of the Law School of Minzu University of China, said both China and Europe have long histories of contributing to human civilization and global governance.

He said China-Europe human rights dialogue should move beyond ideological confrontation and help build "a new form of human rights" based on civilizational diversity, equality among nations and peaceful development.

Tang Jianjun, secretary-general of the China Society for Human Rights Studies, stressed the importance of China and Europe exchanging views on human rights at the seminar, expressing hope that it will play a bigger role in the future.

If China and the EU stick to equal dialogue, respect differences, and expand human rights cooperation, they can narrow disputes, strengthen cooperation, and support global human rights progress, the conference concluded.

Nature-based solutions key to cities: UN official

By EDITH MUTETHYA in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

Anaclaudia Rossbach, executive director of the United Nations Human Settlements Programme, or UN-Habitat, says cities must place housing, resilient infrastructure and nature-based solutions at the center of urban planning to withstand growing climate threats such as floods, heat waves and droughts.

In an interview with China Daily on the sidelines of the 13th session of the World Urban Forum, or WUF13, being held in Baku, Azerbaijan, Rossbach said rapid and often unplanned urbanization is concentrating people and infrastructure in highly climate-vulnerable areas, exposing millions of residents, especially low-income communities, to escalating climate risks.

She said more than 1 billion people live in informal settlements, often located in flood-prone or environmentally fragile areas globally, while nearly 3 billion people face some form of housing inadequacy.

"Without stronger climate action, inequality and housing insecurity will only deepen," Rossbach said.

She stressed that urban planning must become more "housing-first and resilience-driven", aligned with the UN Sustainable Development Goals.

"This means investing in affordable, climate-smart housing with resilient building standards, passive cooling, water-resistant materials and secure tenure, while upgrading informal settlements," Rossbach said.

She said cities should address climate risks in informal settlements through community-centered upgrading rather than forced displacement.

Rossbach said that participatory risk mapping can help identify areas where relocation may be unavoidable, emphasizing that any resettlement must follow due process to protect livelihoods.

"When cities align housing, land management, infrastructure and social protection policies, they can reduce climate risks while keeping communities connected to jobs, schools and services," Rossbach said.

Looking ahead, Rossbach said a truly climate-smart city will balance lower emissions, stronger climate resilience and improved access to services, while ensuring better housing conditions for all residents.

The forum running through Friday, and themed "Housing the World: Safe and Resilient Cities and Communities", is the largest to date, attracting more than 40,000 participants from more than 180 countries.

Paths open for US-Iran pact despite strains

Regional mediation efforts gain fresh momentum as escalation risks loom

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran said it has consistently honored its commitments, and all paths remain open to a diplomatic solution as the United States claimed it is in the "final stages" of securing a deal with Tehran, but the situation could also "escalate quickly".

Iranian President Masoud Pezeshkian defended his country's strategy amid the ongoing war — triggered by the US and Israel attacks on Feb 28 — saying Tehran has "explored every avenue to avert war".

"All paths remain open from our side. Forcing Iran to surrender through coercion is nothing but an illusion. Mutual respect in diplomacy is far wiser, safer, and more sustainable than war," said Pezeshkian.

Iranian Foreign Ministry spokesman Esmaeil Baqaei said in a televised interview on Wednesday that Iran and the US have been exchanging messages through Pakistan.

In the latest developments, Pakistan's army chief Asim Munir is said to be traveling to Tehran on Thursday, according to Iran's ISNA News Agency.

On Wednesday, Pakistan's Interior Minister Mohsin Naqvi traveled to Iran, marking his second trip to the country in a week.

"Many times, intermediary parties prefer to be present alongside the texts being exchanged and help with the process," Baqaei was quoted as saying by Iran's Nour News Agency. He said Iran is currently focused on "ending the war on all fronts, including Lebanon", while reiterating Tehran's longstanding demands.

Baqaei said that "our demands are clear", citing the release of Iran's blocked assets, issues related to US "maritime piracy", and harassment of Iran's shipping activities.

"We view the other side with intense suspicion and entirely based on our right to do so, because of their very bad record over the past year and a half," Baqaei was quoted as saying by Nour News Agency.

"At the same time, we are pursuing the discussions with full capability and complete goodwill," he added.

US President Donald Trump told reporters on Wednesday that the situation was "right on the borderline" and could escalate quickly.

He reiterated his determination not to allow Iran to acquire a nuclear weapon. "We're in the final stages of Iran (talks). We'll see what happens. Either (we) have a deal, or we're going to do some things that are a little bit nasty, but hopefully that won't happen," Trump told reporters.

Meanwhile, Saudi Arabia's Foreign Minister Prince Faisal bin Farhan said in a post on X that Riyadh appreciates Trump's willingness to find a diplomatic end to the war and also praised Pakistan's mediation efforts.

Faisal also said Saudi Arabia is looking forward to Iran seizing the opportunity to avoid the dangerous implications of escalation and urgently responding to efforts to advance negotiations toward a comprehensive agreement to achieve lasting peace in the region and the world.

Strategic miscalculation

Arhama Siddiqa, a research fellow at the Pakistan-based Institute of Strategic Studies Islamabad, told China Daily that the latest diplomatic activity suggests that Trump is seeking to contain the consequences of a war that increasingly appears to have been a strategic miscalculation.

"The decision to use force against Iran may have been intended to compel concessions, but it has instead increased regional instability, exposed Gulf energy and maritime vulnerabilities, and created diplomatic pressure on Washington to find an exit without appearing to retreat," said Siddiqa.

She said Pezeshkian's statement that Iran remains open to diplomacy is therefore "significant", as it gives the regional mediators a basis to press for a negotiated settlement.

Further, Siddiqa noted that Trump's claim shows that Washington is trying to preserve coercive leverage even as it explores de-escalation.

"The reported role of Pakistan, Qatar, Saudi Arabia, Turkiye, and Egypt in refining a proposal to bridge US-Iran differences indicates a wider regional consensus that prolonged conflict would damage regional stability, energy security, and trade routes," she said.

Reduced to rubble

Lebanese civil defense workers search through the rubble in the southern Lebanese village of Deir Qanun al-Nahr on Wednesday, a day after Israeli strikes. Tuesday's Israeli airstrikes across southern Lebanon killed 19 people, the health ministry said, as Hezbollah reported clashes with Israeli troops despite a truce. ADRI SALIDO / GETTY IMAGES

Uganda's electric buses drive green shift

KAMPALA — On the busy streets of Kampala, Uganda's capital, a quiet transformation is unfolding. Sleek, locally manufactured electric buses are becoming part of the city's daily rhythm, marking the country's accelerating drive toward greener and more sustainable urban transport.

Since their introduction, the green-and-gray 40-seater electric buses have quickly drawn growing public attention. Equipped with onboard WiFi, they allow passengers to share photos and videos of their journeys on social media in real time.

Uganda's journey into electric mobility dates back to 2016, when it unveiled Africa's first solar-powered electric bus, the Kayoola electric vehicle, a name loosely translated as "mass carrier".

At the heart of this transition is Kiira Motors Corporation, or KMC, and its subsidiary E-Bus Xpress Kiira Ltd, which are spearheading efforts to scale up electric mobility across the country.

During a recent media tour of the company's production plant, managing director Ian Kyeyune said the number of buses operating on city routes is set to rise from 16 to 45 within a month.

He added that Uganda plans to produce more than 1,500 electric buses over the next year, forming part of a broader national e-mobility strategy targeting 15,000 electric vehicles by 2030.

To support the shift, city authorities are reshaping urban traffic management — removing roadside parking in downtown areas and introducing dedicated bus lanes, aimed at easing congestion and prioritizing public transport in a city long dominated by fuel-powered vehicles.

An engineer stands inside an electric bus at the Kiira Vehicle Plant in Jinja, eastern Uganda, on Monday. HAJARAH NALWADDA / XINHUA

The government is also expanding the sector through a campaign that encourages private participation. Under the initiative, transport operators can own buses, while investors may purchase seats for fixed periods under franchise arrangements.

KMC engineers say the electric buses offer clear economic advantages over diesel-powered alternatives, particularly in acquisition, servicing, and maintenance costs.

"We save over 60 percent of energy costs. While an ordinary taxi would spend 1,800 shillings ($0.48), we only spend 800 shillings on energy costs per kilometer," Kyeyune said.

He added that studies indicate operators can recover their investment within about three years, thanks to lower fuel expenses. The batteries can later be reused for applications such as solar energy storage.

Richard Madanda, KMC's director of production, said the batteries used in the buses, with an estimated lifespan of 12 years, are imported from China and that the company is working closely with Chinese partners to develop local technical expertise in electric vehicle technology.

"We are working with a partner from China because their auto industry, in terms of electric vehicles, is the best in the world. We want to learn from the best," Madanda said.

Uganda is also testing its electric mobility ambitions beyond its borders. Late last year, Uganda launched an African expedition featuring a locally manufactured electric bus that traveled 13,000 km across five African countries — Tanzania, Zambia, Botswana, Eswatini, and South Africa.

Indonesia steps up coal gasification amid fuel shocks

By **PRIME SARMIENTO** in Hong Kong and **LEONARDUS JEGHO** in Jakarta

As the Middle East crisis rattles global fuel markets, Indonesia needs to pull in more investments and technology transfers to accelerate a coal gasification program that can shield its economy from the import costs of volatile liquefied petroleum gas, or LPG, analysts said.

Indonesia is a net exporter of coal and one of Asia's largest coal consumers. Its vast coal resources enable it to produce higher-value products like dimethyl ether, or DME — a colorless gas synthesized from coal-derived methanol that can be used as an alternative to LPG, a widely used cooking fuel.

However, there is still no coal-to-DME project operating commercially in Indonesia due to high operating costs.

Ahmad Erani Yustika, secretary-general of Indonesia's Ministry of Energy and Mineral Resources, said on Tuesday that the government is developing domestic energy sources to cut Indonesia's reliance on imported fuels and strengthen national energy independence.

Yustika said a coal gasification-based DME project remained under consideration for investment by Danantara, Indonesia's sovereign wealth fund.

Fahmy Radhi, a lecturer and energy economist at Gadjah Mada University in Yogyakarta, called for the government to issue policies to attract investors in the coal gasification industry. Radhi cited Indonesia's Domestic Market Obligation policy, which requires producers of coal and other resources to allocate a portion of their production for domestic use before exporting it.

He said a clear tax mechanism for coal exports is also needed to ensure a sufficient supply of coal for local needs.

Elias Ginting, chairman of the Association of Indonesia Coke Industry, said Indonesia can cooperate with China on coal downstreaming, such as converting coal into DME.

"We need innovation and technology, we need technology transfer. And at this time, the best of them come from China," Ginting told China Daily.

In March 2025, Indonesian President Prabowo Subianto met with the Task Force for Accelerating Downstreaming and National Energy Resilience to discuss the development of coal gasification projects on the islands of Sumatra and Borneo. By producing its own DME, Indonesia can cut its reliance on imported LPG. Indonesia imports over 7 million tons of LPG each year, about 20 percent of which is sourced from the Middle East.

Workers unload frozen fish at Juwana fishing port, as rising diesel prices leave many fishing boats docked, in Pati, Central Java Province, Indonesia, on May 8. WILLY KURNIAWAN / REUTERS

Tri Winarno, director general of Minerals and Coal at Indonesia's Ministry of Energy and Mineral Resources, said coal downstreaming is part of the country's strategy to develop local energy resources.

"Indonesia views the energy transition as needing to be carried out in a realistic, gradual, and just manner," Winarno said on May 11 during the opening of the Indonesia Coal and Energy Expo in Jakarta.

He said China is becoming increasingly central to Indonesia's downstream strategy.

Lei Huang, vice-president of China Coal Technology & Engineering Group, said at the expo that Indonesia "has a solid industrial foundation and huge development potential" as a major coal producer and exporter, and that there are opportunities to deepen China-Indonesia cooperation on coal downstream projects.

Promoting coal gasification, however, may not align with Indonesia's climate commitments. At the G20 Summit held in Brazil in November 2024, Prabowo announced that Indonesia will achieve net-zero emissions by 2050, phase out coal plants within the next 15 years and build 75 gigawatts of additional renewable energy.

But according to Putra Adhiguna, managing director of the Energy Shift Institute, an Australia-based energy finance think tank, climate mitigation measures such as carbon capture and storage may help reduce emissions, but they will also come at an extra cost. He added that DME is expensive to produce, casting doubt on the economic viability of such plants.

China's UN envoy urges protection of civilians

By **MINLU ZHANG** in the United Nations
minluzhang@chinadailyusa.com

China called for ceasefires, political dialogue and civilian protection during a UN Security Council annual debate on the protection of civilians on Wednesday, as the United Nations reported rising civilian deaths, displacement and attacks on hospitals in conflicts worldwide.

"Only by ending conflicts can civilians be fundamentally protected," Fu Cong, China's permanent representative to the UN, said while chairing the Security Council meeting on the protection of civilians in armed conflict.

On Iran, Fu said the conflict "has already caused serious losses to people across the region, including in Iran itself". He called on the parties concerned to respond to international appeals, reopen shipping routes, and safeguard the stability and smooth functioning of global industrial and supply chains.

Iranian state media IRNA said on Sunday that around 3,468 people were killed during the 40-day war with Israel and the United States, including 1,460 civilians.

On Gaza, Fu said it "should not remain a permanent battlefield" and called for "a comprehensive and lasting ceasefire" and expanded humanitarian access.

The UN secretary-general's annual report on the protection of civilians in armed conflict, circulated on May 7, recorded more than 37,000 civilian deaths across 20 armed conflicts last year, compared with 36,000 civilian deaths across 14 armed conflicts in 2024.

"Even war has rules," Fu said, calling for upholding international law and safeguarding the bottom line of civilian protection. He noted that methods of warfare "continue to break basic norms", with schools, hospitals and towns full of civilians becoming targets of military operations, while humanitarian workers, medical personnel and peacekeepers are subjected to attacks.

Humanitarian action

China, together with France, Brazil, Jordan, Kazakhstan, South Africa and the International Committee of the Red Cross, or ICRC, jointly launched the "International Humanitarian Law Initiative" in 2024.

The initiative aims "to renew firm commitment to international humanitarian law", the Chinese ambassador said, calling on more countries to join it.

Fu said China appreciates the contributions made by humanitarian organizations such as the ICRC, and called on the international community to "provide greater political and financial support for humanitarian action and ensure the safety and unimpeded delivery of humanitarian assistance".

Fu also warned that the misuse of technologies such as artificial intelligence and drones was creating new risks for civilians in conflict zones.

China believes weapons systems using artificial intelligence "must remain under human control" and comply with international humanitarian law, he said.

Fu added that governments bear the primary responsibility for protecting civilians and cautioned against "external interference" and unilateral sanctions imposed without Security Council authorization, saying such measures weaken governance capacity and worsen civilian suffering.

Edem Wosornu of the UN Office for the Coordination of Humanitarian Affairs said one civilian was killed approximately every 14 minutes in armed conflicts in 2025, adding that the true toll was likely higher.

Violence against journalists and aid workers has also intensified, according to UN officials.

Passing on cultural heritage and tradition, pursuing cultural innovation and creativity

As China advances toward the goal of building a modern socialist country in all respects, culture is emerging not only as a new driver of economic growth and high-quality development, but also as a source of national confidence and social vitality.

The Forum on Building up China's Cultural Strength 2026, which opened in Shenzhen, Guangdong province, on Thursday reflects this broader shift. The forum focuses on passing on cultural heritage and tradition, and pursuing cultural innovation and creativity.

Coming at the start of the 15th Five-Year Plan (2026-30) period, the forum underscores the growing recognition that cultural prosperity, service-sector upgrading and innovation-driven development are becoming increasingly interconnected with the country's modernization.

China's per capita GDP surpassed the $10,000 threshold in the mid-2010s. Since then, cultural consumption has accelerated significantly. Official data show that domestic tourism trips in 2025 exceeded 6.5 billion, up more than 16 percent year-on-year, while tourism expenditure reached 6.3 trillion yuan ($875 billion), both record highs. Meanwhile, the value-added output of tourism and related industries accounted for about 4.35 percent of China's GDP.

The 15th Five-Year Plan treats culture as a horizontal policy instrument embedded across the broader economy. Through "culture plus industry" models, cultural resources are being integrated into manufacturing, tourism, urban renewal and technology development. Historical districts, heritage sites and museums are no longer viewed merely as preservation projects, but as economic zones capable of generating consumption, employment and innovation. This marks a structural shift from "culture as industry" toward "culture for economic transformation".

China's rapid expansion of public cultural services reflects this. By the end of 2025, the country had established more than 70,000 public libraries nationwide, while museums, reading spaces and digital cultural platforms have become increasingly accessible to ordinary citizens.

At the same time, digital technology is reshaping cultural creation and participation on an unprecedented scale. The integration of artificial intelligence, immersive technologies, digital publishing and short-video platforms is expected to become one of the core growth engines of China's cultural sector.

By lowering the production and distribution costs of cultural goods, digital platforms and AI technologies are accelerating cultural participation and human capital formation. Online literature, micro-dramas, interactive entertainment and AI-assisted content creation are expanding access to cultural products while creating new service-sector business models.

This transition is already visible across China's booming digital economy. Chinese online literature now has around 200 million active overseas users, while Chinese micro-drama applications have expanded into more than 160 countries and regions. Movie productions such as *Ne Zha 2* and the global popularity of Chinese short-video content demonstrate how the fusion of traditional culture and digital innovation is enhancing both economic value and the country's international cultural influence.

In knowledge-based economies, highly skilled talent gravitates toward cities and regions with strong cultural ecosystems, vibrant creative industries and high-quality public services. By leveraging cultural amenities to attract creative talent, China is strengthening the interaction between cultural vitality and innovation-driven growth.

Meanwhile, related efforts to build an independent Chinese knowledge system in philosophy and social sciences are becoming increasingly important as China seeks to provide intellectual frameworks rooted in its own development experience while contributing new perspectives to global governance, modernization and civilizational exchanges.

Culture carries the memory of a civilization, but it also shapes future productivity, creativity and social cohesion. As China moves toward the goal of becoming a cultural powerhouse by 2035, the interaction between cultural prosperity, technological innovation and service-sector transformation is likely to form a new virtuous cycle. Rising incomes stimulate cultural consumption, cultural participation strengthens human capital and creativity, and stronger innovation capacity in turn generates new momentum for high-quality development.

In that sense, culture is no longer merely a reflection of development. It is increasingly becoming one of its engines.

Restrictions serve no party's interest

In a recent interview, Christophe Fouquet, chief executive officer of ASML, compared US chip restrictions on China to cutting off food supplies in a desert. "If I put you in a desert and tell you that you're not going to have access to food anymore — how long does it take you to make your own garden?" he asked. "It's a matter of survival."

This analogy underscores a critical point: While the United States' escalating export controls might disrupt markets in the short term, they are also pushing China to accelerate its own innovation. This shift from a passive recipient of technology to a proactive innovator highlights China's resilience and determination in the face of the technological walls the US is trying to erect.

The global semiconductor industry is undergoing profound changes. The rise of artificial intelligence, 5G communications and autonomous driving has fueled a surge in demand for high-end chips. Market research suggests that by 2030, the global chip market could reach $1.5 trillion. In response to these trends, the US seeks to curb China's growth by restricting advanced semiconductors and fabrication equipment and urging its allies to do the same. However, such protectionist policies, shortsighted as they are, threaten global supply chain stability and may cause the US to miss out on key opportunities in the semiconductor sector.

