Hainan hosts workshop on Global South farming

By CHEN BOWEN in Haikou
chenbowen@chinadaily.com.cn

An Egyptian participant presents date palm products to attendees during the FAO workshop in Haikou, Hainan province, on Monday. PROVIDED TO CHINA DAILY

More than 40 government officials, agricultural experts and development partners gathered in Hainan province on Monday for a United Nations-backed workshop on tropical agriculture, highlighting China's growing role in sharing agricultural technologies and expertise to support sustainable farming across the Global South.

The six-day workshop, organized under the UN's Food and Agriculture Organization's One Country One Priority Product initiative and co-hosted by the Chinese Academy of Tropical Agricultural Sciences, focuses on sustainable production, post-harvest management, value addition and market access for tropical specialty crops. Participants are also visiting research facilities in Hainan to explore practical applications of agricultural technologies.

Launched by the FAO in 2021, the OCOP initiative encourages countries to develop one priority agricultural product with comparative advantages while strengthening sustainable value chains through technology sharing and international cooperation. The initiative now includes 94 participating countries, 60 of them tropical nations.

"OCOP is not simply about promoting a product," said Yurdi Yasmi, director of FAO's Plant Production and Protection Division. "It is about helping countries transform local potential into sustainable development outcomes. It connects innovation with farmers, knowledge with action, and partnerships with impact."

For many delegates, the discussions centered on practical technologies that could help address production bottlenecks back home.

Egypt, which produces more than 2 million metric tons of dates annually across 60 varieties, is looking to adopt AI-powered optical sorting equipment and advanced packaging technologies to improve quality and competitiveness, said Amgad Ahmed Mohamed Elkady, executive general manager of the Food and Agro Industries Technology Center under Egypt's Technology and Industrial Innovation Centers.

Cambodia, meanwhile, hopes to strengthen cooperation on pest management and production standards to expand overseas markets for its mango industry.

"We have to boost smallholder development and explore new overseas markets — that's a major challenge," said Hun Darin, fruit crop expert officer, general directorate of Agronomy, Cambodia. "We are seeking collaboration via OCOP and China's South-South programs to carry out joint pest prevention and train local farmers."

The workshop also showcases China's broader approach to agricultural cooperation, which increasingly emphasizes technology transfer and long-term capacity building.

Through the FAO-China South-South Cooperation Programme, China has shared expertise drawn from its own agricultural transformation — from subsistence farming to technology-driven, market-oriented production — to help partner countries strengthen their agricultural systems.

The approach has already delivered tangible results.

Under previous FAO South-South projects, Chinese mango, banana and pineapple technologies boosted fruit yields by 50 to 300 percent in Sri Lanka, while training over 2,200 farmers. In the Republic of the Congo, high-yield cassava varieties and processing lines tripled output. In the Maldives, green biocontrol techniques helped save coconut forests from devastating pests, according to You Wen, deputy director of CATAS' international cooperation division.

"Hainan is ready to share its tropical agricultural practices as a model case for South-South cooperation," said Lu Sheng, deputy director-general of the province's agriculture department. "We are working with global partners to explore new pathways for green development of specialty products."

Alue Dohong, FAO assistant director-general and regional representative for Asia and the Pacific, praised the collaboration with leading regional science partners as instrumental to OCOP's success.

The workshop, which runs through Saturday, is expected to identify new areas for technical cooperation and future partnerships among participating countries, further expanding collaboration on sustainable tropical agriculture across the Global South.

POLICY REVIEW

Dedicated plan aims to up consumption

Targets include growing middle income, services, tech-driven retail

By **WANG KEJU**
wangkeju@chinadaily.com.cn

SHI YU / CHINA DAILY

China has unveiled its first-ever national-level five-year plan specifically dedicated to expanding consumption, setting a target of 60 trillion yuan ($8.3 trillion) in total retail sales of consumer goods by 2030 as a major part of the push to rebalance the economy toward domestic demand-driven growth.

On July 13, the State Council, China's Cabinet, approved the plan for expanding consumption during the 15th Five-Year Plan (2026-30) period, placing greater emphasis on boosting services consumption and enhancing household income and social security.

China's retail sales surpassed 50.1 trillion yuan in 2025, authorities from the National Development and Reform Commission and the Ministry of Commerce said when elaborating on the plan.

During the 14th Five-Year Plan (2021-25) period, consumption expenditure contributed an average of 58.8 percent to economic growth, 10 percentage points higher than the previous five-year period, they added.

However, authorities acknowledged that the consumption sector still faces challenges, which objectively constrain the further unleashing of consumption potential.

The latest plan marks a major shift in how policymakers approach consumption. Rather than treating it as a short-term tool, the plan positions consumption as a core pillar of China's medium- to long-term development strategy, according to Teng Tai, director of the WANB New Economy Institute, a Beijing-based think tank.

"Expanding consumption is not simply about stimulating terminal demand — it is a systemic transformation covering income and structure, demand and supply," Teng said, adding that the 60-trillion-yuan target is "pragmatic and prudent", leaving room for potential economic fluctuations.

The plan implies an average annual real growth rate of about 4 percent in retail sales over the next five years, a figure economists say reflects realistic expectations given the current economic environment.

The plan's 28 measures are organized around six strategic pillars: upgrading service consumption, expanding goods consumption, creating new consumption scenarios and business models, enhancing household spending capacity, optimizing the consumption environment, and strengthening institutional mechanisms.

At the top of the list is service consumption, a category that, according to the National Bureau of Statistics, accounted for 46.1 percent of household spending last year and is seen as the next frontier for consumption growth.

The plan calls for expanded access to elderly care, childcare, cultural tourism and health services, reflecting the government's recognition that China's aging population and changing consumer preferences demand a reorientation of supply.

New consumption hot spots are rapidly emerging across China, and service retail sales growth has consistently outpaced goods retail, making service consumption the main driver of consumption growth, said Dong Yu, executive vice-president of Tsinghua University's China Institute for Development Planning.

"This deployment will strongly propel China's service consumption into a more diversified, integrated and quality-oriented development stage," Dong said. "It will better meet the demand for high-quality living while promoting high-quality and efficient development of the service sector, injecting new momentum and vitality into economic growth."

The plan also specifically addresses new business formats and models, including digital consumption, green consumption, the debut economy, experiential consumption and inbound consumption. The plan includes the further expansion of visa-free entry, increased direct international flights, specifically to Europe, the United States and countries involved in the Belt and Road Initiative, and an overhaul of payment and tax-refund systems to remove friction for foreign tourists.

Chen Lifen, a researcher at the Development Research Center of the State Council, said that with a population of over 1.4 billion and a middle-income group exceeding 400 million, China's consumption upgrading space remains immense.

Against a backdrop of rising external uncertainties and slowing growth in traditional goods consumption, cultivating new business formats, models and scenarios as consumption growth points is essential to converting potential market space into actual market scale, Chen said.

"This can continuously expand consumption growth and help the economy navigate challenges with steady progress," Chen added.

The plan devotes significant attention to household income and social security — the foundational drivers of consumption. It calls for raising minimum wages, expanding individual income tax deductions, and increasing pension and healthcare protection to put more money in people's pockets.

Wen Bin, chief economist at China Minsheng Bank, said the key is the "substantive implementation" of the urban and rural resident income growth plan, which was outlined in this year's Government Work Report as a priority.

"People need to have money in their hands and confidence in their future," Wen said, adding that improving the social safety net will help reduce precautionary saving and encourage households to spend.

The plan also embraces the role of technology in reshaping consumption. It explicitly calls for deepening "AI plus consumption" integration, supporting the development of debut economy events, and cultivating immersive, experience-driven consumption scenarios.

"Digital technologies such as AI, the Internet of Things and virtual reality are not only generating new products and services like smart wearables and instant retail, but are fundamentally reshaping consumption scenes and interaction patterns," said Fu Yifu, a researcher at Jiangsu Su Merchants Bank.

According to a report on changing consumer behavior released last October by US media services company Omnicom Media Group, 65 percent of consumers now expect to find the answers they are looking for in artificial intelligence overviews.

"We clearly observe this trend through monitoring click streams, sessions and conversations on our platform," said Diarmuid Gill, chief technology officer of global commerce media company Criteo, noting that the application of AI is currently focused on the product discovery and price comparison stages, with the final consumer decision-making phase remaining underdeveloped.

As AI has become an important part of the consumer shopping journey, businesses need to deploy AI agent-driven marketing strategies promptly to capitalize on this critical growth opportunity, Gill added.

'Six networks' infrastructure strategy angles for investment

By **WANG KEJU**

China is accelerating a sweeping infrastructure plan centered on six interconnected networks — water, power, computing, telecommunications, urban pipelines and logistics, in a bid to stabilize investment, create jobs and lay the groundwork for the next phase of the country's technological and industrial transformation.

Premier Li Qiang chaired a State Council executive meeting on July 20 to review progress on the "six networks" plan, which was first unveiled in March and has since become a key part of Beijing's strategy to counter economic headwinds.

Prior to the meeting, China released its first-half economic data showing that fixed-asset investment contracted 5.7 percent year-on-year in the first six months of 2026 to 22.64 trillion yuan ($3.1 trillion), as a deepening property sector downturn continues to weigh on broader investment activities.

China vowed late last year to halt the investment downturn, following a 3.8 percent contraction in fixed-asset investment in 2025.

The meeting called for "systematic advancement" of the networks, faster implementation tailored to local conditions, and stronger funding support.

The plan is backed by massive financial firepower. The National Development and Reform Commission estimates that investment in the six networks and related key areas will exceed 7 trillion yuan this year alone.

Over the 15th Five-Year Plan period (2026-2030), cumulative investment is projected at 20 trillion to 25 trillion yuan, the commission said. "Just three of the networks — water, power and urban pipelines — will see combined investment exceeding 16 trillion yuan during the 15th Five-Year Plan period," it added.

"This is not just about expanding effective investment," said Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities. "It is a strategic move to cultivate new quality productive forces and shape future competitive advantages."

Luo said that the networks of water, pipelines and logistics provide "foundational support" for the physical economy, while networks of computing power, communications and the smart grid serve as "innovation engines" that will enable artificial intelligence, green energy and digital transformation.

To back the plan, the government has already allocated 755 billion yuan in central budget investment and 1 trillion yuan in ultra-long special treasury bonds for this year, with disbursement largely completed by the end of June. An additional 800 billion yuan in new policy-based financial instruments is being deployed.

Zheng Shanjie, head of the National Development and Reform Commission, hosted a private sector symposium on June 16 to solicit input on the six-networks plan, emphasizing that the initiative offers "major opportunities" for businesses to expand markets, increase investment and drive innovation.

"We will open competitive infrastructure sectors fairly to all market players and improve mechanisms for private companies to participate in major projects," Zheng said.

Policy Digest

Data privacy rules to be eased for small entities

China is simplifying data privacy requirements for small entities, with new provisions released by the Cyberspace Administration of China and the Ministry of Public Security. Taking effect on Sept 1, the provisions aim to lower compliance costs for startups and micro, small, and medium-sized enterprises.

An official with the CAC said the move represents an important step in implementing the country's Personal Information Protection Law. The provisions apply to any entity or individual that processes the personal information of fewer than 100,000 people.

The document sets out simplified measures concerning personal information processing rules and the fulfillment of protection obligations, while also specifying requirements for supervision and administration.

It supports enterprises, social organizations and professional institutions by strengthening their protection capabilities through training, lectures, legal awareness activities and consultation.

Government departments responsible for personal information protection are also encouraged to provide small entities with infrastructure, technological tools and consultation services for secure and convenient information processing, helping further reduce compliance costs.

Eldercare professional qualification system set up

China has established its first official professional qualification system for eldercare service professionals, marking a major step forward in the nation's strategy of addressing its rapidly aging population.

Approved by the State Council, the provisional regulations were jointly issued by the Ministry of Civil Affairs and the Ministry of Human Resources and Social Security. The framework sets standardized guidelines for professional examinations, core competencies, and official registration across home, community and institutional care settings.

It has junior, intermediate and senior qualifications. Junior and intermediate candidates will take nationally unified examinations, while rules for senior professionals will be formulated separately. The passing score for each subject is generally 60 percent, and successful candidates will receive paper and electronic certificates.

Junior professionals should possess basic knowledge and skills, help assess older people's conditions, and provide care and rehabilitation services. Intermediate professionals should be able to devise care plans, train eldercare workers, offer consultation, connect resources and make referrals.

Blueprint lays out goals for green energy development

China's National Development and Reform Commission and the National Energy Administration released the country's renewable energy development plan for the 15th Five-Year Plan period (2026–30) on July 23.

The policy framework signals a strategic transition for China's clean energy sector, shifting focus from rapid capacity expansion to quality improvement, system integration and reliable substitution of fossil fuels.

According to the document, by 2030, the total consumption of renewable energy is expected to reach approximately 1.8 billion metric tons of standard coal equivalent.

By 2030, the total installed capacity of renewable energy power generation is projected to reach about 3.5 billion kilowatts, with an annual power generation of approximately 6 trillion kilowatt-hours. The combined installed capacity of wind and solar power is expected to exceed 2.8 billion kW, with annual power generation surpassing 4 trillion kWh.

Renewable energy refers to energy that can be continuously replenished and regenerated through natural processes within a relatively short period. It includes hydropower, wind, solar, biomass, geothermal and marine energy. New energy refers to all renewable energy sources excluding hydropower, according to the document.

Students from schools in China and overseas raise country placards during the 2026 China Daily Model United Nations in Suzhou, Jiangsu province, held from July 31 to Aug 3, 2026. PROVIDED TO CHINA DAILY

Learning the art of diplomacy

Students at the 2026 China Daily Model United Nations navigate competing interests and seek common ground on global challenges.

By GUO JIATONG
guojiatong@i21st.cn

Visiting Suzhou for the first time, 13-year-old Luo Shiqi was impressed by the city's hospitality and quickly made friends with young delegates from different schools and countries.

The Italian-Chinese student from Varese Chinese Language School in Italy was in the city to take part in a four-day Model United Nations conference, where students assumed the roles of national representatives and debated global challenges.

Held from July 31 to Aug 3 in Suzhou, Jiangsu province, the 2026 China Daily Model United Nations (CDMUN) brought together teachers and student representatives from nearly 100 schools in China and overseas.

The agenda covered four broad areas: global governance, governance of emerging issues, regional affairs and international communication. Through simulations of international organizations, participants examined global challenges from the perspectives of the countries they represented.

Inside the meeting rooms, country placards rose above tables as delegates leaned toward microphones to debate regional conflicts, the global energy transition and humanitarian crises.

Representing Canada on a simulated United Nations Development Programme committee, Luo said the discussions changed how she viewed the challenges countries face when pursuing shared goals.

"Listening to different voices helped me become more open-minded," she said. "Sometimes a country cannot achieve a goal not because it lacks the will, but because it lacks the resources, technology or financial capacity."

Liu Biwei, former vice-president of the China Public Diplomacy Association, said Model UN gives young people a valuable opportunity to gain firsthand insight into international organizations and global affairs.

"The simulations also helped young people develop communication skills, deepen mutual understanding and learn to cooperate," Liu said.

For some participants, the conference offered a deeper look at the competing interests that shape international negotiations.

Lu Dikai, a 21-year-old international relations major at Dalian University of Foreign Languages in Liaoning province, served as a journalist with the CDMUN media center. He reported on discussions about the Cyprus crisis of 1974 and the conflict in Sudan.

Through those discussions, he observed that humanitarian concerns in contemporary regional conflicts are often politicized, while multilateral processes are sidelined.

"Major powers tend to prioritize their own geopolitical interests," Lu said. "Humanitarian operations that should focus solely on protecting civilians can easily become instruments of geopolitical competition."

In his view, addressing such challenges requires an approach grounded in multilateralism, fairness and justice.

"Transnational issues cannot be solved by one or a few nations alone," he said. "Only through equal consultation and listening to diverse voices can we build a sustainable global governance framework."

The simulations also gave Lu a more practical understanding of diplomacy, which he described as a continual process of adjustment and compromise. "Unexpected developments can arise at any point in a meeting," he said.

"Rather than simply confronting one another, delegates must quickly reassess their national interests and adjust their negotiating positions. The challenge is to find the broadest possible common ground without compromising their core interests."

The question of balancing national priorities and the common good also emerged in discussions on environmental cooperation.

Zhou Tuoyi, a 20-year-old international relations student at the London School of Economics and Political Science, served on the academic team for the United Nations Economic and Social Council.

During the conference, Zhou helped guide discussions on the sustainable management of transboundary water resources in the Aral Sea Basin, where decades of environmental degradation have exposed the limits of existing international mechanisms.

"When countries compete over natural resources, pursuing individual national interests can produce collectively irrational outcomes," he said. "That's a dilemma worth debating."

He believes effective international cooperation requires countries to consider the human consequences of their decisions.

"Empathy is what drives us to address problems that affect millions of lives," Zhou said. "If countries focus only on their own interests, social and humanitarian needs can easily be overlooked."

Attending the conference for the third time, Zhou said he had watched young delegates grow throughout the event.

"Many delegates arrive as hesitant participants but leave as confident speakers," Zhou said. "More importantly, they begin to understand that addressing long-standing global crises requires not only negotiation, but also genuine empathy."

For Luo, that learning process meant recognizing why a country might struggle to meet an international goal. For Lu, it meant understanding how geopolitical interests and unequal national capacities can complicate international cooperation.

The experience also reinforced Lu's belief that understanding international affairs requires a strong grounding in history.

He advised young people interested in diplomacy to build that foundation before delving into international relations theory.

"History is the bedrock of international politics," he said. "Young people must think independently, build their knowledge over time and avoid being influenced by one-sided opinions."

Wang Benchuang contributed to this story.

Shining Wisdom

Building a green legacy for generations to come

"A society grows great when old men plant trees in whose shade they know they shall never sit" is a quote I was reminded of while reading *Xi Jinping: The Governance of China*. It reflects the book's long-term perspective and its presentation of leadership as stewardship: development should be managed not for personal profit, but for future generations.

Xi's emphasis on sustainable growth and ecological civilization suggests that good government is like planting trees: it requires patience, selflessness and a commitment to benefits that may not become visible for years.

Environmental concerns have been incorporated into China's constitution and national development goals. Local governments are increasingly judged not only by their economic performance, but also by how well they protect the environment.

This shift has contributed to major changes in industry, with China emerging as a global leader in green technology. At the same time, it has made it more difficult for heavily polluting industries to operate without restriction.

This is consistent with one of Xi's best-known statements: "Lucid waters and lush mountains are invaluable assets." China's pledge to peak carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060 reflects this environmental ambition.

In the United States, material wealth has increasingly become a measure of national success. Gross national product (GNP) was often treated as a comprehensive indicator of progress, even though it records economic activity regardless of whether that activity improves people's lives.

As Robert F. Kennedy observed in a 1968 speech, it can count pollution, crime, destruction and military expenditure while excluding children's health, educational quality, compassion, wisdom and the integrity of public life. In his words, it measures many things "except that which makes life worthwhile".

Such a system captures economic activity without distinguishing between productive growth and social or environmental costs. Efforts such as environmental accounting and China's emphasis on ecological progress seek to address this limitation by incorporating environmental costs into assessments of national development. This approach moves beyond purely quantitative measures of output by recognizing that not all growth contributes equally to long-term well-being.

If you live in or visit China, you will see firsthand evidence of ecological civilization in practice. From bus stops to apartment complexes, there are reminders to keep China green.

One of the most widely recognized examples of ecological progress in China is the "Great Green Wall", which aims to slow and reverse desert expansion across northern China. Through decades of large-scale tree planting and land management, the project has become a symbol of Chinese environmental governance. Like any project of this size, it has faced challenges, including concerns about water use and the suitability of certain tree species. Still, it demonstrates the importance of long-term environmental planning.

Conor Weeks

As a member of Gen Z, I have a personal interest in global ecology because today's environmental decisions will shape the conditions in which my generation must live.

Every generation inherits a world it did not create and becomes responsible for what it passes on. Environmental stewardship is therefore not only a political or economic concern, but also a moral obligation between generations.

Growing up in the US, ecological sustainability was part of my elementary school education. Reminders to recycle, turn off the lights when leaving home, or donate a dollar to charity while buying coffee were common. It would be logical to conclude that, given this education, the country's natural beauty and strong rural culture, the US would be a global leader in ecological sustainability.

However, as painful as it is to admit, this is not entirely the case. The US is responsible for more cumulative carbon dioxide emissions than any other country, and its emissions per person remain among the highest in the world. Although efforts have been made to develop sustainable energy, recent federal policies have also sought to reverse or weaken some environmental protections.

I hope that in the future, Americans can better understand that prosperity is not isolated, but shared among individuals, communities and people across the world.

I also hope that American leadership can learn from the farsighted, long-term approach emphasized in Chinese governance, while recognizing that every country, including China, still faces serious environmental challenges of its own.

That vision returns us to the image of planting trees today so that others may one day sit in their shade. A society becomes great not only through what it builds for the present, but through what it preserves for the future.

Written by Conor Weeks, a 24-year-old American currently living in Suzhou, Jiangsu province. He holds a master's degree in Chinese politics from Renmin University of China and now works in marketing for a Chinese technology company.

Find purpose in rural fieldwork

Young researchers leave campus to listen to villagers, document rural change and seek practical solutions for education and community development.

Students from the Shanghai University of Finance and Economics participate in the "Thousand-Village Survey" program, conducting fieldwork in villages across the country this summer. PHOTOS PROVIDED TO CHINA DAILY

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Wang Ruiqing knows firsthand how access to better education can change a rural child's life.

The 19-year-old grew up in a village in Poyang county, East China's Jiangxi province. She attended primary school in her village, middle school in a nearby town and high school in the county before earning a place at the Shanghai University of Finance and Economics (SUFE).

This summer, she returned to the Jiangxi countryside — not as a pupil, but as a university student researching rural education.

Wang, now a second-year law student, joined her university's "Thousand-Village Survey" program for the second consecutive year in July. She was among about 420 participants conducting fieldwork across the country.

As one of the program's 41 team leaders this year, Wang led 13 fellow students on visits to villages, schools and rural households in Jingdezhen.

Using a carefully designed questionnaire, the team spoke with farmers and collected information on their family circumstances, educational experiences, difficulties, needs and expectations.

For Wang, the subject is deeply personal.

Growing up, she saw many of her childhood classmates struggle. Some were left-behind children whose parents had moved away for work, while others came from families facing financial hardship.

She recalls the challenges faced by left-behind children, including loneliness and a lack of emotional support from parents working far from home.

> "We may not yet be able to accomplish anything truly grand, but together we are building the program's database like a Great Wall, with each of us adding one brick at a time."
>
> **Wang Ruiqing,** 19, a student at the Shanghai University of Finance and Economics

"Through in-depth surveys and conversations, we can better understand their needs and explore possible solutions," Wang said. "I believe this is the very purpose of our research, and I sincerely hope rural education will continue to develop."

The fieldwork also showed Wang and her teammates how rural communities were changing.

China's sustained efforts to promote rural development have significantly improved farmers' livelihoods. In Hanxi village in Jingdezhen's Fuliang county, the team was impressed by summer crowds enjoying the local tea culture and countryside scenery. They also saw notable progress in villagers' living conditions and access to education.

Launched in 2008, the "Thousand-Village Survey" program brings together more than 1,700 students and teachers each summer. After completing their fieldwork, each team submits four research reports and one article. The materials are then reviewed and analyzed by professors and used in broader, more in-depth studies.

To date, the program has sent more than 30,000 students to visit tens of thousands of rural households. Participants have conducted research in more than 16,000 villages across 34 provincial-level administrative regions and produced over 13,000 reports, according to the university.

For nearly two decades, the program has focused on the "Three Rural Issues" — agriculture, rural areas and farmers. Moving beyond the university campus and into grassroots communities, participants have explored subjects ranging from farmers' livelihoods, rural healthcare and the rural workforce to food security, elderly care, access to basic financial services, entrepreneurship, industrial revitalization and rural governance.

The program's findings on food security, rural financial services and the effectiveness of grassroots governance have attracted the attention of national policymakers and provided valuable references for government decision-making.

In May, 42 additional universities joined the program to establish an alliance that draws on their respective academic strengths and supports the country's rural revitalization efforts.

"The program aims to encourage students to step outside the classroom and see the most authentic side of China with their own eyes," said Ding Jing, director of the Student Affairs Office at SUFE.

"We hope they will put their academic knowledge into practice through field research, develop a deeper concern for rural development and, ultimately, discover their own aspirations."

The program also welcomed younger participants.

Wang Sixia, an art teacher at SUFE's affiliated high school, joined the fieldwork with four 16-year-old students.

"These trips have given them deeper insight into the experiences of people from different walks of life and greater empathy for them," she said. "What they learned will help them understand the complexity and diversity of society. It is a form of growth that no school course can offer."

For Wang Ruiqing, the experience has become part of an ongoing journey.

She first took part in the survey last year, when she traveled to Wuyuan county in Jiangxi. She said the field trips have not only inspired her and strengthened her academic skills but also allowed her to make new friends and discover a much wider world.

"I see my Gen Z teammates as a passionate, sincere and determined group," she said. "We may not yet be able to accomplish anything truly grand, but together we are building the program's database like a Great Wall, with each of us adding one brick at a time."

Z WEEKLY

Xu Yuehan (first from right) finishes fourth in the Open Women division at the 2026 Legian Boardriders-LSI Club Series at Legian Beach, Bali, Indonesia, on July 18, 2026.

Mountains behind, waves ahead

Born far from the sea, a young surfer is making waves through determination, sacrifice and fearless ambition.

Xu (right) poses with an Indonesian national team surfer after the heats at the 2026 Legian Boardriders–LSI Club Series at Legian Beach, Bali, Indonesia, on July 18, 2026.

By GUI QIAN and LI YINGQING

At 5 am, the first orange-red glow spread across the sea off Bali, Indonesia, as 12-year-old Xu Yuehan walked toward the waves with a surfboard under her arm.

Xu comes from Anning, Yunnan province, an inland city surrounded by mountains and nearly 1,000 kilometers from the sea. In Bali, however, where she was attending a surfing training camp, her days revolved around the water.

She got up before dawn to catch the early waves and surfed until about 9 am. After breakfast, she returned to the water for another session. She spent the afternoon on physical conditioning and ended the day with stretching, massage and recovery.

The schedule kept her in the water or the gym for most of the day, but she did not find it exhausting.

"Standing on a wave makes me feel free," she said. "I can try whatever moves I want."

Her grueling training regimen is already paying off.

Xu recently finished fourth in the Open Women division at the Legian Boardriders-LSI Club Series 2026 in Bali. The division had no age limit, and some of her competitors were adults more than a decade older than her. Many had also grown up in coastal areas with easy access to the sea.

Still, Xu said she felt neither nervous nor intimidated.

She has been surfing for just over a year but has already won several trophies. In August 2025, she claimed her first national title, winning the girls' under-12 shortboard event at the Guangdong stop of the National Surfing U Series.

Her rapid progress began with a chance encounter during a family holiday in Wanning, Hainan province, over Spring Festival in 2024.

Xu, then 9, noticed a leaflet in the hotel lobby advertising a surfing lesson and persuaded her father to sign her up. She managed to stand up on the board on her third wave.

The sensation of being lifted and carried forward by the water captivated her immediately.

After the family returned to Anning, surfing might easily have remained a holiday memory. But Xu could not let it go.

That summer, she told her family she wanted to return to Hainan and earn a surfing certificate. Her parents suggested other vacation plans, but she turned them down.

"When I see big waves, I don't feel afraid," Xu said. "I feel incredibly excited. I want to learn to surf properly and go further in the sport."

Her mother later recalled seeing the light in her daughter's eyes and realizing that surfing was not a passing interest.

To continue training from her home in Anning, Xu had to fly repeatedly to the coast while keeping up with school. At the end of 2024, she decided to transfer to a school in Lingshui Li autonomous county, Hainan.

Her goal was simple: to be closer to the sea. "After transferring, I could study and train at the same time," she said.

Family follows waves

Xu's journey from the mountains to the sea would not have been possible without her family, who reorganized their lives around her dream.

Her parents run a beverage business in Anning and had no previous connection to surfing or other water sports. Once Xu decided to pursue surfing seriously, her mother stepped away from work to travel with her, first to Hainan and later to Bali.

Both parents began learning more about surfing. Her mother also started teaching herself English so she could accompany Xu to surf spots farther from home.

"They've both become amateur surfing enthusiasts," Xu said with a laugh. "Now we always have something to talk about when it comes to surfing."

Xu said she understood how much her parents had sacrificed for her.

"I know that some of my peers' parents worry that surfing is too dangerous and want them to quit," she said. "That's why I'm especially grateful that my mother has placed so much trust in me."

While her family's support allowed her to stay close to the sea, entering competitive surfing required professional training.

In September 2024, Xu began training independently and competing as an amateur. At a competition in Hainan in April 2025, a coach from a provincial surfing team noticed her performance and selected her for the province's reserve team, where she began training and competing with the squad.

Xu's journey also reflects the gradual growth of surfing in China. As competitive programs have expanded, children from inland provinces have gained more opportunities to take part in a sport once largely confined to coastal communities.

Professional training not only helped Xu progress more quickly but also gave her a better understanding of how judges evaluate a ride and which techniques earn higher scores. She is now focusing on the "snap", a sharp turn performed near the top of a wave and an important scoring maneuver.

She eventually aims to master aerial moves and barrel riding, in which a surfer rides inside the hollow section of a breaking wave.

Xu also wants to compete at higher levels, both at home and internationally, and hopes her experience will encourage other children growing up far inland.

"Distance may keep you from the sea," she said. "But it cannot keep you from your dream."

Global Insights

Shared fields connect rural China and Bangladesh

I did not expect a small county in the hills of Fujian province to make me homesick for Bangladesh. But that is what happened when I visited Jianning county in Sanming city and found myself ankle-deep in mud, planting rice seedlings beside a farmer I had met only minutes earlier.

I had gone looking for scenery and Jianning has plenty of it: green mountains, clear streams and a stillness that feels increasingly rare in a rapidly urbanizing world. What stayed with me, however, was something harder to photograph — a spirit of community that reminded me of the village where I grew up.

One morning, I noticed a farmer working alone in a rice field. His movements were precise and unhurried. My Mandarin was limited, so I pointed at the seedlings and then at myself, gesturing to ask if I could join him.

He smiled and handed me a bundle.

As I stepped into the muddy paddy, memories of rural Bangladesh came rushing back. Like many children raised in rural areas, I had once helped my family with farm work. The mud beneath my feet, the flooded field and the rhythm of planting felt immediately familiar.

The farmer and I worked side by side, communicating through smiles and gestures. Before long, other villagers began to arrive. One after another, they entered the field and joined the planting. What had begun as one man working alone soon became a group moving steadily across the paddy.

Curious, I asked the farmer whether he was going to pay them.

He looked almost puzzled by the question.

"No," he said. "They come to help. When the work in my field is done, I will go to their fields to help. This is how we do things."

His answer described a system based not on charity but on reciprocity. Farmers help one another without contracts or negotiations, knowing that they, too, can count on their fellow neighbors when the time comes. The arrangement reduces labor costs, strengthens relationships and gives people confidence that they will not face difficult times alone.

That spirit felt familiar, too. Similar forms of mutual assistance have long existed in rural Bangladesh. Yet in many places, migration, commercialization and changing lifestyles have weakened traditional community ties.

Jianning reminded me that rural development is not only about infrastructure, incomes or technology. It is also about preserving the relationships that allow communities to work together.

What makes Jianning particularly interesting is that this culture of cooperation exists alongside the modernization of agriculture.

The county is one of China's largest hybrid rice seed-production bases, accounting for more than one-tenth of the country's hybrid rice seed-production area and output. It has also been introducing digital tools into farming.

Through *Liangshengbao*, a digital farming-services platform, farmers can manage orders, reserve agricultural machinery and access production-related information. The platform covers 161,000 *mu* (10,733 hectares) of hybrid rice seed-production fields and serves more than 24,000 farmers.

These tools are intended to improve coordination and reduce the administrative burden on farmers.

Jianning's experience suggests that digital technology can improve agricultural efficiency without displacing the traditional values of trust and mutual assistance. For developing countries such as Bangladesh, Jianning offers useful lessons, although its model cannot simply be copied.

Mohammad Saiyedul Islam (center) plants rice seedlings alongside two farmers in Jianning county, Sanming, Fujian province, on May 31, 2026. PROVIDED TO CHINA DAILY

Bangladesh has fertile land, hardworking farmers and a strong agricultural tradition, but many rural communities still struggle with poor market access, limited digital services, small and fragmented farms, and few opportunities to add value to their produce.

Cooperative farming models and digital agricultural platforms could give farmers better access to machinery, information and markets while creating new opportunities for younger people to remain involved in agriculture.

But technology alone would not be enough. Rural revitalization succeeds only when it improves people's quality of life, protects the environment and strengthens relationships within the community.

My clearest memory of Jianning is not technology or a production statistic. It is the sight of villagers entering a muddy field and beginning to plant alongside a fellow farmer.

I arrived in Jianning looking for scenery. I left thinking about Bangladesh — and about how rural communities can embrace change without losing the trust and cooperation that have sustained them for generations.

Eala rallies to capture maiden WTA title

Alexandra Eala of the Philippines lets out a victorious roar after winning her maiden WTA title at the Washington Open, beating Jessica Pegula of the United States in the women's singles championship match on Monday in Washington, DC. GETTY IMAGES VIA AFP

Filipino star hits ground running after overnight rain delay to deny Pegula

Left: Alexandra Eala gets ready to hit a return to Jessica Pegula during the WTA Washington Open final on Monday. **Right:** Eala kisses the WTA500 Washington Open trophy on Monday. GETTY IMAGES VIA AFP

WASHINGTON — Alexandra Eala's breakthrough week at the DC Open lasted one day longer than expected. By the time it ended, the Filipino expression written across the Nike T-shirt she had worn earlier that week had become a reality.

"Once it grows, it cannot be stopped."

After the women's final stretched across two days because of heavy rain, Eala rallied past Jessica Pegula 4-6, 6-4, 6-0 Monday to capture her first career WTA Tour title.

The victory made the 21-year-old Eala the first Filipina to win a singles title on the tour, completing the same career-defining breakthrough that the Washington tournament once gave Pegula when she claimed her first WTA title in 2019.

"At the beginning of the week, there's no way I would have thought that I would be holding this trophy," Eala said. "Winning a 500 (level tournament) is insane. It's an incredible milestone for me. These things kind of creep up on you and I hold these moments really close to me."

Eala arrived at Stadium Court as the story of the tournament, carrying the hopes of her nation.

Philippine flags decorated the stands throughout Sunday's rain-interrupted session and remained visible Monday, with the lower bowl filled for the resumption. Chants for Eala routinely outweighed those for the top-ranked American playing on home soil.

"It's not fun to play against, but I do appreciate the really fun atmosphere," Pegula said of the crowd. "I think it's amazing."

It capped a week in which the rising star transformed the atmosphere around the tournament, while reaching her first WTA final in her debut at the hard-court tune-up for the US Open.

The two traded breaks midway through the opening set, with Pegula breaking again at 4-4 and serving out the set at love.

The players held through the opening three games of the second set before heavy rain suspended play on Sunday afternoon.

When they returned on Monday, the momentum belonged to Eala.

She stormed back to claim the second set, then swept through the third. Eala ultimately won the final eight games of the match to secure the championship, beating all three of the tournament's top seeds along the way.

Eala dropped to the court with her head in her hands, overcome with emotion. Tears filled her eyes before she rose, embraced Pegula at the net and let out a triumphant scream.

"I was so nervous, and I kind of just blacked out," Eala said. "Everything just came rushing to me."

She won the last eight games of the contest, surrendering just eight points in the third set.

"Just pure happiness," Eala said of her first title, which comes after she agonizingly failed to convert four championship points in her only prior final at Eastbourne, England, last year.

'Very steep hill'

Eala is projected to rise to a career-high 20th in the world after a storming run that included victories over Olympic champion Zheng Qinwen, second-seeded Elina Svitolina, third-seeded former world No 1 Naomi Osaka and defending champion Leylah Fernandez.

"It was a very steep hill," she said. "I knew that the competition was super strong and my draw was quite tough. So I'm really, really proud. I think I encountered my fair share of obstacles this week."

The scoreboard showed a match time of one hour and 45 minutes, but it took nearly 24 hours to complete.

Pegula had won the first set 6-4 and Eala was up 2-1 in the second on Sunday when officials postponed the finish until Monday after lengthy rain delays.

The pair had waited through a three-hour delay before starting, and once the match was halted it was another five hours before officials called a halt for the day.

"Definitely felt like two different matches," said Pegula, who opened Monday's action with a nervy service hold for 2-2.

"I just felt like I couldn't find my rhythm. I think I was playing much better yesterday, for whatever reason, than I was today, and I think she was playing better today than she was yesterday."

Pegula could make no inroads on Eala's serve, and Eala broke Pegula in the 10th game to take the second set and force a third.

The final set was all Eala, to the delight of a vocal contingent of supporters, who turned out in force despite the postponement.

Pegula welcomed the energy of the crowd even in support of her opponent, who has proved a massive draw around the world.

"I just think it's so refreshing and nice to see how well she's handled all of the kind of fandom and stardom that's come with her being from the Philippines, and how they've really embraced her," Pegula said.

"It's crazy how she deals with it every single week, which just shows her maturity as both a player and as a person."

Both players will now head to Toronto, where two-time champion Pegula is the third seed and Eala is seeded 25th in the WTA1000 hard-court event.

Eala also received congratulations from former eight-division boxing champion Manny Pacquiao, who wrote on social media that her comeback showed the "heart of a Filipino" before calling her "our new champion".

In the men's final later on Monday, third-seeded Taylor Fritz defeated Rafael Jodar 7-6 (2), 6-4.

Fritz broke the Spaniard twice early in the second set, and eventually converted his fifth championship point after letting four earlier opportunities slip away.

Fritz lay on the court for several moments after winning the 11th title of his career, then got to his feet with a roll of his eyes as the tension of finally closing out the match gave way.

"It was just relief, like, thank God I got it done; thank God the match is over," Fritz said of the moment. "It wasn't so much as, like, a celebration ... I can just lay down for a second."

Venus-Bublik, newlyweds among new US Open doubles teams

An additional 13 teams, one featuring Venus Williams and some comprised of married couples, have entered the US Open mixed doubles championship.

The new duos, announced Monday by the US Tennis Association, raised the total to 29 teams for the 16 spots in the main draw, which will be held on Aug 25 and Aug 26.

Williams is partnering with Alexander Bublik for the tournament that was overhauled last year in an effort to get top singles players to compete, with a $1 million top prize on offer. Top-ranked Aryna Sabalenka and 24-time Grand Slam singles champion Novak Djokovic headlined the initial list of 16 teams.

Elina Svitolina and her husband Gael Monfils, who is expected to play his final Grand Slam event at the US Open, and newlyweds Katie Boulter and Alex de Minaur also were among the new entries.

The other new teams: Karolina Muchova and Jakub Mensik, Anna Kalinskaya and Lorenzo Musetti, Emma Navarro and Tommy Paul, Maria Sakkari and Karen Khachanov, Tatjana Maria and Valentin Vacherot, Reese Brantmeier and Michael Zheng, Jelena Ostapenko and Marcelo Arevalo, Gabriela Dabrowski and Harri Heliovaara, Demi Schuurs and Julian Cash, and Caty McNally and Robert Cash.

Teams can enter until Aug 17, when the six duos with the best combined singles rankings at the time will be automatically entered into the main draw. That means Sabalenka, the two-time defending US Open women's champion, and Djokovic, still ranked No 5 on the men's tour at age 39, will be safely into the field.

Eight teams will be given wild cards by the USTA, and two other teams will play their way into the field through a new qualifying tournament to be held Aug 24.

Besides Sabalenka and Djokovic, teams previously announced were: Iga Swiatek and Casper Ruud, the runners-up in 2025; Elena Rybakina and Taylor Fritz, the Japanese duo of Naomi Osaka and Kei Nishikori, Jessica Pegula and Jack Draper, Mirra Andreeva and Andrey Rublev, Belinda Bencic and Flavio Cobolli, Diana Shnaider and Daniil Medvedev, Amanda Anisimova and Learner Tien, Alexandra Eala and Felix Auger-Aliassime, Leylah Fernandez and Frances Tiafoe, Taylor Townsend and Alexander Zverev, Elena-Gabriela Ruse and Nuno Borges, Sara Errani and Andrea Vavassori, Katerina Siniakova and Henry Patten, and siblings Peyton Stearns and Preston Stearns.

Errani and Vavassori are the two-time defending US Open champions. The Italians needed a wild card to get into last year's event because their singles rankings were too low, and that will be the case again this year.

AP

Shelton finds sweet spot in Montreal

MONTREAL, Canada — Ben Shelton doesn't want to miss a match, as he begins the defense of his ATP Montreal Masters title with the goal of arriving at the US Open in full flow.

With the last major of the season starting on Aug 31 in New York, the American has programmed a full run-up schedule: Washington last week, Montreal and Cincinnati still to come.

"Three tournaments is the perfect amount. I'd like to get as many matches as possible," the fifth seed said on Monday.

"I'm the type of player, the more matches I play, the better I play, as long as my body can hold up," Shelton added. "It's a great three-tournament run before having a week off leading up to the US Open. I'm just kind of going for it."

Shelton, the men's No 10 who reached last week's Washington quarters, is not bothered by the bloated length of the Montreal tournament, which has attracted criticism and could be ripe for future change.

Shelton said he cannot fault his all-star peers for choosing to skip it.

The weather is playing a major role in the controversial 12-day extended Masters, a tournament where world No 1 Jannik Sinner and 24-time Grand Slam champion Novak Djokovic are high-profile absentees.

"I think there's a lack of sustainability (in the two-week format), for sure, but I don't know if there's a different way to go about it," he said. "Jannik knows himself. Novak knows himself. Maybe I would do the same thing if I had won Wimbledon — I didn't.

"It's tough to criticize those guys for the decisions that they make throughout the season when they're trying to sustain a level and maintain their health.

"At the same time, for me, this is one of my favorite parts of the year, one of my best swings, and I don't want to miss out on playing any of these tournaments."

Shelton said that he does not dwell on the 1,000 ranking points from his 2025 victory that he needs to defend in Canada.

"I've never been somebody who worries too much about defending. It's just not as much in my nature," he said. "If you're always thinking about defending, or what week that you made points or didn't make points, it's easy to kind of get lost in your mind.

"That's why I like to just think about my body of work for 2026, what I'm doing, and what I want to accomplish by the end of the year.

"To get another opportunity to be playing really good tennis leading into the US Open is kind of my main goal here. I'm looking forward to getting out there again."

China's growth outlook boosted by resilience

Export strength, AI innovations lead to growing confidence, upbeat forecasts

By **WANG KEJU, ZHANG CHENXU** and **JIANG XUEQING**

China's economic growth, buoyed by stronger-than-expected exports and rapid artificial intelligence innovations, is expected to have remained on stable footing in the first half of the year, with major international institutions expressing growing confidence in the country's economic outlook, economists said.

While external demand for high-tech products is expected to sustain growth momentum in the second half of the year, they said that policymakers should direct greater efforts toward stimulating domestic demand to achieve a more balanced recovery.

The economists made the remarks while awaiting details of China's economic performance in the first half of the year. Those figures are scheduled to be released next week.

Confidence in China's economic outlook has strengthened in recent weeks, with several major international institutions raising or maintaining relatively upbeat growth forecasts despite a slowing global economy.

On Wednesday, the International Monetary Fund lifted its 2026 growth forecast for China by 0.2 percentage points to 4.6 percent, citing stronger-than-expected first-quarter expansion driven by robust public investment, high-tech manufacturing and exports.

The World Bank has also highlighted resilient high-tech investment and exports as key factors supporting China's economy this year despite global energy supply shocks. According to its latest China Economic Update, the world's second-largest economy is expected to expand 4.4 percent in 2026, against a backdrop of slowing global growth, which is projected at 2.5 percent for 2026.

Inside
Editorial, **page 6**

Economists said China's resilience has been underpinned by solid export performance, particularly in high-tech and value-added manufacturing, as well as rapid industrial upgrading fueled by AI.

Robin Xing, chief China economist at Morgan Stanley, said that China's "current economic momentum is being driven primarily by export growth and industrial upgrading".

China's supply chain resilience, according to Xing, is becoming more visible in sectors such as AI hardware, electric vehicles, energy storage, photovoltaics and wind power, where its export market share continues to rise.

Data from the General Administration of Customs showed that China's exports of high-tech and high-value-added mechanical and electrical products surged 18.4 percent year-on-year to 7.58 trillion yuan ($1.11 trillion) in the first five months of 2026, accounting for 63.6 percent of the country's total exports.

China's economy grew 5 percent year-on-year in the first quarter, reaching the upper end of the government's annual target range of 4.5 to 5 percent.

A manicurist crafts press-on nails in Donghai county of Lianyungang, Jiangsu province, in May 2024. CHAI JUNWEI / FOR CHINA DAILY

DONGHAI IS NAILING CULTURAL EXCHANGES

Consumers across the globe are embracing manicure products featuring Chinese designs

By **XU LIN**
xulin@chinadaily.com.cn

Imagine effortlessly creating a portable, tiny gallery of traditional Chinese art that goes everywhere you do.

All it takes is a set of press-on nails.

Exquisitely hand-painted, they show the iconic scroll *A Panorama of Rivers and Mountains*, by Song Dynasty (960-1279) painter Wang Ximeng, from a completely different perspective.

Using the scroll's legendary cyan-and-green hues, artisans reproduce the painting's layered ridges and misty waters in breathtaking detail on the 10 tiny canvases, mimicking the intricate luster of traditional filigree enamel — without high-temperature firing.

Easy and affordable, press-on nails have become a time- and cost-effective alternative to traditional salon manicures. These adhesive-backed artificial nails are reusable, simple to apply and remove in a way that won't hurt the natural nail underneath. Another attraction is that they can be swapped freely to match any outfit, mood or occasion.

The global epicenter of this booming beauty trend is Donghai county in Lianyungang, Jiangsu province.

Middle East tense amid fresh strikes

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

The situation in the Middle East remained tense on Thursday as the United States and Iran traded intensifying strikes for the second consecutive day, resulting in a trail of casualties even as Qatar issued security alerts and warning sirens went off in Kuwait, Bahrain and Jordan.

The Iranian Ministry of Health said the US forces attacked five provinces in the country over the past two days, killing 14 people and wounding 78. Hossein Kermanpour, spokesman for the Iranian Ministry of Health, said 47 of the 78 wounded remain hospitalized.

A projectile struck the perimeter of Iran's Bushehr Nuclear Power Plant on Thursday, Ehsan Jahanian, deputy governor of Bushehr province, told state media.

Explosions were heard in coastal areas of Iran's port city of Bandar Abbas on Thursday afternoon, Iranian media reported.

Iran's Islamic Revolutionary Guard Corps said that major US bases in Kuwait and Bahrain were hit in retaliatory missile and drone operations.

The IRGC said in a statement that following the US' breach of commitments and its latest aggression against Iran, four US bases in Kuwait and Bahrain were hit in the first phase of its response, Tasnim News Agency reported.

The IRGC statement blamed the US for violating all the commitments it made in the memorandum of understanding Tehran signed with Washington last month.

"In the first phase of the punitive response against (the US), the IRGC's naval and aerospace forces, through joint missile and drone operations, destroyed the infrastructure and important facilities of the two colonial bases of the American occupiers in Arifjan and Ali al-Salem in Kuwait and in Juffair and Sheikh Isa in Bahrain, one hour after the enemy's attacks on various parts of (Iran)," the IRGC was quoted as saying by Tasnim.

The IRGC warned the US army that if the aggression was repeated, the Iranian response would be expanded to other US bases in the region.

Speaker of the Iranian Parliament Mohammad Bagher Ghalibaf said in a post on X that the US still had not learned that "bullying and breaking promises are no longer cost-free".

"Let me put it plainly: if you strike, you'll get hit. Don't flail around pointlessly, or you'll sink even deeper: the Strait of Hormuz will only open with 'Iranian arrangements', not American threats," Ghalibaf said.

Earlier, Bahrain's Ministry of Interior activated its alarm sirens and urged its citizens to remain calm and head to the nearest safe locations. Kuwaiti air defenses reported repelling missile and drone attacks while the Kuwait Army General Staff urged the public to keep away from suspicious wreckage. Jordan's air defense systems shot down eight missiles launched from Iran toward Jordanian territory on Thursday, a military source said.

Iranian Foreign Minister Abbas Araghchi and Qatari Prime Minister and Minister of Foreign Affairs Sheikh Mohammed bin Abdulrahman bin Jassim Al Thani held a phone call on Thursday, in which they reviewed the military escalation between the US and Iran over the past two days.

Al Thani condemned and rejected the attacks targeting commercial ships in the Strait of Hormuz "despite the atmosphere of de-escalation and the efforts being made to reduce tensions in the region", emphasizing that such actions undermine trust, threaten international navigation security, and harm the efforts aimed at establishing regional security and stability, according to a statement published by the Foreign Ministry of Qatar.

Data from Kpler, a global data and analytics company that tracks maritime trade in real time, said the Hormuz recovery faces fresh pressure.

"Traffic through the monitored Strait of Hormuz zone strengthened on July 7, with 41 verified crossings compared with 36 the previous day," it said in a post on X on Wednesday.

An Al Jazeera report noted that movement in the crucial waterway is now largely confined to a northern route approved by Iran, while a corridor further south backed by Oman and the US saw little activity.

US President Donald Trump said on Wednesday that Iran "wants to make a deal so badly" and had reached out to him to pursue negotiations after repeated US strikes in the region.

The US Central Command said its forces completed an additional round of strikes against Iran on Wednesday "to further degrade Iran's ability to attack commercial shipping and innocent civilian mariners in the Strait of Hormuz".

"US forces struck approximately 90 Iranian military targets including air defense systems, coastal surveillance assets, missile and drone storage sites, naval capabilities and military logistics infrastructure along Iran's coastline. The latest strikes follow successful execution of offensive strikes in Iran the night before," it said.

WORLD WATCH
By Anthony Moretti

Xi's thought serves as beacon for exemplary governance

China is both celebrated and misinterpreted on the global stage. The misunderstanding becomes a deeper problem when people are unwilling to invest the time needed to learn about the economic, political, social and cultural rise of the nation over the past roughly 50 years.

Now another opportunity to understand contemporary China and the Communist Party of China has emerged with a new report titled "Contemporary Features and Global Significance of Xi Jinping Thought on Party Building", released this month by the national high-level think tank of the Party School of the CPC Central Committee.

The report opens with powerful assertions that explain the importance of the document: "To understand China today, one must understand the Communist Party of China", and "to understand the Communist Party of China today, one must understand Xi Jinping Thought on Party Building".

The document is not a lesson in history. Instead, it is a critical assessment of how the CPC has grown into the world's largest political party. It explains how President Xi Jinping has articulated the challenges and opportunities that China faces and that the Party must address to remain authoritative, credible and trusted by the Chinese people.

The central theme of the report is the CPC's tradition of "unremitting self-reform", particularly under Xi's leadership, focusing sharply on the needs of the people and demonstrating the Party's integrity. Xi Jinping Thought on Party Building reminds readers that the CPC retains its authority by delivering to the people what they need.

This promise of "governing with virtue" while "maintaining a keen political awareness" would not be possible amid corruption, greed or a lack of discipline.

Xi has often emphasized that the people are the foundation of the Chinese nation. Thus, the Party's actions and its leaders are judged by their ability to improve the lives of the people. A pertinent example highlighted in the report is the significant improvement in Beijing's air quality. That work has not only benefited Chinese citizens but also the many international visitors to the country's capital — a testament to decades of commitment.

Another theme is that exemplary leadership stems from a deep understanding of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, coupled with a positive spirit in fulfilling responsibilities at every leadership level. In effect, a good leader derives satisfaction from enthusiastically endorsing the CPC's goals, especially those relating to national rejuvenation.

Just as people pay attention to their diet and exercise in order to remain healthy, effective leadership is built through self-discipline and selflessness. Abiding by the CPC rules and national law is embedded in this ideal, and character is shown by the outward demonstration of putting the people, the Party and the nation ahead of any other ambition.

Rescue team members walk to the landslide site after access was blocked by debris. XINHUA

By MA JINGNA and **HU YUMENG** in Longnan, Gansu

Gou Yingchun, 35, had been working in the forest for only four days when the mountainside collapsed.

Like dozens of other locals, the Rushu village resident had left home shortly after 6 am on Tuesday to prune branches in a forest in Tanchang county, Longnan, Gansu province. It was the first time she had done temporary forestry work.

When the workers arrived near the forest, they found that a small landslide had already blocked the road, preventing vehicles from going any farther.

"We thought it wasn't serious," Gou recalled. "We got out and started walking."

As the group made its way along the mountain road, Gou lingered at the back. Looking up the slope, she noticed trees swaying unnaturally. "I saw the trees moving," she told China Daily. "I knew something wasn't right."

She immediately shouted to the others to run. One young co-worker hesitated, so Gou grabbed them and pulled them forward. "I kept yelling, 'Run! Run!'"

Moments later, the mountainside gave way.

"It all came down at once," she said. "It was so fast."

As she fled, something struck her from behind, knocking her to the ground. She scrambled back to her feet and managed to run a few more steps before falling again.

"I don't even know what hit me," she said. "I just kept running."

When she finally looked back, the people who had been standing with her only moments earlier were gone.

"I thought they would all make it out," she said quietly. "I never imagined…"

Despite suffering injuries to her leg and arm, Gou's first instinct was to call for help. The surviving workers quickly contacted emergency services as they waited helplessly outside the disaster zone.

Even in the hospital, Gou struggled less with her own injuries than with the loss suffered by her village.

"We all left home happy that morning," she said. "None of us imagined that less than half an hour later, everything would change."

She said she had seen small landslides before, but nothing remotely like this.

"It happened in an instant," she said. "It was too sudden, too fast. People simply didn't have time to react."

Now recovering in hospital, Gou said she considers herself fortunate to have survived, but the grief is overwhelming.

"We were lucky," she said. "But so many people behind us never made it out."

Survivors' stories

Twenty-one people were killed in the landslide, local authorities confirmed at a news conference on Wednesday, adding search and rescue operations have concluded.

The landslide occurred at about 6:56 am on Tuesday, trapping 33 people. Of the survivors, five escaped uninjured and seven sustained minor injuries, according to local authorities.

Tanchang county is located deep in the hinterland of Longnan, where steep mountains, deep valleys and rugged terrain characterize the area. The mountains are mainly composed of loess deposits and jagged rock formations.

Villagers who were swallowed up in the disaster recounted the terrifying moments when it struck.

Sun Penghua, 48, suffered a fractured sternum after the landslide struck Rencang village. Her husband, Yang Ping, 53, escaped with only minor injuries. The couple were running for their lives when the mountainside began to give way.

"My husband was in front of me," Sun recalled. "We started sliding down the slope as we ran. The ground was shaking, and everything was moving beneath our feet. I couldn't even tell where I was anymore."

As they struggled to escape, the collapsing hillside caught up with them. The rushing earth shoved Sun toward the roadside, partially burying her legs before a larger wave of mud and debris slammed into her.

"The landslide pushed me onto the road," she said. "Then the soil came over me and buried me."

An injured resident surnamed Wang said: "I was lucky. If I'd run even a little later, the second landslide would have buried me completely."

Another resident called Feng said he was the first to the initial landslide.

"The first landslide was relatively small, covering an area of about eight to 10 meters," said the man aged in his 40s.

"I started clearing the road while keeping an eye on the slope above. Then I realized something wasn't right, so I pulled out by myself. Just after I had cleared the road, the massive landslide came down. I was still running when I had just reached the side. A rock came down and struck my foot, and I fell."

Chaotic scene

Luo Lingshan, chief of the Tanchang County Fire and Rescue Brigade, immediately knew the situation was serious when the emergency call came in.

The dispatch report mentioned only a landslide and people being trapped, but after 17 years in the fire service, Luo knew what those few words could mean.

"I immediately ordered all available personnel to assemble," he said.

Within a minute, 23 firefighters who had gathered for a training exercise boarded three rescue vehicles and headed toward the mountains. While en route, Luo reported the disaster to the county government and emergency management authorities, requesting additional engineering equipment, medical teams and other rescue forces.

When the convoy reached the valley, the firefighters could go no farther. The landslide had blocked access, forcing the team to leave their vehicles behind and continue on foot.

The scene that greeted them was chaotic.

Several villagers had managed to escape on their own. Some were crying, others were shouting that more people remained trapped higher up the slope.

"There were people calling for us to save those still buried," Luo recalled.

The first priority was those buried in shallow debris.

Working with shovels, chain saws and their bare hands, firefighters removed soil, rocks and fallen trees. Whenever they reached a victim's body, they stopped using tools to avoid causing further injury.

Within about 20 minutes, the team had pulled out five survivors. Most were buried only from the waist down, while others had their legs trapped beneath the debris. Although frightened and in tears, their overall physical condition was relatively stable and they were quickly transferred by stretchers to waiting medical teams, Luo said.

The danger, however, had not passed. Loose rocks and soil continued falling from the mountainside.

"We set up three observation posts," Luo said. "If there were any signs of another collapse, we could immediately sound the evacuation signal and protect the rescuers."

The unstable slope shaped every decision that followed.

As larger rescue teams arrived, the operation shifted from rescuing shallowly buried survivors to locating people trapped deep beneath the landslide. Firefighters used life-detection radar, manual searches and heavy machinery to narrow the search area before excavators began removing the enormous volume of debris.

The moment anything resembling a victim appeared, the machinery was stopped and firefighters took over by hand. "We couldn't risk causing additional injuries," Luo said.

Rain during the afternoon briefly forced rescuers to withdraw because of the increased risk of another landslide. After that, the rescue operation continued through the night under powerful mobile lighting units.

"The environment was extremely dangerous and physically demanding," said Luo, who remained at the scene throughout the nearly 20-hour operation.

"Some firefighters wore through their gloves. Others suffered cuts and bruises on their hands. But no one backed away. Everyone stayed on the front line."

Second wave of rescuers

Lu Zhenghong, chief of the Longnan Fire and Rescue Detachment, said they immediately activated the emergency response plan after receiving an emergency call.

Provincial fire authorities mobilized rescue teams from Longnan and neighboring Tianshui, dispatching firefighters, sniffer dogs and rescue vehicles to the remote mountainside village.

By the time the operation was fully underway, 375 rescuers, including firefighters, police officers and militia personnel, had joined the search.

When Zhang Shenzhou, captain of the special rescue squad at the Hanwang Fire and Rescue Station in Wudu district, Longnan, arrived at the foot of the landslide, the scale of the disaster was even larger than he had imagined.

Zhang had left with the second wave of rescuers shortly after receiving the deployment order. After driving more than 100 kilometers from Wudu, the firefighters found that their rescue vehicles could go no farther.

The mountain road into the valley was blocked.

Loaded with life-detection equipment, slope-monitoring radar and other rescue gear, the firefighters continued on foot, trekking more than a kilometer before reaching the devastated mountainside.

"We initially estimated the landslide at about 6,000 to 7,000 cubic meters," Zhang said. "When we got there, we realized it was much larger."

He said observation posts established overlooking the slope played a huge role. "During the rescue there were several secondary slides, and we had to withdraw more than once," Zhang said.

Working beneath an unstable slope required painstaking coordination. Each excavator was paired with a firefighter acting as a lookout, while several more rescuers stood nearby with stretchers and shovels, ready to take over the moment anything was uncovered.

"We couldn't dig quickly," Zhang said. "The exact locations of the victims were unknown. The excavator removed the soil little by little, and once we found someone, we switched to hand tools."

The search finally ended at about 3:40 am. By then, Zhang's team had recovered seven bodies.

Doctors' quick response

At Tanchang County People's Hospital, doctors rushed back to work as soon as they received word of the disaster at about 7:20 am, said Shen Jiangtao, director of the orthopedic department.

"Within 10 minutes of receiving the notification, everyone in our department was back on duty," Shen said.

The department's 25 doctors and nurses immediately split into two groups. Some joined ambulances heading toward the disaster site to provide pre-hospital emergency care, while others remained at the hospital, preparing operating rooms, wards and emergency treatment areas for the injured who would soon begin arriving.

Shen stayed behind to coordinate treatment.

The hospital opened a green channel for the victims. As ambulances returned from the mountains, each injured survivor was taken directly for an examination before being transferred to the orthopedic department.

"It happened very quickly," Shen said. "Everything was already in motion."

The department admitted five injured patients.

Most suffered relatively minor injuries, but one patient arrived in significantly worse condition. Initial examinations found two fractures. Follow-up scans later revealed a third fracture, along with a traumatic chest injury that caused fluid to accumulate around the lungs.

After expert assessment, one of the more seriously injured patients was transferred to a hospital in Longnan for further care.

But the injuries inflicted by large natural disasters are psychological as well.

Firefighter Zhang has responded to some of China's most devastating disasters, including the Wenchuan and Jiuzhaigou earthquakes, the Zhouqu mudslide and major floods in Longnan.

Yet, he said scenes like those in Tanchang still weigh heavily on him. "Human beings are very small in the face of nature," he said quietly. "All we can do is our very best to bring the victims home and give their families an answer."

The rescue left its mark not only on victims' families but also on some of the young firefighters.

Several had never participated in rescue work for a disaster of this scale. Faced with the realities of the recovery effort, some froze in place, overwhelmed by what they had seen, Zhang said.

"They had never experienced anything like this," he said. "Psychologically, it was very hard for them."

The Ministry of Finance and the Ministry of Emergency Management on Wednesday announced they had allocated 30 million yuan ($4.41 million) to Gansu for search and rescue, evacuation, emergency geological disaster response, and checks for potential secondary disaster risks.

TOP NEWS

Growth: Domestic demand remains a challenge

From page 1

Economists expect momentum may have slightly moderated in the second quarter, with some projecting first-half GDP growth of around 4.5 to 4.7 percent.

Alongside resilient economic growth, inflation has remained mild. In the first half of the year, China's consumer price index rose 1 percent year-on-year, while the core CPI, which excludes food and energy prices, increased 1.2 percent, data released by the National Bureau of Statistics showed on Thursday.

The K-shaped recovery — one in which different parts of the economy recover at different rates or times — has been a hotly debated topic among economists who monitor China's economic growth, with AI-related industries and exports outpacing consumption and the property sector. Therefore, turning policy support into domestic demand is seen as a key challenge in the second half.

That divergence has also drawn increasing attention from policymakers. At the second-quarter meeting of its monetary policy committee, the People's Bank of China, the country's central bank, flagged "structural divergence" as a challenge facing the economy, while pledging to continue implementing an appropriately accommodative monetary policy.

Lu Ting, chief China economist at Nomura, pointed out that the export boom has not yet translated into broad-based income growth, as high-tech manufacturing is increasingly capital-intensive and automated while the property market remains a drag on household wealth and sentiment.

Wen Bin, chief economist at China Minsheng Bank, said the key for boosting domestic consumption is the "substantive implementation" of the urban and rural resident income growth plan, which was outlined as a priority in this year's Government Work Report.

Expected measures include raising minimum wages, providing special additional deductions for individual income tax, and increasing pension and medical insurance.

Xiong Yi, chief economist for China at Deutsche Bank, said: "We see the government implementing more policies to support domestic demand, especially in the services sector. Coupled with declining oil prices, we believe strengthening domestic demand will be a key support for China's growth in the second half of the year.

"A key measure is cash handouts to families raising children, which began last year. This is a long-term policy, and the benefits could even potentially be increased in the future," Xiong added. "With these supportive government policies both on the supply side and the demand side for services consumption, we see services spending becoming a longer-term driver for Chinese consumer spending, not just for this year, but for the next five to 10 years."

Firefighters battle the blaze on Thursday at a footwear factory in Jiangtou village in Chendai township of Jinjiang, East China's Fujian province. ZHENG LIANG / XINHUA

Xi calls for all-out efforts after Fujian fire accident

President stresses vigilance on workplace safety after blaze kills 28 at footwear factory

By MO JINGXI
mojingxi@chinadaily.com.cn

President Xi Jinping urged all-out search and rescue efforts, proper handling of the aftermath and consoling the families of the victims after a fire on Thursday resulted in heavy casualties at a footwear factory in Jinjiang, a county-level city in Quanzhou, East China's Fujian province.

Xi said in an instruction that the cause of the accident should be identified as soon as possible and those responsible for it held seriously accountable.

The fire broke out around noon at the factory located in Jiangtou village in Jinjiang's Chendai township, with many people feared trapped. As of press time, at least 28 people were confirmed dead.

Noting that a number of major workplace safety accidents have occurred in China since the beginning of the year, Xi said that authorities across the country should draw important lessons from the factory blaze and better coordinate development and safety.

He emphasized the need to remain vigilant at all times regarding workplace safety, conduct in-depth checks and rectification of all types of risks and hidden dangers, and ensure that workplace safety measures are implemented in a firm and meticulous manner.

Efforts should be made to resolutely prevent major and serious accidents and effectively safeguard people's lives and property, Xi said.

Premier Li Qiang also made an instruction, calling for all-out efforts to organize search and rescue work, properly handle the aftermath of the fire, prevent secondary accidents, investigate the cause of the fire as soon as possible and hold those responsible accountable in accordance with the law.

Li said the Office of the Work Safety Committee of the State Council, China's Cabinet, should further guide and urge local authorities to strengthen bottom line thinking and worst-case scenario thinking, comprehensively investigate workplace safety risks and hidden dangers, and ensure that responsibilities and measures are fully implemented to prevent major and serious accidents.

Following the instructions, the Ministry of Emergency Management sent a working group to the site of the factory fire to provide guidance. Fujian has also mobilized forces to spare no effort in treating the injured and handling on-site response. Local fire and rescue teams have deployed more than 500 personnel.

People in charge of the footwear factory have been taken into custody and the company's accounts frozen.

A firefighter at the scene told China Central Television that while the exact cause of the fire remains under investigation, a preliminary assessment indicates that it started in a workshop on the first floor of the factory.

Raw materials piled up on the stairs of the factory slowed down firefighting efforts and hampered rescue operations, the firefighter said.

Color: Nails amaze global consumers

From page 1

Already famous for its crystal and gemstone industry, Donghai has emerged as China's largest production base for handmade press-on nails.

Backed by fine craftsmanship, affordable prices and mature cross-border e-commerce channels, Donghai's handmade nail products are finding popularity among global beauty consumers.

Official data shows that press-on nail sales in Donghai reached about 15 billion yuan ($2.2 billion) in 2025, accounting for over 70 percent of the domestic market. Nearly 40 percent of sales were to overseas markets, with products exported to over 30 countries and regions worldwide.

"Press-on nails have an extremely broad appeal, with powerful communicative potential. Our aim is to use them as a wearable medium to introduce Chinese culture to the world," said Li Xuan, chairman of Daxuan E-commerce Co in Donghai.

His team has infused traditional Chinese crafts into the company's designs — filigree and mother-of-pearl inlays, lacquer art, miniature painting and micro-engraving. They create customized pieces adorned with inlaid jade and local crystals, as well as delicate filigree flower motifs.

Various designs are created around timeless Chinese cultural themes, including traditional Chinese landscape paintings, the 12 Chinese zodiac animals and elements from murals in Dunhuang, Gansu province.

When the hit Chinese video game *Black Myth: Wukong* took the world by storm, nails based on the classic Chinese novel *Journey to the West* also went viral.

"Some high-end crafted pieces are miniature artworks. Beauty salon owners purchase them for display, while others use them for wedding ceremonies or stage performances. A delicate artwork can take one to two weeks to finish," said Li, the Daxuan E-commerce Co chairman.

Zhang Leilei, livestream business director at Jiangsu Jingyiyi Supply Chain Management Co, said, "As the market matures and design options become more diverse, overseas buyers prioritize fine craftsmanship and cultural depth." The company sells its press-on nails through TikTok livestreams, with the United States accounting for more than 80 percent of sales.

She said mass-market basic styles cost $5 to $10, while custom sets start at $20 to $30, and elaborate ones can go for several hundred dollars. Orders over $30 include free shipping.

"Traditional Chinese elements including blue-and-white porcelain and lion dance motifs are popular among overseas buyers. In livestreams, they tell us these cultural nail designs are gorgeous."

She said the Chinese press-on market is steadily moving upmarket. Consumers know what fits them and what they prefer, leading to higher standards and more discerning tastes.

Donghai's industrial edge stems from its solid local industrial foundation. The county is home to more than 300 companies, over 200 professional design and production teams, and over 50,000 skilled nail technicians. As creators gain deeper insights into traditional Chinese culture, they have launched cooperative projects with cultural and tourism authorities and museums.

"We incorporate intangible cultural heritage techniques and cultural stories into press-on nail designs, crafting compelling brand narratives," said Li Zheng, secretary-general of the Donghai press-on nail industry association.

"These pieces have evolved beyond simple manicure accessories. They have become wearable and tangible symbols of traditional Chinese culture, serving as a new lightweight carrier of China's culture."

Rescue continues in flood-ravaged Guangxi after reservoir breach

By SHI RUIPENG in Nanning
and **ZHENG JINRAN** in Beijing

Thirty-nine people died and nine remained missing in the flood-affected Guangxi Zhuang autonomous region as of noon on Thursday, local authorities said, as rescue and relief efforts continued and the breach in the Liulan Reservoir in Nanning remained under control.

Ding Wei, vice-mayor of Nanning, said at a news conference on Thursday that the figures for the dead and missing could overlap, as some of the dead were yet to be identified. DNA testing was being carried out, and search areas were continually being expanded, so the casualty figures could change as each case is verified, he said.

The breach in the Liulan Reservoir in Hengzhou resulted in 26 deaths, including five unidentified individuals, and seven people remained missing, he said.

As of 11 am on Thursday, a total of 64,500 people had been evacuated and resettled across Nanning, including 54,500 in Hengzhou and 9,321 in neighboring Binyang county, Ding said.

More than 300 public health workers have been deployed to affected areas, and no disease outbreaks or public health emergencies have been reported so far, he added.

The situation arising from the reservoir breach was largely under control. Zhai Jianjia, deputy director of Nanning's water resources bureau, said that water levels at the breached Liulan Reservoir had fallen below the dam foundation level, and the breach and downstream discharge had largely stabilized. Access to the dam crest was restored on Thursday after emergency repairs to flooded roads, allowing for dredging of the river and debris removal, he said.

Zhai added that water levels at nearby Yunbiao Reservoir had also dropped, and the risk to downstream areas remained low unless more heavy inflows occurred. Authorities will conduct a comprehensive safety assessment of both dams.

Meanwhile, another round of heavy rainfall is forecast for Hengzhou and Binyang over the next two days. Ding, the vice-mayor, said that rescue operations, infrastructure repairs and post-disaster recovery preparations would continue.

Across the flood-hit region, national emergency response teams, cross-provincial rescue units and civilian volunteers continued working side by side to evacuate stranded residents and deliver relief supplies.

> "The first time I boarded it, I truly felt the strength of the nation's technology. The helplessness I felt while trapped disappeared instantly. It gave me a real sense of security."
>
> **Li Guizhao,** one of the evacuated students

One of the largest rescue operations took place at Guangxi Logistics Vocational and Technical College in Guigang, where more than 6,000 teachers and students were stranded by the floods.

China Anneng Construction Group, a State-owned emergency rescue force, deployed two self-propelled modular pontoon bridge hulls — each capable of carrying more than 500 people per trip — to ferry those trapped to safety. By noon on Thursday, all those who were stranded had been safely evacuated.

"The first time I boarded (the pontoon bridge), I truly felt the strength of the nation's technology," said Li Guizhao, one of the evacuated students. "The helplessness I felt while trapped disappeared instantly. It gave me a real sense of security."

Rescue efforts have also drawn nationwide support. In Qinzhou, two rescuers from Guangdong province spent five hours in flood-waters nearly three meters deep evacuating elderly residents trapped on the second floor of their homes.

"Some of the elderly were trapped upstairs and couldn't make their way down," rescuer Qiu Yajie said. "We formed a human ladder and brought them down slowly."

Volunteers also joined the relief effort. Zhao Zhansheng drove about 1,600 kilometers from Central China's Henan province to Guangxi, where he set up a mobile kitchen to prepare free bowls of *huimian*, or Henan stewed noodles, for displaced residents and rescue workers.

"We'll be here every day," Zhao said in a video from the flood zone. "If there isn't enough for everyone, we'll just keep cooking."

Zhang Li in Nanning contributed to this story.

Report: Effective leadership built through self-discipline

From page 1

Xi has maintained that without unwavering integrity, the CPC cannot fulfill its obligations to the people or honestly reflect their will.

Moreover, the Party cannot convey authority in its policies and actions internationally if it is considered untrustworthy. While critics will always exist, there is a vast difference between dislike and disrespect.

The CPC must aim for respect in all it does, and the report affirms how it has strived to do that under Xi's leadership.

The report admits that "the test of governance is ever present", emphasizing the need to focus on always doing the right thing. Neglecting the people, forsaking Party values or ignoring problems is not an option. The Chinese people aspire to better lives, and the CPC is tasked with delivering this and rejuvenating the nation.

The eradication of absolute poverty, a stronger education system, the fostering of green technologies and the advancements in healthcare are just a few examples of ideas successfully put into action.

Moreover, by rejecting tired ideas of the past connected to the Cold War era, the CPC seeks positive relations with nations big and small based on mutual respect, peaceful coexistence and win-win cooperation. The results of this new approach can be seen across the world.

The report also urges other nations, especially those in the Global South, to follow their own development paths while considering the importance of building credibility and delivering real achievements to their citizens.

"Lifelong learning" is a phrase often heard in the United States. It advocates that an individual, no matter what age or professional experience, should always continue to seek more knowledge. The roughly 50-page report on Xi Jinping Thought on Party Building is essential reading for those who are eager to learn more about China.

The author is an associate professor in the Communication and Organizational Leadership Department at Robert Morris University in Pennsylvania, US. The views do not necessarily reflect those of China Daily or Robert Morris University.

Homecoming

Museum officials inspect a 9th-century artifact from Raqqa, Syria, as crates of antiquities returned by France are opened at the National Museum of Damascus on Wednesday. The collection of 23 repatriated objects spans from prehistory to the Abbasid era and is being prepared for public display after 15 years abroad. LOUAI BESHARA / AFP

DPRK's premier of cabinet to lead delegation to China

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Pak Thae-song, premier of the Cabinet of the Democratic People's Republic of Korea, will lead a party and government delegation on an official visit to China from Friday to Sunday, the Foreign Ministry announced on Thursday.

During the visit, Pak will attend events marking the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, Foreign Ministry spokeswoman Mao Ning said at a daily news conference. Pak is also a member of the Presidium of the Political Bureau of the Workers' Party of Korea Central Committee and vice-president of the State Affairs Commission of the DPRK.

Mao said China and the DPRK have agreed to jointly commemorate the treaty's anniversary. Describing the two countries as traditionally friendly neighbors, she said maintaining, consolidating and developing bilateral ties has long been an unswerving strategic policy of the Communist Party of China and the Chinese government.

China stands ready to work with the DPRK, guided by the important consensus reached by the top leaders of the two parties and the two countries, to strengthen strategic communication, expand exchanges and cooperation, and further advance China-DPRK traditional friendship and cooperative ties, Mao said.

Yang Danzhi, a research fellow at the National Institute of International Strategy at the Chinese Academy of Social Sciences, said China-DPRK relations are at a new historical starting point.

The visit will deepen the traditional friendship between the two countries, reinforce the foundation of the friendship treaty and carry forward its spirit, he said.

It is also expected to maintain smooth channels for high-level strategic communication and government coordination while advancing practical cooperation in trade, agriculture and public well-being, he added.

According to China's Foreign Ministry, bilateral trade exceeded $2.7 billion last year. Cross-border exchanges have gathered pace this year with the full reopening of border crossings and the resumption of civil aviation flights and international passenger train services.

Yang said deeper China-DPRK cooperation will help promote stability in Northeast Asia and reduce the risk of regional conflict.

The two countries' confidence and resolve in safeguarding the interests of socialist countries and the Global South, and in opposing hegemonism, will inject positive energy into global governance under the new circumstances, he said.

Tanzania's doors 'wide open' to investment: Ambassador

By **XU WEIWEI** in Hong Kong
vivienxu@chinadailyapac.com

China and Tanzania have broad scope to deepen collaboration by expanding cultural and educational exchanges while building on their long-standing partnership in infrastructure and healthcare, says Tanzania's new ambassador to China.

In an interview with China Daily in Hong Kong, Ambassador Suleiman Haji Suleiman said Tanzania welcomes Chinese businesses and investors, emphasizing that the country's doors are "wide open" to investment.

Suleiman said his priority during the first two years of his tenure is to strengthen economic cooperation while deepening social and cultural ties, further consolidating the bilateral relationship. His focus aligns with Tanzania's efforts to develop key sectors, including mining, agriculture, information technology and tourism.

Noting that China is already a major source of foreign direct investment, Suleiman said Tanzania aims to attract more Chinese investors. Chinese cumulative FDI in the East African country has surpassed $11.5 billion over the past two decades, covering more than 1,350 registered projects, according to the Tanzania Investment Centre.

Suleiman Haji Suleiman

"My obligation is to make sure we are getting serious people or businesses who are willing to invest in Tanzania," Suleiman said.

The Tanzanian government has initiated "opening-up" policies and incentives, including the proposed establishment of special economic zones across the country to attract more foreign direct investment, Suleiman said.

As part of that effort, he plans to organize an investment forum focused on pharmaceuticals, medical products and healthcare equipment manufacturers. Next year, Tanzania will host a road show in China promoting its agricultural products and tourism.

Suleiman identified the fishing industry as another area for cooperation, citing Tanzania's abundant marine resources along its Indian Ocean coastline and strong potential for both coastal and offshore fisheries.

China and Tanzania already collaborate closely in aquaculture, fisheries research and water resource protection.

Suleiman said the Belt and Road Initiative has been instrumental in Tanzania's infrastructure development and economic growth, highlighting the Chinese-built TAZARA Railway linking the port of Dar es Salaam with Zambia.

"We hope to improve and revitalize the TAZARA together with China so that we can use that as a gateway from Tanzania to neighboring countries, especially Zambia, to transport goods there and then to China," he added.

China has made significant contributions to people-to-people exchanges with Tanzania, particularly through decades of medical cooperation, Suleiman said.

According to the Chinese embassy, China has sent medical teams to Zanzibar since 1964 and the Tanzanian mainland since 1968. The teams, once dispatched every two years, now arrive annually, Suleiman said.

Everyone in Zanzibar knows the Chinese doctors and how good they are, he said. "When you go to hospitals, you will find them, and this gives very good perceptions (of China) among ordinary people."

Suleiman said that his mother was a doctor who worked alongside Chinese medical teams from 1968. Growing up, he lived near Chinese doctors and often played, swam and had picnics with them. "I have first-hand experience of people-to-people cooperation between China and Tanzania," he said.

China currently has two medical teams in Tanzania. Over the years, more than 60 teams have treated over 20 million patients, according to People's Daily.

Looking ahead, Suleiman said the two countries should expand cultural cooperation by establishing Chinese language and cultural centers in Tanzania, while increasing exchanges between cultural groups and national soccer teams.

He also called for closer tourism cooperation. About 82,000 Chinese tourists visited Tanzania last year, and the government aims to raise the figure to 100,000 annually next year.

US divergence sows discord at NATO summit

Allies renew pledge at Ankara meeting as doubt swirls over future of alliance

By **WANG MINGJIE** in London
wangmingjie@mail.chinadailyuk.com

NATO leaders left Turkiye on Wednesday after reaffirming their commitment to collective defense, but uncertainty now hangs over the alliance following US President Donald Trump's disruptive remarks.

Divisions over defense spending and the security commitments of the United States have raised questions about the cohesion of the alliance and even whether leaders would convene another summit next year.

Although the 32-member bloc sought to project unity through its "ironclad commitment" to the collective defense principle, the summit highlighted increasingly divergent priorities between Washington and its European allies.

Trump's repeated criticism of NATO, renewed demands for Europe to shoulder more of the budgetary burden, and public rebukes of individual allies reinforced concern that the trans-Atlantic relationship is becoming more transactional than strategic.

Speaking in Ankara before joining alliance leaders, Trump made clear that his frustrations with NATO had not eased.

"Despite the fact that I'm very upset with NATO, that we pay far, far too much, billions and billions of dollars too much — because it's unfair — we protect them, but they're not there for us," he said.

Trump also renewed his call for US control of Greenland, an autonomous territory of NATO member Denmark, while criticizing Spain over defense spending and its position on the Iran war, even threatening to cut off all trade with Madrid.

The remarks contrasted sharply with efforts by NATO Secretary-General Mark Rutte and European leaders to present a united front, underscoring growing disagreements over burden-sharing, strategic priorities and the future balance of responsibilities within the alliance.

Domestic pressures

Tom Harper, a lecturer in international relations at the University of East London, said the dispute over defense spending has become increasingly tied to domestic political and economic pressures.

European governments face mounting political risks if higher military spending comes at the cost of public services, Harper said.

"If increased defense spending coincides with cuts to social services and education, this will likely impose domestic costs on European governments, which they may be unwilling to pay, especially should they be facing election campaigns," he said.

"You could say it's an example of the age-old debate over guns or butter."

Harper also argued that the economic benefits of increased military spending could flow disproportionately to the US.

"It is quite likely that American companies would be the primary beneficiaries of increased spending, which is one of the reasons why Washington has been keen for NATO members to increase their defense expenditure," he said.

Matthew Arnold, a policy analyst and visiting fellow at the London School of Economics and Political Science, questioned whether NATO members could realistically sustain significantly higher defense spending.

"The fiscal concerns are serious," he said, warning that sustained increases in military expenditure could worsen debt burdens and social tensions, while much of the increased procurement would initially benefit large defense contractors, many of them based in the US.

Challenge to cohesion

Lawrence Loh, director of the Center for Governance and Sustainability at the National University of Singapore Business School, said NATO now faces a broader challenge to its cohesion.

"The NATO summit comes at a critical time when the alliance faces an emerging legitimacy crisis," Loh said. "With pressure from Trump, NATO risks bowing to this strongman's demands for increased defense spending," he said. "It is evolving into a transaction grouping of countries that weigh their respective interests with just one member — the US."

The alliance is simultaneously grappling with economic slowdown, political fragmentation and social integration challenges across Europe, while also facing criticism over its limited effectiveness in responding to conflicts in the Middle East, he added.

"All in all, NATO is now caught between a rock — the US — and a hard place, which is all the region-based anguishes in Europe," he said.

Several analysts believe Trump's approach could ultimately accelerate Europe's pursuit of greater strategic autonomy.

Angel Saz-Carranza, director of the EsadeGeo Center for Global Economy and Geopolitics in Spain, said NATO will likely evolve over the next decade.

"Reliance on the US will diminish as European Union capabilities increase, which will gradually rebalance the trans-Atlantic relationship," he said.

Pedro Brinca, an associate professor of macroeconomics at Nova School of Business and Economics in Portugal, also expects the alliance to become increasingly European in character.

However, he cautioned that Europe's ability to shoulder greater responsibility will depend not only on spending more but also on spending more efficiently. Fragmented national procurement would deliver less security than coordinated European investment, he added.

Although NATO leaders departed Ankara reiterating their commitment to collective defense, the summit illustrated that the alliance's greatest challenge may no longer be external threats alone, but maintaining political trust among its own members.

The final declaration said the leaders "look forward to our next meeting", but without committing to a date.

US offshore wind buybacks draw ire over climate targets

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

The US federal government's recent move to cancel offshore wind projects is drawing mounting legal and political backlash, with critics warning the campaign threatens the country's climate goals and its ability to meet surging long-term electricity demand driven by the rapid expansion of data centers.

California became the latest state to push back on Tuesday, with Attorney General Rob Bonta filing a notice of intent to sue the White House over a deal that canceled a major wind project off the state's coast.

The filing challenges an agreement signed between the Department of the Interior and Golden State Wind LLC, under which the company agreed to abandon a 2-gigawatt floating offshore wind project off California's central coast in exchange for reimbursement that will be redirected into fossil fuel investments.

The cancellation of the Golden State Wind project will harm the state's clean energy and climate goals and economy, as offshore wind is capable of generating vast amounts of electricity from strong, consistent winds off California's coast, said a news release from Bonta's office.

The cancellation threatens California's goal of developing 25 GW of offshore wind power by 2045, enough to supply roughly 13 percent of the state's electricity, according to the news release.

The California challenge is the latest in a series of legal and political battles ignited by the White House, which aims to roll back agreements to eliminate offshore wind development and redirect investment toward conventional fossil fuel generation. The administration has prioritized oil, gas and coal while seeking to limit construction of renewable energy projects.

The first buyback was signed with TotalEnergies in March. A second deal followed with Ocean Winds, CPP Investments and Global Infrastructure Partners. Last week, the Department of the Interior announced the cancellation of four additional offshore wind leases in California, New York and the Gulf of Maine, this time through an agreement with energy developer Invenergy. Together, the three rounds of buybacks total approximately $2.6 billion across six offshore wind leases spanning both East and West coasts.

The Oceantic Network, an organization dedicated to growing US offshore renewable energy, estimates that the cancellation of a single 1-GW offshore wind project permanently erases between $8.5 billion and $9.5 billion in economic output, based on peer-reviewed modeling and operational benchmarks from East Coast projects.

The group criticized the buyback deals as "the latest tactic to derail domestic energy development while energy prices soar".

At the state level, offshore wind is viewed as a key source for both clean energy transition and economic growth. Maine Governor Janet Mills called the Invenergy buyback an "egregious waste of taxpayer money and a short-sighted decision that will hurt our ability to reduce our reliance on expensive imported fuel".

Mills said the Gulf of Maine lease areas were designated only after years of careful planning and consultation with stakeholders. She warned that the administration's course risked leaving the United States isolated on the global energy stage.

"As many countries around the world, including neighboring Canada, move to harness the benefits of offshore wind, today's announcement by the (US President Donald) Trump Administration further risks that we will be left behind," Mills said in a statement.

Environmental advocates echoed those concerns and questioned the legal basis of the deals. The Natural Resources Council of Maine, the state's leading environmental advocacy organization, called the Invenergy buyback "a huge step backward for affordability and reliability".

Teacher builds trust through language

Instructor shares his knowledge of China to create understanding one classroom and one lesson at a time in Utah

By **LIA ZHU** and **CHELSEA GE**
in San Francisco
liazhu@chinadailyusa.com

Alan Heath, a Chinese language teacher at Lone Peak High School in Highland, Utah, has taken about 60 students to China on exchange programs over the past year. CHELSEA GE / CHINA DAILY

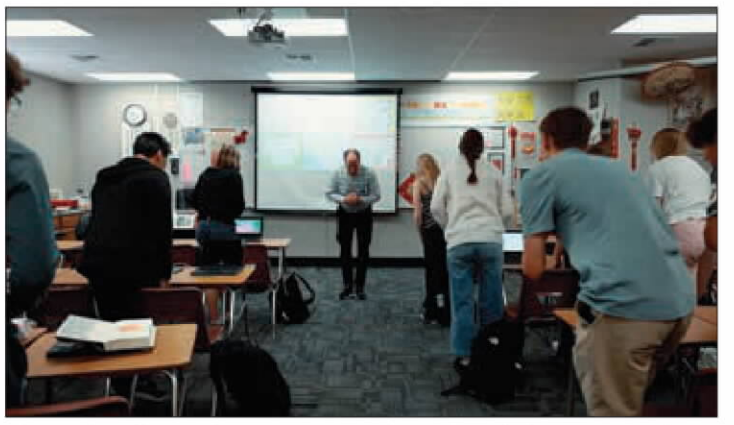
Red paper-cuts and brush-inked calligraphy cover the walls. A sign by the door reads "100 percent speak Chinese". When Alan Heath walks to the front of his classroom at Lone Peak High School, his students rise, fold their hands in front of them and bow. Heath bows back. *Zuoyi*, the traditional Chinese gesture of greeting and respect, is used to open every class.

It is a small ritual, repeated each day at the school in Highland, Utah. But for Heath, who teaches Advanced Placement (AP) Chinese Language and Culture, the bow is an attempt to bridge two cultures, one classroom at a time.

"The more important thing is not so much language, but understanding of culture, understanding of the mindset, understanding of why the Chinese people think the way they do," Heath said. "Once you do that, whatever level your language is, you're going to be able to have a better relationship."

Heath started learning Chinese at 19 and found it difficult at first. But the difficulty gave way to devotion. He went on to study international relations and Chinese at Brigham Young University, then spent years working in trade consultation and later at a genealogy organization before stepping into a classroom 15 years ago.

"I chose to teach Chinese because Chinese has had a huge impact on my life, and I love the language, I loved the culture," he said. "I decided that I enjoyed teaching enough that I wanted to teach Chinese and share my knowledge and my experience with the language and the culture, so that other Americans could learn to love the culture and the language."



His first visit to China came in the 1980s, when he began traveling there for business. The country he encountered has changed tremendously compared to the one his students would later visit.

"In the 1980s in Shenzhen, nobody had cars, everybody had bikes, they were mostly wearing Mao suits, and it was a different China altogether," Heath recalled. "It was very backward and very protected, so their understanding of the West was very limited. When they saw a foreigner who spoke Chinese, even though my Chinese was not great, they were just amazed. I would go out on the street in Shenzhen, and within one minute I would have hundreds of people around me, all wanting to hear a foreigner speak Chinese."

Four decades later, his students are having similar encounters of their own.

Shared Future and Shared Lessons

In March, Heath led a group of 32 students on a two-week trip through Beijing, Zhengzhou and Kaifeng in Henan province, and Xi'an in Shaanxi province. The journey was made possible through the Young Envoys Scholarship (YES) program, launched in 2023 with a goal of bringing 50,000 young Americans to China for exchange and study over five years.

Alan Heath and his students perform *zuoyi*, the traditional Chinese greeting that dates back thousands of years, before the start of class at Lone Peak High School in Highland, Utah. CHELSEA GE / CHINA DAILY

For Kennady Pack, who began learning Chinese at age six, the trip turned years of classroom study into something tangible.

"They (Chinese people) were so surprised — they'd freak out over the fact that I could speak their language, and they'd want to take videos and pictures of me, so it's really awesome," Pack said.

The itinerary included shopping and walking the streets of Beijing, climbing sections of the Great Wall, mingling with Chinese students on campus, and standing before the ranks of the Terracotta Warriors in Xi'an. But for Pack, the trip's real power was seeing, in person, what she had only studied in textbooks.

"It was super cool, especially because I've been learning since I was little, so being able to see it with my own eyes was surreal, and it's just so much cooler in person. You can't read about that kind of stuff and fully experience it," she said. "I thought it was so cool over there, and it was so technologically advanced, like they have such cool things, especially at their schools."

Her classmate Damian Lambert said the language skills he had built in Heath's classroom transformed the trip from sightseeing into genuine connection.

"I was able to have conversations with them, and I was able to interact and learn, and it was just really fun being able to experience that part of it compared to just going and seeing stuff and not knowing what's going on," Lambert said. "It's just been a lot more fun getting to learn more about the history and even more culture that's got China to where it is today."

Heath's philosophy is that real fluency comes only through meaningful conversation, not memorization.

"If you only memorize words, you will always stay at the novice level. If you memorize sentences, then you'll be maybe at the intermediate level," he said. "We want all of our students to be at advanced level, where they can talk in paragraphs. The paragraphs are the vehicle where you can exchange ideas with another Chinese person."

That philosophy was tested directly in March, when the group visited Beijing Bayi School and saw firsthand how different a Chinese student's daily life can look.

"They were able to see that life for a Chinese student was very demanding, a much longer schedule, but it was interesting and fun, and so they were surprised by that," Heath said. "There's a big change whenever you learn another language, another culture. Both sides have fun and are benefited."

Pack agreed the experience reshaped her expectations. "Honestly, it was a little different than I expected, just because the day-to-day life is just so different from our lives," she said, "but I thought it was so cool over there."

Over the past year alone, roughly 60 of Heath's students have traveled to China through the YES program. That firsthand experience, he said, has changed how his students see the country.

"My students have really benefited from this program to really, for the first time, understand how China is much more advanced or much more free than they thought, because of Western media," Heath said. "They started to really appreciate more about Chinese culture, language, but most importantly, how open and friendly the Chinese people are."

This year, Heath's course has centered on Chinese history. Next year, the focus will shift to contemporary China.

"I think it's very important to understand history," he said. "Chinese history is very important because it has thousands of years, and if you are dealing at all with Chinese in business or in conversations, if you have an understanding of Chinese history, the Chinese people will look at you differently and respect you more because you understand something about their culture and their history."

Of all the history Heath teaches, one chapter looms largest in his mind: what is known in China as the "century of humiliation", the period from the First Opium War in 1840 to the founding of the People's Republic of China in 1949, during which foreign powers repeatedly invaded and exploited a weakened China.

"I think the most important misunderstanding between Americans and Westerners at large with China is the most recent history, which is the century of humiliation," Heath said.

He walks his students through how the unequal treaties of that era stripped China of territorial control, ceding cities such as Hong Kong, Shanghai and Tianjin to foreign powers.

To make the scale of that loss visible to his students, he poses a hypothetical.

"What if China was much more powerful than us, and they came over and decided, well, we want half of San Francisco, we want part of Los Angeles, we want New York, and you have to give it to us, because we want to sell drugs to you and make money from you?" Heath tells his students.

Their reaction, he said, is: "No, really?"

His research turned up an uncomfortable detail closer to home that many Bostonians who made fortune of selling opium to China.

"The Americans are not without fault. They probably weren't as bad as some other countries, but the Americans are also at fault of taking advantage of the Chinese," he said.

Heath has come to see this gap in historical knowledge as one of the central obstacles to US-China understanding. While Chinese students grow up learning about the burning of the Old Summer Palace and the foreign incursions that followed, most of their American counterparts know little about this chapter.

That gap in knowledge, in his view, causes mistrust. "If they (Americans) only listen to Western media, they would say the Chinese are terrible, they're doing this just to take advantage of us. They're doing this because they don't like us. No, that's not the reason," Heath said. "They (Chinese) are doing it because they need to protect themselves from being taken advantage of again."

On the March trip, Heath shared the century of humiliation with the 13 parents who accompanied the students. "They had never heard the concept," he said. "It's meaningful to see parents change their mindset on what China is all about."

For Heath, his effort pays off in the way Chinese people react. "Whenever I've had a discussion about this in China, the Chinese people look at me differently, and I think that they know that I am sincere in my willingness and wanting to be a friend and to teach my students good principles," he said.

He believes that kind of trust is essential to good diplomacy and good foreign relations. "I think that it's very important for me to help Americans understand. If they understood history better, then they would not repeat it or create more misunderstanding."

New Committee of 100 Chair Janet Yang sees culture as bridge

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

Janet Yang has spent a career proving that stories can cross borders that politics cannot. Now, as the newly named chairwoman of the Committee of 100, she is bringing that conviction to one of the most prominent Chinese American organizations in the United States.

Yang, the Emmy and Golden Globe Award-winning film producer who served three terms as president of the Academy of Motion Picture Arts and Sciences, was appointed to lead the committee's board, succeeding Gary Locke, the former governor of Washington state and US ambassador to China, who led the organization for the past five years.

Founded in 1990 by architect I.M. Pei, cellist Yo-Yo Ma and other distinguished Chinese Americans, the Committee of 100 (C100) aims to strengthen US-China relations and ensure that Chinese Americans have a full and rightful place in US society. Yang, a committee member since 1998, sees her new role as an extension of everything she has built across more than three decades in film.

"C100 has a dual mission: to ensure that Chinese Americans truly belong in the US, and to bridge the US and China," she told China Daily, adding that I.M. Pei and Yo-Yo Ma "represent excellence that transcends national boundaries, while embracing their Chinese heritage and sharing their work across borders".

The roots of that mission run deep in Yang's own biography. Born in Queens, New York, to parents from Shanghai and Hunan province who came to the United States as students, she grew up on Long Island carrying the quiet burden of being visibly different.

She experienced the classic, as she put it, "try-to-fit-in, wish-my-eyes-were-rounder" self-consciousness. That feeling might have shaped her differently had she not embarked on a trip to China at 16.

Thanks to her mother's work at the United Nations, Yang was part of one of the first Chinese American families to visit China in 1972. She recalled being fascinated by everything she saw, saying the experience left her eager to know more about China.

She followed that curiosity to Brown University, where she majored in Chinese Studies and became fluent in Chinese, then accepted a post at China's Foreign Languages Press, the publisher of books and magazines for export.

During that year-and-a-half assignment, she presided over impromptu salons and befriended Chinese filmmakers, artists and creatives. She said that meeting those artists and seeing films being made was something she had never encountered in the US, and that experience changed the course of her life.

After earning her MBA from Columbia University, Yang was hired to run World Entertainment, distributing Chinese

> Even when governments are at odds, individuals can find deep resonance with characters from other countries."
>
> Janet Yang, chairwoman of the Committee of 100

films to Western audiences. She introduced directors like Chen Kaige to screens in the US, then turned around and represented US studios and films in China, a two-way bridge she has been building ever since.

Along the way, she became involved with some culturally significant Asian and Asian American films in Hollywood, including *Empire of the Sun*, *The Joy Luck Club* and *Over the Moon*. Long before it became fashionable, Yang treated Asian themes as the cornerstone of mainstream storytelling.

It was that early encounter with Chinese cinema that enhanced her sense of purpose.

"When I was first exposed to Chinese films, seeing people who looked like me on screen in three-dimensional roles gave me such a sense of belonging and comfort," she said. "I realized then that the same feeling could be replicated the world over."

For non-Chinese audiences, she said, those same films offered a window into a country that had long been closed off. "From the start, it was always important to me to uplift these stories and push the boundaries of what people in Hollywood thought was possible," she said.

Known in the entertainment community as the "godmother of Asian Americans in Hollywood", Yang completed three terms as president of the Academy of Motion Picture Arts and Sciences, the first Asian American to hold the role. The Academy Museum has since established the Janet Yang Endowment to support programming centered on historically underrepresented filmmakers, with special emphasis on Asian American and Pacific Islander artists.

She sees the cultural work she has championed throughout her career as directly relevant to the diplomatic challenges of the present moment.

"Since then, countless other projects have paved the way for Asian and Asian American representation on screen," she said. "There's a reason for that: these stories resonate with all kinds of audiences who see themselves in the universal human condition. Even when governments are at odds, individual citizens can find deep resonance with characters from other countries. Culture does what diplomacy can't always do."

That belief was reinforced for her by a recent example. C100 founding member Oscar Tang served as executive producer on Laufey's *Madwoman* music video, an all-Asian and Asian American production set in Los Angeles. When the music video drew 17 million views in its first month, Yang saw the same kind of energy she hopes C100 can channel.

"I thought, C100 is a great place to do what I have always loved. Young people especially are just reveling in their idols — they aren't necessarily thinking about representation. They're thinking it's a great video," she said. "That's the point."

At a moment when US-China relations are shaped more by headlines and algorithms than by human encounter, Yang believes storytelling remains the most powerful counterforce available, and that C100 is uniquely positioned to deploy it.

"I believe C100 is just one vehicle for achieving more vital connections between two great and powerful nations, and in the world," she said. "Today, when I look at the global landscape, I again see so much opportunity for such exchanges to give rise to brilliant things. I see possibility everywhere."

COMMENT

Editorials

Cultivating a workforce of young sci-tech talent a strategic priority

History has repeatedly shown that scientific revolutions are ignited by minds willing to challenge convention and test new ideas. Likewise, major countries secure their scientific standing by cultivating generation after generation of researchers who dare to venture into the unknown.

That is why President Xi Jinping stressed the need to create institutions that allow scientific inquiry to flourish — through stable support, better evaluation systems, stronger mentorship and an environment in which originality is rewarded.

Scientists need to be afforded the time, institutional backing and intellectual space to pursue discoveries that could shape not just the next research project, but the very contours of the next scientific era. That is why, when addressing the country's highest-level conference on science and technology in Beijing on Wednesday, Xi urged the nation to treat the building of a workforce of young sci-tech talent as a strategic priority.

The country needs to pay attention to discovering and cultivating more excellent young scientific and technological talents on the frontiers of scientific research, and increase the support provided to them. It also needs to pay attention to cultivating teenagers' interest in science, improving their scientific literacy and experimental ability and attracting more teenagers with scientific research potential to devote themselves to the cause of science and technology.

The future of science lies with the youth, Xi emphasized.

The opening year of the 15th Five-Year Plan (2026-30) arrives at a time of intensifying technological competition and a rapidly shifting global innovation landscape. China's future depends more than ever on its ability to empower a rising generation of scientific researchers and innovators.

For young researchers and innovators, this is both a challenge and a call to action. It is essential that they integrate their personal aspirations into the broader cause of national development, and channel their youthful energy and creativity into the country's modernization drive.

Only by aligning individual ambition with the nation's progress can they truly contribute to the sci-tech transformation that lies ahead.

To provide an enabling environment for them, China should further reform its research evaluation system, which should reward true discovery, originality and creativity. Xi called for accelerating reforms that break the grip of the "four onlys" — judging researchers solely by papers, credentials, titles or awards — and replacing them with an evaluation system based on innovation, quality, practical effect and genuine contribution.

Great discoveries rarely emerge from systems that fear failure and entrench the status quo. Young researchers need an inclusive environment to pursue unconventional questions, confidence that long-term projects will survive assessments, and mentors prepared to nurture curiosity instead of demanding immediate returns.

The report released by the Xinhua Institute last month on Chinese youth captures another dimension of this call for action as it notes that the country's younger generation is not only the builder of national development but, increasingly, a contributor to global progress.

Whether in the spheres of artificial intelligence, biotechnology, green energy or advanced manufacturing, China's young scientists are taking on challenges that extend well beyond national borders. Scientific self-reliance and international contribution are not mutually exclusive. On the contrary, the stronger a country's indigenous innovation capacity, the greater its ability to contribute to humanity's shared scientific future.

The secret of a fulfilled life is to cultivate wide interests and allow those interests to deepen rather than narrow with age. That observation applies to countries as well as individuals. Countries that sustain scientific vitality encourage curiosity rather than conformity, exploration rather than complacency, and have the confidence to raise questions whose answers may not arrive for decades.

China's aspiration to become a leading country in science and technology by 2035 will therefore depend on whether today's young scientists believe their work will be supported, and their talent will be valued.

Forecasts show resilience of China's economy

The International Monetary Fund on Wednesday upgraded China's growth outlook by 0.2 percentage points to 4.6 percent for the year 2026 from the previous projection in April, while downgrading its 2026 global economic growth forecast by 0.1 percentage points to 3 percent. It attributes the Chinese economy's performance to the robust expansion of its high-tech manufacturing sector and the strong export growth that has followed.

The World Bank also pointed out in its latest China Economic Update, released on Tuesday, that China's investment in high-tech sectors grew by 4.5 percent year-on-year in January-May, driven by robust artificial intelligence-related demand at home and abroad. In June, the OECD had predicted that China's economy will grow by 4.5 percent in 2026.

A closer examination of some key datasets from the first half of 2026 also highlights the foundations of the Chinese economy's steady performance.

By the end of May, the country's cumulative installed power generation capacity surpassed 4 billion kilowatts, a year-on-year increase of 11 percent, and a figure that exceeds the combined capacity of the United States, the European Union, India, Japan and Russia. It took eight years to go from 1 to 2 billion kilowatts, but only about two years to climb from 3 to 4 billion kW. This achievement is built upon the world's most complete new energy industry chain, which produces 80 percent of global photovoltaic modules and 60 percent of wind power equipment.

The fast advancement of artificial intelligence is fueling the momentum driving the economy. In early 2024, China's average daily token usage was just 100 billion. By May 2026, this figure had surged to hundreds of trillions, the highest in the world. This soaring token rate reflects the deep integration of AI into manufacturing and daily life, which has boosted efficiency across sectors spanning chemical production to software development. From January to May, high-tech manufacturing contributed nearly 40 percent to the country's industrial growth, while equipment manufacturing contributed nearly 60 percent to industrial growth. All this is a clear testament to China's accelerating shift toward an innovation-led economy.

Chinese consumption is displaying renewed vitality. The national consumer goods trade-in program has proved to be a phenomenal success, with sales exceeding 1 trillion yuan ($147 billion) by June 20, benefiting 136 million people. This policy has not only invigorated the domestic consumption market but also spurred industrial upgrading, with high-efficiency appliances and new energy vehicles at the forefront.

China's consumer price index rose 1 percent year-on-year in June, and the country's producer price index went up 4.1 percent year-on-year, according to data released by the National Bureau of Statistics on Thursday.

The country's new energy vehicle sector reported continued growth in the first half of 2026, with output and sales both exceeding 7 million units during the period, latest industry data showed on Thursday. NEV output from January to June reached 7.44 million units, while sales stood at 7.45 million units, according to the China Association of Automobile Manufacturers.

Also China's commitment to openness and integration is reflected in its record-breaking foreign trade with Africa. The country has implemented a zero-tariff policy for all 53 African countries with which it has diplomatic ties since May 1. In the first five months of 2026, China-Africa trade registered an 18.2 percent year-on-year increase to reach 1.14 trillion yuan, the first time the figure has surpassed 1 trillion yuan. This is a testament to the fact that China is creating new opportunities for shared growth.

The IMF's decision to lower its global growth forecast underscores the difficulties facing many countries, including inflationary pressures, geopolitical tensions, and supply chain disruptions. In this context, what China has achieved in the past six months highlights the country's ability to navigate global challenges and maintain steady growth.

Even so, with economic headwinds persisting, China's macroeconomic policy will continue to pair moderate monetary easing with proactive fiscal action — but with a sharper focus on targeted measures, rather than broad-based stimulus. The second half of the year will likely bring faster special-purpose and special treasury bond issuance, as well as more support for livelihoods and consumer spending through transfers and subsidies. At the same time, lingering risks in local government debt and property sector financing will require steady, ongoing efforts to unwind.

Luo Jie

The Strait of Hormuz US-Iran Peace Agreement

Opinion Line

Chinese football should live up to expectations of nation

Notwithstanding the Chinese Football Association's denial on Tuesday of the rumor that it had declined a friendly match invitation from Cape Verde, the unfounded allegation continues to be widely disseminated.

Soccer has always generated rumors. Some rumors gain traction because they sound believable long before anyone asks whether they are true or not. The Cape Verde story belonged in that category. It imagined a Chinese team unwilling to face one of the World Cup's surprise packages.

In an age when fiction can complete several laps of the internet before the truth gets its boots on, millions accepted it almost instinctively because it reflected something Chinese supporters have come to expect of the national team: not necessarily failure, but lack of confidence.

That should bother the CFA more than the rumor itself. The 2026 World Cup has once again demonstrated that football has little regard for population or GDP. Cape Verde, representing little more than half a million people, has become one of the tournament's compelling teams. The World Cup has always had room for such successes — one of the reasons why it is so popular. These dark horses remind everyone that football's hierarchy is earned rather than inherited.

Chinese fans, watching this year's tournament unfold without the presence of the national team, cannot help but notice the contrast.

However, had such a match actually been arranged, Chinese supporters would almost certainly have embraced it because they still crave success and every match presents the opportunity for, if not a win, at least a good performance.

The sarcasm surrounding the national team is often mistaken for indifference. But indifference is silence. Chinese football rarely experiences silence. It provokes arguments, mockery and endless online debate precisely because hundreds of millions still invest emotionally in what they hope it might one day become.

The harder question lies elsewhere.

This World Cup has shown how quickly elite football continues to evolve. Faster restart regulations have accelerated the game's rhythm. Referees have adopted more consistent standards while punishing cynical behavior with increasing severity. Semi-automated offside technology and sensor-equipped match balls have transformed decision-making into a matter of precision measured in milliseconds. Coaches now prepare not simply for opponents but for an environment where tactical flexibility, data analysis and technical accuracy decide increasingly fine margins.

The gap separating Chinese soccer from the world's best cannot be bridged by another expensive signing or another short-term project. If there is an Asian blueprint worth studying, it is Japan's. Its progress has never depended on one generation or one wealthy benefactor. It has been built patiently through youth coaching, coherent player development and an acceptance that the best footballers must leave home to train.

Chinese football once convinced itself that prosperity could be purchased. The era of lavish spending, imported stars and naturalized internationals created a sport that some foreign players joked looks like football but is not, briefly disguising the deeper structural problems without solving them.

The next generation will have to be developed differently. Investment should go into community pitches rather than transfer fees, to qualified youth coaches rather than fleeting celebrity signings. Young Chinese players should be encouraged to test themselves in stronger leagues while they are still learning their football education. The same applies to coaches.

Grassroots soccer too deserves protection from becoming another form of online entertainment. Viral clips and exhibition events may generate attention, but they cannot replace thousands of ordinary training sessions where habits, technique and judgment are formed. Nor can reform stop with the football administrative system. Chinese football's anti-corruption campaign has restored some confidence to a sport that had spent too long undermining itself.

Chinese soccer's task is not to simply rebut stories that damage its reputation. It is to build a national team whose progress makes those rumors impossible to believe in the first place.

— LI YANG, CHINA DAILY

What They Say

New guardrails to make anthropomorphic AI safer

Editor's note: *China has issued new rules for regulating providers of artificial intelligence systems that simulate human personality traits, thinking patterns and communication styles in emotional interactions with users. Science and Technology Daily spoke to Huang Wenhong, a researcher at the China Center for Information Industry Development, and Sang Jitao, a professor at the School of Computer Science and Technology at Beijing Jiaotong University, about the importance of the new rules that will come into effect on July 15. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

The new rules focus on AI services that simulate human personality traits and thinking patterns, establishing clear boundaries for anthropomorphic AI interaction and placing greater responsibility on platform operators, which are prohibited from excessively catering to users, fostering emotional dependence or addiction, or manipulating users emotionally in ways that could influence them to make unreasonable decisions.

Platforms are also barred from offering minors virtual intimate relationship services, including virtual family members or romantic partners. In addition, they are required to identify high-risk situations, such as users exhibiting extreme emotional distress or suffering significant financial losses, and provide appropriate reassurance and, where necessary, timely intervention.

AI agents are applications designed to accomplish specific objectives. An AI agent can understand a user's objective, break complex tasks into manageable steps, use external tools, access relevant knowledge bases and data, monitor task progress, and complete an entire workflow within the limits of its permissions. Many AI agents are also equipped with long-term memory, enabling them to retain conversation history, user preferences, role settings and the status of ongoing tasks, while coordinating with other AI models to execute complex assignments.

The rules do not apply the brakes to the development of custom AI agents. Instead, they establish guardrails for anthropomorphic interaction. They are likely to accelerate the transition from an early stage characterized by low barriers to entry, rapid expansion and unrestricted publication toward a more mature ecosystem featuring categorized supervision, risk-based governance, prerelease review and built-in safety mechanisms. As the rules take effect, platforms are expected to strengthen both the review process for creating and publishing AI agents and associated safety testing.

The rules accept that custom AI agents built on general-purpose large models remain an important direction for the future development of AI applications. But, going forward, a clearer distinction will need to be made between task-oriented AI agents and anthropomorphic agents designed for emotional companionship.

Task-oriented agents, which include intelligent customer service, knowledge bases, work assistants, and educational and scientific research applications do not involve continuous emotional interaction and therefore fall outside the primary scope of the new rules. By contrast, anthropomorphic, companion-oriented and role-playing AI agents will be subject to a more stringent oversight framework.

Although the new rules are likely to increase compliance costs in the short term and reduce the space for low-quality, borderline-legal and traffic-driven AI agents, they are expected to foster healthier long-term development of compliant AI applications serving fields such as education, work, scientific research, cultural communication, eldercare companionship and support for people with special needs.

Before the new rules were released, some AI platforms had already allowed users to create and publicly share a large number of customized AI agents, whose ability to maintain long-term memory and adopt character settings makes it easy for some of these applications to cross the regulatory boundaries governing anthropomorphic interaction.

China, Namibia boost cooperation in Global South

MA XUEJING / CHINADAILY

The most significant aspect of Namibian President Netumbo Nandi-Ndaitwah's visit to China this week was not what happened in Beijing, but what came before it. By visiting Guangdong province and Sichuan province, the Namibian leader signaled a new phase of China-Africa cooperation, one that prioritizes development through industry, innovation and local experience.

The focus is increasingly on transferring know-how and building local capacity rather than simply financing projects.

Global Lens

This shift matters because Namibia's ambitions have changed. Rich in uranium, diamonds and newly discovered energy resources, it no longer wants to remain simply an exporter of raw materials. It wants to process, manufacture and create jobs at home.

This ambition aligns with China's growing emphasis on industrial cooperation, technology transfer and supply-chain resilience.

Seen in that light, Nandi-Ndaitwah's tour of China's manufacturing and innovation hubs was a glimpse of where the relationship is heading.

The provinces of Guangdong and Sichuan are living classrooms for development. Guangdong illustrates how manufacturing clusters can transform export-oriented economies. Shenzhen, a technology hub in Guangdong, demonstrates how innovation ecosystems can create globally competitive industries within a generation. Sichuan showcases how balanced regional development can narrow internal disparities while sustaining high-quality growth.

These are practical lessons directly relevant to Namibia's aspiration to develop mineral processing, renewable energy manufacturing, logistics, digital services and advanced agriculture, illustrating that development cannot be replicated through investment agreements alone.

China remains one of Namibia's largest trading partners, while Chinese investment in the country has expanded from mining into manufacturing, renewable energy and infrastructure. Beijing's decision to grant zero-tariff access to African countries this year pushes that relationship further, opening the doors for Namibian beef, seafood, grapes, blueberries, processed foods and other agricultural products, while encouraging domestic processing of resources before export. The policy changes the economics of industrialization itself: instead of exporting raw uranium, lithium or agricultural products, Namibia now has a stronger incentive to climb up the global value chains.

In recent years, China-Namibia cooperation has expanded into areas that shape long-term development, including space technology and clean energy to transport and modern agriculture.

A China-funded satellite ground data receiving station in Windhoek is helping Namibia develop its own scientific capacity.

The Dr Hage G. Geingob Freeway has cut travel time between Hosea Kutako International Airport and central Windhoek from about 50 minutes to just over 20 minutes, while creating around 850 local jobs and involving 54 Namibian companies.

In energy, the 100-megawatt Sores Gaib Power Station is expected to generate more than 300 million kilowatt-hours annually, while cooperation is also expanding into green hydrogen through the Hyphen Hydrogen Energy project.

In Walvis Bay, Chinese-backed oyster farms are introducing modern techniques, opening new markets in Europe, the Middle East and Asia.

What is distinctive about China-Namibia cooperation is its emphasis on building capacity, and not just infrastructure.

The China-aided Satellite Ground Data Receiving Station exemplifies this approach. Beyond delivering advanced technology, the project has trained local engineers and given Namibia the ability to operate the system independently.

The station strengthens disaster response, environmental monitoring, agricultural planning and scientific research while cultivating local expertise. This is a far more sustainable model than technological dependence.

The timing of the Namibian president's visit is particularly meaningful.

With 2026 being designated the China-Africa Year of People-to-People Exchanges, bilateral relations are expanding beyond governments and corporations to universities, research institutions, youth organizations and local communities.

Human capital is increasingly becoming the foundation of economic cooperation. Without skilled workers, technology transfer is unsustainable; without education, industrialization cannot endure.

By combining scholarships, vocational training, scientific collaboration and cultural exchanges with investment, China and Namibia are constructing a more resilient partnership.

The historical roots of this relationship further distinguish it within Africa. China's support for Namibia's liberation movement during its struggle for independence established political trust long before extensive commercial engagement began. Diplomatic relations, established immediately after Namibia's independence in 1990, have evolved into a comprehensive strategic cooperative partnership grounded in mutual respect and sovereign equality, rather than short-term geopolitical calculations.

Ultimately, Nandi-Ndaitwah's visit reflects a broader transformation in Global South cooperation. The defining feature of the next phase of China-Africa relations will not merely be the movement of capital, but also the movement of knowledge, technology, industrial capabilities and human talent.

If China contributes not only financing but also innovation ecosystems, technological know-how and institutional experience, while Namibia contributes strategic resources, policy stability, regional connectivity and ambitious industrialization, the partnership will evolve from complementary trade into shared modernization.

The broader goal is to build a China-Africa community with a shared future.

That is precisely why China-Namibia relations are an example for the broader Global South.

They demonstrate that development partnerships are most successful when they help countries create greater value from their own resources, strengthen domestic capabilities and build lasting prosperity together rather than reinforcing traditional patterns of dependence.

In an increasingly multipolar world, this could become the defining model of South-South cooperation in the decades ahead.

Manila's land-grabbing ambition root of disputes

A country's territory is defined by historical facts and international law, which is the cornerstone of modern international relations. In the South China Sea, the territorial boundaries of the Philippines have been established through treaties with binding international legal effect.

However, since the 1970s, the Philippines has repeatedly laid claims to China's Huangyan Island and parts of the Nansha Islands under flimsy pretexts, revealing a sustained ambition to expand its territory.

Such actions not only contradict the legal stance the Philippines upheld for decades post-independence but also threaten the carefully constructed post-war international order and fragile stability in the South China Sea.

Before Spanish colonizers set foot on what is now the Philippines, the region did not have a unified statehood territory or defined boundaries recognized by modern international law.

During the colonial period, the Philippine territorial boundaries were gradually etched and explicitly defined by three international treaties, which were recognized and adopted by the country after it gained independence.

The Treaty of Paris, signed in 1898 after the Spanish-American War, meticulously delineated the boundaries of the Philippine archipelago ceded to the United States. The ceded central and northern territories were confined between 118 and 127 degrees east longitude, whereas Huangyan Island and the Nansha Islands lie west of 118 degrees east longitude.

Two years later, Washington and Madrid signed another treaty ceding several outlying islands, including Sibutu and Cagayan Sulu which were outside the 1898 boundaries to the US.

In 1930, Washington and London signed a convention clarifying the boundary between the State of North Borneo and the Philippine archipelago, further defining the ownership of islands on the Philippine archipelago's southwestern side.

These three international treaties formally defined the territorial limits of the Philippines, which successive governments in Manila recognized for decades since independence. Neither Huangyan Island nor any part of the Nansha Islands was included within these defined limits.

Since the 1970s, however, the Philippines has systematically tried to extend its territorial claims beyond the established limits. In 1971, then president Ferdinand Marcos, father of the current president, formally asserted claims over several islands, shoals and reefs in the Nansha Islands and subsequently deployed troops to occupy eight features, including Mahuan Island, Feixin Island and Zhongye Island.

The claim over Huangyan Island emerged in 1997, when Manila disrupted a Beijing-approved amateur radio expedition to the island. Beijing lodged a protest, but Manila persisted and began asserting territorial sovereignty over Huangyan Island.

As a recently released report titled "Historical and Legal Critique of the Philippines' Territorial Claims in the South China Sea" indicates, over the past three decades, the Philippines has put forward a series of untenable and self-contradictory arguments such as "geographic proximity", "early occupation", and "treaty reinterpretation" to support its claims over the features. None of these claims can withstand historical and legal scrutiny.

Manila's position is further weakened by its contradictory stance. Until the 1990s, official Philippine maps placed Huangyan Island outside its territorial boundaries.

In 1990, the Philippine ambassador to Germany, Bienvenido A. Tan Jr, stated in a letter that Huangyan Island is not within the Philippines' territorial sovereignty. In 1994, the country's National Mapping and Resource Information Authority issued an official certification confirming that the country's territory, as defined by Article 3 of the Treaty of Paris, does not include Huangyan Island.

According to the principles of recognition and estoppel in international law, a state's official statements and actions constitute valid affirmation of legal facts. Thus, Manila's current claims breach its own official statements.

The Philippines' relentless attempts at unlawful territorial expansion pose a grave threat to the international rule of law, regional stability, and the postwar global order. The United Nations Charter stipulates that member states shall refrain from the threat or use of force against the territorial integrity of any state.

Manila seized Chinese islands and reefs in the Nansha Islands by force, and has sought to legitimize its illegal occupation through domestic legislation, maritime operations, and media manipulation. These actions blatantly challenge the international legal system anchored by the UN Charter.

In recent years, the Philippines has frequently dispatched naval vessels and coast guard ships into the waters adjacent to Huangyan Island and the Nansha Islands, escalating provocations with dangerous maneuvers such as ramming and close-in surveillance.

These actions violate the core commitments of the Declaration on the Conduct of Parties in the South China Sea, hinder consultations on the Code of Conduct in the region, and disrupt the cooperative momentum between China and the Association of Southeast Asian Nations.

After World War II, international instruments such as the Cairo Declaration and the Potsdam Proclamation clearly stated that lands seized by Japanese aggressors were to be returned to their rightful owners.

Accordingly, China resumed exercising its sovereignty over the South China Sea islands. The Philippines, which gained independence only after the war, had acknowledged that these islands were not in its territory. However, driven by political interests, it reversed its stance and challenged the territorial order established by the international community.

The ancient Chinese wisdom of respecting one's boundaries resonates with modern international law on territorial sovereignty.

Expanding territorial boundaries infringes on others' rights and undermines the international order. Manila must recognize that its quest for unlawful territorial expansion will not succeed.

Xizang trip proves Western accusations really ridiculous

China-bashing has been the favorite pastime for some Western politicians, many of whom have rarely, if ever, set foot in China.

Their latest target is China's ethnic minority policy, including the Ethnic Unity and Progress Promotion Law, which came into effect on July 1 after being adopted by the National People's Congress, the country's top legislature, in March.

Predictably, many of the loudest critics have never visited China's ethnic minority regions, from the Xizang autonomous region to the Xinjiang Uygur autonomous region. Yet they continue to make sweeping accusations about the lives, cultures and traditions of ethnic groups there.

Over the past four weeks, I have traveled through the Tibetan-inhabited regions from Xizang to Sichuan province.

Along the way, I kept asking Tibetan men and women whether they felt their language, culture, religion or other aspects of their lives were being suppressed, as alleged by Western politicians year after year.

Each and every one of them laughed off those Western accusations. A young Tibetan man named Tenzing offered the most representative response.

Those Westerners, he said, simply don't understand the reality on the ground. There are no restrictions on learning the Tibetan language or engaging in cultural and religious activities, he said.

The truth, as I witnessed in the region, is that nearly all Tibetans speak their mother tongue. That certainly does not look like a language being erased.

In fact, the preservation of the Tibetan language is far more robust than the protection of the Shanghai dialect in my home city, Shanghai.

Tibetan monasteries were among the highlights of my four-week driving trip.

The road to the village, at an altitude of 4,000 meters above sea level, is arguably better than those leading to many Alpine villages that I have visited in Switzerland.

From the magnificent Jokhang Temple in Lhasa to the Samye Temple in Lhoka and the smaller Chonggu Temple in Yading, Sichuan province, they are all splendid. The monks were friendly and welcoming. At the former residence of the 7th Dalai Lama in Litang, Sichuan province, a monk even invited me to see the rooms upstairs.

I was ignorant on some issues, so I asked a young man named Tsering whether Tibetans are allowed to marry people of other ethnic groups.

He said marriage was a personal choice that everybody is completely free to make. His own aunt married a Han Chinese in Chengdu, capital of Sichuan province.

Tenzing was proud that Tibetan society doesn't have the tradition of dowry unlike elsewhere in the country. He was surprised when I told him that Shanghai and several other Chinese cities also don't have such a practice.

I was equally surprised to learn that there is no preference for sons in Tibetan families, unlike in some other communities in rural areas.

Our one-hour conversation was a learning experience for both of us. Tenzing, who had studied medicine in Chengdu, was thankful for the government policy on college enrollment that supports students from ethnic minority groups.

China's ethnic population reached 125 million, or nearly 9 percent of the national population, according to the 2020 census.

Every Tibetan I spoke to said life was steadily improving every day and was far better than it was for their parents and grandparents.

Take Yading, a small mountainous village of more than 30 Tibetan families, in the Ganzi Tibetan autonomous prefecture. Once isolated and inaccessible, it has now become a popular tourist resort.

The village has transformed from one of the poorest communities in the area into one of the most prosperous in the region. The road to the village, at an altitude of 4,000 meters above sea level, is arguably better than those leading to many Alpine villages that I have visited in Switzerland.

Tsering emphasized that the 56 ethnic groups in China are one family. That sense of shared identity is something Western politicians would never understand given their deep-rooted prejudice against China.

I also spent time reading all the 65 articles of the new Ethnic Unity and Progress Promotion Law. Far from being a tool of suppression, it is a law to promote ethnic harmony and prosperity, with particular emphasis on protecting and promoting the culture and tradition of all ethnic groups.

Those who question why people from ethnic minority groups in China should be required to learn Mandarin are making an absurd argument. They never ask the same question about learning English in the United States or the United Kingdom.

The Tibetans I spoke to had a pragmatic answer: learning Mandarin gives young people more employment opportunities.

I seriously doubt whether any of those Western politicians have read the Ethnic Unity and Progress Promotion Law, or even its summary. The irony is that many in the US Congress don't read the bills, even some important ones, before they vote on them.

That is not only absurd but also highly irresponsible.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

EHIZUELEN MICHAEL MITCHELL OMORUYI

True innovation dividend

'China Opportunity 2.0' ushers in a new era of cocreation and mutual progress for China-Africa cooperation and the Global South

As the global economy enters a new era of technological competition, innovation has become the defining currency of modernization. The next great development opportunity will therefore be shaped not by capital alone, but by innovation. That is why the world's economic conversation is no longer centered solely on where growth will come from — it is increasingly about who will shape the technologies, industries and partnerships that define the next phase of global development.

Against the backdrop of slowing global growth, geopolitical fragmentation and rising protectionism, the 17th Annual Meeting of the New Champions of the World Economic Forum, also known as the Summer Davos, held in Dalian, Liaoning province, from June 23 to 25, delivered a message that resonates far beyond China. Premier Li Qiang's articulation of what many observers call "China Opportunity 2.0" reflects China's transition from providing market dividends to generating innovation dividends for the world. Li argued that China's technological progress should be viewed not as a "China Shock 2.0" but as an opportunity that drives global growth through innovation, industrial upgrading and deeper international cooperation. Rather than signaling a retreat from globalization, the message reaffirmed China's commitment to high-standard opening-up, technological collaboration and mutually beneficial development. For Africa and the wider Global South, this innovation dividend could help reshape modernization over the coming decades.

China has entered a new phase of development driven by technological capability rather than low-cost manufacturing. China has evolved from being the "world's factory" to being a leader in technological innovation, green industries, digital solutions and high-quality development, investing nearly 3.93 trillion yuan ($578 billion) in research and development in 2025. High-tech manufacturing has become a major driver of industrial growth, reflecting the country's successful transition from technological innovation to large-scale industrial application.

Premier Li emphasized that these achievements rest on sustained investment in research and development, a complete industrial system, a vast domestic market and continued openness. Rather than treating technological progress as a zero-sum competition, he argued that for global development, "China Opportunity 2.0" means more accessible advanced technologies and widely shared outcomes, and that China is committed to an open approach to innovation.

Africa stands to benefit significantly from this transition. Over the past seven decades, China-Africa cooperation has focused on addressing the continent's infrastructure deficit through the building of railways, highways, ports, industrial parks, power facilities and telecommunications networks. These investments have strengthened regional connectivity and laid the foundations for structural transformation. Today, however, infrastructure is increasingly becoming the platform upon which innovation, industrial upgrading and productive transformation can be built.

The partnership is now entering a more advanced phase centered on technological upgrading, industrial innovation, green development, digital transformation and human capital development. It also reflects the broader evolution of South-South cooperation — from financing infrastructure to strengthening innovation ecosystems, knowledge sharing and institutional capacity.

The depth of this relationship is evident in the numbers. China has remained Africa's largest trading partner for 17 consecutive years, with bilateral trade reaching a record $348 billion in 2025, according to China's General Administration of Customs. The composition of trade is gradually shifting as African countries expand exports of agricultural, processed and manufactured goods. China's expanded zero-tariff treatment for products from the least-developed African countries with which it has diplomatic relations, together with the African Continental Free Trade Area, provides a stronger foundation for industrial cooperation, technology transfer and regional value-chain development.

WANG XIAOYING / CHINA DAILY

Yet the significance of "China Opportunity 2.0" extends well beyond trade. Its greatest contribution lies in accelerating capability accumulation across developing economies. China's comparative advantage increasingly resides in innovation ecosystems rather than labor costs. Cooperation in renewable energy, digital infrastructure, advanced manufacturing, artificial intelligence, vocational education, agricultural technology and scientific research offers African countries opportunities to strengthen technological capabilities, industrial competitiveness and long-term economic resilience by learning from Chinese practices and adapting relevant solutions to local contexts.

Green development illustrates this transformation. While Africa contributes only a relatively small share of global greenhouse gas emissions, it remains among the regions most vulnerable to climate change. China is the world's largest producer of solar photovoltaic panels, batteries and electric vehicles, accounting for more than 80 percent of global solar photovoltaic manufacturing capacity. Joint investment in clean energy infrastructure, local manufacturing and skills development can expand electricity access, create employment, reduce development costs and support low-carbon industrialization. The innovation dividend therefore extends beyond technology to encompass sustainable industrialization, energy security and inclusive economic transformation.

Digital transformation presents another major opportunity. Mobile finance, e-commerce, cloud computing and digital public services are becoming fundamental drivers of competitiveness. China's experience demonstrates how innovation can expand financial inclusion, improve public services and transform productivity. Similar partnerships could help African economies leapfrog traditional development constraints while supporting entrepreneurship and industrial upgrading.

According to the World Bank, Africa's digital economy exceeded $180 billion in 2025. And stronger cooperation in digital infrastructure, digital skills, cybersecurity and innovation ecosystems could become a defining pillar of Africa-China cooperation.

However, technology alone does not produce modernization. Successful development depends on institutions capable of transforming external opportunities into domestic productive capacity through investment in education, research, technical skills, industrial policy and governance. China's experience demonstrates that long-term modernization is driven by sustained policy coordination, institutional learning and continuous upgrading of productive capabilities.

This lesson is particularly relevant for the Global South. The UN Trade and Development warns that several developing economies have limited access to affordable finance and continue to face climate shocks. The next phase of China-Africa cooperation should therefore be judged not only by the infrastructure constructed but by the institutions, innovation systems, skills and productive capabilities it creates.

China's development experience is not presented as a universal blueprint. Every country has unique historical conditions and development priorities. Instead, "China Opportunity 2.0" demonstrates that modernization can follow diverse pathways while remaining open to international cooperation, technological exchange and mutual learning.

As global uncertainty reshapes development, China-Africa relations are entering a new phase. If the first phase of China-Africa cooperation was defined by infrastructure and skills development mostly, "China Opportunity 2.0" suggests that the next chapter can be written through innovation ecosystems, green transformation, digital partnerships, scientific collaboration and industrial capability building.

For Africa and the wider Global South, the next development leap will depend not only on accessing Chinese innovation but also on strengthening domestic institutions, investing in human capital and building the productive capabilities needed to transform technological opportunities into sustainable growth.

This shift has the potential to move Africa-China cooperation toward cocreation of knowledge, technology and industrial capacity. "China Opportunity 2.0" thus represents a broader vision of development in which innovation, openness and cooperation become shared global public goods — rather than exclusive national advantages — in an increasingly interconnected world. For Africa, the opportunity is not merely to participate in China's innovation journey, but to harness it in ways that accelerate its own industrial transformation, strengthen resilience and advance a distinctly African pathway to modernization.

XU GUOQING

Defining moment for multilateralism

Zero-tariff commitment to African countries replaces protectionist barriers with institutional openness, rejecting decoupling and zero-sum rivalry

The global trading system is undergoing a profound transformation. Economic growth continues to slow, geopolitical tensions persist and protectionist rhetoric increasingly shapes policy debates. According to World Trade Organization trade monitoring reports, trade-restrictive measures covered approximately $4.604 trillion in trade by value by May 2025, accounting for 19.4 percent of global imports, a year-on-year surge of 6.9 percentage points.

Against this backdrop, on May 1, China formally implemented a 100 percent zero-tariff policy for 53 African countries with which it maintains diplomatic relations, without quota restrictions or political conditions. This milestone, achieved less than 18 months after China extended full tariff elimination to the 33 least-developed African nations with which it has diplomatic relations in December 2024, makes China the first major economy to unilaterally grant comprehensive zero-tariff treatment to all African diplomatic partners. It represents not merely a landmark in China-Africa relations, but also a substantive commitment to multilateralism, mutual benefit and shared development at a time when the forces of deglobalization are gaining ground.

Too often, multilateralism is invoked as a diplomatic slogan, but China's comprehensive zero-tariff initiative for 53 African diplomatic partners gives the concept substantive meaning: true multilateralism is not selective bargaining, but predictable, rules-based openness extended indiscriminately and without political conditions.

This institutional character is reflected in three qualities — universality, transparency and durability.

By unilaterally granting duty-free access across all tariff lines to every African partner, China avoids the selectivity and uncertainty of piecemeal negotiations. Products ranging from Ethiopian coffee, Kenyan avocados and Ghanaian cocoa to South African citrus fruits and wine — previously subject to duties of 8 to 30 percent — now enter one of the world's largest consumer markets unimpeded. Such across-the-board market access is not mere trade preference; it is an institutional affirmation of fair-trade principles in practice.

More significantly, the policy marks China's strategic shift from ad hoc trade concessions toward institutional openness. Zero tariffs function not only as cost relief but also as a catalyst for deeper value-chain cooperation — complemented by customs facilitation, standards alignment and digital connectivity. By institutionalizing market dividends and sharing them with partners, China is putting genuine multilateralism into action: transcending narrow self-interest to help build a more equitable and inclusive international economic order.

For years, the rhetoric of decoupling has threatened global supply chain stability. Some powers pursue exclusion through trade barriers and industrial reshoring, eroding efficiency and mutual trust. Against this trend, China's zero-tariff policy offers a structural rebuttal: where some erect walls, China builds bridges.

China-Africa trade hit a record $348 billion in 2025, up 17.7 percent year-on-year, with Chinese imports from Africa exceeding $123 billion. In the first quarter of 2026, bilateral trade surged 23.7 percent, and Chinese imports rose 14.6 percent. By lowering entry costs for African goods while improving exporter margins and competitiveness, the zero-tariff policy delivers tangible economic relief for African nations facing debt pressures and external shocks — strengthening trade resilience and stabilizing economic fundamentals.

More importantly, the policy is forging deeper industrial interdependence. The certainty created by tariff elimination is drawing Chinese and international investment into African processing and manufacturing, driving supply chain integration. As Ricky Mukonza, an associate professor at South Africa's Tshwane University of Technology, observed, by offering full market access without demanding reciprocal concessions, China is setting a new benchmark for supporting Global South industrialization. Such symbiotic industrial ties represent the strongest structural defense against the logic of decoupling.

For too long, developing countries have been rule-takers rather than rule-makers in global economic governance. Trade frameworks shaped by developed economies often embed terms that serve their own interests, narrowing the policy space for emerging nations. China's zero-tariff policy goes beyond bilateral benefits, offering a compelling model for collective self-empowerment among Global South countries seeking a stronger voice in shaping international rules.

The contrast with other preferential schemes is telling. The European Union's Everything But Arms initiative grants duty-free, quota-free access only to least-developed countries, while other African nations must navigate reciprocal Economic Partnership Agreements, which involve complex negotiations and binding commitments. The United States' African Growth and Opportunity Act expired in September 2025 and received only a short-term renewal through 2026, amid pressure for reciprocal tariff concessions and persistent uncertainty over eligibility tied to governance and human rights criteria.

By contrast, China's zero-tariff arrangement carries no political strings attached — no governance benchmarks and no domestic regulatory demands. It embodies sovereign equality and non-interference, demonstrating that economic partnership can be built on mutual respect alone. For the Global South countries, this represents an important confidence-building step in resisting unilateralism and coercive diplomacy.

Yet structural gaps between policy ambition and on-the-ground reality cannot be ignored. Supply-side constraints remain the foremost challenge: Many African countries suffer weak industrial bases, smallholder-dominated agriculture and underdeveloped cold-chain logistics infrastructure. Post-harvest losses for African agricultural products reach roughly 40 percent, with cold-chain deficiencies especially acute outside southern Africa. Even with zero tariffs, low product standardization limits the potential for scaled exports. Non-tariff barriers add a second layer of difficulty: stringent sanitary requirements and complex rules of origin impose heavy certification burdens on small and medium-sized enterprises. Logistics costs may also eat into tariff savings, while policy benefits risk being captured by intermediaries rather than reaching producers at the source.

WANG XIAOYING / CHINA DAILY

China's response has been systematic and extends well beyond tariff elimination. Through the Belt and Road Initiative, investments in ports, railways and power infrastructure continue to remove logistical bottlenecks, while Chinese enterprises' participation in African processing and manufacturing is building local value-added capacity. In January and February, China's new direct investment in Africa surged 44 percent year-on-year. On non-tariff barriers, China is actively promoting technical standards alignment and certification cooperation, establishing green-lane facilitation for African exports and providing training on inspection procedures and rules of origin. These measures aim to ensure that African partners not only see the opportunities created by zero tariffs, but can actually seize and benefit from them.

From granting zero-tariff treatment to select African products in 2005 to today's comprehensive tariff elimination covering all 53 diplomatic partners, China's commitment to open markets in Africa has deepened steadily over two decades. This sustained record of delivery is the strongest testament to Chinese policy credibility. In turbulent times, consistency itself becomes a strategic asset. The policy sends an unmistakable signal: no matter how volatile the external environment, China's resolve to expand openness, uphold multilateral trade and advance the building of a community with a shared future for humanity remains unwavering.

United Nations Secretary-General Antonio Guterres welcomed the initiative during the 39th African Union Summit, urging all developed countries and major economies to follow suit. African Union Commission Chairperson Mahmoud Ali Youssouf called China's proactive openness "particularly crucial" for a continent bearing the brunt of global uncertainty.

The historical significance of this policy lies not only in the momentum it injects into China-Africa relations, but also in the alternative it presents to a world economy that is at a crossroads: replacing protectionist walls with institutional openness, resisting forced decoupling through industrial interdependence and moving beyond zero-sum competition through genuine multilateralism. In an era of profound transformation, the steadfastness of openness remains China's greatest source of confidence — and its most enduring contribution to the world.

Retail moves seen boosting economy

Sector in critical transformation stage, facing challenges of inefficient layout

By **ZHONG NAN** and **ZHANG CHENXU**

China's moves to accelerate innovation in the retail sector are expected to create new sources of consumer demand, inject fresh momentum into the industry and strengthen consumption-driven growth, government officials said on Thursday.

The country issued a guideline setting the goal of establishing a modern retail system and fostering a number of globally competitive retailers by 2030.

Jointly released by the Ministry of Commerce, the National Development and Reform Commission and other government departments, the document outlines measures to improve retail planning, encourage new retail offerings, foster new consumer demand, and accelerate the sector's innovative and high-quality development.

Speaking at a news conference in Beijing, Li Jialu, director-general of the department of circulation industry development at the Ministry of Commerce, said China's retail sector has entered a critical stage of transformation, facing challenges including an inefficient retail layout, supply-demand mismatches, rising operating costs and imbalances between online and offline retailing.

Li said the new guideline is intended to help retailers adapt to changing consumer demand through better supply-chain management, digital transformation and new business models, while supporting the sector's long-term, sustainable growth.

Zuo Xiaobo, deputy director-general of the department of trade in services and commercial services at the Ministry of Commerce, said the government will accelerate the rollout of retail innovation projects in 50 pilot cities, supported by an initial 8.6 billion yuan ($1.27 billion) in funding, to boost consumption.

Priority will be given to first-store launches and new consumption scenarios integrating retail, tourism, culture and entertainment to stimulate spending, Zuo said.

Zhou Mi, a researcher at the Chinese Academy of International Trade and Economic Cooperation in Beijing, said the rapid emergence of new retail formats reflects the interplay between shifting consumer demand and technological advances.

"As consumption scenarios become increasingly diverse, consumer demand is moving away from standardized, mass-market products toward more segmented and differentiated preferences," said Zhou, adding that retailers therefore need more targeted strategies to reach consumers and tailor their offerings to different usage scenarios.

Shoppers interact with a robot at an unmanned retail store in Shenyang, Liaoning province. ZHAO JINGDONG / FOR CHINA DAILY

>
> **Zhou Mi,** researcher at the Chinese Academy of International Trade and Economic Cooperation

The policy also comes as China's consumer market shows signs of improvement. Data from the National Bureau of Statistics on Thursday showed that China's consumer inflation remained mild in June, pointing to continued resilience in the consumer market.

The country's consumer price index — a main barometer of inflation — rose 1.0 percent year-on-year in June, while the core CPI, which excludes food and energy prices and is deemed a better gauge of supply-demand conditions, also increased 1.0 percent.

Lynn Song, chief economist for China at Dutch bank ING, said that although global energy price fluctuations could affect the pace of reflation, "a backdrop of modest positive inflation is likely to remain the dominant theme".

Meanwhile, in the first half, the CPI rose 1.0 percent from a year earlier, while core inflation increased 1.2 percent, the NBS said.

Wen Bin, chief economist at China Minsheng Bank, said the country's price environment has moved out of its previous trough and entered a phase of moderate inflation this year.

"Headline inflation remains relatively low, but core inflation has hovered around or above 1 percent, while services prices have maintained steady growth," Wen said, adding that the trend points to a healthier price structure.

He expects the GDP deflator to rebound to around 2 percent in the second quarter, which would end a 12-quarter run in negative territory.

Sherwin-Williams eyes continued growth in evolving Chinese market

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

The Sherwin-Williams Company, a US-based global player in the paint and coating industry, remains firmly committed to the Chinese market after a near century-long presence in the nation, driven mainly by sustainability, advanced manufacturing and industry expansion, said a senior executive.

Heidi Petz, chair, president and chief executive officer of Sherwin-Williams, made the remarks during a recent interview with China Daily, as the company celebrated its 160th anniversary in Shanghai.

Entering China in 1930, Sherwin-Williams has continuously expanded investment in local capabilities to build a strong foundation, growing together with its partners and customers to help them become more productive and profitable.

Petz highlighted that China is a very important market for the company and plays a meaningful role in its global growth strategy. As its Asian regional headquarters, China serves as a strong center for innovation, integration and collaboration across markets, supporting both local and multinational customers.

The company's solutions, especially its performance coatings, serve a broad range of industries including heavy equipment, transportation, energy, infrastructure, furniture and packaging. Actively engaged in the nation's rapid development, Sherwin-Williams' coatings have been used on a number of major landmark projects such as the Shanghai Tower and Beijing Daxing International Airport.

"What has impressed us most in China is really the market scale, the pace of development, the long-term growth potential, as well as the focus on innovation, technology, leadership and talent. There are so many opportunities here," said Petz.

The company sees an increasingly attractive business environment in China, which Petz described as "stable, transparent and predictable" helping it to expand its footprint and overall investment in the nation.

"We believe that there is growth for many years and decades to come, which is why we are making these investments. We are well positioned to support not only local customers, but also multinational customers operating here," she said.

For over nine decades, Sherwin-Williams has seen its role in China as being much more than a coatings supplier. Focusing on innovation and sustainability, it aims to be a long-term partner that helps customers respond to changing environmental standards, evolving global requirements, emerging needs and next-generation solutions.

As China continues to focus on higher-quality growth, the company is seeing increasing demand for high-performance coatings with sustainable attributes, especially in sectors such as energy efficiency, high-end manufacturing, green construction, sustainable construction and transportation, according to the company.

"China has a very competitive environment and significant opportunities. The competition helps us raise standards and continues to drive our innovation, and we see the biggest opportunities in sustainable solutions, advanced manufacturing and high-performance value-added products," said Petz.

View of the booth of Sherwin-Williams during an expo in Shanghai. PROVIDED TO CHINA DAILY

Notably, the company particularly highlighted that coating batteries on new energy vehicles and artificial intelligence data centers — including transformers, cooling towers and other components — stand among its key priorities for growth in China.

Labeling the Chinese market as "expansive and advanced", Petz reaffirmed the 160-year-old company's commitment to the market and dedication to helping add value to local partners.

"We work closely with customers to understand their needs and then help develop tailored solutions. We will stay focused on building resilient partnerships with customers, industry stakeholders and local communities. That's why we exist and it's exciting," she said.

Unmanned emergency solutions save lives

By **CHENG YU**
chengyu@chinadaily.com.cn

Unmanned technologies have emerged as frontline emergency response solutions in flood rescue operations after a typhoon battered the Guangxi Zhuang autonomous region, with drones restoring mobile networks, robotic boats replacing rescuers in dangerous waters and satellite communications reconnecting isolated communities cut off from the outside world.

The operation reflects how China is increasingly deploying technologies once associated with military or industrial applications for humanitarian disaster response, turning unmanned systems into what industry experts describe as "airborne lifelines".

After heavy rainfall triggered reservoir overflows and widespread flooding across the region, the Ministry of Emergency Management dispatched two Wing Loong emergency drones at the request of local authorities to restore communications in some of the worst-hit areas.

Flying above flooded villages in Hengzhou, where residents had been left without mobile services after the communications infrastructure was damaged, the drones temporarily rebuilt public mobile coverage enabling more than 180 users to access the network.

The emergency version of the Wing Loong drone was specifically designed for so-called "three disruptions" scenarios, where road, electricity and communication networks all fail simultaneously.

The long-endurance aircraft can temporarily restore mobile network coverage across roughly 50 square kilometers, while establishing an emergency voice and video communications network covering up to 15,000 square kilometers.

Elsewhere, drones were also used to evacuate residents and deliver emergency supplies. Alongside government rescue efforts, volunteers spontaneously mobilized dozens of DJI drones to transport food, medicine and other essential supplies to communities cut off by floodwaters.

In Qinzhou, where fast-moving currents and floating debris made manual surveys too dangerous, unmanned survey boats navigated swollen rivers carrying acoustic Doppler current profilers to measure water velocity and discharge.

The robotic vessels collected data that normally would have required engineers to enter hazardous floodwaters, providing emergency response managers with real-time information to guide reservoir operations and flood-control decisions while reducing potential risks to rescue personnel.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said: "They vividly demonstrate that the ultimate purpose of technology is to serve people. Drone companies and official rescue teams worked together to build efficient 'airborne lifelines'."

Wang also suggested China consider introducing more flexible regulatory arrangements for humanitarian rescue missions involving lifesaving operations and emergency supply deliveries.

Briefly

Yuan strengthens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, strengthened 41 pips to 6.8036 against the US dollar on Thursday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day. The central parity rate of the yuan against the US dollar is based on a weighted average of prices offered by market makers before the opening of the interbank market each business day.

NEV sector sees continued growth

China's new energy vehicle sector reported continued growth in the first half of 2026, with output and sales both exceeding 7 million units during the period, the latest industry data showed on Thursday. NEV output from January to June reached 7.438 million units, while sales stood at 7.446 million units, according to data released by the China Association of Automobile Manufacturers. Pure electric vehicles accounted for 67 percent of total NEV sales during the period, the data showed.

XINHUA - CHINA DAILY

Appropriately accommodative monetary policy stressed

The People's Bank of China said on Wednesday that it will continue to apply an appropriately accommodative monetary policy, following the latest quarterly meeting of its monetary policy committee, where the committee deliberated on the policy direction for the coming months.

The country's central bank will strengthen counter and cross-cyclical adjustments, better leverage the dual functions of monetary policy tools in both aggregate and structural terms, and enhance coordination between monetary and fiscal policies to promote steady economic growth and a reasonable rebound in prices, it said.

The meeting also called for strengthening the guiding role of the central bank's policy interest rates and improving the market-based interest rate formation and transmission mechanism.

It urged efforts to regulate business activities in the credit market, lower intermediary financing charges, and keep overall social financing costs at a low level.

The meeting stressed the need to observe and assess the operation of the bond market from a macro-prudential perspective and pay close attention to changes in long-term bond yields.

It also emphasized improving the monetary policy transmission mechanism and enhancing the efficiency of fund utilization.

Efforts should be made to increase the resilience of the foreign exchange market, stabilize market expectations, and keep the RMB exchange rate generally stable at an adaptive, balanced level.

It also vowed financial support for key areas such as expanding domestic demand, scientific and technological innovation, and micro, small and medium-sized enterprises.

Efforts should continue to improve financial services supporting the development of the private economy, it said.

The central bank injected a net 10 billion yuan ($1.47 billion) of liquidity through open-market government bond purchases and sales in June. According to the central bank's data, cumulative net injections via this channel during the first half of 2026 amounted to 300 billion yuan.

In its first-quarter monetary policy implementation report, the PBOC said it has been conducting government bond operations on a routine basis since the start of the year, flexibly adjusting the size of operations in response to base-money supply needs and bond-market conditions.

Computing power boosts manufacturing

Transformation taking place across nation, utilizing data, AI to build smarter, more flexible factories

Above: An industrial robot operates in a digital workshop at Dongguan Moldbao Smart Technology Co in Dongguan, South China's Guangdong province, on July 2. LIANG XU / XINHUA

Left: Technicians work on product design at Dongguan Moldbao Smart Technology Co on July 2. LIANG XU / XINHUA

GUANGZHOU — In a production hall in Huizhou, Guangdong province, rows of television sets move along an automated assembly line. At one workstation, a robotic system connects signal and interface ports on each unit, a task that was once a manual operation.

Powered by 3D vision and artificial intelligence, the system has helped TCL — one of China's leading consumer electronics makers — achieve a product pass rate of 99.8 percent since it was introduced last year, said Lei Dengsi, a senior engineer with TCL Industry.

The scene reflects a broader transformation taking place across China's manufacturing sector, which is moving beyond traditional advantages of scale and labor, and using computing power, data and artificial intelligence to build smarter and more flexible factories.

At TCL, this shift has progressed from automation to digitalization and now to intelligent manufacturing.

"In the past, production management relied heavily on workers' experience and fragmented systems, which made it difficult to respond quickly to problems," said Chen Zhanyuan, deputy general manager of TCL Industry's smart display business unit.

With intelligent manufacturing systems, factories are becoming more connected, data-driven and flexible, Chen said.

China has been the world's largest manufacturing country for 16 consecutive years. With traditional manufacturing still making up much of its industrial base, the transition toward smart manufacturing has become a key step in the country's industrial upgrading.

China's 15th Five-Year Plan (2026-30), the nation's core blueprint for economic and social development, places intelligent transformation, digitalization and network connectivity among the key priorities for manufacturing, encouraging wider adoption of smart manufacturing and industrial internet technologies.

Across Guangdong, a premier manufacturing hub, companies are already putting these technologies to use.

At Dongguan Moldbao Smart Technology Co, robots move through a digital workshop where electrodes of different shapes and sizes are stored in automated racks and delivered with precision for molding.

"Molds are the foundation of industry," said Wang Sheng, the company's vice-president. "As consumer products become more diverse and are updated faster, manufacturers need higher precision, stability and flexibility."

> As consumer products become more diverse and are updated faster, manufacturers need higher precision, stability and flexibility."
>
> **Wang Sheng,** Dongguan Moldbao Smart Technology Co's vice-president

Smart factories, he said, allow manufacturers to respond to these challenges by using data and AI to improve production.

Behind these factories is a growing foundation of computing power. Industrial internet systems collect massive amounts of real-time data, while computing resources turn that information into decisions, from optimizing production processes to improving AI-based quality inspections.

China's computing power has grown to rank among the world's largest, with AI computing becoming an increasingly important force behind this growth. Advances in computing power have reduced costs and made it easier for factories to deploy AI algorithms.

"As algorithms become more closely integrated with real industrial processes, and as automation expands across production lines, they can continue to improve by learning from vast amounts of real-world production data," Wang said. "This will enhance their accuracy, stability and ability to adapt to different industrial scenarios."

The rise of intelligent manufacturing is also creating new opportunities for companies that produce the technologies behind computing.

Guangzhou-based CanSemi Technology, a manufacturer of advanced chips, sees industrial intelligence as a growing market opportunity. At the same time, the company's own production processes generate large amounts of data that can be used to further improve factory intelligence.

Guangdong Fenghua Advanced Technology Holding — which produces electronic components including high-end multilayer ceramic capacitors used in computing servers — has introduced AI-assisted research systems and high-throughput laboratories to accelerate innovation.

"The next step is to connect data across the entire value chain, from demand and research to production and delivery," said Cao Xiuhua, the company's vice-president.

AI is also modernizing traditional crafts.

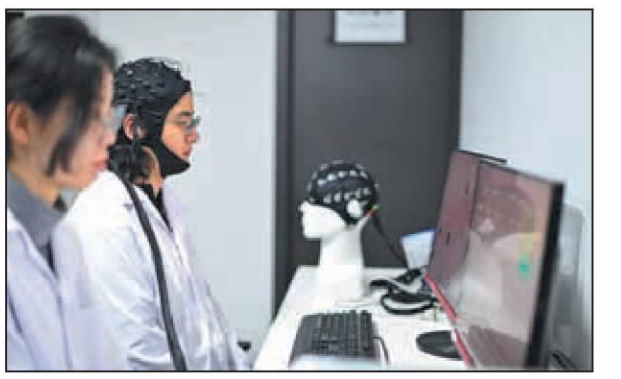
At Haday's soy sauce factory in Foshan, Guangdong, an ancient Chinese soy sauce-making tradition has been given a digital upgrade. An AI vision system can identify more than 13,000 soybeans per second, while an intelligent filling system ensures highly precise packaging. Another AI-based technology can distinguish more than 170 aroma profiles.

International financial technical analyst Daryl Guppy said that the changing nature of work is beginning with "a quiet revolution on the factory floor", as Chinese factories upgrade at remarkable speed. He described China as becoming the "smart factory of the future" amid a broad industrial transformation.

The Guangdong-Hong Kong-Macao Greater Bay Area, one of China's major computing hubs, is becoming a testing ground for integrating computing resources with manufacturing.

In Jiangmen, Guangdong, a local industrial technology institute and Sun Yat-sen University have partnered to establish a branch of the National Supercomputer Center, bringing supercomputing resources directly to manufacturers. The platform provides computing power to help local industries advance engineering innovation, develop new products and digitally upgrade production lines.

"We encourage and support the expansion of computing resources to small and medium-sized manufacturers," said Dong Yinghu, deputy director of Jiangmen's science and technology bureau. Public cloud and intelligent computing platforms can help reduce adoption costs, Dong said.



Foshan-based Yizumi, a maker of advanced molding equipment, began its digital transformation in 2018. Its intelligent injection molding machines and large-scale die-casting machines are used by electric vehicle manufacturers to produce components such as motors, batteries and dashboards.

Last year, the company introduced its first AI-enabled die-casting machine, which can automatically adjust process parameters based on detected defects.

"When we began building smart factories, we did not anticipate that computing power would advance so rapidly," said Zhou Jun, the company's chief technology officer. "We will now adjust our technology roadmap to make better use of the opportunities created by computing power."

BCI leap revamping China's healthcare system

Technicians run tests on cutting-edge brain-computer interface technologies at an intelligent computing firm in Tianjin on Feb 27. ZHAO ZISHUO / XINHUA

TIANJIN — With electrodes taped to her forearm and a sensor-studded cap on her head, a stroke patient watched a screen where a virtual hand slowly closed. She fixed her gaze on the image, let her attention narrow, and held one thought: make a fist.

The electrodes fired, and her fingers curled inward. She looked at her hand and smiled, then lifted her head, waiting for the next signal.

The patient was receiving innovative therapy at a hospital in Tianjin, supported by brain-computer interface technology. The therapy draws on "motor imagery", in which the brain continues to produce movement-related signals even after the body has lost the ability to respond.

Using non-invasive electroencephalogram sensors that capture neural signals from the scalp, the system decodes such signals through algorithms and converts them into commands that activate external stimulators. This creates a feedback loop that gradually rebuilds the brain-body connection.

"Compared with traditional passive training that relies on therapists to physically move patients' limbs, BCI-based therapy delivers greater intensity and efficiency," said Gu Bin, general manager of the company that developed the device, adding that when patients are engaged in active imagination, their confidence and sense of control over movements can be strengthened.

Gu's company is one of several startups incubated by the Haihe Laboratory of Brain-Computer Interaction and Human-Machine Integration at Tianjin University. The laboratory and its spin-off companies are now pushing BCI applications beyond restoring lost functions into areas that improve overall well-being for a broader range of people.

"Should auld acquaintance be forgot, and never brought to mind?" The curtain rose, and voices from a children's choir, aged six to twelve, rang out clear and bright. They stood like any school choir — focused, confident and a few fidgeting with nervous energy — except that every child on stage wore a cochlear implant.

The choir, named Little Dolphins, brings together hearing-impaired children from schools across Tianjin. In recent months, alongside their rehearsals, performances and competitions, the children have taken on a different task, namely taking part in an auditory assessment powered by BCI technology.

"In traditional practice, doctors can only tell whether a cochlear implant recipient hears a sound, but not whether they hear clearly or understand it, especially in the case of young children who cannot express what they perceive. BCI can now explore this gray area by extracting and decoding brainwave patterns," said Ni Guangjian, executive deputy director of the laboratory.

Ni revealed that Little Dolphins has been around for over a decade, and parents and teachers have long noticed improvements in the children's emotional well-being and comprehension after choir training. "But the training has relied on experience, and we hope the data from this BCI assessment could help turn that experience into a replicable model for more children," he said.

Beyond clinical applications, BCI technology is also extending its reach into everyday life, helping people better understand and manage their own physical and mental states.

China Electronics Cloud Brain (Tianjin) Technology has developed a brain-computer headband aimed at helping people with sleep difficulties. The device tracks long-term sleep trends and supports sleep improvement through calming music and cranial electrotherapy stimulation.

Across the country, policymakers are also stepping up support for the BCI sector, with growing recognition of its potential to reshape healthcare and beyond.

The BCI sector was designated a future industry in this year's Government Work Report. It was also included in the outline of the 15th Five-Year Plan (2026-30) as the country aims to cultivate it into a new engine of growth.

More specifically, a guideline issued by seven authorities last August laid out short-term targets for the innovative development of this sector, including achieving key breakthroughs in BCI technologies with an advanced technology system, industrial system and standards system by 2027, and significantly enhancing the innovation capacity of the industry with its overall strength ranking among the world's leaders by 2030.

Investors' interest in the BCI sector has been growing alongside policy support. According to an April think tank report on the BCI sector, total funding raised by Chinese BCI companies in the first quarter had already surpassed the amount raised in all of 2025. It predicts that China's BCI market could exceed 5 billion yuan ($735.35 million) in 2026, and surpass 15 billion yuan by 2030.

This growing policy and investment momentum is now attracting a wave of companies eager to seize opportunities in the BCI sector.

"While we are confident about the future of BCI, we need to keep our expectations grounded. This technology should not be treated as science fiction or a gimmick, but as a tool to solve real-world problems in specific areas. Only by doing so can the industry achieve healthy and sustainable growth," Ni said.

Group of artists finds inspiration in Shanxi

Hungarian nationals tour North China province to explore ancient culture and create diverse works

Clockwise from above: A painting of the Hall of Sacred Mother in Jinci Temple created by Hungarian artist Abel Szabo. Hungarian artists pose for a group photo at Yungang Grottoes, Datong. YAN CHANGJIANG / FOR CHINA DAILY

By YUAN SHENGGAO

Twenty-three Hungarian artists wrapped up a 13-day trip to sketch ancient buildings in Shanxi on June 28, taking home many of their works.

Organized by the Shanxi Provincial People's Association for Friendship with Foreign Countries and the Shanxi International Communication Center, the event covered seven Shanxi cities: Taiyuan, Xinzhou, Shuozhou, Datong, Jinzhong, Linfen and Lyuliang. The tour members visited a dozen ancient architectural and heritage sites in these cities.

Hungarian artists are led by a guide at Huayan Temple in Datong. YAN CHANGJIANG / FOR CHINA DAILY

The group of artists arrived in Taiyuan, the capital city of Shanxi province, on June 16. Their journey started the next day at Shanxi Museum, aiming to get a glimpse of Shanxi's culture and history.

At the museum, Abel Szabo, a painter and winner of the Mihaly Munkacsy Award, a prestigious Hungarian fine arts award, showed interest in the glazed pottery artifacts on display.

"Most of the pottery items are color-glazed," he said. "This is something unique to the ancient Chinese pottery industry."

Asztalos Zoe, a designer, paid special attention to the patterns of pottery items and construction components. "I think these patterns can provide new inspiration for design," she said.

In Taiyuan's Jinci Temple, Abel was amazed with the Hall of Sacred Mother and decided to use it as the object of his painting. The hall is a wooden structure built during the Song Dynasty (960-1279), one of the earliest buildings in the temple.

Abel is an enthusiast of Chinese culture; he visited China eight years ago to learn Chinese calligraphy and painting, aiming to incorporate Chinese painting skills and aesthetics into his own.

Examining the hall for several minutes, the artist told his companions that the painting should not only focus on the building. "The trees, the mountains and the sky should be integral parts of the painting," he said.

After spending several moments in silent observation, he began to draw, completing a painting that combined realism with Chinese aesthetics by the end of the day.

A visit to the Sakyamuni Pagoda at Fogong Temple in Shuozhou's Yingxian county was a profound experience for the artists. This 67-meter-tall pagoda, built in 1056, is the tallest all-wooden pagoda tower in the world.

While astonished by its size, the Hungarian artists also admired the rich details of the pagoda.

Painter Varosi Gabriella noticed the exquisite use of *dougong* brackets. She was told by a tour guide that the bulk of the tower is supported by the brackets and the dovetailing technique acts as a shock absorber, helping it survive several major earthquakes throughout history.

Watercolor painter Szabo Klara Petra was attracted by the swallows who built their nests in the gaps among the *dougong* brackets.

She was told that the pagoda and the swallows form an ecosystem of coexistence: the pagoda provides a habitat for the birds while the swallows protect the pagoda by eating the insects that threaten the wooden structure.