As the world's two largest economies, cooperation and mutual benefit are the best choices for both China and the US, and attempts to use technological restrictions to halt China's innovation progress will lead nowhere.

China's 15th Five-Year Plan (2026-30) places technological innovation at the core of the national development strategy. The plan states that accelerating high-level technological self-reliance and self-improvement is the key to leading the development of new quality productive forces.

Through systematic measures such as enhancing original innovation, tackling core technologies and strengthening the role of enterprises, the plan presents a clear road map for China's technological progress.

Recent China-US economic and trade consultations in the Republic of Korea produced generally balanced and positive outcomes, as the two sides reached a consensus on major issues such as tariff arrangements, councils to manage trade and investment disputes, and agricultural trade, showcasing a spirit of mutually beneficial cooperation. This cooperation model, grounded in mutual respect, equality and reciprocity, is the rational way to handle trade and technology disputes between the two sides.

Both countries and the global tech industry have much to gain from their collaboration.

In particular, the two sides agreed in principle to discuss a framework for reciprocal tariff reductions on products of equal value under the trade council, with each side committing to $30 billion or more. This will help the two countries establish a stable trade framework. The agreements will bring greater certainty and stability to the next phase of China-US economic and trade relations, and to the global economy as well.

China is building a comprehensive innovation ecosystem, spanning from basic research to industrial applications. This enhancement in self-innovation capability serves as the best defense against technological blockades. Consequently, China is accelerating breakthroughs in several "choke point" technologies, ranging from lithography machines to AI chips.

Recently, China's three major telecom operators launched AI token packages, marking a new step in the country's AI development. This innovative model not only lowers the barriers to AI technology use, but also provides strong momentum for industrial upgrading. It has injected new vitality into global technological progress as well.

While US restrictions will continue to pose challenges, they also present incentives for China to innovate and thrive independently.

Yet the path forward lies in cooperation, not confrontation. By working together, China and the US can create a more stable and prosperous global tech landscape. But this requires dialogue, mutual understanding and a commitment to shared goals.

Bloc politics divorced from reality of alliance relations

Speaking at a forum hosted by the Center for American Progress on Tuesday, shortly after US President Donald Trump concluded his second visit to China in nine years, former US secretary of state Antony Blinken warned that the United States must rally allies into a broad coalition against China as it could not compete with China alone.

The irony was difficult to miss. Rather than reflecting on the failure of the policy he helped design, Blinken merely prescribed more of the same medicine: more alliance-building, more geopolitical mobilization and more zero-sum thinking.

That outlook is deeply rooted in the Cold War mentality that has long shaped sections of Washington's foreign policy establishment. For many in that circle, the US' triumph over the Soviet Union became not merely a historical episode but a permanent intellectual template. They continue to see international relations through the prism of ideological confrontation and strategic containment, believing any rising power must inevitably be treated as an adversary to be weakened and isolated.

However, the global economy is now profoundly interconnected and the challenges facing humanity — climate change, public health crises, energy security, technological governance and economic recovery — demand cooperation rather than bloc confrontation.

Despite the loud rhetoric about "small yard and high fences", trade between China and the US under the Joe Biden administration, for which Blinken served as the top diplomat, remained sizable. What emerged was not "decoupling", but selective restrictions in a handful of strategic sectors by the US alongside continued cooperation across much of the broader economy.

And even as Washington urged allies to reduce economic ties with China, it preserved its own extensive commercial relationship with the world's second-largest economy — a contradiction that did not go unnoticed by US partners.

Blinken's latest call for rebuilding the "united front" also conveniently overlooks the costs that US allies and partners were forced to bear under the previous administration's ill-advised policies. Washington repeatedly demanded strategic alignment against China while pursuing economic measures that primarily benefited the US.

The Inflation Reduction Act and the CHIPS and Science Act were promoted as pillars of industrial renewal, yet many US allies viewed them as unmistakably "America First" policies in new packaging. European governments openly criticized US subsidies and "Buy American" provisions that diverted investment away from Europe toward the US. Concerns spread from Paris to Berlin that Washington was effectively weaponizing economic policy against friends.

In other words, some allies increasingly felt they were being asked to provide the oil to keep the US' engine running while absorbing the economic losses themselves. This exposes the inherent weakness of Blinken's coalition logic. Partnerships cannot endure if they are built primarily around pressure, fear and asymmetric sacrifice, which the former US administration branded as a moral imperative. Nor can strategic stability emerge from attempts to divide the world into opposing camps.

The reality is that China is not an enemy. It is a major partner with which the US should learn to coexist. That is precisely why the new vision jointly advanced during Trump's visit to China last week — of building a constructive bilateral relationship of strategic stability — deserves serious attention. It reflects valuable lessons drawn from decades of Sino-US engagement.

The "constructive strategic stability" is a positive stability with cooperation as the mainstay, a sound stability with moderate competition, a constant stability with manageable differences, and an enduring stability with promises of peace.

Those who still cling to outdated bloc politics should do their homework carefully. Until those like Blinken in Washington's policy circle step out of their "comfort zone", it will be difficult for US policymaking to shed the musty odor of the Cold War playbook.

— LI YANG, CHINA DAILY

What They Say

Stable supply chains smooth economic circulation

Editor's note: *China released regulations for industry and supply chain security in April. China Economic Times spoke to Wei Jigang, a researcher at the Development Research Centre of the State Council, on the resilience and security of the country's supply chain system. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Supply chains represent a form of core competitiveness, reflecting a country's ability to coordinate production, match supply with demand, manage risks and improve efficiency. Supply chains have increasingly become a governance tool tied to industrial development, security guarantees and international cooperation.

Domestically, supply chains are critical to ensuring smooth economic circulation and unlocking the advantages of China's vast domestic market. Internationally, they are a strategic instrument for participating in global competition, expanding development space and safeguarding national interests.

For industries, they serve as the driving force behind technological upgrading and high-quality growth. From a security perspective, they protect against external shocks and ensure stability in critical sectors.

The development of high-quality industry chains requires coordinated efforts across strategic planning, technological innovation, digital transformation, security protection and ecosystem building.

First, China should strengthen its top-level institutional design and improve its strategic support systems. Supply chain development should be incorporated into national development plans, while cross-regional and cross-sector coordination mechanisms should be enhanced.

The legal and regulatory framework needs improvement. Greater support should be provided in finance, technology, talent and industrial policy to foster globally competitive leading enterprises as well as specialized and innovative small and medium-sized firms.

Second, China should focus on key sectors and strengthen both weak and competitive links. Tailored policies should be introduced for major industries such as manufacturing, energy, food security, information technology and transportation. For bottleneck technologies such as semiconductors, machine tools and critical components, resources should be concentrated on achieving technological breakthroughs and greater self-reliance.

Meanwhile, China should consolidate its advantages in areas such as new energy, 5G, high-speed rail and construction machinery to strengthen its position in the global industrial competition.

Third, digital and intelligent technologies should drive supply chain modernization. Under the national action plan for digital and intelligent supply chains, technologies such as big data, artificial intelligence, the internet of things and blockchain should be more deeply integrated into supply chain management.

Fourth, development and security must be advanced together. China should establish a multilevel supply chain security framework featuring risk monitoring, early-warning systems, stress testing and emergency response mechanisms for critical sectors.

Strategic reserves and emergency production capacity for key products should also be improved. In addition, legal and policy tools should be strengthened to address external risks and safeguard China's supply chain security against containment and disruption.

Finally, green and open development should remain central to the country's future supply chain strategy. China should accelerate the transition toward low-carbon supply chains by promoting green procurement, green manufacturing and environmentally friendly logistics systems.

VIEWS

China and the World Roundtable | China-US Relations of Strategic Stability

Editor's Note: *The symposium on the Future of China-US Relations was conducted by China Daily's Opinion Channel, the Institute of American Studies of the Chinese Academy of Social Sciences and the Chinese Association of American Studies on Thursday. Several experts from both China and the United States shared their views on the theme. Below are excerpts of their speeches.*

Sailing Sino-US relations with stabilizing levers

MA XUEJING / CHINA DAILY

Cooperation is the 'why not' moment for China and US

Siddharth Chatterjee is the CEO of Global Neighbours and former United Nations Resident Coordinator in China.

Today, we face five major challenges unprecedented in the postwar era.

First, the pandemic has exposed the fragility of human health and global health systems.

Second, we are grappling with a triple climate crisis: climate change, loss of biodiversity, and climate refugees.

Third, there are around 80 ongoing conflicts in the world. Fourth, 800 million people are suffering from hunger. Fifth, inequality is widening, whether it is digital, income or quality of life.

A mother in Beijing, Washington, Nairobi or Mali shares the same aspirations for her children: better education, improved nutrition and greater opportunities.

For the first time after World War II, over 170 million people have been displaced because of conflicts, climate change, poor governance, despondency, poverty and other factors.

Having served for 30 years in the United Nations, I firmly believe that the Global Development Initiative presents a massive opportunity for companies from the United States, China and Europe to come together and transform Africa.

The potential is boundless, and limited only by our imagination. Consider how Russia and the US collaborated on the vaccine that eradicated smallpox.

If scientists from the US, China, Germany, India, Russia and other countries work together, we could probably develop vaccines that can prevent future pandemics.

The Sino-US relationship, the most consequential relationship of the 21st century, has the capacity to manage these global challenges that affect everybody across the world.

I speak not as an American and not as a Chinese but as a global citizen with three decades in the UN.

If the US and China can collaborate on the Global Governance Initiative proposed by China at the Shanghai Cooperation Organization meeting last year, the potential is promising.

So why not? Why don't we see the Build Back Better Act of the US and the Global Development Initiative and Global Governance Initiative of China coming together for a transformative change?

To conclude with the remarks of George Bernard Shaw, who said: "You see things; and you say 'Why?' But I dream things that never were; and I say 'Why not?'"

This is the "why not" moment for China and the US.

Summit helps to strengthen responsible major-power relations

Fred Teng is the president of the America China Public Affairs Institute.

The May 14 Beijing meeting between the two heads of state represents a serious attempt to move China-US relations from confrontation management to strategic stability.

Confrontation can lead to uncertainties and severe repercussions, with farmers, students, researchers, manufacturers, and consumers all paying the price.

That is why this summit matters.

A "constructive China-US relationship of strategic stability" does not mean the two countries agree on everything — they clearly do not — but that they recognize that unmanaged rivalry is dangerous.

The goal is not to eliminate competition but to discipline it.

There are five important outcomes of the summit.

First, trade and tariffs. The reported extension of the tariff truce sends a direct signal to the markets. Politicized tariffs have become weapons triggering higher costs, disrupting supply chains and damaging confidence.

Easing tariffs, especially on agricultural products, supports US farmers, helps Chinese importers and consumers and reduces one of the most visible sources of economic friction.

Second, institutional mechanisms. The proposed economic, trade and investment review channels matter because they replace sudden escalation with structured negotiation.

A mechanism does not solve every dispute, but it creates space to talk before disputes become crises. That is how serious great-power relations must be managed.

Third, technology. This remains the hardest area.

High-end AI chips, advanced lithography machines, and military-related technologies might remain restricted.

But the reported easing of certain mid-range chips and equipment restrictions suggests a more practical distinction between strategic technology and normal commercial technology.

That distinction is essential to avoid a technological Cold War, from which neither country benefits.

Fourth, people-to-people exchanges. This may be the most overlooked achievement.

Visas, flights, students, scholars, businesspeople and tourists are not side issues.

They are the human foundation of the relationship. Restoring direct flights and longer-term visas is not symbolic but practical diplomacy to foster trust.

Fifth, crisis management. Restarting fentanyl-related law enforcement cooperation moves the issue from accusation to action.

Restoring military communication channels helps reduce the risk of miscalculation in the South China Sea and the Taiwan Strait.

Hotlines are not signs of weakness but signs of strategic maturity.

Of course, this is not a full reset. But diplomacy should not be judged only by whether it solves everything.

It should also be judged by whether it prevents the worst outcomes.

The real choice before China and the US is not friendship or confrontation but managed competition or unmanaged rivalry.

If these understandings reached in Beijing are implemented seriously, this summit may mark an important step toward stability, predictability, and responsible major-power relations.

And in today's world, that is a major advance.

Beijing summit matters more than immediate headlines

Einar Tangen is a commentator on US current affairs.

For years, the dominant assumption surrounding US-China relations was that deterioration had become irreversible and the world's two largest economies were drifting toward a modern version of the Thucydides Trap, the historical pattern where rising and established powers slide into conflict.

Yet what unfolded in Beijing last week may force us to reconsider that assumption.

The easy interpretation is to dismiss the summit between the two heads of state as just optics: Washington received Boeing headlines and export announcements and Beijing gained goodwill while projecting confidence and stability.

But the reactions afterward suggest something more substantial may be emerging — the outline of a "grand bargain", a strategic understanding where both sides continue competing, but within mutually recognized limits designed to avoid systemic rupture.

The agreement to define a "constructive China-US relationship of strategic stability" reflects concepts that Beijing has pursued for years: managed competition, coexistence, and recognition that neither side can eliminate the other from the international system.

For China, stability is the prerequisite for peace and progress.

The appeal of a broader bargain also exists on the US side, especially for the Donald Trump administration.

A grand bargain with China offers it the ability to reframe its policy as the mechanism that produced peace and strategic advantage — reduced tensions between the world's two largest economies, expanded US exports to China, and stabilized global supply chains.

This explains why the Beijing summit may matter far more than the immediate headlines suggest.

The deeper issue is whether Washington and Beijing are beginning to accept a common reality — that neither side can achieve absolute dominance without imposing catastrophic costs on itself and the world; that China is not collapsing; and that the US remains indispensable to global finance, technology, consumption, and security architecture.

And most importantly, both countries now require stability more than escalation.

If Beijing and Washington are now exploring ways to manage global strain together rather than intensify it, historians may eventually look back at this summit very differently from the way contemporary commentators initially framed it.

Truly seismic shifts in geopolitics rarely announce themselves clearly and more often first appear as optics.

Peoples' bonds timeless pillar for Sino-US ties

Zhao Mei is a research fellow at the Institute of American Studies, Chinese Academy of Social Sciences.

At an international symposium commemorating the victory in the World Anti-Fascist War late last year, I spoke about the Flying Tigers, General Joseph Stilwell, and the rescue of the Doolittle Raiders.

The United States moderator, with tears in her eyes, added that her father was one of the US pilots rescued by Chinese soldiers and civilians.

The attendees were deeply moved by this heartfelt bond between the Chinese and US people.

The friendship across the Pacific spans over two centuries.

In 1784, the US merchant ship Empress of China arrived in Guangzhou, initiating the first exchange.

In 1879, Ge Kunhua, a scholar from the late Qing Dynasty, taught the Chinese language at Harvard University.

In 1901, a Chinese laborer named Dean Lung donated $12,000 to support the establishment of East Asian Studies at Columbia University.

Among the Chinese students studying in the US, Zhou Peiyuan, Zhu Kezhen, Qian Xuesen, Qian Weichang, and Liang Sicheng made significant contributions to the development of science, education and culture in China.

Richard Sears, known as "Uncle Hanzi", founded the website named Chinese Etymology, which now features nearly 100,000 ancient Chinese character forms.

The website has ignited a passion for learning Chinese characters and culture among many foreigners.

Such "cultural ambassadors" have made significant contributions to enhancing mutual understanding and learning between the two civilizations.

Since the establishment of diplomatic relations between China and the US, Sino-US relations have weathered twists and turns but have generally remained stable.

Throughout this period, people-to-people exchanges have been a crucial pillar supporting the steady development of the bilateral relationship.

However, since 2018, headwinds have emerged, causing more than 100 dialogue and exchange mechanisms to largely come to a halt.

The number of students studying in both countries has also declined.

In April 2024, a US newspaper warned that the decrease in US students in China could result in a lost generation of China experts in the US.

History shows that mutual engagement between the Chinese and US people has repeatedly helped the bilateral relationship overcome its low points.

In 1971, ping-pong diplomacy broke the ice of estrangement.

In 1979, Deng Xiaoping, then Chinese leader, attended a welcoming event hosted by the US side, where he warmly interacted with US children singing a Chinese song, an exchange that was met with applause and was hailed as an iconic moment in China-US relations.

Today, dialogue, exchanges, and cooperation continue to provide a steady stream of positive energy for deepening mutual understanding and promoting the healthy development of the bilateral relationship in a complex international landscape.

Scientific cooperation and educational exchanges mutually beneficial

Denis Simon is a senior research fellow at the Quincy Institute for Responsible Statecraft.

After the establishment of diplomatic relations in 1979, the United States and China built one of the world's largest bilateral scientific and educational relationships.

The 1979 US-China Science and Technology Cooperation Agreement became one of the most important scientific partnerships in modern history and provided the institutional foundation for decades of collaboration.

At the same time, educational exchanges exploded.

Hundreds of thousands of Chinese students studied in the US, while thousands of US students studied in China.

Joint research programs connected universities, laboratories, companies and government agencies.

This relationship accelerated China's modernization, strengthened US universities and research labs, increased scientific productivity globally, and created deep people-to-people ties between the two societies.

For nearly four decades, scientific collaboration and educational exchanges remained among the most stabilizing and constructive dimensions of the US-China relationship. The benefits were real and mutual.

Chinese students and scholars became deeply integrated into the US innovation system.

Many remained in the US and contributed significantly to the development of US universities, Silicon Valley, biotechnology, semiconductors and entrepreneurship.

At the same time, Chinese students returning home helped build China's research universities, technology sector, AI ecosystem, and industrial innovation capacity.

The relationship was never a one-way transfer of knowledge. Instead, it became an interdependent innovation ecosystem. However, since roughly the late 2010s, the relationship has shifted.

Mutual concerns of both countries have led to declining trust, reduced institutional cooperation, greater scrutiny of researchers and the fragmentation of global science networks.

Concerns emerged in Washington over issues such as intellectual property protection, technology transfer, export controls and dependency in critical technologies as policymakers concluded that advanced technologies could no longer be separated from national security considerations.

China, in turn, became concerned about technological containment, semiconductor restrictions, visa scrutiny, limitations on academic collaboration, and barriers to accessing US research ecosystems.

A realistic assessment suggests that the era of broad, optimistic engagement is over.

The future of US-China scientific relations is unlikely to return to the openness of the 1990s or 2000s.

But a complete scientific divorce is neither realistic nor desirable. It will be defined by how successfully the two countries manage a difficult coexistence.

I remain cautiously optimistic about the future. Strategic competition in science and technology may continue for years to come.

Yet history also shows that scientific collaboration and educational exchange can create channels of communication and reduce misperceptions even during periods of geopolitical rivalry.

The central challenge for both countries is whether they can protect legitimate national security interests while preserving enough openness to sustain innovation, academic inquiry, and global problem-solving.

The stakes are not simply bilateral but global.

The views don't necessarily represent those of China Daily.