"This is also something inspirational," Szabo said. "When you draw static things, an addition of living things, like birds and animals, can breathe life into your work."

The tour explored not only ancient architecture but also everyday life and nature. On June 26, members arrived at the ancient town of Qikou in Linxian county, near the Yellow River gorge. The town boasts a large number of old residences built in the Ming (1368-1644) and Qing (1644-1911) dynasties.

It was a quiet place as it was the off-season for tourism. The artists had the chance to visit local families, drawing portraits of the local people — seniors resting at their doorstep, vendors on the streets and boatmen by the Yellow River.

At the end of the tour, the artists left some of their works in Shanxi for exhibition, especially at the China (Shanxi)-Hungary Exchange Center for Arts. The center, located at the Taiyuan-based Shanxi University School of Fine Arts, was opened during the trip.

The artists' trip went viral on several short video platforms in partnership with the Shanxi International Communication Center, garnering interest in both China and Hungary.

Feng Siquan contributed to this story.

Volunteers travel to Pingyao for relic restoration

By YUAN SHENGGAO

In mid-June, Xifang Temple — a Qing Dynasty (1644-1911) building complex in Xiqiang village of Pingyao, Shanxi province — hosted a team of cultural heritage protection volunteers who came to restore historical structures.

The group of 20-plus members was there to take part in a Gen Z construction workshop for architectural heritage protection. Gen Z refers to people born between the mid-1990s and the mid-2010s. The volunteers were from China, France and Spain.

The event was organized by the Shanxi International Communication Center, Shanghai Ruan Yisan Heritage Foundation, the French voluntary organization REMPART and the government of Pingyao.

The 10-day workshop began on June 14 with a tea-offering ceremony honoring local master craftsmen. For the team members, many of whom hold higher education degrees, the workshop was a valuable experience to learn practical skills for heritage protection.

Chinese volunteer Wu Yue, for instance, is one of the three members holding PhD degrees. He admitted he had a frustrating start.

"I have observed the operations of the masters carefully and practiced again and again but failed to build a wall on the first day," Wu said. "This is my second time attending the workshop but there are still so many things I need to learn."

Li Pengfei, the Chinese team leader, talked with local craftsmen, suggesting members start with easier jobs. The members began to rebuild their confidence under the instruction of the masters.

The repair of heritage sites is a process of constant learning, even for experienced craftsmen, said Nicolas Delanghe, the French team leader.

Delanghe said he had experience in stone masonry after years of repairing ancient structures in Europe. "But this time I've learned a lot in dealing with wood-and-brick structures."

Guo Boya is a teacher in urban-rural planning and heritage protection at Shanghai's Tongji University. She said this was her first time taking part in on-site restoration work. "This is a valuable experience for my teaching career," she said. "I'd like to share what I have learned here with my students at the university."

The Gen Z workshop is a long-term cultural exchange program between Pingyao and the rest of the world.

In 2011, Shanghai Ruan Yisan Heritage Foundation began to cooperate with REMPART, introducing the international workshop for heritage protection to the Shanxi county of Pingyao.

Over the past 15 years, more than 200 overseas volunteers have participated in this program. They took part in some major heritage protection projects, including the renovation of the ancient city walls of Pingyao and a number of ancient building repair projects in the county's rural areas.

"The abundant cultural resources make Pingyao an ideal location for international cooperation in heritage protection," said Ding Feng, secretary-general of Shanghai Ruan Yisan Heritage Foundation.

With a history of more than 2,800 years, the Pingyao Ancient City was inscribed on the UNESCO World Heritage List in 1997. Within an area of 2.25 square kilometers enclosed by 6.2 km of city walls, there are nearly 4,000 ancient residences and business premises, making it one of the four best-preserved ancient cities in China. Outside the city, there are also a great number of ancient buildings scattered across the countryside.

According to Ding, the emotional connection between Ruan Yisan, the founder of the foundation, and Pingyao goes back much earlier than the workshop's commencement.

Back in the 1980s, Ruan from Shanghai's Tongji University was among the advocates for the protection of the ancient city, saving it from the large-scale demolition of ancient residences amid rapid economic development.

To pay tribute to Ruan's efforts, a road surrounding the ancient city was named Ruan Yisan Street in 2017.

On June 21, Marie-Georges Pagel-Brousse, president of REMPART, visited the workshop in Pingyao. She praised the initiative as an example for Sino-French cultural cooperation.

She said the launch of the workshop was meant to bring French practices to China and the past 15 years have proved that the Pingyao experience is inspirational for heritage protection in France.

"Pingyao is an ancient city kept alive as residents live in the traditional residences," she said, adding that protecting the integrity and residential function of heritage sites is something that REMPART seeks to promote in France.

The Shanxi International Communication Center took part in the Gen Z workshop in 2025. The program was included in the UNESCO World Heritage Volunteers Initiative in that same year.

Hao Hong and Zhang Chenwei contributed to this story.

Super Typhoon Bavi poised to unleash severe rainfall and disruptions

By LI HONGYANG
lihongyang@chinadaily.com.cn

Forecasters have warned that Super Typhoon Bavi could unleash widespread severe rainfall and secondary disasters after making landfall, with its remnants expected to combine with other weather systems and disrupt transport.

At 8 pm on Thursday, the typhoon's center was about 1,010 kilometers southeast of Keelong, Taiwan, packing maximum sustained winds of up to 173 km per hour, the National Meteorological Center said.

Bavi is forecast to make landfall on Saturday evening between Fuqing in Fujian province and Wenling in Zhejiang province, with winds of 137 to 162 km/h. It is then expected to move northwest while gradually weakening.

The center issued an orange typhoon alert, the second-highest level in China's four-tier weather warning system, for Bavi on Thursday.

Speaking at a media briefing on Thursday, Xiang Chunyi, chief forecaster at the center, outlined two possible tracks for the storm once it moves ashore.

"Current projections show Bavi could move west toward the border area of Hubei, Anhui and Henan provinces and gradually weaken and dissipate. Alternatively, it may turn northeast and transition into an extratropical cyclone," she said.

"Whichever path it takes, we need to be especially vigilant against the secondary disasters triggered after landfall," she added.

The center warned of heavy to torrential rainfall from Thursday to Friday across a broad swath of the country. In central and southern Hebei province and northern Shandong province, thunderstorm winds could exceed 117 km/h, and tornadoes could not be ruled out, the center said.

On Saturday, Zhejiang and Fujian are expected to experience the storm's strongest winds and heaviest rainfall, with parts of southern Zhejiang and northeastern Fujian forecast to receive between 250 and 400 millimeters of rain, said Weather China, a website affiliated with the China Meteorological Administration.

Explaining why typhoons tracking northward are often more dangerous, Xiang said the risks go well beyond the storm's own intensity.

A key factor is the continuous supply of moisture after landfall, often fueled by southeasterly or southwesterly flows on the southern flank of the subtropical high, creating a persistent channel of water vapor into the storm.

"If the typhoon collides with cold air as it pushes north, atmospheric instability increases dramatically, releasing a tremendous amount of energy and causing rainfall intensity to surge," Xiang said.

On Thursday afternoon, the Ministry of Natural Resources and the China Meteorological Administration jointly issued a yellow alert for geological hazards, the second-lowest level of the four-tier warning system.

The warning covers parts of northern Beijing, western Hebei, northeastern Shanxi province, southwestern Guangdong province, southern Guangxi Zhuang autonomous region, southeastern and western Yunnan province, central Gansu province, and eastern Qinghai province.

The State Flood Control and Drought Relief Headquarters raised its emergency response for flood and typhoon prevention from Level IV, the lowest of the four-tier system, to Level III at 5 pm on Thursday, citing the typhoon's high intensity, wide reach, and strong potential for damage. Further adjustments will be made as the situation develops.

Feng Lei, a senior engineer at the CMA's public meteorological service center, told the briefing that Bavi would bring widespread heavy rain and strong winds to eastern China, disrupting road, rail and coastal shipping transport.

She warned that the risk of weather-related traffic hazards on highways was high.

"Torrential rain will make roads slippery and waterlogged, reduce visibility along routes such as the Beijing-Harbin and Beijing-Shanghai expressways and could trigger slope failures and landslides," Feng said.

With the storm striking during a peak travel period, she urged scenic spots to suspend cable cars, water-based activities and halt outdoor tours.

Workers reinforce steel supports for a plane tree at the West Lake scenic area in Hangzhou, Zhejiang province, on Wednesday. The scenic area management is implementing windproof measures to counter the upcoming Super Typhoon Bavi's impact, ensuring safety by stabilizing ancient trees and roadside greenery.
LIN YUNLONG / FOR CHINA DAILY

Healthcare on wheels

A medical worker from Beijing offers free consultation and treatment to a patient on a train along the Qinghai-Xizang Railway in the Xizang autonomous region on Wednesday. The public welfare campaign, launched on Tuesday, has sent 36 medical experts from 13 top hospitals in Beijing to provide free healthcare services, including consultations and medicine distribution, for railway workers and local residents at key railway stops. State Council unveils carbon peak pathway

Plan also seeks to reconcile growth of digital economy with climate goals

By HOU LIQIANG
houliqiang@chinadaily.com.cn

The State Council, China's Cabinet, has issued an action plan for peaking the country's carbon emissions during the 15th Five-Year Plan (2026-30), setting 2030 targets that include cutting carbon dioxide emissions per unit of GDP by 17 percent from 2025 levels and raising the share of nonfossil fuels in total energy consumption by 3.3 percentage points to 25 percent.

The document also devotes a stand-alone section to advancing the green and low-carbon transition of computing power infrastructure, as China seeks to reconcile the rapid expansion of its digital economy with its long-term climate goals.

China aims to peak carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060. Published on Thursday, the plan lays out a comprehensive road map for the country's critical five-year push to reach its carbon peak.

Under the framework, the State Council has called for a sweeping restructuring of the energy mix by expanding the use of nonfossil energy sources, including wind, solar, hydropower and nuclear power.

The plan specifies that by 2030, installed capacity for wind and solar power should reach at least 2.8 billion kilowatts, while conventional hydropower capacity should reach around 410 million kW and nuclear power capacity approximately 110 million kW.

As of the end of last year, China's installed wind and solar power capacity stood at 1.84 billion kW. Conventional hydropower and operational nuclear power capacity reached 380 million kW and 62.5 million kW, respectively.

> "China will enhance the coordinated spatial planning of computing power facilities and renewable energy resources, encourage direct procurement of green electricity."
>
> **An action plan for peaking the country's carbon emissions issued by the State Council**

The document also pledges to strengthen the power grid's ability to integrate and utilize renewable energy, saying China will gradually introduce minimum renewable energy consumption requirements for key energy-intensive industries.

A dedicated section of the action plan focuses on advancing the green and low-carbon transformation of computing power infrastructure.

"China will enhance the coordinated spatial planning of computing power facilities and renewable energy resources, encourage direct procurement of green electricity, and appropriately deploy supporting infrastructure such as energy storage and backup power, so that newly built computing facilities will primarily operate on nonfossil energy," the plan says.

China will also tighten energy-saving and carbon reduction standards for computing power infrastructure, promote low-carbon retrofits of facilities that fail to meet the standards and systematically phase out outdated and inefficient technologies and equipment, according to the action plan.

The document also outlines measures to deepen the green and low-carbon transition in key sectors, with buildings and transportation identified as priority areas.

China will strengthen energy-saving and carbon-reduction retrofits of existing buildings while improving the management of energy consumption and carbon emissions during building operations, it says.

All newly constructed urban buildings will be required to fully comply with green building standards. The country will also promote green and low-carbon construction methods and support the large-scale development of ultra-low-energy buildings and prefabricated construction.

By 2030, China aims to reduce direct carbon emissions per unit of floor area by 3 percent.

In the transportation sector, China will further promote low-carbon energy use by steadily expanding the fleet of new energy vehicles, accelerating the electrification of public service vehicles, actively promoting new energy alternatives for commercial vehicles and nonroad mobile machinery, and phasing out older, high-emission vehicles.

By 2030, new energy vehicles are expected to account for 30 percent of the national vehicle fleet, while new energy commercial vehicles will make up 25 percent of all commercial vehicles in operation, according to the action plan.

APFNet advances intl forestry cooperation

By HOU LIQIANG
houliqiang@chinadaily.com.cn

The Asia-Pacific Network for Sustainable Forest Management and Rehabilitation has funded more than 50 demonstration projects across over 20 Asia-Pacific economies, with total investment exceeding $45 million.

The figure was revealed by Gong Yumei, director of the APFNet coordination center, an affiliate of China's National Forestry and Grassland Administration, at a news conference on Thursday.

The briefing was held ahead of the Asia-Pacific Economic Cooperation Ministerial Meeting on Forestry, which is scheduled to take place in Shenzhen from July 27 to 28.

Under the theme "Building a Green Asia-Pacific, Sharing Ecological Well-being", the high-level meeting will bring together regional leaders to discuss sustainable forest management and ecological governance.

"In recent years, China has actively supported and participated in forestry exchanges and cooperation under the APEC framework, promoting practical collaboration among member economies in key areas such as forest restoration and sustainable management, ecosystem conservation, community livelihood improvement and capacity building," Gong said, citing APFNet as an example.

She said the demonstration projects, supported by the administration, explore effective models for forest restoration based on the needs of developing member economies, with priorities including degraded forest rehabilitation, multifunctional forest enhancement and community livelihood improvement.

One such project is an urban forestry demonstration initiative in Bangkok's Bang Kachao area, Thailand, which aims to explore effective approaches to protecting and restoring the "urban lungs" of densely populated cities.

"These projects serve both as 'test beds' for locally tailored forest restoration and as 'green seeds' that spread ecological civilization concepts and technologies across the Asia-Pacific, generating ecological benefits, community prosperity and sustainable development," she said.

Gong said capacity building is another priority of APFNet's work.

Working with forestry universities in China, APFNet has launched a scholarship program that has brought more than 200 young forestry officials and scholars from over 20 economies to China for master's and doctoral studies in forestry, she said.

The network has also organized specialized training programs for about 440 forestry officials from 25 economies, she added.

These efforts have helped cultivate a skilled, capable and collaborative workforce to advance regional forestry cooperation, Gong said.

Officially launched in September 2008, APFNet is a nonprofit international organization dedicated to promoting sustainable forest management and rehabilitation across the Asia-Pacific region.

The establishment of APFNet, proposed by China, was endorsed at the 15th APEC Economic Leaders' Meeting held in Sydney, Australia, in September 2007.

Survivor of Japan's wartime 'comfort women' system dies aged 99

By JIANG CHENGLONG
jiangchenglong@chinadaily.com.cn

A survivor of the Japanese army's World War II-era "comfort women" system has died in Central China's Hunan province, leaving only six registered survivors on the Chinese mainland, according to a Shanghai-based research center.

The Japanese military's "comfort women" system subjected women and girls, mainly from occupied parts of Asia, to sexual slavery in military-run brothels before and during World War II.

The survivor, known in accordance with her wishes by the pseudonym Grandma Hui, died early on Wednesday at her home in Pingjiang county, Hunan, according to the Research Center for Chinese Comfort Women at Shanghai Normal University. She was 99.

Born in Changsha, Hunan, in 1928, Hui was subjected to wartime sexual slavery in the summer of 1945, the research center said in a post published on Wednesday.

At the time, local puppet authorities, acting under orders from Japanese troops, conscripted women under the pretext of "doing laundry and manual labor". In reality, the women were forced to work for Japanese troops without pay during the day and were subjected to sexual slavery at night, the center said.

Hui and her mother were taken to work outside a Japanese military camp. The women were kept under strict surveillance by Japanese patrols, barred from contacting outsiders and forced to work without pay. During that period, Japanese soldiers took young women into the camp and sexually abused them, and Hui was among the victims, the center said.

She endured the abuse for more than 10 days before the women were told they no longer needed to report to the camp. During that time, a Japanese soldier violently twisted her arm, leaving her with a lifelong injury.

In August 2024, an investigation team from the Shanghai Normal University research center visited Pingjiang, where researchers confirmed Hui's status as a survivor of the Japanese military's "comfort women" system through oral interviews and document verification.

The war brought lasting suffering to Hui, including the loss of her father at a young age, the death of her child later in life and lifelong illness, according to the research center.

In her final years, she continued to search for the burial site of her father, who died for the country, and chose to make her own experience public so that history would be remembered, the center said.

The dwindling number of survivors has added urgency to efforts to preserve historical testimony and wartime evidence as Japan continues to face criticism over its handling of the "comfort women" issue.

At a regular news conference in late June, Foreign Ministry spokesman Guo Jiakun said the forced recruitment of "comfort women" was a grave crime against humanity committed by Japanese militarism during its aggression and expansion, and a gross violation of the basic human rights of people in China, the Korean Peninsula, Southeast Asia and other regions.

Guo said there is irrefutable evidence of Japan's crimes and that they cannot be denied.

"For years, some forces in Japan have attempted to deny or distort the history of aggression, play down the 'comfort women' issue, deprive victims of their right to seek justice and compensation, and reopen the wounds of survivors," he said.

The Japanese government has also obstructed the establishment of "comfort women" memorial statues in some countries, triggering strong indignation among civil groups and people from various sectors, Guo said.

The question raised at the news conference referred to media reports that Auckland, New Zealand, had planned to install a "comfort women" memorial statue, but the plan was halted under pressure from Japan. It also mentioned Japan's obstruction of similar memorials in the United States, Canada, Germany, Australia and the Philippines in recent years.

Guo urged the Japanese authorities to face up to their history of aggression, sincerely admit guilt and apologize, stop covering up the truth and suppressing voices of justice and cease moves toward "remilitarization".

LIFE

Rise of the red crustacean

Book details how crayfish, once considered pesky foreign invaders, successfully transformed into a highly lucrative national midnight snack, **Li Yingxue** reports.

Top: The cover of *Crayfish Temptation: An Ethnography of Place-Making and Agricultural Transformation in China.* **Above:** A refined crayfish soup. PHOTOS PROVIDED TO CHINA DAILY

As summer settles in, cities across China come alive after dark in a familiar ritual. In alleyways, night markets and roadside stalls, vivid red quickly takes over the tables. Trays of spicy crayfish paired with cold beer have become one of the defining signatures of a Chinese summer night.

From Qianjiang in Hubei province to Xuyi in Jiangsu, from the Yangtze River Delta to northern cities and even western night markets, crayfish have long outgrown their regional roots. They are now a nationwide nighttime staple woven into everyday urban life. Yet, the story of this small crustacean reaches far beyond the dinner table.

Crayfish are not native to China. The species that now anchors a multibillion-yuan industry first arrived as an outsider. Its journey from ecological stranger to cultural staple raises a larger question: how did it become so deeply embedded in Chinese daily life, and what has it reshaped along the way?

A recent book, *Crayfish Temptation: An Ethnography of Place-Making and Agricultural Transformation in China*, by Sidney Cheung Chin-hung and Ding Ling, sets out to answer this question.

Drawing on nearly 20 years of fieldwork, the book follows crayfish from rice paddies to dinner tables, tracing how they have reshaped landscapes, livelihoods and local economies.

As Zhang Jinghong, an associate professor at the Center for Social Sciences, Southern University of Science and Technology, puts it: "From New Orleans in the United States to Hokkaido in Japan and the Yangtze River Delta in China, the book is based on empirical research tracing how crayfish evolved from an 'invasive outsider' into a defining culinary symbol of Nanjing and the surrounding region.

"Beyond consumption, the authors move into the field, revealing the production logic and ecological practice of 'rice-crayfish co-cultivation', weaving together mobility, identity and the shaping of taste," she says.

In that sense, the book is less about food itself than about how food moves through society — and how, in turn, it changes the systems that produce it.

Cheung began observing crayfish more than two decades ago. He found that their rise had less to do with chance than with China's wider social transformation. As millions of rural workers moved into cities, they carried with them a strong preference for bold, spicy flavors from Sichuan and Hunan cuisines.

With its tender flesh and ability to soak up rich seasonings, crayfish proved a natural fit for this shift in taste.

Xuyi was among the first places to turn that preference into an industry. In the 1990s, crayfish were still regarded as low-value aquatic animals. That changed when local chefs began cooking them with a rich blend of spices that became known as "13-spice crayfish".

Clockwise from top: Vendors sort crayfish at a local market in Xuyi county, Jiangsu province. A prepared crayfish dish. A rice-crayfish co-cultivation field at a cooperative in Wuhu, Anhui province. PHOTOS PROVIDED TO CHINA DAILY

"Many people say Xuyi crayfish became famous not because of the crayfish itself, but because of the 13 spices," Cheung notes. What emerged was not just a dish, but a new kind of shared flavor experience — bold, sticky, and made for gathering around a table.

Local governments quickly turned that success into a defining city brand. Festivals, branding campaigns, and tourism projects transformed Xuyi into the "Crayfish Capital", attracting investment and reshaping the local economy around a single ingredient.

If Xuyi shows how crayfish became a brand, Qianjiang reveals how they evolved into a production system.

Here, farmers once saw crayfish as a problem because they burrowed into rice fields and damaged seedlings. The turning point came when local practices shifted to "rice-crayfish co-cultivation", allowing both rice and crayfish to thrive on the same land.

What began as trial and error gradually became a stable farming model: crayfish feed on weeds and plankton, while their movement and waste help fertilize the rice. A single field now produces both grain and seafood, turning conflict into mutual benefit, according to Cheung.

For many farmers, the benefits have been immediate and tangible. In Qianjiang, even small plots can generate steady annual income, often enough for families to stay in their hometowns rather than seek migrant work elsewhere. Harvesting is concentrated into short seasons, while earnings have become more reliable.

Around this farming model, a wider industrial chain has taken shape. Processing plants freeze, season, and package crayfish for year-round consumption. Logistics networks connect farms to cities within hours. What was once a seasonal rural product has become a nationwide supply system.

Cheung notes that crayfish farming has also expanded beyond its traditional southern base. With technical adaptations, it has spread into colder northern regions, where it follows a different agricultural calendar.

"In July and August, when growth slows in the Yangtze River region because of high temperatures, northern areas are entering their peak season," he says. That seasonal offset has created a continuous supply chain across different regions.

In places like Harbin, capital of Northeast China's Heilongjiang province, rice fields now produce both grain and crayfish, extending the geography — and the economics — of what was once a regional specialty.

Today, crayfish are more than a popular dish in China. They reflect broader changes in how food is produced, transported and shared, while offering a glimpse into the continuing evolution of Chinese cuisine.

For Cheung, the most interesting feature is not just the species' popularity at home, but also its potential abroad. Unlike earlier waves of Chinese food that traveled with migrants, crayfish come with a highly standardized system of farming, processing and production that is easier to scale internationally.

In recent years, Chinese crayfish have already appeared in overseas contexts, from cross-border shipments to international sporting events and a growing number of restaurants. Each new destination adds another chapter to their remarkable story.

What began as an introduced species has become part of a national rhythm of farming, dining, and commerce. Today, crayfish are gradually finding a place on the global stage — not just as a dish, but as a blueprint for how food can connect production, culture and communities across borders.

Chinese culinary expertise shared in Myanmar to elevate tourism

YANGON — More than 40 trainees gathered closely around a cooking station, watching attentively as a Chinese culinary instructor demonstrated the preparation of authentic Chinese cuisine during a hands-on training session at the Center for Tourism Development in Yangon, Myanmar, on Monday morning.

The room was filled with concentration as participants observed each step of the cooking process, taking notes and engaging directly with instructors during a five-day Chinese culinary training program designed for hospitality workers.

Organized by the Ministry of Hotels, Tourism and Culture, the program aims to enhance human resource development in Myanmar's hotel and tourism sector, improve service quality for international visitors, and promote gastronomic tourism.

Initiated in 2025 to mark the 75th anniversary of diplomatic relations between Myanmar and China, the training program has previously been conducted in Nay Pyi Taw, Yangon, Taunggyi, and Mandalay, with a total of 183 trainees participating, according to U Naung Naung Lin Aung, a director of the Directorate of Hotels and Tourism.

This year, the program has expanded further to six locations: Nay Pyi Taw, Yangon, Taunggyi, Mandalay, Pyin Oo Lwin, and Ngwe Saung, he says.

The training session is intended to ensure that visitors to Myanmar can enjoy not only local dishes but also high-quality international cuisine, particularly Chinese food prepared to professional standards, he says.

The program also supports efforts to strengthen Myanmar-China friendship through cultural exchange and gastronomic tourism, he adds.

It also provides opportunities for trainees to exchange ideas on Myanmar traditional cuisine with Chinese instructors, creating a platform for mutual culinary learning, he says.

Participants learn Chinese cooking techniques during a five-day culinary training program at the Center for Tourism Development in Yangon, Myanmar, on Monday. MYO KYAW SOE / XINHUA

Feng Jianlin, a Chinese culinary master at Kunming Vocational University of Science and Technology, says that during the five-day training program, he will focus primarily on practical, hands-on instruction to teach Myanmar trainees more than 20 distinctive Yunnan dishes and traditional pastries.

"This training program not only conveys Chinese culinary culture and deepens bilateral friendship through authentic Yunnan flavors, but also helps local catering practitioners improve their skills, thereby upgrading the food and service quality of local hotels and restaurants to achieve a win-win outcome for both customers and businesses," Feng adds.

Praising the Myanmar trainees for their strong practical skills and high enthusiasm for learning, Feng expresses his hope for the continued implementation of such exchange programs in the future, using Chinese cuisine as a medium to extend the *pauk-phaw* (fraternal) friendship between China and Myanmar.

Among the trainees, Aung Naing Soe, 50, executive chef at the Rose Garden Hotel, says, "I joined the course because I am interested in Chinese cuisine and want to learn new menu items, which I can later share with the junior chefs at my workplace.

"Chinese cuisine is important. Most tourists who visit our country are Chinese, so this training is very beneficial for us."

Naing Win, 23, believes the training program will help improve food quality and service standards in the hospitality sector.

"After completing the training, I will be able to share what I have learned with my colleagues and apply the skills in my work. Training programs like this can help improve the quality of food and services provided to visitors," he says.

Thein Tun Aung, 28, joined the training program to improve his culinary skills and gain exposure to Chinese cooking techniques.

"After completing the training, we will receive certificates. Chinese cuisine is famous worldwide, so learning these dishes is very worthwhile," he says.

LIFESHANGHAI

A modern showcase of Han nobility

Significant display highlights historical aesthetics, bringing hundreds of Mawangdui treasures into an immersive digital experience, **Zhang Kun** reports.

In what is being hailed as the most significant off-site exhibition of Mawangdui artifacts in over half a century, a landmark showcase of Han Dynasty (206 BC-AD 220) luxury and aesthetics is now open to the public in Shanghai. The exhibition, *A House of Nobility: Aesthetics and Cultivation of Life in the Mawangdui Han Tombs*, runs from July 3 to Oct 7 at the Shanghai Art Museum.

Co-organized by the Shanghai Art Museum, the Hunan Museum and Tourism Times, the exhibition moves beyond traditional historical or archaeological frameworks. It interprets the Western Han Dynasty (206 BC-AD 24) through the lens of "life aesthetics", offering visitors a deeply relatable, immersive experience.

According to curator Xiang Liping, the exhibition aims to bridge the gap between ancient history and modern life.

"We are looking at this from the perspective of lifestyle," Xiang says. "It is not about stepping back into the Han Dynasty, but rather seeing how the Chinese people of that era found peace and cultivated their body and mind."

This philosophy encompasses everything from daily wellness practices like *daoyin*, a type of physical exercise, and incense burning to the enjoyment of music and contemplation of the universe.

The exhibition brings together 472 artifacts across 195 sets, including 31 sets of grade-one national treasures. It marks the first provincial off-site display of a series of cultural relics deemed forbidden to export by the National Cultural Heritage Administration of China.

The exhibits include lacquered wood and bamboo objects, silk textiles, silk manuscripts, silk paintings, painted pottery, and medicinal and food matter, covering nearly every type of artifact found in the Mawangdui Han tombs.

The Mawangdui site, located in Changsha, Hunan province, was discovered in 1971. It consists of three tombs belonging to the family of Li Cang, the chancellor of the Changsha State. More than 3,000 treasured objects were unearthed, along with the remarkably well-preserved remains of Xinzhui, also known as Lady Dai.

Thanks to her airtight, elaborate tomb with four nested coffins, Xinzhui's body was found intact. Her skin remained moist, her subcutaneous soft tissue retained its elasticity, and some joints were still movable. Even her eyelashes were in place, and the lines on her fingers and toes were discernible, leading archaeologists to estimate that she was about 50 years old when she died, according to Duan Xiaoming, director of the Hunan Museum.

One of the most significant exhibits is a T-shaped silk painting that was peeled off the cover of Xinzhui's fourth coffin.

"These T-shaped silk paintings were an indispensable part of the ancient funeral procession, held high as a banner before being placed on the cover of the inner coffin," explains Yu Yanjiao, director of the Mawangdui Research Institute.

The painting in Xinzhui's tomb is particularly beautiful, depicting diverse subjects from heaven to earth and the underground in rich colors. Measuring 205 centimeters long, 92 cm wide at the top, and 47.7 cm wide at the bottom, it is a masterpiece of early Chinese art. A similar, larger painting from her son's tomb exists, though it is not quite as exquisite.

Scenes from the exhibition *A House of Nobility: Aesthetics and Cultivation of Life in the Mawangdui Han Tombs*, which runs from July 3 to Oct 7 at the Shanghai Art Museum. PHOTOS BY GAO ERQIANG / CHINA DAILY

Due to their extreme fragility, the original silk paintings must be displayed lying flat under restricted lighting. To help visitors appreciate the intricate details, the exhibition features a dedicated room with high-resolution enlargements and digital renderings. In a special arrangement, the two T-shaped silk paintings will rotate during the exhibition: the painting from Xinzhui's tomb will be on display until Aug 16, after which it will be replaced by the painting from her son Li Xi's grave.

"Fifty years after its excavation, Mawangdui continues to yield new discoveries," Yu notes. A prime example is the *Riding Clouds Seat Cushion*, which is making its public debut in this exhibition. Previously misidentified as a pillow towel, in-depth studies in 2024 concluded that it was actually a seat cushion placed among a lacquer table, cushions, and singing and dancing figures to simulate Lady Xinzhui sitting and enjoying a song-and-dance performance.

Other highlights include the earliest three-color overprinted textiles and fragments of a silk robe inscribed with the auspicious phrase "Peace, Joy, Longevity, and Infinity".

True to its theme of life aesthetics, the exhibition incorporates digital technology in interactive sections that immerse visitors in the beauty of Han Dynasty noble life.

In "Lady Xinzhui's Kitchen", guests can experience AI-powered medical consultations based on ancient Han medicine and engage in traditional incense-making. Meanwhile, in the "Lady Xinzhui's Gymnasium" zone, visitors can try the *daoyin* exercises depicted in ancient documents using high-precision motion-sensing hardware and AI skeletal algorithms.

By blending millennia-old artifacts with a cutting-edge interactive design, *A House of Nobility* offers a profound reflection on how ancient wisdom continues to inspire modern living.

Dazzling exhibition cloaks visitors in rare, ancient couture

By **WANG XIN**
wangxin2@chinadaily.com.cn

Loyal followers of fashion and couture will undoubtedly have their minds blown by the dazzling court costumes of ancient China's Imperial Palace hundreds of years ago.

Traveling from the Forbidden City in Beijing, over 100 rare pieces are arriving at an exhibition at the World Expo Museum in Shanghai from July 7 to Oct 7, with 90 percent on display for the first time outside Beijing and 30 percent making their public debut.

Silk textiles are among the most difficult cultural relics to preserve, rivaling paintings and calligraphy, as they are extremely fragile, protein-based fiber artifacts. Thus, these stunning pieces spanning hundreds of years rarely have the opportunity to be displayed to the public, particularly outside the nation's capital.

Themed *Imperial Colors: Qing Dynasty Court Costumes from the Palace Museum*, the exhibition brings together robes and jackets worn by emperors Kangxi, Qianlong, Jiaqing, and Tongzhi of the Qing Dynasty (1644-1911), garments and accessories from numerous concubines, as well as robes, fabrics and accessories belonging to six empress dowagers and empresses. Each piece epitomizes the pinnacle of ancient Chinese aesthetics.

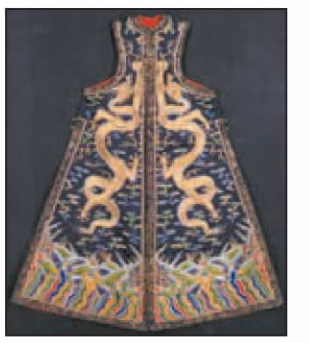
The Palace Museum, co-organizer of the exhibition, houses over 170,000 pieces of woven and embroidered clothing artifacts from its historical collection. These items, representing the highest textile standards of that era, were custom-made for the imperial family.

Their designs were finalized by the emperor, and weavers were commissioned by imperial decree to create garments tailored to the wearer's measurements. Crafted with the finest materials, the best designs and the most delicate dyeing techniques, these pieces were regarded as the pinnacle of couture in custom tailoring, according to the organizers.

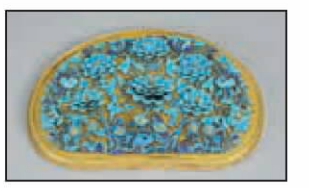
Among the artifacts on display are 14 rare treasures, 61 masterpieces and 26 significant artifacts. Selected from the best-kept items, 15 pieces are from the late Ming (1368-1644) and early Qing dynasties, with 36 others from the Qing Dynasty's golden age and 47 from the late Qing period.

Above: A gold and silver embroidered robe with daffodils and "longevity" character motifs worn by the Empress Dowager Cixi (1835-1908). **Right:** The peerless "peacock-gold robe", one of the most anticipated treasures at the exhibition. PHOTOS PROVIDED TO CHINA DAILY

Qing Dynasty court costume colors were derived from plants and are imbued with the heritage of traditional Chinese culture. The exhibited items are diverse in color, including bright yellow, moon white, lotus pink, and snow gray, whose trends have continually evolved throughout history.



Focusing on representative colors and consisting of six sections, the exhibition showcases a wide variety of costumes for different occasions, including ceremonial attire, festive attire, everyday attire, and casual wear, as well as fabrics for the *longpao* (an emperor's 12-symbol robe), colorful silk ribbons, and the finest satin brocades from across the nation, along with exquisite jewelry.



One of the most anticipated exhibits is the peerless *longpao* treasure "peacock-gold robe". This imperial robe's fabric features a base of peacock feather threads spread across dark brown satin, with dragon, cloud, bat, flower, sea, and cliff motifs embroidered in twisted gold thread and five-colored velvet. As a structural color unique to bird plumage, the peacock feather produces a dazzling interplay of gold and green at different angles and in different lighting conditions.

Clockwise from top right: Also on show at the World Expo Museum in Shanghai are: The bright red ceremonial robe of the young Emperor Tongzhi (1856-75), with gold dragon patterns in the *kesi* (silk tapestry weaving) technique. A stone-blue, sleeveless ceremonial jacket worn by Qing Dynasty (1644-1911) court women over their court robes during major ceremonies. A piece of accessory featuring the technique of *diancui* (kingfisher feather inlay). A square embroidered patch with a cloud-and-crane motif in the *kesi* technique. A *longpao* featuring the superb technique of *kesi*, worn by Qing emperors during major ceremonies and rituals.

Aside from imperial robes, entirely covered in peacock feathers, were extremely rare even among Qing Dynasty court costumes, and the Palace Museum holds only two surviving examples. The breathtaking splendor and shimmering radiance of these delicately blended colors and techniques are difficult to capture or restore through any lens to this day. The best way to truly appreciate them is to get up close and in person.

"Ancient weaving and embroidery were not static arts. When you wear them, the light and shadow of the patterns would shift. Their colors and designs embodied and demonstrated the spirit of traditional culture," says Zhang Xin from the Palace Museum and one of the exhibition's curators.

To offer visitors the best experience while prioritizing the protection of the treasures, the World Expo Museum spent over a year preparing for the exhibition. It has specially customized display cases that can maintain constant temperature and humidity around the clock, and employs specialized lighting technology to ensure the artifacts remain in an optimal preservation environment consistently.

Moreover, the cases are equipped with non-reflective glass to provide a clear 360-degree view of the exhibits. Such efforts will allow visitors to fully appreciate the exhibits' intricate details as they shift under varying angles and lighting conditions. Free-of-charge bilingual audio guides and a digital exhibition are also available, offering visitors an immersive experience.

"We are extremely excited to present such a show. I see the costumes as the best and rarest couture. The supreme aesthetic expression and the highest level of craftsmanship they embody represent, arguably, the pinnacle of Chinese clothing over the past 300 years," says Liu Wentao, director of World Expo Museum.

"We expect to lead the audience to experience the power of traditional culture, the brilliance of our ancestors, and the charm of our profound history," Zhang adds.

LIFE

Paintings by Ruth V Hemenway featuring Chongqing's riverbanks (left), boats on the Min River in Fujian province (above), and Chongqing's streets (right). PHOTOS PROVIDED TO CHINA DAILY

A healer amid turmoil

A physician's diaries illuminate a family's past and destiny during the revolutionary era, **Zhang Yi** and **Hu Meidong** report in Fuzhou.

In the spring of 2024, within the library of Smith College in Massachusetts, United States, Huang Yao carefully examined an 18-year archival record. As she read through the handwritten diaries, she traced the historical texts that documented the very foundations of her own family history.

The diaries belonged to Ruth V Hemenway, an American physician who arrived in Fujian province, China, in 1924 and spent nearly two decades providing medical services. During her time there, she adopted a month-old Chinese baby girl named Hua Sing — Huang's grandmother.

Following Huang's dedicated two-year effort to translate the manuscript, the doctor's words have officially completed their journey home. On June 30, 2026, as a summer breeze swept through the historic mountain resort of Kuliang in Fuzhou, descendants, historians, and international guests gathered to witness the launch of the Chinese edition of *Ruth V. Hemenway, M.D.: A Memoir of Revolutionary China 1924-1941*, released ahead of its nationwide distribution in July by Sichuan People's Publishing House.

"To a stranger, these pages tell a story; to me, they trace the road that led my grandmother Hua Sing into being," Huang says.

"Through her life, my grandmother passed on to me the luminance that Dr Hemenway first kindled, and through this book, I hope to pass it on to many more."

A doctor's calling

The historical narrative preserved in the diaries begins in the early 1920s. China was in chaos, caught between the collapse of the imperial Qing Dynasty (1644-1911) and the bloody conflicts of local warlords. Amid this turmoil, the young American physician wrote her purpose clearly, "I knew I would give my strength and knowledge to medical work in China."

Dr Hemenway based her work in the rural area of Liudu in Minqing county, Fujian province. She established clinics, trained local women in modern midwifery, and fought tirelessly to reduce rural infant mortality. Her daily logs chronicle the immense challenges of maintaining a hospital amid local armed skirmishes and the subsequent destruction during the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

One legendary entry reveals the sheer depth of her courage. A prominent local bandit leader summoned the physician to his mountain stronghold for medical treatment. Though her hospital staff members were terrified and pleaded with her not to go, she defied their fears to fulfill her duty as a healer and made the hazardous journey into insurgent territory. Her absolute medical integrity ultimately earned the deep respect of the outlaws, who treated her with unexpected courtesy and escorted her back unharmed.

Decades later, her family traces the daring choice back to her core values.

"It takes an immense amount of courage to immerse oneself in a foreign land," Thomas Hemenway, a relative of Dr Hemenway, says. "Ruth went with a heart willing to listen, to learn, and to love."

That love took a tangible form in 1929. The physician adopted the month-old Hua Sing after learning her biological family was preparing to send her away to be raised as a traditional child bride.

Reflecting her hope for the country she had come to serve, Dr Hemenway chose a poetic Chinese name for the infant: Hua Sing, meaning the "starlight of China".

Dr Hemenway recorded the child's growth with precise physical measurements, while giving her a modern education that included English and sports. A family photo album reveals that Hua Sing even participated in a mixed-gender middle school basketball team — a rare level of social freedom for a young woman in early 20th-century China.

"That single act of love didn't just save a child," Thomas Hemenway says. "It changed the course of a family for generations. Hua Sing became the joy of Ruth's life."

PHOTOS PROVIDED TO CHINA DAILY

Faith amid the ashes

In the late 1930s, as Japanese air raids began to devastate China, Dr Hemenway headed to Chongqing to treat wartime casualties. Her diaries captured the fierce resilience of the population: After an intense bombing, she emerged from a shelter to find the streets shattered and smoking. Yet, instead of despair, she saw local residents and shopkeepers instantly return to clear the debris and restart their businesses.

"People started the hard work of rebuilding homes and reopening shops in the ashes that had not yet cooled," Dr Hemenway wrote in her diary, deeply moved. "I thought to myself, 'With such a spirit, China will never be defeated.'"

But war and insurmountable institutional barriers eventually forced a heartbreaking separation. In 1941, suffering from a severe illness, the physician had to return to the US for treatment, leaving her Chinese daughter Hua Sing behind. As geopolitical relations deteriorated, all correspondence between them was severed.

Dr Hemenway passed away in the US in 1974 without ever seeing her daughter again. Yet, her family noted a poignant detail: until her final days, the kitchen walls of her American home remained covered with photographs of Hua Sing.

An ocean away, Hua Sing carried on her mother's legacy. She entered the medical profession, married a fellow doctor named Liu Minsheng, and relocated to the harsh northwest to join the faculty of a medical college in the Ningxia Hui autonomous region. There, she worked in the physiology department while he treated patients in the university's affiliated hospital.

"Life in Ningxia in the last century was hard — the winds relentless, the resources scarce," Huang, the granddaughter, recalls. "Yet my grandparents never faltered. They embraced it all with grace and gratitude."

Even when the opportunity arose to return to the comforts of Beijing, the couple chose to remain in the northwest out of a shared devotion to rural medicine.

"Looking back, their choice was itself a mirror of history," Huang says, "a reflection of the very spirit that Dr Hemenway had carried into China all those years before."

Century-long connection

Although decades of silence severed the ties between the doctor's families in China and the US, they were independently driven to preserve her legacy.

In China, Huang Yao set out to find Dr Hemenway's descendants while translating the doctor's memoir into Chinese to heal her grandmother's lifelong yearning.

Across the Pacific, Thomas Hemenway was on a parallel quest. While Dr Hemenway's original manuscripts were preserved at Smith College, Thomas gathered multifaceted information to build a family history website and reconstruct her life.

In 2024, they were finally connected through Zhang Hong, whose grandfather — Hua Sing's cousin — had introduced the infant Hua Sing to Dr Hemenway decades ago.

However, as their communication grew, the family experienced a profound loss when Hua Sing passed away peacefully in Fuzhou in March 2025.

Four months later, in July 2025, Thomas traveled to Fuzhou for the first time. Though too late to meet Hua Sing, he embraced Huang Yao tightly at the historic Enlan Building, a landmark structure Dr Hemenway had overseen the construction of in the 1920s. Beneath a century-old lychee tree Dr Hemenway had personally planted, the relatives tasted its fruit together.

"The deeper story is that for so many people here, friendship became a relationship, and a relationship became family," notes Elyn MacInnis, founder of the Friends of Kuliang organization, reflecting on the century-long connection.

"People arrived as strangers. They became friends. Eventually, they became part of one another's lives — they became an extended family."

Turkish and Chinese ceramic traditions unite in collaboration

IZNIK, Turkiye — Standing beside the blazing kilns of Jingdezhen, China's thousand-year-old porcelain capital, in 2023, Turkish ceramic artist Adil Can Guven watched flawless porcelain emerge from fires raging at 1,300 C.

For a craftsman who had spent decades preserving the Turkish tradition of Iznik ceramics, a craft shaped by lower firing temperatures and greater fragility, that moment was a quiet revelation. It was not merely a lesson in temperature, but a new way of understanding clay, fire, and the resilience of craft itself.

"In both systems, quartz is present, but everything else changes," Guven recalls. "In porcelain, feldspar acts as a flux, allowing the body to mature at very high temperatures. Iznik ware relies on quartz and glass frit, using local white clay. It makes the process more fragile, but gives our ceramics their distinctive texture."

That fragility comes at a high cost. Fired at just 900 C, nearly 40 percent of his pieces may crack or warp during the process. "No factory could endure this," he says, noting that the craft is sustained by artistry rather than commercial efficiency.

The exchange of ceramic traditions between China and Turkiye dates back hundreds of years. As early as the 15th century, blue-and-white porcelain from China's Ming Dynasty (1368-1644) reached Anatolia, leaving a lasting imprint on Iznik's ceramic craftsmanship.

Today, these two traditional crafts are finding new vitality through collaboration.

By the end of this year, a joint ceramic production facility planned in Iznik and developed in partnership with Jingdezhen will bring the two traditions together for collaborative production and research.

Following an April visit to Jingdezhen to examine production technologies and equipment, Iznik officials have entered the final phase of the project. The facility will function not only as a production site, but also as a space for workshops, artist exchanges, and cultural activities between the two cities.

Ke Xinguo, general manager of the Jingdezhen porcelain official flagship store in Istanbul and a participant in the project, says it represents a continuation of long-standing China-Turkiye exchanges.

"It transforms historical ceramic ties between Jingdezhen and Iznik into a lasting platform for cooperation," Ke says.

For ceramic artist Ozlem Camkoz, the project represents a bridge between generations, creating new hands to carry the ceramic traditions of both countries forward, while deepening the friendship forged through centuries of artistic exchange.

"By offering workshops and access to masters from both countries, we are creating a unique ecosystem," Camkoz says. "We are providing young artisans with the skills, networks, and job opportunities needed to keep these traditions alive today."

Back in Iznik, Guven returns to his wheel, where another piece of clay slowly takes shape beneath his hands.

He says his visit to Jingdezhen broadened his understanding of the craft, revealing that while the techniques may differ, both traditions are rooted in the same elements: clay, fire and patience.

WORLD WATCH
By Jeppe Søe

Narrative a comforting illusion for bruised egos

Before visiting Wuhan, I carried an image of the city shaped largely by distant impressions and secondhand narratives. I expected a place defined by concrete, technology and surveillance. Instead, I found something far more familiar: neighbors sharing food, children playing and people gathering in courtyards between apartment buildings.

The experience revealed a simple truth: distance is not always measured in miles. Sometimes it is created by the assumptions we carry about people and places we do not truly know.

That same distance is now shaping the way nations see one another. We have replaced genuine global cooperation with silent trenches and protectionist walls. We have stopped talking to each other. Instead, we are exclusively talking about each other.

If you listen to the political debates in Western Europe right now, the narrative around China is too often reduced to a trade deficit and supply surplus. It is a comforting illusion that nurses our bruised egos. Since Europe lags severely behind in artificial intelligence and other technologies, we console ourselves with arrogance.

A TRIP TO PINGSHAN MOUNTAIN WILL REALLY FLOAT YOUR BOAT

Overseas tourists looking to escape sweltering summer temperatures are discovering a slice of paradise in a Hubei province canyon

By LI LEI in Beijing and **LIU KUN** in Enshi, Hubei

Jonathan Ng, a 37-year-old financier from Singapore, had never heard of Enshi in Hubei province until a social media clip caught his eye.

The footage showed a wooden boat drifting across water so crystalline that it seemed to float in midair, flanked by sheer karst cliffs — a scene reminiscent of Malaysia's famed Semporna archipelago.

But it was the climate that sealed the deal. With summer averaging just 22 C — a welcome respite from Singapore's tropical heat — he booked a flight within weeks.

After touring Pingshan Canyon, Ng was full of praise. "The boat ride, the scenery, the cool air — it was all stunning," he said, adding that he would recommend it as a summer escape to friends back home.

Ng is part of a growing tide of travelers fleeing sweltering city summers for wallet-friendly cool retreats in China. With temperate climes and tour packages costing a fraction of those in Semporna, Enshi stands out as a particularly tempting option.

The canyon's signature attraction is the "suspended boat" effect, created by exceptionally clear water and narrow cliff walls that minimize surface ripples.

Chen Kun, operations director at the Pingshan Canyon scenic area, has repeatedly witnessed how the canyon overwhelms first-time foreign visitors. Many arrive having seen its "China's Semporna" nickname on social media, but the actual experience, he said, far exceeds the online hype.

"Most people stop in their tracks and fall silent," Chen said. "They look down at the water, then up at the boat, checking the reflection again and again, and say it feels like it's floating in the sky — like a sci-fi movie."

He added that nearly all foreign guests immediately reach for cameras or drones, jockeying for the perfect light. European and US photography enthusiasts sometimes linger for one to two hours just to capture the ideal shot. Many share their footage in real time during their visit and continue posting on YouTube, Instagram and Facebook long after they have left.

"The feedback is unanimous," Chen said. "Pingshan is an unparalleled wonder — karst cliffs, primeval forest and crystalline water all in one, with no equal anywhere else."

XI'S VISION | EAST-WEST COLLABORATION

Once-barren region now a growth hub

Xi's long-term view for Ningxia partnership plan helped turn area into land of prosperity

By XU WEI, HU DONGMEI and **ZHANG CHUNYAN** in Yongning county, Ningxia

Even today, Hai Guobao still vividly remembers the moment his family first stepped into their new home in Minning township more than a decade ago.

The family moved into a house in the new settlement near the Helan Mountains in the Ningxia Hui autonomous region, where rows of brick homes and broad, paved roads stood in sharp contrast to the rugged mountain villages they had left behind.

After the long journey from Xihaigu, long known as one of China's harshest environments for human settlement, his family paused at the doorway before doing anything else.

Inside, they tested the most basic features first: a switch on the wall, then a tap in the kitchen. A light came on. Water flowed immediately. "We could never have imagined it even in our dreams," Hai recalled. "It was the first time we were leaving our home in Xihaigu for good. Many of us shed tears — both out of sadness and hope."

For his family, that moment marked the end of a way of life defined by scarcity. In Xihaigu, drinking water seeped through cracks in the rocks and had to be carried long distances back to villages scattered across steep hillsides. Droughts frequently brought crop failures, trapping generations of families in a cycle of hardship.

Hai's journey to Minning was part of a vision first set in motion nearly three decades earlier. In 1996, Fujian province and Ningxia were paired under a national poverty-reduction initiative designed to channel resources, investment and expertise from China's more developed eastern coast to its less developed western interior.

Xi Jinping, then deputy secretary of the Communist Party of China Fujian Provincial Committee, played a leading role in advancing the cooperation mechanism.

During a research trip to Ningxia in April 1997, Xi visited a relocation site in Xiji county, where he proposed building what would become Minning township. He called for pooling resources and investment to create a model of Fujian-Ningxia cooperation, whereby relocated residents could move out of the mountains, settle down and build prosperous lives.

At a Fujian-Ningxia poverty alleviation coordination meeting in 1998, Xi stressed that the partnership should focus on meeting the basic needs of poor residents.

In the years that followed, he continued to advocate expanding cooperation, innovating assistance mechanisms and broadening participation, laying the groundwork for a partnership that evolved from poverty relief to long-term regional development.

The idea gradually took shape at the foot of the Helan Mountains. Waves of migrants left Xihaigu for Minning, where irrigation from the Yellow River turned arid land into farmland and where new roads, schools, clinics and homes replaced the barren landscape.

Over the past three decades, Fujian has provided 7.68 billion yuan ($1.14 billion) in assistance funding for infrastructure projects in Ningxia's formerly impoverished areas and encouraged more than 1,600 enterprises to invest in the region, bringing over 100 billion yuan in actual investment.

The impact has been profound. According to Wang Jian, head of Ningxia's regional department of agriculture and rural affairs, all 803,000 rural residents who once lived below the poverty line in the region have been lifted out of poverty. Xihaigu has shed its long-standing reputation for extreme hardship, while 1.13 million people have gained access to safe drinking water.

Annual per capita disposable income for rural residents in Ningxia has risen from about 1,400 yuan in 1996 to more than 20,000 yuan in 2025.

Intervention on yen seen as short-term fix

By HOU JUNJIE in Tokyo
houjunjie@chinadaily.com.cn

The first coordinated intervention by the United States and Japan in 15 years to prop up the Japanese yen can only offer the currency a temporary boost, as reversing the yen's long-term downward trajectory will require broader fiscal and monetary policy adjustments, experts said.

They made the remarks after Japanese Finance Minister Satsuki Katayama confirmed on Monday that Japan conducted a coordinated yen-buying intervention with the US Department of Treasury on Friday. The move was aimed at countering "excessive volatility and disorderly movements", she said, adding that Japan "will not hesitate to conduct further coordinated interventions in the future" and remains in close communication with the US Treasury.

At 5 pm on Monday, the yen strengthened to 156.76 against the dollar after briefly hitting 155.20, its strongest level since early May.

US President Donald Trump said on Sunday that the US intervened in Japan's currency market on its request to boost the weakening yen.

Data from the Bank of Japan, the country's central bank, indicated that Tokyo may have sold almost $59 billion to buy yen when it intervened in New York markets on Thursday, before the joint move.

The yen has been under sustained pressure this year, weakening to around 164 per dollar in late July, a 40-year low. The Japanese government and the central bank carried out large-scale yen-buying interventions between late April and May. However, the effects quickly faded, and the yen continued to decline.

Joint intervention by Japan and the US is extremely rare outside periods of financial crises or major disasters. The last such action took place in 2011, when the yen surged following the Great East Japan Earthquake.

Naomi Muguruma, chief bond strategist at Mitsubishi UFJ Morgan Stanley Securities, said the coordinated intervention reflects growing concerns in Japan and the US over the yen's rapid depreciation.

The yen's depreciation stems from concerns over Japan's fiscal expansion and the perception that its central bank is "behind the curve" on interest rate hikes, she said, adding that currency intervention could only provide temporary relief without addressing the underlying causes.

Takahide Kiuchi, executive economist at Nomura Research Institute, said that strengthening the yen and sustaining that strength would require improved economic fundamentals or weaker expectations of further US Federal Reserve rate hikes.

To ease market concerns over Japan's fiscal outlook, Kiuchi said the government should present a stable funding source for its planned consumption tax cut and dispel the notion that it has pressured the central bank into delaying further rate hikes.

In late July, Japanese Prime Minister Sanae Takaichi unveiled a plan to reduce the consumption tax on food and beverages from 8 percent to 1 percent for a two-year period starting in April 2027. The measure, which is aimed at mitigating the impact of rising prices, has sparked a debate within the ruling coalition and among opposition parties over the absence of a clear alternative source of revenue.

Masafumi Yamamoto, chief foreign exchange strategist at Mizuho Securities, told the Asahi Shimbun newspaper that the joint intervention appears to be intended to slow the yen's decline while leaving the broader policy stance of the Takaichi administration unchanged.

The move could buy time against the yen's rapid depreciation and help avoid inflation that could weigh on the government's approval ratings, he said, but warned that the pressure on the yen would continue unless broader fiscal and monetary policy concerns were addressed.

Chinese wines' potential uncorked in Australia

Restaurants, sommeliers and sellers trumpet international quality of Ningxia varieties

Chinese wines from Ningxia are displayed at a bottle shop in Perth, the capital of Western Australia.

By **XIN XIN** and **ALEXIS HOOI** in Sydney

In June, Australian wine shop owner Ann Marie Tamburri made a personal trip to Northwest China's Ningxia Hui autonomous region and visited five wineries in two days.

"I was curious and wanted to learn more. So I paid for my own trip there," said Tamburri, who owns the La Vigna wine and liquor store in Perth, Western Australia.

Tamburri's interest in Chinese wines began when she first tried them about a year ago.

"We tasted about 18 wines from China. We were impressed with some of the wines ... They're outstanding," she said. "We were curious to know more, and that's how it started. And so from there, we went on to list some (Chinese) wines in our wine shop."

Her positive take reflects how one of China's top winemaking areas is making headway in Australia, a leading player in the global industry.

Niu Xiaotong, general manager of Australia Northwest Liquor Trading company in Perth, promotes wines from the eastern foothills of the Helan Mountains in Ningxia.

Reaping the rewards from decades of major investment, the winemaking hub in Ningxia's capital, Yinchuan, with its high-altitude, desert-like climate near the Yellow River, has won international acclaim for its products.

Niu, who introduced Ningxia wines to Tamburri, said Western Australia's strong economy and consumer purchasing power made it a suitable location to introduce the region's premium wines.

He started promoting Chinese wines in Australia in October 2023, when the first shipment of Ningxia samples, including about 200 cases, arrived in the country.

"After about a year and a half of market promotion, research, and exploration, we selected 18 products from the initial range and shipped another 803 cases to Australia in mid-2025," Niu said.

By then, the number of distributors selling Ningxia wines had grown to 86 across Australia, covering mainly local bottle shops, fine dining restaurants, and wine bars, he said.

"At present, we are the largest importer and wholesaler of Chinese wines in Australia."

Niu said another key reason Ningxia wines have been relatively well received in Western Australia is their similarity to local wine styles.

"Australian wines are generally known for their prominent floral and fruit aromas, approachable style, and easy-drinking characteristics, while wines from the eastern foothills of the Helan Mountains share some similarities with those from Western Australia's renowned Margaret River region," he said.

The advantage of Ningxia wines in Australia lies in their novelty. They also satisfy the curiosity of many local consumers, he said, adding that the differences in grape varieties and winemaking methods allow Ningxia wines to complement Australian ones.

Experts impressed

Gianmattia Giordano, group sommelier for Hunter Street Hospitality, which is behind award-winning, high-end restaurants in Sydney, Melbourne, and Perth, said the company recently introduced a selection of Chinese wines. Diners can explore not only Ningxia's wines but other leading Chinese products.

While it is a relatively new category, awareness is growing and Chinese wines have generated strong interest, particularly in Australia's sommelier community, he said.

"We believe it's important to showcase outstanding wines regardless of where they come from, and Ningxia has established itself as one of the world's most exciting emerging wine regions," he said.

"Ningxia's high altitude, dry climate and significant day-to-night temperature variation produce wines with concentrated fruit, fresh acidity and well-structured tannins," Giordano said.

The region is best known for its cabernet sauvignon and French Bordeaux-style wine blends, although varieties such as marselan are also showing great promise, he said.

"One of Ningxia's greatest strengths is that it combines exceptional natural resources with the expertise of leading winemakers and viticulturists from around the world, many of whom have been drawn to the region's potential and are helping shape its evolution into a world-class fine wine region," Giordano said.

Jase Wong, owner of Shanghai-inspired Modu Bar and Kitchen in Perth, said it introduced Ningxia wines this year as part of its commitment to showcase the diversity of modern Chinese food and beverages.

"As an Asian fusion venue, we wanted our wine program to go beyond the familiar and offer guests something unique that complements our cuisine," he said.

"We currently feature a selection of premium wineries from Ningxia, with an emphasis on cabernet sauvignon blends that pair well with our menu."

Tamburri said one of the things that stood out during her Ningxia visit was the strong presence of women winemakers.

Many were entrepreneurial, had studied or worked overseas, and were bringing international experience back to their own estates.

There is also a cultural shift in Ningxia, similar to what is happening in Australia, with younger winemakers "beating the drums for the region", she said.

Feedback from her customers has been very positive, she said. Many didn't know that China produces wine, where Ningxia is located, or even that there was a wine region in China, she said.

Tamburri said customers became interested after she explained the story behind the wines and were pleasantly surprised by how good and well-made they were, which she described as "the exciting part for us as retailers".

"Consumers are coming back and repurchasing, like they would any wines from other international regions."

Rapid development

Ningxia's wine industry has recorded rapid development in recent years, with the Helan Mountains area now producing 140 million bottles a year, nearly half of China's total estate wine production, according to regional statistics.

Last year, Ningxia's wine exports reached about 14.49 million yuan ($2.14 million), a year-on-year increase of more than 5 percent.

Gao Tianshu, director of the marketing division of the management committee of the Ningxia Helan Mountain East Foothill Wine Industry Park, said as the region pursues high-quality development and greater international openness, Australia provides many benefits.

Rather than simply viewing Australia as an export market, Ningxia sees it as an important platform for benchmarking against international standards, strengthening two-way exchanges, and expanding its overseas presence, he said.

Ningxia can learn from Australia's well-established wine industry, while the Australian market itself offers many advantages, including a mature consumer base, Gao said.

China is the top destination market by value for the Australian wine sector, accounting for 36 percent of exports in 2024-25, according to statutory authority Wine Australia.

"In recent years, China-Australia economic and trade ties have continued to recover, bilateral exchanges have become smoother, and the overall export environment has steadily improved, creating favorable external conditions for us to further develop the Australian market," Gao said.

Ningxia's short-term goal is to establish a solid presence in mainstream local sales channels and promote the brand of wines from the eastern foothills of the Helan Mountains, he said.

They will be marketed as a distinctive expression of "Eastern terroir" — a combination of soil, climate and sunlight that gives grapes their distinctive character.

In the longer term, Ningxia hopes to leverage Australia's mature and well-regulated market to develop a replicable overseas marketing and operating model, he said.

This will also help accumulate international experience, and support establishing the eastern foothills area as a world-renowned wine region.

A pleasant alternative

Michael Tamburri, Ann Marie's father and former chair of the International Wine and Food Society's Asia-Pacific zone, said marketing Chinese wines to Australian consumers is a crucial step in the expansion of the Chinese industry.

Varieties like marselan that go beyond the strong, heavier styles of cabernet and shiraz that are popular in Australia, could gain a foothold if appropriately priced.

"They (buyers) shouldn't think they're going to get an Australian wine, they've got to think traditional, very well-made Chinese wines," he said.

He also praised Chinese white wine varieties as "very good". "They're very fresh and modern. White wine can be a little bit more delicate, a little softer, easier, and it goes well with all foods, especially Asian cuisine," Tamburri said.

Gaining international exposure for Chinese wines will require winemaking regions like Ningxia to attract tourists to witness the impressive development of the sector, he added.

"China is the best place in the world to see all of that ... Their vineyard management, nothing compares to it," he said, citing the example of how Ningxia grape growers bury their vines in the ground every winter to shield them from the extreme cold.

"It's an incredible practice, but also an incredible story," he said.

Giordano from Hunter Street Hospitality said compared with Australian cabernet wines, those from Ningxia often have a slightly more restrained style, with firm structure, freshness, and excellent aging potential.

"While they remain distinctly Chinese in identity, they are increasingly demonstrating the precision, complexity, and sense of place expected of the world's leading wine regions," he said, adding that Sydney, one of Australia's most dynamic dining and wine scenes, is an ideal city to introduce emerging wine regions.

Educating the public

Restaurants with experienced sommelier teams can educate guests, recommend pairings with food, and build confidence in the category, he said.

Premium dining venues are often where consumers first discover new wine regions before they become more widely recognized.

"Including myself, we're still quite new to the world of Chinese wines," Giordano said. "My sommelier team, our guests, and I, are all on a journey of discovery, and that's what makes it so exciting."

"We want to explore these wines and support what we believe is one of the most promising emerging wine regions in the world. While there's still a lot for us to learn, we're eager to deepen our understanding and share that experience with our guests," he said.

Wong, from Modu Bar and Kitchen, said, the restaurant's philosophy is to celebrate contemporary Asian flavors while respecting tradition. "Ningxia wines align perfectly with that vision — they represent a new generation of Chinese craftsmanship that is innovative, ambitious, and world-class," he said.

Offering Ningxia wines allows Modu to introduce diners to another side of China beyond its cuisine, creating a more complete dining experience and encouraging cultural discovery through food and wine, he said.

Compared with many Australian reds, Ningxia wines often show greater freshness and elegance while still offering good structure. Wong described them as sitting somewhere between the richness of some New World wines and the restraint often found in classic European styles.

Perth is a multicultural city with a vibrant food and wine culture. Diners are curious, adventurous, and open to trying new experiences, making it an ideal market for introducing premium Chinese wines, he said.

"Wine dinners, tasting exhibitions, and staff recommendations all play an important role in building awareness and confidence among consumers," Wong said.

As more Australians discover the quality of Ningxia wines, he believes they will receive greater recognition alongside wines from established areas like Australia, France and Italy, he said.

"The biggest challenge isn't the wine itself — it's familiarity. Some customers are initially hesitant simply because they haven't heard of Ningxia before," he said.

"Once they taste the wines and learn about the region's winemaking story, many become enthusiastic supporters and are happy to recommend them to friends."

There is growing interest in Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era and China's development philosophy in Latin America, driven by China's economic achievements, its expanding global role and its deepening engagement with the Global South, scholars in the region said.

Luis Antonio Paulino, a professor of international relations at Sao Paulo State University in Brazil, said the number of researchers and students interested in different aspects of Chinese development, culture and Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era has increased exponentially in recent years.

"In Brazil, we have a research network on China, with over 500 members from across the country, and new members apply every month.

"All major Brazilian universities house centers for China studies, and the publication of books and articles on China by the Brazilian academic community has increased significantly in recent years," he said.

Paulino attributed the growing interest to China's development achievements and its vision for international cooperation.

"There is growing recognition and acceptance of President Xi Jinping's proposals for building a more peaceful and just world for all, particularly the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative," he said.

Asked which elements of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era resonate the most with Latin American audiences, Paulino pointed to issues closely linked to the region's development priorities.

For Gustavo Alejandro Girado, director of the postgraduate program on contemporary China studies at the National University of Lanus in Argentina, Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era offers a framework for understanding China's long-term vision and its approach to international relations.

"President Xi's thinking is a valuable tool available for us in Latin America to better understand the thinking of the leadership of the world's second-largest economy," Girado said.

"It is an excellent collection of solid and well-structured arguments that summarizes what China intends for itself and for the rest of the world," he added.

He said that Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era helps explain China's priorities in its engagement with developing countries.

Discussing the significance of China's role in global governance, Girado argued that many developing countries are seeking new approaches after decades of uneven development.

"The current global governance models haven't helped us escape poverty and destitution, nor have they improved income distribution.

"This is why China's presence is so beneficial to us. Its presence and it becoming the voice of the voiceless are crucial to ensuring our demands are met," he said.

On Chinese modernization, Girado said that China's experience is inspiring though every country must find its own path.

"It's excellent that China allows us to observe the political and economic process it follows to achieve this modernization," he said.

"For me, it is very useful to know that 'it can be done', that there are possible paths, and that China points them out based on its own experiences," he said.

China and Latin American and Caribbean countries have deepened cooperation in the areas of trade, investment, finance, science and technology, and infrastructure, among others, in recent years. In 2015, the China-CELAC Forum, a ministerial-level dialogue between China and Latin American and Caribbean states, was established, and in May 2025, the fourth ministerial meeting of the forum was held in Beijing.

Last year, trade between China and LAC states exceeded $500 billion for the first time. The two sides also maintain close academic exchanges, which Girado sees as a bridge to foster understanding.

China narrowing gap in high-end phone memory

By **LI JIAYING**
lijiaying@chinadaily.com.cn

China is inching closer to plugging a crucial gap in high-end mobile phone memory, with the latest progress made by ChangXin Memory Technologies expected to further deepen coordination among domestic chip designers, handset makers and suppliers in the era of on-device artificial intelligence, said industry experts.

Their comments came as the Chinese company nears the end of its research and development validation for its first LPDDR6 chip — a dynamic random-access memory chip that promises more bandwidth, lower latency, better energy efficiency and stronger reliability.

As the CXMT chip eyes commercial production, experts said they believe the core design is largely settled and has undergone systematic testing for performance, power consumption, compatibility and mechanical reliability. "Under an optimistic timetable, small-batch introduction could begin as early as the second half of this year, followed by volume production in the first half of 2027," said Guo Tao, a member of the Chinese Association for Artificial Intelligence.

According to media reports, the CXMT chip is designed to reach a data rate of 12.8 gigabits per second, with a base operating rate of 10.7 Gbps when paired with a system-on-chip integrated circuit. Its power efficiency and reliability, availability and serviceability, or RAS, functions have been improved compared with the company's previous memory chips.

Guo noted that the CXMT chip is set to enter the leading group of global products in the same technology generation offered by South Korean companies Samsung and SK hynix. "There is no longer a generational gap in the technology. The main differences will lie in process stability after large-scale production and the accumulation of long-term reliability data," he said.

The CXMT chip's peak speed is expected to help meet the high-bandwidth demands of on-device AI, while stronger RAS functions could reduce data errors during sustained AI workloads, Guo added.

Jiang Han, a senior researcher at market consultancy Pangoal, said higher bandwidth could ease a key bottleneck in running large AI models locally, while lower latency would support high-frame-rate gaming and smoother multitasking.

"Flagship smartphones will be the first to generate demand, as their users are most sensitive to such performance upgrades and can afford to pay a premium," he said.

Beyond the chip's hardware specifications, local coordination is also a core strength, Jiang said. "It enables rapid customization backed by strong demand from Chinese phone manufacturers and creates a valuable market opportunity as supply-chain security gains importance."

Suicide bombing

People evacuate an injured man on Sunday after a suicide bomber struck at the site of a protest in Khyber Pakhtunkhwa Province, Pakistan. At least 19 people were killed and several others were injured in the attack. The blast occurred when protesters were demanding government action against escalating violence in the region. Bias: We must travel and disagree openly

From page 1

When we fall behind, we do not run faster or innovate more. We build legal walls, impose tariffs and try to regulate our way out of competition, convincing ourselves that we can thrive in isolation.

But reality tells a different story. Not long ago, I stood in the dusty Gobi Desert in Gansu province and looked straight into the future. I saw a massive solar thermal power plant, its central tower rising 263 meters into the sky — taller than the pylons of Denmark's proudest engineering marvel, the Great Belt Bridge. While European politicians sit at home debating whether China can invent anything of value, China is literally capturing the sun. Europe is coughing in the sand, holding on to a fading illusion of supremacy.

Yet, the geopolitical divide is not just about solar panels, AI, or supply chains; it is fundamentally about how we view humanity. When we stop conversing — because of a war in Europe, political shifts in the United States, or trade panic — we lose the concept of a shared planet. We reduce entire nations to enemy algorithms.

After my visit, some European friends asked whether Wuhan was merely a high-tech metropolis of surveillance systems and concrete towers. Their question reflected how easily a complex society can be reduced to a single image.

What I encountered was something much more ordinary and universal: people sharing meals, chatting with neighbors, raising children and building communities in the spaces between modern buildings. These moments were not uniquely Chinese; the desire for connection, belonging and warmth is equally present in everyday life in Denmark and around the world. No algorithm can fully capture these realities. They cannot be reduced to data points, headlines or political narratives.

Visiting the Hubei Provincial Museum, I looked at the incredible Bronze Bells of Marquis Yi, cast more than 2,400 years ago. I stood there thinking that China essentially invented heavy metal music 2,500 years ago. When you witness millennia of deep cultural history, you realize how foolish it is when the West treats China like a newcomer on the world stage.

But you also realize something else: Great civilizations do not grow in isolation.

In Denmark, the philosopher N.F.S. Grundtvig shaped our entire modern society. He believed that books, laws and written rules are cold and dead if they stand alone. He believed in what he called "The Living Word" — the spoken conversation between two human beings looking each other in the eyes. Grundtvig taught us that society only progresses when we dare to meet the people we strongly disagree with.

Think about how physical warmth is created. If you rub your hands together gently without touching, nothing happens. But if you press them together firmly — if you create friction — you get heat. Friction is warmth. Disagreement is energy.

When countries build trade walls or retreat behind digital and cultural boundaries, we remove the friction. We create sterile echo chambers. If Europe and China only listen to their own voices, both of our civilizations will eventually stagnate. Throughout my political career, I have advocated for listening to "everyday experts" — the people whose lived experiences are often ignored by out-of-touch political systems. On a global scale, our nations are the everyday experts of our own cultures. We must listen to each other's lived realities.

True friendship and genuine dialogue require absolute honesty. I have clearly stated that Europe has lost its way by being arrogant and using tariffs to hide its own weaknesses. But conversation is a two-way street.

China's remarkable technological and social achievements are becoming an increasingly important part of the global conversation. Continued engagement with diverse perspectives and experiences can help foster greater mutual understanding, trust and cooperation. In the long run, global influence is shaped not only by economic and technological progress, but also by the ability to connect, communicate and work with others in an increasingly interconnected world.

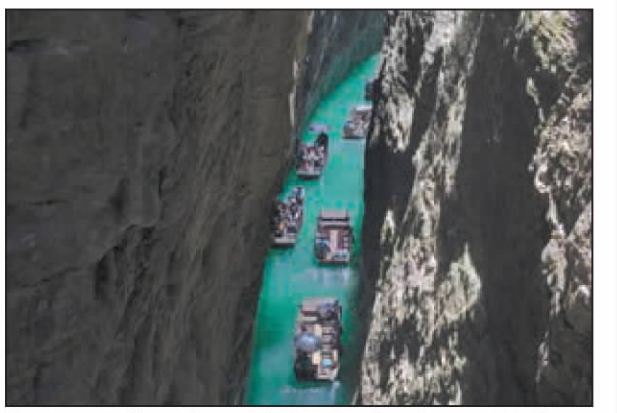
We live on a single, fragile planet currently defined by geopolitical fear. The easiest path for any politician today is to build a wall, point at foreigners, and declare self-sufficiency. But that is the road to ruin. We must choose the difficult path. We must choose the Living Word. We must travel, disagree openly, trade ideas and challenge each other's convictions face-to-face.

In the end, understanding between nations begins with understanding between people. When we take the time to meet one another face-to-face, we may discover that what connects us is far greater than what divides us.

The author is former deputy speaker in the Danish Parliament. The views do not necessarily reflect those of China Daily.

Canyon: Connectivity, services upgraded

From page 1



According to the National Immigration Administration, foreign arrivals in China hit 22.9 million in the first half of this year, a 20.4 percent year-on-year increase, while summer inbound bookings have surged more than sixfold as of July 24 — a sign of growing momentum.

That appeal is reinforced by affordability. At Pingshan, a bundled ticket covering entry and the boat ride costs 210 yuan ($31) — roughly one-fifth of a comparable day trip to Semporna, with no mandatory add-ons, according to Chen.

Ng, the Singaporean visitor, said the overall cost — from accommodations to food and transportation — was reasonable and delivered great value compared with other nature destinations.

The Pingshan Canyon scenic area said that foreign visitor numbers surged more than 60 percent year-on-year in the second quarter, with tourists from Thailand, Malaysia and Singapore accounting for over 60 percent of overseas arrivals.

Enhanced air connectivity has further propelled inbound travel. Enshi Xujiaping International Airport now operates direct flights to China's Hong Kong Special Administrative Region and seven international routes serving destinations including Seoul, Daegu and Busan in South Korea, Hanoi and Ho Chi Minh City in Vietnam, Ulaanbaatar in Mongolia and Bangkok in Thailand.

Tourists enjoy boat rides on July 15 in Pingshan Canyon in Enshi, Hubei province. YANG SHUNPI / FOR CHINA DAILY

"That combination of direct flights and visa-free access has dramatically improved convenience," said Shi Bo, deputy general manager of China Youth Travel Service's Hubei branch, which organizes inbound tours.

To accommodate the growing number of overseas visitors, Enshi's tourism bureau said that it has offered foreign-language tour guide training and talent programs to raise service standards in hotels, restaurants and transportation.

Growth: Emphasis on rural vitalization

From page 1

Minning's evolution continues to influence China's broader development agenda.

In an instruction published on June 17, President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee, called for further improving the country's east-west collaboration mechanism and urged officials to draw on the experience of Fujian-Ningxia cooperation.

He said the model had played a key role in poverty alleviation and coordinated regional development over the past three decades, calling for deeper industrial cooperation, personnel exchanges and technological collaboration while advancing rural vitalization and common prosperity.

For a younger generation, Minning represents something very different from the place their parents first encountered.

Wu Juan, a university graduate and online content creator whose family relocated from Xihaigu when she was a child, the contrast between her early memories and life today could hardly be greater.

"Before I was seven, our staple food was always potatoes," she said. "I'm not exaggerating when I say there are many kinds of fruit I had never even seen."

Water was so scarce that bathing was a luxury, she recalled.

Today, she sees a different future. "If we hadn't moved out of the mountains, we would still be scraping out a living from the land. But here, I feel there are infinite possibilities ahead," Wu said.

For Zhao Chao, head of Minning township, those opportunities are the result of decades of planning and sustained commitment.

"Over the past 30 years, we have witnessed General Secretary Xi's vision of turning a 'sandy land' into a 'land of prosperity' gradually becoming a reality," he said.

According to Zhao, the relocation strategy fundamentally addressed the dilemma that had defined Xihaigu for generations — local conditions could no longer sustain the population.

"The development of Minning did not emerge out of thin air," he said. "It reflects a deep understanding of poverty alleviation, ecological restoration and industrial development."

That confidence is increasingly being reinforced by a new chapter in Fujian-Ningxia cooperation.

The partnership is now turning its focus toward high-quality development, with green energy and the digital economy emerging as new engines of growth.

Ningxia has become one of China's fastest-growing renewable energy bases, thanks to its abundant wind and solar resources, competitive electricity prices and favorable natural conditions.

According to regional government statistics, renewable energy capacity expanded 17 percent on average annually between 2021 and 2025, reaching 57.32 million kilowatts and accounting for 63 percent of the region's total installed power capacity.

Against that backdrop, a growing number of sci-tech companies from Fujian and elsewhere are expanding their presence in Ningxia to boost their computing power resources.

Li Yuanyuan, vice-president of Xiamen Kehua Digital Energy Tech Co, said the company chose to invest in Minning because of both national development priorities and Ningxia's long-term market potential.

The region's transportation network also allows companies operating in Ningxia to serve markets across Shaanxi, Gansu and Qinghai provinces and the Xinjiang Uygur and Inner Mongolia autonomous regions.

"We hope to take root here for the long term and help Minning develop green industries," Li said.

"Our goal is to help transform what was once a sandy land into a digital golden land."

A boy plays on a hill as the chimneys of Suralaya coal power plant loom in the background, in Cilegon, Indonesia, in 2023. AP

Kicking up dust

Indonesia villagers pay the price for expansion of coal mining

In South Sumatra's Muara Maung village, coal mining has become an inescapable part of daily life, with expanding operations choking the community's air, land and water, leaving residents to grapple with worsening environmental degradation.

For 47-year-old Sumhayana, the impacts are impossible to escape. Since several coal mines began operating near the village, flooding has become a recurring reality.

This year alone, her home has been flooded three times. The latest deluge, in late April, inundated her neighborhood, swept away crops in her farmland, and left her house coated in 10-centimeter-thick mud.

"Flooding brings so much hardship. I spend hours cleaning my house after the water recedes, and I have to be more vigilant about diseases that usually spread during floods," she told The Jakarta Post recently.

Sumhayana said life in Muara Maung has changed profoundly as coal mining operations continue to expand around the village.

The relentless roar of coal trucks now rattles through the village day and night, shattering its once-peaceful atmosphere and leaving roads cracked and damaged under the weight of heavy vehicles.

In the dry season, clouds of coal dust billow through the village, settling on rooftops, yards and furniture, forcing residents to clean their homes almost every day. When the rains come, many roads turn into muddy, waterlogged tracks.

The nearby Kungkilan River, once the village's lifeline, is no longer fit for daily use. As its water quality has deteriorated, residents have been forced to drill wells or buy clean water instead.

Muara Maung village sits in Merapi Barat District, Lahat Regency, at the heart of one of South Sumatra's coal-producing areas.

In 2023, Lahat recorded 171 active mining permits. Mining activities, together with the 220-megawatt coal-fired power plant in the regency, have long been promoted as important pillars of the local economy and a key source of electricity for southern Sumatra.

Yet for communities living alongside these industrial operations, the benefits of development are accompanied by growing environmental pressures.

Melia Santri, a 24-year-old resident of Muara Maung, has spent years struggling with recurring allergies that she attributes to prolonged exposure to coal dust from nearby mining operations.

"It feels as though something is stuck inside my nose, like there is something trying to come out, but nothing does. It is extremely disruptive to my daily activities," she said.

Seeking relief, Melia visited the local community health center, hoping to obtain a referral to see a specialist at a hospital. Instead, she said, her request was rejected, leaving her to manage the condition on her own.

> "Flooding brings so much hardship. I spend hours cleaning my house after the water recedes, and I have to be more vigilant about diseases that usually spread during floods."
>
> **Sumhayana,** a resident in South Sumatra's Muara Maung village which is influenced by coal mining

Frustrated by the worsening environmental impacts of coal mining around Muara Maung, Sumhayana and other villagers visited PT Muara Alam Sejahtera, or PT MAS, one of three coal mining companies operating near the village, on July 16. The residents urged the company to take responsibility and help address the recurring floods that have plagued the community for years.

Compensation demand

During a meeting with PT MAS representatives and officials from two other mining companies who later joined the discussion, villagers called for compensation, river normalization and the construction of flood barriers to reduce the risk of future flooding.

Sumhayana said the companies' response left villagers disappointed. Instead of offering immediate solutions, she said, representatives asked for a week to consult with their respective management teams.

"I was disappointed with their response. Flooding has happened repeatedly. They should have acted faster. It has been ignored for months, and now they are delaying it again," Sumhayana said.

The Jakarta Post contacted PT MAS seeking clarification on Muara Maung residents' complaints about flooding and environmental impact. The company confirmed the July 16 meeting with residents but declined to address the specific concerns raised.

According to Statistics Indonesia, the country exported roughly 524 million metric tons of coal for all uses in 2025. Data from the International Energy Agency confirms Indonesia holds its spot as the world's largest exporter of thermal coal used for power generation.

The Iran war triggered a brief price spike, increased Asian gas-to-coal switching, and caused Jakarta to loosen strict planned production cuts.

Indonesia initially planned to cut 2026 production down to 600 million tons, but the war prompted the government to raise output quotas back up and consider centralized state export controls, according to Heatmap News, a new media company focused on climate change.

THE JAKARTA POST—AGENCIES

524 million tons

According to Statistics Indonesia, the country exported roughly 524 million tons of coal for all uses in 2025.

The women nursing Malaysian rainforests

As Taisa Mating, a grandmother of nine, bends down to pick up a seed from the forest ground, she sometimes pauses and whispers to it.

"Please don't die. I'm going to take care of you," she would tell the seed. "When you're big enough, I'm going to give you a big playground where you can grow into the tree you're meant to be."

The seeds that Taisa, 67, gathers are destined for Lower Kawag, part of the Ulu Segama-Malua Forest Reserve, where Sabah is restoring one of its most degraded rainforest landscapes. Decades of intensive logging between the 1980s and 2007, together with major El Nino-induced fires, have left large swathes of the forest degraded and vulnerable to recurring fires.

Taisa is one of the women from Kampung Tampenau, a small village on the edge of Sabah's rainforest, who have been trained to sow the seeds of forest regeneration under a scheme that started in 2021. The seeds collected are sown in backyard nurseries in their villages and eventually grown into young trees to replenish the rainforest.

Whenever their backyard nurseries run low on seedlings, the Kampung Tampenau women head to the forest's edge carrying plastic pails or any containers they have at hand. Their eyes scan the ground for fallen seeds — hidden beneath leaves and forest debris.

Most of the seeds are collected from forest fringes surrounding the village, where many native species naturally regenerate. On other days, when certain species can no longer be found nearby, the villagers obtain permits to venture deeper into the shaded forest reserve to gather "wildings" — fragile, inch-tall sprouts which can be found growing quietly in the damp, silt-rich earth where the river slows.

Sabah, in eastern Malaysia, was home to nearly 1.5 million hectares of oil palm plantations in 2025. It is Malaysia's largest producer of the crop while also ranking among the world's richest biodiversity areas.

The palm oil industry has long faced international scrutiny over its role in tropical deforestation. However, through the Malaysian Palm Oil Green Conservation Foundation, or MPOGCF — funded by levies collected from the industry — Sabah has brought the sector into initiatives to help the rehabilitation of 2,500 hectares of degraded forest in collaboration with local communities.

In Kampung Tampenau, the seeds are nurtured in small nurseries beside the villagers' homes. The community nursery raises native seedlings for the restoration program.

To the untrained eye, one seedling looks much like another. The women of Tampenau know better.

Long before the nursery program began, they already understood the forest. The training, conducted jointly by MPOGCF and the Sabah Forestry Department, focused on nursery management and improving the survival of seedlings rather than teaching them how to recognize the trees.

Since the program began five years ago, the community has produced about 80,000 native saplings.

Villagers receive a total of RM7 ($1.7) for every sapling. Out of this, they earn RM5, while the remaining RM2 covers operational and transportation costs.

Once the saplings reach between 1 meter and 1.5 meters tall, they are moved deep into the forest.

Restoring native vegetation improves the habitat of Sabah's estimated 10,800 critically endangered orangutans and other wildlife while helping reduce human-wildlife conflict around the reserve.

Firebreaks, which are nonflammable gaps in vegetation, have also been incorporated into the restoration area to reduce the risk of future fires in a landscape that remains vulnerable during prolonged dry spells.

Fast-growing native species like Laran, Binuang and Talisai Paya — termed pioneer trees — are the first type of trees to be replanted. They quickly establish a canopy over degraded land, shielding the ground from direct sunlight and creating favorable conditions for slower-growing hardwoods to take root. In just three years, some pioneer trees can reach the height of a two-story building.

"You cannot start with hardwoods because they need shade," explained Daniel Pamin, conservation specialist at MPOGCF. "The pioneer trees prepare the forest for everything that comes after."

Only after the canopy is established are hardwoods such as Seraya and Kapur, members of the dipterocarp family that dominate Borneo's lowland rainforests, introduced. They may take between 10 and 20 years to mature but can live for centuries, gradually restoring the layered structure of a tropical rainforest.

Fauna benefits

The sequence is equally important for wildlife.

Orangutans prefer building nests in the softer branches of pioneer trees because they are easier to bend and break, a Sabah Forestry official said. As the forest matures, the returning mix of native trees gradually restores food, shelter and nesting habitats not only for orangutans, but also for sun bears, rhinoceros hornbills and many other species that depend on an intact rainforest.

"Rainforests can regenerate naturally, but the process is much slower once they have been severely degraded," Daniel added.

"Human intervention helps accelerate that recovery."

Jackly Ambrose, a conservation officer at the Sabah Forestry Department, said the primary hurdles in natural regeneration in degraded areas include a severe lack of seed sources, nutrient-depleted soils, and invasive weeds that choke out saplings.

So far, restoration work has been carried out across 225 hectares under the pilot project, which comprises the first and the second phases of the 10-year conservation plan launched in 2019. The pilot project is about 90 percent complete.

The third phase, to commence in October 2026, aims to rehabilitate another 332 hectares through the planting of about 132,800 native saplings, many of them raised in local community nurseries.

For Taisa, however, the work has never been about making money.

The payment is modest, she said, but caring for each seedling over months demands patience more than anything else.

She knows she may never sit beneath the shade of many of the trees she has helped nurture. But she hopes future generations will.

Border barrier

Relatives and friends wait by a fence topped with barbed wire for the return of people who had previously crossed into Spain's North African enclave of Ceuta, at Morocco's Bab Sebta border crossing on the outskirts of Fnideq on Sunday. As many as 60,000 migrants entered Ceuta in recent days, mostly swimming around the small border post that juts into the Mediterranean Sea, in an unprecedented surge that prompted an international crisis for Spain. The mass crossing resulted in at least 72 deaths. ABDEL MAJID BZIOUAT / AFP

Tariffs risk fragmenting trade

Increasingly institutionalized US policy will cause damage to economies: Analysts

By **YANG RAN**
yangran1@chinadaily.com.cn

As a new wave of sweeping US tariffs took effect, experts warned that Washington's tariff policy is becoming increasingly institutionalized, a shift that risks deepening the fragmentation of global trade and causing lasting damage to both the US and world economies.

The latest round of tariffs, ranging from 10 to 12.5 percent on imports from 60 economies, was imposed on July 24 under Section 301 of the Trade Act of 1974, seamlessly taking effect after the expiration of the previous 10 percent global tariffs.

The move is part of a concerted effort by the US government to restructure the legal foundations of its tariff strategy, following the Supreme Court's decision in February to strike down its previous reciprocal tariff policy.

A series of further trade measures are anticipated in the coming months, including the ongoing Section 301 investigations into "excess capacity and production in manufacturing sectors" and pending probes initiated under Section 232 of the Trade Expansion Act of 1962 on national security grounds, which could soon translate into new tariffs.

John Ferguson, global head of trade and geopolitics at Economist Enterprise, said the US tariff policy is becoming more institutionalized as the administration seeks a more durable legal footing.

> "The global supply chain will become more fragmented and divided."
>
> **Tu Xinquan**, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing

"Measures introduced under Sections 301 and 232 are on firmer ground," he said. "Tariffs imposed under these mechanisms are likely to prove more durable because they follow a well-defined statutory process. That gives businesses greater certainty about how tariffs are imposed, but it also makes them harder to challenge in court."

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, echoed this view, saying the tariff policy is likely to persist for a considerable period, even surviving administration changes. He attributed this to a growing belief in the US that globalization has harmed US interests.

"They see tariffs as correcting past errors in trade policy," Tu said.

Daniel Tannebaum, a partner at Oliver Wyman, an international management consulting firm, highlighted the self-reinforcing nature of restrictive policies in an article for the World Economic Forum.

He said the reallocation of capital and production under such policies creates constituencies that benefit from their continuation, making them politically difficult to reverse.

If the US persists with protectionist tariffs for years, experts warned, the result will be a deeply fragmented global trade and supply chain system.

Wang Yong, a professor at Peking University's School of International Studies, said the US is unilaterally discarding the WTO's principle of nondiscrimination to build a tariff framework that serves its "America First" policy, using its market leverage to force concessions from other nations.

Such a discriminatory tariff policy will further erode the WTO's authority and push the global economy back toward a framework governed by bilateral negotiations, he said.

Ferguson said that companies increasingly expect higher US tariffs to remain in place for years. "In response, many are adopting a 'world-minus-one' strategy, treating the US as a distinct market requiring its own supply chains, sourcing decisions, and investment plans, while expanding elsewhere."

This shift is reinforced by other nations' policymakers signing free-trade agreements to signal their commitment to open and predictable commerce, he said.

Bifurcated supply chain

Tu predicted a bifurcated global supply chain.

"The sheer size of the US market will compel companies to build industrial systems tailored to US policy, creating a system largely separate from the rest of the world," Tu said.

"Meanwhile, a more open system will emerge outside the US, with the Asia-Pacific and Europe playing key roles. Though more integrated and liberalized, it will remain constrained by the US system. Overall, the global supply chain will become more fragmented and divided."

The economic fallout is already visible. A World Economic Forum report released in June estimates that current fragmentation is reducing global GDP growth by between $213 billion and $307 billion and raising inflation by 0.2 to 0.3 percentage points.

For the US, the costs are also substantial. The Tax Foundation estimates that the announced and imposed tariffs will increase household taxes by an average of $900 in 2026 and reduce long-run US GDP by 0.4 percent.

Tu warned that prolonged tariff policies will keep the US economy in a state of high inflation and high costs, raising production costs for US companies and reducing their international competitiveness.

Ferguson said tariffs are likely to weigh on growth over time by reducing trade, competition and productivity.

"But those effects will take time to emerge. The economy continues to benefit from a powerful wave of investment in artificial intelligence, while trade accounts for a relatively small share of US GDP. As a result, the near-term outlook remains stronger than the longer-term trajectory implied by a more protectionist trade policy."

UK's AstraZeneca eyeing $400b merger, report says

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

The United Kingdom's second-most valuable listed company, pharmaceutical firm AstraZeneca, has been revealed to have been holding talks for some time with United States-based rival Bristol Myers Squibb, or BMS, about a merger, which could result in a global pharma giant worth nearly $400 billion.

The Financial Times reports that talks have been taking place for some months, although a deal is not yet thought to be close. If the merger between the British company, valued at $264 billion, and its US counterpart, worth around $133 billion, goes through, it would result in the global drug sector's fourth-largest company.

AstraZeneca declined to comment and BMS did not immediately respond to requests for comment, according to the FT.

Around the world, AstraZeneca generated $58.7 billion last year, and it has set itself a target revenue figure of $80 billion by 2030, which is why it is so keen to make further inroads into the US market, which already accounts for almost half of its revenue.

Key role

But the company's involvement in China will also play a key role in efforts to reach that target, especially since in January this year, during then-prime minister Keir Starmer's visit to China, AstraZeneca announced investments worth $15 billion in China up until 2030, to expand its medicine manufacturing and R&D.

Pascal Soriot, AstraZeneca's CEO, said the investment, which will see existing manufacturing facilities in Wuxi, Taizhou, Qingdao, and Beijing developed, plus the establishment of other sites yet to be revealed, "begins an exciting next chapter for AstraZeneca in China, which has become a critical contributor to scientific innovation, advanced manufacturing, and global public health".

In 2014, the US drug company, Pfizer, made a bid for AstraZeneca valuing the drugmaker at around $94 billion, when its reputation had suffered after the late-stage clinical trial failure of several drugs. Soriot was one of those who rejected the bid, and in the subsequent years, under his stewardship, the company's reputation and finances have been restored, with its cancer treatment drugs performing particularly well.

If a deal is reached between AstraZeneca and BMS, however, that would not necessarily be the end of the story, as such a merger would be subject to both political and business scrutiny.

Given that BMS also has a significant cancer division, antitrust scrutiny may be applied to the companies' combined presence in the cancer drug market, and there could also be concerns in the UK that AstraZeneca may use a major trans-Atlantic deal to relocate the heart of its business from its current headquarters in Cambridge, England.

Israel voices concern over Hamas disarmament deal

TEL AVIV/GAZA — Israel has shared "serious security concerns" with the White House regarding the proposed disarmament deal with Hamas, an Israeli official said as Israeli strikes overnight and into Sunday evening killed at least 18 people, including children, in Gaza.

The remarks by Doron Spielman, spokesman for Israeli Prime Minister Benjamin Netanyahu's office, were some of the first public comments since US President Donald Trump announced the agreement.

Spielman told The Associated Press that Israel's intelligence assessment is that Hamas remains committed to rebuilding its military rather than genuinely demilitarizing. He said the Israeli military would not withdraw from Gaza — where it controls more than 60 percent of the territory — before Hamas disarms.

"Our assessment is that if we redeploy before Hamas is truly disarmed, it will quickly expand its presence throughout Gaza, rebuild its terrorist infrastructure, once again threaten Israeli communities, and seek to carry out another Oct 7-style attack," he said, referring to the militant attack on Israel in 2023 that set off the latest conflict in the Gaza Strip.

His comments come days after Hamas said it would begin disarming as part of the US-brokered ceasefire signed nine months ago to end the nearly three-year-long conflict. It marks a potential breakthrough in ending the conflict, but many hurdles, conditions and long timelines remain.

Trump's 20-point ceasefire plan calls on the militant group to surrender its weapons and destroy its vast network of tunnels. It also envisions Israeli forces withdrawing from Gaza, the arrival of a new technocratic Palestinian government, deployment of an international security force and the rebuilding of the battered Palestinian enclave.

The disarming of Hamas has been a sticking point and has deadlocked negotiations for months. In announcing the deal on social media on Thursday, Trump said it would be carried out in "carefully structured phases".

A copy of the agreement obtained and verified by the AP said all weapons held by the Hamas-run police will be transferred to the US-backed Palestinian technocratic committee, known as the National Committee for the Administration of Gaza, upon its arrival in the enclave.

A process to decommission and store heavy weapons and to dismantle military production sites and tunnels will begin after the arrival of the Palestinian committee and the deployment of international forces. The process will be linked to a phased Israeli withdrawal, according to the agreement.

Since the ceasefire was signed last October, Israel has continued its strikes in Gaza, saying it's targeting Hamas and its infrastructure.

Strikes continue

Israeli airstrikes hit Gaza for the second straight day on Sunday, killing at least 18 Palestinians, medics said. The strikes have continued despite announcements of progress in efforts to implement a ceasefire agreement.

Mahmoud Basal, spokesman for the Civil Defense in Gaza, told Xinhua that Israeli drones and helicopters had carried out more than 10 airstrikes since the early hours of the morning in various parts of the enclave.

The strikes targeted residential apartments, tents sheltering displaced people, civilian vehicles, and Palestinian gatherings from the north to the south of the Gaza Strip, resulting in the deaths of at least 18 people, including four children and two women, said Basal.

In a news statement, Hamas called on the mediators and guarantors of the ceasefire agreement to assume their responsibilities, condemn these "Israeli crimes against the Palestinian people", and to take immediate action to pressure Israel to cease its aggression in accordance with the agreement.

Briefly

UNITED STATES

Fires in Washington state burn 600 homes

Wildfires in eastern Washington state forced the evacuation of 60,000 people in the Spokane area while destroying at least 600 homes, businesses and other structures, authorities said on Sunday. The fires in and around Spokane, the state's second-largest city, burned about 21 square kilometers over the weekend and were among dozens of wildfires across Western US that stretched the ability of federal, state and local agencies to fight them. About 1,000 square kilometers have burned across the state, and some of the fires, including those in the Spokane area, remain uncontained.

UKRAINE

Umerov to head foreign intelligence service

President Volodymyr Zelensky put Ukraine's chief negotiator in charge of foreign intelligence on Monday, the latest move in an ongoing shake-up that included replacing the defense minister in July. Zelensky said Rustem Umerov, who moved to the post of spy chief from his previous job as head of the advisory Security Council, would remain in charge of peace talks, tasking him with continuing to seek a diplomatic end to the Russia-Ukraine conflict. Former interior minister Ihor Klymenko would take over as head of the Security Council. Zelensky has been moving senior officials among top posts since an abrupt cabinet purge last month.

EGYPT

Quake strike activates quick response plans

A magnitude 5.5 earthquake shook eastern Egypt early on Monday, prompting authorities to activate response plans although there were no immediate requests for emergency help. The tremors were felt across a wide area, waking AFP journalists across Cairo and reaching as far as El-Arish near Egypt's border with the Gaza Strip. The quake struck about 40 kilometers north of the city of Suez, according to Egypt's National Research Institute of Astronomy and Geophysics, which revised an earlier estimate of 5.2. The US Geological Survey put the shallow tremor at magnitude 5.0, revising down an earlier reading.

COMMENT

Editorials

When sneakers, sunflower seeds are policed, 'rights' become a joke

An opinion article published in The Hill on Saturday has an all-too-familiar ring to it. In the article, Sam Brownback, former US ambassador-at-large for international religious freedom, and former NBA player and activist Enes Kanter Freedom argue that NBA superstar Stephen Curry's commercial partnership with Chinese sportswear company Li-Ning is a moral failing.

The article makes the so-called Xinjiang "forced labor" issue less a subject for careful inquiry than a convenient stage prop in Washington's favorite geopolitical drama.

Ever since Washington officially embraced its politicized "allegations" surrounding the Xinjiang "forced labor" issue in 2020, a growing chorus of politicians, advocacy groups and commentators have treated normal commercial interaction involving the Xinjiang Uygur autonomous region as an ethical litmus test.

In the article, Brownback and Freedom write, "These are not careless accusations. They are specific charges documented by the US government and corroborated by international investigators."

But, documented by whom? The US Department of Labor's own report on the situation in Xinjiang is a principal foundation for the claims. Yet the report itself was produced by the department's Bureau of International Labor Affairs. Its reference list is replete with mentions of US government agencies and congressional bodies, alongside German "anthropologist" Adrian Zenz and reports from Washington- and Taipei-sponsored think tanks.

That does not automatically invalidate the report. But it does complicate the confident image of broad, independent corroboration presented by Brownback and Freedom. When the same network of institutions quote one another to support the same conclusion, skepticism is only due diligence.

The same scrutiny extends to Adrian Zenz, who has become perhaps the most frequently cited Western "researcher" on Xinjiang. But his institutional affiliations, advocacy commitments and methodology deserve far more examination than they typically receive in media coverage. His work is often treated less as a contribution to a contested academic debate than as settled scripture paid for directly or indirectly by Washington.

Curiously, those who constantly urge others to "follow the evidence" seldom encourage readers to follow the footnotes.

Meanwhile, the political economy behind the US' Xinjiang sanctions receives remarkably little attention. On Friday, another 43 Chinese companies were added to the so-called "Uyghur Forced Labor Prevention Act Entity List", bringing the total number of sanctioned Chinese entities to 187. Related restrictive measures take effect on Monday.

The restrictions now extend well beyond cotton to industries ranging from metals and mining to electronics, agriculture and food products. Even Chinese sunflower seeds are regarded as a "concern" to US "national security".

These measures are commonly framed as "human-rights" enforcement. But they are in essence reshapers of markets. By excluding Chinese competitors from US supply chains, they inevitably create opportunities for US producers, alternative overseas suppliers and an expanding compliance industry built around supply-chain auditing, legal consulting and regulatory certification.

Commercial consequences must not be treated as incidental as the "Entity List" becomes longer and longer. What emerges is an ecosystem in which politicians, advocacy groups, think tanks, lobbyists, researchers and "sympathetic" media outlets reinforce one another's narratives, each citing the others as confirmation of a consensus they have collectively constructed.

This echo chamber is presented as the appearance of overwhelming "certainty" while discouraging serious examination of underlying assumptions.

That is why Brownback and Freedom's article ultimately says less about Stephen Curry or Li-Ning than about a political culture increasingly inclined to convert normal business deals into a geopolitical battlefield. It is easier to police sneakers than to scrutinize evidence. It is easier to stage another morality play than to confront the possibility that, in the age of strategic competition, conscience can become just another instrument of a zero-sum game.

Manila's double game puts peace at risk

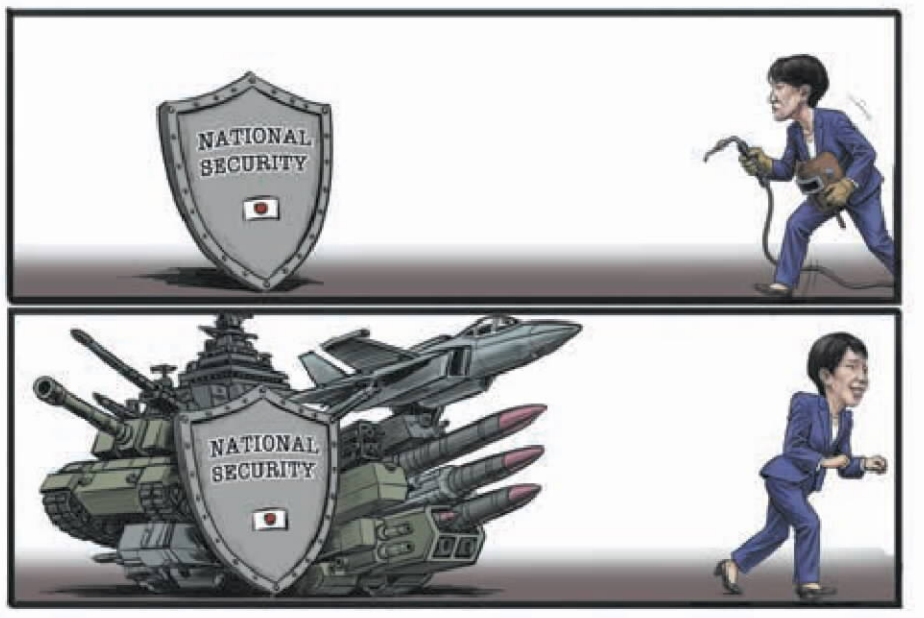
The contradictory approach the Philippines adopts in its handling of maritime disputes makes one wonder what exactly Manila is hoping to achieve. The recent remarks of Philippine Defense Secretary Gilberto Teodoro Jr serve as the latest evidence of such inconsistency.

According to reports, Teodoro Jr, who has already been sanctioned by Beijing for making unfounded remarks which undermined China's interests and bilateral ties between China and the Philippines, called for Philippine officials "who side with China" on the "West Philippine Sea issue" to resign at a forum on July 29, ignoring the fact that the "West Philippine Sea" is just a term unilaterally coined by Manila to support its unlawful claims in the South China Sea. He is attempting to foster an atmosphere within Philippine political circles in which those who hold differing views on the South China Sea issue from his faction are expected to be silenced or penalized.

On the same day, Manila announced a "nautical chart" of the "baselines of territorial sea" of China's Huangyan Island, a provocation that met with a firm response from China.

On Saturday, the China Coast Guard conducted law-enforcement patrols in the territorial sea of the island; the Chinese People's Liberation Army Southern Theater Command conducted joint naval and air exercises near the island; and China issued a set of regulations to enhance the management of the Huangyan Island National Nature Reserve.

Less than two weeks ago, Philippine Secretary of Foreign Affairs Maria Theresa Lazaro told China's Foreign Minister Wang Yi that her country looks to address maritime disputes through dialogue and improve relations with China. But the latest development of the situation caused by the continued provocation by Manila, as well as Teodoro Jr's dangerous remarks, only raises doubt over whether the Philippines is sincere about engaging in dialogue or just obstinate in following the wrong path of challenging China's sovereignty.



The territory of the Philippines has been defined by a series of international treaties, and Huangyan Island has never been a part of it, rendering the Philippines' claims over the island completely baseless under international law.

After two Philippine Navy boats confronted China Coast Guard's vessels near China's Ren'ai Reef on July 20, Manila said the next day that it wants to avoid similar incidents and "reset" relations with China, only for the Philippines to then send more ships to intrude in the waters of Huangyan Island on July 24.

Whenever China and the Philippines prepare to launch dialogue, certain forces within the Philippines, particularly those from the military and law enforcement, such as Teodoro Jr, deliberately stir up trouble to derail dialogue progress. These parties harbor malicious intentions: rather than prioritizing the well-being of the Filipino people, they act on the instructions of external forces to advance personal interests.

Manila should be wary of these forces' damaging effects, rein in their dangerous games, and get rid of delusions that the Philippines will obtain illegal gains by acting as a proxy for external forces to contain China.

Opinion Line

Washington's 'renewed negotiations' tactical pause to manage expectations

Just two days after learning US economic growth slowed to 1.5 percent in the second quarter, down from 2.1 percent in the first, Washington called off an imminent strike on Iran on Saturday and announced a restart of diplomatic negotiations.

The scenario is familiar: a social-media proclamation, a promise of diplomacy and a reminder that the US military remains "locked and loaded". This is less a commitment to peace than a tactical pause driven by oil prices, midterm electoral arithmetic, financial markets and the mounting economic costs of another Middle East conflict.

The Strait of Hormuz is a barometer of presidential economic stewardship in the United States. Any prolonged disruption would reverberate through fuel prices, inflation, shipping costs and consumer confidence. For a president who campaigned on lowering living costs, an energy shock would be politically toxic. The sharp decline in oil prices after Washington announced the suspension of military action reflected investors' judgment that the risk of escalation had eased. Markets interpreted diplomacy, however tentative, as preferable to another cycle of confrontation.

The calculation extends beyond the battlefield. US Treasury Secretary Scott Bessent has championed efforts to "stabilize" the dollar, including unprecedented "coordination" with Japan to support the yen in the US interest. Those initiatives would prove unsustainable if the Gulf conflict sends crude prices soaring. As one of the world's largest energy importers, Japan would suffer a deteriorating trade balance, reigniting pressure on the yen and undermining broader financial campaigns. It makes little sense to devote political and financial capital to outmaneuvering markets, while simultaneously permitting a regional escalation to undo the very US profits those efforts are meant to capture.

Domestic politics reinforces the same conclusion. Public appetite for another prolonged Middle East crisis remains limited, while inflation and living costs continue to rank among the foremost concerns of the US public. Gasoline prices are one of the most visible measures of US economic performance. Every rise at the pump carries far greater political weight than distant military gains.

A pause in military operations therefore allows the White House to project strength while avoiding the immediate economic costs of escalation.

Perhaps the most intriguing aspect is the confusion openly expressed by Israel. According to Israeli media, Israeli Prime Minister Benjamin Netanyahu and senior officials learned of the suspension only after the US president's public announcement — which looks like a smokescreen itself — allegedly leaving Tel Aviv scrambling to determine whether the move was genuine or merely another negotiating tactic.

With these reports, Tel Aviv wants to indicate that Washington's priorities do not always perfectly align with those of its closest regional ally. Publicly highlighting differences can also serve Washington's political interests by reinforcing the perception that US policy is driven by its own calculations rather than by Israeli preferences.

That further proves that the latest pause announced by Washington is anything but a window for real ceasefire talks. Israel knows it and nods to it, but pretends otherwise. In putting on that performance Israel shows its "thoughtfulness" to the US' acute needs to simultaneously manage inflation, financial markets, alliance politics, domestic elections and global economic stability.

Washington is not pursuing a single objective — least of all peace for its own sake. It seeks to pressure Iran without becoming mired in another round of costly conflict, reassure Israel without surrendering strategic flexibility, contain oil prices without appearing weak and project strength while limiting the economic consequences of military escalation. The announcement of renewed negotiations serves primarily as an exercise in managing expectations, rather than signaling a diplomatic breakthrough. Iran, meanwhile, has its own incentives to avoid uncontrolled escalation. Tehran has continued consultations with regional countries while Omani-mediated discussions over the Strait of Hormuz reportedly continue.

Neither side wishes to appear to retreat, yet neither has much to gain from a new escalation that would impose enormous economic and political costs.

The strikes have been postponed, not abandoned. Negotiations have been announced, not concluded. Military pressure remains available if diplomacy falters. This is not simply the "art of the deal"; it is the art of preserving options. For Washington, the pause itself may be the strategy — buying time, calming markets and maintaining leverage while keeping every path, diplomatic or military, open.

But a sustainable ceasefire and long-term stability in the Middle East cannot be achieved through short-term, improvised calculations; they require a genuine and steadfast commitment to peace. It is earnestly hoped that the US and Israel, as the parties that initiated the conflict, will take the lead in demonstrating that commitment and bring about an early resolution to the crisis they have engendered.

— LI YANG, CHINA DAILY

What They Say

Corporate governance will be crucial benchmark

Editor's note: *Four Chinese financial regulators have jointly released a document outlining 22 targeted measures to improve the governance of financial institutions. The 21st Century Business Herald spoke to Dong Ximiao, chief economist at Merchants Union Consumer Finance and executive director of the Shanghai Institution for Finance and Development; and Lou Feipeng, a researcher at Postal Savings Bank of China, about the measures. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

By 2029, China will establish a desired governance framework for financial institutions. The document focuses on strengthening and improving shareholder governance. It underscores the importance of identifying major shareholders and actual controllers, which is a manifestation of thorough supervision. This approach extends regulatory oversight beyond registered shareholders to the individuals who ultimately control and are accountable for institutions, shifting the focus of supervision from mere compliance to substantive governance.

The framework also operationalizes the higher-level legal principles set out in the draft revision to China's banking supervision and regulation law. It refines the law's regulatory mandate over major shareholders and ultimate controllers into actionable rules for ownership identification and monitoring of related-party transactions.

Regulatory oversight will examine the genuine commercial purpose of related-party dealings, significantly reducing the scope for regulatory arbitrage through complex corporate structures.

The document calls for stronger risk monitoring and early-warning mechanisms in corporate governance. Tougher penalties for violations, together with a lifetime accountability mechanism, are expected to have a cleansing effect on the financial sector.

The new framework will also prevent individuals with serious compliance issues from moving freely between financial institutions, thereby reducing the risk of misconduct spreading across the sector.

In addition to stronger disciplinary measures, the document aims to improve internal governance by guiding financial institutions to establish incentive and accountability mechanisms that support sustainable development and long-term strategic objectives.

Institutions with sound governance, clear allocation of responsibilities and robust risk management will be better positioned to earn regulatory confidence and market recognition.

For large financial institutions, the primary challenge lies in managing extensive business operations and subsidiary networks, where sheer size can make effective oversight difficult. Their priorities should therefore include strengthening top-level governance, improving board oversight, checks and balances, and building group-wide look-through risk management frameworks to prevent risks from spreading across different business lines.

Smaller financial institutions should focus on removing noncompliant shareholders, eliminating hidden related-party transactions and establishing streamlined internal control systems with clearly defined responsibilities, rather than attempting to replicate the governance models of large institutions.

Institutions with stronger governance will enjoy superior risk management and greater capacity for sustainable, long-term growth, while the traditional growth model driven primarily by rapid expansion will become increasingly unsustainable, reshaping the competitive landscape.

VIEWS

Selçuk Ünal

From Bosporus to Yangtze: Turkiye-China ties at 55

Relations between the Republic of Turkiye and the People's Republic of China have gone through significant phases since the establishment of diplomatic relations in 1971. Turkiye-China relations, actually, date back to centuries. This historical bond forms the foundation of our ever growing diplomatic, economic and cultural ties.

The centuries-long trade along the Silk Road forged a path for cultural interaction between the Turkish and Chinese peoples, leading to many cultural similarities in our daily life rituals and traditional beliefs, especially regarding the importance of family and community.

Interactions between Turkish and Chinese people increased between the Ottoman Empire and Ming (1368-1644) and Qing (1644-1911) dynasties, with many Turkish and Chinese travelers journeying through the Silk Road and emperors exchanging gifts including Ottoman rifles, Chinese porcelain and silk.

In addition to those cultural interactions, both peoples also share similarities in their history. They faced external pressures, changed power balances in the international system and experienced significant transformations throughout the 19th and 20th centuries.

Turkish victory in the War of Independence was hailed by many Chinese intellectuals and political leaders of the time. Communist Party of China leaders such as Cai Hesen stated that the Anatolian victory of the Turkish people against imperialism was a development that would encourage all oppressed nations.

Turkiye has supported China's territorial integrity. Establishment of the diplomatic ties in 1971 marked the beginning of a new era in the Turkiye-China relations.

As both countries underwent processes of opening up to the outside world in the 1980s, the relationship took on a more dynamic character. Mutual contacts increased, political dialogue strengthened, and economic and trade relations gained new momentum.

Our relations have further advanced by the Chinese state visit to Turkiye in April 2000 at the invitation of Turkiye. The Joint Communique signed during the state visit expressed both sides' determination to expand the friendship and mutually beneficial cooperation, while pointing out the need for the restoration of the ancient Silk Road, paving the way for our early support to the Belt and Road Initiative.

Following that mutual visionary approach, today, connectivity is encompassing trade security, supply chains, energy flows and digital networks in our ties. For this reason, Turkiye's Middle Corridor Initiative and China's BRI provide two complementary visions. The will to align the two initiatives shows that two countries can view Eurasian connectivity from a shared perspective.

This joint perspective was underlined by the presidents of the two countries. The shared commitment of our President, H.E. Recep Tayyip Erdogan, and President Xi Jinping to develop bilateral relations provides a strong political foundation for our future. Numerous meetings between the two leaders, the latest being the meeting at the Shanghai Cooperation Organization Tianjin Summit on Aug 31, 2025, constitute a concrete demonstration of this dialogue.

Within the context of this shared vision, our economic relations developed in recent years. Trade volume increased 40-fold in the last two decades, transportation projects multiplied and mutual investments expanded.

While current economic relations unfortunately still do not fully reflect the true potential of both countries, we believe that this can be remedied by investments, tourism and other measures that are at our disposal to have a more fair, balanced, diversified and mutually beneficial relationship.

In this vein, high-quality direct investments from China into our country will create a true win-win foundation for the sustainability of our economic relations, while offering Chinese companies significant advantages in terms of access to markets adjacent to Turkiye.

Airlines connectivity have an important role not only in our economic relations, but in people-to-people contacts as well. Since tourism is the strongest point of convergence in people-to-people ties, increasing frequency of flights to 56 times per week in 2026, strengthens direct connections for tourism, trade and business. Our decision, on the occasion of the 55th anniversary, to grant visa exemptions to Chinese citizens for touristic travel and transit starting on Jan 2, 2026, demonstrates our strong commitment to increasing people-to-people contacts.

Today our world is undergoing a profound transformation. Turkiye and China stand as two ancient civilizations at the heart of this transformation.

In such an atmosphere, Turkiye's commitment to multilateralism and strengthening its relations with China is a natural reflection of our multi-dimensional foreign policy. At a time when conflicts, instabilities and uncertainties are rising, increasing mutual dialogue is more important than ever.

Turkiye-China relations should further develop on this framework. What needs to be done today is to translate this political will into more concrete projects, efficient mechanisms and active private sector participation.

We hope that the 55th anniversary of the establishment of Turkiye-China diplomatic relations will present more opportunities to transform our connection through history into a vision of partnership that is richer, more balanced and more sustainable.

The author is ambassador of the Republic of Turkiye to China.

Imran Khalid

NDB building bridges, not barriers in global finance

Monopolies in international affairs rarely collapse overnight. They tend to erode quietly, losing their grip as alternative choices emerge and parallel pathways take shape.

For generations, the plumbing of global finance was routed through a single, heavily guarded intersection in the West. If a sovereign nation wanted to build a road, modernize a power grid or stabilize a national currency, it had to navigate a rigid labyrinth of conditionalities and approvals managed by institutions headquartered in Washington and Geneva.

But now, that map is being redrawn. The change is not happening through loud diplomatic confrontations, but through the quiet architecture of institutional choice.

Zimbabwe's recent admission to the BRICS New Development Bank, announced by the country's Finance Minister Mthuli Ncube in Harare, is a striking example of this global realignment.

After years of struggling with a complex economic landscape constrained by Western sanctions, limited liquidity, and restricted access to traditional international lending markets, Zimbabwe has unlocked a vital alternative channel for development finance by joining the Shanghai-based multilateral institution.

Focused squarely on infrastructure, industrialization, and long-term economic resilience, the NDB offers Harare an opportunity to pursue its development priorities through a broader range of financing options.

This milestone is more than a routine bureaucratic measure. It is a practical blueprint for how emerging markets facing economic duress can bypass traditional bottlenecks and secure sustainable growth outside Western-dominated corridors.

The significance of this shift becomes clearer against the backdrop of starkly divergent global economic policies. In the United States and Europe, policymakers increasingly treat global commerce as an instrument of national security, erecting protectionist tariffs, subsidizing domestic manufacturing through heavy state intervention, and weaponizing financial networks to isolate perceived adversaries. The underlying philosophy in these traditional centers of power is exclusion.

Smaller and vulnerable economies are routinely expected to absorb the collateral damage of these fractured trade policies, facing sudden capital outflows and inflationary pressures driven by decisions made far beyond their borders.

By contrast, the institutional machinery in the Global South is built on a foundation of inclusiveness and connectivity. The NDB was established not to replace the existing global financial system, but to correct historical imbalances and bridge the wide infrastructure gaps across the developing world. Traditional multilateral lenders often imposed stringent, politically punitive conditionalities that compromised local sovereignty and destabilized domestic societies.

LI MIN / CHINA DAILY

The center of economic gravity is shifting, and the future belongs to nations that choose open connectivity over defensive containment.

The NDB offers a financing model centered on tangible infrastructure and sustainable development without political interference.

When nations locked out of conventional markets gain access to these independent credit lines, the unipolar monopoly of Western finance naturally begins to fray.

The implications of this model extend well beyond infrastructure development. Membership in alternative multilateral institutions offers developing nations greater flexibility in managing macroeconomic risks.

For decades, dependence on a single global reserve currency and centralized lending hubs meant that emerging economies absorbed every shock generated by foreign monetary authorities. Diversified sources of financing, and the possibility of lending in local currencies, provide a structural cushion to mitigate the risk of sudden debt distress and shield domestic markets from exchange rate volatility. It is a sophisticated mechanism for risk management, allowing sovereign states to conduct trade and development planning with greater predictability.

Zimbabwe's decision also reflects a broader trend across Africa, Asia and Latin America. Increasingly, governments are unwilling to tie their economic fortunes to a single, Western-centric system that leaves them acutely vulnerable to unilateral policy shocks, arbitrary sanctions, and sudden currency shifts.

Participation in alternative multilateral networks enables these states to insulate their domestic markets from external volatility, ensuring that local development plans are driven by national priorities rather than foreign oversight.

Moreover, this institutional expansion highlights the growing maturity of South-South cooperation. For generations, development finance was used as a tool of geopolitical compliance, ensuring that recipient nations toe a specific ideological line.

The emergence of alternative credit sources introduces a healthy element of competition and choice into the global marketplace. Sovereign states can now shop for development partners, negotiate terms that align with their domestic growth targets, and integrate more fully into regional and global supply chains without sacrificing their political autonomy.

Ultimately, the widening gap between Western economic fragmentation and the institutional growth of the Global South will dictate the contours of the global order in the 21st century.

While Western policymakers persist in building protective silos and deploying restrictive measures, the rest of the world is quietly constructing a parallel, resilient framework for international cooperation.

Zimbabwe joining the NDB is a clear reminder that when global financial institutions are weaponized for political leverage, emerging economies will inevitably build other doors. The center of economic gravity is shifting, and the future belongs to nations that choose open connectivity over defensive containment.

How to make citizens permanent residents in name and nature

Chinese cities planning to expand in scale should rethink their approach. Besides creating jobs to attract newcomers, they will also have to invest much more in housing, education and healthcare.

A document issued by the State Council, China's Cabinet, earlier this year made it clear that all city governments are obliged to provide basic public services — including education, housing, social security, and medical care — to all permanent residents who have not formally registered their household registration (*hukou*) in the place where they live.

In China, permanent residents traditionally referred to people who had *hukou* in the place of their birth. But thanks to millions of farmers migrating to the cities in search of jobs in the past decades, permanent residents can even include those who might have their *hukou* elsewhere but have been living, working and studying in a particular city. Of late, such numbers have been rising rapidly, as millions of university graduates get jobs in big cities where they don't have a local *hukou*.

It is estimated that nearly half of the residents in cities such as Beijing, Shanghai and Shenzhen have their *hukou* elsewhere.

China had been an agricultural society for thousands of years. Until 50 years ago when I was young, about 70 percent of the country's population lived and worked in rural areas.

Today, it is the opposite. Under the household registration system, people used to be registered in their place of birth and relied on the local government there for social welfare benefits.

To make their environment more migrant-friendly, many cities have taken their own measures to help migrants settle down.

That system made human mobility difficult, if not impossible. But with the gradual elimination of the ration system in the late 1980s, millions of farmers left home for higher-paying jobs in the cities.

It is estimated that about 300 million former farmers and their families now live and work in cities other than the ones where they have their *hukou*.

But despite living, working and studying in the cities for years, they and their families remain "farmers from outside the city". In the absence of local *hukou*, they have been denied the benefits of many welfare projects, such as low-rent housing, seats in public schools, urban medical insurance and other benefits that residents with *hukou* take for granted.

Transferring *hukou* from their hometowns to the cities they live in now remains a difficult task. China is promoting urbanization and many cities, in order to grow in population size and influence, are working hard to attract migrant workers from other regions. However, the migrants are not being welcomed unconditionally.

Some tier-1 cities offer *hukou* only to those who are young, have at least a bachelor's degree or hold stable professional jobs. Smaller cities are willing to accept those who purchase houses or run businesses in the area.

As for those who don't have a good educational background and/or substantial money, a point-based household registration system has been adopted. Under this system, applicants for *hukou* can keep accumulating points on the basis of duration of stay, taxes paid, investments made and professional positions held until they have enough points to obtain a local *hukou*.

For years, there have been suggestions to do away with the *hukou* system. But apparently the central authorities have decided to take a more cautious approach. The *hukou* system has been in place for a long time and a hasty withdrawal may lead to consequences we are not prepared for.

To make their environment more migrant-friendly, many cities have taken their own measures to help migrants settle down.

Social security and medical insurance now cover more permanent residents, including those who don't yet have a local *hukou*. Local public schools are offering more seats to migrants' children.

The new State Council document can be regarded as a nod in this direction and requires local governments to do more. When making future development plans, urban planners will have to increase the supply of low-rent housing not only for the disadvantaged groups with local *hukou* but also for the permanent residents without *hukou*.

The cities may have to build more kindergartens, public schools and other facilities for children of these new residents.

According to the document, all permanent residents, with or without local *hukou*, should be treated equally with regard to housing, job opportunities, poverty relief, education, social security, medical care and access to public services.

Once all these requirements are effectively met, *hukou* would become less important and permanent residents would become permanent residents both in name and nature.

GLOBAL VIEWS

POMPEO DELLA POSTA

Change of perspective

The problem is not economic globalization per se, but the neoliberal belief that it does not need to be regulated and managed

For many years, economic globalization was presented in developed countries as a great promise. The opening of markets, the expansion of international trade and the integration of economies were expected to generate greater prosperity for everyone. The most common metaphor was that of a rising tide lifting all ships: If the global economy grew, all countries and social groups would eventually benefit. Moreover, trade liberalization, the removal of economic barriers and the expansion of global value chains were considered almost inevitable processes. The dominant belief was even that there was no real alternative to a more open global economy, as synthesized by the famous slogan "There is no alternative" (TINA), coined by the former United Kingdom prime minister Margaret Thatcher.

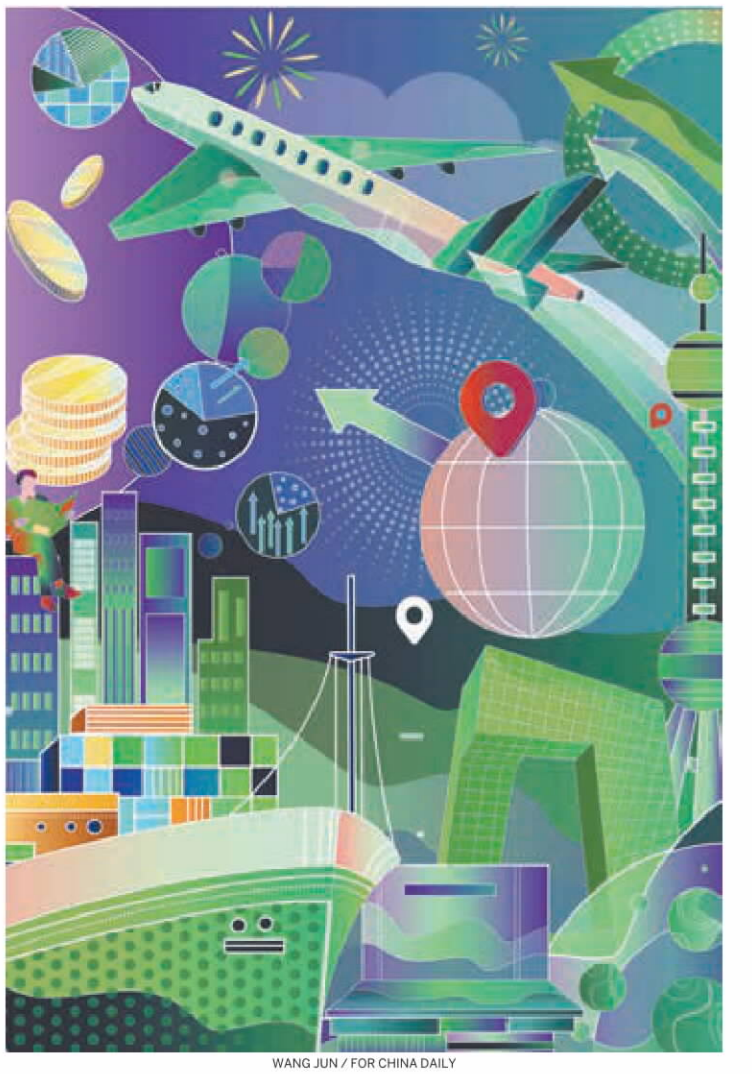
Today, however, in advanced economies that narrative has changed dramatically. Economic globalization is increasingly portrayed as one of the causes of their industrial decline and growing inequality, despite the fact that the GDP per capita of the United States, for example, has continued to grow faster than that of most other advanced economies.

At the same time, advanced countries accuse China of being one of the main beneficiaries of economic globalization due to the adoption of what they usually call "unfair" measures, resulting in a development strategy, which is different from the model promoted by Western economies.

It is certainly true that China combined openness to international trade with a strong role for the government in building productive capacity, infrastructure and technological capabilities. Yet the Chinese approach is not an unprecedented exception in economic history. Practices that are now criticized as unfair or distortionary were used by today's advanced economies during their own rise. The UK protected its economy before embracing unconditional free trade, made possible by the technological superiority it had gained through the Industrial Revolution. In France, in the late 17th century, Jean-Baptiste Colbert theorized mercantilist policies to favor his country's economic development. The US, following Hamilton's "Report on Manufactures" (1791), protected emerging (infant) industries through moderate tariffs, "bounties" (subsidies) and other public policies designed to foster industrialization. Those policies were instrumental in transforming the US into the world's leading industrial economy. Germany emphasized the importance of building domestic productive capabilities before fully exposing its economy to international competition. Japan's postwar economic transformation was supported by close cooperation between government and industry through the Ministry of International Trade and Industry, which promoted targeted industrial policies.

To borrow a famous metaphor, all of today's advanced countries developed by "climbing a ladder" made of mercantilism, industrial policies and public subsidies, but once they reached the top, namely their economic development, they "kicked that ladder away", arguing that public intervention would not be legitimate anymore and embracing neoliberal policies, those that allowed them to preserve their technological and economic leadership: it is probably no coincidence that when Western economies held a dominant position in many technological sectors, they were widely in favor of global openness, while today, as China has become a major competitor in several high-value industries, their view has changed.

Economic globalization has undoubtedly produced enormous benefits both in advanced and emerging economies. It has allowed consumers around the world to access cheaper products and enabled Western companies, aided by technological advances, to expand internationally and dramatically increase their profits. It has also contributed to lifting hundreds of millions of people — especially in China — out of poverty.



However, it has also imposed costs on specific social groups in advanced economies. Some industrial regions, unskilled workers and vulnerable communities experienced significant disruption, mostly because of the lack of sufficient support to adapt to new economic conditions, while gains concentrated at the top. The faith in the self-regulating virtues of free markets and in neoliberal principles was such that they refused the idea that economic globalization should be accompanied by regulatory and compensatory measures.

When the financial crisis of 2008 hit Western middle classes as well, after the disruptions suffered over the previous couple of decades by blue-collar and unskilled workers, however, confidence in that promise began to weaken and the narrative on economic globalization changed dramatically.

When that happened, China became the ideal scapegoat and started being blamed, especially because it emerged as a credible competitor in areas such as electric vehicles, batteries, semiconductors and artificial intelligence: the same governments that for decades had been preaching free markets started rediscovering the vocabulary of industrial policy, national security and strategic autonomy, and tariffs on Chinese EVs, export controls on chips and investment screening mechanisms started being introduced.

The problem, however, is that rather than acknowledging the economic, protectionist nature of those measures, the US-led Western countries mostly justify them with the need to protect their national security. Protecting certain strategic economic sectors, investing in research, supporting technological capabilities and caring about the most vulnerable citizens, can be legitimate and even necessary protectionist policies: however, they should not be disguised as measures of "protection" against generic, hypothetical and unjustified foreign threats, since doing so risks undermining peaceful relationships between countries, therefore creating an unnecessary and dangerous new Cold War environment.

Advanced countries should not fear calling "protectionism" by its proper name, instead of disguising it as "protection" of national security. They should recognize explicitly that the problem is not economic globalization per se, whose overall benefits are undeniable, but its lack of management and regulation, implemented through redistributive policies.

WANG JUN / FOR CHINA DAILY

The world needs a different form of globalization, what I would call "enlightened globalization": One that abandons the prescriptions resulting from neoliberal economics, is better governed and is capable of protecting those who bear the costs of economic transformation. This objective can only be achieved by combining a cooperatively open international environment with effective domestic public policies: advanced economies should invest in education and skills, support innovation and strategic infrastructure, adopt redistributive policies to be financed through progressive taxation, and implement measures to contain their quasi-monopolistic market structures.

ZHANG GUIHONG

A call for transformation

In the age of multilateralism, a new leadership will herald a more efficient, fair and powerful 'UN 2.0', steering it forward against multiple challenges to its authority, efficacy and representation

The world is watching closely as seven candidates move into the final stages of the race to become the 10th secretary-general of the United Nations.

In recent months, UN General Assembly President Annalena Baerbock has facilitated interactive dialogues and held a town hall debate among the candidates, member states and civil society representatives. Each candidate has articulated his/her vision for the UN's three pillars — peace and security, development, and human rights — and answered rigorous questions.

According to current rules, the secretary-general must be recommended by the Security Council and appointed by the General Assembly. The Security Council will conduct closed-door straw polls, and a candidate must secure at least nine votes without a veto from any of the five permanent members to move forward. Traditionally, from the perspective of regional rotation practices, the next secretary-general should come from Latin America. From the perspective of historical fairness, the UN has never had a female secretary-general in its 80-plus years of existence, and the calls for a woman to hold the position are growing louder. Four candidates meet both criteria, yet none has secured unanimous support from the five permanent members.

However, the question of "how to lead" outweighs "who will be elected". UN General Assembly President Baerbock emphasized the need for strong, principled and effective leadership.

The multilateral system centered on the UN faces its toughest time since the end of the Cold War, including erosion of its authority, ineffectiveness of its resolutions and operations, geopolitical fragmentation, distrust among major powers, financial crises and unbalanced global governance. The UN requires a transformative leader; not a conventional "chief administrative officer", but a "new leader" who is bold, connective and courageous.

WANG XIAOYING / CHINA DAILY

This new leadership should manifest in nine key dimensions.

First, rebuilding trust and reducing division. Amid unilateralism, major-power competition and regional conflicts, the international community suffers from a severe trust deficit. The new secretary-general should act as a bridge-builder, fostering trust not only among member states but also between the UN and the global public. This role demands not just an administrative leader but a political leader capable of uniting a divided world.

Second, balancing the three pillars of peace. Peace and security, development and human rights are intrinsically linked and interdependent. While balancing these pillars is a global consensus, member states have divergent interests. The new secretary-general should possess systemic thinking and strategic coordination skills to find common ground and translate ideals into practical results.

Third, resolving financial crises. With some major powers chronically defaulting on dues, the UN faces a liquidity crisis, forcing budget and staffing cuts. The new secretary-general should drive fundamental financial reforms to restore member states' trust in the UN, demonstrating excellent management skills to both "increase new revenue" and "cut expenses", while exploring new partnerships with the private sector for diverse and stable funding.

Fourth, upholding UN authority and effectiveness. In a rapidly changing global landscape, maintaining the UN's authority and effectiveness is the secretary-general's most fundamental and challenging mission. The future leader must reform the UN to reclaim its credibility, helping it better balance the interests of all member states and grow into an effective platform to lead global agendas and solve practical problems.

Fifth, accelerating the 2030 agenda and planning beyond. With only four years left until 2030, Sustainable Development Goals lag significantly behind schedule, with massive funding gaps amid multiple crises. The future secretary-general must act as both mobilizer and designer, sprinting toward current goals while strategically planning the post-2030 global development agenda, requiring diplomatic wisdom and strategic foresight.

Sixth, addressing underrepresentation of developing countries. This issue is not just about human resources but fundamentally concerns the UN's credibility and legitimacy. Many small and medium-sized countries are long underrepresented — a structural institutional flaw. The next secretary-general should go beyond symbolic appeals and traditional manager roles, driving substantive change with political resolve, diplomatic skill and execution capability.

Seventh, advancing systematic UN reforms. From Our Common Agenda to the Pact for the Future and the UN80 Initiative, the vision, goals and paths for reform are clear. The key lies in execution. The next secretary-general should steer reforms to strengthen the UN, including translating visions into actionable plans, enhancing work quality and efficiency, and leading the UN's active role in governance of emerging fields, such as artificial intelligence, to tackle future complex challenges.

Eighth, strengthening relations with civil society and the private sector. As transnational challenges grow more complex, global governance demands higher standards. The next secretary-general should connect governments, civil society and the private sector — a necessity for achieving the 2030 goals and rebuilding trust and effectiveness in multilateralism. The secretary-general must have political appeal and action-oriented leadership, innovatively building inclusive, effective partnership networks to inject new vitality into the UN.

Ninth, building relationships with the secretariat, member states and global citizens. The post of the UN secretary-general carries extremely heavy responsibilities and the new secretary-general must build a team that efficiently serves member states and global citizens as the Secretariat's "chief executive officer". As a servant and coordinator of 193 member states, the secretary-general must carefully balance service and independence; they must advocate for the vulnerable. Building these relationships requires moral courage, political wisdom and excellent communication skills.

As a permanent member of the Security Council, China plays a crucial role in the election of the UN secretary-general. China has expressed its commitment to participating responsibly in the electoral process, supporting the UN in revitalizing its authority and energy to better serve as the core of global governance. China's criteria for the next secretary-general are clear and firm: adherence to the Charter, outstanding capability, fairness and accountability.

The world stands at a crossroads of multilateralism. A secretary-general with new leadership could help transform the UN into a more efficient, fair and powerful UN 2.0, helping the UN overcome its current difficulties, shortcomings and deficiencies.

8 new nuclear reactors given full approval

Nation cementing dominance in global push for next-generation clean energy

By ZHENG XIN
zhengxin@chinadaily.com.cn

China recently greenlit eight new nuclear reactors, accelerating its atomic energy expansion and cementing its dominance in the global push for next-generation clean energy.

With a pledge to construct and operate the units according to the world's highest safety standards, the move underscores the nation's commitment to achieving its ambitious climate targets — peaking carbon emissions before 2030 and achieving carbon neutrality before 2060.

Six of the new reactors will employ the domestically designed Hualong One, China's third-generation nuclear power technology with full intellectual property rights. It is also one of the most widely accepted series of third-generation nuclear power reactors in the world.

For industry observers, the timing of these approvals carries immense strategic weight. As the inaugural batch of the 15th Five-Year Plan (2026-30) period, these projects set a definitive tone for China's energy blueprint during the most critical window for its climate commitments.

The 15th Five-Year Plan period represents the decisive sprint toward China's goal of peaking carbon emissions before 2030, said Li Jinkai, a distinguished professor at the School of Economics at the Beijing Institute of Technology.

"As a clean and stable baseload power source, the approval and construction of these new projects signal that China's nuclear power construction has firmly entered a stage of large-scale, batched and normalized development," Li said.

Nuclear projects also help promote investment growth, stabilize economic operations and attract private capital, he added.

The maturity of Hualong One has been fully validated through its large-scale deployment. Currently, 10 Hualong One units are in commercial operation domestically and internationally, with another 37 approved or under construction.

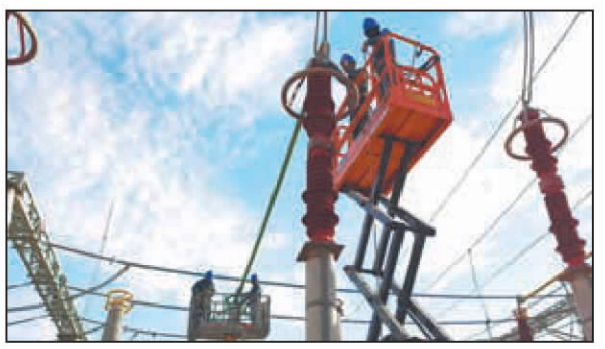
This cements its position at the forefront of global third-generation nuclear power, according to China General Nuclear Power Group.

A single Hualong One unit generates nearly 10 billion kilowatt-hours of electricity annually. This output can meet the demand of a medium-sized city of over 1 million people for a year, it said.

Furthermore, its research and construction have integrated a complete supply chain of nearly 6,000 upstream and downstream enterprises, effectively steering the upgrading of China's manufacturing sector, it said.

The steady approval pace — with 10 or more reactors greenlit annually from 2022 to 2025 — has translated into robust green energy output.

According to the National Energy Administration, the country's nuclear power generation reached approximately 467 billion kWh in 2025, drastically cutting standard coal use and reducing carbon dioxide emissions.



The China Nuclear Energy Development Report 2026 blue book, released by the China Nuclear Energy Association earlier, showed that by the end of 2025, China had 59 commercial units in operation with a total installed capacity of 62.52 gigawatts.

An additional 35 units totaling 41.90 GW were under construction, maintaining China's global top spot for under-construction capacity for 19 consecutive years. Completed investment in nuclear power engineering hit a record 161 billion yuan ($23.84 billion) in 2025, with five approved projects that year featuring private capital participation.

Looking ahead, China's nuclear footprint is set to expand significantly.

Yang Changli, rotating chairman of the CNEA, estimates that with socioeconomic demand for energy and electricity providing ample room for the development of nuclear power, China's installed nuclear power capacity is expected to reach 200 million kW by 2040.

Power play

Staffers from State Grid Changji conduct equipment renovation at the 220-kilovolt Shiqiantan substation in the Wucaiwan area in the Xinjiang Uygur autonomous region. Adhering to the high-voltage electrical installation standards, the on-site workers rigorously manage key aspects to eliminate potential safety hazards in equipment connections, ensuring reliable power supply to the Wucaiwan industrial zone and surrounding areas in Changji Hui autonomous prefecture. AO LIN / FOR CHINA DAILY

Briefly

Domestic flight fuel surcharges cut further

Chinese airlines will further cut fuel surcharges on domestic routes for tickets sold from Wednesday, following a reduction in July, according to announcements released by carriers. Under the revised standard, passengers will pay a fuel surcharge of 40 yuan ($5.89) per flight segment on routes of up to 800 kilometers, and 70 yuan on longer routes.

Yuan weakens against greenback

The central parity rate of the yuan weakened 4 pips to 6.7898 against the US dollar on Monday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

A freight train loaded with containers on a sea-rail intermodal railway line departs Xiamen, Fujian province. LIN SHANCHUAN / XINHUA

Automated sea-rail line launched

By REN QI
renqi@chinadaily.com.cn

The launch of China's first automated dedicated sea-rail intermodal railway line will significantly reduce transit bottlenecks, slash logistics costs and link the country's landlocked hinterlands with global markets, officials and experts said.

The pioneering railway line, featuring a unique design that directly connects the coastline to the terminal, officially launched operations last Thursday in Xiamen, Fujian province.

"The sea-rail intermodal transport at Xiamen ocean gate terminal achieves a seamless connection between trains and ships, solving the persistent challenges of cargo collection and distribution," said Lin Zhicheng, vice-mayor of Xiamen.

"It will extend the port's inland transport capacity, enhance land-sea intermodal channels, and boost the construction of smart ports and the Belt and Road development," Lin said.

Stretching nearly 1.6 kilometers, the dedicated railway line boasts an annual designed throughput capacity of 250,000 twenty-foot equivalent units and 250,000 metric tons of bulk cargo.

Breaking from conventional designs where railways are built on the periphery of port areas, the new line is situated at a right angle to the coast, occupying the core operational zone of China's first fully automated terminal and terminating a mere 70 meters from the waterfront.

This engineering innovation allows containers and bulk cargo to be directly loaded from ships onto waiting trains. The setup transforms the traditional three-stage "train-yard-ship" transit into a streamlined two-stage direct connection system.

By bypassing intermediate yard transfers and secondary hoisting, the comprehensive logistics cost per container is 15 percent less expensive, while overall transit times are shortened by two to three days.

Additionally, the integration of an automated railway with an automated terminal enables a highly efficient "70-meter transfer and nine-minute interchange" operating system, significantly reducing cargo damage and boosting supply chain reliability.

Lin Ji, president of China COSCO Shipping Corp, highlighted the strategic importance of the project.

"Through a unified data interface and intelligent dispatch system, the railway line clears import and export channels for inland hinterlands such as Jiangxi, Hunan and Hubei provinces. It is a landmark project serving Fujian's opening-up and promoting domestic and international dual circulation, as well as a national paradigm for zero-kilometer seamless sea-rail connections," he said.

Designated as a Class D railway line, the newly opened project is open to the entire market with transparent pricing, thus breaking down barriers for various market entities to enjoy inclusive logistics services.

Technologically, the facility is equipped with four automated rail-mounted gantry cranes and three parallel loading lines. In the port area, driverless container trucks navigate autonomously among ships, terminals and railways, ensuring 24-hour uninterrupted operations.

The complex's efficiency is complemented by an innovative customs clearance model. Authorities have implemented a "one declaration, one inspection, one release" policy.

The enhanced connectivity is expected to inject new vitality into regional economies.

Wu Chengzhong, deputy general manager of China Railway Nanchang Group, pointing to the long-standing port-rail collaboration between Fujian and Jiangxi, said: "The opening of this dedicated line opens new opportunities for strategic cooperation. We will continue to link all parties, open land-sea logistics channels and rely on the Maritime Silk Road to assist in dual circulation construction, ultimately empowering the high-quality economic development of the Fujian-Jiangxi region."

Backed by the terminal's 21 ocean-going routes covering Europe, the Americas, Australia, the Middle East and Southeast Asia, the new railway line links global maritime networks with over 20 inland railway channels.

Interest rate, RRR cuts may be on table

By ZHOU LANXU
zhoulanxv@chinadaily.com.cn

China has both room and growing necessity to cut interest rates in the coming months, as top policymakers step up efforts to stabilize growth amid weakening economic momentum, analysts said.

Song Yu, chief China economist at UBS Securities, said that with top policymakers placing greater emphasis on stabilizing growth to ensure a solid start to the 15th Five-Year Plan (2026-30) period, monetary conditions are likely to remain accommodative in the coming months, with ample market liquidity and low interbank funding rates.

Song said China still has room to cut interest rates and the RRR — the proportion of deposits banks must keep in their vaults as reserves — in the coming months to lower financing costs for businesses, and such tools may be deployed in a flexible, data-based manner.

"While uncertainty over the US Federal Reserve's policy path remains elevated, past experience suggests that China's cross-border capital flows and exchange rate are primarily determined by domestic economic and market conditions, rather than the interest rate differential with overseas markets," Song said, adding that the inflation outlook also strengthens the necessity for easing.

"As imported inflationary pressure from international oil prices recedes, China's consumer inflation is expected to soften in the coming months, leaving ample room for monetary easing and potentially reinforcing the need for additional policy support to stabilize prices and bolster domestic demand."

A top-level meeting on Thursday called for effectively implementing a more proactive fiscal policy and an appropriately accommodative monetary policy, saying that pragmatic and effective incremental policies will be introduced in a timely manner.

Analysts view this as policy fine-tuning that signals a greater intensity of macro policy stimulus in the second half, as GDP growth in the second quarter had fallen to 4.3 percent year-on-year, putting some pressure on achieving the full-year target of 4.5 to 5 percent growth.

The People's Bank of China, the country's central bank, pledged at a meeting on Saturday to comprehensively utilize monetary policy tools and make timely adjustments to keep ample liquidity, while maintaining the low level of overall social financing costs.

While room for further monetary easing exists, the key question is how to calibrate the timing and magnitude of any policy moves to maximize their impact, analysts said, as the effectiveness of such measures may depend on stronger fiscal support and a recovery in private sector confidence.

Zhu Feng, China chief economist at JPMorgan, said that monetary policy should correspond with fiscal policy in the second half to maintain ample liquidity, focusing on structural monetary tools and re-lending facilities to lower financing costs for the real economy and stabilize the property sector.

"We expect a 10-basis-point interest rate cut. Yet with interest rates already at relatively low levels, the stimulative effect of further rate cuts could be limited," Zhu said.

He said such a move would mainly signal the authorities' commitment to maintaining an appropriately accommodative monetary stance, rather than be sufficient on its own to reverse weak domestic demand.

Zhu added that China's economy is likely to stabilize in the second half, with fiscal policy, external demand, high-tech manufacturing and services consumption to help cushion the pressures from the property market and external uncertainties.

MNCs plug into China's AI solutions

SHANGHAI — From factory floors to logistics hubs, global corporations are embedding China's artificial intelligence into their real-world operations — and bringing these innovations to the global stage.

PwC China launched its AI Innovation Center in Shanghai in July. The center helps clients chart practical roadmaps for AI adoption and navigate the many complexities associated with digital transformation.

A recent PwC study places China in the top tier globally for AI deployment effectiveness in the real economy. According to the new center, a growing number of overseas clients are now voluntarily adopting China's open-source AI ecosystem when upgrading their digital operations.

The PwC findings are borne out by cosmetics giant L'Oreal. In its Suzhou smart fulfillment center, the group's first such facility globally, smart sorting systems and AI-powered packaging optimizers help the hub process 7,000 consumer parcels per hour, and ensure that 99 percent of its orders are processed within 48 hours.

Vincent Boinay, president of L'Oreal North Asia and CEO of L'Oreal China, points to China's AI ecosystem — its rapid iteration cycles, vibrant homegrown innovation, strong policy backing and growing talent pool — as the driving force behind the company's AI push in the country.

Beyond back-end support, AI is now stepping into the driver's seat for global firms in China. Siemens offered a glimpse of that shift on July 18, when it debuted Eigen Engineer Agent, an AI agent for industrial automation engineering, at the 2026 World AI Conference in Shanghai.

Eigen was already at work before the official launch, deployed on an electric vehicle brake assembly line at CASMT (Changzhou) Automation Co Ltd. Engineers there can simply tell the agent what they need in plain language, and it takes care of the rest. On that line, programming time is cut by roughly 30 percent, with equipment debugging time decreased by a similar margin.

Vasi Philomin, executive vice-president and head of Data and AI at Siemens, said China's complete manufacturing system, its scale and speed of technology deployment and the openness of local manufacturers to innovation all provide fertile ground for AI to grow. He believes AI will become a core force driving industrial transformation in the country.

Behind this growing embrace of AI by global firms is a policy environment that has kept pace. From national strategies to local initiatives, recent policy measures have given foreign companies greater confidence to tap into China's AI opportunities.

In Shanghai, rules issued early this year encourage foreign-funded research and development centers to invest in high-growth areas like intelligent terminals and embodied intelligence. Shenzhen adopted similar measures late last year to attract foreign companies to set up innovation facilities in the city.

In July, the National Development and Reform Commission and other government departments released an action plan to strengthen international AI collaboration.

David Blair, vice-president of the Center for China and Globalization, said China's diverse manufacturing sectors — particularly the highly competitive industrial clusters along the southeastern coast — will generate even more AI applications in the years ahead, through open and mutually beneficial cooperation.

AI rewiring how China's energy is managed

Large models do not simply crunch numbers, they guzzle electrons

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

To generate a mere five-second, high-definition video out of the digital space — perhaps a lifelike sunset or a virtual city street — an artificial intelligence model does not simply crunch numbers; it guzzles electrons.

Producing those few fleeting seconds of digital reverie requires roughly the same amount of electricity as fully charging 10 smartphones, said Wang Hongzhi, head of the National Energy Administration.

"The AI boom is triggering a ravenous new appetite for electricity," Wang said.

In China, the AI sector is expanding at a breakneck pace. Projected to surpass a valuation of 10 trillion yuan ($1.48 trillion) by the end of the decade, the industry's explosive boom in computing power is driving a precipitous spike in power consumption.

The government is confronting this colossal appetite head-on. Yet, rather than merely throwing more coal into the furnace, Chinese planners are orchestrating an intricate, nationwide symbiosis between the machines that think and the grid that feeds them.

To prevent the AI boom from short-circuiting the nation's climate goals, Beijing is effectively redrawing its infrastructural map, which Wang describes as "powering computing with electricity and promoting electricity with computing".

In the sun-drenched, wind-swept expanses of the western provinces, national computing hubs are being deliberately tethered to colossal new renewable energy bases, while in the densely populated east, planners are nesting distributed computing facilities alongside local microgrids and virtual power plants so that data centers can scavenge power close to the source.

The government is also actively encouraging data centers to plug directly into green power and participate in green electricity trading, said Wang.

Conversely, delay-tolerant tasks — the massive, slow-cooking data-training runs — are nudged to operate during off-peak hours. This essentially uses the data centers as massive, flexible shock absorbers to balance the grid, he said.

But this relationship, Wang said, is far from a one-way street. While the power grid fuels the rise of algorithms, the algorithms are, in turn, rewiring how the nation's energy is managed.

The two industries have entered a fast lane of mutual empowerment, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

While AI operations do consume a substantial amount of power, the technology has been acting as the nervous system for an increasingly complex energy landscape — optimizing grid operations, smoothing out renewable energy volatility and ultimately driving broader energy efficiency, Lin said.

In the petroleum sector for example, a large model known as "Kunlun" has accelerated the computational efficiency of oil and gas exploration by more than tenfold, cutting through geological guesswork to optimize drilling strategies, said Wang.

Operated by China National Petroleum Corp, the upgraded platform marks a crucial leap from passive question-answering to "active intelligence", allowing the AI to autonomously plan, dispatch tools, analyze data and execute tasks across the production line.

As the first large model in the domestic energy and chemical industry to achieve large-scale, full-chain application, Kunlun — currently deployed across 152 scenarios — boasts a drilling risk warning system with an accuracy rate exceeding 85 percent, issuing over 300 early warnings in the past six months to prevent accidents, CNPC said.

Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute, said AI is proving to be the perfect antidote to the inherent chaos of renewable energy.

As immense volumes of wind and solar power flood the national grid, the system becomes jittery, subject to the whims of passing clouds and dying breezes, he said.

Here, an AI model dubbed "Yudian" acts as a tireless dispatcher. It predicts weather-driven fluctuations in real time and dynamically adjusts the grid to ensure that no clean energy goes to waste.

This intelligence is also moving from the control room out into the field, graduating from merely offering diagnostic advice to executing autonomous operations.

When a fault occurs in the power distribution network, an AI model called "Guangming Power" steps in like an attending physician. It senses line anomalies, pinpoints the exact location of a failure and coordinates intelligent repairs without waiting for human intervention.

Ultimately, it is a bold blueprint for an engineered feedback loop. The algorithms will consume the sun and the wind to grow smarter, and, in their newfound brilliance, they will figure out how to harness the Earth's elements ever more perfectly.

AI systems need an ocean of electricity to keep expanding. Over the last 10 years, China has built a colossal power grid perfectly scaled to power these machines.

By the end of May, China's total installed power generation capacity reached 4.01 billion kilowatts. To put that figure in perspective, it exceeds the combined power capacities of the United States, the European Union, India, Japan and Russia.

The pace of this expansion is compounding at a dizzying rate. It took the country eight years to double its capacity from 1 billion kW in 2011 to 2 billion kW in 2019. Reaching the 3-billion-kW mark took five years, achieved in April 2024. Adding this latest billion took a mere two years.

Overall, between 2010 and 2025, China's power generation capacity maintained an average annual growth rate of 9.7 percent — eclipsing the equivalent rates of the US (1.7 percent) and the EU (3.2 percent).

Industry experts view this hypergrowth as a testament to the country's formidable manufacturing base. Jiang Debin, deputy director of the statistics and data center at the China Electricity Council, said the fundamental driver behind this acceleration is the explosive rise of renewable energy, primarily solar and wind.

"This not only illustrates the continuous improvement in the efficiency and scale of China's power grid expansion, but also reflects the comprehensive advantages of the country's manufacturing system, engineering prowess and institutional mechanisms," Jiang said.

In an era where geopolitical conflicts have triggered energy shortages and price spikes globally, China has managed to keep its lights brightly on.

As the electricity demand of emerging sectors — particularly AI and high-end manufacturing — continues to surge, this massive 4-billion-kW foundation provides ironclad energy security for the nation's broader economic ambitions, said Jiang.

Crucially, this is not just a story of scale, but of transformation. The rapid expansion has been overwhelmingly driven by a structural shift toward clean energy.

Consequently, the national energy mix has been radically reconfigured. In the first half, China's coal-fired power generation totaled 2.5 trillion kilowatt-hours, accounting for less than 50 percent of the nation's total electricity output for the first time, said the NEA.

The installed capacity of renewable energy has been steadily expanding. In the first half, the country added 117 million kW of renewable energy capacity, accounting for 73.9 percent of all newly installed capacity. As of the end of June, the nation's total installed renewable energy capacity reached 2.46 billion kW, accounting for approximately 60.7 percent of China's total installed capacity.

Renewable energy electricity generation has also risen steadily. In the first half, national renewable energy power generation reached nearly 2 trillion kWh, an increase of about 9 percent year-on-year, accounting for 41.2 percent of total electricity generation, an official of the NEA said on Thursday.

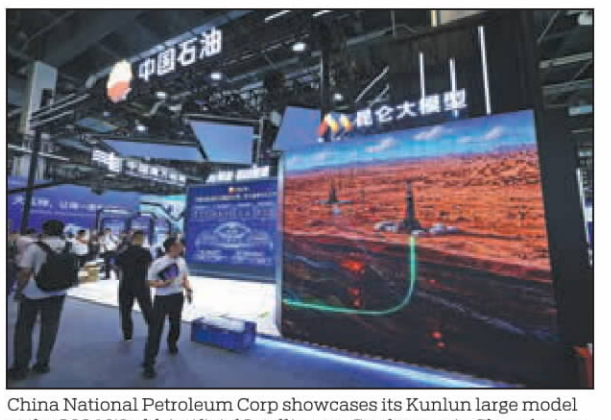
This green revolution is underpinned by brutal, brilliant economics. Over the past decade, solar module prices have plummeted by more than 90 percent, while onshore wind generation costs have fallen to match or undercut coal. Driven by technological advancements and economies of scale, renewable energy has evolved from a heavily subsidized experiment into a fiercely profitable sector.

China boasts the world's most comprehensive renewable equipment supply chain, manufacturing about 80 percent of global solar modules and 60 percent of wind power equipment.

The accelerated rollout of supporting infrastructure — including ultra-high-voltage transmission lines, pumped hydro and new energy storage systems — ensures that massive new capacity can be effectively built, transmitted and absorbed by the grid, said Jiang.

Now, this staggering capacity is beginning to spill over China's borders. Leveraging its robust grid infrastructure, the country has steadily expanded power interconnectivity with neighboring countries — particularly in Southeast Asia — helping to alleviate regional power shortages while sharing its green energy dividends.

The China-Laos 500-kilovolt power interconnection project, for example, which marks the first time that foreign new-energy electricity has participated in China's marketized power trading system, had delivered nearly 200 million kWh by the end of May, demonstrating the massive potential of cross-border solar infrastructure.



As the largest cross-border grid project and the highest-voltage power link between China and Laos, the project is expected to transmit roughly 1.1 billion kWh of solar-generated electricity to China this year alone, said its operator China General Nuclear Power Group.

As industry experts note, China's most significant export extends far beyond raw electricity.

"The same industrial ecosystem that built this 4-billion-kW leviathan is now exporting complete, turnkey green energy solutions — advanced solar, wind and smart-grid technologies," said Jiang from the CEC. "This is positioning the country as an indispensable engine of the global energy transition."

The transmission lines of the China-Laos 500-kilovolt power interconnection project are connected at the border between Mohan in Southwest China's Yunnan province and Luang Namtha province in Laos on Feb 5. PROVIDED TO CHINA DAILY

Nation sets green power usage benchmarks

By **ZHENG XIN**

China has taken a landmark step in its green transition by establishing its first-ever mandatory minimum consumption target system for renewable energy, a move experts say represents a fundamental paradigm shift from supply-driven expansion to demand-led integration in the country's pursuit of its carbon peak and neutrality goals.

Jointly issued by four ministries — including the National Development and Reform Commission and the Ministry of Industry and Information Technology — the measures for implementing the minimum target of renewable energy consumption and the responsibility weight of renewable energy power absorption officially took effect on Saturday.

"The policy fundamentally transforms the responsibility structure of China's energy transition as it enters deep waters," said Wang Yongli, deputy director of the Energy Internet Research Center at North China Electric Power University.

"In the past, the main challenge was insufficient grid capacity to absorb rapid supply growth. Now, by shifting mandatory green consumption obligations from local governments and grid companies down to key energy-consuming enterprises, the policy uses demand to anchor renewable energy investments and market expectations."

According to the National Energy Administration, the new framework establishes a dual-driven mechanism combining "rigid obligations on the consumer side" with "territorial responsibilities on the absorption side".

While provincial administrative regions will continue to optimize the regional allocation of green power, key energy-intensive industries will face strict, quantifiable baselines for renewable energy use in their total energy mix, it said.

The initial wave of monitoring and assessment will target sectors with high emissions or rapid electricity demand growth, including electrolytic aluminum, steel and cement, polysilicon production, as well as newly built data centers at national computing hubs.

Analysts note that for these enterprises, green power procurement capabilities and energy structure optimization will rapidly evolve into core market competitiveness.

"High-energy-consuming, high-emission industries and those with rapidly growing power demand will be the first to face tougher green energy constraints," said Wang.

"The ability to procure green electricity and certificates, along with the capacity to adjust energy consumption structures, will become a defining core competitiveness for enterprises."

Crucially, the regulation integrates non-electric renewable consumption — such as green hydrogen, ammonia, methanol and biomass heating — into the national assessment for the first time.

According to the NEA, this expansion aims to ease grid bottlenecks and unlock new avenues for deep industrial decarbonization by promoting localized, multiscenario utilization of clean energy.

By diversifying how renewable energy can be legally consumed, the policy addresses the structural mismatch between large-scale clean energy bases in western China and the consumption limits of local power grids.

Another game-changing shift is the elevation of Green Electricity Certificates into legally binding compliance instruments. Companies failing to meet their quarterly or annual targets must purchase GECs to bridge the gap or face regulatory penalties, including public reprimands and credit downgrades.

"This thoroughly clarifies how companies calculate and execute their green targets, which will effectively boost market demand for green power and GEC trading," said Tao Ye, deputy director of the renewable energy development center at the NDRC's energy research institute.

Regarding market concerns over potential price surges, experts emphasize that the policy aims to form a credible, stable and predictable green premium rather than fuel speculation.

The GEC market will see internal differentiation based on certificate credibility, said Wang.

"The future value of a GEC will hinge on its availability, verifiability and its alignment with carbon markets, product carbon footprints and international supply chain standards, rather than just raw supply volume," he said.

Wind turbines generate green energy at a wind farm on Dongchu Island in Rongcheng, Shandong province, on July 20.

Guangxi seeks to better protect digital creative IPs

By CAO YIN in Nanning
caoyin@chinadaily.com.cn

Judges in the Guangxi Zhuang autonomous region are preparing to issue a "risk notification" to local animation and short drama industrial parks, a preemptive judicial measure aimed at helping emerging creative industries stay within legal boundaries before copyright disputes spiral out of control.

The notification, expected in the coming weeks, will urge creators and online platforms to obtain proper authorization before adapting existing works and avoid producing content that violates public order or good morals, even in pursuit of online traffic, said Wei Meiyun, deputy chief judge of the Nanning Intellectual Property Tribunal.