GLOBAL VIEWS

DARYL GUPPY

Unity or division

The APEC meeting in Suzhou is a key point to reaffirm multilateral rules prior to the leaders' meeting

SONG CHEN / CHINA DAILY

The 32nd Asia-Pacific Economic Cooperation trade ministers' meeting in Suzhou, Jiangsu province, convenes at a critical time when many businesses and organizations fear that the rules governing the global trading environment are fraying. The fears have been compounded by the unrest in the Strait of Hormuz, which has exposed the fragility of international rules and the vulnerability of global supply chains.

With its focus on major economic and trade issues in the Asia-Pacific, the meeting in Suzhou on Friday and Saturday is an important part of this year's APEC cooperation process and provides a platform for determined action to support the multilateral trading system based on the World Trade Organization rules.

The trade ministers' meeting aligns with the theme of the APEC "China Year", "Building an Asia-Pacific Community to Prosper Together", which emphasizes openness, innovation and cooperation.

According to China's Ministry of Commerce, the major focus of the APEC trade ministers' meeting in Suzhou is on strengthening regional cooperation amid slowing global growth and increasing trade uncertainty. Such regional cooperation can provide a counterbalance to the disruptions in the trade environment.

The Suzhou meeting is a key decision point, allowing the APEC middle powers and smaller economies in the Global South to focus on supporting the basis of international trade. Reaffirmation of a common unity and determined support for multilateral solutions in preference to unilateral action will send a message to those forces that are disrupting global trade. The proposals from the Suzhou meeting will help set the agenda for the future of trade relations within the APEC region.

The catalyst for distraction is the security of oil and product supply chains from the Middle East. Although the media focus is on oil supplies, the impact of the obstructions in the Strait of Hormuz is far more diverse, including disruptions to the supply of agricultural fertilizer, the feedstocks for the production of plastics and the specialist gases required for semiconductors and other industries.

These are important supplies whose disruption has the potential to trigger social dislocation, but it is important that they do not detract from the strategic issues that the APEC meeting in Suzhou also needs to consider. These include a cluster of trade development issues and the broader question of support for the international trade environment.

Li Chenggang, China's international trade representative with the Ministry of Commerce and vice-commerce minister, highlighted this strategic task when he noted that China will work with all APEC members to promote consensus on building an open and predictable regional and multilateral economic and trade order.

The emphasis on an "open, predictable and multilateral economic and trade order" provides the basic logic for the Suzhou meeting. Reaching consensus on this objective would further enhance the status of APEC.

Consensus would signal a commitment to supporting multilateral solutions and rejecting unilateral diktat. Such consensus would explicitly deny arbitrary orders or settlements imposed by a superior authority which are typically without negotiation or consent.

It is this multilateral framework that will enable and empower the trade ministers' discussions on deepening cooperation in emerging sectors including the digital economy, green development and supply-chain resilience. These objectives are only achievable by creating a more open, stable and predictable trade environment.

Support for these objectives is consistent with China's long-term support for the authority of the United Nations, as demonstrated by the four global initiatives that China has put forward.

These initiatives are designed to help reform the international governance systems and promote a community with a shared future. They address global challenges through cooperation, development, and enhanced multilateralism with the UN at the center. APEC is consistent with these proposals because it strengthens regional economic and trade cooperation amid slowing global growth and increasing trade uncertainty.

These global objectives can be placed within a regional context via the Suzhou meeting, which is expected to help push forward regional economic integration and reinforce support for the rules-based multilateral trading system.

In the fast-moving world of artificial intelligence, quantum computing and digital economy, it is essential that trade ministers consider ways to enhance digital cooperation, which goes hand-in-hand with the development of the green economy.

APEC has a record of introducing practical measures that boost economic productivity. The Suzhou meeting can consider policy proposals including the wider and coordinated use of electronic bills of lading and digital port networks. Standardization in these areas would improve port and trade efficiency with faster customs clearances and shipping processes.

Moreover, one of APEC's most important gatherings of the year can prove decisive by reaching a key consensus to observe multilateral unity and reject the path of balkanization and fragmented self-interest.

As a member economy of APEC, Australia places great importance on the stable and positive trade performance with other APEC economies. In 2024, bilateral trade in goods between China and Australia reached $211.27 billion, marking an 85.6 percent increase from 2015, and accounting for 24 percent of Australia's total foreign trade.

According to the "China Business Environment Brief" released by the China-Australia Chamber of Commerce, 70 percent of Australian companies view China as their top investment destination, with half planning to expand their presence there. China's vast market of 1.4 billion people, with a growing middle-income group, has a strong demand for high-quality Australian food, health products and services. This is a "big pond" that no forward-thinking business can afford to overlook.

The APEC trade ministers' meeting in Suzhou presents a fresh opportunity for China-Australia cooperation. In the future, there can be deeper collaboration in optimizing trade structures and promoting trade diversification, fully leveraging the APEC cooperation mechanism to inject lasting vitality into the economic prosperity and stability of the Asia-Pacific region.

ZHANG YUN

Restorative process

APEC ministerial meeting can help revive confidence in regional economic integration and globalization

SHI YU / CHINA DAILY

The 32nd APEC Ministers Responsible for Trade Meeting takes place in Suzhou, Jiangsu province, on Friday and Saturday. It serves as a key preparatory session for the APEC Economic Leaders' Meeting, scheduled to be held in Shenzhen, Guangdong province, in November. The meeting comes against the backdrop marked by last year's tariff war launched by the United States, and the US-Israeli war against Iran, which has produced intense shocks to energy markets and global supply chains.

The current international situation is arguably the most volatile and uncertain since the end of the Cold War. Regional conflicts and disputes are flaring up. Trade protectionism in the name of economic security is spreading. And confidence in the post-World War II multilateral global governance framework has been severely shaken.

In these times of compounding turmoil, Asia-Pacific economies need to return to APEC's founding mission and reaffirm their confidence in regional economic integration and globalization. As President Xi Jinping emphasized at the 2025 APEC meetings in Gyeongju, the Republic of Korea: "We should stay true to APEC's founding mission to promote economic growth and improve people's lives." As the world's second-largest economy, China is the top trading partner of nearly all APEC members. Its rapid development model illustrates how opening-up and shared growth with other economies can work. China has economic and trade ties with almost all countries and regions worldwide, pursuing equal and mutually beneficial development under World Trade Organization principles. It has achieved remarkable success through openness, inclusiveness and sharing.

China is willing to share its development opportunities with other countries. It is hosting the APEC meetings for the third time, which is testament to its commitment to development through opening-up and sends a strong message that it continues to uphold free trade and inclusive development.

This year also marks the start of China's 15th Five-Year Plan (2026-30) period. The country will make moves to expand its openness and strengthen its global economic connectivity. With high-quality development goals in place, China's market will expand in scale and improve in quality, offering a counterweight to the sluggish growth trend in international trade, especially for the Asia-Pacific region. China is the world's second-largest consumer market and import market, at nearly 50 trillion yuan ($7.35 trillion) and about 20 trillion yuan, respectively. Rising incomes, expanding demand and consumption upgrading will provide sustained momentum for regional economic integration.

As a major economic powerhouse, Jiangsu province has benefited from China's opening-up drive and its integration into the world economy. According to statistics from customs authorities, the province's foreign trade volume reached 5.95 trillion yuan in 2025, accounting for 13.1 percent of China's total. And in the first two months of this year alone, Suzhou's total imports and exports surged by 27.3 percent to 514.51 billion yuan, accounting for 6.7 percent of the national total and 49.8 percent of Jiangsu province's total. In short, Jiangsu province and Suzhou exemplify China's open economy and the country's steady push toward institutional opening-up and international cooperation in the new era.

The APEC Ministers Responsible for Trade Meeting in Suzhou can help channel positive energy into trade frictions management through equal consultation, and prevent normal economic activities from being overly politicized or securitized. In recent years, there have been growing claims that economic globalization and interdependence undermine national security and harm domestic economies. In the name of economic security, some economies have adopted various legislative measures and investment restrictions, leading to a decline in cross-border investment and rising risks facing industry and supply chains. These protectionist measures, in essence, reduce economic efficiency and dampen confidence in free trade and investment.

Yet the process of economic globalization will not be stopped, nor reversed. The current international economic turbulence reflects a deeper transition in global trade rules and order. As core stakeholders, Asia-Pacific economies must shoulder the responsibility of improving those rules and order. Just as in international politics, disputes and differences among countries are normal. Trade frictions and disputes are not inherently fearsome; the key lies in how they are handled. During complex transitions, destructive factors — such as erecting walls and barriers — are on the rise. But constructive forces are also at work, building consensus, strengthening connectivity, and countering fragmentation and bloc formation through integration. The former are driven by short-term self-interest; the latter are rooted in long-term strategic planning.

The APEC trade ministers' meeting in Suzhou can answer a long-term strategic question: What kind of trade and economic order should the Asia-Pacific region build? The Asia-Pacific economies vary greatly in size, systems, cultures and development levels. Their achievements in economic development and integration have been built on the principles of equality, inclusiveness and mutual benefit. In 2025, China initiated and promoted the establishment of the International Organization for Mediation in the Hong Kong Special Administrative Region, offering an Asia-Pacific solution and wisdom for resolving international trade disputes.

As the host of this year's APEC meetings, China will rally efforts toward the ambitious goal of building an Asia-Pacific community. Faced with rising protectionism, Asia-Pacific economies cannot afford to merely worry about the global outlook or retreat into self-protection. Instead, they must work to solidify consensus and prevent the region's trade order from sliding into the law of the jungle.

The theme for the APEC "China Year" is "Building an Asia-Pacific Community to Prosper Together". This is about answering the question of where the Asia-Pacific is heading. Setting the goal of building an Asia-Pacific community will provide clear direction and stability for regional development. As Foreign Minister Wang Yi stated at the APEC Senior Officials' Meeting in Guangzhou in February, "China will focus on the three priorities of openness, innovation and cooperation", and "we should reaffirm the original aspirations of Asia-Pacific cooperation, focus on the future of APEC and work toward a clear, substantive outcome document at this year's leaders' meeting", holding high "the banner of building an Asia-Pacific community, and exploring objectives and a road map for community-building in the period ahead".

The APEC Ministers Responsible for Trade Meeting in Suzhou and the APEC Economic Leaders' Meeting in Shenzhen will play a critical role in restoring confidence and effectively helping reform the multilateral trade governance system across the Asia-Pacific region and the wider international community.

Nation ramps up ultra-deep gas development

Domestic AI solutions help unlock reserves buried 4,500 m underground

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

As global energy markets grow increasingly volatile, China is looking deeper underground to insulate its economic engine.

The ability to unlock massive, ultra-deep subterranean reserves is no longer just an engineering triumph, but has become a vital geopolitical shield, allowing the world's second-largest economy to steadily replace vulnerable foreign gas imports with a homegrown "ballast stone" of energy security.

At the heart of this strategic shift is the newly certified Ziyang Dongfeng shale gas field in the Sichuan Basin, China's first ultra-deep shale gas field of this scale.

Operated by State-owned energy giant China Petroleum and Chemical Corp, or Sinopec, the field passed the Ministry of Natural Resources' review on May 13 with proven geological reserves totaling 235.69 billion cubic meters.

Tapping into this immense energy reservoir pushed Chinese exploration into uncharted territory. The gas lies trapped within the Earth's oldest commercially discovered shale layer, formed over 540 million years ago. To extract these resources, engineers had to drill to punishing depths ranging from 4,500 to 5,200 meters, said Sinopec.

Operations at this subterranean level present world-class geological challenges, including complex accumulation mechanisms, thick and difficult-to-drill rock formations, and extreme high-temperature and high-pressure conditions, it said.

By integrating artificial intelligence into geophysical imaging and developing fully proprietary ultra-deep drilling and fracturing systems, domestic engineers successfully cracked these global bottlenecks to turn theoretical reserves into commercially viable yields.

Industry experts emphasize that unlocking these staggering reserves substantially elevates China's domestic natural gas self-sufficiency.

In an era marked by severe geopolitical unpredictability and sharp fluctuations in international oil and gas prices, heavy reliance on imported energy can expose a country to imported inflation and supply disruptions, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Tapping into domestic mega-reserves like Ziyang Dongfeng effectively cushions Chinese industrial supply chains and consumer markets from these external shocks. By lowering the nation's overall external dependence, the newly proven reserves act as a crucial stabilizing force, ensuring that energy supply remains uninterrupted despite global market turbulence, Lin added.

This achievement strongly aligns with the broader strategic framework outlined by the National Energy Administration.

For decades, China's fundamental resource endowment has been officially characterized by the NEA as being "rich in coal, poor in oil and short of gas". To bridge the domestic supply gap and enhance self-reliance, the NEA has systematically prioritized the exploration of unconventional oil and gas resources.

According to the NEA's ongoing assessments, as homegrown exploration technologies have matured over the past decade, shale gas has emerged as an indispensable pillar for the country's sustainable reserve growth.

Securing massive, stable domestic outputs is considered vital to accelerating China's broader green energy transition while maintaining economic stability, it said.

The NEA has consistently stressed that in the face of increasingly complex global geopolitical dynamics, national energy security must be anchored by robust, autonomous production capabilities.

Overcoming these ultra-deep hurdles provides a replicable technical pathway to expand China's development frontier. Moving forward, the accelerated capacity growth of the Ziyang Dongfeng field will ensure that China retains firm control over its energy destiny, reinforcing the nation's resilience amidst a complex and shifting global landscape, said Sinopec.

Consumers gather at a Mixue store in Bangkok, Thailand, on March 21. Mixue is a Chinese beverage brand. PATRICK CHENGZHI WANG / LIGHTROCKET VIA GETTY IMAGES

Beyond EVs, electronics, more Chinese brands surge across ASEAN markets

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

4,153
number of Mixue's overseas stores by April

Chinese consumer brands are rapidly expanding across Southeast Asia, moving beyond electronics and electric vehicles into sectors such as beauty, food service and home appliances, according to a report by Euromonitor International.

Its "Rise of Chinese Brands in Southeast Asia" report found that the ASEAN economies of Indonesia, Malaysia, the Philippines, Singapore, Thailand and Vietnam account for 95 percent of the region's $4 trillion GDP. The region has become the largest and fastest-growing export destination for Chinese goods.

In 2024, China's exports to Southeast Asia reached $587 billion, up 12 percent year-on-year. More than 70 percent of Chinese companies operating in ASEAN plan further expansion, citing strong performance and untapped consumer demand, said the China Council for the Promotion of International Trade.

With a population exceeding 650 million, 63 percent under 40 and a median age of 31, Southeast Asia's consumer market is thriving. This demographic fuels demand for e-commerce, livestreaming shopping, fintech solutions and affordable premium products.

Countries like Vietnam and Indonesia are outpacing China in GDP growth, offering Chinese brands a rapidly expanding consumer base with rising disposable incomes and accelerating urbanization, said the report.

Chinese companies have long dominated sectors such as EVs, consumer electronics and home appliances. In EVs, BYD is now the top brand in most Southeast Asian markets and the number-one car brand in Singapore, surpassing Toyota. In home appliances, Chinese brands' share of the air conditioner market rose from 9 percent in 2015 to 25 percent in 2024. Haier, Midea and Gree have become household names. In smartphones, Chinese brands' market share has increased from 21 percent in 2014 to over 60 percent today.

Now, Chinese companies are breaking into sectors once considered difficult for foreign entrants. In beauty and personal care, mass-market skincare brands achieved a 115 percent compound annual growth rate (CAGR) from 2019 to 2024. In the consumer food and beverage sector, chains such as Mixue, Luckin Coffee and Chagee are expanding aggressively. Mixue outlets grew 80 percent between 2019 and 2024, and by April 2026, Mixue had 4,153 overseas stores, while Chagee reached 262, said the China Chain Store and Franchise Association.

Nathanael Lim, APAC insight manager for beverages at Euromonitor International, said: "Chinese coffee and tea chains maintain consumer interest through relentless product innovation, often unveiling new menu items monthly. Significant investment in research and development and direct ingredient sourcing allows them to craft unique flavors that resonate with local palates."

Partnerships with local players are also central to expansion. In January, Eastroc Beverage signed a cooperation agreement with Indonesia's Salim Group to establish a joint venture, with investments of up to $200 million. Since 2021, Eastroc has exported products to 30 countries and regions.

Euromonitor said deep localization is key to Chinese brands' success, surpassing mere price competition. Many beauty and F&B companies register as local entities, adapt products for tropical climates and employ local teams for livestreaming and marketing activities.

"To move beyond transactional entry points, Chinese companies must transition from exporters to long-term ecosystem participants. Embedding within local value chains, adapting to cultural and economic contexts, and cultivating trust — through local manufacturing, customer service and community engagement — will be essential to sustaining growth," the report said.

China-Africa corridor enters new era of industrial, green cooperation

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

The China-Africa corridor is emerging as one of the world's most important economic partnerships as cooperation shifts beyond traditional resource trade toward industrial development, green investment and deeper supply-chain integration, business and financial leaders said at a forum in Beijing.

Speaking at the China-Africa Financial Bridges Forum 2026 on Wednesday, Youssef Rouissi, deputy CEO of Attijariwafa bank, said the bank recognized years ago that the China-Africa corridor would become "one of the defining economic realities of our era".

As Morocco's largest bank and one of Africa's leading financial groups, Attijariwafa bank is ready to serve as the financial bridge between China and Africa, he said.

Rouissi said China's decision to implement zero tariffs for 53 African countries with diplomatic ties to China, effective May 1, signals a long-term strategic commitment rather than simply a trade measure.

"It is the clearest signal that China sees Africa not as a supplier of raw materials, but as a partner in a shared economic future," he said, adding that the policy is expected to create new momentum for trade finance and improve the competitiveness of African industries and small businesses.

> "It is the clearest signal that China sees Africa not as a supplier of raw materials, but as a partner in a shared economic future."
>
> **Youssef Rouissi,** deputy CEO of Attijariwafa bank

Bill Feng, APAC regional contributor relations senior manager at London Stock Exchange Group, said China-Africa cooperation is increasingly focused on balanced trade and industrial collaboration. He noted that the zero-tariff policy will not only encourage African exports to China, but also help retain more processing, manufacturing and value-added activities within Africa.

Feng said Chinese companies' acquisitions and investments in African industrial assets have become a new driver of bilateral economic and trade cooperation, particularly in resources, energy and power sectors. Over the past five years, Chinese companies' mergers and acquisitions in Africa have highlighted three major trends: a growing focus on new energy resources and critical minerals such as lithium and gold; expansion of the building materials sector to support infrastructure, urbanization and industrial parks; and a shift from simple trade procurement toward deeper participation in local assets and industrial development.

"Africa is becoming one of the centers of global supply-chain restructuring, competition for critical minerals, green transition and infrastructure financing," Feng said. "The next stage of China-Africa cooperation will focus not only on infrastructure connectivity, but also on green development, industrial-chain integration and the co-creation of long-term value."

Lyu Xiaohui, vice-president of the China-Africa Development Fund, said Africa's demand for sustainable, high-quality and green investment is both urgent and far greater than previously expected.

"In the past, we thought Africa's greatest needs were infrastructure such as transportation and electricity. In fact, we have found that what Africa urgently needs is local processing capacity, the establishment of local industrial chains and the development of self-sustaining capabilities. There is a pressing need to implement green energy, high-end manufacturing and industrial cooperation in Africa," Lyu said.

He added that the strengths China has developed through its modernization and industrialization over the years align closely with Africa's needs, creating strong long-term opportunities for both sides.

Youssef Rouissi, deputy CEO of Attijariwafa bank, speaks at the China-Africa Financial Bridges Forum 2026 in Beijing on Wednesday. PROVIDED TO CHINA DAILY

Rouissi highlighted Morocco's role as a manufacturing and logistics hub, particularly in the electric vehicle and renewable energy sectors.

"We are seeing more industrial projects entering Morocco, with Chinese investors leveraging the country's strategic position as a gateway for global trade and investment, particularly through its logistics network and access to European markets," he said.

Rouissi also emphasized the growing importance of technology, innovation and services in Africa, noting that startups and fintech companies are flourishing across the continent, creating significant opportunities for Chinese companies to invest and expand.

Attijariwafa bank serves more than 12 million clients through a network of over 8,000 branches. The bank has established a strong presence in North, West and Central Africa, where it is enhancing partnerships and synergies with Chinese financial institutions to help provide Chinese investors and banks with a stronger local presence, he said.

Quectel sues US DoD over blacklisting

By **CHENG YU**
chengyu@chinadaily.com.cn

Chinese wireless communications module maker Quectel Wireless Solutions sued the US Department of Defense recently after Washington placed the company on a blacklist of firms allegedly linked to China's military.

"Quectel has always operated with integrity, transparency and full compliance with the laws and regulations of every jurisdiction in which we do business," the company said in a statement, strongly denying any ties to the Chinese military.

The lawsuit challenges the Pentagon's January decision to add Quectel to a list of so-called Chinese military companies. Quectel is one of the world's largest suppliers of wireless communication modules used in IoT (the internet of things) devices, ranging from smart cars and industrial equipment to logistics systems and consumer electronics.

The Pentagon has increasingly expanded its blacklist of Chinese technology firms in recent years as Washington seeks to curb Beijing's rise in technology. The latest list of Chinese companies, mandated under US law as the "Section 1260H list", designated 134 companies, including chipmaker ChangXin Memory Technologies, Quectel Wireless Solutions and drone maker Autel Robotics.

In fact, the move came just weeks after the Pentagon removed two companies, including Advanced Micro-Fabrication Equipment Inc China, a leading Chinese chip equipment manufacturer, from the blacklist.

> "Their goals have been unmasked, that is, to suppress emerging Chinese companies and industries and curb China's tech rise at minimal cost."
>
> **Tu Xinquan,** dean of the University of International Business and Economics' China Institute for WTO Studies

AMEC, which said it has never been involved in military activities, filed a federal lawsuit against the decision in August. The court ruled in December that there was "insufficient evidence" to justify the decision.

In 2021, Chinese smartphone maker Xiaomi filed a lawsuit against the US DoD over the same blacklist. Four months later, Xiaomi was removed from the list.

Last year, the Pentagon also removed six companies it said no longer met the requirements for the designation, including artificial intelligence company Beijing Megvii Technology, China Railway Construction Corp, China State Construction Group and China Telecommunications.

Tu Xinquan, dean of the University of International Business and Economics' China Institute for WTO Studies, said that US suppression has become increasingly unreasonable and lacks legitimacy.

"Their goals have been unmasked, that is, to suppress emerging Chinese companies and industries and curb China's tech rise at minimal cost," Tu said.

"However, the more Washington escalates its measures against China, the less effective these measures prove to be, and the more they reveal their underlying fears," he said.

Brian Tycangco, an editor and analyst at Stansberry Research, posted on social media platform X, "It's turning out that if you're an innovative Chinese business making money, you're likely to be considered a threat to US national security."

Growing demand for US pistachios

Country imported fruits, nuts worth $5.88 bln in first four months of 2026

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Driven by rising demand for healthy snacks among Chinese consumers, nut growers in California, the United States, are expected to export 111,000 metric tons of pistachios to China in the 2026 crop year (Sept 1, 2026 to Aug 31, 2027), according to a major US industry player.

Wonderful Pistachios and Almonds LLC, or Wonderful Pistachios, the largest pistachio producer by production volume and sales revenue in the US, projected that total California pistachio shipments to China by the company and other growers could reach 110,000 tons in the 2025 crop year (Sept 1, 2025 to Aug 31, 2026), up 3.8 percent from 106,000 tons in the previous crop year.

Anita Lam, managing director for China and chief representative for Asia Pacific at Wonderful Pistachios, said the industry remains confident about the long-term growth potential for Californian pistachios in the Chinese market, and her company will continue leveraging its vertically integrated supply chain and longstanding operations to deepen its presence in the country.

Lam said the Los Angeles-based company is well-positioned to meet growing demand from the Chinese market, backed by more than 500,000 acres (202,300 hectares) of pistachio orchards in California and over $1 billion invested in next-generation processing facilities, while pistachio acreage in the state continues to expand at an annual rate of 6 to 10 percent.

Having cultivated the Chinese market for nearly two decades, Wonderful Pistachios has developed strong local expertise. Its local team closely tracks consumer preferences, allowing it to tailor products and marketing strategies to evolving demand, particularly as consumption shifts beyond major cities.

To create new channels for foreign products entering the Chinese market, the Ministry of Commerce launched the "Big Market for All: Export to China" initiative in November, a move business experts said underscores China's commitment to further unilateral opening-up and consumption upgrading.

Against this backdrop, Lam said opportunities are expanding as health awareness spreads from top- and second-tier cities to lower-tier markets. Younger consumers, in particular, are showing a growing appetite for nutritious snacks, with pistachios gaining traction due to their high protein and dietary fiber content.

"At the same time, digital platforms such as Douyin and WeChat are accelerating the shift from seasonal gifting to everyday consumption," said Lam, adding that through short videos and collaborations with key opinion leaders, pistachios are increasingly positioned as snacks for fitness, office breaks and outdoor activities.

She said younger consumers' rapidly evolving tastes and growing expectations for interactive brand engagement are pushing companies to innovate in marketing formats and pursue more cross-industry collaborations.

According to the outline of the 15th Five-Year Plan (2026-30) for national economic and social development, China will strengthen coordination between imports and exports, place equal emphasis on trade in goods and services, and better integrate efforts to attract foreign investment and promote outbound investment.

"We will deepen cooperation with industry partners in China by ensuring stable supply, promoting diversified applications and jointly building a stronger ecosystem for category growth," said Lam.

China imported fruits and nuts worth $5.88 billion in the first four months of 2026, up 0.1 percent year-on-year, said the General Administration of Customs.

Sino-Russian trade riding cross-border trains

By **REN QI**
renqi@chinadaily.com.cn

From Manzhouli Port in North China's Inner Mongolia autonomous region to Russia's Zabaykalsky Krai and Irkutsk Oblast, bustling cross-border trains and a steady two-way flow of tourists highlight thriving industrial cooperation in grain processing, timber production and cultural tourism, serving as a vivid microcosm of upgraded and more efficient bilateral economic ties.

In the workshop of Manzhouli Xinfeng Grain and Oil Industrial Limited Company, the aroma of raw grain fills the air as fully automated production lines operate smoothly. Flaxseeds and oats from Russia undergo hulling, pressing and grinding, transforming into high-quality edible oils and premium coarse cereals before being dispatched across China.

"Following the closed-customs operation of the China-Russia Border Residents' Mutual Trade Zone at Manzhouli railway port in 2024, our 'mutual trade plus' import model has significantly reduced raw material costs and notably boosted profits," said Yang Zhihong, the company's deputy general manager. In 2025, the enterprise's agricultural imports from Russia surged to 19,000 metric tons from about 7,400 tons.

"Border residents enjoy a daily tax-free mutual trade quota of 8,000 yuan ($1,176), and enterprises purchase these imported agricultural products through cooperatives, which lowers procurement costs and provides locals with doorstep income," said Pei Xintong from the zone's economic development bureau.

People learn about Russian handicrafts during a cultural exchange event in Manzhouli, Inner Mongolia autonomous region, on Dec 20. LIAN ZHEN / XINHUA

This trade relies on Russian hubs like the Zabaykalsk grain terminal. As a flagship facility of the Sino-Russian New Land Grain Corridor, it features dual-gauge railways for efficient transfer and dispatch.

Chinese enterprises have formed a complete chain of overseas planting, cross-border logistics, and domestic processing and distribution. Alexander Osipov, governor of Russia's Zabaykalsky Krai, highlighted broad prospects for supplying organic agricultural products to China.

At Manzhouli Tianwang Wood, the sound of sawing echoes as imported Russian timber is cut, polished and assembled into various solid structures.

General Manager Wang Wei recounted the company's evolution from a small workshop in 2010 to a 47,000-square-meter facility with over 60 employees, producing cabins, biomass pellets and solid wood flooring. Recently, the company opened new avenues through livestreaming and customized tourism products.

Forestry is a pillar industry in Russia's Khabarovsk and Zabaykalsky Krais. Welcoming Chinese joint ventures in timber harvesting and processing, Osipov said Zabaykalsky is a major timber supplier to China.

"We use high-quality Russian timber to build zero-formaldehyde solid wood cabins," Wang said. Targeting ecological tourism, the company partners with herdsmen to build tourist spots, integrating timber processing with cultural tourism.

This cooperation has formed an industrial cluster in Manzhouli integrating imports, processing, manufacturing and sales, achieving a multiplication of timber value.

The mutual visa-exemption policy has invigorated cross-border tourism. Inner Mongolia's Hulunbuir, bordering Zabaykalsky Krai, launched a "Tracing the Great Tea Road" route in May 2025, while study tours and activities like the "China-Russia Friendship, Argun Journey" have become prominent calling cards for cultural exchanges.

Russian resources are equally attractive, said Igor Kobzev, governor of Irkutsk Oblast, adding that nearly 40,000 Chinese citizens visited last year. In 2026, the Russian federal government approved a tourism and recreation special economic zone in Baikalsk, offering settled enterprises preferential tax and infrastructure policies.

To attract Chinese tourists, restaurants in Chita and Irkutsk offer Taiga forest and Siberian cuisines, while some mining enterprises have launched industrial tourism featuring factory tours and shopping.

Mineral cooperation remains a crucial direction for industrial integration. Kobzev said resource-rich Irkutsk seeks Chinese partners to jointly develop resources and advance high-end manufacturing, adding that exports of edible oils and mineral water to China will also be expanded to broaden cooperation.

Magnum pins growth on Chinese cravings for sweet indulgence

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

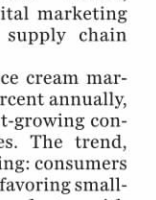
At a sprawling factory in Taicang, Jiangsu province, Peter ter Kulve, CEO of The Magnum Ice Cream Company, watched as a robot dog patrolled the factory complex. Nicknamed *Ne Zha*, the robot conducts 24/7 safety inspections — monitoring temperatures, checking compressor systems and feeding real-time data to the team.

"I want that dog everywhere," he joked.

This mix of cutting-edge automation reflects TMICC's broader strategy. "We have created a business that is very much China for China. But when it comes to technology and innovation, we now take a lot of innovations from here to the rest of the world," ter Kulve said.

While products are tailored to Chinese tastes, the technological advances — like artificial intelligence-driven production — are shared with TMICC operations worldwide.

For ter Kulve — who first arrived in China in 1982 and later led Wall's China from 1999 — the encounter with *Ne Zha* symbolized the dramatic transformation sweeping the country's supply chains. On a recent two-week trip, he observed firsthand how AI, robotics and automation are reshaping production, logistics and retail operations.



Leveraging technology and innovation is key to balancing high quality with affordability, particularly for a leading ice cream company like TMICC, he said. Precision manufacturing has also helped narrow the price gap with local competitors by minimizing waste and optimizing ingredient usage. For example, innovative products such as the Cornetto seven-layer ice cream stick now retail for just six yuan ($0.88).

Yet, the transformation isn't just technological. Chinese consumers themselves have evolved. "People used to want something cheap and large or foreign," he recalled of 25 years ago. "Now, they are sophisticated, discerning and exposed to the best from around the world. Yet, they also want the best to be Chinese."

TMICC has embraced this shift. China remains a strategic market for the company. Since being demerged from Unilever in 2025 and its subsequent global listing, TMICC has operated as a standalone company, positioning China as a key hub. Earlier this year, its Asia headquarters officially opened in Shanghai, signaling a deepened commitment to the market.

The company's numbers back up this strategy. TMICC holds a 21 percent share of the global retail ice cream market and manages four of the five largest global ice cream brands, including Wall's, Magnum, Cornetto and Ben & Jerry's. In China alone, nearly 30 new products have been launched this year, driving high-single-digit growth in the first quarter of 2026.

Ter Kulve attributes the company's success in China to a mix of high-quality production, strong local management, premium branding and relentless innovation — a formula that ensures sustainable growth.

> "Everyone can afford a little happiness. Our job is to make life taste better with ice cream — making these brands exciting through joy, entertainment and a touch of luxury."
>
> **Peter ter Kulve,** CEO of The Magnum Ice Cream Company

Despite per capita consumption of ice cream being lower than the global average, competition in China remains fierce. Euromonitor reports that in 2025, Yili led the market, TMICC was among the top five players along with Mengniu, General Mills and Deshi China. Meanwhile, snack and beverage companies are entering the ice cream category, adding pressure with offerings ranging from high-end to budget-friendly products.

To stay ahead, TMICC's China unit has announced plans for this year, including expanding freezer deployment, accelerating local innovation through the China research and development center, investing in digital marketing and advancing supply chain digitization.

Globally, the ice cream market grows 3-4 percent annually, one of the fastest-growing consumer categories. The trend, however, is shifting: consumers are increasingly favoring smaller, premium products with superior ingredients, flavors and health benefits. Magnum aims to lead this transformation, using China as both a testing ground and a launchpad for global innovation.

The CEO highlighted the entertainment side of the ice cream business over mere convenience. "Online offers convenience, but it can't replicate the joy of experiencing ice cream in person," he said. Pop-up stores, influencer events and sampling campaigns are becoming integral to the ice cream shopping experience.

For example, from April 30 to May 10, the company launched the Magnum pleasure store pop-up in Hangzhou's iconic West Lake, attracting large crowds and becoming one of the city's standout summer lifestyle destinations. Visitors could co-craft their own limited-edition Magnum ice creams and beverages.

For ter Kulve, ice cream is more than a product — it's a cultural statement. "Ice cream is fashion — it's the 'lipstick' of the food world. Everyone can afford a little happiness," he said. "Our job is to make life taste better with ice cream — making these brands exciting through joy, entertainment and a touch of luxury."

A boy enjoys ice cream at a Magnum pop-up store on Hubin commercial street in Hangzhou, Zhejiang province, on May 4. PROVIDED TO CHINA DAILY

China bucks global trend, curbs dengue

Country willing to share effective and low-cost strategies with intl partners

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

China has successfully curbed the domestic spread of dengue fever despite rising global infection rates, and the country stands ready to work with international partners to share effective, low-cost control strategies and technologies with regions in need, a senior health official said this week.

Dengue fever has spread rapidly in recent years and is now endemic in more than 100 countries. The number of global infections surged to a record high of 14.4 million in 2024 and remained at elevated levels in 2025, according to data shared on Monday at an event on the sidelines of the World Health Assembly in Geneva, Switzerland, which concludes on Saturday.

Shen Hongbing, vice-minister of the National Health Commission and administrator of the National Disease Control and Prevention Administration, said local outbreaks in China are usually triggered by imported cases.

"In 2025, even as imported cases rose by 89 percent, locally transmitted outbreaks fell by 65 percent compared with the previous year — a notable achievement in disease control," Shen, who is also deputy head of the Chinese delegation to the assembly, said at the event hosted by the GX Foundation, a Hong Kong-based NGO.

At the heart of the nation's effective disease control efforts are comprehensive strategies that include government leadership, intensified surveillance, vector surveillance and control, prompt outbreak responses and growing public health awareness, he said.

Shen said that since 2005, China has established special dengue control funds and steadily increased investment over the years.

To strengthen surveillance and early warning, authorities have established mechanisms for public health cooperation and cross-border coordination at ports and border areas. Intelligent software has also been deployed at medical institutions to facilitate syndromic surveillance and active case finding.

Efforts have also been made to deepen the integration of climate monitoring with disease early warning systems to predict epidemic trends and upgrade prevention measures in advance.

Because dengue fever is transmitted to humans through the bites of infected mosquitoes, China has established a national surveillance network on the ecology, pathogens and insecticide resistance of mosquito vectors. The country has also carried out environmental management to reduce mosquito density and applied automated, digital, intelligent and other novel technologies.

In response to local outbreaks, measures such as designating risk zones, intensifying vector control, activating emergency surveillance and risk assessments, and enhancing treatment and isolation management are being implemented to curb further spread of the viral disease, Shen said.

The country also provides public health education to improve awareness of the disease and preventive measures. Inbound and outbound travelers are encouraged to voluntarily report symptoms and adopt personal protective measures.

On global cooperation, Shen said China has held an international conference on sustainable management of vector insects for 10 consecutive years and offered training to professionals from around the world, demonstrating the nation's commitment to building a global community of health for all.

"Looking ahead, China will continue to strengthen dengue prevention and control under the coordination of the World Health Organization and support GX Foundation and other nongovernmental actors in playing their role," he said.

Shen added that through communication and exchanges, it is hoped that effective prevention and control experience, as well as efficient and low-cost technologies, will benefit more regions and contribute to building a global community of health for all.

In April, the GX Foundation released a consensus statement on the physical control of dengue fever, introducing a Chinese solution that uses tools such as mosquito lamps, bed nets and sticky fly traps to curb the spread of the viral disease.

Shen said the strategy introduces convenient and safe control measures and is particularly valuable in endemic areas with limited resources.

Arthur Li Kwok-cheung, a member of the Executive Council of the Hong Kong Special Administrative Region and a board member of the GX Foundation, said during the side event that the strategy has proved sustainable, well accepted by communities and environmentally friendly. It has already yielded tangible results in Timor-Leste and Honduras.

He added that the strategy is now being promoted further in Cambodia and Vanuatu. The foundation plans to further upgrade mosquito lamps and other devices based on practical needs, promote solar-powered and intelligent systems, enhance the accuracy of rapid test kits, and deepen supply chain cooperation.

Revving up trade

Visitors view a replica of the champion ZXMOTO 820RR-RS bike from the Superbike World Championship at the Eighth Western China International Fair for Investment and Trade that opened in Chongqing on Thursday. The fair highlights the participation of nearly 1,400 enterprises from 50 countries and regions.

Young Russian builds biz bridges in Xi'an

By **REN QI**
renqi@chinadaily.com.cn

Every year, more than 1.5 million Russians cross the border into China, a country they see as full of opportunities. More than 50,000 Russians have already settled across the nation.

From the chilly province of Heilongjiang to the tropical island of Hainan, from the bustling metropolis of Shanghai to the historic capital of Beijing, an increasing number of Russians are quietly blending into China's urban landscape.

Among them is Anna Samodolova, a 27-year-old Russian entrepreneur who is determined to stay in Xi'an, Shaanxi province, and continue developing her startup.

"Currently, my career in China is very important to me. Starting a business in China has made me more independent and confident," she told Chinese media.

While at university, Samodolova noticed China's rapid economic development and abundant entrepreneurial opportunities, prompting her to choose Chinese as her second foreign language. In 2019, she came to China for the first time to study Chinese for a semester at Heilongjiang International University.

"From the airport to the city, everything was very clean and highly modern," she said. "China was completely different from what I had imagined before."