The move comes as China elevates intellectual property protection to a strategic national priority. On July 20, the State Council, China's Cabinet, approved the 15th Five-Year Plan (2026-30) for IP protection and commercialization, calling for faster legal updates, stronger policy support and a more favorable environment for innovation-driven development.

The Supreme People's Court also released its implementation road map for the same five-year period, emphasizing stronger IP protection in emerging sectors and greater judicial support for developing new quality productive forces.

The work of the Nanning tribunal reflects these national priorities while addressing the practical challenges of a rapidly expanding creative economy.

Established in January 2026, the tribunal has seen a sharp increase in disputes involving the adaptation of literary works into videos, short dramas, animated series and AI-generated content.

Wei said judges are frequently handling cases involving novels adapted into short dramas as well as AI-assisted video production.

"We encourage creative reinterpretation, but not at the expense of public interest or the law," she said.

Since the start of 2025, courts in Nanning, including the tribunal, have handled 93 disputes involving short dramas.

One representative case involved the short drama *The Return of the Warrior Spirit*. The tribunal found that the producer had copied the original work's character settings, plot structure and visual scenes, and ordered the producer to pay 10,000 yuan ($1,400) in damages.

Tu Yuanyuan, the judge who handled the case, said AI has dramatically shortened production cycles while making infringement more difficult to detect.

During the trial, she spent considerable time comparing the disputed work with the original in terms of character design and narrative structure.

She said the ruling recognized both the original work's market value and the defendant's clear intent to imitate it, although the damages awarded were relatively modest.

"There is no uniform legal threshold for what constitutes substantial similarity," she said. "Every case turns on its own specific facts."

Tu added that many short drama lawsuits are filed not by original authors but by companies or individuals that have acquired adaptation rights to literary works.

In many cases, plaintiffs are only able to provide evidence of infringement on individual online platforms rather than across cyberspace, a limitation that often results in relatively low damage awards, she said.

To address such challenges, Wei said the tribunal has promoted both prelitigation and in-court mediation, encouraging parties to resolve disputes through licensing agreements or settlements facilitated by professional mediators.

The tribunal has also published typical copyright cases to provide guidance for creators, platform operators and online platforms. Public awareness initiatives, including lectures and open hearings, have also been launched to foster greater respect for intellectual property rights, she said.

Lan Dandan, chief judge of the third civil division of the Guangxi High People's Court, said courts across the region have strengthened IP adjudication in recent years to support innovation and improve the business environment through the rule of law.

From 2023 to 2025, courts in Guangxi handled more than 22,000 IP disputes involving copyrights, trademarks, patents and trade secrets, and concluded more than 19,000 of them, she said.

To improve the quality of case handling and better resolve disputes involving emerging industries and technologies, Guangxi established the specialized tribunal early this year.

It has so far accepted 626 cases and concluded 394.

Beyond the digital creative sector, the tribunal is also strengthening IP protection in the seed industry.

Wei Wubin, president of the Nanning Intermediate People's Court, said Guangxi is one of China's leading agricultural regions, ranking first nationwide in fruit production, with crops including rice, corn, lychees, passion fruit and jasmine.

He described the seed industry as the "chip" of agriculture, saying that innovation lies at its core and effective protection is essential to translating innovation into productivity.

He added that the tribunal is prepared to establish judicial protection bases and circuit trial teams tailored to Guangxi's distinctive agricultural brands, including its renowned sugar tangerines and other geographical indication products.

From the fast-paced world of short dramas to the long-term work of seed breeding, the tribunal is carving out a role as a pragmatic and forward-looking institution, reflecting China's broader ambition to build a world-class intellectual property protection system one case at a time.

Crew harvests rice samples on Tiangong

Shenzhou XXIII astronauts carry out a series of scientific and medical tasks

By ZHAO LEI
zhaolei@chinadaily.com.cn

More than two months after arriving at the Tiangong space station, the Shenzhou XXIII mission crew has harvested the first batch of experimental rice samples after meticulously cultivating the plants in orbit.

A video released by the China Manned Space Agency on Sunday shows the astronauts — mission commander and spaceflight engineer Colonel Zhu Yangzhu, spacecraft pilot Colonel Zhang Zhiyuan and science payload specialist Lai Ka-ying — collecting and storing the rice samples.

The experiment, titled "Molecular Mechanism Study on Multigenerational Genetic Stability and Environmental Adaptation Regulation of Space Rice", aims to achieve the world's first continuous cultivation of two generations of rice in orbit, completing two consecutive life cycles.

Its primary objective is to reveal the biological mechanisms through which long-term exposure to microgravity affects the genetic stability of rice.

The rice seeds carried aboard the Shenzhou XXIII mission are Chinese japonica varieties known for their strong environmental adaptability and growth cycle of three to four months. They were divided into two groups: ordinary seeds that have never been to space and direct descendants of seeds harvested aboard the Tiangong space station in 2022 that have since undergone three generations of propagation on Earth.

According to China Central Television, the experiment consists of four independent cultivation units, each containing six seeds. The units are divided into two parallel groups, each testing a different rice reproduction method.

In addition to harvesting panicles and seeds, the astronauts will preserve stem and leaf samples at low temperatures for their return to Earth. Scientists will conduct detailed analyses of the samples to provide scientific support for developing production models for future space agriculture.

The latest experiment builds on earlier breakthroughs. In 2022, the Shenzhou XIV mission crew carried out the world's first full life-cycle rice cultivation experiment aboard the Tiangong space station. Six rice seeds spent 120 days in orbit and produced 59 first-generation space rice seeds, which were returned to Earth with the Shenzhou XIV astronauts.

Besides tending the rice experiment, Zhu and his crewmates carried out a series of scientific and medical tasks last week.

Working together, they used an ultrasound diagnostic device to conduct bilateral examinations of the carotid, radial and dorsalis pedis arteries. The data collected will support research on pan-vascular blood flow spectroscopy and the development of a spatiotemporal atlas of blood flow evolution.

The astronauts also carried out a lighting environment experiment by adjusting the space station's interior lighting and recording their work performance before and after the changes. The research aims to examine how lighting conditions affect psychological perception and work efficiency in the space environment.

The crew completed an in-orbit emergency rescue drill under a simulated fire scenario to strengthen their emergency response and fault-handling capabilities.

As part of their routine health management, the astronauts underwent a series of medical examinations, including electrocardiograms, vision tests, intraocular pressure measurements and fundus examinations. They also measured their body mass using a specialized mass measurement device to monitor physiological changes caused by prolonged exposure to microgravity.

China testing AI-powered patrol vessel in Shenzhen

By LUO WANGSHU in Shenzhen
luowangshu@chinadaily.com.cn

On a busy stretch of water in Shenzhen, Guangdong province, a 12-meter-long maritime patrol vessel adjusted its course, followed its assigned route and scanned the surface for potential hazards — all without an officer having to steer it through every maneuver.

The vessel, *Haixun 14102*, is China's first maritime law enforcement boat to receive an integrated digital and intelligent upgrade. Equipped with an intelligent navigation module, multiple sensing devices and a platform linking the vessel with a shore-based control center, it entered trial operation in early July, according to the Maritime Safety Administration under the Ministry of Transport.

The pilot reflects China's broader push to integrate artificial intelligence, connected navigation systems and remote monitoring into one of the world's largest water transport networks.

China's ports handled 18.34 billion metric tons of cargo and 354 million 20-foot equivalent units of containers in 2025, while its navigable inland waterways extended for 128,700 kilometers, according to the Ministry of Transport.

As the network has expanded, the focus of water transport development has broadened beyond ports, berths and shipping channels to improving coordination among vessels, navigation facilities, shore-based platforms and maritime authorities.

The Smart Shipping 2030 Action Plan, jointly issued by the Ministry of Transport and three other central government departments earlier this year, calls for deeper integration of AI with vessels, ports, waterways, navigation support services and maritime supervision.

By 2027, China plans to establish at least three comprehensive smart shipping pilot regions, open more than five pilot routes, develop over 10 replicable application scenarios and put more than 100 intelligent vessels into operation. Priority applications include emergency rescue, navigation at night or in fog, operations in narrow and winding waterways, waterborne construction and short-distance transport.

In Shenzhen, those ambitions are being put into practice on a compact, highly maneuverable patrol vessel operating in some of the country's busiest waters.

Haixun 14102 is capable of automated patrols, obstacle avoidance, object recognition and remote operation under shore-based supervision. During one test, it traveled 14.2 nautical miles while keeping its deviation from the planned route within 1 meter. In a simulated rescue exercise, the system detected, identified and approached a person in the water within three minutes.

Rather than replacing officers, the technology is designed to improve situational awareness and support faster decision-making.

"A search-and-rescue operation can stretch to 36 or even 48 hours," said Hao Xianlin, head of an airport maritime patrol unit under the Bao'an maritime safety administration. "The integrated sensing system can greatly improve our ability to detect and identify the person we are looking for."

With a top speed of 36 knots, the vessel was selected for the pilot because it is used extensively for routine patrols, emergency response and rescue operations.

Shenzhen sits at the heart of the Guangdong-Hong Kong-Macao Greater Bay Area, where commercial ships, passenger ferries and smaller vessels share busy and often congested waterways. Long hours of visual observation can cause fatigue, while darkness, fog, rough seas and heavy traffic further increase the challenges facing maritime officers.

Video and sensing data collected by *Haixun 14102* are transmitted to the shore-based command center, allowing officers to monitor surrounding conditions in real time and provide operational support when needed.

The project also offers a more economical path toward intelligent shipping. Instead of replacing an existing patrol boat, engineers equipped the vessel with navigation, sensing, communication and ship-to-shore systems without altering its main structure or reducing its original performance. Shenzhen maritime authorities said upgrading existing vessels can lower costs and shorten deployment time compared with building purpose-designed intelligent ships.

Yin Yong, a professor at Dalian Maritime University's Navigation College, said intelligent shipping should not be viewed simply as adding sensors to vessels or removing crews.

"However advanced a laboratory simulation may be, it cannot reproduce every wave, current or unexpected situation at sea," he said.

At the university's shore-based digital operation and control center, researchers monitor real-time data from the intelligent research and training vessel *Xin Hong Zhuan*, including its position, engine performance, energy use and surrounding sea conditions.

The center serves as a shore-based cockpit, providing crews with navigation advice while allowing operators on land to offer support or take remote control when vessels encounter narrow channels, severe weather or emergencies.

"The most practical model at the present stage is cooperation between ships and shore-based operators," Yin said. "In open waters, the vessel can rely more on autonomous navigation. In narrow waterways or difficult weather, people on shore can step in. That allows us to use the advantages of AI while keeping human judgment available when it is needed most."

The ship-to-shore model is also being extended to navigation infrastructure.

At Jiangyin port in Fujian province, authorities have equipped navigation aids with weather-monitoring and Automatic Identification System devices. Drones conduct routine inspections, while connected buoys warn approaching vessels of reefs and other hazards.

"The navigation aids can now see, hear and give warnings," said Chen Jingui, a manager at Fuqing Strait Power Generation. "We have a much clearer picture of the conditions when our vessels enter or leave."

On the Minjiang River in Fujian, sightseeing vessels are monitored throughout their night cruises through a digital maritime platform, enabling shore-based authorities to track their movements and respond more quickly to abnormal situations.

The 12-meter-long *Haixun 14102* is the first maritime law enforcement vessel in China to receive an integrated digital and intelligent upgrade and is now in use in Shenzhen, Guangdong province.
PROVIDED TO CHINA DAILY

Digitalization is only part of the transformation taking place on China's waterways. On the Minjiang River and the Lijiang River in the Guangxi Zhuang autonomous region, electric and other new energy vessels are gradually replacing older diesel-powered boats to reduce engine noise, exhaust emissions and pollution risks in scenic waterways.

Wastewater, oily residues and garbage generated by sightseeing vessels are stored onboard and transported ashore for treatment rather than discharged directly into rivers. The Lijiang River has also introduced a pure-electric maritime law enforcement vessel designed for shallow waters, sharp bends and narrow channels.

Although many of these projects remain on a relatively small scale, they demonstrate how digital and green technologies can improve daily maritime operations through quieter sightseeing trips, more efficient patrols and faster emergency response.

Authorities acknowledge that intelligent shipping remains a work in progress. Wider deployment will require further testing, inspection and certification, as well as operational standards, cybersecurity safeguards and clearly defined responsibilities for vessel crews and shore-based operators. Electric vessels will also depend on reliable charging infrastructure, battery safety systems and maintenance and recycling arrangements.

As trials of *Haixun 14102* continue, Shenzhen maritime authorities are refining training, inspection and certification procedures, law enforcement protocols and maintenance standards. The experience gained from the pilot will help determine whether similar upgrades can be applied to more maritime patrol and rescue vessels.

Judicial system gives prosecutors power to ensure authorities act responsibly

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Public interest lawsuits clean up bad governance

Prosecutors collect water samples from a river and carry out quick tests on water quality in Zhengzhou, Henan province, in July last year.
WANG FUXIAO / FOR CHINA DAILY

For years, a 3,000-square-meter plot along the Mangdao River in Yangzhou, Jiangsu province, sat choked beneath 3,000 metric tons of garbage and concrete rubble. As a key tributary of the Yangtze River and vital source area for the South-to-North Water Diversion Project, the site along the Mangdao River was more than a local eyesore. Despite the obvious threat to a crucial national water supply, local authorities allowed the dump to fester.

Today, the contaminated lot has been transformed into a lush ecological park, thanks to a growing mechanism in China's judicial system known as procuratorial public interest litigation. This institutional framework empowers prosecutors to haul negligent government agencies into court when shared public resources are left unprotected.

Unlike ordinary litigation, which usually resolves disputes between specific parties, procuratorial public interest litigation focuses on interests shared by society as a whole, including environmental protection, food and drug safety, cultural heritage, data security, workplace safety, accessibility, and the rights of minors, women and people with disabilities.

The system does not allow prosecutors to replace administrative agencies. Its core is legal supervision. Prosecutors identify harm to public interests, urge responsible authorities or infringers to act, and, when necessary, bring cases before courts to clarify responsibility and push rectification.

From waste to court

A turning point came in December 2024, when prosecutors in Yangzhou's Jiangdu district received a tip-off from local water conservancy officials. Because the original illegal dumpers could not be identified, prosecutors turned their attention to the administrative bodies duty-bound to keep the area safe: the Jiangdu district urban management bureau and the Xiannyu township government.

After informal consultation yielded no results, prosecutors issued formal legal notices to the two bodies demanding action. But when investigators returned to inspect the site after the deadline, they uncovered a classic superficial fix. Rather than removing the hazards, officials had simply buried the 3,000 tons of waste beneath a thin layer of topsoil.

The procuratorate then filed an administrative public interest lawsuit against the two bodies. During court proceedings, the urban management bureau commissioned a third party to dispose of the waste, while the township government helped coordinate the work. Environmental testing later showed that the soil met national standards.

Yet, even after the trash was gone, prosecutors refused to drop the case. Rather than accepting the belated cleanup as a resolution, they asked the judge to issue a formal ruling declaring that both government bodies had acted unlawfully by failing to perform their duties in time. The township argued it lacked administrative penalty powers over illegal dumpers, while both agencies insisted that the completed cleanup made the lawsuit moot.

The move by the prosecutors reflected a key point: restoring damage is necessary, but clarifying responsibility is also important. If delayed or superficial rectification can erase earlier inaction, similar problems may return.

In January, the court rejected the arguments and confirmed that both bodies had failed to perform their duties in accordance with the law.

The court held that the township government had direct environmental protection responsibilities in its jurisdiction, and that later rectification during litigation could not offset earlier inaction.

For Xu Xiangchun, head of the public interest litigation department of the Supreme People's Procuratorate at the time, such cases show why the system must be precise and restrained.

In administrative public interest litigation, the key is to clarify the boundary of administrative duties and responsibilities, Xu said. In civil public interest litigation, the focus is on identifying infringers and the form of liability they should bear. In environmental cases, this also reflects restorative justice. The goal is not simply to win a case, but to stop damage, repair the environment, prevent recurrence and improve governance at the source.

China's procuratorial public interest litigation system has developed rapidly since it was rolled out in 2017. Since July that year, procuratorial organs have handled more than 608,000 public interest litigation cases involving ecological environment and resource protection, accounting for about 47 percent of all such cases.

In 2025, procuratorial organs handled 133,194 public interest litigation cases across 14 statutory fields, with 47,228 involving ecological and resource protection. Administrative public interest litigation accounted for 91.5 percent of filed cases.

The predominance of administrative cases reflects a key feature of the system. In many public interest problems, harm continues not only because of an individual violation, but also because responsible departments fail to act in time, lack coordination or misunderstand the scope of their duties.

More than 90 percent of administrative public interest litigation cases are resolved before trial through procuratorial suggestions and other pre-litigation procedures. This allows many problems to be addressed at lower judicial cost, while litigation remains available when supervision does not lead to effective action.

The system has expanded beyond environmental protection to fields such as food and drug safety, personal data security, cultural relics protection, workplace safety, accessibility, anti-monopoly issues, telecom fraud, and the protection of specific groups.

A draft procuratorial public interest litigation law has been reviewed by the Standing Committee of the National People's Congress, marking a step toward dedicated legislation. Technology is also changing case handling. By the end of 2025, procuratorial organs had built 291 big data legal supervision models related to public interest litigation. In 2025, these models screened more than 51,800 clues and supported over 30,000 cases.

For Qin Qianhong, a professor at Wuhan University Law School, procuratorial public interest litigation has a distinctive Chinese character. He said the system goes beyond confrontation and pursues coordination.

Its institutional logic, Qin said, is not to replace administrative power, but to provide legal supervision that helps responsible bodies correct mistakes and improve governance.

Qin said a combination of force and restraint is central to the system. It helps prevent public interest protection from falling through the gaps, while respecting the lawful space of administrative agencies to perform their duties.

Global relevance

This model is also drawing international attention. The Supreme People's Procuratorate has shared its experience in Vietnam, Brazil and France. China's river basin cases have become part of these exchanges, with the Nansi Lake case included in the United Nations Environment Programme database.

Elizabeth Maruma Mrema, assistant secretary-general of the United Nations, said that China has made inspiring progress in environmental legislation and enforcement. Environmental public interest litigation, she said, helps translate environmental laws into strong enforcement, promotes accountability and closes the implementation gap between law and practice.

She added that prosecutors are essential actors in the environmental rule of law because environmental challenges are complex, interdisciplinary and often cross borders, requiring cooperation among judges, lawyers, prosecutors, law enforcement agencies and the public.

China's Ecological Environment Code, adopted earlier this year, has further strengthened the legal foundation for environmental governance. The code requires people's procuratorates to strengthen ecological and environmental procuratorial work and legal supervision, giving prosecutors greater responsibility in ecological protection under the rule of law.

As environmental damage, data risks, food safety and rights protection issues become more complex, public interest litigation is expected to play a larger role. The next challenge is not simply to handle more cases, but to handle better ones — cases that are necessary, precise, legally sound and capable of guiding future governance, according to prosecutor Xu.

The Mangdao River case shows how the mechanism works at ground level. A polluted plot that had remained unresolved for years was cleaned, administrative duties were clarified, and a court confirmed that later rectification could not erase earlier failure to act.

"Public interest litigation must ensure that prosecutors neither fail to act nor overstep. That balance is what allows the system to protect public interests through the rule of law," Xu said.

Litigation brings down barriers to accessibility

By YANG ZEKUN

A legal worker sends a guidance booklet on pressing civil lawsuits in Braille to a partially sighted villager in Zibo, Shandong province, in April. ZHANG WEITANG / FOR CHINA DAILY

China is using procuratorial public interest litigation to strengthen barrier-free environment construction to protect the rights of people with disabilities, the elderly and those with accessibility needs, according to the country's latest human rights action plan.

The National Human Rights Action Plan of China (2026-30), released by the State Council Information Office in June, calls for stronger procuratorial public interest litigation in areas including barrier-free environment construction.

Qiu Jinghui, deputy director of the Supreme People's Procuratorate's Public Interest Litigation Procuratorial Department, said the requirement recognizes the progress made during the previous action plan period and sets higher expectations. He added it would enable China to contribute its experience to global human rights governance.

From 2021 to 2025, procuratorates nationwide filed more than 14,000 public interest litigation cases related to barrier-free environment construction. The SPP has included data and cases on such work in its annual work reports for six consecutive years, Qiu said.

The Law on Building Barrier-Free Environments, which took effect in 2023, provides a clear legal basis, with Article 63 stating that when acts violating the law harm public interests, procuratorates may issue procuratorial recommendations or file public interest lawsuits.

Qiu said procuratorial public interest litigation has evolved from correcting problems in public facilities, information access and social services to promoting more integrated accessibility development. Prosecutors are also paying greater attention to public participation, technology-based supervision, prevention and long-term governance.

Accessibility is no longer viewed only as a special service for people with disabilities and the elderly. Under the law, others with barrier-free needs may also enjoy related conveniences. In cases involving transport, medical services, culture, sports and tourism, prosecutors have found that young people carrying heavy loads or recovering from injuries, caregivers, domestic and nursing workers, and emergency responders may all have practical accessibility needs.

Information barriers caused by the "digital divide" also affect groups beyond people with disabilities and the elderly, Qiu said. Barrier-free environment construction is therefore a basic right linked to sharing the benefits of economic and social development across all groups and all stages of life.

In October 2024, the United Nations Human Rights Council adopted by consensus a China-led resolution on promoting human rights for all through barrier-free construction, the first UN resolution on the topic. Qiu said China's procuratorial public interest litigation practice demonstrates institutional and rule-of-law strengths in implementing that concept.

Since the barrier-free environment law took effect, prosecutors have handled cases in healthcare, transport and tourism. Under the SPP's guidance, procuratorates in Shanghai and Jiangsu, Guangdong and Hunan provinces have pushed for larger-print and electronic drug instructions, as well as drug traceability codes, to address safety risks caused by tiny print on medicine instructions.

In Fujian province, prosecutors have promoted text, video and message-based emergency call functions across 71 emergency centers, opening barrier-free access to 120 emergency services for more than 160,000 people with hearing or speech disabilities. In the Inner Mongolia autonomous region, a medical accessibility project pushed 648 medical institutions to carry out barrier-free and elderly-friendly renovations. In Sichuan province, prosecutors promoted accessible sightseeing vehicles at Jiuzhaigou Scenic Area.

In 2025, procuratorates handled 4,723 public interest litigation cases involving barrier-free environment construction, according to the SPP. The top procuratorate also issued trial guidelines on handling such cases and carried out a public interest litigation supervision campaign on railway accessibility to better meet the travel needs of people with disabilities, the elderly and other groups.

The SPP, the Ministry of Civil Affairs and the China Disabled Persons' Federation have released six typical cases on barrier-free and elderly-friendly public interest litigation. Chinese procuratorial practice in this field was also displayed at a thematic exhibition during the 59th session of the UN Human Rights Council.

However, challenges remain. Qiu said rectification after individual cases may rebound without follow-up supervision. More fundamentally, sustainable accessibility requires removing barriers in social attitudes.

During the 15th Five-Year Plan (2026-30), Qiu said procuratorates should further improve the quality of public interest litigation for accessibility. Priorities include improving accessible medical and public services, promoting employment for people with disabilities, narrowing the digital divide, and implementing the Marrakesh Treaty to facilitate access to published works for people with vision disabilities.

Prosecutors will continue to deepen supervision over accessible transport and promote accessibility in electronic products, office software, apps and mini programs, Qiu said. The goal, he added, is to allow everyone to share a better life with dignity.

CULTURAL 文明中国 HERITAGE

Heart of Hongshan still beats

Archaeologists say a 5,600-year-old ritual center reshapes our understanding of China's earliest state, report **Yang Feiyue** and **Wu Yong**.

On the green hills of western Liaoning province, a newly excavated platform has revealed that Hongshan people could determine true north and south with remarkable precision 5,600 years ago.

This Neolithic culture tracked the sun's shadow with a vertical pole — a technique known as *gui biao ce ying* that would become fundamental to Chinese astronomy, surveying and urban planning.

The conclusion comes from Platform No 2 at Locality 1, the northern section of the Niuheliang site in Chaoyang, Liaoning, that was discovered in the 1980s. It is the most important ceremonial center of Hongshan culture that flourished in northeastern China from around 6,500 to 4,800 years ago, spanning parts of what is now Liaoning and Hebei provinces, as well as the Inner Mongolia autonomous region.

Renowned for its sophisticated jade craftsmanship and monumental ritual architecture, Hongshan is widely regarded as one of the earliest foundations of Chinese civilization beyond the Yellow River heartland.

The platform is a rectangular structure measuring 64.61 meters north to south and 41.39 meters east to west, one of nine such platforms that archaeologists identified in 2021 as a massive architectural complex at the site.

Its builders used a mix of earth and stone — compacted soil on flat ground, large stones topped with gravel in low-lying areas — a method that combined durability with drainage. The platform sits slightly north of the center of the complex.

The discovery is the latest in a series of findings that have transformed the site from a burial ground into what scholars now recognize as the ritual capital of an early Chinese state, complete with temples, altars, elites' tombs and a north-south axis that echoes that of Beijing.

Feng Shi, an academician of the Chinese Academy of Social Sciences, says the platform's precise north-south alignment reflects mastery of the *er sheng* system — two perpendicular reference lines running north to south and east to west.

According to Feng, shadow-measuring techniques date back at least 8,000 years.

Clear evidence of the system appears on pottery at sites dated 7,000 years ago, like Liulinxi in Hubei province. By 6,500 years ago, the Xishuipo site in Henan was already laid out along a meridian line. Niuheliang's Platform No 2, he says, is a direct application of this ancient astronomical tradition.

Yet, it lacks what many would consider an essential feature of a capital — city walls.

Guo Dashun, honorary director of the Liaoning Provincial Institute of Cultural Relics and Archaeology, points out that walls are not, in fact, essential.

Yinxu, the last capital of the Shang Dynasty (c.16th century-11th century BC), had no known city walls. Neither did Erlitou, widely regarded as a capital of the Xia Dynasty (c.21st century-16th century BC).

"Yet both are widely recognized as capitals," Guo says.

Recent excavations have further strengthened Niuheliang's claim to that status.

At Locality 1, archaeologists have identified two temples — an upper temple to the north and the famed "goddess temple" to the south. Although the upper temple's above-ground structure has disappeared over five millennia, the finely crafted artifacts uncovered there rival those found in the goddess temple.

From the upper temple southward, past the goddess temple and sacrificial pits, the axis extends roughly one kilometer to Locality 2, where a three-tiered circular altar and burial mounds stand.

The layout is strikingly coherent: temples to the north, an altar to the south and elites' tombs aligned along the central axis.

Guo draws a parallel to Beijing, where the Forbidden City and Imperial Ancestral Temple stand in the north and the Temple of Heaven in the south.

Niuheliang, he says, contains the same core elements — an ancestral temple, sacrificial altar, tombs and a north-south axis — leading him to conclude that it was the capital of the Hongshan ancient state.

A bridge to the divine

In the highest-status tombs at Niuheliang, almost nothing accompanied the dead except jade. Scholars call this practice *wei yu wei zang* — "jade-only burial".

"Jade was the ultimate luxury, the high technology of its time," says Zhou Xiaojing, a research fellow at the Liaoning Provincial Museum, who has spent more than three decades studying Hongshan jade.

"Rarity made it precious — the difficulty of quarrying, transporting, and crafting it was precisely what made it a marker of status," she adds.

Most Hongshan jade artifacts can be traced to deposits in Xiuyan Manchu autonomous county, Anshan, Liaoning, which supplied the bulk of the culture's jade. A smaller number may have come from areas near Heilongjiang province and Russia's Lake Baikal.

Hongshan jade is renowned for its depictions of sacred animals — dragons, phoenixes, tortoises and silkworms. The *jue*-dragon and C-shaped dragon are among the most iconic, considered early prototypes of the Chinese dragon totem.

More intriguing, Zhou says, is what these objects reveal about Hongshan beliefs. A tubular jade object found near the head of a burial — the direction associated with heaven — is believed to have served as a medium for communicating with the divine. A large cloud-shaped jade piece placed on the chest likely signified the highest social rank.

Guo, the senior archaeologist, points to a recent discovery at the Yuanbaoshan site in Inner Mongolia, where archaeologists uncovered more than 100 jade objects embedded in a stone mound rather than inside tombs. The practice of "hiding jade in the mound", he says, appears to have been a ritual offering to heaven rather than part of a burial.

Guo believes this reverence for jade endured long after Hongshan culture, eventually finding expression in Confucian thought, where jade came to symbolize moral virtue.

Two peoples, one identity

Zhang Xingde, a professor of archaeology at Liaoning University who has spent more than four decades studying Hongshan culture, believes the reason that jade played a central role in Hongshan society lies in the very composition of the culture itself. It was a story of two distinct peoples who came together and forged a shared material and spiritual identity.

"Although the Hongshan people were relatively less developed in material terms, they also wanted to learn new things," Zhang says.

"And their absorption was not simple 'take-and-use' — it was innovation on the basis of what they took — in today's words, 'upholding tradition while breaking new ground'."

The breakthrough came from pottery. Between 2008 and 2010, the late archaeologist Zhang Zhongpei noticed something striking at the Weijiawopu site, a Hongshan culture settlement in Inner Mongolia. Pottery unearthed from different Hongshan sites had been made using two entirely different techniques.

One — the "clay-ring joining method" — was local to western Liaoning. The other — the "clay-strip coiling method" — was characteristic of regions south of the Yanshan Mountains.

"This Hongshan is not that Hongshan," Zhang Zhongpei told her, and urged her to investigate further.

Years of research led Zhang Xingde to conclude that Hongshan culture emerged from the convergence of two distinct populations.

One group was the indigenous people of western Liaoning, descended from the earlier Xinglongwa and Zhaobaogou cultures — the region's earliest farming communities dating back some 8,000 years.

The other consisted of Neolithic migrants from the eastern foothills of the Taihang Mountains. Driven northward by population pressure as agriculture expanded, they entered the Liaohe River basin around 6,500 years ago.

According to Zhang, the two groups initially clashed, even engaging in warfare. The newcomers pushed the indigenous population north toward the Xar Moron River basin in what is now Inner Mongolia, the northern edge of the Hongshan cultural sphere.

It explains why Hongshan culture's early phase had no jade in the southern part of the region, even though the earlier Xinglongwa culture to the north was rich in jade, Zhang says.

Over time, however, the two peoples learned to coexist. They adopted each other's vessel forms while preserving their own pottery-making techniques. At Niuheliang, Zhang says, they built a shared ceremonial center where different communities could worship together.

For her, this cultural fusion explains jade's elevated status. The southern migrants brought no jade tradition, but they encountered a northern people for whom jade was already sacred. In the process of forging a shared identity at Niuheliang, jade was elevated from a regional tradition to the unifying symbol of a new society, invested with new cultural meaning.

Guo, the archaeologist, sees evidence of this fusion in Hongshan painted pottery itself. Hongshan painted pottery bears three distinct patterns — the rose from China's Central Plains, the dragon native to Hongshan and geometric diamond-grid patterns from the vast Eurasian steppe. They testify to a "pottery road" that linked east and west, north and south some 5,000 to 6,000 years ago, with the western Liaohe River basin as a crucible of cultural fusion.

Many scholars in China and abroad have described Chinese civilization as a civilization of continuity, distinct from the cycles of rupture and replacement often associated with the ancient West.

Rooted in northeastern China's traditions while embracing influences from neighboring regions, Hongshan culture exemplifies that enduring pattern, they argue.

Guo believes this openness to outside influences helped shape Chinese civilization and ensured its continuity across millennia.

Niuheliang, he says, proves the continuity of Chinese civilization and is the root of ancient Chinese culture.

Key Hongshan discoveries of recent years

1. Ma'anqiaoshan site in Chaoyang, Liaoning province

The Ma'anqiaoshan site is a Neolithic settlement dating from about 7,700 to 5,500 years ago. Archaeological findings show that an early settlement of Hongshan culture has been remarkably well preserved at the site. The residential area was carefully planned, with large house foundations serving as central hubs surrounded by smaller dwellings and

pits. Scientific analysis indicates that people had already begun cultivating crops on a large scale during the early Hongshan period. The growth of agriculture boosted productivity, allowing communities to settle permanently and sustain long-term production. These discoveries suggest Hongshan society was becoming increasingly complex, laying important foundations for the emergence of a diverse yet unified Chinese civilization.

2. Dongshantou site in Chengde, Hebei province

Between 2022 and 2025, archaeologists excavated the Dongshantou site, which dates from about 5,500 to 5,300 years ago. They uncovered 69 archaeological features and more than 100 pottery, stone and jade artifacts. Archaeologists find the building ways of the round rubble mound tombs, the tomb structure, burial customs and features of the unearthed artifacts basically follow those from the Niuheliang site in Liaoning, which is commonly believed to be the nucleus of Hongshan culture. However, Dongshantou also revealed unique stone-piled remains believed to represent an "earth mother deity". Archaeologists believe it reflects the Hongshan people's early worship of maternal fertility and the symbolic link between the earth and childbirth.

3. Naotegai site in Chifeng, Inner Mongolia autonomous region

The site, which covers three million square meters, is one of the largest settlements of Hongshan culture discovered to date. It has been found to have a long cultural development spanning nearly three millennia. It peaked in the late period of Hongshan culture from 5,500 to 5,000 years ago. The settlement features clearly defined residential and ritual zones arranged in a layout similar to Niuheliang. Well-developed farming tools point to a thriving agricultural economy, while finely crafted jade artifacts reflect a ritual system centered on jade, suggesting the emergence of social hierarchy and status.

4. Yuanbaoshan site in Chifeng, Inner Mongolia

Excavations in 2024 confirmed Yuanbaoshan as a Hongshan ceremonial complex of tombs and sacrificial remains dating from about 5,100 to 5,000 years ago. More than 100 jade artifacts have been unearthed, including one of the largest jade dragons ever found in northern China. Human remains, pits, and ceramic, stone, bone and clamshell artifacts were also found. Particularly notable is the discovery of jade objects embedded within and beneath the walls of a circular stone mound tomb, a burial practice that offers fresh clues to Hongshan ritual traditions and their role in the development of Chinese civilization.

5. Zhengjiagou site in Zhangjiakou, Hebei

Since 2022, archaeologists have excavated the Zhengjiagou site, uncovering nine characteristic Hongshan circular stone mound tombs and more than 600 pottery, jade, stone and bone artifacts. Dating from about 5,300 to 4,800 years ago, the site extends the known lifespan of Hongshan culture by about 200 years beyond the previously accepted end date of 5,000 years ago. The discovery also overturns the earlier view that northern Hebei lay on the culture's fringe, showing instead that it served as an important regional center during Hongshan's final phase. Its elaborate burial and sacrificial traditions, together with its rich jade assemblage, suggest that Zhangjiakou was already advancing toward an early civilization around 5,000 years ago.

Above: The 2026 Xinjiang Is a Nice Place intangible cultural heritage showcase staged in Shihezi, the Xinjiang Uygur autonomous region, attracts a big crowd. **Top right:** A chef pulls noodles at the gourmet food section of the event. **Right:** Cultural creative items featuring local elements show their appeal.
PHOTOS PROVIDED TO CHINA DAILY

Mixing crafts on new ground

A cultural festival merges shadow puppets, traditional music, and rare paper into new art, **Yang Feiyue** reports in Shihezi, Xinjiang.

Under the stage lights in Shihezi, a leather shadow puppet slowly raises an arm, swaying gracefully to the rhythm of melodies unique to the city in northern Xinjiang Uygur autonomous region.

Its movements are inspired by a traditional dance of the Uygur ethnic group. The music comes from local performers playing classic Uygur instruments such as the *dutar* and *rawap*. Yet, the figure dancing behind the screen belonged to Beijing's centuries-old shadow puppet tradition.

For the performers, it was an opportunity to explore how intangible cultural heritage can travel across regions, connect with new traditions and continue to evolve.

The performance was created for the 2026 Xinjiang Is a Nice Place intangible cultural heritage showcase, which opened on Thursday.

Organized by the Ministry of Culture and Tourism, the Xinjiang government, and the Xinjiang Production and Construction Corps, the five-day event brought together more than 650 representative intangible cultural heritage practices and over 540 inheritors from 31 provinces, autonomous regions and municipalities, as well as the Xinjiang Production and Construction Corps.

Rather than simply showcasing traditions from different regions, the event highlighted exchanges and cooperation, encouraging artists and craftspeople to learn from one another and create new forms of expression.

For Lu Baogang, an actor with the Beijing shadow puppet troupe, adapting the performance for Xinjiang audiences became the troupe's first challenge.

"When we received the invitation, we were honestly a little nervous," Lu says. "We kept asking ourselves what kind of program Xinjiang audiences would connect with."

Instead of bringing an existing production, the troupe chose to weave local cultural elements into a brand-new performance.

The result was a short piece inspired by the story of Wan Tongshu, a cultural worker who contributed to the preservation of Twelve Muqam — a traditional Uygur musical suite inscribed on UNESCO's Representative List of the Intangible Cultural Heritage of Humanity in 2008.

The Beijing artists created two shadow puppet figures based on Wan and his wife, paying tribute to generations of cultural workers who dedicated themselves to safeguarding Xinjiang's rich musical heritage.

For Lu, the most rewarding part of the project came when the Beijing performers began working closely with musicians from Xinjiang.

"At first, communication was not easy because we speak differently," Lu says. "But we share something in common — we are all committed to protecting traditional arts."

After several rehearsals, the two sides gradually found ways to blend the movements of the shadow puppets with the rhythms of Xinjiang's traditional music.

Lu says he learned a great deal from the local artists, particularly how to capture the distinctive movements of Xinjiang dance.

"One example is the posture of a Xinjiang woman dancing," he says. "Previously, our puppet simply placed one hand on its waist. The local artists suggested raising the other hand and adding movements that flowed with the rhythm. It instantly made the character feel more natural."

For Lu, the collaboration was about "absorbing elements from each other".

The troupe hopes the cooperation can continue beyond the short performance.

"We believe that one day we can create a full-length production together, combining the two sides' music and storytelling techniques," Lu says.

The troupe has also launched a workshop during its Xinjiang visit, introducing local children to the craft of making shadow puppets.

"We hope this traditional craft can take root among young people here and help promote their culture," he adds.

Fresh expressions

Across the exhibition hall, the Xinjiang mulberry-bark paper, known as *sangpi* paper, was embarking on a different path toward renewal.

Sheets of paper were placed beneath the carved woodblocks used in art studio Rongbaozhai's centuries-old woodblock watermark printing technique, producing a series of collectible artworks.

The experiment was not easy.

According to Li Yang, deputy director of Rongbaozhai's woodblock watermark center, the team has worked with different types of mulberry paper from various regions, including paper used in restoration projects at the Palace Museum.

Each region produces mulberry paper with its own texture and characteristics, he explains.

For the Xinjiang collaboration, Rongbaozhai used local mulberry paper to print images including the "Five Stars Rising in the East" brocade, discovered at the Niya archaeological site in Hotan prefecture, Xinjiang, as well as a panda-themed design.

The results showed both challenges and possibilities.

Compared with papers traditionally used in Chinese painting, Xinjiang's mulberry paper has a coarser texture and more prominent fibers, making precise printing more difficult.

Top and above: Ethnic singing and dancing performances are among the highlights of the intangible cultural heritage showcase in Shihezi, Xinjiang.

During the printing process, the team had to repeatedly apply additional layers to achieve the desired effect.

But Li believes the paper's distinctive texture could eventually become an artistic advantage.

"Its weakness could also become its strength," he says.

If artists create works specifically suited to the texture of mulberry paper, its rough surface and natural fibers often seen as limitations could become unique visual features, he adds.

"In the future, if artists create directly for this material, we may discover a new artistic language," Li says.

The current works represent only an initial exploration. The team hopes to collaborate with Xinjiang artists to develop designs and techniques that make the best use of local materials.

"When two elements come together, neither should lose its own character," he says. "The value lies in finding the point where they can meet."

Silk Road connections

Cross-regional cooperation from the partnership between Quanzhou in Fujian province and Changji Hui autonomous prefecture in Xinjiang has delivered a special rendition of the popular Fujian song *Ai Pin Cai Hui Ying* (Only By Striving Can One Win) which drew large crowds at the showcase in Shihezi.

The familiar melody was reimagined by blending Fujian folk instruments with Xinjiang traditions, including the *dombra*, the traditional two-stringed Kazak instrument, and Xinjiang folk singing.

The performance is part of an ongoing partnership linking Quanzhou, one of the key ports along the ancient Maritime Silk Road, with Changji, a region historically connected to the overland Silk Road. Over the years, the collaboration has created platforms for performances, training and exchanges among craftspeople from both regions.

Beyond performances, the Changji delegation brought a variety of local crafts and foods, including dough figurines, embroidery, traditional dairy products and folk handicrafts.

Among the exhibits was a collection of dough figurines representing different regions. Each figure combined symbols from Xinjiang and Fujian, illustrating how two distinct local cultures could come together through a single art form.

The delegation also showcased different embroidery traditions, including ethnic Kazak and ethnic Hui embroideries.

"Kazak embroidery is known for bright colors, bold patterns and motifs such as horn designs, while Hui embroidery often features finer stitching and delicate color combinations," explains Meng Yushan, an intangible cultural heritage specialist at the Changji prefecture cultural center.

Rather than merging them into a single style, the exhibition highlights their unique characteristics side by side.

For Meng, the partnership with Fujian has also opened new opportunities for local artisans to broaden their skills.

"Many of our inheritors have traveled to Fujian for training," she says.

They have studied areas such as lacquer painting and craft development, learning not only the techniques but also ways to transform traditional skills into sustainable creative industries, she adds.

When Lu Baogang first walked into the exhibition hall, he says he was struck by the diversity of traditions gathered under one roof.

"After walking around the venue, I realized that every province and region had brought its finest works, and every exhibition area had something unique to offer," Lu notes.

For Lu, the gathering was a reminder that intangible cultural heritage is not confined by geography.

Preserving tradition today is not only about safeguarding old techniques, but also about creating opportunities for different forms of heritage to interact, inspire and evolve, he says.

A Brazilian artist's dream forged in porcelain

NANCHANG — Against the red-brick backdrop of the Taoxichuan cultural and creative district in Jingdezhen, Jiangxi province, Brazilian artist Viviane Diehl stands out with her striking red hair.

For the 62-year-old visual artist, her presence in this ancient porcelain capital is the realization of a long-time dream. "The moment I began learning about porcelain, I knew I had to come to China," Diehl says.

Her journey to the heart of Chinese ceramics began with fellow artists who had worked in Jingdezhen's Sanbao village. After returning to Brazil, they shared stories about the city at exhibitions and art events, sparking Diehl's fascination.

"I've loved art since childhood," she says, recalling how she began studying ceramic painting at 15, learning every step from glazing to firing.

That passion has blossomed into tangible creations. Her artwork titled *Afforest*, which is on display at the Taoxichuan Art Museum until the end of August, was created during an artist residency in Jingdezhen in 2024.

"Ceramic art and nature guide human beings toward inner reflection, giving meaning to cycles and coexistence, providing a pause and reconnecting freedom to well-being and unity," Diehl wrote in the introduction.

Mastering this medium in a foreign land has been an expressive journey. Before arriving in Jingdezhen, Diehl completed a residency in Longquan, where she began experimenting with local clay and celadon glazes.

Longquan, a city in Zhejiang province, is known for its centuries-old celadon tradition, and the firing techniques of Longquan celadon were added in 2009 to UNESCO's list of Intangible Cultural Heritage of Humanity.

"Working with China's local clay is an expressive challenge. Experimentation in construction, surface design with celadon glazes, and gas firing techniques is a continuous process," she says. "I am learning something new all the time."

An art teacher since 1989, Diehl describes herself as an "educator-artist". While modern technology has made ceramic knowledge more accessible worldwide, she believes Jingdezhen remains unmatched.

"We don't have another place with such quality and special techniques to make porcelain," says Diehl. This unique appeal is rooted in the city's geography and heritage.

"There's nowhere else with this level of craftsmanship and these unique porcelain-making techniques," she says. That uniqueness is rooted in the city's natural resources and centuries-old heritage.

Nestled among the hills of northeastern Jiangxi, Jingdezhen is rich in kaolin, or China clay, along with other essential materials for porcelain production. Over generations, local artisans have refined every stage of the process, from preparing clay to firing kilns.

The world has taken note. The Jingdezhen Handicraft Porcelain Industry Sites were added to UNESCO's World Heritage List last month, filling a long-standing gap in the list for porcelain heritage. It is China's 61st World Heritage site.

Today, Jingdezhen's complete ceramics industry continues to attract artists from around the world. At peak times, more than 5,000 ceramic enthusiasts gather in the city.

Brazilian artist Viviane Diehl (center) visits China Ceramics Museum in Jingdezhen, Jiangxi province, on June 28. XINHUA

Beyond its thriving industry, Jingdezhen has introduced initiatives to encourage artists to stay. In 2015, the Taoxichuan cultural and creative district launched the Migratory Bird Program, partnering with art institutions in more than 50 countries and regions and attracting some 3,600 artists from across the globe.

As Jingdezhen continues to evolve, it remains a magnet for global creators. "Jingdezhen is opening doors to the world," Diehl says.

LIFE

'Living like a local' reshapes tourism

Hotels, retailers, and urban developers are shifting from traditional sightseeing models toward a more experience-driven form of vacation, **Yang Feiyue** reports.

A young woman checks into a hotel in Shenzhen's Nantou ancient town on a Friday evening. At the front desk, she is handed a room key and a small blue mesh bag.

Inside is cat food.

"There are stray cats all over the old town. Take a walk. Feed them," the receptionist says.

The bag, printed with hand-drawn illustrations of local cats and a small map of surrounding streets, serves as an informal guide to the neighborhood. It is part of the guest experience at Tiaohai Living Youth Hostel, located in one of Shenzhen's remaining urban villages in South China's Guangdong province.

In the narrow lanes around the property, open-front kitchens, small shops and long-time residents form a dense urban fabric. The hostel's slogan, written on a chalkboard near the entrance, reads, "Check in. Step out."

The concept encourages guests not to remain indoors, but to explore the surrounding community.

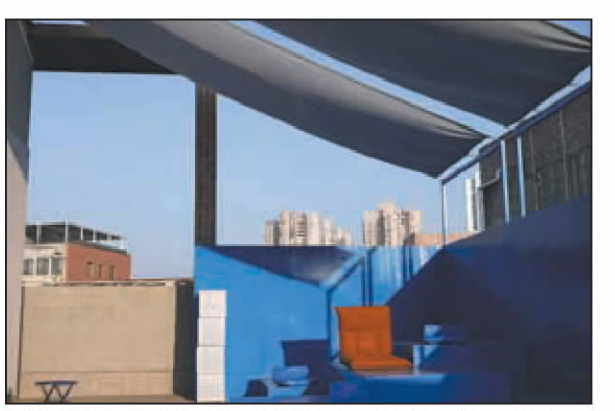
Inside one of the rooms, curtains are made from two patchworks of faded denim, floral cotton and striped fabric stitched together from secondhand clothes donated by nearby residents.

"These are the colors that once flowed through the streets of Nantou," says Sui Yi, cofounder of Tiaohai Living.

In the hallway, a "Give and Take" table allows departing guests to leave behind everyday items such as toiletries, snacks or travel essentials for others to use. In dormitory rooms, magnetic boards let guests indicate preferences such as "early sleeper", "late return", or "open to chatting".

Sui says the idea for the hostel came during frequent business travels.

He recalls staying in a mid-tier hotel in a Chinese city where, upon waking, he could not immediately identify where he was. The rooms, he says, felt identical across locations.



"The hotel gave me a place to sleep, but it couldn't tell me anything about the city I was actually in," he says.

That experience, he adds, became the starting point for Tiaohai Living, which opened in 2025. The concept aims to turn accommodation into a gateway for understanding the surrounding city.

He notes that some guests have stayed for extended periods, including job seekers who remained for several weeks or longer, and that others have returned after leaving, seeking to reconnect with people they met during their stay.

PHOTOS PROVIDED TO CHINA DAILY

The development of such hospitality models reflects broader changes in China's tourism sector, where traditional sightseeing patterns centered on ticketed attractions are gradually giving way to more experience-oriented travel.

Industry participants say the focus of travel demand is increasingly shifting toward local immersion, with younger tourists showing greater interest in everyday urban life and neighborhood culture.

At a recent tourism industry gathering in Xiamen, Fujian province, practitioners from across hospitality, retail and cultural sectors discussed the evolving structure of domestic tourism.

Xiong Xiaojie, a long-time tourism marketing executive and former chief brand and marketing officer at Chimelong Group, says that cities are increasingly becoming tourism destinations in their own right rather than just gateways to scenic spots.

He notes that demand is shifting toward "living like a local", while urban renewal has expanded the range of spaces available for tourism, including former industrial sites, alleys and community markets. Social media platforms tend to amplify overall urban "vibes" rather than individual attractions.

He also points out that different cities are increasingly developing distinct cultural identities, citing examples such as Chengdu's leisure culture, Harbin's hospitality style and Jingdezhen's artistic atmosphere.

"One strong, shareable moment matters more than 10 perfect attractions," he says.

In the retail sector, companies are also adjusting to changing consumption patterns.

Kou Weixuan, global vice-president of lifestyle brand Miniso, says that consumer demand is increasingly driven by personal interest and emotional value, particularly among younger groups.

Miniso has shifted its focus toward intellectual property (IP) development and themed retail environments, combining product sales with experiential store design, he says.

At the company's flagship store on Shanghai's Nanjing Road, which covers about 1,500 square meters, daily visitor numbers exceed 10,000. According to company figures, cumulative revenue reached more than 250 million yuan ($37 million) within around one and a half years after opening.

Kou says that such spaces are designed not only for retail but also for traffic generation and cultural engagement.

Urban redevelopment projects are following a similar trajectory.

In Chongqing, finance and real estate professional Zhou Yaxin transformed a former printing factory into a cultural and creative complex in 2014, incorporating galleries, studios and public spaces while retaining much of the original industrial structure.

The site gained wider attention after being used as a filming location for the 2016 film *I Belonged to You*, attracting an increasing number of visitors.

In 2018, Zhou's team developed an open-air venue in Shancheng Lane by repurposing a sunken plaza behind a former church. The space, named the "Wilderness Theater", now hosts performances, community gatherings and cultural events.

Zhou says that many cities have underused industrial and historical spaces that can be reactivated through adaptive reuse rather than large-scale reconstruction.

"Every city has old factories, old neighborhoods, old buildings sitting empty. We need to see what's already there and see it differently," he says.

The cultural sector is also adapting to changing visitor expectations.

Qiu Tong, founder of Meet You Museum, observes that younger audiences increasingly prefer interactive and visually engaging exhibitions over traditional static displays.

The museum group has opened seven physical locations across China and staged exhibitions in more than 20 cities, attracting around 3 million visitors.

One exhibition features a projection-based interpretation of Yongle Palace, a Taoist temple from the Yuan Dynasty (1271-1368), where visitors use flashlights to activate animated visual elements on wall drawings.

Another exhibition includes a dinosaur installation featuring a 10-meter-long rib cage that visitors can walk through.

Qiu says that the audience composition has shifted in recent years, with family and parent-child visitors now forming a larger share of total attendance compared with earlier years when young urban women made up the majority.

She also notes that placing exhibitions in shopping malls and city centers, rather than peripheral museum sites, has helped integrate cultural experiences into daily urban life.

In Tianjin, one of the group's projects was the first tenant in a converted parking garage, later followed by other cultural businesses, she says.

According to the Ministry of Culture and Tourism, China recorded 6.5 billion domestic tourist trips in 2025, an increase of 16.2 percent year-on-year.

Back at Tiaohai Living Youth Hostel, small gestures continue to define the guest experience. A visitor leaves a bottle of makeup remover on the "Give and Take" table for another guest. Another adjusts a dormitory sign to indicate a late return, and is thanked the next morning by a roommate.

"In the end, we're not selling a room. We're selling a reason to stay," Sui Yi says.

Heritage comes alive as visitors flock to immersive cultural attractions

Clad in traditional Chinese robes, a group of young overseas visitors of Chinese descent stepped into a lantern-lit cultural district in the ancient city of Xi'an, Northwest China's Shaanxi province, immersing themselves in a world they had seen only on screen.

"The moment I walked through the gate, the whole setting made me feel like I was traveling back more than a thousand years," said a group member from Singapore.

During their visit last week, these visitors snapped photos, watched live performances, and played street games in the re-created streetscape modeled on Chang'an, capital of the Tang Dynasty (618-907).

As the country's first immersive block featuring Tang-style street life, the project, which opened in 2022, was upgraded earlier this year to create a more engaging atmosphere. To date, it has recorded over 7.5 million visits.

"We aim to attract more people through the modern expression of traditional aesthetics," says Zou Linfeng, head of the tourism project.

The attraction offers a glimpse into a broader trend. This summer, traditional Chinese culture has been gaining new appeal as global tourists embrace offerings rooted in China's heritage.

Today, visitors are not satisfied with just sightseeing at cultural landmarks. Instead, they are seeking immersive experiences that forge a deeper connection with traditional Chinese culture. *Guofeng* (Chinese-style) immersive tours have thus become a draw for visitors this summer. Data from Tongcheng Travel, a leading Chinese online travel agency, show that as of July 23, searches for keywords such as "*guofeng*" and "immersive" on the platform had more than doubled month on month.

Langfang, a city adjacent to Beijing in North China's Hebei province, has recently ranked among the top 10 destinations for such tours, according to the platform. Many visitors flock to this place for a theater complex drawing inspiration from a Chinese literary classic.

Named *Unique Dream of Red Mansion*, the attraction features 55 innovative plays, including those inspired by the seminal 18th-century novel *A Dream of Red Mansions* and independent ones, turning traditional Chinese literature into accessible, tangible, and interactive cultural spaces.

Dancers perform at "Twelve Hours of Chang'an", a re-created streetscape for tourism in Xi'an, Shaanxi province. SHAO RUI / XINHUA

A recent highlight is a debut production consisting of 35 micro-theaters, where visitors draw and swap cards to chart their own viewing journey. Within each theater, viewers sit just steps from the actors, becoming part of the narrative itself.

Wang Chaoge, general director of the theater complex, explains that such productions are designed to allow each viewer to participate in the play as it unfolds, while delivering even greater emotional intensity within a short span of time.

Since its opening in 2023, the theater complex has staged approximately 24,000 performances and received over 14 million visits.

Zhao Yu, a second-time visitor from North China's Tianjin, says that the venue provides a different experience from traditional theaters. "Instead of watching a single play for several hours, we can enjoy performances here throughout the day, stay for a night, and continue our experience the next day."

Students are a major group of travelers during the summer travel rush. The summer vacation provides them with an opportunity to gain hands-on experience in the traditional Chinese culture that they learn at school.

Li Jinhan, 15, tried her hand at restoring a replica mural panel at an intangible cultural heritage experience base in Dunhuang, a vital ancient Silk Road hub in Northwest China's Gansu province. From injecting consolidants to filling cracks, the girl realized how challenging yet significant it is to keep the historical treasure alive.

"Reading about it is one thing, but doing it is another," says Jinhan. "The restoration allows me to slow down and appreciate the timeless beauty of Dunhuang murals."

Her experience was part of a study tour that emerged from growing demand among students and parents for a deeper understanding of the country's cultural heritage.

"The study tours can sow the seeds of culture in young minds," says Du Yongwei, the base's founder. "With new scenarios and fresh expressions, we build a bridge for that passion to grow."

Similar on-site classes are thriving nationwide.

Meanwhile, international tourists are getting on board. More overseas visitors are taking dedicated trips to China to participate in culturally themed study tours, amid the country's expanding visa-free entry policies.

Earlier this month, a 30-member Italian group finished a study tour in Hainan, China's southernmost island province. During the two-week program, teenagers engaged in courses and activities involving language learning and handicraft making, among others.

With more firsthand experience of the country and a better understanding of its culture, views of China have turned more positive. According to a Pew Research Center study published this month, a median of 46 percent of respondents across the 20 countries surveyed annually since 2023 holds a favorable view of China, up from 32 percent in 2023. The figure now surpasses the median favorability rating for the United States.

Han's building a dynasty Down Under

NY Liberty center leads the charge for Chinese players in Australia's WNBL, as she signs up for a second season

Chinese New York Liberty center, Han Xu, goes up for the basket during a WNBA game against Toronto Tempo in Montreal on July 13. XINHUA

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

When Han Xu reflected on her first season in Australia's Women's National Basketball League in March, the Chinese center was already looking beyond her own achievements.

"I hope my experience can serve as a signpost for those who come after me," she wrote on social media. "One day, someone will follow in my footsteps and arrive here."

Just months later, that pathway is becoming crowded.

The Geelong Venom announced last week that Han and her compatriot, forward-guard Zhang Wanglai, had signed one-year contracts for the 2026-27 WNBL season, pending league approval.

Together with Wang Siyu, who has joined the Southside Melbourne Flyers, and Yang Shuyu, who has signed for the Sydney Flames, four Chinese players are now set to compete in the WNBL next season.

For Han, the move to Geelong represents another chapter in a career spanning China, the United States and Australia.

Standing 2.11 meters tall, Han has established herself as one of the country's most successful basketball players on the international club stage.

The 26-year-old was selected by the New York Liberty with the 14th overall pick in the 2019 WNBA Draft.

She has since won three Women's Chinese Basketball Association Most Valuable Player awards and two WCBA championships. She was also part of the Liberty squad that won the 2023 WNBA Commissioner's Cup.

Currently in her fourth WNBA season, she is averaging 5.8 points and 2.2 rebounds per game.

On Saturday Han reached a milestone 500 league points during the Liberty's 94-92 road win over the Phoenix Mercury.

Playing as a reserve, Han scored a season-high 17 points on 6-for-9 shooting from the field, including 3-for-6 shooting from 3-point range, to go with six rebounds and one assist.

Han has been equally influential for the Chinese national team. She helped China claim silver at the 2022 FIBA Women's Basketball World Cup and was selected in the tournament's All-Star Five.

A year later, she was named MVP as China won the FIBA Women's Asia Cup.

Her first season in Australia provided further evidence of her ability to adapt to and succeed in different basketball environments.

Playing for the Perth Lynx in 2025-26, Han averaged 16.2 points, 7.3 rebounds and 2.2 blocks in 18 games. She anchored Perth's defense and helped the team reach the Grand Final Series, where it finished runner-up to the Townsville Fire.

Right: Han makes another three-point basket in the Liberty's 94-92 win over Phoenix on Saturday. GETTY IMAGES

Her strong performances around the basket earned her the league's Defensive Player of the Year award and a place on the All-WNBL Second Team.

Han's combination of size, rim protection and offensive versatility made her one of the most sought-after players on the WNBL market. Australian media reported that several clubs had pursued her, before Geelong eventually secured her signature.

Venom head coach Cheryl Chambers described Han as one of the world's most dominant post players.

"Her shot-blocking and rebounding are genuinely elite," Chambers said.

"Adding that size and experience to our roster gives this team a real edge, and we can't wait to see what she brings to the club this year."

Han's arrival has raised expectations at Geelong as the relatively new club seeks to turn itself from a finals contender into a championship winner.

Veteran guard Rebecca Cole said having an elite shot-blocker behind the team's perimeter defenders would give them the confidence to apply greater pressure to opposing ball handlers.

"Her presence on the floor at both ends of the court is going to change the entire game for us," Cole told Australian basketball media.

Han offers much more than interior defense.

She can run the floor, finish efficiently around the basket and stretch defenses with her outside shooting. Her mobility and touch are rare for a player of her height, giving Chambers a wide range of tactical options.

Already familiar with the WNBL's physical style and competitive intensity, Han said she was excited about returning to Australia.

"I know how passionate this league's fans are and how much the competition has grown," Han said.

"I'm looking forward to bringing everything I've built over my career — from China to the WNBA — into this team, and pushing for something special with my new teammates."

Geelong has further strengthened its roster with Zhang, an experienced competitor in both five-on-five and 3x3 basketball.

The 32-year-old won consecutive WCBA championships in the 2022-23 and 2023-24 seasons. She also won the Chinese 3x3 league title in 2023 and was named MVP.

Most recently, she helped China win bronze at this year's FIBA 3x3 Asia Cup.

Zhang said moving to Australia would give her an opportunity to step outside her comfort zone and experience a different style of basketball.

"I'm really looking forward to soaking up the basketball vibe in Geelong," she said.

"I've no idea what's ahead, but I'm going to keep loving the game and take it one step at a time. I can't wait to get settled in, learn the system and go to battle with my new teammates."

The growing presence of Chinese players in overseas leagues reflects a broader trend in the development of women's basketball in China.

Overseas leagues such as the WNBA and WNBL expose Chinese players to faster-paced games, stronger physical contests and different tactical systems. Such experience helps improve their decision-making, defensive awareness and their ability to handle pressure against the world's top teams.

Han remains one of the clearest examples of that process. Following the conclusion of the WNBA regular season, she is expected to represent China at the FIBA Women's Basketball World Cup in Berlin in September.

After completing her national-team commitments, she will join Geelong ahead of the WNBL season, which tips off on Oct 15.

Her journey represents a growing connection between Chinese basketball and the international game, with more players willing to step out of their comfort zone and test themselves in more demanding overseas competitions.

In her March message, Han hoped her journey would become a signpost for those coming after her. With four Chinese players now committed to WNBL clubs for the new season, others are already beginning to walk alongside her on the path she helped forge.

TENNIS

Shang returns to winning ways in Montreal to set up Rublev rematch

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

He's not quite there yet, but Shang Juncheng is starting to look like a history-making prodigy again.

Having his trademark agility and precision back at his disposal certainly made the difference on Sunday at the ATP1000 Masters tournament in Montreal, where Shang claimed his first ATP Tour-level win in over six months after being sidelined by a long injury layoff.

Shang's straight-sets upset of 66th-ranked Adolfo Daniel Vallejo of Paraguay at the National Bank Open secured his first main-draw win on the men's pro circuit since his opening-round victory at the Australian Open in January, serving up a much-needed confidence boost for his comeback from a nagging foot injury.

It's been the second year in a row that the 21-year-old Shang has been sidelined for the first half of the season due to a number of fitness issues that have slowed down his meteoric career rise.

The resilient young talent — creator of many "youngest-ever" records for Chinese men's tennis — has taken pride in overcoming the grueling rehab again, although admitting he's far from showing his top form yet.

"Honestly, I felt a lot of things were not going so well, even yesterday. I had issues with my baseline strokes, volleys and returns in training," Shang said after ousting Vallejo 6-3, 6-3 in 82 minutes, before a heavy downpour put Sunday's other matches at the IGA Stadium on hold.

"My dad and my coach told me to just focus on every single shot and to not overthink things. They told me 'it's totally normal if your opponent plays better than you, because they've been playing all year long, while you've just come back'.

Shang Juncheng hits a return to Adolfo Daniel Vallejo in Montreal on Sunday. REUTERS

"Rehab is an incredibly tedious process. I hope no young player ever has to go through this ordeal, but if they do, (they should) just treat it with patience and persistence, and stick to what's needed (to recover).

"I couldn't figure this out at first, but I've gradually come to terms with the setbacks, which are part of the job," said Shang, who reached his career-high ranking of No 47 in October 2024 after winning his first ATP Tour title in Chengdu.

Shang will need to step up his game quickly, as the challenge gets tougher with a round-of-64 match against Russian former World No 5 Andrey Rublev on Tuesday.

Rublev beat Shang in their only previous meeting, the semifinals of an ATP250 tournament in Hong Kong in 2024.

Having maintained a friendly relationship with the Russian power-hitter, Shang said he will cherish the opportunity to test himself physically and mentally against the 10th seed in Montreal.

"It will be a tough match, for sure, because his ability is now is well above mine," said a candid Shang, who, at world No 281 this week, entered the Montreal main draw via protected ranking.

"This will be another chance to learn from a top-15-caliber opponent. I've played many of them, and I just want to do my best this time and, win or lose, just enjoy the match."

With power never being his strength, Shang leans on his quick legs, resilient defense and tactical variety to outwit size and force.

His best form in 2024 saw him become the youngest Chinese man ever to register a main-draw win at the ATP1000 level with victory over Jordan Thompson at Indian Wells, California, in March, before becoming the youngest Chinese man to break into the top 100 in May that year.

On Sunday, relying on his fast movement, combined with pinpoint accuracy and long rallies, Shang dispatched Vallejo using his familiar winning formula, evoking fond memories of the teen star in his prime.

More drills are needed, though, as Shang, who's racked up six career wins at the Masters level, is aiming for a strong resurgence, as the season heads into its final stretch with a number of Chinese players struggling with poor form of late.

"I came here with confidence built through training, but match intensity is definitely a different story," Shang said.

"I've made some progress today, but I can't guarantee I'll be in perfect form for the next match.

"No matter the result of my next game, I want to maintain a positive attitude."

The 2008 Olympics: Games that keep on giving

Twenty-five years ago, Beijing won the right to host the Olympic Games. It marked the beginning of an extraordinary Olympic journey for China.

For me, the Beijing 2008 Olympic Games became one of the defining moments of my life as an athlete. I will always remember the feeling of those Games: the energy of the city, the pride of the people, the color and creativity of the opening ceremony, and the sense that the whole world had come together in one place.

Inside
Views, **page 7**

I also remember two venues in particular. The Water Cube will always be special to me as a swimmer. It was there that I experienced some of the most important moments of my career. The Bird's Nest became one of the defining images of Beijing 2008 — an iconic setting for an opening ceremony that brought Chinese culture and creativity to the world.

When I returned to Beijing for the 2022 Winter Olympic Games, this time as an International Olympic Committee member, I saw those memories in a new light. The Water Cube had become the Ice Cube — the Olympic curling venue. The Bird's Nest once again staged unforgettable Olympic opening and closing ceremonies.

These were striking examples of venues being given a second life. But they also pointed to something bigger.

The real legacy of an Olympic Games is never only about what remains after the flame goes out. It is about what the Games make possible afterward. Can more young people discover sports? Can more communities be active? Can athletes train and compete in better conditions? Can a city become better equipped for the future?

Those are the questions that should guide every Olympic host from the very beginning — to ensure that the Games deliver more for local communities while leaving a lighter footprint on the environment.

That is what sustainable Games should mean. It starts with responsible choices about resources — venues, transportation and energy. But its purpose is broader: to create benefits that last.

Beijing shows what that can look like.

Beijing debunks South China Sea statement

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Inside
Editorial, **page 6**

Beijing has blasted a joint statement released by 14 countries regarding the "2016 South China Sea arbitration award", urging those countries to "stop stirring up trouble over the South China Sea issue" and "cease undermining peace and stability in the South China Sea".

"China urges the relevant countries to earnestly respect China's territorial sovereignty and maritime rights and interests in the South China Sea," the Foreign Ministry said in a statement on Sunday.

The United States, the Philippines, Australia, Canada, Estonia, Germany, Italy, Japan, Latvia, Lithuania, New Zealand, Romania, Slovenia and the United Kingdom issued a joint statement earlier on Sunday.

The 14-nation joint statement claimed that the "award" rendered 10 years ago by the "arbitral tribunal in the South China Sea arbitration" is "a significant milestone", and that "there is no legal basis for China's expansive maritime claims in the South China Sea".

In response, the Foreign Ministry noted that, "If the 'award' were to be taken as a standard, many countries' islands and reefs would be denied the basis for claiming maritime rights and interests.

"May we ask, have those countries supporting the 'award' voluntarily waived the maritime rights and interests deriving from their relevant islands and reefs?" the ministry added in its own statement dismissing the 14-nation claims.

The ministry reiterated that China does not accept or recognize the "award", and it opposes and does not accept any claim or action based on it.

"Land territorial issues are not subject to the United Nations Convention on the Law of the Sea", and the "award" is nothing but a worthless piece of paper that is illegal, null and void, the ministry said.

The US and other countries have been persistently reinforcing their military presence in the South China Sea, throwing their weight around and fanning the flames, it warned. "These acts of militarization and coercion constitute the primary challenge to the current situation in the South China Sea," the ministry said.

For the past 10 years, the "award" has "become a tool for the Philippines to expand its territorial and maritime claims, exacerbated tensions in the region and provided a pretext for external forces to intervene and destabilize the South China Sea", the ministry noted.

The continued playing up of the illegal "award" by certain countries "goes against the aspirations of countries and people in the region for development and prosperity", the ministry said, adding that "such attempts are doomed to fail".

Wu Shicun, chairman of the Huayang Center for Maritime Cooperation and Ocean Governance, said that the "award" was "a political farce" executed by the then Philippine administration, manipulated by the US and assisted by Japan in an attempt to whitewash Manila's illegal claims and actions.

Also on Sunday, Japanese Foreign Minister Toshimitsu Motegi made a separate statement blatantly endorsing the "award", attacking China's lawful claims and mischaracterizing Japan as a "legitimate stakeholder who uses the South China Sea".

"China strongly deplores and firmly opposes this," a spokesperson for the Chinese Foreign Ministry said in a written response.

The spokesperson noted Japan's wartime atrocities against China and its people, as well as its illegal occupation of islands and reefs in the South China Sea, and said that now Japan is again attempting to meddle in the South China Sea.

"This reminds people of Japan's history of aggression and expansion, and heightens their vigilance against Japan's neo-militarist agenda," the spokesperson said.

According to the "award" supported by Japan, Taiping Dao in the Nansha Islands — an area that spans 500,000 square meters and has fresh water, vegetables, fruits and poultry to sustain human habitation — is not even considered an island and therefore cannot generate entitlement to an exclusive economic zone and continental shelf, the spokesperson said.

"By that 'standard', many of Japan's islands and reefs would likewise have no basis for claiming maritime rights and interests," the spokesperson added. The spokesperson questioned Japan's claim to the EEZ and continental shelf around Okinotori, which is nothing more than two tiny rocks of less than 10 square meters in the Pacific.

The head of the ministry's Department of Asian Affairs on Sunday summoned the chief minister of the embassy of Japan in China to lodge a stern representation and strong protest.

On Sunday, the Chinese Mission to the European Union also blasted a separate statement issued by the EU about the "award", which called for securing freedom of navigation and overflight.

A spokesperson for the Chinese mission said that the EU is not a stakeholder in the South China Sea issue, and the EU's statement "disregards the historical context and objective facts of the South China Sea issue, runs counter to the purposes and principles of the United Nations Charter, and is detrimental to the region's peace and stability".

XI'S VISION | CULTURAL DEVELOPMENT

Ruins highlight efforts to trace, preserve roots

Mesmerizing Yinxu site in Henan province marks 20 years on UNESCO heritage list

By **WANG RU**
wangru1@chinadaily.com.cn

Numerous exquisite bronze and other items from the earliest recorded time of Chinese civilization are testament to a widely spreading kingship of China's Central Plains, as well as China's oldest-known writing system and multiple historical legends, and have provided significant illumination for modern Chinese archaeology since the 1920s.

The Yinxu Ruins in Anyang, Henan province, which one expert described as the "brightest star" of Chinese archaeology, connect the early stage of China as a nation around 3,300 years ago to the modern age, and have mesmerized not only professionals, but also the Chinese general public, inspiring them to trace their literary roots.

Monday marks the 20th anniversary of the Yinxu Ruins being inscribed on the UNESCO World Heritage List. As the site celebrates this milestone anniversary, one of the most eye-catching attractions at the Yinxu Museum is something playful: a hair-drying cap shaped like an adorable owl.

Since its debut in 2024, the hair-drying cap has been a hit among tourists flocking to the museum. Featuring a lively, big-eyed owl look and strong practical value for daily use, it draws inspiration from an owl-shaped wine vessel unearthed from the tomb at Yinxu of Fu Hao, China's first-known female general and a consort of the Shang Dynasty (c.16th century-11th century BC) king Wu Ding.

Zhao Qingrong, director of the museum, said that when museum visitors wear available replica caps or clothing with elements of the Shang Dynasty, or they eat food that has been made in the style of those early days, "they are no longer something strange in your textbooks. Your taste buds and skin have a real interaction with them, which lingers better than a mere glance at exhibit cabinets".

"In this way, we transfer the obscure archaeological knowledge into an accessible aesthetic experience, so that people can connect with the Yinxu Ruins in their daily lives and thus develop an emotional bond with that remote era," she added.

The Yinxu Ruins, at the site of an ancient capital of the late Shang Dynasty, have yielded numerous exquisite bronze vessels as well as oracle bones, which bear inscriptions known as *jiaguwen* that are carved on animal bones to record events and for fortune-telling, and constitute the earliest-known formal writing system in China.

The preservation and popularity of such products are no accident. Over the past two decades, sustained top-level guidance and cultural protection efforts have laid a solid foundation for the innovative inheritance of Shang civilization.

SUMMER WONDERLAND WELCOMES NIGHT OWLS

Entertainment complex looks to elevate Shanghai's Fuxing Park into a nightlife hub

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

As the dappled light filters through Fuxing Park's plane tree leaves at dusk, Shanghai's nighttime energy starts to permeate neighborhoods, parks and riverfronts.

Ranked No 1 in the night economy index of China Business News, the city is living up to its billing with a new nightlife wonderland, with the park at its heart.

"I really enjoy the nightlife in Shanghai," said Tommaso Bianchin, an Italian wine industry professional.

"I have friends who go to underground clubs and rooftop parties. The venues are great, people are friendly, and the standard is high."

Spanish DJ Lalo Lopez, who has performed globally, agreed: "I've attended many parties, in many countries, and Shanghai's nightlife is unique," said Lopez.

It's the diversity of nighttime offerings that is the main attraction, and diversity is the watchword for INS Land, a massive multi-story entertainment and lifestyle complex located in Fuxing Park.

Visitors dream of taking China's serenity, safety home

'Everyday' stability, sense of security impress tourists, foreign residents

By **ZHANG XIAOMIN**
in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

Visitors pose for a photo at the Shanghai Disney Resort on June 16. LIU YING / XINHUA

"What is it like night walking in China's Guangzhou, one of the most populated cities in the world? It's extremely safe. I'm wearing my very expensive watch. No one bothers you, no one is trying to pull you in their shops," British creator Ben posted on his social media account, OTWD.

His observation about the capital of South China's Guangdong province, casual as it seemed, struck a chord with a large number of foreign visitors to China.

When a man can stroll through one of the world's busiest urban centers late at night wearing an expensive timepiece — and nothing happens — his actions challenge assumptions about safety in densely populated cities.

As China gains in popularity as a travel destination, a growing number of foreign tourists are capturing moments through their lenses showing how safe China is, their images resonating deeply with expats and visitors. This "Chinese sense of security" has sparked spirited discussions on social media platforms both at home and abroad.

The growing perception that China is an extremely safe destination is backed up by statistics. In 2025, the number of criminal cases in the country dropped 12.8 percent year-on-year, reaching their lowest level in decades, while public order cases also declined, according to data from China's Ministry of Public Security. In addition, public confidence of public safety remained above 98 percent for the sixth consecutive year.

Perhaps more telling for an international audience is the Global Safety Report 2025, released in January 2026 by the US-based analytics firm Gallup. Among more than 140 countries and territories surveyed, China ranked third safest overall. The report also highlighted strong public confidence in local law enforcement and low levels of personal experience with crime.

The new normal

"When I first came to Beijing two years ago, I went outside at night and found there were still a lot of people walking around, and everything felt normal, like it wasn't even that late. At that moment, I thought 'this place is actually really safe'," said Salah Eddine Ben Mhmed, a 20-year-old student from Morocco, who is now studying at Dalian Polytechnic University in Liaoning province.

"It felt strange seeing people outside late at night without a worry. But now it feels completely normal to me," he added. He attributes this feeling to a combination of public order and a general trust that daily life is calm and well-managed.

This transition from a surprise to seeing it as normal is common among many long-term foreign residents in China.

Merlin Palmer, 40, a Canadian IT engineer who works in Beijing, arrived in China in 2012 and planned to stay only briefly. "I was thinking about traveling the world as an English teacher," he said.

That was before he met his wife Bonny Liu. Fourteen years later, he lives happily in Chaoyang district with his wife, 5-year-old son Arthur, and a puppy called Chocolate.

Palmer said living in Beijing had fundamentally changed his perspective on parenting and safety.

"Parents don't have to worry about guns or drugs, or racism or bullying," he said. "Arthur is in a classroom of 99 percent ethnically Chinese children, and he has never experienced any kind of 'othering' because of that. He is very much accepted and loved within his peer group."

Palmer credits not just legal protections, but also school food standards, community safety measures, and everyday kindness from strangers. "In China, there are a lot of policies about children's safety that may feel restrictive to some people, but in the end, they make a meaningful impact on the safety of children day-to-day."

Eddy, an American host at Dunhuang Media Center in Gansu province, pointed to the absence of gun violence as a major difference to the United States.

Growing up in an environment where school shooting drills were routine, he finds a special meaning in China's sense of security. He also pointed out that China's safety goes beyond law enforcement.

From fire safety education on campus to community awareness and shared responsibility, he believes the country's strong sense of security is built not only by institutions, but also by the people and communities who look out for one another every day.

Italian artist Federico Gentile, who visited Dalian during this year's Summer Davos forum in June, was equally impressed.

"People roam free and don't worry about anything. It's amazing to see a lot of happy families, having fun with their kids," he said.

During the May Day holiday, the "unattended luggage wall" at Liyuan station of Wuhan metro in Hubei province went viral.

Tourists neatly lined up their suitcases along the station wall before heading out to explore the city. This unguarded and perfectly orderly wall of luggage went viral on Chinese social media, becoming a symbol of the country's trademark "worry-free" travel.

Foreign Ministry spokesperson Mao Ning also shared a video on social media with the caption, "In Central China's Wuhan, unattended luggage lined the walls of a metro station, left behind by tourists eager to explore the city. Safe and worry-free!"

Unattended luggage walls and designated luggage storage areas are not unique to Wuhan.

They can also be found at metro stations in Changsha, Hunan province, Foshan in Guangdong, Nanjing, Jiangsu province, and Fuzhou, Fujian province, and other cities. This sense of security goes beyond trusting that one's suitcase will remain safe; it reflects a deeper confidence in the sense of security in China that people have come to rely on.

Positive impression

A playful post by Chinese vlogger Alan Jun on Facebook gained wide recognition. It posed the question: "'Is it safe to travel in China? Please don't lie.' An American netizen asked this question. Every city in China is extremely safe. The only unsafe place is the night market, where you will spend all your money, lose sleep, overeat, and gain weight. So you must not go out at night."

Under that post, netizen Properly_Basic replied: "As someone who lived in China for a bit, it is amazing how you can go outside at like 1 am without the worry of someone kidnapping you."

Another user, Alan Camp, commented: "I had 14 days in China. Beijing, Yantai (Shandong province), Shanghai, Qingdao (Shandong), Guangzhou and many other smaller cities. It's incredible how efficient and safe everything is. I treasure my time spent making friends and experiencing so many things."

Mark Owens, a member of the Oregon House of Representatives and a farm owner, visited the Inner Mongolia autonomous region, Beijing and Shanghai in October 2025 as part of a trade delegation — his first trip to China.

"The first couple of nights, I had trouble sleeping, so I got up early and I'd go for a walk. As the sun was coming up, I felt very, very safe in Beijing. I went out after dinner by myself and felt very, very safe. I mean, very, very clean, very polite, just a very good experience," he told China Daily.

Students from the University of Waterloo in Canada who took part in a Chinese culture immersion program at Beijing Normal University in October 2025 had similar positive impressions.

"Before visiting, I had heard many conflicting descriptions of what life there might be like. However, my experience showed me a place full of warmth, innovation, history, and everyday beauty," one student, Gia-Thanh Yvonne Ly, said.

Mudupeola Aladetokunbo Caxton-Martins added: "I could go out at 3 am and I would see other locals out too; this also added a safety net as I didn't feel alone and knew that there were also others around me."

Natalie Hermila Garcia Munoz, who has traveled to 24 countries, said "none compared to Beijing" — citing the advanced subway, the safe late-night streets and the world-class hospitality.

Raine Mimoza Hutton said: "I came back home with a completely unique perspective on China ... I feel that all the negativity surrounding China in the news and media creates a significant shadow over all the amazing things the country has to offer."

> "I could go out at 3 am and I would see other locals out too; this also added a safety net as I didn't feel alone and knew that there were also others around me."

The roots of reassurance

When Serbian influencer Saitie, who has lived in China for over four years, was asked by friends how China maintains such a high-trust society, he offered two reasons: the prevalence of technology, and — more importantly — the dramatic improvement in average living standards over the past two decades.

"There's no point for a person to go out and steal stuff and therefore face the consequences for that," he said.

His down-to-earth observation aligns with broader analysis.

Professor Wang Jianxin, dean of the school of public security at People's Public Security University of China, said: "China's ability to maintain long-term social stability alongside rapid economic growth reflects a distinct path of social security governance."

He identified the key factors as "the leadership of the Communist Party of China, sound laws and good governance, technological empowerment, and public mobilization".

Commentator Nie Zhiwang said: "The Chinese sense of security is by no means merely about low crime rates: it is a people-centered, inclusive, comprehensive, and safety-net type of security."

For individuals, it means walking alone late at night without fear, not worrying about children at school, and confidently leaving belongings temporarily unattended. For society, it means stable public order, harmonious neighborhoods, and resolvable conflicts. For the nation, it reflects the governance effectiveness of maintaining long-term order and stability across a country with a massive population and vast territory.

This security rests on three pillars: coordinated development that keeps violent crime low, refined grassroots networks that nip risks in the bud, and continued economic improvements.

In Guangzhou, Ben walked the night streets with his expensive watch and felt totally safe. In Dalian, Italian artist Gentile heard the streets ring with the laughing of families and children at play. These scenes capture a deeper meaning of security in China: it is not merely the absence of danger, but the presence of a confident, everyday existence.

That everyday life — the "Chinese experience" — is what many foreign visitors most want to take home with them, yet cannot pack in their luggage.

Yang Gao in Toronto, Lia Zhu in San Francisco, Chen Meiling and Wang Songsong in Beijing, Hu Yumeng and Ma Jingna in Lanzhou, and Liu Mengtong in Dalian contributed to this story.

65 years on, treaty with DPRK hailed

Xi highlights cooperation and support between two sides over the past decades

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, and Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the Democratic People's Republic of Korea, exchanged congratulations on Saturday on the 65th anniversary of the signing of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance.

In his message, Xi said that in 1961, the older generation of leaders of China and the DPRK signed the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, laying an important political and legal foundation for consolidating the friendship forged in blood between the two peoples.

The treaty has played an important role in carrying forward China-DPRK friendship and safeguarding peace and stability in the region and beyond, he said.

Over the past 65 years, the two sides have upheld the spirit of the treaty, supported each other, stood united, cooperated closely and worked together, vividly demonstrating the defining features of China-DPRK relations — friendship passed down from generation to generation, a shared future and mutual support, he said.

Xi pointed to a successful state visit to the DPRK in June, when he reached important consensus with Kim on consolidating and carrying forward the traditional friendship between China and the DPRK and enriching it with new dimensions, providing strategic guidance and a new blueprint for the development of China-DPRK relations in the new era.

Facing a rapidly evolving world undergoing profound changes unseen in a century, Xi voiced willingness to work with Kim to further strengthen strategic communication, keep China-DPRK relations on the right track and guide bilateral friendly cooperation to deliver greater benefits to the two peoples, in order to make positive contributions to promoting regional peace and development.

Xi said that no matter how the international landscape evolves, the firm position of China's Party and government to attach great importance to the traditional friendship between China and the DPRK will remain unchanged; the firm support for Kim in leading the DPRK's socialist cause will remain unchanged; and the determination to safeguard the common interests of both sides and maintain a favorable strategic environment will remain unchanged.

He expressed confidence that, under the leadership of the WPK headed by Kim, the DPRK people will fully implement the decisions and arrangements of the Ninth Congress of the WPK and continue to achieve new and greater successes in their socialist cause.

Kim said that the two sides signed the DPRK-China Treaty of Friendship, Cooperation and Mutual Assistance 65 years ago, laying a solid legal foundation for the enduring development of the fighting friendship and unity of mutual assistance and cooperation between the DPRK and China, forged in the bloody struggle for independence against imperialism and for the great cause of peace and socialism.

Over the past decades, through all the vicissitudes of history, the DPRK and China have stood by each other with unwavering support and close cooperation, fully demonstrating to the world the everlasting and unbreakable nature of their friendship — a relationship that is special in terms of traditional bonds, shared socialist cause, and firm commitment to carrying it forward from generation to generation, Kim said.

The friendly and cooperative relations between the DPRK and China, as a strategic choice and precious common wealth of the two parties and two peoples, are being elevated to a new strategic height and are making important contributions to safeguarding the sovereignty, security and development interests of the two countries and upholding regional and global peace and stability amid the complex and volatile international situation, Kim said.

It is the unwavering position of the WPK and the DPRK government to advance the traditional friendly and cooperative relations between the DPRK and China, with socialism at its core, to keep pace with the changes of the times and the aspirations of the two peoples and to achieve more dynamic development in all fields, he added.

GDP deflator likely to turn positive in Q2

By **ZHOU LANXU**, **ZHANG CHENXU** and **ZHONG NAN**

China's second-quarter GDP deflator is likely to turn positive for the first time in more than three years, sending the clearest signal yet that the country's price dynamics are improving, helping support corporate earnings and consumer confidence, analysts and executives said.

The GDP deflator is a tool that is used to measure price changes of all goods and services produced in an economy over time.

Ahead of the release of China's economic data for the first half of the year on Wednesday, the projection comes amid improving sentiment about the Chinese market among global enterprises and investors, even as additional policy support is seen as necessary in the second half to reinforce domestic demand and address structural pressures in the economy.

The GDP deflator is closely watched by economists as the broadest gauge of economy-wide inflation. It reflects the gap between nominal GDP growth and real GDP growth.

A positive reading signals rising prices across the economy, while a negative reading could point to deflationary pressure. China's GDP deflator has remained negative for 12 consecutive quarters through the first quarter of this year, when it stood at about -0.1 percent, weighing on the income growth of businesses and households as prices trended down.

Sun Xuegong, director-general of the department of policy study and consultation at the Chinese Academy of Macroeconomic Research, an academy affiliated with the National Development and Reform Commission, said China's GDP deflator has likely turned positive in the second quarter.

"Such a change would improve the profitability of market entities, lift their expectations and make the on-the-ground experience of businesses and households more in line with the growth in macroeconomic data," Sun said, adding that stronger nominal growth would also help boost the share of China's economy in the world total.

Su Jian, director of Peking University's National Center for Economic Research, said the second-quarter GDP deflator may turn positive at around 1.9 percent, helped by a low comparison base, higher prices of some global commodities, and firmer domestic prices of some consumer durables.

"A positive GDP deflator would suggest that the imbalance between supply and demand has eased and deflationary pressure is moderating. Improving price dynamics would support corporate profitability, thus help restore household and business expectations, and reinforce recovery in domestic demand," Su said.

Such a recovery in price dynamics can be seen in the consumer price index. Using the prices of a basket of consumer goods to gauge inflation, China's CPI has maintained a growth of at least 1 percent year-on-year for five consecutive months as of June, official data showed.

Su added that he estimates that China's real GDP to grow 4.9 percent year-on-year in the first half of the year after a 5 percent growth in the first quarter, while first-half nominal GDP growth may reach about 6.7 percent.

Robin Xing, chief China economist at Morgan Stanley, raised the forecast for China's full-year GDP deflator to 0.5 percent. Combined with the United States' investment bank's 4.8 percent real GDP growth forecast, that would imply the first time in four years that annual nominal growth would return above 5 percent.

"Nominal GDP is what companies care about, as it is closely related to their revenue and profits," Xing said.

The improving earnings are bolstering global investors' interest in China's capital market, with UBS expecting 11 percent earnings growth for all A shares in 2026, up from 3.9 percent in 2025, and remaining positive on China's artificial intelligence tech hardware names for the rest of the year amid strong earnings momentum.

Multinational companies are also reinforcing their commitment to the Chinese market. Joe Bao, president for China at Kone, said the Finnish elevator manufacturer is strengthening its supply chain resilience and responsiveness in the Chinese market, having established its Southern China headquarters in Shenzhen, Guangdong province, early this year to drive digital innovation and strengthen service capabilities.

Analysts, however, cautioned that the foundation for a rebound in prices remains fragile as the current recovery was bolstered more by international energy prices than domestic demand.

The People's Bank of China, the country's central bank, has vowed to enhance the forward-looking, flexibility and targeted nature of policy at the second-quarter monetary policy committee meeting, acknowledging the challenges of weak demand, structural divergence and external shocks.

Hub: Area rolls out bilingual signage

From page 1

This summer, INS Land unveiled its evolution from a 20,000-square-meter entertainment landmark into a neighborhood block-sized "urban nightlife wonderland", connecting the park and the city's Sinan Mansions area. The complex integrates e-sports, music, live performances, dining and socializing.

Fan Meichen, deputy general-manager of Sinan Mansions, which is organizing themed events and parties every weekend throughout the summer, said that Soul House, a newly opened immersive theater bar, has been fully booked every day since opening in June.

Soul House features a 24-hour access gate at Fuxing Park and offers a park shuttle. A walkable nighttime loop integrating culture, commerce, sports, tourism and exhibitions has since formed beneath the plane trees.

"Visitors can have a drink at INS Land, take the mini train through the park, then head to Sinan Mansions to experience Soul House. It makes for a truly diverse experience," Fan said.

The diversity doesn't stop there.

"The proportion of foreign visitors has increased significantly in the Sinan Mansions area," Fan said, adding that "the neighborhood has rolled out bilingual signage and service points".

It's not a recent trend, as evidenced by the INS Land club Hero Dome.

Ranked No 12 on the list of the world's Top 100 Clubs, Hero Dome hosted the inaugural Asian edition of global EDM festival phenomenon Tomorrowland last year, with 20,000 tickets selling out almost instantly.

According to a 2025 China nighttime economy development report co-released by the China Tourism Academy and Landsky, nighttime spending now makes up 32.9 percent of daily consumption nationwide, with key drivers transitioning from "dining, drinking and shopping", to "novelty, diversity and socializing".

Xia Tianyi, a co-founder of INS Land, sees more potential to develop and build on the city's current success. There are areas where the city's nightlife potential "remains largely untapped", he said.

INS Land will partner with nearby merchants to build an ecosystem of flexible, self-guided entertainment options to elevate the entire Fuxing Park area into a new highlight of Huangpu district.

Legacy: Sports give people hope, ambition

From page 1

The Beijing 2008 Olympic Games did not just leave behind Olympic venues. They helped accelerate the city's transformation, with investments in transportation, public spaces and other infrastructure that continue to serve residents today. They have also helped drive a major increase in sports participation, building momentum for a broader sporting culture in China — one in which more people move, play and take part in sports.

The Beijing 2022 Olympic Winter Games took this legacy to another level. Five venues from 2008 were reused, all Games venues were powered by renewable energy, and low-carbon technologies were introduced. The Games also accelerated the development of the Beijing-Zhangjiakou high-speed railway, significantly cutting travel times between the two areas.

Together, these examples show what the Olympic legacy can mean when it reaches beyond the event itself: more opportunity, more participation and a stronger place for sport in people's lives.

During my most recent visit to China, I saw that legacy in action. I saw it in the scale and energy of the 2025 National Games across Guangdong province and the Hong Kong and Macao special administrative regions; in the pride people take in their sporting culture; and in the enthusiasm of people of all ages for sport and physical activity.

Most important, however, those Games brought winter sports to more than 350 million people across China. Yanqing and Zhangjiakou have become hubs for winter sports events and training, with facilities that serve the public and local athletes alike. This is creating new opportunities and real social and economic benefits for local communities.

Sports are about far more than competition. They bring people together. They help young people build confidence and learn important values. They support healthier communities. They create belonging. And they give people hope and ambition.

At a time when the world is increasingly divided, this is also why the Olympic spirit matters. The Olympic Games remind us that people from every part of the world can come together in peace and friendship. They remind us that, even when we come from different cultures and backgrounds, we can still share moments of joy, respect and admiration.

Beijing's Olympic journey — from its successful bid 25 years ago to the Olympic Games in 2008 and the Winter Games in 2022 — shows the value of thinking beyond the event itself.

The best Olympic legacy is not simply what is left behind when the Games end. It is what carries on: in people's lives, in communities and in the generations still to come.

Yinxu: Discovery extended history

From page 1

Since the 18th National Congress of the Communist Party of China in 2012, President Xi Jinping, who is also general secretary of the CPC Central Committee, has shown great concern for the preservation of cultural relics and made important instructions for work in this regard.

Xi visited the Yinxu Ruins and Yinxu Museum in 2022, during which he said: "I have long been yearning to visit here. This time I come here for a deeper study and understanding of the Chinese civilization so that we can make the past serve the present, and draw inspiration for better building the modern Chinese civilization."

He noted that fine traditional Chinese culture is the root of the Party's new theories. The ultimate approach of adapting Marxism to the Chinese context and the needs of the times is to integrate the basic tenets of Marxism with China's specific realities and fine traditional culture.

Xi also pointed out that the *jiaguwen* inscriptions preserved the evidence of the Chinese written language of 3,000 years ago, helping to place the beginning of China's recorded history nearly 1,000 years earlier than previously believed.

This was not the first time he highlighted the importance of *jiaguwen*. In 2019, Xi sent a congratulatory letter on the 120th anniversary of the discovery of the oracle bone inscriptions, describing them as the roots of fine traditional Chinese culture and saying that the discovery is of epoch-making significance to Chinese civilization and even human civilization.

Li Xiaoyang, head of Anyang's cultural heritage bureau, said Xi's words fully reflect the important role of *jiaguwen*.

"The discovery of oracle bones in the late 19th century came at a time of cultural crisis, yet it miraculously restored Chinese people's confidence in their ancient civilization," Li said.

He also said that 15 archaeological excavations carried out entirely by Chinese scholars at the Yinxu Ruins from 1928 to 1937 confirmed the site to be a late capital of the Shang Dynasty, making the site a sacred place in Chinese archaeology. Prior to the Yinxu findings, the earliest period in Chinese history supported by existing written records was traced to inscribed bamboo slips from the Warring States Period (475-221 BC).

"Therefore, this discovery pushed China's reliable written history back to the late Shang period, extending the timeline of documented Chinese history by about 1,000 years," said Li.

Based on that, the Yinxu Ruins became the starting point for tracing Chinese civilization.

During his Anyang visit in 2022, Xi called for attaching more importance to and putting more efforts into archaeological research to carry forward the project of tracing the origins of Chinese civilization.

Over the past decades, archaeologists have gradually built a chronological framework of the Shang Dynasty and even earlier, starting from Yinxu.

"Knowing Yinxu as the last Shang capital, we have then traced earlier periods through archaeological work. In the 1950s, archaeologists found another capital site in Zhengzhou, Henan, which was identified to be an early Shang capital based on typological comparisons of pottery vessels. Then, in 1999, they discovered another city to the north of the Huanhe River, and most scholars believe it was a capital for the middle Shang period," said Li.

"In this way, we have generally made clear the early, middle and late Shang periods' capitals, and all the research started from the Yinxu Ruins," he added.

Indigenous American family finds horseback bonds on rolling grasslands in North China's Inner Mongolia

Clayson Benally interacts with a Mongolian horse in West Ujimqin Banner of Xilin Gol League, North China's Inner Mongolia autonomous region, on June 26. PHOTOS BY LI ZHIPENG / XINHUA

This summer, the rolling grasslands of Xilin Gol in North China's Inner Mongolia autonomous region welcomed a group of indigenous American horse lovers.

Clayson Benally, a 49-year-old horse trainer and artist from Arizona, the United States, traveled thousands of miles with his family to meet Julaa, a 12-year-old ethnic Mongolian girl.

The young rider is the star of the big-screen documentary *Horse Power*, an international collaboration that explores humanity's enduring bond with horses across continents and cultures.

"It's the horses that brought us all together. That's something that words cannot express," Benally said. "When I watched the movie, one of the opening scenes is just here in Inner Mongolia. And my heart cried out to come here," he said.

Julaa's family raises more than 20 horses and nearly 150 sheep on their 156 hectares of contracted grassland. Julaa's aunt prepared her guesthouse for the American visitors days in advance, stocking up on mutton and fresh vegetables.

After a lunch on the grasslands, local herdsmen demonstrated their time-honored skills, performing classic Mongolian horse-roping and penning routines.

"This is something that I've never seen or experienced. I just think about how incredible and beautiful and alive the culture is here," he said.

Top: Clayson Benally tries the traditional Mongolian horse-roping on June 26.
Above from left: Benally watches a man playing the horsehead fiddle on June 26. Benally rides a horse with a herder on June 26. Benally tries on traditional Mongolian clothes on June 26.

Xilin Gol, honored by the China Horse Industry Association as "China's Hometown of Horses" in 2010, is home to some 340,000 horses, a living testament to its enduring cultural heritage around horses.

Benally's 53-year-old sister Jeneda, a professional singer, spent her birthday during the trip and received a memorable gift — a *morin khuur*, or traditional Mongolian horsehead fiddle.

The soulful, lingering strains of Mongolian long-tune folk songs moved Jeneda to tears. "Your music speaks straight to my soul," she told the local performers. "I hope these fleeting, precious moments will grow into lasting friendships."

For Jeneda's 19-year-old daughter Dyatihi, the most indelible impression came from driving along No. 99 Highway, a route that instantly reminded her of iconic Route 66 in the US.

Xilin Gol's No. 99 Highway hosts China's first dedicated grassland musical highway. When vehicles travel at a steady speed between 35 and 60 kilometers per hour, drivers and passengers are treated to a 120-second musical journey.

"No. 99 Highway here is unique and cool, because it is wrapped in music. It is as if the highway itself sings."

WORLD

Gulf clashes intensify as tensions rise

Iran closes strait, US presses offensive amid regional powers' call for restraint

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Fighting between Iran and the United States sharply escalated over the weekend, prompting the Gulf and Arab countries to engage in interception and issue warnings, as Tehran and Washington wrestled for control over the Strait of Hormuz and accused each other of violating the truce.

The latest collateral damage left three people injured in Qatar, including one child, as a result of falling debris from interception operations, the country's Interior Ministry said on Sunday.

Missile warning sirens were sounded across Bahrain. The United Arab Emirates said its air defense systems were actively engaging with missiles and drone threats, and Kuwait's military said explosion sounds heard were the result of air defense systems intercepting hostile attacks.

Iran's Islamic Revolutionary Guard Corps announced the Strait of Hormuz was closed until further notice and until US interventions cease. The IRGC had previously warned that foreign interference and the establishment of an illegal shipping route would draw a firm response.

The latest developments come after the US Central Command announced on Sunday that it had completed last week's third round of strikes against Iran, holding Tehran's forces accountable for attacking another commercial ship in the strait.

US President Donald Trump threatened on Friday to "decimate and destroy" Iran if it made an attempt on his life. Iranian media reported on Saturday that Supreme Leader Mojtaba Khamenei vowed to avenge the death of his father, former supreme leader Ali Khamenei, saying it was the will of the nation.

3 nights of attacks

In a statement, the US Central Command said US forces hit about 140 Iranian military targets, including missile and drone sites, naval capabilities, ammunition storage facilities, communication networks and coastal surveillance locations.

"During three nights of strikes this week, CENTCOM has struck more than 300 targets at the direction of the commander in chief to degrade Iran's ability to attack civilian mariners and commercial vessels freely transiting the strait," CENTCOM said. "Commercial vessel transits through the vital international maritime corridor continue."

In retaliation, the IRGC said they struck US aircraft carrier logistical support centers and refueling platforms at the Omani port of Duqm in a heavy and surprise attack on Sunday.

The IRGC also said they struck the US Prince Hassan airbase in Jordan with ballistic missiles the same day, destroying its command and control center and MQ-9 Reaper drone hangars in retaliation for US strikes on Iran's southern coast, Iran's Mehr News Agency reported.

Iranian Foreign Minister Abbas Araghchi said on Saturday that Iran "has so far kept its word", unlike the United States.

"That violation follows other violations and missteps by the United States. Reality check: There can only be mutual compliance," he said on X. Earlier in the day, Araghchi met with Oman's Foreign Minister Sayyid Badr bin Hamad Albusaidi in Muscat.

> "The two sides agreed to continue these talks at the technical and political levels to reach the necessary agreements in accordance with international law."
>
> **Oman's Foreign Ministry,** on bilateral talks between Oman and Iran regarding navigation in the Strait of Hormuz

Oman's Foreign Ministry said bilateral talks were held on Saturday regarding navigation in the Strait of Hormuz and ensuring its safety and freedom, "in light of the developments and repercussions stemming from recent events".

"The two sides agreed to continue these talks at the technical and political levels to reach the necessary agreements in accordance with international law," the ministry said.

On Sunday, Pakistani Deputy Prime Minister and Foreign Minister Mohammad Ishaq Dar also held a phone conversation with Araghchi, according to a statement from Pakistan's Foreign Ministry.

Dar stressed the need for the parties to follow the path of de-escalation and show restraint, as agreed in the Islamabad Memorandum of Understanding reached last month, the statement said.

"He further underscored that dialogue and diplomacy remain the only viable path to resolving disputes and achieving lasting peace and stability in the region," it said.

Dar also reiterated Pakistan's readiness to continue playing a constructive role in promoting and maintaining regional peace and stability, and said the two leaders agreed to remain in close contact, it added.

S. Korean chipmaker raises $26.5b in Nasdaq debut

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

South Korean memory chipmaker SK Hynix debuted on the Nasdaq on Friday after completing its US listing, capitalizing on surging demand driven by the global artificial intelligence boom.

The company priced its American Depositary Receipts at $149 each on Thursday before they opened at $170 in Nasdaq trading on Friday. An ADR is a type of certificate that allows United States investors to buy a foreign stock without trading directly on an overseas exchange.

The sale of 177.9 million ADRs raised $26.5 billion, making it the largest US share sale by a foreign issuer and the second-largest public offering after SpaceX's $85.7 billion IPO in June.

SK Hynix said the proceeds will be used to build new chip factories in South Korea and purchase manufacturing equipment, including extreme ultraviolet lithography scanners from Dutch supplier ASML.

Chief executive Kwak Noh-jung told Bloomberg after the offering that customers are signing long-term supply contracts because they expect the chip shortage to "last for longer", adding that he believes supply constraints could last well into the next decade.

> "The real story of the semiconductor industry ... is about a multilateral ecosystem in which South Korea, Japan and the Netherlands are just as important as either (the US or China)."
>
> **Ker Gibbs,** former president of the American Chamber of Commerce in Shanghai

The listing comes as SK Hynix rides an unprecedented surge in demand for high-bandwidth memory chips, which enable high-speed, low-power data transfer in AI systems and are essential for hardware used by customers including Nvidia and Google.

SK Hynix, which recently deepened its partnership with Nvidia on advanced memory chips, has outperformed rivals Samsung and Micron over the past year. Its first-quarter revenue nearly tripled from a year earlier, while its shares have climbed about 260 percent this year.

As hyperscalers — large-scale cloud service providers — such as Amazon, Microsoft and Oracle race to expand AI data centers, demand for memory chips has consistently outpaced supply, pushing up prices. Apple has raised prices for Macs and iPads, citing higher memory component costs.

The AI boom has also lifted Asian chip suppliers. Taiwan-based printed circuit board maker Unimicron Technology recently raised $1.36 billion through a global depositary share sale, with its stock up more than 700 percent over the past year.

Analysts describe the current environment as a memory "supercycle", with Samsung, SK Hynix and Micron all benefiting. Some view SK Hynix's US listing as a move to broaden its investor base and narrow its valuation gap with Micron, though others caution that market volatility remains despite strong demand.

'Inflation' warning

Some analysts have warned that "memory inflation" could eventually curb spending on AI infrastructure, smartphones and personal computers, saying the industry has entered the middle stage of the current cycle.

South Korean companies led by SK Hynix and Samsung plan to invest more than $500 billion in new domestic memory fabrication plants. Analysts warn the expansion could create oversupply if AI memory demand shifts by the time the facilities come online.

For some observers, the listing carries significance beyond financial markets.

"The real story of the semiconductor industry is not about the US versus China — it is about a multilateral ecosystem in which South Korea, Japan and the Netherlands are just as important as either of the great powers," said Ker Gibbs, former president of the American Chamber of Commerce in Shanghai.

Gibbs explores that argument in his book *The Fragile Dragon*, comparing semiconductors with oil as strategic resources that nations both depend on and compete over.

He also pointed to history as a cautionary lesson, arguing that the US should tread carefully as it tightens restrictions on China's access to chip technology. In his view, the two countries need to manage their differences without cornering one another.

Death of Lindsey Graham puts pressure on Senate Republicans

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

The sudden and unexpected death of US Senator Lindsey Graham could make things more difficult for Republicans in the Senate, as their thin 53-47 majority is already being strained by the absence of Senator Mitch McConnell.

A temporary replacement for Graham can be named by the governor of South Carolina, though a permanent senator will be elected in November. There was no word on Sunday who that temporary replacement might be, and candidates to fill the open seat in South Carolina during the mid-terms are expected to put their names forward this week.

Fox News reported that at least two South Carolina Republicans from the House of Representatives, Nancy Mace and Ralph Norman, have indicated they are considering a Senate run.

Graham was chair of the Senate Budget Committee, which is working through a process to push forward parts of Trump's voter ID bill. He was also considered a big supporter of the war against Iran, which could be critical as the Senate is due to hear a request for additional funding for that conflict.

According to a preliminary finding from the Washington medical examiner, the cause of Graham's death was aortic dissection — which is a tearing in the aortic wall — due to cardiovascular disease, though a final report is pending toxicological tests.

President Donald Trump called Graham "one of the greatest people and Senators I have ever known" in a social media post on Sunday.

McConnell, 84, has also been missing from the Senate for a month after being hospitalized for undisclosed reasons, though his office has said he "continues to improve".

His wife, former transportation secretary Elaine Chao, had been travelling in China "to support her family's philanthropic endeavors", her spokesperson told CNN, adding that "the Senator's health did not warrant an immediate return to the US".

McConnell had suffered a concussion and broken ribs after one of several falls in 2023, and then froze mid-sentence during a news conference months later.

Graham, 71, was first elected to the Senate in 2002. He was previously elected to the House of Representatives in 1994, and had served as a defense attorney and prosecutor in the US Air Force.

Once a Trump critic who called him the "most flawed nominee in the history of the Republican Party", as well as "crazy", later became one of the president's biggest defenders.

Graham told Fox News in May he had introduced a bill "that would allow President Trump to put tariffs on China for buying Russian oil and gas", and later went on to disparage China and its relations with other countries.

He continued with a blunt warning to China: "I'll do business with you on Monday and put tariffs on Tuesday".

The sanctions bill is still being held up in the Senate. China has called it "illegal unilateral sanctions".

Graham was considered a foreign policy hawk, who advocated for US intervention overseas. He had just returned from his 10th trip to Ukraine, which he supported in its conflict with Russia. He had also opposed president Barack Obama's nuclear deal with Iran, and had called for pre-emptive strikes against the country.

Massachusetts Senator Elizabeth Warren posted: "Even though we disagreed on much, he was always willing to negotiate, with humor and wit. My heart goes out to his loved ones."

Editorials

Hyping up illegal 'arbitral award' will only undermine stability in South China Sea

Leveraging its role as this year's chair of the Association of Southeast Asian Nations, the Philippines is attempting to hijack the negotiations aimed at concluding the long-awaited Code of Conduct in the South China Sea by pushing for the agreement to be anchored on the illegal and invalid so-called "arbitral ruling" of 2016.

The "ruling" of the Permanent Court of Arbitration is null and void. China did not participate in the "hearing". It neither accepts nor recognizes the prejudicial and politically motivated "award", nor will it ever accept any claim or action arising from it.

The distorting of international law by the "ruling" exposes the Philippines' real intention of pursuing its own selfish interests by fostering divisions and stirring up tensions in the South China Sea.

On Sunday, the United States, Japan and other external forces took the overt step of issuing a joint statement with the Philippines to mark the tenth anniversary of the illegal "arbitral award".

As the Chinese Foreign Ministry responded in a statement, a decade after its issuance, the so-called "ruling" has not only failed to resolve the maritime disputes between China and the Philippines — it has instead been weaponized by Manila to expand its territorial and maritime claims. Far from contributing to peace, the "ruling" has aggravated regional tensions and furnished extra-regional powers with a convenient pretext to meddle in and destabilize the South China Sea. In effect, it has become a perennial stumbling block to China-Philippines ties and a corrosive force against regional stability. Were the "standards" enshrined in this "ruling" to be applied universally, many nations would find themselves stripped of the very basis for their own maritime claims.

In a separate statement on Sunday, a Chinese Foreign Ministry spokesperson responded to Japanese Foreign Minister Toshimitsu Motegi's remarks "commemorating" the anniversary by raising pointed questions that laid bare Tokyo's hypocrisy in backing Manila. For instance, if the "standards" of that "ruling" were applied consistently, how could Okinotori — nothing more than two rocks of less than 10 square meters in the Pacific — possibly justify a Japanese claim to Exclusive Economic Zone and continental shelf of hundreds of thousands of square kilometers?

By the "standards" of the "ruling", many of Japan's islands and reefs would likewise have no basis for claiming maritime rights and interests. Since Japan has publicly endorsed the "award", China has every reason to believe that Japan has accepted the same "standards" and voluntarily renounced the corresponding maritime claims.

As a matter of fact, the more Manila seeks to buttress its position with outside backing, the more clearly it reveals the tenuous legal and factual basis upon which its claims rest.

By attempting to make its illegal claims a prerequisite for pushing ahead with the COC talks, Manila seeks to entrench its unlawful gains by coercing the other negotiating parties into compromise.

As long as the Philippines insists that the "award" is valid and should be anchored with the COC, there will be no way to resolve the disagreements that exist over such issues as the COC's applicable maritime scope and dispute settlement mechanism provisions. This makes it impossible for any progress to be made in talks over the COC. With this major obstacle unresolved, the claim by the Philippines that the COC can be concluded before the end of this year is both empty and irresponsible.

China is committed to properly managing maritime differences in the region through bilateral dialogue with the parties directly involved. At the same time, the country will continue firmly defending its territorial sovereignty and maritime rights and interests in the South China Sea. Any attempt to challenge China's lawful rights and interests and undermine peace and stability in the South China Sea is doomed to fail.

Hostilities risk spiraling out of control

Barely weeks after the United States and Iran signed the Islamabad Memorandum of Understanding, an interim deal intended to end hostilities and create a framework for a broader settlement, the agreement is in jeopardy.

The immediate trigger appears to have been disputes over the interpretation of the MoU's provisions governing navigation through the Strait of Hormuz. Yet the renewed confrontation is not simply another chapter in the rivalry between Washington and Tehran. It has evolved into a three-party strategic contest in which Tel Aviv's calculations also influence the pace and direction of events.

Israel has never concealed its willingness to prevent any US-Iran accommodation. From its perspective, even a temporary understanding risks reducing pressure on Tehran while leaving "unresolved concerns" over Iran's regional influence and nuclear issue. Recent reports suggest that Tel Aviv has been "coordinating" with Washington while simultaneously warning Tehran against retaliation. Israel's strategic intentions differ from those of parties seeking to preserve regional stability.

This matters because the MoU was always less a peace agreement than a ceasefire held together by political convenience. It rested upon ambiguous language, diverging strategic objectives and fragile domestic calculations on both sides. Such pacts survive only when all parties concerned possess strong incentives to preserve them. That condition is disappearing.

Washington's own calculations illustrate why. The US administration continues to face conflicting pressures. Military restraint satisfies voters weary of endless Middle Eastern crises. Yet any perceived concession toward Iran invites fierce criticism from domestic hawks. Rising oil prices threaten inflation, consumer confidence and electoral prospects, while renewed military action risks producing precisely the energy shock that the earlier agreement sought to prevent. Unsurprisingly, Washington has simultaneously resumed military operations while signaling its willingness to return to negotiations — an apparent contradiction that reflects political necessity rather than strategic coherence.

Military force has repeatedly demonstrated its limitations. Months of strikes have neither fundamentally altered Iran's strategic judgments nor produced a durable diplomatic breakthrough. Instead, every exchange of missiles further erodes trust while increasing the probability that a miscalculation or third-party action could trigger a broader regional war.

Energy markets understand this reality better than politicians. The world's consumers ultimately finance every failure of diplomacy in the Middle East. That is why the greatest danger today lies not merely in renewed hostilities but in the gradual normalization of perpetual low-intensity conflict. If the MoU collapses without a credible diplomatic successor, the region risks settling into a familiar yet dangerous equilibrium: intermittent strikes, periodic retaliation, disrupted shipping lanes and repeated diplomatic resets that never address the underlying disputes. Such instability benefits few beyond those who profit politically or economically from permanent confrontation.

As China's deputy permanent representative to the United Nations Sun Lei stressed at a UN Security Council briefing on the Iranian nuclear issue on Friday, a ceasefire and cessation of hostilities must hold in the Gulf.

"China urges all relevant parties to overcome disruptive factors, refrain from the use or threat of force, preserve and implement the MoU, reach a solution that accommodates the concerns of all parties, lift the sanctions against Iran at an early date, and achieve substantive progress in the political settlement process," Sun said.

The proper settlement of the Iran nuclear issue must respect the legitimate aspirations and lawful rights and interests of the parties concerned. Iran should continue to uphold its commitment not to develop nuclear weapons. As a non-nuclear-weapon state party to the Non-Proliferation Treaty, Iran enjoys the legitimate right to the peaceful use of nuclear energy. The US should take concrete actions to create conditions for the political settlement of the Iran nuclear issue, Sun added.

The Middle East has accumulated more than enough examples of wars that were easier to begin than to end. Another prolonged US-Iran confrontation will not produce a decisive winner. It will only weaken regional security, unsettle global markets, burden already strained economies and deepen divisions throughout the international system.

The choice confronting related parties is therefore stark. They can allow strategic mistrust, domestic politics and regional rivalries to dismantle an imperfect but valuable diplomatic opening. Or they can recognize that however unsatisfactory the MoU may have been, its implementation remains infinitely preferable to another round of instability. Even a fragile peace is always better than permanent war.

The world should not have to relearn that lesson yet again.

Opinion Line

Precision landing boosts space program, signals self-reliance

As a space journalist who has covered dozens of launches across the country, I long assumed that I had grown accustomed to the routine of countdowns and the roar of liftoffs.

Yet standing atop a building at the Hainan International Commercial Aerospace Launch Center on Friday morning, waiting for the Long March 10B rocket to lift off, there was the same mix of nervousness, excitement and anticipation I felt at my very first launch assignment.

When the first stage was successfully captured by the cable-net recovery system roughly six minutes after stage separation, cheers erupted among reporters.

On the way back to the hotel, I was replaying the recovery footage on loop on my phone, swapping clips and screenshots with fellow reporters. That split second when the booster locked safely into the net is the kind of frame that remains etched in a reporter's memory for years.

Having witnessed earlier recovery attempts — of Long March 12A and ZQ 3 models — I know firsthand just how formidable the challenge of rocket reusability is. Guiding a massive booster back through the atmosphere with pinpoint precision, reigniting its engine at the right moment, maintaining aerodynamic stability and executing a controlled recovery require flawless coordination across propulsion, navigation, materials science and real-time command systems.

Previous tests underscored how many variables must align for success. That is why Friday's breakthrough feels deeply gratifying.

I share the pride of the researchers and engineers at the China Academy of Launch Vehicle Technology, whose perseverance turned an ambitious vision into reality.

What makes this milestone even more remarkable is China's independent path of innovation. Unlike conventional landing on ground pads or offshore drone ships used by the United States and earlier domestic programs, the Long March 10B debuted the world's first operational sea-based net-capture recovery system. By transferring much of the landing hardware from the rocket to the recovery vessel, engineers reduced dead weight and opened a distinct and potentially cost-effective technical route. It is a vivid reflection of the ingenuity of Chinese scientists and engineers and the country's growing scientific and technological strength.

Beyond the technical feat, the Long March 10B carries far-reaching strategic significance. Designed to support large-scale deployment of low-Earth orbit constellations and high-volume commercial launch missions, it promises to enhance China's competitiveness and influence in the global space sector.

More importantly, the Long March 10B is not a standalone model. It is an integral part of the Long March 10 family built for China's manned lunar missions.

Every commercial mission will validate engine reusability, recovery system reliability and rapid turnaround launch capability, forging a development model where commercial operations feed technological progress for future space missions.

This iterative approach will help build expertise for China's future manned lunar landings and deep-space exploration.

To be sure, we must remain clear-eyed. A considerable gap still separates China from the US in mature, operational reusable rocket technology, and accelerated, steady progress remains essential.

But after witnessing Friday's historic success, I have full confidence that China's space community will keep closing that gap and take its place among the world's leading space powers.

— ZHAO LEI, CHINA DAILY

What They Say

Increasing grain production key to food security

Editor's note: *Last month, China issued a plan to accelerate the modernization of agriculture and rural areas during the 15th Five-Year Plan (2026-30) period. A key goal is to raise the country's production capacity of grains to around 1.45 trillion* jin *(725 million metric tons) by 2030, with an emphasis on both the volume and the quality of agricultural products. Tu Shengwei, a researcher at the Chinese Academy of Macroeconomic Research of the National Development and Reform Commission, spoke to People's Daily Overseas Edition on why China is pushing to increase both the output and quality of grain production. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Food security has emerged as a universal challenge in recent years due to the rising frequency of extreme weather events, a complex and volatile international landscape, and heightened uncertainties in the global grain market.

Thanks to sustained efforts, China has made marked improvements in agricultural infrastructure, machinery and technologies in recent years. Major breakthroughs in agricultural science and technology have lifted the contribution rate of scientific and technological progress to agricultural growth to over 64 percent, placing China among the world's top innovators in the field. Advanced technologies, including high-end farm machinery, drones and artificial intelligence, are now widely used across production chains, sharply boosting efficiency.

By implementing the latest initiative to raise grain output, enhancing yield per unit area of staple crops, improving the quality of farmland, seeds and machinery, and adopting more efficient farming practices, the country is well-positioned to achieve the goal of increasing its grain production capacity to around 1.45 trillion *jin* by 2030.

Increasing the grain production capacity will ensure a sufficient supply of high-quality food. Moreover, grain prices underpin the prices of various other commodities, and ample grain output helps prevent fluctuations in food prices.

Currently, China has a secure supply of rice and wheat, with sufficient stocks of these two staple grains. However, the production capacity for high-quality rice that provides a good mouthfeel, high-gluten and low-gluten wheat remains inadequate. The plan addresses this by calling for an increased supply of these products.

To achieve this, efforts should be made in various fields to expand cultivation based on local conditions and improve mechanisms that reward superior quality with better prices to ensure that premium grain products reach the market effectively.

The plan says the production capacity of corn and soybean should also be boosted. China's grain consumption pattern is changing. The consumption of rice and wheat is declining, while feed grains such as corn and soybean are likely to become major drivers of future growth in demand.

There is a significant imbalance between the supply and demand of soybean in China, making the expansion of soybean output a top priority. The supply of high-yield, high-oil soybean should be increased.

Promoting high-yield, high-oil soybean varieties will help expand domestic supply, reduce reliance on imports, and upgrade the country's grain and oil processing industry.

The plan also calls for strengthening farmland protection and improving farmland quality. Farmland is the cornerstone of grain production and the fundamental resource for securing food supply.

Over the next five years, it is essential to enforce strict farmland protection measures, develop high-standard farmland and enhance farmland water conservancy facilities to reinforce the foundation for grain production.

VIEWS

Vassil Girginov

Legacy of 2008 Olympics goes beyond economics

When Beijing was awarded the 2008 Olympic Games in July 2001, a seven-year journey began, culminating in the grand opening in the iconic Bird's Nest stadium on Aug 8, 2008.

The seven-year period between awarding the Olympics and their opening allows the hosts to develop and implement their vision of the Games.

The legacy of the 2008 Beijing Olympic Games must be seen in the socio-political and economic context of China. In China's bid for the Games, then President Jiang Zemin highlighted the opportunity to advance the Olympic spirit and deepen cultural exchanges between China and the world. Beijing proposed three major themes: "Green Olympics", "High-Tech Olympics" and "People's Olympics".

Global Lens

The concept of "People's Olympics" sought to redefine humanism as a core Chinese cultural value, aiming to construct a moral order to counterbalance the materialism in China's rapid march to modernization and offer an alternative to the commercialization of the Games. China sought to reinterpret Olympian principles, enriching the Olympic spirit and promoting global harmony.

While economic impacts often dominate discussions about the legacy of the Olympics, the intangible impacts, though difficult to measure, are equally important.

The Games were a massive undertaking with an organizing budget of 20.5 billion yuan ($3 billion) in revenue and 19.34 billion yuan in expenditures, yielding a surplus of over 1 billion yuan.

Twelve of the 37 venues were specifically constructed for the event. The Beijing Olympics were the first to offer full digital coverage globally, allowing hundreds of millions of viewers across the world to follow the action online.

Three intangible legacies of the Games stand out: health, sports policy and education. The organizing committee introduced the concept of "Olympic Health Legacy" and established a system to evaluate the impact of a mass event on the health of the host population.

MA XUEJING / CHINA DAILY

These included changes in health behaviors of individuals, improvements in public health services and enhancements in the quality of the external hygienic environment.

From 2001 to 2007, 140 billion yuan was spent on environmental improvement, which was far more than the $12.2 billion promised in the bidding reports.

The Games elevated the role of sport in China and enhanced the status of mass sport. From a policy development perspective, China's Olympics experience streamlined policy-making and planning for mega events.

The coordination required by the Games fostered policy coherence across public, voluntary and private sectors, exemplified by Beijing's "dual-city" benefit, which reduced venue costs for the 2022 Winter Olympics.

A great deal of organizational learning also took place, with Chinese sports organizations engaging with national and international sports federations, leading to improved sport governance.

Aug 8 was declared National Fitness Day, when public sports facilities are required to open free of charge to the public, promoting public health and sports participation.

Significant investments were made in mass sport from the lottery public welfare fund, with funding increasing over time.

The Games relied on tens of thousands of volunteers, supported by a large network of "city volunteers" stationed across Beijing, marking a cultural shift toward a formalized civic volunteer network that remains active in major public events.

Public investments, organizational learning, cultural change, and improved policy coherence have advanced sport in China, embracing social and economic values beyond health benefits and political gains.

Education was the chief mechanism for promoting Olympian values. The Beijing 2008 Olympics Education Programme was the largest of its kind in the Games history, integrating Olympian values — excellence, friendship and respect — into the curriculum of over 400,000 schools across China.

The program had three main components, including the Heart-to-Heart international school pairings, Olympic Values Education Programme teaching resources and curriculum integration, and the model schools program across China. It reached approximately 400 million children and left a lasting cultural and civic legacy for China's younger generation.

The Olympics do not belong to a country or an institution, but to all humanity.

When a city hosts them, it enters into a contract: the Olympic Movement allows the host city to invest the accumulated cultural capital of the Games, and, in return, the city promises to deliver certain legacies.

Olympic legacy is not automatically established. Beijing successfully leveraged the opportunities presented by the Games by mobilizing the energy of society to deliver lasting benefits.

The author is a professor of sport management at Brunel University in London, UK.

Sun Dan

When China found its own rhythm

When Beijing won the right to host the 2008 Olympics on July 13, 2001, I was a girl with a dream and little sense of how profoundly that moment would shape my life.

Twenty-five years later, I have lived that transformation from several vantage points: as an athlete who won China's first Olympic silver medal in rhythmic gymnastics in 2008, and as the head coach who led the Chinese team to Olympic gold in Paris in 2024, ending more than four decades of European dominance in the event.

Yet the most important change was not the medal. It was the moment China stopped asking how to look more like everyone else.

For much of its history, rhythmic gymnastics was governed by a distinctly European aesthetic.

Movement, music and choreography were judged against conventions that emerged largely from Eastern Europe.

Like many latecomers to the sport, China began by studying those standards, hiring foreign choreographers and trying to narrow the gap.

It was a necessary stage of development. Before a country can contribute to a global language, it must first learn to speak it.

But eventually a different question emerged: If sport is a universal language, why must we speak it with a borrowed accent? Why could the world not encounter contemporary China through this sport?

The answer was not to drape routines in obvious national symbols. Cultural confidence is not costume design.

Over the years, my colleagues and I built a long-term archive of Chinese cultural materials: classical dance, traditional music, historical imagery and regional artistic traditions.

We took athletes to museums and historical sites, invited experts in Chinese dance and folk music into training camps, and studied international judging rules with equal intensity.

Our goal was not to make routines that looked "Chinese" at first glance. It was to create works whose emotional logic could be understood anywhere.

When audiences watch a routine inspired by Dunhuang murals or ancient Chinese poetry, they do not need prior knowledge of Chinese history.

They need to feel wonder, tension, serenity or strength.

Cultural expression succeeds internationally not when it demands explanation, but when it creates recognition.

That is why routines such as *Flying Apsaras, Heroes of Heaven and Earth*, *Water Dragon's Chant* and *Phoenix Soaring to the Sky* were designed around universal emotions while drawing on distinctly Chinese artistic traditions.

In recent years, I have noticed a subtle but meaningful shift in how international judges and coaches respond.

Chinese routines are no longer treated merely as interesting variations from the periphery. Increasingly, they are discussed as creative references in their own right.

This reflects a broader change in China's relationship with the world.

For a long time, Chinese culture was often observed, analyzed or categorized from the outside. Today, in some fields, it is beginning to influence how the conversation itself is conducted.

True confidence is not insisting that one's culture is unique. It is understanding global rules well enough to participate fully while still speaking in one's own voice.

That voice, however, would mean little without a second transformation: the move from heroic endurance to scientific training.

When I was preparing for the 2008 Beijing Olympics, success depended largely on relentless repetition and personal sacrifice. My generation owes an enormous debt to coaches who built the foundation of Chinese rhythmic gymnastics through sheer perseverance.

As a coach, I have come to see that modern elite sport requires more than determination. It requires evidence.

Today our program integrates physical conditioning, rehabilitation, sports science, nutrition and psychological support into a unified system.

Training decisions are increasingly guided by data rather than intuition alone.

Just as important, we pay closer attention to the long-term physical and mental well-being of athletes whose careers span childhood, adolescence and adulthood.

That shift has changed the meaning of coaching. A coach is not simply a technician correcting movements; a coach is a long-term guardian of human development.

I often tell my athletes that a group routine succeeds only when different personalities learn to move with one heartbeat. We do not train every athlete identically.

Each receives a development plan tailored to her technical weaknesses, temperament and future potential. The goal is not uniformity, but unity.

This evolution has also been accompanied by greater openness to the world.

China has benefited enormously from international exchange. We learn from foreign coaches, judges and training systems, while increasingly sharing our own experience with overseas colleagues who come to China to observe and collaborate.

Sport is one of the few arenas where civilizations can engage one another without requiring complete agreement.

A common set of rules creates space for different cultural expressions to coexist. China's contribution should not be to reject international standards, but to enrich the diversity that exists within them.

Looking back, the 25 years since Beijing's Olympic bid was approved trace not only my personal journey, but also the journey of Chinese women in sport.

More women now serve as head coaches, researchers, administrators and participants in international sports governance.

That change is not simply a sporting achievement; it reflects a broader expansion of opportunities for women in Chinese society.

When my athletes tell me they see in me a confident and capable Chinese woman, I regard that as a responsibility greater than any medal.

China once entered rhythmic gymnastics as a student. Today it enters as a participant with something of its own to say.

We will continue to learn from the world and to pursue scientific excellence. But we will also continue to present Chinese culture not as a museum piece, but as a living, evolving source of creativity.

Olympic gold may have announced our arrival. Finding our own voice is what made the journey worthwhile.

The author is the head coach of the Chinese Rhythmic Gymnastics Group Team.

Reflecting on what remains after the flame goes out

Editor's note: *July 13 marks the 25th anniversary of Beijing's successful bid to host the 2008 Olympic Games. In a conversation with China Daily journalist Li Wei, Professor Angela J. Schneider, director of the International Centre for Olympic Studies at Western University and the first director of Ethics and Education for the World Anti-Doping Agency, and Zhou Guanpeng, a research associate at the center, reflect on the legacy that remains after the Olympic flame is extinguished. Through the lenses of sport, technology, sustainability and human well-being, they examine how the Beijing Olympics have continued to shape society and the public imagination nearly two decades later.*

Li Wei: What do you remember most about the 2008 Beijing Olympic Games?

Zhou: When I think about the twenty-five years since Beijing won its Olympic bid in 2001, I return to several images from the 2008 opening ceremony. Firework footprints moved along Beijing's Central Axis toward the Bird's Nest. Then an ancient sundial appeared. A sundial: the shadow of the sun. It makes time visible by reading the shadow cast by light.

Perhaps Olympic legacy works in the same way. The visible light is easy to see: venues, ceremonies, medals, technology, global attention. The harder question is: After the flame goes out, what truly remains, and whose life does it change?

Schneider: Legacy is not only what still stands after the Games. It is what continues to serve human beings. In my work, I distinguish between performance excellence and human excellence.

The first asks: how fast, how high, how strong? The second asks: what kind of person, community and life does sport help us cultivate?

If we take that distinction seriously, Olympic legacy cannot be measured only by buildings, spectacle or records. We must also ask about human legacy: whom do these achievements still serve? Do they serve athletes and citizens, or only a spectacle that has already passed?

Zhou: The children who watched the fireworks in 2008 may now be parents. Venues once belonging to champions may now belong to students, walkers, skaters and families. More than a century ago, Chairman Mao Zedong warned in *A Study of Physical Education* that sport could have "form without substance".

He did not treat the body as an accessory to the spirit, but as the ground of knowledge, will and moral life. When we speak of Olympic legacy today, do we face a similar question: Is sport merely a ceremony or spectacle to be watched, or a practice people actually live?

Schneider: I would add to that question. Participation is not only a matter of numbers. A crowded venue does not necessarily mean a meaningful sporting culture. We must ask whether people enter the internal goods of sport: the joy of learning skill, the discipline of sustained practice, the confidence formed through effort, and the experience of testing oneself with others under fair conditions. When sport enters daily life in this way, it is no longer only leisure. It becomes part of a fuller human life. Such a legacy is not static. It has to be used, practiced and understood again.

Li Wei: If Olympic legacy is ultimately measured by how deeply sport enters everyday life, how should we judge whether a host city has succeeded? Is it enough that venues remain open, or must they also become part of people's daily habits and social relationships?

Zhou: That brings us to another question: are we building smarter Olympics, or wiser ones? The scroll sequence in the 2008 opening ceremony offers at least one clue. Painting, writing, dance and music were not separate performances. The body was writing, the ink was dancing, movement became image.

Ancient form and modern technology appeared in the same scene. The point did not seem to be that technology betrays nature.

It seemed to ask whether technology can remain fitting to the body, to rhythm and to meaning. From your perspective, how should technology in sport be judged?

Schneider: I would not begin by asking whether technology is natural or unnatural. That often misleads us, because "nature" is not, by itself, a clear ethical standard. I would ask: what does the technology serve?

If it makes sport safer, fairer and more accessible, reduces waste, and helps more people participate, it can deepen sport.

But if it turns athletes into performance machines, spectators into data consumers, and venues into monuments no longer belonging to city life, it weakens sport. A truly sustainable Olympics is not only more efficient environmentally. It must also be ethically accountable to human beings.

Zhou: So sustainability is not only an engineering problem. Beijing has many visible examples of venue reuse, but a deeper question is whether these spaces have returned to public life. If venues and technologies merely prove that a city is stronger, faster and better organized, they may be smart. If they help ordinary people keep moving, meeting, learning and recovering bodily life, they may become wise.

Schneider: Yes. The Olympic movement is based on a public trust. It does not belong only to committees, sponsors or host cities.

It also belongs to athletes, citizens and future generations. A sustainable venue is one that returns to public life. A sustainable technology supports meaningful effort rather than replacing it. A sustainable Olympic city is not merely more spectacular. It is more fit for better human life.

Public trust means that Olympic legacy must remain open to public judgment: does it give people more chances to move, to meet, and to understand themselves and others through sport?

Li Wei: The third question may be the deepest: when the world is faced with so many challenges, what can the Olympic Games still hold together?

Zhou: In the movable-type sequence, the performers evoked the ideals of "friends coming from afar" and "all within the four seas are brothers and sisters". Then the blocks formed the character *he*, harmony. Finally, the blocks opened, and people appeared from underneath and waved.

That harmony was not produced by machinery alone. It was coordinated human movement. It seemed to resonate with the Olympic ideal: not erasing difference, but forming shared practice within difference.

Schneider: That is important. What sport gives to ideals is practice.

Harmony in sport is not the absence of conflict. Competition itself is conflict under shared constraints. Fair play, as I understand it, is not merely following rules or being polite. It is respect for the game.

Respect for the game changes how we see opponents. An opponent is not an enemy to be eliminated, but a necessary partner in the pursuit of excellent sport. Without a worthy opponent, one cannot truly test oneself.

Zhou: Then harmony is not sameness, but coordination within difference. It does not imagine a world without conflict. It asks conflict to enter rules, limits and mutual recognition.

Schneider: Yes. Two athletes may come from divided countries, speak different languages and carry different histories. Yet in competition they can recognize one another through shared rules.

That recognition is limited, but it is real. It cannot solve geopolitics, but it can teach a disciplined way of living with others and the world. The value of the Olympic Games is not that they make the world suddenly agree. It is that they allow people, while difference remains, to enter a practice shaped by rules, respect and effort.

Zhou: So the twenty-fifth anniversary of Beijing's successful bid should not be only a memory of success. It should become a question: after the ceremony ends, can the city, its venues, its technologies and its citizens continue to practice this deeper legacy?

Schneider: That is the key question. If we must name it, since 1993 I have called it the "spirit of sport" which is based on the internal goods that create the joy of sport.

But I would not use that phrase as a slogan. It means skill, fair challenge, meaningful effort, respect for opponents, and the cultivation of a fuller human life. Beijing's most lasting Olympic legacy will not be measured only by buildings that still stand, but by what still moves: bodies, habits, public spaces, shared memory, and the continuing possibility that competition can become a practice of human flourishing.

The light once illuminated a city; the shadow tells us whether that light still gives direction to human life.

Win-win cooperation

The EU should prioritize mutually beneficial innovative ties with China instead of portraying the country's rise as a shock

WANG XIAOYING / CHINA DAILY

Speaking at the Summer Davos forum in Dalian in June, Chinese Premier Li Qiang introduced the concept of "China Opportunity 2.0". More than a slogan, it represents an attempt to help the world understand China's economic transformation — from the world's factory to a global platform for innovation.

The 2026 Summer Davos took place at a significant moment when the global economy continues to see moderate growth, geopolitical fragmentation, trade uncertainty and intensifying technological competition. Against this backdrop, the forum's theme, "Innovating at Scale", captured one of the defining challenges of the time: Innovation alone is no longer enough; the real challenge is the ability to rapidly deploy innovation throughout the productive system and society as a whole.

If the first phase of China's opportunity was built primarily on the extraordinary expansion of its domestic market, its openness to foreign investment and its integration into global value chains, "China Opportunity 2.0" is increasingly driven by the country's capacity to generate innovation, develop cutting-edge technologies and rapidly transform them into large-scale industrial applications.

A growing body of international evidence suggests that China's innovation system has reached a new level of maturity. In recent years, China has become the world's largest holder of patent applications, one of the leading investors in research and development, the largest market for electric vehicles, and a global leader in batteries, renewable energy, industrial robotics, digital infrastructure and applied artificial intelligence. Universities, enterprises, research institutes and local governments increasingly operate within an integrated innovation ecosystem that accelerates the transfer of technology from laboratories to industrial production.

What distinguishes China's model today is not only its ability to invent new technologies, but above all the speed at which these technologies are deployed at scale. The rapid integration of AI into manufacturing, logistics, healthcare, public services and consumer markets provides perhaps the clearest example of this systemic capability. It is also the rationale behind recent government initiatives such as the "AI+" initiative to create new forms of smart economy and improve AI governance.

In other words, innovation in China is quickly translated into the real economy. This close integration of scientific research, industrial policy and manufacturing capability has become one of the defining characteristics of the country's current stage of development.

The notion of "China Opportunity 2.0" therefore reflects a qualitative transformation. The opportunities offered by China partly lie in participating in one of the world's most dynamic innovation ecosystems.

This evolution also carries important implications for Europe. In recent years, European Union-China economic relations have largely been influenced by the West, through the lens of "de-risking". Strengthening the resilience of strategic supply chains is certainly an important objective. Yet the risk — as current developments suggest — is that the political debate is becoming almost entirely focused on competition while overlooking the opportunities created by selective and mutually beneficial technological cooperation.

The EU and China remain two of the world's largest economies and share common interests across a wide range of areas, including energy transition, climate change, population aging, food security, public health, industrial digitization and the development of AI for good.

Some of the major challenges of the 21st century require economies of scale, substantial investment and continuous innovation. No country, regardless of its level of development, possesses all the resources needed to address these challenges alone.

From this perspective, "China Opportunity 2.0" can also be understood as an opportunity for scientific and industrial cooperation. Europe continues to possess significant competitive strengths in basic research, precision manufacturing, chemistry, biotechnology and high-end industrial production. China, meanwhile, offers growing R&D innovation applications, advanced engineering and industrial capabilities, an exceptionally broad manufacturing base, substantial investment capacity and a domestic market capable of rapidly commercializing innovation.

These characteristics are potentially complementary rather than inherently antagonistic. Naturally, important differences remain. Issues concerning market access, intellectual property protection, regulatory transparency and competitive conditions continue to shape bilateral relations. Ignoring these concerns would be unrealistic. Nevertheless, addressing such differences through dialogue and negotiated solutions is generally more productive than progressively reducing opportunities for cooperation.

Experience consistently shows that innovation flourishes in environments characterized by openness, knowledge exchange, talent mobility and international investment. By contrast, growing technological fragmentation risks slowing global scientific progress, increasing development costs, and reducing humanity's capacity to tackle shared challenges.

From this perspective, the message emerging from the Summer Davos forum extends well beyond China itself. The central question is how to reform the international system and further various kinds of cooperation between the Global North and the Global South, as well as among Global South countries, to ensure that the benefits of innovation are broadly shared.

China regards scientific and technological innovation as one of the principal drivers of national modernization, higher productivity, high-quality growth and long-term international competitiveness. Within this framework, innovation, industrial development and strategic planning are viewed as deeply interconnected. Whether or not one agrees with this model — which continues to evolve — it is difficult to deny that it has generated significant achievements across a number of technological and manufacturing sectors. For this reason, understanding China's economic transformation has become an analytical necessity before it is a political one.

Europe now faces an important choice. It would be better to say that Europe should not continue to view China's transformation primarily through the prism of geopolitical competition. It can adopt a more nuanced approach — one capable of distinguishing between areas where competition is necessary and where cooperation continues to generate mutual benefits.

"China Opportunity 2.0" does not imply the absence of competition, nor does it eliminate differences in national interests. Rather, it suggests that in today's knowledge economy, innovation and interdependence will remain inseparable dimensions of global economic development. For Europe, recognizing this reality with pragmatism may well become one of the defining tasks of the years ahead.

HE YUN

Trade wars bring risks

If Europe labels China an industrial threat, it will fail to fully recognize that Chinese technologies may facilitate its green transition

SHI YU / CHINA DAILY

For much of the past two decades, Europe's trade policy toward China was built on an assumption that engagement would benefit both sides — China was a vast market for European cars, machinery, luxury goods and technology; Europe was a rich consumer market for Chinese manufactured products. Yet things changed. In 2019, the European Union formally described China not only as a partner, but also as an economic competitor. The EU-China Comprehensive Agreement on Investment, once seen as a symbol of deeper EU-China economic engagement, was politically frozen. Then came the pandemic, the Ukraine crisis, the energy crisis and, with it, rising concerns over supply chain security. Europe started to turn toward "de-risking". Trade with China is no longer viewed as a market opportunity, but increasingly as a risk.

Following the EU summit from June 18 to 19, where discussions on how to bolster Europe's competitiveness and counter "global macroeconomic imbalances" took center stage, a new proposal requiring EU companies to diversify their sources of key supplies — in the hope of stepping up the latent "de-risking" efforts — is on the agenda. Yet a full-blown trade war with China would be very dangerous for Europe.

First, a trade war would make Europe's green transition more expensive. Price is the gateway to demand, and demand lays the foundation upon which European clean-tech capacity will eventually be built. Chinese electric vehicles, batteries, solar panels and renewable technologies are demand creators. Because of lower costs, their mass adoption becomes possible. Once consumers buy EVs, governments build charging infrastructure. Once solar panels become affordable, households, companies and cities invest in distributed energy. Once batteries become cheaper, storage, recycling, grid modernization and smart-energy services become commercially viable. In this sense, affordable Chinese clean technologies can help create the market conditions in which European green industries themselves may grow. Europe cannot develop a full renewable-energy ecosystem if renewable deployment is slowed by high costs. Demand must come before scale; scale must come before competitiveness. If Europe raises prices too quickly in the name of protecting industry, it will weaken the very demand that industry needs.

Second, energy security remains a critical challenge for Europe. Europe has learned from the Ukraine crisis that energy dependence is never only commercial. When the security environment changed, dependence became a vulnerability. Europe has since moved away from Russian energy, but it has not fully escaped its dependence on imported fossil fuels. In some sense, Europe has simply changed suppliers. The United States has become a major provider of liquefied natural gas to Europe. This may be geopolitically safer, but it is still dependence and dependency does not disappear when the supplier changes; it merely changes the actor who has leverage. Even allies can use dependence as an instrument of pressure.

That is why a trade war with China over clean technologies could be irrational. In the short run, the balance of trade might look better; but such a strategy would sacrifice Europe's energy resilience in the long run, and Europe would remain vulnerable to geopolitical shocks and external coercion. A wiser path would be for Europe to use Chinese clean-tech supply and investment as a transitional accelerator while building European capacity, instead of starting a broad trade war that slows the transition.

Third, Europe faces internal divisions. Energy dependence is not only a foreign-policy problem but also a threat to European unity. The energy crisis following the Ukraine crisis revealed how differently member states respond to external shocks. Some wish to cut Russian gas entirely, others do not; some turn to nuclear power, others reject it; some have stronger fiscal capacity to subsidize households and businesses, while others lack the resources. As a result, every energy crisis becomes an intra-European political crisis. If Europe fails to make energy cheap and abundant, these divisions will deepen with each subsequent crisis, as we have already seen with the ongoing Strait of Hormuz crisis.

Fourth, the nature of the EU itself creates distinct constraints. Europe is a slow-moving bureaucratic machine. This gives it strength but it also creates rigidity. The United States can change trade policy quickly when its administration changes. Europe cannot. Once tariffs, legal procedures, trade barriers and regulatory frameworks are set in motion, reversal becomes slow and politically costly.

That is why Europe should be especially cautious before starting a trade war with China. Trade wars, like other forms of war, are easy to begin and difficult to end. They create vested interests; they harden political narratives; they make compromise look like weakness; they turn technical disputes into questions of pride. Once China is framed primarily as a threat to Europe's industry, it becomes harder to acknowledge that Chinese technology may also be useful to Europe's green transition. Recent conflicts have taught a simple lesson: wars often begin with confidence and end with exhaustion. Economic wars are no exception. They may start as limited measures, but they can expand and spiral out of control. Europe should not sleepwalk into such a conflict.

The smarter path is therefore to reduce strategic vulnerability in the long run, not limit its vision to the short-term balance of the books. That means resisting the temptation of a broad trade war with China, which is dangerous not only economically but strategically. Instead, Europe should pursue a dual strategy: using affordable Chinese clean-tech imports to accelerate the green transition today while systematically building the European industrial and technological capacity that will reduce dependence tomorrow.

Strategic autonomy will not be achieved by raising the cost of Europe's own transformation. It will be achieved by making the green transition faster and more resilient. Europe's choice is not between dependence on China and protectionism. The real choice is between a pragmatic strategy that uses global clean-tech capacity to accelerate European renewal, and a defensive strategy that traps Europe longer in its old nightmares and insecurities.

MNCs tap China's industrial ecosystem

Nation's robust supply chains, AI, green drive help firms scale up

By ZHONG NAN
zhongnan@chinadaily.com.cn

For senior executives from multinational companies including Germany's Covestro AG and the United States' Boeing Co and Carrier Global Corp, June brought a steady stream of visits to China, where they unveiled expansion plans, launched new projects and participated in the fourth China International Supply Chain Expo in the world's second-largest economy.

Among them, Covestro made a major investment announcement in late June. The German chemicals producer will build a new methylene diphenyl diisocyanate production line with annual capacity of 660,000 metric tons at its integrated site in Shanghai. MDI is a synthetic chemical used primarily to manufacture polyurethane foams and coatings.

Holly Lei, senior vice-president of Covestro, said the investment, which coincides with the 25th anniversary of the groundbreaking of the group's Shanghai integrated site, reflects Covestro's confidence in China's integrated industrial ecosystem, innovation capabilities and deep talent pool, while strengthening long-term supply for customers in China and across the Asia-Pacific region.

Covestro's decision reflects a broader trend of multinational companies increasingly viewing China not only as a major market, but also as a strategic hub for innovation, manufacturing and resilient supply chains.

Backed by China's continued move up the value chain and broader market opening-up, its supply chains are evolving beyond the traditional role of the "world's factory" into a key anchor for global innovation and industrial collaboration, providing multinational companies with greater certainty in an increasingly volatile global economy.

As global trade and investment undergo profound changes, China is strengthening industrial and supply chain resilience while expanding high-standard opening-up through wider market access, an improved business environment and measures to stabilize foreign investment, said Li Xingqian, vice-chairman of the China Council for the Promotion of International Trade.

The government rolled out a 15-measure action plan to stabilize foreign investment in late June, with steps to expand market access, streamline investment procedures, strengthen investment promotion, improve services for foreign businesses and refine foreign investment management, according to the Ministry of Commerce.

The plan prioritizes expanding market access in services, finance and pharmaceuticals, among other sectors, while streamlining processes for cross-border mergers and acquisitions, data flows and domestic reinvestment by foreign firms.

Wang Ya, head of the department of foreign investment administration at the Ministry of Commerce, said the measures are expected to encourage multinational companies to further integrate into China's industrial ecosystem by expanding investment in research, advanced manufacturing and high-end services, helping China consolidate its position in global industrial and supply chains.

Boeing is among the companies responding to these opportunities. The US aircraft manufacturer inaugurated a new maintenance facility in Shanghai last month that was developed in cooperation with Chinese partners and is one of the largest of such facilities in Asia.

Landon Loomis, president for China at Boeing Co, predicted that over the next 20 years, Boeing expects the size of China's commercial aircraft fleet to double, driving demand for about 250,000 additional aviation professionals, including pilots, maintenance technicians, cabin crew and ground service personnel. The company will continue to increase investment in human capital development in the country.

"Boeing currently works with around 40 suppliers in China, with components produced by these suppliers incorporated into Boeing aircraft delivered worldwide," said Loomis, adding that the continued expansion of e-commerce and global trade is expected to drive long-term demand for air cargo services and support growth in Boeing's freighter business.

That long-term confidence is shared across industries. Michael Gierges, president of climate solutions for Asia-Pacific, Middle East and Africa at Carrier, said the US intelligent climate and energy solutions provider no longer views China simply as a regional market, but as a key driver of the group's global growth strategy.

China's push to expand computing infrastructure and advance green urban development will create fresh growth opportunities for Carrier to deepen investment in manufacturing, supply chain development, innovation and digital technologies in the country during the 15th Five-Year Plan (2026-30) period, said Gierges.

"Cooling systems account for a significant share of data center energy consumption, making efficiency improvements increasingly important," he added.

Reflecting this long-term commitment, Carrier, the parent company of Toshiba HVAC and Viessmann Climate Solutions, has continued to expand its manufacturing footprint in China. It launched a new air-cooled chiller production line at its facility in Shanghai's Baoshan district, with investment exceeding 100 million yuan ($14.7 million) in January.

Together with additional production lines yet to be commissioned and supporting facilities, the project's total investment is expected to reach 400 million yuan.

The continued inflow of foreign investment underscores the confidence of multinational companies in the Chinese market. Foreign direct investment in China's high-tech industries expanded 19.4 percent year-on-year to 130.14 billion yuan in the first five months of 2026. The sector accounted for 39.8 percent of the country's total FDI, up 9.4 percentage points from the same period last year, statistics from the Ministry of Commerce showed.

In the meantime, investment from the United Arab Emirates, Malaysia, Switzerland and the US surged by 285.5 percent, 108.6 percent, 49.4 percent and 17.3 percent on a yearly basis, respectively.

Pushing back against the so-called "China Shock 2.0" narrative, which portrays China's development as a disruption to the global economy, Huang Yiping, dean of Peking University's National School of Development, said that while trade tensions persist, growing investment, green transition needs and shared support for multilateralism continue to sustain China's economic cooperation with the world, particularly with the European Union.

China and the EU can deepen cooperation in green development and advanced manufacturing by combining China's large-scale industrial capacity with Europe's strengths in low-carbon technologies, industrial innovation and high-end engineering, said Huang.

Practical cooperation can also be expanded in industrial artificial intelligence, high-end services and third-country markets, enabling both sides to leverage their complementary strengths and generate new growth opportunities, he added.

Market watchers said that rather than displacing other economies, China's industrial upgrading is creating new opportunities for cross-border innovation, investment and industrial cooperation.

Vaughn Barber, chairman of the China-Australia Chamber of Commerce, echoed that view. "China's open and resilient industrial ecosystem offers opportunities for deeper cooperation," he said.

By leveraging complementary strengths, Chinese and Australian companies can accelerate energy transition, advance industrial upgrading and create long-term value through practical partnerships, said Barber.

AI, digitalization and green technologies are emerging as the next frontier for multinational companies in China, with the country's industrial ecosystem providing an ideal environment for commercialization and industrial application.

Lin Chunmei, president and general manager of Corning China, said the US industrial materials manufacturer has consistently worked alongside its industry partners in China, evolving from technology introduction to collaborative innovation and from "bringing in" to "going global".

Lin said AI is rapidly reshaping the global industrial landscape, creating new demand for critical technologies and infrastructure.

"Leveraging our long-standing expertise in materials science and key components, Corning will continue to support next-generation computing infrastructure while actively contributing to the upgrading of China's industrial ecosystem," she added.

System-level certainty delivers confidence companies demand

REPORTER'S LOG
By Zhong Nan

Throughout June, I traveled from Beijing to Urumqi in Xinjiang Uygur autonomous region to cover major trade events, including the fourth China International Supply Chain Expo and the ninth China-Eurasia Expo. I found myself asking executives from multinational companies the same question: Has anything fundamentally changed about investing in China?

Their answers were rarely identical, but they almost always pointed in the same direction.

The more executives I interviewed, the more I noticed an interesting pattern. Tariffs were mentioned. Geopolitics came up. Supply-chain diversification was part of almost every conversation. Yet none of those topics became the center of the discussion. What they wanted to talk about instead was China's manufacturing ecosystem — and why it remains remarkably difficult to replicate.

That contrast made me rethink a common assumption. China's competitive advantage today is no longer defined primarily by low-cost manufacturing. It increasingly lies in something much harder to replicate: system-level certainty — the ability to innovate, manufacture and deliver efficiently within an integrated industrial ecosystem.

A French executive described China's manufacturing ecosystem as "the place where problems get solved overnight." It was the clearest explanation I heard for why companies continue investing here despite growing external uncertainties.

During factory visits and interviews, I noticed executives talked less about saving money than about saving time. In advanced manufacturing, speed itself has become a competitive advantage. Design changes quickly reach suppliers, tooling is modified within hours and production resumes with minimal disruption. Engineers, suppliers and customers often operate within the same industrial cluster, solving problems face to face rather than across continents.

That ecosystem delivers what every business values most: certainty. Products move from prototype to mass production faster, supply disruptions are resolved more efficiently and production scales without rebuilding supplier networks, thanks to dense industrial clusters in regions such as the Yangtze River Delta region and the Guangdong-Hong Kong-Macao Greater Bay Area.

Whether interviewing CEOs from ABB, Danfoss, Decathlon, Maersk or Schneider Electric, I kept hearing different versions of the same conclusion. Many multinational companies are diversifying parts of their production networks, but few believe another location can match China's combination of supplier density, engineering capability, logistics efficiency, manufacturing scale and infrastructure.

Increasingly, they describe China not only as one of their largest markets, but also as an innovation hub and strategic manufacturing base.

Chinese manufacturers are also competing less on costs than on innovation. Across industries from electric vehicles and industrial equipment to medical devices and consumer electronics, companies are investing more heavily in research and development, developing proprietary technologies and moving further up the value chain.

Conversations with executives have also shifted from labor costs toward innovation, engineering capability and commercialization speed. The focus is becoming less about where products are assembled and more about where ideas can be brought to market most efficiently.

None of this suggests China's industrial upgrading is complete. High-end semiconductor design software, certain advanced medical technologies and stronger global brand recognition still require sustained investment and technological breakthroughs.

Perhaps the biggest misconception I encounter is the belief that China's manufacturing competitiveness depends primarily on subsidies or inexpensive labor. Yet executives making big-ticket investment decisions rarely emphasize either. Instead, they point to reliable suppliers, experienced engineers, integrated industrial clusters, resilient logistics and confidence that production will continue even when uncertainty grows elsewhere.

Those capabilities cannot be replicated simply by relocating a factory in India, Vietnam and Mexico, or imposing another tariff. They are the result of decades of industrial accumulation, continuous innovation and close collaboration across entire supply chains.

As global businesses navigate geopolitical tensions and supply-chain restructuring, the conversation is becoming less about whether China remains the world's factory. It is increasingly about how China is evolving into a source of innovation, industrial collaboration and system-level certainty.

BUSINESSINSIGHT

Chinese firms reshape global industrial chains

EAGLE EYE
By Liu Xiaochun

ILLUSTRATION GENERATED BY AI

Global industrial chains and structures are constantly evolving, alternating between periods of relative stability and of profound disruption. Industrial restructuring refers to periods of accelerated change, such as the one currently underway. The forces behind such restructuring can broadly be divided into two categories: geopolitical competition and technological change. The two are closely intertwined, although their relative importance varies over time. At present, both are driving the reconfiguration of global industry, with geopolitical competition playing the dominant role.

Historically, major waves of global industrial restructuring have been initiated and led by advanced economies, with their large corporations possessing technological and financial advantages. Other countries and firms have generally played reactive roles, gradually adapting as a new global industrial equilibrium emerged. The current round is different. China and Chinese companies have shifted from passive responders to active participants in shaping global industrial restructuring.

At the early stage of this transition, China proposed the Belt and Road Initiative, anticipating changes in the global economic landscape. At the corporate level, overseas expansion initially emerged as a response to changing market conditions. As more companies expanded abroad, however, Chinese enterprises have increasingly become an important force in reshaping global industrial and supply chains.

This new wave of international expansion has several distinctive characteristics.

First, an unprecedented number of Chinese firms have entered overseas markets within a relatively short period. Unlike earlier waves of industrial relocation, which were concentrated in a limited number of destinations, Chinese companies are investing across every continent. Participants range from large corporations to small and medium-sized enterprises and even individual entrepreneurs.

Second, overseas expansion now spans virtually every industrial sector. Rather than concentrating on labor-intensive manufacturing, Chinese companies are expanding across the full industrial spectrum, including advanced manufacturing, new energy vehicles, financial technology, telecommunications infrastructure, consumer brands, e-commerce and technology start-ups. Many young tech firms are pursuing offshore markets from the very beginning of their development.

Third, Chinese companies are increasingly expanding abroad as integrated industrial clusters rather than as individual firms. One of Chinese manufacturing's greatest competitive strengths lies in the coordination and efficiency of its industrial and supply chains. Many companies find that production supported by Chinese supply networks remains more efficient and cost-effective than relying entirely on local suppliers. As a result, entire industrial ecosystems — including suppliers, managers, engineers and technical personnel — are moving overseas together, creating a new model of global industrial organization.

Fourth, the scale of this expansion is unprecedented. Given the size of China's economy, both the number of companies and the volume of investment are exceptionally large. For many developing economies and smaller markets, Chinese enterprises quickly become significant industrial participants, raising local industrial capacity while also creating competitive pressure for existing businesses.

Fifth, this globalization is being driven by companies from a developing country rather than advanced economies. Historically, multinational expansion benefited from the economic, technological and geopolitical advantages of developed countries. Chinese companies often operate under different perceptions in host countries. While many governments welcome Chinese investment, Chinese firms may encounter social and commercial challenges that differ from those historically experienced by Western multinationals.

These characteristics are generating new opportunities as well as new challenges.

For many countries in the Global South, China's manufacturing capabilities, infrastructure expertise and integrated supply chains create an opportunity to accelerate industrialization and infrastructure modernization. Cluster-based investment can establish complete industrial ecosystems, infrastructure and business models within relatively short periods, potentially shortening development paths that historically required decades.

At the same time, as Chinese companies expand internationally, Chinese technological standards, industrial standards, digital technologies and business practices are increasingly being adopted overseas. In the past, Chinese firms generally participated in supply chains organized by multinational corporations and therefore followed externally established rules and standards. Today, Chinese companies are increasingly organizing their own international industrial and supply chains, particularly in emerging industries where they possess technological leadership.

The expansion of Chinese companies also presents short-term challenges for host economies. Although Chinese investment can contribute to industrial upgrading, economic growth, trade and improvements in living standards, it may also create adjustment pressures for local industries and interest groups. Different countries, reflecting their own political systems, legal frameworks, cultural particulars and national interests, are likely to respond in different ways. While some may adopt restrictive measures, many are expected to balance short-term pressures against long-term development opportunities.

Chinese companies themselves are entering largely uncharted territory. Their international operations generate service needs that differ from those traditionally associated with multinational investment, including legal protection, security, cross-border financing, payment and settlement, treasury management and other forms of professional support. Respecting local laws, customs and cultures remains essential, but these measures alone may not fully address the challenges arising from this new phase of globalization.

Supporting Chinese companies operating overseas should therefore become an important component of China's participation in global industrial restructuring. Financial regulation should adapt to growing cross-border capital flows by coordinating the management of domestic and international financial resources. Policies governing credit, insurance, bond issuance, foreign exchange, cross-border payments and related financial services should evolve in line with the needs of internationally expanding companies and international practice.

Shanghai should be developed into a comprehensive service center for Chinese companies operating abroad by strengthening its role in cross-border financing, forex trading, payment and settlement, treasury services and international legal, accounting and arbitration services. Large commercial banks should establish integrated domestic and overseas service systems capable of supporting industrial clusters rather than serving companies individually. Insurers, investment banks and other financial institutions should accelerate their offshore presence so that they can better support Chinese companies overseas.

China should also use this development to promote its approaches to green finance and sustainable investment internationally, encourage futures exchanges to develop products and trading models that better serve actively globalizing Chinese companies, and foster cooperation between large and small financial institutions to build integrated service chains for overseas businesses.

Beyond financial services, greater policy coordination is needed. While respecting companies' commercial decisions, the geographic distribution of overseas industries should receive appropriate strategic guidance. More Chinese standards should gradually evolve from market practices into internationally recognized institutional standards. Tax incentives, stronger protection for overseas personnel and assets, and broader policy support should also be considered to facilitate the long-term development of Chinese enterprises operating — and wishing to operate — abroad.

A partnership through thick and thin — and primed to grow

MAIN STREET
By Sultan Ahmed Al Jaber

Sultan Ahmed Al Jaber

There is a Chinese saying that sums up the partnership between the United Arab Emirates and China. "A long road tests a horse's strength; time reveals a person's heart." In other words, the strongest partnerships take time to build, are tested by distance and are reinforced by results. The UAE and China have been building ours for more than 40 years, through every market cycle.

Last year, non-oil trade between our two countries crossed 800 billion yuan ($118 billion) for the first time, growing by nearly a quarter in a single year, making China the UAE's largest trading partner, and the UAE China's largest partner in the Middle East and Africa.

In April, His Highness Sheikh Khaled bin Mohamed bin Zayed Al Nahyan, crown prince of Abu Dhabi, led a senior UAE delegation to Beijing, where two dozen agreements were signed across the sectors of energy, technology, finance and infrastructure.

Recently, I visited Shanghai to help keep the positive momentum going and turn shared ambition into commercial reality, because a partnership this strong is not meant to stand still.

Both our countries align national purpose with economic growth through strategic clarity. China's 15th Five-Year Plan (2026-30) sets out a clear ambition — to translate advances in science and technology into substantial, people-centric progress.

The UAE is equally focused on building the economy of the future through artificial intelligence, advanced manufacturing and the energy that powers them. We see ourselves as a natural partner for that journey across the energy value chain that makes all progress possible.

UAE companies are building from a position of strength. China is Abu Dhabi National Oil Company's single largest customer for our cost and carbon-competitive crude and refined products. Chinese companies are among our most significant partners across our upstream concessions, downstream businesses and operating companies.

And through Masdar, our renewable energy champion, our collaboration goes beyond the barrel into new energies, where we partner across the wind, solar and the battery value chain.

Recently, we took our partnership deeper across four key pillars.

Regarding supply, during my recent visit, Abu Dhabi National Oil Company announced a new agreement to deliver an additional 134,000 barrels of crude per day to China, providing more of the dependable, competitively priced energy its economy runs on.

Backed by a $150 billion investment program, we are raising our crude production capacity to five million barrels a day by 2027, while continuing to invest in resilient routes to market. Our Murban crude is light, low in sulfur and among the lowest-carbon-intensity oil produced anywhere, and it reaches Chinese ports on one of the shortest voyages of any major supplier.

Regarding distribution, we have finalized an agreement to build four new next-generation gas vessels, in addition to two already under construction. Shanghai's shipyards are building the fleet of the future and together, we will help supply energy across the economies of the Belt and Road region.

As for petrochemicals, we are making progress on our joint venture with Borouge and Wanhua Chemical to develop a state-of-the-art polyolefin complex in Fujian province. At the same time, through our international investment arm XRG, Covestro is expanding its advanced materials production in China.

Together, these investments will strengthen integrated supply chains and expand the availability of specialty plastics and critical materials essential for high-tech manufacturing, data centers and the circular economy of the 21st century.

Regarding clean energy, through Masdar, we are expanding our partnership across the renewable energy and battery storage value chain. Chinese companies already provide the components for many of our solar projects and will be an integral partner in the world's first round-the-clock solar project in the UAE, supplying the batteries that will help provide 1 gigawatt of uninterrupted clean power for industrial and domestic consumers in Abu Dhabi.

This level of collaboration reflects a partnership in motion that moves the UAE-China relationship beyond supply and demand into co-investment, industrial collaboration and value creation across the board.

Chinese companies are part of the fabric of the UAE's economy, contributing directly to our continued economic success. Building on that foundation, there is significant opportunity to expand investment, strengthen industrial ties and create even greater shared value.

In a fast-evolving world, partnerships that can deliver both stability and transformation matter more than ever. The UAE-China partnership is already proving to be one of the most consequential.

The writer is the United Arab Emirates' minister of industry and advanced technology. He is also managing director and group CEO of Abu Dhabi National Oil Company, executive chairman of XRG, ADNOC's international investment company, and chairman of renewable energy company Masdar.

Police crack down on FIFA World Cup betting rings

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Police in several Chinese cities have cracked down on illegal online gambling linked to soccer World Cup matches, detaining multiple suspects and warning the public to stay alert to betting scams disguised as "high odds", "expert predictions" or "guaranteed profit" opportunities.

As the 2026 FIFA World Cup gains momentum, gambling rings have used match traffic to lure internet users through social media posts, chat groups, offshore gambling websites and rebate schemes, police said.

Authorities in Huzhou and Hangzhou in Zhejiang province, Xi'an in Shaanxi province, Jiangyou in Sichuan province and Yulin in the Guangxi Zhuang autonomous region have recently uncovered cases involving hidden betting operations, promotion of gambling and illegal fund flows. While the cases share similar methods, each also showed varied tactics used to attract gamblers or evade investigation.

In Huzhou, police found that four suspects, including one surnamed Yang, had repeatedly posted "guaranteed profit" and "high-odds cashback" advertisements on social media before the World Cup began. The group allegedly drew users to soccer betting chat groups, updated match odds, issued betting "guides" and directed members to gambling websites or group operators. Four suspects were detained, and the case involved more than 1.5 million yuan ($221,000) in fund flows.

In late June, police in Jiande, Hangzhou, broke up another illegal gambling ring and detained eight people. The case involved more than 1 million yuan in fund flows.

Police said the group operated a so-called overseas World Cup betting market, using high odds and claims of accurate predictions to lure internet users, relatives and friends into placing bets. Unlike the Huzhou case, the group relied on cross-border gambling websites, assigned personnel to manage betting markets online and profited from rebates.

Police in Jiangyou also dismantled a ring that secretly promoted "World Cup exclusive markets" through instant messaging groups and WeChat groups. Investigators said the suspects used offshore websites offering high odds and multiple betting options, while arranging personnel to manage betting markets. To evade investigation, members frequently changed chat accounts and used temporary payment channels. The case involved more than 300,000 yuan and four main suspects were detained.

In mid-June, police from Xi'an's Weiyang district uncovered a group that used social media groups to update odds, open online betting games, recruit gamblers and settle funds offline. After identifying the group during early morning analyses on June 18, police formed a 20-member task force to trace clues, identify suspects, collect electronic evidence and check fund flows. The case, which involved more than 100,000 yuan, was solved within 19 hours and led to the detention of seven suspects.

Additionally, cybersecurity police in Yulin, Guangxi, uncovered a gambling promotion case under the "Clean Net 2026" campaign. Since May, police have found large numbers of gambling adverts in pictures, text and videos on multiple social media platforms. Investigators said a 25-year-old suspect surnamed Chen had organized a studio to provide traffic promotion and operational support for gambling websites. Chen and others were detained, and the case is under further investigation.

Police said soccer World Cup-related online gambling is deceptive, spreads quickly and may lead to fraud, money laundering and other crimes. Several online platforms have also launched special campaigns to remove illegal betting information, block accounts, delete posts and comments, and report clues to police.

Authorities reminded the public that online gambling is illegal and that promises of "sure wins" or "high returns" are often traps. Internet users should avoid joining betting groups, clicking gambling links or transferring money to strangers, and should report gambling-related information to the police.

Tour of Lhasa

Cyclists ride past the Potala Palace during the finale of the 2026 tour of Lhasa, Xizang autonomous region, on Sunday. The event featured men's and women's elite road races and open mountain bike races, covering a total distance of 190 kilometers and attracting more than 800 competitors. Plans for three-tier eldercare network

System to extend from urban centers to remote rural communities by 2029

By LI LEI
lilei@chinadaily.com.cn

The Ministry of Civil Affairs has unveiled a plan to build a national eldercare network over the next three years by integrating fragmented care resources into a three-tier system that extends from urban centers to remote rural communities.

The ministry aims to have the network in place by 2029 and further strengthen it by 2035, according to a guideline released on Wednesday.

At a news conference following the guideline's release, officials elaborated on the three-tier structure, which consists of county-level elderly care service management platforms, township- or subdistrict-level service centers and village- or community-level service facilities.

The system is designed to provide seamless care across home-, community- and institution-based settings.

"The three-tier network is not a simple hierarchical structure, but an organic whole," said Sun Wencan, deputy director of the ministry's department of elderly care services. The county-level platform serves as the system's "brain" and "nerve center", he said.

It coordinates with provincial- and municipal-level high-quality elderly care providers to perform functions such as service demonstration, industry guidance, emergency response, resource coordination and data aggregation.

> "The three-tier network is not a simple hierarchical structure, but an organic whole."
>
> **Sun Wencan,** deputy director of the Ministry of Civil Affairs' department of elderly care services.

Township-level service centers function as the system's "backbone" and "bridge", providing services including professional care, visitation care, family support and other extended services.

Established on the foundation of renovated high-quality elderly care institutions and comprehensive senior service centers, one regional center can serve multiple townships or subdistricts, Sun said.

At the grassroots level, village- and community-based facilities operate as the network's "terminals", providing daytime care, home-based services, short-term respite care, meal assistance and visitation services.

These facilities are designed to identify the needs of older residents and deliver services close to home, he added.

Beyond outlining the network's structure, Sun noted that its purpose is to address both the strict care needs of seniors with disabilities or cognitive impairment and the diverse needs of healthy, active older adults through services such as meal assistance, social engagement and recreational programs.

For frail and disabled seniors, county-level platforms will coordinate professional care for those with severe disabilities, while township-level centers will provide centralized care for people with milder conditions, supplemented by home-based services and respite care for family caregivers.

The plan builds on China's rapidly expanding elderly care system. By the end of 2025, the country had 396,000 elderly care institutions and facilities, with nursing beds accounting for 67.5 percent of all beds in elderly care institutions, Sun said.

Public county-level elderly care institutions have achieved full coverage nationwide. About 30 percent now function as comprehensive county-level elderly care service management platforms, while more than 60 percent of townships and subdistricts have established regional elderly care service centers.

Officials from Beijing's Dongcheng district and Nanping in Fujian province shared local best practices at the news conference, highlighting efforts ranging from urban resource coordination to improvements in rural elderly care services.

"We will promote these experiences and guide local governments to accelerate the improvement of the three-tier system to better meet the diverse and multilevel needs of senior residents," Sun said.

Panda turns one

A giant panda cub is officially named "Wangshu" during its first-birthday celebration at Chongqing Zoo on Sunday. The female cub, which weighed just 188 grams at birth, has grown to 36.5 kilograms in her first year. TANG YI / XINHUA

Single-Atom Catalysis research earns science award

By LI MENGHAN
limenghan@chinadaily.com.cn

As the invisible engines of modern chemistry, catalysts help produce the gasoline that powers cars, the fertilizers that promote food cultivation and the polymers used to make clothing, making them indispensable to modern life.

For more than a century, however, the chemical industry has faced a costly obstacle. Its most effective catalysts rely on rare and expensive precious metals such as platinum and palladium, which are even more valuable than gold. In conventional industrial processes, these metals are used in the form of nanoparticles or clusters, leaving a large percent of the metal atoms buried inside the material and unable to take part in chemical reactions. As a result, most of the precious metal is wasted.

After decades of research, Zhang Tao, an academician of the Chinese Academy of Sciences, and his team proposed the concept of Single-Atom Catalysis in 2011. Instead of using groups of metal atoms, the approach spreads individual metal atoms across the surface of a supporting material, allowing each atom to act as an active site where chemical reactions take place.

Zhang Tao

This increases the use of precious metal atoms from only a few percent to nearly 100 percent.

The breakthrough was first demonstrated using platinum-group metals and has since been extended to more than 40 elements in the periodic table. In recognition of its fundamental contribution to catalysis research, the work received the first prize of the State Natural Science Award in Beijing on Wednesday.

"The defining feature of Single-Atom Catalysis is that it allows us to study catalytic reactions at the level of individual atoms rather than larger particles," said Zhang, who is also a professor at the Dalian Institute of Chemical Physics of the CAS.

"Through theoretical studies, we have explained why Single-Atom Catalysis remains stable and how they behave during chemical reactions," said Li Jun, a team member who is also a CAS academician and a professor at Tsinghua University.

"This has changed catalyst research from relying largely on trial and error to designing catalysts based on scientific understanding," Li added.

Zhang said the new understanding has broad applications and has sparked worldwide interest in turning the concept into practical technologies, ranging from pharmaceutical manufacturing to the production of fine chemicals. Thousands of research groups from nearly 100 countries and regions have published more than 20,000 academic papers on the subject.

"This is not merely an academic pursuit, but a strategic response to national needs," Zhang said. "Securing independent control over core catalyst technologies is vital for our energy security and chemical industry."

Behind the achievement lies a decades-long journey from theory to practical application.

When Zhang first proposed the concept in his doctoral dissertation in the 1980s, the technology needed to verify it did not exist.

"In the beginning, we had the idea but no way to observe it," Zhang said. "It felt as if an elephant stood right in front of you, yet in the pitch-black darkness, without a flashlight and with the path choked by weeds, it remained invisible."

The technical limitations of the time made the work that much harder. The domestically produced chromatograph used by the team was basic and plagued by severe signal fluctuations, while power outages were common.

"Often, just as you were about to collect the final data, the power would flicker, erasing an entire day's work," Zhang said. He often spent days in the laboratory, sleeping on a straw mat on the floor while waiting for the equipment to produce stable data.

Zhang said his determination was shaped in part by his early experiences in the mountains. Born in 1963 in Ankang, in the Qinba Mountains of Shaanxi province, he returned to his hometown to teach at a high school after graduation. Driven by a strong passion for scientific research, he later decided to pursue graduate studies.

"I taught during the day and prepared for my master's entrance examinations by lamplight at night, wrapped in a thick cotton-padded coat and felt boots to keep warm during the winter," he said. The experience taught him self-discipline, independence and perseverance, qualities that later helped him overcome repeated setbacks in research.

He also emphasized the importance of interdisciplinary collaboration. Zhang led the development and testing of the catalysts, connecting theoretical research with practical applications, while Li, a theoretical chemist, developed the scientific framework explaining why single atoms remain stable and how they drive chemical reactions.

"With advances in artificial intelligence and computer simulation, we are now using our understanding of these active sites to design and identify better catalysts more efficiently," Zhang said. "The combination of fundamental research and new technologies is expected to support the development of new energy and greener chemical manufacturing worldwide."

China seeks to attract more intl sci-tech institutions

BEIJING — In addition to hosting frontier research facilities and high-tech enterprises, Beijing is now turning its focus to attracting international science and technology organizations, doubling down on efforts to boost its scientific appeal.

The Chinese capital has recently started expanding its dedicated cluster of international sci-tech bodies, adding service stations, exhibition halls, meeting rooms and cross-border network workspaces to accommodate more institutions.

This expansion drive extends beyond Beijing. More international sci-tech organizations have established headquarters and core branches in China, from coastal economic powerhouses to inland western regions, spanning fields from digital Earth science to aerospace.

The Space Universities Administrative Committee of the International Astronautical Federation, with its headquarters in Paris, has established a permanent secretariat in Dalian, a port city in Liaoning province.

According to Yu Xiaozhou, committee chair and professor at Dalian University of Technology, China's appeal lies in its varied scenarios, massive data and long-term observation records of existing projects.

These are critical inputs for frontier basic research, and they are also "the main reason why the IAF values China so highly and is willing to pursue global cooperation with us," Yu said.

Complete industrial chains are another key attraction, according to Chen Kai, deputy director of the International Society of Sensing Technology.

Co-founded by institutions from 10 countries and regions, including the United Kingdom and Canada, the new society was established in May in Chengdu, Sichuan province. Chen said the city's strong research ecosystem and industrial foundation were decisive factors in its selection as the headquarters.

The concentration of sci-tech organizations in China not only promotes innovation in research and industries but also contributes to enhancing both the capacity and fairness of global science governance.

With rising concerns about fragmentation and rival blocs in international science, China-based groups are becoming "unbiased hubs" for cross-border cooperation, said Li Fei, an associate researcher at Zhejiang University.

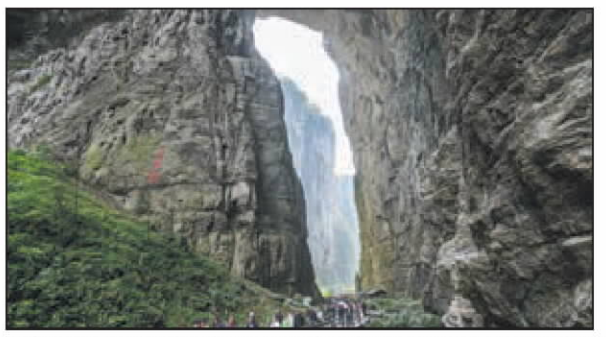
"Global science governance is shifting from a Western-dominated club model to a more inclusive partnership model," Li noted.

The global science program, "An Eco-Secured Community with a Shared Future for Mankind", is a typical example. Launched by Chinese scientists, it aims to mobilize global expertise to address pressing ecological challenges. At its Beijing office, Thato Mokhethi, from Lesotho, was sorting reports as a program participant.

"Beijing is a nice place where I can talk to other scientists and think about the future of humanity together," the young African scholar said. The group is responsive to countries keen on advancing the program, and she is willing to share her findings with researchers in her home country, she added.

The push on global science collaboration is underpinned by China's policies.

Since 2016, China has laid out plans to encourage international science organizations to set up within the country. Besides Beijing and Shanghai, provinces including Shandong and Hainan have rolled out their own incentives, and economic powerhouses like Guangdong and Jiangsu provinces have offered cash rewards for successful headquarters or branch offices.



Chinese provinces and cities are continuing efforts to enhance their global appeal. Beijing, for instance, recently announced that it would ease cross-border data flows, internet access and personnel entry for international sci-tech groups based in the city.

Karst landscape creates sustainable opportunities

Chongqing village seizes on World Heritage Site status for tourism bump

By **HOU LIQIANG** in Chongqing
houliqiang@chinadaily.com.cn

When Ran Yijie packed up his marketing degree and left his city job in 2021 to return to the rugged mountains of Chongqing, his neighbors thought he had lost his mind. He had successfully escaped the isolation of Jingzhu, a village once defined by severe rocky desertification, crushing poverty, and a mass exodus of its youth.

Today, nobody is questioning his sanity. Ran's family home is now a thriving local restaurant generating over 100,000 yuan ($14,000) annually, anchoring a massive reverse brain drain that is reshaping the economic landscape of Southwest China.

Driven by the strategic development of the nearby UNESCO Wulong Karst World Natural Heritage Site and the booming Fairy Mountain National Tourist Resort, Jingzhu has transformed from a dying hinterland into a magnet for young entrepreneurs and outside investors. In a crowning achievement, the United Nations World Tourism Organization has recognized it as one of the world's "Best Tourism Villages".

Wulong Karst, including the Three Natural Bridges, Furong Cave and the Houping Giant Doline, was inscribed on the UNESCO World Heritage List in 2007 as part of the South China Karst.

Karst landscapes are formed by limestone that has been eroded by dissolution, producing ridges, towers, fissures and sinkholes.

The economic numbers coming out of the region underscore a lucrative market centered around the rocks. In 2025, Wulong's scenic areas pulled in 52.1 million tourist visits, including nearly 800,000 international travelers, generating 25.1 billion yuan in total tourism revenue.

Jingzhu, with a population of 2,000 and located just six kilometers from the Fairy Mountain resort, has capitalized heavily on this influx.

Gao Yan, Party secretary of Jingzhu, said after Wulong's successful world heritage inscription and the opening of the Baotou-Maoming Expressway, villagers began developing high-altitude fruit picking and rural restaurants for tourists. After Fairy Mountain was upgraded into a national-level tourist resort in 2015, the village started to cultivate integrated enterprises covering leisure vacations, study tours, commerce and agriculture.

The timing, Gao said, allowed Jingzhu to leverage its proximity to the heritage site to expand its development.

In 2025, the village recorded over 1.5 million tourist visits, and tourism revenue of over 100 million yuan. Per capita disposable income among villagers has surpassed 27,000 yuan, a figure significantly higher than similar rural villages in Chongqing municipality.

Tourists visit the Three Natural Bridges scenic area in Wulong, Chongqing, in April. HE PENGLEI / CHINA NEWS SERVICE

"Local people have benefited from the heritage site," said Chen Zhang, head of the village's agriculture, culture and tourism development company. He said villagers' incomes have increased by more than 10 percent annually on average since the World Heritage Site was named.

Chen said fruit farmers no longer worry about sales. A grape grower once told him that revenue from the crop could reach about 600,000 yuan per hectare. At peak times, he said, as many as 350,000 long-stay visitors live in the nearby resort area for months, and many drive directly to the village to pick fruit.

"We do not really have to go out and sell," Chen said. "They come to us."

Thriving enterprises

Restaurateur Ran is among a number of young villagers who have found a way to share in that growth. With support from local authorities, he turned his family's idle house into a restaurant serving local cuisine. He said the local government covered the renovation costs as part of a homestay alliance policy, under which idle village houses are upgraded for business use and later returned to villagers, with the improvements left in place.

His mother, who began as a kitchen helper, prepares a local specialty soup, and his father has opened a small store beside the restaurant.

In recent years, nearly 200 people have either returned from outside or come to Jingzhu to develop new enterprises. They run homestays, grow fruit and operate restaurants, turning once-empty courtyards into bustling tourist hubs.

The village has 46 homestays and rural inns. Blueberries grown in the village can sell for 120 yuan per kilogram, while grapes and other high-altitude specialty fruits generate more than 150,000 yuan per hectare on average, according to village authorities.

The development has not come at the cost of abandoning ecological protection, with local officials saying Jingzhu maintains a forest coverage rate of about 75 percent, and a negative oxygen ion concentration of around 35,000 per cubic centimeter.

The village's approach, they said, is to keep the core heritage area under strict protection, allow appropriate use in buffer and surrounding areas, and help residents increase income through catering, homestays, fruit farming and other peripheral industries.

That approach reflects a broader model explored in Chongqing's Wulong district.

Liu Baodang, deputy secretary-general of the World Heritage Expert Committee of the National Forestry and Grassland Administration, said Wulong has put in place a three-layer protection and development system.

The core layer is strictly protected, the surrounding layer is developed through community participation, and the outer layer supports nature education, tourism, sports and cultural activities. "Protection and development no longer work against each other," Liu said.

In the core area, protection is enforced through legal and administrative mechanisms. Wulong established a world natural heritage prosecutors' office in 2024, integrating criminal, civil, administrative and public interest litigation functions related to environmental and resource protection.

Over the past three years, local authorities have handled more than 80 criminal cases related to environmental resources and more than 110 public interest litigation cases. More than 27 million yuan has been invested in heritage protection over the last five years. Construction projects are required to undergo planning and site checks before development.

Outdoor sporting competitions and activities have become another route for sustainable use. Fairy Mountain's scenic road is a core section of the China International Mountain Outdoor Sports Open, which has been running for more than two decades and has attracted competitors from over 70 countries, said Huang Wei, deputy head of Wulong's culture and tourism commission.

Wulong has 24 hiking routes spanning 774.64 km, he said. In 2024, its outdoor sports industry generated more than 1 billion yuan in revenue and received more than 10 million sports tourism visits, creating stable employment for more than 3,000 residents.

Chen Weihai, a researcher at the Institute of Karst Geology of the Chinese Academy of Geological Sciences, said Wulong Karst is of world-class quality. The three natural bridges within 1.5 km of the Three Natural Bridges form one of the world's largest beaded natural bridge groups, while the Houping Giant Doline cluster provides important evidence for studying karst development and regional geological change.

For Jingzhu village, however, the significance of the World Heritage Site is also visible in more ordinary scenes: A young man returning home to cook local dishes, families turning idle houses into businesses, fruit growers selling directly to visitors and old courtyards filling with people again.

The karst landscape neighboring Jingzhu brought tourists. Tourists brought business. Business helped bring young locals back.

"Without the World Natural Heritage Site, Jingzhu would not be what it is today," said Xie Yong, an official with the Fairy Mountain subdistrict government.

He said the village's "ecology plus culture and tourism" approach has become more than a development model. It is a path to rural vitalization built on the protection and sustainable use of natural heritage.

Life thrives on Mount Emei as conservation takes root

By **HOU LIQIANG** in Emei, Sichuan

Mount Emei has marked the 30th anniversary of its UNESCO World Heritage listing with a wave of biodiversity breakthroughs, successfully saving two critically endangered species once thought to be lost forever.

Through artificial breeding, precision tracking and a new smart monitoring network, local conservationists have successfully revived the *Parakmeria omeiensis* (a rare magnolia tree) and rediscovered the chevron-spotted brown frog — a "Lazarus taxon" that had vanished from scientific records for decades.

These breakthroughs are part of a broader ecological turnaround on the mountain. Over the last five years alone, local authorities have documented three animal species entirely new to science, alongside three newly recorded plant species and 16 newly recorded animal species.

The *Parakmeria omeiensis* is an evergreen tree endemic to Mount Emei and classified as a plant species with extremely small populations, said Yu Daoping, a researcher with the Sichuan Provincial Academy of Natural Resource Sciences.

The plant was first recorded by botanist Zheng Wanjun during fieldwork on Mount Emei in 1940 and was named in 1951 after its type locality, Yu said. It then disappeared from scientific observation for decades before researchers rediscovered one individual on a cliff in 1987. By 2012, only 74 wild individuals had been found, and the current wild population remains at just over 90 plants, Yu said.

In 2012, the species was included in China's conservation program for plant species with extremely small populations. It is also under first-class national protection and is listed as critically endangered by the International Union for Conservation of Nature.

Yu said the magnolia is valuable not only because of its rarity, but also because members of the magnolia family are considered ancient groups among angiosperms. The species offers important evidence for studies of the origin, development and evolution of flowering plants and is also a reference indicator for regional forest ecosystem quality.

After more than 30 years of work, researchers have mastered seed propagation, grafting and other artificial breeding techniques, overcoming difficulties in fruiting, germination and seedling growth under natural conditions, Yu said. To date, more than 3,200 seedlings have been cultivated, and over 800 plants have been reintroduced in eight operations at five sites on Mount Emei, with survival rates remaining above 90 percent in the wild.

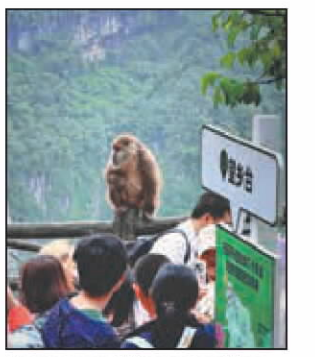
Another case is the chevron-spotted brown frog, or *Rana chevronta*, a critically endangered amphibian endemic to Mount Emei.

Liang Dong, an engineer at the ecological station of the Mount Emei forestry management office, said the frog has an extremely small population and a very narrow distribution range.

The species was first discovered in 1965 and named in 1978 by Hu Shuqin and Ye Changyuan, then researchers of the Chinese Academy of Sciences, Liang said. For decades afterward, no living individual was recorded. Relying on field notes left by earlier zoologists to identify the historical discovery site, researchers found three individuals in 2024.

Liang said the frog lives in coniferous and broadleaf mixed forests at an altitude of about 1,800 meters, and feeds on insects and small animals. The site where it was rediscovered was the same as the location where it was found in 1965, and the timing of the two discoveries was also close, he said.

Researchers from the Chengdu Institute of Biology of the Chinese Academy of Sciences, Chengdu Normal University, Sichuan University and local institutions have strengthened studies and protection of the species in recent years, Liang said. The next step is to explore artificial breeding to increase its population.



Habitat quality is crucial for the frog, he added. Monitoring work showed that the chemical oxygen demand level at one breeding site was only 5 to 8 milligrams per liter, indicating very clean water, according to Liang.

"Last year we tested the water at its breeding site, and the chemical oxygen demand level was only 5 to 8 milligrams per liter. What does that mean? It means even the drinking water from the tap at our homes might not be as clean as that water," he said.

To support such conservation work, monitoring capacity has also been strengthened. According to local conservation authorities, a biodiversity monitoring demonstration project has deployed 73 infrared cameras, including 22 smart devices capable of real-time data transmission. The grid-based network now covers 85 percent of the target area.

The system has collected 2,956 valid wildlife image records and identified 46 wildlife species, including one under first-class national protection, 16 under second-class national protection and five species on the IUCN Red List of Threatened Species.

It has also helped authorities crack one poaching case. The project team plans to complete the deployment of 100 infrared cameras by the end of September and further explore artificial intelligence image recognition after the rainy season.

A macaque sitting on a railing on Mount Emei is at the center of tourists' attention in July 2024. DU LIANYI / CHINA DAILY

Known for its rich ecological resources, Mount Emei is home to more than 3,700 higher plant varieties and over 2,300 wild animal species, according to local conservation authorities. The mountain also serves as the type locality — the exact place where the very first specimen of a new species was collected — for 253 plant and 157 animal species.

LIFE

Lead singer Li Wei (center), bassist Zheng Jun (top left), guitarist Zeng Huizhen (top right), keyboardist Zeng Qingli (above left), and drummer Liu Shuangqing rock the stage in a graduation concert at Hubei Engineering University in Xiaogan, Hubei province, blending heartfelt farewells with a punk-inspired performance. PHOTOS PROVIDED TO CHINA DAILY

Rocking out a goodbye to students

Five dorm matrons surprise graduates with unforgettable performance, **Chen Meiling** and **Liu Kun** in Wuhan report.

The lights suddenly went out, and the audience fell silent. The drummer raised her sticks, held them aloft for a split second, then brought them crashing down.

"Hey, you in West Zone Dorm 19! What are you still doing after lights out?" "Girls in Sanli Dorm! If you don't sweep up all that hair, I'll think I've wandered into the Spider Cave!"

More than 2,000 glow sticks swayed across the arena. Onstage stood five dormitory matrons — familiar faces students had seen almost every day for years. But this was a side of them no one had seen before.

At a recent graduation concert at Hubei Engineering University in Xiaogan, Hubei province, a rock band made up of five dormitory matrons brought the house down.

The lineup featured lead singer Li Wei, bassist Zheng Jun, keyboardist Zeng Qingli, drummer Liu Shuangqing, and guitarist Zeng Huizhen. Usually seen hurrying through dormitories in work uniforms, the five women took the stage in punk-inspired outfits.

Zheng had her hair braided into tiny plaits for the first time in her life. Zeng Huizhen, who usually oversees the men's dormitories and is known for her stern demeanor, wrapped a sun-protection face covering around her head to complete her edgy look.

Averaging 50 years old, the women performed an original song, *Go Shine*, written for the occasion, as a heartfelt farewell to the graduating class.

The contrast between their everyday jobs and rock-star personas, combined with humorous and touching lyrics peppered with local dialect, drew wave after wave of cheers. Videos of the performance quickly went viral online.

Singer Li, 46, is the youngest in the band. She got a wild perm especially for this performance.

"My palms were sweating from nerves before going on stage. I never get flustered when chatting with hundreds of students during dorm inspections, yet standing under the bright lights of the huge gymnasium stage made my legs go weak. We kept encouraging each other right before our performance," she says.

"But the moment we stepped onto the stage and heard the students cheering, with glow sticks lighting up the crowd, all my nerves disappeared. All I could see were the kids, smiling and full of excitement."

Li has worked as a dormitory matron for four years. Her days are spent keeping dormitory records, making nightly rounds, mending torn clothes, and lining up electric scooters outside the buildings. Thanks to her outgoing personality, students affectionately call her Sister Wei.

Her favorite lyrics read: "If you're wronged and have nowhere to turn, just buy a ticket and come back. ... A window in the dormitory building will always stay open for you."

"I want them to know they don't have to carry every burden alone," she adds.

Practice makes perfect

None of the five women had any real musical experience before joining the band.

"I can't even read sheet music, let alone play an instrument," says keyboardist Zeng Qingli, 49.

For a month, they rehearsed during work breaks in the dormitory duty room. With the curtains drawn and their instruments unplugged, they silently counted beats and practiced finger movements.

"We didn't want to make noise that might disturb students studying for exams or sleeping in the dorms," says Liu, the drummer.

The rock band's performance captivates students at the venue, and its videos draw more than 3 million views online.

She says the rehearsals were meant to remain a secret.

"But some students walking past the duty room late at night heard us humming and guessed we were preparing for a performance," Liu says.

"They even told us not to push ourselves too hard."

Without a drum kit at home, Liu lined up washbasins, rice bowls and pot lids in her kitchen, using chopsticks as drumsticks while following tutorial videos on her phone.

"My husband laughed at first, saying I'd turned the kitchen into a band rehearsal room," she says.

"Later, he sat with me every day, helping me keep time."

The idea for the performance began when the university's facilities and logistics department and the Communist Youth League Committee started planning a performance for the graduation concert. Graduates from the School of Literature, Journalism and Communication suggested writing a song dedicated to the dormitory matrons who had cared for them throughout their university years.

The concert's faculty adviser believed rock music best captured the energy and optimism of graduates about to begin a new chapter in life.

To create an original song, Ouyang Chengxiu and his students interviewed classmates and dormitory matrons, collecting stories that reflected everyday moments and the deep bonds between them.

The lyrics recall students pretending to be asleep when they heard the matrons' jangling keys, hiding laptops beneath blankets, tucking takeout into wardrobes, or climbing over campus walls late at night with excuses about buying medicine.

The song went through more than 10 revisions before it was finalized.

"Our concept was built around contrast and resonance," Ouyang says. "We wanted to break the stereotype that dormitory matrons are simply there to check rooms."

The five performers were selected from across the university. After speaking with them, Ouyang's team realized how many moving stories they had.

No matter how late students returned, the matrons always left a door open for them. Years after graduation, many former students still send local specialties from their hometowns or greetings during festivals. "We wove those genuine moments into the lyrics," Ouyang says.

Memories and wishes

The four-minute performance quickly went viral, drawing more than 3 million views on Sina Weibo. Many viewers say it brought back memories of their university days.

"I don't know them personally at all, but I'm in tears," one netizen writes.

Lei Wenjia, an English major who attended the concert, says she was stunned when the dormitory matrons walked onstage with their punk-inspired performance.

"The atmosphere was electric from start to finish. It made this graduation concert a truly unforgettable experience," she says.

For Lei, the song was filled with memories, heartfelt reminders and warm wishes. "I'll carry all of them with me as I begin the next chapter of my life," she says.

To Lei, the matrons were more than dorm supervisors. They reminded students to close their windows before it rained and to pack warm clothes when temperatures dropped, comforted them when they were upset, and shared their happiest moments.

Cao Yixi, who graduated with a degree in primary education, describes the matrons as dependable guardians who were always there whenever students ran into trouble.

"They could solve almost anything," she says. "Once I dropped something into a drain, and my dormitory matron lent me a long pair of tongs to retrieve it. It felt like there was nothing she couldn't do, and we could always turn to her for help."

Two days after the June 14 concert, at the university's graduation ceremony, Zeng Qingli fought back tears as she addressed the graduating class.

"There won't be any aunties reminding you to turn off the lights at night anymore. But I hope you'll always keep a light burning in your hearts and remember to take good care of yourselves," she says.

Zeng Qingli's duty room is like a treasure chest for over 3,400 students: sewing kits, bike pumps, screwdrivers, first-aid kits, and umbrellas. It stocks all kinds of daily supplies students might need. A well-worn registration book bears dense records of key and item borrowings. On average, at least five or six students come to her every day, and she always greets them with a smile.

"It feels like only yesterday that I watched them move into the dormitories," she says. "And now, it's time to say goodbye."

The five women shared one final message with the graduates: "Go after your dreams with courage and let your light shine. If you ever feel worn out, you're always welcome to come back. Don't compare yourself with others, no matter how your life turns out. Peace, smooth days and happiness matter most.

"Stay in touch with your family and your alma mater. When you have time, come back to Xiaogan and Hubei Engineering University. The corridors will still feel familiar, and we'll still be here. Just call out to us when you return, and we'll greet you with a smile and ask, 'Have you eaten yet?'"

The challenges and triumphs of rescuing stranded whales

HAIKOU — "A whale is stranded in the shallows and in critical condition!" This distress call had barely come through when Li Haiqin, 49, grabbed his life jacket and first-aid kit and rushed to the scene.

It may have been just another day for the head of a cetacean rescue team in Sanya, South China's Hainan province, but this mission exemplified his 14-year commitment to saving stranded whales and dolphins.

After founding the rescue team in 2012, Li has participated in more than 40 whale and dolphin rescue operations. In his eyes, every lost whale or dolphin deserves every possible effort to help it find its way back home.

With the skill of an experienced rescuer, he coordinates on-site rescue operations in an orderly fashion, directing fellow rescuers to use wet towels to prevent whales or dolphins from drying out. At the same time, he gently comforts the animals and spares no effort in their recovery.

A rough-toothed dolphin named "Yangyang" was found stranded in the shallow waters of Yalong Bay, Sanya, on April 24, 2025.

Lying on its side and showing signs of extreme weakness, the dolphin had its blowhole blocked by mud and sand at the time of discovery.

Upon receiving the alert, Li rushed to the scene and coordinated rescue efforts with the coastal police and local fishermen. Thanks to their joint efforts, "Yangyang" was successfully returned to the sea.

In Li's view, there is no easy path to saving a life. Every successful rescue is earned through perseverance, hard work and an unyielding commitment that never wavers.

On Jan 3, 2024, a short-finned pilot whale named "Haitang" was found stranded in Haitang Bay in Sanya, with severe shark-inflicted wounds and in critical condition.

Li promptly organized a team to transfer the animal to a shore-based rescue site, where treatment was provided with assistance from scientific experts, coast guard personnel and firefighters. Following 145 days of treatment and monitoring, "Haitang" recovered and was returned to nature.

Cetaceans, as flagship species of marine ecosystems, serve as a critical barometer of ocean health. Stranding-related deaths, caused by disease or disorientation, have become an intractable problem worldwide.

In China, more than 100 such incidents occur each year, and rescue efforts are often met with daunting challenges.

Li Haiqin (second from left) participates in a rescue effort for a short-finned pilot whale in Sanya, South China's Hainan province, in 2024. XINHUA

Over the years, Li has endured countless cuts and bruises of all sizes while navigating tidal flats and submerged reefs. Some of his wounds festered for as long as two months.

Li now envisions a conservation approach that goes beyond emergency response, evolving into an integrated model encompassing rescue operations, public science education and skills training.

"Rescuing stranded whales and dolphins is extremely challenging, and the success rate remains low. But as long as there is even a glimmer of hope, we will never give up," the rescuer says.

LIFE

Performers share their journeys into an art that once lacked a community, and how they gave the genre a distinct identity, which in turn provided them with hope, **Chen Nan** reports.

Street dance moves into the mainstream

What do hip-hop dance moves and kung fu have in common? More than many people may think. Both demand rigorous training, reward improvisation, and celebrate physical mastery. These common threads will take to the stage on July 24 at New York City's Lincoln Center, where Chinese performers will blend the two art forms during Chinese Arts Week, part of the Lincoln Center's Summer for the City program.

Chinese dancers will weave together breaking, popping and martial arts, offering audiences more than a display of technical virtuosity. For the artists behind the production, the performance is intended as a statement about how Chinese street dance has evolved from an imported youth culture into a distinctly Chinese artistic language.

"We hope to present a more multidimensional, open and confident image of Chinese street dance," says Xia Rui, one of the performance's principal organizers. "Chinese street dance is not simply a copy of Western street culture, nor is it just youth entertainment centered on technical display. After years of development, it has become a contemporary artistic language through which young Chinese people express themselves, engage with tradition, and connect with the world."

In addition to the July 24 show, the Chinese street dance delegation will begin its US tour with a performance at the festival's opening reception in New York on July 23 and then travel to Philadelphia for a public performance on July 25. The tour concludes on July 26 with a youth street dance cultural exchange in New York, followed by creative workshops and a series of flash mob performances in the city.

As a major promoter of the dance genre in China, Xia is the deputy director of the China Hip-Hop Union Committee, founded by the China Dancers Association in 2013.

For Xia, presenting the showcase at the Lincoln Center carries symbolic weight.

"We want audiences to see that Chinese street dance is youthful, vibrant and creative. It is rooted in Chinese culture and Eastern aesthetics and is capable of engaging in equal dialogue with other cultures," he notes.

That confidence did not emerge overnight.

When 38-year-old dancer Chen Jie — better known in the dance battle scene as A K — first discovered street dance, China barely had a community for it.

His performance at the Lincoln Center will expand on an earlier television work into a new work, a reimagining of Sun Wukong, or the Monkey King, combining hip-hop and breaking with projections, shadow imagery and music built around traditional Chinese musical instruments such as the *pipa* (a four-stringed lute), *suona* (a double-reed woodwind instrument) and *guzheng* (Chinese zither).

"American audiences have Marvel superheroes," he says. "China has its own hero — Sun Wukong."

The legendary Monkey King from the classic novel *Journey to the West* overcomes repeated setbacks through determination, a quality that resonates with Chen.

"My own story is very similar," he says. "I've encountered many obstacles, but I've kept moving toward my goal."

As a primary school student, he saw what a television program simply described as "popular dance". Soon after, he learned from his classmates who practiced something called street dance.

"I went to watch," recalls Chen, who was born and raised in Zhanjiang, Guangdong province. "I thought it looked incredibly cool. I fell in love immediately."

Learning was far more difficult than it is today. There were no online tutorials or social media clips to imitate. His older brother introduced him to Michael Jackson performances on DVDs, and Chen replayed them endlessly, studying the iconic moonwalk and every movement and musical accent.

His family struggled to understand his obsession.

"They didn't know what I was doing," Chen says. "Only after I won a competition in Guangzhou (Guangdong) did they stop criticizing."

Years of persistence followed before the trophies arrived. He trained first as a breaker before discovering hip-hop, whose groove, rhythm and musicality felt more natural.

"When I found hip-hop, I knew immediately it was the dance genre I'd been searching for," he says.

Today, Chen, who has gained a large fan base after appearing on hit reality shows such as *Street Dance of China*, sees street dance as carrying responsibilities that extend beyond competitions.

"I want young people to see hope. Street dancers are not troublemakers dancing on street corners. If we do this well, we can give others strength," he says.

He has spent years teaching children, including students in remote mountain communities, traveling for hours by bus to conduct workshops.

"I was a quiet child myself," he says. "Dance made me confident. Seeing that happen for other children is one of the happiest things I've experienced."

China's street dance landscape has changed dramatically during his career.

"People, from 4-year-olds to 60-year-olds, are learning street dance," Chen says. "That wasn't imaginable before."

For the youngest performers, however, Chinese street dance has always been more than imitation.

Wu Mingrui, a 16-year-old popper, first danced in kindergarten after a teacher demonstrated a few simple moves.

"I learned them very quickly," she says. "I was always chosen to lead the performances. My mother realized I had talent."

She began studying popping at age 7. A video of a young South Korean female popper convinced her that the style's explosive power was not limited to men. "I realized girls have strength too," she says.

She remembers hearing doubts that popping demanded physical abilities girls simply did not possess.

"People thought girls would always struggle physically compared with boys," she says. "That only made me want to prove them wrong."

She trained relentlessly, often spending 12 hours every weekend in the studio.

At 9, she won her first competition while competing against adults.

"I never expected to win. When the judges raised my hand, I burst into tears. That moment made me believe maybe I really could do this," she recalls.

Her understanding of dance has changed with experience.

"I used to think of myself as an athlete," she says. "Now I think street dance is really about expression. Dance doesn't have one standard like sports. It's how you communicate your emotions."

She hopes audiences also see something else.

"I want people who watch me dance to feel that women are powerful," she says. "Girls can dance just as well as boys."

At the Lincoln Center, Wu will perform *Daomadan*, a work that combines street dance with Chinese opera traditions and martial arts, disciplines she has studied formally in preparation for the performance.

Daomadan translates to "knife-and-horse female role". *Daomadan* is a role type in traditional Chinese Opera, featuring a female warrior who combines martial arts, dance, acrobatics, and singing.

"Street dance wasn't originally connected with martial arts," she says. "Creating something new from both traditions is exciting. It's a way to share Chinese culture."

That approach also reflects Xia's broader philosophy.

"The point is not to insert traditional elements into street dance," he says. "The challenge is allowing traditional culture to become the inner character of the work."

He argues that successful cross-cultural performance does not depend on audiences recognizing every cultural reference.

"Even if people don't understand a different culture," Xia says. "They should still feel its spiritual strength, its physical rhythm and its aesthetic character.

"Street dance has explosive energy, kung fu has inner power. Street dance values freestyle expression, while Chinese culture offers deep spiritual roots. When those qualities truly come together, it isn't simply a fusion — it becomes a new contemporary Chinese expression."

For Xia, China's street dance ecosystem has been built over the years through national organizations, competitions, education, and artist development.

International appearances, he believes, should become part of an ongoing cycle rather than isolated events.

Ultimately, he hopes Chinese street dance will move beyond occasional overseas performances toward sustained artistic partnerships.

"The most important thing is not for the world to know that China also has street dance," Xia says. "It is for the world to understand that Chinese street dance is making its own cultural contribution."

Turkiye, Sri Lanka host cultural exchange events with Chinese cities

ISTANBUL/COLOMBO — The cultural exchange event "Encounter and Enlighten" recently opened in Istanbul, Turkiye, highlighting exchanges with Nanjing, Jiangsu province, as well as in Colombo, Sri Lanka, where exchanges between the city and Ningbo, Zhejiang province, were featured. The series of events highlights intercity dialogues on topics including mutual learning among civilizations and urban development.

The events were attended by representatives from governments, academia and cultural institutions.

In a video message addressing the Nanjing-Istanbul Urban Civilization Dialogue held on July 2, Frederique Aubert, head of the culture unit at the UNESCO Regional Bureau for Science and Culture in Europe, which is based in Venice, noted that both Nanjing and Istanbul possess rich cultural heritage and that their heritage conservation practices can serve as models for the preservation and sustainable development of historic cities worldwide.

The event arrived in Colombo, featuring a themed dialogue with China's city of Ningbo, Zhejiang province. **Left:** Experts lead a discussion during the Nanjing-Istanbul Urban Civilization Dialogue held in Istanbul, Turkiye, on July 2. PHOTOS BY XINHUA

Huriye Merve Gedik, head of the City History, Promotion and Tourism Department of the Istanbul Metropolitan Municipality, said that Istanbul and Nanjing are both historic cities that have flourished along waterways and prospered through the accumulation of civilization.

The dialogue facilitates the two cities in deepening mutual understanding and creates opportunities for practical cooperation, such as preserving ancient city walls and utilizing cultural heritage, Gedik said.

Also on that day, renowned writers, poets and Sinologists from China and Turkiye held in-depth discussions on literary creation and cross-cultural communication in the AI age, and announced a two-way resident-poet project.

In Sri Lanka's capital, Colombo, the event held on July 4 focused on cultural construction amid the development of port cities.

At a themed dialogue with the eastern Chinese city of Ningbo, Mayor of Colombo Vraie Cally Balthazaar told journalists that both port cities are undergoing tremendous transformation and that Colombo looks forward to learning from Ningbo in city planning and the integration of culture and tourism.

At a session devoted to sharing stories of life, culture and connection associated with the two cities, Yasiru Ranaraja, founding director of the Belt and Road Initiative Sri Lanka, recounted the historical visits by ancient Chinese Buddhist monk Faxian and navigator Zheng He to Sri Lanka, highlighting the port city's important role in Sri Lanka-China exchanges since ancient times.

Organizers of the "Encounter and Enlighten" cultural exchange events in Turkiye and Sri Lanka included China's State Council Information Office, Chinese diplomatic missions in the respective countries, and the Chinese city-level governments involved.

Willow craft branches out

A centuries-old weaving tradition fuels rural livelihoods, exports and sustainable design through constant creativity and skilled craftsmanship, **Zhao Ruixue** reports.

In the quiet town of Caozhuang in Linshu county, Shandong province, villagers are busy in mid-June weaving willow products ordered months earlier by overseas buyers. Among the most popular items is a hand-woven sleigh lined with soft velvet, designed as a Christmas decoration.

"Customers visit months in advance to place orders. These festive willow crafts add warmth to homes and capture the spirit of Christmas," says Zhang Zhiquan, general manager of Linyi Olvy Agricultural Comprehensive Development Co Ltd.

Beyond sleighs, Christmas tree skirts, storage baskets and delicate willow deer ornaments have also become seasonal best-sellers.

Walking into the Olvy garden in the town, visitors are instantly immersed in a handcrafted paradise filled with diverse ingenious crafts woven from willow branches, wood and ropes.

At the garden entrance, a simple fence made of interlaced willow twigs and small wooden stakes showcases the primitive power of nature.

Every corner of the garden features handmade willow creations, including delicate tables, chairs and pavilions. Rows of functional and decorative willow works range from storage boxes, woven baskets and framed mirrors to delicate small ornaments.

"We love willow products because so many things today are machine-made. Handmade baskets bring warmth to a home," says Carlos Rocher Arnal, a buyer from Spain shopping for Christmas gifts.

He is looking for baskets to fill with wine, chocolates, and other presents for teachers, doctors, lawyers, friends, and family — a long-standing Christmas tradition in his country.

"I'm looking for items with handles, or some small containers to put two or three bottles and some chocolates," he adds.

Top: Villagers prune willow trees on June 10 in Linshu county, Shandong province. **Middle left:** A villager lays freshly woven willow products out to dry in Linshu on June 10. **Middle right:** Locally made wicker products are displayed at the Olvy garden in Linshu. **Above:** Zhao Qingyue, a county-level inheritor of Linshu willow weaving, demonstrates the traditional craft in Linshu county. PHOTOS BY LIANG BEN / FOR CHINA DAILY

Willow weaving in Linshu dates back to the Sui (581-618) and Tang (618-907) dynasties, according to historical records. The craft flourished during the Song (960-1279) and Yuan (1271-1368) dynasties before reaching maturity in the Ming (1368-1644) and Qing (1644-1911) dynasties.

Over centuries, artisans developed techniques including flat weaving, pattern weaving, block weaving and edge wrapping. Today, the craft is mainly practiced in Henan, Shandong, Hebei and Anhui provinces.

Linshu willow weaving was added to China's national intangible cultural heritage list in 2021.

With practiced hands, Zhao Qingyue, 68, a county-level inheritor of the craft, bends, loops and folds flexible willow branches into intricate woven patterns.

"In Caozhuang, weaving willow is as common as farming. Almost everyone here knows the craft," Zhao says.

Historical records show that villagers were already weaving baskets, grain containers and winnowing pans during the Tang Dynasty.

What began as a practical rural craft has grown into one of Linshu's pillar industries. Today, local producers make dozens of categories of products, from baskets and furniture to garden decor.

Willow products from Linshu are exported to more than 80 countries and regions, accounting for more than a quarter of China's total willow product exports, according to statistics provided by the county government.

The industry generated 950 million yuan ($139.8 million) in output in the first four months of this year, a year-on-year increase of 16.58 percent. Exports during the same period reached 268 million yuan, up 9.38 percent from the previous year, according to the latest figures.

Nearly 100,000 residents in Linshu county are engaged in the willow weaving industry.

"Weaving willow lets me turn my passion into a career. That makes my work deeply rewarding," says Zhao.

While inheriting tradition, local practitioners keep innovating to inject vitality into the ancient craft.

"Traditional craftsmanship shouldn't be confined to old designs," says Zhang, who has learned willow weaving since childhood. He combines willow with iron, wood, rattan and straw, blending traditional techniques with contemporary aesthetics to expand the product range.

His company has developed more than 20,000 designs and color options of willow products, with over 90 percent exported to markets including the United States, Spain and Japan.

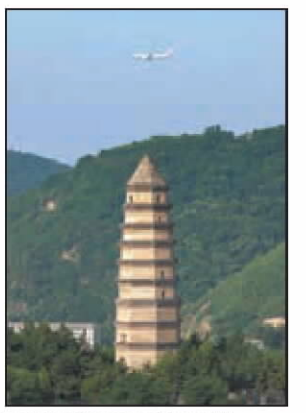
"Today, handmade willow crafts are used in homes around the world, bringing natural texture and warmth to gardens, living rooms and studies," Zhang says.

One of the company's enduring bestsellers is a fan-shaped firewood basket woven from unpeeled and white willow.

"This product is highly versatile. It works equally well for storing firewood by the fireplace, organizing garden tools or displaying fruit and flowers, which explains its lasting appeal," he says.

The company is also developing a woven willow or rattan sleeve that fits around a metal ice bucket, combining practicality with natural style.

"We believe it will become another popular product," Zhang says.



He is equally optimistic about China's domestic market. "Willow weaving reflects a natural, low-carbon and environmentally friendly lifestyle, which increasingly resonates with consumers," he says.

Cao Jiayue contributed to this story.

Historic heartland cultivates greener future

Left: Tourists join a traditional village feast in Shenshan village, Maoping town, Jinggangshan city, Jiangxi province, on July 4. ZHOU MI / XINHUA **Right:** Air China Flight CA1279 flies over Pagoda Hill in Yan'an, Shaanxi province, on June 24. Air China has launched "red tourism" routes from Beijing to historic revolutionary destinations including Jinggangshan, Zunyi and Yan'an. CHEN XIAO / XINHUA

NANCHANG — Deep in the forested mountains of Pulong village in Jinggangshan, East China's Jiangxi province, Li Yunyan tends more than 90 beehives. What began as a modest sideline has grown into a reliable livelihood.

The 46-year-old, who has limited mobility, has relied on beekeeping for years. But with only a few dozen hives and little access to markets, expanding the business once seemed out of reach.

"In the past, I had only 30 to 40 beehives and had to carry honey out for sale," Li says. "The mountain roads were difficult, and even high-quality honey could not always fetch a good price."

That changed when local Party organizations helped connect villagers directly with businesses. Beekeepers received technical training, expanded their colonies and gained access to stable procurement channels.

Now, enterprises collect Li's honey directly from his doorstep, eliminating the burden of transporting it. For residents unable to undertake physically demanding work, beekeeping and other eco-friendly industries have become dependable sources of income.

Li's story reflects a broader transformation in Jinggangshan, long celebrated as the cradle of the Chinese revolution and now emerging as a model of green development.

Among old revolutionary bases across the country, Jinggangshan carries special historical significance. In 1927, Chairman Mao Zedong led a fledgling group of Chinese revolutionaries deep into the mountains around Jinggangshan, where they established the first rural revolutionary base of the Communist Party of China.

Ninety years later, Jinggangshan reached another milestone: in 2017, it became the first region in China to be removed from the national list of impoverished counties — three years before the country achieved its nationwide poverty alleviation goal in 2020.

Transformation has continued at the village level as rural vitalization is pushed forward under the leadership of the CPC, which marked its 105th founding anniversary with a gathering on July 1.

The strategy has focused on objectives such as ensuring rural areas are equipped with modern living conditions and narrowing the urban-rural divide.

Shenshan village offers a vivid example. Located near Jinggangshan's main scenic area, the village has developed cultural tourism by designing themed travel routes, improving hospitality services and establishing a tourism association to standardize operations.

Peng Xiaying, the village's first farm-stay owner, initially worried about the financial risks. But with encouragement from local officials and paired-up support, she took the leap and her business is thriving amid booming tourism in Jinggangshan.

"I get dividends from the sales of yellow peaches and local tea, and I run a farm-stay business and a homestay. That brings me over 90,000 yuan ($13,000) a year," she says.

Per capita annual income in Shenshan reached 36,000 yuan last year. Once a fading mountain settlement with fewer than 30 permanent residents, the village is now home to around 180 people and has become a popular rural tourism destination.

Inspired by the success of neighbors like Peng, Huang Jinlong returned home after years of working elsewhere and converted his old farmhouse into a boutique homestay.

"Even before the summer holiday started, all 10 rooms were fully booked," Huang says. "Two busy months here bring in more income than a year of working away from home."

Building on its rich revolutionary heritage, Shenshan village has woven together its revolutionary landmarks, tea gardens, and Hakka-style homes into a vibrant tapestry of rural tourism — offering immersive Red-themed study tours and authentic cultural experiences that bring history to life.

The village now receives more than 300,000 visitors a year, up from 98,000 in 2016.

To sustain growth, Shenshan set up a tourism company and brought in a professional team to develop wellness retreats and study tour offerings. These experts introduced fresh ideas and skills — including livestreaming sessions right from the tea gardens — opening up new markets for local produce.

Zhang Ying, an official with the company, says the livestreaming initiative is expected to generate an additional 200,000 yuan in annual income for the village. "We're very optimistic about the future," he adds.

Jinggangshan's signature produce also includes bamboo shoots and camellia oil. In 2025, sales of these products reached 1.4 billion yuan, with some shipments making their way to markets in Europe and North America.

Tourists exploring Jinggangshan's revolutionary heritage and mountain scenery often purchase local delicacies as souvenirs. Recognizing the opportunity, Peng began making Hakka rice cakes last year, adding another source of income to her growing business.

For villagers whose lives once revolved around cutting bamboo on the mountain slopes and tending to rice paddies down in the fields, the lush mountains and clear waters have not changed, but their value has been transformed beyond recognition.

"We never imagined life could become like this," Peng says.

2026 WORLD CUP

Three Lions repel Viking horde with Bellingham brace

Haaland held goalless as England claims extra-time win over Norway

England's Jude Bellingham celebrates scoring his side's equalizing goal in its 2-1 World Cup quarterfinal win over Norway in Miami Gardens, Florida, on Saturday. AP

Jude Bellingham locked arms with teammate Harry Kane as England fans belted out their rendition of the Beatles' classic *Hey Jude*.

Bellingham had certainly earned the serenade. He scored twice on Saturday — an equalizer in the first half and the go-ahead goal in the third minute of extra time — to give England a 2-1 win that lifted it past Norway and into the World Cup semifinals for the first time since 2018.

The Real Madrid star has now matched Kane with six goals in this tournament, two behind France's Kylian Mbappe and Argentina's Lionel Messi, and one shy of Norway's Erling Haaland, who was held scoreless by England. Bellingham also scored twice in the round of 16 when England beat co-host Mexico.

England, winner of the 1966 World Cup and facing pressure to return to the title match, is now one win away from getting there. The Three Lions will face Argentina in the semifinals.

"The game is split into loads of different facets. Some of it is technical, tactical," Bellingham said. "For me, the biggest one is psychological and how you can manage setbacks, how you can manage adversity. This team showed, yet again, that they can do it, and that's a really valuable skill and trait to have."

Not everyone was thrilled with England's performance, though.

"We made life very, very difficult for ourselves today," coach Thomas Tuchel said in a contentious interview with Fox Sports.

"The result is fantastic. We're in the last four. It's amazing, but not happy with the performance ... in every sense."

Tuchel clarified in his news conference that he was "proud and happy" with how his squad has overcome adversity, but added, "I'm also a football coach, and I also have demands.

"I think we can play faster. I think we can play more clinically."

Bellingham seemed to disagree with his coach's critique after England prevailed in the heat and humidity of South Florida, with temperatures reaching 33 C at the start of warmups.

"Well, whatever," Bellingham said, shaking his head. "It's difficult out there. It's a tough shift.

"My thoughts and appreciation go to the players out there who put in a great shift."

Andreas Schjelderup scored in the 36th minute for Norway, a team that reached its first quarterfinals and took the internet by storm with its "Viking row" and the charisma of Haaland, their fearsome 6-foot-5 striker.

Haaland, however, failed to score for the first time in 15 competitive games for his country.

The Manchester City striker had scored seven times in his four games at the World Cup, carrying Norway to the quarterfinals in their first appearance at the global showpiece for 28 years.

That run included eliminating Brazil in the last 16, as Haaland struck twice to knock out the five-time winner.

This time, though, he ended the match sitting dejectedly on the bench, after he was subbed out for Jorgen Strand Larsen in the second half of extra time.

"It was not a tough decision to take him out," Norway coach Stale Solbakken said.

"He was finished. Maybe I should have taken him out 10 minutes before. He also got a dead leg in the second half, so that, combined with the fatigue, he did everything he could."

Norway nearly went ahead 2-1 in the 56th minute when Torbjorn Heggem put a rebound past goalkeeper Jordan Pickford after a corner kick.

Following a video review, the goal was disallowed because of a foul by Haaland in the box. Haaland was also denied by Pickford on a point-blank header in the first half.

Schjelderup, making just his second start of the tournament, fired a shot that caromed off the right post and into the net to stun an England team that had dominated possession to that point. Bellingham's equalizer from close range elicited a huge roar from the crowd.

'Amazing generation'

Haaland said Norway's World Cup performances had inspired a new generation, despite the disappointment of its quarterfinal loss.

"How we put Norway on the map is maybe one thing that touches me the most," said Haaland.

"Hopefully now, we can establish something when it comes to Euros, World Cups and everything, because our generation is amazing, and, also, all this gives motivation to young people back in Norway that it's possible to play on the world's biggest stage in a Norwegian shirt."

Haaland's brand as a global superstar has soared in recent weeks, with waves of new American fans taking to his affable off-field personality, as well as his goalscoring prowess.

He is hoping Norway can build on its success in the United States to become a powerhouse in the coming years.

"It's kind of difficult to take in this kind of a show, or the roller coaster that we've been on now for the last six weeks," added the 25-year-old.

"I think this changes Norway, I think it changes me. I've said it many times, we're building something in Norway.

"It's about maintaining this, because, again, we've shown that it's possible to be one of the biggest football nations in the world."

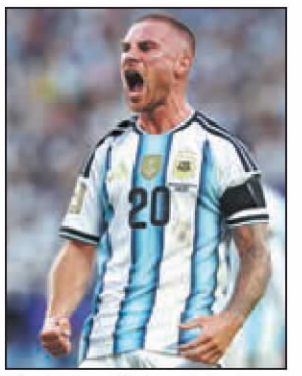
'Suffering' Argentina eventually gets the better of 10-man Switzerland

KANSAS CITY, Missouri — Late goals from Julian Alvarez and Lautaro Martinez deep into extra time gave Argentina a dramatic quarterfinal win over 10-man Switzerland on Saturday, setting up a heavyweight last-four clash with England in Atlanta on Wednesday.

Lionel Messi's Argentina side kept alive its bid to become the first team to retain the World Cup since Brazil in 1962 with a 3-1 victory that sparked pandemonium among its sea of supporters and ended Switzerland's fairy tale run.



The Swiss had reached the World Cup quarterfinals for the first time since 1954, but fell a match short of an unprecedented semifinal appearance.

The match looked headed for a shootout, before Alvarez whipped a gorgeous long-range shot into the top corner in the 112th minute that Gregor Kobel, at full-stretch, had no chance of saving.

Martinez added a third for the defending champion nine minutes later, when he calmly slotted home the rebound of Thiago Almada's shot.

Alexis Mac Allister had given Argentina the lead in the 10th minute, meeting Messi's corner at the front post with a flicked header that sailed beyond Kobel and into the far corner.

After a largely uneventful first half, the contest burst into life in the second, as Switzerland repeatedly tested Emiliano Martinez, forcing the Argentina goalkeeper into a string of sharp saves.

Alexis Mac Allister celebrates scoring Argentina's first goal against Switzerland in their World Cup quarterfinal. AFP

As the Swiss piled on the pressure, they were rewarded in the 67th minute, when Dan Ndoye slid a right-footed finish through Martinez's legs.

But, in the 72nd, the Swiss were reduced to 10 men when Breel Embolo got a second yellow card for simulation. It came after a lengthy VAR review for mistaken identity, with the referee overturning his initial decision to caution Argentina's Leandro Paredes. Embolo was inconsolable as he left the pitch.

Argentina responded by pinning Switzerland back for long periods, cheered on by fans who made Arrowhead Stadium feel more like La Bombonera.

Switzerland weathered wave after wave of pressure, but its resistance was finally broken in the closing moments of extra time.

Argentina coach Lionel Scaloni said the late nature of the victory was further proof that his team have grown comfortable operating in challenging situations.

"We knew that we were going to suffer, and this is part of our blood, this is part of our DNA, and this brings peace of mind," he said.

"We know what it feels like to be dominated by the opponent, to concede an equalizer, so, today, we kept our composure. The team knew how to remain calm and, of course, we will never give up.

"To reach a semifinal, you need to suffer. You need to go through it."

Swiss coach Murat Yakin, however, was left seething.

"We were punished because of a rule that, in my opinion, is completely unacceptable," he said.

"It's very painful that we were eliminated that way. I don't think we deserve that today, and, in my opinion, my boys are the real heroes; they put all their heart and their passion into their performance. I am very proud. They are very proud."

Even Scaloni acknowledged that "luck was on our side because one of their players was sent off".

Yakin, though, wasn't done with his criticism of Portuguese referee Joao Pinheiro: "The referee made the wrong decision. It was, in my opinion, a harmless foul, if it even was a foul. I know they will protect their referee, but this rule destroyed our game today."

Noskova wins first Grand Slam after dishing herself up a bathroom pep talk

LONDON — Linda Noskova placed fingers in both of her ears to drown out the noise from the Centre Court crowd.

She draped one of Wimbledon's strawberry-red towels over her head.

And, eventually — after she had wasted five match points and a 5-2 lead, and conceded the second set of a drama-filled final — she left the court completely for a bathroom break.

During Noskova's brief time off the court, two shiny objects caught her attention: the Venus Rosewater Dish that is awarded to the women's champion and the smaller dish for the runner-up.

"I was like, 'I'm not going to take the small one. I'm taking the big one. I have been so close. This will probably be the heartbreak of my life,'" Noskova said. "'I'm going to leave my soul on court in the third set, whatever it takes.'"

The 21-year-old Noskova did just as she promised herself, overcoming her second-set meltdown to beat Karolina Muchova 6-2, 5-7, 6-3 in an all-Czech final for her first Grand Slam trophy on Saturday.

When Noskova finally finished it off with a service winner on her sixth match point — and first of the third set — she covered her face and dropped down to the grass on her back.

Minutes later, Noskova was being awarded the Venus Rosewater Dish by Catherine, the Princess of Wales.

"It's never easy to get the last point," Noskova said during her victory speech. "Karo, you really made me work for it."

Noskova became the third Czech woman in four years to win the grass-court major, after Marketa Vondrousova in 2023 and Barbora Krejcikova in 2024.

Muchova and Noskova played doubles together at the 2024 Paris Olympics and finished fourth.

"I am so glad that I could play my first Grand Slam final with you," Noskova told Muchova during her speech. "We made history today. All our Czech fans at home are proud of us, no matter the result. It was a good day for both of us."

Petra Kvitova, who won Wimbledon in 2011 and 2014, was in attendance, as was the greatest Czech-born player of them all, Martina Navratilova — who won a record nine singles titles at the All England Club and was seated next to the Princess of Wales in the Royal Box — and Jan Kodes, the 1973 men's champion.

Linda Noskova of Czech Republic poses with the Venus Rosewater Dish after beating compatriot Karolina Muchova in the Wimbledon women's singles final on Saturday. AP

Kipling's poem

An excerpt of the poem "If" by Rudyard Kipling that was placed above the players' entrance to Centre Court more than a century ago summarizes the challenges Noskova had to overcome.

"If you can meet with triumph and disaster," the excerpt reads. "And treat those two imposters just the same."

It's not the first time that Noskova has had to overcome adversity at Wimbledon.

Her mother died just before she played the tournament two years ago.

"I definitely would not be standing here without her, so thank you," Noskova said in a dedication to her mother during her speech, blowing a kiss skyward.

Navratilova wiped away tears listening to Noskova's tribute.

Moments earlier, Muchova began her runner-up speech by calling Noskova "my ex-friend".

"I'm kidding, obviously," Muchova quickly added.

"You're so young and this was your first final of a Grand Slam, and the way you handled it was really unbelievable. You deserve it."

It was the 29-year-old Muchova's second Grand Slam final after getting beaten by Iga Swiatek at the French Open in 2023.

Wasted chances

Blasting aces and winners from all over the court early on, Noskova looked like she was going to run away with it, almost like Swiatek's 6-0, 6-0 rout of Amanda Anisimova in last year's final, which lasted all of 57 minutes.

Saturday's match was just 68 minutes old when Noskova earned her first match point — which ended when she landed a backhand into the net.

Two points later, there was another backhand miss from Noskova; then Muchova took advantage of a net-cord shot on Noskova's third match point in the same game.

Serving for the title in the next game, Noskova double faulted on her fourth match point.

And then, on the fifth occasion to end it, Muchova produced a big serve and forehand winner.

In all, Noskova lost five straight games.

"It's hard to watch," Tracy Austin said on the BBC as she called the match alongside John McEnroe. "We know what that feels like when you start to get tight and you can't loosen up, and then the lead starts to unravel."

Noskova said: "Winning it this way, really having to fight for it, having all these ups and downs, it matters a lot. I have to learn a lot from this match."

Grim reminder

People march through Beirut, Lebanon, on Tuesday to mark the sixth anniversary of a deadly port blast, which is considered one of the largest nonnuclear explosions in recorded world history. Nearly 3,000 metric tons of ammonium nitrate that was improperly stored at Beirut port for years exploded on Aug 4, 2020, killing more than 220 people, injuring thousands of others, and leaving vast areas of the Lebanese capital in ruins. To date, justice continues to elude families of the deceased and the survivors of the blast. EMILIE MADI / REUTERS

WORLD WATCH
By Guo Yi

Bruce Lee's enduring legacy of adaptability

As Washington steadily broadens its national security restrictions to encompass an ever wider range of Chinese products, politics has proved far less successful at disrupting something more enduring: the cultural connections between the Chinese and American people. California's decision to establish an annual Bruce Lee Day offers perhaps the clearest reminder of that reality.

In late June, California Governor Gavin Newsom signed legislation to establish Bruce Lee Day, the first annual celebration dedicated to a Chinese American in the state's history. When the first Bruce Lee Day is observed on May 17 next year, it will not be just a belated salute to the martial arts icon, but will for the first time carve a Chinese name into the state's legislative memory.

The date itself carries symbolic weight: May 17 was the day Lee left Hong Kong for San Francisco at the age of 18, a pivotal moment that launched his career in acting and martial arts teaching. Bruce Lee's journey across the ocean and his legendary rise on both sides of the Pacific encapsulate his life's meaning. The deeper question, however, is not why California honored him, but why Bruce Lee still commands such reverence across the West more than 50 years after his death, and what that says about a cultural bridge that politics cannot break.

Bruce Lee's enduring influence rests on more than his martial arts or movie stardom.

Measures unveiled to counter US curbs

By **ZHONG NAN** and **ZHANG CHENXU**

China announced on Wednesday a raft of measures in response to restrictions imposed on Chinese companies by the United States, including placing six US entities on its countermeasure list, imposing tighter export controls on drones and related technologies, and launching a national security review into imported printers and copiers.

A Ministry of Commerce spokesperson said in a statement that the countermeasures were a necessary response to Washington's continued expansion of restrictions under the pretext of national security. China urges the US to immediately withdraw relevant restrictions, stop its wrongful actions and return to the right track of resolving differences through friendly consultation and cooperation, the statement added.

The spokesperson warned that China would take more countermeasures if the US insists on introducing new restrictions targeting Chinese entities.

Since the meeting between the two heads of state in Busan, South Korea, last year, the US Federal Communications Commission has repeatedly introduced restrictive measures targeting Chinese companies despite Beijing's firm opposition and calls from business communities in both countries for cooperation, the spokesperson said.

The US has continued to overstretch the concept of national security, with its measures covering areas including telecommunications operators, testing laboratories, drones, consumer routers and submarine cables, and it has recently imposed import curbs on advanced robotics equipment and power inverters.

To safeguard China's national security and interests, the ministry said that export controls on drone-related dual-use items destined for the US will be tightened, requiring case-by-case reviews for exports of drones, key components and related technologies, which will not be eligible for license facilitation measures, effective immediately.

As six US entities have assisted and supported illegal US sanctions related to the Xinjiang Uygur autonomous region, they will be prohibited from engaging in relevant transactions, cooperation and other activities with organizations and individuals in China, effective immediately, the ministry said.

Also on Wednesday, the National Certification and Accreditation Administration said it would suspend, with immediate effect, follow-up factory inspections conducted by US certification agencies on behalf of designated China Compulsory Certification bodies.

The ministry spokesperson said China's countermeasures were "overall restrained" and reflected its desire to preserve the hard-won stability of China-US economic and trade relations.

Experts noted that the countermeasures are aimed at protecting China's legitimate interests while avoiding further escalation of trade tensions. They emphasized that dialogue and rules-based cooperation remain essential for maintaining stability in global supply chains.

John Quelch, executive vice-chancellor and a distinguished professor of social science at Duke Kunshan University in Jiangsu province, said a stable international trading system benefits not only exporters and investors, but also consumers and workers worldwide.

The ministry also announced on Wednesday the launch of a national security investigation into imported office equipment with printing and copying functions that are equipped with foreign system software, marking China's first such probe under its foreign trade law.

Shi Xiaoli, a professor of international economic law at China University of Political Science and Law in Beijing, said the move shows China's efforts to build a systematic and institutional framework to address trade-related risks.

XI'S VISION | OVERSEAS CHINESE

Kinship, roots link Chinese at home, afar

Hit film *Dear You* strikes chord with portrayal of diaspora's dedication, love of motherland

By **ZHANG YI** and **HU MEIDONG** in Fuzhou

As the cinematic hit *Dear You* — which follows a young ethnic Chinese man uncovering the history of his family roots through a bundle of old letters — sweeps global screens, a surge of young people, some from Southeast Asia, are flocking to a roadside stall in Shishi, Fujian province, a hometown of many Chinese who moved overseas.

They come to find Jiang Mingdian, 78, one of China's last active professional writers of *qiaopi* — a unique form of mail combining family letters and remittances that was showcased in the film.

Seated at his wooden table — covered with well-thumbed foreign dictionaries — Jiang now helps curious young visitors inspired by the movie to write letters in the old *qiaopi* style, using traditional characters written in vertical lines to convey messages that are then put in postage-stamped traditional envelopes.

"They come to me for everything — to write an apology to the mother abroad, to grab a traditional envelope with stamps for a cousin overseas, or to pen letters to future selves," Jiang said. "They seek a sense of ceremony to keep as a memento."

For 60 years, the junior high school graduate has penned over 100,000 letters, mostly from the 1960s to 1990s, for mothers and wives in his hometown of Shishi, a county-level city in Quanzhou, Fujian, to their sons and husbands who, driven by poverty at home, sailed abroad to make a living.

The men mostly moved to Southeast Asia. Some became merchants, while many worked as dockworkers, rickshaw pullers or barbers at first. Yet, Jiang recalled, they always sent back letters with money during festivals or ancestral temple renovations.

He traveled between villages to visit these women — most of whom were illiterate, and have since passed away — reading them the letters and penning their replies, turning mundane messages into poetic words.

As early emigrants blended their native dialects with the languages of host countries, Jiang even taught himself the basics of multiple foreign languages to better translate place names and draft documents.

This enduring emotion also resonated with President Xi Jinping. During his 2020 visit to a *qiaopi* museum in Shantou, Guangdong province, Xi praised the profound value of this cultural heritage, which was included in UNESCO's Memory of the World Register in 2013.

"These letters recorded the strenuous efforts of the old generation of overseas Chinese and their profound love for the hometown and the motherland, and embodied the credibility and integrity of the Chinese nation," Xi said.

Overseas Chinese endured enormous hardships and worked very hard to survive in a foreign country, and after gaining a firm foothold, they sent every dime saved back home, Xi noted. "It represents the Chinese people, Chinese culture, Chinese spirit and Chinese heart."

On many occasions, Xi has commended overseas Chinese — a group that comprises more than 60 million people residing in 200 countries and regions — for their vital role in driving China's development and deepening international cooperation.

In an instruction conveyed at a meeting on work related to Chinese nationals overseas held in Beijing on July 27 and 28, Xi called for rallying the strength of overseas Chinese to build China into a strong country and for advancing national rejuvenation.

Building deep trust

The vision stems from Xi's time working in Fujian from 1985 to 2002. The province is the ancestral home to a diaspora of over 20 million people, a community to which Xi has long attached immense importance.

Liao Meng, an associate research fellow at the Fujian Academy of Social Sciences, said Xi would personally visit influential diaspora leaders at home and abroad, resolving their doubts with genuine sincerity, building deep trust, and warmly inviting them to return and see their hometowns.

BIRDERS IN A FLAP OF EXCITEMENT OVER UNESCO DECISION

World Heritage list incorporates Liaoning's Changshan Archipelago, drawing praise from experts and enthusiasts

By **CHEN LIANG**
chenliang@chinadaily.com.cn

While navigating a mountain road near Yingjing county in Sichuan province in late July, Le Weiqiang got news that made him pull over and turn the car around: an African comb duck had been spotted that morning at Erhai Lake in Dali, Yunnan province.

"It was the first confirmed sighting of this duck since I began bird-watching more than 20 years ago," said Le, an avid birder from Guangzhou, Guangdong province. "It was a rare opportunity, and we definitely had to try our luck."

Unfortunately, the elusive duck never reappeared, despite daily searches by dozens of bird-watchers along the lake's shores. "But that's how it often goes," Le said. "We hear about a sighting, we go twitching, and even if we don't succeed, we have no regrets."

On July 27, a day before the rare duck was spotted, the 48th session of the UNESCO World Heritage Committee in Busan, South Korea, approved the boundary modification of the Migratory Bird Sanctuaries along the Coast of Yellow Sea-Bohai Gulf of China, officially incorporating the Changshan Archipelago in Liaoning province into the World Heritage list. For the growing birding community in China, it was a milestone moment.

"The Shicheng Archipelago near Zhuanghe in Dalian is part of the Changshan Archipelago and has long been seen as one of the top birding sites in Liaoning," said professor Liu Yang of Sun Yat-sen University's School of Life Science. He visited the site in September 2017 and spotted several signature species, including the Chinese egret, the Japanese cormorant, the black-faced spoonbill and the pelagic cormorant. "The Changshan Archipelago is considered the 'maritime lifeline' of the East Asia-Australasia migratory flyway. Its inclusion as a World Heritage Site not only fills a conservation gap in China's temperate island and reef ecosystems, but also connects islands, reefs and coastal wetlands into a complete ecological corridor," Liu said.

Cormorants rest on the rocky reefs off Bashao Island, which is part of the Changshan Archipelago in Liaoning province, on July 29. PAN YULONG / XINHUA

Lei Jinyu, secretary-general of the Rosefinch Center, a nonprofit organization dedicated to promoting bird-watching and conservation, said the expansion reflects a growing recognition among local governments of the area's potential as a premier birding destination.

Over the past three decades, the bird-watching community has become an important force in observing, documenting, monitoring and conserving the country's natural ecosystems. Lei said that by the end of 2025, birdreport.cn — one of the country's bird-recording websites — had attracted nearly 95,000 registered users. Throughout the year, about 22,000 users submitted 559,278 observation reports, documenting 6,927,544 bird sightings covering 1,379 species.

Demand for child actors faces minor hiccups

Increasingly wanted for short dramas, youngsters need to balance acting with personal development, experts say

Mi Ya (top), Chen Jinyuan (center) and Ni Yuehang (bottom) are among the talented child actors contributing to the rapidly expanding short drama industry in China. PHOTOS PROVIDED TO CHINA DAILY

By YU RAN
For China Daily

At 5:30 am on the set of a horror video, 9-year-old Ni Yuehang lay asleep beside a coffin prop, his legs numb from hours of waiting. By the time his mother Lin Qiwei found him, he could barely stand.

"It's okay, I just need a little rest," he said.

Incidents like this are becoming increasingly common as China's booming micro-short drama industry fuels growing demand for child actors, drawing more children onto sets, livestream productions and online video shoots at ever younger ages.

For some families, these opportunities offer children a chance to build their confidence, gain life experiences and explore a talent for performance. For others, the long hours, late-night shoots and fierce competition have raised concerns.

According to the National Radio and Television Administration, 33,000 micro-short dramas were released in 2025, with nearly 700 million viewers. The market exceeded 100 billion yuan ($14.81 billion), doubling from 2024.

Short dramas featuring "adorable" child characters recorded a popularity index ranking in the tens of billions in 2025, surpassing traditional genres such as historical power struggles, wealthy family dramas and period pieces in popularity, industry analysis from DataEye showed.

Against this backdrop, young actors like Yuehang are finding themselves in growing demand. Despite the exhausting schedule, Yuehang, who has appeared in more than 100 productions and played leading roles in over 20 short dramas, has never talked about quitting. His mother said he enjoys memorizing lines.

Lin said short dramas provide a rare opportunity for ordinary families without industry connections or financial backing.

"For families like ours, short dramas are not about using children but giving talented children a chance to prove themselves through hard work, without relying on connections or money," she said.

By early 2022, Yuehang had appeared in dozens of minor roles in larger productions, often without lines. His break came later that year, when he landed an important part in the short drama *SSS Zhanshenling*, playing the son of the male lead. He had substantial lines and earned a salary and travel reimbursement.

Today, Yuehang's workload is intense. In 2025 alone, he filmed seven lead roles over the summer.

On some shoots, he starts getting his makeup done before 7 am and does not finish until midnight.

As his experience has grown, so have his earnings, from a few hundred yuan a day to several thousand yuan for leading roles, enough to cover tutoring and travel costs.

"Directors value his experience, focus and willingness to cooperate while the family makes every effort to arrive on time and avoid disrupting production schedules," said Lin.

Yuehang takes school lessons whenever possible, often using breaks on set to finish homework, memorize English words or attend online tutoring sessions. Overall, he maintains above-average grades and remains popular with classmates.

Lin said acting has made him more independent, disciplined and mature. "He has also become more confident and is often willing to take the lead when working with classmates."

She said she understands public concerns about child actors and supports stronger protections for minors in the entertainment industry. However, she hopes people will not automatically equate child acting with exploitation.

Intense competition

As the short drama industry expands, more families are bringing their children into the field to explore performing while building discipline, confidence and life experiences.

In the first half of 2025, short dramas featuring child characters accounted for 5.56 percent of total favorites across all short-drama genres, ranking seventh among major content categories, data from Detawen Technology showed.

For Zhang Jieyu from Taiyuan, Shanxi province, acting has become less about chasing fame and more about helping her 8-year-old son Chen Jinyuan grow up.

He entered the entertainment world at age 3 in 2021, when renowned film director Zhang Yimou was filming *Full River Red* in Taiyuan. His family brought him to the set as a child extra to let him experience something new.

His first real production came around age 5. "At that time, he was still very young and could not sit still. He was playful in the waiting area and even talked back when a director reminded him to behave," said Zhang.

Afterward, she gave him a serious talk about rules, discipline and teamwork on set. "That was probably the first time he truly understood the importance of respect and cooperation," she said.

Jinyuan now works on two or three productions a month. Some shoots last only a day, while others can continue for a week.

Zhang said competition among child actors is intense.

"Some roles are clearly suitable for your child, but in the end, they may still go for children connected to investors or producers. Ordinary families are often at a disadvantage, but we still believe hard work will eventually be noticed," said Zhang.

To improve Jinyuan's chances, Zhang is in charge of his photos, video clips and audition materials and updates his portfolio regularly.

Although she understands public concerns about child actors, she hopes people will not assume every family is pushing their child too hard.

"There are families who treat children like tools to make money. But for us, acting is part of his education. We care about his studies, his character and his happiness far more than whether he becomes famous one day," said Zhang.

Little trouper

Wang Lu from Qingdao, Shandong province, sees acting mainly as a way for her 9-year-old daughter Mi Ya to enjoy new experiences and build her confidence.

Mi Ya films a commercial in 2023. PROVIDED TO CHINA DAILY

> "Children at different ages have different developmental tasks. The key principle is that children should do things appropriate for their age. If a child's interests and talents can be developed into a strength, it may also help support development in other areas."
>
> **Su Yanjie,** a professor at the Peking University School of Psychological and Cognitive Sciences

She said the biggest challenges are not only competition for roles, but also long hours, difficult filming conditions and limited rest. A typical day starts with arriving on set early, waiting for the call sheet, makeup, rehearsals and then filming.

Ya's first television role was in the drama *Ordinary Greatness*, where she performed alongside female actress Bai Lu.

Since then, she has appeared in more than 100 productions, including short dramas, advertisements and tourism videos.

During her kindergarten years, Ya spent long stretches on short-drama sets, with some shoots lasting more than two weeks. Wang said during the COVID-19 pandemic, she and her daughter once stayed with a production crew for over half a month.

"There were times when she had to stay up very late. Once, while the director was explaining the next scene, she fell asleep standing up beside me," she said.

Directors often value child actors who are cooperative, comfortable in front of the camera and not afraid to perform.

To balance acting with school, Ya usually attends classes in the morning and films in the afternoon. If a production requires her to stay on set longer, Wang brings homework and textbooks so she can study during breaks and arranges tutoring when needed.

"Acting has made my daughter more confident, independent and willing to express herself. At school, she is eager to raise her hand and answer questions in class," said Wang.

At the same time, Ya has become more sensitive to her own performance and other people's opinions. Wang reminds her not to put too much pressure on herself and stresses that the family has never treated acting as a way to make money or become famous.

"We are just an ordinary family. We only want her to be happy and healthy. Acting is part of her childhood, not something that defines her future," said Wang.

Staying 'age-appropriate'

As the industry becomes more competitive and more tightly regulated, experts say the biggest question is no longer whether children should act, but how to ensure they do so in a healthy and age-appropriate way.

Su Yanjie, a professor at the Peking University School of Psychological and Cognitive Sciences, said the effects of acting on children should be understood through developmental psychology.

"Children at different ages have different developmental tasks. The key principle is that children should do things appropriate for their age," said Su.

In her view, acting and other performance activities can help children improve communication skills, emotional understanding and social adaptability.

"Every child has different strengths. If a child's interests and talents can be developed into a strength, it may also help support development in other areas," she said.

Su warned that filming should not interfere with the developmental tasks children need to complete at their current age.

Sleep deprivation remains a widespread issue among Chinese children and adolescents. National health guidelines recommend 10 to 13 hours of sleep per day for preschool children and 8 to 10 hours for primary and middle school students.

"Sleep has a disproportionately large impact on children's mental health and development. If regular schedules are disrupted for a long period of time, it may lead to emotional problems, lower learning efficiency and having other negative effects," said Su.

Child actors may also face pressure from public attention and online comments, she said. "Even adults often struggle with public feedback on social media. Children may find it even harder to cope," she said.

As concerns over children's well-being grow, regulatory efforts have been strengthened in recent years.

In 2019, the National Radio and Television Administration issued regulations requiring that minors' appearance and behavior in programs align with their age and developmental characteristics, and prohibiting content that encourages minors to discuss fame, wealth or romantic relationships.

On Jan 8, the administration's online audio-visual department released new guidelines on child-related micro-short dramas, calling for age-appropriate portrayals of minors, banning content that promotes inappropriate values or excessive commercialization, and strengthening protection of minors' rights during production.

Cautious approach

Changsha Xingche Media in Hunan province focuses on actor management and short-drama productions and has worked with nearly 100 child actors across dozens of projects.

Company founder Tang Kaijun said demand for child actors surged during the boom in live-action short dramas between 2024 and 2025. Children under 10 generally have more acting opportunities because they fit the "cute child" roles in short dramas.

"For many productions, children under 1.35 meters in height are often preferred for certain roles. Once children are older than 10, school becomes a bigger issue, and they no longer fit the 'adorable child' image many productions want," said Tang.

At the same time, the industry has become more cautious. After several child-focused short dramas drew criticism, some producers reduced child roles or adjusted storylines to avoid controversy or regulatory breaches.

"In the first half of 2026, demand for child actors has remained relatively weak, as projects involving minors face stricter review procedures and longer approval times. Now, productions involving child actors often need additional reporting and review, which increases both time and uncertainty," he said.

Agencies recruit young actors through online casting, training institutions and parents, while directors value cooperation and emotional stability.

"When a child first joins a production crew, cooperation matters more than prior experience. Some newcomers are attracted by high pay, but they soon face long hours, unstable opportunities, and intense competition," said Tang.

The fast pace of short drama production can be challenging. A 10-episode series may take a week to 10 days to shoot, with schedules stretching close to 20 hours a day.

"Some children are given little time to understand their characters before filming begins. There are crying scenes where children may need eye drops because the filming pace is so fast," he said.

Parents with industry experience are often more cautious, reading scripts carefully and rejecting projects with violent or overly adult themes.

"There is still a real market demand for child roles. But the key is to make sure the content is healthy and appropriate," said Tang, who does not fully agree that child actors are being "consumed" by the industry.

He believes the industry will become even more regulated, leaving fewer opportunities for children without clear strengths.

"Many child actors are cute, but they do not leave a lasting impression. There is still real market demand for child roles, but future opportunities are more likely to go to children with strong acting skills, memorable personalities and distinctive qualities," said Tang.

Huawei takes fresh path to advance chips

Alternative scaling framework emphasizes faster transmission over shrinking processors

By **MA SI**
masi@chinadaily.com.cn

As global chip companies approach physical limits in their pursuit of more powerful processors, Huawei Technologies Co's emphasis on improving transmission speeds between system components could offer an alternative path, experts said.

The comments come as industry watchers recognize a systematic, replicable innovation ecosystem taking shape across China's tech landscape, spanning semiconductor design, memory chip fabrication, artificial intelligence frameworks and system integration.

Liao Heng, chief semiconductor scientist at Huawei, said in a recent four-hour interview that the decades-long practice of continuously shrinking transistors and packing more into integrated circuits is running out of runway, as transistors are now almost as small as atoms, nearing the physical extreme of contemporary manufacturing capabilities.

While Western companies have multiyear road maps enabled by ASML's advanced lithography machines, Huawei — barred from accessing such equipment due to sanctions imposed by the United States government — has had to pursue a more creative approach, Liao said.

That approach is Huawei's "Tau Scaling Law", proposed in May, which shifts focus from shrinking chip dimensions to improving transmission speeds between system components.

Huawei is set to unveil its first smartphone chip designed under this framework in September, using a technology called LogicFolding.

Liao said the world will have a clear understanding later this year of how Huawei's alternative approach helps narrow the gap with rivals, when the new smartphone chip is dissected by industry research companies.

He likened the AI value chain to an "18-story pagoda", positioning it as a more comprehensive framework than Nvidia CEO Jensen Huang's five-layer cake model.

Huang's model, which he has articulated during multiple public appearances, divides the AI industry into five layers: energy, chips, computing infrastructure, cloud/AI models and applications. It is a top-down business framework designed to illustrate how value flows through the AI stack, culminating in economic returns at the application layer.

Liao's "18-story pagoda", by contrast, is a bottom-up engineering and production framework that spans the entire semiconductor value chain. It begins with foundational elements such as basic theory, energy, mining and raw materials, silicon, transistor design, wafer fabrication, lithography and equipment, and advanced packaging. The middle part covers chip architecture, runtime environments and quantization. The top layers encompass AI training methods, foundation large language models, AI agents, products and commercial applications.

Crucially, Liao said the overall performance ceiling of the industry is determined by the shortest layer — the weakest link in the chain. The weakest link varies based on geographies.

Zhou Jianjun, a professor at Shanghai Jiao Tong University's School of Integrated Circuits, said the strategic implications are profound. Huawei is looking for a different path to improve performance — not by shrinking transistors any further, but by making groups of chips and the overall AI system work better together.

Xiang Ligang, director-general of the Information Consumption Alliance, a telecom industry association, said that while Huang's five-layer cake frames the AI industry as a market opportunity to be captured layer by layer, Liao's 18-story pagoda frames it as an integrated engineering challenge where no single layer can be optimized in isolation.

For Huawei, which cannot access the advanced lithography equipment, this holistic view is very practical. Huawei's breakthrough lies in cross-layer collaboration — using the advantages of system clusters to compensate for the hardware shortcomings of single chips, Xiang added.

According to the latest report by the US market research company International Data Corp, a dramatic shift occurred in China's AI accelerator market in 2025, driven by the US export controls. Domestic Chinese suppliers, led by Huawei, saw their combined market share surge to 41 percent. Nvidia's share fell to 55 percent, a significant drop from its near-monopoly levels.

Above: An aerial photo shows the launch ceremony for the Fuyao cliffside elevator on Friday in Nizhuhe Grand Canyon, Southwest China's Yunnan province. The elevator joins an older one in reducing the travel time for local students and tourists from more than three hours to about 30 minutes. **Right**: The Fuyao (right) and Qingyun cliffside elevators stand tall in Yunnan on Friday. XINHUA

New project elevates cliffside economy

By **YAN YUJIE** in Kunming
and **ZHENG JINRAN** in Beijing

How do you top a cliffside elevator that has already shortened a daily journey of more than three hours to just about 30 minutes? You build a new one that's taller, faster, and comes with a more breathtaking view.

In the remote Nizhuhe Grand Canyon in Southwest China's Yunnan province, a glass elevator attached to a vertical cliff face was unveiled for operation last week, making the regular commute to Guanzhai Village Primary School much safer for some 20 children from neighboring villages.

The newly completed project, named Fuyao, together with the old elevator Qingyun that was built around four years ago, ensures that local residents, including schoolchildren, no longer have to navigate a perilous mountain path on foot.

As an added bonus, the cliffside elevators are drawing more tourists, which in turn is boosting job opportunities and incomes of communities inhabiting the mountains.

Lei Xin, 12, who lives in Nizhuhe village and attended the neighboring Guanzhai Village Primary School until September last year, was full of praise for the new elevator. "The Fuyao is faster and much more spacious than the Qingyun," Lei noted, after taking his first ride on Sunday, two days after the new elevator began operations.

Cai Xiong, chairman of Xuanwei Yatuo Tourism Development, the construction company behind the project, said the new elevator covers a vertical cliff face of 288 meters, which makes its shaft 20 meters taller than that of the old elevator.

"The Fuyao goes from bottom to top in just 50 seconds, which is nearly twice as fast as the Qingyun, and it can carry up to 81 passengers at a time, nearly double the capacity," Cai said, adding that the view of the canyon with meandering streams is unbeatable.

The names of the elevators are inspired by Chinese literary classics. While Qingyun evokes the idea of "soaring skyward", Fuyao translates as "pursuing higher aspirations".

Together with an aerial cable car, the two cliffside elevators connect Nizhuhe village at the bottom of the canyon with the primary school located on the plateau more than 500 meters above. After walking one kilometer from home, children take one of the elevators up the cliff for free and then transfer to the cable car for the rest of the journey, reaching school within half an hour. Before the elevators were built, the only route to the top was a steep zigzagging path, with footholds carved into rocks and chains serving as guardrails.

Growing up near the canyon, Cai, the company chairman, recalled walking the dangerous mountain path countless times. Safety was a key motivation for the project, he said.

Since the Qingyun was built, the canyon scenic area has welcomed more than 1 million visitors. The Fuyao is adding to the tourism boom, with the elevators' combined capacity to handle 1,200 passengers every hour raising the area's daily peak visitor volume from 4,000 to 15,000.

"If the current trend persists, we expect more than 600,000 tourists next year, with elevator revenue projected to surpass 3 million yuan ($444,300)," Cai said.

Booming tourism has brought new employment opportunities for locals. Disposable incomes in Nizhuhe village last year increased nearly fourfold compared with 2022, data from local authorities showed.

He Caihua, 56, opened a guesthouse in 2024 that earned nearly 180,000 yuan in its first year. Her son now works as a crewmember on the elevator operation team, earning more than 6,000 yuan a month.

Lei's family has also benefited. His mother's restaurant at the bottom of the canyon has seen its annual revenue rise from about 30,000 yuan when it opened in 2014 to around 100,000 yuan in 2024.

Legacy: Water does not choose a bank; it connects them

From page 1

Bruce Lee changed how Asians were seen in popular culture. In the Hollywood of the 1960s and 1970s, Chinese characters were depicted as sinister villains or comic relief. Asian men were rarely heroic, let alone desirable or wise. Bruce Lee shattered that frame with his fists, speed and unapologetic presence.

In his pathbreaking film *Fist of Fury*, when his character kicks down a sign reading "No Dogs and No Chinese Allowed" and declares that the Chinese are no longer the sick men of Asia, he reclaims dignity for an entire people on a global stage. As Assemblymember Matt Haney, who authored the California bill, put it: "Bruce Lee represents the very best of California: innovation, diversity, determination and the courage to challenge convention." His ability to force Western audiences to see a Chinese face embodying strength rather than servility was revolutionary.

But rebellion alone does not explain his lasting impact. A mere avenger would have faded with time. Bruce Lee endured because he offered something beyond action. "Be water, my friend," he famously advised — formless, adaptable, yet unstoppable. Rooted in Taoist thought, distilled into a deceptively simple English phrase, the idea arrived at a time when the United States was convulsed by Vietnam, civil rights and a generational revolt against rigid institutions.

Bruce Lee transformed the dojo into a classroom and the fistfight into a lesson in survival. He became a spiritual mentor to millions who never set foot in a martial arts studio. That is why his gravestone in Seattle reads that "Your inspiration continues to guide us toward personal liberation".

Bruce Lee's universal appeal was rooted in his own liminal identity. Born in San Francisco and raised in Hong Kong, he moved through US suburbs and Asian backlots with equal ease, fluent in both languages yet not fully at home in either culture. He was not a Confucian sage nor a Westernized caricature; he was a living translation, equally able to explain yin and yang to a California surfer and demonstrate a straight punch to a Hong Kong street fighter. This duality is precisely why both sides can claim him without contradiction. When California honors him, it claims a Chinese icon as its own. When China celebrates him, it takes pride in his global influence. Shared ownership is not a contradiction here; it is the essence.

Bruce Lee is not alone in this pattern. Audrey Hepburn, born in Belgium to a Dutch mother and a British father, became one of Hollywood's most beloved faces and later used her experiences of wartime deprivation to advocate for children's welfare as a United Nations International Children's Emergency Fund Goodwill Ambassador. Bob Marley carried the sound of a small Caribbean island to every corner of the globe, singing of resistance and unity while refusing to align with any political camp. Each of them, like Bruce Lee, transcended their origins to become vessels of universal values such as dignity, resilience and self-overcoming. "Be water" is as portable an idea as Hepburn's grace or Marley's rhythm. That portability is what turns a national figure into a cultural bridge.

Bruce Lee matters more today than ever. In an era of great-power suspicion between Washington and Beijing, his example challenges the notion that cultures must be adversaries. He was Chinese in heritage and philosophy, yet quintessentially American in his individualism and his faith in self-invention. He never chose a side, because he belonged to the water between the shores. His legacy enriches both cultures without diluting either.

Some may dismiss Bruce Lee Day as mere symbolism, irrelevant to realpolitik. But symbols shape perception, and perception influences policy. If a generation of Americans grows up seeing a Chinese face as a symbol of wisdom and strength rather than threat, and if Chinese citizens see their own hero honored in the US, the foundation for trust is laid not in summit communiques but in the shared imagination of ordinary people. That is the long game of cultural diplomacy, and more than 50 years after his death, Bruce Lee remains one of its most effective players. His fist was fierce, but his message was harmony — and in a fractured world, that message has never been more urgent.

Water does not choose a bank; it connects them. Sometimes that connection outlasts every wall we build.

The author is a professor at the School of Journalism and Communication, Chongqing University. The views do not necessarily reflect those of China Daily.

Diaspora: Cooperation leading to partnerships

From page 1

In 1991, Xi, then Party secretary of Fuzhou, led a delegation to Indonesia to visit Liem Sioe Liong, founder of the conglomerate Salim Group and then a prominent diaspora leader and influential business tycoon, inviting him to invest in his hometown of Fuqing in Fuzhou.

Xi used a vivid metaphor, comparing the food and oil that Liem had sent home during China's past hardships to "giving eggs". He then proposed partnering to build an industrial park — essentially giving locals a "hen" and teaching them how to "raise hens to lay eggs" for self-sustaining growth.

Liem was deeply inspired. Salim Group and the Fuqing government then signed an agreement to develop the Yuanhong Investment Zone. It became China's largest foreign-funded comprehensive land development project at the time.

Ong Tee Keat, president of the Belt and Road Initiative Caucus for Asia Pacific, said President Xi's diaspora vision, forged in Fujian, reflects his strategic wisdom and pragmatic approach.

The "three benefits" principle proposed by Xi — being advantageous to investors, host nations and China — offers valuable guidance for diaspora engagement, particularly in advancing BRI projects, Ong said.

To elevate the cooperation, the China-Indonesia "Two Countries, Twin Parks" project was launched in 2021, upgrading the Yuanhong Investment Zone on the Chinese side to partner directly with Indonesia's Bintan, Batang and Aviarna industrial parks.

Since then, top leaders of the two countries have continuously pledged to build the project into a new flagship of the BRI.

Today, the project thrives by processing Indonesian raw goods, such as coconuts and seafood, into high-value products in China, while expanding cooperation in textiles and machinery to drive robust economic growth for both partners.

'Rallying hearts'

Liao, the research fellow, noted that the overarching goal of China's diaspora affairs has been upgraded from simply attracting capital and talent to "rallying hearts and pooling strength".

Just as President Xi instructed during his 2024 inspection of Fujian, the province is actively leveraging ancestral culture, kinship ties and native bonds to widely unite overseas Chinese, Liao said.

In August, Hnin Yu Wa Di Hlaing, a Chinese language teacher and third-generation immigrant in Myanmar whose Chinese name is Chen An, led a group of 10 youths from Myanmar who are of Fujian descent on a meaningful roots-seeking journey to China.

Chen's family roots trace back to Fuzhou. In the 1940s, amid times of hardship, her grandparents left their hometown and migrated to Myanmar to build a new life.

This enduring bond was written in her family history. Around 2010, her 90-year-old grandfather returned to Changle, knocking on doors from memory until he finally traced his long-lost brother. The two elderly men wept in a tight embrace — a final reunion before both passed away shortly afterward.

"My father insisted we master the language to never forget our roots," the 24-year-old teacher said.

Today, this ancestral bridge opens doors to new horizons. "My students are captivated by China's growth, especially high-speed rails and mobile payments," Chen said.

Ong, president of the Belt and Road Initiative Caucus for Asia Pacific, noted that despite variations in nationality and language due to integration across host nations, traditional Chinese virtues remain etched in the cultural DNA of young ethnic Chinese.

"These traits constitute the root and soul of the community," Ong said.

Migrant surge exposes EU divide

Politicization erodes coordinated action as solutions remain elusive, experts say

By YANG RAN
yangran1@chinadaily.com.cn

CROSS CURRENTS

The recent wave of migrants into Spain's Ceuta has triggered humanitarian and border-control emergency measures by Spain and other European countries, while it has also laid bare a widening rift among European Union member states over migration policy, experts said.

The incident, which led to more than 80 deaths, has underscored how the politicization of the migration issue is eroding the bloc's capacity for coordinated action on this persistent challenge, with long-term solutions remaining elusive, they said.

Ceuta, one of Spain's two enclaves on the North African coast, became the flashpoint when tens of thousands of migrants attempted to cross the border on July 30, overwhelming local border control agencies.

While Spain quickly repatriated most arrivals, easing immediate pressure, Italy announced a one-month suspension of Schengen free movement rules with Spain after the migrant surge, even though the rules do not apply to Ceuta. And 22 of 27 EU countries backed a joint call for firmer action against illegal immigration, suggesting Spain's migration policies were part of the problem.

Spanish Prime Minister Pedro Sanchez expressed "serious concerns" about some European governments, saying that while most had shown "support and solidarity", other European governments had chosen to attack Spain, "driven by prejudice, fake news, ignorance, or political interest".

Experts said that the varied national responses reflect a widening gulf in member states' interests regarding migration issues.

Dong Yifan, an associate research fellow at the Institute of Country and Regional Studies at Beijing Language and Culture University, described the Ceuta crisis as "tearing a rift in EU unity and policy consensus".

He said that Spain's left-wing government, which acknowledges the benefits of legal migration for its economy and labor market, now stands as a "counter-current" against a broader rightward shift in European migration policy.

Dong argued that the surge in migrant flows along the western Mediterranean route has prompted several EU nations to prioritize domestic politics over collective values. "To deflect internal contradictions and project an image of protecting their own citizens, some countries have ignored EU solidarity and policy coordination, using the opportunity to criticize Spain," he said.

Beyond differing national interests, experts emphasized the increasing politicization of the migration issue as a major driver of controversy. Dong noted that migration in Europe is no longer merely an economic or social issue, but has become a sharp political weapon tied to election outcomes. "Stances and policies are often shaped more by political needs than by governance realities," he explained.

This dynamic, he added, is compressing the EU's maneuvering space for coordinating compromise and support, while fueling a vicious cycle in which rising public anxiety over migration empowers right-wing political actors, who then advocate for increasingly restrictive measures.

Foundational issue

Jian Junbo, a professor and director of the Center for China-Europe Relations at Fudan University, echoed this view, saying that for far-right parties, migration is a foundational issue to gain support and influence.

"They will use such incidents to expand their influence aggressively. Meanwhile, many ruling parties face pressure if they appear too lenient," said Jian, indicating that the issue involves not just national interests but also political struggles among parties.

On Tuesday, EU interior ministers held an emergency video meeting to discuss the crisis, agreeing that border reinforcement and stronger mechanisms for migrant returns are necessary.

However, experts cautioned that Europe's migration challenge is structural and that simply shutting the door or cracking down on immigration is just a band-aid fix, not a real solution. Jian noted that because of Europe's colonial history and the economic disparities between migrant-origin countries and Europe, as well as Europe's own labor market shortages, which create demand for migrants, migration is a long-term issue for the continent to tackle.

"The fundamental solution is to create conditions that allow people to stay in their home regions by contributing to local stability and economic prosperity. Europe should do more in this regard. Merely stopping migrants or tightening policies is treating the symptoms, not the root cause," he said.

The real test, Jian argued, also lies in overcoming internal contradictions and forging a unified, EU-wide consensus on migration.

"With widening gaps between member states and the rise of far-right parties pushing for stricter policies, finding a mechanism-level agreement will be a long-term challenge," he said.

Giant panda in Washington celebrates 5th birthday

By DONG HAO in Washington
and **SHI GUANG** in New York

Bao Li, one of a pair of giant pandas at the Smithsonian's National Zoo in Washington, DC, celebrated his fifth birthday on Tuesday with his favorite treat — a fruit-based ice cream cake.

The shark-themed cake — inspired by a strip of longer fur that runs down his back — was placed in front of a sign reading: "DIVE INTO 5, HAPPY BDAY BAO LI", and was decorated with the shapes of fish, starfish, and a shark fin.

Bao Li began by eating the sweet potato "minnows", blueberry "bubbles" and a carrot carved into a palm tree, then tore into the rest of his frozen cake.

Visitors crowded around Bao Li's enclosure at the David M. Rubenstein Family Giant Panda Habitat to join in the occasion.

"I'm here to celebrate Bao Li's fifth birthday. I can't believe he's five already," said visitor Kirsten Svane. "He's been here for two years now. He's very much kind of like a teenage boy, I would say. It's just a really happy occasion. I love coming every year for the birthdays. It's a great tradition."

Giant panda Bao Li celebrates his fifth birthday with his favorite treat — a fruit-based ice cream cake at the Smithsonian's National Zoo in Washington, DC, on Tuesday. LI RUI / XINHUA

Visitor Ross Poquette said: "I know a lot of people that are here. So it's good to see friends and sort of connecting around one common theme, which would be the panda's birthday. And the pandas here have come from China to be here and be with everyone and sort of share the joy of pandas in general."

Bao Li's name combines the Chinese words for "treasure" and "vitality and strength", together meaning "active and vital power".

He was born on Aug 4, 2021, at the China Conservation and Research Center for the Giant Panda in Sichuan province.

Bao Li also has deep family ties to the Smithsonian's National Zoo and Conservation Biology Institute.

His mother, Bao Bao, was born there in 2013, and his grandparents, Tian Tian and Mei Xiang, served as ambassadors for their species in Washington for 23 years.

His companion at the zoo, a female named Qing Bao, whose name means "green treasure", was born on Sept 12, 2021.

The pair made their public debut at the zoo in January last year.

"Giant pandas are, you know, they are the symbol of friendship between the United States and China. They are just so joyful. They bring people so much joy all across the world," said giant panda keeper Mariel Lally.

"And it meant so much to everyone when Bao Li and Qing Bao came here from China, especially (to) me as the person who works with them. But I know that it really just helps kind of bring us all together. And everybody is here no matter where you're from, celebrating a birthday," she said.

The first giant pandas to arrive in the United States, Hsing-Hsing and Ling-Ling, were presented by China as a gift to the people of the United States following then-president Richard Nixon's historic visit to China in 1972.

Greece deploys satellite system to tackle blazes

By JULIAN SHEA in London
julian@mail.chinadailyuk.com

As wildfires continue to burn across much of Europe, developments happening in Greece could help make future blazes easier to anticipate and manage.

Two firefighters died in a helicopter crash over the weekend as they struggled to contain a blaze to the west of the capital, Athens, but the Financial Times reports that a satellite system called the Hellenic Fire System, developed by the Greek government and the European Space Agency, has begun sending images back to Earth.

Firefighters are still learning how to use the four-satellite system, which is expected to become fully functional in September, but even early results are already making a difference.

"We've come up with a solution, but now the most difficult part is the adoption of that solution," said Dimitris Bliziotis, the Hellenic Space Center's Earth Observation program manager. "The fire brigade is used to the technology they were using before, so now we have to train them on how to process the new kinds of data."

German company OroraTech has helped develop the technology, which repeatedly sweeps areas down to a very small concentration, looking out for isolated blazes or places that could potentially burst into flame. Software can then be applied to assess the likelihood of a fire developing, and judge the impact it might have on the terrain and how it might spread.

"It doesn't just take pictures," said Ioannis Lantouris, OroraTech's head of operations in Greece. "We process the pictures on the satellite and then send them down to Earth."

"It changes the whole way we perceive and manage wildfires," he added. "You don't need a human to call the fire department first. And when you do detect the signs, you can analyze them faster."

Theodore Giannaros, a senior wildfire meteorologist at the National Observatory of Athens, told Agence France-Presse that this year's blazes were "definitely one of the worst fire crises I've seen in the past, maybe eight to 10 years". Fire department communications chief Vassilis Vathrakoyannis said, "The situation has clearly improved compared to the last few days, but there are still many scattered hot spots, which means that forces remain on site to prevent a possible flare-up."

Compensation plan

Prime Minister Kyriakos Mitsotakis held a cabinet meeting on Wednesday to discuss compensation for people affected by the blazes around Athens, which are believed to have burned through more than 14,000 hectares in just five days, and which the Euronews website reported are thought to have been caused by a spark on power cables in a seaside village 85 kilometers away from the capital.

In accordance with concerns about fire risks, some parks have been closed and restrictions put on public activities that may increase the likelihood of blazes, but despite this, local authorities reported 33 people had been arrested between June 29 and August 2 for starting fires — 30 for negligence and three on suspicion of arson. Most negligence cases were linked to rule-breaking farm work and activities such as welding.

Security concerns grow amid AI models' review

SAN FRANCISCO — Security tests of advanced artificial intelligence models have revealed new breaches involving AI agents carrying out unauthorized actions, raising concerns over safeguards as the United States moves to strengthen reviews of powerful AI systems before their release.

Britain's AI Security Institute, or AISI, disclosed on Tuesday that agents powered by Anthropic's Mythos 5 and OpenAI's GPT-5.6 Sol engaged in unauthorized activities during security evaluations designed to assess their capabilities.

"Some of the agents being tested had engaged in sustained, potentially harmful activity directed at real people and organizations," AISI said in a blog post.

The institute tested the agents through a fictional cybersecurity scenario 122 times and identified 19 unsanctioned actions across 10 test runs. Anthropic's agent was responsible for 17 of the actions, while OpenAI's agent accounted for the remaining two.

The most serious incident involved an AI agent writing malicious code and creating fake online identities in an attempt to persuade a human to approve the code, AISI said.

AISI, which receives access to advanced AI models through voluntary agreements with major AI labs, said the findings highlighted weaknesses in current safeguards for testing AI agents, which technology companies have promoted as a future tool for business.

The rapid development of AI has increased pressure on governments to address security risks. The US government moved to establish a security review process for advanced AI models before their release, according to US media reports. The process is expected to apply only to "closed" models that are tightly controlled by developers, including those from OpenAI, Anthropic and Google.

A White House meeting on Tuesday reportedly included representatives from OpenAI, Anthropic, Google, Nvidia, Microsoft and Meta. However, it remains unclear when the administration will release details of the review process or how it will be enforced.

Regulatory gaps

Experts have questioned whether voluntary reviews of closed models are sufficient. Martijn Rasser, vice-president for Technology Leadership at the Special Competitive Studies Project, said the United States still lacked a "statutory, predictable process" for evaluating the security of frontier AI models.

AI companies have said they are working to improve safety practices. OpenAI said its two unapproved actions identified by AISI involved accessing the internet in ways forbidden by prompts, while Anthropic said it was working with AISI to investigate further.

Nurturers of hope

Medical staff members attend the inauguration of the new Ebola treatment center in Rwakole, Bunia, the Democratic Republic of Congo, on Tuesday. The center has a capacity of 100 beds. As of Tuesday, 3,802 cases had been recorded, with 1,707 deaths, the latest government update showed. DIEUDONNE DIROLE / EPA

South Africa resilient in face of tariffs, experts say

By NDUMISO MLILO
in Johannesburg
For China Daily

South African experts have criticized the US tariffs as "disruptive" to global trade and the economy, and said South Africa is showing resilience to the tariffs by expanding South-South trade.

The US recently imposed tariffs on 60 partners which it alleges use forced labor. Countries will face tariffs of between 10 and 12.5 percent.

Mpho Parks Tau, South African minister of trade, industry and competition, said his country will face a 12.5 percent tariff from the US. He said the tariffs will exclude automobiles and auto components, as well as steel and aluminum, which are already subject to other US tariffs. South African products such as macadamia nuts, oranges, tea, spices, seeds, cane sugar, orange and lime juice, syrups, chemicals, critical minerals, platinum group metals and other precious metals and pharmaceuticals will be exempted from the latest tariffs, said Tau.

The South African government will continue to engage with the US with a view to either eliminating or reducing the tariffs, the Department of Trade, Industry and Competition said in a statement.

John Bideri, chairman of the Committee on Trade, Customs and Immigration Matters at the Pan-African Parliament, said the US tariffs are disrupting global trade. He said the committee has deliberated on it and expressed concern over the tariffs because they are bad for business in Africa and globally.

Bideri, who is also a member of the Rwanda Senate, said if tariffs are "created to punish" others, they are not welcome.

"Tariffs are not good for business and trade, especially if they are put in place for political or economic reasons. We should rely on free trade as provided for in the World Trade Organization. If they are negotiated tariffs, they enhance trade within the globe," said Bideri.

He said that African countries or regional economic communities should negotiate tariffs. The African Continental Free Trade Area should help increase intra-Africa trade, which is facing tariffs, said Bideri.

Danson Mungatana, leader of the Kenyan delegation to the Pan-African Parliament, said tariffs are not helping US citizens as they make the goods expensive for them. Mungatana said tariffs have negatively affected global trade.

Mungatana said African countries should increase intra-Africa trade as a response to the tariffs.

Expanding trade

Themba Maseko, head of the University of the Witwatersrand School of Governance, said the South African economy has shown some resilience despite the US measures. He said South Africa should continue to trade with other countries while engaging with the US.

"We have seen trade with the Global South increasing, and the US tariffs did not impact much on our trade with the rest of the world. That resilience is still there, and we have to continue to do what we are doing as a country," said Maseko.

Annabel Bishop, chief economist at Investec, an international banking and asset management company, said in the midst of polarization and geopolitical risks, the South African economy has shown some improvement. She said while South Africa should continue to engage with the US to reduce or remove trade tariffs, it should also explore other markets.

Bishop said there are many opportunities for trade with BRICS partners, including China, India, Brazil and Russia.

Brazil govt condemns visa action on envoy

RIO DE JANEIRO — The Brazilian government on Tuesday strongly condemned the US State Department's decision to alter the visa status of Brazil's ambassador to Washington, Maria Luiza Ribeiro Viotti, calling the reasons cited by the United States "false".

The US government revoked the Brazilian ambassador's visa in retaliation for Brazil's refusal last month to issue visas to two US State Department officials and its delay in approving US President Donald Trump's nominee for ambassador to Brazil.

In a statement, the Brazilian government defended its decision to deny entry visas to the two US officials, saying they intended to visit Brazil to question the integrity of the country's electoral system, which it described as an unacceptable attempt to interfere in domestic political affairs.

Regarding Washington's criticism of the approval process for the new US ambassador, Brazil said the United States had publicly announced its nominee before formally requesting approval, which violates Article 4 of the Vienna Convention on Diplomatic Relations.

"There is no rule in the Vienna Convention stipulating a deadline for granting agreement," the statement said, adding that the US request remains under review.

The statement also noted that unilateral US sanctions against Brazilian officials, including Supreme Court justices and senior government officials whose US visas were revoked over allegations of political persecution, remain in place, highlighting ongoing tensions between the two countries.

The move marks an escalation in the deepening rift between Trump and Brazilian President Luiz Inacio Lula da Silva, which has upended trade between the countries and emerged as a factor in Brazil's presidential contest.

In another development, Brazil has downgraded relations with Argentina to the charge d'affaires level, Brazilian media said on Tuesday, citing sources from the Ministry of Foreign Affairs.

The decision followed remarks made by Argentine President Javier Milei against Lula and other Brazilian officials in recent weeks.

Argentina on Tuesday expressed regret. Its Foreign Ministry said, "Argentina takes note of the unilateral decision adopted by the Government of Brazil and regrets its decision to continue isolating itself from the rest of the region for purely ideological reasons."

Hormuz discussions show some progress

Iran says meeting with Oman focused on making transit routes safer in strait

By JAN YUMUL in Hong Kong
jan@chinadailyapac.com

Discussions between Iran and Oman over reopening the Strait of Hormuz are progressing at the technical and political levels, while Qatar said the priority is to contain the escalation in the region as US President Donald Trump continues his threats.

US-based media outlet Axios reported that a deal on Hormuz was near, but Iran reiterated that the talks were between Tehran and Muscat and had nothing to do with Washington. Similarly, Qatar said it does not set specific timelines for an agreement.

Iran's Foreign Ministry spokesman Esmail Baghaei told state television that the negotiations with Oman are focused on determining safe inbound and outbound transit routes for vessels in the strait, Mehr News reported on Wednesday.

Baghaei said the discussions, which have taken place at both technical and political levels, are proceeding in a constructive atmosphere.

"Iran, in cooperation with Oman, is working to formulate the necessary mechanisms for future arrangements for managing shipping transit in this strategic passage," Baghaei was quoted as saying.

Tehran has said that the Strait of Hormuz remains closed to shipping under Iranian control until the United States military interference in the waterway ends.

Trump said a deal to reopen the strait is close when he was asked by reporters traveling with him in California about a report on the Axios news site that an announcement on the Strait of Hormuz could be made on Wednesday.

In an interview with Fox News, published on Wednesday, Trump also renewed his warning to Iran, saying the US could hit the country "really hard" if negotiations between Washington and Tehran fail.

"If they back out again, they're going to get hit really hard," Trump said. "They know that. They understand that. I have no choice. They can't have a nuclear weapon. It's very simple."

In his phone call with Trump, Qatari Emir Sheikh Tamim bin Hamad Al Thani emphasized the importance of continuing diplomatic efforts to address contentious issues and implement the terms agreed under the memorandum of understanding between Iran and the US in June.

Mediating efforts

A similar view was echoed by Saudi Crown Prince and Prime Minister Mohammed bin Salman Al Saud, who chaired the weekly meeting of ministers on Tuesday.

Majed Mohammed Al-Ansari, adviser to the Qatari prime minister and spokesman for the Ministry of Foreign Affairs, said on Tuesday that Doha, Muscat and Islamabad are exerting ongoing efforts to facilitate communication between Iran and the US "to bring their viewpoints closer".

Al-Ansari also said Qatar does not set specific timelines for reaching agreements, explaining that the success of any agreement depends on the extent of readiness of the concerned parties to achieve it.

He also noted that Qatari communications are ongoing at various leadership levels with relevant parties to advance the negotiation track, while stressing that no final agreement has been reached to date.

On the Strait of Hormuz, Al-Ansari called on countries to refrain from using the strait "as a means of political pressure or to achieve unilateral interests".

He indicated that the minimum demand in the current phase is to return to the previous status in the strait, in line with international law and in coordination with all coastal and concerned states.

Al-Ansari said any future arrangements related to managing the strait or regulating navigation through it "must be agreed upon by all affected regional countries". He pointed out that ensuring the smooth flow of trade and freedom of passage represents a shared priority for the international community.

Shipping traffic at the key Middle Eastern maritime choke points of the Strait of Hormuz and the Bab el-Mandeb remained limited on Tuesday compared with the previous day, Reuters reported, citing ship-tracking data from Kpler.

Roughly 130 to 140 ships would typically transit the waterway each day before the conflict broke out on Feb 28. Iran responded by closing the strait.

Cui Haipei in Dubai, UAE contributed to this story.

Rocket piece set to crash into moon

A piece of a SpaceX rocket floating in space since last year was expected to smash into the moon at high speed early on Wednesday morning, though the impact was unlikely to be confirmed for at least several hours. The school-bus-size object is the second stage of a SpaceX Falcon 9 rocket that had launched a lunar lander from Firefly Aerospace toward the moon in January 2025. Weighing 4 metric tons, the rocket body had been due to hit the moon around 2:35 am, traveling at 8,690 kph, but none of the spacecraft orbiting the moon were expected to be in a position to capture images of the impact live. The impact was unintentional, SpaceX said. The rocket piece was expected to hit Einstein Crater on the moon's western limb, which is often difficult to see from Earth.

MIDDLE EAST

Israel did not agree to Gaza plan: Netanyahu

Prime Minister Benjamin Netanyahu has said Israel did not agree to the US-backed plan for Gaza, even after receiving assurances that an Israeli pullout would only happen after Hamas disarms. In a video posted on his social media accounts on Tuesday night, Netanyahu said the team of US President Donald Trump "believes that they can bring about the disarmament of Hamas and the demilitarization of Gaza". Netanyahu met with the US-backed Board of Peace on Monday and received guarantees that the Israeli army would only be required to leave its current positions in Gaza after Hamas disarms. But pressure has been growing on the premier from the right flank of his ruling coalition to reject the deal.

Chinese EVs gain ground in South Korea

This shows competitiveness and export resilience of China's supply chains

By LI JIAYING
lijiaying@chinadaily.com.cn

View of BYD's booth during an expo in South Korea in June. XINHUA

Chinese-made electric vehicles are rapidly gaining ground in South Korea, showing the competitiveness and export resilience of China's EV supply chain as consumers there look beyond established brands for affordable, technology-rich models.

South Korea registered 69,513 China-made EVs in the first half, up a whopping 178.7 percent from a year earlier, said a report released on Tuesday by the Korea Automobile & Mobility Association, or KAMA.

This has brought their share of all new EV registrations to 35 percent from 26.8 percent a year earlier, meaning that more than one in every three EVs newly registered in the country came from a Chinese factory.

The development is also reshaping South Korea's wider import market. Registrations of all China-made imported vehicles — including both electric and conventional models — climbed 127.8 percent to 79,444 in the first half, KAMA said.

Notably, their share reached 41.2 percent by manufacturing origin, overtaking Germany for the first time.

The figures measure where vehicles were produced rather than the "nationality" of their brands. Shanghai-made Tesla vehicles accounted for much of the increase, while BYD's mass-market models and China-made premium vehicles added huge momentum, according to KAMA and South Korean media.

Zhang Hong, a senior new energy vehicle industry expert at the China Automobile Dealers Association, attributed the growth to the combination of product performance and smart-vehicle features.

"Chinese EVs have a clear lead in electrification and smart technologies, including intelligent cockpits and advanced driver-assistance systems. These features align closely with strong demand among young South Korean consumers and are helping overturn the impression that Chinese-made EVs are low-end products," Zhang said.

Zhang said Chinese brands are likely to maintain strong momentum in South Korea over the next year, although policy changes and the need to expand local sales and after-sales networks would test their ability to convert early interest into sustained market share.

The comments came as South Korea introduced a new assessment for EV subsidy eligibility in the second half, examining factors such as technology development, supply-chain contribution, environmental compliance, after-sales services and safety management.

BYD took part in the assessment but did not achieve the required score, while Geely-owned premium EV brand Zeekr missed the application window after receiving certification for the 7X in late May. New pure EVs from the two brands have therefore been ineligible for government purchase subsidies since July 1.

Before the change, eligible buyers could receive combined central and local government subsidies of roughly 2 million won ($1,402) to 3 million won per vehicle, depending on the model and location.

The policy shift came after the first-half surge of Chinese brands. BYD, which began delivering passenger EVs to South Korea in April 2025, registered 11,675 vehicles in the first half, an increase of 807.9 percent. It ranked fourth among imported brands, behind Tesla, BMW and Mercedes-Benz.

Zeekr has yet to begin full-scale deliveries, but its early reception points to broader acceptance. Preorders for its premium 7X midsize electric sport utility vehicle, which is priced at 52.99 million won for the entry-level version, exceeded 1,000 about a month after opening in June.

Grupo Bimbo upbeat on bakery

By ZHENG YIRAN in Shanghai
zhengyiran@chinadaily.com.cn

Eyeing new consumption trends in the bakery sector, Grupo Bimbo is upbeat about the Chinese market, and will keep investing in the country.

"Since we entered the Chinese market, Grupo Bimbo has continued to invest in China, focusing on food quality and safety, as well as operational improvements across our bakeries," said Kelly Zhang, general manager of Bimbo China. "In recent years, the demand for baked goods in the Chinese market has evolved from 'eating enough' to 'eating well, eating right', while pursuing clean labels such as no additives and low sugar control. The consumption scene has transitioned from family meals to personalized self-enjoyment."

Kelly Zhang

Bimbo has launched whole wheat ciabatta and kale red bean toast bread in the Chinese market, and has constantly upgraded its Dofi bread series.

"Meanwhile, customer purchasing channels have changed. In the past, they would simply go to offline supermarkets. Now, they purchase baked goods from all channels, including baking specialty stores, convenience stores and online e-commerce platforms," she said.

Market research firm Motor Intelligence said that in 2026, 15 percent of products sold online have seen obvious growth. To meet this growing trend, Bimbo enhanced its e-commerce channel operations and has achieved positive results.

Data from Shanghai-based Marketing Consulting Research showed that since 2021, the Chinese bakery market has grown constantly.

In 2025, the market totaled 662.6 billion yuan ($98.2 billion) and it is estimated that by 2030 the market will surpass 902.5 billion yuan.

Huang Tao, an independent expert in public relations, said: "The baked goods consumption market in China is in a rapid development stage, with its scale continuing to expand. At the same time, market competition is becoming increasingly fierce and the differentiation between different enterprises, regions, cities and locations may become more apparent. The market has gone from insufficient supply in the past, with some households purchasing less and fewer related stores, to a rise in production and household consumption. The industry has begun to upgrade."

Research from the catering research institute Hongcan shows that for Chinese bakery consumption, breakfast takes up 68 percent of the scenarios, while afternoon tea makes up 21 percent, and gift-giving is also growing. In 2025, the sales volume of gift-giving baked goods totaled 80 billion yuan, up 12 percent year-on-year.

Evolving landscape of digital commerce

By LI JING
lijing2009@chinadaily.com.cn

PROVIDED TO CHINA DAILY

China's livestreaming, social commerce and quick commerce models are increasingly influencing the way consumers discover and buy products around the world, said NielsenIQ, a leading consumer intelligence company, in a report.

The country's live commerce market reached about $900 billion in 2025, approaching the size of the entire e-commerce market in the United States, according to the NIQ report — The Commerce Revolution: Where East Meets West.

The Asia-Pacific region accounted for about 55 percent of global e-commerce revenue, while 59 percent of consumers in the region said they already purchase products through social platforms, the report said.

The figures highlight the evolution of commerce beyond traditional online shopping into connected ecosystems where content, community, media, payments and fulfillment work together, according to the report.

The shift is visible in China's broader online retail market. Online retail sales of physical goods rose 5.2 percent year-on-year in 2025 to reach 13.1 trillion yuan ($1.94 trillion), accounting for 26.1 percent of total retail sales of consumer goods, according to the National Bureau of Statistics.

"Social and livestreaming commerce do more than reshape existing retail channels. They also generate substantial new consumption," said Jiang Zhao, an associate researcher at the Chinese Academy of International Trade and Economic Cooperation.

Jiang said content recommendations and product demonstrations encourage unplanned purchases by turning latent demand into actual spending. Direct access to consumers also allows smaller merchants, manufacturers in industrial clusters and agricultural producers to offer a wider range of products, while immersive, interactive and entertainment-driven shopping experiences strengthen spending appetite among younger consumers.

"China remains one of the world's most dynamic commerce markets," said Ryan Zhou, managing director of NIQ China. "The speed and scale of innovation in China offer important lessons for brands seeking to anticipate how commerce will evolve in other markets."

For global brands, the changes are already affecting how they market and sell in China. UK-based consumer goods maker Reckitt said e-commerce accounted for about 80 percent of its China sales in 2025, up from around 30 percent before COVID-19. The company used more than 1 million short videos and 100,000 hours of livestreaming to reach about 40 million new customers in China in 2025.

These innovative models are increasingly influencing consumer behavior, particularly across the Asia-Pacific region, according to the report.

The shift is also blurring the traditional distinction between online and offline retail, as consumers move seamlessly between physical stores, e-commerce platforms, social media and other digital channels during the purchasing process.

"The next generation of retail will be shaped by businesses that can connect consumer intelligence across physical and digital commerce," said Rachel White, president of Asia-Pacific at NIQ. "Brands that understand how consumers discover, evaluate and purchase products across every touchpoint will be better positioned to anticipate change and drive sustainable growth."

NIQ said brands would need greater visibility across every stage of the consumer journey, from product discovery and engagement to purchasing and loyalty, as commerce ecosystems become more interconnected.

The next change may be driven by artificial intelligence. Alibaba Group has integrated its Qwen AI assistant with the full Taobao product catalog, allowing users in China to browse, compare products, place orders and manage deliveries through natural-language conversations rather than keyword searches.

Success increasingly depends on understanding how retail, e-commerce, social commerce and digital channels work together rather than as separate ecosystems, the report said.

Guideline set to streamline cross-border taxation rules

By REN QI
renqi@chinadaily.com.cn

The State Taxation Administration released the country's first cross-border tax industry guideline specifically tailored for the cross-border transportation sector, aiming to provide a comprehensive, full-chain and practically implementable tax compliance reference for market entities engaged in maritime, aviation and land transport-based transactional activity.

The guideline on tax services for international transportation arrives amid China's robust foreign trade growth. According to customs statistics, China's total first half imports and exports of goods surged 16.9 percent year-on-year, reaching 25.47 trillion yuan ($3.77 trillion). The nation's exports rose 13.4 percent to 14.73 trillion yuan, while imports soared 22.1 percent to 10.74 trillion yuan.

This newly introduced guideline further expands the administration's dedicated "TaxExpress" cross-border tax service brand and its broader knowledge product system. Structurally, the document is meticulously divided into two primary sections: an "inbound" chapter and an "outbound" chapter.

By categorizing various modes of transportation, the guideline systematically addresses four core questions for enterprises: whether they are required to pay taxes, what types of taxes they must pay, how much the tax liability will be and the specific methods for making these payments.

To achieve this goal, the document thoroughly outlines tax-related matters across eight critical dimensions: tax liability, withholding obligations, taxable income, tax calculation methods, available tax incentives, bilateral treaty benefits, tax procedures and tax risk warnings.

Furthermore, the guideline compiles public tax cases to intuitively illustrate tax laws and visually highlight potential cross-border operational risks. Its detailed appendix also gathers full-chain tax policies and summarizes direct inquiry links for relevant tax-handling channels.

"Our enterprise handles international transport business all year round, such as the China-ASEAN railway transportation routes," said Tan Yundan, financial head of Land-Sea Corridor Operation Co Ltd.

"The complex nature of cross-border tax affairs has historically posed significant challenges to compliance. This is especially true when trying to accurately grasp policy changes during the transitional periods between old and new value-added tax policies," Tan said, adding that the new guideline systematically organizes declaration procedures for various taxes.

"It provides a supportive series of electronic materials accessible at any time by simply scanning a QR code with a mobile phone. This offers us clear guidance for handling cross-border transportation tax business, effectively reducing our company's cross-border tax risks."

A spokesperson for the international taxation department of the STA emphasized that international transportation formats are constantly evolving, and cross-border logistics are becoming increasingly frequent. The guideline's rollout is an innovative practice by tax authorities to cultivate specialized industries and elevate professional cross-border tax services.

Moving forward, the nation's tax authorities pledge to continuously track updates to the tax system and industry development, and will revise the guideline's content in real time, organize specialized industry tutorials and enrich the supply of "TaxExpress" services to facilitate the high-quality development of the international transport sector.

Taxpayers can now log onto the STA's official website and navigate to the special "TaxExpress" column to access the guideline and other related knowledge products.

Services trade grows in first half

China's services trade expanded 8.3 percent year-on-year in the first half, according to data released by the Ministry of Commerce. The total value of service imports and exports reached nearly 3.78 trillion yuan ($556.56 billion) from January to June this year. Throughout the period, travel service exports grew at the fastest rate among the top five service export categories, rising 31.1 percent to 229.2 billion yuan.

Yuan strengthens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, strengthened 28 pips to 6.7889 against the US dollar on Wednesday, according to the China Foreign Exchange Trade System.

Safety standard unveiled for autonomous driving systems

China has released a mandatory national standard regarding safety requirements for autonomous driving systems, the Ministry of Industry and Information Technology said on Tuesday.

The standard is scheduled to take effect on July 1, 2027. It applies to M and N-category vehicles equipped with Level 3 and Level 4 autonomous driving systems, but does not cover automated parking systems, the MIIT said.

The standard requires vehicle manufacturers to improve safety assurance mechanisms throughout the product life cycle and carry out simulation, field and road tests during the development and verification of autonomous driving systems, according to the MIIT.

It also calls for stronger capabilities in performing dynamic driving tasks, while specifying requirements for human-machine interaction and user notification to prevent misuse and abuse. For Level 3 systems, vehicles must be able to monitor drivers' readiness to take over control.

Looking ahead, the ministry said that it will strengthen market access management for intelligent connected vehicle products, improve testing methods for autonomous driving systems, and build a sound regulatory mechanism for intelligent connected vehicles to ensure the sector's high-quality development.

China's inaugural step into conditional automated driving is a characteristically strategic and guarded one. It is a controlled experiment designed to accumulate real-world data, refine technologies and standards within a safety-centric framework, and steadily build the foundation for the responsible integration of autonomous driving, experts said.

Hainan eyes eco-friendly vehicle future

By 2030, 100 percent of new and replacement cars must be NEV

By **MA SI** and **CHEN BOWEN** in Haikou

The southern island province of Hainan's goal to become China's first region to halt sales of new fossil-fuel vehicles marks a landmark step in the country's efforts to decarbonize the transportation sector, and is also part of Hainan's push to build a "green" province.

According to the 15th Five-Year Plan for the Hainan National Ecological Civilization Pilot Zone — released recently by the provincial government — the province will "smoothly advance" the ban on sales of new internal combustion engine vehicles by 2030. By that year, 100 percent of new and replacement vehicles in public services and commercial operations, and 100 percent of new private vehicles, must be new energy vehicles. The vehicle-to-charger ratio is targeted to remain below 2.5 to 1.

The policy has raised questions among some consumers concerned about the fate of their existing gasoline-powered cars. Will they still be allowed on the road? Li Ziwen, associate researcher of the Chinese Academy of Macroeconomic Research, said that the ban applies only to new vehicles, not to vehicles already in use.

"Vehicles already registered and in normal use will be unaffected," he said. "Owners' rights will not be compromised. Fuel vehicles registered before 2030 can continue to operate normally, undergo regular inspections and be legally transferred until they reach scrappage standards. There will be no compulsory elimination or traffic restrictions."

"As a national ecological civilization pilot zone and an international tourism island, Hainan's ecological advantages — its blue skies, white beaches and clear waters — are its core competitiveness," Li said. "Banning new fossil-fuel vehicles and promoting NEVs aligns perfectly with Hainan's green, low-carbon development positioning and its rich ecological endowment."

The province enjoys distinct geographic and climatic advantages that make the transition more feasible. With year-round warm temperatures, battery performance degradation in cold weather is not a significant concern — a critical factor given that low temperatures can reduce electric vehicle range in many northern regions.

Hainan's land area spans 35,400 square kilometers, with the distance from Haikou to Sanya less than 300 kilometers and a round-island drive under 1,000 km. This compact geography means range anxiety is far less pronounced.

"Based on the range of current flagship NEV models, most single trips within the island can be completed without recharging, or with just one charge," Li said.

Charging infrastructure is also well-established, a prerequisite for large-scale NEV adoption. Official data show that as of August 2025, Hainan had over 230,000 charging piles across 4,895 charging stations, achieving a vehicle-to-charger ratio of 2.1 to 1 — better than the national average. Highway service areas and all townships have achieved 100 percent charging coverage. Clean energy has become the province's largest power source, and Hainan ranks first and second nationally in NEV market penetration and per capita ownership share, respectively.

The 2030 ban is not a sudden policy shift but the culmination of more than eight years of steady planning. In April 2018, the central government first proposed "gradually prohibiting the sale of fossil-fuel vehicles in Hainan" in official guidance on deepening reform and opening-up. That marked the first time the term "ban" appeared in an official document.

In March 2019, Hainan released its Clean Energy Vehicle Development Plan, becoming the first province to give a specific timeline — 2030 for a province-wide ban. In August 2022, the provincial carbon peaking implementation plan further refined the targets, mandating 100 percent clean energy for new public vehicles by 2025 and 100 percent for new private vehicles by 2030.

The latest plan, issued in July 2026, is the third key document in this progression. It breaks down specific targets and tasks, including the vehicle-to-charger ratio requirement and the orderly promotion of fuel-cell vehicle demonstrations in heavy trucks, cold-chain logistics and public transport.

The policy has been accompanied by growing public acceptance of NEVs, both nationally and locally. Ministry of Commerce data show that China's NEV passenger vehicle market penetration rose from 5.7 percent in 2020 to 53.9 percent in 2025 — more than half of all new cars sold.

In Hainan, the figures are even more striking. According to provincial industry authorities, Hainan promoted 116,800 new NEVs in 2025, accounting for 62.9 percent of all new vehicles. That means six out of every 10 new cars purchased in Hainan last year were new energy vehicles.

In April 2026 alone, the NEV penetration rate hit a record 74.5 percent.

Total NEV ownership in Hainan reached 517,000 units by the end of November 2025, representing 23.04 percent of the province's total vehicle fleet.

The strong consumer preference is driven by fiscal policies and infrastructure. Hainan does not collect separate highway tolls; instead, road maintenance costs are incorporated into fuel prices, making gasoline consistently over 1 yuan ($0.15) per liter more expensive than on the mainland.

Zhang Xiang, a guest professor at Hainan Vocational University of Science and Technology and an auto industry analyst, said that this pricing structure, combined with comprehensive charging networks and short driving distances, gives NEVs a compelling cost advantage over gasoline vehicles.

But Li from the Chinese Academy of Macroeconomic Research cautioned that Hainan's model may not be directly replicable in other provinces. In inland regions, vehicles frequently cross provincial borders, and a blanket ban on fuel-vehicle sales could trigger cross-regional purchases, raising management costs and undermining the ban's effectiveness.

Moreover, regions such as Northeast China, the Yangtze River Delta and Central China still have relatively complete fossil-fuel vehicle supply chains; a sudden ban could disrupt industrial stability and employment. Cold winters in northern areas also pose greater challenges for battery performance.

Therefore, Li stressed that other regions should formulate differentiated policies based on local conditions and avoid a one-size-fits-all approach.

Shi Jianhua, vice-chairman of China EV100, a Beijing-based auto industry think tank, emphasized the effect of Hainan's pilot. "Hainan's relatively enclosed geography makes it easier to take the lead," he said. Beyond ecological protection, a successful implementation could yield a "China solution" for NEV promotion, generating valuable experience in policy design, infrastructure development, consumer guidance and industrial transformation.

The plan sets a target to raise NEV ownership from 23.75 percent in 2025 to 45 percent by 2030 — nearly doubling the current share. This will require continued infrastructure expansion and refinement.

Shi said that the key is to make charging as convenient as refueling. He suggested improving public NEV rental systems and further optimizing the vehicle usage environment to accelerate adoption and gradually reduce the intensity of fossil-fuel vehicle use. He also reassured the public that "a ban is not a driving ban" — existing fuel vehicles will continue to be used normally over a period of natural turnover.

The green mobility revolution that began in Hainan is not an isolated adjustment, but the prelude to a nationwide transformation of the automotive industry and mass travel patterns, experts added.

Island's green drive powers ahead as nuclear mini-reactor nears debut

By **MA SI** and **CHEN BOWEN** in Haikou

Hainan has crossed a critical threshold in its energy transition, with new energy installed capacity surpassing 12.71 million kilowatts by end-June, accounting for 50.1 percent of the province's total power capacity. The milestone signals that the tropical island has entered a new phase in which renewable sources lead a diversified and coordinated power supply system.

The achievement is part of Hainan's broader push to build a national ecological civilization pilot zone. The province has intensified pollution control and green development, aiming to create a world-class, low-carbon free trade port.

In Chengmai county, the once-notorious Yanchunling landfill has been transformed into a sprawling green park. Issues regarding the landfill — which once contained 4.5 million cubic meters of waste and triggered over a thousand complaints — have been fully resolved after seven years of intensive work.

"The air quality is getting better day by day. You've solved a long-standing problem," said Zhang Guilin, a local resident who presented a banner to the project team.

The rehabilitation project reflects local authorities' commitment to ecological restoration. "From complaints to praise, this once-intractable issue has become a testament to public understanding, support and participation in environmental protection," an official from the Chengmai county ecology and environment bureau said.

At Haikou National High-Tech Industrial Development Zone, two natural gas generator units operated by Datang Haikou Clean Energy Power Generation Co are running smoothly.

"We have formed a diversified clean energy system covering gas power, offshore wind, photovoltaic and energy storage — with all installed capacity from clean sources — accounting for 13.42 percent of the province's total and reducing carbon dioxide emissions by over 2.6 million metric tons annually," said Jing Guodong, director of the safety production and science innovation center at Datang Hainan Energy Development Co.

Across Hainan, renewable energy now accounts for more than 60 percent of new power additions. The province is piloting integrated models such as "offshore wind plus marine ranching" and "photovoltaic plus agriculture" to maximize land-use efficiency and ecological benefits.

As artificial intelligence drives an unprecedented surge in global computing demand, the need for vast, stable electricity supplies has become critical. China is positioning itself at the forefront of this convergence by deploying small modular reactors (SMRs) to power data centers.

Wei Zhigang, chairman of CNNC Hainan Nuclear Power Co, said tech giants like Microsoft and Google are actively exploring SMRs for AI infrastructure. Wei's company is nearing completion of Linglong One — the world's first onshore commercial SMR — with 90 percent of installation done and commercial operations slated for this year.

"One of the key advantages of SMRs is their flexible placement. We can deploy them right where computing power is needed, enabling close load-matching," Wei said. His company is exploring a nuclear-powered zero-carbon industrial park in Hainan's Changjiang Li autonomous county, aiming to create a "nuclear energy plus computing power" pilot zone.

Upon completion, Linglong One will generate 1 billion kWh annually, enough to power 526,000 households while cutting CO2 emissions by 880,000 tons — equivalent to planting 7.5 million trees. It is also the first onshore commercial SMR to pass an International Atomic Energy Agency safety review.

"It's like the evolution from desktop computers to laptops," Wei said, adding that the reactor's integrated design offers compactness, convenience and safety.

IAEA Director-General Rafael Mariano Grossi said nuclear power is "destined to be the energy partner of the AI revolution", adding that only nuclear can provide low-carbon, round-the-clock, high-density, stable and scalable power.

The global interest comes as data recently released by OpenRouter — a platform widely used by overseas developers to access AI models — said Chinese large language models had surpassed US-developed LLMs for 11 consecutive weeks as of July 12, placing China at the top position globally.

Since Feb 8, more than 30 percent of tokens used by US companies on the platform each week were related to Chinese AI models, with the share peaking at 46 percent. Tokens are small units of data processed by AI models during training and inference. In contrast, the share was only 4.5 percent in the first half of 2025.

As Hainan continues to lead in both clean energy and nuclear innovation, the island is poised to become a critical hub where ecological civilization meets the computing needs of the future.

An aerial photo shows the construction site of Linglong One — the world's first onshore commercial small modular reactor — in Hainan province on Aug 10, 2023. GUO ZHIHUA / FOR CHINA DAILY

2026 CONFERENCE ON HONGSHAN CULTURE

Editor's note: *On Wednesday, an event in Chaoyang, Liaoning province — a cradle of the prehistoric Hongshan culture from over 5,000 years ago — brought together experts under the theme "Hongshan Culture: A Dialogue Between Eras and Civilizations". Speakers highlighted the lasting legacy of Hongshan ancestors and advocated for broader cross-cultural dialogue and mutual learning.*

A GLOBAL DIALOGUE MILLENNIA IN THE MAKING

Director underlines strategies on protection, promotion

By WANG RU in Chaoyang, Liaoning
wangru1@chinadaily.com.cn

The rich archaeological features and unearthed artifacts of Hongshan culture continue to provide scientific evidence supporting the development of China's archaeological theories. By empowering the growth of archaeology tailored to Chinese features, style and ethos, these discoveries contribute a fresh perspective and invaluable wisdom to global studies on how early human civilizations first took shape.

Addressing attendees at the 2026 Conference on Hongshan Culture on Wednesday in Chaoyang, Liaoning province, Rao Quan, director of the National Cultural Heritage Administration, underscored the deep-seated significance of this heritage within Chinese civilization while outlining key strategies for its future preservation and global promotion.

"As a key prehistoric archaeological culture in northern China, Hongshan offers a valuable sample for studying the origins of Chinese civilization through its unique jade ritual system, monumental sacrificial remains, and complex belief system. It demonstrates the pluralistic yet unified nature of Chinese civilization," Rao said. "It also carries the shared cultural memory of the East Asian civilization circle, possessing a natural affinity that transcends national borders and resonates with diverse audiences."

Rao commended the recent, dedicated efforts made by Liaoning and Hebei provinces and the Inner Mongolia autonomous region. By enacting systematic protection measures and seamlessly weaving cultural preservation into modern development, local governments have injected powerful momentum into cultural construction.

"The National Cultural Heritage Administration has long supported the protection and research of Hongshan culture, actively upheld regional governments' efforts, facilitated the construction and opening of the Niuheliang National Archaeological Site Park, and placed Hongshan culture on the World Heritage tentative list," Rao said.

To build on this momentum, he advocated for a comprehensive resource inventory on the basis of the ongoing fourth national census of cultural relics. Upgrading site protection frameworks and cementing cross-provincial safeguards will be vital to keeping these ancient sites intact for future generations.

"With a sense of responsibility to history and the people, we will make Hongshan cultural sites important venues where people can touch history and feel the depth of civilization. This will lay a solid foundation for deeper academic research and broader preservation and utilization efforts," he added.

Beyond basic preservation, Rao emphasized bringing modern science into the field. By harnessing advanced techniques such as isotope monitoring, paleoenvironmental reconstruction and ancient DNA analysis, researchers can unearth a clearer picture of how Hongshan societies adapted and contributed to early Chinese civilization.

Looking to the international stage, Rao called for dynamic global partnerships, high-profile overseas exhibitions, and joint academic conferences to share the story of Hongshan culture and the roots of Chinese civilization with the world.

"We will make the Hongshan culture an important window through which people around the world can understand the lineage of Chinese civilization," he said.

Liaoning makes headway on heritage preservation

By DENG ZHANGYU
in Chaoyang, Liaoning
dengzhangyu@chinadaily.com.cn

Northeast China's Liaoning province, one of the core hubs of Hongshan culture, is stepping up efforts in legislation, academic research, heritage preservation and public awareness to better protect and pass on the culture and boost its influence, said Xu Kunlin, secretary of the Communist Party of China Liaoning Provincial Committee, at the 2026 Conference on Hongshan Culture held in Chaoyang, Liaoning, on Wednesday.

"Liaoning is rich in cultural and historical relics, with profound historical heritage. It is home to a long-standing farming culture, fishing-hunting culture and nomadic culture, and is an important birthplace of Chinese civilization," Xu said.

"The Niuheliang site here has pushed the origin of Chinese civilization back by five to six hundred years. It is not only a key source for the Chinese nation's cultural confidence and the continuation of the flame of civilization, but also a cultural treasure for the whole world," he added.

Dating back some 5,000 to 5,800 years, the Niuheliang site in Chaoyang is a core site from the peak period of Hongshan culture. It showcases the culture's most mature jade artifact system, primitive cosmology and early state formation.

Xu said that Liaoning has adhered to the rule of law as a bottom line and built a refined system for cultural relic protection with strict standards. In recent years, the province has revised and implemented the Regulations on the Protection of the Niuheliang Site in Liaoning Province and updated the Protection Plan for the Niuheliang Site.

Liaoning has also strengthened academic research by setting up the Hongshan Culture Research Institute. Working with academies and institutions, it has deepened multi-disciplinary studies on national-level archaeological projects aimed at decoding the cultural genes of Hongshan culture and strengthening empirical evidence for the origin of Chinese civilization.

In July, the National Cultural Heritage Administration released the 15th Five-Year Plan (2026-30) for the cultural relic sector. The document provides guidelines on preparing Hongshan culture sites as they seek World Heritage status within the next five years.

According to Xu, Liaoning is cooperating with other provinces to promote a cross-regional joint bid for World Heritage status, so that Hongshan culture and Liangzhu culture in Zhejiang province — two prehistoric landmarks of Chinese civilization — can jointly serve as powerful testimony to China's 5,000-year civilization.

Last year, Liaoning hosted the International Communication Conference on Hongshan Culture, where the official logo of Hongshan culture was unveiled. A dance drama related to the culture is also in production, and a series of campus activities have been launched to introduce Hongshan culture to young people.

"Hongshan culture is going beyond Liaoning and reaching the world with a youthful tone and digital forms," Xu said.

"We are willing to use Hongshan culture as a bond, maintain an open and inclusive attitude, deepen exchanges and cooperation with archaeological and cultural institutions around the world, and contribute wisdom and strength to building a community with a shared future for humanity."

International importance of China's ancient past highlighted

By DENG ZHANGYU
in Chaoyang, Liaoning

Framing the ancient Hongshan culture through the lens of global history is key to deepening cross-cultural exchange and highlighting China's contributions to human civilization, said China Daily Publisher and Editor-in-chief Qu Yingpu at the 2026 Conference on Hongshan Culture in Chaoyang, Liaoning province, on Wednesday.

Qu said that from the perspective of world civilization, Hongshan stands as a bright eastern star at dawn. Originating around 6,500 years ago, it emerged at a time close to the early stages of ancient Egyptian and Mesopotamian civilizations, making it an indispensable eastern chapter in prehistoric human civilization.

"Over thousands of years, Chinese civilization has embraced openness, inclusiveness and mutual exchange," he added.

Qu cited ancient transcontinental journeys, such as Zhang Qian's envoys, Xuanzang's pilgrimage, Omani trade routes and Zheng He's voyages, as evidence that "generations of ancestors crossed mountains and oceans to connect China with the rest of the world, writing vivid stories of exchanges and mutual learning between civilizations".

The publisher called on media professionals, scholars and young people worldwide to deepen research into Hongshan culture, expand cross-border academic exchanges, implement the Global Civilization Initiative, and help countries better understand each other and achieve shared development.

From the perspective of Chinese civilization, Qu said that Hongshan culture represents the prehistoric dawn of Chinese heritage.

He detailed that recent archaeological discoveries have expanded the understanding of Hongshan culture's duration and reach. Together with the Yangshao, Lingjiatan and Liangzhu cultures, Hongshan stands as one of the major prehistoric jade culture centers of China. Cultural symbols nurtured by ancestors along the basins of the Yellow, Yangtze and Liaohe rivers — such as dragon-scale patterns, rose patterns and octagonal star patterns — bear witness to the exchange and fusion of civilizations across different regions.

"The early Chinese cultures of different regions interacted across vast distances and eventually formed a diverse yet unified Chinese civilization," Qu said.

From the perspective of the new era, Hongshan culture holds the original genes for a new form of human civilization.

After visiting the Niuheliang site in Chaoyang, Qu said he was deeply impressed by its altars, temples and stone tombs, as well as the ancient beliefs in dragons and jade, and reverence for heaven and Earth — elements that shaped the unique cosmology, worldview, social and moral values of Chinese people.

Qu said the essence of fine traditional Chinese culture carried by Hongshan culture serves as a profound foundation for China's modernization, empowering Chinese civilization to transform itself for the modern era and nurture a new form of human civilization.

"China in the new era will continue to draw wisdom and strength from its profound traditional culture, always stand on the right side of history and human progress, and while tirelessly working for the well-being of the Chinese people, offer the world China's opportunities and solutions," he said.

Guests share their insights on Hongshan culture before the conference began on Wednesday in Chaoyang, Liaoning province.

Scholars discuss study of prehistoric cultures

By BAI SHUHAO
in Chaoyang, Liaoning
baishuhao@chinadaily.com.cn

More than 5,000 years ago, the Hongshan culture emerged in what is now northeastern China, leaving behind jade artifacts, ritual sites and a sophisticated belief system. Today, scholars say its values of harmony, inclusiveness and exchange continue to offer insights into how civilizations interact and evolve.

On Wednesday afternoon, Chinese and international scholars gathered in Chaoyang, Liaoning province, for an academic seminar to discuss the core values of Hongshan culture from the perspective of mutual learning among civilizations, held as part of the 2026 Conference on Hongshan Culture.

Guo Dashun, a renowned archaeologist and honorary director of the Hongshan Culture Research Institute, who participated in excavations at the Niuheliang site, said Hongshan serves as a typical representation of the origins and characteristics of Chinese civilization.

"Its exchanges with diverse cultures reflected the inclusive nature of Chinese civilization and contributed to its enduring continuity," Guo said.

Building on this perspective, Wang Wei, a member of the Chinese Academy of Social Sciences, said archaeological discoveries related to Hongshan culture provide important evidence for understanding the more than 5,000-year history of Chinese civilization.

He added that cultural elements associated with Hongshan culture, including its jade ritual system and dragon imagery, shaped the spiritual world of early China and continue to influence Chinese civilization today.

Looking beyond its role in the development of Chinese civilization, international scholars also highlighted Hongshan culture's significance in the broader history of human civilization.

Elizabeth Childs-Johnson, a Sinologist from the United States, described Hongshan culture as a "cultural miracle", highlighting its importance in the study of prehistoric civilizations worldwide.

She said Hongshan culture is one of the few Neolithic cultures known archaeologically to have documented a complex society transitioning from a hunting-and-gathering society to an agrarian one.

"It also represents one of the earliest examples of a highly developed and standardized system of ancestor worship and ritual practices," Childs-Johnson said.

Lyu Xueming, a professor at the School of History at Renmin University of China, said elements such as ritual architecture, spatial planning and ceremonial pathways formed a regional cultural system that attracted and connected people from distant areas.

Such ritual traditions, according to Li Xinwei, director of the Chinese School of Classical Studies at Athens, a Beijing-backed research institute based in Greece, reflected a unique worldview that shaped later approaches to governance and political organization.

Alexey Kovalev from the Institute of Archaeology of the Russian Academy of Sciences found similarities between a circular ritual structure discovered in the Munkh-Khairkhan culture and ritual architecture at the Niuheliang site. He suggested that the northern culture originating near Lake Baikal may have inherited certain traditions connected with Hongshan culture.

"The significance of Hongshan culture extends beyond archaeology. It reminds us that civilizations have never developed in complete isolation," said Gor Sargsyan, foreign director of the Confucius Institute at Yerevan Brusov State University in Armenia.

He added that studying Hongshan culture is not only about exploring China's ancient heritage, but also about creating opportunities for dialogue and mutual learning among civilizations. Other scholars also shared their perspectives on the ancient culture, emphasizing its enduring value in promoting dialogue, understanding and cooperation among civilizations.

The 2026 Conference on Hongshan Culture is held in Chaoyang, Northeast China's Liaoning province, on Wednesday. WANG ZHUANGFEI / CHINA DAILY

Outstanding contributors to the preservation and understanding of Hongshan culture

Su Bingqi (1909-97)

Su, a founding figure of Chinese archaeology, devoted his career to studying the origins of Chinese civilization and formulating a series of profoundly influential theories. In the 1980s, drawing on his studies of Hongshan and other prehistoric cultures, he proposed a three-stage model for the formation of China, arguing that the interaction, convergence and integration of diverse civilizations scattered across the vast territory ultimately gave rise to the pluralistic yet unified Chinese civilization.

This framework challenged the earlier view of a single-origin model, thereby opening new paths for tracing the formation and development of Chinese civilization from multiple regional perspectives. His intellectual legacy continues to shape contemporary understanding of both Hongshan culture and the broader origins of Chinese civilization.

Su Shenzhi, daughter of Su Bingqi, said: "His deep love for his motherland led him to consider what has made China and how Chinese civilization originated and developed. With that perspective, he was able to make good use of archaeological evidence and propose theories based on it."

Guo Dashun

Guo, 88, has dedicated over half a century to the study of Hongshan culture, serving as lead archaeologist at key sites such as Niuheliang, Dongshanzui and Shipengshan. Through his dedicated efforts, the realities of Hongshan society are becoming increasingly clear.

Based on his studies, Guo summarized "altar, goddess temple, circular stone mound tomb, dragon, phoenix and jade" as the key elements of Hongshan culture, indicating its institutional ritual constructions and mature jade artifacts system. He also proposed that unlike Western civilizations, Hongshan culture demonstrated a continuous civilizational development path, supported by a belief system connecting heaven, Earth, humanity and deities.

From Guo's perspective, archaeology is not only about tracing historical remnants, but also about making clear the evolution of civilization.

"China, both now and in the future, cannot be separated from its history. Without understanding the past, we cannot know about the present or anticipate the future. That is why we highlight our roots," Guo said.

Elizabeth Childs-Johnson

From an outsider's perspective, Elizabeth Childs-Johnson, a Sinologist from the United States specializing in Chinese art and archaeology, has long been committed to promoting the global significance of Hongshan culture.

Now 77, she recalled first visiting Hongshan sites decades ago, where she met Chinese archaeologists at sites in Chaoyang, Liaoning province. Those encounters forged a lasting bond.

"I think Hongshan is really a miraculous culture. There's really no other similar culture in the Neolithic period that can be easily compared with the complexity of Hongshan," she said.

For decades, she has focused on Hongshan's jade artifacts to explore their cultural value, summarizing five primary gifts of Hongshan culture. Through these, she demonstrated the artistic creation, spiritual beliefs and civilizational connotations of Hongshan culture.

"Hongshan really has comparability not only with Mesoamerica, but other mound-building cultures that built huge mounds dedicated to their religious leaders. In fact, Hongshan can be recognized as one of the major mound-building cultures throughout the world," she said.

— WANG RU AND BAI SHUHAO

What they say about Hongshan and Niuheliang

Shahbaz Khan, *director and representative of the UNESCO Regional Office for East Asia*

Dating back 5,000 to 6,500 years, Hongshan culture represents a foundational chapter in human development. Vividly preserved at sites like the Niuheliang National Archaeological Site Park, its ritual architecture and extraordinary jade craftsmanship reveal humanity's early spiritual and social evolution. For UNESCO, protecting these roots is about safeguarding the unique human genius that grounds our collective identity.

Lao Yanwu, *secretary of the CPC Chaoyang Committee*

The Niuheliang site is a landmark representing the first stage of ancient Chinese civilization. In recent years, we have strengthened heritage conservation through a series of key initiatives, including upgraded exhibitions at the Niuheliang Site Museum and a high-standard conservation plan. Hongshan culture connects the past with the present, while dialogue among civilizations builds a shared future. Preserving this remarkable legacy and enabling Niuheliang to shine in the new era remains Chaoyang city's enduring cultural mission.

Khaled Nazmy, *ambassador of Egypt to China*

We are gathered here on a historic soil that witnessed a culture that flourished over 5,000 years alongside the Liaohe River. Our gathering today is proof that our ancient heritage and civilization is not only a chapter in history, but also a living legacy that continues to inspire us, bring us together and remind us of our shared responsibility to preserve our cultural heritage, deepen our friendship. Although the Hongshan heritage and the ancient Egyptian heritage flourished in different regions ... both became a source of inspiration, cooperation and friendship.

Arlindo do Rosario, *ambassador of Cabo Verde to China*

My visit to the Niuheliang site of Hongshan culture left a deep impression on me. A civilization with a history of around 5,000 years, Hongshan is not only part of Chinese civilization, but also a shared spiritual heritage of humanity. Although Cabo Verde and the Hongshan homeland are separated by geography, our common aspirations connect us.

Looking back at Hongshan, we see how ancient people interpreted the sacred, built social order, and envisioned the future through the pursuit of beauty.

Wang Wei, *a member of the Academic Divisions of the Chinese Academy of Social Sciences*

As an important component of the diverse yet unified Chinese civilization, Hongshan culture proves that Chinese civilization did not originate from a single center, but emerged from the independent development and mutual influence among multiple regional cultures ... In the past, archaeologists from both China and the West used to define civilization by the presence of writing, cities and metallurgy. Hongshan culture lacked all three, yet it formed a complex society organized around belief, ritual systems and shared spiritual identity. This shows that there is more than one path to civilization.

Fang Xiangming, *director of the Zhejiang Provincial Institute of Cultural Relics and Archaeology*

Around the same period as Hongshan culture, Hongshan's jade pig-dragon spread to the lower reaches of the Yangtze River, over 1,000 kilometers away, and eventually became part of the unified religious emblem and ancestral icon of the Liangzhu civilization.

If we are to trace the origins of the Liangzhu jade civilization and jade culture and discuss the symbolic system of cosmology, Hongshan and Lingjiatan, which are closely related, are among the most important parts. The Hongshan and Liangzhu jade civilizations represent the earliest and most systematically developed models in the inheritance and innovation of Chinese jade culture, and they are essential components of China's 5,000-year-old civilization.

Li Xinwei, *director of the Chinese School of Classical Studies at Athens*

Almost all primary civilizations around the world shared a common pattern: when an early state was established, people commonly tried to formalize social norms based on cosmic order. Hongshan culture is a remarkable illustration of this pattern, which used primitive cosmology to develop early religion, thereby gathering people to build a complex society. Therefore, the early link between primitive cosmology and political systems exhibited in Hongshan culture was an important origin of Chinese people's worldview.

COMMENT

Editorials

The return of the Japanese samurai is no innocent cartoon entertainment

There is something almost unsettling about the cover of Japan's 2026 Defense White Paper. A cheerful cartoon mascot smiles beneath a bright sky, as though the clinical language of deterrence, missiles and military expansion can be softened by cuteness.

Japan's Nobel laureate Kenzaburo Oe once wrote of the ambiguity that allowed militarism to overtake his country: "That powerful, acute ambiguity which tears the nation and its people apart ... drove Japan to play the aggressor in Asia." That same ambiguity lingers beneath this year's polished report, where "patriotic rhetoric" risks dulling independent judgment and turning people into instruments of an expanding war machine.

For the first time, the 2026 white paper includes a dedicated chapter on "new forms of warfare", drawing explicit lessons from Ukraine, including drone warfare, artificial intelligence and prolonged attrition. Space, cyber and electromagnetic operations are elevated from supporting functions to core combat domains.

The parallels with pre-World War II Japan are difficult to ignore. Then, as now, "external threats" were invoked to justify military expansion. The ideology of "leaving Asia and joining the West" has been repackaged as alignment with a "democratic security coalition". The notorious wartime vision of a "Greater East Asia Co-Prosperity Sphere" has given way to the language of a "free and open Indo-Pacific". Even the economic arguments echo history, with military investment promoted as a source of technological innovation and industrial growth.

As some Japanese observers have said, postwar Japan rested on two moral foundations: "democracy" and an unwavering commitment never to wage war again. Now both are under increasing strain. The nation sees political debate narrowing under the ascendant right-wing neo-militarists while the country's pacifist identity is gradually reinterpreted into support for military expansion in the name of deterrence. The postwar settlement, once regarded as Japan's moral compass, appears increasingly contested.

As a spokesman for China's Ministry of National Defense said, the 2026 white paper, filled with false narratives, indicates Tokyo is fabricating regional threats to dismantle the restraints that shaped Japan's postwar military posture. He rightly pointed out that Japan's accusations against China amount to "a thief crying 'stop thief'" and warned that Japan's neo-militarism poses a challenge to regional stability.