In 2022, carrying her dreams with her, Samodolova returned to China to pursue a master's degree at Xi'an Jiaotong University. After graduation, she decided to stay in Xi'an and start her own business, registering a consulting company aimed at building a bridge for cultural and people-to-people exchanges between China and Russia.

"Xi'an is an international tourist city and an important node city of the Belt and Road Initiative. There are many foreigners and abundant opportunities here," she said.

Her first project involved facilitating business cooperation between a Moscow ice cream manufacturer and three Chinese enterprises. Taking charge of a large-scale business negotiation for the first time, she made extensive preparations in advance, helping arrange meetings between the Moscow manufacturer and the three Chinese companies in one day.

"The Chinese companies needed localized flavors, while the Moscow manufacturer had cost considerations, so a deal was ultimately not reached," Samodolova said. "But this experience made me realize that I was somewhat reserved in social interactions and lacked certain language and business etiquette skills."

To improve communication with Chinese and foreign business people, she began studying business Chinese and Chinese etiquette online.

In August 2024, a Russian producer approached her for help in arranging performances in China for the Russian band Garage Dayz. Although unfamiliar with Xi'an's performing arts market, Samodolova immersed herself in finding venues, connecting with Chinese performance companies and applying for performance permits.

Thanks to her meticulous work, Garage Dayz successfully performed in Xi'an in April this year.

Having lived in China for more than three years, Samodolova said she has quickly integrated into local life and become more mature and confident. On Sept 23, she attended the "2025 Euro-Asia Youth Elite Dialogue" during the Euro-Asia Economic Forum in Xi'an, where she delivered a speech highlighting the opportunities created by China's rapidly developing digital economy.

"In China, the rapid development of technologies such as AI and mobile payments has made Sino-foreign cooperation much more convenient," she said in her speech.

Living in the ancient capital of Xi'an, Samodolova has also developed a deep appreciation for local cuisine and intangible cultural heritage.

Inspired by her daughter, Samodolova's mother has also begun learning Chinese online. The pair now greet each other in Chinese during phone calls.

As exchanges between China and Russia become increasingly convenient, Samodolova's business projects have continued to grow.

Guideline calls for human-centric AI

By **JIANG CHENGLONG** in Beijing and **SHI RUIPENG** in Nanning

China has released a technical guideline on the ethics and safety of artificial intelligence applications, offering a Chinese approach that emphasizes human-centered development, AI for good, and human leadership over AI systems.

The document, titled "Ethics-Safety Guidelines for Artificial Intelligence Applications 1.0", was released on Tuesday at a subforum of the 2026 China Internet Civilization Conference in Nanning, capital of the Guangxi Zhuang autonomous region.

Issued by the National Technical Committee 260 on Cybersecurity, China's key body responsible for cybersecurity standardization, the guideline is described as a "principle-based and reference technical document". It covers AI application development, service provision and use, and provides guidance for organizations and individuals carrying out AI-related activities.

The document was drafted by leading Chinese institutions and companies, including Tsinghua University, the China Electronics Standardization Institute, technology giants Alibaba Group and Huawei Technologies, and DeepSeek, a well-known AI enterprise.

It outlines major principles including reasonable risk control, openness and transparency, privacy and security protection, controllability and trustworthiness, agile co-governance, and inclusive sharing.

Fan Kefeng, vice-president of the China Electronics Standardization Institute, said AI applications are expanding from content generation to assisted decision-making, interactive control and other fields. With the emergence of new forms such as intelligent agents and integrated AI systems, AI applications are becoming increasingly autonomous, complex and influential, he said.

"While improving production efficiency, AI has also made ethical and safety issues such as job displacement, decision-making responsibility and emotional dependence more prominent," Fan said, adding that such changes are bringing new challenges to human agency, social trust and public order.

The guideline states that AI applications should always serve "the common well-being of humanity", calling for ensuring that "the leadership over AI applications belongs to humans", with mechanisms for human control, emergency response and intervention established at key stages.

The document also urges relevant parties to retain "human judgment, supervision, intervention and correction" in key processes to avoid excessive replacement of human decision-making by AI.

For users, it advises moderate AI use and a proper understanding of AI emotional services. It states that AI should be treated as "a tool to assist real life", urging users to avoid excessive dependence, addiction, or replacing real interpersonal communication and activities with AI.

For information and communication services, the guideline calls for stronger risk governance of AI-generated and recommended content, warning against "information cocoons, cognitive misleading and cognitive degradation".

The guideline also encourages building an open-source innovation ecosystem, while improving the security capabilities of the open-source ecosystem.

Zhang Linghan, director of the institute of AI law and governance at China University of Political Science and Law, said the guideline provides detailed pathways and a Chinese approach to preventing ethical and safety risks at a time when AI is increasingly embedded in production and daily life, reshaping human-machine relations and being applied in more complex scenarios.

She said the guideline emphasizes that human leadership must not be weakened.

Beyond interpersonal and socio-political relations, it also addresses ecological concerns. "It also takes into account AI's consumption of energy and resources," said Zhang, who is also an expert with the United Nations High-Level Advisory Body on Artificial Intelligence.

Zhou Jingren, a partner at Alibaba Group and senior AI executive, said AI technology and large language models are still undergoing rapid development. From the outset, Alibaba established an ethics committee for large language models and invited experts from different fields to jointly explore solutions in this emerging area, he said.

Cheng Zixin contributed to this story.

APEC exhibitors shine at intl fair

By **ATLAS SHAO**
in Shenzhen, Guangdong
atlasshao@chinadailyhk.com

With the debut of a dedicated APEC exhibition zone, the 22nd China (Shenzhen) International Cultural Industries Fair opened on Thursday, serving as a premier showcase for the nation's cultural and technology trends while fostering global ties.

Spanning 160,000 square meters, the event — China's largest cultural expo — has drawn more than 6,300 exhibitors across 65 countries and regions. Running until Monday, this year's fair spotlights innovative retail models, tech-driven products and the rich cultural and tourism resources of Asia-Pacific Economic Cooperation economies, offering a preview as Shenzhen prepares to host the APEC Economic Leaders' Meeting in mid-November.

At the APEC exhibition zone, coffee from Vietnam, Thailand's creative cultural products, Malaysian handicrafts, snack foods produced by South Korean companies, wine from Chile, Peru's alpaca products and Canada's tourism offerings have attracted visitors, transforming the exhibition zone into an area for cultural exchange and cooperation across the Asia-Pacific region.

Viann Ye, administrative executive of the MayCham China Guangdong office, said this is the first time the Malaysian Chamber of Commerce has participated in a culture-themed exhibition. Instead of selling products, she hopes to enhance public recognition of Malaysia through the fair, and thereby attract more travelers to the country.

Ye told China Daily that the chamber would like to participate in the November APEC meeting in Shenzhen if there are themes of mutual interest, and hopes to find more opportunities for Malaysian products to go global.

"The exhibition's scale and diversity have amazed me," said Hartanto W. Tanto, an Indonesian exhibitor who attended the event at the invitation of the Indonesian consulate general in Guangzhou.

He brought specialty products to the event, including batik silk scarves and sambal sauce, and received inquiries from buyers within the first hour of the opening.

He owns six restaurants in Xiamen and Fuzhou in Fujian province, and said Chinese consumers have a high level of enthusiasm for Indonesian cuisine.

Given that the Guangdong-Hong Kong-Macao Greater Bay Area is a region he has hoped to tap into, he said the fair is providing him with the opportunity to better understand the Shenzhen market.

Under the theme "Unboxing Hong Kong", the Hong Kong Pavilion at this year's cultural fair is displaying more than 100 exhibits to showcase Hong Kong's design capabilities.

A pop-up store has been opened for the first time in the pavilion, making Hong Kong cultural and creative products available for on-site purchase.

During the exhibition, the Hong Kong Pavilion will also host multiple cultural activities, including a lecture on the transformation of neon lights and mahjong craftsmanship, as well as a seminar exploring the use of emotional language in design.

The Macao Pavilion features enterprises from the Macao SAR's film production, advertising, large-event organization and technology sectors.

This year's cultural fair has also set up three major exhibition areas showcasing AI technology products.

Duan Chao, senior marketing manager at DexForce Technology Co, an enterprise specializing in embodied intelligence technology, said several cultural and tourism government departments and overseas chambers of commerce had visited his booth and shown strong interest in the company's products.

On a wing and a prayer

Over four decades of conservation efforts in Shaanxi's Yangxian county pull the crested ibis back from the brink of extinction

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

In 1981, it was thought that there were just seven crested ibises left on the globe. Fast forward to today, and the population of these "oriental gems" has ballooned to nearly 7,000 in the city of Hanzhong, Shaanxi province.

The achievement is the result of decades of dedicated conservation, expanding the footprint of this once-critically endangered species to 13 other provincial-level regions across China, with a global total population surpassing 11,000.

Just three days after the rediscovery of the crested ibis back in 1981, a "Four Prohibitions" notice was issued, banning activities such as hunting, tree felling, the use of pesticides and chemical fertilizers, as well as blasting and reclamation in areas where the birds live, feed, nest and breed, recalled Li Jie, deputy head of Yangxian county government.

Yangxian is administered by Hanzhong.

In a news conference on May 13, Li said that for over four decades, Yangxian has implemented strict measures on ecological conservation, including shutting down polluting factories.

To date, the county has designated 2,800 hectares of protected areas for the crested ibis and established 126 monitoring sites, she said.

According to the Hanzhong government, the efforts to conserve the species have yielded both ecological and economic benefits.

The city has seen a significant improvement in biodiversity, with the number of terrestrial wildlife species increasing from 618 at the end of the 13th Five-Year Plan (2016-20) period to 684 today.

Thanks to its ongoing conservation efforts, Yangxian has experienced a significant boom in its organic food industry.

A total of 115 organic products across 15 categories in the county have obtained organic certification, and organic farmland covers over 13,300 hectares.

Yangxian has also built the largest organic industrial park in Northwest China, home to 52 enterprises. The park's total annual output value exceeds 10 billion yuan ($1.46 billion), with the organic industry contributing 5.5 billion yuan.

Fishing talent
The crested ibis is a carnivorous wading bird that likes to eat fish, shrimps, crabs, frogs, insects and other small animals. It sometimes will eat a small amount of grass and leaves for dietary fiber.

Gray coat
During its breeding season, the feathers on its head, neck and back turn lead gray, known as its wedding feathers or breeding feathers. It acts as a protective camouflage color in the season.

Warm-hearted moment
The crested ibis expresses affection to others by passing twigs and branches, touching each other's beak, preening feathers and coupling.

Gifting branches
The behavior of nipping branches among the crested ibis is observed to have two intentions: one is about showing love to their partners, the other is about nesting.

Self defense
The crested ibis has a gentle temperament and mainly protects itself by warding off invaders. They shout loudly, puff up their feathers, spread their wings and peck fiercely to show their strength.

Mutual preening
To transmit information and maintain family bonds, adult crested ibises will preen each other during nesting and the early stage of the brooding period. Young birds also do this to resolve conflicts.

Bath time
Bathing in midsummer is one of the most common behaviors of the crested ibis. They will also take a bath on warm winter afternoons. This helps maintain the lipid coating on their feathers.

Family party
Crested ibises live in groups during the nonbreeding period with a hierarchy among family members.

CULTURE

Above left: Director Chen Yi oversees the full-cave digital scanning of the Binyang Central Cave at the Longmen Grottoes in Henan province. **Above:** Chen interviews an expert at the Longmen Grottoes. **Left:** Chen examines fragments of the *Emperor and Empress Paying Homage to the Buddha* alongside an expert in the storeroom of the Longmen Grottoes Research Institute. **Below left:** Chen films ancient cultural relics at the Longmen Grottoes. PHOTOS PROVIDED TO CHINA DAILY

The hunt for an emperor's face

Documentary captures the decades-long search for Longmen fragments scattered overseas after historic looting, **Yang Feiyue** reports.

Inside the Binyang Central Cave at the Longmen Grottoes in Central China's Henan province, a researcher from the Longmen Grottoes Research Institute holds a small 3D-printed fragment against a weathered stone wall. For a moment, nothing happens. Then the piece clicks into place, its curve fitting perfectly into a shallow groove carved 15 centuries ago.

The data show a 93.3 percent match.

"It was the most unforgettable moment," recalls Chen Yi, the documentary filmmaker who witnessed the discovery. "Completely unexpected. We found the face of Emperor Xiaowen."

In the past, it could take cultural heritage workers years to relocate a single Buddha head to its original position. This time, the documentary team helped accelerate the process, completing it in just 14 months.

"The key was finding the right method," Chen says.

That breakthrough and the years of detective work behind it lie at the heart of Chen's new documentary, *How I Miss "Her"*, which aired on China Central Television's documentary channel on Sunday.

The film traces the century-long odyssey of the *Emperor and Empress Paying Homage to the Buddha*, a pair of carved stone reliefs from the Northern Wei Dynasty (386-534), regarded as masterpieces of Chinese Buddhist cave art.

In the 1930s, the reliefs were violently dismantled.

Working on orders from overseas buyers, a Beijing antiquities dealer named Yue Bin organized the systematic chiseling of the two panels into more than 6,000 fragments. Around 4,000 pieces made their way to the United States, split between the Metropolitan Museum of Art in New York and the Nelson-Atkins Museum of Art in Kansas City, Missouri. The remaining 2,300 or so were kept in Longmen's storerooms.

No one could determine with certainty which fragments were authentic. Looters had mixed genuine pieces with fakes to inflate prices, according to historical records of Yue Bin's confession cited in the film.

Abroad, the fragments were also subjected to questionable restoration practices. At the Nelson-Atkins Museum of Art, then-curator Laurence Sickman — whose teacher, Langdon Warner, remains controversial for removing murals from the Dunhuang caves — spent two to three years patching the broken pieces together with plaster. The restored panels, scholars point out, carried the fingerprints of their modern reconstruction as much as their ancient origins. At the Met, when the documentary team requested restoration records, very little was provided.

"The result became a huge mystery in Chinese art history," Chen notes.

The film introduces Wen Yucheng, the 87-year-old honorary director of the Longmen Grottoes Research Institute, who first began sorting the fragments in 1965 shortly after graduating from Peking University's archaeology department. He was on a three-person team investigating the looting.

Six decades later, he appears in Chen's documentary as a living bridge between the original crime and the ongoing effort to repair its damage.

Xiao Guangyi, a documentary studies teacher at Chengdu College of Arts and Sciences in Sichuan province, says she was deeply moved by Wen's lifelong devotion to the Longmen caves.

"Hearing an elderly scholar say that — how he missed the stones when he was away — is deeply moving. We see a tourist site. But generations of people have devoted their lives to protecting our civilization," Xiao says.

For Xiao, the documentary's most powerful moment comes when researchers test the fragment against the cave wall.

"Piece by piece, centimeter by centimeter — until it clicked. Suddenly you feel that all those efforts, all those generations of dedication, have finally found hope."

A chance encounter

Chen first heard about the project by chance in 2022, while filming at the Yungang Grottoes in North China's Shanxi province for the second season of *Hello AI*, her documentary series on artificial intelligence and cultural heritage. It is a follow-up to the 2019 film that marked one of the country's first documentaries dedicated entirely to AI.

On set, she ran into an old collaborator, Huang Xianfeng, a remote sensing expert from Wuhan University. They had previously worked together on digital restoration projects at Dunhuang in Gansu province and the Jiankou section of the Great Wall in Beijing.

She asked him whether his work had ever extended to artifacts that had been looted and taken overseas. That was when Huang mentioned the Longmen reliefs.

Chen started digging. What she found was a detective story spanning continents and decades, with smuggling rings and a paper trail buried in archives from New York to Cambridge, Massachusetts. As shown in the film, a key piece emerged from the Harvard University archives — a letter from Sickman to Alan Priest of the Met, accompanied by a sketched male head. The drawing proved that American curators had been searching for the same specific missing piece, providing crucial historical corroboration for fragments later found in Longmen's storeroom.

For years, Chen had worked with two seemingly separate tool kits. Her early career was focused on cultural documentaries, such as *The Forbidden City, Kunqu of Six Centenary* and *Taipei Palace Museum*. Later, she directed *A Century with Cars*, a 12-part series examining Western industrial civilization through what she describes as "the eyes of a Chinese documentary filmmaker".

That was followed by *Hello AI*, where she learned to visualize invisible algorithms while tackling the challenge of projecting data streams onto server racks and using crosscutting techniques to keep otherwise static code visually alive on-screen.

"One foot in the humanities, one foot in technology. I'd been waiting for a subject that could bring them together," she recalls.

She realized that the emperor and empress reliefs offered exactly that opportunity.

In 2024, the Longmen Grottoes Research Institute launched a full-scale digital restoration project, led by senior researcher Gao Junping. The first challenge was separating authentic fragments from fakes.

Tian Hengci, a researcher at the Chinese Academy of Sciences who usually analyzes lunar samples, applied nondestructive testing technology to the Longmen fragments. His device can detect trace elements at concentrations as low as one part per million — a geological fingerprint precise enough to distinguish different stone sources.

As documented in the film, of the five candidate pieces, only one cataloged as H05 matched the chemical composition of the original cave wall. The rest were counterfeit.

Yet, finding the correct fragment solved only part of the puzzle. The cave wall stands two meters high and four meters wide. H05 is roughly the size of a palm. Somewhere on that vast, weathered surface, the tiny piece needed to find its home.

The documentary reveals how researchers combined high-precision 3D scanning, AI-assisted surface matching, and what some scholars call "digital reunion": scanning overseas collections and virtually reassembling scattered fragments without physically moving them.

"Academically, 'digital reunion' isn't quite accurate, but it helps people understand what we're trying to do," Chen emphasizes.

Privately, she prefers another phrase: "civilization backup".

"For people 200 years from now, these digital models will be a heritage of their own — a record of how we, in our time, tried to save what we could," she explains.

Xiao sees this fusion of technology and humanity as essential to the documentary's success.

"Hard technology plus soft humanities is the soul of this kind of film, and a growing trend," she says.

"Without technology, Wen Yucheng's regret might have remained just regret. But without humanities, the film becomes a boring engineering log. You need both — technology as the engine, humanities as the heart. Neither works alone," she elaborates.

For Xiao, the idea of "reunion" defines the film.

"It's not only about reassembling broken stones," she says. "It's also about reuniting hearts and reconnecting civilizations." She adds that researchers, scientists, curators and scholars from China and abroad are all participating in an effort to restore a fragmented cultural legacy.

"We're using hands that reached for the moon to touch the missing pieces left behind a thousand years ago," she says.

The film's title *How I Miss "Her"* comes from a line by early 20th-century poet Liu Bannong. The Chinese character *ta* (her) was once reserved in Chinese documentary captions for national treasures, a grammatical gesture that imbued stone and bronze with something like soul.

"This film is an innovative work that uses contemporary thinking to question history and technological artistry to empower imagery," says Tan Xue, the film's producer.

In recent years, artificial intelligence has opened new narrative possibilities for cultural heritage, giving rise to many moving stories of "reunion", Tan notes.

The film allows those who have missed "her" to see how cultural heritage researchers, represented by the team at the Longmen Grottoes Research Institute, are using contemporary wisdom to heal the wounds of history, she says.

The title also raises the question: how do you miss something that may never come back?