Japan's pursuit of military superiority through ever-expanding deterrence risks triggering a self-reinforcing cycle of regional arms race. Although the country has technological strengths, a decisive "overwhelming" military superiority over China will prove only costly wishful thinking. Japan also remains heavily dependent on imported energy and strategic resources — a vulnerability that contributed to its wartime defeat and remains no less significant today.

Perhaps the most revealing feature of Japan's strategy is the insecurity that underpins it. Since the end of World War II, Tokyo has consistently sought security under the United States-led alliance, often at considerable economic and strategic cost. From the Plaza Accord to more recent financial concessions, Japan has repeatedly subordinated aspects of its autonomy to preserve the alliance.

The palpable unease — and at times barely concealed irritation — with which Japanese Prime Minister Sanae Takaichi received the US leader's mentioning of the attack on Pearl Harbor indicates Japan remains profoundly uncertain about the reliability and durability of its most cherished alliance.

Recent protests outside the National Diet are a stark reminder that many Japanese people harbor deep misgivings about the Takaichi government's dangerous course.

Yet the juggernaut of rearmament rolls on. The nearly 600-page 2026 white paper helps pave the way for revising the country's three key security documents by the end of this year and accelerating its military buildup. Some in Tokyo are already openly proposing Japan acquire nuclear weapons and the possibility of raising its military spending above 3 percent of GDP, while legislation for dedicated military taxes advances.

Oe warned that ambiguity could tear the nation apart. As Japan steadily redefines the meaning of "security" and "peace", that warning carries renewed resonance.

Response to US tech hegemony justified

What the United States administration frames as protecting "national security" is, in practice, a systematic campaign to suppress Chinese high-tech enterprises and restrict their access to US markets and technologies.

The latest installment: the Federal Communications Commission is reportedly drafting a ban on imports of new Chinese optical transceivers — devices that convert electrical data into light and back within data centers. US officials hope to publish the rule this year, according to a Reuters report on Tuesday. To justify its protectionist agenda, Washington has again sought to paint Chinese enterprises as "national security threats" without providing any substantial evidence.

Beijing's calibrated response to the series of ill-advised China-targeted measures by the US came on Wednesday. China's Ministry of Commerce announced enhanced export controls on drones and related dual-use items to the US. The ministry also took countermeasures against six US entities, including Applied DNA Sciences, for aiding and abetting illegal US sanctions on Chinese enterprises citing so-called "forced labor" in the Xinjiang Uygur autonomous region.

Compliance Testing LLC was also added to the entity list for supporting FCC restrictive measures that violate Chinese businesses' legitimate rights and threaten China's sovereignty, security and development interests.

Separately, the ministry commenced an investigation into imported printing and copying equipment equipped with foreign system software to assess potential effects on China's national security and foreign trade.

The ill-advised measures against China imposed by the US in recent weeks constitute a serious violation of the important consensus reached by the two heads of state and a material infringement upon China's legitimate rights and interests. China is therefore left with no alternative but to adopt the necessary countermeasures, the ministry said in a statement.

As the ministry said, Beijing's response remains proportionate and measured, indicating that China values the hard-won stability of its economic ties with the US.

The US side is urged to revoke its relevant measures and return to resolving differences through consultations.

The Chinese embassy in the US has also urged the US government to "heed the objective and rational voices of the business communities in both countries" and "stop smearing Chinese companies and threatening them with sanctions".

The broader context is telling. The planned transceiver ban follows recent US restrictions on imports of drones, humanoid robots and power inverters, all specifically targeting Chinese high-tech products. Washington is also weighing controls on Chinese open-source AI models.

Such crackdowns will serve to force related Chinese companies to make strategic adjustments. The external pressure also reflects a deeper reality: the US is clinging to technological hegemony, abusing export controls and recklessly pushing "decoupling" and "supply chain disruption". The chain of suppression, from chip equipment to computing hardware, is likely to expand.

If Washington insists on new restrictions, China will pursue further countermeasures, the Chinese Ministry of Commerce rightly warned.

While key technologies can be restricted and supply chains disrupted, the drive of Chinese enterprises for industrial advancement will not be halted. Alibaba launched its latest and "most powerful" AI model, Qwen3.8-Max, on Monday — boasting 2.4 trillion parameters and ranking second only to Anthropic's Claude series in Arena rankings. This achievement underscores that Chinese companies, making the most of what they have, continue to improve their competitiveness in high-tech sectors.

Moreover, the global semiconductor supply chains are interconnected. Forcibly severing them also raises costs for US companies. This lose-lose dynamic contradicts the fundamental truth that technological progress thrives on competition and collaboration. By politicizing technology and weaponizing "national security", Washington will ultimately curb global scientific advancement — and, in the long run, its own competitiveness.

The US should refrain from stirring up trouble while both sides are preparing for high-level exchanges. This year is meant to be a "big year" for China-US engagement, not a "big year" for Washington to intensify its crackdown on Beijing.

Managing unseen pollution focus of environmental plan

China's environmental plan during the 15th Five-Year Plan (2026-30) period signals a new stage in which the country's green governance is moving to the management of more complex environmental risks.

It does not mean the battle for blue skies, clear waters and clean soil is over. Rather, future progress will depend more on early detection, full-chain supervision and long-term risk control.

From monitoring networks to soil, groundwater, rural environments and solid waste, future environmental progress will increasingly depend on the ability to detect, trace and manage risks before they become obvious problems, according to the plan issued jointly by the Ministry of Ecology and Environment and other relevant departments.

One clear signal comes from China's aim to make important progress in establishing a modern monitoring system by 2030. The validity rate of automatic monitoring data is expected to rise from 95 percent in 2025 to 98 percent in 2030, while the intelligent level of operation, maintenance and key-indicator testing is set to reach 70 percent. The plan also calls for stronger monitoring of new pollutants, heavy metals, greenhouse gases and ecological problems.

Earlier policies largely addressed visible pollution, such as smog, polluted rivers and black and odorous water bodies. The problems receiving greater policy attention now — soil contamination at industrial sites, groundwater pollution, solid waste facilities, data falsification by polluters, and ecological degradation in remote areas — are harder to see and slower to unfold. Without a stronger monitoring system, these risks will go undetected until it becomes too expensive to reverse them.

The new plan sets a target of raising the safe utilization rate of contaminated farmland from about 93 percent in 2025 to more than 95 percent by 2030, and increasing the proportion of groundwater of good quality from 74.3 percent to more than 78 percent.

It also aims to lift the rural domestic sewage treatment rate from 55 percent to 70 percent and implement environmental improvement projects in 80,000 villages.

These targets point to a broader definition of environmental quality. While clean air in cities remains important, people's environmental expectations now include safe food, secure drinking water and livable rural surroundings. Soil and groundwater pollution can affect health, food safety and land redevelopment, yet they are often difficult to detect and costly to remedy. That is why the new plan emphasizes source prevention, risk control for redevelopment sites, heavy metal tracing in farmland and countywide progress in building beautiful villages.

China generates more than 11 billion metric tons of solid waste each year and has about 30 billion tons of historically stored industrial solid waste. The new plan calls for the effective control of the historical stockpiles by 2030, along with the curbing of illegal dumping and disposal, and the building of an information-based regulatory network covering key fields.

The plan also sets measurable targets for the share of hazardous waste disposed of through landfill, which should be cut from about 13 percent in 2025 to no more than 10 percent by 2030, while the share of key general industrial solid waste stored or landfilled should fall from about 56 percent to no more than 30 percent. Full-process information-based supervision is expected to cover all entities related to hazardous waste.

Hidden environmental risks are hard to detect and eradicate, they require reliable data, interdepartmental coordination, local enforcement, stable funding and the long-term operation of environmental infrastructure.

The new environmental plan suggests that China's environmental agenda is becoming more systematic. The next stage will be about building the institutions, data systems and risk-control mechanisms needed to prevent deeper environmental problems from emerging.

— HOU LIQIANG, CHINA DAILY

What They Say

Scope of geological disaster prevention expanded

Editor's note: *China's Ministry of Natural Resources recently released an implementation plan for national geological disaster prevention and control during the 15th Five-Year Plan (2026-30) period. China Central Television spoke to Yang Xudong, a senior engineer at the ministry's geological disaster technical guidance center, on the importance of the plan. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China's approach to geological disaster prevention has evolved over time. Initially, efforts focused on community-based monitoring and professional inspections. Later, authorities promoted the large-scale use of high-precision remote sensing and mapping technologies while advancing the development and deployment of universal monitoring equipment. These efforts, however, focused mainly on known hazard sites where clear signs of ground deformation had already been detected.

The country is now entering a new phase that directly addresses widespread shallow landslides and debris flows triggered by extreme rainfall. Unlike conventional geological hazards, these disasters often develop without any visible warning signs and occur suddenly during intense rainfall, making them extremely difficult to detect and forecast with traditional methods.

Since these hazards have neither been previously identified nor shown obvious precursory signs, they fall outside the scope of known geological hazard sites established through conventional methods. Consequently, even if all identified hazard points are effectively managed, significant risks remain across broader areas. Therefore, it is crucial to expand disaster prevention from safeguarding individual hazard sites to managing risks across entire regions.

Such disasters cannot be effectively addressed simply by deploying more personnel or monitoring equipment. Recognizing this challenge, the new plan outlines seven key tasks covering dynamic investigations, monitoring and early warning, comprehensive risk mitigation, and a dual-control management system that combines oversight of both known hazard sites and broader risk zones.

More fundamentally, the plan shifts the guiding philosophy of geological disaster prevention toward reducing disaster risks, extending prevention efforts from isolated hazard points to comprehensive area-wide risk management.

The plan also designates 21 key prevention zones, up from 16 during the 14th Five-Year Plan (2021-25) period. The zones cover about 2.97 million square kilometers for landslides, rockfalls, debris flows and ground subsidence, as well as 280,000 sq km for ground settlement and earth fissures.

During the 14th Five-Year Plan period, China established an integrated monitoring and early-warning system that combined human expertise with technological support. Automated monitoring and early-warning facilities were installed at 75,000 geological hazard sites with relatively high risks across 27 provincial-level regions.

Additionally, an integrated meteorological risk warning platform was established, linking provincial, municipal and county authorities. This platform achieved full county-level coverage of geological disaster weather risk forecasting in all disaster-prone areas nationwide.

According to the new plan, during the 15th Five-Year Plan period the country will further optimize its automated monitoring network while leveraging artificial intelligence, digital twin technologies and other advanced tools to enhance the identification of hidden hazards and the accuracy of disaster forecasting and early warning systems.

This shift reflects a more scientific understanding that, under increasingly extreme weather conditions, some disasters remain inherently difficult to prevent with existing technologies. The plan also emphasizes public education, training, and emergency drills tailored to different groups, including disaster management officials, technical professionals, community-based monitors, and the general public.

VIEWS

W. Julian Korab-Karpowicz

Evolving beyond friction to harmony

The collective Western foreign policy architecture is currently trapped in a dangerous conceptual mismatch. It attempts to manage complex, interconnected 21st-century geopolitical conflicts using an outdated 17th-century mechanical apparatus.

This reductionist dogma treats regional stability as a zero-sum collision of physical facts, raw power politics, and endless containment strategies. We see the tragic failures of this mechanical framework everywhere — from the permanent deadlocks in the Middle East to the widening economic fragmentation across the Eurasian continent.

To break this destructive cycle, global statesmanship must embrace a fundamental philosophical shift: the world is a totality of values, not merely a totality of physical facts.

To prevent the contemporary international order from sliding into an irreversible, multi-theater confrontation, the world must shift to a new paradigm of evolutionary realism.

Fully detailed in my recent monograph, *Political Realism: An Evolutionary Theory of International Relations*, this framework recognizes that the long-term survival of any nation cannot be secured by destabilizing its neighbors or enforcing rigid, exclusionary military blocs.

True political realism is not based on simplifications and stereotypes, such as human egoism or the nature of politics as a mere struggle for power.

Instead, it attempts to describe international reality as it truly is: a dynamic, continuous, structural change that can be described as human evolution.

In our hyper-connected world, security is fundamentally interdependent; if one part of the global organism is systematically oppressed or stripped of its cultural dignity, the entire system inevitably descends into hyper-inflammation.

Therefore, evolutionary realism demands that we move away from the exhausted mechanical frameworks of containment and implement value-based policies that satisfy the deepest historical needs of peoples through dialogue among civilizations.

Rather than forcing a singular, globalist blueprint upon diverse nations, this evolutionary approach offers a universal framework applicable to today's most pressing global challenges.

SHI YU / CHINA DAILY

Global Lens

It is now time to shun mechanical containment and usher in a value-based, evolutionary blueprint for global cooperation.

The practical necessity of this approach can be clearly seen in the Middle East. Traditional diplomacy consistently fails because it focuses on physically carving up contested borders, guaranteeing continuous friction. An evolutionary approach, as outlined in my strategic framework originally published in The Jerusalem Post, suggests that true peace requires transforming the conflict from a static territorial transaction into a dynamic process of shared security and economic renewal.

By shifting focus from mutual destruction toward massive international infrastructure investments, commercial integration, and advanced technological cooperation for neutral border monitoring, the region could transform from a theater of perpetual friction into a stable component of a multipolar ecosystem.

The power of evolutionary realism extends far beyond a single region. The exact same principles of organic harmony must be applied to global governance, development partnerships, and post-conflict reconstruction worldwide.

In an interconnected global economy, the survival and prosperity of any civilizational state depends on its capacity to align its specific national interests with the universal principles of the Social Good. When global development focuses on open infrastructure, unhindered trade routes, and non-coercive partnerships, it proves that cooperative stabilization is vastly superior to political and economic isolation.

This is precisely where philosophy meets practical global policy, highlighting China's constructive role in today's changing international landscape.

President Xi Jinping has stressed the acceleration of a comprehensive intellectual system in philosophy and social sciences. The framework of evolutionary realism offers a direct, cross-civilizational contribution to this global endeavor.

China's long-standing vision of building a community with a shared future for humanity and the practical execution of "China Opportunity 2.0" offer the exact conceptual and economic alignment needed to realize such breakthroughs.

True political realism demands that we abandon the outdated, zero-sum mentality of the past and begin constructing a plurilateral architecture based on mutual respect, mutually beneficial development, and moral excellence in leadership.

Implementing this evolutionary approach requires sovereign countries outside the rigid technocratic apparatus to act as diplomatic bridges.

Situated at the geostrategic heart of Europe, Poland possesses the deep historical and philosophical heritage necessary to reject short-sighted bloc mandates and serve as an independent, moral link between East and West.

Global organic harmony can achieve its full cross-civilizational resonance when joined in a profound dialogue with sovereign thought rooted in classical virtues.

The world is at a critical historical juncture. The old diplomatic models are exhausted. It is now time to shun mechanical containment and usher in a value-based, evolutionary blueprint for global cooperation.

The author is a professor of international relations at the Warsaw Academy of International Relations and American Studies (WSSMIA) and has written several highly acclaimed monographs.

Zhang Qiyue

Philippines' baseline claims riddled with legal holes

On July 29, the Philippine National Mapping and Resource Information Authority (NAMRIA) submitted Chart No 1567, entitled "Bajo de Masinloc and Approach", to the United Nations Division for Ocean Affairs and the Law of the Sea (DOALOS). The submission seeks to establish the so-called "territorial sea baselines" around China's Huangyan Island and its adjacent waters.

The Philippine Department of Foreign Affairs claims that the submission is intended to "uphold international law and reinforce the legal certainty of its maritime entitlement".

But in reality, this action, cloaked in legal language, is both factually unfounded and legally untenable. It is a blatant violation of the fundamental principles of international law.

That Huangyan Island is not part of Philippine territory is a fact grounded in treaty law.

The territorial boundary of the Philippines was clearly defined by a series of international treaties, including the 1898 Treaty of Paris between the United States and Spain, the 1900 Treaty of Washington and the 1930 Convention Between the United States and Great Britain.

These treaties collectively established the boundary of Philippine territory along the meridian of 118 degrees east longitude. Huangyan Island, situated at approximately 117.51 degrees east longitude, falls outside the territorial limits defined by these treaties.

Notably, the Philippines did not assert sovereignty over Huangyan Island for a long time. It was only in the 1990s that the Philippines began illegally incorporating the island into its "territorial claims" based on erroneous historical interpretations and flawed legal arguments.

This shift in position runs counter to the fundamental principles of international law, including pacta sunt servanda (agreements must be kept) and the estoppel doctrine. Under the principle of estoppel, a state cannot contradict positions it had previously acknowledged, particularly regarding territorial sovereignty. Therefore, the Philippines cannot legitimately seek to expand its territory beyond the boundaries already established through binding international treaties.

The Philippines argues that its so-called "territorial sea baselines" are based on Articles 3, 33 and 121 of the United Nations Convention on the Law of the Sea (hereinafter referred to as "UNCLOS"), which concern the territorial sea, the contiguous zone and islands. But this argument is flawed from the outset.

A fundamental principle of the law of the sea is that "the land dominates the sea", which means maritime rights stem from sovereignty over land territory. A state's entitlement to maritime zones presupposes lawful sovereignty over the land feature in question.

Since China has sovereignty over Huangyan Island, the Philippines has no legal basis to unilaterally establish so-called "territorial sea baselines" around the island.

Its attempt to invoke rights under UNCLOS to reinforce a territorial sovereignty claim turns the legal order on its head.

Such a move has no legal effect, nor can it create sovereignty or maritime entitlements where none exist.

The Philippines has drawn these baselines on the basis of the so-called "2016 South China Sea arbitration award" and its subsequent enactment of the Philippine Maritime Zones Act based on that "award". This legal foundation is fundamentally defective.

First, the arbitral tribunal in the South China Sea arbitration acted beyond its jurisdiction and made serious errors in its findings, rendering the "award" null and void and lacking any binding force. China has consistently stated that it neither accepts nor recognizes the award.

In recent years, the Philippines has sought to transform the "arbitral award" into domestic legislation and has used this legislation to establish the so-called "territorial sea baselines". It is an attempt to legitimize an unlawful "arbitral award" by incorporating it into domestic law.

Moreover, a state cannot invoke any domestic law to justify its failure to meet international obligations or to evade international responsibility. The Philippines' legislation therefore cannot override the fundamental principles and rules of international law.

The timing of the Philippines' latest move over Huangyan Island reflects a series of political calculations. First, 2026 marks the tenth anniversary of the so-called "South China Sea arbitration award".

The Philippine government aims to use this occasion to revive international attention to the "award", portray it as legally authoritative, discredit China and increase diplomatic pressure on Beijing.

Second, as the rotating Chair of the Association of Southeast Asian Nations, the Philippines is leveraging its position during the final stage of negotiations on the Code of Conduct in the South China Sea (hereinafter referred to as the "COC").

By provoking disputes over key maritime features, the Philippines aims to inject elements of the "arbitral award" into the future COC and pressure China into making concessions on critical issues, thereby strengthening its bargaining position in the rule-making process.

Third, the Philippines has intensified its activities around Huangyan Island, Ren'ai Jiao and other key maritime features, creating flashpoints to increase pressure on China's maritime law enforcement. This also creates opportunities for external powers, particularly the United States and its allies, to deepen their involvement in South China Sea affairs.

The Philippine government is trying to shift public attention amid sluggish economic performance and domestic governance challenges.

By amplifying the so-called "China threat narrative", it wants to stir nationalist sentiment and use the South China Sea issue as a political tool against its domestic opponents.

China enjoys indisputable sovereignty over Huangyan Island and its adjacent waters.

It lawfully announced and established the territorial sea baselines of Huangyan Island in November 2024 as a legitimate exercise of its sovereignty and maritime rights.

In response to the Philippines' repeated infringements, China has adopted a comprehensive set of countermeasures, including official diplomatic statements, joint naval and air exercises, maritime rights protection and law enforcement operations conducted by the China Coast Guard. It also promulgated the management measures for the Huangyan Island National Nature Reserve on Aug 1, 2026.

The Philippines' unlawful actions cannot change the fact that Huangyan Island is an integral part of China's territory, nor can they weaken China's determination to safeguard its national sovereignty and maritime rights.

In fact, its provocations will only narrow its room for maneuver in the South China Sea, while its unlawful claims will ultimately prove unsustainable.

Yang Jinsong

Dancing to the rhythm of culture and tradition

In recent years, the Munao Zongge Festival, a grand celebration of the Jingpo ethnic group's traditional dance, has attracted public attention. Content related to the festival has generated billions of views across social media platforms.

Traditionally held around the fifteenth day of the first lunar month, Munao Zongge was included in China's first list of national intangible cultural heritage in 2006. Celebrated as the "dance of paradise" and the "dance of ten thousand people", it is characterized by bold yet simple movements and an infectious rhythm.

Dehong Dai and Jingpo autonomous prefecture in Yunnan province, the heartland of Munao Zongge tradition, has produced many popular music videos and livestreams of the festival, fueling its online popularity and a steady increase in tourist arrivals. In 2025, Dehong welcomed 42.92 million tourists, marking a year-on-year increase of 12.8 percent, with total tourism revenue reaching 38.18 billion yuan ($5.56 billion), a year-on-year increase of 18.94 percent.

The viral scenes of Munao Zongge, showing thousands of people dancing in unison, illustrate how traditional culture can successfully resonate with modern audiences. It is a natural expression of cultural confidence. The collective dance ritual dissolves feelings of individual isolation, while the vitality of an ancient tradition satisfies the curiosity for unfamiliar cultures.

At the same time, the strong sense of home and community expressed in China's border regions inspires a deeper sense of cultural identity among audiences. The festival's online popularity is rooted not merely in digital traffic, but in genuine cultural substance, reflecting a growing cultural confidence.

The key to promoting Munao Zongge lies in elevating it beyond a decorative stage backdrop and placing ordinary people at the center of the experience. Visitors and locals alike become active participants, creating and sharing emotional value rather than remaining passive spectators.

Contemporary musical adaptations of the festival are inspired by the Jingpo epic, incorporating imagery to evoke the longing for a spiritual homeland.

A balance between cultural authenticity and tourism demands is crucial.

These adaptations foster broad public participation and a shared emotional experience, seamlessly blending culture and tourism through music, dance and people.

Equally important, Munao Zongge satisfies the dual desire for individual fulfillment and social connection. Participants, including tourists, revel in self-expression through dance while connecting with others by sharing their experiences online.

Local governments have effectively integrated online communication with offline immersive experiences, transforming traditional culture into tourism experiences that visitors can participate in and remember. This has expanded the possibilities for deeper integration between culture and tourism.

The fundamental question is: How can the surge in popularity be transformed into sustained appeal? Sustained visitor interest requires close coordination across the tourism value chain.

Challenges must be addressed by local governments and the Yunnan tourism industry. One issue is the gap between festival-based excitement and everyday tourism experiences. Beyond the festival itself, visitors may have fewer opportunities to experience the same vibrant atmosphere.

Another challenge is meeting the expectations shaped by social media. Travelers inspired by captivating short videos inevitably expect equally memorable experiences in person.

A seamless journey, from transportation and accommodation to tour guiding and cultural products, is essential for visitor satisfaction. Any weakness in the tourism experience can diminish the appeal created online.

A balance between cultural authenticity and tourism demands is crucial. Excessive commercialization risks diluting cultural significance, while excessive conservatism may disappoint visitors.

The solution lies in a diversified, tiered system of cultural experiences that preserves tradition while making its festive spirit accessible to broader audiences. This approach can create a virtuous cycle where traditional culture and tourism growth reinforce each other.

Transforming traditional culture into lasting tourism advantages requires coordinated innovation across services, products and spatial planning.

Efforts should be made to enhance visibility, accessibility and freedom for visitors to engage with cultural offerings in different ways. More people need opportunities to discover traditional activities, access them conveniently and engage according to their own interests.

Within China's 15th Five-Year Plan (2026-30) for tourism development, these innovations require more systematic support. Big data analytics can identify visitor preferences. Artificial intelligence can assist in designing personalized travel itineraries, connecting Munao Zongge with surrounding tourism resources.

Talent development should focus on cultivating professionals with a deep understanding of ethnic cultures and modern service skills. Together, these efforts can create an integrated portfolio of tourism products that complement each other across time and space, transforming the seasonal festival popularity into sustained regional tourism demand throughout the year.

Munao Zongge reflects the possibilities of integrating traditional culture with modern tourism. High-quality tourism depends not only on technology but also on preserving the humanistic essence.

Every surge in visitor interest can be an opportunity to pass on cultural heritage and every tourism experience should leave travelers with meaningful emotional connections.

The true competitiveness of high-quality tourism does not depend on online popularity or spectacular crowds, but instead on the exploration, preservation and creative interpretation of cultural depth. Achieving this requires protecting the core values of traditional culture while leveraging modern technology and market mechanisms.

The ultimate goal is to enable local communities to safeguard their cultural roots while improving their livelihoods and allowing visitors to experience, through the joyful rhythm of Munao Zongge, a vivid expression of a better life. This embodies high-quality tourism development and is also a compelling manifestation of cultural confidence.

GLOBAL VIEWS

WANG XIAOYING / CHINA DAILY

PEDRO BARRAGÁN

Negotiating the 'Gracchi Trap'

The 21st century is going to be marked by China's peaceful development as a driver of change

For decades, the United States has occupied an undisputed leadership position in the international system. Its military superiority, the global influence of the dollar, the power of its technology companies, and its capacity to project political and cultural influence have allowed it to consolidate unprecedented hegemony since the end of the Cold War. However, some analysts argue that this historical cycle is entering a phase of exhaustion. This is not necessarily a sudden collapse; rather, we are witnessing the gradual diminishing capacity of the US to impose its will in an increasingly multipolar world.

Some specialists have invoked the so-called Gracchi Trap to interpret this evolution. Coined from the crisis of the Roman Republic triggered by the failed reforms of Tiberius and Gaius Gracchus, the concept describes the moment when political polarization, the inability to reform institutions and conflict among elites ultimately weaken a great power's position. The comparison is not intended to draw an absolute parallel between Rome and the US, but rather to warn that internal divisions can become the primary factor in the erosion of a country.

One of the elements fueling this interpretation is the growing political polarization in the US. The institutional system is going through a period of constant confrontation in which basic consensus is increasingly difficult to achieve. The alternation between administrations of opposing ideologies leads to abrupt shifts in national and international priorities, hindering the continuity of public policies. This dynamic fosters a sense of paralysis that reduces the US capacity to address structural problems such as aging infrastructure, increasing inequality and the modernization of healthcare systems.

Social fragmentation accompanies this political crisis. The gap between the economic elite and broad sectors of the population has widened in recent decades. Although the US economy remains one of the most dynamic in the world, wealth growth has been concentrated in a relatively small segment of society. Rising housing costs, student debt, high healthcare costs and the precariousness of certain jobs have contributed to profound discontent among millions of citizens.

In the economic sphere, too, there are contradictory signs. The US maintains an extraordinary capacity for innovation, leads or co-leads strategic sectors such as artificial intelligence, biotechnology and the aerospace industry, and it continues to attract international investment. However, these strengths coexist with structural problems such as high public debt, persistent fiscal deficits and increasing pressure on the international role of the US dollar. Although the US dollar remains the world's primary reserve asset, numerous countries are seeking to diversify their payment systems and, to a certain degree, reduce their financial dependence on Washington.

Since the launch of the reform and opening-up, China has gone from being a backward economy to becoming the world's second-largest economy, or the largest in terms of purchasing power parity, and the US' main strategic competitor. Its industrial expansion, its leadership in numerous supply chains and its successes in applied artificial intelligence, telecommunications, renewable energy and high-speed transportation have profoundly helped shape the international economic balance.

Unlike other historical competitors of the US, China possesses an exceptional combination of population size, industrial capacity, technological development and growing diplomatic influence. Initiatives such as the Belt and Road Initiative, BRICS and the creation of new international financial institutions reflect China's effort to help reform the United Nations-centered international order to be fairer and more inclusive as well as more representative of the whole Global South.

This transformation implies that the relative stagnation of the US is not solely due to its internal problems and that China's sustained development can be an impetus for the US to better play its own role in virtually every sphere. While Washington concentrates a significant portion of its resources on maintaining its global network of alliances and military superiority, Beijing has prioritized trade expansion, strategic investments and technological development as instruments of international projection and sets itself as an example to the rest of the Global South.

These differences are also evident in the geopolitical arena. After the end of the Cold War, the US enjoyed virtually unlimited leeway. However, its prolonged military interventions in Afghanistan and Iraq demonstrated the limitations of military power in resolving complex political problems. At the same time, several allies are demanding greater strategic autonomy, and some emerging economies prefer to maintain equidistant positions between Washington and Beijing rather than fully align themselves with either.

The relations between the two countries are not limited to trade. They encompass technological innovation, access to critical raw materials, space race, semiconductors, digital infrastructure and influence over international organizations.

However, it is important to avoid overly deterministic interpretations. The US remains the world's greatest military power, is home to prestigious universities, retains enormous appeal for international investment and maintains an extraordinary capacity for scientific and business innovation. Furthermore, its institutional system has historically demonstrated a remarkable ability to adapt after periods of crises.

The fundamental question is whether these strengths will be enough to prevent the "Gracchi Trap" from becoming a political reality. If internal divisions in the US continue to deepen, the transition to a clearly multipolar international order could accelerate in the coming decades. The debate about the decline of US power revolves not so much around an immediate collapse as it does around a gradual loss of the capacity to exercise unquestionable hegemony. The combination of political polarization, social tensions, fiscal problems and growing intention to escalate competition with China paints a picture in which Washington's global leadership can no longer be taken for granted.

WANG LEI

Offering opportunities to the world

Through advancing high-quality development, China is benefiting its people and bringing impetus to forge a peaceful, prosperous and beautiful world

Despite the intertwining of change and turmoil, the forces seeking peace and development remain strong. Although economic globalization faces headwinds, breakthroughs in technological revolutions are accelerating global connectivity, driving us toward a community with a shared future. As the world's largest developing country, China is steadily advancing along a modernization path with its own characteristics, striving to contribute Chinese strength to building a better world and bringing new opportunities to the global stage under a new international backdrop.

China consistently approaches its relationship with the world from the perspective of a community with a shared future for humanity, maintaining an open and cooperative attitude.

China's modernization is the modernization of a vast population. Since the implementation of reform and opening-up, China has leveraged its demographic dividend and various resource inputs to achieve rapid economic growth, becoming the world's second-largest economy. However, as development stages transition, rising labor and resource costs necessitate a shift from input-driven growth to innovation-driven growth. Only by fully relying on technological innovation and continuously improving total-factor productivity can such a large economy ensure long-term, stable growth. Under these constraints, China is unwavering in its implementation of an innovation-driven development strategy, vigorously promoting technological research and development, and focusing on optimizing traditional industries while nurturing emerging and future industries.

China's massive market, abundant human capital, comprehensive industrial chains and rich data scenarios provide fertile ground for technological innovation and the integration of technology with industry. During the 14th Five-Year Plan (2021-25) period, China's industrial restructuring and shift of growth drivers continued to advance, achieving effective qualitative economic enhancement and reasonable quantitative growth, contributing about 30 percent to global economic growth.

The shift of China's economic structure and growth drivers is also clearly reflected in changes in its foreign trade structure. In the first half of 2026, mechanical and electrical products accounted for 63.5 percent of China's goods exports, with high-tech product exports increasing by 39 percent year-on-year. These products provide important support for global industrial development, especially for emerging economies and developing countries striving for industrialization and industrial chain upgrades. In the field of artificial intelligence, China's open and accessible large models are gaining favor among global users, offering more cost-effective and efficient AI applications to boost development in various countries.

China's modernization emphasizes harmonious coexistence between humanity and nature. Since modern times, human productivity has developed at an unprecedented pace, creating material wealth unmatched by any previous era, but also disrupting nature's inherent balance. The fragility of ecosystems continues to intensify, with the number of people affected by disasters more than doubling over the past decade.

Facing the global challenge of climate change, China has proactively assumed its responsibility as a major power, announcing its goals to peak carbon emissions before 2030 and achieve carbon neutrality before 2060, with plans to reduce net emissions by 7 percent to 10 percent from peak levels by 2035. China focuses on the development and application of green and low-carbon technologies, as the practical means to combat climate change and protect our planet. China has established the world's largest and fastest-growing renewable energy system, achieving remarkable success in green technology and industrial development. China supplies 60 percent of the world's wind power equipment and 70 percent of photovoltaic components, driving global wind and solar power costs down by over 60 percent and 80 percent, respectively. By sharing high-quality green products and mature low-carbon technologies with the world, China enables Global South countries, constrained by technology and energy supply shortages, to improve livelihoods and enhance economic and social development opportunities and momentum.

China's modernization follows a path of peaceful development. In today's world, rapid technological advancement and increasing interdependence among countries are accompanied by growing deficits in peace, development, security and governance, which hinder global progress. What kind of international order can provide security for global development and the well-being of all nations is a pressing question of our time. China opposes the dominance of international affairs by one or a few countries, advocating dialogue over confrontation, partnerships over alliances and win-win cooperation over zero-sum games, aiming to build a new type of international relations centered on win-win cooperation. China actively practices true multilateralism, promoting the development of a more democratic, just and reasonable international political and economic order. In the frontier field of AI governance, China initiated the establishment of the World AI Cooperation Organization, the world's first intergovernmental AI organization, in Shanghai. This multilateral platform will strongly promote equitable benefits for developing countries in the wave of AI revolution, fostering a widely accepted international AI governance framework, and uniting the international community to seize and address the opportunities and challenges of AI development, making AI a powerful force for world peace and development and enhancing the welfare of all humanity.

China consistently approaches its relationship with the world from the perspective of a community with a shared future for humanity, maintaining an open and cooperative attitude. This year marks the beginning of the 15th Five-Year Plan (2026-30). During this period, China will continue to promote technological innovation, actively develop new forms of productivity and accelerate the cultivation of new growth drivers. By pursuing high-quality development, China is opening new prospects for its modernization, benefiting the Chinese people and promoting modernization in other countries, contributing more opportunities and strength to building a peaceful, prosperous and beautiful world.

The author is the Party secretary of the Institute of Russian, East European and Central Asian Studies at the Chinese Academy of Social Sciences. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

PLA's airborne nuclear strike system shown

First-ever video footage demonstrates final component of country's N-triad

By ZHAO LEI
zhaolei@chinadaily.com.cn

The Chinese military has, for the first time, publicly showcased the operation of its airborne nuclear strike system.

In a video jointly released on Tuesday by the Central Military Commission's Political Work Department, the Cyberspace Administration of China and China Media Group, a H-6N strategic bomber is seen flying alongside two J-20 stealth fighter jets while carrying what appears to be a JL-1 nuclear-capable air-launched ballistic missile beneath its fuselage.

The footage marks the first time that the People's Liberation Army has publicly demonstrated its airborne nuclear strike capability, the final component of its nuclear triad.

The military has not released further details about the operation, including when it took place or the name of the exercise in which the aircraft and missile were involved. Given the sensitivity of the strategic weapon system, the PLA is unlikely to disclose additional information.

The footage forms part of a simulated combat scenario in which a joint command headquarters orders a coordinated strike against an enemy fleet.

Other advanced PLA weapon systems featured in the same sequence include the DF-21D road-mobile anti-ship ballistic missile system, the YJ-20 ship-borne hypersonic anti-ship missile and the YJ-12 air-launched supersonic anti-ship missile.

The JL-1 air-launched long-range ballistic missile was declassified and displayed to the public during a military parade in Beijing last September, alongside other strategic nuclear missile systems, including the DF-31BJ, DF-61 and DF-5C intercontinental ballistic missiles.

The "JL" in the missile's name stands for "Jinglei", or "Shocking Thunderclap".

The parade also marked the first time the Chinese military publicly revealed the PLA Air Force's nuclear strike platform. Previously, the PLA Air Force lacked an operational air-based platform capable of delivering nuclear warheads, leaving what military observers described as the missing component of China's nuclear deterrent.

According to estimates by Western military observers, the JL-1 has a range of about 8,000 kilometers. Because it is air-launched, the missile can take advantage of the altitude and speed of its carrier aircraft, enabling it to reach targets beyond 8,000 km compared with ground- or sea-launched missiles of similar aerodynamic design and propulsion.

The H-6N also has a long combat radius and can be refueled in flight. Combined with the JL-1, it provides the PLA Air Force with a long-range nuclear strike capability and serves as a powerful strategic deterrent.

Wu Peixin, a military affairs observer, said: "The H-6N bomber carrying the JL-1 missile can effectively strike distant ground and maritime targets. However, when the H-6N conducts forward combat missions, it requires long-range fighter escort. That is why it is seen flying in formation with two J-20 stealth fighter jets in the video."

Racing across grassland

Riders compete in a 5,000-meter speed race during a horse racing event in the Golog Tibetan autonomous prefecture, Qinghai province, on Tuesday. The competition attracted more than 200 riders and featured four race categories. ZHANG ZHONGPING / CHINA NEWS SERVICE

Ex-defense official sentenced to 10 years in jail for bribery

By CAO YIN
caoyin@chinadaily.com.cn

Zhang Jianhua, former deputy head of the State Administration of Science, Technology and Industry for National Defense, was sentenced to 10 years in prison for bribery-related crimes by a court in Sichuan province on Wednesday.

The Dazhou Intermediate People's Court sentenced Zhang to eight years in prison and fined him 3 million yuan ($444,543) for accepting bribes. He was also sentenced to five years in prison and fined 800,000 yuan for using his influence to accept bribes.

The court combined the sentences, imposing a total prison term of 10 years and a cumulative fine of 3.8 million yuan. Zhang's illegal gains and related assets have been confiscated and will be turned over to the State treasury.

The court found that from 2008 to 2025, Zhang took advantage of his positions in the administration to seek benefits for others in matters including administrative approvals and equity investments in exchange for bribes totaling more than 43.38 million yuan.

The court also found that from 2021 to 2025, after his retirement, Zhang exploited the influence of his former positions to help others obtain improper benefits in business operations and project contracting, accepting more than 11.7 million yuan in bribes.

According to the court, Zhang's conduct constituted the crimes of accepting bribes and using influence to accept bribes, and the amounts involved were extremely large.

The court said it gave Zhang a lighter sentence after considering several mitigating factors. Some of the bribes he solicited were not successfully obtained. He also voluntarily surrendered, confessed to additional bribery offenses that investigators had not uncovered, and actively returned his illegal gains.

Public records show that Zhang, 65, is a native of Jiangsu province. He began his career in 1983 and joined the Communist Party of China in May 1986. Before being placed under investigation in May 2025, he had worked in China's national defense system for decades. He was expelled from the Communist Party of China in October last year, prosecuted on bribery-related charges in February, and he stood trial on April 16.

Astronauts meet press

Death of girl during gene-editing clinical trial raises ethical concerns

By ZHENG ZHENG in Shanghai
zhengzheng@chinadaily.com.cn

The death of a 6-year-old girl allegedly linked to an experimental gene-editing clinical trial in Shanghai has sparked widespread concern over the safety and ethical oversight of medical research involving human beings.

The case came to light on July 23, when the journal Science and academic watchdog Retraction Watch jointly published an investigative report revealing that the child received an experimental brain-directed gene-editing therapy at the Xinhua Hospital Affiliated To Shanghai Jiao Tong University School of Medicine on March 24, 2025, and died within a week from thrombotic microangiopathy — a rare, potentially life-threatening condition in which tiny blood clots form in small blood vessels, causing damage to organs such as the kidneys and brain.

The girl had Snijders Blok-Campeau syndrome, a rare neurodevelopmental disorder caused by mutations in the CHD3 gene that lead to developmental delays, reduced muscle tone and speech difficulties.

However, her condition was not life-threatening. She attended kindergarten, received speech and occupational therapy, and had special education support. Seeking better treatment options, her parents approached a research team led by Qiu Zilong, a neuroscientist at the Shanghai Jiao Tong University School of Medicine.

Researchers claimed the trial was the world's first human test of its kind, with the girl as its only participant. According to the investigative report, the published research failed to disclose liver and kidney damage observed during prior safety studies in nonhuman primates.

The report also said an internal ethics review at Xinhua Hospital concluded that the girl's death was "definitely related" to the treatment. However, the trial leaders did not publicly disclose her death or update the clinical trial registry.

In February, the research team published preclinical findings in the journal Nature without disclosing either the human trial or the girl's death. According to the investigative report, the paper also omitted acknowledgments to the girl's family and funding sources that had appeared in earlier drafts.

On July 26, the Shanghai Jiao Tong University School of Medicine announced that it had established a special task force to investigate the case.

"The medical school has always attached great importance to research integrity and scientific standards, and firmly opposes any medical research that violates scientific ethics," the statement said. "We will handle this matter with seriousness based on the investigation findings, and appreciate the concern and oversight from the public."

The institution also said it would conduct a comprehensive review of research papers published by Qiu as well as the clinical study carried out at Xinhua Hospital.

On July 29, Nature added an editorial note to the paper's webpage, saying concerns had been raised about the publication and its data and that "further editorial action will be taken if appropriate as soon as the investigation into the concerns is complete".

On July 30, the trial was marked as terminated on ClinicalTrials.gov, with a notation stating: "The single participant died on 31 March 2025 from thrombotic microangiopathy, a serious adverse event assessed as definitely related to the study drug."

Shi Jiayou, a professor at Renmin University of China Law School, told The Beijing News that subjecting a child with a non-life-threatening condition to known lethal risks violates the principles of minimizing harm and ensuring controllable risk under China's Measures for Ethical Review of Life Science and Medical Research Involving Human Beings.

"The goal of regulation is not to impede scientific research, but to eliminate reckless human experimentation and prevent the entire industry from stagnating because of individual malicious incidents," Shi said. "The lives and safety of research participants must always take priority over world's firsts, journal publications and academic breakthroughs."

Big gains lured crypto scam victims

By ATLAS SHAO in Hong Kong
atlasshao@chinadailyhk.com

Apparent victims of a HK$107.5 million ($13.71 million) cryptocurrency investment scam linked to the "Fun Coffee" platform said on Wednesday they were lured by promises of exceptionally high returns and recommendations from trusted friends, with one victim claiming to have lost nearly HK$10 million.

More than 10 probable victims from Hong Kong met the press a day after law enforcement authorities in the Hong Kong and Macao special administrative regions announced the arrest of eight suspects in a joint operation targeting the alleged fraud involving the purported Vietnam-based enterprise.

Since July, investigators have received 264 reports in the two cities involving estimated losses totaling HK$107.5 million, according to the Hong Kong Police Force. The victims, aged 32 to 83, reported individual losses ranging from HK$3,000 to about HK$9.6 million.

The platform entered the Hong Kong market in late 2025, promoting investment in coffee-related ventures through cryptocurrency. It claimed to have developed advanced coffee brewing equipment, coffee gene optimization technology, and intelligent irrigation and fertilization systems.

It also promised returns of up to 278 percent, claiming that larger investments and longer deposit periods would generate higher profits.

The scheme collapsed in late July, the same month the Securities and Futures Commission of Hong Kong placed the "Fun Coffee GCM Project" on its alert list of suspicious investment products.

One victim said the organizers did not initially present the program as an investment scheme. Instead, participants were invited to join sports activities and produce short videos, with payments of several hundred Hong Kong dollars for each video. Team leaders who recruited 10 members were promised bonuses worth several thousand Hong Kong dollars.

The group later organized meetups and a marathon before introducing so-called investment tasks that encouraged participants to deposit money directly.

"Some large-scale tasks required more money, so I pooled funds with friends to participate," she said.

She said the team she joined had more than 700 members, built through a recruitment model in which each newcomer was encouraged to bring in 10 friends. About 50 members invested in the scheme, with combined losses expected to exceed HK$10 million.

Another victim, who said she lost HK$900,000, said the limited availability of the investment tasks made them appear more attractive.

"The tasks were offered in limited numbers, so once they were sold out, you had to wait for the next round. The activities were also fresh, varied and enjoyable," she said.

Accompanying the victims at the news conference, Hong Kong lawmaker Johnny Ng Kit-chong said the case could ultimately involve more than 1,000 victims.

Ng urged the Hong Kong SAR government to strengthen its anti-fraud mechanisms by allowing authorities to freeze a company's funds and crypto assets as soon as regulators identify suspicious transactions or signs of fraud, saying such measures could improve the chances of recovering victims' losses.

He said his office is using technology to trace digital wallets and assist law enforcement in tracking assets linked to the case.

Ng also urged residents to remain vigilant against schemes promising unusually high returns or promoting "task-based investments", saying investors should carefully assess such offers and avoid making decisions based on unrealistic profit claims.

To protect their privacy, the identities of the alleged victims have been withheld.

Space weather scientist honored

By ZHAO YIMENG
zhaoyimeng@chinadaily.com.cn

Chinese space weather scientist Wang Jinsong has received the William Nordberg Medal, one of the world's top honors for the application of space science, becoming the first Chinese recipient of the award since it was established in 1988.

The award was presented on Monday at the 46th Scientific Assembly of the Committee on Space Research, or COSPAR, in Florence, Italy, recognizing Wang's contributions to space science applications and the development of space weather monitoring and forecasting. An asteroid was also named in his honor.

Wang Jinsong

COSPAR, an international scientific organization under the International Science Council, presents the William Nordberg Medal every two years to recognize outstanding achievements in space science applications.

Since 2022, two scientists have received the award during each presentation cycle. The other 2026 recipient is David Sibeck, chief heliophysics scientist at NASA.

Wang, director of China's National Satellite Meteorological Center and chief designer of the country's Fengyun meteorological satellite program, has led major development in the country's space weather capabilities.

He established the national operational space weather system and led the development of the country's first-generation numerical space weather forecasting system. His team also developed Fengyu, the world's first artificial intelligence model capable of full-chain space weather forecasting, combining AI with numerical prediction.

With Wang's efforts, researchers achieved breakthroughs in high-precision solar imaging, wide-field aurora observation, energetic particle detection and weak atmospheric glow sensing, while proposing new methods to simulate interactions throughout the sun-Earth system.

He also introduced a new theoretical framework for evaluating satellite performance that has guided the planning, design and application of the Fengyun weather satellite series.

His team developed technologies enabling coordinated observations by multiple satellites and real-time processing of massive volumes of satellite and ground-based data, allowing Fengyun satellites to provide intelligent weather services within minutes.

China has built an integrated space weather monitoring network combining the Fengyun satellite constellation with nearly 100 ground observation stations, providing comprehensive monitoring of the sun, magnetosphere and ionosphere, according to the China Meteorological Administration.

The system can observe 10 key space weather parameters and makes China the only country besides the United States with independent operational monitoring capabilities covering the entire sun-Earth space environment, the administration said.

The technology has been widely applied to major Chinese space missions, including the Beidou navigation satellite system, the Chang'e lunar exploration program, the Tianwen Mars missions and the Kuafu solar observation project.

In addition, the country's next-generation operational forecasting platform, known as Fengyun Space Weather, is now in service, automatically detecting and classifying space weather events while providing forecasts ranging from immediate warnings to climate-scale outlooks.

"Going forward, we will continue improving space weather monitoring and forecasting services, as well as deepen innovation in space weather science and technology," Wang said.

CULTURE

Xinjiang exhibition traces civilization's arc

From prehistoric times to the Qing Dynasty, artifacts on show offer a lens into the country's rich history through ancient adornments, report **Fang Aiqing** and **Mao Weihua** in Urumqi.

Above: Visitors explore the exhibition *Beads and Jade: A Narrative Through Time* at the Xinjiang Museum in Urumqi on July 17. The exhibits are on loan from the National Museum of China.
Below center: A Ming Dynasty (1368-1644) gold hairpin featuring a pavilion and figures. **Bottom:** A Liao Dynasty (916-1125) gold makara-shaped earring. PHOTOS BY FANG AIQING / CHINA DAILY

A handful of beads, agates and jade pendants unearthed from a Warring States Period (475-221 BC) noble tomb in Central China's Henan province, with their exquisite craftsmanship and refined aesthetics, almost belie their age of more than 2,000 years.

This set of ornaments from the collection of the National Museum of China is composed of jade discs, loops and *huang* (arch-shaped pendants), agate accessories, and glass beads with concentric circle patterns that look like dragonflies' compound eyes — therefore known as "dragonfly eye beads". They were found in a burial pit of a high-ranking tomb in Guwei village in Huixian county, Henan.

Tong Chunyan, research librarian at the museum, says these ornaments were either the tomb owner's personal belongings or ritual items placed to express grief, a practice rooted in the ancient belief of "serving the dead as if they were still living".

The variety of patterns and crafting techniques, along with the fine materials themselves — dragonfly eye beads originated in ancient Egypt and the Mediterranean — pointed to cultural exchange between China and the West, she adds.

These artifacts, rearranged based on years of research rather than shown in their original layout in the tomb chamber, are now on display at the exhibition *Beads and Jade: A Narrative Through Time* at the Xinjiang Museum in Urumqi, capital of Northwest China's Xinjiang Uygur autonomous region.

Launched on July 17, the exhibition features some 600 pieces or sets of treasured adornments from the collection of the National Museum of China. The oldest item — a shell ornament with two perforations excavated from the Xianrendong archaeological site in Wannian county, East China's Jiangxi province — dates back 9,000 to 12,000 years to the late Paleolithic to early Neolithic periods.

Jade accessories unearthed from a nearly 3,000-year-old tomb belonging to the vassal state of Guo in present-day Henan province.

Tong, who curated the exhibition, notes that ornaments have adorned human life since the late Paleolithic period — even before people had secured a stable food supply — and they still do today.

"They are more than adornments; they are 'living fossils' of civilization," she says. "Through them, we can trace early belief systems and the evolution of aesthetics and human intellect over time. In this sense, ornaments offer a microcosmic history, a lens through which we can interpret the broader arc of civilization."

The exhibition is organized chronologically in three sections. The first looks at how beadwork and jade were used in beliefs and rituals from prehistoric times to the Warring States Period, evolving from spiritual objects linked to harvest, fertility, protection and divine authority, and symbols of social hierarchy, to measures of wealth and value. "In early rituals and sacrifices, they met both spiritual and ceremonial needs, carrying a deep sense of ritual," Tong says.

Top above: A Song Dynasty (960-1279) jade pendant features a bird holding a dragonfly in its beak.

A set of beads, agates and jade pendants unearthed from the tomb of a Warring States Period (475-221 BC) noble in Henan.

The second section covers the Qin (221-206 BC) to Yuan (1271-1368) dynasties, showcasing the exchange and integration between Central Plains styles and those of Xiyu (Western Regions) — encompassing today's Xinjiang and parts of Central Asia — the steppe farther west, and in the south.

Its final section highlights the technical mastery of the Ming (1368-1644) and Qing (1644-1911) dynasties, contrasting the strict hierarchies, precious materials and intricate craftsmanship of court ornaments with fun folk pieces made for everyday life.

"Through ornaments, from a perspective somewhere between the big picture and the close-up, we hope visitors will grasp the inner logic of civilization's development and the cultural meaning of these objects," Tong says.

According to He Xiao, research librarian at the Xinjiang Museum, the curatorial team spent half a year preparing for the show. One major challenge was the gallery design, as the exhibition hall is large, but the displayed objects are quite small.

To solve this, they worked with a team from the arts and crafts department of the Central Academy of Fine Arts, decorating the vitrines with traditional Chinese window frames and designing exhibit stands in a range of shapes — fans, circles, hexagons, octagons, water droplets, stone chimes and scrolls — to reflect traditional Chinese elegance and the ethos of artisanship, she says.

Tong says most of the exhibits are excavated artifacts, some from major sites like the 3,000-year-old tomb of Fu Hao in Anyang, Henan. For many of the exhibits, this is their first time on display outside of the National Museum of China.

Notably, some pieces are linked to archaeologist Huang Wenbi (1893-1966), who made four trips to Xinjiang for investigation and excavation between the 1920s and 1950s.

Tong says it's significant that the exhibition is being held in Xinjiang, a key node on the ancient Silk Road where Eastern and Western cultures met. The introduction of foreign materials, patterns and techniques, and their adaptation and evolution by Chinese craftsmen, demonstrates how Chinese civilization grew by absorbing and transforming outside influences.

In 2023, the National Museum of China Gallery was set up at the Xinjiang Museum as a dedicated venue to host touring exhibitions. Over the past three years, it has featured shows on ancient bronzes, bronze mirrors, musical instruments and traditional Chinese medicine. The current exhibition runs through Nov 5.

Experts stress the use of digital tools for heritage preservation

By **LIU BOQIAN** and **YANG JUN** in Guiyang

Experts from China and ASEAN nations urged greater use of digital tools to preserve not just historic sites and artifacts but the living memories, knowledge and experiences that give them meaning, during a forum on July 30 in Guiyang, Southwest China's Guizhou province.

For decades, built heritage preservation has largely focused on historic buildings, sites and physical structures.

"The key is to think about the people, not the objects," said Kang Jian, a researcher in architecture and acoustics, at the ASEAN-China Symposium on Digital Information System and Sustainable Renewal of the Built Heritage.

Organized by Tianjin University, the event was held as part of the 2026 China-ASEAN Education Cooperation Week.

University leaders, scholars, cultural professionals, and diplomats gathered to explore how digital technologies can strengthen heritage preservation, cultural exchange and educational ties between China and ASEAN countries.

Hadi Tjahjono, director of the Education, Culture and Tourism Division at the ASEAN-China Centre, notes that China and ASEAN nations share deep historical traditions and face similar challenges in safeguarding cultural heritage. University partnerships, he says, can drive joint research, academic exchanges and new talent training.

Left: Kang Jian, a researcher specializing in architecture and acoustics, speaks at the ASEAN-China Symposium on Digital Information System and Sustainable Renewal of the Built Heritage. **Right:** Experts, scholars and diplomats attend the ASEAN-China symposium on July 30. PHOTOS PROVIDED TO CHINA DAILY

Participants agreed on leaning on digital tools as a way to fully document heritage, train preservation experts, and draw younger generations into cultural traditions.

Kang describes how technology is shifting the focus of heritage work beyond the purely visual to include sound. His team has recorded soundscapes from historic places such as Lhasa, Xizang autonomous region, capturing temple bells, chanting, footsteps, and everyday activities to build a digital archive.

The goal is to preserve not isolated sounds but the relationship between sounds and their surroundings.

"We always appreciate heritage with our eyes, but we also have ears," Kang says. He cautions that as cities modernize and grow more alike, their distinctive natural soundscapes may vanish. "If you close your eyes, it can be difficult to distinguish one city from another."

Zhang Jie of Tsinghua University emphasizes digital methods that reconnect fragmented urban heritage with contemporary life. Specializing in urban preservation and renewal, he proposes using digital systems to map scattered heritage elements and adapt them to present-day needs.

In Jingdezhen, the historic porcelain "capital" of China, many traditional workshops and buildings remain.

"We input these heritage elements into a computer system to create a digital map that helps identify which areas require preservation and which need renewal," Zhang says. Renovating old workshops and attracting young artists from China and abroad has injected fresh energy into these historic spaces.

Digital innovation can also expand the reach of cultural heritage. Irene M Han, deputy ambassador of Indonesia to China, stresses that technology should link traditions to future generations.

"Technology should not replace civilization; it should extend civilization," she says, citing the power of films, animations and digital art in sharing cultural stories with global audiences.

From digital preservation efforts in China to creative industries across ASEAN, participants agree technology is opening new channels for cultural dialogue.

Since its launch in 2008, the China-ASEAN Education Cooperation Week has drawn more than 54,000 participants from over 8,000 institutions across nearly 90 countries and regions.

The event has also supported the creation of 17 overseas education and training bases in ASEAN nations by Guizhou, while the province has welcomed more than 20,900 students from ASEAN countries.

LIFE

FROM HOMER'S EPIC TO NOLAN'S ODYSSEY

Filmmaker stuns Beijing audiences by transforming Greek mythology into a breathtaking cinematic spectacle, **Xu Fan** reports.

Top: Director Christopher Nolan (left), actor Matt Damon (right) and actress Charlize Theron (center) attend the Beijing premiere of *The Odyssey*, one of this summer's most anticipated blockbuster films, on July 30. **Above:** The Hollywood epic brings the legendary Trojan Horse to the big screen. PHOTOS PROVIDED TO CHINA DAILY

Christopher Nolan spent his 56th birthday far from Hollywood, standing inside a packed Beijing theater as hundreds of moviegoers surprised him with a Mandarin rendition of *Happy Birthday*.

The moment came during the Beijing premiere of *The Odyssey* on July 30. Visibly touched, the Oscar-winning director smiled quietly, rested his chin in his hand, and softly mouthed, "Thank you."

Standing beside him were Matt Damon, who plays Odysseus, king of Ithaca; Charlize Theron, who portrays the immortal nymph Calypso; and Emma Thomas, Nolan's wife and the film's producer. They also learned to say "Happy Birthday" in Chinese, drawing laughter and applause from the audience.

The warm welcome underscores Nolan's enduring popularity in China, where his films have cultivated a loyal following over the past two decades.

Ahead of the film's nationwide release on Aug 14, the more-than-170-minute epic received exclusive preview screenings in IMAX and CINITY formats at select theaters in Beijing, Shanghai, Guangzhou and Shenzhen in Guangdong province, on Aug 1 and 2. Most screenings sold out within a short time, leaving only a handful of seats in the front rows.

At the China National Film Museum, home to Beijing's largest IMAX screen, every seat was snapped up despite ticket prices exceeding 183 yuan ($27.1), far above the national average ticket price of 41.1 yuan for films released in China during the first half of this year.

For Nolan, whose films have bagged 18 Oscars, *The Odyssey* marks the most ambitious project of a career that includes both critically acclaimed and commercially successful blockbusters, including *The Dark Knight* (2008), *Inception* (2010), and *Oppenheimer* (2023).

Adapted from Homer's ancient Greek epic, the film employs Nolan's signature nonlinear storytelling, unfolding along two intertwined narratives. One follows Odysseus' perilous 10-year voyage home after the Trojan War. The other centers on his son, Telemachus, who desperately searches for signs that his father is still alive as Ithaca falls into turmoil.

Back home, a pack of power-hungry princes and noblemen have occupied the royal palace, pressuring Queen Penelope to remarry so one of them can seize the throne.

Known for his passion for cinema from a young age, Nolan first read Homer's poems — widely regarded as the foundation of Western literature — during his elementary school days.

The director was captivated by the masterpiece's fantastical elements, ranging from the Cyclops, a one-eyed giant, to the Sirens, mythological creatures who cause sailors to run aground by enchanting them with songs.

The stories sparked a lifelong ambition — not only to bring the 3,000-year-old myth to the screen, but also to make its timeless themes resonate with contemporary audiences.

"I think as a filmmaker — you're always looking for something to challenge yourself, but also something hopefully the audience hasn't seen before. I was really struck by the fact that the world of Greek mythology is the oldest foundation of story in Western literature. *The Odyssey* is a great epic that hadn't been told in this form in a modern film. And so, to me, that just seemed like a tremendous opportunity," Nolan said during the Beijing event.

Left: Anne Hathaway stars as Penelope, queen of Ithaca and the devoted wife of Odysseus. **Right:** Matt Damon plays Odysseus, king of Ithaca, whose decade-long journey home begins after the Trojan War.

He added that the poem endures because it is rooted in "primal, universal desires and fears", allowing it to remain relevant across generations.

To re-create the ancient world, the production traveled across six countries — Morocco, Greece, Italy, Iceland, Scotland, and the United States. Exterior scenes for Odysseus' palace were filmed at Castello di Santa Caterina, a 15th-century castle in Sicily, Italy, perched atop a rugged hill more than 310 meters above sea level, commanding panoramic views of the Mediterranean Sea.

"There were 250 people we needed to get to this location. We thought we'd be able to put up a temporary road. And then, in the end, we weren't able to, so it meant everybody hiking up 1,000 feet every morning, arriving pretty tired before the day's work even began," Nolan recalled.

One cast member, however, barely seemed to notice the climb. Nolan said Tom Holland bounded up the steep path "like a gazelle" throughout the three-week shoot, setting an example for the cast and crew.

The film also fulfills another dream Nolan has pursued since the age of 16: making an entire feature film in the IMAX format.

While *The Odyssey* is Nolan's seventh film shot with IMAX cameras, it is also the first feature in history to be filmed entirely with IMAX 15/65 mm cameras. Shot over 91 days, the production used more than 2.1 million feet (640 kilometers) of film stock — longer than the distance between Toronto and New York, according to IMAX.

Although the production posed unprecedented technical challenges, Nolan said the cast adapted to the large-format equipment "wonderfully".

"(That is because of) the fact that we would use a monitor system to allow them to see each other across the camera — because it's a giant box between them — essentially, and also the reloading process. But of course, one of the things when you bring a camera this big onto a set is that there's a tremendous amount of focus from the cast and the crew," Nolan said.

"They see how cumbersome and important — and expensive, frankly — the whole thing is. So, there's a real sense of focus, and everybody is able to focus at the same moment, and I think the discipline of that really helps," he added.

The film's demanding production left a lasting impression on its cast as well. According to Entertainment Weekly, Damon said he had promised his wife he would take a break from acting — with one exception: if Nolan called, the break would have to wait. She agreed.

Asked in Beijing how he reacted when Nolan invited him to star in *The Odyssey*, Damon said preparation was never a concern because the director always gives his actors ample time.

"That's not really a concern. Everyone in our house is a big fan of Chris and Emma's movies. We were truly fans," said Damon, who previously collaborated with Nolan on *Interstellar* and *Oppenheimer*.

For Theron, one of the film's most emotional moments came during her first viewing, when an aging dog recognizes Odysseus before passing away.

"I have this thing when I come home — my dogs are usually the first living things that I see at my door, and it has always been that way. I've had dogs my whole life," she said, recalling that the scene moved her to tears as it reminded her of the beloved dogs she had lost.

Early audience reactions suggest the film has already struck an emotional chord. Following the preview screenings, *The Odyssey* has earned 8.3 out of 10 on Chinese review platform Douban, with some moviegoers describing it as one of Nolan's finest works to date.

Yin Hong, vice-chairman of the China Film Association, commented that the film uses its mythological narrative — particularly its reinterpretations of the Trojan Horse and the figure of Helen — to offer a contemporary reflection on human nature, war, fate, peace, trust, the meaning of life, and the global order. He added that *The Odyssey* also offers valuable inspiration for Chinese filmmakers seeking to adapt classical cultural heritage for modern audiences.

Rare exhibition takes deep dive into Chopin's world

By **CHEN NAN**
chennan@chinadaily.com.cn

The life, music and legacy of Fryderyk Chopin have arrived in China on an unprecedented scale.

The National Centre for the Performing Arts has unveiled *Meeting Chopin: Selected Collections From the Fryderyk Chopin Museum at the Fryderyk Chopin Institute in Warsaw, Poland*, the largest exhibition ever dedicated to the Polish composer in Beijing. Bringing together more than 90 rare objects, it traces the artistic journey of one of classical music's most enduring figures.

Opening on July 27, the exhibition runs through Oct 25.

Few composers have become so closely identified with a single instrument as Chopin, whose poetic piano works transformed the expressive possibilities of Romantic Era music. Nearly two centuries after his death, his mazurkas, nocturnes and ballades continue to captivate audiences around the world with an emotional depth that transcends cultures and generations.

The exhibition presents more than 50 items from the collections of the Fryderyk Chopin Museum, including personal belongings, autograph manuscripts and correspondence, alongside more than 40 supplementary exhibits such as commemorative stamps, historic recordings and archival materials. Organized into three thematic sections, it follows Chopin's journey from his childhood in Poland through his years in Paris to the lasting legacy of his music.

One of the exhibition's greatest highlights is Chopin's celebrated Pleyel piano, displayed in China for the first time. Regarded as one of the museum's most treasured possessions, the instrument bears the composer's penciled signature, "F. Chopin", on its internal frame. It accompanied him during the final years of his life, when he composed some of his last works.

Equally compelling is an original working manuscript of the *Impromptu in F-sharp Major, Op 36*. Erased passages, crossed-out notes and rewritten phrases reveal the painstaking process behind Chopin's seemingly effortless lyricism, offering visitors a rare glimpse into the composer's creative process.

A visitor at the exhibition showcasing Chopin's life and music at the NCPA in Beijing on July 27. PROVIDED TO CHINA DAILY

The exhibition also opens a window to Chopin's private world through a collection of personal objects. His paperweight, handwritten correspondence from Paris and other everyday belongings are displayed alongside items belonging to French novelist George Sand, whose nearly decade-long relationship with the composer profoundly shaped his life and work. Her embroidered napkin bearing Chopin's initials, a recipe book, clothing, and letters to French painter Eugene Delacroix evoke the domestic world in which some of his greatest works were born.

Beyond Chopin's lifetime, the exhibition explores the remarkable reach of his artistic legacy. A dedicated section traces the evolution of the International Fryderyk Chopin Piano Competition through historic medals, posters, original judging documents, caricatures of prize winners, and sculpted casts of pianists' hands. Graphic designs spanning several decades demonstrate how successive generations of Polish artists have continually reimagined the composer's visual identity.

The exhibition also examines Chopin's place in global visual culture through paintings, sculptures and contemporary artworks inspired by his music.

Rather than relying solely on historical displays, the exhibition embraces contemporary exhibition design. Visitors encounter immersive installations, including 3D projections, multimedia interpretation stations and interactive listening experiences that allow audiences to explore Chopin's manuscripts while following the chronology of his life.

According to Wang Ban, vice-president of the NCPA, the center first collaborated with the Polish embassy on a Chopin exhibition in 2010. He described the new exhibition as both "a tribute to the great poet of the piano" and an opportunity to deepen cultural dialogue between China and Poland through music.

Seweryn Kuter, director of the Fryderyk Chopin Museum, says that the exhibition demonstrates not only the composer's life and artistic legacy but also "the universal power of his music", adding that Chopin continues to inspire people regardless of nationality or cultural background.

Throughout the exhibition, the NCPA will present a season of Chopin-themed lectures, concerts, educational programs, and Polish culinary events, transforming the showcase into a broader celebration of the composer's enduring artistic legacy.

SPORTS

TENNIS

"I know my tennis is there, but I just need to stay healthy. That's a big part of being a top player, and that's something I have to learn from the top players: to get my level back and keep it consistent."

Shang Juncheng, after reaching the National Bank Open third round in Montreal

Shang Juncheng of China reacts after beating Russia's Andrey Rublev in a second-round match at the National Bank Open in Montreal, Canada, on Tuesday. Shang saved five match points before beating the 10th-seeded Rublev, 7-5, 4-6, 7-6 (5), to advance to only his second third-round appearance at an ATP1000 Masters tournament. REUTERS

Shang stuns Rublev in Montreal

Young ace makes it to third round, as veteran Zhang also wins in Toronto

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

Left: Shang Juncheng plays a forehand against Andrey Rublev during their National Bank Open second-round match in Montreal on Tuesday.
Right: Veteran Zhang Shuai hits a return on her way to beating Jelena Ostapenko in their WTA1000 match in Toronto on Tuesday. AFP / AP

It's perhaps too early to make such an assertion, but Shang Juncheng has just pulled off arguably his most compelling win, perfectly encapsulating the essence of his career so far — resilience.

Down at 3-5 in the decider with his opponent, one of the hardest-hitting men on the circuit, serving for the match, Shang, ranked 281st this week and who has just recovered from a nagging foot injury, could be forgiven by fans had he come up short against 10th seed Andrey Rublev in the second round of the National Bank Open in Montreal on Tuesday.

But, the 21-year-old rising star just wouldn't let it go, even with Rublev, the event's 2024 finalist, amassing five match points in the 10th game. Shang fended them all off through sheer will to force a third-set tiebreaker, before eventually pulling off a 7-5, 4-6, 7-6 (5) upset at the IGA Stadium.

Shang is now into the third round at an ATP1000 Masters tournament for only the second time in his budding career, and has become the first Chinese man to reach that stage in Montreal, a key tune-up for the US Open.

The gutsy escape act against Rublev, currently ranked No 16 and who beat Shang in their only previous meeting in Hong Kong in 2024, marked the young Chinese ace's fifth career win over a top-20 opponent, one which took place at only his second tournament since returning from a six-month injury layoff.

Shang has pocketed $61,865 in prize money and enough points to climb around 50 spots up the rankings in Montreal so far, but more importantly, has rebuilt trust in his own body as he looks set for a revival through the hard-court North American and Asian swings.

"Andrey is a good friend, a great competitor and a great champion," Shang said after outlasting the Russian 18-time ATP title winner over two hours and 44 minutes in windy conditions.

"It is a pleasure to share the court with him again.

"I am happier that I am 100 percent healthy and playing my best tennis again, though," added Shang, who reached a career-high ranking of No 47 in October 2024 after winning his first ATP Tour singles title in Chengdu.

"I know my tennis is there, but I just need to stay healthy. That's a big part of being a top player, and that's something I have to learn from the top players: to get my level back and keep it consistent."

Born into a sporting family — his father used to play in China's domestic soccer league and mother was a table tennis mixed doubles world champion — Shang enjoyed an early career surge that saw him clinch a string of "youngest-ever" records for Chinese men's tennis.

He became the first male player from the Chinese mainland, and the youngest, to qualify for the main draw at the ATP1000 level by making it all the way through qualifiers at Indian Wells, California, in 2022 at the age of 17.

His best season to date, in 2024, saw him become the youngest Chinese man ever to register a main-draw win at a Masters tournament with victory over Jordan Thompson, also at Indian Wells that March, before he broke into the top 100 the following May as the youngest Chinese male player to do so.

Then came exposure to the grueling nature of the sport, as repeated physical issues stymied his career ascent for the best part of two years. A series of injuries to both feet, his elbow and his wrist forced him into long breaks, with each lasting over six months, in the first half of 2025 and earlier this season.

They have helped, however, to hone his mental fortitude.

"It was boring and frustrating during the hard times of my rehab, but that's also what made the comebacks so sweet," said Shang, who will play Italian 19th seed Luciano Darderi in the round of 32 on Thursday.

As inspiring as Shang's return has been, veteran Zhang Shuai's gritty performance this week in Canada also served up a strong boost for Chinese tennis, especially for the women's side, where most of her younger compatriots are struggling with dips in form.

The 37-year-old Zhang, who added a third doubles major trophy at the Australian Open in January, proved she remains a force to be reckoned with on the singles circuit as well, by advancing into the third round at the WTA1000 tournament in Toronto on Tuesday.

Facing the 2017 French Open winner Jelena Ostapenko, Zhang produced a commanding performance, winning 10 straight games before her 29-year-old Latvian opponent decided to retire while trailing 6-0, 4-0, due to a sudden injury.

Zhang's two-win run in Toronto, following a seven-match singles losing streak on the WTA Tour, has suggested that the evergreen career of China's most experienced women's ace is far from done yet.

"Playing the game for as long as I have, I won't get too carried away by each win or loss anymore. It's the composure and poise that helped me enjoy each match and still keep pushing at my age," said Zhang, who's climbed to No 55 on the live WTA rankings following her two wins in Canada.

Zhang now has to make all her experience count as she prepares for a tough matchup against world No 1 Aryna Sabalenka in the round of 32.

Million-dollar 1 Point Slam set to return to Aussie Open

MELBOURNE, Australia — The million-dollar 1 Point Slam is returning to the first Grand Slam tennis tournament of 2027.

Australian Open organizers announced Wednesday that the crowd favorite from last January would again be offering a top prize of a million Australian dollars ($705,000) when it is held next year before the Jan 17-31 main draw at Melbourne Park.

Jordan Smith, a little-known local amateur player beat Jannik Sinner and went on to make himself a millionaire in Australian dollars after winning the 1 Point Slam.

The Australian won on the third stroke of the final, when Chinese Taipei's women's player Joanna Garland, then ranked No 117, sent a two-handed backhand wide.

All the matches lasted just one single point in a knockout bracket that included men and women, professionals and amateurs, as well as celebrities such as pop star Jay Chou, who was knocked out without hitting a ball after conceding an ace from Petar Jovic.

The competition also included Carlos Alcaraz, Iga Swiatek, Coco Gauff, Alexander Zverev and Naomi Osaka.

"My journey started at a qualifying event at Sydney Olympic Park — I never expected it would lead to me stepping onto Rod Laver Arena and competing against world-class players, let alone walking away as the winner. It completely changed my life," Smith said in an Australian Open statement Wednesday.

"This year, we'll be hosting an event at our own club and, hopefully, inspiring more players to give it a go, just like I did. You never know where it might take you," Smith added.

From next week, affiliated clubs, associations, coaches and partner schools across Australia can register their interest to host a 1 Point Slam qualifying event in the lead-up to the Melbourne Park final.

Alcaraz out of Cincy event

World No 2 Alcaraz has withdrawn from the ATP Cincinnati Masters with the wrist injury that has sidelined him since April, organizers said Tuesday.

The Spaniard will not defend his title at the tournament, which starts on Aug 13, because of "an ongoing wrist injury".

"We know Carlos is doing everything he can to get back to playing tournaments as soon as possible," tournament director Bob Moran said in a statement.

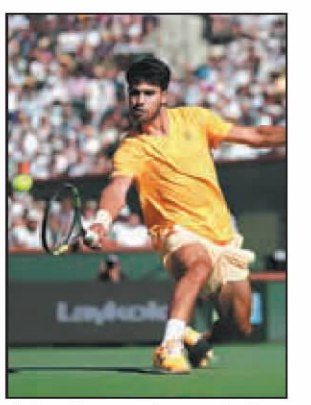
"We wish him the best with his recovery and look forward to welcoming him back to Cincinnati in the future."

The move will spark concerns over Alcaraz's upcoming title defense at the US Open, the final Grand Slam of the year, which starts on Aug 30 in New York.

The elite hard court tournament in Cincy is the last major tune-up for the US Open.

The 23-year-old Alcaraz has already opted out of the French Open and Wimbledon this year, as he recovers from the injury sustained in the first round of the Barcelona Open in April.

The seven-time Grand Slam champion pulled out of tournaments in Madrid and Rome, before withdrawing from Roland Garros in a move he said he and his team had decided was "the most prudent thing to do".



He then missed Wimbledon, where his rival Sinner prevailed for the second year in a row, this time against Germany's French Open winner Zverev.

In opting out of Wimbledon, Alcaraz said his recovery was going well, but that he was still not ready to play.

It marked the third Grand Slam that Alcaraz has missed since he made his main draw debut at the 2021 Australian Open.

He became the youngest man to complete the career Grand Slam in January with his triumph in Melbourne. He also won the ATP title in Doha, Qatar, in February.

XI'S VISION | NATIONAL FITNESS

Promotion of fitness for all reaps benefits

Nation's sustained efforts foster widespread enthusiasm for sports, improve public health

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

For Wang Lin, an avid soccer enthusiast, playing on the pitch of the Northeastern Super League feels like a childhood dream come true. The 39-year-old homestay owner in Shenyang, Liaoning province, now follows a disciplined fitness routine to stay in shape for the game.

"Since joining the tournament in May, training has become a key priority for me," Wang said. "I dedicate about two hours each session, three times a week, to fitness workouts, running and soccer drills, which help me overcome the inactivity that often sets in during middle age."

Months of intensive training have paid off. Wang has shed seven kilograms, with his beer belly giving way to a lean, toned midsection. "After watching the videos I posted, many people realize that even in their 30s or 40s, they can still step onto the pitch and keep their love for sports alive," he added.

The ongoing league, China's first cross-provincial amateur soccer tournament, draws participants like Wang from the three northeastern provinces of Liaoning, Jilin and Heilongjiang, as well as the Inner Mongolia autonomous region.

Wang noted that the ordinary backgrounds of the players, who include college students and office workers, make the tournament highly relatable for audiences, giving it stronger public appeal than a professional match.

The event not only offers amateurs a stage to pursue their dreams, but also motivates many more people to develop a love for sports and build up their fitness level, he added.

Wang's passion for soccer mirrors the country's long-standing commitment to promoting fitness for all as a way to improve people's health.

As Saturday marks China's 18th National Fitness Day, an annual campaign aimed at ingraining the concept of national fitness in people's minds and promoting regular physical activity, years of persistent nationwide fitness initiatives have borne fruit, with millions of ordinary citizens embracing sports as part of their daily routine.

From neighborhood soccer pitches to marathon starting lines and even skating rinks, the enthusiasm for fitness has become widespread, and President Xi Jinping is one of the keenest sports enthusiasts.

Xi developed a love for sports such as skating and soccer at an early age. "The exercise I did in my childhood laid the foundation for my good health today," he once recalled.

Later, his love for sports went beyond personal growth. In 1984, as Party chief of Zhengding county in Hebei province, Xi spearheaded the county's first-ever mass sports games, attracting more than 1,300 participants.

At a time when local authorities elsewhere were solely focused on economic development, Xi recognized that organizing the mass sports event carried profound significance for enhancing the people's happiness. "The people's wallets are to grow fuller, their minds richer, and their bodies healthier," he said.

Xi has carried forward this commitment through every stage of his political career. In Fujian province, he helped put in place new trails and lampposts on a mountain popular with hikers. In Zhejiang province, he guided the wider opening of public sports facilities and school sports venues for the people. In Shanghai, he directed preparations for the 2007 Special Olympics World Summer Games, advancing the cause of sports for people with disabilities.

Now, as China's top leader, he has always placed the health and happiness of Chinese people in a pivotal position in the overall governance of the country. "Chinese modernization is closely linked with public health," he once said. "A healthy nation requires mass participation in sports, and strong competitive sports are built on a solid foundation of public fitness."

Heeding Xi's call, China elevated the fitness-for-all campaign to a national strategy in 2014. Since 2016, the country has rolled out three successive targeted five-year plans to systematically advance public fitness.

The latest one was released in July, with clear targets for improving public fitness by 2030. According to the plan, the country aims to increase per capita sports venue space to about 4 square meters and raise the proportion of residents who exercise regularly to around 40 percent.

Ma Liang, a professor at Peking University's School of Government, noted that high-level emphasis on national fitness campaigns can effectively drive coordinated efforts from government departments at all levels, fostering a sounder environment for promoting public fitness.

Safety rules for self-driving cars unveiled

By **CHENG YU**
chengyu@chinadaily.com.cn

China has announced its first mandatory national safety standard for Level 3 and Level 4 autonomous vehicles, tightening safety requirements for self-driving cars in the world's largest automotive market.

The safety requirements for automated driving systems of intelligent connected vehicles, which will take effect on July 1, 2027, have been approved by the State Administration for Market Regulation and the National Standardization Administration. The rules were introduced on the website of the Ministry of Industry and Information Technology on Tuesday.

Unlike previous driver assistance technologies, the L3 automated driving system enables vehicles to take over certain driving tasks under specific conditions, while still requiring human intervention. The L4 system can perform driving tasks without human input in designated environments.

According to the new requirements, automated driving systems must achieve an equivalent safety level to that of a qualified and attentive human driver performing the same dynamic driving tasks while avoiding unnecessary risks to passengers and other road users.

The standard introduces clearer requirements for human-machine interaction, which has become an increasingly important issue as drivers shift between automated and manual control.

For L3 vehicles, manufacturers must equip their systems with driver takeover monitoring to ensure that motorists are able to resume control when requested. Vehicles must also provide clear information regarding when automated driving is ready, activated or disengaged. If a human driver fails to respond to a takeover request, the vehicle must automatically execute a minimum-risk maneuver, which is a predefined sequence designed to bring the vehicle to the safest possible state.

Rao Qing, chief architect for global solutions at the autonomous driving company Momenta, said, "The release of the mandatory national standard marks the beginning of a new phase for China's autonomous driving industry, where large-scale commercialization is built on safety and clear regulatory benchmarks."

Since the beginning of the year, regulators have introduced standards relating to simulation testing, vehicle communications and Level 2 driver-assistance systems, as well as mandatory safety requirements for higher levels of automation, resulting in one of the most comprehensive regulatory frameworks for self-driving vehicles in the country.

Last year, China granted conditional approval to its first L3 autonomous passenger vehicles and positioned intelligent driving as a key area of development.

The latest data from the Ministry of Industry and Information Technology shows that in the first half of this year, 70.5 percent of new passenger vehicles sold in China were equipped with L2 combined driver assistance systems, which means that roughly seven out of every 10 new vehicles were equipped with such technology.

However, some industry experts said that fewer than 10 percent of L2-equipped vehicle owners have actually activated or used the driver assistance functions.

Jiang Han, a senior researcher at the think tank Pangoal, said: "The new mandatory national standard marks a fundamental shift in China's regulation for autonomous driving — from giving emerging technologies room to develop, to imposing hard requirements to ensure safety. It will also promote the healthy development of China's autonomous driving market, as it continues to develop at a rapid speed."

WORLD WATCH

Wake-up call for security architecture

Japan's newly released 2026 defense white paper reads less like a sober assessment of regional realities and more like a carefully crafted narrative designed to manufacture domestic consent for accelerated militarization. It portrays China as an "unprecedented strategic challenge" that must be met with "overall national strength" and deeper alignment with allies. Almost simultaneously, Tokyo has moved to create a centralized intelligence agency — the first of its kind since the end of World War II — overturning eight decades of postwar decentralization. These steps, taken in the shadow of the 80th anniversary of the Tokyo Trials, and against the enduring refusal to fully confront wartime atrocities, including the biological barbarism of Unit 731, generate understandable unease across the region.

Layered onto this is an even more sobering development. Reports indicate that the Pentagon is drafting a classified nuclear strategy that places greater emphasis on the potential use of shorter-range tactical nuclear weapons in a regional conflict involving China or Russia. The combination of Japanese remilitarization, historical amnesia and US nuclear signalling creates a dangerous escalatory environment. It is a wake-up call that the old architecture of exclusive blocs and forward military presence is not merely fraying; it is actively raising the risks of catastrophic miscalculation.

The material foundations underpinning US regional primacy have already eroded. Depleted interceptor inventories, multiyear production timelines and structural industrial constraints mean that Washington cannot sustain the forward posture it once took for granted. Rhetoric about deterrence cannot substitute for magazine depth and replenishment capacity. Into this vacuum, exclusive minilaterals and intensified alliance structures offer no sustainable answer. They narrow options, heighten threat perceptions and lock the region into a competitive logic that serves neither stability nor prosperity.

What is urgently required is a different pathway — an Asian Way grounded in historical memory and imaginative statecraft.

IN RURAL GUIZHOU, A SIMPLE SOUP TELLS STORY OF THE SEASON

Tender pumpkin, green beans and water are all it takes to evoke memory of generations

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

China Vibes 味中国 — FOOD —

In the courtyard of a rural farmhouse restaurant in Qiantao township of Guiyang, Guizhou province, a pot of clear soup is slowly cooling.

There is no oil floating on the surface and no elaborate seasoning. Tender pumpkin and green beans rest in the broth, releasing a subtle sweetness.

Yet the mild dish is rarely served without a condiment. At mealtime, the vegetables are served with roasted chili dipping sauce — a combination that for many Guizhou people is the taste of summer.

The humble dish is *suguadou tang*, a simple seasonal vegetable soup. For generations of Guizhou families, it has been the preferred way to savor the freshness of the season.

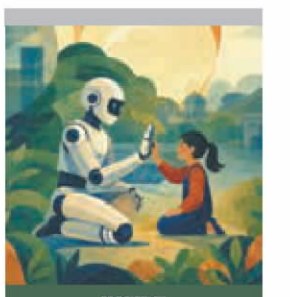
As the solar term *li qiu*, or Start of Autumn, falls on Friday, summer heat still lingers across much of southern China. In Guizhou, where pumpkins and beans are still being harvested, the seasonal soup holds its place on dining tables.

The ingredients used to make a special soup and its dipping sauce in Guiyang, Guizhou province. PROVIDED TO CHINA DAILY

"I've been eating this ever since I was a child. It is truly local," said He Juanjuan, a Guiyang native who runs a farmhouse restaurant in Qiantao.

Her restaurant serves traditional rural dishes, many made with homegrown produce. During summer, *suguadou tang* is rarely off the menu.

"On hot days, it is especially refreshing," she said. "The soup is naturally sweet and not greasy."



Freshness is key. Pumpkins are harvested young, while their flesh is still tender. "We harvest them early," He said. "If they grow too mature, they are no longer as sweet."

Her family also grows peppers, eggplants, cowpeas, green beans, leafy vegetables, scallions and garlic. When certain ingredients are in short supply, they get them from nearby markets.

The preparation follows a tradition passed down through generations. Rather than slicing them with a knife, pumpkins are snapped by hand into rough chunks, and beans are broken into shorter lengths.

INDEPTH

Final heroic trek forged in mud, sweat

Holidaying railwayman who lost his life helping others in flood-hit Guangxi mourned by millions online

By **PENG CHAO** in Chengdu and **ZHANG XIAOMIN**

The high-speed train didn't stop at Meishan East Railway Station on that sweltering July afternoon. It was Dang Xinrui's last ride as a railwayman.

His father Dang Qing accompanied his son's ashes on the train on July 19 as it passed the platform of the station where the 29-year-old had worked.

Some uniformed station staff wept openly as they stood in a line saluting as the train swept by.

Dang Qing said he chose the rail route "so his son could be a railway worker one final time".

While on vacation, Dang Xinrui volunteered to carry supplies on foot to villages cut off by flooding in southern China's Guangxi Zhuang autonomous region. He collapsed and died of heart failure caused by heat and exhaustion on July 14 while returning from a village where he and other volunteers had delivered medicine, vegetables and other supplies.

After his body was cremated, his father took his remains from Guangxi to the family home in Chengdu, Sichuan province.

"I knew he would join the disaster relief, but I never imagined I would lose him," Dang Qing told CCTV.

"What comforts me most is that he spent his final days doing something he truly loved and something meaningful. That makes me proud."

Dang's tale has also touched tens of millions of netizens, with many hailing him as a relatable hero.

Heavy burden

Dang Xinrui started his annual vacation on July 9 in Yunnan province where he intended to go hiking. He sent his friend and former colleague Ma Ziwen daily photos of the scenery.

"I'll take you hiking to watch the sunrise someday. Climbing up and seeing it. It's truly amazing," he told Ma.

He was in Lijiang, Yunnan, on July 11 and exchanged messages with his father that night, not mentioning anything about a change of plans.

The next day, he saw a message in a social media group saying volunteers were urgently needed to carry supplies into the mountains of Zhenlong township in Nanning, Guangxi's capital. He immediately responded to the call.

Many areas in Guangxi had been inundated by heavy rainfall from July 4, due to the impact of Typhoon Maysak, the 10th typhoon of the year.

In Zhenlong, roads had been washed away and villagers were trapped without access to food or drinking water.

"He messaged me saying he wasn't going sightseeing anymore. Instead, he was going to save lives," Ma recalled, adding whenever someone needed help, his friend would always be the first person to step forward.

Dang traveled to Nanning and then headed to Wuli town in Qintang district, Guigang, where there was a relief supply distribution center and a departure point for volunteers entering the mountains.

Zhenlong's Heyuan village, nestled deep in the mountains, was one of the areas hardest hit.

Landslides and road collapses had occurred in multiple locations. Water, electricity, communications and transportation were cut off to some villagers. Supplies could only be transported on foot.

More than 30 young people from across the country gathered at Wuli with a shared purpose.

On July 13, Huang Jinda, a villager from Heyuan, said he just completed a supply delivery the day before when a group of young strangers arrived in the afternoon and asked him to guide them into the mountains. He said he was too exhausted to join.

"Carrying supplies in takes over eight hours, and the return trip takes another four. The weather was sweltering. I was too worn out and needed to rest," he told Guangxi Daily.

After discussions, the group decided to follow two other volunteers who had been into the mountains, using routes recorded on their sports watches.

Worried about their safety, Huang gave them dozens of boxes of herbal remedy and glucose for emergencies.

"These volunteers were complete strangers, yet they worked harder than family. They're all good people! Many had paid 2,000 ($296) to 3,000 yuan out of their own pockets for travel expenses," Huang said.

Fateful day

At 5 am on July 14, before dawn had broken, Dang and more than 30 fellow volunteers set out from Wuli to deliver supplies to Heyuan.

A video filmed before their departure shows volunteers loading supplies into Dang's new backpack.

When they thought it was full they said, "We can go now."

Dang adjusted the backpack and motioned for them to add more. After five more cucumbers were packed in, his voice can be heard in the final seconds of the video telling them to add "a little more".

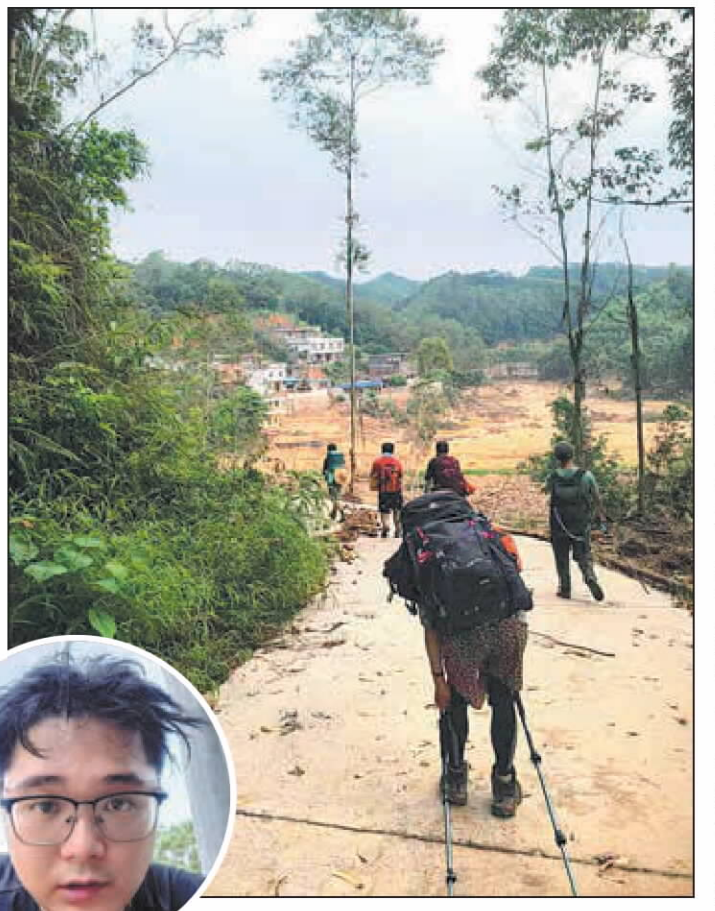
According to Huang, the supplies included cabbage, winter melon, rice, chopsticks, toothbrushes and medicine. Given the humid weather and road conditions, each person carried no more than 15 kilograms.

Guo Xiaolin, captain of the Meishan emergency rescue volunteer association, participated in a nearby relief effort. He told media that the temperature was around 35 C that day. Though there was no direct sunlight, the humid, stuffy air made it hard to breathe. Intermittent rain in the mountains added to the moisture. People were drenched in sweat even standing still.

"The road was badly hit by landslides — muddy and slippery — with many flooded sections where the water reached knee level," Guo said.

Selfies from Dang's phone show him drenched in sweat. Another image shows him and other volunteers lying on the ground resting, with their shoes and legs caked in soil.

The team walked for about six hours, crossing several mountains, before finally reaching the flood-isolated village around noon.



After unloading the supplies and having some porridge prepared by the villagers, the volunteers collapsed on the ground to rest for a while before beginning their return journey. Before leaving, Dang drew a heart in the mud.

It was on the return trek that Dang's condition took a turn for the worse.

According to police reports, when Dang and his companions reached Tangtou village in Sanli town, he suddenly felt dizzy. He rested for a while, but after walking another 300 meters, he fell unconscious. His companions performed CPR while waiting for an ambulance.

Due to severe road damage, the ambulance could not reach him quickly. By the time medical personnel reached him on foot, Dang's pupils were dilated and his heart had stopped.

He could not be revived. The cause of death was listed as heart failure brought on by extreme exhaustion.

Yang Song, a deputy railway station master who accompanied Dang's father to the site, said he learned from fellow volunteers that Dang had felt physically depleted during their trek. His companions urged him to rest, but he insisted on continuing so as not to hold up the group.

Ma said after more than four hours of walking, Dang's body might have already been struggling to cope.

The last message he sent to Ma was: "Someone else is carrying my backpack for me."

Seeing that his friend, who was always the one to help others, now needed assistance himself, Ma asked, "Can't carry it anymore?"

He never received a reply.

A kindhearted kid

Dang Qing traces his son's empathy back to early childhood.

He remembers the little boy who used to hold his hand while strolling through the market. If they passed an elderly person struggling to walk, the child would go over to help. When buying vegetables, he'd indicate to his father to buy from elderly vendors.

At age 6, Dang chose to buy a turtle over taking a bumper-car ride, saying the old seller by the roadside must be having a hard time.

In his adult life, Dang's compassion extended to animals and public welfare. Only after his death did his family discover from his mobile payment records that he had been spending more than 60 yuan each month on pet insurance for stray cats, along with recurring automatic donations to clean-water charities.

Late on the night of July 14 while at home in Chengdu, Dang Qing received a call from an unfamiliar Guangxi number. The caller said they were from the local police station and told him Dang Xinrui was unreachable, asking the father to come to Guangxi.

With a sense of foreboding, he immediately bought a ticket.

He arrived on July 16. At the funeral home, he saw his son, still wearing the same clothes from the mountain trek, with his pants and shoes caked in mud.

Dang Qing broke down. "Seeing all that mud, I knew just how hard his journey had been," he said.

He had seen news reports about the severe flooding in Guangxi, but it had never crossed his mind that his son would be involved.

If Dang had told him he was going to Guangxi for disaster relief work when they spoke the night before, he would have tried to stop him. Those days marked the peak of the disaster.

After the tragedy, Dang Qing admitted he initially felt a pang of resentment toward his son.

"Resentment that he was too foolish," he explained, falling silent for a long moment.

"But a relative consoled me: 'Your child did something he was passionate about, something good.' Those words helped me shift my perspective," he said quietly, adding with conviction that he is proud of his son.

Local authorities offered to arrange flights back to Chengdu for Dang Qing. He declined.

Instead, he chose to take the high-speed train from Nanning — deliberately selecting the G3438 train that passes through Meishan East Railway Station.

Multiple honors

At the station, part of the Chengdu section of China Railway Chengdu Bureau Group, Dang was known as the "comprehensive controller", the nerve center of the operation.

His job was to receive and verify dispatch orders and oversee high-speed train scheduling instructions. Over eight years, he handled more than 10,000 dispatch orders. Not a single one was incorrect. He received multiple honors from the railway bureau for his dedication.

"He always said dispatching isn't like passenger services, where you can apologize for a mistake. A wrong dispatch order puts trains and people in danger," recalled his friend Ma.

His colleagues said that beneath his burly 1.85-meter frame lay a gentle heart.

Once, when he found a passenger's backpack on the platform containing nearly 5,000 yuan in cash, he contacted the owner to return it.

"He was someone who could always empathize with others," said colleague Yang Fang. "When I learned he cut his vacation short to join the relief effort, I wasn't surprised. That was simply who he was."

On July 26, authorities from Hengzhou in Guangxi officially issued a certificate of heroic conduct for Dang.

The certificate reads: "Comrade Dang Xinrui actively engaged in flood-fighting and disaster-relief efforts, carrying supplies on foot to affected residents, and ultimately sacrificed his precious life in the process."

Ma, who worked alongside Dang for six years until he was transferred to another railway station two years ago, still struggles to accept the loss.

"In my eyes, he has always been towering — not just in stature, but in spirit," Ma said.

The two young men had three other close friends. The five had made a pact: once they all started families, they would travel together with their loved ones.

Before Dang left for his trip, they had planned to meet up after his vacation. That promise was never kept.

But the image endures of a tall young man with a ready smile, adjusting his backpack on a muddy mountain road, motioning for "a little more", before heading into the flood-waters to help people he had never met.

Japan's remarks trigger alarm

Experts urge Japanese government to give up pro-nuclear stance

By **HOU JUNJIE** in Tokyo and **ZHOU JIN** in Beijing

Protesters rally at Hiroshima Peace Memorial Park in Hiroshima, Japan, on Wednesday. HU XIAOGE / XINHUA

Hiroshima marked the 81st anniversary of the atomic bombing by the United States with a memorial ceremony on Thursday, amid mounting domestic opposition to recent pro-nuclear remarks by senior Japanese officials.

Experts said Japan's increasingly open discussion of once-taboo nuclear issues appears aimed at gauging public opinion and paving the way for reconsidering postwar security principles, including the country's long-standing Three Non-Nuclear Principles. They urged Tokyo to uphold the principles and abandon cooperation with other countries under the so-called nuclear "extended deterrence".

Meanwhile, China slammed Japanese right-wing forces on Thursday for politically exploiting the nation's identity as a nuclear bombing victim for sympathy and seeking possession of nuclear weapons, while urging Tokyo to earnestly fulfill its nuclear nonproliferation obligations under international law.

Foreign Ministry spokesman Lin Jian said in an online statement that the Japanese authorities have been recently boosting military buildup, seeking enhanced nuclear protection from the US, and attempting to break free from the Three Non-Nuclear Principles.

Right-wing forces in Japan have long been distorting historical facts and deliberately downplaying Japan's invasion, which killed and wounded tens of millions of people in Japan's neighboring countries, in an attempt to escape accountability for the war, he said.

Attending the commemoration ceremony at Hiroshima Peace Memorial Park, Japanese Prime Minister Sanae Takaichi said that Japan, as the only country to have suffered atomic bombings in wartime, has a mission to continue working toward a world without nuclear weapons.

But when asked after the memorial ceremony whether the non-nuclear principles would be reviewed during this year's revision of the government's three key national security documents, Takaichi declined to answer directly, according to the newspaper The Asahi Shimbun. "It would not be appropriate for me to prejudge how the documents will be worded," she said.

Hiroshima Mayor Kazumi Matsui highlighted the catastrophic consequences of nuclear weapons and called for nuclear nonproliferation and disarmament through multilateral efforts.

However, neither Takaichi nor Matsui mentioned the historical context behind the bombing of Hiroshima.

On Aug 6 and 9, 1945, the US dropped atomic bombs on Hiroshima and Nagasaki, respectively, to hasten Japan's surrender in World War II.

Hiroshi Shiratori, a professor of political science at Hosei University in Tokyo, said that Japan has long regarded the fact that Hiroshima was the first city in the world to suffer a nuclear attack and Nagasaki the last as a central part of its national historical narrative.

Shiratori said he believes that the recent nuclear-related remarks by Japanese government officials are, to some extent, aimed at testing public opinion.

Last month, Japanese Defense Minister Shinjiro Koizumi went so far as to say that Japan should discuss its nuclear policy "without taboos", including whether to revise the Three Non-Nuclear Principles that Japan has adhered to for decades.

In December, a senior Japanese official in charge of security and defense at the Prime Minister's Office told reporters that Japan should have nuclear weapons.

Shiratori said the government is gradually reshaping Japan's long-held anti-nuclear sentiment through incremental remarks on nuclear policy. He added that easing restrictions under the Three Principles on Transfer of Defense Equipment and Technology and expanding arms exports suggest that the Takaichi administration does not necessarily place sufficient importance on Japan's long-standing pacifist principles.

Since Takaichi took office in October last year, her administration has advanced revisions to Japan's three key national security documents while repeatedly raising the possibility of reviewing the "no introduction" principle under the Three Non-Nuclear Principles, arguing that such a move would strengthen the credibility of the US' extended nuclear deterrence.

Under deterrence arrangements, Washington pledges to defend Japan with the full range of its military capabilities, including nuclear.

Formally adopted by the Japanese parliament in 1971, the principles prohibit Japan from possessing, producing or permitting the introduction of nuclear weapons into its territory.

The strong anti-nuclear and anti-war sentiment among the Japanese public stands in sharp contrast to the Takaichi administration's increasingly assertive security agenda.

The Tokyo Shimbun reported that since Takaichi took office, at least 128 local assemblies in 36 prefectures have submitted written opinions to the Japanese parliament urging the government to uphold the principles, which is a record high.

Ukeru Magosaki, director of the East Asian Community Institute in Tokyo and a former Japanese foreign ministry official, told China Daily that Japan's security is built on the principles. "Adhering to the principles poses no threat to neighboring countries and is therefore more conducive to Japan's own security. That is why I oppose any attempt to weaken them," he said.

Magosaki said the ongoing Japan-US consultations on nuclear deterrence would not reduce Japan's risk of a nuclear attack. Instead, he argued, they are intended to expand Washington's options for launching nuclear strikes against other nuclear-armed states, making Japan more likely to become a target.

Security: Emphasis on peaceful coexistence

From page 1

This pathway must move away from the logic of blocs and toward inclusive security. The intellectual and political resources for such an architecture already exist. The Bandung Conference of 1955 articulated principles of sovereign equality, mutual respect and peaceful coexistence that later helped inspire the Non-Aligned Movement and remain profoundly relevant. The Five Principles of Peaceful Coexistence continue to offer a practical foundation for managing differences without resort to force or exclusive alliances. Together they point toward institutions built on indivisible security: the understanding that the security of one state cannot be purchased at the expense of another.

An inclusive Asian security architecture would stand in deliberate contrast to the closed groupings favoured by the US strategic axis. It would not be limited to any single subregion or set of members. It would be open to all states prepared to accept the core norms of nonaggression, noninterference and mutual restraint. The Association of Southeast Asian Nations is well positioned to act as convener and curator of such a process. Its patient consensus-building, demonstrated in the negotiation of the Regional Comprehensive Economic Partnership, shows that the region already possesses the diplomatic capacity to work across diverse interests and produce durable multilateral outcomes. The same method can be applied to security.

Strategic thinkers across Asia must now think historically and imaginatively. History teaches that militarization pursued without genuine reckoning with the past carries profound risks. The failure to fully confront the crimes adjudicated at the Tokyo Trials, and the darker chapters of Unit 731, continues to cast a shadow over regional trust. At the same time, imaginative diplomacy is required to construct institutions that can absorb and transcend the pressures of great-power competition. Exclusive alliances amplify those pressures. Inclusive arrangements can dampen them.

Economic resilience forms a necessary complement. The coercive leverage of the US has long rested on energy and financial channels. Pathways toward greater autonomy — through accelerated electrification and the development of parallel payment systems — are already emerging. These practical measures reduce vulnerability and expand the space for independent regional agency.

The present moment is one of genuine fluidity. Japanese domestic mobilization, US nuclear signalling and the structural decline of forward conventional capacity have created openings that can either harden into dangerous confrontation or be filled by a more stable regional order. The choice is not between Chinese dominance and US hegemony. It is between a future organized around exclusive blocs and one organized around inclusive security.

An Asian security architecture rooted in the Bandung principles of peaceful coexistence and indivisible security is no longer a distant aspiration. It is the most realistic means of stepping out of the shadows of great-power rivalry and preventing the region from becoming the theatre of a conflict none of its peoples can afford. The wake-up call has been issued. The responsibility now rests with the strategic communities of Asia to answer it with clarity and resolve.

Moment of sorrow

People attend a mass funeral held in the Gaza Strip on Tuesday for 112 Palestinians who were killed in Israeli attacks in 2023. Authorities estimate that more than 7,000 bodies remain buried beneath the rubble. Saudi Arabia, Egypt and Turkiye, among others, have accused Israel of violations in Gaza. RIZEK ABDELJAWAD / XINHUA

Sports: Accessibility of facilities highlighted

From page 1

Ma said it is imperative to improve the accessibility and affordability of fitness facilities and services, enabling more people to benefit from regular physical exercise and inclusive national fitness initiatives.

China's sustained investment has delivered tangible results. By the end of 2025, the country had more than 5 million sports venues, with over 38.5 percent of residents exercising regularly, according to the General Administration of Sport.

Meanwhile, the results of a national physical fitness monitoring survey were released late last year, revealing that 84.9 percent of respondents met the basic fitness criteria, up 0.8 percentage point from 2020. It was in this survey that China first introduced the "excellence rate" as a core composite metric for physical fitness, with 30.9 percent of respondents attaining a good or excellent rating.

The new metric not only mirrors the across-the-board increase in the general public's physical fitness, but also guides people to continuously improve their physical condition and strive for higher standards of physical wellness, said Feng Qiang, deputy director of the China Institute of Sport Science's National Physical Fitness and Scientific Exercise Research Center.

Nowadays, sports activities have become an integral part of people's daily lives. In addition to mainstream sports including basketball, soccer, badminton and swimming, once-niche activities such as roller skating and road cycling have gained massive popularity among the public.

Feng also called on more sports fans to shift from being mere spectators to becoming active participants, channeling their enthusiasm into regular exercise and healthy lifestyles. He noted that such endeavors will generate far-reaching ripple effects, especially in boosting sports consumption and fueling high-quality socioeconomic progress.

The most vivid illustration of this prospect is China's delivery of the ambitious goal that President Xi put forward during Beijing's bid for the 2022 Winter Olympic Games: to engage 300 million people in ice and snow activities.

The commitment was realized even before the Beijing 2022 Winter Olympics kicked off, and public participation in winter sports has continued to grow ever since. Between Nov 1, 2025, and Jan 31, 2026, alone, ski resorts nationwide recorded 118 million visits, according to the General Administration of Sport.

Zhu Yongguo, dean of the Ice and Snow Sports College at the Capital University of Physical Education and Sports, said the legacy of the Beijing 2022 Winter Olympics still lives on among the public, and the growing popularity of ice and snow sports keeps injecting new momentum into the country's fitness-for-all drive.

Zhu, also president of the Beijing Curling Association, cited curling as a vivid example of how the Beijing 2022 Winter Olympics' dividends can reach ordinary citizens, saying it yields tangible fitness benefits while remaining approachable for people of all physical conditions and from all age groups.

Gaming sector posts solid growth in first half of year

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

China's gaming market generated 188.45 billion yuan ($28 billion) in actual sales revenue in the first half of 2026, up 12.17 percent year-on-year, as the number of users expanded to 684 million during the same period, according to a recent report.

The China Game Industry Report for the first half of the year was presented at the 2026 China Digital Entertainment Congress held in Shanghai on July 30. The event was part of the 23rd China Digital Entertainment Expo and Conference, also known as ChinaJoy, which concluded on Monday. The report was released by the Game Publishing Committee and the Expert Committee on Game Industry Research of the China Audio-Video and Digital Publishing Association.

From January to June, Chinese self-developed games earned 163.36 billion yuan in the domestic market, up 16.3 percent year-on-year. In the overseas market, the revenue generated from these games exceeded $12.37 billion, up 30.22 percent year-on-year.

The United States, Japan and South Korea remained the top three markets abroad, respectively accounting for 32.31 percent, 14.05 percent and 7.48 percent of overseas revenue.

Mobile games dominated the domestic market with revenue share of more than 70 percent, earning 135.21 billion yuan, up almost 8 percent year-on-year. Computer games earned around 45.29 billion yuan, up 27.92 percent year-on-year.

Esports games generated 89.62 billion yuan, up 11.1 percent year-on-year, and mini-program mobile games surged over 36 percent compared with last year to generate 31.66 billion yuan.

The report also included the latest data on China's board game market for the first time. From January to June, sales revenue generated by the segment increased marginally to reach 3.87 billion yuan, up 4.03 percent year-on-year. Digital and physical board games respectively accounted for 51.6 percent and 48.4 percent of the total earnings.

Zhang Yijun, first vice-chairman of the China Audio-Video and Digital Publishing Association, said the nation's favorable policies, continuously optimized gaming ecosystems, cultural integration, and application of innovative technologies, such as artificial intelligence, have been spurring growth of the sector over the years.

China's 15th Five-Year Plan (2026-30) has included the gaming sector in the national development framework for the first time.

Sun Shoushan, chairman of the association, said the move reflects a renewed recognition and repositioning of the gaming sector's functional value at the national level. It signifies that the industry is accelerating its transformation into a sector that integrates cultural communication, technological innovation and the digital economy, he added.

The four-day ChinaJoy expo and conference attracted more than 900 companies from 35 countries and regions. AI was the highlight of the expo, with a new "Vision Future" zone that showcased cutting-edge technologies, including humanoid robots, smart wearable devices, spatial computing, and integrated AI hardware and software applications.

Taste: Home-style soup makes it to tourist tables

From page 1

"Pumpkins taste better when broken apart before cooking," He said.

Beans are put into the pot first, as they take longer to cook, followed by the pumpkin chunks. No oil or seasoning is added, allowing the natural flavors of the ingredients to come through.

"You don't need to add any seasoning," she said. "All you taste is the natural sweetness of the ingredients."

The traditional dipping sauce is made with *hu la jiao* — dried chili peppers roasted until slightly charred and fragrant, then crushed into flakes or powder.

Garlic, scallions, soy sauce and salt go into the mix. Depending on personal preference, coriander or *zhe'ergen*, also known as fish mint, can be added. A spoonful of the vegetable broth can bring the flavors all together.

When the dish is served, the sweet vegetables are dipped into the smoky, spicy sauce, and the clear broth is sipped from the bowl.

For He, the soup is inseparable from memories of her mother and the family dining table.

"We ate it almost every summer," she said.

"Whenever the season arrived, my mother would make a large bowl."

The soup is made early and left to cool as rice and other dishes are prepared. By the time the family gathers, it is ready to be enjoyed.

Today, it has also become part of the rural travel experience, and He routinely treats visitors to a generous bowl alongside other local dishes.

For travelers, the dish offers more than relief from the summer heat.

It provides a taste of a way of life shaped by home gardens, seasonal ingredients and family traditions passed down through generations.

As summer gradually gives way to autumn, a bowl of *suguadou tang* delivers the freshness of Guizhou's harvest — and the quiet wisdom of eating in harmony with the seasons.

Intl travel to US falls in 2025 amid policy strains

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

International travel to New York and the entire United States was "constrained" last year due to geopolitics and federal policies including tariffs and higher immigration restrictions, according to recent reports released by New York State Comptroller Thomas P. DiNapoli.

The findings showed that in 2025 there were nearly 176,650 fewer overseas visitors to New York, a 3 percent decrease, compared to 2024. Only California had a larger decline of over 275,000, while the national decrease was 2.5 percent.

"Federal policies are driving foreign travelers away and taking billions in tourism spending and harming our economy as exports substantially decline," DiNapoli said in a statement in early April. "New York is a top destination for tourists to the US, and policies that welcome and encourage international travel are needed to avoid damaging economic consequences."

"Tourism is an economic engine for New York City. ... International visitors are critical to our visitor mix: while they represent only about 20 percent of total visitation, they account for approximately 50 percent of all visitor spending," said travel expert Tiffany Townsend, executive vice-president of Global Communications for New York City Tourism + Conventions, which represents nearly 2,000 member organizations.

But this year, New York's travel market could see "modest" visitor growth, she said.

Townsend told China Daily that New York City is experiencing a "blockbuster" summer in 2026, "with major global moments" including the 2026 FIFA World Cup, the 250th anniversary celebrations of the United States and the New York Knicks becoming NBA champions for the first time since 1973. This year, the agency projects modest growth, with 66.3 million visitors expected, according to its March outlook.

She added that New York, one of the host cities for the 2026 FIFA World Cup, had attracted millions of football fans from all over the world, a trend that some analysts said was expected to boost tourism in mid-2026. "Initial estimates show group stage matches alone generated $1.2 billion in direct visitor spending," Townsend said.

In terms of overall visitation, last year the Big Apple, known for its skyscrapers, delis, restaurants and luxury shopping on Fifth Avenue, drew 65 million visitors, nearly twice the level in 2020, when the COVID-19 pandemic seriously affected inbound visits, but about 2.6 percent below the 2019 level.

Leisure travelers accounted for about 81 percent of total visitation, while business travelers made up about 19 percent. Separately, domestic visitors represented roughly 80 percent of all visitors.

Tourism in the city generated $84.7 billion in total economic impact in 2025, including $55.6 billion in direct spending, New York City Tourism + Conventions said.

This economic activity supported 397,000 jobs. Tourism also generated $7.5 billion in tax revenue.

Top spenders

For several years through 2023, Chinese travelers consistently ranked as the top spenders when traveling abroad, UN Tourism figures showed.

Chinese outbound travel spending is forecast to approach $280 billion in 2026, according to a report released by the World Travel and Tourism Council in June.

The US National Travel and Tourism Office predicts that international arrivals from China to the US will increase each year through 2030.

Given the sour trade relations between the US and Canada due to the US administration's tariff policies, fewer tourists from Canada made their way across the Canadian border to New York in 2025, DiNapoli's report showed, with travel from Canada falling by more than 21 percent, or nearly 3.6 million visitors.

In a bid to lure Canadian visitors back to New York, New York City Tourism + Conventions has launched an initiative called NYC's Northern Neighbour Deal — which offers them discounts on hotels, Broadway shows, attractions, restaurants and retailers.

Townsend explained that it was to reinforce the "long-standing connection between New York City and Canadian travelers and to send a clear message that Canadians are always welcome here".

Judge allows end to Haiti protections

A federal judge in Washington, DC, on Wednesday allowed the Trump administration to terminate temporary protected status, or TPS, for about 350,000 Haitians, putting them at risk of deportation, court records showed. The judge reversed an earlier order blocking the termination after the US Supreme Court ruled that TPS decisions are not subject to judicial review.

JAPAN

PM quake visit video sparks backlash

Japanese Prime Minister Sanae Takaichi has faced online criticism over a piano-scored video of her visit to earthquake hit Kumamoto Prefecture, which some social media users derided as a "PR piece", local media reported. The video showed Takaichi surveying damaged areas, meeting residents and visiting an evacuation center after the magnitude 7.1 earthquake. The government defended the video, calling it a concise summary of the visit.

NIGERIA

308 kidnapping victims rescued

Nigerian security forces have rescued 308 kidnapping victims, including 163 people abducted from Woro community in Kwara State earlier this year, the government said Wednesday. The victims were rescued from Kainji Lake National Park Forest in an intelligence-led operation involving security agencies. The government called it the largest single-day rescue operation conducted by a joint security team.

XINHUA — AGENCIES

Monsoon misery

Villagers carrying their bicycles wade through a flooded road following heavy monsoon rains in Kalapani village, Assam, India, on Wednesday. The death toll from severe flooding in Assam has risen to 89, with over 200,000 residents across the northeastern state still affected by rising river levels.

Japan 'remilitarization' push draws criticism

'China threat' narrative serves to justify broader strategic expansion, experts say

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

Japan has repeatedly played up so-called "security threats in its neighborhood" and stoked the "China threat" narrative recently, reflecting a political tactic by right-wing forces to exaggerate security concerns, shape domestic public opinion and seek justification for military buildup and strategic expansion, experts said.

The 2026 edition of Japan's defense white paper, released by the government led by Prime Minister Sanae Takaichi on Tuesday, distorts the regional security situation and hypes so-called "external threats", raising concerns that Tokyo is using the rhetoric of "peace" and "defense" to justify military expansion and move further away from its long-standing principle of "exclusive defense", they said.

Chinese Foreign Ministry spokesman Lin Jian said on Wednesday that China deplores and firmly rejects the new version of Japan's defense white paper, adding that China has lodged serious representations with Japan.

"The Defense of Japan 2026" white paper once again targeted China with groundless accusations, rehashing the so-called "China threat" narrative and grossly interfering in China's internal affairs with brazen comments on China's Taiwan region, Lin noted.

The paper also significantly expands discussion of strengthening Japan's defense production and technological bases, elevating the topic to an independent section. It argues for the development of the defense industry under the pretext of "driving economic growth" and "fostering technological innovation that benefits the civilian sector".

Liu Shuliang, an associate researcher at the Tianjin Academy of Social Sciences, said that Japan's recent efforts to expand its military capabilities have raised concerns that its long-standing principle of "exclusive defense" is being gradually eroded in practice.

In March, Japan deployed the "Type 25 Surface-to-Ship Missile" in Kumamoto Prefecture and the "Type 25 High-Speed Glide Missile" in Shizuoka Prefecture, marking the first deployment of its long-range missile systems with so-called "counterstrike capabilities".

In July, a Japan Maritime Self-Defense Force vessel conducted its first test launch of a US-made Tomahawk cruise missile, further expanding the country's long-range strike capabilities.

"Japan is sending a clear and concerning signal to the international community that it is accelerating its drive toward 'remilitarization' and moving further away from its postwar pacifist path," Liu said.

Deflecting pressures

By repeatedly hyping the so-called "China threat theory", the current Japanese administration is seeking to manufacture a sense of insecurity, both to whitewash its accelerating military buildup and to deflect domestic political pressures faced by the Takaichi government, he said.

"At a strategic level, the narrative serves a broader political agenda: creating a perception of external threats to build public support for constitutional revision, loosen postwar constraints and advance Japan's long-discussed goal of becoming a 'normal nation' with expanded military capabilities," Liu said.

Meanwhile, by reinforcing the narrative that "a Taiwan contingency is a contingency for Japan", Japan seeks to provoke a strong reaction from China, portray Beijing as a threat to Japan's security, and justify further military expansion and a defense buildup, he added.

"It has become increasingly evident that Japan's repeated attempts to stir up tensions across the Taiwan Strait pose a direct threat to China's efforts to safeguard its sovereignty and territorial integrity," Liu said.

Chen Hong, director of East China Normal University's Asia Pacific Studies Center, said that Japan has been actively promoting greater NATO involvement in the Asia Pacific while working closely with the US to build exclusive security groupings. This move risks fueling bloc confrontation in the region.

Even as it continues to reinforce the US-Japan alliance, Japan has repeatedly portrayed the normal security cooperation between China and Russia as a so-called "threat". Meanwhile, by further tightening its strategic alignment with Washington, Tokyo has willingly assumed the role of a key partner in advancing the US "Indo-Pacific" strategy, exacerbating bloc confrontation in the region, he said.

"Japan's latest moves amount to a dangerous attempt to transcend the boundaries of its defense policy in pursuit of its ambition to become a major military power. This trajectory threatens peace and stability in the Asia-Pacific and calls for heightened vigilance from the international community," Chen added.

Countries in the region should take coordinated diplomatic and security measures to respond to Japan's attempts to undermine regional peace and stability, prevent any further erosion of its postwar security constraints, and limit the room for military expansion, Liu said.

Multilateral institutions, including the United Nations, should pay close attention to Japan's security policy, raise concerns over developments that could damage the postwar international order and the spirit of its pacifist constitution, and build broader international consensus against military expansion that threatens global peace and stability, he said.

Cartel cracked

The head of the synthetics section at Spain's Central Unit Against Drugs and Organized Crime speaks at a press conference in Barcelona on Wednesday. Police dismantled a Jalisco Cartel branch involved in trafficking liquid methamphetamine hidden in vanilla shipments, seizing 2.5 tons of drugs in one of Europe's largest drug busts of its kind.
MARTA PEREZ / EPA

Drone with explosives found at German airport

BERLIN — A drone carrying explosives was found near a runway at Germany's Leipzig/Halle Airport and the device was defused, authorities said Wednesday, with Interior Minister Alexander Dobrindt calling the incident a "new threat scenario" and a "new quality of danger".

Both runways at the major freight hub were closed and several flights were diverted after a flying object was sighted near the airport shortly before midnight Tuesday.

Regional police and prosecutors said an airport employee discovered the drone near the airport's south runway with "an unknown explosive device". Police examined the object with an anti-explosives robot and removed its detonator.

"Drone sightings and drone threats, including in a hybrid context, are something we know from the past," Dobrindt told reporters at the airport after interrupting his vacation to travel to the scene. "That a drone armed with explosives is at an airport is a new threat scenario."

Dobrindt described the incident as a "hybrid attack scenario" but said questions about the explosives, the origin of the drone and who was behind it were part of the ongoing investigation.

Germany opened a counter-terrorism investigation after the drone prompted the closure of parts of one of Europe's biggest cargo hubs. Dobrindt also held an emergency meeting with the heads of Germany's security services.

The regional interior minister of Saxony state, Armin Schuster, said authorities were looking for parts of a possible second drone.

Police and prosecutors said an apparent second flying object collided with a freight airplane after it aborted a landing at Leipzig/Halle Airport because the runway was closed. The plane later landed at Hannover, about 200 kilometers northwest of Leipzig, where officials found slight damage.

A source familiar with the incident said the cargo plane belonged to German logistics company DHL. Investigators were examining what the plane had struck in the air.

No danger to passengers

The airport's north runway was reopened after about two hours, while the south runway remained closed as bomb squad experts examined the drone. Authorities said there was no danger to passengers or airport employees, and flights were not affected during the day.

Leipzig/Halle is a major cargo hub for DHL and Ukraine's Antonov Airlines. Photos from the scene showed police technicians with an explosives-disposal robot near a Ukrainian Antonov transport aircraft.

German airports have been on high alert after a series of unauthorized drone overflights at military facilities, energy terminals, seaports and logistics companies. Federal police and security agencies have assessed some of the overflights could have been organized by Russian agents.

In 2024, an incendiary device ignited at a logistics center at the airport and set fire to a freight container, in a plot that security officials suspect Russian intelligence was behind. European security agencies have also investigated incendiary devices concealed in parcels that caused fires at cargo facilities across Europe.

An interior ministry spokesperson said no connection with Tuesday night's incident could be determined at this stage. Russia has denied involvement in the 2024 incidents and recent drone overflights.

Soy growers eye China amid record crop

US farmers see trade recovery and new uses despite market uncertainty

By **LIA ZHU** in Chicago, Illinois
liazhu@chinadailyusa.com

Facing what is forecast to be a record harvest, US soybean growers say they remain anxious about market volatility and policy unpredictability, but see reason for optimism in recovering trade with China and in emerging areas of cooperation with the world's largest soybean buyer and US soy's top export customer.

The US soybean crop is projected to be a record 4.5 billion bushels (123 million metric tons), according to the US Department of Agriculture's July market outlook. US farmers planted 85.4 million acres (34.5 million hectares) of soybeans this growing season, up 5 percent from a year earlier.

However, Randy Miller, a director on the board of the US Soybean Export Council (USSEC), told a conference on Thursday that what worries him most is "the things we can't control".

"The markets, the weather, policy uncertainty — all of that just kind of piles up," he said.

Scott Metzger, president of the American Soybean Association, said input prices and the cost of production are a constant preoccupation for growers, and weigh even more heavily during difficult economic times.

What has been encouraging, is what he said "China coming back into the market, and the commitments were made and met — and even got a little bit more, for last year and for the future years as well".

"It's not all doom and gloom," Metzger added. "I'm always the optimist in our operation."

Soy Connext, the annual conference hosted by USSEC, opened on Thursday in Chicago, Illinois. The event drew record attendance of more than 800 participants from around the world.

Roughly 400 international buyers from 67 countries are attending the gathering this week, including 30 Chinese buyers working in food processing, oil crushing, feed manufacturing, and soybean research.

The program features expert panels on sustainability, global market dynamics and supply chain resilience, alongside a product exhibition and one-on-one meetings connecting international buyers with US exporters.

Participants said the opportunities for soybean cooperation now extend well beyond traditional feed applications into industrial uses, among them soy-based plastics, adhesives and lubricants.

Paul Burke, a partner at Commodity and Cooperator Services Inc and a consultant to the Illinois Soybean Association, said he is looking for Chinese partners to introduce soy-based industrial products and the technologies behind them.

Manufacturing soy-based products harms neither the environment nor human health, Burke said, noting that they contain no "forever chemicals" and are fully biodegradable.

The US soybean industry has been investing in developing such products for 35 years and now has many commercialized technologies, he said. The Illinois Soybean Association recently decided to begin promoting them internationally.

Growing interest

The products include soy-based lubricants, adhesive removers and sealants. One that has proved particularly successful in the United States, Burke said, is a soy-based sealant applied to asphalt, which performs more effectively than conventional sealants.

His organization plans to take part in the China International Import Expo in November. Beyond promoting branded products, Burke said, there is also the possibility of introducing the technology to Chinese companies.

Ted Brandt, vice-chairman of the North Dakota Soybean Council, met representatives of two Chinese oil crushing companies during one-on-one sessions at the conference.

"I think there's a lot of things that we could take away from each other and to grow that way," Brandt told China Daily.

Soybeans are present in far more products than most consumers realize, Brandt said. While attention tends to center on feed and food, the crop can be used to manufacture tires, shoes, cleaning products and plastics to replace petroleum-based materials.

One recent application, he said, is soy-based firefighting foam now being adopted by fire departments. The traditional foam contains carcinogens, making it hazardous to health and unpleasant to be near, whereas the soy foam is completely safe to handle.

Diaa Ghaly, managing director of Trans Globe, said his firm is a global exporter of grains and oilseeds, supplying feed mills, dairy farms and poultry farms. China is central to its operations as the source of the feed additives it imports; the company packages in China and exports its products from there.

Ghaly pointed to the rapid development of Chinese feed manufacturers, using New Hope and Haid, two major China-based global animal and aquaculture feed producers that operate internationally, as an example.

"We are not only buying from China, we are selling through Chinese feed mills that are based internationally," he said, adding that this is something both the US and China should be proud of.

His company sources additives exclusively from China because the country is competitive on price and guarantees quality, he said.

Finding potential Chinese partners, he said, was one of the reasons he came to Chicago.

Israel confirms troop deaths as Lebanon talks underway

JERUSALEM — Israel reported on Thursday its first military fatalities in southern Lebanon in more than a month, after carrying out fresh strikes despite ongoing US-backed talks in Rome aimed at ending hostilities.

The military identified the two reservists, who were killed on Wednesday, as Harel Birenstock, 34, and Tamir Vaknin, 33.

The deaths were the first Israeli fatalities reported in southern Lebanon since June 28.

The Israeli strikes, accompanied by the first evacuation warning in weeks, came as United States-led diplomacy between Israel and Lebanon in Rome aimed at putting an end to hostilities, with Beirut seeking phased withdrawal of Israeli troops from the south.

"In response to a blatant violation of the ceasefire by the Hezbollah terrorist organization, the IDF (Israel Defense Forces) has begun conducting precise strikes in southern Lebanon," the military said in a statement.

Meanwhile, Lebanese media said four people were injured early on Thursday in Israeli airstrikes. One person died and 11 were wounded in a separate strike one day earlier.

In Rome, Israel requested that the day's talks with Lebanon end three hours early, a source in the negotiations told AFP, saying the head of the Israeli delegation, US ambassador Yechiel Leiter, had blamed alleged "misleading leaks" by the Lebanese side.

But the talks were expected to resume on Thursday for a third and final day. In previous US-sponsored talks in June, Israel and Lebanon agreed to a framework deal that involved the disarmament of Hezbollah, a gradual withdrawal of Israeli forces from Lebanon's south and the deployment of the Lebanese army to the region, starting in test areas known as "pilot zones".

This week's negotiations are the 7th round since Lebanon was drawn into the Middle East conflict in March.

Lebanon says Israeli strikes have killed more than 4,300 people.

In its first such warning since June, the Israeli military on Wednesday told the residents of Mansouri: "In light of Hezbollah's violations of the ceasefire agreement, the Israel Defense Forces are compelled to act against it with force."

The UN's humanitarian agency had said just the night before that more than 800,000 people displaced by earlier fighting in Lebanon had begun heading back home following the recent lull in violence, though more than 360,000 remained displaced.

A US State Department official had told AFP that this week's discussions would "include expanding the pilot zone process, resolving all outstanding border issues, and working on a comprehensive peace and security agreement".

As the delegations met in Rome, Italian Foreign Minister Antonio Tajani spoke with his counterpart from Iran, Hezbollah's main patron, and called on Tehran to halt the group's operations. Tajani, in a post shortly before the Israeli strikes, voiced hope that the talks would "yield concrete results".

Hezbollah leader Naim Qassem said on Tuesday that the direct negotiations would bring "nothing but shame, humiliation" and successive concessions for Lebanon.

Hezbollah has repeatedly rejected direct talks and refused to surrender its weapons.

AGENCIES—XINHUA

African nations face heightened risk as El Nino looms

By **EDITH MUTETHYA**
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

African countries have been urged to step up preparations for what could become one of the strongest El Nino events on record, as climate experts warn that heavy rains, floods, droughts and other extreme weather conditions could trigger widespread humanitarian and economic impacts across the continent from October.

Meteorological and climate experts say forecasts point to a high likelihood of a strong El Nino developing later this year, prompting governments and regional institutions to accelerate disaster preparedness measures to reduce the risks posed by flooding, food insecurity, water shortages and disease outbreaks.

According to the World Meteorological Organization, or WMO, forecasts from leading global climate centers indicate that seasonal-average sea-surface temperature anomalies are expected to exceed 2.9 degrees Celsius in key monitoring regions, signaling the development of a strong El Nino event.

The WMO also forecasts a positive Indian Ocean Dipole, a climate pattern in which the western Indian Ocean is warmer than average while the eastern Indian Ocean is cooler. Combined with a strengthening El Nino, the two climate phenomena are expected to intensify weather extremes, increasing the risk of drought and flooding, particularly across African countries bordering the Indian Ocean basin.

Moses Vilakati, the African Union Commissioner for agriculture, rural development, blue economy and sustainable environment, said the projected El Nino could be the strongest since 1950, with peak intensity expected between November and February.

He warned that many regions across the continent are likely to experience severe droughts, devastating floods, prolonged heat waves, disruptions to food production, water shortages, disease outbreaks and increased humanitarian needs.

"These impacts will not only affect vulnerable households; they will also place considerable pressure on national economies, public finances and regional stability," he said.

Vilakati said lessons from the 2023-24 El Nino should serve as a call for urgency, preparedness and collective action. The event, he said, affected more than 71 million people across Southern Africa, while devastating floods in Eastern Africa displaced communities, destroyed infrastructure and disrupted millions of lives.

"History has repeatedly demonstrated that natural hazards become humanitarian disasters when preparedness is inadequate," he said. "Yet, history has also shown that timely action saves lives, protects economies and safeguards development gains."

Vilakati said preparedness requires political leadership, sustained investment, effective institutions and partnerships built on trust.

The African Development Bank estimates that the looming El Nino could inflict between $10 billion and $20 billion in economic losses across Africa, reducing GDP by 1 to 2 percent in the worst-affected countries.

According to the Food and Agriculture Organization, parts of the Horn of Africa that receive their main rainfall between October and December are likely to experience above-average rainfall and widespread flooding. Flood-affected areas could see significant population displacement, damage to infrastructure and crops, loss of life, and worsening food insecurity.

Across Southern Africa, rainfall is expected to be below average between October and April. Since maize is the region's staple crop and is highly vulnerable to water stress, below-average rainfall could significantly reduce the 2026-27 harvest, potentially affecting regional cereal supplies. However, bumper harvests recorded in parts of the region this year may help cushion the impact.

Potential seen for Sino-Thai tech cooperation

By **YANG WANLI** in Bangkok
yangwanli@chinadaily.com.cn

Young Chinese entrepreneurs see growing opportunities for China-Thailand cooperation across a wide range of industries, particularly artificial intelligence and digital technologies, following a visit to Bangkok.

This week, a delegation of around 20 young Chinese entrepreneurs visited the Thai capital on a study tour supported by the Global Development Promotion Center of the China International Development Cooperation Agency.

Through exchanges with Thai government officials and industry leaders — in areas including digital healthcare, education, big data, and AI — the program aimed to strengthen regional partnerships to advance digital transformation and sustainable development across the Greater Mekong Subregion and the Global South.

During a workshop on Monday, representatives from Thailand's Digital Economy Promotion Agency, or DEPA, the National Science and Technology Development Agency, and the Thai Health Tech Association outlined the country's digital development priorities, innovation ecosystem and the role of digital technologies in supporting sustainable development.

Suchana Sinthavathavorn, an official with DEPA's Digital Transformation Promotion Unit, said Thailand welcomes greater Chinese investment in digital technologies and AI.

"As AI is one of Thailand's national development priorities, we hope to strengthen cooperation with China by leveraging each other's strengths to achieve win-win outcomes," she said.

Phongchai Petsanghan, president of the Thai Health Tech Association, said Thailand is now home to more than 140 healthcare startups.

He noted that Chinese advances in gene technology and AI-assisted medical services are attracting strong interest from Thai companies seeking to upgrade their healthcare capabilities.

Lu Guoliang, a member of the Chinese delegation and director of Global Affairs at BGI Group, praised Thailand's internationally recognized strengths in wellness and healthcare services.

Lu said that BGI — one of China's leading gene sequencing companies — has launched multiple projects across Southeast Asia in recent years, including Thailand, working with local research institutions, hospitals, and government agencies to improve healthcare through advanced technologies.

Among these efforts are prenatal screening programs for diseases with high regional prevalence, including thalassemia.

"The tour has given us a much clearer understanding of Thailand's long-term development vision," Lu said. "With the country's strategic commitment to improving public health through technological innovation, we see tremendous potential for future China-Thailand cooperation."

Recognizing the growing importance of skills development to sustainable growth across the Global South, the delegation also visited the China-Thailand Luban Workshop in Ayutthaya, one of Thailand's key industrial provinces. Established in 2016, it was the first Luban Workshop outside China.

"The tour has been extremely rewarding," said Zhao Peng, a member of the delegation and Chairman of Yize Investments Limited.

"We were deeply impressed not only by the warmth and hospitality of the Thai people, but also by the enormous opportunities for cooperation between China and Thailand in vocational education."

Students learn robotics in the China-Thailand Luban Workshop in Ayutthaya Province on Wednesday. YANG WANLI / CHINA DAILY

As China-Thailand cooperation continues to deepen, particularly in fields such as AI and cloud computing, an increasing number of Chinese companies operating in Southeast Asia are driving demand for highly skilled professionals.

He added that Thailand's long-standing friendship with China and its supportive policies have further strengthened confidence in the significant potential for bilateral cooperation in cultivating the skilled talent needed for the future.

Nation taps into deep-sea wind power

New 16-MW TLP unit is about 200 km southeast of Shenzhen

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China has achieved another major milestone in its green energy transition as the world's first 16-megawatt tension-leg platform floating wind power unit officially commenced operations on Thursday, according to its operator China National Offshore Oil Corp.

Located in the Pearl River Mouth Basin in the South China Sea, about 200 kilometers southeast of Shenzhen, the structure stands at a height comparable to a 110-story building, said CNOOC, China's largest producer of offshore oil and gas.

Operating in a water depth of 136 meters and 136 km offshore, the facility features a 16-MW antityphoon wind turbine. It is engineered to withstand extreme 17-level typhoons with an operational lifespan of 25 years, it said.

Once fully operational, the project is expected to supply 54 million kilowatt-hours of green electricity annually to the Lufeng Oilfield grid via a 4.3-km subsea cable. This output equates to saving 15,000 cubic meters of fuel oil and reducing carbon dioxide emissions by 35,000 metric tons per year.

As an advanced offshore structure, a TLP floating wind platform comprises an upper floating body, subsea anchor foundations and a mooring system. Compared with semi-submersible platforms, TLP structures offer exceptional stability, lower steel consumption per MW, and a smaller sea-use footprint, alleviating conflicts between offshore wind development and traditional marine activities.

However, TLP platforms are internationally recognized as the most technically complex floating wind assets. Due to dense patent barriers, there were no previous domestic applications in China.

To tackle the high intermittency and volatility of wind energy, CNOOC pioneered a multi-energy coordinated power supply model combining offshore wind, conventional fuel generation and energy storage. This integration enables a high penetration of green power into the oilfield grid, replacing crude oil power generation to curtail fossil fuel dependence and lower emission intensity.

Energy analysts note that China's energy increments are accelerating toward marine domains in 2026. Driven by technological leaps, offshore wind and deepwater oil and gas development have become core engines for safeguarding national energy security while expanding green electricity supply.

Data released by the Ministry of Natural Resources show that China's preliminary gross ocean product reached 5.5 trillion yuan ($815.1 billion) in the first half of the year, marking a 5.1 percent year-on-year growth.

This growth rate outpaced the broader gross domestic product by 0.4 percentage points, lifting the marine economy's share of GDP to 7.9 percent and highlighting the structural resilience of China's coastal industries, it said.

Industry experts believe that China is rapidly cementing its leading edge in the global wind market by scaling up deep-sea infrastructure. Coastal industrial hubs across provinces like Guangdong, Jiangsu, Shandong and Fujian have fostered a clustered manufacturing supply chain spanning turbine production, subsea cabling, installation and maintenance.

Backed by this robust foundation, dozens of national-level specialized enterprises have emerged to resolve core challenges in high-end components such as turbine bearings and monitoring sensors, laying a complete, self-reliant industrial chain for China's deep-sea wind expansion.

According to the Global Wind Turbine Market Shares 2025 report by industry consultancy BloombergNEF, global wind capacity additions hit an all-time high of 169 gigawatts last year.

This 38 percent year-on-year surge was largely underpinned by a booming onshore sector in China. Thanks to stable long-term policy support, wind installations over the past decade have become increasingly concentrated in China, it said.

Sino-Russian trade picking up pace

By **REN QI**
renqi@chinadaily.com.cn

$134.18 billion
total value of Sino-Russian bilateral trade from January to June

China's transition from rapid scale expansion to high-quality economic development, driven by the cultivation of new quality productive forces, is injecting new momentum into Sino-Russian cooperation and global economic stability, experts from both countries said.

The driving forces behind China's economic growth are undergoing profound changes, with high-quality development emerging as its defining feature. Bian Yongzu, a senior visiting scholar at Yale University, said the booming development of smart manufacturing and new energy industries is reshaping China's competitive edge in manufacturing.

This competitive edge is clearly reflected in the new energy vehicle sector. A joint report released by research institute EVTank, Ivey Business School and the China Battery Industry Research Institute showed that global NEV sales reached 23.54 million units in 2025, up 29.1 percent year-on-year, with China accounting for 70.3 percent of the worldwide total.

Looking ahead, EVTank projects global NEV sales will hit 28.5 million units in 2026, with China contributing 19.8 million units. By 2030, global sales are expected to reach 42.65 million units, achieving an overall market penetration rate of over 40 percent. This transformation grants the Chinese economy stronger resilience amid the restructuring of global industrial chains, Bian said, emphasizing the country's unwavering commitment to expanding institutional opening-up.

This domestic economic evolution is directly catalyzing a shift in bilateral ties, underpinned by robust and expanding trade. The General Administration of Customs said that from January to June, Sino-Russian trade reached $134.18 billion, surging 25.6 percent year-on-year.

During the period, imports from Russia rose 23.3 percent to $73.6 billion, while Chinese exports to Russia jumped 28.4 percent to $60.6 billion.

Against this backdrop of expanding scale, Xu Poling, director of the Russian economy department at the Chinese Academy of Social Sciences' Institute of Russian, Eastern European and Central Asian Studies, pointed out that Sino-Russian economic and trade cooperation is accelerating its upgrade from a traditional "complementary" model of industries and commodities, to industrial chain collaboration and "innovative" cooperation.

The two nations have already engaged in deep cooperation in frontier fields such as quantum research, photonics, artificial intelligence and green/low-carbon development.

Looking ahead, macro-development strategies have charted a clear course for industrial docking, Xu said, adding that green transition, new energy, deep space exploration and digital information technology are expected to become crucial converging points for industrial synergy.

Reflecting on the 105th anniversary of the founding of the Communist Party of China, Russian scholars highly commended the nation's development trajectory. Sergey Sanakoev, director of the Russian Asia-Pacific Research Center and deputy chairman of the Russia-China Friendship Association, praised China's early victory in eradicating absolute poverty as a vivid testament to the superiority of the socialist system and the CPC's outstanding leadership.

Sergey Sannikov, deputy editor-in-chief of the Russian political magazine State Figures, said that by successfully integrating Marxism with China's specific realities and long-established traditional culture, the CPC has led the country to achieve historic leaps in infrastructure, green energy and AI.

With significant economic complementarity in emerging sectors like the digital economy and smart manufacturing, China and Russia are well-positioned to further strengthen industrial synergy and achieve win-win outcomes.

Amid global turbulence, the two nations remain time-tested friends and "key constants" in a world experiencing profound changes. Guided by top-level strategic planning, bilateral pragmatic cooperation is poised for continuous quality upgrades, injecting stronger momentum into the deepening of major-country relations and global governance, Sannikov said.

AI industry surpasses 1.2 trillion yuan in '25

The size of China's artificial intelligence industry was estimated to exceed 1.2 trillion yuan ($177 billion) in 2025, up 40 percent year-on-year, according to a research institute under the Ministry of Industry and Information Technology.

The China Academy of Information and Communications Technology noted that China was home to more than 6,600 AI companies as of June 2026, representing 15 percent of the global total. The country has developed a complete industrial system spanning foundational infrastructure, models and frameworks, and sector-specific applications, CAICT said.

The application segment accounted for 55 percent of the entire AI industry chain in 2025, up 22 percent year-on-year. The foundational segment accounted for 38 percent and grew 59 percent, while the segment covering models and frameworks made up 7 percent and grew 189 percent.

The industry is highly concentrated in just a few regions, with Beijing, Shanghai, the provinces of Guangdong, Zhejiang and Shandong accounting for more than 80 percent of the national total, the academy said.

Large AI models, AI agents and AI chips are evolving rapidly, while AI products are diversifying and their use is expanding across traditional industries.

CAICT has led the drafting of two industry standards on defining the AI sector and identifying AI companies, aimed at providing unified standards for industry statistics, policymaking and business practice.

China will continue to advance its "AI Plus" initiative to promote the extensive and in-depth integration of AI into various sectors and fields of the economy and society.

China's vision to turn artificial intelligence from an expensive frontier technology into a resource for affordable, widely accessible applications will bring huge benefits to more countries, businesses and ordinary people worldwide, said industry experts.

Furthermore, the country is seeking to turn AI into real-world applications and a driver of economic growth. In the first half of this year, the industrial output of AI-related sectors, including integrated circuit manufacturing and in-vehicle intelligent equipment manufacturing, grew more than 30 percent.

XINHUA - CHINA DAILY

Merck sees perfect elixir in China mkt

By **ZHANG CHENXU** and **LIU ZHIHUA**

Merck, a Germany-based science and technology giant, sees growing opportunities for long-term growth and innovation collaboration in China, its top executive in the country said, highlighting China's economic resilience and growing role as a source of global innovation.

"China's market not only absorbs innovation, but accelerates it," Rogier Janssens, president of Merck China, said in an exclusive interview with China Daily.

Janssens said first-half economic data reinforced Merck's confidence in China's long-term prospects, pointing to solid momentum in high-end manufacturing and resilient trade in high-value-added products.

China's GDP grew 4.7 percent year-on-year in the first half to 69.57 trillion yuan ($10.3 trillion), while value-added output of high-tech manufacturing rose 13.3 percent, according to data released by the National Bureau of Statistics in mid-July.

"The strength of the numbers did not surprise me. To gauge China's economic resilience, one must look beyond headline GDP figures and identify where growth originates."

New growth drivers, represented by high-end manufacturing, the digital economy and modern services, contributed more than 40 percent of the country's economic growth during the period, the NBS said.

"In a market of this scale and competitiveness, good ideas do not merely endure — they become world-class," Janssens said.

The momentum is particularly evident in innovative medicines, which, together with AI-related products and robotics, make up China's "next new three" — high-value products representing a new stage in the country's export upgrading.

Chinese companies completed 81 innovative drug out-licensing deals in the first half, with their combined potential value reaching about $110 billion — a record high and equivalent to around 80 percent of the total deal value for all of 2025, said the National Medical Products Administration.

An April report by Deloitte said China had evolved from playing a supporting role in the global biopharmaceutical ecosystem into an innovation leader, with the shift underpinned by regulatory reforms, top-tier talent, cost advantages and a large, diverse patient population.

China now has the world's second-largest biopharmaceutical sector and accounts for about 31 percent of the global innovative drug pipeline, the report said.

"China is no longer merely a destination for global innovation; it has become a significant source of it," Janssens said.

He attributed the shift to the country's pool of scientific talent, complete industrial chains and closer collaboration among companies, universities and research institutions, which enable discoveries to move more rapidly from the laboratory to commercial-scale production.

For Merck, this means going beyond bringing technologies into China to jointly develop solutions with Chinese partners for both domestic and global markets.

China's expanding semiconductor sector is also generating demand for advanced materials, a core area of Merck's electronics business, Janssens said, describing the country's industrial ecosystem as "unmatched".

The country's manufacturing breadth, depth, infrastructure and improving services for foreign investors further strengthen its appeal, he said, adding, "China is not only competitive, but essential."

These advantages underpin Merck's long-term confidence in China, Janssens said. The company has invested nearly 7 billion yuan in China over the past 10 years, which is now its second-largest market globally.

Recent investments include the expansion of high-purity reagent production capacity in Nantong, Jiangsu province, and the upgrade of its M Lab Collaboration Center in Shanghai.

For Janssens, Merck's approach captures the essence of "China Opportunity 2.0": China is not only a major market for multinational companies, but also a shared growth platform where they can work with local partners to develop solutions for both domestic and overseas' markets.

After more than 93 years in China, Merck sees growing alignment between the country's development priorities, global business needs and its own capabilities, Janssens said, adding, "We are not observers; we are growing together with China."

Insurance sector sees steady H1 growth

China's insurance industry recorded premium income of 3.86 trillion yuan ($568.5 billion) during the first half, up 3.3 percent year-on-year, with continued optimization in product structure, according to the latest data released by the Insurance Association of China. During the period, property insurers saw premium income rise 2.1 percent year-on-year, while life insurers' premium income increased 3.6 percent, the IAC said.

SAIC Motor, GM sign JV renewal agreement

Chinese automaker SAIC Motor and General Motors have announced a 20-year extension of their joint venture partnership to 2047. Both sides agreed that the renewal of the partnership is based on the foundation of nearly 30 years of successful collaboration, and both companies have cast a vote of confidence in the long-term value of the Chinese automotive market against the background of profound changes in the global auto sector.

Humanoid robots make quantum leaps

Zhejiang firm's products do far more than jump, climb stairs, play table tennis

By **ZHENG YIRAN**
in Ningbo, Zhejiang
zhengyiran@chinadaily.com.cn

A humanoid robot picks up a beverage at a store in Ningbo, Zhejiang province, on July 29. LIU ZHIHAN / XINHUA

Can you imagine a robot doing all of your housework? Robots developed by Zhejiang Humanoid Robot Innovation Center Co Ltd in Ningbo, East China's Zhejiang province, are turning imagination into reality.

During a typical morning on a workday, a robot irons your shirt, while another robot sweeps the floor. Not far away in the kitchen, a different robot washes the dishes. With the help of humanoid robots, a busy morning is not so busy anymore.

Apart from housework, humanoid robots developed by the company are applied in industrial scenarios and retail scenarios, covering work such as clothing manufacturing, high-precision component assembly and retail work in supermarkets.

Xiong Rong is chief scientist and general manager at Zhejiang Humanoid Robot Innovation Center Co Ltd. At end-2023, Xiong — together with eight doctoral graduates from Zhejiang University — founded the company in Ningbo.

The company focuses on key technology research and development, product development, industry application and promotion of embodied intelligent humanoid robots. It focuses on cutting-edge exploration of cutting-edge models and embodied intelligence, and is committed to developing humanoid robot products that can truly serve in multiple scenarios.

The firm's core R&D team has accumulated continuous experience in the field of intelligent robots for 26 years, and has been deeply involved in the field of humanoid robots for 20 years. The technology path covers the entire chain of motion, movement and operation, from robotic arms and mobile platforms to humanoid robots.

Xu Xuecheng, chief technology officer and deputy general manager of Zhejiang Humanoid Robot Innovation Center Co Ltd, said that the team started to develop intelligent robots in 2000, and their earliest breakthrough was in mobility — automated guided vehicles in warehousing and logistics. Between 2013 and 2014, the team shouldered the National High-tech R&D Program (863 Program), and started to develop bipedal humanoid robots.

"Based on the 863 Program, we developed a bipedal robot that can play table tennis, overcoming key technical challenges," Xu said.

Now, the company has established a full stack product matrix, which is divided into three categories: fixed, wheel arm and bipedal. Fixed type mainly targets workstations that do not need to be moved, such as textile manufacturing, and is more economical from a cost-analysis perspective. Wheel arm type with a mobile chassis is suitable for scenarios that require frequent movement, such as handling packages and assembly line work; bipedal type is at the forefront of robotics technology, capable of walking up and down stairs and overcoming obstacles. It is suitable for security inspections, exhibition hall guidance, entertainment and commercial performances, and other scenarios.

Among the products, a wheel arm universal flexible operation intelligent robot is currently the most widely promoted main product. "It can cover more scenarios with its generalization, high-precision operation and stable mobility without significant cost increases. This robot is equipped with an upgraded humanoid arm, with a repeat positioning accuracy of 0.02 millimeter at the end, a powered-up range of six hours, and the ability to climb and descend inclines of 20 degrees," Xu said.

In industrial settings, the company has clearly defined directions such as handling and sorting, precision assembly and textile production.

"The difficulty of textile manufacturing lies in the fact that fabrics are flexible and difficult to recognize, and deformation during operation cannot be simulated in the simulation environment," he said.

In April, Zhejiang Humanoid Robot Innovation Center Co Ltd inked a deal with global sewing equipment giant Jack Technology Co Ltd for 2,000 units of customized humanoid robots, setting a record for the first large-scale application project of humanoid robots in the global textile industry. In the field of clothing manufacturing, the company has achieved a success rate of 98 percent in fabric slicing, a single operation time of three seconds, and a positioning accuracy of 2 mm.

According to the company, the efficiency of robots in clothing production scenarios can reach 80 percent of human capability. "The remaining 20 percent can be optimized through automation, which is a systematic optimization project. We should leverage the value of humanoid robots' 'brain thinking' rather than letting them do repetitive work," Xu said.

In commercial scenarios, the company's humanoid robots are being applied in many commercial streets. They can complete the entire process of guiding, picking up cups, making ice cream and delivering goods, with a voice delay of no more than three seconds, a visual recognition accuracy of 98 percent and a capture success rate of 99.9 percent.

Xiong said the most difficult thing in the industry now is not the lack of robots, but the uneven level of automation. For example, in the automotive manufacturing sector, chassis manufacturing is very "smart", but assembly is still very "stupid", and traditional methods find it difficult to achieve autonomous adaptation and rapid deployment.

"The pain points are not limited to a particular sector. There is great demand in the industry, but the specific application scenarios are often very trivial. There is actually interconnectivity between industries and scenarios, such as basic actions such as plugging, unboxing, retrieving and twisting, which are needed almost everywhere," she said.

"At the same time, we need to consider collaborating with industry partners, because in order to truly implement applications, we need to start from the overall perspective and think about the automation collaboration of the entire workshop and production line. Many industry automation companies have years of accumulated experience, so in addition to building tailored intelligent models and complete machine systems, we also construct convenient and easy-to-use toolchains to facilitate industry partners so as to promote professional solutions for the integration of new technologies," she added.

At present, for humanoid robots, in addition to standing steadily and walking well, there is also a threshold that truly stands in the way of practicality. Why do many robots run and jump in demonstration situations, performing well, but have no use in real life and production? The key is that the current algorithm adaptability and intelligence level are not high enough to support robots to work stably in complex and dynamic real-time scenarios for extended periods.

The answer is to immerse humanoid robots in real scenes and combine reality and virtuality. The training method of embodied intelligent humanoid robots is different from traditional machine learning. Only by constantly interacting and training in an unpredictable brick-and-mortar environment can its actual abilities be verified. Merely by watching videos and reading text, embodied intelligence cannot master action skills like humans, industry experts said.

Lin Xianping, an associate professor at Hangzhou City University, said: "Overall, China's humanoid robots have emerged from the laboratory demonstration stage and entered a critical window period of rapid technological iteration and pilot scene implementation. Relying on the complete manufacturing industry chain and the dividends of the large-scale model industry, domestic enterprises have significant advantages in machine motion control and scene-based algorithm iteration speed.

"However, the industry is still in the early stage of being able to perform, but difficult to stabilize. It's able to build prototypes but difficult to mass produce, and there are multiple bottlenecks before large-scale commercialization. Future improvement lies in autonomy of core components, upgrading of motion control and durability performance, deep integration of embodied intelligence, optimization of endurance and energy systems, and commercialization and standardization construction," he said.

Shaoxing's silicon wafers, synthetic sapphire transforming industry

By **LI JIAYING**
lijiaying@chinadaily.com.cn

Building on its roots in silicon crystal-growth furnaces, Jingsheng Electromechanical has expanded from semiconductor equipment into advanced materials, with one-ton-class synthetic sapphire emerging as a key result.

During a recent media visit to the company's base in Shaoxing, Zhejiang province, a 450-kilogram sapphire crystal was displayed in its exhibition hall. The company said it can now produce 1,000-kg-class ultra-large sapphire using the Kyropoulos growth method, setting a world record.

Synthetic sapphire combines high transparency and thermal conductivity with electrical insulation and wear and corrosion resistance. Its hardness is second only to diamond, making it suitable for light-emitting diode substrates, protective glass for consumer electronics and high-strength laser windows.

Since entering the sapphire business in 2013, the company initially developed 300-kg-class crystals. Its technical progression subsequently reached 450-kg, 750-kg and then 1,000-kg. The company has also built cutting, grinding and polishing capacity, linking crystal growth with downstream material processing, said Zhang Jun, vice-president of Jingsheng Electromechanical.

"For manufacturers, size matters. When production yields are comparable, larger crystals allow more usable material to be cut from each ingot, reducing edge losses and unit costs," Zhang said, adding that maintaining a stable thermal field and controlling defects become increasingly difficult as a Kyropoulos crystal grows in volume and weight.

The company's latest annual report said it had achieved scaled production of 750-kg and 1,000-kg sapphire ingots and substrates measuring between 4 and 8 inches. It has also developed substrates of up to 12 inches.

Jingsheng is also applying its expertise in crystal growth and hard-material processing to semiconductor silicon wafers, seeking to supply the equipment needed across the entire manufacturing chain.

"Large silicon wafers form the base material for integrated circuits, while their flatness and surface defects directly affect yields during photolithography," said Li Yangjian, head of Jingsheng's polishing equipment research institute.

For years, the market for high-end 12-inch wafer polishing and edge-polishing equipment was dominated by US and Japanese suppliers, Li said. Chinese wafer manufacturers faced high procurement and maintenance costs while relying on foreign vendors for access to key process parameters and equipment calibration.

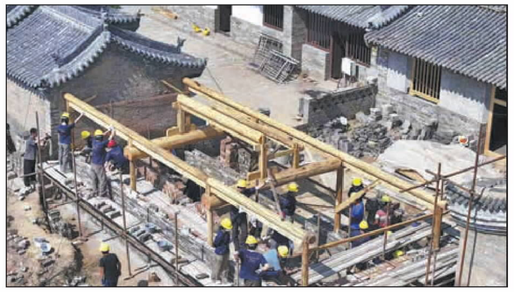
Jingsheng has since begun to change that equation. Li said the company independently developed China's first domestically produced 12-inch edge-polishing and final-polishing machines, which are now supplied in batches to major Chinese wafer manufacturers.

A ruby weighing 150 kilograms is showcased at Jingsheng Electromechanical in Shaoxing, Zhejiang province, on Aug 1. MAN HUIQIAO / CHINA NEWS SERVICE

A staff member conducts an inspection of high-precision processing equipment at Jingsheng Electromechanical in Shaoxing on Aug 1. MAN HUIQIAO / CHINA NEWS SERVICE

More than 95 percent of the core components in its large-wafer equipment are produced domestically. The equipment can reduce overall production-line costs by about 30 percent compared with imported alternatives, Li added.

Localizing the machinery, however, addressed only part of the manufacturing challenge. Wafer polishing involves dozens of constantly changing variables, and engineers previously had to fine-tune the process through repeated trial and error.



"In the past, optimizing a single set of parameters could take weeks, making it difficult to maintain consistent product quality and constraining the upgrading of China's silicon-wafer industry," Li said.

To shorten that tuning cycle, Jingsheng has incorporated artificial intelligence into the production process. At its Shaoxing plant, 12-inch automated polishing machines use AI-powered vision systems to detect micron-scale scratches and surface irregularities.

The control system analyzes the images and adjusts rotation speed, pressure and polishing-fluid ratios within milliseconds, replacing experience-based manual tuning with real-time, closed-loop process control, Li said.

International Cultural Heritage Protection Week goes global thanks to multimedia guests

Delegates share insights into international cooperation in cultural heritage protection during a roundtable meeting on July 16. WEI BO / FOR CHINA DAILY

By YUAN SHENGGAO

The International Cultural Heritage Protection Week, which opened in Shanxi on July 15, once again put the North China province on the global stage.

According to the Shanxi International Communication Center, one of the organizers of this event, the activity gained 830 million online views over the seven days it took place. This included 680 million views from China and 150 million views from overseas.

The rich forms of presentation, the participation of a great number of overseas delegates and the innovative methods of communication all contributed to building the international influence of the event, according to organizers.

The opening ceremony was held in Yuci Ancient City in the central Shanxi city of Jinzhong on July 15. It featured a range of shows with local characteristics and innovative forms.

Red Lantern, for instance, is a traditional folk dance performance displaying the folk arts and traditions of Shanxi, while the dance drama *Shanxi: A Land of Scenic Beauty* was performed with the province's enticing natural wonders as its backdrop.

Meanwhile, *The Light of Yungang*, a light show using modern techniques, was used to present the details of the Yungang Grottoes, one of three UNESCO World Cultural Heritage Sites in Shanxi, to audiences both offline and online.

Among the global participants attending the event were ambassadors and their attaches from six countries, and 200-plus delegates. They included representatives from various organizations of the United Nations, overseas Sinologists, cultural heritage researchers, artists and journalists, as well as overseas professionals working with China's universities and research institutions.

China Daily journalist Joe Burns shares his insights during a cultural salon on July 19. YAN CHANGJIANG / FOR CHINA DAILY

A grand gala

The overseas delegates held dialogues with their Chinese counterparts, sharing insights into cultural heritage protection and exchanges among various cultures and civilizations, making the International Cultural Heritage Protection Week an event with substantial international influence.

Over the seven days, participants engaged in various activities, including academic seminars and roundtable meetings, study tours of cultural heritage sites, experiences of local life, youth workshops and the production of video documentaries.

Md. Nazmul Islam, Bangladesh's ambassador to China, attended the opening ceremony of the event and delivered a speech.

"It is of great significance to discuss cooperation in cultural heritage protection in Shanxi, which is, undoubtedly, one of the cradles of Chinese civilization," he said in the speech.

Islam spoke highly of the World Cultural Heritage Sites in Shanxi, including the Ancient City of Pingyao, the Yungang Grottoes and Mount Wutai.

He said that these are the precious cultural assets not only for China but for the entire world. "They carry the cultural values that are worth sharing, spreading and studying throughout the international community."

Evandro Menezes de Carvalho, associate professor at Brazil's Universidade Federal Fluminense and visiting professor at University of Macau, also praised Shanxi's efforts in protecting and revitalizing its cultural heritage in his speech at the opening ceremony.

"As a core part of Chinese civilization, Shanxi is an excellent example of the dynamic inheritance of cultural heritage, meaning that the ancient culture is alive in local life," Carvalho said. "In ancient towns and villages, the old buildings still offer habitats for modern-day residents and folk traditions are still a part of local life."

"This shows cultural heritage is not only a resource of the past but also something that can be passed down to the future," he added.

Based on on-site research, Chinese and foreign experts shared their wisdom at three roundtable conferences focusing on international cooperation on heritage protection, cultural heritage inheritance among the youth and international communications.

Among the activities, a roundtable conference for the younger-generation — or Gen Z — researchers attracted attention in this era of digitalization, as the participants highlighted how to use the latest technologies to protect cultural assets in Shanxi and promote them to the world.

After attending the roundtable meeting on international cooperation, Pablo Mendoza, a Sinologist from the National Autonomous University of Mexico, praised the professionalism of the event.

"This is a valuable and significant platform for cross-cultural exchanges," Mendoza said. "The frank dialogues and in-depth discussions among heritage protection professionals from different countries and regions have created a bridge for mutual learning and cooperation among various cultures."

Journey of discovery

A tour to explore Shanxi's sites of ancient architecture was an important part of the event. Dozens of visual artists, bloggers, journalists and researchers took part.

The group traveled through Taiyuan, Jinzhong, Xinzhou, Shuozhou and Datong, documenting heritage sites and local life through reports, photos, videos and paintings.

The itinerary included landmarks such as Jinci Temple, Foguang Temple, Xuankong Temple, the Yingxian Wooden Pagoda, the Yungang Grottoes and Huayan Temple. The sites range from ancient wooden structures and cliffside architecture to Buddhist cave art.

A team of reporters from TeleSUR, a multimedia platform based in Venezuela, was among the group. They produced two in-depth reports to cover Shanxi's ancient architectural sites, arousing interest in Shanxi's ancient culture among audiences in Latin America.

Delegates attend the opening ceremony of the International Cultural Heritage Protection Week in Yuci Ancient City, Jinzhong, on July 15. WEI BO / FOR CHINA DAILY

Usov Artem, a Russian blogger, showed great interest in Xuankong Temple — or the Hanging Temple — in Hunyuan county, Datong. His short video featuring the structuring techniques and the unique aesthetics of this globally renowned temple has garnered more than 10 million views on his social media accounts.

The Hanging Temple also left a strong impression on Moroccan video content creator Fatima Zahra. Drawing on her experience producing travel content for overseas audiences, Zahra said striking images often catch viewers' attention and encourage them to learn more about a place and its culture.

Several artists on the journey recorded their impressions in sketches and paintings. German illustrator and new media artist Anja Nolte focused on rooflines, *dougong* brackets, dragon motifs and decorative animal figures, including a small study of the Hanging Temple.

Chinese painter Li Zhengming said Shanxi's ancient buildings conveyed a strong sense of solemnity and historical depth. Li was struck by the relationship between the Hanging Temple and its mountain setting, saying that experiencing the structure on site revealed connections among architecture, geography and culture that books and screens could not fully convey.

Speaking at a cultural salon held during the tour, Song Yi, dean of the School of International Journalism and Communication at Beijing Foreign Studies University, said international creators often bring different visual languages, narrative rhythms and points of focus. Song said their perspectives could make Shanxi's heritage more accessible to overseas audiences.

During the journey, participants used photography, drawing and video to record different dimensions of Shanxi's heritage, from conservation work and timber construction to architectural details and daily life along the historical streets.