Chen's answer lies less in sentiment than in action.

"Science and art part ways at the foot of the mountain. But they meet again at the summit," she says.

At the foot of that mountain, a sixth-century artisan carved an emperor's face into stone. At the summit, a laser originally developed for lunar exploration scans a fragment no larger than a hand while algorithms search for patterns invisible to the human eye.

"That's where we are now," Chen says.

"Not because we have all the answers. But because, for the first time, we have a way to ask the right questions."

Ancient volumes reunite across the strait with digital vision

LANZHOU — Inside a climate-controlled repository in Northwest China's Gansu province, Fung Ming-chu leans toward a display case, her eyes fixed on a rare surviving set of ancient Chinese texts.

For the former director of the Taipei Palace Museum, the moment carried the weight of decades.

"My wish has finally come true," Fung says. After spending years guarding the Wenyuange copy, she has now seen with her own eyes all the surviving three-and-a-half copies of the *Siku Quanshu*.

Known in English as *The Complete Library of the Four Treasuries*, the *Siku Quanshu* is regarded as one of the most comprehensive collections in Chinese history. The monumental compilation was produced during the Qing Dynasty (1644-1911).

Of the seven copies originally produced, only three and a half survive today. The Wenyuange copy is housed at the Taipei Palace Museum, the Wenjinge copy at the National Library of China in Beijing, and the Wensuge copy in Lanzhou, the capital city of Gansu.

Chu Hui-liang, a former researcher at the Taipei Palace Museum, shares Fung's excitement while looking at the neatly stacked 1,128 camphorwood book chests containing the Wensuge copy.

"As descendants of the Chinese nation, it is a source of great pride to witness this monumental work with our own eyes," Chu says.

"We often call the stains on ancient texts 'age spots'. But the Wensuge copy is nearly free of such marks. That shows how carefully generations of guardians in Gansu have preserved it," Chu adds.

Fung Ming-chu (center), former director of the Taipei Palace Museum, visits the Gansu Provincial Library in Lanzhou, Gansu province, on May 13. LIU KEYING / XINHUA

Xiao Xuezhi, director of the Gansu Provincial Library where the repository is located, says local authorities have invested heavily in preservation efforts since the Wensuge copy arrived in the province. Dedicated institutions and specialist staff have also been established to ensure its long-term protection.

Over the years, the library has developed preservation methods suited to local conditions. The building's structure and natural ventilation help regulate temperature and humidity, while the camphorwood chests protect the texts from insects and mildew.

Another former Taipei Palace Museum researcher, Lin Tieng-jen, gently touched the pages and the wooden case with gloved hands under the guidance of museum staff members. A specialist in ancient Chinese cartography, Lin had systematically studied the Wenyuange copy but had rarely had the chance to touch it.

"I can't bear to let go, yet I'm afraid to touch it too much," he says. The Wensuge copy, he notes, is similar to the Wenyuange version in the calligraphy, line spacing and even the design of the wooden cases.

"The *Siku Quanshu* is a monumental collection that preserves the very essence of Chinese heritage," Fung says, emphasizing its growing research value. She expresses hope for future joint exhibitions.

After learning that the Wensuge copy has been digitized and is set for facsimile publication, Fung envisions a "digital reunion" of the copies from both sides of the Strait.

Fung also expects more cross-Strait efforts to help wider audiences engage with classical texts through digital platforms and cultural products.

LIFESHANGHAI

Travelers take in city through new lenses

An eyeglasses market benefits from visa exemptions as international tourists seek better services than their home countries provide, **Zhou Wenting** reports.

Swiss tourist Mia Bernauer's first trip to China in mid-May included a stop that may seem unexpected to many: getting prescription glasses in Shanghai. She bought glasses for myopia in two different styles to switch between.

While planning her trip to Shanghai, Bernauer found through online research that the city offers affordable, high-quality eyewear. She was also influenced by TikTok videos featuring foreign tourists sharing their shopping experiences at the Shanghai International Glasses City, located in the heart of the city.

"The shops here have a really nice selection, and they have world-famous brands that are good quality. But the price is half, or even less, than in Switzerland," says Bernauer, 24, who spent five days in Shanghai.

"It's a great bonus that some of the shop managers speak English," she says.

Bernauer is not alone. Many international tourists are adding the eyeglasses market to their Shanghai itineraries these days, alongside traditional attractions, such as custom-made *qipao* at the clothing market near the Bund, and trying local delicacies like *xiaolongbao* (steamed buns).

On TripAdvisor, a popular travel review site, the four-story Shanghai International Glasses City on Zhongxing Road ranks among the city's top five landmarks, following the Bund, Yuyuan Garden, and Xintiandi. Opened in 2007, this eyeglasses market, which began in wholesale markets, offers retail prices generally half of those at other optical shops and has recently gained popularity on overseas social media platforms.

Many shop owners at the market noted an increase in foreign customers starting last year, with more this year. They said some foreign tour guides have been spontaneously bringing tour groups in.

In 2024, China significantly upgraded its visa-free transit policy. By 2025, the number of countries with unilateral visa exemptions increased to 48, and the number of countries with mutual visa exemptions expanded to 29, with 65 ports allowing 240-hour visa-free transit.

Riding this wave of inbound travel, Shanghai has continued to establish itself as a first stop for international tourists arriving in China. According to the Shanghai Municipal Administration of Culture and Tourism, the city received over 9.36 million inbound travelers last year, a nearly 40 percent increase year-on-year, setting a new record. In the first two months of 2026, international tourist arrivals in Shanghai reached nearly 1.15 million, up 21.4 percent compared with the same period last year.

Left: Sofiia Pavlova and her husband from Russia visit Tong Qingying's shop at the Shanghai International Glasses City on May 15. **Top above:** Swiss tourist Mia Bernauer, who was on her first trip to China, bought two pairs of prescription glasses at the Shanghai store on May 15. PHOTOS BY ZHOU WENTING / CHINA DAILY **Above:** New Zealander Chris picks eyeglasses frames at the Shanghai store, during his visit there on May 16. GAO ERQIANG / CHINA DAILY

> "The shops here have a really nice selection, and they have world-famous brands that are good quality. But the price is half, or even less, than in Switzerland."
>
> **Mia Bernauer,** Swiss tourist

Hua Xiaochun, owner of one of the eyeglass shops in the market, says that the number of visitors arriving from Russia increased noticeably at first, and now international customers hail from around the world, mainly from Europe, North America, and Southeast Asia. Many come well-prepared, with a large proportion bringing their existing prescriptions, avoiding an on-site eye exam, he says.

"Customers from Europe and the United States have strong purchasing power. Some are satisfied with a particular style and directly calculate the price to make a purchase. Others will bargain, which the guides probably taught about negotiating with individual businesses in China," says Hua.

According to foreign customers, what attracts them is not just the price but also the quality and the speed of service. In many countries, getting glasses requires first seeing a doctor for a prescription and then having the glasses made, which sometimes takes a week. As a result, many people have experienced the embarrassment of having to temporarily fix broken glasses with tape.

They praise the shopkeepers at the market for their friendliness and professionalism, and they also appreciate the wide range of options available.

There are hundreds of shops in the market, each with a different selection based on the shop owner's buying preferences. Hua says his preference focuses on trendy styles.

"Foreigners usually have a different aesthetic preference from our local customers. They prefer trendy, bold designs. Most Chinese customers accept recommendations from shopkeepers, but foreigners are often confident in their own choices," he adds.

Many shopkeepers recall having experienced groups of foreign tourists buying more than 20 pairs of glasses at once. Hua notes that foreigners like sunglasses a lot, mentioning a recent customer from the US who bought several pairs one day and returned two days later to purchase more, totaling over a dozen pairs, likely as gifts for his family and friends.

Getting glasses at the market usually takes only 30 minutes to an hour from order to pickup. During this time, shopkeepers recommend that customers visit the shopping center across the street, and many return with bags full of items, such as blind box toys, hair accessories, power banks, and hairdryers.

More complex lenses, like progressive and multifocal, take two to three days to customize. Some customers return to pick them up, while others opt for express delivery to their hotel to save time.

On May 15, at Tong Qingying's counter, more than 20 pairs of custom-made glasses were awaiting foreign customers to pick up over the weekend. She had already sent another 20 to customers' hotels via express delivery that day.

Tong speaks some English and has learned the professional terms for the glasses-fitting process. Her shop is one of the market's most popular with foreign customers, who make up a huge proportion of her clientele.

The recent increase in foreign business at her shop is partly attributed to a Russian customer who bought glasses and posted a video sharing her experience on Instagram in April, which received over 100,000 views.

Sofiia Pavlova, a Russian customer who visited Tong's shop on May 15, was brought there by this video.

"Eyeglasses are far more expensive in Russia, almost two to three times the price here. Also, it takes a week to get them in Russia, but here I get them within 30 minutes," says Pavlova, 27, who was visiting China with her husband for the first time. Their plans in Shanghai also included checking out a Chinese brand hybrid car and getting trendy clothes for their dog.

Tong, 42, says some foreign customers send her photos on WeChat after returning home, expressing satisfaction with the glasses and wanting to order more for themselves or family members.

"I send international shipments weekly to countries like Germany, Denmark and Russia," she says.

To better accommodate international customers, the market has suggested that shops prepare reading test cards in English and accept international bank card payments. It also plans to install multilingual signs in the mall and enhance foreign-language services at the information desk.

Experts agree that Shanghai's inbound tourism is evolving from merely visiting typical scenic spots to a dual focus on service and consumption. The city's competitive edge lies in its combination of productive service industries, such as finance and shipping, and daily life service industries, including eyewear and dining.

Wang Hong, a city-level lawmaker in Shanghai, says it is necessary to make full use of the benefits of visa-free inbound tourism and turn them into opportunities for consumption and service upgrades. Among these, the key lies in providing high-quality city services, such as improved payment systems, tax refunds and multilingual services.

Attraction to DIY handicrafts beads to the urban surface

By **ZHENG YIRAN**
zhengyiran@chinadaily.com.cn

Consumers create on fuse-bead crafts at "San Qian Zao Wu She" (also called 3000 DIY Store) in May. As part of the emerging "handmade economy", bead-craft stores are tapping into younger consumers' growing appetite for emotionally rewarding experiences. PHOTOS BY GAO ERQIANG / CHINA DAILY

On a weekday night at a DIY store on Nanjing East Road, William Brook, an 11-year-old visitor from the United Kingdom in Shanghai, finally finished his peach blossom tree fuse-bead handicraft.

He worked on his "masterpiece" over two days. With the last pink bead pressed on the 50 by 50 centimeter plastic baseplate, the vivid peach blossom tree artwork was completed.

"I came to China for a piano competition. Yesterday, my mother and I were walking past this hobby store. I was fascinated by the fuse-bead handicraft. I love Chinese culture, so I decided to make a peach blossom tree as a special gift to take home," William says.

His mom also made over 100 heart-shaped fuse-bead handicrafts at "San Qian Zao Wu She", or 3000 DIY Store, as gifts for relatives and friends. She feels the handmade craft symbolizes sincerity.

Fuse bead art, also known overseas as Perler beads, is a handicraft that involves arranging small plastic beads into patterns and fusing them with heat. It is usually marketed as a toy for children, but is now widely practiced by adults as a stress-relieving hobby.

Wu Yuyan, a customer working in advertising, says she was bombarded with work-related text messages day and night, which exhausted her. "When I put my phone away and focused on making fuse-bead art, I could feel relaxed joy.

"I love the concentration and serenity," the 32-year-old says.

"Modern people are usually under great stress. It's hard to concentrate. The charm of fuse beads helps people concentrate and relax. When they are immersed in handicrafts, they don't think about anything else," says Qian Mengyao, a young shop assistant born after 2000.

"In addition, they can use fuse beads to make patterns they like, such as idols or cartoons, which demonstrate their creativity," she says.

Fuse bead art can be traced back to the 1970s, when it was not originally intended for personal enjoyment, but for rehabilitation training in nursing homes. In the 1980s, Perler, in the United States, improved it into a children's puzzle toy, which later spread worldwide.

At the end of 2024, a young Chinese actor showcased a homemade fuse-bead brooch during a live promotional broadcast, thus igniting the "fuse bead craze" in China.

Subsequently, with the continued support of numerous popular IPs, the trend grew stronger: in Taobao's "top 10 products of 2025", fuse bead art ranked second, with year-on-year search volume increasing by nearly 500 percent. The hashtag "I'm addicted to fuse beads" on the social media platform Xiaohongshu exceeded 6.9 billion views. The 2026 Spring Festival consumption data of Douyin, China's TikTok, show that the number of orders placed by Generation Z (those born between 1995 and 2009) for group purchases of beads is up by 9,018 percent year-on-year, much higher than the 348 percent growth rate of the second-rated group buy, pet foster care.

In Luer King, a handicrafts store on Daxue Road in Shanghai, customers stay for the whole afternoon or even till evening working on their handicrafts, and there are consistently team-building activities with over 20 people in the store.

Lin Xianping, associate professor of Hangzhou City University, says: "Fuse beads' rapid popularity lies in its precise alignment with the consumption and emotional needs of young people today. Its creation threshold is low and does not require professional skills. The time-consuming and focused assembly process allows young people to break away from electronic devices, achieve emotional and stress relief, and after completing exclusive works, they can also gain a strong sense of achievement."

As promising as the market is, Lin says that in the long run, the "handmade economy" needs to continuously innovate gameplay, create differentiated content, and deepen IP integration to overcome the limitations of trends. Overall, if the demand for emotional consumption remains unchanged, the "handmade economy" has long-term growth potential and is on a high-quality track for consumption upgrading, according to Lin.

CULTURE

From left: Tianjin Conservatory of Music stages *Cavalleria Rusticana* (Rustic Chivalry), an outdoor production of the opera by Italian composer Pietro Mascagni, in Tianjin during the May Day holiday; Zheng Xiaoying gives a master class at the Tianjin school on May 8; Wang Hongwei, tenor and president of Tianjin Conservatory of Music, announces the school's plans on May 12. PHOTOS PROVIDED TO CHINA DAILY

A legend returns home

At 97, pioneering conductor Zheng Xiaoying heads back to Tianjin, the city where her artistic journey began, **Chen Nan** reports.

Ninety-seven-year-old Chinese conductor Zheng Xiaoying leads a two-week master class at Tianjin Conservatory of Music, guiding young conductors and opera performers in the art of Chinese-language opera.

At 97, most people might retire into quiet reflection, but Zheng Xiaoying, China's first female opera and symphony conductor, is boarding flights, stepping onto stages, and returning to her roots to teach.

Invited by Tianjin Conservatory of Music, she has returned to the city that she calls her artistic homeland to lead a two-week master class that began on May 8, guiding young conductors and opera performers in the art of Chinese-language opera.

The two-week master class culminated in a concert performance of Mozart's comic opera *The Marriage of Figaro* on Thursday at Tianjin Grand Theatre, showcasing the results of Zheng's teaching and the enduring vitality of Chinese-language opera.

"Tianjin is my 'old home'," Zheng says. "When I was invited to teach here, I didn't hesitate. This is where my formal music education began, and where my artistic journey truly started."

In 1952, Zheng began her studies at what was then the Tianjin campus of the Central Conservatory of Music. Three years later, she was selected to study choral conducting in Beijing. By the end of 1955, she returned to Tianjin to become one of the first teachers of China's newly founded conducting department, simultaneously continuing her composition studies.

"Walking into this school, the building on my right housed the country's first conducting department," she recalls. "That period of hard work laid the professional foundation for my entire career and shaped my respect for art and dedication to teaching."

Zheng has devoted decades to Chinese opera. She recounts the early days of opera education in Tianjin with pride.

"The first opera we staged was Verdi's *La Traviata*, performed in Chinese. It brought Western classics to Chinese audiences for the first time," she says.

In 1982, Zheng and the China National Opera House staged Verdi's *La Traviata* in Tianjin, performing 39 consecutive sold-out shows. Before each performance, she gave a 20-minute public lecture explaining the music, characterizations, and dramatic techniques, ensuring audiences could not only hear, but also understand the operatic storytelling. These efforts cemented her belief that "singing foreign operas in Chinese" is a great way for Western classics to resonate with Chinese audiences.

For this master class in Tianjin, Zheng selected *The Marriage of Figaro*, teaching students how to interpret, rehearse, and perform Western operas in a way that is authentically Chinese in language, expression, and cultural understanding.

"The story isn't just about a wedding ceremony," she tells the students. "It's about the conflict between the aristocracy and commoners, about interference and negotiation. The translation reflects the work's core themes, not just its surface plot."

This opera has long been a cornerstone of Zheng's teaching. In 1983, a Chinese-language production of *The Marriage of Figaro* became the graduation showcase for the Central Conservatory's vocal department, later refined by Zheng into a model teaching production. With the Chinese adaptation of *The Marriage of Figaro*, Chinese audiences were able to enjoy the performance without the language barrier, which helped make opera popular in the country.

"Chinese-language operas serve as the best practical training for young vocalists," she says. "I hope this master class can plant a seed here, so that systematic, high-quality opera education continues in Tianjin."

For the students, every gesture of this silver-haired maestro carries weight. In the very building where she once learned, practiced, and taught, Zheng is not just instructing technique but passing on a lifetime of experience, dedication, and love for opera, planting seeds that will shape China's musical landscape for generations to come.

"For students, stage experience is the most important. It's only on stage that they can truly discover their own shortcomings," says veteran tenor Wang Hongwei, the president of the Tianjin Conservatory of Music, who invited Zheng to deliver the master class to students of the conservatory.

Wang says that from May to July, the conservatory will take center stage during the 2026 Tianjin Music Festival, offering a spectacular lineup of 100 concerts, performances, and academic lectures across the city.

Audiences will enjoy operas staged in unique urban spaces in Tianjin, as well as concerts featuring works by Shi Guangnan (1940-90) — one of the most famous and prolific songwriters in the country — student-teacher recitals with soprano Lei Jia, and performances by tenor Yan Weiwen and his students.

Besides *The Marriage of Figaro*, on the operatic front, the conservatory will present a dynamic mix of classics, original works, and beloved revivals. Highlights include *Xiao Erhei Gets Married*, *Knot of Togetherness* and *Erquan*.

Knot of Togetherness will be staged at the National Centre for the Performing Arts on June 13 and 14 in Beijing, while *Erquan* will embark on tours nationwide.

Throughout the year, Tianjin Conservatory of Music's traditional Chinese music department will hold a total of 107 events featuring traditional Chinese musical instruments. Besides concert halls, shows will be staged in public schools, communities, and at scenic destinations nationwide.

"As a music school, besides teaching our next generation of musicians, we want to bring music directly to the general public, making music more accessible, engaging, and connected to everyday life," says Wang.

Wang notes that earlier this year, Tianjin Conservatory of Music launched a memorial hall for the composer Shi Guangnan, allowing the public to learn about the creative life of this musician, who graduated from Tianjin Conservatory of Music, and is known for compositions such as *Toast Song* and *On the Fields of Hope*. Over the decades, these songs have been performed by generations of singers, resonating deeply with listeners.

The collection includes more than 13,000 items, such as his enrollment certificate, examination papers, original manuscripts, clothing, personal belongings, and collectibles.

"We believe in a 'campus without walls', connecting with the wider community and sharing the joy of art with everyone," says Wang.

Immersive attractions spark interest in literary masterpieces

Left: A performance is staged at the Unique Dream of Red Mansion theater complex in Langfang, Hebei province, last month. REN LIYING / XINHUA **Right:** A play inspired by *Outlaws of the Marsh* is staged at the Wansuishan Martial Arts City in Kaifeng, Henan province, last month. REN ZHUORU / XINHUA

BEIJING — Wang Zixuan's fascination with classic Chinese novels was sparked by a recent trip to a bustling theme park.

During his visit to Kaifeng in central China's Henan province, the 10-year-old boy watched plays inspired by the Chinese classic *Outlaws of the Marsh*. Afterward, he asked his mother to find him audio recordings to delve deeper into the story, and eventually, he lost himself in the print books.

"Every character in the book captivates me," Zixuan says. "Reading the book after school is the happiest moment of my day, and it allows me to learn about society and the history of that era."

Wansuishan Martial Arts City is a Disney-style theme park that features many scenes and plays inspired by *Outlaws of the Marsh*. Not far from its entrance stands a sculpture of the literary masterpiece written about 700 years ago.

In a nearby pub, a well-known scene from the classic novel was brought to life, as Lin Chong, one of the book's main characters, engaged in a spirited duel with another martial arts master, deftly wielding a stick as he moved with agility. The audience erupted in thunderous applause.

Zixuan's mother never expected that the trip could transform her child from a passive reader into a bookworm. But after watching the shows, she was impressed. "Incredible! They have perfectly re-created the iconic scenes from the original work."

Lin Chong, an official-turned-rebel, was portrayed by 25-year-old Zhao Yunze. "During the early rehearsals, the director told me repeatedly that I wasn't capturing the essence of the character. So I immersed myself in the book and watched the TV adaptation over and over again, delving deep into Lin's personality," he recalls.

In the theme park, there are over 100 such shows a day, catering to an enthusiastic audience. During the three-day Qingming Festival holiday last month, a show depicting an epic siege in the novel attracted nearly 4,000 spectators per performance. It was staged three times daily by over 100 actors, including 20 cavalrymen.

It represents a new approach to inspiring youngsters to read the sometimes obscure literary classics in the era of short videos. Wansuishan Martial Arts City has become a social media sensation with vibrant live-action shows and charismatic performers. Still, many visitors like Zixuan say such an "influencer hot spot" has nevertheless motivated them to dive into the original texts.

"Our programs aim to honor the original work while ensuring that audiences can easily grasp and connect with the story," says Yu Liuyi, director of the performances. "Our performance style is more like a cinematic presentation than a traditional stage play, and we enhance the visual impact with special effects like pyrotechnics."

More than 500 kilometers away from Kaifeng, an attraction in Langfang, in North China's Hebei province, draws inspiration from yet another Chinese magnum opus and has amassed 14 million visits since its launch in 2023.

Named Unique Dream of Red Mansion, this theater complex features 21 innovative plays, including those inspired by the seminal 18th-century book *A Dream of Red Mansions*, as well as independent plays. In one theater, the audience members stand onstage while characters from the book observe them from spectator seats as if gazing upon the afterlife, while in another show, female figures from the novel confront the author over the cruel twists of fate he penned for them.

Among the visitors were about 270 10th-grade students from Hua Chen School in the neighboring city of Tianjin, who are currently studying the novel that chronicles the rise and fall of an aristocratic Chinese family. Yang Zhuqing, 16, was visiting the theater complex for the second time.

"I used to find the book hard to comprehend, but the plays here helped me better understand the characters," she says. "Now we even playfully liken our classmates to characters from the book."

Han Shiyan, a Chinese-language teacher at the school, believes that the social atmosphere for reading classics is improving, noting that schools are encouraging students to read classic literature. She says that a dedicated class on the novel is held every two weeks, and continues for an entire semester.

Many new media formats, including short videos and immersive plays, are also fueling this wave of classic reading. Han says such content can spark interest, encouraging more children to pick up physical books. "Once they become interested in a certain story, they will probably explore the entire book," she says.

Wang Zuoquan, who is in charge of the Unique Dream of Red Mansion brand, says that they have forged partnerships with more than 100 schools, resulting in approximately 150,000 visits from teachers and students.

He notes that one primary objective of this attraction is to ignite people's interest in the original work. "Through our performances, we plant a seed in the hearts of the audience. The director of the plays envisions these theaters as a starting point, encouraging audiences to open the book once again," he says.

China has made nationwide reading a national strategy. In the Outline of the 15th Five-Year Plan (2026-30) for national economic and social development, it is stated that the country will further promote nationwide reading to build China into a nation of avid readers.

To enhance institutional support, a regulation on promoting nationwide reading, which took effect in February, designates the fourth week of April as National Reading Week, observed for the first time this year.

Hui Dong, an associate professor at the School of History and Culture at Henan University, agrees that performance-based attractions help with the reading trend, as they translate static texts into dynamic experiences, rendering ancient books more approachable and comprehensible to modern readers.

"This is mutual empowerment between tourism and literature," Hui says.

"Classics are those that transcend their times and touch upon universal human nature," says Wang Zuoquan. "Engaging in a dialogue with classics is akin to engaging in a dialogue with human nature. The reading of classics by successive generations ensures the inheritance and continuity of civilization."

At the end of a 65-minute play at the Unique Dream of Red Mansion, characters from the original novel appeared onstage to remind readers to go back to the original book.

Dowager Lady Jia, a pivotal character in *A Dream of Red Mansions*, thanked the audience: "We have lived for 270 years (since the book was written). We will continue to be alive as long as you keep reading this book."

A BIGGER WORLD THROUGH CHINESE

American youths discover language learning provides opportunities for wider communication and understanding other cultures

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Luca Pole (center), an elementary school student from Denver, Colorado, poses with his parents during the 2026 Chinese Bridge Chinese Proficiency Competition regional final in Los Angeles on May 9. RENA LI /CHINA DAILY

For many young American students, learning Chinese began at an early age and gradually became part of their identity, family life and understanding of the world.

This shared passion for language and cultural exchange recently brought students from across the western United States together in Los Angeles, where they exchanged stories, performances and experiences centered around their journey of learning Chinese.

Luca Pole, an elementary school student from Denver, Colorado, said he enjoys both the Chinese language and culture.

"I like the Chinese culture and language because I can learn writing, reading, et cetera," Luca told China Daily during the 2026 Chinese Bridge Chinese Proficiency Competition Los Angeles regional final held on May 9.

"Chinese Bridge is like a place where everyone is brought together to learn Chinese, and it's a really friendly competition," he said.

Luca, whose Chinese name is Lu Ke, performed the song *Xin Nian Hao* and shared the traditional Chinese New Year legend of Nian during the competition. His parents said they enrolled him in a Chinese immersion school when he was 4 years old to help him develop his language skills and broaden his worldview.

"I think it's great for him to become a global citizen and recognize other cultures," his father Larry Pole said. His mother Traci added that she hopes Luca will "understand and appreciate other cultures".

For some families, learning Chinese is closely connected to preserving family heritage and cultural roots.

Jacob Hegedus, whose Chinese name is Zhao Zhuoran, said he enjoys speaking Chinese because his mother's family speaks the language.

"I am proud to be part of a Chinese family," he said.

Jacob's mother, Zhao Jing, said she has spoken Chinese with him since he was very young because she wanted to "pass down Chinese culture and language". His father, who is Hungarian, also encourages multilingual learning at home.

"For us, our family roots are very important," Jacob's father said. "That's why I really encourage him to speak his mother's language Chinese, and my language Hungarian."

Other students described Chinese as a bridge to understanding the wider world and building friendships across cultures.

Lewis Green, a student from Cedar City, Utah, attended the competition wearing traditional Chinese dragon-themed clothing. His Chinese name is Guo Luyi.

"I love the pattern of the traditional Chinese dragon," Green said. "I feel great to wear it."

Green said his interest in Chinese began after a professor from China visited his home and shared meals and conversations with his family.

"I really enjoy communicating with people from different countries," Green said. "It made me feel that the world is very big, but people are still closely connected."

Now able to speak Chinese with his father and older sister, Green said the language has opened a new perspective on the world. He also expressed excitement about an upcoming family trip to China.

"I want to see what China is like, try Chinese food and talk with Chinese children so we can learn from each other," he said.

For Vesper Gaines from Hawaii, Chinese has become much more than a school subject. Gaines, who won first place in the middle school division of the Hawaii regional preliminary competition, said learning Mandarin has shaped much of her life.

"Learning Mandarin has been like all I've ever known my whole life," Gaines said.

She described her Chinese teachers as being "more like aunties than teachers", and said Chinese language learning introduced her to a broader community and different ways of seeing the world.

"Chinese has enveloped me into a community that I didn't know," Gaines said. "Chinese culture taught me so much about how to view the world in different ways and value diversity."

For some students, visiting China transformed their understanding of the language from a classroom subject into a real-life cultural experience.

Students from Mountain Ridge High School in Utah shared how their trips to China changed their perspectives on communication and cultural exchange.

Chase Glenn, who has studied Chinese for 12 years, said his first visit to China helped him realize the practical meaning of the language.

"For a long time, Chinese was just a subject to me," Glenn said. "All that changed when I went to China for the first time."

After giving a speech in China and being understood by the audience, Glenn said he realized language could become "a connection between people".

"That moment changed everything for me," he said. "It was my first real intercultural exchange."

Scott Tolman said he hopes to become "a bridge between Chinese and American cultures", while fellow student Max Warren said learning Chinese has given them "a bigger world".

"We are not just learning Chinese," Warren said, "we're building bridges."

The students also shared how they created a Chinese-language music video during one of their trips to China, combining singing and musical performances in Mandarin. The project later won second place in a national competition.

"I was able to express myself through singing, performing, playing the piano and guitar, all in Chinese," Warren said. "It wasn't about trying to impress people. It was about expressing who we are and telling our story."

Educators at the gathering also emphasized the growing role of Chinese language programs in promoting cultural understanding and youth exchanges.

Shana Tong, president of Maryknoll School in Honolulu, Hawaii, said the school's Mandarin immersion program, launched in 2017, remains the only program of its kind in Hawaii.

Students spend half of the school day learning in Chinese and half in English, studying subjects including mathematics and science in both languages.

The school has also organized cultural events celebrating the Mid-Autumn Festival, Spring Festival and Lantern Festival, while expanding exchanges with China through youth cultural programs and student visits.

"Through these trips, students not only improve their Chinese, but also develop a greater understanding of contemporary China," Tong said. "Seeing is believing."

Tong said educational exchanges have helped build friendships and understanding across cultures.

"When education connects people, the Pacific Ocean is no longer a distance — it becomes a bridge of friendship and understanding," she said.

Students find real connection in China through Mandarin studies

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

A cloth tiger toy. A miniature framed calligraphy. A transparent phone case holding a Polaroid photograph of two smiling teenage girls — one American, one Chinese.

To 16-year-old Beatrix Leonards, a high school student in Berkeley, California, these souvenirs from a summer trip to China are reminders of a friendship forged across the Pacific and kept alive through weekly video calls, where the two girls practice each other's languages and laugh at pronunciation mistakes.

More than 100 kilometers away in Sacramento, California, 14-year-old Sam Fine recalled a shared meal with a stranger that helped him understand what communication could accomplish.

It was Thanksgiving break last year in China's Guilin, a city in the Guangxi Zhuang autonomous region, known for its beautiful landscapes. He and his family had hired a rideshare driver who pulled over because he was hungry. The driver invited them to join him for Guilin rice noodles at a small roadside stand.

"Rather than just a driver, I felt he was more like a tour guide," Sam said in an interview conducted in Chinese.

Sam first visited China with his parents at age 6. He started learning Chinese in first grade at an elementary school with a Chinese immersion program in Sacramento.

"My father felt that we had gone to China so many times but still could not talk to people there, and he felt like we were letting them down," Sam said in fluent Chinese. "So I started learning Chinese. That way, we could chat with our friends and also gain a deeper understanding of China."

By the time he graduated from elementary school, Sam had committed fully to his studies. Now he takes Chinese lessons entirely online, including composition classes, mathematics instruction in Chinese and even debate courses. His younger brother, Thomas, has followed the same path, taking lessons several times daily.

The shift in how Sam experienced China struck him most powerfully during the 2024 Chinese Bridge competition in Beijing.

"After I learned Chinese, the overall experience changed. Compared with before, I could talk to the people around me, and it was as if the experience had gained a little more color," he said.

During the competition, held at the Forbidden City, Sam looked at the classical characters inscribed on the ancient structures.

"If I had just been a foreign tourist like before, I definitely would not have known how to read them," he said. "But as someone who knows Chinese, I could read them."

For that competition, Sam won the Americas championship in the fourth Chinese Bridge Chinese Show for Foreign Primary School Students in October 2024.

That ability to read the language opened doors to understanding the country itself. After visiting multiple Chinese cities, Sam absorbed the weight of Chinese history, such as the Sanxingdui ruins and the legends of *Romance of the Three Kingdoms*.

He also began to feel frustrated with stereotypes he heard back home.

"Some people around me still do not understand China very well and have some stereotypes, so I tell them that the real China is completely different from what they imagined," he said. "That is why I definitely hope they can visit China. To me, China is a very interesting country."

His motivation deepened during that Thanksgiving trip to Guilin. The driver who invited them over for rice noodles told Sam something that stayed with him.

"He said he had picked up many foreign tourists before but could only translate simple phrases on his phone," Sam recalled. By contrast, the driver spoke freely with Sam and his family about Guilin's beauty, local life and his own experiences.

"Thank you for talking with me. I hope I can be your driver again next time," the man said when they arrived at their destination, Sam recounted. "He said no foreign tourists had chatted with him before, so he really treasured the experience of driving and talking with me and my family."

That encounter helped Sam understand why communication matters. "I feel like learning Chinese has helped me understand how Chinese people feel, and how different people feel," Sam said.

Beatrix took a different path into Chinese studies. Now a junior at a high school in Berkeley, she became drawn to the language at a cultural event in Chinatown in Oakland, California.

"I really love learning languages, and I think the really interesting thing about Chinese is that it is so different from English. That was one of the reasons I wanted to learn it," Beatrix said.

The tonal system, the character-based writing and the grammar being fundamentally distinct from English all appealed to her sense of intellectual adventure. She committed to her studies, and several years of dedication paid off when she was accepted into a summer exchange program in China.

Last summer, Beatrix traveled to Beijing, Shanghai and several other Chinese cities. She visited historical sites and, more importantly, spent time with Chinese students her own age. Among them was a girl whose face appeared in the Polaroid photograph she carries in her phone case.

What began as a summer friendship has endured across the Pacific. The two young women video call regularly, switching between English and Chinese as they practice pronunciation and trade stories about their lives.

The friendship surprised her with its ease. During the exchange, she and her Chinese friends encountered moments when one struggled to express a thought in the other's language. Rather than abandon the conversation, they simply used English when Chinese fell short, or Chinese when English did not quite capture the meaning.

Both Sam and Beatrix have thought deeply about what their cross-cultural friendships mean at a time of geopolitical tension.

"When you have two groups of people who are on opposite sides of the world, like the United States and China, it can be very hard to learn about each other and see what life is actually like for a person in the other country," said Beatrix.

Geopolitical tension, she suggested, can seep into personal relationships if people allow it to. But direct contact, genuine friendship and real conversations can disrupt that dynamic.

"Cultural exchange is so important, because it reminds you that the relationship between two countries' governments should not affect people's ability to bond with each other, get to know each other, really learn about each other and have a good relationship," she said.

Sam observed that American and Chinese young people have much in common.

"To young Chinese people, I would tell them America is similar to China in a lot of ways," Sam said. "Both places are big, they have a lot of cities and you can explore a lot once you understand the languages."

Students enjoy their break at China-Laos Friendship Nongping Primary School in Vientiane, the capital of Laos, on May 21. YANG WANLI / CHINA DAILY

VISITS OF VISION

Enduring ties grow ever stronger

China-Laos collaboration, connectivity yield fruit as Xi promotes development assistance

By **YANG WANLI** in Vientiane
yangwanli@chinadaily.com.cn

Along the banks of the Mekong River in Vientiane, the capital of Laos, stands a recently expanded modern medical complex — Mahosot Hospital, Laos' first hospital when established in 1910 and now its largest.

Financed by Chinese funds and with a total investment of about $92 million, the expanded hospital now spans three hectares, with 600 beds and a rooftop helicopter pad.

In 2017, President Xi Jinping made a state visit to Laos — the first by a Chinese head of state and top leader of the Communist Party of China in 11 years.

Since then, there have been frequent mutual visits between Chinese and Lao leaders. In the latest development, General Secretary of the Lao People's Revolutionary Party Central Committee and Lao President Thongloun Sisoulith arrived on Tuesday in Hangzhou, the capital of eastern China's Zhejiang province, formally starting a five-day state visit.

The visits have led to closer cooperation between the two countries in areas such as infrastructure, energy, trade, agriculture and people's livelihoods, including the Mahosot Hospital project.

The groundbreaking ceremony in 2017 for the hospital's expansion was attended by Xi and then Lao president Bounnhang Vorachit.

The hospital's director, Susa Vongphachan, who served as deputy director at that time, still remembers Xi's visit.

"There were several meters (distance) between President Xi and me, but I was deeply impressed by his presence," Susa recalled.

"Tall and dignified, he projected both confidence and approachability," Susa said, adding that whenever he sees Xi in the news today, memories of that visit immediately return.

Susa recalled Xi visiting Lao patients receiving free cataract surgery from Chinese ophthalmologists as part of a medical assistance program, while encouraging Chinese medical teams to continue supporting the Lao people.

In 2024, the expansion project was completed, doubling the hospital's treatment capacity. Susa said that the hospital recorded around 220,000 patient visits last year, an increase of 40 percent compared with the number before the renovation.

In addition to funding hospital infrastructure, the Chinese government has supplied medical equipment to Mahosot Hospital. Over the years, more than 10 Chinese hospitals have carried out training programs and exchanges with the Lao medical staff.

During Xi's state visit to Laos in 2017, the two countries agreed to strengthen cooperation to improve Lao people's livelihoods and advance the building of a China-Laos community with a shared future.

Since Xi's visit, connectivity between the two countries has undergone a dramatic transformation. Connectivity has paved the way for win-win cooperation, and the China-Laos Railway stands as a landmark of friendship, unleashing the efficiency of the China-Laos Economic Corridor.

The China-Laos international freight train service was launched in December 2021. Data from China Railway Kunming Group shows that more than 71,000 freight train trips had operated along the route as of March this year, while transportation costs had dropped by 30 to 50 percent.

Passenger service on the railway, which is more than 1,000 kilometers long, has also expanded rapidly since cross-border operations began in April 2023, according to the group. As of mid-May, the railway had handled 73.38 million passenger trips, including more than 840,000 cross-border journeys.

In northern Laos, the Luang Prabang station has emerged as the busiest passenger hub on the railway line. As of April, it had served more than 4.36 million domestic and international passengers, helping drive local economic and social development, according to Laos-China Railway Co.

"The number of hotels has nearly tripled over the past three years because of booming tourism," said Wongporapi Mengho, owner of a local family-run hotel. "Improved connectivity has created jobs and increased incomes for local residents.

"Now the city has a wide range of restaurants, from Chinese to Italian cuisine," he added. "The growing number of international tourists has also boosted cultural exchanges and mutual understanding."