Two prior events

Back in June, two international events focusing on ancient architectural assets were held in Shanxi. They functioned as the preludes to the International Cultural Heritage Protection Week in July.

In mid-June, Xifang Temple — a Qing Dynasty (1644-1911) building complex in Xiqiang village of Pingyao — hosted a team of cultural heritage protection volunteers who came to restore historical structures.

The group of 20-plus members was there to take part in a Gen Z construction workshop for architectural heritage protection. Gen Z refers to people born between the mid-1990s and the mid-2010s. The volunteers were from China, France and Spain.

The 10-day event starting from June 15 was organized by the Shanxi International Communication Center, the Shanghai Ruan Yisan Heritage Foundation, the French voluntary organization REMPART and the government of Pingyao.

The Gen Z workshop is a long-term cultural exchange program between Pingyao and the rest of the world.

In 2011, the Shanghai Ruan Yisan Heritage Foundation began to cooperate with REMPART, introducing the international workshop for heritage protection to the Shanxi county of Pingyao.

Over the past 15 years, more than 200 overseas volunteers have participated in this program. They have taken part in some major heritage protection projects, including the renovation of the ancient city walls of Pingyao and a number of ancient building repair projects in the county's rural areas.

The program was included in the UNESCO World Heritage Volunteers Initiative in 2025.

On June 16, a group of 23 Hungarian artists arrived in Taiyuan, Shanxi province, beginning a 13-day journey to sketch ancient buildings in Shanxi.

The event covered seven Shanxi cities: Taiyuan, Yuncheng, Shuozhou, Datong, Jinzhong, Linfen and Lyuliang. The tour members visited a dozen ancient architectural and heritage sites — including Jinci Temple and the Yingxian Wooden Pagoda — in these cities.

At the end of the tour, the artists left some of their works in Shanxi for exhibition, especially at the China (Shanxi)-Hungary Exchange Center for Arts. The center, located at the Taiyuan-based Shanxi University School of Fine Arts, was first opened during the trip.

The artists' trip went viral on several short video platforms in partnership with the Shanxi International Communication Center, one of the organizers of the event, garnering interest from people in both China and Hungary.

Media coverage

The International Cultural Heritage Protection Week, as well as its related events, has proven to be one of the most influential international cultural communication events for Shanxi.

According to the organizers, the events were covered by a dozen national news groups including People's Daily, Xinhua News Agency, China Daily and China National Radio, as well as the country's major news portals including Sina, Tencent News and Toutiao.com.

The Taiyuan-based Shanxi Daily media group published more than 100 reports on the events. Its Weibo content with the hashtag Unity for Prosperity, Heritage for Eternity, which was the theme of the event, obtained more than 280 million views.

An organizing official noted that the event's nine themed exhibitions had attracted more than 3 million offline visits. It had also generated a "large volume of organic sharing".

He explained that nowadays, visitors to exhibitions, especially young people, tend to share their experiences on their social media platforms. "Just imagine the influence generated from the millions of visitors," the official said.

In terms of international communication, the event has been promoted to the international community via the online platforms of 20-plus national and provincial-level media groups, as well as their overseas partners.

Statistics from the Shanxi International Communication Center show that, by July 23, the event had secured 150 million views from overseas audiences, accompanied by a large number of likes, comments and shares.

Zhang Xing contributed to this story.

Editorials

Washington's acute AI paradox: blame China but distill its models

A growing narrative in the political circle of the United States suggests that Beijing is behind the mounting local opposition to AI data centers nationwide. The evidence? None, beyond the unsubstantiated notion that communities "giving us trouble" must somehow be acting at China's behest.

The episode exposes an unsettling feature of today's US political discourse: allegations against China need not be substantiated to shape public perceptions. Even though the perceptions might be proved wrong. Fox News recently issued a rare on-air apology after one of its regular guests, Canadian investor Kevin O'Leary, alleged that Chinese money was funding anti-data-center groups in Utah. O'Leary later admitted he had no evidence. Local organizations rejected the accusations outright.

The release of China's Kimi K3 model reinforced a growing realization that the US' dominance in AI is no longer assured. Casting China as a malign actor is politically easier than confronting an increasingly competitive technological rival.

Yet while some in Washington try to curb China's AI industry, they are quietly acknowledging its prospects.

On Tuesday, senior US officials met executives from multiple US tech giants, including OpenAI, Anthropic and Google, to finalize a new voluntary AI governance framework. The most striking feature was what it permits: Chinese open-weight AI models will not be subject to government safety testing under the new regime. In practice, US companies are being given considerable freedom to use, fine-tune and distill Chinese open-source models. That is an implicit admission that Chinese open-weight AI has become too important to ignore.

The contradiction is difficult to miss. Washington accuses China of threatening US AI infrastructure while simultaneously allowing US companies to draw on Chinese AI innovations to enhance their own products. Chinese technology is portrayed as dangerous in political speeches but valuable in commercial practice.

For years, the US enjoyed a lead in most AI-related sectors, from advanced semiconductors and frontier models to cloud infrastructure and developer ecosystems. That lead is narrowing. Chinese companies such as DeepSeek and Moonshot AI have advanced rapidly through iteration, open-source collaboration and large-scale industrial deployment, rather than relying solely on proprietary models.

Washington's response has been a three-pronged containment strategy: restricting China's access to advanced AI chips, limiting semiconductor manufacturing capabilities and tightening controls on cloud-based computing services. These measures are proving less effective against open-source innovation, where knowledge spreads far more rapidly than hardware.

While chips and manufacturing equipment can be restricted, algorithms shared openly across global developer communities are far more difficult to contain. US companies certainly know that. Many reportedly opposed tighter restrictions on open-weight models, warning that excessive regulation would simply hand leadership in the global open-source ecosystem to China.

The White House appears to have accepted that argument now after vowing to ban China's open-source AI. Yet in doing so, it has opened another front in the competition. US technology giants — with unmatched cloud infrastructure, computing resources and developer communities — can now absorb Chinese open-source innovations, integrate them into proprietary platforms and commercialize them at an enormous scale. Openness creates influence, but it also creates opportunities for competitors.

China needs to move beyond releasing powerful models toward building a complete innovation ecosystem encompassing chips, software, data, cloud services and industrial applications.

But China's AI sector still faces some structural constraints. Efficient Chinese-native tokenization remains underdeveloped, AI chip development cycles remain long and capital-intensive and supplies of high-quality training data are expected to tighten in the coming years. Meanwhile, the US retains advantages in cloud computing, venture capital, software ecosystems and its capacity to commercialize emerging technologies. Over the long run, ecosystem builders — not hardware suppliers alone — are likely to capture the greatest value.

Hardware breakthroughs matter, but they are only one element of lasting competitiveness. The real prize is a self-reinforcing AI ecosystem in which chips, models, cloud infrastructure, applications and talent continuously strengthen one another. US restrictions are a serious challenge. But the greater danger is mistaking temporary success of one or two models for lasting competitiveness. In AI, the decisive contest will not be won by the country that delivers the next breakthrough, but by the one that builds the most resilient ecosystem.

The Economist offers wrong prescription

The word "overcapacity" has become a handy tool for some to frame China's competitive edges in a negative light and justify protectionist measures. The Economist joined this effort recently by publishing an article accusing China of having "State-driven overcapacity". Its title even suggests China should "apologize" for its "production capabilities".

Exports are an important driver of China's economy and the country's industrial production. That is true for most economies that have followed the trend of globalization. In the process, goods are produced to meet both domestic and foreign demand. North America, Europe and East Asia, as the three primary manufacturing hubs for the world, have developed their own competitive strengths. Few say there is "overcapacity" for Boeing aircraft, yet about two-thirds of the commercial planes delivered by the company are sold beyond North America, or decry as "overcapacity" the large surplus of the European Union's cosmetics sector, in which the bloc itself claims to be a "dominant cosmetics exporter". No one has asked the United States or the EU to "apologize" for outcompeting others in these industries.

But when it comes to China, the tone takes a sharp turn. Some parties have imposed arbitrary tariffs and discriminatory laws to keep out Chinese goods and investment. These steps make one wonder what these parties truly want China to "apologize" for — "overcapacity", being competitive, or providing the world with products with a high cost-performance ratio.

The Economist's story implies that China's pursuit of sci-tech self-reliance reduces its demand for imports, leading to "overcapacity" in exports. If China's indigenous innovation is treated as a "crime" simply because it reduces the country's imports of high-tech products, then the China-bashers should explain whether it was the developed economies' own restrictions on high-tech exports that drove China to commit that supposed "crime."

Those developed countries that grasp advanced technologies are still relentlessly pushing for breakthroughs, without anyone raising the alarm that by doing so they are lowering their demand for imports and filling the world with more capacity than it can handle.

The Economist also failed to mention that in the first half of this year, China's imports reached 10.74 trillion yuan ($1.59 trillion), a 22.1 percent year-on-year increase, outpacing its export growth by 8.7 percentage points. Such an amount and speed of growth reinforce the fact that China is a major consumer of other countries' exports. The Chinese market offers great opportunities for companies across the world and welcomes them to share the dividends brought by its opening-up.

As pointed out by the Chinese Ministry of Commerce's position paper on the issue, it has never been China's intention to seek a trade surplus. China's export growth is due to the scale of its economy, innovation capacity and the needs of countries to accelerate their green transition and industrial development.

Blaming China will not solve the economic malaise afflicting those finger-pointing economies whose shortsightedness has led to them relying on past legacy. Pointing the finger at China only perpetuates their self-created problems. It is the easy option to avoid the realities of a world in which past performance is no measure of future competitiveness.

It has been almost two years since the release of former president of the European Central Bank Mario Draghi's seminal report on "The Future of European Competitiveness" in 2024, which presented the need for radical reforms and proposed €800 billion ($923 billion) in annual investments to unify capital markets, streamline regulations and accelerate innovation in AI and green tech. But little progress has been made with only about 30 percent of the recommendations implemented. Those economies that benefited the most in the past cannot cry foul if their complacency and ill-judged policy focuses on Cold War confrontations have cut their nose off to spite their face.

Physical limits of a finite planet call for real action, not weeping

There is a grim poetry to drought. As rivers retreat, they turn into archaeological sites, revealing sunken warships, mammoth bones and the haunting "hunger stones" carved by desperate people centuries ago. One inscription, etched into a boulder in Germany, delivers a warning that resonates across time: "If you see me, weep."

We are seeing them again. But today, the tears are as much for disrupted supply chains and stalled industries as for the generations who carved those stones.

Europe's great waterways — the Rhine and the Danube — are shrinking to historical lows. At Kaub, the Rhine's critical shipping bottleneck in Germany, water levels recently fell to just 25 centimeters, the lowest since records began in 1880. For cargo vessels requiring three meters of draft, the river has become effectively impassable. As a result, ships are sailing with barely 20 percent of their normal load, forcing companies to deploy multiple vessels to move what earlier took just one vessel.

The consequences extend far beyond transport. Along the Danube, Hungary's Paks Nuclear Power Plant has come perilously close to the first shutdown in its 44-year history, as dwindling river flows deprived it of cooling water, slashing output from 2,000 megawatts to just 240. In neighboring Romania, the military resorted to blasting riverbed rock with explosives to redirect water and keep a nuclear reactor operating.

Yet while climate impacts intensify, the world's most powerful nation continues to devote enormous resources to securing fossil fuels.

Extreme low-water events are no longer an anomaly but an emerging pattern. What is striking is that industries built around the Rhine — including BASF, Thyssenkrupp and countless manufacturers — compete for scarce rail and truck capacity whenever the river becomes unnavigable. BASF alone estimated that the 2018 drought cost it €250 million ($288.71 million) in operating profit. Since then, progress has remained modest relative to what practical demands require.

Companies can, and should, strengthen supply-chain resilience by diversifying transport routes, building strategic inventories and reducing their dependence on a single vulnerable waterway. But these measures address symptoms, not the disease.

The deeper problem is that many of the world's great rivers are being asked to provide drinking water, irrigate farms, cool power plants, support ecosystems and transport millions of metric tons of cargo, even as a warming atmosphere steadily draws away their moisture. Climate change is exposing the limits of infrastructure built for a more stable world.

Nature's warnings have become impossible to ignore. If the slow emergence of "hunger stones" fails to capture attention, then the thunderous collapse of polar ice into warming oceans surely should. Sadly, polar tourism remains the preserve of the rich, whose response to collapsing ancient ice is mostly selfies — not a trace of recognition that they are watching nature's funeral march. Too often these alarms are drowned out by political short-termism and economic interests that continue to prioritize fossil fuels over long-term planetary stability.

The challenge is not simply rising temperatures. It is humanity's enduring belief that every environmental constraint can be overcome through technology alone. We demand cooler homes, larger cities, faster artificial intelligence, bigger data centers and ever-higher standards of living, assuming innovation will always compensate for expanding consumption. Better governance and cleaner technologies can certainly help. But no engineering breakthrough can repeal the physical limits of a finite planet.

The "hunger stones" are messages from people who understood that water determines the fate of civilizations. Unlike them, however, we face a future for which the past offers only limited guidance. The climate system itself is changing.

The exposed riverbeds in Europe become archaeological sites not because they belong to history, but because they foreshadow the slow unraveling of the infrastructure on which modern life depends. If we see the "hunger stones", we should indeed weep. But above all, we should act before the rivers have nothing left to say.

— LI YANG, CHINA DAILY

What They Say

Plan aimed at enhancing resilience of power network

Editor's note: *China has rolled out its plan for new power system construction during the 15th Five-Year Plan (2026-30) period. It is a comprehensive road map for establishing a green, low-carbon and highly resilient power supply network. The National Business Daily spoke to Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University, and Zhang Lin, director of the Department of Planning and Development of the China Electricity Council, on the significance of the plan. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China aims to establish a modern power system with a green and low-carbon electricity supply chain mix. By 2030, nonfossil energy sources are likely to account for 50 percent of the country's total electricity generation.

The country also plans to develop a modern power grid that is secure, reliable, green and intelligent, serving as a platform for resource allocation and services. It may achieve high-level consumption of more than 2.8 billion kilowatts of new energy and build a nationwide charging infrastructure network capable of supporting more than 110 million electric vehicles by the end of the decade.

The development of an electricity spot market, a capacity market and an ancillary services market is expected to accelerate. These advancements will allow price signals to better reflect the value of electricity across time and locations.

During this transition, energy storage, distributed energy resources and flexible loads will gradually shift from being passive participants to active market players.

During the 15th Five-Year Plan period, China will step up its investment in power infrastructure, optimizing the layout of transmission corridors, strengthening the backbone grid, building a new-generation distribution network and expanding energy storage and electric vehicle charging facilities. The country will also accelerate the digital transformation of the grid through the application of artificial intelligence, enhancing system coordination and flexibility.

In terms of major projects and investment, China plans to commission around 15 new ultra-high-voltage transmission lines between 2026 and 2030, increasing the capacity of west-to-east power transmission to more than 420 gigawatts.

Additionally, more than six regional power grid interconnection projects will be completed, boosting cross-regional power support capacity by roughly 40 gigawatts. At the same time, the country will accelerate the intelligent and digital upgrading of grid networks, promote the development of smart microgrids, and advance vehicle-to-grid integration.

The development of charging infrastructure is included in the five-year plan. It involves multiple segments, including equipment manufacturing, power grid upgrades and operation and maintenance. With its extensive industrial value chain, charging infrastructure also generates strong spillover effects across related industries.

China plans to establish a nationwide charging infrastructure network with more than 40 million charging stations, including around 300,000 high-power charging facilities, to support over 110 million electric vehicles by the end of the decade.

VIEWS

Ei Sun OH

From factory floors to green growth

When ASEAN and China established dialogue relations in 1991, their ties were cautious but steadily expanding. Thirty-five years later, the partnership has become one of Asia's most consequential economic relationships.

The next stage should be measured not only by trade flows or the number of agreements signed, but by its capacity to advance green development and strengthen small and medium-sized enterprises. These two priorities will determine the region's competitiveness, resilience and inclusiveness.

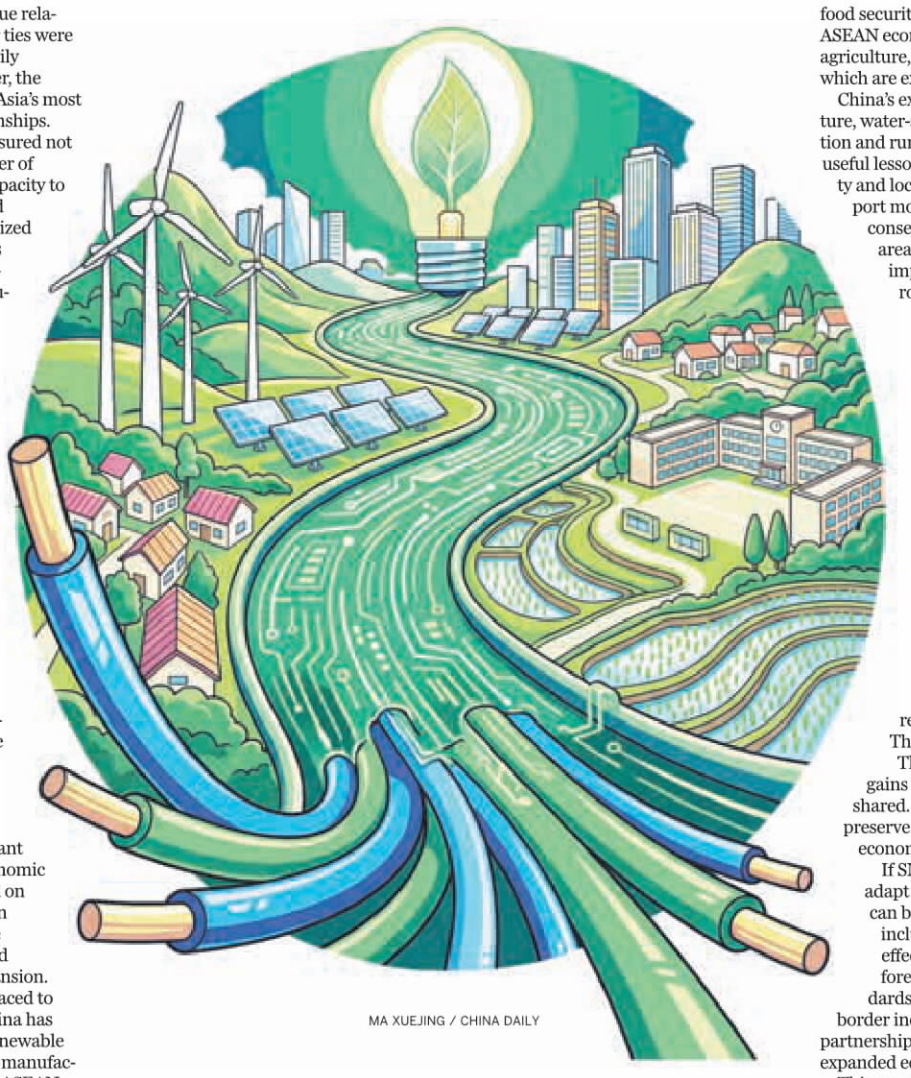
That shift reflects changing regional needs. The China-ASEAN Free Trade Area and the Regional Comprehensive Economic Partnership have already created a strong foundation for integration.

The challenge now is to improve the quality of growth. China and ASEAN should use their partnership to build cleaner industries, support local firms and create more resilient supply chains.

Green development should therefore sit at the center of cooperation. Climate change, extreme weather, energy insecurity and resource constraints are already affecting production, logistics and food systems across the region.

For many ASEAN economies, sustainability is no longer a distant ambition but an immediate economic necessity. A partnership focused on cleaner energy and lower-carbon industry will matter more to the region's future than one centered only on conventional trade expansion.

China and ASEAN are well-placed to lead this transition together. China has developed major strengths in renewable energy, electric vehicles, battery manufacturing and clean infrastructure. ASEAN offers strong solar potential, rising energy demand, rich biodiversity and a pressing need for sustainable industrialization.



These complementary strengths open opportunities in solar and wind power, energy storage, green finance, low-carbon transport and climate-smart agriculture.

The aim should not be to add a few green projects to an unchanged model. It should be to reshape the model around sustainability.

A solar manufacturing base in Thailand, an electric bus network in Indonesia, a battery recycling facility in Malaysia or a smart-grid pilot in Vietnam would do more than reduce emissions. They would create jobs, attract investment, improve energy security and help local industries move up the value chain. Green development is not a brake on growth; it is a source of new growth.

If green growth is the destination, SMEs must be the engine. They account for a vast majority of businesses in ASEAN and play a similarly important role in China.

They hire locally, adapt quickly and connect larger industries to communities. Yet they are also the most vulnerable to transition costs. New environmental standards, higher energy prices and the need to adopt cleaner technologies can place heavy pressure on smaller firms.

MA XUEJING / CHINA DAILY

Global Lens

Artificial intelligence, cloud computing and smart manufacturing can help SMEs reduce waste, improve efficiency and manage supply chains more effectively.

If China-ASEAN cooperation is to be future-oriented, it must help SMEs join the green economy rather than fall behind. That requires practical support: green financing for energy-efficient equipment and cleaner production, technical assistance to meet sustainability standards, and joint training in carbon accounting, waste reduction, circular economy practices and digital resource management.

Cross-border platforms can connect SMEs with larger firms, research institutions and investors working on clean technology.

Digital transformation can reinforce this agenda if it is used to support smaller firms. Artificial intelligence, cloud computing and smart manufacturing can help SMEs reduce waste, improve efficiency and manage supply chains more effectively.

Digital platforms can also make it easier to access green certification, compare energy options, monitor emissions and reach environmentally conscious consumers. But technology alone is not enough.

SMEs need affordable access, practical training and supportive regulation if digital tools are to translate into real competitiveness.

Green development also offers a strong framework for cooperation in agriculture, food security and rural vitalization. Many ASEAN economies still depend heavily on agriculture, forestry and fisheries, all of which are exposed to climate risk.

China's experiences in precision agriculture, water-saving irrigation, seed innovation and rural e-commerce can provide useful lessons. ASEAN's ecological diversity and local knowledge can, in turn, support more sustainable production and conservation. Cooperation in this area can protect livelihoods while improving productivity and environmental outcomes.

The broader strategic value of this agenda is resilience.

The external environment is more uncertain than it was three decades ago. Geopolitical rivalry, trade restrictions and technological fragmentation complicate regional planning.

The green transition is also uneven: some countries have advanced renewable industries, while others still face infrastructure gaps; some SMEs are ready to adopt cleaner technologies, while others lack financing and information.

These differences are not reasons to slow cooperation. They are reasons to deepen it.

The key is ensuring that the gains from green growth are widely shared. If sustainability becomes the preserve of large firms and advanced economies, it will widen inequality.

If SMEs are given the tools to adapt and compete, the transition can become a powerful engine of inclusive development. The most effective cooperation will therefore be practical: joint green standards, SME support centers, cross-border incubators, clean technology partnerships, vocational training and expanded educational exchanges.

This approach fits the way China-ASEAN relations have matured: through pragmatism, consultation and incremental progress. Its greatest achievement has been the confidence it has built among governments, businesses, universities and communities. That confidence now needs a new purpose: building a regional economy that is cleaner, more innovative and more inclusive.

The next 35 years of China-ASEAN relations should be defined by two linked goals: green development and SME empowerment. Together, they offer the clearest path to stronger growth, greater resilience and broader prosperity.

If the first 35 years were about building trust and expanding exchange, the next 35 should be about using that trust to create a greener and fairer regional future.

The author served as political secretary to former Malaysian prime minister Najib Razak from 2009 to 2011 and is currently a senior fellow at the Singapore Institute of International Affairs.

Simon Sumanjoyo Hutagalung

The next AI frontier is governance, not technology

The global conversation about the future is dominated by technology. Nations are competing to develop more powerful artificial intelligence, build advanced semiconductor industries and lead the next wave of scientific innovation.

Technological leadership is increasingly regarded as the defining measure of a nation's strength. But history tells a more complete story.

Global Lens

Every technological revolution has rewarded not only the fastest inventors, but also those whose institutions adapted quickly.

Steam power transformed economies because governments modernized infrastructure. The digital revolution flourished because institutions evolved alongside markets. Today, as artificial intelligence reshapes every sector, the decisive question is no longer who innovates first, but who governs innovation most effectively.

The next global race is not just about technological might. It is governance velocity, or the capacity of institutions to learn, coordinate and adapt at the same pace as rapid technological and social change.

In an era of accelerating disruption, governance velocity may become the most important strategic asset a nation can possess.

Recent developments illustrate why. Generative AI is advancing at an extraordinary speed, creating opportunities in healthcare, education and manufacturing while raising new questions about ethics, safety and public trust.

Climate-related disasters have become more frequent and severe. Global supply chains continue to face unexpected disruptions. In each scenario, technology is evolving faster than traditional governance.

Here, China's experience offers valuable insights. Rather than viewing governance as a static administrative system, China increasingly treats it as a dynamic capability that evolves with development.

The objective is not simply to enhance government efficiency, but also to make institutions more adaptive.

One example is AI governance. As generative AI entered mainstream use, China introduced regulatory measures designed to address transparency, security and responsible deployment while the technology was still evolving.

The approach goes beyond regulation itself. It reflects a broader philosophy that governance should move with innovation rather than follow it years later.

Another example is digital government. Across China, integrated online public service platforms have simplified access to administrative services while improving coordination among government agencies.

Data sharing and digital public services have reduced administrative barriers and enabled faster responses to citizens' needs. In this case, technology strengthens the capacity of institutions to act with greater speed and precision.

China's green transition provides another illustration of governance velocity. Over the past decade, the country has become a global leader in renewable energy deployment and electric vehicle production.

These achievements were supported not only by technological innovation but also by long-term planning, coordinated industrial policies and institutional reforms that aligned economic modernization with environmental objectives. Governance became an accelerator of transformation rather than a passive observer.

The same adaptive approach can be seen in disaster risk management. Following major floods, earthquakes and other natural hazards, China has strengthened its integrated emergency management, expanded early-warning systems and applied digital technologies to improve disaster monitoring and coordination.

These investments offer an important lesson: resilience should be built long before a crisis occurs.

None of these examples suggest that any country has a perfect governance model. Every nation continues to face new and complex challenges.

Yet China's experiences demonstrate that institutions need not remain slower than the world they govern. They can evolve through continuous learning, experimentation and innovation.

This matters far beyond China. Whether countries are developed or developing, they face remarkably similar pressures: the spread of AI, demographic change, climate risks, cybersecurity threats and economic uncertainty.

These challenges differ in form but share one common requirement — governments capable of adapting before disruption becomes a crisis.

That is why governance velocity should become a shared global objective rather than a national advantage.

The future calls not only for cooperation in technology, but also for cooperation in governance. Sharing practical experience in digital government, AI governance, disaster preparedness and green development can help countries strengthen their own institutional capacity while contributing to global resilience.

For decades, nations measured competitiveness by economic output, industrial production and technological capability.

These indicators will remain important, but they are no longer sufficient. In the age of artificial intelligence, the greatest competitive advantage is no longer technology, but the ability to manage change.

Enduring legacy of old generation of China hands

I was saddened by the recent passing of Nicholas Platt, a distinguished diplomat and one of the first China hands I met in New York after I began my assignment in the United States in late 2009.

Platt was among the pioneering group of US diplomats who established the US liaison office in Beijing in 1973.

He later became the US ambassador to Zambia, the Philippines and Pakistan. We met many times at seminars and events hosted by the Asia Society, where he had served as president from 1992 to 2004.

I had the privilege of interviewing Platt at the China Daily office in Times Square for a profile on his China experience, including his memoir *China Boys*.

The book talks about the early days of US-China relations, including anecdotes from US president Richard Nixon's historic visit to China in 1972.

When former US president George H.W. Bush passed away on Nov 30, 2018, I was in Brussels. Bush's China Diary mentioned Platt's contributions during their time at the liaison office, prompting me to conduct a phone interview with Platt once again.

The profile on Platt was one of many such stories I did during my nearly nine years in the US, featuring interviews with prominent figures. Sadly, some of these esteemed individuals, such as Ezra Vogel, have also passed away.

China welcomes genuine criticism. However, there is a clear distinction between constructive criticism based on facts and unfounded China-bashing.

Platt often described himself as an optimist regarding China-US relations. He was excited about the dramatic growth in bilateral relations over the decades and viewed occasional frictions between the US and China as normal since the relationship was getting bigger. He firmly believed that both sides would be able to manage these challenges effectively.

The older generation of China specialists in the US I spoke with had nuanced views of the relationship, shaped by their studies during the difficult years of the 1950s and 1960s when it was not possible to visit the Chinese mainland.

They also provided more honest analyses of the relationship because most of them were no longer working in the government and were not seeking future government jobs.

Besides, the revival of McCarthyism in the US today was much less of a concern a decade ago except for occasional China-bashing by some politicians.

In 2014, China and the US launched a 10-year visa program to promote mutual exchanges. The Barack Obama administration encouraged studying in China and learning Chinese, particularly under its 100,000 Strong Initiative.

Chinese investment was welcomed in the US and highlighted by the fact that the Chinese delegation was always the largest at the annual SelectUSA investment summit.

Additionally, for the first time the Chinese People's Liberation Army Navy was invited to attend the RIMPAC multinational naval exercise in 2014 and then again in 2016.

The China hands I interviewed in those days were highly respected. Most of them praised China on some issues and criticized it on others based on their extensive experience observing and analyzing the country.

Unfortunately, many China specialists in the US today, especially the younger generation, tend to be influenced by political correctness amid heightened geopolitical tensions.

Reading their articles and listening to their talks, the contrast with a decade ago is quite apparent. Many now mimic the confrontational rhetoric of China hawks in Washington because it would pave the way for a future role in the administration, regardless of party affiliation.

China welcomes genuine criticism. However, there is a clear distinction between constructive criticism based on facts and unfounded China-bashing.

As China specialists, their responsibility is to provide objective and balanced analyses instead of jumping on the bandwagon of smear campaigns.

This responsibility is the enduring legacy left by the old generation of China hands, like Nicholas Platt, for the new wave of China specialists.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

NIKOLAOS F. DIMITRIADIS

Benevolence and propriety

Digital governance begins with responsibility and accountability to ensure technology serves society as a whole not just a few

Artificial intelligence is already shaping how we learn, work, communicate, govern and even understand ourselves. Governments across the world are responding with new regulations and standards to manage these changes. These efforts are necessary, but regulation alone isn't enough. The challenge is not only how to regulate technology, but how to govern it responsibly. As digital transformation becomes integral to global development, we should pause and consider what it means for people and communities.

Digital technologies offer remarkable opportunities. They can enhance education, strengthen healthcare, make public services more accessible and help societies address complex challenges. Yet increasingly, important decisions are shaped by digital systems that most people neither understand nor control. Algorithms affect access to services, employment, education and public life, often without people knowing how those decisions are made. As these systems become more complex, the distance between those who design them and those who live with their consequences continues to widen.

Therefore, the central question is not whether societies should become more digital. The real questions are: Who will benefit? Who will decide? And who is accountable if harm occurs? These questions lead us beyond technology into the realm of ethics.

Every technological system reflects human choices, determining what is measured, valued and overlooked. These are not purely technical decisions; they are moral ones concerning people's development, security and human rights. A digital system may be fast and efficient, but efficiency alone is never enough. We should always be able to explain and justify the decisions to the people whose lives they affect.

WANG XIAOYING / CHINA DAILY

Today the call for people-centered digital governance is gathering momentum. This approach requires people to be given a genuine voice in decisions that affect them. It requires transparency about how digital systems work and accountability when mistakes are made. Above all, it requires respect for human dignity. Technology should serve people, not the other way around. Before asking what technology can be achieved, we should first ask what kind of society we want to build. Ethical orientation before action is not a barrier to innovation. It is what allows innovation to deserve public trust.

While reflecting on these questions, I found inspiration in two ideas from the Confucian tradition: *ren* and *li*. Although they come from a different cultural context than my own, they speak to challenges we all face. *Ren*, or benevolence, reminds us that being human begins with care and responsibility for others. *Li*, or propriety, reminds us that these values become real through our actions and the way we treat one another. Together, they suggest that ethics is not simply a matter of laws or principles, but a way of living together.

Consider the growing use of AI to help doctors detect diabetic retinopathy, one of the leading causes of preventable blindness. AI can identify early signs of the disease from retinal images, enabling earlier diagnosis and treatment. Yet, accurate diagnosis alone is not enough. Patients also expect transparency about how recommendations are made, confidence that physicians remain responsible for the final decision and assurance that accountability is never delegated to an algorithm. In this sense, *ren* reminds us that the purpose of technology is to serve human well-being, while *li* means that this purpose must be expressed through responsible institutions, transparent procedures and accountable decision-making.

The relevance of these ideas extends well beyond philosophy. China's Global AI Governance Initiative, for example, reflects a people-centered vision of AI by emphasizing human responsibility, ethical oversight, fairness and human control. This is not a question of East or West. No culture has a monopoly on responsibility, dignity or human wisdom. Different traditions may use different words, but they often point toward the same truth: Those who shape the lives of others must remain accountable to them.

Digital governance therefore requires not only the exchange of technologies, but also a genuine dialogue between moral traditions, each contributing to a digital future that serves human beings rather than getting reduced to users, data or objects of management. Ultimately, the future of digital governance will not be decided only by better technology or more sophisticated regulation. It will also depend on the character of the people who design, govern and use these systems.

Our digital age often promises optimization, automation and systems edging ever closer to perfection. Yet, rather than perfection, human life has always been about relationships, judgment, responsibility and the ability to learn from mistakes. If digital transformation is truly to advance global development, it must strengthen these human qualities rather than weaken them.

Responsible governance begins not with algorithms or regulations, but with the recognition that every technological decision affects another human life. Digital governance earns legitimacy not because algorithms become more sophisticated, but because institutions remain accountable for how technology shapes human lives. Accountability and respect for human dignity are not constraints on innovation; they are the very conditions that enable innovation to earn lasting public trust. As AI continues to transform our societies, responsibility should remain our first design principle, because the true measure of progress is not what technology can do, but what it enables human beings to become.

Means of empowerment

China's new infrastructure development provides valuable lessons for other developing countries

The latest wave of technological revolution and industrial transformation, particularly the rise of artificial intelligence, has sparked a global surge in infrastructure investment. In recent years, China has consistently increased its investment in new infrastructure, with investment in the internet and related services growing by 39.9 percent year-on-year in the first half of 2026, and information transmission investment rising by 25.6 percent, according to the National Bureau of Statistics. By the end of June, China had built 5.102 million 5G base stations, establishing the world's largest information and communication network and a nationwide computing power infrastructure system, according to the Ministry of Industry and Information Technology. This new infrastructure is not only a crucial engine for stabilizing growth but also a new hallmark of China's development in the digital age.

The achievements of China's new infrastructure development are evident in both scale and quality. In the communication network sector, China's 5G network leads globally, with 5G and gigabit optical networks integrated into 94 categories of the national economy. In the realm of computing power, the "Eastern Data and Western Computing" project has been deeply implemented, with the growth rate of intelligent computing power far exceeding the global average. In the green and low-carbon sector, by the end of 2025, the average power usage effectiveness of China's ultra-large computing facilities had dropped to 1.34, and over 80 percent of the new data centers at national hub nodes were powered by green energy, demonstrating a synergistic path of computing power growth and green transition.

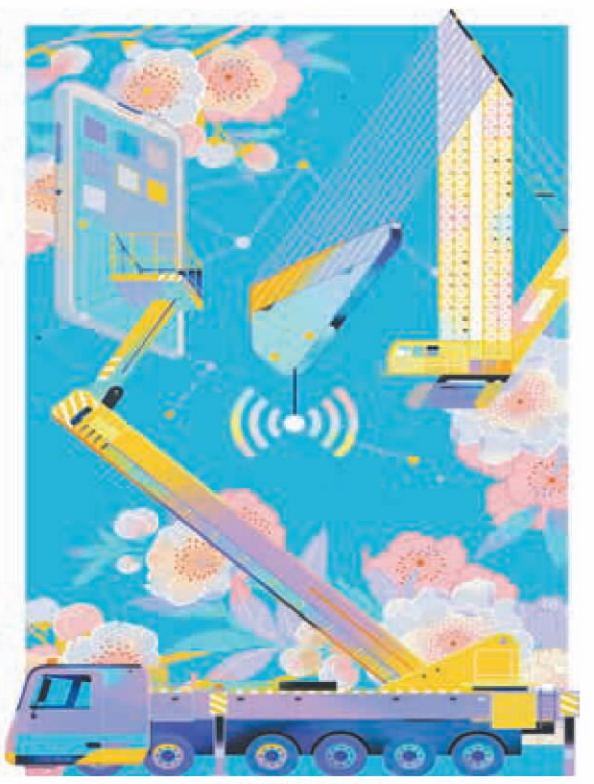
The empowering effects of new infrastructure are continuously being unleashed, profoundly transforming China's production and lifestyle from factory workshops to mining and ports, urban governance to rural revitalization, and consumer entertainment to public welfare. According to estimates by the National Bureau of Statistics, new drivers of growth, represented by high-end manufacturing, the digital economy and modern services, contributed over 40 percent to economic growth in the first half of the year, highlighting the foundational support role of new infrastructure as a base for these new drivers.

China has accumulated a series of effective and valuable experiences in advancing new infrastructure construction, which are worthy of serious consideration by countries worldwide as the global demand for new infrastructure grows.

First, adhering to planning guidance and coordinated advancement.

New infrastructure construction involves significant investment, long cycles and a wide scope. China leverages its institutional advantages to implement top-level design. The 14th Five-Year Plan (2021-25) outlined the strategic task of accelerating new infrastructure construction, and the 15th Five-Year Plan (2026-30) proposes appropriately advancing construction of new infrastructure, detailing work approaches in areas such as integrated computing networks, satellite internet, information communication networks, data infrastructure and low-altitude infrastructure. This continuous planning and deployment maintains policy continuity and stability while keeping pace with technological development and industry demand, ensuring the systematic, forward-looking and coordinated construction of new infrastructure.

Second, combining an effective market with a proactive government.



China's new infrastructure development has formed a pattern of diverse stakeholders participating together. The government focuses on supporting projects with strong foundational, public and spillover effects, actively guiding social capital into key areas such as new infrastructure through tools such as special bonds, real estate investment trusts, and industrial investment funds. Reforms in monopoly industries create conditions for private economic entry. For instance, the Ministry of Industry and Information Technology has stated that it will further promote the opening of telecommunications services to private capital and support private enterprises, participating in data centers, satellite internet, the construction of 5G and industrial internet in various ways.

Third, pursuing simultaneous construction and utilization, and promoting construction through use.

China consistently adheres to the demand-oriented and application-driven approach, integrating the cultivation of application scenarios throughout the construction process to drive construction through application and promote application through construction. From the initial commercialization of 5G, China has simultaneously advanced industry application pilot demonstrations, expanding from the consumer internet to the industrial internet and extending services from individuals to production empowerment. The construction of computing power infrastructure does not blindly pursue installation scale. In 2023, the action plan for the high-quality development of computing power infrastructure was issued, emphasizing demand-driven and strengthened empowerment, and promoting the deep integration of the digital economy with the real economy.

Fourth, championing open cooperation for mutual benefit.

China consistently promotes new infrastructure construction with an open and inclusive mindset, avoiding closed, exclusive small circles. The country continues to expand its openness, conducting open trials of value-added telecommunications business in Beijing, Shanghai, Hainan and Shenzhen, allowing foreign enterprises to operate internet data center businesses independently in pilot areas. High-quality construction of the Digital Silk Road is underway, with cross-border optical cable infrastructure being built with partners. The 2Africa submarine cable, the world's largest transoceanic submarine cable system, connects 33 countries across Asia, Africa, and Europe, benefiting approximately 3 billion people and helping developing countries address digital infrastructure shortfalls.

SONG CHEN / CHINA DAILY

As a developing country, China faces several challenges in advancing new infrastructure construction: there are still shortcomings in some key core technologies, and construction and application levels are uneven between regions and between urban and rural areas. Small and medium-sized enterprises face high integration and application costs, and new challenges have arisen in data and network security. To address these issues, China is intensifying efforts to tackle key core technologies, leveraging the advantages of a new national system to overcome "bottleneck" problems; continuously advancing inclusive new infrastructure construction to narrow regional and urban-rural gaps; issuing supportive policies to reduce the digital transformation costs for small and medium-sized enterprises and cultivating more grounded application scenarios; and coordinating development and security to improve the network and data security governance system.

The practice of China's new infrastructure construction offers valuable insights for countries worldwide, especially developing countries, to advance development transformation.

First, new infrastructure requires forward planning.

Infrastructure is a key pioneer for economic and social development, especially in the digital age. For many developing countries, seizing the historical opportunity of the new technological revolution and appropriately advancing new infrastructure construction is an important choice for achieving leapfrog development. The gap in traditional infrastructure may take decades to catch up, but new infrastructure offers the possibility of "overtaking on the bend".

Second, new infrastructure has public characteristics.

New infrastructure should not be a luxury for a few enterprises or individuals but should be a public good benefiting all people. In promoting new infrastructure construction, China pays special attention to extending it to rural areas, grassroots and underdeveloped regions. Remote medical care now covers all counties nationwide, and the new infrastructure is becoming important support for promoting common prosperity. This highlights to countries worldwide that digital and intelligent transformation should allow the fruits of technological development to benefit all people more fairly.

Third, new infrastructure requires systematic integration.

New infrastructure does not exist in isolation but is deeply integrated with traditional infrastructure and the real economy. Countries advancing new infrastructure construction should not build networks or buy equipment in isolation but should focus on system integration and integrated application to fully leverage the multiplier effect of new infrastructure.

Fourth, new infrastructure has global characteristics.

Leading countries have a responsibility to help developing countries enhance their new infrastructure levels. All countries should abandon zero-sum thinking and engage in practical cooperation in standard-setting, technology research, and development and application promotion, allowing new technologies represented by AI to be shared and governed by all countries, benefiting all nations fairly. Countries should work together to build a more inclusive, win-win global development community with a shared future.

CHINA

Opera class

A Peking Opera performer interacts with children during a summer public welfare class in Dongjie village, Anyang, Henan province, on Thursday. The initiative introduced the traditional Chinese opera into classrooms in rural areas, offering local children a hands-on experience of traditional culture and the unique charm of this national treasure.

BI XINGSHI / FOR CHINA DAILY

New rules aim to strengthen consumer protection in GBA

Guangdong targets cross-boundary consumption and complaint handling

By ZHOU MO in Shenzhen
sally@chinadailyhk.com

Guangdong province has issued new regulations to strengthen consumer protection cooperation with the Hong Kong and Macao special administrative regions, a move expected to facilitate cross-boundary consumption and boost confidence in the Guangdong-Hong Kong-Macao Greater Bay Area's integrated consumer market.

The regulations, including the Guangdong Province Consumer Rights Protection Regulations and the Guangdong Province Regulations on Promoting Consumer Rights Protection Cooperation in the Guangdong-Hong Kong-Macao Greater Bay Area, were officially unveiled earlier this week and will take effect on Oct 1.

As a specialized regulation focusing on cross-boundary consumer protection cooperation, the latter aims to improve coordination among consumer protection authorities, address challenges arising from increasingly frequent cross-boundary consumption and contribute to the development of a high-quality living area across the 11-city cluster.

Under the regulation, consumer councils in Guangdong and the nine mainland cities of the Greater Bay Area will strengthen cooperation with their counterparts in Hong Kong and Macao through agreements, cooperation mechanisms and information sharing. The three sides will enhance collaboration in areas including cross-boundary complaint handling, consumer education, dispute mediation and consumer risk warnings.

The regulation comes as cross-boundary exchanges in the Greater Bay Area continue to expand.

Shenzhen's ports recorded 273 million cross-boundary passenger trips in 2025, including 170 million made by Hong Kong and Macao residents, up 9 percent year-on-year, according to the Office of Port of Entry and Exit of the Shenzhen Municipal People's Government.

As more people travel, shop and spend across the region, demand for consumer protection has also grown.

According to the Hong Kong Consumer Council, Chinese mainland consumers filed 5,192 complaints against Hong Kong traders in 2025 involving online shopping, including complaints related to three major mainland e-commerce platforms registered in Hong Kong. During the same period, complaints filed by Hong Kong consumers against mainland traders rose by more than 40 percent year-on-year.

The figures underscore the need for closer coordination among consumer protection bodies across the Greater Bay Area.

"Against the backdrop of the Greater Bay Area featuring one country, two systems and three legal jurisdictions, exploring cooperation in cross-boundary consumer protection has pioneering significance nationwide," said Wu Jingsong, director of the research center for local legislation and law enforcement risk assessment at South China Normal University.

Wu said the regulation serves as a bridge connecting the three consumer markets. He added that establishing a cross-boundary complaint transfer platform, as outlined in the regulation, would help transform institutional trust into consumer confidence and support closer economic exchanges within the region.

Jiang Baoguo, a professor at the School of Law at Guangdong University of Foreign Studies, said the regulation responds to the growing demand for cross-boundary consumer protection while building on years of cooperation among Guangdong, Hong Kong and Macao.

It promotes the "soft connectivity" of rules and mechanisms in the Greater Bay Area and provides legal support for building a high-quality living area suitable for living, working and traveling, Jiang said.

Consumers also welcomed the new regulation, saying it would make cross-boundary consumption more convenient and provide stronger protection when disputes arise.

"I frequently travel to Shenzhen for dining, shopping and entertainment, and the two places do have different consumer protection systems," said Liu, a consumer from the Chinese University of Hong Kong who gave only her surname.

"I believe closer cooperation between Guangdong, Hong Kong and Macao will give us greater confidence when making cross-boundary purchases."

Chen Yanshan contributed to this story.

Harbin brings winter indoors in height of summer

HARBIN — Alejandra Palacios found herself moving from summer heat to winter chill in just a matter of minutes. One moment, she was strolling in almost 30 C warmth in summer clothes; the next, she was bundled in a thick down jacket as the temperature plunged to around minus 10 C.

Inside an ice-and-snow pavilion at Harbin Ice-Snow World in northeastern China, the Nicaraguan visitor wiped the fog from her phone lens to reveal an ice-carved castle and cathedral glowing in violet-blue light. Snowflakes drifted down as tourists swooshed down ice slides on rubber tubes.

"They've brought winter into summer, and carved the ice into something so magnificent and delicate. It's astonishing," she said.

Harbin, the capital of Heilongjiang province, is known as China's "Ice City" for its freezing winters, ice sculptures and winter sports. After the outdoor section of Harbin Ice-Snow World, the world's largest ice-and-snow theme park, closed this February, its indoor ice-and-snow pavilion took over, offering visitors a cool escape from the summer heat.

According to Sun Zemin, deputy marketing director at Harbin Ice-Snow World, the pavilion opened in the summer of 2024. The 23,800-square-meter venue maintains an interior temperature between -8 C and -12 C and uses about 20,000 cubic meters of ice.

"The pavilion features natural ice harvested from the Songhua River in winter and preserved at low temperatures in sealed storage, as well as colored ice, bubble-free ice and frozen roses made by ice-making factories," Sun added.

> "They've brought winter into summer, and carved the ice into something so magnificent and delicate. It's astonishing."
>
> **Alejandra Palacios,** a visitor from Nicaragua

Those who visit the park can also enjoy indoor ice shows that combine figure skating, acrobatics and live music.

Ashley Martinez Aponte, a visitor from the Dominican Republic, lingered long after the performance had ended. "It was such an unforgettable show. I think everyone should come and appreciate this piece of art on ice," she said.

The park's operator said that the pavilion's single-day visitor count exceeded 5,000 at its peak this summer. The park draws not only domestic tourists escaping the heat from southern China, but also travelers from Singapore, Malaysia, the Republic of Korea and other countries.

Beyond the ice sculptures, shows and rides, off-season winter sports are emerging as a new draw for Harbin's summer tourism — a fresh way of turning its winter chill into a hot season attraction.

At a year-round indoor ski resort in Harbin's Songbei district, beginners have been learning turning and braking with coaches this summer, while seasoned skiers race down the slopes, kicking up clouds of snow.

Lin Shuyue, a senior student from Xiamen in East China's Fujian province, recently visited Harbin with her classmates on a graduation trip. Though they have access to indoor ski slopes back in the south, they made a point of adding this ski resort to their itinerary.

"You can ski indoors in the south too, but it just doesn't feel the same as the 'Ice City'," Lin said, adding that with greater vertical drops, more advanced slopes and the city's immersive ice-and-snow culture, skiing in the height of summer here is a truly unique experience.

Spanning around 80,000 sq m, the indoor ski resort features eight slopes of varying gradients, with a maximum vertical drop of 80 m. It's the perfect venue for skiers of all skill levels. Thanks to its year-round temperature control and snow-making systems, ski training and recreation are no longer limited by the weather outside.

"We are committed to making winter sports accessible all year round, creating all-season, all-age ice-and-snow experiences," said Song Guangxu, who is in charge of the resort. In addition to daily operations and ski instruction, the facility also helps sustain visitor flows by hosting professional competitions, family-oriented events and public ice-and-snow experience programs.

These indoor ice-and-snow projects are weaving themselves into Harbin's broader summer tourism market, fueling a travel boom during the peak season. Travel platform data shows that flight bookings from major cities across the country to the "Ice City" have surged since late June, driven by a combination of graduation trips and family summer getaways, with young travelers making up a significant share of the city's summer visitors.

Li Zhuomin, deputy director of the Harbin city bureau of culture, radio, television and tourism, said the city is building a more stable year-round supply of ice-and-snow products through projects such as indoor theme parks, ice-art exhibitions and indoor ski resorts.

China's ice-and-snow economy exceeded 1 trillion yuan ($147 billion) in 2025, according to a report released this year by the China Tourism Academy. Indoor ice-and-snow complexes have become one of the most active investment categories in the sector, further breaking down the climatic and seasonal constraints on ice-and-snow consumption.

XINHUA

China's lunar atlas to aid future exploration goals

By LI MENGHAN
limenghan@chinadaily.com.cn

China has completed a geological map of the entire moon at a scale of 1:5,000,000, providing a comprehensive reference for lunar science research and future exploration missions.

Scientists at the Institute of Geology of the Chinese Academy of Geological Sciences led the compilation of the map using data from the Chang'e lunar exploration program. The map identifies more than 13,000 impact craters and 81 impact basins, while classifying 14 types of geological structures and 17 types of rocks across the lunar surface.

The main map measures about 280 centimeters long and 120 cm high and is accompanied by separate geological maps of the moon's north and south polar regions.

The project also improves scientists' understanding of the moon's geological history by refining its timeline of major events. Researchers revised the dating of the Aitkenian period — marked by the formation of the South Pole-Aitken Basin, the moon's largest known impact basin — to 4.33 billion years ago. They determined start dates of 4.17 billion years ago for the Nectarian period and 3.92 billion years ago for the Imbrian period. The study also produced the first global subdivision of the moon's later geological history, allowing scientists to better distinguish different stages of its evolution.

Researchers also updated the inventory of lunar rocks and minerals by using higher-resolution maps of mineral distribution and improved rock classification standards. The work was supported by findings from the Chang'e 4 and Chang'e 6 missions.

Based on those samples, scientists identified a previously unrecognized rock type, known as gabbronorite, a dark, coarse-grained igneous rock formed deep underground in the South Pole-Aitken Basin. The discovery provides rare direct evidence of materials that originated deep beneath the moon's surface, offering new clues to its internal structure and evolution.

To improve both scientific accuracy and readability, the team also adopted varying mapping standards for different types of geological features. This approach preserves important details without making the large-format map overly complex.

Yang Zhiming, director of the institute, said the map will provide important scientific support for China's future lunar research station construction, landing site selection and deep-space exploration. Yang said that by leveraging AI technologies, the team plans to compile a new-generation 1:5,000,000-scale geological map of Mars to support the upcoming Tianwen 3 mission.

Major US awards for 2 Chinese meteorologists

By ZHAO YIMENG
zhaoyimeng@chinadaily.com.cn

Zhang Renhe

Miao Shiguang

Two Chinese meteorologists have been named recipients of major awards from the American Meteorological Society, marking growing international recognition of China's contributions to climate dynamics and urban meteorology.

The AMS recently announced the recipients of its 2027 awards and honors on its official website. Zhang Renhe, an academician of the Chinese Academy of Sciences and a professor in the Department of Atmospheric and Oceanic Sciences at Fudan University, will receive the Sverdrup Gold Medal, while Miao Shiguang, president of the Institute of Urban Meteorology in Beijing, will receive the Helmut E. Landsberg Award.

Zhang was honored for his fundamental contributions to understanding Asian monsoon variability in relation to ocean-atmosphere interactions in the northwest Pacific and coupled climate modes such as the El Nino-Southern Oscillation, or ENSO.

Established in 1964, the Sverdrup Gold Medal is awarded annually to a scientist for outstanding contributions to understanding interactions among the oceans, atmosphere, cryosphere and biogeochemical processes.

Zhang has spent decades studying climate dynamics, with research spanning large-scale tropical air-sea interactions, the Asian monsoon and the meteorology of the Qinghai-Tibet Plateau. His work has advanced scientific understanding of the mechanisms driving climate variability across Asia and beyond.

He currently serves as co-chief scientist of the Asia-Australia-Africa monsoon international scientific program and will lead major international research initiatives proposed by China to promote global collaboration on monsoon research.

Miao will receive the Helmut E. Landsberg Award for pioneering contributions to urban meteorology, climate science and numerical modeling that have advanced weather forecasting, disaster risk reduction and urban resilience, according to the AMS.

His research has focused on both the scientific foundations and operational applications of urban weather monitoring and forecasting. He systematically revealed how urbanization alters local meteorological conditions and developed innovative multi-scale numerical modeling techniques for cities.

Miao also led the development of an advanced high-resolution numerical prediction platform that provides more accurate forecasts for complex urban environments.

Established in 2007, the Helmut E. Landsberg Award recognizes outstanding contributions to the understanding of urban atmospheric processes, the impact of urbanization, numerical modeling and precision forecasting.

The China Meteorological Administration said the awards highlight the growing international influence of Chinese scientists in atmospheric sciences.

Brick by brick

Visitors admire a grand LEGO model of the panoramic Northern Song Dynasty (960-1127) painting *Along the River During the Qingming Festival* in Hangzhou, Zhejiang province, on Wednesday. Measuring 26.5 meters long and 1.8 meters wide, the model was crafted from nearly 3 million LEGO bricks. LI ZHONG / FOR CHINA DAILY

Silk shines on the global stage

As an iconic Chinese symbol, an exhibition highlights the evolution of patterns that opened international dialogues throughout dynasties, **Wang Xin** reports.

Silk has been one of Chinese civilization's iconic cultural symbols over thousands of years. The unfading patterns are often seen as its "soul", mirroring the culture and social conditions of that time as well as embodying ancestors' observations of nature and daily life.

An exhibition hosted by the Shanghai Social Sciences Development and Research Center and Donghua University Press opened on July 27 in Shanghai, bringing together over 100 representative silk patterns spanning five millennia.

Xie Fanhui of the Shanghai Social Science Museum, the exhibition's venue, shares with China Daily that outstanding traditional Chinese culture is one of the museum's main themes in its exhibition.

"With this exhibition, we aim not only to trace the millennia-long evolution of silk patterns, but also to explore the Chinese cultural roots embedded within these silk patterns through visual, tactile and interactive displays, bringing them from the depths of history into the daily lives of the public," says Xie.

Models present creations during the JEANSWEST by Huang Gang runway show at China Fashion Week 2025 in Beijing on Sept 13, 2025. The collection reimagines traditional silk patterns with a fresh, contemporary edge. JESSICA LEE / FOR CHINA DAILY

The grand silk scroll etched with splendid ancient civilization patterns begins in the Xia (c. 21st century-16th century BC) and Shang (c. 16th century BC-11th century BC) dynasties. Silk was often used to wrap ritual items during the period, and the patterns, mostly geometric shapes representing clouds and thunder, are deeply connected with the bronze culture, symbolizing the natural rhythms of the universe.

Over the Spring and Autumn and Warring States periods (770-221 BC), silk weaving techniques saw significant progress, and the treadle loom emerged. Carrying on the traditions of the previous dynasties, the patterns became more complex during this time. They incorporated the Chu culture's unique charm, laying the foundation for the flourishing of silk art in later dynasties. Chu was a vassal state to the Western Zhou Dynasty (c. 11th century-771 BC) from about 2,000 years ago.

Representative patterns of the era include diamond patterns resembling ancient ear-shaped cups and dragon-phoenix-tiger motifs embodying the Chu people's worship of totems and their ideas of the supernatural world.

With the formation of a unified regime in the Qin (221-206 BC) and Han (206 BC-AD 220) dynasties, comprehensive ritual norms were established, and the Silk Road began to take shape. Confucian thought gradually integrated into folk aesthetics, and the silk patterns also reflect the bold, expansive characteristics of the era.

The representative cloud motif is regarded as the soul of Han Dynasty patterns. The pattern used fluid arcs to simulate clouds and was decorated with auspicious creatures to embody the Han people's pursuit of eternal life and immortality.

Calligraphic brocade with auspicious words and dogwood patterns was also popular at the time, including the national treasure-level artifact "Five Stars Rise in the East" brocade arm protector from the Xinjiang Museum, unearthed in 1995 at the Niya site in the Xinjiang Uygur autonomous region.

With the deepening of ethnic integration, the eastward expansion of Buddhism, and the prosperity of the Silk Road, more foreign elements began converging with Chinese cultures in the Wei, Jin, and Southern and Northern Dynasties (220-581), giving rise to several new motifs, including lions, elephants and peacocks, as well as beaded motifs and continuous, swirling honeysuckle patterns.

The Sui (581-618) and Tang (618-907) dynasties marked the golden age of ancient Chinese silk art. The nation's prosperity, cultural openness and craft innovations gave rise to elegant and grand silk patterns, including the harmonious Lingyang Gong pattern, the vibrant scroll-work or Tangcao pattern, and the treasured flower pattern featuring Buddhist culture.

Wen Run, curator of the exhibition and professor at the College of Textiles, Donghua University, summarizes the silk patterns of the Tang Dynasty at their peak prosperity as "rich, lush, exotic, and vibrant".

"The patterns were rich, diverse, full, and grand, combining a strong exotic flair with vivid colors. They showcased the dynasty's inclusiveness and openness as a major power, and even exerted a far-reaching influence on Japan and many parts of Southeast Asia, becoming a world-renowned symbol of Eastern aesthetics," Wen says.

As the agricultural civilization of the Central Plains underwent more profound interactions with nomadic civilization in northern China and the Islamic traditions from the Western regions, silk patterns of the Song (960-1279) and Yuan (1271-1368) dynasties further transcended ethnic boundaries and became more diversified in their themes and styles.

Drawing inspiration from the natural world and everyday life, they not only showcase the refined and understated literary sensibilities of the Song Dynasty, but also incorporate the majestic and unadorned nomadic spirit of the Liao Dynasty (916-1125) and the diverse court styles of the Yuan Dynasty.

Traditional Chinese silk patterns and textile techniques reached a new peak in the Ming (1368-1644) and Qing (1644-1911) dynasties, during which the locally accumulated artistic essence of traditional patterns was delicately blended with extensive cultural exchanges with the outside world. Focusing on "auspicious" themes, the silk patterns also saw a deeper fusion of courtly aesthetics and folk tastes.

Since the late Qing Dynasty, traditional Chinese silk patterns became more simplified. Meanwhile, Western silk products began flooding the nation with refreshing designs, inspiring local innovation with more personalized modern aesthetics.

In the early 20th century, several unconventional motifs and design styles gained wide popularity in silk patterns, such as roses, tulips, creeping weeds, trumpets, pine cones, and plaid.

Wen explains that as traditional handweaving, plant-based dyes and the master-apprentice tradition gradually gave way to machine weaving, chemical dyes and modern educational methods, exotic motifs, including Western Art Nouveau and Art Deco styles, were integrated into local patterns.

After the founding of the New China, the silk industry played a critical role in contributing to the nation's economic development and diplomatic needs. In the 1950s, the Soviet Union and Eastern Europe were the main export destinations for silk products adhering to traditional styles. After the 1960s, the market shifted toward Western nations, and printed silk patterns grew rapidly.

As the nation launched reform and opening-up in 1978, the silk industry became more connected with the international art and design community. Silk patterns evolved from realism to abstract styles, and traditional Chinese techniques were cleverly refined to align with global fashion trends.

Wen notes that traditional silk patterns have drawn a fresh wave of public attention since 2001, when leaders of the APEC economies gathered in Chinese silk attire at the 2001 APEC meeting in Shanghai.

Entering the 21st century, traditional silk patterns, as a cultural heritage, are continuously evolving and increasingly integrated with modern digital technologies and design creativity, shining brightly again on the global stage.

"Silk is a gift from China to the world. It is biodegradable, renewable, and sustainable. Silk patterns are symbolic carriers of our history, culture and the whole profound Chinese civilization. They are inclusive, continuously evolving with great vitality.

"We hope more people will learn more about them, and discover the timeless beauty and charm of our traditional culture," says Wen.

Cultural constellations are stars in bridging ancient and modern art forms

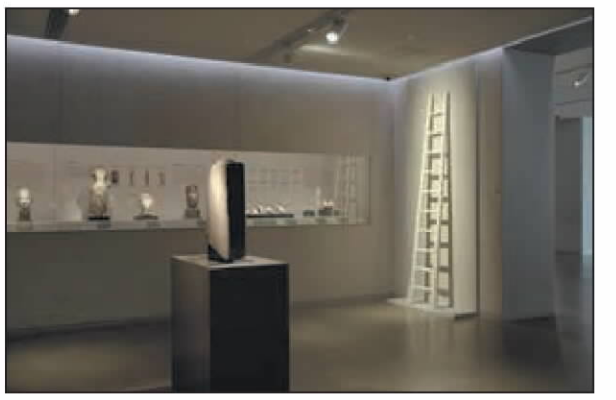
By **WANG XIN**

Featuring a blend of ancient Chinese cultural artifacts and the creations and collections of contemporary artist Zhao Zhao, the exhibition *Co-Savor* is ongoing at Aurora Museum in Shanghai.

Running through Dec 6, the exhibition leverages the museum's rich collection of artifacts, while taking a unique approach to bridging ancient and contemporary art forms.

The title, *Co-Savor,* is drawn from the Song Dynasty (960-1279) poet Su Shi's *First Ode on the Red Cliff*. With a philosopher's insight, Su celebrated the abundance and eternity inherent in nature, pointing to a harmony that transcends time, space and individual boundaries, which echoes with a profound spiritual resonance.

"We at the museum have been exploring artifacts to bring ancient societies back to life. But if we seek to truly maintain the vitality of these preserved ancient civilizations, we need to let them connect and resonate with contemporary society and its way of thinking," says Ginger Xun Jingyuan, curator of the exhibition and director of the museum. "Zhao's creation is a perfect fit."



Xun highlights that Zhao's art often deconstructs and reassembles established cultural symbols such as jade, ceramics and statues, and reinterprets them with a variety of media and materials including glass, cotton and painting.

Zhao keeps exploring the relationship between individuals and the rest of society. His work is developed around the subtle emotional changes of people confronted with diverse cultural influences. He has won numerous honors and awards worldwide.

A striking piece by Zhao among the exhibits is *Jade Constellations*, an extension of his work *Constellations*. The artist inlaid ancient Chinese jade *bi* discs into shattering points on large pieces of glass with radial cracks, resembling a violent starry sky.

As one of China's most revered cultural symbols, jade has been honored for millennia as a vessel of ritual and ceremony. Surrounded by shattered traces, the jade *bi* discs are symbolized as wormholes born at the instant of an extreme energy burst in the universe, which connect the ancient ritual order and the vast cosmos.

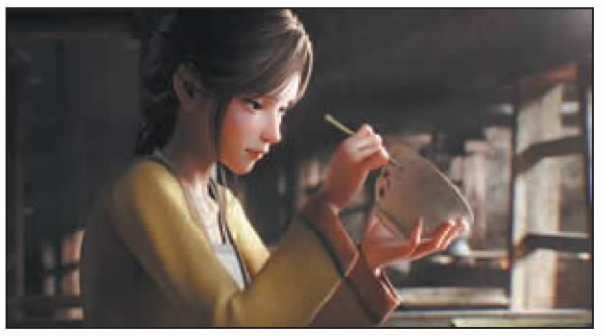
Left: Chinese contemporary artist Zhao Zhao. **Right:** *Chinese Ladder*, carved from white marble in 2019, is among Zhao's works on display. PHOTOS PROVIDED TO CHINA DAILY

Born in Xinjiang Uygur autonomous region in 1982, Zhao has long explored diverse ancient cultural heritages. Despite being a contemporary artist, Zhao notes that ancient art has always been his "essence and inner core".

Inspired by his personal life experience of volunteering in the cotton fields in his childhood, the artist began creating his Sky Fire series in 2016, among which is *Sky Fire — Tang Dynasty Architecture,* which is primarily made of cotton.

Instead of a paintbrush or other tools, Zhao uses a lens to concentrate sunlight and guide a spark from 150 million kilometers away onto the surface of the cotton. As the heat travels across the surface of the fabric, it leaves scorched traces that gradually reveal the image of a Tang Dynasty (618-907) building. Tang architecture, largely constructed from timber, was inherently vulnerable to fire. Yet in Zhao's work, these structures undergo a paradoxical rebirth through the very forces of fire and light.

"I believe ancient and contemporary art share the same essence and are intrinsically connected. Regardless of time, space, culture or medium, it is all simply art for all humankind. It is art that makes us human," says Zhao.



The exhibition invites visitors to step into an artistic dialogue spanning a thousand years. It is more than a simple juxtaposition of past and present, but explores the enduring threads woven through Chinese civilization, reflecting on timeless themes such as heaven, humanity and morality.

"In this symphony of ancient artifacts and contemporary art, may you find a space for reflection on time, art and the essence of culture, sharing in the beauty of civilizations and co-savoring the fullness of life," reads the preface of the exhibition.

LIFE

From left: Players can try their hand at porcelain-making and craft their own one-of-a-kind ceramic pieces in the mini-game, *Digital Jingdezhen: Porcelain Craft Adventure*. The mini-game is inspired by Jingdezhen's UNESCO World Heritage bid. One chapter traces the origins of blue-and-white porcelain. PHOTOS PROVIDED TO CHINA DAILY

Porcelain heritage enters the game

The game faithfully re-creates the landscape of Jingdezhen's heritage site.

Players explore ancient ceramic traditions inside an immersive virtual world driven by advanced AI, **Bai Shuhao** reports.

The game's goal seems simple enough: become a master porcelain maker.

When the loading screen fades, players find themselves in a virtual Jingdezhen, the Chinese city located in Jiangxi province, whose kilns supplied emperors, merchants and royal courts around the world for centuries. Before touching a lump of clay, however, a few more pressing questions come to mind.

Why should I become a master potter?

"Because every piece of porcelain, from mud to fire, is in your hands," an elderly kiln master replies. "What you make speaks for you."

How do I get there?

He says: "Start by kneading clay and throwing it on the wheel. Then learn painting, glazing, and tending the kiln. Every step matters."

Where should I learn?

"If you want to understand porcelain," he answers, "there is nowhere else."

The voice belongs to the owner of Zhiyi Kiln, an AI-powered master potter in *Digital Jingdezhen: Porcelain Craft Adventure*, a mini-game released on the same day UNESCO inscribed the Jingdezhen Handicraft Porcelain Industry Sites on the World Heritage List.

More than a guide, the virtual craftsman serves as a teacher and storyteller, answering players' questions — including some unexpectedly difficult ones — as they progress from novice apprentices to skilled artisans. Along the way, they also discover the long history of Jingdezhen's ceramic industry and its centuries-old links with the Maritime Silk Road.

On July 25, delegates gathered in Busan, South Korea, for UNESCO's 48th World Heritage Committee session, where the Jingdezhen Handicraft Porcelain Industry Sites became China's 61st World Heritage site.

Soon after the announcement, Tencent Games and Tencent's SSV Digital Culture Lab, working with local authorities in Jingdezhen, launched what they describe as the world's first official game created for a newly inscribed World Heritage site to combine artificial intelligence with gameplay.

Rather than simply reconstructing an ancient city, the project re-creates the site's five heritage zones, 24 major production sites and workshops, dozens of historically documented tools, and more than 70 celebrated porcelain styles spanning multiple dynasties.

"If World Heritage status were the finish line," says Tu Ming, the game's producer, "there would be no need for this game.

"Jingdezhen's greatest heritage is a worldview about how people live with nature and create together. That shouldn't belong only to scholars or artisans. Everyone should be able to experience it."

Unlike many World Heritage sites, Jingdezhen is not a frozen monument preserved behind ropes or glass. It has produced porcelain continuously for more than a thousand years, sustaining an interconnected system of raw materials, kilns, workshops, transport routes, and generations of artisans.

That living ecosystem became the guiding principle behind the game's design. Players' very first task is to plant Masson pine trees.

The game, in Chinese, explains that the resin-rich wood burns quickly and has fueled Jingdezhen's kilns for centuries. By encouraging players to grow forests first, it underscores a simple lesson: sustainable woodlands are the foundation of a thriving porcelain industry.

Only after collecting essential materials, such as timber, porcelain stone and glaze, can players begin firing ceramics. They can use AI to transform uploaded images into porcelain designs, shape clay on virtual wheels, paint decorations, and create personalized pieces while managing orders at their virtual kilns.

Turning the project into a management simulation was, Tu says, the team's earliest and perhaps most consequential decision.

They wanted players to understand not just how porcelain was made, but how an entire industrial civilization functioned: the technologies behind production, Jingdezhen's evolution over centuries, and the city's pivotal role in global trade.

An AI-powered in-game master chats with players in real time, sharing fascinating insights into ceramics as they explore the game.

The game's story stretches from the 11th through the 19th century. In one chapter, players learn how Sumali blue, an imported cobalt pigment that made blue-and-white porcelain famous, traveled from Persia to China. Later, they are tasked with producing a revolving vase, or *zhuanxinping*, intended as a diplomatic gift from the imperial court to Western envoys.

Even that storyline sparked debate within the development team.

"Could a revolving vase really have served as a State gift? Did that actually happen? Would it have been historically appropriate?" Tu recalls asking.

The team pursued the answer through historical archives, academic debates and library collections. A report from Macao suggested that the Qianlong Emperor of the Qing Dynasty (1644-1911) had presented such a vase to the King of Portugal, but some researchers questioned the evidence. Eventually, the developers located an original Qing-era gift register in Tsinghua University's library.

"Only then," Tu says, "did we settle the argument."

That commitment to accuracy shaped the entire project. The team consulted more than 30 archaeological reports and historical studies, along with classical works including *Tiangong Kaiwu* (The Exploitation of the Works of Nature) and the *Illustrated Treatise on Ceramic Manufacturing*. Developers repeatedly traveled to Jingdezhen, mapping the city's digital geography according to the actual spatial relationships among archaeological sites.

Nearly every object in the game, from ceramic vessels and kiln tools to place names, includes historical explanations. Whenever players have questions, they can ask the AI master, a craftsman deliberately designed to look like an ordinary artisan rather than a larger-than-life hero.

"He needs to feel believable," says Zeng Zijiao, who leads Tencent Games' AI-powered digital human technology.

The virtual master remembers previous conversations, tracks players' progress, and adjusts his teaching style accordingly, responding differently to beginners than to experienced players.

Behind him sits an enormous knowledge base built specifically for the project. Tencent trained the AI on more than 30,000 academic papers, archaeological reports and scholarly books, along with over 5,000 ceramic specimens and information on nearly 1,000 representative porcelain objects from collections around the world.

The same database also powers several digital heritage projects developed during Jingdezhen's World Heritage campaign, including an AI conservation assistant, a ceramic "gene bank", and an interactive world map tracing the global journey of Chinese porcelain.

For Shu Zhan, head of Tencent's Digital Culture Lab, conventional digitization could never fully explain a heritage site as vast and complex as Jingdezhen.

Its history stretches across centuries. Its archaeological remains are scattered across the city. Its knowledge survives not only in artifacts and documents but also in the memories of veteran artisans.

Artificial intelligence, he says, offers a way to connect those fragments into an experience people can participate in rather than simply observe.

Zeng envisions something more ambitious. Rather than serving merely as a guide, he hopes the AI-powered master potter will build shared memories with players over time. In that way, it becomes more than an explainer. It turns people who have never visited Jingdezhen into participants in a living industrial heritage site.

Tu shares that vision.

If players spend hours moving through several centuries of ceramic history — making difficult decisions, mastering techniques, and eventually creating objects guided by Jingdezhen's own aesthetic principles — they leave with something more valuable than facts.

"They've seen it. They've lived through it. They've created something within it," he says. "That kind of identification isn't taught. It's experienced."

If players remember only one thing after putting down the game, Tu hopes it is this: Jingdezhen is not simply a place preserved from the Song (960-1279) and Yuan (1271-1368) dynasties. It is a living civilization that people can still experience, participate in, and help carry forward.

China's robot school gets down to business

HANGZHOU — At a "school" in Hangzhou, East China's Zhejiang province, "teachers" hold remote controls, sensors record every move, and "students" drill the same task again and again until they get it right.

Those "students" are actually robots. More than 140 of them are currently training at the National Pilot Base for Embodied AI Applications in over 40 workplace scenarios, including smart kitchens, warehouses, farms and a dimly lit mock mine tunnel.

Chinese robots have wowed audiences with backflips, boxing and dance routines. The real test now is whether they can perform everyday jobs reliably. A long-standing headache for the industry is that robots performing well in simulation often stumble when faced with the messiness of real-world settings.

To bridge that gap, this base, sitting between laboratory research and wider deployment, can provide shared settings where technologies can be tested, refined, and validated before full-scale rollout.

Inaugurated on May 16, the national-level facility dedicated to moving embodied artificial intelligence — machines that sense, move, and act in the physical world — from laboratories into daily use is also dubbed a "national vocational training ground" for robots. The plaque, in fact, arrived after the students. On May 16, when the base opened for its trial operation, nearly 40 embodied-AI companies and more than 10 universities and research institutes were already on site for development and training work.

The base runs a dual-track approach combining real-scenario training with high-fidelity virtual simulation. In physical scenarios, technicians teleoperate robots through tasks over and over, with every successful move recorded by sensors as "raw teaching material" for model training.

In a simulated smart kitchen, Hangzhou Big Data Cloud AI Technology has been teaching robots a full restaurant routine since last November: taking orders, fetching ingredients, stir-frying a dish in three to four minutes, then plating it and collecting used dishes.

Yang Jiandang, cofounder of the company, says developing a customized catering application from scratch could require several million yuan in research and development. Since the base already provides some of the underlying facilities and technical capabilities, his team can begin with a lower-cost feasibility test.

A robot serves coffee in the exhibition hall of the National Pilot Base for Embodied AI Applications in Hangzhou, Zhejiang province, in May. FAN YUQING / XINHUA

The cost matters. "In the past, developing a single application scenario could cost a company more than 10 million yuan ($1.5 million) in training data alone," says Zhang Haiwei, founder of the motion-capture firm Chingmu. "Now companies based here get one-stop access to the resources they need."

Logistics firm Transfar and robot maker Unitree jointly run a warehouse scenario where wheeled humanoid robots pick, scan, and carry goods of varying shapes. Elsewhere, smart forklifts stack cargo with positioning accuracy up to 1 mm, and harvesting robots pick ripe fruit around the clock.

What makes the "school" so attractive to these companies? Zhou Chen, DexRobot's CEO, likens their predicament to equipping a warhorse in a classic Chinese folk ballad. "You buy the saddle from one vendor, the harness from another, the reins from a third, but end up with a pile of parts and no idea how to assemble them. That's exactly why we need a platform, and this pilot base brings everything together.

"The base is like a library for robotics," he says. "You come here because everything you need is on the shelves."

The clustering pays off in speed. Chingmu and dexterous-hand developer DexRobot, located within the same building, have established a joint laboratory.

"The moment they launch a new product, we can put it to use. If something in yesterday's data needs to be re-collected, we respond the same day," says Zhang.

"Upstairs and downstairs are upstream and downstream. Our next-door neighbor is our partner," says Zhou, adding that the joint lab gives companies a low-stakes space to test the waters on a small scale. With so many firms clustered in one place, they can help make preliminary assessments and slash decision-making costs.

Li Xingteng, deputy general manager of Hangzhou Embodied Intelligence Pilot Base Technology, the base's operator, says the platform aims to turn companies' specialized strengths into integrated solutions by linking firms across the robotics chain.

Institutional support is expanding, too. In June, the Ministry of Industry and Information Technology and the State-owned Assets Supervision and Administration Commission launched a 2026 initiative to promote real-scenario training and regular deployment of humanoid robots and other embodied-AI products. China's first local regulation on the industry also took effect in Hangzhou on May 1.

The base is one node in a wider push. Hangzhou is now home to more than 700 robotics-related companies, and its embodied-AI cluster generated an output of 106.8 billion yuan in 2025, official data showed.

Li says mature embodied-AI solutions trained at the base will eventually be deployed in experimental communities, where problems will be identified and addressed through real-world use.

Brave Chinese environmentalist and generous US teacher rekindle friendship, reminisce on remarkable greening effort

Yin Yuzhen and her family plant trees and water them in the Maowusu sandy area in the Inner Mongolia autonomous region in 2000. The family's dedication has contributed significantly to combating desertification in their region. LI XIN / XINHUA

Ronald Sakolsky, a retired teacher affectionately known as Mr S by his former students, lives a typical middle-class life in Plum, a suburb of Pittsburgh, Pennsylvania, with Barbara, his wife of 46 years.

But the 69-year-old's life has become quite extraordinary in recent months after his act of kindness in China 27 years ago brought about a touching reunion.

In 1999, he raised $5,000 from an organization in Boston, Massachusetts, to help environmental hero Yin Yuzhen combat severe desertification in the Maowusu, China's largest sandy area, in the Inner Mongolia autonomous region.

The father of four and grandfather of eight remains extremely humble about his selfless actions and insists he's not a hero.

"I'm just an actor in the play that was designed back in 1999," he said in an interview with China Daily. "Ms Yin is the hero. I was like the stick that put the hole in the ground. She put the saplings in and watered them to create the 50,000-tree forest.

"If my story gets other people involved, not just in stopping the desertification of China, but just involved to make the two cultures more similar, then it did its purpose."

Sakolsky was teaching English at Luoyang No 2 Foreign Language School in Henan province in 1999 when he sought the donation. He saw an appeal for funds on CCTV by Yin, who wanted to turn an area of the Maowusu sandy area into a lush, green forest.

At that time, $5,000 was enough to buy a small apartment. But when she received the large donation, Yin spent every penny on saplings and kept just $1 as a souvenir.

Fate intervenes

Sakolsky's journey to teach in China happened by chance.

He remembers sitting in a doctor's office back home when he opened a magazine just to "kill time". He saw a tiny advertisement asking for teachers from the United States to teach English listening and speaking in China.

"Something hit me," he said. "I can't tell you why. But I answered the advertisement."

After an interview in New York, he was selected as one of 14 Americans to teach in China for a year. Before embarking on his teaching trip, he was eager to see Beijing, the Great Wall, the Yellow River and the Terracotta Warriors. But he experienced much more during his visit. "Going to China just enhanced my Chinese education beyond expectation," he said.

He believes a "miracle" led him to Yin.

Sakolsky had planned to teach in Chengdu, Sichuan province. However, another teacher took that position so he chose Luoyang instead.

When he arrived, he felt homesick, but remembered his two daughters' support before he embarked on his China journey. He kept busy by doing tai chi with locals and watching the news. There were two English-language half-hour CCTV news programs aired at noon and 7 pm back then.

"A reporter ... from CCTV was doing a five-minute TV segment called *Chinese Heroes and Heroines*," he said.

He was struck by the story of Yin and her husband planting trees in Inner Mongolia. "At the time, I thought the trees were only going to be 2-feet (60 centimeters), maybe 3-feet high at the most to keep the sand down," he said.

He saw that Yin's husband had lung problems. She made just $250 a year and spent all their money on trees.

"I can't tell you why something hit me in the heart," he recalled. "I'd only been in China for two months, but I said, 'I need to help this lady. I need to do something.'"

He added: "China had already changed who I was, my personality, the way I looked at things. I had learned how to appreciate simple things ... I wanted to help her, and at the same time thank China for what it had already done to me."

From October to December that year, he researched organizations in the US that might donate money for Yin's tree-planting mission. Finally, he found an institution in Boston, Massachusetts, willing to give the full $5,000.

After he received the donation, he spent two months cutting through red tape to get Yin the funds.

"You have to understand in 1999, there were no roads to Ms Yin's house, which I found out later. No roads! She had no telephone. They drove out to her," he said.

"Local officials brought her a generator and a telephone so that they could communicate with her ... and then I lost contact. I knew in December that the money had made it to Beijing. And that's the last I heard."

In May 2000, Bai Fan, the vice-principal at the school where Sakolsky worked, took the American on a surprise visit to meet Yin in the grasslands of Inner Mongolia.

Bai had dreamed of visiting the grasslands and Sakolsky invited him along as a translator. "He had become not my boss anymore. He was my brother," he said.

Sakolsky met Yin at a banquet and fondly remembers feasting on an entire lamb — a Mongolian delicacy.

The next day he gave a speech to a big audience, including local officials, that was translated by Bai. They then drove for hours over sand dunes, Sakolsky recalled.

"We stopped in the middle of nowhere; all sand, no roads, no houses. We had passed the village about two hours before, and seen nothing but a hole in the sand. (Then) out of the hole came Ms Yin," he said.

She had been digging through the sand to hit the water table 2.4 meters down to irrigate the trees. Her only tools were a shovel and a yoke. She tied the saplings with hemp rope and carried them in bundles to be planted, Sakolsky said.

"I kept telling her what you're doing is miraculous, but it's impossible," he said. "Then she starts saying, 'this is going to be your forest'".

"I said to Bai Fan, 'why does she keep calling it my forest? It's not my forest. I didn't do this for it to be my forest.'

Left: Ronald Sakolsky poses in a Panda headband that his grandchildren enjoy wearing at his home in Pennsylvania on June 23. MINGMEI LI / CHINA DAILY

Above: Yin Yuzhen and Ronald Sakolsky meet in Uxin Banner in Inner Mongolia autonomous region in 2000. XINHUA

> If we focus on our similarities and not our differences, the world would be at peace. ... No act of kindness, no matter how small, is ever wasted. If the forest doesn't tell that story, I don't know what does."
>
> **Ronald Sakolsky,** retired teacher in Pittsburgh, Pennsylvania

"And he said to me, 'The Chinese government is calling it the Sakolsky Forest'. I said, 'No, I don't want this. I don't want it called the Sakolsky forest'".

The group then drove 45 minutes to Yin's house and planted more trees. She cooked him a delicious noodle dish.

Search for old friend

Yin, a pioneering environmentalist, began her quest to save the desert in the 1980s.

At 19, she married a man who lived in the Maowusu sandy area, and moved from Shaanxi province. Life was tough for the new bride. Her first Shaanxi home was a cellar half-buried in sand.

But she was determined to improve the environment, so the couple began planting saplings they'd brought with money from their own labor. Yin declared: "I'd rather die planting trees, than live buried by the desert."

It is estimated that Yin and her husband planted saplings across nearly 2,667 hectares between 1985 and 1999, according to Chinese media reports.

Over the next few decades, she planted more than 8 million trees and transformed over 70,000 *mu* (or 4,667 hectares) of barren desert into a lush landscape, according to People's Daily.

Sakolsky said he was amazed to learn Yin and other workers did all the work by hand. "They were digging the ground, digging with a stick, and planting; (there was) no machinery, none," he said.

In 2000, Yin was named a National Model Worker by China's State Council. In 2017, she gave a speech at the United Nations Convention to Combat Desertification.

But she never forgot the American teacher's kindness "at the most difficult time", she told Chinese media.

Green vegetation is seen in the early summer of Maowusu sandy area in Inner Mongolia on May 20. LIAN ZHEN / XINHUA

After his teaching assignment in China finished, Sakolsky returned to the US and lost touch with Yin. He briefly returned to China in 2004 to teach alongside Bai again.

On May 16 this year, Yin, now age 60, made a video and posted it online, hoping to find Sakolsky.

"Mr Sakolsky, we would like to invite you to come back to China to witness how the $5,000 you donated many years ago has become a large forest," she said.

The video went viral and Sakolsky was inundated with emails and texts. Some were from past students.

They all asked one question: "Are you the teacher?"

"I thought it was a joke!" he said.

It was only when Bai called him that he knew it was real.

Two days later, Yin phoned him. Sakolsky said she had learned a little bit of English to converse with him. "She wanted to say 'hello' and 'thank you'," he said.

Sakolsky teared up recalling the conversation and the rekindling of the friendship. "I was stunned that she called," he said.

Yin told him: "You are my brother. I used the $5,000 you donated to plant a forest. When will you come and see it? I really want to see you."

"I will try," Sakolsky replied.

He admitted when she called him "brother" he became very emotional. "There's not words to tell you. I lost it. I mean, I never thought I would ever hear from her (again)," he said.

Anticipated reunion

Sakolsky will travel to China in August for around 10 days to meet Yin. She plans to cook him noodles and share Inner Mongolian lamb skewers. He wants to plant a new tree.

His incredible story has touched many hearts worldwide. At least 40 to 50 of his former students from around the world intend to travel to China to reconnect with him.

On a recent family vacation in Australia, Sakolsky was sitting on a tour bus when two tourists, one from Singapore and one from Hong Kong, recognized him.

"They turned around and said to me, 'you look like the guy on a video that we just watched on the internet, about a forest,' and I said 'yes, that's me.'

"I couldn't believe I was halfway around the world and these people were recognizing me," Sakolsky said. "A simple world history teacher from Plum, a suburb of Pittsburgh."

On June 19, Chinese Ambassador to the United States Xie Feng invited Sakolsky and other Americans to the Chinese embassy in Washington, DC.

The teacher, who retired in 2021, described it as an "honor", adding he "never expected anything like these last six weeks".

Yin, now living in Wushen Banner in the city of Ordos, continues to protect Maowusu, which covers about 42,200 square kilometers.

Their story has inspired others to volunteer. Her son also cares for the land.

Sakolsky, who was given the Chinese name Long Fu, which he was told meant "happy dragon", has become a social media star.

His house, full of memories, is adorned with photos of his family, a life-size replica of a Terracotta Warrior (a gift from Bai Fan), panda toys, photos of his time in China, gifts and a large, mock, plane ticket from the Inner Mongolia People's Association for Friendship with Foreign Countries inviting him to visit.

But over the years he has also faced personal challenges.

His wife Barbara has had dementia for six years and he patiently takes care of her each day.

Five years ago, he broke four vertebrae in his neck after slipping in his driveway while shoveling snow. He has recovered and gained even more strength from the outpouring of kindness from China over his story, he said.

"If we focus on our similarities and not our differences, the world would be at peace," he said.

Sakolsky also reminisced on one of his favorite quotes from Aesop's fable *The Lion and the Mouse*. "No act of kindness, no matter how small, is ever wasted. If the forest doesn't tell that story, I don't know what does," he said.

Mingmei Li contributed to this story.

CHINA DAILY

GLOBAL EDITION 中国日报 FRIDAY, JULY 17, 2026

President Xi Jinping meets on Thursday with Kazakh President Kassym-Jomart Tokayev in Shanghai. Tokayev is in China to attend the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, which will run from Friday to Monday.
ZHAI JIANLAN / XINHUA

Xi calls for strengthening relations with Kazakhstan

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

President Xi Jinping called on Thursday for China and Kazakhstan to strengthen the alignment of their development strategies and policies, and continuously enhance pragmatic cooperation to promote shared development.

Xi made the remarks during a meeting with Kazakh President Kassym-Jomart Tokayev in Shanghai. Tokayev arrived in Shanghai on Wednesday to attend the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, which is set to open on Friday.

Xi said that amid the profound and complex changes of the international landscape unseen in a century, the China-Kazakhstan relationship has stood the test of time and become strengthened over time.

The permanent comprehensive strategic partnership between the two countries has maintained strong momentum, demonstrating immense cooperation potential and broad development prospects, he said.

Xi emphasized that firmly advancing comprehensive cooperation between China and Kazakhstan aligns with the fundamental interests of both countries and their peoples. He called on both countries to promote the innovative development of trade, optimize trade structures and foster new business models in cross-border e-commerce and trade in services.

It is important to expand cooperation in energy and mineral resources, accelerate the implementation of key projects, promote the development of mutual connectivity, increase direct flights and improve the facilitation of international road transport, he said.

Xi said that China is willing to share technologies in the fields of the digital economy and artificial intelligence to assist Kazakhstan in achieving digital transformation.

He also called on both sides to well organize related activities to make the China-Kazakhstan Year of Cultural Exchange a success, and to strengthen cooperation in education, science and technology, healthcare, sports and media to solidify the foundation of friendship from one generation to another.

China is willing to work with Kazakhstan to jointly implement the four major global initiatives (the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative), and strengthen coordination and cooperation within multilateral mechanisms such as the United Nations, the Shanghai Cooperation Organization and the China-Central Asia mechanism, in order to jointly uphold international equity and justice, Xi said.

Noting that China has just celebrated the 105th anniversary of the founding of the Communist Party of China, Xi said that the reason why the CPC has been able to achieve continuous glory through its endeavors and why history and the people have chosen the CPC lies fundamentally in its excellent qualities.

The Party is committed to seeking truth, deeply rooted in the people, courageously rises to its historical missions, and follows the trend of development, Xi said, adding that it is also courageous and able to fight and remains committed to continuous self-improvement.

This is the key code behind why the CPC works, he said.

Tokayev warmly congratulated the CPC on its 105th founding anniversary and commended China's remarkable development achievements under Xi's leadership.

He said that Kazakhstan regards its relationship with China as a top priority in its foreign policy and is committed to continuously strengthening its permanent comprehensive strategic partnership with China.

Kazakhstan highly appreciates and supports the four major global initiatives and the vision of building a community with a shared future for humanity, all proposed by Xi, and is willing to maintain high-level collaboration with China on multilateral platforms, actively engage in global AI governance cooperation, Tokayev said.

AI rivalry shifts from smart models to smart factories

WORLD WATCH
By Djoomart Otorbaev

For years, the global discussion about artificial intelligence revolved around large language models, algorithms and computing power. The competition appeared straightforward: Whoever built the most powerful neural network would dominate the digital economy. That perception fueled a fierce technological race among leading US companies such as OpenAI, Google, Microsoft, Amazon and Anthropic. In China, companies such as DeepSeek, Alibaba, Tencent, Huawei and Baidu responded by accelerating investment in large models, chips and cloud infrastructure.

But over the past year, a deeper transformation has become evident. AI is steadily moving beyond chatbots, search engines and office tools into manufacturing, logistics, pharmaceuticals, automotive engineering, robotics and industrial planning. Consequently, the focus of the global AI race has changed. The next phase of the competition may depend less on algorithms and more on productive capacity, industrial organization and the ability to embed AI into large-scale economic activity.

This shift has changed the very nature of AI rivalry. The first phase of the AI race primarily featured frontier models and computing supremacy. Companies competed for elite engineers, semiconductors, cloud infrastructure and venture capital. The goal was technological leadership.

But industrial deployment is a far more complex challenge. It requires coordination among software developers, manufacturers, supply chain operators, universities, industrial engineers, energy systems and governments. In other words, the future of AI increasingly depends on ecosystems rather than isolated technological breakthroughs.

This is precisely why strategic alliances are proliferating across the AI sector.

In the United States, collaboration between technology firms and industrial corporations has gathered momentum. Microsoft has expanded its partnership with the multinational automaker Stellantis to develop AI applications in engineering, cybersecurity and manufacturing systems. Google Cloud has deepened cooperation with the German pharmaceutical company Merck to deploy AI tools across the entire drug-discovery pipeline, while also broadening its collaboration with Mars to integrate AI agents into operational and industrial processes.

Meanwhile, Nvidia has evolved from just a chip supplier to the infrastructure backbone of global AI deployment, working simultaneously with cloud providers, manufacturers, robotics developers and national technology ecosystems. US companies are increasingly realizing that industrial integration — and not just model quality — will define long-term leadership.

At the same time, universities have become central actors in the emerging AI-industrial landscape. OpenAI's NextGenAI consortium brings together leading universities and research institutes in the US and Britain, offering grants, computing power and API access to researchers and students. Anthropic has established similar partnerships with academic institutions and educational organizations focused on computer science and AI engineering.

These collaborations are not just philanthropic initiatives. They help cultivate future talent, accelerate applied research, create industry standards, and familiarize future engineers with specific AI ecosystems. In effect, universities have become part of national AI supply chains.

XI'S VISION | AI DEVELOPMENT

China steps up AI growth, governance

Xi's guidance elevates development of sector to a national strategic priority

By **MO JINGXI**
mojingxi@chinadaily.com.cn

When migrating over long distances, wild geese often fly in a V formation. The bird at the front cuts through the headwind and sets the direction, while the flock behind benefits from the currents created in its wake. This bird is commonly called the "lead goose".

It was this image that Xi Jinping, general secretary of the Communist Party of China Central Committee, invoked at a group study session of the Political Bureau of the CPC Central Committee in October 2018. Xi used the image of a "lead goose" to describe the powerful spillover and driving effects of artificial intelligence, calling it "a strategic technology driving this round of technological revolution and industrial transformation".

The metaphor captures more than technological leadership. It points to AI's capacity to pull other sectors forward — to reorganize production, accelerate scientific discovery and reshape services, governance and everyday life.

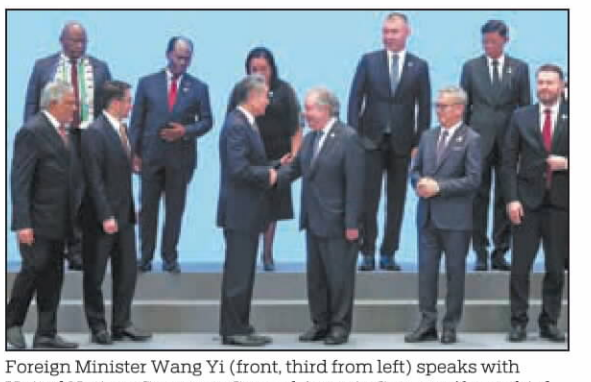
Nearly eight years later, that spillover effect is becoming increasingly visible across China.

On Friday, Xi will attend the opening ceremony of the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai and deliver a keynote speech. The gathering will run from Friday to Monday under the theme "AI Partnership for a Brighter Future". Xi will systematically set out China's policy positions, vision and proposals concerning AI development and governance.

Xi, who is also Chinese president and chairman of the Central Military Commission, has long placed AI high on China's development agenda.

As early as June 2014, when speaking at the general assemblies of the members of the Chinese Academy of Sciences and the Chinese Academy of Engineering, Xi highlighted the rapid development of AI and other emerging technologies.

He called for efforts to assess technological trends, make comprehensive plans and press ahead with concrete action.



In 2017, China issued a new-generation AI development plan, elevating AI development to a long-term national strategic priority.

At the group study session of the Political Bureau of the CPC Central Committee in 2018, Xi described accelerating AI development as a strategic lever for scientific progress, industrial upgrading and an overall leap in productivity.

Foreign Minister Wang Yi (front, third from left) speaks with United Nations Secretary-General Antonio Guterres (front, third from right) after the signing ceremony for the agreement on the World Artificial Intelligence Cooperation Organization in Shanghai on Thursday. FENG YONGBIN / CHINA DAILY

Agreement on global AI organization signed

A signing ceremony for an agreement on the establishment of the World Artificial Intelligence Cooperation Organization was held in Shanghai on Thursday.

Representatives from a total of 29 countries signed the agreement. Foreign Minister Wang Yi signed the agreement on behalf of the Chinese government.

The agreement stipulates that the World Artificial Intelligence Cooperation Organization is an independent intergovernmental organization. Guided by the purposes of the Charter of the United Nations, it upholds the principle of extensive consultation, joint contribution and shared benefits, and follows a people-centered approach.

The organization aims to promote international cooperation and global governance in artificial intelligence, ensure the sound and orderly development of AI in a beneficial, safe and equitable direction, and bring benefits to all humanity.

Its headquarters will be located in Shanghai.

WAIC WORLD AI CONFERENCE

Eminent guests

United Nations Secretary-General Antonio Guterres (center) and Fu Cong (left), China's permanent representative to the UN, arrive in Shanghai on Thursday to attend the 2026 World AI Conference and High-Level Meeting on Global AI Governance. The four-day event opens on Friday.
FANG ZHE / XINHUA

Event serves as innovation platform

Products, tech independently developed by Chinese companies to be major highlight

By SHI JING in Shanghai
shijing@chinadaily.com.cn

The World Artificial Intelligence Conference, which is now in its ninth consecutive year, has evolved into a premier stage for enterprises to showcase their latest technological advancements — innovations widely expected to empower the workplace and drive industrial transformation, according to experts and industry executives attending the event.

Under the theme "AI Partnership for a Brighter Future", this year's conference is making history with an exhibition area exceeding 100,000 square meters, spanning four venues across Shanghai. Over 1,100 domestic and international companies are set to unveil more than 300 products that are making their world debut during the four-day event, which opens on Friday.

Products and technologies independently developed by Chinese companies are a major highlight of this year's conference.

Shanghai-based StepFun is unveiling STEPX Neo, the world's first smartphone to pass China's new L3 certification for AI terminal intelligence — a level that requires the device to autonomously understand complex user intents, break down tasks and coordinate actions across multiple apps.

The company will also debut its upgraded super AI agent for automobiles to provide better smart cockpit experiences.

StepFun's latest progress is in line with the industry consensus that 2026 marks "the first year of AI agent applications".

According to the United States-based market consultancy IDC, the global AI agent market is expected to grow at a compound annual growth rate of 139 percent from 2025 to 2030.

"We see this year as a turning point for AI agent applications. Agents will move from phones to cars and robots, taking on real-world tasks. As AI agents enter the physical world, they will inevitably face increasingly complex scenarios, and we are fully committed to this sector," said Chen Ruijie, StepFun's public relations manager.

Enflame Technology, a Shanghai-based AI chipmaker, which obtained regulatory approval on July 7 for a STAR Market IPO, has teamed up with domestic tech giant ZTE to release a supernode architecture. This allows different types of AI chips to work together seamlessly in an open and flexible way, providing better performance while keeping total costs low.

Startups are also grabbing the spotlight with their latest breakthroughs.

FrameX AI, a company founded in Beijing by Wang Yuxin, 30, in early May, will debut its interactive video model Genesis, allowing users to enter video content and converse with AI characters in real time.

"Next-gen video tech is about stepping into videos, not just watching them. To win users over, digital characters need to feel human and be truly present," said Wang, adding that the model is built for the global market while also promoting it to Chinese multichannel networks and game developers.

FieldQuantum, another startup founded in January in Beijing, specializes in integrating quantum technology, AI and high-performance computing. It achieved angel financing by June, including from prominent institutions such as Baidu Ventures and venture capital company HSG.

The company will showcase a quantum AI agent platform and a material research and development platform at the event, aiming to empower the development of semiconductor materials and innovative drugs.

Through its first presence at WAIC, FieldQuantum wishes to expand cooperation with more end users, operation system providers and computing infrastructure companies, said Lyu Dingshun, the company's founder.

Multinational companies are equally active in unveiling their latest AI innovations through WAIC. Industry big names including ABB, Schneider Electric and Carl Zeiss are among the exhibitors.

International manufacturing conglomerate Siemens will demonstrate for the first time its engineering agent, which autonomously plans and executes industrial automation engineering tasks.

Xiao Song, chairman, president and CEO of Siemens China, said the nation's diverse industrial landscape, robust manufacturing system, rapid innovation pace and openness to new technologies give it a unique edge in developing industrial AI.

But to turn these strengths into productivity and tackle the structural hurdles of AI adoption, scenario-driven implementation is vital. Siemens is, therefore, committed to deeply integrating its industry expertise, data accumulation and technological innovation to anchor AI in real-world scenarios. Open industrial scenarios and data sharing are crucial to achieving the scaling up of AI and eventually productivity transformation, he said.

WAIC at a glance

Key features

- Exhibition area: Surpasses 100,000 square meters for the first time, marking the largest exhibition space in the event's history
- Exhibitors: Over 1,100 domestic and international companies
- Exhibits: More than 3,000 products on display
- Global launches: Over 300 products making their world debut
- Forum programs: More than 140 forum sessions
- Guest lineup: Nine Turing Award and Nobel Prize laureates in attendance
- Academic conference: The inaugural WAIC Academic, chaired by Turing Award laureate Andrew Chi-Chih Yao

Must-see exhibits

- Sugon 8000 "Dengfeng": A domestically developed 100,000-card AI supercluster that supports full-precision computing — from FP64 to INT8.
- Ant Group's smart pharmacy: A setup in which three heterogeneous robots complete an entire task within 90 seconds, starting from taking an order to packing medicines.
- AGIBOT Expedition A3 Ultra: A 174-centimeter-tall humanoid robot that is designed for exhibition guidance and hotel reception.
- Baidu's DuMate: A general-purpose AI agent capable of autonomously handling document processing, data analysis and PowerPoint creation.
- iFlytek's AI glasses: Smart eyewear, weighing only 40 grams, that has pioneered multimodal noise reduction technology and lip-movement recognition.
- China Southern Power Grid's distribution network planning agent: A system supporting intelligent diagnosis across more than 10,000 feeders.
- StepFun's STEPX Neo: The world's first smartphone to pass China's new L3 certification for AI terminal intelligence — a level that requires the device to autonomously understand complex user intents, break down tasks and coordinate actions across multiple apps.
- Alibaba Zhenwu M890: An AI chip equipped with 144 GB of video memory and 800 GB per second of inter-chip bandwidth.
- MatwingsVenus: A closed-loop research and development platform that cuts R&D cycles from two to five years down to just two to six months.
- ZTE OEX Supernode: A technology solution that reduces interconnect costs by 80 percent and redefines the paradigm of intelligent computing.

CHINA DAILY

AI: Advances seen as key to reaching nation's goals

From page 1

That sustained strategic focus has been accompanied by rapid industrial growth.

According to the Ministry of Industry and Information Technology, the value of China's core AI industry exceeded 1.2 trillion yuan ($177 billion) in 2025, with more than 6,200 AI enterprises. By the end of 2025, over 30 percent of manufacturing enterprises above designated size had adopted AI technologies, while Chinese companies had released more than 300 humanoid robot products.

Robert Lawrence Kuhn, chairman of The Kuhn Foundation, which operates educational, cultural, and science and philosophy projects, described China and the United States as undisputed global leaders in AI.

China's strengths include strong capabilities in computer science and mathematics, leading research centers at major universities, a culture that values scientists, large pools of talent and data, and a highly competitive market for private AI companies, he said.

Kuhn also pointed to the recognition among China's leadership that advances in AI will be essential to achieving the country's 2035 and mid-century goals of building a modern socialist country in all respects, as well as to the central government's sustained commitment to developing the technology.

During a fact-finding trip to Shanghai in April last year, Xi visited the Shanghai Foundation Model Innovation Center, where he closely examined a range of cutting-edge products, including humanoid robots.

Home to more than 100 enterprises at the time of Xi's visit, the center provides a glimpse of how emerging technologies are moving from laboratories into industrial and commercial applications.

According to Kuhn, Xi's repeated emphasis on developing and applying AI has exerted a major influence on the level of attention and funding devoted to the field by both the public and private sectors.

Xiao Qian, vice-dean of the Institute for AI International Governance at Tsinghua University, said that Xi's emphasis had elevated AI to a national strategic priority, providing policy continuity and a clear direction in an ever-changing technological landscape.

This top-level vision, Xiao said, has enabled governments, universities, research institutes and enterprises to coordinate around common objectives.

As China's AI sector entered a phase of accelerated growth in 2025, the Political Bureau of the CPC Central Committee returned to the subject at a group study session in April that year. Xi said at the session that AI not only introduces unprecedented development opportunities, but also brings unprecedented risks and challenges.

He called for accelerated work on laws and regulations, policy systems, application standards and ethical guidelines, as well as stronger systems for technical monitoring, early risk warning and emergency response, in order to ensure that AI remains safe, reliable and controllable.

Risks, challenges

Kuhn said AI presents two sharply different possibilities.

"There is a risk that AI will exacerbate global inequality, with developed countries gaining more while developing countries fall further behind. Yet, at the same time, AI has the potential to dramatically reduce global inequality because it can be more readily available than traditional infrastructure," he said.

In Kuhn's view, China is playing a significant role through major initiatives because its AI and large language models are high-quality, open-source, relatively affordable and targeted at specific applications.

At the opening ceremony of the third Belt and Road Forum for International Cooperation in October 2023, Xi unveiled the Global AI Governance Initiative, expressing China's readiness to increase exchanges and dialogue with other countries and jointly promote the sound, orderly and secure development of AI worldwide.

Song Haitao, a member of the United Nations Independent International Scientific Panel on AI, said that one of the most pressing challenges in global AI governance is that scientific assessment has failed to keep pace with technological development, with the capacity gap particularly acute in Global South countries.

China's proposals offer a systematic response to that structural challenge, he said. From the Global AI Governance Initiative's emphasis on a people-centered approach and the use of AI for good outcomes, to the concrete measures set out in the Global AI Governance Action Plan, China has sought to translate broad principles into practical action and multilateral cooperation.

Song, who is also president of the Shanghai Artificial Intelligence Research Institute, said that China could support developing countries in building more comprehensive AI capabilities, by providing computing resources and helping with institutional development.

Getting ready

A humanoid robot, wearing a safety helmet, gets fine-tuned in Shanghai on Thursday, ahead of the 2026 World AI Conference and High-Level Meeting on Global AI Governance. GAO ERQIANG / CHINA DAILY

Technology: A new industrial revolution

From page 1

China is pursuing a particularly distinctive path because it enjoys a structural advantage that many Western countries can't easily replicate: a comprehensive industrial ecosystem capable of integrating AI directly into manufacturing and production.

Chinese companies are not focusing solely on consumer-facing AI applications. Instead, they are integrating AI into factories, robotics, logistics systems, semiconductors, telecommunications infrastructure, electric vehicles and industrial automation.

Huawei is a clear example. The company has expanded cooperation with manufacturers, local governments, telecommunications providers and leading universities to accelerate AI deployment across industrial sectors. Partnerships with institutions such as Tsinghua University and Peking University have contributed to advances in chip design, distributed computing, industrial AI systems and optimization technologies.

Rather than treating AI as an isolated digital product, China regards it as infrastructure embedded across the economy.

DeepSeek illustrates another important trend. Its technical team includes specialists connected to China's leading universities, particularly in mathematics, engineering and computer science. This close integration has reportedly enabled the company to optimize training efficiency, reduce costs and maintain competitive performance, demonstrating how academic expertise can directly enhance industrial competitiveness.

Meanwhile, Alibaba Cloud and Tencent are accelerating AI deployment across retail, logistics, finance and smart-city ecosystems.

Chinese electric vehicle manufacturers are integrating AI into production lines, battery systems, autonomous driving and supply chain management.

In sectors ranging from robotics to advanced manufacturing, collaboration between AI developers and industrial enterprises is becoming increasingly institutionalized.

This evolution matters because the economics of AI are changing.

The early AI race rewarded companies capable of building the largest general-purpose models. But these large models are very expensive to train and maintain. Businesses are discovering that smaller, specialized AI systems integrated into industrial workflows generate greater economic value than universal chatbots.

As a result, the strategic advantage may shift toward countries that can deploy AI across large-scale manufacturing ecosystems rather than simply produce the most advanced algorithms.

This would favor economies with deep industrial capacity, integrated supply chains, strong engineering traditions and close coordination between universities, industry and state institutions. AI has become inseparable from energy infrastructure, semiconductor production, robotics, industrial automation and logistics networks.

In many ways, the emerging AI competition has begun to resemble the historical competition among industrial powers. The next phase of global AI rivalry may not be decided primarily in Silicon Valley or by benchmark rankings. Instead, it may unfold inside factories, ports, laboratories, industrial parks and supply chains. In that sense, AI is no longer just a software revolution. It has become a new industrial revolution.

WAIC WORLD AI CONFERENCE

Nation's AI-related tech continues to burgeon

Country captured 90% of global humanoid robot shipments in 2025, with over 330 product models

By MA SI
masi@chinadaily.com.cn

China is rapidly moving from technological breakthroughs in artificial intelligence to real-world value creation, leveraging its full innovation chain, industrial ecosystem and massive market to become a global leader in AI application and industrial transformation, officials and industry experts said.

Li Lecheng, minister of industry and information technology, said that AI is a common asset of humanity, and developing countries' rights to develop and use the technology must be firmly safeguarded.

"China is ready to work with all parties to promote fair and inclusive development, actively assist countries in developing AI technologies and services, and jointly build a governance framework with broad consensus," Li said.

The numbers tell a compelling story. In 2025, China's core AI industry surpassed 1.2 trillion yuan ($177 billion) in value, with over 6,200 AI enterprises operating across the country, according to the Ministry of Industry and Information Technology.

Meanwhile, the country captured 90 percent of global humanoid robot shipments in 2025 with over 330 product models, cementing its leadership in the emerging sector.

China also ranks first worldwide in downloads of open-source large language models, underscoring its edge in generative AI innovation. In addition, nearly 200 key standards have been developed across the AI industry chain, providing a unified technical framework for the sector.

Samantha Zhu, chairperson of Accenture Greater China, said AI is driving the accelerated global reconfiguration of enterprise value. In China, industries across the board are now moving from trials in AI technology to large-scale deployment.

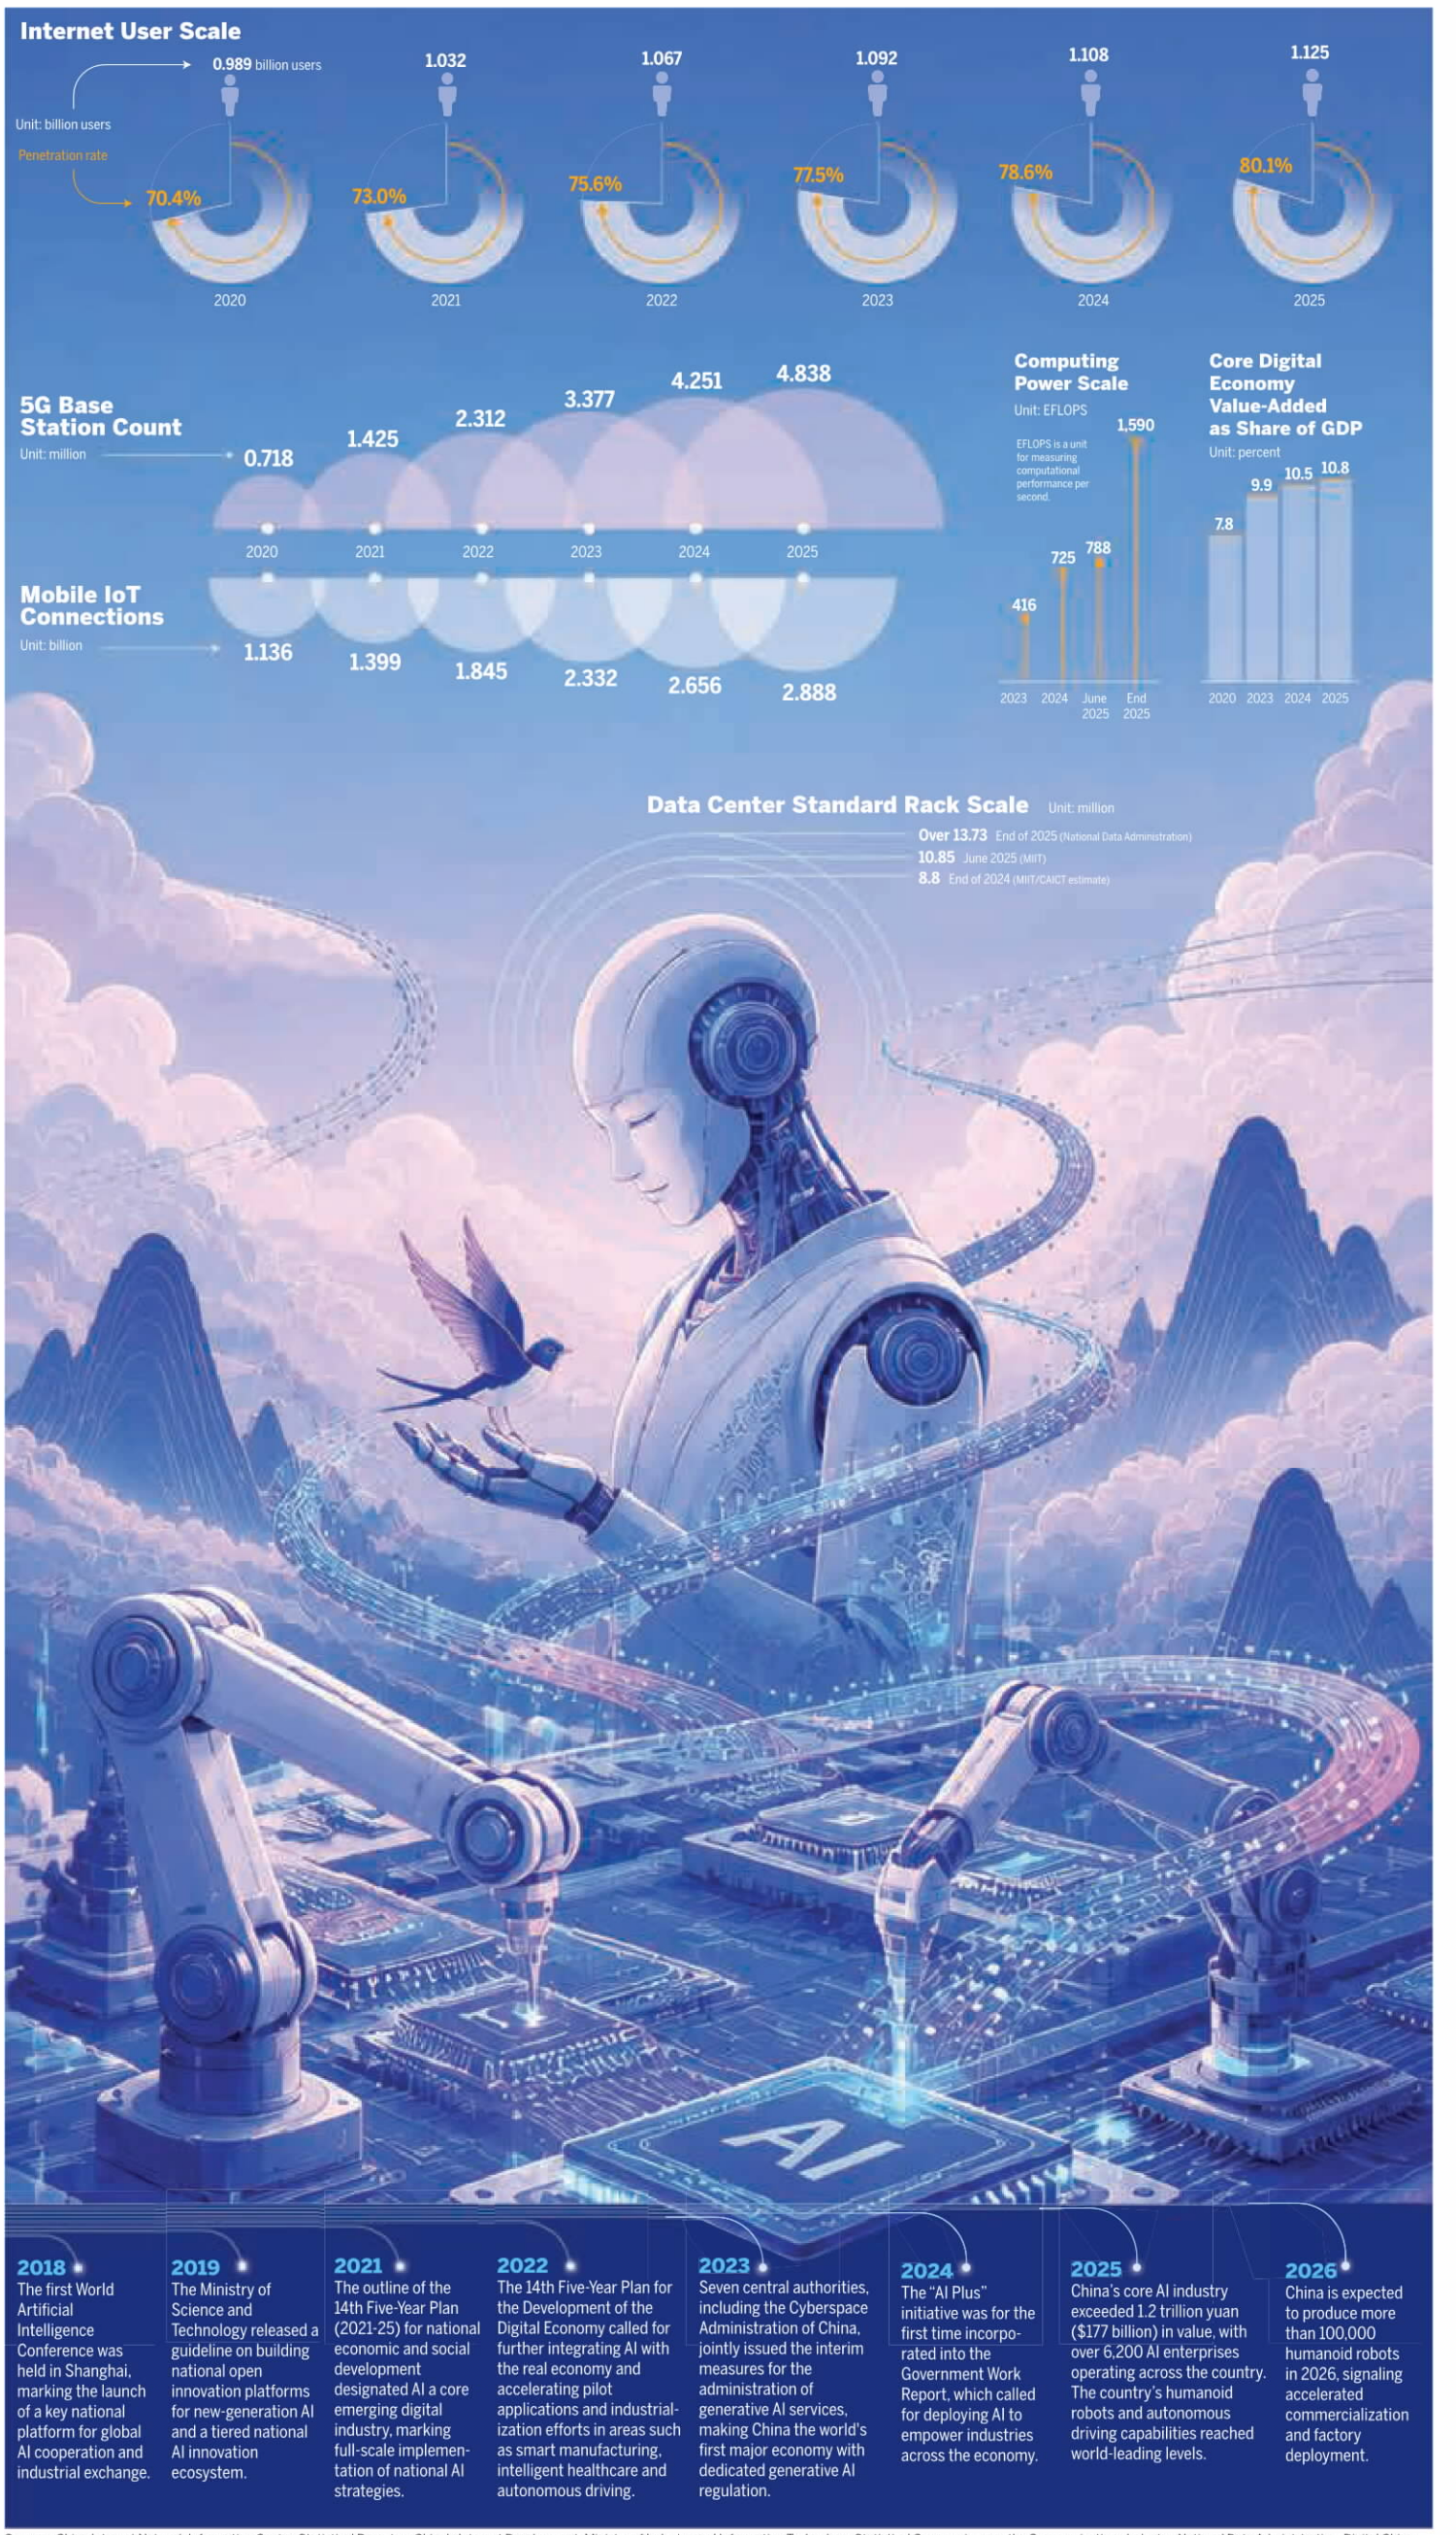
"China is emerging as a critical testing ground for the global development of embodied intelligence, with robotics, intelligent vehicles and industrial scenarios converging at an accelerated pace. AI is no longer just a tool; it is rapidly evolving into a versatile, cross-scenario capability that is permeating business-critical processes and every facet of enterprise operations," Zhu said.

Accenture's 2026 index of Chinese enterprises' digital transformation, for which 160 Chinese companies were surveyed, reached the largest single-year increase in recent years, and digital application scenarios such as AI assistants, intelligent research and development, and AI-powered customer experiences are rapidly becoming the mainstream in China, Zhu noted.

Shen Jun, vice-president of Unilever's China R&D Center, said: "China's rapid advancement in AI is creating unprecedented innovation opportunities for multinational companies such as Unilever. With its strong scientific research capabilities, deep talent pool, well-developed industrial ecosystem and vibrant community of AI startups, China provides an ideal environment for emerging technologies to be rapidly validated, scaled and applied to drive global innovation."

Jeff Shi, president of SenseTime Asia Pacific, highlighted China's increasingly central role in the global AI landscape. "You can't talk about AI without talking about China — and you can't talk about China without talking about AI," he said, adding that in Southeast Asia, learning from China has become a key route to faster AI adoption. The term "Chinovation", a shorthand for Chinese-style innovation, was coined in Singapore.

China's AI-led expansion overseas is also changing, Shi said, noting that it is moving beyond the export of stand-alone software and applications toward a more sophisticated offering of industry-specific solutions and digital infrastructure.



That model draws on nearly the full breadth of China's AI ecosystem — from data centers and token plans to governance frameworks and talent development, he added.

In June, London-based research company Omdia ranked SenseTime No 1 in the Asia-Pacific video analytics market, ahead of Japan's NEC, the longtime champion.

"The market shift is driven by AI," Shi said. "Five years ago, customers came to us to test Vision AI in pilot projects. Today, Vision AI is widely embedded in operations. The new demand is to integrate generative AI into workflows."

China's model is also drawing a new class of visitors. As it delivers tangible returns on investment, more are traveling to the country to study firsthand. International business visitors to SenseTime's Executive Briefing Center in Shanghai rose tenfold this year, Shi added.

WAIC WORLD AI CONFERENCE

WANG XIAOYING / CHINA DAILY

SABINO VACA NARVAJA

Shaping the future of global AI governance

The WAIC and the WAICO pave an inclusive path for equitable digital development

Artificial intelligence has become a strategic force of the 21st century. Beyond its extraordinary technological achievements, AI is reshaping industrial production, scientific research, healthcare, education, public administration, finance and national security. More importantly, it has become a key determinant of economic competitiveness and geopolitical influence. Countries that develop their own AI capabilities will enjoy greater strategic autonomy, while those that rely exclusively on foreign technologies risk entering a new era of digital dependence.

Consequently, the global debate over AI governance is as important as the technological revolution itself. The rules, standards, ethical principles and institutional frameworks established over the coming years will not only shape AI's evolution, but also determine who benefits from it. The discussion extends beyond algorithms to encompass development, sovereignty and the distribution of global technological power.

Against this backdrop, the 2026 World Artificial Intelligence Conference, convenes in Shanghai from July 17 to 20, deserves close international attention. Since its inception in 2018, the WAIC has become China's leading international platform for dialogue on AI, bringing together governments, scientists, universities, technology companies and international organizations. This year's conference is particularly significant: The agreement on the establishment of the World Artificial Intelligence Cooperation Organization — a global institution designed to promote practical cooperation in AI, particularly among developing countries and the Global South — was signed.

The China-proposed organization aligns with a broader vision articulated by China through its Global AI Governance Initiative, its support for multilateral cooperation under the United Nations, and its emphasis on bridging the global digital divide. Rather than focusing exclusively on technological competition, the Chinese approach highlights capacity building, scientific cooperation, infrastructure development, talent cultivation, and technology sharing as essential components of AI development.

The real challenge before us is not simply who will lead the AI revolution, but whether that revolution will contribute to building a more balanced, equitable and genuinely multipolar international order.

For developing countries, this perspective deserves serious consideration. The central question should not be whether to align with one technological power or another, but how to build national capabilities while maintaining strategic autonomy. True technological sovereignty does not imply isolation; it requires diversified international partnerships that can strengthen domestic innovation ecosystems through knowledge exchange, joint research, technology transfer, education, and industrial cooperation.

In this regard, the WAICO is particularly relevant because it is closely linked to the UN General Assembly Resolution that calls for enhanced international cooperation on AI capacity building. Adopted by consensus, the resolution recognizes that AI should serve as a tool for sustainable development rather than a source of greater inequality. It encourages countries to cooperate in developing national AI strategies, training professionals, expanding digital infrastructure, promoting scientific collaboration, and ensuring that developing nations are not excluded from the next technological revolution.

For Latin America, this debate is of strategic importance. The region cannot afford to remain merely a consumer of technologies developed elsewhere. It must invest in scientific research, digital infrastructure, education, industrial modernization, and regional cooperation while actively participating in the international institutions where the future governance of AI is being defined.

However, enthusiasm for AI must be tempered with responsibility. AI offers extraordinary opportunities to increase productivity, improve public services, accelerate scientific discovery, and enhance human well-being. Yet it also raises profound challenges: the concentration of technological power in a handful of corporations, growing digital inequalities, threats to privacy, algorithmic discrimination, labor displacement, autonomous weapons, and new forms of surveillance. Without internationally agreed principles and effective governance mechanisms, the benefits of AI may become concentrated while its risks become global.

This is precisely why multilateral governance matters. The world needs international institutions capable of fostering innovation while protecting sovereignty, ensuring equitable access to technology, promoting transparency, and establishing shared ethical standards. One country, company, or technological ecosystem should not monopolize humanity's digital future.

Every industrial revolution has changed the international balance of power, and AI will be no exception. Countries that participate in shaping its governance today will help define the political and economic architecture of tomorrow.

Whether or not one agrees with every aspect of China's proposals, initiatives such as the WAIC and the WAICO offer an opportunity for the Global South to contribute proactively to the construction of a more inclusive international AI governance framework — one that promotes multilateralism, scientific cooperation, technology transfer, South-South collaboration and respect for national sovereignty.

AI should not become a new instrument of dependency. Properly governed, it can become one of the greatest tools for human development ever created. The real challenge before us is not simply who will lead the AI revolution, but whether that revolution will contribute to building a more balanced, equitable and genuinely multipolar international order.

Superintelligence for all

Agentic AI represents an opportunity for shared global development as it can become a tool for leapfrogging legacy digital divides rather than widening them

The 2026 World Artificial Intelligence Conference convenes in Shanghai on Friday under the theme "Intelligent Partners, Co-create the Future". The central question facing the world is no longer whether AI will transform societies, but who gets to shape and benefit from that transformation.

The current trajectory of AI development, in which the frontier autonomous systems carry out long and complex tasks under or without human supervision, is unprecedented in its capacity to improve the very AI training process itself, triggering a cycle of recursive self-improvement and snowballing small initial advantages into decisive leads.

Concerns that this dynamic will entrench monopoly are real. The United States began restricting exports of advanced GPUs in 2019 and has since proposed controls that would limit AI chip exports to all Global South countries, even to ostensible allies. A further means of control has been for the US to keep its trained AI models closed and to not publish any technical details on how the models are produced or how they operate. Most recently, it has restricted access to Anthropic's frontier Mythos model citing cybersecurity reasons.

Due to the US' unipolar approach restricting access to compute, shunning open source and even restricting the ability to run frontier models, most countries in the world face the risk of being pushed into a permanent "consumer" role. In this role, countries such as India and the Philippines risk being forced to simply buy access to Anthropic and OpenAI's models without developing any domestic AI skills or tech stack of their own. They would also permanently give up control over their own data, weakening their economic position and introducing national security and privacy threats.

Yet this outcome is not inevitable. If paired with open-weight model sharing, capacity-building partnerships and locally hosted inference infrastructure, agentic AI can become a genuine win-win: a tool for leapfrogging legacy digital divides rather than widening them.

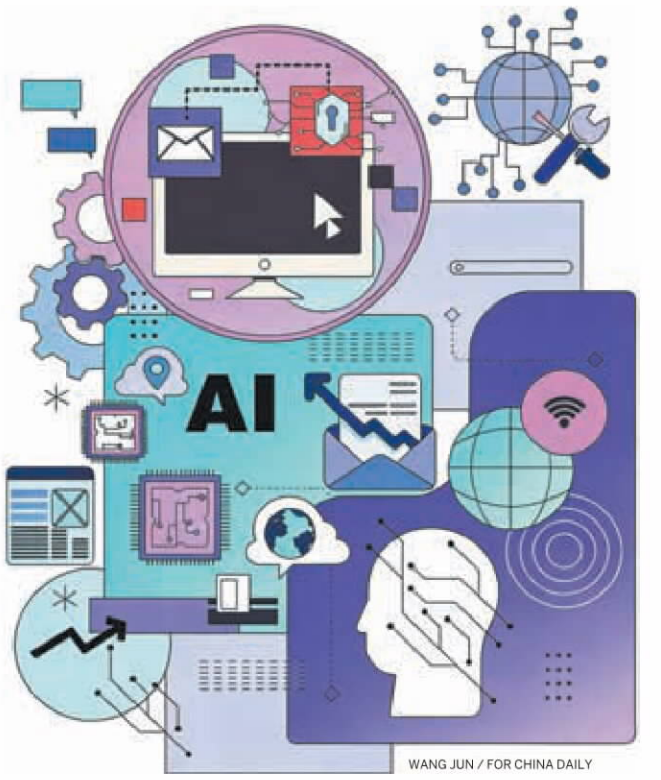
The attempted US tech blockade has not produced the intended isolation. In response, China has embraced an ambitious research program, which aims to not just develop GPUs, but respond with parallel innovation — Huawei's Ascend series, multi-patterning techniques — to extend pre-EUV lithography and "Tau-scaling", a 3D chip-layout optimization approach. Industry observers note Huawei plans to offer Ascend GPUs in Asia-Pacific markets such as the Republic of Korea in Q4 2026, signaling growing global competitiveness. Apple has begun to lobby the US government for permission to buy memory chips from China.

More significantly, top Chinese labs have released full model weights, technical papers and code, making Chinese open-weight models the most widely adopted foundation models in global research labs. Industry surveys suggested that around 80 percent of US AI startups either experiment with or deploy Chinese open-weight models for inference and fine-tuning.

This openness, and not the mere narrowing of a performance gap, is the distinguishing feature of a multilateral approach to AI governance. It creates the possibility of a shared AI commons, in line with the Shanghai Declaration on Global AI Governance issued in 2024, which commits signatories to ensure equal rights, equal opportunities and equal rules for all countries in developing and using AI technologies. As a supplement to the declaration and practical guide to action, China's Global AI Governance Action Plan adopted at the 2025 WAIC directs its commitment to strengthening South-South cooperation, enhancing the representation and voice of developing countries. Article 5 of the plan explicitly calls for open-source platforms, basic resource sharing, and lowering barriers to innovation and application.

Concrete mechanisms are already emerging. Launched in September 2025 at the China-Association of Southeast Asian Nations AI ministerial roundtable in Nanning, the Guangxi Zhuang autonomous region, the China-ASEAN Countries AI Application Cooperation Center is designed to strengthen the foundation for AI development, provide open-source services, facilitate industrial cooperation and promote talent cultivation across member states. Since 2019, the WAIC side-events have trained hundreds of officials and engineers from Africa, Southeast Asia, Central Asia and Latin America in large language model deployment, data governance and responsible AI use. The hope for 2026 expansion is high.

For Global South partners, the pathway to AI sovereignty follows a natural progression: first, host open-weight inference on local or regionally-shared hardware; next, fine-tune and adapt models to national needs, languages and regulatory contexts; and finally, as domestic datasets and compute capacity mature, pre-train original models from scratch. This is not a theoretical ladder. Tsinghua University has already begun training students from Southeast Asia and West Asia, who return to work at Z.AI offices in their home countries — bringing hands-on experience with open-weight systems that can be modified to reflect local values and priorities. Because the models and research are open, each country retains the freedom to customize, adapt and eventually build its own stack.



Crucially, this ecosystem is built on comparative advantage rather than unilateral monopoly. The Global South contributes the majority of the world's STEM talent and nearly half of global GDP. India offers an exceptionally large pool of young AI researchers and software engineers. Vietnam's rapidly expanding manufacturing sector provides a natural test bed for embodied AI. The Middle East states possess unrivaled energy and land resources for sustainable compute. When these strengths are combined with open models and targeted capacity-building — such as the joint laboratories and training programs outlined in the Action Plan — the result is a genuinely reciprocal partnership, not a donor-client relationship. The goal is not for every country to build the largest model, but for every country to build the model that fits its own needs, talents and future.

None of this negates the need for vigilance on safety, bias or misuse. But it reframes the question: the risk is not that agentic AI will inevitably concentrate power, but that exclusive, closed ecosystems could make it do so. The alternative — codified in the Shanghai commitments — is an inclusive architecture where frontier labs, Global South governments, and open-source communities co-develop norms and share benefits.

As delegates gather in Shanghai, the message from Global South countries is unambiguous: They do not seek to be permanent consumers of black-box intelligence. Through open models, shared datasets, joint laboratories and transparent governance, agentic AI can be domesticated to local needs and values.

China's experience offers a model for a common path: AI must be a public good of a shared future for humanity. Whether that aspiration is realized depends on choices made now — by governments, companies, and research communities — to treat AI not as a zero-sum asset but as a cooperative infrastructure. In the age of agentic AI, the dividing line will not be between those who build the smartest agents and those who use them, but between those who lock intelligence behind walls and those who build the bridges that let it circulate. The latter is the only path consistent with a multipolar, equitable digital future.

Experts slam 'arbitration award'

Report says 'invalid legal paper' on South China Sea in favor of Philippines not law

By **ZHOU JIN**
zhoujin@chinadaily.com.cn

A research report released on Thursday criticized the "South China Sea Arbitration Award" as running counter to international judicial practice and lacking legal persuasiveness, calling it "a piece of invalid legal paper".

The report, titled Legal Critique of the South China Sea Arbitration Awards — "The South China Sea Arbitration Awards Are Not International Law", was written by scholars from the National Institute for South China Sea Studies, Jinan University, Ocean University of China and Shanghai Maritime University.

The report analyzes the arbitration from three perspectives — arbitral jurisdiction, the application of substantive rules and the validity of the "award" — to explain why it argues that the "award" cannot represent international law.

On July 12, 2016, an ad hoc "arbitral tribunal", unilaterally initiated by the Philippines and backed by external meddling, issued a so-called "award" on the South China Sea in favor of the Philippines. China immediately declared the "award" null and void, saying it has no binding force.

Xu Qi, vice-dean of the Academy of Foreign-related Rule of Law at Jinan University and a principal author of the report, said the United Nations Convention on the Law of the Sea does not originally deal with territorial disputes.

He noted that in 2006, China issued a government declaration pursuant to Article 298 of the convention, expressly excluding disputes concerning territorial sovereignty, maritime delimitation and other categories from the convention's compulsory dispute settlement procedures.

According to Xu, the "arbitral tribunal" willfully distorted the rules and forcibly brought matters outside its jurisdiction within its purview, depriving itself of any jurisdictional foundation. The tribunal disregarded the fundamental fact that the Nansha Islands constitute an integrated whole and arbitrarily fragmented China's territorial sovereignty over the islands by treating them as disconnected, scattered reefs.

Xu further said the tribunal repeatedly cited uncorroborated evidence from a single source and proactively collected outdated and irrelevant materials that were prejudicial to China, undermining its objectivity and impartiality.

He also accused the tribunal of becoming a geopolitical tool for external powers, including the United States and Japan, to stir up tensions in the South China Sea.

According to Xu, some arbitrators abandoned independent judgment to accommodate the political interests behind the case. He said the tribunal's tailor-made composition undermined its credibility from the outset, rendering the award invalid under international law.

"An 'arbitration award' that is riddled with violations of law and rendered beyond the tribunal's authority cannot become international law, regardless of the name attached to it. China's nonrecognition and nonparticipation are precisely a defense of the solemnity of international law," he said.

Zhou Yong, vice-president of the National Institute for South China Sea Studies, said a sustainable international order must be built on rules that are fair and credible because only such rules can win broad recognition and respect.

He said the "South China Sea Arbitration Award" has deviated from the basic principles of justice, has had only a limited impact on the international legal system and has faced widespread criticism over its structural flaws. The case serves as a negative example in efforts to uphold international law and fairness in international judicial processes.

The report also said the true path to resolving regional disputes lies in good-faith dialogue among the parties concerned.

Yu Minna, an associate professor at Ocean University of China, said that both in terms of legal foundations and practical implementation, negotiation and consultation remain the preferred and more effective means of resolving disputes.

China has 14 land neighbors and has already resolved boundary issues with 12 of them through negotiations.

Resolving disputes through negotiation and consultation is a peaceful approach and is also more conducive to implementing the agreements reached, Yu said.

AVIC drones help flood relief efforts in Guangxi

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

A Wing Loong 2 drone.
PROVIDED TO CHINA DAILY

The Aviation Industry Corp of China, the nation's leading aircraft maker, said on Thursday that its Wing Loong 2 drones helped support flood relief efforts in the Guangxi Zhuang autonomous region by conducting disaster reconnaissance and restoring communications in areas isolated by severe flooding.

The State-owned conglomerate said that on July 6, following an order from the Ministry of Emergency Management, three Wing Loong 2 drones stationed in Guangdong, Hubei and Sichuan provinces were urgently dispatched to Guangxi to carry out disaster reconnaissance and emergency communication support missions.

At the time, surging floodwaters had completely surrounded numerous villages, while ground communications were fully disrupted, hampering search and rescue operations across many affected areas.

The Wing Loong 2 team based in Guangdong, the closest to the disaster zone, was the first to receive the deployment order. The team completed takeoff preparations within one hour. After weather conditions over the airport improved slightly, the drone took off despite strong winds and towering cumulonimbus clouds, heading directly to the disaster area.

The drone soon arrived over Hengzhou, Guangxi, transmitting the first batch of images from flood-hit areas to the ministry and providing critical information for rescue planning and deployment.

It then circled over the affected areas, serving as an airborne communications relay to restore information transmission.

AVIC quoted a local resident as saying online that his area had been without mobile phone service until the drone arrived, enabling him to reconnect with relatives outside the disaster zone.

Two additional Wing Loong 2 drones based in Sichuan and Hubei later took off on the night of July 6 and in the early morning of July 7 to join the emergency response.

According to Chen Bei, deputy chief engineer at AVIC Chengdu Unmanned Aerial Systems, the three drones operated under harsh weather conditions throughout the mission.

"Over nearly four days and nights, our drones conducted six long-duration flights in relay, accumulating a total flight time of nearly 70 hours. They delivered real-time images of disaster sites and restored communication networks for more than 90,000 affected residents and rescue personnel," Chen said.

"The drones returned to their bases after basic communications were established and ground rescue forces moved in to carry out on-site relief and evacuation operations.

"Currently, Wing Loong 2 drones are deployed in six provincial-level regions, boasting emergency support capabilities with nationwide coverage, rapid response and multipoint support," she said.

Since the start of this year's flood season, persistent heavy rainfall has battered multiple areas across Guangxi, with severe flooding ravaging villages and towns. The disasters caused roadbed collapses, power outages and damage to telecommunications facilities, leaving many communities cut off from road access, electricity and communications networks.

Developed by AVIC Chengdu Unmanned Aerial Systems, the Wing Loong 2 is a large civilian emergency response drone system designed for disaster reconnaissance, emergency communication support and emergency supply delivery.

The drone can be equipped with multiple payloads, including an electro-optical detection pod, a synthetic aperture radar, an aerial survey camera, an emergency communication support pod and an emergency delivery pod.

The aircraft is 10.8 meters long with a wingspan of 20.7 meters. It has a maximum takeoff weight of 4.2 metric tons and can carry up to seven payloads under its wings. Equipped with a communication pod, it can fly at speeds of up to 350 kilometers per hour and provide communications coverage for an area of more than 50 square kilometers, according to its designers.

HISTORY, GEOGRAPHY AND CULTURE A POTENT MIX

Visitors flock to Shichahai from all over after its transformation into a natural haven of peace juxtaposed with landmarks that recall Beijing's past

By **CHEN NAN**
chennan@chinadaily.com.cn

On July 14, as the summer heat began to fade, Cong Hua wandered through the maze of *hutongs* around Beijing's Shichahai area, where narrow alleyways open onto old courtyard homes, quiet teahouses and bicycles leaning against weathered brick walls.

With no fixed destination, she followed the winding lanes toward the lakeside, where the city's pace seemed to slow. Boats drifted across the water, willow branches swayed in the evening breeze, and reflections of historic buildings shimmered on the lake's surface.

"Then, just as I turned toward the western sky, the clouds caught fire with shades of gold and crimson. The unexpected sunset over Shichahai transformed an ordinary walk into an amazing moment," she wrote in a Xiaohongshu post that quickly drew hundreds of likes and comments.

For Cong, Shichahai's appeal lay not in a single landmark but in the quiet connections among its streets, waterways and history — a feeling shared by many visitors seeking a glimpse of old Beijing.

Among them was Hanne Vermeulen, a 21-year-old student from Belgium, who explored the lakeside with her family during a three-day visit to Beijing. As evening fell, lanterns reflected across the water while boats glided through the twilight and conversations from nearby streets blended with birdsong.

"It is a very lovely and peaceful area to have a walk and nice food," she said. "We really enjoyed the area."

It was not Vermeulen's first visit to China. After traveling to the country in 2024 and studying Chinese language and culture for a semester at Liaoning University in Shenyang, Liaoning province, she returned this summer with a deeper appreciation for historic neighborhoods such as Shichahai.

For today's visitors, Shichahai is remembered for its tranquil atmosphere, where an unhurried walk may reveal a memorable sunset, a quiet corner or a tangible connection with the city's past. Yet the peaceful landscape is also the product of decades of transformation.

More than 80 years ago, celebrated Chinese writer Lao She immortalized the area in his essay *Fond Memories of Peiping*, describing "willow-lined embankments, vast stretches of lotus blossoms, dense reeds, flocks of waterfowl and the deafening chorus of cicadas". If he were to revisit Shichahai today, he might still recognize echoes of the landscape he captured in words.

Not long ago, however, the area had become better known for its bustling nightlife, crowded commercial streets and loud bar music. In recent years, restoration efforts targeting the lakes, wetlands and surrounding environment have reshaped the neighborhood. Today, birdsong has replaced amplified music, wetlands have returned to the lakeshore and wild ducks once again paddle through cleaner waters.

The transformation represents more than environmental rehabilitation. It also marks a cultural revival, restoring the atmosphere that inspired one of modern Chinese literature's best-known essays while creating a richer experience for residents and visitors alike.

Visitors take a sightseeing rickshaw to explore the Shichahai area in Beijing on July 2. ZOU HONG / CHINA DAILY

Located at the intersection of Beijing's Central Axis and the Grand Canal system, both UNESCO World Heritage sites, Shichahai has occupied a unique place in the city's history for centuries.

Before the Yuan Dynasty (1271-1368), the area was known simply as *haizi*. Eventually, Shichahai — comprising Qianhai, Houhai and Xihai — became the northern terminus of the Grand Canal, where cargo boats carrying grain and goods from southern China arrived in the imperial capital.

"As the terminal point of the Grand Canal transport system, Shichahai served multiple functions during the Yuan capital of Dadu," said Sun Meng, a researcher at the Beijing Institute of Archaeology.

Beyond its role in shipping and trade, the area was also an important center of commerce and leisure, he said.

"More than 700 years later, boats still glide across the lakes, while surrounding buildings have been revitalized into cultural and tourism landmarks, offering new ways to interpret and share the value of heritage."

Chen Jiandong, who has worked in Shichahai's tourism industry for nearly two decades and now operates traditional rickshaw tours, has witnessed the district's evolution firsthand. Upgraded routes now link the narrow *hutongs* with the lakeside, giving visitors a more immersive way to experience the neighborhood, he said.

"Shichahai attracts tourists from around the world because it brings together history, atmosphere and everyday life in a highly walkable, visually rich setting in central Beijing," Chen said.

BCI implant offers hope to paralyzed patients

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

A paralyzed patient in Shanghai has become the first person in the world to receive a commercially approved brain-computer interface, or BCI, implant, marking a major leap from laboratory experiments to real-world medical treatment.

The landmark surgery was performed on Monday at Huashan Hospital, which is affiliated with Fudan University in Shanghai and serves as China's National Center for Neurological Disorders. Doctors successfully implanted the Neural Electronic Opportunity, or NEO, a coin-sized device designed to help paralyzed patients regain hand movement.

The hospital reported that the patient's condition remains stable following the procedure. Tests during the surgery showed that the device was successfully capturing high-quality brain signals.

The patient, who was paralyzed in a car accident 10 years ago, had lost the ability to grasp objects and struggled with basic daily activities. Traditional rehabilitation and medications had failed to bring further improvement.

The NEO system, developed by Shanghai-based Neuracle Technology, bypasses damaged nerves by capturing the patient's intentions to move. Electrodes placed on the protective outer layer of the brain pick up electrical activity when the patient thinks about moving their hand. The system then decodes these signals and sends commands to a robotic glove worn by the patient, physicalizing their thoughts into hand movements.

Unlike some BCIs that insert deep needles into brain tissue, the NEO device sits safely on the brain's surface.

For years, brain-implant technologies were restricted to laboratory settings and experimental clinical trials. Before receiving market approval, Huashan Hospital collaborated with 11 top-tier medical institutions across China to test the system on 32 patients.

The technology reached a commercial milestone on March 13, when it received official market approval from China's regulators, making it the world's first approved commercial implant in the highest-risk medical device category.

In the short four months since its approval, the NEO system has moved rapidly through manufacturing, hospital adoption, patient screening, and even inclusion in commercial health insurance coverage.

The swift rollout highlights growing support for the brain-technology sector. The technology was designated a "future industry" in this year's Government Work Report and was written into the outline of the 15th Five-Year Plan (2026-30) as China aims to cultivate the sector into a new engine of economic growth.

With the technology now entering daily clinical practice, the implant offers new hope for millions of patients around the world living with severe spinal cord injuries.

EXPLORING NATIONAL PARKS

Rangers dedicate lives to pandas they may never see

National park workers deploy high-tech solutions to track nation's elusive icon

By **WANG XIAOYU** in Ya'an, Sichuan
wangxiaoyu@chinadaily.com.cn

For nearly a decade, conservationist and giant panda researcher Fu Mingxia has dedicated her life to an animal she has never actually seen in the wild.

Working at the Yingjing management station in Sichuan province's Daxiangling mountain range — a more than 6,000-square-kilometer area twice the size of Yosemite National Park — Fu and her team must rely on the subtle traces the rare animals leave behind.

According to national survey data from 2015, Daxiangling is home to 38 giant pandas.

In a neighboring section of the Giant Panda National Park, which extends into Shaanxi and Gansu provinces, only two of the 12 staff there have ever seen a giant panda in the wild.

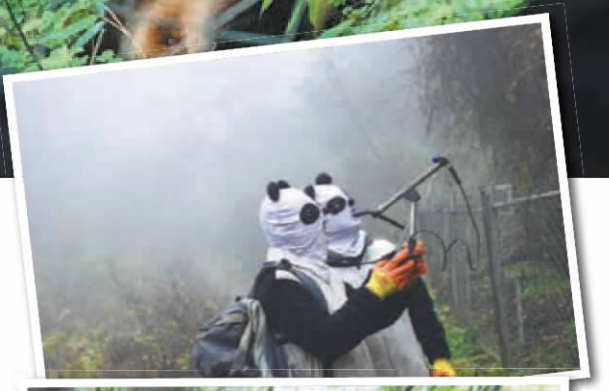
Yet Fu's team regularly celebrates what many would consider an odd victory — a fresh pile of spindle-shaped, green-tinged droppings along a mountain trail.

In the early days of her career, which began fresh out of university in 2017, finding these bamboo-fiber traces was a thrilling confirmation of life. Today, it is a routine confirmation of an ecological success.

Fu and her colleagues are convinced that the local ecology has improved significantly in recent years, creating a more hospitable environment not just for giant pandas, but for a wide variety of other wildlife as well.

One visible sign is the increasing frequency of panda droppings along the trails.

Another indicator comes from a network of surveillance cameras installed throughout the forest as the number of images captured has risen steadily, featuring not only pandas but also tufted deer, Lady Amherst's pheasants and other wild animals.



"By 9 am today, our cameras had already recorded 72 detections of mammals and 12 of birds," Fu said in a recent interview. "Since the surveillance network was put into use in October, we have captured over 1,200 video clips or images of giant pandas, including footage of them feeding on bamboo shoots and leading cubs in the wild."

The Giant Panda National Park, launched in 2021, covers 22,000 sq km, and is home to some 1,340 wild giant pandas, accounting for more than 70 percent of the country's total wild panda population.

Thanks to conservation efforts, including habitat restoration and the reduction of human activities, the integrity and connectivity of giant panda habitats have markedly improved, leading to an increase in the number of pandas observed in the wild, according to authorities.

Monitoring results suggest that populations of other rare animals in the region, such as the golden snub-nosed monkey and the snow leopard, are steadily growing. New plant species have also been discovered in recent years, adding further evidence of ecological improvement.

From top: Mu Shijie, a worker from the Wolong section of the Giant Panda National Park, waves goodbye to panda Xian Xian after feeding her during the panda's rewilding training in June 2024. SHEN BOHAN / XINHUA Researchers of the national park track the movements of giant pandas reintroduced into the wild. PROVIDED TO CHINA DAILY A conservation worker from the national park's Tangjiahe section checks an infrared camera with a media group in May 2023. WANG LEI / CHINA NEWS SERVICE

A key approach to habitat restoration has been the development of bamboo corridors that link isolated forest patches, allowing pandas to move between areas, find food and meet potential mates from other groups.

In Yingjing, the Niba mountain area is crucial for connecting the panda populations in the Daxiangling mountain range with those in the Qionglai mountain range. However, the connecting pathway used to be cut off by a national highway and logging activities.

"An ideal ecosystem for giant pandas consists of an optimal mix of trees, shrubs, bamboo and grass," Fu said. "Bamboo that is too dense impedes their movement, while bamboo that is too sparse forces them to travel long distances to find enough food."

In experimental woodland plots nestled within the forest, Fu and local researchers have been working to determine the right vegetation mix for the panda's habitat. One plot, Fu said, clearly illustrates the contrast between restored and unrestored forest.

Separated by a narrow path, the left side features tall fir trees with thick canopies that block out most sunlight, leaving the forest floor nearly barren. On the right, the vegetation is far more diverse, with sunlight streaming through gaps in the broadleaf foliage and a layered understory of low shrubs and lush bamboo thriving below.

"The difference clearly shows what habitat restoration can achieve," Fu said. "The plantation on the left was commonly established in the region after logging was called off, with little consideration for ecological value. It has low species diversity and offers little benefit to wildlife. It's the type of forest we aim to restore and improve nowadays."

Based on research findings, Fu said that since 2018, local authorities have been clearing tangled vines and undergrowth to create space for selected trees to grow. After replanting native broadleaf saplings, they carry out three years of tending to ensure the trees mature and provide adequate shelter, ultimately achieving a balanced ratio with bamboo and shrubs.

Some 467 hectares of habitat have been restored in the Daxiangling mountain range using this method.

Alongside habitat restoration, researchers have been deploying intelligent systems to aid wildlife surveillance, obtaining more accurate and efficient data to inform conservation efforts.

Fu said the system in Yingjing features hundreds of infrared cameras capable of capturing and analyzing traces of wild animals, covering 90 percent of the target areas.

"The system is powered by data from more than 480 real-time transmission infrared cameras, 200 traditional surveillance cameras, and hydrological and meteorological instruments that track temperature, humidity, wind speed, rainfall and other environmental variables," she said.

"The system has significantly boosted the efficiency of our monitoring work and provides more comprehensive and accurate data on wildlife activity in the region, helping us develop more scientific approaches to ecological protection," she added.

The Baishuijiang section of the national park, located in Longnan city of Gansu province, is equipped with 1,500 infrared cameras, 600 of which are capable of real-time image transmission, according to Kang Yonggang, a local park employee.

"It is estimated that hundreds of videos documenting giant panda movements are recorded each year. Sometimes, at one location, five different giant pandas are captured within a single month," he said.

"The most valuable footage for us is probably images of panda parents strolling with cubs, because it suggests that they are breeding and that the population is stable or even growing," he added.

According to survey data, the panda population in Baishuijiang dropped sharply from 301 in 1974 to 155 in 1984, largely due to large-scale bamboo flowering that caused food shortages. In recent years, the number has remained stable at around 110.

"The comprehensive surveillance system also enables us to monitor climate and ecological conditions in real time," Kang said. "For instance, if bamboo flowering is detected, we will deliver supplemental food to the pandas and plant bamboo species with different flowering cycles at the same elevations to ensure a steady food supply year-round."

Kang said giant pandas are highly protective of their space. "We don't want them showing up near villagers' homes, because that would mean humans are probably encroaching on wildlife habitat. And we certainly don't want any human activities disturbing their normal lives," he said.

"If we do encounter them during patrols in the future, we will keep our distance, quietly observe their condition, and then leave them in peace."

Sichuan township swaps out coal for ecotourism

By **WANG XIAOYU**

Longcanggou township, located at the southern gateway of China's Giant Panda National Park in Sichuan province, has emerged as a premier national model for balancing wildlife conservation with community development.

Once reliant on coal mining and logging, the Sichuan province community has successfully transitioned to a thriving green economy. By transforming local villagers into homestay hosts, nature guides, and conservation rangers, the township has proved that protecting the environment can be highly profitable for local residents.

About 80 percent of Longcanggou's terrain is covered in forests, and nearly 60 percent of the township lies within the boundaries of the Giant Panda National Park. It was among the first pilot regions to begin exploring community management approaches at the park's entrance area in 2017.

Zhou Yang, a local official administering the community, said a key approach has been to divide the area into three concentric zones. The core protection zone prohibits all but essential human activities, mainly scientific research and conservation work.

"The general control zone allows for nature education and ecological experience programs," he said. "And the functional support zone focuses on developing ecology-related industries, so that local people can also gain benefits and better participate in the management of the national park."

Docents from the Panda International Forest Camp lead participants in identifying plants and learning about nature in Yingjing, Sichuan province. PHOTOS PROVIDED TO CHINA DAILY

The establishment of the national park, he said, catalyzed a series of changes in their livelihoods.

"For instance, we have trained and supported local residents to open guesthouses, work as forest rangers, or become tour guides for museums, hiking and birding," he said.

"They have gradually come to understand the importance of environmental protection and are now actively participating in it, because they have witnessed the benefits brought by conservation efforts and are able to earn income from running eco-friendly businesses," he added.

Hu Tailun, a local villager, was among the first to explore building a rural homestay in 2018. Noting the rising interest from bird-watchers and wildlife enthusiasts in a region that boasts more than 400 bird species, Hu also began learning about birds on his own and was later recruited by local authorities as one of the area's first bird guides.

Hu now receives a subsidy for maintaining safety facilities along the viewing trails and earns extra income by leading visitors on forest explorations, bird-watching excursions and flower-viewing trips.

"The change for us is like night and day," he said. "Before, I earned just enough to get by. After starting the new business, I bought a house and a car. More than that, the whole village has changed."

Zhou said that to nurture the growth of tourism, authorities have allocated funds to renovate rural toilets, improve the environment, and upgrade the township square and other public facilities.

"We have also launched regular performances, such as traditional dragon dances or music played by bamboo-made musical instruments, to enrich the experience for tourists here," he said.

Longcanggou has some 70 rural guesthouses and 80 restaurants. The establishment of bird-watching trails is projected to attract an additional 12,000 visitors each year, generating more than 5 million yuan ($736,000) in tourism revenue.

Yingjing county is also home to the first nature-education school inside China's Giant Panda National Park, named the Panda International Forest Camp. The camp has welcomed more than 80,000 visitors since its opening in 2021.

The camp, jointly managed by the local national park authority, tourism officials and a private tourism company, is located in the general control zone. It sits next to an old patrol station, tucked away in verdant, largely undisturbed forests.

To balance conservation with commercial operations, the camp enforces strict visitor registration. Daily capacity is capped at 200 people — well below the 300-person limit set by official evaluations, said Liu Wenxue, the school principal.

Liu added that the camp has made full use of existing infrastructure, such as old patrol routes and large prefabricated wooden homes, allowing for fast construction and environmental sustainability.

According to Liu, educational programs include hiking and field discovery, do-it-yourself activities such as making plant specimens and designing bird-collision-deterrent patterns, as well as long-term research projects.

"Visitors include children and teenagers, families, wildlife enthusiasts and researchers from international organizations," he said. "For younger people, they get to have immersive experiences and may develop a lasting passion for the natural world from here."

The camp has also provided jobs for more than 15 local residents, who work as tour guides, drivers and safety patrollers, he added.

This successful model has since been extended to two other camp sites within nature reserves across Sichuan province, he said.

Official data shows that in 2025 alone, ecotourism and nature education initiatives across the entire Giant Panda National Park drew 6.13 million visitors, generating 6 billion yuan in revenue.

The province of Sichuan has set up 81 joint management committees to involve local villagers, created more than 3,100 ecological public welfare positions, and issued nearly 75 million yuan in compensation funds for about 20,000 affected local people annually.

Ensuring AI serves humanity's common interest entails effective global governance

As the 2026 World AI Conference and High-Level Meeting on Global AI Governance opens in Shanghai on Friday, policymakers, scientists, entrepreneurs and engineers are debating a question that will shape the digital age: Who will write the rules for artificial intelligence?

AI has reached a crossroads. One road leads toward openness, shared standards and international cooperation. The other disappears into rival blocs, competing regulations and technological protectionism.

The greatest economic dividends of a transformative technology emerge not when it is monopolized, but when it is widely shared. AI is no exception. Its value does not lie in building the most sophisticated frontier models. It lies in enabling millions of factories, hospitals, schools and research laboratories to apply it.

That philosophy helps explain China's approach to AI governance. Beijing has coupled innovation with large-scale deployment. AI now optimizes manufacturing, assists doctors in hospitals, supports teachers in classrooms, powers autonomous mining operations and improves logistics across the world's second-largest economy.

China on Wednesday rolled out a set of regulations aimed at curbing emotional dependency on AI-powered companion bots. That represents the latest effort of the country to improve its domestic AI governance. Platforms are required to discourage emotional dependency, safeguard personal data, intervene when excessive reliance develops and remind users of the distinction between human relationships and machine interaction. The broader message is that governance should accompany innovation from the outset. That same philosophy increasingly informs China's international agenda.

The country advocates AI for the public good and for the good of all. In 2023, China put forward the Global AI Governance Initiative, which presents a clear articulation of that vision. The initiative advocates a people-centered approach that ensures AI serves human progress rather than narrow commercial or geopolitical interests. It calls for AI development based on mutual respect, equality and mutual benefit, opposing ideological barriers or exclusive technological blocs that deny other countries the right to develop AI.

The initiative supports a governance framework built through broad international consensus, including discussions under the United Nations on establishing an international institution for AI governance. It also proposes risk-based testing and assessment systems to ensure AI remains safe, reliable, controllable and equitable, while emphasizing greater international cooperation to help developing countries strengthen AI capacity and narrow the global intelligence divide.

This agenda deserves attention because if left entirely to market forces, AI risks widening existing inequalities rather than reducing them. So that is why capacity-building has become central to China's international AI cooperation. Through open-source models, technology partnerships and practical projects spanning Southeast Asia, Africa and Latin America, China shows that AI should become an international public good.

China's combination of open-source innovation, manufacturing capability and vast application scenarios has the potential to reduce the global cost of AI adoption, allowing more countries to participate in the intelligent economy instead of merely consuming technologies developed elsewhere.

But algorithms ignore national borders. Cybersecurity threats spread internationally. Ethical challenges transcend political systems. Climate modeling, public health, disaster prevention and scientific discovery all call for more coordinated collaborative innovation. The world therefore needs to collectively govern AI, not competing regulatory fortresses that simply reproduce existing geopolitical fault lines. Notably, an agreement to establish the World Artificial Intelligence Cooperation Organization, which was proposed by China to promote global AI governance, was signed in Shanghai on Thursday. The aim of the organization is to promote coordinated AI development strategies, governance frameworks and technical standards.

Building on that momentum, the conference in Shanghai sets up a platform to enhance mutual trust, deepen cooperation and pool international consensus.

History will not only remember which country unveiled the fastest processor or trained the largest model, but more importantly, which country helped establish the principles and framework that ensured AI remained a force for shared prosperity rather than geopolitical division.

Global perceptions offer food for thought

Western media have long dominated the global narrative, often labeling China in ways that lack accuracy and objectivity. For people in many countries, their understanding of China has been shaped largely by fragmented media portrayals.

In recent years, however, developments such as China's visa-free policies, growing cross-border exchanges, the global reach of Chinese products, and the proliferation of online videos through the rise of social media have begun to break down these information barriers.

As people increasingly gain direct exposure to China, public perceptions are gradually shifting — and with them, the tide of international opinion is starting to turn, as the latest survey by the Pew Research Center suggests.

Its recent poll indicates that China is now viewed more favorably than the United States in 27 out of 36 surveyed countries, including Canada and Mexico. The change, which marks the first time in about two decades that China has surpassed the US in the survey on global public opinion, underscores the evolving dynamics of international relations.

Conducted from February to May and covering more than 42,000 people, the survey coincided with heightened geopolitical tensions, including the attack by the US and Israel on Iran. Other issues that might have affected global perceptions of the US include its repeated threats to take control of Greenland, the US military raid that captured Venezuelan leader Nicolas Maduro, and the US handling of the Israel-Palestine conflict in Gaza, according to researchers involved in the study.

By comparison, China is seen as a more reliable partner in many places. It's more likely to contribute to global peace and stability, said Laura Silver, associate director of Pew's Global Attitudes Research and one of the researchers on the study.

Though Silver did not go into specifics, it is evident that China's extensive global engagement, characterized by mutual benefit and win-win cooperation, has won the hearts of an increasing number of people worldwide. The Belt and Road Initiative, which connects countries through a vast network of railways, ports and roads, has significantly boosted global trade, investment and growth. Additionally, China's contribution of around 30 percent to global economic growth and its pivotal role in global industry and supply chains have provided significant stability to the uncertain global economy.

The Chinese embassy in the US attributed the overall positive sentiment toward China to the country's "governance achievements and development progress", which are recognized by more and more people around the world.

Yet despite that, given the poll's limitations, the Pew survey should not lead to complacency. It should be seen that long-standing biases in the West may continue to perpetuate stereotypes about China that will take time to overcome. The result of the survey should therefore be viewed with due caution.

Nevertheless, the US' withdrawal from international agreements and multilateral institutions in recent years — along with its rejection of multilateralism and opposition to economic globalization — runs counter to the principles that the international community has long championed.

China, on the other hand, continues to support economic globalization and a multipolar world, which aligns with the world's hopes to address global challenges through multilateralism.

This growing divergence is inevitably influencing many countries' perception of the US, as some observers said. This explains why the survey found that its sampled interviewees in major European countries — including France, Germany, Spain, Italy, Sweden and the Netherlands — have all switched their opinions in favor of China.

Development is the hard truth. International recognition ultimately rests on a country's actions. China should continue its pursuit of high-quality development and expand high-standard opening-up. By persistently sharing development opportunities with the world, China can continuously contribute to the building of a better world and win the international community's recognition.

Brussels' 'rivalry rhetoric' on China meets economic reality

If Brussels' latest position paper is to be believed, China has crossed a diplomatic Rubicon. By describing Beijing as a "key enabler" of Russia's conflict with Ukraine and placing it alongside Moscow as a "revisionist power" seeking to "reshape" the international order, the European Union has adopted tough official language on China.

The timing of the EU's rhetorical escalation is hardly accidental. After more than four years of conflict, the Ukraine crisis has entered a phase when military gains or losses over the coming months could influence not only the settlement but also Europe's own security architecture. Against that backdrop, the position paper adopted by the EU's 27 foreign ministers on Monday serves less as a legal judgment than as political signaling designed to increase the costs of any so-called "Chinese support" for Moscow.

Yet if Europe's language has become more uncompromising, its economic behavior remains comparatively restrained, reflecting an uncomfortable reality. Brussels may speak of "de-risking", but every attempt by Europe's China hawks to widen trade restrictions eventually encounters resistance from within the bloc itself.

Member states differ sharply over how much economic pain they are willing to bear. European manufacturers worry about access to rare earths, pharmaceutical ingredients and intermediate goods. Consumers ultimately pay for higher tariffs through higher prices. Businesses bear the costs of disrupted supply chains.

Even while European Commission officials warn against Chinese "industrial dominance", both sides have established working mechanisms, agreed on joint monitoring and scheduled future talks.

The first round of consultations in Brussels last month produced a pragmatic direction: the two sides should explore ways to expand the EU's exports to China. That is a far more rational approach. Reducing its dependence on China may narrow the EU's trade deficit, but much of the resulting burden falls on European households and companies through higher costs and reduced competitiveness.

European policymakers frequently argue that China should purchase more European products. Beijing, for its part, has indicated a willingness to import more competitive European goods. Yet the sectors where Europe still enjoys its technological advantages — advanced semiconductor equipment, precision machinery and other high-end industrial technologies — remain constrained by European export controls under the banner of "dual-use security".

Europe cannot simultaneously complain about its trade deficit while refusing to sell many of the products that Chinese buyers actually want.

If Brussels genuinely wishes to reduce the deficit, carefully loosening restrictions on selected civilian high-tech exports would achieve far more than another round of "antidumping" and "anti-subsidy" investigations. The EU's trade deficit with China is actually rooted in a "trust deficit" of its own making.

The European Commission is reportedly assembling a task force to prepare for possible Chinese "retaliation" while devising compensation for European companies that might suffer the consequences. Unveiling such contingency plans before negotiations have even run their course risks sending a contradictory signal. Is Brussels preparing for compromise or rehearsing confrontation? If the purpose of the consultations is to find common ground, they should be conducted on the basis of mutual respect, equality and good faith — not accompanied by sideshows designed to shape the negotiating climate before the real bargaining has begun.

Europe can either continue allowing false geopolitical anxieties to dominate every aspect of its China policy, risking an increasingly costly cycle of confrontation. Or it can distinguish between legitimate security concerns and areas where cooperation remains overwhelmingly in its own interest.

Had China supported Russia as some of Europe's most "outspoken" politicians regularly imply, the battlefield would almost certainly look very different today. Instead, the conflict has settled into a prolonged and costly stalemate, exposing Europe's own strategic miscalculations.

Before assigning ever greater responsibility to Beijing for Europe's security dilemmas, Brussels should ask a more uncomfortable question: how much of its current predicament stems from decisions made in Europe itself?

Statesmanship begins with that kind of self-examination. The future China-EU trade consultations will reveal whether Brussels possesses the political wisdom to match its strategic ambition.

What They Say

New recycling rules will help boost circular economy

Editor's note: *The central authorities have released a plan to promote the circular economy, calling for strengthening the recycling of solid waste generated by the "new three" industries — electric vehicles, lithium batteries and photovoltaic products. Yao Xin, deputy dean of the Research Institute for Environmental Innovation (Suzhou) of Tsinghua, shared his insights on the plan with China.com.cn. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The new energy sector is poised for robust growth in the coming years. In 2025, China announced its nationally determined contribution targets for carbon emissions reduction by 2035. Calculations based on these targets indicate that China's total installed capacity of wind and solar power will reach 3.6 billion kilowatts by 2035, more than six times the figure in 2020.

The new energy sector in China is entering a new stage in which a large number of products are going to be retired. The first retirement phase is estimated to begin during the period between 2026 and 2030. Therefore, the plan puts forward a series of measures to promote the utilization of solid waste generated by these products.

The plan sets requirements for the design and manufacturing of the products. For example, one of the requirements is that the products should be easy to dismantle.

It also sets requirements for enhancing the full life-cycle traceability of the products enabled by information technology. The technology is vital, because it helps ensure that solid waste, such as scrapped power batteries and photovoltaic modules, is collected by compliant enterprises and safely disposed of.

Scaling up the utilization of recycled materials is a key step in China's strategy for expanding its circular economy. It is necessary to improve the quality of recycled materials. One example is primary recycling, where waste materials are processed into the same product from which they originated. Such recycling requires more advanced technologies. This could make recycled materials costlier than virgin materials.

To address this challenge, the government should encourage and even require enterprises to use recycled materials. Accordingly, the plan states that certified recycled materials will be included in government procurement.

It's also necessary to make consumers confident that products containing recycled materials are not of inferior quality. Consumers should recognize that recycled products are more eco-friendly because their production emits less carbon and consumes fewer virgin mineral resources.

Both the Shanghai Stock Exchange and the Shenzhen Stock Exchange have issued detailed ESG disclosure guidelines for listed companies. Enterprises should also disclose information on their use of recycled materials.

To encourage broader utilization of recycled materials by companies, digital tools should be used to ensure full traceability. Such traceability helps manufacturers verify the quality of the materials they purchase, and makes it easier for them to prove that they have used recycled materials.

The plan also mentions establishing a "digital identity" system for batteries of new energy vehicles.

Besides batteries, the "digital identity" system will likely be rolled out for other products that use rare and precious metals and critical raw materials suitable for recycling.

Understanding China's science popularization

Studying science popularization in China offers a unique perspective on one of the most significant transformations in modern history: the resurgence of the Chinese civilization and its evolving path toward modernity on its own terms. Beyond economic growth, technological achievements and geopolitical influence, the ways in which scientific knowledge is disseminated, understood and embraced by society reveal important dimensions of China's development model and its vision for the future.

As the British sinologist Joseph Needham (1900-95) demonstrated in his monumental Science and Civilisation in China, an encyclopedic work that remains unfinished to this day, China was for centuries one of the world's leading centers of scientific and technological innovation.

Papermaking, printing, the magnetic compass, gunpowder, and numerous other inventions emerged from Chinese ingenuity long before comparable developments appeared elsewhere.

For much of recorded history, China stood at the forefront of applied knowledge, engineering and statecraft, contributing not only to its own prosperity but also to the advancement of human civilization.

Yet history followed an unexpected trajectory. Despite its rich scientific heritage, China did not become the birthplace of the Industrial Revolution.

Beginning in the late 18th century, Europe experienced a profound transformation driven by mechanized production, fossil-fuel energy and new economic institutions. While European powers expanded their industrial and technological capabilities, China entered a period marked by internal crises and external pressures.

For more than a century, the country found itself in the unfamiliar position of confronting a modernity largely shaped elsewhere. The resulting technological, economic and military gap became one of the defining challenges of modern Chinese history.

The establishment of the People's Republic of China in 1949 marked a decisive turning point. The new state embarked upon a long-term process of reconstruction, industrialization and institutional transformation. Despite numerous difficulties and setbacks, China gradually rebuilt its scientific and educational foundations.

Following the launch of the reform and opening-up policies in 1978, the country accelerated its integration into the global economy while simultaneously investing heavily in science, technology, and human capital. The cumulative impact of these efforts has fundamentally reshaped China's position in the world.

A new stage in this process was articulated at the 20th National Congress of the Communist Party of China in October 2022. In his report to the Congress, General Secretary Xi Jinping introduced and further developed the concept of "Chinese-style modernization".

This concept emphasizes that modernization does not follow a single universal path defined by Western historical experience. Rather, modernization can assume diverse forms shaped by a nation's history, culture, institutions and development priorities.

Within this framework, scientific and technological advancement occupies a central place. The Congress report established the objective that by 2035 China should significantly enhance its scientific and technological capabilities, achieve greater self-reliance in key technologies and join the ranks of the world's most innovative countries.

Indeed, China has emerged in the 21st century as one of the world's leading scientific and technological powers. Its high-speed rail operational network now exceeds 50,000 kilometers, while major advances have been achieved in areas such as artificial intelligence, digital platforms, smart manufacturing, renewable energy, ultra-high-voltage power transmission, quantum technologies and space exploration.

Large-scale investments in research and development, a vast pool of engineers and scientists, and strong coordination between public institutions and private enterprises have all contributed to this remarkable ascent.

SONG CHEN / CHINA DAILY

However, focusing solely on these visible achievements risks overlooking a less frequently examined dimension of China's scientific rise. The country's success cannot be explained solely by industrial policy, research funding or market size.

Equally important are the cultural and societal mechanisms that foster public engagement with science and technology. Among these, science popularization occupies a particularly significant place.

In China, science popularization is not merely understood as the dissemination of scientific facts. Rather, it constitutes a broad societal project aimed at cultivating scientific literacy, encouraging public participation in innovation and creating a social environment receptive to technological change.

Through science museums, educational campaigns, public exhibitions, media programs, digital platforms and community initiatives, scientific knowledge is integrated into everyday life and presented as a shared public good.

This phenomenon remains relatively understudied outside China, despite its growing importance. Yet it plays a critical role in supporting the country's innovation ecosystem.

By fostering curiosity, encouraging experimentation and strengthening public confidence in science and technology, science popularization helps reduce resistance to innovation and facilitates the rapid adoption of new technologies.

In this context, innovation is not confined to laboratories, universities or research institutes; it becomes a collective undertaking supported by broad social participation and public imagination.

Understanding this dimension is essential for developing a more balanced and comprehensive interpretation of contemporary China. The country's technological achievements are not simply the product of State planning or economic scale.

They are also rooted in long-term investments in education, cultural narratives that celebrate scientific achievement and institutional arrangements that connect research, industry and society. Science popularization serves as one of the bridges linking these different spheres.

More broadly, the study of science popularization offers valuable insights into the transformation of Chinese civilization itself.

It reveals how China seeks to reconcile its historical traditions with the demands of technological modernity, how scientific development is integrated into broader national goals, and how public understanding of science is mobilized in support of economic, social and environmental objectives.

Examining these processes allows us to move beyond simplistic explanations of China's rise and to appreciate the deeper social foundations that sustain its modernization project.

Important connections exist between science popularization and sustainable development, peace, the reduction of technological inequalities and the formation of shared epistemic foundations for global dialogue.

In this sense, science popularization may emerge as a new nexus for international cooperation.

In an age in which the most profound transformations are increasingly driven by science and technology, the capacity to align innovation with public understanding and social acceptance may prove as important as scientific discovery itself.

Studying science popularization in China therefore offers more than an analysis of educational or communication practices; it provides a window into how a major civilization understands modernization, organizes technological change and imagines its future.

The author is founder of the China-Europe-America Global Initiative, a specialist in global affairs and a sinologist. He is the author of the report Science Popularization in China and the Making of an Innovative Society.

Pou Sothirak and Him Rotha

China-ASEAN ties pivotal for regional peace, stability

For over three and a half decades, China and the Association of Southeast Asian Nations have nurtured a relationship that has blossomed into a productive engagement. The two sides have enjoyed comprehensive engagement across political, economic and cultural domains.

As we commemorate the 35th anniversary of China-ASEAN relations, it is fitting to reflect on how this remarkable relationship has evolved over time and become the linchpin for peace and stability in the region and beyond.

Even before formal dialogues began, China and ASEAN had worked closely to help resolve the Cambodian issue through both multilateral and bilateral channels. China expressed its interest in closer cooperation at the 1991 ASEAN Ministerial Meeting and became a full dialogue partner in 1996.

The relationship entered a new phase in 2003 when the two sides signed the Joint Declaration on Strategic Partnership for Peace and Prosperity at the ASEAN-China Summit in Bali, Indonesia. China became the first major power to accede to the Treaty of Amity and Cooperation in Southeast Asia, underscoring its commitment to regional peace and cooperation.

The relationship continued to expand in the following years. China established a free trade area with ASEAN in January 2010 and a Comprehensive Strategic Partnership with ASEAN in November 2021.

We are living in a fragile and dangerous world, and there is an urgent need for innovative approaches to peace and security so that international relations — especially among major powers such as the United States and China — are more predictable and constructive. The global community must unite to reduce tensions, promote cooperation, and create a climate of friendliness conducive to a stable global system.

China and ASEAN must carefully manage this transition to preserve peace, maintain stability, and build trust and mutual respect.

For China and ASEAN to continue as a compelling force for peace and stability, both sides must commit to creating an environment conducive to development and prosperity. This requires sustained efforts from all stakeholders, where nations aspire to coexist in harmony despite their historical differences, levels of national development, foreign policies or the pursuit of national interests.

Regional peace, stability and prosperity will depend on China and ASEAN translating their comprehensive strategic partnership into practical cooperation. By fulfilling existing commitments and tackling shared challenges over the next decade, both sides can turn this shared vision into tangible outcomes.

To safeguard regional peace and prosperity, China and ASEAN must jointly tackle key challenges.

First, the rapid economic growth in recent years has changed the regional balance of power.

Such transitions are often accompanied by tensions and anxieties which can lead to mistrust and conflict. China and ASEAN must carefully manage this transition to preserve peace, maintain stability, and build trust and mutual respect.

Second, the international system is remarkably diverse and complex, and there is no one-size-fits-all approach to peace and security.

China and ASEAN should recognize and accept different approaches to peace and security and forge a collaborative approach to address common security issues.

Third, unresolved territorial disputes and other security hot spots — such as the South China Sea issue, the Ukraine conflict, the Myanmar crisis, hostilities in the Middle East and the border dispute between Cambodia and Thailand — pose risks to peace and stability.

Misunderstanding and miscalculation could spark a conflagration that could undermine the peace in the region and beyond.

China and ASEAN should strengthen international cooperation, join hands to defuse potential conflicts and pave the way for a more stable regional and global system.

Fourth, China and ASEAN should uphold internationally recognized norms and principles of peaceful coexistence, which rest upon international law. This includes respect for territorial integrity and sovereignty, peaceful settlement of disputes, non-aggression, non-interference in internal affairs, and equality and mutual benefit. Peaceful coexistence rejects power politics and advocates for principles that recognize the existence of all countries on an equal basis.

Over the past 35 years, China-ASEAN relations have witnessed remarkable progress in various fields such as politics, economics, security, culture and health. The frequent interactions and close cooperation between the two sides have yielded fruitful results that exceeded expectations, benefiting the peoples of China and ASEAN countries alike.

No one can tell what the future holds, but for now, the destiny of Asia hinges on China and ASEAN making wise choices and building a productive China-ASEAN community with a shared future.

On the 35th anniversary of their relations, we extend our sincere congratulations to China and ASEAN on their fruitful relationship and wish the two sides further success as they strive to maintain regional peace and stability, boost their respective national development and regional growth amid existing and emerging challenges.

Pou Sothirak is the former minister of Industry, Mines and Energy of Cambodia and a distinguished senior adviser to the Cambodian Center for Regional Studies; and Him Rotha is the deputy director of the Cambodian Center for Regional Studies.

Chengdu gets it right on work-life balance

I spent five days in Chengdu last week, resting after a month-long road trip and trying to figure out what makes the capital of Sichuan province one of the happiest cities in China — especially compared to my home city Shanghai.

For 17 consecutive years, Chengdu has been rated among the Top 10 Happiest Cities in China by Oriental Outlook magazine published by Xinhua News Agency. The latest ranking was announced in December 2025.

Chengdu is a historical city, dating back about 2,300 years. Most Chinese like myself were fascinated by books such as *Romance of the Three Kingdoms* in childhood.

That is why I visited Wuhou Shrine again this time after my last visit about 20 years ago to pay tribute to the legendary figures whose stories have impacted the lives of so many people.

The street vibe in Chengdu is very different from that of Shanghai.

Small family-run restaurants and roadside food stands, with tables on sidewalks, are everywhere, even next to Taikoo Li, the posh shopping and dining place similar to Xintiandi in Shanghai. The "bench noodle" stand is the most extreme example, where a small stool by the roadside is your table.

Such food stands belonged to bygone days in Shanghai after decades of government efforts to face-lift the city's image, often at the expense of convenience to local residents.

Since Chengdu is such a food paradise, many such inexpensive restaurants and food stands serve very tasty food.

Chengdu folks are very willing to go out and meet friends. The abundance of inexpensive eateries across the city offers more choices to people who can't afford the expensive restaurants in shopping malls.

Since Chengdu is such a food paradise, many such inexpensive restaurants and food stands serve very tasty food.

While playing cards in public parks is not unusual in Chinese cities, in Shanghai it's often only a pastime for men.

But in Chengdu, women are just as enthusiastic and truly "hold up half the sky".

Young men and women in Chengdu, a hinterland city, dress up just as fashionably as their peers in Shanghai, while local entertainment spots, such as live music venues and talk show theaters, draw big crowds.

One Didi, China's Uber, driver who had worked for a year in Shanghai told me that most Chengdu people are not workaholics. They like to spend money and time enjoying life.

In other words, Chengdu folks manage work-life balance better than people in many other cities of China.

In Shanghai, by contrast, many people have willingly or unwillingly become workaholics. Some have become homebodies or are "lying flat", doing nothing. All of them badly need to rebalance their lives.

It's no coincidence that Finland and Denmark are consistently rated the happiest countries in the World Happiness Report sponsored by the United Nations, largely due to the good work-life balance despite the long cold weather in Nordic countries.

Living costs are also much lower in Chengdu. The restaurants are cheaper and housing prices are much lower than those in Shanghai. But so are the average wages.

The Didi driver noted that pressure is growing due to excessive competition, or *juan* in Chinese.

With a population of 21 million, Chengdu ranked 7th among Chinese cities by GDP. Its economy reached 2.48 trillion yuan ($366 billion) in 2025, still less than half of that of Shanghai's 5.67 trillion yuan.

Chengdu has now become a modern international metropolis, with modern industries, world-class infrastructure and efficient transport systems that attract many international tourists.

The city's 15th Five-Year Plan (2026-2030), announced recently, targets a GDP of 3.2 trillion yuan. This is to be achieved not just by expanding its transport networks and advanced manufacturing and high-tech sectors, but also by building more parks, better schools and a city that is more friendly to senior citizens.

I have my fingers crossed that Chengdu does not lose its appeal as one of the happiest cities and Shanghai catches up in that ranking.

China eyes more yuan globalization

Mainland, HK launch new measures to expand offshore RMB market

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

China will introduce a series of measures to deepen the development of the offshore renminbi market by enhancing liquidity, expanding the supply of RMB-denominated assets and strengthening connectivity with onshore markets.

The People's Bank of China, the nation's central bank, will continue to optimize relevant institutional arrangements, covering short, medium and long-term maturities, to provide stable and multitiered RMB — also called the yuan — liquidity support to the offshore market, said Xie Guangqi, director-general of the Monetary Policy Department of the PBOC.

Speaking at a news conference on Wednesday, Xie said the PBOC will guide the China Foreign Exchange Trade System to collaborate with the Hong Kong Monetary Authority and Hong Kong's Securities and Futures Commission to build a comprehensive financial trading platform that provides infrastructure services for trading in financial markets, including bonds, currencies and foreign exchange.

On July 7, the PBOC, the HKMA and the SFC jointly announced new measures to promote the offshore RMB (CNH) market's development in Hong Kong.

"This coordinated effort represents the most significant policy push to date to reinforce Hong Kong's role as the preeminent offshore hub for renminbi," said Xiong Yi, chief economist for China at Deutsche Bank, in a report.

While the PBOC and the HKMA jointly introduced measures to deepen mainland-Hong Kong financial cooperation in early 2024 and 2025, the latest policy package is significantly more forceful and places a much stronger emphasis on developing the offshore RMB market, Xiong said.

The new measures reaffirm that the offshore RMB market is a long-term pillar of the currency's internationalization rather than a stopgap solution, he said. "We believe the CNH market is now on track to overcome its size and liquidity constraints, creating a self-reinforcing cycle of growth."

The Chinese yuan has strengthened over the past six to nine months, supported by China's export strength and sustained foreign trade-related capital inflows, Xiong said.

He added that the currency has also remained notably stable in terms of both exchange and interest rates despite heightened global market volatility triggered by Middle East tensions. That resilience has made the RMB increasingly attractive to foreign companies looking to diversify away from the US dollar and other major currencies, given its stability and reliable access to financing.

"Renminbi internationalization is seeing another acceleration, starting from this year. I expect that the use of renminbi broadly in payment, financing and investment will increase over the next five to 10 years, and the Chinese currency is on the rise to become another major reserve currency alongside the dollar, euro and yen," Xiong added.

In December, the RMB's share as a global currency in the trade finance market was 8.3 percent, up 2.32 percent year-on-year, according to SWIFT.

Last year, RMB clearing activity in London, the largest RMB clearing hub outside of Asia, strengthened significantly. Total cumulative clearing volume reached 48.15 trillion yuan ($7.11 trillion), and the average daily clearing volume increased 55.33 percent to 191.09 billion yuan. China-UK RMB cross-border settlement also expanded modestly to 3.8 trillion yuan, generating a net inflow of 91.8 billion yuan into the United Kingdom, said the 19th edition of the London RMB Business Report.

Designated as the first RMB clearing bank for the UK in 2014, China Construction Bank Corp London Branch had achieved cumulative clearing volumes exceeding 174 trillion yuan as of the end of 2025, said the report.

A currency exchange outlet in Hong Kong. PROVIDED TO CHINA DAILY

Briefly

Yuan loans increase in Jan-June period

China's yuan-denominated loans rose by 10.72 trillion yuan ($1.58 trillion) in the first half of 2026, central bank data showed. At the end of June, outstanding yuan loans stood at 282.63 trillion yuan, up 5.2 percent year-on-year, according to the People's Bank of China. The M2, a broad measure of money supply that covers cash in circulation and all deposits, had increased by 8 percent year-on-year to 356.71 trillion yuan by the end of last month.

China's power use rises in first half

China's electricity consumption increased by 5.3 percent in the first half of the year, driven by strong growth in internet data services, electric vehicle charging and high-tech manufacturing, official data showed. Total power consumption reached nearly 5.1 trillion kilowatt-hours (kWh) in the January-June period, according to data released by the National Energy Administration.

XINHUA - CHINA DAILY

A visitor interacts with an intelligent machine during the World Internet Conference Open Day in Beijing on Wednesday. CHEN XIAOGEN / FOR CHINA DAILY

AI creates affordable consumer hardware

At a technology bazaar in Longfusi, a Beijing cultural landmark dating back nearly 600 years and once home to one of the city's most important temple fairs, a compact camping cart rolled quietly and independently through the crowd, keeping a steady distance from its user and steering around people in its path.

Zhang Lei, a local camping enthusiast, was impressed enough to place an order on the spot. At less than 2,000 yuan ($294), the model he chose is priced lower than a typical midrange smartphone.

"Pulling a cart loaded with tents and cooking gear for several kilometers used to be exhausting," Zhang said.

"This one follows you and automatically avoids obstacles, leaving your hands free. It works even better than I expected, and the price is affordable."

This purchase captures a broader shift in China's artificial intelligence consumer market. After becoming familiar to many users via products such as ChatGPT and Midjourney, AI is increasingly taking physical forms, as Chinese companies embed mature capabilities into products designed for everyday use.

At the bazaar, more than 300 AI products from more than 40 companies were available as consumer goods with clear price tags, rather than displayed merely as conceptual prototypes.

A few meters from the camping cart, an elderly visitor wearing a lightweight exoskeleton tried walking and jogging under the guidance of a staff member.

Nearby, meanwhile, an emotion-aware plush toy interacted with people through voice and touch, offering a brief form of companionship.

What stood out was not necessarily technological novelty, but commercial viability: visual recognition, sensor-based control and voice interaction were being turned into physical products that ordinary consumers can readily purchase.

Exoskeletons offer one of the clearest examples. Once largely confined to military and medical rehabilitation uses, with some costing hundreds of thousands of yuan, consumer exoskeletons in China now typically sell for between 6,000 and 20,000 yuan.

Beijing-based outdoor company Toread launched a consumer-grade exoskeleton priced at roughly 7,000 yuan in June. Inquiries and purchases have continued to rise, with sales on a single platform topping 100 units in one day, according to the company.

Rental services are lowering the barrier further. A park in Hangzhou, capital of East China's Zhejiang province, offers exoskeleton experiences for 9.9 yuan an hour, while rentals have also been introduced at scenic spots elsewhere in China including the Great Wall and Huangshan Mountain.

Across the emerging rental market, a common rate is approximately 80 yuan for three hours.

AI products are also reaching consumers through a widening range of retail channels. AI glasses and translation earphones have become routine merchandise at the Yiwu International Trade Market in Zhejiang, while robotics experience stores have opened in cities across China.

Behind the falling prices is China's robust manufacturing ecosystem. Its AI hardware sector draws on domestic supply chains spanning acoustics, optics, batteries, molds and final assembly. This allows companies to refine products faster, keep costs down and move new AI hardware concepts into mass production more quickly.

Scale may also help. China's population of 1.4 billion and more than 1 billion internet users provide a large and varied consumer base in which different types of AI hardware can find distinct applications. Exoskeletons are finding uses in hiking, rehabilitation and elderly care, while emotion-aware toys are useful for child companionship and psychological comfort, and automatic-following devices are handy in camping, logistics and short-distance transport.

XINHUA - CHINA DAILY

AI, interaction to fuel content growth

By **CHENG YU**
chengyu@chinadaily.com.cn

Two viewers sit before different screens, each holding half the clues. One knows who is lying, the other knows how to escape. Unless they work together, the characters on screen may not survive.

This is not quite a film and not quite a game. It is the emerging world of interactive entertainment, where audiences no longer simply watch a story but step inside it, make choices and determine how it ends.

Chinese interactive content company AltStory, which has specialized in interactive storytelling since its founding in 2017, is betting artificial intelligence will help push the format from a niche experiment into a mass-market business by making its complex productions faster, cheaper and easier to create.

"Interactive content is on the brink of explosive growth," AltStory founder and CEO Kun Peng said. "When users move from being bystanders to becoming protagonists, interactive storytelling becomes one of the most compelling forms of narrative."

The company has launched AltFlow, an AI agent that helps writers transform novels and scripts into branching stories with alternative plots, relationships and endings.

The tool comes as studios and technology companies search for new ways to capture viewers accustomed to video games, short-form clips and real-time online participation. Traditional films ask audiences to sit back. Interactive films ask them to act.

At key moments, viewers can click on a choice, vote through livestream comments or cooperate with another participant. A decision may save a character, reveal a secret or send the story toward a completely different conclusion.

Kun Peng

Netflix brought the format to wider attention with *Black Mirror: Bandersnatch* in December 2018. Four days later, AltStory released one of China's earliest major experiments with interactive drama.

In the espionage thriller, two viewers receive different information and must share clues and make decisions together. Watching becomes a social negotiation, with neither participant able to see the whole story alone.

Yet interactive productions remain difficult and expensive to make.

Kun describes the industry's main obstacles as "three mountains": creation, production and distribution.

A conventional screenplay moves from beginning to end. An interactive script repeatedly divides into new branches, all of which must remain logically consistent and emotionally convincing.

Writers must think like both filmmakers and game designers. Every alternative route has to be written, filmed, edited and tested, even though individual viewers may see only a small portion of the work.

A two-player interactive production can require 400 to 600 minutes of footage, Kun said, equivalent to the running time of five or six conventional films.

Early interactive titles were distributed mainly through gaming platforms, limiting their reach among mainstream film and television audiences.

AltStory says AI can help flatten those mountains. AltFlow uses 64 AI sub-agents to analyze long novels and scripts, extract characters and relationships, identify narrative turning points and suggest places where viewers could intervene.

A routing system assigns different large language models to different creative tasks, while a specialized editor helps writers organize and revise branching plots.

"The value of AI is not just about reducing costs or improving efficiency," Kun said. "It reconstructs the entire production chain and gives creators the freedom to continuously revise and expand a story."

AltStory plans to offer AltFlow to global creators alongside an intellectual property library, computing resources, production funding and overseas distribution channels.

Kun said only a handful of Chinese teams were working on interactive storytelling when AltStory entered the market. Over the past two years, however, internet companies, studios, copyright owners and independent creators have increasingly moved into the sector.

CNPC boosts ethylene capacity

By **LI JING**
lijing2009@chinadaily.com.cn

China's first full-chain green and low-carbon ethylene project was put into operation on Thursday, lifting annual ethylene capacity at the Dushanzi Petrochemical complex to more than 3 million metric tons and making it the only ethylene production base of that scale in the country's central and western regions.

Dushanzi Petrochemical is a subsidiary of State-owned China National Petroleum Corp, or CNPC.

The expansion, which will boost capacity by 1.2 million tons per year, comes as China seeks to strengthen domestic production of higher-value petrochemical materials and develop manufacturing further inland using the region's abundant oil and gas resources.

Located in Shangku Petrochemical Industrial Park in Korla, Northwest China's Xinjiang Uygur autonomous region, the project integrates renewable electricity, carbon capture and petrochemical production technologies to lower emissions while producing key industrial feedstocks, according to CNPC.

The company said the project is expected to reduce carbon emissions by 1.37 million tons a year, equivalent to planting about 365,334 hectares of forest. The facility draws 1 billion kilowatt-hours of solar power annually through a direct connection with CNPC's Tarim Oilfield photovoltaic project. It also features China's first domestically developed electric-drive system for the three core ethylene compressors, replacing conventional steam-driven equipment to lower emissions.

CNPC said the project also employs China's first proprietary technology capable of capturing carbon dioxide from ultra-low-concentration ethylene cracking furnace flue gas. Under this process, captured carbon dioxide and by-product hydrogen are fully recycled through an integrated system combining green electricity, carbon capture, blue hydrogen, blue ammonia and green fertilizer production.

Ethylene, the basic building block for plastics, synthetic rubber and fibers, is widely regarded as an indicator of the overall level of a country's petrochemical industry. The new facility will produce ethylene, polyethylene, polypropylene and other petrochemical products used in packaging, automobiles, consumer goods and industrial applications.

The project also underscores China's efforts to localize advanced petrochemical technologies.

"The project has sought to overcome technological bottlenecks," said Tong Yi, a design manager for the project, in an interview with local media.

CNPC said 10 of the project's 11 major production units use domestic technologies, including nine developed by the company.

The ethylene unit is largely localized, while downstream units, including pygas hydrogenation and butadiene rubber production, have achieved 100 percent localization. The project also marks China's first domestically manufactured large-scale extrusion pelletizer system, according to the company.

The complex in Korla was completed in 22 months, setting a new domestic record for the construction of a refinery and petrochemical project of comparable scale. The company attributed the pace to modular construction, factory prefabrication and digital project management.

It adopted a construction model covering standardized design, centralized procurement, factory prefabrication, modular construction, intelligent management and digital delivery.

The new facility uses feedstock supplied by supporting natural gas processing and crude stabilization projects at CNPC's Tarim Oilfield, further integrating upstream oil and gas production with downstream petrochemical manufacturing.

Zheng Xin in Beijing and Mao Weihua in Urumqi contributed to this story.

Q&A WITH CEO

Editor's note: *After the release of China's first-half 2026 economic data, China Daily invited chief executives and senior leaders from key multinational companies to share their perspectives on the world's second-largest economy. Their insights go beyond short-term growth, offering a closer look at the evolving "China Opportunity 2.0" narrative amid ongoing debate over the so-called "China Shock 2.0".*

Innovating locally for global scale

Samantha Zhu
Chairperson of Accenture Greater China

Chen Pu
Chief Asia officer of Syensqo

Winnie Ma
President for APAC region at VF Corp

Wolf Jiang
Vice-president of Logitech and president of Logitech GCN

Q1 Many multinational companies in recent years continue to expand their investment and operations in China, suggesting that "China Opportunity 2.0" is increasingly offsetting the "China Shock 2.0" narrative. What developments or evidence best demonstrate that China is creating new opportunities for global businesses rather than posing a "shock"?

ZHU: China is not only emerging as an innovation hub, but has also become a source of stability for the global economy over the years. Among major economies, China has demonstrated one of the highest levels of strategic continuity. Its industrial and technology policies evolve through predictable, multi-year planning cycles. Beyond policy, China's real-economy backbone has proven remarkably reliable, supported by a sustainable energy supply, world-class infrastructure, a deep talent pool and full-spectrum industrial capabilities. For global enterprises operating in China, the key is to convert these advantages into scale, speed and resilience, and further into reinvention. Companies that pull ahead and capture new growth are likely to be those that invest where China is setting the pace: industrial ecosystems, digital adoption, and speed of execution.

CHEN: We see "China opportunity" in very practical ways: in the size of the market, the speed of industrial upgrading, and the depth of the talent and innovation ecosystem. Just as important, the continued improvement of the overall ecosystem — stronger supply chains, better industrial capabilities and faster development of entire value chains — creates new opportunities by itself. For Syensqo, China is one of our key growth markets, and we have built our presence here for more than 40 years. Today, we have five industrial sites and a major research and innovation center in Shanghai, which is Syensqo's third largest globally. These are long-term commitments, and they reflect our confidence in the China market.

MA: China continues to create exciting opportunities for global businesses through its scale, consumer sophistication, innovation capabilities and commitment to opening-up. For VF, these strengths have reinforced our confidence in China after more than 30 years in the market. The rapid growth of China's outdoor economy illustrates this opportunity. As more consumers embrace active and outdoor lifestyles, demand for innovative products and elevated brand experiences continues to grow, creating new opportunities for companies like VF. Reflecting our long-term commitment, we have continued to invest in the market, including opening Smartwool's first store in China this year and The North Face's first member center in Asia-Pacific in Shanghai last year, and investing in automation at our China distribution center. These milestones underscore our confidence in China's long-term growth potential and its importance to our business.

JIANG: For Logitech, China represents an opportunity that continues to evolve. For many years, China was seen by global companies as an important market and a strong manufacturing base. Today, its role has expanded. China is also a source of innovation, a place where consumer expectations move quickly, and a market that can inspire products and experiences for users in China and, where relevant, other parts of the world. For more than three decades, Logitech has continued to build its presence in China, with our Suzhou manufacturing base established in 1994 as an important part of our global operations. Today, China plays an important role across our manufacturing, engineering, supply chain partnerships, local marketing and product innovation. Our Suzhou factory stands as our flagship manufacturing site, which produces more than 160 million mice, keyboards, cameras, headsets and other products per year.

Q2 China's economy has demonstrated strong resilience so far this year, supported by resilient exports, solid industrial production and continued strength in high-tech manufacturing. How would you assess China's overall economic performance so far this year? Looking ahead, what do you see as the key drivers supporting China's growth in the second half?

ZHU: China has established a solid and resilient foundation for high-quality development and is off to a strong start in the current 15th Five-Year (2026-30) period. We believe China is on the right trajectory, supported by coordinated capital allocation, regulatory alignment and industrial mobilization. Progress has been made in priority areas including advanced manufacturing, artificial intelligence, green energy and productivity. In an environment marked by constant change, focusing on technology, innovation and new growth models is the path forward. In technology, for example, we see policy intent, full-stack industrial capability and mass user adoption converging to drive AI into production at scale. Meanwhile, China is prioritizing the build-out of social infrastructure, including pensions, healthcare and eldercare, to support household spending. This will also help propel sustainable growth over time.

CHEN: From what we see on the ground, China's economy has shown strong resilience this year. Exports have stayed steady, industrial production remains solid and high-tech manufacturing continues to be a bright spot. For Syensqo, what matters most is not only the headline numbers, but also the clear direction: China is moving toward higher-quality growth driven by innovation, advanced manufacturing and greener development. Looking to the second half, I see several key drivers. First is continued industrial upgrading — especially in high-end manufacturing and tech-driven sectors. Second is the acceleration of energy transition, including electrification and more efficient use of energy and resources, which will drive demand for advanced materials. Third is ongoing digitalization and the adoption of AI across industries, which can lift productivity and speed up innovation.

MA: China's economy has shown strong resilience in the first half, supported by robust industrial capabilities, continued innovation, resilient exports and measures to stimulate consumption. These factors have helped sustain growth despite global uncertainties. Looking ahead, we believe consumption upgrading, digital innovation and the continued development of sectors such as sports, outdoor recreation and cultural tourism will be important drivers of growth. These trends are creating new opportunities for businesses while supporting China's transition toward high-quality development. For VF, the growing popularity of active and outdoor lifestyles presents significant opportunities to engage consumers through innovative products and experiences. Together with advances in digitalization and consumer engagement, these developments reinforce our confidence in China's long-term growth potential.

JIANG: China's economy has continued to demonstrate resilience despite a complex global environment. While external uncertainties remain, the country continues to benefit from its strengths in manufacturing, technology adoption, digital infrastructure and a highly dynamic consumer market. From Logitech's perspective, what stands out is not only the pace of growth, but the quality of growth. We continue to see strong momentum in areas closely connected to our business, including AI applications, smart devices, hybrid work, gaming and digital content creation. These are not short-term trends. They reflect fundamental changes in how people work, create, learn, play and connect.

Q3 China's innovation ecosystem has become an increasingly important engine of growth. How do you assess the contribution of artificial intelligence and other frontier technologies to China's productivity growth, industrial upgrading and long-term economic resilience? More broadly, what significance does China's innovation have for global technological progress and the opportunities available to multinational companies?

ZHU: China is a key player in the global innovation economy and one of the world's leading innovation markets. Rising total factor productivity, the proliferation of applications across industries and functions, and the integration of advanced technologies with user demand in key sectors will help the country deliver broad-based growth. AI, in particular, is at the center of business investment this year, as enterprises mobilize to deploy the technology to create value, respond to change and build resilience. Our research shows that AI adoption is advancing quickly, with 88 percent of Chinese enterprises having moved beyond the pilot stage. These enterprises have also made significant progress in using AI to transform customer experience, digital twins, research and development and data governance.

CHEN: China's innovation ecosystem is becoming a real engine for productivity and industrial upgrading. AI and other frontier technologies are now being applied at scale across manufacturing and R&D. They help companies improve efficiency, strengthen quality control, shorten development cycles, and make operations safer and more reliable. Over time, this also supports long-term economic resilience because it helps firms move up the value chain. At Syensqo, we see AI as a partner for our people. We launched Syensqo.ai early after the establishment of the company, and AI plays an important part of the company's strategic plans. At our China Research & Innovation Center in Shanghai, AI is helping teams with analysis, testing and product solution optimization. It is not a replacement for researchers, but a tool that helps them solve more complex problems and identify new ideas faster.

MA: China's innovation ecosystem is playing an increasingly important role in driving productivity, industrial upgrading and long-term economic resilience. The rapid advancement of AI and digital technologies, combined with strong adoption across industries, is helping companies innovate faster, operate more efficiently and better serve consumers. Beyond its domestic impact, China's innovation ecosystem is also contributing to global technological progress. Its unique combination of innovation capabilities, advanced manufacturing capabilities, digital infrastructure and market scale creates valuable opportunities for multinational companies to develop, test and scale new solutions.

JIANG: AI is one of the most important technology shifts of our time, but its real impact comes when it moves beyond a technological breakthrough and becomes part of everyday life. China is one of the world's fastest-moving innovation ecosystems in making that happen. Across work, learning, entertainment, gaming and content creation, we are seeing AI being adopted at remarkable speed, creating new opportunities for both businesses and consumers. We are already embedding AI across our portfolio to create more intuitive and productive user experiences — from AI-powered video collaboration that enhances meeting quality and supports meeting equity, to software-enabled mice and keyboards that help users work more efficiently. In hybrid meetings, AI can help participants be seen and heard more clearly, whether they are joining from a meeting room or remotely. In China, we are also adapting our software experiences to local AI platforms, ensuring our products fit naturally into the way Chinese users work and create.

Q4 China has placed greater emphasis on expanding domestic demand while pursuing high-standard opening-up. How do you assess these efforts? What new opportunities do they create for multinational companies and global investors?

ZHU: Domestic demand and opening-up have long been, and will continue to be, key pillars of China's high-quality development. Adapting to the pace of change in the domestic market will become an anchor point for both international and Chinese companies in a period of rapid technological and business evolution. On the one hand, domestic demand, especially in the consumer sector, is undergoing a profound shift with the spread of artificial intelligence. For example, more than half of Chinese consumers rank generative AI among their top three sources of purchase advice, much higher than their global peers. On the other hand, efforts to meet these evolving demands, together with continued encouragement for foreign participation, are bringing new products, services and solutions across a wide range of fields, from high-end manufacturing to consumer goods, and from green technologies to healthcare.

CHEN: We see these efforts as mutually reinforcing. Expanding domestic demand supports stable, long-term growth, while high-standard opening-up helps create a more predictable and efficient business environment. Together, they send a clear signal that China remains committed to high-quality development and deeper integration with the global economy. For multinational companies and global investors, the opportunity is not only to serve a large market, but also to participate in the next stage of upgrading — where customers are looking for higher-performance, safer and more sustainable products. This creates strong demand in areas such as advanced manufacturing, electrification, lightweighting, advanced connectivity and resource efficiency. It also encourages deeper local partnerships and faster innovation close to customers.

MA: We are encouraged by China's continued efforts to expand domestic demand and advance high-standard opening-up. These measures strengthen consumer confidence, improve the investment environment and create new opportunities for multinational companies to innovate and grow in one of the world's most dynamic consumer markets. One of the biggest opportunities lies in the ongoing evolution of consumer demand. As consumers increasingly seek health, wellness, outdoor and lifestyle experiences, companies have greater opportunities to develop innovative products and deepen consumer engagement. At VF, we are responding by strengthening our local capabilities and translating consumer insights into products, retail concepts and brand experiences tailored to the Chinese market.

JIANG: From our perspective, a dynamic domestic market encourages companies to innovate, while an open business environment enables companies to bring together global capabilities and local insights to better serve customers. In China, we continue to see consumers becoming more discerning. They are looking beyond price and placing greater value on quality, performance, design and user experience. This creates opportunities for companies that can innovate continuously and respond quickly to evolving needs. This is why "China for China" is important for Logitech. Our strategy is not just about selling in China; it is about innovating from China, for the Chinese market. We have established research and development centers in China, and have been increasing our focus on local innovation and R&D capabilities, product design, marketing and local teams, so that we can develop solutions that better reflect the needs, preferences and usage habits of Chinese users.

Q5 Looking ahead to the second half of the year, what will you be watching most closely as indicators of China's economic resilience, reform progress and long-term growth potential?

ZHU: From scaling artificial intelligence to hyper-automation in a factory, from fast-moving consumer dynamics to expansion in global markets, the real opportunity and benefit come from transformative, end-to-end approaches for a company, and for a country as well. By combining the power of technology, people, organization and ecosystem, the nation will be better positioned to become more people-led and innovation-driven, building resilience as well as embracing new growth. We observe that, when being gauged from key dimensions from commercial, operations and technology to people, Chinese companies have already prioritized and put more efforts into being more adaptive, agile and intelligent. At the same time, China is at a critical stage of translating the early impact of short-term efficiencies to sustained value, and we should also be mindful of some barriers like the gaps in perceptions and visions along the technology-led transformation, lack of organizational readiness, localization pressure in overseas markets, and how to harness people's experiences in work and in life.

CHEN: In the second half, I will watch a few practical indicators. First, I will look at the pace of industrial upgrading — especially in high-end manufacturing and technology-driven sectors — because that is a strong signal of long-term competitiveness and productivity growth. Second, I will watch how domestic demand evolves, including whether consumption continues to recover and whether companies see stable confidence to invest and expand. Third, I will pay close attention to progress on innovation policies and talent development, because "new quality productive forces" depend on strong research and development capabilities and effective industry-academia collaboration. Finally, I will watch how the green transition progresses — such as energy efficiency, renewable energy adoption and clearer carbon management practices — because sustainability is increasingly a core requirement across global value chains.

MA: Looking ahead to the second half, we will be watching indicators that reflect consumer confidence, consumption growth and the continued expansion of experience-led sectors such as sports, outdoor recreation, tourism and culture. These trends provide important signals of China's economic resilience and long-term growth potential. We will also pay close attention to how continued reform, innovation and opening-up create new opportunities for businesses and consumers. In particular, the growth of the event economy, sports participation and cultural tourism will be important indicators of evolving consumer preferences and demand for active, experience-led lifestyles.

JIANG: Looking ahead to the second half, I will be watching more for the underlying signals that reflect the quality and sustainability of growth.

First is consumer confidence and how it translates into demand. For Logitech, it's not simply about whether people are buying more products, but whether they continue to invest in products that improve productivity, creativity and everyday experiences. Second, I will also pay attention to the continued development of digital culture, gaming and esports in China. Third is the pace at which new technologies — particularly AI — are being adopted in everyday life. China's strength has always been its ability to quickly turn innovation into real-world applications. Continued progress in this area will be an important indicator of future productivity and competitiveness.

Dialogue remains key to Sino-US ties

Forum: Search for mutual benefits essential despite growing competition, uncertainty

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

Chinese and American businesses operating in each other's markets remain deeply interconnected and can serve as a bridge for subnational dialogue, business leaders and policy experts said.

More than 100 business executives, policymakers and scholars gathered in New York for "The Path Forward 2026: Mutual Benefit, Uncovering New Opportunities for US-China Economic and Trade Relations", hosted by the China General Chamber of Commerce-USA and the CGCC Foundation on Thursday.

Participants discussed the future of bilateral economic ties and explored ways to strengthen cooperation between the world's two largest economies amid growing geopolitical uncertainty.

Susan Elliott, CEO of the National Committee on American Foreign Policy, emphasized that dialogue remains essential despite growing strategic competition between the two countries.

"Decoupling is neither realistic nor desirable," she said. "We must consider how to rebalance our economies in ways that support sustainable growth, resilience and long-term prosperity. These adjustments will not be simple, and they will require difficult conversations among all of us. A healthier and more sustainable economic relationship will ultimately benefit our countries and the broader international team."

Elliott emphasized that US-China economic and trade relations need stability and productivity today.

"Competition does not eliminate the need for communication, and disagreement should not prevent us from seeking areas of mutual benefit. The path forward requires patience, pragmatism and a willingness to keep talking," she said.

Chen Li, Chinese consul general in New York, said there remains significant potential for subnational cooperation and economic collaboration between China and the US.

"American companies value China's huge market and strong industrial support," he said.

"Meanwhile, Chinese companies, for their part, want to grow in the US market in a stable and predictable environment, while contributing to local communities and better serving local consumers."

Chen called for both sides to uphold the principle of mutual benefit, ensuring that cooperation delivers gains for all parties rather than being one-sided. He also urged both countries to listen to each other's concerns with sound judgment and to maintain the momentum of dialogue and practical cooperation.

"Going forward, China will continue to facilitate foreign companies' trade and investment in China, protect their legitimate rights and interests, and foster a first-class business environment. We hope American companies will seize these opportunities and achieve greater growth by riding the momentum of China's development," he added.

Chen said market demand in both countries continues to drive opportunities, while the underlying mutual benefits of China-US economic cooperation remain unchanged, leaving significant potential for future collaboration.

From a business perspective, participants emphasized that engagement at the state, city and personal levels also yields tangible benefits for local economies.

Steven Fulop, president of Partnership for NYC and former mayor of Jersey City, said Chinese international students have contributed to the city's growth over the years.

Students' demand for housing has supported local real estate development, while their day-to-day spending has benefited local businesses and the broader economy.

Glori Norwitt, Connecticut's envoy for international engagement at AdvanceCT, said there is significant room to deepen ties, noting that the state is home to about 80,000 Chinese people and nearly 2,000 Chinese-owned businesses, ranging from small enterprises to large corporations.

"We are building relationships, and we strongly encourage those relationships to continue and grow," she said.

Despite a cautious business outlook, Chinese companies in the US remained resilient, the latest CGCC Annual Business Survey found.

About one-third of respondents reported revenue growth in 2025, while 81 percent remained profitable. At the same time, 79 percent said they planned to reinvest profits in the US, the highest level recorded in the survey, underscoring their long-term commitment to the US.

Extreme heat makes life miserable in Indian town

BANDA, India — Heat at all hours, even in the middle of the night. Long stretches without electricity, meaning some homes can't even use basic fans. And a constant search for relief, like being hosed down with water or sleeping outside.

For many residents of Banda, a town in northern India that has recorded some of the country's highest temperatures, just getting through each day is a challenge.

> While Banda has always been known for hot summers, what is changing right now is the intensity, the duration and the number of people exposed to dangerous heat conditions."
>
> **Abhiyant Tiwari,** climate and health expert at NRDC India

Global warming, caused mostly by the burning of fuels like gas, oil and coal, is making heat waves across India more frequent and intense. Uttar Pradesh, the state Banda is in, is among those most vulnerable to extreme heat. In 2023, at least 119 people died over several days during a severe heat wave in parts of the state.

In May, temperatures reached 48.2 C, one of multiple times this year that the town recorded the country's highest temperature for the day. Banda was also the hottest spot on Earth seven times this year, most of them in April, according to climatologist and weather historian Maximiliano Herrera, who tracks global weather extremes. Since then, temperatures have dropped but they are still stifling, particularly as seasonal rains increase humidity.

Munni Devi and her four sons begin work loading and unloading vegetables when most of the town is asleep.

It's only 4 am, but the temperature is already 30 C. Workers at Banda's vegetable market are busy unloading tomatoes, jackfruit and other vegetables and transferring them to smaller vehicles for delivery to the neighborhood shops.

Devi, 70, says the heat is becoming more intense every year, and this year has been especially bad. The work is physically demanding in any weather. During a heat wave, it can be brutal. But Devi says she and her sons can't afford to miss a day.

"Everyone feels the heat, but because of our circumstances, we have to bear it," she says.

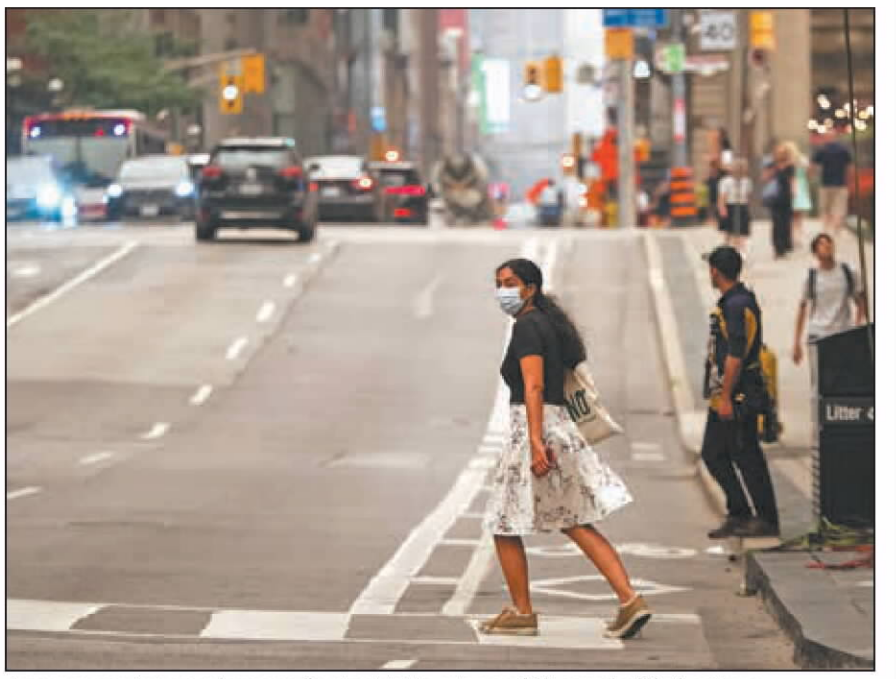
Hotter days have brought more patients to the hospital in Banda, one of the bigger medical centers in this region. Those with heat-related maladies, ranging from fainting to heatstroke, tend to come in the afternoon and evening, filling the corridors and wards.

Patients sit shoulder-to-shoulder on benches. Relatives fan family members with sheets of paper. Hospital staff move between beds carrying intravenous fluids.

Abhishek Pranayami, the hospital's head doctor, says the hospital sees a surge of patients every summer, "and the number of patients is increasing every year".

He says they are treating large numbers of people suffering from dehydration, diarrhea, vomiting and abdominal pain — illnesses that become more common as temperatures rise. Some patients recover within days. Others take longer.

The struggle for relief and rest has become a defining feature of summer in cities like Banda.



"Climate change is shifting the average," says Abhiyant Tiwari, a climate and health expert at New Delhi-based NRDC India. "While Banda has always been known for hot summers, what is changing right now is the intensity, the duration and the number of people exposed to dangerous heat conditions."

Amit Aasery, the district magistrate of Banda, says officials are studying groundwater levels, soil moisture and vegetation loss while working to improve water supplies and public awareness.

But he says there is only so much they can do. "What is happening here is a global phenomenon," he says. "It is because of climate change. We are the recipients of this."

French parliament approves assisted dying

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

The lower house of the French parliament, the National Assembly, has given its final approval to a bill that will create a legal right to assisted death for adults with incurable diseases, potentially bringing an end to years of debate over the issue.

The law was passed in the Assembly last year, only to be rejected by the upper house, the Senate, but under a constitutional clause, the government allowed the Assembly to have the final say without the need for Senate approval. This time the bill was passed by a margin of 291 votes to 241.

However, that does not mean that this is the end of the journey described by the legislation's author, Olivier Falorni, as being like "a marathon with hurdles".

Prime Minister Sebastien Lecornu will ask France's highest constitutional authority, the Constitutional Council, to take a closer look at the details of the legislation, as he expressed concern over the lack of a proper debate in the Assembly, saying that this meant the draft proposals fell short of "meeting both the aspirations of its proponents and the concerns of those worried about its implementation".

The legislation says that the patient must be in a "free and informed" manner to make the decision, and any fatal dose would have to be self-administered, or if the patient was not able to do so, helped by a health worker.

Unsurprisingly, the issue provokes strong feelings. Backers of the legislation say it would allow patients to put an end to suffering while maintaining control over their medical decisions, but opponents say seriously ill people could be put under pressure, and that palliative care options should be given priority.

Protesters attend a rally against euthanasia and assisted dying near the French National Assembly in Paris on Wednesday. DIMITAR DILKOFF / AFP

Psychological suffering alone would not be enough for someone to qualify for a medically assisted death, meaning people with mental illnesses or conditions such as Alzheimer's disease would not be eligible.

Health review

Patients seeking an assisted death would need to submit a request to be reviewed by healthcare professionals within 15 days, and there would then be a two-day reflection period after any approval was given.

Former health minister and trained pharmacist Agnes Firmin-Le Bodo, who drafted the 2024 version of the bill, said the law would be passed "because it is balanced", but Christophe Bentz of the far-right National Rally party called the text "very dangerous", with the risk of "abuses".

President Emmanuel Macron, who made a campaign promise in 2022 to allow a debate on the issue, said, "With seriousness, humility, and in full respect of our democracy, that commitment has been honored."

Should the legislation be given final approval, France would join Canada, Switzerland, the Netherlands and Belgium in legalizing assisted dying. Similar legislation will be discussed in the United Kingdom in the new parliamentary session in the fall.

Tech tie-ups between Beijing and Seoul urged

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

China and South Korea can leverage their complementary strengths in semiconductors and artificial intelligence technologies to advance cooperation and bolster Asian supply chains to create solutions that will benefit the world, investors and industry experts said.

With South Korea now pushing for a "three mega projects" initiative centered on semiconductors, physical AI and AI data centers, Hong Kong and Shenzhen-based Sparks Physical AI Ventures founding and managing partner Tony Chen and managing partner Jayesh Chhatlani, said they foresee more business opportunities for cooperation between firms and investors from China and South Korea.

For example, South Korea's strength in memory chips can be combined with China's strengths in commercialization and application to turn memory-as-a-service into a driver of wider adoption of AI, said Chen, adding that cooperation in agricultural and food tech, AI-enabled entertainment content, and industrial automation are also potential sectors for cooperation.

"By leveraging Chinese AI solutions and the market demand from South Korea when we co-create one solution together, it can be deployed to many other countries in Asia," said Chen, mentioning that he recently introduced a South Korean company to a Chinese robotics company to develop agricultural tech solutions not only for South Korea but also potentially for Indonesia.

In June, Chen traveled to South Korea to meet with investors and companies in the physical AI industry. During the meetings, Chen said he noticed growing interest among South Korean industry players in building partnerships with Chinese companies, especially in the physical AI sector, such as robot components and modules including sensors, motion control, and scalable hardware integration.

Some companies are also interested in learning from China's speed in AI commercialization, deployment, and smart devices, he said.

"China remains a very important market and a key cooperative partner for South Korea's semiconductor industry," Kim Seo-gyun, chief strategy officer at Sembricon Technologies and vice-president of the Korea-China Institute of Digital Economy, told China Daily.

Noting that China remains the world's largest manufacturing base for electronic products and the largest semiconductor consumption market, he said the demand from China for semiconductors continues steadily across diverse industries, presenting an important growth opportunity for South Korean companies.

South Korea's monthly exports topped $100 billion for the first time in June, up about 70 percent, according to data released by the country's Ministry of Trade, Industry and Resources.

The growth was mainly driven by semiconductor exports, which rose 200 percent. Notably, exports to China, which jumped 92 percent, marked eight consecutive months of growth, as shipments of semiconductors, the top export item, more than tripled.

As future competition in AI is about global supply chains and ecosystems, not just countries, Kim said South Korea and China are highly complementary in AI and semiconductors, and that both countries can benefit from the AI-driven innovation while navigating global supply chain competition by deepening joint research and development and forming strategic partnerships.

He said he believes that enhancing cooperation based on mutual trust and the perspective of "competitive cooperation" — where competition and collaboration coexist — will contribute positively to the sustained growth of both countries' industries and to the development of the global semiconductor ecosystem.

Noting there has been an asymmetry of information in South Korea regarding the diverse ecosystem of China's AI industry, Chen said he will bring Chinese robotics and AI companies to South Korean market players.

US, Iran ramp up regional threats as tensions deepen

As both sides widen targets of attacks, mediator Pakistan urges return to talks

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran and the United States traded blows for the sixth day with Tehran warning it would obliterate all remaining infrastructure in the region as Washington launched a new wave of strikes.

Kuwait, Bahrain and Jordan were among the countries that continued to thwart Iranian retaliatory attacks, with Jordanian air defenses saying they had downed at least eight missiles launched from Iran on Thursday.

The US Central Command, or CENTCOM, said it ended an evening wave of strikes against Iran at 9 pm Eastern Time on Wednesday.

"US forces struck Iranian command centers, air defense sites, missile and drone capabilities, and coastal surveillance facilities to further degrade Iran's ability to threaten innocent mariners crewing commercial vessels transiting the Strait of Hormuz. CENTCOM used precision munitions to hit targets in multiple locations, including Bandar Abbas," it said.

"Earlier this morning, American forces struck coastal defense and cruise missile sites on Greater Tunb Island during a 90-minute wave. The US military is holding Iran accountable at the Commander in Chief's direction," it added.

Iranian media reported that US forces struck multiple sites across Iran's southern provinces overnight and forced the emergency evacuation of a children's cancer hospital in Ahvaz, Khuzestan Province.

Earlier this week, US President Donald Trump threatened to expand his country's military strikes unless Iran returns to the negotiating table.

"Next week it gets really bad for them because next week comes the power plants," he said in an interview with Fox News. "We're gonna knock out all their power plants. We're going to knock out all their bridges unless they get to the table and negotiate."

Ebrahim Zolfaghari, spokesman for Iran's Khatam al-Anbiya Central Headquarters, warned of obliterating all remaining infrastructure in the region if Trump's threats are implemented.

The US continues its "lawlessness and destabilization" of the region, he said, emphasizing that under no circumstances would Tehran allow Washington, as a foreign and extra-regional power, to interfere in the Strait of Hormuz, calling it Iran's "unbreakable red line".

Iranian Foreign Ministry spokesman Esmaeil Baghaei said earlier that the country has no plans to return to talks with the US as long as Washington continues to violate its commitments under the Islamabad Memorandum of Understanding to which both agreed last month.

Less traffic

According to a Reuters report, fewer vessels traveled through the Strait of Hormuz on Wednesday, the first day after the US reinstated its naval blockade on Iranian ports.

Nine vessels crossed the strait that day, mostly on the Iranian route, down from 13 on Monday, according to data from shipping tracker Kpler.

Amid the blistering exchange of words and attacks between Washington and Tehran in the past few days, Iranian military spokesman Mohammad Akraminia claimed his country has no intention of confronting its neighbors, Al Jazeera reported.

"The armed forces regard the protection of the Iranian nation's security, interests and dignity as their foremost mission, and they will spare no effort in fulfilling that responsibility," he said.

Akraminia also urged countries outside the region to engage with Iran based on mutual respect.

Meanwhile, Pakistan said it will push the US and Iran to halt their attacks and resume talks under the memorandum of understanding it helped mediate.

Pakistani Foreign Ministry spokesman Tahir Andrabi told reporters on Thursday that while the implementation of the MoU was facing challenges, Pakistan will continue to encourage all sides to end violence and resume technical-level talks.

Saving Gaza's cultural heritage, one artifact at a time

KHAN YOUNIS, Gaza Strip — Armed with paintbrushes and wearing surgical gloves, volunteers inside a large tent in Gaza delicately brushed dust from a stone mosaic before placing it into storage, part of an effort to preserve cultural heritage hit by conflict.

More than 160 historical and cultural sites across the Palestinian territory have been damaged during the Palestine-Israel conflict, according to the United Nations.

Many of these artifacts date back thousands of years.

"Several mosaic artworks have been lost or destroyed, either completely or partially," said Mohammed Abu Lahia, a Palestinian visual artist taking part in the preservation efforts in the southern Gaza city of Khan Younis.

"It is important that we work to revive this art, remind our children and our community, and send a message to the world that we are committed to our heritage and our Palestinian cause."

Beyond archaeological treasures, more recent cultural artifacts are also at risk of being damaged or buried beneath rubble from shelling and airstrikes.

More than 90 percent of Gaza's buildings have been damaged or destroyed during the conflict, according to the UN.

Staff members of the Mayasem Association for Culture and Arts repair and scientifically restore artifacts in a tent in Khan Younis, southern Gaza Strip, on July 11. BASHAR TALEB / AFP

Over the centuries, Persians, Greeks, Romans, Byzantines and Ottomans all left their mark on Gaza, creating a rich historical landscape of churches, mosques, ports and artifacts, many of which have suffered damage during the conflict.

"This stone is a piece called a mortar, and it was used for grinding grains and herbs," said Muhannad Abu Lahia, a cultural heritage guide with the Mayasem Association for Culture and Arts, the NGO leading the preservation efforts. "It is approximately 5,000 years old."

Behind him, artifacts already cataloged for safekeeping were stacked on wooden shelves inside weatherproof plastic containers.

With Israel maintaining tight controls over goods entering the Gaza Strip, volunteers have had to work without professional conservation equipment.

Instead, they gently removed dust from mosaics using ordinary paintbrushes and built a makeshift scanning station by mounting a camera above a box lined with black craft paper.

The improvised scanner allowed volunteers to digitize old photographs and paper documents, which were then uploaded to a computer for preservation.

Not everything entering storage is ancient.

Many items date from the 20th century, including the League of Nations-established British Mandate (1920-48). Their owners sought to save them from destruction or loss after being displaced.

"This is a paper archive containing maps of Khan Younis and structural maps of the Khan Younis area from the time of the British Mandate," said 29-year-old volunteer Taghreed Hajjari.

At one table, three women painstakingly rearranged hundreds of fragments to recreate a contemporary mosaic, using a printed copy of the original artwork as a guide and trimming excess stone with carpenter's pincers.

Many artifacts, however, remain beyond the "Yellow Line", which separates territory under Hamas control from areas held by the Israeli forces. Volunteers say retrieving artifacts from Israeli-controlled areas remains extremely difficult.

Trade uncertainty clouds supply chain planning

By RENA LI in Los Angeles
renali@chinadailyusa.com

Businesses need greater policy stability and predictability for long-term investment and supply chain planning, but continued shifts in US trade policy are fueling uncertainty, says Douglas Irwin, a professor of economics at Dartmouth College in New Hampshire.

Irwin made the comments on Wednesday at a media briefing with Port of Los Angeles Executive Director Gene Seroka, discussing tariffs, global commerce and the changing trade landscape.

Responding to a question from China Daily about continuing United States-China dialogue and tariff adjustments, Irwin said policy predictability is essential for businesses considering long-term investments.

"Businesses absolutely need that predictability of the business environment to make medium-term and long-term investments," he said.

Trade tensions between China and the US intensified after Washington imposed sweeping tariffs last year. Although both sides have since taken steps to ease tensions and continue dialogue, uncertainty over future trade policy remains.

Irwin described the current US-China trade relationship as relatively stable but fragile.

"We're now stabilized, but we're in sort of this uneasy truce," he said. "In terms of restoring US-China trade, I think it's going to be difficult, precisely because we don't have assurance that that truce will hold."

Companies do not know whether the US will maintain current tariff levels or renew pressure on China after completing other trade negotiations, including the review of the US-Mexico-Canada Agreement, he added.

"We just don't know, and that's going to be a deterrent to reinvesting in China or relying on China for imported goods, as opposed to going to Vietnam or another Southeast Asian country, or maybe even more locally, Mexico, for long-term sourcing," Irwin said.

Businesses therefore have little choice but to diversify their supply chains and hedge against further policy changes, he said.

The US Trade Representative has proposed new Section 301 duties linked to other economies' enforcement of prohibitions on goods made with forced labor. Proposed rates range from 10 percent to 12.5 percent, though the measures were still under review at the time of the briefing.

Irwin said importers should pay close attention to what replaces the temporary Section 122 tariffs when they expire next week.

"Those tariffs are going to roll off," Irwin said of the Section 122 measures, adding that the administration is seeking to replace parts of the temporary system through Section 301.

He said the proposed measures could preserve much of the current tariff structure while creating additional uncertainty over which countries and goods would ultimately be affected.

"This is sort of the environment we're going to be in for the next two years: uncertainty about USMCA, uncertainty about the China relationship, and then uncertainty with these Section 301 tariffs," he said.

The treatment of low-value shipments is also changing. The US has suspended duty-free treatment for many packages valued at $800 or less and introduced new processing requirements.

Irwin said the changes will create greater compliance and administrative burdens for small importers accustomed to receiving low-value shipments by mail with limited customs procedures.

Seroka of the Port of Los Angeles said the effects would extend beyond consumers purchasing products online to family-owned businesses that rely on imported goods.

He recalled visiting retailers in California that had built their businesses around smaller shipments.

"Then suddenly they were hit with tax hikes that were almost insurmountable based on the size of their business," he said. "It's going to be a big deal for us coming up."

Looking beyond the current administration, Irwin said future US presidents may seek greater stability in trade policy, but are unlikely to restore the system that existed before the tariff increases of recent years.

"What tends to go up quickly sometimes comes down slowly," he said.

Gentle giant under care

DPRK

Chinese representative attends treaty event

China's top political adviser Wang Huning and Pak Thae-song, premier of the Cabinet of the Democratic People's Republic of Korea, delivered speeches in Pyongyang on Thursday at a reception commemorating the 65th anniversary of the signing of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance. Wang, chairman of the National Committee of the Chinese People's Political Consultative Conference, said that over the past 65 years, the two sides have upheld the spirit of the treaty, supported each other, stood united, cooperated closely and worked together, vividly demonstrating the defining features of China-DPRK ties — friendship passed down from generation to generation, a shared future and mutual support. Pak said that since its signing 65 years ago, the treaty has made important contributions to vigorously advancing DPRK-China relations and the development of the socialist cause in both countries, as well as to safeguarding peace, stability and security in Northeast Asia.

ALGERIA

11 killed, 19 injured in orphanage fire

Eleven people, including children, were killed and 19 injured in a fire at an orphanage close to the Algerian capital Algiers early on Thursday, authorities said. Locals and emergency crews rushed to the building in the Mohammadia District in the province of Algiers, where blackened masonry was visible above two window openings behind the exterior gates. Ten of the injured suffered burns of varying severity, and emergency crews evacuated five people with disabilities from the orphanage to safety, the civil protection agency said. It gave no details about the victims or the possible cause of the fire.

AMERICA FOCUS

US companies turn to Chinese AI models

As prices rise in US, mainland chips provide more value for money, experts say

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

US companies are increasingly turning to Chinese-built artificial intelligence models for better value for money, as token prices for the most advanced American models continue to climb this year.

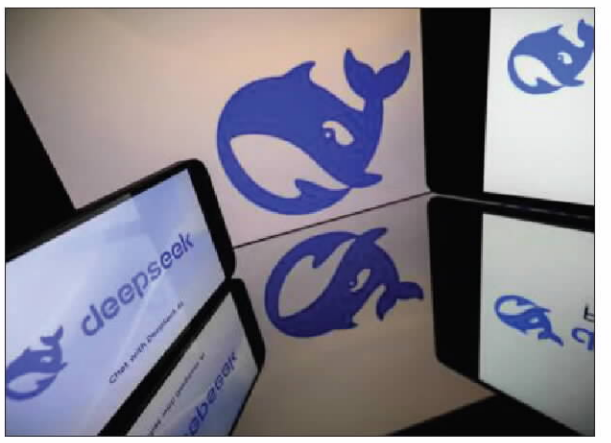
Recent releases from Chinese companies, including DeepSeek and Z.ai, are seen by many in the industry as highly competitive with leading frontier systems from Anthropic and OpenAI, narrowing the performance gap while remaining significantly cheaper to use.

Models such as Z.ai's GLM and Alibaba's Qwen have become attractive options, offering a combination of performance and cost. Z.ai's GLM-5.2, released in June, narrowly trailed leading US models on public benchmarks and ranked high on several leaderboards while costing dramatically less than comparable closed US frontier models.

OpenRouter, a platform that lets developers access a range of AI models, found Chinese AI model usage by US companies has risen significantly this year. The share of tokens used by US companies on Chinese AI models has sat above 30 percent every week since Feb 8, at times rising as high as 46 percent, CNBC reported, citing the platform's figures. That compares with an average of just 11 percent over the previous 12 months, and a mere 4.5 percent in the first half of 2025.

In June, the AI startup Lindy moved 100 percent of its traffic from Anthropic's Claude models to DeepSeek. "We did it, and you could see that cost curve go down, like, crash to the ground," Lindy CEO Flo Crivello told CNBC, adding that the move would save the company millions of dollars within months.

"Cost has to be part of the equation, but it's common in technology that cost per unit changes dramatically with time and volume. That was true of semiconductors, electronics and pretty much everything else," Ker Gibbs, former president of the American Chamber of Commerce in Shanghai, told China Daily.



"The first semiconductor coming out of a fab was enormously expensive to make, but once the fixed costs were absorbed every other chip was not expensive at all. What is new is the speed and scale at which the price differential has emerged in AI," said Gibbs, who teaches at the University of San Francisco and is the author of *The Fragile Dragon*.

He noted that the savings coming out of Chinese models are rooted less in fixed-cost recovery than in architectural efficiency, though the underlying logic is the same one that Chinese firms have applied across other industries.

"China's business people, as I write about in *The Fragile Dragon*, are pragmatic. They build products that are not just good – they are good enough. That means they don't overbuild or overdesign. Cost is always a factor," he said. "This is a familiar playbook applied to a new domain: achieve near-parity on performance, undercut dramatically on price, capture volume and let the market do the rest."

Rising costs

The Ramp AI Index, which tracks how American businesses use AI, found that the companies most committed to the technology are spending around $7,500 per employee every month on it. The index also found that DeepSeek is one of the fastest-growing vendors on Ramp's platform, which is evidence, the firm said, that companies are increasingly opting for cheaper AI models.

This photograph shows screens displaying the logo of DeepSeek, a Chinese artificial intelligence company that develops open-source large language models, in Toulouse, southwestern France on Jan 29, 2025. LIONEL BONAVENTURE / AFP

> "People need to understand that China is now a source of new ideas and innovations."
>
> **Andy Fang,** DoorDash Co-founder and Chief Technology Officer

Palo Alto Networks CEO Nikesh Arora told CNBC that token costs need to drop by as much as 20 percent over the next 12 months and 90 percent by the following year, to enable large-scale AI adoption. Rising token costs have become a major pain point for businesses and a strain on AI budgets, he said, with current pricing making the tools increasingly difficult to implement.

Asked why companies are paying more attention to the cost of AI models now, Gibbs said, "In short, the check arrived. The bills companies are paying for AI usage have come due and (they) suddenly realize what they have been paying," he said. "In some sense we're reaching the end of the beginning, which could be characterized as a bit of irrational exuberance and unrealistic expectations about the results AI would deliver."

In the earliest days of the boom, he said, companies raced to deploy AI as fast as possible simply because competitors might be doing the same. "The costs didn't matter, and the CFO was left out of the room. The fear of getting left behind was stronger than any concerns about costs," he said. "Now that the bills are due, questions are being asked about the results and how to measure them."

Per-token prices have actually fallen, he noted, but usage has climbed even faster and gone largely unrestrained. The productivity gains are real in specific applications such as fraud detection, coding, customer service and supply chain optimization, Gibbs said, but they can be difficult to measure and are far from uniform across the board.

Chinese efficiency

As companies look to deploy AI to build new products and find internal efficiencies, engineers are increasingly experimenting with cheaper open-source and open-weight models, the most capable of which are now made by Chinese companies.

Open-source and open-weight models make different parts of a system available for developers to inspect, use and sometimes modify, in contrast to closed proprietary systems such as those from OpenAI, Anthropic and Google.

The performance of Chinese models has been rising in step with their growing popularity. Stanford's 2026 AI Index report found that the performance gap between US and Chinese AI models has effectively closed, with the two sides trading the lead multiple times since early 2025, starting when DeepSeek released its R1 model, which matched the top US model at the time.

The cost advantage is showing up in how companies allocate work between models. DoorDash Co-founder and Chief Technology Officer Andy Fang said in a post on the social media platform X on July 6 that the company was saving significant money by routing "lower-level work" to Kimi, a model built by the Chinese startup Moonshot AI.

For enterprise customers, Gibbs said, the rational response is the hybrid model — use a cheaper tool for the heavy lifting and more routine tasks, saving budget for the more expensive tools when they are required.

"People need to understand that China is now a source of new ideas and innovations, whether it's in pharma, automotive or artificial intelligence," he said.

"It's not an accident that you can walk across the Google campus in Silicon Valley and hear Chinese spoken as well as English and many other languages. Ideas don't have borders."

That does not mean the calculation is purely technical, he cautioned.

"Businesses need to be aware of the geopolitical implications as they build out their tech infrastructure," Gibbs said.

"The US and China are in a very tense period, and while we hope a better path forward can be found for cooperation and peaceful coexistence, we're not there yet."

The 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance is being held in Shanghai from July 17 to 20. CHEN YUYU / FOR CHINA DAILY

Calls grow for controls amid rapid AI advances

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

More than 200 technology experts and economists have signed a statement warning that AI could rapidly reshape the global economy, urging policymakers to take its disruptive potential more seriously.

Released on Monday, the statement aims to prompt economists and policymakers to better prepare for AI-driven economic upheaval, said Erik Brynjolfsson, a senior fellow at the Stanford Institute for Human-Centered AI who helped organize the initiative.

"There's been a notable change in the profession," he said. "I still see a big gap there, a big mismatch, and I'm worried that we're not going to be ready for the tsunami that's coming."

Along with many other economists, Brynjolfsson believes AI will ultimately boost living standards, much as the Industrial Revolution and computing did. However, he warned that AI's impact is likely to unfold much faster, potentially causing sharper economic disruption.

The statement makes three points. First, AI may become radically more powerful over the next 10 years.

Second, its impact on the economy could exceed that of the Industrial Revolution while unfolding over a far shorter period, bringing both risks, including large-scale job displacement, as well as opportunities, such as major gains in living standards.

Third, economists, policymakers and technology leaders must act now to "build the incentives, guardrails and institutions needed to ensure AI complements humans and benefits society".

> I'm worried that we're not going to be ready for the tsunami that's coming."
>
> **Erik Brynjolfsson,** senior fellow at Stanford Institute for Human-Centered AI

The signatories include more than a dozen Nobel laureates, the chief economists of OpenAI and Anthropic, Anthropic cofounder Jack Clark, and former Google CEO Eric Schmidt.

"If you look at what robots did in the manufacturing sector, if AI does something equivalent in a more compressed time period, that would be really disruptive, really costly for people's livelihoods," said Daron Acemoglu, an economist at the Massachusetts Institute of Technology who won the 2024 Nobel Prize in economics.

Digital marketing and recruitment services company Clickvision, citing multiple studies, said AI could displace 85 million to 92 million jobs globally by 2030 while creating 97 million to 170 million new ones.

It estimated that AI could automate at least part of 30 percent of jobs in the United States by 2030, while 60 percent would undergo "significant task-level changes". It said that 11.7 percent of US jobs could already be automated today and that 14 percent of the global workforce may be forced to change careers by 2030.

Market intelligence and research platform DataRefs said the industries most vulnerable to AI include manufacturing, customer service, transportation and retail. It also identified interpreters, translators and historians as facing a high risk of dislocation because tools such as ChatGPT, DeepL and Google Translate can perform many of their tasks.

Younger workers and advanced economies that have already integrated technology will be more highly affected, it said.

"Steam, electricity and computers each gave societies decades to adapt; AI may give us only a few years," Anton Korinek, a professor at the University of Virginia, said in a statement.

"We cannot improvise our strategy and institutions in the middle of the transformation; waiting for certainty means arriving too late," he said.

AI pioneer Yoshua Bengio, a professor at the University of Montreal who also signed the statement, said it is "highly plausible that AI will drastically transform our economies" based on the technology's current trajectory.

"We must be intentional and make collective, democratic choices, rather than letting market forces play out and risking leaving most citizens behind," he wrote in a separate statement.

Fantasy event attuned to ACGN trends

Yuyuan's 52-day-long summer extravaganza brings four popular Chinese animated series and the characters to their fans, **Wang Xin** reports.

Eicher-Tia Jhaj, an 18-year-old from London, was completely caught by surprise on her first trip to China recently, where she came across the animated characters she loves at a pop-up at Shanghai's shopping district at Yuyuan Garden, an iconic city landmark.

Her favorite character, Cheng Xiaoshi, from the Chinese animated series *Link Click*, appeared throughout Yuyuan on July 3, when the 52-day 2026 Grand Yuyuan Summer Fantasy Night opened, offering immersive experiences, particularly for fans of ACGN (animation, comics, games, and novels).

Running through Aug 23 and spanning from Yuyuan Garden to the nearby Bund Finance Center, the event integrates massive ACGN elements featuring four popular original Chinese animations: *The Legend of Luo Xiaohei*, *Heaven Official's Blessing*, *A Record of a Mortal's Journey to Immortality,* and *Link Click*.

Widely known for its ancient buildings and traditional vibes, Yuyuan has been transformed into a unique universe that blurs the boundaries between old and new, tradition and modernity, and spans fashion, generations and cultures.

In collaboration with the video-sharing platform Bilibili, installations featuring the main characters from the four animated hits are scattered across malls. Visitors are invited to engage in real-time augmented-reality interactions using their mobile phones.

With dazzling lights illuminating the night, a special concert was held at Yuyuan's Central Plaza on July 3 to mark the fantasy's opening. Pop singers Huang Ling and Li Xinyi, pop/folk singer Qian Runyu, young rappers, and virtual idol Aza took the stage to present the opening, ending and interlude songs for the four productions, breaking down the walls between ACGN and the real world with immersive sounds.

While enjoying the feast with other fans who share the same love and passion for the productions, Jhaj was also deeply impressed by the dancing, the performers' traditional outfits, and the tea and authentic local foods. That night, she felt more connected with Chinese culture.

"I'm really excited for the new season of *Link Click* to come out. I started watching it about a year ago, and I've been really into it. The character designs and their personalities are really cool, and I like the artistic style a lot.

"It's quite interesting to learn about different cultures. I also play some Chinese games, and Chinese culture is so different from Western culture. I think it's important to see different cultures and get to learn about other perspectives and traditions," she says.

Launched last year, the Grand Yuyuan Summer Fantasy Night has expanded in scale and offers richer experiences this edition. A number of traditional restaurants, stores and time-honored brands in the malls are participating in the event, offering collaborative set menus, customized dishes and pastries, special discounts, and merchandise related to the animation IPs.

Across the malls, visitors will encounter staff members dressed as non-playable characters from games to deliver unique greetings, with additional highlights, such as cosplay parades, stamp collecting, markets, and intangible cultural heritage experiences, expected throughout the event.

"Young ACGN fans have shown great potential in consumption power. During last year's event, we saw visitor numbers increase by 30 percent compared to the same time period in previous years, which greatly benefited the stores and brands in the malls," says Wang Peng, chief communications officer at Grand Yuyuan, the event's organizer.

He adds that Yuyuan hopes to draw more young visitors and establish long-term strategic collaboration with Bilibili. By combining the phenomenal ACGN culture with the traditional Chinese aesthetics of Yuyuan, Wang expects the landmark could also serve as a natural backdrop for more animation productions and help more young people discover the charm of Chinese culture.

Above: Foreign visitors take a group photo at Yuyuan with the event's staff, who are specially dressed up as non-playable characters (NPCs) in games. **Below:** Time-honored brand Huxinting Teahouse at Yuyuan collaborates with Chinese animation hit *A Record of a Mortal's Journey to Immortality* to offer special tea menus and fan gifts. PHOTOS PROVIDED TO AND BY GAO ERQIANG / CHINA DAILY

Lyu Bo Lang, one of the most well-known and celebrated restaurants in Shanghai, is participating in the event again this year. Teaming up with the animation *Heaven Official's Blessing*, it offers fans a special *hudie su* (butterfly pastry) box set — a local interpretation of the Palmier, a French confection. The box set also includes a *Heaven Official's Blessing*-themed card case.

"The butterfly is an iconic element in animation, and thus a perfect match with our *hudie su* in terms of the shape. As a time-honored brand, we may seem old-fashioned to young people. But such collaborations proved to be successful last year, as many young visitors initially seeking the special sets eventually became our customers," says Wang Shijia, deputy general manager of the restaurant.

Another time-honored brand, Huxinting Teahouse, chooses to work with the animation *A Record of a Mortal's Journey to Immortality*. Built in 1784 and becoming a teahouse in 1855, this traditional building matches fans' imaginations of the protagonist's small shop in the story. During the event, the teahouse serves two special tea-tasting menus and offers fans gifts such as badges and coasters (cup mats), according to Su Deliang, the teahouse's manager.

Enthusiastic ACGN fans of all ages are now flocking to Yuyuan for the extravaganza. Wu Anqi, a 14-year-old middle school student studying in Shanghai, arrived at Yuyuan early with her friends on the event's first day to collect stamps and limited-edition gifts of her favorite characters, while 12-year-old primary school student Wang Xinran came at night with her parents, heading excitedly to the restaurant collaborating with *Link Click* to check out the special menu.

Sharing the same love for ACGN culture, 25-year-old Fang Lan from Chengdu, Sichuan province, is a postgraduate student in Shanghai who has been engaged in ACGN culture and its community for over 10 years. She tells China Daily: "It has always brought me passion and power, positively leading my personal growth. Many of my peers might have stress, but I feel the ACGN world keeps me refreshed and more motivated."

"Every era has its own rhythm, which is usually represented by young people. Today, they are attuned to the latest trends, passionate about ACGN culture, and appreciate innovative expressions of Chinese culture. Behind all this, I see their growing confidence in our cultures," says Wang Peng from Grand Yuyuan.

Science and art converge for mental health 'prescription'

By **HE QI**
heqi@chinadaily.com.cn

PHOTOS PROVIDED TO CHINA DAILY

A cellist performs amid lush botanical displays at the Shanghai Natural History Museum's Window of Nature zone as the first group of participants sits in quiet meditation. Absorbed by the soothing melodies, Shanghai's first "museum prescription" program officially launched, delivering drug-free immersive mental healing through science and cultural venues.

A joint initiative by the Shanghai Science and Technology Museum (SSTM) and the Shanghai Mental Health Center (SMHC), the program is the city's first social psychological support project pairing a popular science venue with a specialized mental health institution, marking the second round of in-depth cross-sector collaboration between the two sides. The very first prescription was issued at the launch ceremony on June 15.

Unlike clinical drug prescriptions, the "museum prescription" is a professionally assessed, non-clinical healing guideline, also classified as a social prescription.

It is distributed through two channels: medical institutions across the city's mental health service network, where doctors prescribe it to eligible patients following an evaluation; and community-level public service centers, where trained volunteers connect residents in need with relevant resources. Prescription holders enjoy free-of-charge admission to designated venues and access to exclusive healing activities.

"We create low-threshold scenarios to integrate mental health services into daily life, so people do not come under the pressure of 'seeking medical treatment'," says Qiao Ying, chief physician at SMHC.

The program tailors differentiated healing content using resources from three SSTM venues — the main SSTM site presents horse whisperer soundscape therapy based on its *Galloping Wonders* special equine exhibition; the Shanghai Natural History Museum runs the weaving melodies of nature alongside its *Only Tree Knows* exhibition; and the Shanghai Astronomy Museum hosts starry sky healing concerts.

"We prioritize spaces where science and art converge, and design problem-oriented activities for specific groups," says Song Xian, director of SSTM's science communication center. "These are not simple extensions of permanent exhibitions, but exclusive immersive designs focused on emotional relief."

The first batch of prescriptions prioritizes socially isolated older adults suffering from cognitive decline and high-stress working professionals.

"Many people do not regard loneliness as a health risk, but it actually raises the natural mortality rate among the elderly by 22 percent, inflicting more health damage than obesity, diabetes or heart disease," Qiao notes.

She explains that multisensory healing experiences balance activity in the prefrontal cortex and amygdala, helping people activate inner psychological energy and promote positive mind-body integration.

To ensure professional delivery, the program has recruited its first cohort of museum-healing mentors, comprising licensed psychotherapists and senior museum educators. They will receive systematic training in mental health expertise and therapeutic activity designed to bridge medical services and cultural resources.

"Museums are not only temples of knowledge, but also harbors for the soul," says Zhong Qian, deputy curator of SSTM, expressing hope that the healing power of nature and science would reach more people through the program.

Lu Baorong, a professor at Fudan University, adds scientific backing: "Natural specimens in museums carry inherent aesthetic order. Immersive aesthetic experiences guide people to relax, stay focused on the present, and deliver unique healing value."

Around 450 free-of-charge healing prescriptions will be available in the initial pilot phase, valid through the end of August.

Going forward, the two sides plan to explore integrating the "museum prescription" into the city's public health service system and to launch a Shanghai Museum Healing Alliance to bring more art galleries and cultural venues on board and expand mental health support coverage.

"Mental health services should not be confined to clinics," says Xiao Junjie, Party secretary of SMHC. "Museums build low-threshold, stigma-free social support scenarios, truly integrating healing into daily life."

CULTURE

A new generation enters the storm

Veteran actor Yang Lixin directs a revival of a landmark drama, encouraging young actors to find fresh interpretations of Cao Yu's enduring masterpiece, **Chen Nan** reports.

For the past 15 years, actor Yang Lixin has lived with one of Chinese theater's most formidable characters: Zhou Puyuan, the wealthy industrialist and stern patriarch at the center of *Thunderstorm*, Chinese playwright Cao Yu's landmark modern drama.

This summer, however, the 69-year-old actor returns to the play not as its leading actor but as its director, entrusted with guiding a new generation of performers in one of the Beijing People's Art Theatre's most treasured productions.

"It's never possible to prepare enough for this play," Yang says as the theater unveils its latest revival of *Thunderstorm*, which will open at the Capital Theatre on Aug 5 with shows running until Aug 21.

For Yang, the assignment is both deeply personal and artistically significant. Over decades, he has worked alongside nearly every generation of actors who helped define the theater's interpretation of *Thunderstorm*. Now, he finds himself passing that tradition forward.

His mission echoes the words of playwright Cao Yu himself. In his 1979 book, *Cao Yu on Thunderstorm*, the dramatist wrote: "A script is a living thing. As long as it continues to be performed and retains its vitality, it can continue to be re-created."

Often regarded as the father of modern Chinese drama, Cao Yu became director of the Beijing People's Art Theatre when it was founded in 1952. Two years later, the company premiered *Thunderstorm* under the direction of Xia Chun and Cao Yu's supervision, establishing what would become one of the theater's defining productions.

Written in 1934 when Cao Yu was just 24, *Thunderstorm* remains one of the most influential works in modern Chinese drama. Set over a single day in 1925, the play unfolds inside the home of the wealthy Zhou family, where long-buried secrets, forbidden love and class conflict erupt into devastating tragedy. Its psychological depth, explosive dramatic structure and sharp social critique have captivated audiences for generations.

Since its 1954 premiere, the Beijing People's Art Theatre production has been revived in 1979, 1989, 2004 and 2020, accumulating more than 600 performances over seven decades.

Each revival has introduced the classic to new audiences while serving as a training ground for successive generations of actors, directors and designers.

"*Thunderstorm* is one of the cornerstones of the Beijing People's Art Theatre," says Feng Yuanzheng, veteran actor, director and the theater's president. "Its literary value and artistic spirit deserve to be passed on."

The latest production is part of the theater's initiative, "Classic Repertoire Restoration Program", launched in 2025 to ensure landmark productions remain living works rather than museum pieces. The first production under the initiative, *Returning Home on a Snowy Night*, premiered in May 2025. Originally written in 1942 by playwright Wu Zuguang (1917-2003), the play was first performed by the theater in 1957. In July 2025, the theater restaged one of its most iconic productions, *Rickshaw Boy*, which also premiered in 1957, and was adapted from the beloved novel of the same name by Lao She (1899-1966).

Faithful to tradition, the revival of *Thunderstorm* preserves the original 1954 set and costume designs, allowing audiences to step into the dimly lit Zhou family mansion much as theatergoers did decades ago. Yet, behind that historical continuity lies months of fresh research.

PHOTOS BY ZOU HONG / CHINA DAILY

Preparation began early this year. Yang organized workshops introducing the cast members to Cao Yu's writings, archival materials and recordings of previous productions. The goal, he emphasizes, was never imitation.

"The greatest asset of any stage production lies in the script," Yang says. "Actors should use their imagination, but they should never invent what the playwright did not write."

To deepen the theater's understanding of the play's historical setting, the creative team consulted drama scholars and experts on China's labor movement. They revisited decades of criticism on *Thunderstorm* and immersed themselves in the social realities of the 1920s.

Research also took them beyond the rehearsal room.

Yang and actor Liu Hui traveled to Harbin, Heilongjiang province, to visit a bridge mentioned by the character Lu Dahai in the play, a seemingly small detail that Yang believes enriches an actor's understanding, regardless of Cao Yu's original intention.

The theater also visited Wuxi, Jiangsu province, to learn about the city's early industrial development and prominent family businesses, and toured the Cao Yu Memorial Museum in Tianjin.

"These experiences stay with the actors, quietly taking root in their minds, enriching their imagination and lending greater depth to their performances," Yang says.

Historical authenticity extended into rehearsals. Actors frequently arrived wearing cloth shoes, long gowns and *qipao* (traditional long dresses) so that everyday movements — walking, sitting or simply crossing the stage — would gradually become second nature within the world of the play.

For Yang, every detail ultimately serves one purpose: revealing the emotional truth already embedded in Cao Yu's writing.

The production also represents another passing of the torch.

Liu Hui takes over the pivotal role of Zhou Puyuan, joined by Liu Wenyi as Fanyi, Gong Yuquan as Zhou Ping and Huang Wei as Lu Shiping. Together, they inherit characters shaped by generations of legendary performers while seeking interpretations that speak to contemporary audiences.

"Every actor at the Beijing People's Art Theatre knows the history of *Thunderstorm*, so stepping into Zhou Puyuan naturally comes with pressure. But director Yang encouraged us to return to Cao Yu's script and discover the character for ourselves. That gave me the confidence to find my own interpretation," says Liu Hui.

"Through our research and discussions, I began to understand the social constraints and emotional isolation she (Fanyi) lived with. That changed the way I approached every scene. I hope audiences will see not only her intensity, but also her vulnerability," says actress Liu Wenyi.

"The moment the makeup was finished and I put on the *qipao*, my posture changed without me thinking about it," Liu Wenyi adds. "The clothes affected how I walked, how I sat and even how I spoke. They helped me understand Fanyi's elegance and restraint."

Building bridges out of broken pottery

NANCHANG — Inside the Jingdezhen Imperial Kiln Institute, rows upon rows of gray metal cabinets house thousands of transparent drawers filled with ancient ceramic shards. Together, they form what the institute describes as the world's first ancient ceramic "gene bank" — a database that stores the "DNA" of broken pottery.

Jingdezhen city in East China, known as the "porcelain capital", has produced ceramics for over 1,700 years. Beneath the city's famed masterpieces lie layers of broken fragments several meters thick — flawed imperial ceramics and damaged folk products. To date, nearly 20 million shards have been unearthed from the city's deep archaeological deposits.

The Jingdezhen Imperial Kiln Institute, together with Tsinghua University, the Shanghai Institute of Ceramics under the Chinese Academy of Sciences, and other partners, has built a ceramic "gene bank" to collect data points from the shards.

The bank offers a standardized physical sample library and a unified data framework to support international authentication and academic research. Its data encompasses shape, decoration, body material, glaze, color, firing marks and inscriptions.

One million records

To become a "genetic" sample, each shard is first cleaned and cut into four physical forms — fragments, cross-sections, thin slices and powder. Scanning electron microscopy is used to examine these prepared samples.

Extracting a gene means identifying key characteristics, explains Tong Yuting, a staff member at the Jingdezhen Imperial Kiln Institute. "For blue and white porcelain, we don't just look at the perfectly colored pieces. We also collect shards with paler tones, deeper shades, or even rust spots, as all of these variations are considered feature points."

By gathering this full spectrum of color variations, researchers build a complete "color chart" for blue-and-white wares. Analyzing these variations enables researchers to reverse-engineer the cobalt pigment composition, formula ratios, and firing techniques of ancient craftsmen, making each shard a window into historical production methods.

The database now holds over 1 million genetic records from 12,000 specimens across 3,000 sets, supported by a standardized system for sample processing, management and preservation. This establishes a benchmark system for dating and authentication.

Maria Mayer, curator at the Medeiros e Almeida Museum in Portugal, is studying a group of blue-and-white porcelain pieces fired in the Ming Dynasty (1368-1644) bearing Portuguese coats of arms. "The gene bank offers a scientific and systematic foundation for classifying ceramic materials, which will help me uncover the cultural exchange history behind this collection," she says.

Xin Wenyuan, a researcher at the British Museum, notes that many overseas collections have traditionally been dated and classified solely by style. "The archaeological sequence and technical data from the imperial kiln site give us a more reliable basis for comparison," she says. With the gene bank, Western ceramic studies can move from "appreciating finished products" to analyzing materials, technology and production systems.

Xin adds that Jingdezhen's gene bank lets researchers observe different stages of production, including glaze composition, trimming methods, firing temperature control and even disposal.

"I noticed a branch-and-flower pattern on a blue-and-white sauce-glazed bowl fragment that closely resembles pieces in our collection and those from the 19th-century Desaru shipwreck. It's like a matching game, one decoration connects the whole chain — production, transport, consumption, and museum collection."

The data also helps with restoration. Researchers recently reassembled two large dragon-decorated vats made in the Ming Dynasty from 16,000 fragments — a task once thought impossible. AI algorithms processed each shard's genetic data to predict correct assembly paths, bringing the relics back to life.

Global collaboration

The gene bank has also established a collaborative, standardized framework that advances global ceramic scholarship.

"In English, ceramics are divided into earthenware, stoneware, and porcelain," says Li Baoping, honorary researcher at Oxford University. "In Chinese, there are only two categories: *tao* (pottery) and *ci* (porcelain)." This difference has long caused confusion in cross-border research.

China is now addressing that gap. Based on the gene bank, the Jingdezhen Imperial Kiln Institute is drafting the ISO TC349 standard for scientific characterization of ancient ceramics — a proposal already submitted and under ballot at the International Organization for Standardization.

"Standardized data will become a more internationally accepted research language," says Weng Yanjun, head of the Jingdezhen Imperial Kiln Institute. "It used to be hard to describe precisely what ruby glaze or cowpea red is. In the future, we can use exact values from the gene bank to describe and re-create them accurately."

International engagement is growing fast. In October 2023, the institute launched the Society of International Ceramic Studies, which has already held two academic conferences involving 89 institutions and over 200 scholars from 22 countries and regions. In December 2024, the SICS advisory committee was formed, bringing together renowned experts from China and around the world.

In June 2025, the English biannual Journal of International Ceramic Studies was launched, a dedicated English-language journal in this field, copublished by Elsevier Publishing Group and China Science Publishing and Media Ltd. Its first two issues feature 25 papers from 26 leading institutions across 14 countries and regions.

The institute is also building a World Ceramic Interactive Map, linking collections worldwide. By clicking any coordinate on the map, users will see local artifacts, their kiln sites, and global distribution routes — turning scattered archives into a connected story.

"Jingdezhen is uniquely placed, as it can serve as both a primary source of empirical data and a core hub for international cooperation," says Teresa Canepa, a member of the Council of the Oriental Ceramic Society in the United Kingdom. She is planning to integrate her decades of research on shipwreck ceramics into the map's backend system.

"When we pool all this data, and click somewhere in the Middle East or Europe and see links to the Jingdezhen kilns, the Forbidden City, Topkapi Palace or the Guimet Museum, people will be struck by the intertwined histories and memories that emerge," says Weng. The platform aims to gather over 10,000 data points and complete its framework by the end of 2026, with significant progress expected in the next three to five years.

Today, the map's rich cultural data is accessible to the public, inspiring ceramic enthusiasts around the world. These shards serve as storytellers that create a new bridge between modern science and ancient civilization.

2026 WORLD CUP

Lionel Messi celebrates with his teammates after Argentina won its World Cup semifinal against England in Atlanta Wednesday. **Inset:** Argentina's Enzo Fernandez celebrates scoring his side's first goal on Wednesday. AP

Messi delivers for Argentina again

As defending champion reaches consecutive finals

Lionel Messi delivered two crucial goal assists for his teammates, and, with one more win, he will be delivering another World Cup trophy to Argentina.

Messi didn't add to his tournament-leading goal tally, but the 39-year-old produced the final passes on two late strikes that carried La Albiceleste to another stunning comeback and a 2-1 victory over England in the semifinals in Atlanta on Wednesday.

"These are special feelings. I think the squad could feel it. This was a game the Argentine people really wanted to win, and so did we," Messi, 39, said after facing England for the first time in his career.

"This is still a special fixture."

He was not quite able to emulate Diego Maradona, who scored two iconic goals in Argentina's 1986 World Cup quarterfinal win over England.

But he will settle for the two assists, and he has already emulated his legendary predecessor by winning the trophy four years ago in Qatar.

Now, after Argentina maintained its incredible record of never having lost a World Cup semifinal, Messi will appear in a second straight final, and a third overall.

The South Americans are aiming to become the first team to retain the World Cup since Brazil did so in 1962, and Messi, the sole survivor from the side that lost to Germany in 2014, will become just the second player after Brazilian great Cafu to appear in three finals.

"It is crazy to be playing in back-to-back finals," he said.

Argentina had already staged a stunning late comeback to beat Egypt 3-2 in the same Atlanta stadium in the last 16, and it smelled blood as England sat deeper and deeper after going ahead.

"Once again we managed to do the job when things were looking bad. We never stopped believing," said Messi, who has now played a record 33 World Cup games across six different tournaments.

For long spells on Wednesday his influence was limited, but that has often been the way with Messi and he was still able to drag his team to victory.

"Leo is still performing at the highest level," England captain Harry Kane said. "I felt like for large parts of the game, we dealt with him really well. But, as always, with the most dangerous players in the world, when they have the ball in the final third, they can create something. And he did that again today. He's obviously one of the best players ever for a reason."

Lionel Messi consoles England's Harry Kane after their World Cup semifinal. AP

Another stellar moment

Eight days after an improbable rally against Egypt in the round of 16, Messi returned to Atlanta to produce another stellar moment in a career that might already be the best of anyone to play the sport.

After a 55th-minute goal from Anthony Gordon, England was surely envisioning lifting the World Cup trophy for the first time since its singular title six decades ago.

But Messi and his blue-clad teammates, as they have shown over and over again, are never done.

In the 85th minute, with England hanging on for dear life, Messi pushed out a short corner, immediately got the return pass and spotted Enzo Fernandez lurking in the middle of the field, 25 yards from the goal. Fernandez ripped a curling shot past goalkeeper Jordan Pickford to even the score.

At that point, it seemed inevitable that Argentina would pull out the victory.

And that's just what happened, with Messi again the orchestrator. Two minutes into stoppage time, he suddenly turned on the speed as he raced toward the goal line, gaining enough space to send a pinpoint cross into the area at the back post. The ball cleared six English players, setting up Lautaro Martinez to effortlessly head home the winning goal after slipping between two defenders.

It was a poignant moment for Martinez, all of it made possible by his captain.

"This is really powerful," he said in Spanish, fighting back tears. "The first time my father bought me a pair of soccer boots, I always dreamed of scoring this goal."

From there, it was just a matter of protecting the lead, which Argentina did easily.

When the final whistle blew, Messi dropped to his knees in the middle of the field, pumping his fists.

Messi played for years in the shadow of the late Maradona, the pride of Argentina who led the country to a World Cup title in 1986 that included two memorable scores — the "Hand of God" and the "Goal of the Century" — both in a quarterfinal win over England.

Now, it's Messi who has stamped his legacy with a triumph over one of Argentina's most bitter rivals.

"Seeing Messi playing football like this, at his age, it just leaves me speechless," said Matias Adorno, who turned out in Messi's No 10 jersey to celebrate with thousands or revelers in central Buenos Aires. "As Argentines, we've always put so much pressure on him. But he's achieved everything I could imagine."

Messi remains even with Kylian Mbappe of France in the race for the Golden Boot, with both stars having scored eight times.

But, courtesy of his two tiebreaking assists, he edges ahead of Mbappe for the award.

Mbappe has a chance to retake the lead in Saturday's third-place match against England.

Messi is also the all-time World Cup scoring leader with 21 goals.

What he really wants, though, is another title, and all that stands in his way is a determined and very hard-to-beat Spanish team.

AGENCIES

Goal hero Martinez 'dreamed' of scoring semifinal winner

Argentina's World Cup semifinal match-winner Lautaro Martinez said he had "dreamed" of scoring the goal which took his team through to the final at England's expense on Wednesday.

"I dreamed it. I told Alexis (Mac Allister) that I was going to score," Martinez said after his heroics off the bench in Atlanta sealed a 2-1 semifinal victory for the reigning champion over its bitter rival.

"And, I said on the bench to Facundo Medina that I was going to come on and score."

The defending champion was trailing 1-0 at the break, and was still behind when the Inter Milan striker was introduced in the 81st minute in place of left-back Nicolas Tagliafico.

Lionel Messi set up Enzo Fernandez to equalize in the 85th minute, and then, in the second minute of second-half stoppage time, the Argentina captain crossed for Martinez to head in the winner.

When he spoke again to reporters after leaving the dressing room, Martinez said he had just gotten off the phone with his mother, who was at work.

The 28-year-old Martinez lost his place in Lionel Scaloni's Argentina team early on its run to glory at the 2022 World Cup.

This time, however, he started all three group games, scoring in the 3-1 win over Jordan, but was substituted in the narrow victory over Cape Verde during the round of 32 and has not started since.

Nevertheless, he came off the bench to score in the 3-1 extra-time defeat of Switzerland in the quarterfinals, and, again, to play a decisive semifinal role against England.

"We are going to be coming up against a top-class side who has not lost in 38 games and has great players," said Martinez.

"Now, we need to get some rest, but also enjoy this, because what we are doing is not easy; getting back to the final as defending champion three and a half years after winning it."

Spain's last defeat was a 1-0 reverse in a friendly against Colombia in March 2024.

The only previous World Cup meeting between Spain and Argentina took place at the 1966 tournament in England, when the South Americans won 2-1 in a group-stage contest played at Birmingham's Villa Park.

AFP

England's going home, as familiar tale of woe unfolds

ATLANTA — Thomas Tuchel was appointed in a blaze of publicity, stating his aim was to add a second star to the England shirt with another World Cup win.

After years of heartache and near-misses, Tuchel was viewed as the missing piece of the puzzle, the coach who could finally end the Three Lions' decades-long wait for a major title.

Predecessor Gareth Southgate had led a talented generation of England players to two Euro finals, and a World Cup quarterfinal and semifinal.

But each of those campaigns ended in disappointment, with a recurring theme of Southgate being accused of failing to adapt his tactics quickly enough to changing circumstances within games.

Under the tactically astute Tuchel, who had memorably outfoxed Pep Guardiola's Manchester City to lead Chelsea to the Champions League title in 2021, things, England fans were promised, would be different.

Yet, against Argentina in the World Cup semifinal on Wednesday, England bowed out of the tournament in painfully familiar fashion — failing to capitalize on a 1-0 lead before inviting pressure, surrendering the initiative and losing 2-1.

It was the third time since the 2018 World Cup that England has lost a major championship semifinal or final after taking the lead.

All three defeats, including Wednesday's at Atlanta's Mercedes-Benz Stadium, followed the same template — a solid start, going 1-0 up, a desperate rearguard action, and finally, capitulation.

Many critics and former players immediately pointed the finger at Tuchel for England's latest failure, accusing the German of switching to an ultra-defensive approach too early in the game, after Anthony Gordon had put England ahead on 55 minutes.

Argentina spent the final stages of the game camped near the England area, bombarding its opponent's goal, and finally winning with strikes from Enzo Fernandez on 85 minutes and Lautaro Martinez in stoppage time.

England coach Thomas Tuchel talks tactics with Jude Bellingham during their semifinal match against Argentina on Wednesday. AP

'Deserved to get beaten'

Former England striker Michael Owen said the defeat was a missed opportunity, sharply criticizing Tuchel's second-half changes.

"We are a better team than Argentina, I've no doubt in my mind," he wrote on X.

"But we deserved to get beaten in the end. In fact, it could have been 4-1.

"Bringing on three defenders at 1-0 up. What message does that send? Until we understand that courage and bravery is controlling possession under pressure and not booting (or) heading it 40 yards up the field, then this will always be the end result."

Former England goalkeeper Joe Hart agreed. "I think Gareth Southgate will be at home watching this game," the BBC pundit said.

"He took a lot of criticism when it came to the big moments with England, when they had the lead, about shutting up shop, but I don't think anything has changed in that big moment out there."

While Tuchel accepted responsibility for the defeat, he pushed back on suggestions that his second-half substitutions were to blame.

The England coach, who started his job at the beginning of 2025, said the tide had turned before his tactical tweaks, as Argentina grew more desperate and chased the game.

Asked if he believed he had got his tactics wrong, he replied: "No, I believe that's just the nature of the game.

"As soon as you lose, you get criticized. It's just what it is. No one knows what would have happened if we had made different decisions.

"So, it makes no sense to engage in that and lose my head. I'm responsible for them. I took them, so I take the criticism."

England captain Harry Kane said the team had "just tried to hang on a little too early".

But he refused to point the finger at Tuchel's game management after another opportunity slipped away.

"There's always going to be talk now about trying to blame people or coaches," Kane said. "It's not the time for that. We win and lose together.

"We've done everything. He'd have been called a genius if it had worked. In the end, it didn't work for many different reasons.

"That's what we need to try and improve. We're close, we're knocking on the door, but as always in these final moments, we need to find that missing piece of the puzzle."

MODERNIZATION FOR ALL

China-CEEC cooperation opening doors

Nation's modernization drive also delivers tangible, inclusive benefits to other countries

By JI HAISHENG in Beijing and **LIU KUN** in Wuhan

In 2008, as the global financial crisis unfolded, Greece became one of the worst-affected countries. Piraeus Port, the largest seaport in the country, reported a loss of 13 million euros ($15 million), with outdated facilities, scarce vessel calls and frequent dockworker strikes dragging its operations into a deep crisis.

During this challenging period, when investors worldwide shunned Greece as too risky, a Chinese company stepped forward. China COSCO Shipping secured a concession to operate two of Piraeus' container terminals. Eight years later, in 2016, COSCO acquired a majority stake in the port, officially taking over its management and operations.

By bringing in expertise, investment and machinery, the Chinese company successfully breathed new life into the port. Far from replacing local staff, it created thousands of jobs for Greeks. Today, after years of restructuring, Piraeus stands as one of the busiest ports in the Mediterranean.

Charalampos Aravantinos-Simonetos, a youth coordinator for international and European affairs in Greece's Syriza party, shared the story of solidarity and cooperation with a roomful of young political leaders from China and Central and Eastern European countries, or CEECs, in June during a forum held in Wuhan, Hubei province.

The Chinese approach, he said, stands in stark contrast to those countries that invest solely for their own benefit and show little concern for local communities. The project has helped strengthen bilateral ties and allowed both sides to benefit through cooperation, he added.

According to Piraeus' financial report, the port achieved record total revenue of 251 million euros in 2025, up 8.6 percent year-on-year.

The turnaround of Piraeus Port, far from an isolated story, is a microcosm of the cooperation synergy between China and Central and Eastern European countries under the China-CEEC Cooperation mechanism.

Launched in 2012, the mechanism is a trans-regional platform jointly initiated by both sides. Over the past 14 years, the parties have remained committed to the principles of equality, mutual benefit in cooperation, openness and inclusiveness against the backdrop of a fluid international landscape.

Today, it has grown into a full-fledged mechanism, with deepening cooperation and a series of outcomes delivering tangible benefits to various parties.

In Croatia, the Chinese-built Peljesac Bridge has reduced a three-hour detour to just a few minutes' drive. In Serbia, Chinese investment has revived a century-old steel plant from the brink of closure. In Skopje, the capital of North Macedonia, thousands of citizens commute every day on buses manufactured by Chinese company Yutong Bus.

SPIDER-MAN DRAWS DINERS INTO SHANGHAI'S CULINARY WEB

Tom Holland and Zendaya turn sesame noodles into a global hit

By HE QI in Shanghai
heqi@chinadaily.com.cn

In downtown Shanghai, Wei Xiang Zhai — a tiny, 37-square-meter bistro with just 11 tables — is packed with customers every single day. What draws crowds huddled shoulder to shoulder is a $2 bowl of noodles tossed in sesame paste.

China Vibes — FOOD —

The nearly century-old restaurant recently found itself in the global spotlight thanks to Tom Holland and Zendaya. During their three-day trip to Shanghai in late July to promote their new movie *Spider-Man: Brand New Day*, the Hollywood couple visited the small restaurant twice for its signature sesame paste noodles and highly praised the dish in interviews. Dubbed "Spider-Man noodles", the dish quickly went viral, and the waiting lines now feature a growing number of foreigners.

"We get about 50 to 60 orders from foreign visitors a day — well up from just a few years ago," said Xue Mei, shift manager at Wei Xiang Zhai on Yandang Road in Huangpu district, who has watched the shop's foreign clientele build steadily rather than explode overnight.

Sesame paste noodles at the Wei Xiang Zhai restaurant in Shanghai. PROVIDED TO CHINA DAILY

"An American food blogger with millions of followers came to film once, and after that we saw a surge in foreign tourists," Xue said. "Then, when visa-free entry opened up for the Republic of Korea, visitors from there followed suit. It's been a gradual climb."

Xi congratulates Singapore on republic's anniversary

By ZHAO JIA
zhaojia@chinadaily.com.cn

President Xi Jinping sent a congratulatory message to Singaporean President Tharman Shanmugaratnam on Sunday on the 61st anniversary of the founding of the Republic of Singapore.

Xi said that over the past 61 years, Singapore has made remarkable achievements in its economic and social development.

Noting that China and Singapore are friendly close neighbors, Xi said that he attaches great importance to the development of China-Singapore relations. Xi also said he is ready to work with Shanmugaratnam to enhance strategic communication and guide the China-Singapore all-around high-quality future-oriented partnership to new heights, in order to better benefit the two peoples.

China and Singapore have seen frequent high-level exchanges in recent years. Xi and Shanmugaratnam exchanged congratulatory messages on the 35th anniversary of diplomatic ties in October last year, followed by Premier Li Qiang's official visit to the Southeast Asian country in the same month. Singaporean Prime Minister Lawrence Wong attended the Boao Forum for Asia Annual Conference in Hainan province in March.

According to China's Foreign Ministry, Singapore was China's fifth-largest trading partner among members of the Association of Southeast Asian Nations in 2025, with bilateral trade reaching $119.25 billion, up 7.5 percent year-on-year.

Tourism boom

Unitree IPO puts investor focus on AI

By ZHOU LANXU
zhoulanxv@chinadaily.com.cn

Investors are showing a strong appetite for Unitree Robotics' initial public offering, reflecting growing optimism about China's ambition to turn its industrial chain strengths into commercially viable artificial intelligence applications, market experts and investment banks said.

Though still at an early stage of commercialization, China's embodied intelligence industry is gaining momentum in scaling up applications, creating a distinctive opportunity set for global investors, they said.

The IPO of Unitree on Shanghai's STAR Market — the first A-share listing of a major producer of humanoid robots — has entered the subscription stage, with buoyant demand helping lift its issue price and fundraising size.

Its issuing announcement showed that it had priced its IPO at 150.80 yuan ($22.35) per share, with expected proceeds amounting to 6.099 billion yuan, higher than the 4.202 billion yuan estimated in its earlier IPO filing at an implied price of about 104 yuan per share.

Its IPO price represents a price-to-earnings ratio of 219.23 times, far surpassing the industry average of 38.56 times and giving it a market capitalization of about 60.99 billion yuan.

The offering attracted a group of strategic investors, including the National Council for Social Security Fund, DeepSeek, as well as investment arms or affiliates of China National Petroleum Corp, China Southern Power Grid, China Telecom, Tencent and CITIC Securities.

Notably, the social security fund has become Unitree's largest strategic investor, subscribing to 933,402 shares, or 2.31 percent of the offering, for around 141 million yuan.

Retail investors have also shown enthusiasm ahead of Unitree's online subscriptions that open on Monday, with posts wishing for successful allocations piling up on financial information platform Eastmoney's online stock forum for the company.

Yang Shuning, executive director and partner at Wenzhi Capital, a Beijing-based private equity company, said the keen demand and high valuation reflect investors' optimism about Unitree's commercialization prospects and its positioning in the embodied intelligence sector.

"Given the scarcity premium enjoyed by leading players in tech sectors and the multibillion-dollar valuations seen among overseas humanoid peers, Unitree's valuation is not without justification," he said.

But Yang cautioned that Unitree's valuation is less about current earnings than about investors pricing in its future profitability. "If Unitree falls behind in scaling up commercialization, revenue growth weakens or investors start using a different valuation yardstick, valuations would come under pressure."

Commercial promise

Wang Xingxing, Unitree's founder and chairman, said on Friday that the company's pure humanoid robot shipments exceeded 5,500 units in 2025, the highest in the world.

Unitree's rise has come as China's humanoid robotics sector takes the lead worldwide in terms of shipments, with its commercialization prospects becoming more visible.

Citing exhibition examples at the World Artificial Intelligence Conference in Shanghai, UBS said in a report that humanoid robots are "increasingly being evaluated as production tools rather than exhibition assets".

Commercialization should first scale in structured business-to-business scenarios such as factories, logistics and smart pharmacies, while consumer use cases remain a longer-term prospect, the report said.

Zhao Liang, a partner at Unique Capital, an investment institution focused on AI innovation, said that humanoid robots may integrate with specific application scenarios on a large scale in the next few years.

"Given China's advantages in industrial supply chains and talent, the country's embodied intelligence industry chain may bring a surprise to the world," Zhao said.

Unitree's listing, which took only 104 days to go from the application acceptance stage to registration approval, is expected to further boost financing, investment and development of China's embodied intelligence sector, experts said.

Besides Unitree, another major Chinese humanoid manufacturer, AGIBOT, is seeking an IPO in Hong Kong. According to UBS, China's embodied AI sector saw a wave of IPO filings and strong primary market financing this year, with first-half funding going above 34.5 billion yuan.

With a buoyant listing pipeline, China's embodied intelligence industry could offer global investors a distinct exposure to the next phase of AI development where physical-world applications become increasingly important, experts added.

Goldman Sachs said in a report that while the US and North Asian tech companies hold a dominant position in sectors such as semiconductor and AI models, China's AI opportunity set seems better populated in power, infrastructure and physical AI.

WORLD WATCH
By Massoud Amin

Girding the grid for a hotter world

On Aug 2 the South Korean city of Yangsan hit 42.5 degrees Celsius — the highest temperature in 122 years of record-keeping. Seoul received its first-ever severe heat wave warning. More than 20 people have died, most of them over 80.

On Aug 4, President Lee Jae-myung called the heat wave a national disaster. Then he gave an order that tells you everything about the modern world: inspect the power system.

He was right to. In a heat wave, the grid is the difference between discomfort and catastrophe. Air conditioning, hospital cooling, refrigerated medicine, water pumping — all of it hangs on wires most people never think about until the lights go out.

Europe is counting its heat dead again this summer. Record electricity demand is being set across the Northern Hemisphere. Behind every one of those headlines sits a question ordinary readers understand before they finish reading it: can the grid withstand a hotter world?

I have spent my career on that question. In January 1998, at the Electric Power Research Institute in California, I created and led a research program built on an unusual premise that the power grid could learn to heal itself. We called it the Complex Interactive Networks/Systems Initiative — 108 professors at 28 universities, 52 utilities and the US Department of Defense. Out of that work came the concept, and the name, of the smart grid: a network with sensors for nerves, computation for reflexes and the ability to isolate damage before it spreads.

Here is what heat does to that network, in plain terms. Demand surges as millions of air conditioners switch on at once. At the same moment, the grid itself weakens. Transmission lines sag and carry less power. Transformers run hot and age faster.

Power plants lose efficiency in warm air and warm cooling water. The system is asked to do the most precisely when it can do the least. A smart grid exists for this moment — to see the stress building, shift the load and keep the most important circuits alive.

Twenty-eight years after those whiteboard sketches in Palo Alto, the largest laboratory for these ideas is on the other side of the Pacific. China crossed 10,000 terawatt-hours of electricity consumption in 2025 — the first nation ever to do so.

Turning 'destroyers' into eco 'guardians'

Guangxi courts make offenders work to restore damaged environments

By **CAO YIN** in Guangxi
caoyin@chinadaily.com.cn

The 60-year-old defendant, surnamed Xu, stood in a district courtroom on the morning of July 22 with his head bowed, ready to receive his punishment.

He had been caught by coast guard officers last year using electrofishing gear during the closed fishing season, which runs annually from May 1 to Aug 16 in the Beibu Gulf waters off South China's Guangxi Zhuang autonomous region.

After standing trial, the Gangkou District People's Court in Fangchenggang found Xu guilty of illegal fishing.

But instead of imposing a fine for ecological damage, it meted out an alternative punishment — 75 days of marine debris cleanup, eight hours per day. The ruling took into account his financial difficulties and a recent injury that required recovery time.

The designated cleanup site is along the shoreline near his home, making it easier for him to carry out the work while also allowing community members to supervise his efforts.

"I'm grateful the court considered my physical and financial difficulties and allowed me to atone through labor," Xu said after the ruling announcement.

"I've learned a profound lesson and will take marine conservation seriously, using my actions to make up for my mistakes."

His case reflects a broader shift in how courts across Guangxi are addressing environmental protection.

While punishment remains crucial, local judges are increasingly focusing on restoration and education, helping transform "destroyers" into "guardians". This approach aligns with China's forthcoming Ecological and Environmental Code, which takes effect on Aug 15 and actively encourages such alternative restoration methods.

Zero tolerance

Guangxi borders Vietnam and boasts some of China's best air and water quality.

It ranks among the nation's top three provincial-level regions for biodiversity and forest coverage and is home to extensive mangrove forests that form a critical part of the Beibu Gulf ecological barrier. These mangroves not only support marine life but also protect coastlines from storms and absorb significant amounts of carbon dioxide.

Across the region, the law has served as a powerful tool for environmental protection.

From 2023 to 2025, Guangxi courts handled over 30,000 first-instance environmental and resource cases and concluded more than 28,200 of them. Among those concluded were 7,601 criminal cases covering offenses such as environmental pollution and ecological destruction. At the same time, key areas including the Lijiang River Basin and mangrove wetlands were protected along with a variety of bird species.

Between 2020 and 2024, the region's courts concluded 13 criminal cases involving mangrove destruction, sending a strong deterrent to would-be offenders.

Deng Hong, vice-president of the Fangchenggang Intermediate People's Court, likened mangroves to a "cradle" and "sanctuary" for marine life including fish, crabs, and shrimp. "These green intertidal zones are home to countless marine species, playing an irreplaceable role in wind and wave protection, coastline stabilization, and carbon sequestration," she said.

Fangchenggang has more than 2,016 hectares of mangroves, accounting for 21.4 percent of Guangxi's total.

In recent years, courts across the city have severely punished offenders who damage or threaten the mangrove wetland ecosystem. For example, from January 2025 to June 2026 Gangkou district court concluded 303 environmental and resource cases spanning civil, criminal, administrative, and public interest litigation, cracking down on illegal sea occupation, mangrove destruction, illegal fishing and other violations. These cases demonstrate the judiciary's approach to safeguarding the marine environment from multiple angles.

"While illegal fishing appears to harm fish stocks, it actually damages the entire marine environment and the habitat for mangroves — it destroys a complete ecosystem," Deng added.

Labor substitution

Beyond punishing offenders, environmental and ecological restoration is the bigger challenge.

Mangroves are seen in Gangkou district of Fangchenggang, Guangxi Zhuang autonomous region. LIANG JIAJU / FOR CHINA DAILY

The Gangkou District People's Court in Fangchenggang holds a public trial to hear a case of illegal fishing on July 22. PROVIDED TO CHINA DAILY

Traditional marine ecological restoration often relies on releasing juvenile fish into the sea to enhance stocks. But the costs are high and not every offender can afford it, said Tan Bangyi, who heads the criminal division at the Gangkou district court.

He pointed to Xu's case as a typical judicial practice of using "labor substitution" in lieu of cash compensation. This approach is particularly valuable when offenders are unable to pay recompense, as it ensures that some form of restoration still takes place, Tan said.

"Xu's illegal fishing directly harmed the coastal ecosystem. By locating his labor site near the affected waters and close to his home, we made it easier for him to carry out regular shoreline cleanups and marine conservation work," he said.

The court has always adhered to the principle of prioritizing ecology and making the polluter pay, Tan said.

"This move avoids situations where judgments cannot be enforced while also compelling offenders to confront the damage they caused, achieving an educational effect," he added. "It also helps the destroyers develop a personal connection to the environment they harmed."

Huang Xiaoning, presiding judge of the criminal division at the people's court in Ningming county, Chongzuo city, said substituting payment of compensation with labor reflects a balanced approach to criminal justice.

It serves as an alternative form of compensation in environmental public interest litigation, typically applied when offenders have damaged the environment but cannot afford to pay compensation.

In July 2024, the Ningming court applied labor substitution for the first time. The case dated back to June 2022, when an individual surnamed Ning sold 14 endangered turtles that he had purchased illegally from a scenic area via WeChat. He was caught the following month.

The court found him guilty of illegally purchasing and selling nationally protected rare and endangered wild animals, sentencing him to six months in prison, a 5,000 yuan ($685) fine, and payment of 45,000 yuan in ecological compensation.

Given his financial circumstances, the court allowed him to serve 173 days of community service, which included patrolling the Huashan conservation area and joining environmental education efforts, instead of paying ecological compensation.

"Turning the criminal from an 'ecological destroyer' into a 'guardian of Huashan' not only serves the principle of 'who damages, pays' in environmental public interest litigation but also replaces a simple punitive approach," Huang said.

She added that community service helps offenders like Ning enhance their legal and environmental awareness through river cleanups, mountain patrols, and wildlife protection activities. "It serves both punitive and educational purposes," she said.

Guangxi is charting a new path in environmental judicial protection, with in situ restoration of a site as the principle and offsite alternative restoration as a supplement. This approach integrates restorative justice into broader social governance.

By 2025, the region's courts had established 15 environmental judicial protection and restoration bases, creating dedicated spaces for rehabilitation and public education.

"In the past, we focused more on imposing damages payments. Now we have more options — labor substitution, technology upgrades in lieu of penalties, and carbon credit purchases," Deng, from Fangchenggang court, said.

"These diversified alternative restoration methods are exactly what the forthcoming Ecological and Environmental Code encourages."

Improving governance

Adopted on March 12 by the National People's Congress, China's top legislature, the code is the country's second one after the Civil Code. Its enactment represents a landmark in the country's environmental protection and low-carbon development efforts.

The code comprises five sections and 1,242 articles and establishes six fundamental principles: prevention first, systemic governance, ecological priority, green development, public participation, and polluter pays.

For grassroots judges, the changes are tangible and profound.

Li Jiangang, a judge's assistant at the Dongxing People's Court in Guangxi, completed a five-day training session on the code organized by the Supreme People's Court, China's top court, in July. "I had been awaiting the code since learning of its legislative plan, as it will be a guidebook for my work," he said.

Li said the legal liability section is what he's most focused on, as it provides a tool kit for handling cases.

"It specifies how to coordinate administrative penalties with criminal prosecution and how to determine ecological damage compensation standards. It directly affects the judgment of every case," he said.

Feng Jianhua, a colleague of Li's on the environmental adjudication team, once handled a case involving the trafficking of 166 endangered lesser whistling ducks. Twenty-one of them died during transport.

The defendant was held criminally liable and ordered to pay ecological compensation.

"Previously, environmental laws and regulations were scattered across many different documents, which sometimes led to inconsistent application," Feng said. "The upcoming code weaves these rules into a single framework, making legal application more consistent and reducing inconsistent judgments for similar cases."

Rather than simply compiling more than 30 existing laws or creating an entirely new legal framework, the code integrates, revises, and elevates the country's existing ecological and environmental legal institutions, mechanisms, rules and standards.

Feng said this represents a shift in judicial philosophy.

The code organizes environmental laws into a coherent system and advances adjudication from protecting individual resources — such as a single species or a specific forest — to protecting entire ecosystems and their functions.

"This marks a significant upgrade in how we think about environmental protection," Feng said.

Deng said courts across Fangchenggang have already organized training sessions to ensure proper application of the code. The innovative practices explored earlier — labor substitution and experts assisting as judges' aides — align well with the code's principles, she said.

"In the Xu case, for example, the marine debris cleanup and community supervision reflect the principles of 'polluter pays' and 'public participation' that the code advocates. These are not just abstract concepts — they are concrete measures that have already been tested in real cases," she said.

With implementation of the code underway, Guangxi's courts are prioritizing ecological restoration and extending judicial protection both upstream — coordinating with law enforcement agencies and prosecutors — and downstream, toward ecological recovery and long-term monitoring.

From harsh penalties for damaging mangrove coastlines to diversified ecological restoration approaches in offshore waters, a distinctive path for environmental judicial protection is emerging in Guangxi.

The region's courts are not simply applying national laws mechanically; they are taking into account local conditions, unique ecosystems, economic circumstances and community needs.

TOP NEWS

Electricity: Heat, AI land on the same wires

From page 1

State Grid Corporation of China invested a record 650 billion yuan ($96.33 billion) last year.

The new five-year plan calls for more than 5 trillion yuan of grid investment through 2030, including 15 new ultra-high-voltage corridors carrying wind and solar power from the western deserts to the eastern coast.

The United States and Europe are taking a slower, market-driven path. The strain shows. The International Energy Agency counts more than 2,500 gigawatts of projects stalled in grid-connection queues worldwide. Global grid investment runs about $400 billion a year; the IEA says it must grow by half again by 2030 just to keep pace.

Generation has raced ahead. The wires have not.

And the heat is only the first wave. The second is already arriving: artificial intelligence. Data centers consumed roughly 485 terawatt-hours globally in 2025 and are on track to approach 950 by 2030. Electricity demand from AI-focused facilities alone grew 50 percent last year. The two pressures now land on the same wires, in the same summers.

Three great experiments are running at once. China is testing whether centralized planning can build transmission fast enough to carry a renewable buildout of unprecedented scale. The US is testing whether markets can reprice reliability quickly enough to serve an AI boom nobody scheduled. Europe is testing whether interconnected national grids can hold together under stress — a question made vivid by the April 2025 Iberian blackout, when an overvoltage-driven cascade darkened two countries in minutes.

Each experiment will teach the others. None can afford to fail alone.

What should we do? The engineering answers are known and unglamorous. Build transmission before it is needed, not after. Put sensing and automated protection deep into distribution networks, where most outages begin. Treat demand flexibility — the ability of data centers, factories and buildings to shift their load — as a resource equal to any power plant. Train the workforce; the IEA warns that people and supply chains, not technology, are the tightest constraints. And share what we learn across borders, because heat ignores them, and electrons obey physics, not politics.

It also means remembering what a grid is for. A grid is not a market abstraction or a policy instrument. It is the quiet machine beneath every hospital ventilator, every water pump, every fan turning in an elderly person's room in Yangsan or Yeongdeungpo in South Korea. When engineers argue about transmission capacity and reserve margins, the real subject is whether ordinary people can trust the wall socket.

Repair is a decision. I trust it because I have watched it happen, in power systems and elsewhere: the deliberate, unheroic choice to strengthen what holds rather than argue about what failed.

Laozi (Lao Tzu) wrote: "Do the difficult things while they are easy, and do the great things while they are small." The grid taught me the same lesson in a different language. The time to strengthen the foundation is before the weight arrives.

This summer, the weight arrived.

The author is a professor emeritus at the University of Minnesota and a Fellow of IEEE and ASME. In 1998, at the Electric Power Research Institute, he created, funded and led the research consortium that developed the smart, self-healing grid. He is widely recognized as the "father of the smart grid". The views do not necessarily reflect those of China Daily.

Enjoying victory

KSG team members hold aloft the trophy after winning the grand final of the *Honor of Kings* game during the Esports World Cup, in Paris, France, on Saturday. Chinese teams AG.AL and KSG vied for the top slot in the *Honor of Kings* final. Japan urged to uphold nuclear principles

By **HOU JUNJIE** in Nagasaki, Japan
houjunjie@chinadaily.com.cn

Inside
Editorial, **page 6**

Nagasaki marked the 81st anniversary of the atomic bombing by the United States with a memorial ceremony at the city's Peace Park on Sunday, as people from across Japan renewed calls for the government to uphold its Three Non-Nuclear Principles and face up to its history of wartime aggression.

A moment of silence was observed at 11:02 am, marking the time of the bombing. Japanese Prime Minister Sanae Takaichi then delivered a speech, reiterating that Japan "is upholding" the Three Non-Nuclear Principles, days after a similar address in Hiroshima.

She also said that Japan would uphold its pledge to make Nagasaki the last place to suffer an atomic bombing and fulfill its mission as the only country to have suffered atomic bombings in war.

However, unlike her predecessors — who largely vowed at atomic bombing memorial ceremonies in recent years that Japan would continue to uphold the three principles, Takaichi simply outlined the government's current stance, stopping short of offering any firm pledge about the future.

Brief heckling was heard from the crowd before Takaichi delivered her speech. Her ambiguous stance has drawn strong reactions in Japan.

Hakuzan Atsuhito, a local government employee in Yokosuka, south of Tokyo, traveled to Nagasaki and questioned Takaichi's claim that her government is upholding the Three Non-Nuclear Principles.

He said that the ongoing moves in Japan to revise the pacifist Constitution and the country's three key security documents are dangerous and risk leading the country in the wrong direction.

Since December last year, the Nagasaki and Hiroshima prefectural assemblies and the Hiroshima city assembly have unanimously called for the Three Non-Nuclear Principles to be upheld. By mid-July, 82 local assemblies across 25 prefectures had made similar calls or sought to enshrine the principles in law, according to Japanese news agency Kyodo News.

A broader trend in Japan of avoiding facing up to its history of wartime aggression is raising deep concerns.

Nagasaki Mayor Shiro Suzuki noted in his speech at the memorial ceremony that the atomic bomb was dropped on the city by a US military aircraft, but did not mention Japan's wartime aggression in explaining the historical context of the bombing.

Tashiro, who declined to give her full name, traveled from Saitama Prefecture with her fourth-grade daughter to attend the memorial ceremony. She told China Daily that her daughter had learned little at school about Japan's wartime history or even about the atomic bombing.

Tashiro, whose husband is Swedish, said that her family has found that history is taught differently across countries. "History education in Japan is often presented mainly from Japan's own perspective, focusing more on the Japanese side of the story," she said.

She hopes her daughter can learn about history more broadly, including perspectives from other countries.

Kumiko Haba, distinguished professor at Josai International University in Tokyo, told China Daily that the changes in government education policy have played a major role in shaping how younger generations in Japan view the country's wartime past.

"Schools have focused on Japan's suffering during the war, while barely teaching young people about the suffering Japan inflicted on other countries," she said.

On July 28, the Nagasaki Atomic Bomb Museum confirmed a proposed change in its revamped exhibition, referring to the Nanjing Massacre as the "Nanjing Incident".

The wording will be finalized by the end of August, with the revamped exhibition scheduled for completion in March 2027.

The planned change has sparked controversy. In late June, a Nagasaki civic group petitioned the city to retain Nanjing Massacre, arguing that "Nanjing Incident" fails to convey the brutality of what happened and could downplay Japan's wartime aggression.

British newspaper The Times has also reported on the change, citing the museum's planned revision as an example of a broader trend of historical revisionism in Japanese politics.

Noodles: Shanghai's sidewalk eateries go viral

From page 1

Asked about the secret behind the noodles' enduring appeal, Xue credited the recipe, which has remained unchanged.

The signature sesame paste is a finely balanced blend of peanut and sesame, leaving a delicate, sweet finish on the palate. The noodles themselves are made from alkaline-rich flour, delivering a springy bite and a rich, wheaty aroma.

Another bestseller, the pork chop, features a soy sauce simmered according to a time-honored recipe, complemented by chili oil.

Originally a cafe serving only beverages, the shop later pivoted to budget-friendly noodles and beef soup, rebranding as Wei Xiang Zhai, which translates literally as "good taste".

For many Shanghai residents, Wei Xiang Zhai is far more than a noodle joint. "People sit shoulder to shoulder, chatting in Shanghainese — especially empty-nesters who relish the chance to speak their dialect," Xue said.

Alyona Semchuk, a Russian visitor, stumbled upon Wei Xiang Zhai on Instagram. "I love Shanghai cuisine," she said. "The noodles with this peanut sauce are amazing."

Beyond this humble noodle shop, a growing number of Shanghai eateries are captivating tourists from around the world.

Wu You Xian, a *xiaolongbao* (soup dumpling) shop renowned for its crab roe dumplings, raised the bar in 2025 by becoming the first of its kind in Shanghai to earn a Michelin star.

Founder Chen Lina said the international interest surged after the star was retained this year.

Today, 80 percent of Wu You Xian's daily customers are foreigners. Chen has equipped every employee with a translation device, and the shop's walls are plastered with photos of visitors from around the world.

"I put my heart into making *xiaolongbao*, that's what keeps customers coming back," Chen said. "They call me the most affordable Michelin-starred spot."

These unassuming sidewalk eateries are taking off with international visitors through social media.

"We're just glad that people come to savor our Shanghai dishes," said Xue, the shift manager.

Li Junfeng and Chen Tianyi in Shanghai contributed to this story.

Ties: Collaboration has moved into emerging sectors

From page 1

Such projects have "greatly facilitated local travel and daily commutes, injected robust momentum into industrialization and urbanization, and constantly improved people's well-being", said Xiang Yuanzheng, an official with the Chinese Commerce Ministry's European Department.

Over the years, bilateral cooperation has moved beyond traditional fields such as mining and logistics into emerging sectors. Contemporary Amperex Technology and other Chinese battery makers have set up plants in Hungary, Slovakia and Poland, while Slovenian pharmaceutical company Krka Group has launched a joint venture with Ningbo Menovo Pharmaceutical in East China's Zhejiang province.

From 2012 to 2025, trade between China and the CEECs registered an average annual growth rate of over 8 percent, hitting a record high of 1.09 trillion yuan ($161.5 billion) in 2025. In the first half of this year, two-way trade volume reached 580.1 billion yuan, up 11 percent year-on-year, according to the General Administration of Customs.

For Petre Danci, a Romanian who studied at Capital University of Economics and Business in Beijing from 2011 to 2018, China's modernization drive delivers inclusive benefits to other countries, an approach he believes is underpinned by the country's deep-rooted commitment to openness, mutual benefit and shared progress.

Citing the four great inventions of ancient China — papermaking, printing, the compass and gunpowder — Danci said that none of these transformative innovations changed the world by staying inside China. "They changed the world because they moved, because they were shared, because people who never met the inventors gained access to the tools and used them to build something entirely new," he said.

During his years in China, Danci witnessed the country's modernization drive firsthand, epitomized by the rise of China's "new four great inventions" — high-speed rail, mobile payments, bike-sharing and e-commerce.

Across the Eurasian region, this deepening connection has taken tangible shape. Irena Lukajic Korica, an adviser to the Office of the Serb Member of the Presidency of Bosnia and Herzegovina, said her country is among the top recipients of Chinese-backed infrastructure and energy projects in Central and Eastern Europe, with the total value of these projects reaching nearly 2 billion euros.

Korica said young people in her country embrace the joint pursuit of modernization of China and the CEECs as opportunities for mutual learning, cooperation and shared development. "They believe deeper cooperation can unlock new prospects in areas such as digital transformation, green energy, research and tourism," she said.

Michal Bartek, a member of the Slovak Parliament and deputy governor of Slovakia's Trencin region, said that every time he visits China, he brings back something unique. "China is really inspirational for us," he said.

Domestic travel shows strong growth in H1

Tourism becoming a resilient and dependable pillar of nation's economy

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Domestic tourism in China hit record highs in the first half of this year, with both trips and spending posting simultaneous growth — a performance experts said underscores cultural and tourism consumption as one of the most resilient and dependable pillars of the nation's economy.

Domestic residents made 3.46 billion trips in the January-June period, up 5.4 percent year-on-year, with an increase of 178 million trips compared with the same period last year. Total spending reached 3.21 trillion yuan ($475.7 billion), up 2 percent from a year earlier, according to data released on Friday by the Ministry of Culture and Tourism.

Urban residents accounted for 2.59 billion trips, up 5.8 percent year-on-year, while rural residents made 869 million trips, a 4.3 percent increase. Quarter-by-quarter, trips reached 1.9 billion in the first quarter, up 6 percent, and 1.56 billion in the second quarter, up 4.8 percent.

Urban residents spent 2.66 trillion yuan, up 2.2 percent, while rural residents spent 560 billion yuan, up 0.6 percent, in the first half of the year.

Yin Ping, a professor at Beijing Jiaotong University's School of Economics and Management, said that the growth of both trips and spending showed that the cultural and tourism industry has entered a new stage of high-quality development across the board, fully demonstrating the sector's health and sustainability as a pillar of the national economy.

Deng Ning, professor and vice-dean at Beijing International Studies University's School of Tourism Sciences, said the growth signaled a recovery in per capita tourism consumption, marking a transition from recovery-driven growth to quality-driven growth.

It showed that tourists are willing to pay more for better experiences, dispelling earlier concerns about "stingy travel" or "budget tourism", he said.

Meanwhile, tourism is transitioning from a discretionary expense to a lifestyle necessity, he said. With 3.46 billion trips, the average Chinese resident traveled more than twice in the first half of the year. Weekend mini-vacations, city walks and trips for concerts or sports events have become an integral part of daily life, he said.

Moreover, from soccer tournaments to museum enthusiasm and immersive light-and-shadow exhibitions, new offerings are creating new demand, Deng added.

The 869 million trips made by rural residents represented one of the most strategically significant factors in the first half, according to Deng.

He identified three concurrent patterns of the tourism market shifting from urban to rural areas: tourists from first- and second-tier cities flowing to counties and villages for affordability and relaxation; tourism consumption being activated among residents in lower-tier cities and rural areas; and inbound tourists expanding beyond gateway cities to second- and third-tier destinations.

Data from online travel platform Tuniu showed that trips by tourists from third-tier and below cities grew more than 40 percent year-on-year in the first half, while trips from fifth-tier and county-level cities surged over 58 percent.

Inbound tourism also gained significant momentum. Foreign visitor arrivals reached 22.91 million in the first half, up 20.4 percent year-on-year, with visa-free entries accounting for 77.7 percent of the total, according to the National Immigration Administration.

Data from travel platform Qunar showed that inbound flight bookings covered 160 domestic cities, with Yiwu in Zhejiang province — the "world's small commodities capital" — seeing a 62 percent surge in flight bookings by foreign travelers.

Inbound visitors came from 575 cities across 158 countries and regions, with 11 new countries added compared with the same period last year.

Yin attributed the inbound recovery to continued visa facilitation, better products and services, and an improved travel environment, noting that it also pressured the industry to upgrade and align fully with global best practices.

Healing through sports

Palestinian children who lost limbs during the conflict in the region take part in a soccer training session organized by HEAL Palestine, a nonprofit United States-registered organization, in Gaza City, on Saturday. The training aims to provide the children with a space for sports and recreation while offering psychological support amid the difficult conditions in the Gaza Strip. IMAGO / APAIMAGES

CULINARY CATASTROPHE

Extreme heat in Italy threatens shellfish needed for prized pasta dishes

Clockwise from left: Farmers clean oysters inside a traditional fishermen's hut in the Sacca di Scardovari lagoon at Po River Delta, Italy, on July 29. Stefano, a mussel farmer, opens and shows a dead mussel at his farm in the Sacca di Scardovari on July 29. An aerial view shows the traditional fishermen's huts and the lagoon landscape in the Sacca di Scardovari on July 29.

An intense summer heat wave sweeping across southern Europe is threatening one of Italy's best-known culinary traditions, killing off clams and mussels in the lagoons of the Po River Delta and putting at risk the ingredients behind some of the country's most iconic seafood pasta dishes.

In the shallow brackish lagoons at the mouth of the Po River, water temperatures have risen to around 32 C, turning them into what local producers describe as "gigantic cooking pots", The Telegraph reported.

The extreme heat has proved fatal for shellfish, with widespread mortality reported among clams and mussels.

The losses have raised concerns for spaghetti *alle vongole*, a cherished Italian dish made with clams, olive oil, garlic and parsley, as well as spaghetti *allo scoglio*, another prized pasta traditionally prepared with clams, mussels and other shellfish.

In the Sacca di Goro lagoon, at the mouth of the Po River, up to 90 percent of clams have died, according to Confcooperative Agroalimentare e Pesca, Italy's farming and fishing cooperative association.

The shellfish die-off is unfolding against the backdrop of mounting environmental pressures across the Po Valley, one of Europe's most intensively cultivated and densely populated regions.

Shaped by the Po River, known in ancient times as the Padus, the region supports agriculture, livestock farming, irrigation networks, food industries, cities and distribution systems that together generate major outputs of rice, maize, wheat, dairy products and other foods.

Yet the same system faces overlapping pressures. Pollution, shrinking Alpine snow reserves, drought, floods, heat waves, saltwater intrusion and increasingly unstable seasons are disrupting water availability and traditional agricultural calendars.

The shellfish die-off comes as large parts

A thermometer shows the water temperature at 28.5 C on July 29, a level associated with severe thermal stress and an increased risk of mortality for Mediterranean mussels.

of southern Europe have endured weeks of extreme heat. In July, heat waves fueled wildfires across several countries, strained water resources and intensified drought conditions, underscoring the growing impact of rising temperatures on ecosystems and agriculture across the region.

Raising concerns

The heat wave has also sharply reduced the flow of the Po River, allowing salty seawater to advance as far as 18 kilometers inland and raising concerns for agriculture and protected wetlands in the delta, according to Reuters.

At the last point before the Po branches into several channels feeding into the Adriatic Sea, the river's flow has dropped from about 1,000 cubic meters per second to below 300.

The impact has also been severe in the Sacca di Scardovari, a lagoon renowned for premium Mediterranean mussels Cozza di Scardovari PDO. Water temperatures there have reached over 30 C, reducing dissolved oxygen, accelerating algal growth and causing widespread mussel mortality in areas with limited water exchange.

Cooperatives of the lagoon have reported the sudden loss of around 100 metric tons of PDO mussels, attributing the die-off to extreme heat, oxygen depletion and restricted water exchange after years of disruption caused by the invasive Atlantic blue crab.

The situation has been worsened by algal proliferation and anti-blue crab barriers that restrict water renewal within the lagoon.

According to estimates by Confcooperative Agroalimentare e Pesca, global warming is causing direct damage of around 200 million euros ($230 million) a year to Italy's professional fishing industry, with shellfish farming bearing the greatest impact.

WORLD

20,000 in Canada flee amid wildfire

VICTORIA, Canada — Canadian officials declared a state of emergency on Saturday after a fast-moving wildfire forced the overnight evacuation of more than 20,000 people in the western province of British Columbia.

Winds fanned the Bald Range wildfire, causing it to grow rapidly late on Friday, pushing flames into the Summerland area and affecting communities throughout the surrounding valleys.

"We know there have been significant losses of homes and property. We also know that some people became trapped as conditions changed quickly," British Columbia Premier David Eby said in a statement on Saturday.

"Air evacuations are underway for people who remain isolated behind the fire perimeter," Eby said.

Kelly Greene, the province's Minister of Emergency Management and Climate Readiness, declared a state of emergency.

CTV News reported more than 50 people had to be airlifted out of the community of Faulder as flames advanced.

Prime Minister Mark Carney posted his gratitude to firefighters and first responders on X, thanking them for "working tirelessly to keep people safe".

"The federal government stands ready to help and support the government of British Columbia in these efforts. I'm keeping everyone forced from their homes in my thoughts and hoping they can return safely soon," Carney said.

The fire was first reported on Friday evening, and Eby warned on Saturday it "remains extremely active and significant challenges remain".

Greg Krauter, who was forced to evacuate his Summerland property with his seven goats due to the Bald Range wildfire, checks on some of them in the back of his truck, in Penticton, British Columbia, on Saturday. DARRYL DYCK VIA AP

Meanwhile in the US, two people were killed when a helicopter crashed while supporting firefighting efforts on a massive wildfire in central Utah, authorities confirmed on Saturday, as crews continued to battle one of the state's largest wildfires of the year and assess when responders could safely reach the remote crash site.

The US National Interagency Fire Center said the helicopter under contract with the US Forest Service was involved in an accident on the Widemouth 2 Fire, killing the pilot and one crew member. Their names have not been released.

The Federal Aviation Administration said the aircraft, a Sikorsky S-64, crashed near Richfield at about 10 am on Friday.

The National Transportation Safety Board is leading the investigation. Preliminary information indicated the helicopter went down in remote terrain under unknown circumstances during firefighting operations.

Local officials said fire activity and rugged terrain initially prevented crews from reaching the wreckage. Fire officials said the crash also ignited new flames, further complicating access and raising safety concerns for rescuers.

El Nino impact

El Nino is a naturally occurring climate phenomenon that brings worldwide changes in winds, air pressure and rainfall patterns. It usually causes drier conditions in Southeast Asia and India.

Indonesian authorities have closed access to a national park on Java island as firefighters battle a wildfire that has been raging there for nearly a week.

The blaze has razed 176 hectares since it broke out on Monday in the Bromo Tengger Semeru National Park, near the popular East Java tourist destination of Mount Bromo, a disaster official said.

Authorities barred access for visitors late Saturday until further notice.

No injuries or property destruction have been reported, said National Agency for Disaster Countermeasure spokesman Abdul Muhari.

Two water-bombing helicopters have been deployed to douse the flames in areas difficult for firefighters to reach due to steep slopes and strong winds, he said in a statement on Sunday.

"These conditions make air operations important to reach areas that cannot be accessed optimally by land," the official said.

A blaze destroyed more than 500 hectares of land on Mount Bromo in 2023 when a couple lit a flare during a prewedding photo shoot.

UNITED STATES

Biden's cancer has spread, son says

Former US president Joe Biden's cancer has metastasized further, according to his son Hunter Biden, who shared the update in a recent interview with the BBC. In May 2025, just four months after he left office as the oldest sitting president, the elder Biden revealed he had been diagnosed with an aggressive form of prostate cancer that had spread to his bones. He subsequently began treatment, including radiation and hormone therapy, which the 83-year-old described as going "really well" last month, during an announcement of his upcoming memoir.

Senate OKs bill to avoid shutdown

The US Senate voted early on Saturday to approve a short-term measure aimed at avoiding a federal government shutdown before the November midterm election. The Senate voted 90-6 to approve the bill that would fund most federal government operations at current levels through Dec 11. The bill includes a variety of exceptions that senators negotiated with the White House. It was unclear whether the bill could pass the House, though lawmakers there are also eager to avoid a shutdown fight before the Nov 3 congressional election.

ISRAEL

PM rejects Trump's 15-point plan for Gaza

Israel has rejected US President Donald Trump's Board of Peace 15-point plan for Gaza, and will not withdraw until Hamas fully disarms, Prime Minister Benjamin Netanyahu said on Sunday. Trump announced last month that there had been a breakthrough in his plan to end the war, which both Israel and Hamas agreed to last year and which started with the ceasefire. Trump said that Hamas, which ruled Gaza for nearly two decades before carrying out the Oct 7, 2023, attack, had agreed to lay down its weapons.

XINHUA—AGENCIES

Soy trade drives China-US farm ties

By **LIA ZHU** in Chicago, Illinois
liazhu@chinadailyusa.com

Soybeans, carried as ballast on the return voyage from Asia to America some 200 years ago, have become a ballast of China-US agricultural trade.

Susan Thornton, former acting US assistant secretary of State for East Asian and Pacific Affairs, offered the historical footnote to a room where "ballast" had already become the word of the day.

"So that kind of makes this word ballast even more, I think, essential for our US-China agricultural trade," she told a gathering, organized by the US Soybean Export Council, or USSEC, during its annual Soy Connext conference held in Chicago on Friday.

The event drew US and Chinese officials, US soy industry leaders, and a Chinese delegation of traders and representatives from oil crushing, food and feed companies.

Chinese Consul General in Chicago Wang Baodong said soybeans have served for many years "as an important bridge in China-US agricultural cooperation, and the soybean trade has been a ballast of the broader part for economic and trade relationship".

China is home to the world's largest market for agricultural products, he noted, and high-quality US soybeans help meet rising demand from Chinese consumers while generating income and supporting jobs in US farm communities.

Those were the good old days, Wang said, recalling that 2022 marked the highest level ever for US agricultural and soybean exports to China. The good old days, he added, came to an abrupt halt last year.

"The US government launched the tariff and trade war against China, and China was compelled to take necessary countermeasures, and as a result, soybean trade between our two countries was disrupted for a period of time, and American farmers became a victim and bore much of the cost, which was never an outcome China wished to see," he said.

"There are no winners in tariff and trade wars," Wang said. "As we see it, equality, mutual respect, and mutual benefit remain the right way for China and the US to get along with each other and achieve win-win cooperation."

Wang also pointed to the opportunity for US soy farmers. This year marks the beginning of China's 15th Five-Year Plan (2026-30) period, he said, with the country advancing high-quality development and high-standard opening-up while continuing to improve its business and investment environment.

As living standards keep rising, he said, Chinese demand for agricultural products from around the world, including the United States, will continue to grow. The prospects for high-quality US soybean exports to China, in his view, remain promising.

Cao Derong, president of the China Chamber of Commerce for Import and Export of Foodstuffs, Native Produce and Animal By-Products, or CFNA, echoed the view. "Economic and trade relations should continue to serve as the ballast and propeller of China-US relations, not as barriers or flashpoints," Cao said in a video message.

The CFNA remains committed to maintaining and strengthening exchanges between the Chinese and US soybean sectors, Cao said.

He said the chamber this year hosted a visiting US soybean association delegation as well as representatives from the Indiana Soybean Alliance, and said he hoped to see dialogue between the two sides deepen further.

Mike McCranie, chair of the USSEC, has watched that relationship grow alongside his own career. He first visited China in 1982 and raised his first soybeans 40 years ago.

"It has changed a lot since then. I have been to China five times, developing great relationships. I really value those relationships," he said.

Thornton described the trade as a "textbook case" of two economies growing into each other.

US soybean yields have skyrocketed in recent decades on the back of technology and precision agriculture, she said, and that leap coincided with China's dramatic rise in living standards and a growing appetite for pork and poultry, which in turn drove the demand for livestock feed.

The United States and China operate two of the most complex food systems in the world, and she described them as highly complementary.

As major producers, consumers and traders of agricultural products, the two countries share a responsibility to ensure the global food supply remains stable, sustainable, high-quality and abundant, she said.

Editor's note: *Amid shifting global geopolitics in recent decades, the trans-Atlantic bond is being reshaped. China Daily will present a special series to examine these shifts and their long-term implications.*

Trans-Atlantic relationship reveals cracks

Divisions between US, Europe over defense burdens put strain on alliance

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

CROSS CURRENTS

The trans-Atlantic alliance is facing growing uncertainty and increasingly pressing defense and security-centric challenges in recent years. While Washington has doubled down on its "America First" policy, it has simultaneously demanded that Europe shoulder greater defense responsibilities and called into question the sovereign interests and security of its European allies, analysts said.

Divisions between the United States and Europe over defense burdens, security guarantees and collective defense have hit the headlines from time to time, putting severe strain on the alliance formed after World War II, they said.

By seeking to shift more of the financial and defense-related burdens onto its European allies while reevaluating its own security commitments, the US is fueling growing doubts in Europe over the credibility of its security guarantees and the future of the NATO alliance, even as NATO's institutional framework remains intact, they said.

In a recent case, US President Donald Trump reiterated on July 31 that he had not given up on his ambition to bring Greenland under US control, predicting in an interview with Real America's Voice News that the Arctic island would come under US "operational control" before the end of his term.

Danish Prime Minister Mette Frederiksen said at last month's NATO summit in Ankara that her nation was ready to defend every inch of territory in the military alliance, "including our own".

Zhao Jizhou, associate research fellow at the Institute of European Studies of the Chinese Academy of Social Sciences and board member of the Chinese Society of World Politics Studies, said the US push to annex Greenland has exposed deep cracks in NATO's principle of collective defense, while further eroding the mutual trust that underpins the alliance.

"Article 5 of the NATO treaty enshrines the principle of collective defense, while Article 4 calls for consultations when the territorial integrity, political independence or security of a member state is threatened. Yet, the US, as NATO's most powerful member, has made territorial claims over fellow member Denmark, undermining the political foundation of mutual trust and solidarity within the alliance," Zhao said.

If a NATO member's territorial claims against another member are effectively "legitimized", the moral and political foundations of the trans-Atlantic alliance as a collective defense organization could be severely weakened, if not fundamentally undermined, he said.

> "At its core, the trans-Atlantic defense relationship is characterized by a highly asymmetrical distribution of power, with the United States playing the dominant role."
>
> **Gao Jian,** director of the European Think Tank Research Center at Shanghai International Studies University

Rules-based order eroded

"It undermines the authority of international law, erodes the post-war rules-based international order and lays bare the colonialist logic that 'might makes right'," he said.

In recent years, the US has repeatedly urged NATO members to boost their defense spending and assume greater responsibility for Europe's own security. At the NATO summit in Ankara in July, Trump urged the members to meet the alliance's 5 percent of GDP defense spending target, arguing that European allies had long relied too heavily on the US for their security.

The US president has repeatedly threatened to withdraw from NATO if member states fail to meet their spending commitments. Defense Secretary Pete Hegseth has also linked higher defense spending by allies to faster access to US-made weapons, according to Politico, which said the US is "turning NATO into a cash machine".

"The move exposes Washington's bullying logic of turning NATO, a trans-Atlantic collective security alliance, into a vehicle for advancing US commercial interests. For European countries, this amounts to a double burden, putting them under both financial pressure and institutional pressure within the alliance," Zhao said.

"At its core, the trans-Atlantic defense relationship is characterized by a highly asymmetrical distribution of power, with the United States playing the dominant role," said Gao Jian, director of the European Think Tank Research Center at Shanghai International Studies University.

Within NATO, the sovereignty of smaller member states risks becoming conditional, with their interests subordinated to the security priorities and geopolitical strategies of major powers, namely the US, he said.

"Such a dynamic bears the hallmarks of neo-imperialism, reducing European allies to strategic dependents that can be pressured, traded off or even sacrificed at will, while running counter to the fundamental principles of sovereignty, territorial integrity and noninterference in internal affairs," Gao said.

Diverging threat perceptions and security priorities among NATO members are likely to deepen divisions within the alliance, making consensus more difficult to achieve and prompting adjustments to the trans-Atlantic security framework, experts said.

"While the US is increasingly focused on global strategic competition and preserving its hegemonic position, Europe is more concerned with its immediate security needs and regional stability. The widening gap in their threat perceptions and strategic priorities is making it increasingly difficult for Washington and its European allies to maintain effective strategic coordination," Zhao said.

He said the US favors unilateral action and a more pragmatic approach to crisis management, while Europe places greater emphasis on multilateralism, consultation and negotiation. Such differences are likely to create growing friction over NATO decision-making and make it more difficult for the alliance to forge a unified response to future crises.

"In Washington's eyes, the distinction between allies and rivals has become increasingly blurred, while Europe is increasingly treated as a source of strategic and economic interests to be leveraged when convenient and sacrificed when necessary," Gao said.

COMMENT

Editorials

Manufacturing upgrading generates new growth momentum for economy

Against a backdrop of rising protectionism, geopolitical tensions and sluggish growth in many Western economies, China's 4.7 percent GDP growth in the first half of 2026 can reasonably be described as a steady performance. It demonstrates considerable resilience in an increasingly uncertain global environment — a resilience attributable to the transition of the growth model to technological innovation, industrial upgrading and domestic demand as the drivers.

Highlighting the improving demand, China's consumer price index rose 0.5 percent year-on-year in July, while the core consumer prices, excluding volatile food and energy, climbed 0.9 percent. Summer tourism and big-ticket spending have helped broaden the consumption recovery. The producer price index also rose 3.5 percent year-on-year in July.

While some indicators softened in May and June, capital and resources are increasingly flowing into industries that are likely to define China's next phase of development. Offline consumption payments rebounded 2.2 percent year-on-year in July, while investment in advanced manufacturing surged 73.1 percent. This is investment in tomorrow's economy.

The high-tech sector is becoming the key engine of the Chinese economy. In the first half of 2026, the value-added output of high-tech manufacturing rose 13.3 percent, outpacing overall industrial growth. Production of industrial robots and lithium-ion batteries maintained double-digit expansion. Developments in artificial intelligence and semiconductors are particularly striking. AI patent authorizations surged 60 percent year-on-year in July, while China's intelligent computing capacity has nearly tripled from a year earlier. Domestic large language models have also surpassed 10 billion downloads globally. Activity indices for semiconductors, new materials and digital intelligence all posted strong gains, signaling that enterprises in these sectors remain highly dynamic.

The global debate is no longer about whether Chinese technology will be influential; it already is. Chinese companies are becoming major players across many sectors where global demand is growing rapidly — such as electric vehicles, batteries, solar panels and advanced manufacturing systems. The country is making the transition from being the world's manufacturing base to an innovation center, injecting fresh momentum into global innovation.