SCENT OF A GUANGXI CITY CAPTIVATES THE WORLD

Hengzhou's jasmine vines powering wellness and tourism sectors, generating billions in revenue

By **LIN QI, ZHANG LI** and **SHI RUIPENG** in Nanning

"What a beautiful jasmine flower!
Fragrant and enchanting you are, blooming on the stems,
Incredibly sweet and purely white, you are admired by all,
Let me pluck you and gift you to someone else."

This folk song, one of the best-known Chinese melodies in the world, is believed to have originated in the Qing Dynasty (1644-1911) and was featured in *Turandot*, an opera with Asian influences that the great Italian composer Giacomo Puccini left unfinished at the time of his death. As the opera was staged around the world, jasmine became an iconic cultural symbol of China, embodying romantic sensibilities.

Today, the starry white blossom inspires not only poetry, music and love, but also a wide range of products, including flavored drinks and snacks, incense sticks and sachets, and personal care products that soothe the body and mind.

A major source of this rich scent is Hengzhou in South China's Guangxi Zhuang autonomous region. Hailed as the global jasmine capital, the city boasts a history of cultivating jasmine vines for more than 500 years. However, large-scale production and processing began in the 1980s.

Over the past four decades, Hengzhou has worked to become one of the world's largest jasmine production bases and a prominent exporter of the exotic fragrance.

According to Guangxi's Department of Agriculture and Rural Affairs, the city produces over 80 percent of China's jasmine flowers and jasmine tea, as well as more than 60 percent of the world's total jasmine flower output.

Irish travel blogger Luke O'Farrell and his British partner, Alexander Short, were among the foreigners who recently visited the lesser-known city, which is blessed with fertile soil and a climate conducive to growing jasmine. They learned from local farmers how to pick the flowers and witnessed how those were processed on factory lines.

Chinese team to support Ebola response in DRC

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

A Chinese medical team arrived in Kinshasa, the capital of the Democratic Republic of Congo, on Tuesday for a three-month mission to support the Central African country's response to an Ebola outbreak.

The five-member team includes experts in epidemiology, clinical diagnosis and treatment, research, and traditional Chinese medicine, according to the National Health Commission, which organized the mission along with the Ministry of Foreign Affairs, the Chinese embassy in Kinshasa and other government agencies.

Lu Ming, an official from the commission's department of international cooperation, who is leading the team, said that all members have extensive experience in their respective fields and have participated in previous global medical aid missions and Ebola responses.

"We plan to establish communication and cooperation mechanisms with local governments, healthcare institutions and international organizations under the guidance of the Chinese embassy," Lu said.

"We also aim to obtain the latest, accurate information on the outbreak to formulate a targeted and detailed response," he added.

Furthermore, the team of experts will provide training in disease prevention and treatment for local medical institutions, Chinese-funded enterprises and local Chinese communities.

On May 17, the World Health Organization declared the Ebola outbreak in the DRC "a public health emergency of international concern". The cause of the outbreak is the Bundibugyo strain, which has no approved vaccine and treatment. This strain of Ebola can kill up to 50 percent of those it infects.

The WHO said on Tuesday that there were 321 confirmed cases and 116 suspected ones in the DRC. The confirmed death toll is 48, while six people have recovered, it added.

Lu, the Chinese team leader, said the outbreak poses a bigger challenge due to poor access to the affected areas, risks of cross-border transmission and a lack of funding.

"Sending a high-level medical team demonstrates China's commitment to participating in international action against the epidemic and working hand in hand with other countries to fight the virus," he said.

Jiang Rongmeng, a team member and vice-president of Capital Medical University's Beijing Ditan Hospital, noted that China has accumulated decades of experience in tackling infectious diseases, particularly through low-cost, easily accessible methods.

In the face of the Ebola outbreak, it is crucial to quickly identify suspected cases through screening for typical symptoms and carry out epidemiological investigations into possible contacts with confirmed cases or deceased victims, he said.

On Monday, the commission and the National Administration of Traditional Chinese Medicine released updated diagnosis and treatment guidelines for Ebola. China has so far not reported any domestic or imported infections, it said.

A Chinese medical team, mobilized to assist the Democratic Republic of Congo in its fight against the Ebola virus, prepares for departure at Beijing Capital International Airport late on Monday. ZHANG DAN / FOR CHINA DAILY

Sino-US cooperation can benefit from wider scope

WORLD WATCH
By Park Seung-chan

In his dinner speech following the recent summit between China and the United States, President Xi Jinping mentioned that the Chinese Dream and US President Donald Trump's push to "Make America Great Again" can go hand in hand.

If MAGA and the Chinese Dream of achieving the great rejuvenation of the Chinese nation are viewed from the perspective of cooperation and symbiosis, rather than conflict and confrontation, the two countries could grow and develop in the direction of win-win cooperation rather than a zero-sum game in the future.

While the meeting concluded without a joint statement, this vision offers a hopeful blueprint. But since differences and competition between the two countries remain, a pragmatic understanding of each other's strategies and a concerted effort to foster cooperation will be required instead of escalating confrontation.

Beijing believes that in the medium to long term, although strategic competition with the US is already an unavoidable reality, China can manage the current tense situation and expand its global role without a possible head-on confrontation with the US. However, the current US administration is running out of time, as it must demonstrate, within the remainder of Trump's term, tangible achievements and results for his "Make America Great Again" approach.

However, the strategic competition between the impatient US and the relaxed China must be observed from a long-term perspective.

The US and China are within a complex framework of relationships, in which they must maintain structural strategic competition to avoid a catastrophic scenario for both, and must protect their respective national interests.

Chinese aerospace leaders engage industrial thrust

Viability, speedier launches and mass production prioritized by developers

By **REN QI**
renqi@chinadaily.com.cn

Driven by an increase in orbital filings and successful launches, China's commercial aerospace sector is steadily transitioning from a phase of technical verification to large-scale deployment of its achievements.

Advancements in satellite mass production, in-orbit services and reusable rocket technologies are fueling this expansion. As satellite services integrate into consumer markets and various industries, China is also propelling its position in the competitive domain of low-Earth orbit.

This progress is reflected in recent industry figures. According to the China National Space Administration, the sector conducted 50 commercial launches in 2025, accounting for 54 percent of the country's total space launches for the year.

Meanwhile, 311 commercial satellites were placed into orbit, representing 84 percent of the national total. The newly operational Hainan Commercial Space Launch Site facilitated nine of these missions, demonstrating a turnaround capability of "seven days for launch, and seven days for recovery" at its primary pad.

Alongside physical deployment, China submitted filings to the International Telecommunication Union in late December for up to 203,000 additional satellites. However, the practical execution of this strategy relies heavily on a maturing domestic supply chain.

Clockwise from top left: A Lijian-2 Y1 carrier rocket with three satellites onboard blasts off from the Dongfeng commercial space innovation pilot zone in northwestern China on March 30. WANG JIANGBO / FOR CHINA DAILY Lihong-1 Y1, China's commercial recoverable spacecraft designed for space tourism, successfully completes its suborbital flight test mission on Jan 12. PROVIDED TO CHINA DAILY Visitors observe a model of China's space station at a commercial space exhibition in Beijing on Jan 24. CHEN XIAOGEN / FOR CHINA DAILY A visitor explores a commercial space exhibition in Shanghai on March 12. ZHANG JIANSONG / XINHUA

Fresh focus

Key industry leaders note that the focus has shifted toward mass production and the urgent development of heavy-lift launch capabilities.

Lin Guangrong, a constellation communication system architect at GalaxySpace, said his company has successfully transitioned from a "custom workshop" model to a "digital factory" approach.

Recognized as China's first unicorn company in the commercial aerospace and satellite internet sector, GalaxySpace has established a complete manufacturing chain for satellites weighing 100 to 2,000 kilograms. The company's annual production capacity for medium-sized satellites has stabilized between 100 and 150 units, with the manufacturing cycle shortened by 80 percent compared with traditional models. This efficiency is driven by a "smart brain", where algorithms continuously optimize industrial processes based on data from front-line engineers.

Industrialization extends to launch vehicles, with the aim of turning aerospace equipment into standard industrial products. For example, the Lijian-2 Y1 carrier rocket, which recently had a successful launch, shares an almost identical design for the core stage and two boosters.

Lian Jie, deputy chief designer of the Lijian-2, said this "universal booster core" configuration allows major components to be mass-produced.

Making rockets is becoming akin to assembling building blocks; simplifying the manufacturing process and enabling rapid replacement of parts can support high-frequency, airline-style launch schedules, Lian said.

Space 'gas station'

Chinese commercial space enterprises are also pushing the boundaries of in-orbit capabilities.

A prime example is the Yuxing-3 06 satellite, recently launched from the Jiuquan Satellite Launch Center in Northwest China. It carried out a series of complex in-orbit operations hundreds of kilometers above the Earth, including simulated propellant refueling tasks using a robotic arm.

Developed by Suzhou Sanyuan Aerospace Technology Co, a subsidiary of Beijing Aerospace Yuxing Technology, the satellite is intended to serve as a "space gas station".

Equipped with a flexible robotic arm, it is China's first commercial experimental satellite designed to perform high-difficulty in-orbit operations.

Chen Jing, chief technology officer of Sustain Space, said the satellite utilizes three control modes for refueling: autonomous path planning, remote manual control, and visual servo-guided docking.

Cao Meng, vice-president of Beijing Aerospace Yuxing Technology, envisions a future where satellites swiftly locate targets, perform precise docking, and refuel them. "We hope to build the future 'Space 4S shop' to provide one-stop maintenance and repair solutions for space assets," Cao said.

Meanwhile, computing power is also heading to the stars.

In a low-Earth orbit approximately 500 km above the ground, 12 computing satellites are operating to form a space computing network. Spearheaded by the Zhijiang Lab, this "Three-Body Computing Constellation" aims to bring artificial intelligence directly to space.

Wang Jian, an academician of the Chinese Academy of Engineering and director of the Zhijiang Lab, said nearly 90 percent of satellite data is currently discarded before reaching the ground due to limited onboard processing. By deploying AI models in orbit, the constellation can process data locally.

The team has already successfully deployed 10 AI models in orbit, including an 8-billion-parameter space-based remote sensing model 80, and a 150-million parameter Fuxi weather model 1.5, ensuring data timeliness for critical applications like disaster relief and urban governance.

Technological innovation is also driving the efficiency of communication payloads.

Lin, from GalaxySpace, highlighted the development of payloads using the Q/V band, which combines the Q and V bands to cover frequencies from 47 to 52 gigahertz, more than doubling the bandwidth of current satellite systems.

Lin compared traditional frequency bands to congested city streets and the Q/V band to a new, wider superhighway essential for high-speed satellite internet.

GalaxySpace has developed its fourth-generation Q/V antenna, reducing its weight from over 7 kg to just 3.2 kg, allowing engineers to stack more satellites inside a single rocket fairing, or protective shell. In September, the company also launched the world's first satellite equipped with large flexible solar wings.

These breakthroughs are being tested in the Little Spider Web, China's first low-Earth-orbit broadband trial constellation. The network has verified the ability to provide continuous broadband communications for 30 minutes at a time. It has successfully conducted tests in diverse environments, from verifying power grid connectivity in Yunnan province to enabling maritime emergency communications. Through satellite internet, drones have successfully conducted firefighting missions, and humanoid robots have achieved "remote perception" via synchronized visual data transmission.

Tian Feng, deputy director of the technology research and development center at the Innovation Academy for Microsatellites of the Chinese Academy of Sciences, said low-Earth orbit satellites act as a space-based information highway, eliminating "information silos" in deserts and oceans.

Li Xiayu, chief engineer at the China Academy of Information and Communications Technology, said satellite communications are accelerating their expansion into consumer fields like smartphones and smart vehicles, opening new consumer markets.

Consumer integration

While GalaxySpace focuses on infrastructure, other industry players are concentrating on the downstream ecosystem.

Wang Hui, general manager of BeiDou Satellite Communication Co, a subsidiary of China North Industries Group (Norinco Group), has emphasized that applications are being rapidly integrated into consumer life.

Pan Ying, deputy chief engineer of the company, highlighted the integration of the BeiDou short message service into mass-market consumer devices. Unlike standard GPS, BeiDou allows users to send their location and status without ground-based mobile signals.

By forming joint ventures to develop new chips, the company has integrated this capability into standard smartphones. Since 2022, hundreds of millions of such phones have been shipped. Beyond phones, the company is collaborating with outdoor apparel brands like Bosideng and Phoenix to embed satellite communication modules directly into outdoor gear.

Pan believes Chinese companies are carving out a unique market position. While Western competitors like SpaceX employ a "vertical integration" model, controlling everything from chips to rockets, the Chinese system is defined by specialization — a "letting a hundred flowers bloom" approach.

Rocket manufacturers focus on launch vehicles, and satellite makers focus on spacecraft. Pan said this model concentrates resources to achieve high-quality system completion in a short time frame.

This specialized approach has been heavily supported by local governments, with the building of comprehensive industrial clusters.

In Beijing, a dedicated satellite town and Rocket Avenue are under construction. In Haiyang, Shandong province, the Oriental Aerospace Port connects manufacturing facilities directly to launch craft.

A standout example of this local empowerment is the Xixian New Area in Northwest China's Shaanxi province. The recent successful launch of the Xiguang-1 06 satellite, developed by the Xi'an Zhongke Xiguang Aerospace Technology Group, underscores the robust support provided by the local government.

As China's first and only in-orbit commercial hyper-spectral remote-sensing satellite with full-spectrum coverage of the 400-2,500 nanometers band, it ushers in a new era of "full-spectrum precise perception". Covering 26 independent spectral bands, the satellite functions like a CT scanner for the planet.

"It doesn't just look at surface morphology, but can analyze material composition, monitor crop health and predict ecological hidden dangers," said Kou Yimin, chief engineer at Zhongke Xiguang Aerospace.

The satellite is already monitoring the growth of tea and traditional Chinese medicine herbs in Sichuan and Yunnan provinces, and providing early warnings for landslides in northwestern China's mining areas.

Behind this success is a complete commercial aerospace ecosystem cultivated in the Xixian New Area. Hosting 34 enterprises in the aerospace industry chain, the area achieved an output value of 5.69 billion yuan ($835.29 million) in 2025.

"The success of this satellite sets another benchmark for the new area to cultivate a more modernized industrial system with new quality productive forces," a spokesperson for the Xixian New Area said, adding that they aim to contribute the "Xixian experience" to China's high-quality manufacturing development.

'Use it, or lose it'

The realization of these vast commercial ambitions, however, depends heavily on the physical capacity to launch hardware into space.

The International Telecommunication Union's "first come, first served" regulatory principle comes with strict "use it or lose it" deadlines. Once filed, an applicant must launch the first satellite within seven years and deploy 10 percent of the constellation within nine years.

This regulatory clock places immense pressure on China to increase launch capacity and reduce costs.

The industry is aggressively pursuing reusable rocket technology. In 2025, the Zhuque-3 reusable rocket completed its maiden flight, successfully placing its second stage into orbit and verifying core technologies for first-stage reentry and return.

Furthermore, the "Gravity-2" (Yinli-2) carrier rocket is undergoing intensive hot-fire tests for its "Force-110" liquid oxygen kerosene engine, with a maiden flight and recovery technology verification expected in the second half of the year. The "Blue Flame" 220-ton liquid oxygen methane full-flow staged combustion cycle engine has also completed full-system long-duration test runs.

The Tianlong-3 rocket, designed for large-scale constellation deployment with a "one rocket, 36 satellites" configuration, is preparing for upcoming missions. Experts estimate that reusable technology could slash total launch costs by 40 to 60 percent.

As domestic capabilities mature, Chinese companies are also looking abroad. GalaxySpace is expanding its footprint in Southeast Asia, partnering with local operators in Thailand to build ground stations and test satellite internet applications, marking the first time low-Earth-orbit broadband has been utilized there. Similar agreements have been signed in Hong Kong to explore applications in the Middle East and Africa.

Pan, from Norinco, stressed the importance of international compliance, calling for clearer government guidance to help companies navigate the complex legal landscapes of international operations. Services like the BeiDou short message could find widespread use in global search and rescue, Pan said.

A Long March-12 rocket carrying the 19th group of low-orbit internet satellites blasts off from the Hainan Commercial Space Launch Site in Hainan province on Jan 19. YANG GUANYU / XINHUA

Lebanon conflict rages despite partial truce

By **CUI HAIPEI** in Dubai, UAE and **JAN YUMUL** in Hong Kong

Israeli drone strikes in southern Lebanon on Tuesday killed eight people, including a father and his two children, a day after United States President Donald Trump said that Israel and Hezbollah had agreed to dial back fighting.

Lebanon also announced a partial ceasefire between Hezbollah and Israel, marking limited de-escalation in a conflict that has killed thousands. However, fighting persists, and the flare-up has complicated the wider standoff between the US and Iran, with peace negotiations remaining stalled for weeks.

Hostilities in southern Lebanon, which Israel invaded in March, raged on Tuesday. Lebanon's National News Agency reported Israeli airstrikes targeting multiple places, including a "very violent detonation" in the town of Debbine. The Israel Defense Forces also confirmed that it had intercepted two projectiles launched from Lebanon into northern Israel.

According to Lebanon's embassy in Washington, Hezbollah has accepted a US-proposed "mutual cessation of hostilities", demanding that Israel suspend all strikes targeting Beirut.

Trump said that Hezbollah had pledged via intermediaries to stop attacking Israel. No sitting US president has ever held direct or mediated talks with Hezbollah, which Washington has termed a terrorist organization since 1997.

He added that Israeli Prime Minister Benjamin Netanyahu had agreed to pull back troops poised to assault Beirut. However, Netanyahu later said that Israel would resume military operations if Hezbollah failed to halt cross-border assaults.

Israeli National Security Minister Itamar Ben-Gvir also publicly pressed Netanyahu to resist US pressure over the ceasefire in Lebanon. "Time to say no to Trump," he said on X.

At an emergency United Nations Security Council meeting on Monday, all council members except the US urged Israel to withdraw troops from southern Lebanon and avert further escalation, The New York Times reported.

A spokesperson for UN Secretary-General Antonio Guterres said: "We are deeply alarmed by the escalation in military activities across southern Lebanon and beyond."

The Israel-Hezbollah conflict erupted on March 2 as a spillover of the broader US-Iran war and has remained intertwined with core bilateral negotiations ever since. Iran has made an end to Israeli military assaults in Lebanon a prerequisite for any comprehensive peace accord, while Washington insists that two conflicts should be treated separately.

Lebanon's Ministry of Public Health confirmed that Israeli strikes have so far killed 3,433 and left 10,395 wounded nationwide. Amid the mounting casualties, Iran's Parliament Speaker Mohammad Bagher Ghalibaf warned that continued Israeli "aggression against Lebanon" would prompt Tehran to suspend negotiations with the US and escalate tensions into a direct confrontation.

Iran's Tasnim News Agency reported on Monday that Tehran was putting indirect US peace talks on hold and might end a ceasefire that has largely held since early April, citing Israeli operations in Lebanon.

However, Trump said late on Monday that bilateral negotiations with Iran were advancing at a "rapid pace", predicting a formal accord to prolong the truce and reopen the Strait of Hormuz would be clinched "over the next week".