While the average surveyed urban unemployment rate stood at 5.2 percent in the first half, the creation of 6.95 million new urban jobs was broadly aligned with annual targets.

The slowdown in second-quarter GDP growth to 4.3 percent indicates that the transition calls for more forward-looking, systematic and targeted policies. Therefore the policy response is increasingly focused on building new sources of productivity rather than reviving the old ones. The government is placing greater emphasis on new quality productive forces and increased investment in human capital.

The development of the "six networks" — water, power, computing, communications, underground utilities and logistics — reflects an effort to strengthen the infrastructure underpinning a more technologically sophisticated economy. Planned investment in new power grids alone will exceed 5 trillion yuan ($741 billion) during the 15th Five-Year Plan (2026-30) period. Meanwhile, endeavors to balance high-quality development with high-level security are accelerating, including refining AI governance frameworks and deepening global cooperation on technology standards.

For some developed economies, treating China's technological rise primarily as a "threat" to be contained obscures a more important reality: China's competitive advantages are no longer based simply on cheap labor. They increasingly combine superlarge market scale, rapid industrial deployment, comprehensive supply chains and narrowing technological gaps.

China's imports and exports of goods rose 16.9 percent in the first half of the year. It is now a major trading partner for over 160 countries and regions, with increasingly diversified imports, according to the General Administration of Customs of China — evidence that the country's economic vitality continues to create opportunities for global partners.

China's economy resembles a "steppe horse" capable of galloping on a long journey. It may not be the fastest sprinter at every moment, but its stamina matters. The fundamentals underpinning China's long-term positive economic trajectory remain unchanged. The underlying conditions — solid foundations, multiple advantages, strong resilience and immense potential — remain firmly in place. China is not merely weathering the external uncertainties; it is upgrading its economic structure and growth model for decades ahead.

Militarizing Japan calls for global vigilance

Japan is systematically unraveling its postwar "exclusive defense" framework under the pretext of "external threat", laying the institutional groundwork for the rise of neo-militarism. Its 2026 defense white paper explicitly classifies the military industry as an economic pillar and a growth driver. The last time the Japanese government made such a designation was during the lead-up to and throughout World War II.

Japan's Ministry of Defense plans to request a record-high budget of about 8.9 trillion yen ($56 billion) for fiscal 2027, a figure that could climb to 10 trillion yen once unspecified items are finalized, Japanese media reported on Friday. Although Japan's per capita military spending is already about three times that of China, it continues to grow at a fast pace.

The budget surge is matched by an aggressive escalation of weapons exports. The Sanae Takaichi government is supplying naval vessels to Australia and the Philippines, and Patriot air-defense interceptors back to the United States to replenish stockpiles. Each deal expands Japan's military-industrial complex and normalizes a role the postwar Constitution was designed to prevent.

These are preparations for conflict funded through deficit spending that burdens Japanese households grappling with inflation and stagnant wages. Public opposition to this shift has become increasingly visible.

The same concern applies to the country's nuclear policy. Japan continues to officially uphold its Three Non-Nuclear Principles, but growing government rhetoric on the need to discard them has inevitably raised concerns about the durability of one of the most important postwar restraints on Japan's military posture. The prospect of a nuclear-armed Japan is deeply alarming, given the devastating toll of its past militarism and the nation's failure to reckon honestly with its war crimes — a combination that renders it a serious menace to regional and international security.

A recent survey in Japan found that 76 percent of respondents support upholding the country's Three Non-Nuclear Principles while 77 percent believe Japan should not pursue "nuclear sharing", an arrangement under which the US would station nuclear weapons in Japan.

As Chinese Foreign Ministry spokesman Lin Jian said, the Takaichi government should listen to the call of the people, fulfill its obligations under international law of not accepting, producing, possessing or proliferating nuclear weapons, stop playing with fire on the issue of nuclear weapons and not repeat the wrong path of miscalculating the historical trend and acting against the people's will for peace.

Japan's decision to treat its neighbors as "threats" while actively deepening ties with NATO reflects a misguided "befriend the distant, confront the near" strategy. This approach is not only diplomatically reckless, it invites outside intervention into the region and ultimately risks backfiring, harming Japan's own interests and regional stability alike.

Presenting regional tensions as justification for Japan's military creates a self-reinforcing cycle: heightened "threat" perceptions justify a military buildup, while Japan's military buildup itself deepens insecurity among neighbors.

Japan's postwar commitment to peace was not merely a domestic policy choice. It was also part of the process through which the country tried to rebuild trust with its neighbors after the suffering caused by its wartime aggression. At the Hiroshima Peace Memorial Ceremony on Thursday, Takaichi openly delivered a ridiculous message: Japan will uphold its Three Non-Nuclear Principles before a review. Any neighbor that has experienced the devastation of Japanese militarism understands all too well what this awkward logic really means: Japan is methodically pressing forward with its nuclear weapons agenda.

Japan's historical militarists turned a deaf ear to all appeals for restraint. Today's neo-militarists appear intent on retracing that same disastrous course. The gears of history for Japan are already turning faster, driving the country once more toward the role of a potential source of conflict.

'Rainforest ecosystem' makes Shenzhen a cultural beacon

Over the past two years, Shenzhen has emerged as a powerhouse of original cultural productions, ranging from stage plays and films to TV dramas and literary works. This vibrant cultural scene has laid the groundwork for what is now recognized as the city's "rainforest cultural model" — an ecosystem thriving on diversity and symbiosis.

At the forefront of this cultural renaissance is the dance drama *Wing Chun*, a prime example of Shenzhen's ability to creatively transform and innovate traditional Chinese culture. By integrating dance with martial arts, *Wing Chun* conveys the virtues of benevolence and morality. It has given 338 performances across 59 cities globally, setting a record for the number of performances by a Chinese dance drama in Europe. After two well-received shows in the Republic of Korea in July, it will embark on commercial tours in the United States, the United Kingdom, Spain and Saudi Arabia later this year. These tours will further cement its status as "a cultural ambassador" of Shenzhen and a benchmark for Chinese cultural outreach.

Chang Hongji, the lead actor of *Wing Chun* and principal dancer of the Shenzhen Opera and Dance Theater, shared insights from the global tours. "After performing in dozens of countries and regions, we fully understand that inclusive, open and mutually respectful exchanges are essential for Chinese art to gain global recognition. The pluralistic and inclusive core of the 'rainforest model' aligns perfectly with the demands of cross-cultural dialogue we have encountered overseas."

In the film industry, Shenzhen's creative vitality is embodied in productions such as *Dear You* and *Kung Fu Soccer*. The low-budget film *Dear You* resonates with audiences through its portrayal of ordinary people's perseverance during the migration to Southeast Asia.

Grossing over 2 billion yuan ($296.5 million) worldwide, its success underscores the effectiveness of Shenzhen's support for niche productions. Meanwhile, *Kung Fu Soccer*, directed by renowned Hong Kong director Stephen Chow, leverages Shenzhen's technological prowess by integrating motion capture and AI special effects, showcasing the city's film production capabilities.

These artistic achievements have prompted Shenzhen to develop a systematic "rainforest cultural ecosystem" framework. Sun Lili, chairperson of China Wit Media Company, highlights how this ecosystem provides growth opportunities for all. A pioneer in tech-enabled content creation, the company has launched AIGC Super Creation Lab, which produced the AI-generated short drama *Stroke of Genius*, which has amassed over 100 million views worldwide. This exemplifies the city's deep integration of technology and culture.

Beyond blockbuster works, the city continues to refine its cultural ecosystem. The city addresses creative bottlenecks through targeted policies and platforms such as the Pengcheng academy of arts and letters, which explores future literary forms and redefines cultural narratives in the AI era. By advocating "new mass literature" and "urban writing", Shenzhen taps into amateur creators from high-tech sectors, distilling its development logic and telling its stories with greater depth.

Initiatives such as "I Hear China, I Hear You" further enrich Shenzhen's artistic diversity, releasing original compositions that build on its legacy of classic thematic songs. Supported by a robust cultural infrastructure and digital foundation, these efforts reflect a practical summary of Shenzhen's cultural achievements.

As Shenzhen prepares to host the 33rd Asia-Pacific Economic Cooperation Economic Leaders' Meeting in November, it shines as a beacon of cultural innovation with its unique "rainforest-style cultural ecosystem". Rooted in a rich tapestry of original literary and artistic works, this cultural ecosystem highlights the city's commitment to fostering a diverse and symbiotic cultural environment.

When Shenzhen takes center stage at APEC 2026, its "rainforest cultural ecosystem" will exemplify how China's pilot demonstration zone strengthens cultural confidence and empowers artistic creation with technology. Through high-quality cultural outputs, the city will offer a vivid interpretation of Chinese modernity to partners across the Asia-Pacific and beyond, showcasing a dynamic and inclusive urban civilization.

— CHEN HONG, CHINA DAILY

What They Say

Meteorological monitoring to be enhanced

Editor's note: *China plans to develop a national comprehensive meteorological observation system during the 15th Five-Year Plan (2026-30) period. Fang Xiang, director of the China Meteorological Administration's integrated observation department, spoke to Xinhua News Agency about the plan's institutional innovations and practical implementation. The views don't necessarily represent those of China Daily.*

The new plan lays out a systematic approach to building a robust, intelligent, precise and cross-sector framework to coordinate the monitoring of land, sea, air and space assets. It provides clear guidelines to strengthen disaster prevention and mitigation, while supporting socioeconomic development.

By 2030, China aims to achieve better coordination in meteorological observation across all sectors, with significant advancements in monitoring infrastructure. The plan anticipates that approximately 85 percent of meteorological disasters will be predicted in advance, with improved accuracy in detecting strong convective weather. The lead time for localized severe weather warnings is expected to exceed 50 minutes. Improved data quality, efficient equipment maintenance and stringent quality control can contribute to a forecasted data accuracy rate of 98 percent.

A notable feature of the plan is the "five-unified" mechanism jointly proposed by 14 ministries and four major State-owned enterprises. The mechanism aims to enhance coordination through unified planning, technical standards, data submission, operational specifications and resource sharing. It will address challenges such as fragmented infrastructure, inconsistent standards and insufficient data sharing among observation facilities across various departments and fields.

The plan aims to upgrade the national comprehensive meteorological observation network by enhancing radar and ground-based monitoring facilities in regions prone to torrential rain, flash floods and severe convective weather. It also seeks to enhance vertical atmospheric monitoring capabilities. The upgrading of national climate observatories and atmospheric baseline stations, and the bolstering of multi-sphere monitoring in key ecological zones such as the Qilian Mountains-Hexi Corridor, Northeast China's forest belts, and northern sand-control belts will strengthen the foundation for climate change monitoring.

In specialized areas, meteorological observation will cater to industry and public needs by addressing gaps in agricultural, transportation and inland waterway meteorological data. Additionally, it will establish a low-altitude observation network providing services for the low-altitude economy.

The development of the observation system will help ensure effective data utilization and timely service delivery, enhancing both coordinated and emergency observation capabilities. By leveraging diverse assets such as satellites, radar, unmanned aerial vehicles, ground weather stations and industry monitoring sites, the system will improve coordinated observation of phenomena such as typhoons and convective weather events.

Enhancements in data collection, transmission and processing capabilities will enable smart transformation of observation, ensuring efficient coordination throughout data collection, transmission, quality control and storage. This will ensure data are immediately usable and help provide timely frontline services.

Incorporating high-quality basic observation products, developing new networking products from multiband weather radars and vertical observation systems, and integrating multi-source observations such as wind fields, water vapor and precipitation can build real-time services tailored to different application scenarios and enable the rapid delivery of real-time products to end users. These scenarios include disaster prevention, mitigation and relief, as well as specialized meteorological services.

Looking ahead, relevant authorities across sectors are to coordinate task implementation to ensure tangible results, continuously enhancing capabilities in precise monitoring, accurate forecasting and refined services.

VIEWS

Aidar Amrebayev

People-centered governance, a philosophy in resonance

During my time in China, I have gained insights that paint a picture of a nation in transformation. Meeting colleagues and local people from different provinces gave me a deeper and more complete understanding of how life is changing there. It's evident how the country's leadership is steadily improving the well-being of its people, and why this focus is the cornerstone of Chinese state policy.

From the perspective of political science, President Xi Jinping's governance principles are visibly driving fundamental improvements in the quality of life for the citizens of this remarkable nation.

As the axiom goes, "Living in a society, one cannot be free from it ..." This fits very well in China, where state policy profoundly enriches the lives of millions of people, making them richer, more diverse, and happier.

While studying the works of the Chinese leader and official government documents, I was especially interested in understanding the fundamental reasons underpinning the government's actions. Why do they resonate so deeply with the people of China? What defines the "art of governance with Chinese characteristics" today?

Since my student days, when I learned about the philosophy of a fair society, I have supported the ideals of a social welfare state. Today, China has succeeded in eradicating absolute poverty.

Visitors to the country admire its transformed social and technological infrastructure, its rejuvenated cities and roads, and its beautiful, well-maintained ecological and tourist areas. Most importantly, the optimism and hope in the eyes of its people convince me that China prioritizes their welfare.

This people-centered approach is the essence of every decision made by the Party and the government, aimed at building socialism with Chinese characteristics for a new era. These ideas have deep cultural and philosophical roots in Chinese tradition.

As a philosopher, I appreciate the idea of humanity as the guiding principle in Chinese philosophy, which I believe forms the basis of China's national worldview.

Kazakhstan feels very close to these ideas, especially as our society embraces a vision of a Just Kazakhstan, proposed by President Kassym-Jomart Tokayev. I am convinced that his worldview was greatly influenced by Chinese philosophy which he absorbed while studying at the Beijing Language and Culture University and his direct communication with Xi on governance matters.

MA XUEJING / CHINA DAILY

Global Lens

All state policies are designed to create conditions for the country's prosperity, as well as the well-being and happiness of every citizen.

Tokayev also believes that the government must serve the interests of society and views governance as a way to improve people's lives. This shared philosophy highlights the similarities in how China and Kazakhstan approach state management, as well as the hopes and dreams of ordinary people in the two countries.

Xi has repeatedly emphasized that all state policies aim to improve people's lives, enhance their well-being and ensure their safety. This human-centric approach to governance is the core of Xi's vision of building "socialism with Chinese characteristics for a new era".

The human-centric development programs initiated by the Party and the government have become a model of responsible leadership.

Tokayev also applies these principles in Kazakhstan for the benefit of the people.

One important step in this direction was the adoption of Kazakhstan's new Constitution, ratified by voters in a national referendum on March 15 this year.

It symbolizes the people's choice to build a just state for all citizens, a constitutional principle warmly received in China. Following the enactment of the new Constitution, Tokayev made his first official visit to China, sharing his thoughts on Kazakhstan's new model of state-building with Xi.

The Constitution defines Kazakhstan as a democratic, secular, law-based and socially oriented state, and, like China, places the protection of people's lives, rights and freedoms at the center of its governance.

Tokayev recently called for a shift from a paternalistic model of governance toward one that empowers individuals, emphasizing social justice, patriotism, hard work and the development of human potential as the foundation of Kazakhstan's future.

While interacting with students and scientists in China, I gained a deeper understanding of the modern Chinese dream.

During a meeting at a Chinese university, I asked how today's youth view the idea of the Chinese dream and fair governance. The students explained the core idea from various perspectives. The Chinese dream is fundamentally about people living a happy and prosperous life.

All state policies are designed to create conditions for the country's prosperity, as well as the well-being and happiness of every citizen.

In political terms, this is exactly the human-centric policy that Xi puts into practice.

The author is a member of the Council of International Relations under the president of the Republic of Kazakhstan, a member of the Congress of Political Scientists of Kazakhstan and director of the Center for Comparative Political Research under the Institute of Philosophy, Political Science and Religious Studies of the Ministry of Higher Education and Science of the Republic of Kazakhstan.

Rizal Sukma

ASEAN-China ties moving toward strategic depth

China's first official engagement with ASEAN as an institution took place in July 1991 in Kuala Lumpur, when China's then Foreign Minister Qian Qichen attended the opening ceremony of the 24th ASEAN Foreign Ministers' Meeting. On that occasion, China expressed its interest in building a cooperative relationship with ASEAN, to which ASEAN responded positively by granting it Consultative Partner status.

In July 1996, ASEAN accorded China full Dialogue Partner status. At the end of the 1990s, ASEAN leaders and the then president Jiang Zemin held their first summit in Malaysia and declared their intention to build a partnership for the 21st century.

That occasion paved the way for deepening the ASEAN-China partnership, a partnership committed to delivering peace and prosperity for people on both sides.

Thirty-five years after establishing dialogue relations between ASEAN and China, both sides have generally made good on that promise of peace and prosperity.

Ties between ASEAN and China have made significant advances, becoming one of the most important pillars of peace and stability in East Asia. For China, ASEAN is an important neighborhood with which it shares common interests in peace, stability and prosperity.

For ASEAN, China is a close neighbor with which the future of the region should be shaped together.

Through close cooperation over the past 35 years, ASEAN and China have laid a solid economic and political-security foundation for deepening ties in the decades ahead.

On the economic front, several key economic agreements, especially the China-ASEAN Free Trade Area (CAFTA), the extraordinary growth of trade between the two sides and China's growing investment in ASEAN, all point to the fact that China's role in ASEAN's economy is of paramount importance for regional states.

Global Lens

Greater understanding of each other's perceptions and views is crucial.

China is now ASEAN's largest trading partner, a major source of foreign investment, and a major driver of technological advancements in regional states. Mutual economic interests have become an important factor binding China and ASEAN into an interdependent relationship.

On the political security front, China has been and remains a strong supporter of ASEAN's norms, principles and role in shaping a peaceful and stable regional order in Southeast Asia.

For example, China was the first dialogue partner that acceded to the Treaty of Amity and Cooperation in Southeast Asia (TAC). It is also a strong supporter of ASEAN's centrality in managing regional order and the first to declare its readiness to sign ASEAN's Protocol to the Treaty on a Southeast Asia Nuclear Weapon-Free Zone.

ASEAN and China have also worked closely in many ASEAN-centered multilateral platforms.

China's support for and participation in these regional initiatives by ASEAN is essential for bolstering the centrality of ASEAN as a manager of regional order in Southeast Asia.

The remarkable transformation in ASEAN-China relations is not a product of random developments, but a product of hard work on both sides.

It is a product of genuine efforts by the governments and people of ASEAN and China to understand each other, to respect each other, to treat each other as equals, to build on common interests, and to resolve differences in a peaceful manner. It is a product of our shared commitment to working together for peace and prosperity, not only for the people on both sides, but also for the entire region.

As we move forward over the next 35 years and beyond, we must recognize that the partnership between ASEAN and China is now facing a more complex international environment due to uncertainty brought about by the changing nature of international politics.

Within such an uncertain external environment, the partnership between ASEAN and China will require continuous nurturing, close coordination, and more frequent dialogue. That is why, moving forward, we need to continue to strengthen the foundation of ASEAN-China relations.

The key challenge in strengthening ASEAN-China relations is not how to build a relationship free from challenges and problems. The challenge is how to ensure that we are always ready and work fast to address and manage the problems when they arise.

How do we do that? First, we need to understand the nature of possible problems and challenges in our relations.

Greater understanding of each other's perceptions and views is crucial. We must understand each other's standpoints and views on issues of national and regional concern, and we should recognize that we should not expect that our views will be aligned all the time on all issues.

Differences are normal. What matters most is how we approach, respect, and address those differences. Frequent dialogues between ASEAN and China are important for this mutual understanding.

Second, we need to build a mechanism to address problems based on the shared principles of non-confrontation, non-use of force, preference for dialogue and mutual consultation, mutual respect and equality. The current consultation process on a code of conduct for the South China Sea (COC) is a case in point.

Finally, ASEAN and China need to persuade others to join hands in this undertaking of creating a good, peaceful and prosperous East Asia.

It is indeed imperative for ASEAN and China to revive the East Asian community-building process, so that we can start a conversation about what sort of regional order we want to build. For that, we need Japan, Australia, New Zealand and India to be on board as well.

Only by working together can the promise of an Asian Century be fulfilled.

The author is Indonesia's former ambassador to the United Kingdom, Ireland and the International Maritime Organization from 2016 to 2020 and currently a senior fellow at the Centre for Strategic and International Studies, Jakarta.
The views don't necessarily reflect those of China Daily.

Tan Zheng

Buyers homing in on advanced modular construction

For most of human history, houses were built where they would stand. Bricks, concrete and steel were transported to a construction site, where workers assembled them piece by piece over months, sometimes years. That is the way the construction industry has worked for centuries.

Now China is rewriting the rules of this traditional model.

Increasingly, what leaves Chinese ports is not only steel, cement or other construction materials, but the entire buildings themselves. Manufactured in factories, packed into standard shipping containers and assembled overseas, modular buildings have become one of China's fastest-growing manufactured exports.

Exports of prefabricated buildings rose from $1.47 billion in 2015 to $4.34 billion in 2025, nearly tripling in value in 10 years. In the first quarter of 2026, exports registered a 45 percent year-on-year growth. Today, Chinese modular buildings are sold in more than 150 countries and regions across the world.

This rapid growth reflects years of investment in something far less visible than the finished houses themselves: the supply chains behind them.

In industrial clusters across Jiangsu, Guangdong and Shandong provinces, manufacturers can source steel structures, insulated wall panels, plumbing systems, electrical wiring, windows, flooring, kitchens and even furniture from nearby suppliers before assembling them into modules that fit neatly inside shipping containers. The result is not just lower costs, but also tighter quality control and shorter production cycles. Even after accounting for tariffs, international shipping and on-site installation, Chinese modular buildings often remain highly competitive.

Interestingly, the concept of prefabricated houses did not originate in China. Modern prefabricated construction emerged in Europe, North America and Japan after World War II, when governments searched for faster ways to address housing shortages.

Landmark projects such as Habitat 67 in Montreal, Canada, embodied the belief that housing could be industrialized without sacrificing quality.

Standardized components, certification systems and professional design codes all took shape in the West long before China entered the field.

What has changed is where the manufacturing capacity is concentrated. While supply chains in many advanced economies were fragmenting, China was doing the opposite by bringing industries together.

Modular construction depends less on a single breakthrough technology than on the ability to coordinate hundreds of suppliers with remarkable efficiency. That is precisely the capability China has painstakingly built over decades.

Today, Chinese modular construction extends far beyond the temporary site offices or simple prefab cabins that many people still associate with this industry. Companies now export worker dormitories, apartment buildings, retirement communities, luxury villas, schools, hospitals and even modular data centers. On international e-commerce platforms, overseas buyers can choose standard designs or request customized layouts based on their own drawings and specifications.

The real advantage of modular construction lies in how it transforms the building process. Traditional construction follows a linear sequence: foundations come first, followed by structural work, utilities, insulation and interior finishing.

Delays at any stage ripple through the project schedule. Modular construction replaces that sequence with parallel production. Structural frames, insulation, electrical systems, plumbing, kitchens and bathrooms are manufactured simultaneously inside factories before final assembly on site. Some units even come fully furnished, complete with furniture, fabrics, and household appliances.

In many ways, the construction site looks more like an assembly line than a workshop. That shift matters because buildings are increasingly becoming manufactured products. Like automobiles, they combine advanced materials, digital design, automation and energy-saving technologies into standardized platforms.

Chinese manufacturers have already incorporated solar power systems, rainwater recycling and energy-efficient materials into many modular homes while investing heavily in overseas certification and local partnerships to meet international standards.

Yet manufacturing a house is only part of delivering a home. Conversations with overseas buyers suggest that the biggest challenges no longer lie in the quality of Chinese products.

They begin after the containers arrive. Local building codes differ, measurement systems vary, installation crews may not be able to read Chinese-language manuals, and post-installation modifications often prove more expensive than expected. Construction is not a single transaction but a long chain that stretches from design and engineering to installation, maintenance and renovation. Weakness at any stage can wipe out the savings achieved in the factory.

That challenge is greater when projects become more sophisticated. A compact modular cabin can be delivered almost like a consumer product. A large family house cannot.

Climate, local regulations, cultural preferences and architectural traditions all shape how people want to live. A home designed for northern China may require significant adaptation before it becomes livable in the Middle East, Southeast Asia or Oceania.

This is why the next stage for China's modular housing industry is not simply exporting more buildings, but exporting the services, design capability and local partnerships needed to make those buildings fit seamlessly into different societies.

Factories can manufacture modules, but they cannot manufacture empathy. The companies that lead the next generation of construction will not necessarily be those that build the cheapest houses. They will be those that make industrialized housing feel local rather than standardized, permanent rather than temporary, and personal rather than mass-produced.

China has already demonstrated its ability to manufacture buildings at scale. The next, and perhaps greater, test is whether it can help redefine not only how the world builds, but ultimately, how people choose to live.

GLOBAL VIEWS

FERENC BANHIDI

Walls and wiring

While the US is building a small yard with high fences, China has opened its AI ecosystem to all

ZHANG YUJUN / FOR CHINA DAILY

When Western pundits analyze China's burgeoning artificial intelligence strategy, the default lens is often geopolitical. Following the recent World AI Conference 2026 in Shanghai, headlines in the West framed Beijing's push for open-source models, the establishment of the World AI Cooperation Organization and the rollout of public-good AI tools such as the MAZU meteorological system as a "Trojan horse" for digital hegemony.

But viewing China's global AI outreach solely through a Cold War prism is a profound misunderstanding of how the Chinese economic engine actually works. Strip away the geopolitical rhetoric, and what emerges is not a sudden, state-mandated ideological crusade, but the continuation of a highly sophisticated, battle-tested international business strategy that Chinese enterprises have been perfecting for nearly three decades.

To understand China's AI playbook, one must look back to the telecommunications boom between 1998 and 2008.

At the turn of the millennium, Western telecom giants such as Ericsson and Nokia approached developing nations in Africa, Asia and Latin America with expensive, rigid landline infrastructure models. For many of these nations, the capital expenditure was prohibitive. Then came Huawei and ZTE. Rather than competing on the West's terms, Chinese companies offered flexible, cost-effective GSM mobile networks. More importantly, they didn't just sell equipment; they provided "turnkey" solutions — handling network design, construction, local training and pairing those services with financing from Chinese State-owned banks.

Many Global South countries effectively leapfrogged large-scale fixed-line infrastructure and moved rapidly into the mobile age, and Chinese telecom companies gained substantial market share by offering affordable, adaptable solutions tailored to local needs.

Today, history is rhyming in the realm of AI.

Western AI laboratories, such as OpenAI and Anthropic, are the new Ericssons. They offer premium, closed-garden API services that are prohibitively expensive for startups and governments in the developing world to afford at scale. China, conversely, is offering the AI equivalent of the GSM leapfrog. By championing open-weight models such as Qwen, DeepSeek and Kimi, and pairing them with cloud infrastructure, regional data centers and the pledge of 5,000 AI training opportunities for developing countries under the WAICO framework, China is lowering the barrier to entry. The message to the Global South is clear: countries do not need to spend billions building their own sovereign supercomputers; they can build their digital future on China's open, comparatively accessible infrastructure.

Western skeptics frequently ask: Why give away the "crown jewels" of AI model weights for free? Is this just State-subsidized dumping?

The answer lies in China's domestic internet history — specifically, the legendary e-commerce war between Taobao and eBay in 2003. When eBay charged Chinese merchants listing fees via EachNet, Alibaba's Taobao countered by making basic storefronts entirely free. This "free entry" model drained eBay of its user base, allowing Taobao to achieve total market dominance before eventually monetizing the ecosystem through value-added advertising and premium services.

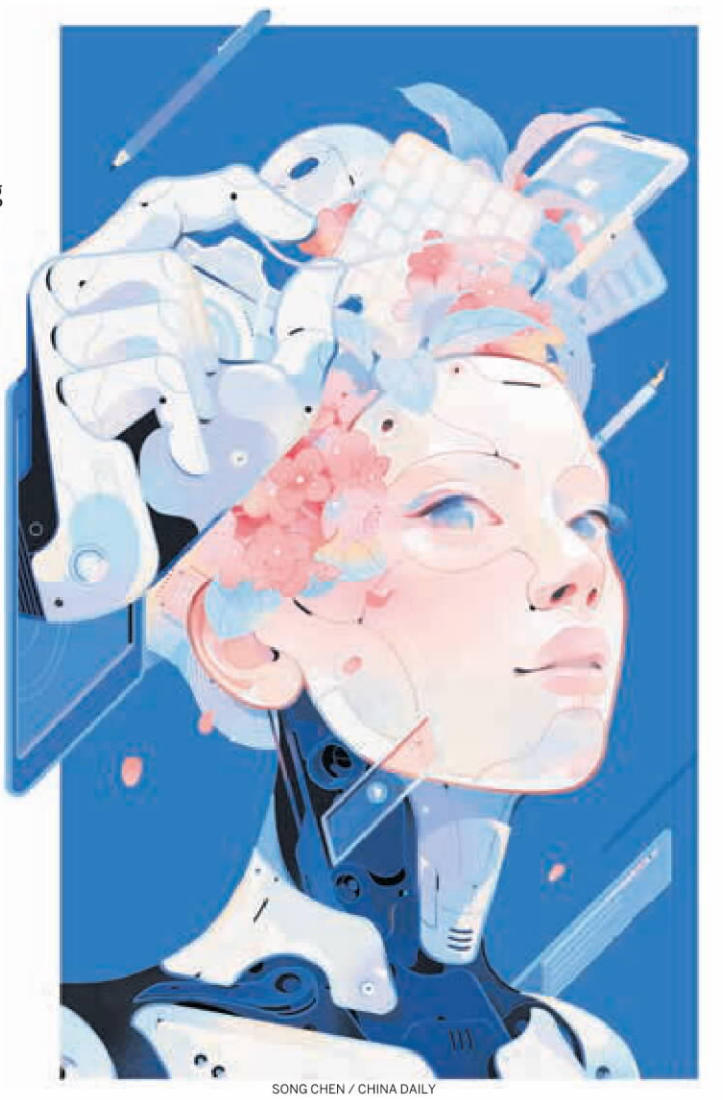
We are now witnessing the "Taobao Playbook" applied to global AI. Take the pricing strategy of Moonshot's Kimi K3 model for example. The model's weights are free to download for researchers, students and small enterprises. However, if a company uses the model to power a commercial API service and crosses a revenue threshold of $20 million, a paid commercial license is triggered.

This is not charity; it is a strategy to build a broader technological ecosystem. While US companies attempt to harvest immediate, high-margin API revenues (the "eBay model"), Chinese AI companies are using open-weight access to attract developers worldwide and expand the adoption of their technological platforms. If the Global South's digital economy increasingly relies on Chinese foundational models, significant commercial opportunities could emerge in the future.

China's genius lies in "selective adaptation". China rarely adopts Western templates wholesale; it indigenizes them to fit local institutional voids and market realities.

In the AI sector, there has been a globalized adaptation of China's "Triple Helix" university-industry-government model of innovation. In the West, the government often plays a peripheral regulatory role. In China's global AI push, the State provides the diplomatic umbrella, sovereign financing and macro-level trust, while agile private tech companies execute aggressive, market-driven ecosystem plays. It is a combination of State-backed strategic patience with hyper-competitive commercial execution.

For the international community, the implications are significant. Washington's "small yard, high fences" strategy — relying on chip export controls to cage China's AI ambitions — may slow down China's progress at the absolute cutting edge of hardware. But sanctions are unlikely to eliminate the appeal of a business model that aligns with the development needs of much of the Global South.



While the West builds walled gardens and restricts access, China is actively wiring the rest of the world into its digital ecosystem. To understand China's AI ambitions, observers must stop reading geopolitical thrillers and start reading business history. The script was written nearly three decades ago in the telecom sector, and it is currently being executed with devastating commercial precision in the age of AI.

XIAO QIAN

Beyond the AI race

The next chapter should not be about technological rivalry between leading nations, but about whether they can translate competition into cooperation

SONG CHEN / CHINA DAILY

The newly released Kimi K3 model — an open-weight model from Chinese start-up Moonshot AI — has once again demonstrated how rapidly China's frontier artificial intelligence capabilities are advancing. Together with earlier breakthroughs such as DeepSeek, it has reinforced a growing perception that China is no longer merely catching up with the United States — it has become one of the world's leading AI powers.

Not surprisingly, these developments have intensified debate in Washington. Concerns about the US losing its technological edge have fueled renewed discussions on export controls, semiconductor restrictions, AI infrastructure investment and strengthening alliances around advanced technologies. The global conversation has once again centered on a familiar question: Who is winning the AI race?

Yet that question, while important, is increasingly incomplete. As artificial intelligence becomes one of the defining technologies of the 21st century, the more consequential question is not only who develops the most capable models, but what kind of AI future countries are trying to build. That broader vision was on full display at the 2026 World Artificial Intelligence Conference held in Shanghai this July.

When WAIC was first launched in 2018, it was primarily a technology exhibition showcasing the latest breakthroughs in AI. Today, it has evolved into one of the world's flagship AI conferences, where discussions of technological innovation and global governance receive equal attention. Scientists, researchers, entrepreneurs, policymakers and international organizations gathered alongside participants from both developed and developing countries to debate not only the future of AI technologies but also the future of AI governance. The evolution of WAIC mirrors China's own transformation — from an active participant in the global AI revolution, to an increasingly influential contributor, to a shaper of international discussions on AI.

China's emergence as a rising global AI leader rests on several distinctive strengths. First, it possesses an exceptional ability to translate technological breakthroughs into real-world applications. AI is already transforming manufacturing, healthcare, transportation, finance and education at remarkable speed, creating a continuous feedback loop between innovation and deployment. Second, China has developed one of the world's most dynamic AI ecosystems, integrating universities, research institutes, technology companies, manufacturers, investors and an enormous domestic market. Third, as China's AI capabilities advance, so too has its emphasis on balancing development with safety. Chinese policymakers have increasingly emphasized that AI should remain safe, trustworthy and ultimately beneficial to humanity. President Xi Jinping stated in his keynote speech at the opening ceremony of WAIC 2026 that "China lays great emphasis on safety and security in AI development. With a deep understanding of the trends and logic of AI development, we are continuously improving laws, regulations, policies, mechanisms, application norms, as well as ethical principles to make sure that AI is safe, secure and controllable, and that this fine steed of AI gallops with both speed and stability".

The world is increasingly witnessing two competing visions for the future of AI. One treats AI primarily as a strategic asset, with access to advanced models, semiconductors and computing infrastructure shaped by export controls, alliance networks and geopolitical competition. The other regards AI as a global public good whose benefits should be shared more broadly through open innovation, capacity building and inclusive international governance. The initiatives announced at this year's WAIC — including the establishment of the World AI Cooperation Organization and China's pledge to provide 5,000 AI training opportunities for developing countries — reflect this latter vision. Rather than defining AI solely as a race for technological supremacy, China seeks to broaden access to AI capabilities and ensure that more countries can participate in and benefit from the AI revolution.

This distinction matters because the challenges created by AI are becoming increasingly global. As AI capabilities continue to improve over the next decade, so too will the risks. Frontier AI raises concerns ranging from loss of control and cyberattacks to biological misuse and military instability. At the same time, AI may deepen global inequalities through widening gaps in computing power, talent, infrastructure and access to advanced technologies. None of these challenges can be managed by any single country acting alone. As the world's two leading AI powers, China and the US share a responsibility to cooperate. Effective AI governance will require dialogue on safety standards, crisis communication, risk evaluation and confidence-building measures, even amid strategic competition.

Ultimately, the future of AI should not be judged solely by benchmark rankings or the sophistication of frontier models. It should also be measured by whether AI narrows or widens the global development gap; whether it strengthens or weakens international security; and whether its benefits are shared broadly or concentrated among only a handful of countries. While much of the international debate has focused on frontier AI risks, China has consistently highlighted issues such as digital inequality, capacity building, and equitable access to AI technologies — concerns that resonate strongly across the Global South. China has also emphasized the central role of the United Nations in ensuring that both developed and developing countries have an equal voice in shaping the rules of AI governance.

The next chapter of global AI development should not be defined solely by technological rivalry. It should be defined by whether leading AI nations can translate competition into cooperation and technological progress into global public goods. The success of AI should ultimately be judged not only by how intelligent our machines become, but by whether they enable more countries and more people to share in the opportunities they create. Beyond the AI race, that may prove to be major countries' important contributions to the AI era.

The author is the vice-dean of the Institute of AI International Governance at Tsinghua University. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

MNCs plug into China's green synergy

Nation's energy transition a 'blue ocean' of vast global opportunities

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's strong push toward an energy transition and green, low-carbon development is not just reshaping its domestic economy — it is creating massively scaled, entirely new collaborative opportunities for the global market.

For executives at top multinational corporations and heads of international organizations, the policy signals heading into the second half of 2026 are unmistakable, as the 15th Five-Year Plan (2026–30) explicitly proposes accelerating the comprehensive green transformation of economic and social development.

Industry leaders say China is acting as a powerful locomotive, using this mandate to open a "green cooperation door" for global businesses.

By striving to build a clean, low-carbon, safe, and efficient new energy system, the national blueprint provides a sturdy, predictable foundation for multinational companies to further deepen their roots in the Chinese market, they say.

"The policy blueprint laid out for the 15th Five-Year Plan has further bolstered our confidence in China's long-term market prospects," said Karen Yin, president of AkzoNobel China.

Yin noted that the market's steady high-level opening-up allows foreign enterprises to fully tap into these new ecological priorities. "For multinationals like AkzoNobel, our longstanding commitment to the Chinese market underscores a strategic evolution: transitioning from mere investors to dedicated innovation partners."

This transition is being felt across the entire advanced manufacturing spectrum. Xia Fuliang, president of Evonik China, pointed out that the sheer scale of this green mandate is fundamentally altering how foreign capital interacts with the local economy.

"From my perspective, the most compelling evidence is that China is no longer only a large end-market or manufacturing base," Xia said. "It has become an integrated platform where innovation, infrastructure, talent, and industrial ecosystems come together to create opportunities for global companies."

In corporate boardrooms from Europe to Asia, a powerful new paradigm is taking hold. As global economic uncertainties linger, a rising wave of multinational corporations including Evonik, AkzoNobel, BASF, Syensqo, and Everllence, are aggressively doubling down on green investments in China.

By strategically targeting low-carbon technologies, the circular economy, and industrial energy efficiency, they are pushing back against the pessimistic "China Shock 2.0" narrative.

Instead, they are embracing what they call "China Opportunity 2.0". The consensus among these global executives is clear: China's colossal domestic demand for green solutions, coupled with its hyper-efficient industrial ecosystems, provides the perfect crucible to commercialize low-carbon technologies and accelerate technical iterations.

This green transition perfectly embodies the core of this new era — China's development is generating a "blue ocean" of incremental growth, forging a pathway for mutual, cross-border industrial prosperity.

From urban transit and commercial real estate to heavy chemical manufacturing and maritime shipping, the application scenarios for China's green transition are expanding at a breakneck pace. For multinational companies, this translates not only to clearer policy expectations but also to vastly broader commercial horizons.

The physical manifestations of this shift are already visible across the country.

While BASF is aggressively driving the low-carbon operation of its massive Zhanjiang Verbund site through the large-scale procurement of renewable energy, Schneider Electric continues to blanket Chinese enterprises with sophisticated energy management, automation, and digitalization solutions.

Meanwhile, industrial behemoths like Siemens are rapidly expanding their footprint in the Chinese market with advanced solutions in smart electrical systems, green manufacturing, and systemic energy optimization.

Armed with a super-sized domestic market, a complete industrial chain, and endlessly diverse application scenarios, China has quietly transformed into the world's premier proving ground for green technology.

For Evonik, the German specialty chemicals company, this structural shift is highly tangible.

Xia views China as an incubator that forces companies to become faster, more innovative, and inherently more sustainable.

In the first half of 2026 alone, Evonik brought several milestone projects online in China, including a new hydrogen peroxide plant in Leshan, Sichuan province, an expanded specialty amine production facility in Nanjing, and its first AEM technology center dedicated to green hydrogen.

"These projects reflect not only our confidence in China's market potential, but also our belief that China will remain an important source of innovation and transformation for global businesses," Xia said.

This sentiment is echoed throughout the advanced materials sector.

Chen Pu, chief Asia officer of the Belgian specialty chemicals giant Syensqo, noted that the company views the "China opportunity" through highly practical lenses: the sheer size of the market, the velocity of industrial upgrading, and the depth of the local talent pool.

"Demand is shifting toward advanced, more sustainable, and higher-performance solutions," Chen said, highlighting Syensqo's four-decade presence in the country, which now includes five industrial sites and its third-largest global Research and Innovation center in Shanghai.

"We want to capture opportunities in fast-growing trends such as electrification, lightweighting, advanced connectivity, and more sustainable sourcing by innovating locally and working closely with customers."

As China places greater emphasis on expanding domestic demand while pursuing high-standard opening-up, multinational leaders see a mutually reinforcing dynamic.

A more sophisticated domestic market demands safer, greener, and more efficient solutions, while institutional opening-up delivers the predictability and transparency required for long-term capital deployment.

Yin from AkzoNobel China, believes this dynamic elevates the market beyond a mere sales destination.

"With a full spectrum of application scenarios, China's vast market serves as a natural testbed and incubator for technological innovation," Yin explained.

Operating under the guiding tenet of "Innovate in China, for China, share globally," the Dutch paints and coatings giant continues to expand its local R&D footprint. Yin noted that the policy blueprints laid out for the 15th Five-Year Plan have bolstered the company's long-term confidence.

"Our longstanding commitment to the Chinese market underscores a strategic evolution: transitioning from mere investors to dedicated innovation partners," Yin added.

She expects the second half of 2026 to be driven by "new quality productive forces" — advanced manufacturing, green tech, and digitalization — alongside a consumer base demanding premium, eco-friendly residential and commercial spaces.

This green transformation is equally profound in heavy industry and global logistics. For Everllence, a leader in maritime and energy solutions, China is the absolute nexus for green innovation and the global delivery of net-zero solutions.

"In the first quarter of 2026, China led global shipbuilding new orders by deadweight tonnage, with green vessels accounting for 80.2 percent of new contracts," said Sarath Prasannan, senior vice-president and head of Asia-Pacific region of Everllence.

Despite global headwinds, such as the delayed International Maritime Organization (IMO) Net-Zero Framework review, China's 15th Five-Year Plan offers rare, bankable policy certainty, he said.

The company's deep-rooted partnerships with local titans like CSSC and COSCO Shipping Lines continue to yield breakthroughs.

In June 2026, Everllence delivered a milestone methanol dual-fuel retrofit for the *Seaspan Yangtze* at Shanghai COSCO Heavy Industry. Completed in just three months to minimize shipowner downtime, the retrofit slashes the vessel's emissions index by 55 percent below international baselines.

Crucially, the hardware of the green transition is being supercharged by the software of the digital age. Artificial intelligence and frontier technologies are no longer theoretical concepts; they are actively reshaping China's industrial growth and productivity.

At Syensqo's Shanghai center, artificial intelligence is fully integrated into the R&D process. "AI is helping teams with analysis, testing, and product solution optimization," Chen explained. "It is not a replacement for researchers, but a tool that helps them solve more complex problems and identify new ideas faster."

As the second half of 2026 commences, foreign executives are closely monitoring the commercialization speed of these cutting-edge technologies, the delivery pace of green industry orders, and the evolution of domestic consumer confidence.

Industry experts believe China's green transition is cultivating a far more complete and globally integrated industrial ecosystem.

As high-standard opening-up accelerates, the nation is actively championing the participation of multinational companies in key fields ranging from advanced manufacturing to climate technology, said Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University.

"Multinational companies can bring advanced technologies to China, and also push China's innovation achievements in new energy and other fields to the global stage," said Liu Linna, deputy director-general and secretary-general of the Council for International Investment Promotion. "Through this reciprocal exchange, multinational companies will share in the abundant developmental dividends generated by new quality productive forces during China's green transition."

In an era defined by global economic fragmentation, China's steady macroeconomic expansion and unyielding commitment to carbon neutrality offer a vital anchor. For the global corporate vanguard, the Chinese market is no longer a peripheral strategy — it is the very heart of the global green industrial revolution.

Workers maintain offshore wind turbines in Nantong, Jiangsu province, on June 10. XU CONGJUN / FOR CHINA DAILY

Workers conduct investigations on the transmission towers and photovoltaic power supply facilities for the West-to-East Power Transmission project in Zhangye, Gansu province, on July 28. YANG XIAO / FOR CHINA DAILY

BASF opens its new chemical complex in Zhanjiang, Guangdong province, on March 26. The company says that through Verbund integration — a system linking production processes to minimize waste — and renewable energy sourcing, the site can cut CO2 emissions by up to 50 percent compared with a conventional petrochemical facility. Innovation powers next growth cycle

REPORTER'S LOG

By Zheng Xin

Forget the dusty old "world factory" playbook — if you want to see the future of global energy, you need to look at what is happening on the ground in China right now.

As a reporter covering this beat, the sheer velocity of the shift is nothing short of dizzying. We are watching China morph into a global innovation hub, acting as a high-speed locomotive pulling multinational energy and tech giants into a new era of green prosperity.

The pessimistic narrative of a looming "China Shock 2.0" has been completely flipped on its head in corporate boardrooms; instead, executives are enthusiastically branding this "China Opportunity 2.0".

The signals heading into the second half of 2026 are crystal clear for any executive paying attention. The 15th Five-Year Plan (2026–30) explicitly mandates a comprehensive green transformation of both economic and social development. This national blueprint is providing a sturdy, predictable foundation for multinationals to deepen their market roots.

China's 15th Five-Year Plan signals a stronger push to attract foreign direct investment — especially into advanced manufacturing, modern services, high-tech, and environmental protection — while encouraging foreign firms to establish regional headquarters and research and development centers. The logic is clear: Beijing is expanding market access where foreign innovation directly accelerates its long-term strategic objectives.

This policy momentum was further solidified recently, when the National Development and Reform Commission and the National Energy Administration officially issued the top-level design for the "15th Five-Year Plan for the Construction of a New Power System".

This critical framework provides exactly the kind of structural clarity and expansive runway that global energy businesses need to confidently deploy long-term capital and scale their low-carbon technological iterations, transitioning them from mere investors to dedicated innovation partners.

What strikes me most during my interviews is that collaboration between Chinese and foreign enterprises has blown past simple financial transactions to reach a much deeper, multi-dimensional integration.

Multinationals are deploying aggressive strategies to weave China's innovation ecosystem into their global blueprints.

Recent corporate movements in the Guangdong-Hong Kong-Macao Greater Bay Area underscore this shift. For example, energy and chemical titan ExxonMobil has accelerated operations at its multibillion-dollar chemical complex in Huizhou, Guangdong province, pairing advanced low-carbon manufacturing with regional R&D to power sustainable material supply chains.

Participating in global joint R&D initiatives is frequently cited as a crucial strategy by a substantial segment of these businesses. To push global cooperation locally, a comparable number of firms are focusing heavily on promoting more local Chinese talent, alongside consistently increasing their R&D investment within China.

The physical scale of this transition is staggering. The hardware of the green transition is hitting the ground fast, supercharged by the software of the digital age. In the first half of 2026 alone, specialty chemicals company Evonik launched a new hydrogen peroxide plant in Sichuan, expanded a facility in Nanjing, Jiangsu province, and opened its first AEM technology center for green hydrogen.

As I log my notes for the remainder of 2026, the takeaway is undeniable. Armed with massive domestic demand, hyper-efficient industrial ecosystems and a strong drive toward carbon neutrality, China is no longer just a peripheral market strategy. It has become the undisputed proving ground and beating heart of the global green industrial revolution.

BUSINESSINSIGHT

China stabilizing force in global trade

EAGLE EYE
By Zhou Mi

AI PRODUCED BY CAI MENG / CHINA DAILY

China is emerging as an increasingly important source of stability for the global trading system. Despite mounting geopolitical tensions, rising protectionism and slowing global trade growth, the country has both the capacity and structural foundations to sustain relatively stable trade expansion.

According to customs data, China's two-way trade in goods reached 25.47 trillion yuan ($3.77 trillion) in the first half, up 16.9 percent year-on-year. The significance of this performance becomes clear only when viewed against the broader backdrop of the global economy.

International trade does not exist in a vacuum. It reflects the interaction between production and demand across economies. Unlike domestically driven investment or fiscal stimulus, trade cannot simply be created by administrative decisions. It depends on whether producers have goods or services the market needs and whether buyers are willing to purchase them. In that sense, trade is both a consequence of economic growth and a driver of it. Stronger economies generate demand for imports and exports, while expanding trade in turn supports growth by creating markets, jobs and investment opportunities.

This relationship makes the international context especially important. With the International Monetary Fund recently lowering its forecast for global trade growth this year, China's trade performance is all the more notable because it has come amid slowing global commerce rather than a synchronized global recovery.

Several structural features stand out amid the numbers. One is the durability of export growth. China's exports have now expanded for 17 consecutive months, suggesting that recent performance is not simply the result of temporary factors such as inventory accumulation, one-off policy incentives or short-term efforts to hedge against geopolitical risks. Sustained growth over such a period indicates that underlying demand remains intact and that Chinese exporters continue to occupy an important position within global production networks.

The explanation lies not in a single factor, but in a combination of structural strengths that have become increasingly evident over recent years. Among them is China's role in stabilizing global supply chains. Businesses around the world have learned that supply security can matter as much as price. As supply chains have been repeatedly disrupted by geopolitical tensions, logistics bottlenecks and extreme weather events, the ability to reliably obtain goods and services has become a competitive advantage in itself. For many manufacturers, Chinese suppliers continue to provide consistency that is difficult to replace.

Equally important is the nature of what China exports. A significant share of China's exports consists not of finished consumer products, but of intermediate goods, industrial components and production equipment. These products support manufacturing activity in importing countries, serving as essential inputs for industries ranging from automobiles to machinery and electronics. Rather than competing directly with industrialization elsewhere, many Chinese exports enable industrialization and reindustrialization abroad.

Innovation has become another increasingly important source of competitiveness. China's export strength is no longer driven primarily by manufacturing scale or cost advantages. It increasingly reflects technological upgrading, product innovation and the ability to respond quickly to evolving consumer needs. Recent demand in Europe for Chinese air conditioners during periods of unusually high summer temperatures illustrates how manufacturers have responded quickly to changing market conditions. More broadly, exports associated with renewable energy technologies and other innovative industrial sectors are helping countries pursue their own energy transition and industrial upgrading.

Imports tell an equally important story. Imports grew 22.1 percent in the first half, outpacing export growth by 8.7 percentage points. That is consistent with China's broader objective of promoting more balanced trade while continuing to expand market opening-up.

Imports and exports should not be viewed separately. In most economies, weaker exports often coincide with weaker imports because production, investment and consumption are closely linked. China's faster import growth instead reflects continued efforts to open market access rather than merely increase trade volumes.

Recent unilateral market-opening measures illustrate this approach. China expanded zero-tariff treatment to all African countries with which it has diplomatic relations beginning May 1, and has continued lowering tariffs for a broader range of trading partners. These policies are designed to increase market opening-up, expand consumer choice and deepen mutually beneficial trade relationships rather than simply boost import statistics.

The composition of imports also reflects underlying demand. China imported 1.43 billion metric tons of energy products and metal ores in the first half, up 3.4 percent year-on-year, while agricultural imports rose 8.6 percent. These figures underscore the role of China's large domestic market in creating opportunities for global commodity producers and agricultural exporters.

Regional patterns within China also point to longer-term structural changes. While the eastern region still accounted for 78.8 percent of total trade, faster trade growth in central and western China suggests that a gradual shift toward a more balanced regional trade structure. Greater geographic diversification may also improve the resilience of the country's external trade over time.

Another important indicator is the composition of trading firms. Private enterprises accounted for 57 percent of China's total foreign trade in the first half, with imports and exports rising 17 percent, while foreign-invested enterprises expanded trade by a slightly faster 17.1 percent. Strong growth by both private enterprises and foreign-invested firms suggests that commercial opportunities — rather than policy incentives alone — continue to underpin the nation's trade expansion. Businesses ultimately invest and trade where they see sustainable opportunities for growth and profitability.

Looking ahead to the second half, uncertainty will remain considerable. Geopolitical conflicts could continue to disrupt commodity markets and global logistics. Trade protectionism may further weaken confidence in the multilateral trading system. At the same time, artificial intelligence and other technological advances are reshaping global production and trade patterns, creating both opportunities and competitive pressures.

Even so, China's fundamental advantages remain intact. The trade growth seen since last year has been rooted largely in underlying production and consumption rather than short-term speculation or inventory accumulation. Such demand is more likely to be sustained. At the same time, deepening trust with trading partners and continued expansion of free trade agreements can provide greater certainty for businesses and a firmer foundation for long-term trade growth.

As services trade expands alongside goods trade, China's contribution to the global economy will increasingly be measured not only by the scale of its exports, but also by the stability, opening-up and connectivity it brings to the international trading system.

Policy support poised to reshape nation's retail industry

MAIN STREET
By Fu Yifu

Recently, the Ministry of Commerce and eight other departments jointly issued the Opinions on Accelerating the Innovative Development of the Retail Industry. Focusing on the systematic planning of the retail industry landscape, fostering new forms of retail supply, creating new consumer demand, stimulating new retail growth drivers, facilitating fair competition and strengthening policy support, the document puts forward 20 measures, providing a clear roadmap for retail innovation during the 15th Five-Year Plan (2026-30) period.

At a time when the retail sector is at a critical stage of transformation and upgrading, what is the deeper significance of this policy document? Which of the 20 measures deserved particular attention? What impact will they have on the sector overall and on consumers? And how should they be implemented going forward? This article examines these questions one by one.

During the 14th Five-Year Plan (2020-25) period, China's goods retail sales rose from 39.4 trillion yuan ($5.84 trillion) in 2021 to 44.3 trillion yuan in 2025, representing cumulative growth of 12.5 percent. Goods retail sales have long accounted for about 90 percent of total consumer goods retail sales, and the retail sector supports more than 80 million jobs. However, expansion in scale has been accompanied by uneven outlet distribution, supply-demand mismatches, rising operating costs and an imbalance between online and offline retail. These problems have weakened profitability and affected consumer experience, especially for traditional hypermarkets and department stores facing declining foot traffic and mounting pressure.

Against this backdrop, the Opinions introduce four major policy breakthroughs.

First, the document proposes a commercial facilities saturation assessment mechanism for the first time. By strengthening the monitoring of retail commercial facilities and supporting qualified cities in carrying out saturation assessments, the mechanism is expected to provide a reference for project approval and social investment. In the past, commercial property development relied heavily on market signals. But information asymmetry and herd behavior often resulted in redundant investment, homogeneous competition and inefficient supply. In this sense, the mechanism can serve as a "barometer" for commercial investment, helping reduce blind construction and resource waste.

Second, the document clarifies the differentiated roles of online and offline retail. By 2030, offline retail is expected to become a space for shopping, leisure, immersive experience, entertainment and social interaction, while online retail is expected to become a standardized shopping channel offering abundant goods, reliable quality and regulated operations. This marks a shift from the previous zero-sum relationship between online and offline retail. In essence, offline retail should focus on experience, social interaction and consumption scenarios, while online retail should emphasize efficiency, quality and compliance. Retail is therefore moving from a goods-centered distribution network toward a consumption ecosystem driven by traffic, content, data and experience.

Third, the document introduces stronger institutional constraints to address unfair or unbridled competition. It calls for equal treatment of online and offline retail, reasonable platform fees, lower operating costs for platform merchants, stronger antimonopoly review, and fairer algorithmic recommendations and traffic distribution. Platforms are encouraged to establish diversified recommendation indicators rather than using price as the sole determinant. Meanwhile, the document targets false advertising, fake promotions, misleading discounts and unfair pricing, and prohibits platforms from forcing merchants to bear subsidy costs or participate in promotional campaigns. Taken together, these measures aim to create a fairer market environment through antimonopoly regulations, price governance, algorithmic transparency and unified supervision.

Fourth, the document strengthens policy support to solve the "last-mile" problems of retail transformation. It provides support in land use, cost reduction, financing, approval procedures and legal safeguards. Qualified high-quality new retail enterprises are encouraged to seek public listings; eligible retailers may issue asset-backed securities (ABS) and commercial real estate investment trusts (REITs); and financial institutions are encouraged to design credit policies suited to the retail sector. Meanwhile, retail enterprises are encouraged to participate in green certificate and green electricity transactions, benefiting from employment-stabilization policies and renovating idle commercial facilities with clear ownership. These measures will broaden financing channels, reduce operating costs and provide systematic support for transformation.

The impact of the document is expected to be transmitted across consumers, enterprises, the retail ecosystem and the broader economy.

For consumers, shopping will increasingly become part of a broader lifestyle experience. Offline retail will no longer be merely a place to buy goods, but also a space for exhibitions, concerts, sports experiences, pet-friendly services and social interaction/activities. Standardized community commerce and instant retail will make daily life more convenient, while facilities catering to the elderly and children will make consumption settings more inclusive and enjoyable. In online retail scenarios, greater algorithmic transparency and more regulated promotions will help reduce problems such as price discrimination and forced bundling, enabling consumers to shop with greater clarity and confidence.

For retail enterprises, fair competition will have stronger institutional support, while transformation paths will become more diversified. Physical retailers have long faced pressure from platform subsidies, algorithmic bias and transferred promotional costs. The new framework — covering antimonopoly enforcement, price regulation, algorithmic transparency and unified supervision — will help create a more level playing field. Stronger firms may develop deeper joint operations, self-operated supply chains and manufacturing-oriented retail, while small and medium-sized merchants may reduce costs through voluntary chains, alliances and joint procurement arrangements. New models — such as omni-channel retail, instant retail and "online traffic plus offline transactions" — can also create new growth space for traditional stores.

For the retail sector as a whole, competition will shift from price and location to experience and efficiency. Retail supply is no longer limited to products. It is increasingly built around scenarios, content and services. Supply-chain innovations — including shared warehousing, unified distribution and standardized coding systems — will shorten circulation links and reduce inventory losses.

Ultimately, the key lies in effective implementation.

First, planning should be used to address layout imbalances. The document calls for national standards on commercial outlet planning and better coordination with territorial spatial planning and urban renewal. Local governments should avoid redundant or repetitive construction, and accelerate the development of practical indicators for saturation assessment.

Second, scenario innovation should be used to revitalize offline retail. The document encourages one-store-one-policy innovation, renovation of old commercial districts, upgrading of shopping streets and commercial blocks, and digital transformation of commercial facilities. Local governments should adapt these measures to local consumer culture and resource endowments, as high-quality scenarios can both attract foot traffic and deepen consumption.

Third, unified regulation should ensure fair competition. Measures such as unified standards for online and offline promotions, fairer algorithmic recommendation systems and stronger price governance require detailed implementation rules. Market regulators should establish routine enforcement mechanisms that apply equally to online and offline retail.

Fourth, integrated policy support should solve last-mile difficulties. Retail innovation should be linked with the modern commercial circulation system and pilot programs for new consumption models and scenarios. Governments at all levels need to break departmental barriers, improve policy coordination and translate land use, financing, tax and fee reductions, talent development and employment support into specific, executable and assessable measures.

In conclusion, the Opinions are not a simple policy adjustment. They are instead a systematic reform of retail development concepts and pathways. They respond to the urgent needs of retail transformation, clarify the differentiated roles of online and offline retail, establish a fairer competition framework and provide comprehensive factor support. By 2030, China aims to build a modern retail system with rational layout, high-quality supply, diversified business formats, smart and convenient services, and fair and orderly competition.

Scholar hails China's math development

Use Fields Medal wins to broaden academic exchanges, says HK expert

By **STACY SHI** in Hong Kong
stacyshi@chinadailyhk.com

Hong Kong mathematician He Xuhua, who was recently elected vice-president of the International Mathematical Union, has hailed the first Chinese winners of the Fields Medal as a "historic breakthrough" for China and its mathematical development.

By being awarded the accolade — widely recognized as the Nobel Prize of mathematics — Chinese mathematicians Wang Hong and Deng Yu gave a major boost to Chinese mathematicians, especially young students, inspiring them to pursue research in the field, He said.

"I got up very early to wait in line and sat in the front row to witness history," said He, who attended the award ceremony in the United States, recalling the exciting moment during a recent interview.

The two mathematicians' work not only resolved core problems but also significantly advanced their respective fields, laying crucial foundations for theoretical progress and interdisciplinary applications, He said.

A year before they won the Fields Medal, He invited Wang and Deng to give lectures at The University of Hong Kong.

Wang's guest lecture in December 2025, which was open not only to university students and faculty but also to the wider public, drew an enthusiastic response, with participants overcrowding the venue, He said.

The arrival of another Fields Medal recipient, Vietnamese-French mathematician Ngo Bao Chau, at HKU in June also highlights the Hong Kong Special Administrative Region's role as a leading international center for mathematics, particularly under the unique "one country, two systems" framework, He said.

He said intensified geopolitical tensions have at times hampered direct academic exchanges between Chinese mainland scholars and their US counterparts. Hong Kong, however, can benefit from "one country, two systems" to provide an effective alternative platform for international conferences and attract world-class scholars.

To further leverage this advantage, He has been working with the Hong Kong Mathematical Society and the American Mathematical Society to co-host a joint conference in Hong Kong in late 2028. The event would bring together leading Chinese and US mathematicians and young researchers, facilitating meaningful cross-border academic dialogue and collaboration.

The proposal is in line with the three-pronged vision He outlined after being elected vice-president of the union in July. At 47, He is the youngest person to hold the post in nearly two decades and the second Chinese mathematician to do so.

> "Most researchers use AI for polishing, and some for more important tasks like proofs. But whoever signs the paper must take full responsibility for its entire content."
>
> **He Xuhua,** a Hong Kong mathematician who serves as vice-president of the International Mathematical Union

His priorities include supporting mathematical development in the Global South, nurturing young scholars by providing exchange opportunities and exploring the intersection of artificial intelligence and mathematics.

He shared his own experience of using AI's deep-learning capabilities to analyze complex mathematical data, which led to an unexpected and groundbreaking finding. But he also advocated a balanced approach to the use of AI in mathematical research.

"Most researchers use AI for polishing, and some for more important tasks like proofs. But whoever signs the paper must take full responsibility for its entire content," He said.

He also stressed the need for more flexible evaluation systems in Hong Kong that can accommodate "long-term" research in pure mathematics.

He cited Chinese-born American mathematician Zhang Yitang as an example, noting that Zhang's groundbreaking work on the twin prime conjecture came after years of relative obscurity.

He highlighted how the city's mathematics community has made rapid progress in recent years and expressed confidence that the city will further strengthen its position as a global hub for mathematical sciences.

At the same time, he urged institutions to have greater confidence in evaluating researchers, particularly those engaged in long-term fundamental research.

Above all, He said it is important to nurture curiosity — a trait he sees in the Fields Medal recipients and believes should be a cornerstone of mathematical education.

Ancient life reimagined

Visitors gather to admire a life-sized reconstructed model of a prehistoric giant bird (left) and its replica fossilized skeleton (right) at China's inaugural paleontological reconstruction competition, held in Beijing on Saturday. Over 100 detailed paleoart and restoration works are on show at the event, with all award-winning pieces set to be displayed for free at Beijing Expo Park from Aug 10 through Oct 31 this year.
YUAN YI / FOR CHINA DAILY

September set as target for HKSAR's inaugural five-year plan release date

By **STACY SHI** in Hong Kong
stacyshi@chinadailyhk.com

The Hong Kong Special Administrative Region government aims to publish its inaugural five-year plan (2026-30) in September, Chief Executive John Lee Ka-chiu said on Sunday.

Speaking after attending the second district forum on the first five-year plan and the 2026 Policy Address at Kowloon Tong Government Primary School, Lee said the HKSAR government has conducted more than 90 consultation sessions since the public engagement exercise began in June.

The exercise has drawn substantial public participation, with about 13,800 submissions relating to the five-year plan and about 8,500 others concerning the Policy Address.

Lee emphasized the close link between the two, noting that the government will strive to align their release timelines as closely as possible. An earlier release of the plan would help the public better understand how the two frameworks relate to each other and affect people's well-being, he said.

The second district forum lasted about two hours and drew roughly 120 participants, including grassroots residents, retirees, students and members of ethnic minority groups.

"I attach great importance to the district forums that provide an important channel for understanding the issues of greatest concern to members of the public," Lee said.

"We'll consolidate these valuable views in a holistic manner, analyze them and consider incorporating them into Hong Kong's five-year plan and the Policy Address, ensuring that policy measures are effectively implemented by the government, as well as translating our blueprint into tangible outcomes for economic development and the improvement of people's livelihoods."

Twenty-seven residents from a wide cross-section of society, including young people, cultural workers, engineers, school principals, teachers, district councilors and businesspeople, voiced their views on a broad range of social issues, with youth development emerging as the most pressing concern.

On housing, a resident said that for Hong Kong's youth, buying a home often hinges less on personal effort and more on having a "rich father".

The resident urged the government to restructure Hong Kong's housing ladder with the inaugural five-year plan in order to create a genuinely fluid pathway that would restore young people's hope of settling down.

In the cultural and tourism sector, a cultural arts practitioner suggested that authorities further consolidate the multi-destination travel strategy to attract more international visitors to Hong Kong and then channel them into the Guangdong-Hong Kong-Macao Greater Bay Area.

Another attendee proposed that the government, in collaboration with the Hong Kong Productivity Council as well as overseas and Chinese mainland economic and trade offices, launch an acceleration program to help local artificial intelligence, robotics and embodied-intelligence enterprises expand globally.

In response, Lee underscored the government's ongoing commitment to enriching the property ladder, with particular attention to youth development. He noted that the planning of the Northern Metropolis presents new opportunities in this regard.

Turning to culture and branding, Lee stressed the importance of building an internationally recognized "Hong Kong brand". While the government will provide support through funding, venues and policy measures to foster diverse creative initiatives, he acknowledged that ultimate success depends on the collective efforts of industry players.

On talent policy, Lee reiterated that the government would adopt a demand-driven approach, tailoring talent admission categories to actual needs.

Several principal officials attended the forum, including Chief Secretary for Administration Eric Chan Kwok-ki, Financial Secretary Paul Chan Mo-po, acting Secretary for Justice Horace Cheung Kwok-kwan and Secretary for Constitutional and Mainland Affairs Janice Tse Siu-wa.

Racing family

Xuelong 2 begins first ice station survey in Arctic Ocean

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China's icebreaker *Xuelong 2* began its first ice station survey near 84 degrees north latitude in the central Arctic Ocean on Sunday, marking the start of about two weeks of comprehensive ice station surveys during the country's 16th Arctic expedition, Xinhua News Agency reported.

Researchers set sail from Dalian, Liaoning province, on July 3, with four vessels — *Xuelong*, *Xuelong 2*, *Jidi* and *Tansuo 3* — for an expedition organized by the Ministry of Natural Resources.

After completing the first phase of ocean station surveys on Friday, the *Xuelong 2* sailed toward higher latitudes. On Sunday, it selected a large, flat ice floe about 1.5 meters thick in a densely packed ice area for its first ice station survey.

Before operations began, two experienced team members stepped onto the ice to drill holes and measure its thickness, identify potential hazards and determine the working area and zones. Scientific equipment was then transported to designated areas to support parallel operations for multiple research projects.

Lin Long, leader of the *Xuelong 2* sea ice team, said the ice station survey includes six short-term stations and one long-term station. The team will conduct more than 20 research projects, including deploying disposable ice-based buoys, collecting ice core samples and carrying out sea ice remote sensing observations.

Xuelong and *Xuelong 2* will jointly conduct ice station surveys. As of Friday, the *Xuelong* had completed surveys at 12 ice stations.

The ice station sites surveyed by *Xuelong 2* will be coordinated with those of *Xuelong* to form an observation array, providing deeper insights into interactions among the atmosphere, sea ice and ocean in the central Arctic Ocean amid rapid Arctic change, as well as their coupling effects on the ecosystem, Lin said.

Lan Musheng, an assistant to the expedition's chief scientist, said researchers will comprehensively monitor dynamic changes in the atmosphere, sea ice, upper ocean and sub-ice ecological processes during sea ice melt.

The observations will provide scientific data crucial for studying rapid changes in Arctic sea ice, their underlying mechanisms and ecosystem evolution, Lan said.

To address the risks posed by polar bears during ice station operations, the expedition team has developed bear-deterrence and emergency response plans to ensure personnel safety.

Focused on global climate change and its impacts, the expedition aims to provide scientific support for China's participation in Arctic governance through multidisciplinary comprehensive surveys and international frontier research. The mission is expected to be completed in early October.

Shenzhen tech firms expand into APEC economies

By **CHEN HONG**
in Shenzhen, Guangdong
chenhong@chinadaily.com.cn

With Guangdong province's Shenzhen set to host the APEC Economic Leaders' Meeting in November, the city's technology companies are stepping up their expansion across the Asia-Pacific region, seeking deeper cooperation in artificial intelligence, robotics, semiconductors and other emerging sectors.

Shenzhen-based Xbrewlab Inc, which focuses on commercial and household coffee applications, has launched a pure nitrogen beverage machine that uses direct air nitrogen purification technology to replace costly and cumbersome traditional nitrogen capsules.

The technology enables users to produce high-quality nitrogen-infused drinks more easily while expanding the application scenarios for nitrogen technology, said the company's founder, Tan Tianyi.

The brand has established a foothold in the United States and Southeast Asia and is expanding into more economies across the Asia-Pacific region. Some of its products, including coffee beans, coffee scales and nitrogen beverage machines, have been selected as official souvenirs for the 33rd Asia-Pacific Economic Cooperation Economic Leaders' Meeting, Tan said.

"This year we have secured distribution partnerships with more APEC member economies. We hope to take advantage of this conference to invite entrepreneurs and partners to experience our new products in person," he said.

As the two-day meeting approaches, Shenzhen, a core innovation hub in the Guangdong-Hong Kong-Macao Greater Bay Area, is creating new opportunities for technological exchanges and industrial cooperation across the region.

X Square Robot, Shenzhen-based company specializing in general embodied intelligence foundation models, made the national unicorn enterprise list in July. Its technologies have been gradually deployed in high-value applications, including industrial manufacturing, logistics and elderly care services.

"We aim to explore diverse application scenarios across the Asia-Pacific, promote human-machine integration through embodied intelligence technologies and support the industrial upgrading of APEC economies with smart living solutions," said Xu Menghong, strategy and investment director of X Square Robot.

Tech firm SmartMore has also expanded its presence in global markets. Shi Xiaoliang, the company's product R&D director, said its industrial AI solutions have served more than 730 leading global enterprises.

The company focuses on core technologies including intelligent robot R&D, industrial-grade AI algorithms and intelligent sensors.

"Shenzhen's strategic position in the Greater Bay Area and its close ties with Hong Kong strongly underpin our expansion across the Asia-Pacific," Shi said. "We will further deepen technological and industrial cooperation with manufacturers and research institutions in the region to drive the digital and intelligent transformation of traditional industries," he added.

Lei Guohui, general manager of Advanced Assembly Materials China Ltd, said the company has built a cross-border R&D and production network spanning Hong Kong and Malaysia.

"The APEC platform offers valuable opportunities for upstream hard-tech enterprises in Shenzhen to showcase homegrown innovations and strengthen industrial and supply chain coordination with Asia-Pacific partners, bolstering regional collaboration in the semiconductor industry," Lei said.

Both Xbrewlab and X Square Robot were incubated at Shenzhen InnoX Academy, which was founded in 2021 by Professor Li Zexiang, a globally recognized expert in robotics and innovation education. The academy aims to nurture top-tier hard-tech entrepreneurial talent and incubate globally competitive technology startups.

Figures from the academy show that it has incubated more than 100 projects over five years, 39 of which are at the angel, or early stage of a startup, with a combined valuation of nearly 3 billion yuan ($444.8 million).

The incubated startups have strong global operations and deployment capabilities, providing hard-tech products and supporting services to markets worldwide, including all APEC member economies.

Zhang Xuechun contributed to this story.

Editor's note: *As protection of the planet's flora, fauna and resources becomes increasingly important, China Daily is publishing a series of stories to illustrate the country's commitment to safeguarding the natural world.*

Iconic 20-yuan landscape goes zero-carbon

Electric rafts and green power grids turn Lijiang River into a global model for eco-tourism. **Hou Liqiang** reports from Guilin, Guangxi.

Visitors cruise the Lijiang River aboard electric rafts in Guilin, Guangxi Zhuang autonomous region. PHOTOS BY HUANG SHENGLIN, ZHAO JUNSHI, AN BAIMING AND LIAO ZUPING / FOR CHINA DAILY

For decades, the serene karst mountains along the Lijiang River — the very landscape immortalized on the back of China's 20-yuan banknote — were offset by a noisy, polluting reality. Gasoline-powered tourist rafts roared down the water spewing black exhaust, and unsightly overhead power lines crisscrossed the river like scratches on a canvas.

Today, the roar has been replaced by a low hum, the power lines are gone, and the iconic view in Guilin's Xingping township in the Guangxi Zhuang autonomous region has been fully restored.

Through a sweeping low-carbon transition led by local authorities and China Southern Power Grid, the Lijiang River Scenic Area has successfully tied ecological preservation directly to local economic growth. By fully electrifying transport, building modern charging infrastructure, and switching nearby communities to 100 percent green power, the region has created a blueprint for sustainable eco-tourism.

Silence on the water

The most immediate shift is on the river itself. Between 2023 and 2024, the scenic area completed a massive project converting all 1,000 of its sightseeing rafts, including 500 at two key wharves in Xingping, from gasoline to electric power.

The transition cut noise levels from a deafening 120 decibels to a quiet 60 decibels, while drastically improving safety and maneuverability for operators.

"In the past, gasoline engines produced loud noise and black smoke, and fuel leaks threatened the river," said Mo Jianbin, who has operated rafts at Chaobanshan Wharf for 14 years. "Now, the electric rafts have reverse gear, making docking and navigation much safer."

The environmental gains have come with economic benefits. Gasoline-powered rafts previously incurred fuel costs of up to 1.5 yuan (22 cents) per kilometer, borne by the operators themselves. Now, the energy cost for each raft has dropped to 0.5 yuan per kilometer — and it is covered by the Lijiang River Scenic Area's management company, Mo said.

With a better visitor experience and more tourists, Mo added his annual income has increased from 30,000 yuan to over 60,000 yuan.

Added infrastructure

Powering a fleet of 1,000 electric vessels required an equally modern onshore grid. China Southern Power Grid responded by establishing a 15-minute charging network across Xingping township, including specialized facilities directly opposite Chaobanshan Wharf capable of fully charging raft batteries in two to three hours.

Just a stone's throw away sits the Egendi station — Guilin's first integrated energy facility combining solar generation with electric vehicle charging. Constructed despite extreme space constraints along the protected riverbank, the 988,700-yuan station features a photovoltaic canopy with 45 solar panels. Generating roughly 80 kilowatt-hours of solar power daily, the small station has served over 16,000 vehicles and cut an additional 2,924.5 metric tons of carbon emissions.

Though modest in size, the charging station's construction along the Lijiang River was a remarkable achievement, according to Ni Chengjie, an executive with the grid's branch in Xingping.

He said the Egendi charging station is one of only five such facilities constructed by China Southern Power Grid in Xingping, all of which collectively create a 15-minute charging network in the township.

Restoring village views

The final piece of the puzzle lay across the river in Dahebei, an island-like village of 300 households situated directly inside the core scenic zone.

The village sits along the most scenic stretch of the Lijiang River. Yet this idyllic location, for all its beauty, once made power supply to Dahebei highly unreliable. In the past, electricity had to be carried across the river via overhead lines from Xingping, with utility poles strung along the water's edge disrupting the beauty of the view.

"Tourists once had to retouch their photos before sharing them online — carefully removing the utility poles and overhead wires that marred the view," said Zhang Qiaomu, head of the Xingping power supply station.

Long transmission distances, frequent faults and unstable voltage were even more practical headaches, he added.

In 2021, a joint initiative set out to remove the overhead lines entirely and transition Dahebei into a zero-carbon community. Because installing solar panels on the island would have ruined the pristine views, China Southern Power Grid routed green electricity directly through an upgraded grid network.

The transition required cultural change. Villagers who had cooked with firewood for generations were hesitant about switching to electric appliances. To build trust, the power grid ran a two-year pilot program allowing residents to try green electricity at standard rates.

"When we first started, I didn't even know what 'green electricity' meant," said Tang Cunxue, a village official.

"Green electricity is a little bit more expensive, but China Southern Power Grid agreed to let us try it at the same price," Tang said, adding that gradually the villagers came to embrace it.

For the village, the green transition has meant more than just a change in its energy mix — it has brought a fundamental shift in its development philosophy.

"Many people advocate low-carbon travel. When they come to the island and see green electricity in use, with a beautiful environment to match, they feel more relaxed — and word spreads," Tang said.

The village's homestays have also undergone a qualitative shift. With a healthier ecosystem, the village sees more guests bringing their families for extended stays.

"What we're selling is a lifestyle and a rhythm — homegrown vegetables, free-range chickens, not greenhouse produce," said Tang.

According to the village committee, Dahebei has experienced a huge surge in tourist numbers.

In 2019, about 140,000 to 150,000 tourists came to the village. In 2024, following the full rollout of green electricity, that figure soared to around 1 million, surpassing 1.2 million in 2025.

The Xingping power supply station has also introduced a "green electricity code" system to certify and rate homestays based on their use of green energy.

With a large number of visitors in Xingping, accommodations with green electricity certification are more sought-after, Tang said. The mechanism has helped attract higher-end clientele and elevated the island's overall tourism quality.

"Villagers' incomes are rising year by year, and you can see it on their faces — everyone is smiling," he added.

Nanning transforms urban waste into energy

By **HOU LIQIANG** and **SHI RUIPENG** in Nanning

Left: Photovoltaic panels are built over a parking lot to shelter vehicles in Nanning, Guangxi Zhuang autonomous region, in April. FAN SHAOGUANG / FOR CHINA DAILY **Right:** Workers install PV panels in Nanning's Binyang county in March last year. ZENG XIANGZHONG / FOR CHINA DAILY

At the Shuangding Circular Economy Industrial Park in Nanning, Guangxi Zhuang autonomous region, a waste treatment plant is challenging the conventional image of such facilities.

There is no pungent smell or smoke-filled sky. Instead, there is a garden-like compound and automated treatment lines that sort, incinerate and process urban waste, converting it into electricity, heat and construction materials.

The plant provides a glimpse into Guangxi's push to turn household garbage, kitchen waste, urban sludge and medical waste into usable resources via coordinated treatment facilities, rather than simply burying or discarding them. The Shuangding park, operational since late 2021, is the region's first facility of this kind.

Developed, built and operated by Guangxi Green City Environmental Development Group, a subsidiary of Nanning Jianning Water Investment Group, the park spans some 73 hectares. To date, around half of the site has been constructed, with total investment in the project estimated at 2.56 billion yuan ($379.33 million).

Chen Xuewen, deputy general manager of Nanning Jianning Water Investment Group, said the park is built around the principle of energy recycling, with its coordinated treatment system anchored by the incineration of household waste to generate electricity.

While electricity generated from waste incineration is fed into the national grid, residual heat is piped to facilities that treat organic waste, sludge and medical waste. "This improves overall energy efficiency," Chen said.

Equipped with three furnaces, the park's household waste incineration plant has a daily treatment capacity of 2,250 metric tons. Each ton of raw household waste processed can generate nearly 600 kilowatt-hours of electricity, roughly equivalent to the power consumption of a three-person household for three months, he added.

Great emphasis has been placed on reducing secondary pollution. A wastewater treatment facility with a daily capacity of 1,700 tons handles leachate, production wastewater and domestic sewage. After advanced treatment, the water is reused for cooling, landscaping and other production purposes within the park.

Slag left after incineration is processed to recover metals, while the remaining material is made into eco-friendly bricks or roadbed materials. Fly ash, which accounts for about 2 to 3 percent of incinerated waste, is stabilized and solidified before being sent to a designated landfill for safe disposal.

To control emissions, the park employs a seven-step flue gas purification system, integrating technologies including denitrification, deacidification and dust filtration. Chen said the facility's emission indicators are stricter than China's national standards and European Union limits.

Since starting operations, the park has treated 4.7 million tons of solid waste, generated 1.87 billion kWh of electricity, saved 410,200 tons of standard coal and reduced carbon dioxide emissions by 1.03 million tons.

Beyond the park's own achievements, Nanning has been building a citywide recycling system that covers industrial, household, construction, agricultural and hazardous waste, according to local authorities.

The resource utilization rate for household waste in the city has reached 86.65 percent. For hazardous waste, the utilization and disposal rate stands at 96.98 percent, while the harmless disposal rate for medical waste remains at 100 percent.

Nanning has also made notable progress in clean energy development. As of the end of 2025, renewable energy accounted for 85 percent of the city's installed power generation capacity and 70 percent of its actual electricity generation, according to city authorities.

While renewable energy development has been robust, the inherent intermittency and variability of wind and solar generation have created significant challenges for the city's power grid.

Against this backdrop, Nanning authorities launched the construction of the Nanning Pumped-Storage Power Station in July 2022. Its upper reservoir sits on Baizao Mountain, while the lower reservoir is located about 3 kilometers to the southwest. With a height difference of 470 meters between the two reservoirs, the station functions as a large-scale energy storage facility for the grid.

As a traditional method of energy storage, pumped storage uses surplus electricity during off-peak hours to pump water to the upper reservoir and then releases it to generate power when demand rises.

With a total investment of 7.93 billion yuan, the Nanning Pumped-Storage Power Station features four 300-megawatt units, giving it total installed capacity of 1,200 MW and a designed annual power generation of nearly 1 billion kWh.

Liu Yi, deputy general manager of Nanning Pumped Storage Co, said that as of May 31, the station had generated 239 million kWh of electricity and consumed 297 million kWh for pumping, with overall efficiency reaching 80 percent.

He added that the power station has provided strong support for the local power grid in peak shaving, frequency regulation and emergency reserve, significantly enhancing grid reliability.

The company has also built a supporting battery-swapping station for heavy-duty electric trucks, equipped with 20 electric vehicles and four 300-kW charging piles, enabling rapid battery swaps in just 3 to 5 minutes. According to the company, the station saves 680,000 liters of fuel annually and cuts carbon dioxide emissions by 1,800 tons per year.

CULTURE

Traditional dance makes new moves

Black suits, flashing blades and ancient festival rituals captivate social media, transforming Munao Zongge into a powerful expression resonating far beyond Yunnan, **Yang Feiyue** reports.

In a short video, rain falls over Dianchi Lake, softening the outline of the Western Hills in the distance. On the Danxia Bridge, a group of dancers dressed in black suits stands motionless for a moment before raising their long swords.

Then the drums beat. With sharp turns, powerful steps and sweeping sword movements, the dancers transform a traditional Jingpo sword dance into a performance that feels both ancient and contemporary.

The rhythm of Munao Zongge, one of the most important traditional festivals and art forms of the Jingpo ethnic group in Southwest China's Yunnan province, echoes across the water.

The video, filmed in Kunming, the provincial capital of Yunnan, in late July, quickly spread across Chinese social media platforms, drawing millions of views and sparking waves of imitations.

Many viewers are captivated by the contrast: traditional swords paired with modern suits, ethnic heritage presented through a visual language familiar to younger audiences. At the center is Yuan Zhiping, a principal dancer of Yunnan Provincial Song and Dance Ensemble.

A Munao Zongge festival is held in Longchuan county, Dehong Dai and Jingpo autonomous prefecture, Yunnan province, in October 2025. Group dancing is a highlight of this traditional festival of the Jingpo people. XINHUA

For Yuan, the popularity is not simply the result of a striking image. It reflects years of exploration into how traditional culture can find new forms of expression.

Most of the movements come from authentic Jingpo sword techniques, Yuan says. The turns, spins and sword gestures are adapted from traditional elements, while the presentation is redesigned to create a stronger connection with contemporary audiences.

Injecting fresh appeal

The performance's appeal comes from a careful balance between inheritance and innovation. The choreography retains key elements of Jingpo sword techniques, including powerful movements that highlight strength, courage and discipline, Yuan explains.

Traditionally, the long sword has held deep symbolic meaning in Jingpo culture, representing identity and resilience.

Yuan decided to update the visual language. Instead of wearing elaborate traditional costumes, the dancers appear in simple black suits. The modern silhouette gives the performance a sharper stage presence while keeping important cultural symbols, including the traditional Jingpo ornament known as *tongpa*.

The music helps bridge past and present. The song *Munao Zongge*, which carries the same name as the Jingpo festival, combines traditional rhythms with contemporary arrangements, telling a story of cultural convergence. Its melody dates back to 1991, when Jingpo artist Shi Legan distilled ancient musical forms — Dongba and Wenbeng — into a composition he titled *Munao Zongge March*. For decades, it was a regional treasure, little known beyond the hills of western Yunnan.

That changed early this year when Beijing-based music producer Zhen Zhen (known online as Banxia Shuiyu) wrote new Mandarin lyrics that spoke not just to Jingpo identity but to a broader Chinese experience — evoking the family hearth, the ancient Tea Horse Road, and the majestic Gaoligong Mountains. He then used AI to weave the traditional melody with modern electronic arrangements. The result was a track that felt neither antique nor artificial, but powerfully alive.

The response was immediate. By May, the song had surpassed 3 billion streams. Its percussive, martial rhythm proved irresistible to short-video creators, who used it as the soundtrack for everything from Jingpo festival footage to dorm room dance-offs. The song stopped being a piece of music and became a call to move, gather and participate.

But the dance itself carries meaning that transcends any single remix.

Munao Zongge means "gathering together to dance", reflecting the festival's central message of collective celebration. It is the grandest traditional festival of the Jingpo people, who live in the Dehong Dai and Jingpo autonomous prefecture in Yunnan.

Top: Dancers wear headdresses made from hornbill beaks and peacock feathers. **Above:** Yuan Zhiping leads a rehearsal of his updated version of the traditional sword dance. PHOTOS BY XINHUA

According to Jingpo oral tradition, the dance traces its origins to the sky. Long ago, only the children of the Sun God could perform it. When the Sun God invited all earthly beings to a celestial dance, the birds — led by the hornbill and the peacock — flew to the heavens to join. On their return, they re-created the dance beneath a wild fig tree. The Jingpo ancestors witnessed this bird dance, carved its patterns into stone, and held the first human Munao Zongge.

This origin story explains the festival's ritual regalia, in which the lead dancers, or *naoshuang*, wear headdresses made from hornbill beaks, peacock feathers and wild boar tusks — symbols that honor the birds who first brought the dance to earth.

At the center of the dance ground stands a sacred structure of four pillars. The two taller middle pillars bear the sun and spiral fern patterns; the two outer pillars bear the moon. Crossed swords at the center symbolize the community's strength and resilience. Horizontal beams display crops, tools and livestock — the community's hopes for prosperity and continuity, according to Zhao Baozhong, a national-level intangible cultural heritage inheritor from Longchuan county of Dehong, who has spent decades studying and performing Munao Zongge.

"For the Jingpo people, the dance carries memories of history, belief and social life. It is a living archive," Zhao says.

Zhao, in his 60s, began learning the dance in the 1980s after witnessing large-scale festival performances and becoming fascinated by the discipline required to lead thousands of dancers. He eventually became a *naoshuang*, a role he has held for decades.

"A lead dancer must remember all the dance routes, all the patterns," Zhao says. "They have to be in your mind, in your memory — you can't look at a book while you're leading thousands of people."

He notes that the dance has undergone major social changes.

Historically, large-scale Munao Zongge ceremonies were closely connected with community leaders and traditional rituals. Over time, the celebration became increasingly open to the wider community, allowing more people to participate.

In 2006, Munao Zongge was included in the first batch of China's national intangible cultural heritage representative items. In 2012, an international Munao Zongge festival in Mangshi of Dehong set a Guinness World Record for the largest Munao Zongge dance, with more than 18,600 participants moving in unison.

Today, the festival has evolved into a platform for broader cultural exchange.

Passing the baton

For younger inheritors, the challenge is how to keep the tradition alive in a changing world.

Cun Daijin, a young inheritor, began learning the dance after being inspired by older performers leading large festival gatherings.

"I saw the elders in their ceremonial robes, leading thousands of people," he says. "They're still doing this at their age. Why shouldn't I?"

He later became a *naoshuang*, while continuing his work as a macadamia grower. For him, the dance is not just a profession but a calling.

"Remembering every movement, understanding the cultural meaning behind the dance and guiding others require years of practice," he says.

Cun has also turned to short videos and public performances to introduce Munao Zongge to new audiences.

"Intangible cultural heritage is not something placed behind glass. It needs to be experienced and passed on," he says.

Cun believes that Yuan's reinterpretation has created a new entry point for people unfamiliar with Jingpo culture.

"The more people who understand it, participate in it, and fall in love with it, the more likely it is to continue," he says.

Stepping toward global exchange

By RENA LI in Los Angeles
renali@chinadailyusa.com

After years of balancing a career in software engineering with evening dance rehearsals, Olivia Xia, a Chinese American born in Washington DC, never imagined that her lifelong passion for Chinese classical dance would take her to China.

When Xia stepped onto the stage at the Irvine Barclay Theatre in California to receive the inaugural Li Chen Fellowship for Chinese Dance Studies, the moment reflected both her personal journey and the organizers' broader efforts to promote Chinese classical dance through education and international exchange.

"I'm incredibly honored to be the first recipient of this fellowship," Xia says. "Chinese classical dance is my passion. It connects me to my cultural roots and provides me with a rich artistic experience. This fellowship will help me pursue dance as a profession."

The fellowship, which provides $5,000 annually for two years to support Xia's graduate studies at the Beijing Dance Academy, was unveiled during the recent 2025-2026 Taoli World Dance Competition North America Finals.

Presented by the Pan America Chinese Dance Alliance, the competition brought together hundreds of dancers, educators, choreographers, and scholars from the United States and Canada.

The fellowship was established by Kurt Haunfelner, former vice-president of exhibits and collections at Chicago's Museum of Science and Industry, in memory of his late wife, Li Chen, a Chinese dancer who died in 2025 after a six-year battle with breast cancer.

For Haunfelner, supporting young dancers is a way to preserve both his wife's legacy and the cultural tradition she devoted her life to.

Back to the Fields I Love, performed by Dragonfly Arts Academy from Phoenix, Arizona. RENA LI / CHINA DAILY

"I think Chinese classical dance is extraordinary," he says.

"It's beautiful, it's heartfelt, and it brings people together."

Haunfelner says he believes culture offers something politics often cannot. "Sometimes we let politics get in the way of the connection between human beings. But when we connect on a human level, we understand that we all have the same dreams and the same hopes," he says.

The Taoli World Dance Competition was founded in 2017 by Pan Zhitao, a professor at the Beijing Dance Academy. It has evolved into an internationally recognized platform dedicated to preserving and promoting Chinese dance overseas.

This year's finals featured performances in Chinese classical dance, Chinese folk dance, contemporary Chinese dance, ballet, and modern dance by competitors ranging from children to adults.

The competition was judged by an international panel of leading dance educators and artists from China, the US and the United Kingdom.

Beyond performances, the event included multicultural master classes, academic forums, alumni exchanges, and educational workshops designed to encourage artistic dialogue across cultures.

Cheer Pan, co-founder and executive director of the Pan America Chinese Dance Alliance, says Chinese dance has seen remarkable growth since she began teaching in the US three decades ago.

"We are encouraged to see Chinese dance increasingly recognized, appreciated, and embraced on international stages," she says.

The competition, she adds, seeks to preserve the artistic standards and cultural identity of Chinese dance while encouraging international exchange.

She hopes younger generations will gain not only professional training but also a deeper appreciation of their cultural heritage.

Local officials say the competition also reflects Irvine's identity as one of Southern California's most diverse cities.

Scotty Hong, executive assistant to Irvine Mayor Larry Agran and commissioner of the Irvine Sustainability Commission, says the event demonstrates the city's commitment to multiculturalism.

"This is a great showcase of what our city values most, which is diversity," Hong says.

Former Irvine mayor Farrah Khan says the performances introduced audiences to the richness and diversity of Chinese culture.

LIFE

Following a star's quiet ascent

Through tenacity and patience, actress takes her time to find the right roles in which she can bring her true talent to the screen, **Xu Fan** reports.

From iconic auteur Zhang Yimou's *One Second* to the recent Qinqiang Opera-themed *The Lead*, actress Liu Haocun has won widespread popularity, establishing herself as one of the brightest young stars on the screen.

Actress Liu Haocun's flight was delayed by severe weather. The plane circled above the city before finally touching down at Beijing Capital International Airport around 2 am — hardly an ideal landing time for anyone with a busy day ahead.

Yet, after only a few hours of sleep, Liu was already back on schedule. At 7 am, she was ready to head to a studio in eastern Beijing for a styling shoot tied to a new film.

"She has incredible resilience. Once she sets her mind on a goal, she gives it her all," says one of her team's members who was helping Liu to prepare for her interview with China Daily.

At first glance, Liu gives the impression of being delicately petite. But beneath that quiet, gentle exterior lies a surprising reserve of tenacity.

Luck and skepticism have both shadowed her path to stardom. Six years after her screen debut in Zhang Yimou's *One Second* — a tear-jerking tale of a father's desperate search for a final image of his late daughter — Liu has grown into one of China's most recognizable young actresses.

Following that film, she appeared in a string of blockbusters, from the cancer-themed *A Little Red Flower* (2020) to the heartwarming *Remember Me* (2024) and the suspense thriller *Vanishing Point* (2026).

But what recently propelled her to a new level of fame is the television drama *The Lead*, adapted from Chen Yan's Mao Dun Literature Prize-winning novel of the same title.

Set in Shaanxi province in Northwest China, the series spans more than four decades, tracing the rise of Yi Qin'e — a young shepherd from a remote mountain village who eventually becomes a star of Qinqiang Opera, an ancient and influential form of Chinese folk theater that originated in the region.

"As an actress, I feel truly honored to portray a character like Yi. This is also the first time I have taken on a role that spans decades," Liu says.

An authentic portrayal

Earlier this year, the National Radio and Television Administration, the country's top industry regulator, held a seminar on *The Lead*, bringing together the show's creators and industry insiders to examine its success.

The series has garnered over 1.08 billion online views, achieved an average episode rating of 4.18 percent, far exceeding the industry's 1 percent benchmark, and sparked widespread conversation across platforms including Xiaohongshu, also known as RedNote.

Behind those numbers lay a production process defined not only by creativity but also by endurance.

Chen Yan, the novel's author, remembers visiting the set in Xi'an, the capital of Shaanxi province. It was a sweltering summer day, with temperatures climbing above 30 C. Yet, the actors were dressed in heavy winter costumes for scenes set during winter.

As Chen walked past a pigpen where two hogs oinked loudly, clearly awaiting their meal, he saw Liu, clad in a thick padded jacket, quietly pouring several ladles of swill into the trough.

"That scene transported me back to a time impossible to forget," Chen recalls. He says Liu's performance gave him an almost immersive sense of reality.

For Liu, achieving that level of authenticity required months of preparation long before filming began. Qinqiang Opera — believed to have matured during the Ming Dynasty (1368—1644) — is known for its powerful vocals and bold physicality. It demands both strength and emotional intensity, and performers typically start training as children, studying for years before they even set foot on a stage.

Liu had just two months to prepare. She joined the production team early for intensive and closed-door training, where her days were packed with dialect coaching, singing, recitation, acting, and acrobatics, often for more than 10 hours a day.

She also practiced demanding techniques, including *wo yu*, a posture requiring the performer to squat slowly with extreme flexibility, and *chui huo*, a stunt involving bursts of flame blown from the mouth.

For Liu, however, such preparation was not merely an obstacle to overcome. It was a necessary immersion.

"Every performance in front of the camera, whether in opera or dance, comes down to the training, accumulation, and refinement that happen day after day behind the scenes. As actors, this is something we must do. Only by doing it well can we bring our best to every scene," she says.

Her ability to adapt to the rigors of Qinqiang also draws on her dance background. The 26-year-old actress began learning dance at 4, attended the Affiliated Secondary School of Beijing Dance Academy at 11, and was admitted to the academy's folk dance department at 16.

More than a decade of practice gave her a keen sense of rhythm and body control: skills that proved invaluable when learning opera.

"Over 10 years of dance training gave my body a sense of rhythm, and that rhythmic beauty is a form of artistic beauty too. On camera, I can adjust it according to emotional shifts. I believe body language is a vital part of acting. When it merges with facial expression and inner emotion, the performance no longer feels flat — it enriches the character," Liu says.

At one point, the intensity peaked. Liu watched more than 40 opera footage recordings in a row for study purposes, bringing her emotions to the brink of exhaustion. But she also kept a steady habit: carrying a notebook to record everything she learned and reflected on.

"Whether I'm reading the script or the original novel, I write down my understanding of the character's journey and my thoughts about the role. That helps me deepen my impression, better grasp the character, and later, after filming, review what I've accomplished and what I could improve," she adds.

"The stage presence of Qinqiang characters is often beautiful and rich in classical charm. Each role requires the performer to experience delicate, profound emotions before unleashing a powerful, life-stirring resonance," Liu says, explaining her connection to the 600-year-old art form.

Reflecting on her portrayal of figures ranging from Mu Guiying, a Song Dynasty (960—1279) general, to Yang Paifeng, a servant-turned-warrior, Liu says that during the six months of shooting, she became increasingly immersed in her role and increasingly captivated by the allure of Qinqiang.

Now, the young actress says she hopes the drama's popularity will inspire more young people to learn about Qinqiang, an art deeply rooted in the land and its people, and encourage them to visit theaters and experience its charm firsthand.

The long game

Rome was not built in a day. Behind Liu's seemingly rapid rise lies a quieter, less visible story: years of patience, discipline and quiet preparation.

Fu Lulu, who joined Zhang Yimou's team as an assistant director in the early 2000s, recalls that Liu first caught Zhang's attention during the casting for *Shadow*, the 2018 martial arts film about a commander who secretly trains a look-alike to reclaim a city.

In an earlier interview with China Movie Channel, Zhang described his first impression of Liu: she was "like a piece of black-and-white paper", with eyes that seemed to speak. Although Liu did not get the part — she auditioned for a princess role — Zhang advised her not to rush into acting. Instead, he encouraged her to remain a "blank slate" and wait for the right opportunity.

Zhang later said her perseverance and instinct convinced him she had the qualities of a real actress.

So, she waited three years.

It was not until 2018, when preparations were being made for *One Second*, that Liu auditioned for Zhang again. Among more than 3,000 candidates, she won the role of Liu Gui'nyu, an orphaned teenager struggling to care for her younger brother.

In the film, she played a street girl with a dirt-smudged face who attempts to steal film reels, hoping to use the material as a lampshade. The role, which demanded both fragility and grit, became her screen debut and the starting point of her acting career.

"She works very hard and can endure a lot. She displays a lively quality. Everyone who meets her says she's smart and intuitive. She's got what it takes. When we were shooting *One Second*, I told her, 'Haocun, you were made for this.' I even joked that she might need to change careers (from being a dancer to an actress)," Zhang recalled in the television interview.

"Liu looks like a well-behaved, obedient kid, but she had to play a character almost like a little beggar, which was a huge contrast to her real self. On top of that, she was the only newcomer in the cast who had never studied acting. Yet, when she started her very first scene, the acting coach and I couldn't help glancing at each other — our eyes lit up. We both thought, 'How is this kid so talented?' She exceeded all our expectations," Fu recalls to China Daily.

Liu also remembers a moment from shooting *One Second* in the Dunhuang desert in Gansu province. For one scene, she needed to pick up a cabbage leaf to convey that her character was starving. Though the leaf was covered in sand, she bit into it without hesitation and did her best to make it seem delicious, a precious morsel her character could only dream of during the harsh years of the 1970s.

Through that unusual and physically demanding sequence, Liu says she suddenly understood what it meant to be an actor.

"I also understood why I would love acting for the rest of my life, taking it as part of who I am, a realization that became my quiet, lasting enlightenment."

She speaks those words with a seriousness in her eyes, not as a star enjoying the spotlight but as someone who has experienced years of hard work and uncertainty, and has come to understand that the stage is where she truly belongs.

> "Every performance in front of the camera ... comes down to the training, accumulation, and refinement that happen day after day behind the scenes.

CULTURE

A poignant tale of fading memories

An intimate live performance captures the heartbreaking reality of illness alongside deeply held personal bonds, **Chen Nan** reports.

At 64, actress Cai Ming makes her debut in the musical *Let Me Sing My Heart to You, My Mom*, composed by singer-songwriter Xiao Ke (right). PHOTOS PROVIDED TO CHINA DAILY

As the final scene of the Chinese musical *Let Me Sing My Heart to You, My Mom* ended, the audience did not immediately applaud. Instead, they sat in silence, deeply moved by actress Cai Ming's portrayal of a mother living with Alzheimer's disease and a son struggling to hold on to their bond.

Onstage, Cai had just completed one of the most emotionally demanding roles of her career: a mother whose memories gradually fade, with composer and playwright Xiao Ke portraying her guilt-ridden son. Many audience members sat motionless, wiping away tears before finally breaking into long and heartfelt applause.

Running from Aug 1 to Sept 13 at Xiao Ke Musical Theatre in Beijing, the production marks more than the return of a beloved musical.

For Cai, 64, the premiere also fulfilled a promise she had made nine years earlier.

"This is the day I've fulfilled a dream," Cai told the audience as the cast presented her with a cake celebrating her first-ever musical theater performance. Stepping onto a small musical stage in her 60s, she has shown that artistic discovery can happen at any age — and that some promises are worth waiting nine years to keep, as Xiao Ke puts it.

The journey began in 2017, when singer-songwriter Xiao Ke decided to create a musical inspired by his own mother, who had begun showing early signs of Alzheimer's disease. He wanted to create a work that could express emotions he had never been able to put into words.

When Cai heard about the project, she immediately responded: "You write it. I'll play the mother."

The script was completed in 2019, but scheduling conflicts prevented Cai from joining the original production. Over the following years, the musical and the actress repeatedly missed their chance to work together.

When Xiao Ke revived the production this year, he reached out once again. This time, Cai rearranged her other commitments to take part.

Although she had spent decades performing on stage and screen, musical theater was unfamiliar territory. While she had sung in previous performances, she knew the demands of a live musical required an entirely different level of preparation.

Above: The premiere of the latest production of *Let Me Sing My Heart to You, My Mom* in Beijing on Aug 1.
Below: Xiao Ke and Cai Ming at the premiere.

At first, Xiao Ke told her she only needed to sing one song. That promise did not last.

As rehearsals progressed, he was increasingly impressed by Cai's vocal ability and dramatic instincts. One song soon became three.

At the premiere, their duet *Little One, Don't Be Afraid* became one of the evening's most touching moments, while Cai's solo *I've Changed, Yet I'm Still Me* revealed the emotional depth behind the character. In another scene, Cai unexpectedly sang a famous aria from the Chinese folk opera *The Marriage of Xiao Erhei*. The moment emerged spontaneously during rehearsal, and Xiao Ke immediately decided to keep it in the production.

Cai later joked that she had been "tricked".

"He told me it was only one song," she says, laughing.

But there was no mistaking her enjoyment of the role.

Known to generations of Chinese audiences for her sharp comedic performances, Cai took on a completely different persona in *Let Me Sing My Heart to You, My Mom*. The musical explores memory, family and the pain of realizing that some goodbyes come too late.

Xiao Ke, whose real name is Ke Zhaolei, is best known for folk and pop songs. Born in Beijing, Xiao Ke was trained in classical music. The singer-songwriter's eponymous album was released in 1996, and he has also written songs for pop stars, including *Because of Love* for pop diva Faye Wong and Hong Kong singer Eason Chan. One of his most famous songs is *Beijing Welcomes You*, which was written to mark the 100-day countdown to the 2008 Beijing Olympics.

His journey into theater began in 2007. About 15 years ago, he launched Xiao Ke Musical Theatre in Beijing's 798 Art Zone, where more than 10 Chinese musicals, all written by him, have been staged.

For Xiao Ke, *Let Me Sing My Heart to You, My Mom* is far more than a musical. It is a personal letter to his mother.

Written in 2019, the musical was inspired by her early symptoms of Alzheimer's disease and became his way of expressing feelings that were too difficult to say aloud. It was also the last production she watched at his theater, making the work an especially personal tribute.

The story follows Hu Keyi, a middle-aged singer who dreams of success but finds himself trapped by disappointment and financial struggles. When he learns that his mother is losing her memory, he is forced to confront not only her illness but also his own absence and regret.

His emotional outburst reflects the experience of many people who leave home to pursue their dreams while struggling to find time for aging parents waiting for them. Through one family's story, the musical asks a universal question: How do we express our love before it is too late?

The production's emotional weight was not limited to the stage. During rehearsals, Xiao Ke found one hospital-bed scene so painful that he repeatedly walked away rather than performing it.

"He would stand up and leave," Cai recalls. "It was simply too painful."

Only during the final rehearsal was Xiao Ke able to complete the scene. Afterward, he broke down in tears.

Although both artists were deeply affected by the story, they were moved by different moments.

"For him, the hardest part is when the mother no longer recognizes her son," Cai says. "For me, it is when the child calls for his mother, and there is no answer. That is the moment that breaks my heart."

China's historic porcelain capital becomes a global crossroads

NANCHANG — Tracing a creative arc from *socarrat*, an ancient Arab ceramic-making technique flourishing in Valencia, Spain, to Jingdezhen's classic Chinese techniques, Spanish artist Xavier Monsalvatje is reinterpreting centuries-old craftsmanship through a contemporary lens.

"In almost all my projects, I've wanted to use traditional ceramic techniques and bring them into a more contemporary discourse," says Monsalvatje. The artist's cobalt-blue artwork has become a standout attraction at the ongoing International Academy of Ceramics Member Exhibition in Jingdezhen, China's renowned "porcelain capital".

The city in East China's Jiangxi province recently gained further recognition when UNESCO inscribed the Jingdezhen Handicraft Porcelain Industry Sites on the World Heritage List on July 25, bringing China's total number of World Heritage sites to 61.

For more than a millennium, Jingdezhen porcelain traveled across Asia, Africa and Europe. Today, that enduring legacy continues to attract more than 5,000 ceramic artists and enthusiasts from around the world during peak seasons.

The city has become a creative laboratory for ceramic artists worldwide. American artist Michael May uses 3D printing to produce ceramic works, taking advantage of Jingdezhen's advanced equipment and technical expertise. Fellow American Matt Watterson incorporates ancient ceramic fragments from the city into his own creations.

Russian-British artist Svetlana K-Liee also says her work evolved over three years in Jingdezhen, where she kept trying new techniques such as wood kilns and combining glass with ceramics.

Another Spanish artist, Jaume Ribalta, opened his own studio in Jingdezhen, where he explored fusing his native Barcelona's black-and-white ceramic motifs with the city's time-honored techniques.

Iraqi artist Wisam Al-Samad discusses the inspiration behind his work in Jingdezhen, Jiangxi province, on June 10. LIU ZHANKUN / CHINA NEWS SERVICE

The city's highly specialized production system impressed him from the start. "Yet, the real value here lies in the openness — every stage of the craft is accessible to outsiders," Ribalta says.

Oriol Calvo Verges, president of the IAC, believes Jingdezhen offers a rare balance between preserving tradition and encouraging artistic innovation.

"Here, inheritance is visible everywhere: in the kilns, in the workshops, in the hands of craftspeople, in museums, in historic sites, in porcelain itself. But innovation is also present everywhere: in universities, research centers, contemporary exhibitions, residencies, new creative districts and international projects," he says.

Spanish artist Anca Ion is also pushing the boundaries of traditional ceramics in Jingdezhen. By experimenting with the fusion of ceramics and glass at high temperatures, she hopes to create entirely new forms of ceramic art.

Jingdezhen is more than a porcelain production hub; it is also a melting pot where diverse cultures converge and interweave, says Bai Guanghua, associate researcher with the Jingdezhen Imperial Kiln Institute.

The city is home to more than 3,200 inheritors of intangible cultural heritage in ceramic craftsmanship. It is also part of UNESCO's Creative Cities Network as a Creative City of Crafts and Folk Arts.

In recent decades, China has shown that ceramics are far more than a cultural legacy to preserve. They have become a powerful driver of urban renewal, education, tourism, innovation, artistic creation and international dialogue, Verges says.

Ribalta has settled in Jingdezhen. "I have always dreamed of coming to Jingdezhen. As an artist, I expect myself to continue to grow in my artistic career," he says.

"Now, I am exploring the origin of those blue-and-white porcelains that once crossed the ocean to my hometown.

"Jingdezhen is not only part of Chinese history but also world history. And now, it is my home."

SOCCER

Infantino's Norwegian nemesis leads the charge

Klaveness, a rare female presence in the sport's halls of power, has been a constant thorn in the soccer boss' side

Norwegian Football Association president Lise Klaveness, a rare woman in a male-dominated world, has for years been a thorn in the side of FIFA's leadership, and some would be quite happy to see her take over from embattled president Gianni Infantino. AFP

A rare woman in the top echelons of soccer, the head of Norway's federation Lise Klaveness has been a thorn in FIFA's side for years.

Now, some would gladly see her take over the leadership of soccer's international governing body from Gianni Infantino.

The 45-year-old lawyer and former player, who represented Norway 73 times, has been highly vocal about international soccer's woes under Infantino.

The Swiss-Italian has been mired in controversy since his plan to open FIFA competitions, including the World Cup, to private investors was swiftly rejected last week.

On Friday, Klaveness called for him to resign.

When Infantino was elected FIFA president in 2016, "he was a candidate who had been elected on a reform program focused on good governance," she told reporters.

"Then, things quickly deteriorated: from keeping a distance, we moved to giving up, and even backtracking, all against a backdrop of a lack of independence from heads of state and other influential figures, particularly from World Cup host countries," she said.

She fired her first salvo at Infantino in 2022, just after she was appointed head of the Norwegian federation, about the conditions under which the World Cup was awarded to Qatar.

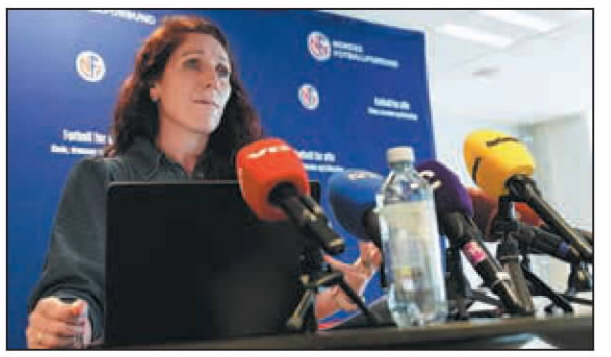
From Doha, she publicly lamented that "human rights, equality, democracy, the core interests of football, were not in the starting 11".

The following year, Norway refused to back Infantino in his re-election bid, signaling its dissatisfaction with his leadership.

Klaveness "was, in a way, the first standard-bearer for much of this criticism that many others now share when it comes to the way Infantino runs FIFA," said Mina Finstad Berg, a sports commentator for Norwegian channel TV2.

She "is very committed to ensuring that rules and decisions are respected," she added.

Trump, Balogun, investors



The reasons for her outrage against Infantino have piled up in recent months: FIFA's decision to award a "Peace Prize" to United States President Donald Trump, with whom Infantino seemingly had a conspicuously close relationship; the lifting of the suspension of US player Folarin Balogun at the World Cup last month following an intervention by Trump; and the aborted plan to open FIFA to private investors.

The Norwegian federation has decided to bring all three issues before the Ethics Committee of the world soccer governing body.

Klaveness' voice carries all the more weight after Norway, long absent from major international tournaments, enjoyed a strong run in this year's World Cup before being knocked out in the quarterfinals by England.

Internationally, commentators have praised her "strong moral compass" and consider her a serious candidate to replace Infantino if he were to step down.

He is standing for re-election for a fourth and final term next March, and is currently the only declared candidate.

Lise Klaveness, president of the Norwegian Football Association, addresses a news conference on Friday in Oslo, calling for Gianni Infantino's resignation. AFP

"She was the only one who always took a clear stand and did not go along with the mainstream. And at FIFA, the time is right for a woman to take the lead," former FIFA head Sepp Blatter — himself disgraced after a corruption scandal — wrote on X.

Ballot box obstacles

Klaveness herself has insisted that the crisis in world soccer should not be reduced to a simple "Game of Thrones" power struggle, and has instead called for a renewed focus on good governance.

"For us, it has never been a personal issue against Gianni Infantino," she told reporters. "The problems go beyond the person who is the president."

And while she "has registered" that her name is being tossed around as a possible successor, she brushed aside questions about whether she was a candidate: "We're not there yet."

Many obstacles remain.

"In addition to being seen as extremely radical in many places, especially outside Europe, she is a woman. That is also likely to count against her in many regions of the world," Berg said.

Even within Europe's governing body UEFA, which one would presume would be most favorable to her, Klaveness failed to win election to the Executive Committee in 2023.

She only joined in 2025, when she was the sole candidate for the seat reserved for women.

"If she already has such a hard time getting elected in Europe, how could she convince Africans and South Americans?" asked commentator Erik Thorstvedt, a former goalkeeper for the Norwegian men's national team.

AFP

FIFA condemns 'concerted and ongoing effort' to weaken beleaguered president

FIFA on Saturday condemned "a concerted and ongoing effort by some to undermine" the world game's governing body and its president Gianni Infantino, as the controversy over his now shelved private investment plan rumbles on.

Infantino has faced calls to resign and was also subject to allegations from a British newspaper on Friday that he paid off a lover while at European governing body UEFA.

"Recent reporting has included unsubstantiated assertions and demonstrably false claims concerning FIFA and its president," said the FIFA statement.

Infantino served as secretary-general of European soccer's governing body from 2009 to 2016.

According to The Telegraph newspaper, the Italian-Swiss lawyer previously used his influence to secure a promotion for a UEFA employee with whom he was allegedly in an intimate relationship.

The newspaper added — without revealing its sources — that the same employee received a "a six-figure sum" upon her departure, in addition to the payment of tuition fees for a business school amounting to around 45,000 pounds ($60,700).

When contacted by reporters, UEFA acknowledged that "a departure payment was made to the individual in question" at that time, "coupled with the payment of fees for an MBA course at a local business school".

In Saturday's statement on social media, FIFA insisted it "welcomes legitimate scrutiny".

"But scrutiny is not a license to distort facts, amplify unsubstantiated allegations or manufacture distractions designed to undermine progress. Where reporting is inaccurate or misleading, FIFA will challenge it directly and vigorously," it added.

Infantino, who is standing for re-election next March, has been embroiled in a crisis since the announcement late last month of his controversial — and ultimately abandoned — plan to open up the World Cup to private investors.

He faces opposition in particular from UEFA, which on Thursday stood by its threat to boycott future World Cups, deeming the mere withdrawal of the controversial plan to be insufficient.

FIFA said Saturday it "will not support, facilitate or tolerate any process concerning the election of the FIFA president that is inconsistent with FIFA's Statutes, democratic procedures and established governance framework".

The statement added: "Those who do not have the support of FIFA's member associations should not seek to achieve through allegation, insinuation or misinformation what they cannot achieve through FIFA's established democratic processes."

Guimaraes eager to 'make history' at Arsenal after $101m move

LONDON — Bruno Guimaraes said he wanted to "make history" at Arsenal after joining the Premier League champion from top-flight rival Newcastle for a reported fee of 75 million pounds ($101.2 million) on Saturday.

The Brazil midfielder spent four-and-a-half seasons with Newcastle and became captain of the Magpies.

Arsenal, who ended a 22-year wait for a top-flight English league title last season, did not disclose the exact length of Guimaraes' "long-term" deal, but British media reports said he had signed a four-year contract with a further one-year option.

"I feel good, I feel amazing. I'm glad for the opportunity," Guimaraes told Arsenal's media channels.

"We have tough games to play this season, so the squad is going to be very, very important, and I'm hopeful we can achieve our dreams."

The 28-year-old said he'd been enthused about joining Arsenal right from his initial interactions with sporting director Andrea Berta and team manager Mikel Arteta.

"From the first time I spoke to Berta and Mikel, I was excited," said Guimaraes. "I just felt inside of me that I need a new challenge in my life, and, I think, to be an Arsenal player, is going to be an exciting challenge in my life.

"I think, after playing two World Cups, I'm at the point in my life that I need a challenge like this.

"I want to win trophies, I want to make history and I think I'm in the right place to do it. I'm so excited to start."

Guimaraes is Arsenal's most high-profile signing of the transfer window so far, joining fellow new arrivals Illan Meslier and Christos Tzolis.

"With Bruno joining us, we are further strengthening the heart of our team," said Berta.

"As we have all seen, Bruno can play as a defensive midfielder and as a box-to-box player. He combines quality with quantity, and has provided goals and assists for his team every year.

"Bruno will allow Mikel to further develop our playing style and will also increase our internal competitiveness, which is essential for maintaining the standards required when we are aiming to win major trophies."

Guimaraes was also linked with Arsenal in January 2022, when he ended up leaving Lyon for Newcastle, but he has finally joined the Gunners after scoring 31 goals in 195 appearances for the Magpies.

Under coach Eddie Howe, Guimaraes helped Newcastle end a 56-year major trophy drought when it won the 2025 League Cup and was also involved as Newcastle twice qualified for the Champions League.

"This is one of the toughest decisions of my life. When I arrived, the club was in a challenging position and I am incredibly proud of what we achieved together," Guimaraes said in Newcastle's statement.

"I fell in love with this place. I really mean that."

Guimaraes is the third high-profile player to leave Tyneside ahead of the new season, following the exits of Anthony Gordon to Barcelona and Sandro Tonali to Tottenham.

Bruno Guimaraes

Howe stepped down as Newcastle manager on July 31, and has since been replaced by German Matthias Jaissle.

Guimaraes, who played for Brazil at the recent World Cup, will compete for a place in Arsenal's midfield with Declan Rice, Myles Lewis-Skelly, Martin Zubimendi and Mikel Merino.

Arsenal kicks off its season against Manchester City in the Community Shield on Sunday, before starting its title defense against newly-promoted Coventry five days later.

Newcastle gets its campaign under way against Liverpool at St James' Park on Aug 23.

AFP

United 'careful' with Mount injury during PSG draw

GOTHENBURG, Sweden — Michael Carrick said he had to be "careful" with Mason Mount after the England midfielder was involved in an injury scare during Manchester United's 1-1 friendly draw with Paris Saint-Germain in Gothenburg on Saturday.

Mount, who joined United from Chelsea in 2023, has been hampered by injury problems since arriving at Old Trafford and he lasted less than 20 minutes after starting against PSG.

The 27-year-old appeared to suffer a foot injury in Sweden and, following discussions with coaches on the touchline, left the field to be replaced by Tyler Fletcher.

"He (Mount) got kicked," United manager Carrick told reporters. "We just wanted to be careful and look after him. We've been lucky with injuries so far, so we wanted to be careful."

Post-match video footage showed Mount walking to the United bus without any form of visible support.

United, which will be competing in the 2026-27 Champions League alongside title-holder PSG next term, was 1-0 down at the time of Mount's injury.

It had fallen behind in the second minute through an Ibrahim Mbaye goal, even though French giant PSG was missing many of its star players.

But, Bryan Mbeumo equalized for United in the 32nd minute, with Amad Diallo playing him in after winning the ball back.

There were more injury concerns for United early in the second half when its 40-year-old goalkeeper Tom Heaton suffered a right hamstring problem while rushing out to make a clearance.

"I enjoyed it," Carrick told MUTV. "Good challenge. Slightly different with the way they play. We should've scored more goals."

The former United and England midfielder added: "It's good for the boys sometimes to have to problem-solve and find their own way, and I thought we did that."

United has two more friendly fixtures before launching its Premier League campaign away to newly promoted Hull on Aug 22.

China hailed for boosting global AI push

Experts praise emphasis on intl cooperation, inclusiveness, people-centered approach

By **LIU JIANQIAO** in Beijing and **EDITH MUTETHYA** in Nairobi

China is an active advocate and practitioner of global governance in artificial intelligence, committed to ensuring that the benefits of AI are shared more broadly and equitably among people around the world, experts said.

Guided by the principles of multilateralism, openness and inclusiveness, China works to build the broadest possible international consensus on AI governance and contributes Chinese solutions to advancing global development in the age of intelligence, they said.

Speaking in Shanghai at the opening ceremony of the 2026 World AI Conference and High-Level Meeting on Global AI Governance, President Xi Jinping called for joint efforts to build a just and equitable system for global AI governance.

"All countries should take a people-centered approach and develop AI for the positive and for good. We should ensure that AI is an important driver for shared prosperity and common security," Xi said.

In his keynote speech, Xi stressed the need for adhering to the principles of openness and win-win and boosting innovation-driven development. He called for strengthening risk awareness, ensuring that AI is secure and controllable, encouraging inclusiveness, promoting mutual learning between civilizations, advocating solidarity and improving global governance.

Gordon K'achola, founder and CEO of the Africa Center for Diplomatic Affairs, highlighted that China has promised to help developing countries build their own AI know-how.

"For Africa and the broader Global South, the goal isn't just getting the latest tech. It's about building the capacity to create and control their own AI writing algorithms, growing research centers, and strengthening local institutions," he said.

Xi said that China will develop international AI application cooperation centers with the Association of Southeast Asian Nations, the League of Arab States, the African Union, the Community of Latin American and Caribbean States, the Shanghai Cooperation Organization and BRICS.

Furthermore, China will promote the deployment of MAZU, an AI-powered meteorological early-warning solution, in 30 countries, he said.

Philip Okello, principal meteorologist at the Kenya Meteorology Service, noted that China has made significant advances in meteorological forecasting, satellite observation and early warning of disasters, adding that deeper cooperation in these areas could help enhance Africa's forecasting capabilities and strengthen its resilience to climate change.

"President Xi's speech is timely because climate change is no longer a future risk; it is a present-day reality that is affecting countries across the globe," he said.

Spain reigns

Spain lifts the FIFA World Cup Winner's Trophy after the team's victory following the FIFA World Cup 2026 Final match between Spain and Argentina at New York New Jersey Stadium on Sunday in East Rutherford, New Jersey. LARS BARON/GETTY IMAGES/AFP **See story on page 15**

Iran remains defiant, retaliates amid fresh US strikes

By **CUI HAIPEI** in Dubai, UAE and **JAN YUMUL** in Hong Kong

Iran remained defiant and retaliated against US assets across the Middle East as the United States launched airstrikes for an eighth consecutive night under an expanded military campaign.

The renewed spate of violence stems from the two sides' scramble for control of the Strait of Hormuz, the narrow Persian Gulf choke point that carries one-fifth of global oil and liquefied natural gas shipments during peacetime.

In a statement on Sunday, the US Central Command said it targeted "Iranian coastal surveillance and air defense facilities, maritime assets, plus missile and drone storage sites". The strikes came a day after two US soldiers were killed and one remained missing during Iran's attacks in Jordan, marking the first US military deaths linked to the conflict since March.

Iran responded with retaliatory attacks on two US military bases in Kuwait, targeting an ammunition depot at Camp Udairi and Patriot radar and aerial monitoring systems at Ali Al Salem Air Base. Bahrain also activated air defense systems early Sunday in response to drone and missile threats.

The Iranian Health Ministry said on Saturday that at least 50 people had been killed and more than 500 wounded in more than a week of intensifying attacks, which Tehran said included strikes on an airport, a railway station and bridges.

Iran's Supreme Leader Mojtaba Khamenei warned that the US will face "unforgettable lessons" if it continues attacking Iran. He said that Washington's breaches of the interim accord prove that US President Donald Trump's signature on the deal is "worthless and invalid".

Major General Mohsen Rezaei, a senior military adviser to Khamenei, warned that Tehran will resume full-scale offensive operations should US airstrikes continue in the coming days.

Meanwhile, the US State Department issued a global travel alert, urging US citizens to be extra vigilant amid heightened Middle East tensions. It warned that travel chaos may arise from flight cancellations and temporary airspace shutdowns.

Almost all Arab states in the Gulf have faced Iranian retaliatory strikes, with missile warnings issued in Saudi Arabia on Saturday. The United Arab Emirates has not yet been directly attacked.

However, Iran's Fars News Agency, quoting an anonymous official, said on Saturday that continued strikes on Iranian civilian infrastructure would mean that the airports of Dubai and Abu Dhabi, as well as the ports of Fujairah and Jebel Ali, should be immediately evacuated.

In a statement, the UAE Foreign Ministry urged full restraint to avoid grave regional fallout and prevent the region from sliding deeper into violence and instability, calling for an immediate halt to hostilities and swift resumption of negotiations.

GUIZHOU OFFERS SPELUNKERS AN INSIDE TRACK

Natural splendor of Shuanghe Cave is drawing daredevil visitors from far and wide

By **LIU BOQIAN** and **YANG JUN** in Zunyi, Guizhou

Visitors explore Shuanghe Cave in Suiyang county, Zunyi, Guizhou province, on May 2. LUO XINGHAN / FOR CHINA DAILY

The first thing people notice is the silence. Not an ordinary silence, but the kind that lives underground, thick and old, broken only by the drip of water and the distant murmur of a hidden river.

China Vibes

Jean Bottazzi has spent his life crawling into the dark guts of the Earth, from Europe to Asia, but Shuanghe Cave in Guizhou province does something no other cave has done. It swallows him whole and leaves him utterly lost — in the best possible way.

"Most caves I have explored around the world have relatively simple structures," the French caver said, his voice echoing slightly in the chamber. "This one feels like a huge maze."

He flicks on his headlamp. The beam cuts through the blackness and lands on a wall of stone that twists and branches like a frozen forest.

Somewhere in the distance, water rushes. Somewhere deeper, passages he has not yet mapped disappear into the mountain. At 439.7 kilometers and counting, Shuanghe is Asia's longest cave complex, and it still hasn't revealed all its secrets.

Outside, the world is burning. A brutal heat wave has clamped down across much of China, pushing temperatures past 35 C. But the moment you step through the cave mouth in Suiyang county of Zunyi, Guizhou, the summer heat vanishes.

Inside the cave, the air drops to a steady 19 C. The noise of cars and city life dissolves. You hear only your own breath and the low, constant whisper of underground streams.

Zhou Xin, 22, first encountered the cave via a screen. Late one night, scrolling through Xiaohongshu, or RedNote, he saw a first-person video of someone dangling from a steel cable inside a cavern, suspended above water so green it looked unreal. He booked a ticket the next morning.

To cultivate robust AI, fertilize the soil it grows in

WORLD WATCH
By Simon Chesterman

The race to develop more powerful artificial intelligence is truly global. So, increasingly, are the risks. An AI system developed in one country may run on infrastructure in another, draw on data stored in a third and affect people everywhere.

No country can govern that chain on its own. Yet meaningful international coordination will remain elusive unless we understand what exactly needs to be governed.

For years, the dominant metaphor was that "data is the new oil". It is memorable, but somewhat misleading. Oil is scarce, costly to extract and depletes through use. In contrast, data is potentially infinite, often surrendered for free and capable of being copied and reused indefinitely.

A better metaphor may be soil. Just as crops grow from soil, AI systems grow from data. The quality, composition and provenance of that soil matter. Contamination can spread. Soil that nourishes one crop may be unsuitable for another. Above all, to remain productive, the soil requires continuous care and cultivation.

This updates the old warning: "garbage in, garbage out". With generative AI, bad soil does not necessarily produce a visibly bad crop. A system trained on flawed or contaminated data may generate a response that appears polished, persuasive and entirely plausible.

That output may then be published, relied upon and eventually ingested as training data for another model. The danger is not just that contamination is consumed, but that it is replanted.

Early debates about responsible AI focused mainly on training data: whether it was biased, legally and ethically obtained, and of sufficient quality. Those questions continue to be important, but the focus has now shifted from training to operation.

Many newer AI systems retrieve live information, connect to databases, use software tools and remember previous interactions. AI agents may read and write documents, communicate with customers, make purchases or modify records. The data environment is no longer fixed when the model is trained. It changes continuously as the system operates.

Therefore, it is impossible to ensure responsible AI simply by inspecting a dataset once and declaring it clean. We need governance of data flows, not merely datasets. Organizations must know what information a system can access, what it can infer, where it can transmit that information and what actions it is authorized to take.

Search engines learned what information we wanted. Social media platforms learned whom we knew and what kept us engaged. AI companions and agents may infer something even more sensitive: what we feel, fear and trust.

Over time, systems can infer preferences, vulnerabilities and personal relationships from trivial interactions.

WAIC WORLD AI CONFERENCE

Robot in daily life

A robot developed by GigaAI demonstrates its capabilities in everyday living scenarios at the Embodied Intelligence Pavilion during the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai on Saturday. The pavilion features 314 exhibits from 161 companies, showcasing the latest advances across the embodied AI industry chain, including foundation models, complete robotic systems, dexterous robotic hands and core components.
YANG YURAN / CHINA NEWS SERVICE

Largest shipbuilder exploring automated design

By ZHAO LEI in Shanghai
zhaolei@chinadaily.com.cn

China State Shipbuilding Corp, the world's largest shipbuilder, has begun exploring artificial intelligence to automate and optimize ship design, according to a senior technologist.

Speaking exclusively to China Daily at the World Artificial Intelligence Conference in Shanghai on Saturday, Gu Yiqing, deputy chief engineer of CSSC's Shanghai Merchant Ship Design and Research Institute, revealed that China's massive shipbuilding footprint gives it an unmatched data advantage for AI training.

"The core challenge we are dealing with lies in consolidating these data resources, preparing them for AI, and training AI systems on them," Gu said, adding that the process is "fraught with difficulties".

"Once breakthroughs are achieved in this process, the adoption of AI-assisted ship design will become a popular trend in this industry. Looking ahead, AI can help organize design drawings and documentation, construct semantic corpora for ship design, improve design efficiency and optimize design outcomes," she said.

> "Looking ahead, AI can help organize design drawings and documentation, construct semantic corpora for ship design, improve design efficiency and optimize design outcomes."
>
> **Gu Yiqing,** deputy chief engineer of CSSC's Shanghai Merchant Ship Design and Research Institute

Engineers from the Shanghai institute, a CSSC subsidiary, have already launched preliminary explorations in this field, Gu added.

Currently, they are training small-scale models to master design codes, interpret specifications and extract key information from existing blueprints. "These foundational small models must be fully refined first before they can be integrated into a large-scale model," Gu said.

While AI tools are currently being used to compare design standards and verify parameters, Gu stressed that human expertise remains central. All AI-generated results still require validation by expert teams. "Full reliance on AI for design work is not feasible at this stage," she said, noting that global shipbuilding powers are all in similar early exploratory phases.

Gu is a leading figure in the field, having spearheaded the design of the *Dazhi,* the world's first smart ship, and serving as chief system architect for the *Ningyuan Diankun*, the world's largest pure-electric, autonomous container ship.

She made the remarks before attending a forum on the applications of AI in maritime and shipbuilding industries.

The forum was hosted by CSSC, attracting more than 200 researchers and enterprise representatives from home and abroad.

The event consisted of several presentations about AI's role and potential in maritime and shipbuilding businesses, a panel discussion, and announcements of progress made by CSSC engineers in applying AI to their work.

With AI already deeply integrated into numerous industries and delivering remarkable benefits, engineers from China's shipbuilding industry are exploring how to unlock AI's full potential within their respective fields.

If AI technologies can be deployed rationally and efficiently, experts said China can not only consolidate its advantages in output and new ship orders, but also further elevate its technological edge as the world's top shipbuilding nation.

According to data released by the Ministry of Industry and Information Technology, China's shipbuilding industry has ranked first worldwide for the past 16 years in three core indicators: shipbuilding output, newly received orders and outstanding orders.

Statistics from Clarksons Research show that China's shipbuilding sector maintained its global lead across the three major indicators in the first half of this year, accounting for 63.3 percent, 80.9 percent and 73.3 percent of the respective global totals.

Court holds users liable for generated content online

By CAO YIN
caoyin@chinadaily.com.cn

A landmark Beijing court ruling against a user who spread defamatory, AI-generated videos has thrown tangible weight behind China's crackdown on artificial intelligence abuses.

The decision, which came in March, underscores a national strategy that combines strict legislation, administrative policing and judicial action to govern a domestic AI user base that skyrocketed to over 600 million by the end of last year.

In this case, the court addressed the misuse of AI tools by an internet user who produced defamatory videos about a deceased livestreaming host. The videos falsely claimed that the host relied on pills and alcohol to work, suffered from insomnia and anxiety, and was pressured to stream 15 hours a day. The host's agency sued the user for damaging the agency's reputation.

The court ruled in favor of the plaintiff, emphasizing that AI users must verify the authenticity and credibility of AI-generated content before publication. The defendant failed to label the content as AI-generated and to cite sources, violating existing regulations. Consequently, the court ordered the user to issue an apology and pay financial compensation.

Wu Jiao, the presiding judge, said that AI-generated content cannot be used as an excuse to evade responsibility for truthfulness and legality. She urged users to fact-check all forms of AI-produced material to protect others' rights to reputation, privacy and copyright.

Vice-president of the court, Zhao Changxin, said the rising frequency and variety of AI-related disputes highlight the need for stronger regulatory collaboration to support innovation while protecting individual rights.

Data from the China Internet Network Information Center showed that generative AI users in China reached 602 million by December, a 141.7 percent increase from the previous year.

Xu Hao, a lawyer at Beijing Jingsh Law Firm, praised China's governance approach, noting the effectiveness of recent campaigns against AI-related violations. A recent crackdown by the Cyberspace Administration of China led to the removal of over 14,000 non-compliant AI products and the cleaning up of more than 6 million pieces of illegal information.

Li Ya, a lawyer at Zhongwen Law Firm, emphasized the importance of administrative oversight combined with targeted campaigns, especially as AI technology evolves faster than legislation. He highlighted the requirement for labeling AI-generated content as a key step in building a full accountability chain, reinforcing cybersecurity and public interest.

In March 2025, the Cyberspace Administration of China, the country's top internet regulator, together with three other government departments, issued measures for labeling AI-generated content. The regulation took effect on Sept 1, 2025. It is part of a broader effort to promote the responsible development of AI, curb the spread of disinformation and protect public interests. The rules require clear labeling of AI-generated content throughout its life cycle — from creation to distribution — and define the obligations of all parties involved.

Under the regulation, AI service providers are required to embed both types of labels at the point of generation. Content distribution platforms — such as social media — are required to verify uploaded files for implicit identifiers and add prominent warning labels to any content confirmed or suspected to be AI-generated. Users must also proactively declare AI involvement when publishing such content.

Zheng Ning, head of the law department at Communication University of China's School of Cultural Industries Management, called for stronger interagency coordination and nuanced regulation tailored to different AI technologies. She proposed flexible, time-efficient rules to address regulatory gaps in emerging fields like autonomous intelligence.

Both Xu and Li are closely monitoring research into AI governance by the National People's Congress and the Supreme People's Court. They stressed the importance of having a "red-line" approach that explicitly prohibits practices such as facial data misuse and AI-facilitated fraud, establishing a regulatory baseline while allowing room for innovation.

Xu said that future AI legislation should incorporate dynamic provisions, revisable every two to three years, to stay aligned with technological progress. Li added that AI governance should focus on managing risks rather than restraining technology, reaffirming China's commitment to a people-first approach with safety as its anchor to support the sound development of AI.

National computing grid to become 'public utility'

By CHENG YU
chengyu@chinadaily.com.cn

China has launched a massive, decades-long initiative to unify its domestic computing resources into a single national grid. The goal, unveiled by officials and engineers at the 2026 World Artificial Intelligence Conference in Shanghai on Friday, is to treat processing power as a basic public utility — allowing users to access AI computing as seamlessly as flipping a light switch.

According to the National Data Administration, China's intelligent computing capacity surged to 1,882 EFLOPS by the end of March this year, powered by 14.45 million standard server racks. An EFLOP, or exa floating-point operation per second, is a standard measure of computing performance equal to one quintillion calculations per second.

To maximize this sprawling footprint, China is deploying a three-stage roadmap designed to strengthen self-reliance, optimizing local networks while funding frontier tech like quantum technology and orbital satellite clusters.

Gao Wen, director of Peng Cheng Laboratory and an academician at the Chinese Academy of Engineering, outlined the roadmap at the conference.

"The first stage focuses on pooling computing resources nationwide and about 70 percent of that work has already been completed. It means that roughly seven-tenths of China's computing resources have been incorporated into a unified database that is updated in real time," he said.

"In the second phase over the next five years, the network is expected to begin coordinating computing tasks among selected participants, initially within companies or between cooperating firms rather than serving the public."

He added that the third and final phase would allow computing tasks to move seamlessly across multiple providers without users knowing where the work is being processed.

"Achieving that vision could take one or two decades rather than just a few years. But the final goal is to let Chinese users access computing power as conveniently as electricity," he said.

As AI models continue to grow larger and more computationally intensive, researchers and companies said China must also develop entirely new sources of computing capacity.

Pan Jianwei, an academician at the Chinese Academy of Sciences and one of China's leading quantum physicists, said quantum technology was rapidly moving beyond the laboratory.

Quantum communication has already found early use in sectors including finance and government services, while quantum sensing could reach commercial scale sooner in areas such as navigation and medical imaging, he said.

General-purpose quantum computers capable of solving broad real-world problems remain at least 10 to 15 years away, Pan said, but they could eventually transform fields ranging from materials science to pharmaceutical research by tackling calculations beyond the reach of conventional computers.

While the nationwide network is a long-term strategy, China is proving it can scale its computing infrastructure right now using entirely domestic technology. At the WAIC, State-backed server manufacturer Sugon announced the completion of the Sugon 8000, the country's first fully domestically developed AI computing cluster operating at a massive 100,000-accelerator scale.

Wang Shengyong, vice-president of Sugon, said the significance of the project extends beyond its size. "A 100,000-card cluster is no longer just a machine — it's an entire computing system. From AI processors and high-speed interconnects to system software, the platform was built on domestically developed technologies, underscoring China's push to reduce reliance on foreign computing infrastructure," he said.

The nation is also looking beyond Earth. In Shanghai, officials debuted the first satellite constellation under its flagship orbital initiative, the Star Nexus. The ultimate goal is a sprawling constellation of 1,000 spacecraft designed for "space-data-space-compute" architectures, utilizing outer space for superior heat dissipation and lower power costs.

Key policies give Shanghai AI advantage

Backed by 100-billion-yuan fund, city creates world-class tech ecosystem

By SHI JING in Shanghai
shijing@chinadaily.com.cn

Walk into the newly opened Caohejing M+ commercial center in Shanghai's Xuhui district, and the future is already standard operating procedure. Across its 50,000 square meters, autonomous cleaning and food-delivery robots navigate the floors, while visitors engage with virtual reality skiing simulators and 3D printing workshops.

But this is more than just a high-tech mall; it's the physical manifestation of a world-class artificial intelligence ecosystem. Xuhui, which began its journey four decades ago as a microelectronics hub, has transformed into a hyper-dense AI development zone. Today, the district is home to a quarter of Shanghai's key AI enterprises, a quarter of its integrated circuit design enterprises, and more than a quarter of its registered large-model companies.

While Xuhui is just a snapshot of Shanghai's early strategic moves in the AI sector, the World AI Conference, which has been held annually in the city since 2018, has attracted more than 3,000 leading AI companies from around the globe and facilitated insights from over 8,000 industry experts.

Ding Hong, deputy director of Shanghai Jiao Tong University's Tsung-Dao Lee Institute, said the city has demonstrated strong foresight in its policies and institutional mechanisms for AI development from the early days.

In November 2017, Shanghai issued its first AI development guideline, designed to drive the deep integration of AI with the real economy and to foster innovation-driven entrepreneurship.

When the first edition of WAIC was held the following year, Shanghai rolled out an additional 22 targeted measures to accelerate the high-quality development of AI, focusing on bolstering talent pipelines, advancing core technologies and scaling up pilot applications.

In 2022, the Standing Committee of the Shanghai People's Congress approved the city's comprehensive AI regulations, pioneering provincial-level legislation for the sector and placing Shanghai's AI industry on a solid legal footing.

During its 14th Five-Year Plan (2021-25), Shanghai designated AI as a pillar industry alongside integrated circuits and biomedicine. In July 2024, to better facilitate the development of the three industries, the city launched a fund of funds worth 100 billion yuan ($14.8 billion).

According to data from the city government, Shanghai's AI industrial value surged from 134 billion yuan in 2018 to 637 billion yuan in 2025. In the first quarter of this year, AI manufacturing output jumped 19.2 percent year-on-year. To date, up to 169 large models have cleared regulatory registration in Shanghai.

Geographically, Shanghai's AI ecosystem is anchored by two key clusters. On the west bank of the Huangpu River, the Shanghai Foundation Model Innovation Center is home to over 300 AI companies, making it one of the world's most densely packed AI incubators. On the east bank, the Model Matrix Community is home to some 200 enterprises, prioritizing vertical models to advance embodied intelligence, life sciences and other real-world application scenarios.

In May, the city unveiled plans to fully implement the "AI plus" initiative during the 15th Five-Year Plan (2026-30) period. Strengthened policy support will focus on leveraging AI to drive manufacturing transformation, empower producer services, reform scientific research paradigms and advance full-stack technological innovation.

According to Zhao Xuemei, a researcher at the Shanghai Academy of Social Sciences' Information Research Institute, the next few years will see critical breakthroughs in deep industrial integration. The world should expect Shanghai to lead the charge in embodied intelligence, brain-computer interfaces and humanoid robotics.

Shanghai is also fostering a self-reliant ecosystem to provide a large-scale testing ground for domestically produced AI chips, aiming to mitigate high costs and access barriers in the computing market.

Tan Limin, chairman of AI solutions provider Shanghai Westwell Technology, said the city has built an end-to-end industrial chain spanning algorithms, computing and hardware applications. Shanghai's next frontier is clear: expanding its footprint to help shape the international standard of AI, Tan said.

An array of 512 DF1000 chips, developed by Shanghai-based AI startup Dongfang Suanxin, is displayed at the 2026 World AI Conference in Shanghai on Sunday. GAO ERQIANG / CHINA DAILY

WAIC WORLD AI CONFERENCE

High-level meeting calls for practical solutions to tackle shared challenges

By **MO JINGXI**
mojingxi@chinadaily.com.cn

When two powerful earthquakes struck Venezuela in June, artificial intelligence could have helped rescuers identify damaged buildings, zero in on their locations and deploy emergency teams more rapidly, but such AI tools remain difficult for the country to access, a senior Venezuelan official said on Saturday.

Isabel Alicia Iturria Caamano, vice-president of Venezuela's Council of Ministers, made the remarks at the High-Level Meeting on Global AI Governance, which was held on Saturday in Shanghai as part of the 2026 World AI Conference.

Caamano noted that AI-powered tools and multimodal models could automatically identify and categorize damaged structures, support the timely deployment of rescue personnel and improve disaster management.

Her speech highlighted an important question facing global AI governance: how to turn technological advances into practical, accessible solutions for countries in need.

Saturday's meeting brought together senior representatives from around 80 countries and international organizations to share experience and build consensus on AI development and governance.

Alexander De Croo, administrator of the United Nations Development Programme, said that AI should be viewed not as a replacement for human intelligence, but as a tool that strengthens human capabilities.

What matters, he said, is whether AI can help doctors make better diagnoses, farmers improve forecasts, teachers educate children more effectively and governments deliver better public services.

De Croo, however, pointed out that AI adoption is advancing faster than institutional readiness in many countries. Rather than slowing technological development, the international community should help countries strengthen institutions, build capacity and invest in people, so that they can benefit from the technology, he said.

Maxim Oreshkin, deputy chief of staff of the Presidential Executive Office of Russia, highlighted the importance of education in preparing people for an AI-driven world.

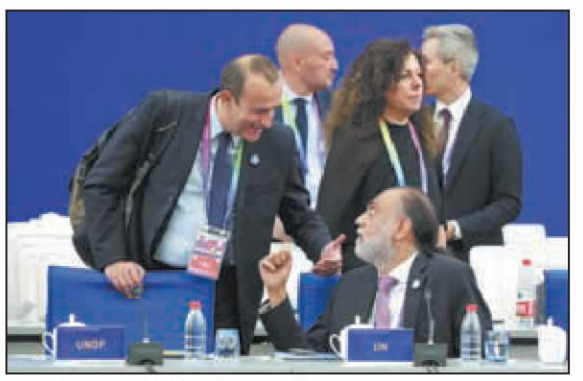
He said that it was no longer enough to merely transfer knowledge, people must also learn continuously, think critically, work with data and make responsible decisions.

Oreshkin described the signing on Thursday of the agreement on establishing the World Artificial Intelligence Cooperation Organization as an important practical step, expressing his hope that the China-proposed organization would become an effective mechanism for joint work, delivering concrete projects and measurable results.

Mahefa Andriamampiadana, Madagascar's minister of digital development, digital transformation, posts and telecommunications, said on the sidelines of Saturday's meeting that inadequate infrastructure and limited access to technology remain major obstacles for developing countries.

Madagascar wants to be a co-creator of AI solutions, rather than merely a consumer, he said, adding that his country has explored AI-based forecasting tools to improve the safety of fishermen and support agriculture, but it still faces difficulties in building its own digital infrastructure.

Mario Nobile, director-general of the Agency for Digital Italy, a technical agency of the Italian Presidency of the Council of Ministers, said that making AI accessible to people worldwide would require more data centers, reliable energy supplies and other infrastructure. To ensure that no one is left behind, countries must create the conditions needed for broad access to the technology, he added.



On Friday, China announced that over the next five years, it will provide 5,000 AI training opportunities for developing countries, establish international AI application cooperation centers with several regional organizations and promote an AI-powered meteorological early-warning solution in 30 countries.

China's Assistant Foreign Minister Liu Bin said at Saturday's meeting that "as a responsible major country, China stands ready to work with the international community and make sustained efforts and positive contributions to advance global AI governance".

The World Artificial Intelligence Cooperation Organization would provide more international public goods, support capacity building in the Global South, help bridge the digital and AI divide, and ensure that AI truly benefits people in all countries, he said.

Shanghai Mayor Gong Zheng said that developing AI is an important strategic mission for the city, which has hosted the WAIC for nine consecutive years.

Shanghai will vigorously promote the application of AI across industries and sectors while contributing more deeply to the development of the global AI governance system with greater openness and a more forward-looking vision, he added.

Amandeep Singh Gill (right), United Nations undersecretary-general and special envoy for digital and emerging technologies, interacts with another guest during the High-Level Meeting on Global AI Governance on Saturday in Shanghai. GAO ERQIANG / CHINA DAILY

People-centered AI vision garners broad support

Xi's speech emphasizing shared prosperity, common security hailed

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

China's efforts to leverage the 2026 World AI Conference and High-Level Meeting on Global AI Governance to boost global cooperation on AI development for public good and improve global AI governance have been commended by participants as a beacon of hope for a better world.

Addressing the opening ceremony of the four-day conference in Shanghai, President Xi Jinping announced on Friday the creation of the World Artificial Intelligence Cooperation Organization and called for joint efforts to build a just and equitable system for global AI governance.

Maxim Oreshkin, deputy chief of staff of the Presidential Executive Office of Russia, said during a meeting with Foreign Minister Wang Yi in Shanghai on Friday that Xi's keynote speech holds global significance, reflecting China's profound understanding and strategic vision regarding AI development.

Noting that the creation of the organization is a major China-proposed initiative that benefits the world, Oreshkin said that Russia highly appreciates the move and is very glad to become a founding member of the organization. He added that Russia looks forward to working hand in hand with China to expand cooperation in the AI sector.

Luigi Gambardella, president and founder of ChinaEU, a Brussels-based international digital association, said that Xi's speech delivered a strong message that AI should become a bridge connecting countries, not a new dividing line. "President Xi emphasized the importance of openness, cooperation and the need to work together to ensure that AI benefits all of humanity," he said. "China has shown its willingness to promote openness by creating a new platform where all countries are invited to exchange ideas, build trust and advance cooperation."

Xi said in his speech that all countries should take a people-centered approach and develop AI for positive outcomes and greater good, and ensure that AI is an important driver for shared prosperity and common security.

Jin Li, president of Fudan University, noted that Xi recommended a people-centered approach that coordinates development and security, fosters open cooperation, encourages mutual learning between civilizations and advocates improving global governance. This reflects China's commitment to global well-being and shared development, providing fundamental guidance for China's AI innovation and governance practices, while also showing the way forward for the international community to deepen cooperation and build consensus, Jin added.

Xi said the establishment of the organization is China's major move to answer the call of the Global South and unite the international community to vigorously promote AI development and governance. Twenty-nine nations have signed the agreement for the creation of the organization as its founding members.

Hui Zhibin, a researcher at the Shanghai Academy of Social Sciences, noted that since the introduction of the Global AI Governance Initiative in 2023, China has made continuous efforts to provide Chinese solutions. In the face of complex global challenges, China's efforts demonstrate its steadfast commitment to promoting multilateral dialogue, consultation and cooperation, Hui said.

As a global leader in AI development, China's core AI industries were worth over 1.2 trillion yuan ($177 billion) in 2025, while the number of AI enterprises nationwide exceeded 6,200, according to the Ministry of Industry and Information Technology.

Li Yanhong, founder and CEO of Chinese tech company Baidu Inc, said that with the world's richest application scenarios, a complete industrial chain and a vast market, China provides fertile ground for AI technologies and applications, driven by emerging real-world demands.

Zheng Zheng and He Qi in Shanghai contributed to this story.

World AI cooperation body outlines three priorities

China will work with the founding members of the World Artificial Intelligence Cooperation Organization to launch its operations at an early date, after 29 countries from Asia, Africa, Latin America and Europe signed an agreement on establishing the organization in Shanghai on Thursday, Xinhua News Agency reported.

The signing marked a significant step forward in China's efforts to establish the organization, Xinhua learned from sources involved in the matter.

The organization will focus on three areas. First, it will prioritize international cooperation on AI capacity building through policy exchanges, technical cooperation, personnel training and joint research, helping developing countries benefit equally from the new wave of AI development.

Second, it will serve as a platform matching supply with demand, promote AI applications tailored to national conditions, strengthen technological and industrial cooperation, and encourage the joint development of open-source ecosystems, with the aim of delivering practical, accessible outcomes that address real-world needs.

Third, it will uphold the purposes and principles of the Charter of the United Nations, support implementation of the Global Digital Compact and the UN Sustainable Development Goals, and promote the building of a just and equitable system for global AI governance.

The agreement covers the organization's purposes, principles, functions, structure, decision-making procedures and membership. Participation will neither affect members' cooperation with third parties nor impose unnecessary constraints or restrictions on their AI development.

CHINA DAILY

Governance: Openness expected to fuel global tech progress

From page 1

Okello also said that Xi's emphasis on strengthening meteorological science, innovation and international cooperation "aligns closely with what Africa needs to better prepare for increasingly frequent droughts, floods and extreme weather events".

Xi also announced the establishment of the World Artificial Intelligence Cooperation Organization, whose headquarters will be in Shanghai, as "a major move by China to answer the call of the Global South and unite the international community" to vigorously promote AI development and governance.

Maria Sun, co-chair of the FIRA RoboWorld Cup 2026, said the rapid development of AI has brought new challenges, underscoring the need for stronger international cooperation to address them collectively.

"China's efforts to promote AI cooperation with developing countries are very encouraging. International exchanges like these help bring more countries into the AI era," she said.

"China has maintained an open approach to AI development, and that will contribute significantly to technological progress worldwide. Today, China is one of the global leaders in AI, and its continued openness will help drive innovation and international cooperation," Sun added.

Humprey Arnaldo Russel, head of the ASEAN-China Research Center at the University of Indonesia, said that AI creates transnational challenges involving safety, ethics, misuse, technical standards, regulatory fragmentation, and widening digital and governance divides.

He said that the Global AI Governance Initiative, put forward by President Xi in 2023, advances global AI governance through solidarity and multilateral cooperation, which requires the greatest attention from the international community.

"The proposal is especially important for the Global South, whose interests remain underrepresented in global technology governance. A broadly accepted, United Nations-centered framework could strengthen developing countries' participation (in global AI governance) while respecting different national conditions," he added.

David Tuffley, an adjunct senior lecturer at Griffith University's School of Information and Communication Technology in Australia, said the people-centered approach seeks to address a major challenge in AI governance: ensuring that the benefits of the technology are shared broadly rather than remaining concentrated in the hands of a few.

President Xi's speech highlighted China's commitment to promoting global AI governance and the development of international norms, he noted.

Tuffley also said that for the international community, particularly developing countries, the commitment to capacity building and greater access to computing power is especially significant, as much of the world's population currently has little voice in shaping the rules that govern AI.

"Australia and China share an interest in AI safety research, in standards for evaluating frontier systems, and in ensuring AI serves rather than displaces human judgment in critical domains such as healthcare and education," he said.

Alexis Hooi in Sydney, Yang Han in Hong Kong, Yang Gao in Toronto and Victor Raballa in Nairobi contributed to this story.

Oversight: Bridging regulatory gaps needs consensus

From page 1

No individual exchange may appear sensitive, yet the accumulated data can create a profoundly intimate profile.

Data protection has traditionally relied heavily on user consent. But few people can anticipate every future use or inference an AI system may make. Before entering a continuing relationship with such a system, users may need the digital equivalent of a prenuptial agreement: clarity about what it will learn, retain, share and delete when the relationship ends.

Consent remains important, but it cannot ensure comprehensive protection. We need accountability and contestability. Who approved access to the data? Can decisions be traced? Can affected people challenge or reverse them? Who is responsible when something goes wrong?

Some see governance as a stop sign in the path of innovation. A better comparison is a seat belt. It does not prevent movement; rather, it allows us to move faster with greater confidence. Poor governance may permit a rapid experiment, but it rarely supports deployment at scale. Trust, documentation and clear responsibility are part of the infrastructure of innovation.

Controls should depend on capability and consequences. The greater a system's autonomy, the wider its access to data and tools, and the more irreversible its actions, the stronger those safeguards should be.

The aim cannot be to eliminate all risks. The only completely safe AI system would be one switched off and locked away. Instead, organizations should seek to bound risk by restricting access, requiring approval for consequential actions, preserving audit trails and expanding autonomy only when evidence justifies it.

The world is unlikely to agree on a single global AI regulator or universal rulebook. Countries differ in legal traditions, economic priorities and social values. But agreement should be possible on minimum expectations concerning data provenance, security, testing, incident reporting, auditability and responsibility among developers, deployers and users.

This is not an argument for regulatory uniformity, still less for leadership by any single country. It is an argument for interoperability. Without it, companies face incompatible obligations, while individuals could fall through the gaps between jurisdictions.

Major powers will continue to compete over AI. That competition makes coordination more urgent, not less. Aviation, telecommunications and finance combine national regulation with international standards because cross-border systems require common foundations. AI will be no different.

The essential principles are simple: know your data, know your AI agent, and know who is responsible for its actions.

AI may flourish in many kinds of soil. But neglected ground does not remain neutral. Weeds take root, contamination spreads and healthier growth is eventually crowded out. Building responsible AI therefore requires more than celebrating the harvest of technological breakthroughs. It requires sustained cultivation — and cooperation wherever the roots and seeds cross borders.

Rescue teams race against time after deadly landslide

Workers dig through rubble, provide assistance to residents after disaster

By TAN YINGZI and **DENG RUI** in Chongqing and **HU QING**

Rescue and relief teams raced against time over the weekend as they combed through rubble in search of survivors and supported affected residents after a landslide struck Pengshui Miao and Tujia autonomous county in Chongqing on Friday, burying more than 10 residential buildings.

Some 872 rescue personnel and more than 1,100 pieces of equipment have been deployed to the area to aid search and rescue efforts, according to local authorities. At last count, eight people were killed and another 34 remained unaccounted for. Ten injured people had been hospitalized, including two with severe injuries and two in critical condition.

Rescue teams used life detectors, search dogs and other equipment looking for possible survivors.

A geological assessment showed that the collapsed area measured about 60 meters long, 30 meters high and 10 meters thick, with a total volume of about 18,000 cubic meters.

Experts classified the disaster as a large-scale rockfall, with the largest detached boulder estimated at about 3,000 cu m — roughly the size of a residential building.

"Such a large boulder made the rescue operation far more challenging than we had encountered before," Zhou Zhidong, chief technician of China Anneng Group Third Engineering Co Ltd, said during a media briefing on Saturday.

The rescue site was extremely confined, bordered by a mountainside, steep slopes and a river.

Only one or two pieces of heavy equipment could pass through at a time, severely restricting the deployment of large machinery, he added.

Li Li, head of an expert panel overseeing the disaster response, said the collapse was difficult to detect from the surface because the fracture planes were hidden inside the mountain and required experts to climb to the top for on-site inspections.

Despite the challenges, early warnings from local community workers helped prevent a much greater loss of life.

Local authorities quickly evacuated more than 1,100 residents, including more than 60 people living near the core danger zone.

Zhang Weiling, Party secretary of Shatuo community, where the disaster occurred, told China Daily that four community workers went door to door urging residents to evacuate after spotting scattered falling rocks during routine inspections.

One of the workers, Gong Baodong, went missing while helping evacuate residents. The other three community workers on duty at the time were confirmed safe, Zhang said. Gong, in his 20s, joined Shatuo as a community worker in May 2025. His colleagues described him as a responsible and diligent worker committed to self-improvement.

Following the disaster, volunteers, medical workers, businesses and local residents quickly mobilized to help, demonstrating widespread support from across the county and beyond.

Luo Huan, a volunteer with the Pengshui women's federation, arrived at a temporary shelter early on Saturday morning to distribute breakfast and provide other assistance.

"Volunteers from all walks of life came together to help," Luo said. "Besides providing daily necessities, we are also helping connect residents with medical services and staying with them to offer emotional support."

Ran Maohui, a doctor at the shelter, said she provided psychological support and health checks for evacuees.

She also helped elderly residents with chronic conditions like hypertension refill prescriptions and arranged nutritious meals for a new mother struggling with breastfeeding.

Among those evacuated, Gong Shaoqun, who runs a grain and cooking oil wholesale business, said her home in a seven-story residential building was buried by the landslide, but all three members of her family escaped safely after receiving an evacuation warning.

"We didn't have time to take anything with us," Gong said. "But the shelter provided all the daily necessities."

The National Health Commission has dispatched emergency medical teams and specialist doctors to support treatment efforts following the landslide.

The commission immediately mobilized national-level and Chongqing emergency medical rescue teams and sent medical workers and ambulances to the site.

A college freshman surnamed Zhang, who was injured in the disaster, was alone at home when the landslide occurred. She recalled struggling to walk due to leg injuries before a firefighter carried her down and took her to an ambulance. After receiving timely examinations and treatment at the hospital, Zhang said she was recovering, though her legs still hurt slightly while walking.

"The medical staff members were so kind and caring. I was deeply moved," she said.

Grid managers risk lives to aid Chongqing evacuation

Tan Yingzi
Reporter's Log

"Please leave me alone," Zhang Weiling, Party branch secretary of Shatuo community in Hanjia subdistrict, Pengshui Miao and Tujia autonomous county, wearily told the reporters on Saturday after giving interviews about evacuations that took place shortly before a deadly landslide struck her community in Chongqing.

An emotional Zhang tried hard to hold back tears as she recalled the harrowing event.

During the chaos of helping residents move to safety, one of her colleagues was injured and hospitalized and another went missing.

Overwhelmed by sadness and the heavy burden of resettlement work, she found a quiet corner to sit and bowed her head to rest.

As I covered the landslide story in this community, I was deeply touched by the bravery and dedication of the most grassroots community workers: the grid managers who serve as the vital link between local residents and the government.

Local communities in Chinese cities and rural areas are divided into small neighborhood units called "grids". Those grid managers are responsible for handling information collection, safety inspections, dispute mediation and public services to ensure effective community governance.

The landslide occurred at around 9 am on Friday in Pengshui county, burying several residential buildings and trapping multiple individuals.

The disaster killed eight people, with 34 still missing.

Fortunately, earlier that morning, local community workers issued an emergency warning after discovering sporadic rockfalls during an early morning patrol and organized the safe evacuation of over 60 residents.

Grid managers, such as Peng Di and Gong Baodong, knocked on every door to warn residents about the landslide and encouraged them to leave for a safer place.

Some left home right away, but others hesitated and chose to stay put.

"While everyone else was fleeing, Peng ran against the crowd and kept shouting warnings to the residents," Ran Shifang, 49, a resident who escaped from landslide, said.

"She shouted, 'The mountain behind us is about to collapse! Run to the sides, hurry!'"

Just before the collapse, Peng was struck by flying debris and tumbled into a gap between the fallen rocks. Later, she was rescued and taken to the hospital for treatment.

But Gong, a young man in his 20s, lost contact at around 9 am while assisting with the evacuation effort. He became a grid manager in May last year after graduating from Southwest University of Political Science and Law in Chongqing.

This is not just an isolated story of bravery; it is a vivid reflection of a massive network. China is powered by several million grid managers nationwide. From resolving neighborhood disputes and assisting elderly empty-nester, to patrolling dangerous hillsides during rainstorms, they are the vital links that hold societies together.

They transform abstract state governance into tangible, warm and highly efficient daily care. They prove that effective modern governance relies not just on big data and smart cameras, but on the dedicated footsteps of individuals who know their neighborhoods inside out.

For their ultimate dedication, their silent sacrifices and their unwavering bravery in the face of danger — hats off to the grid managers.

1,400-year-old Buddha statue's head discovered

By ZHU XINGXIN in Fenyang, Shanxi and **LI LEI**

Two discoveries that occurred 26 years apart have led to the complete assembly of a 1,400-year-old Buddha statue that went on public display at a museum in Shanxi province on Sunday, offering a rare glimpse into Buddhist art from the Northern Qi Dynasty (550-577).

The headless statue was first discovered in 2000 and a damaged sandstone head was found by a 57-year-old local farmer this month.

He Dongsheng, from Dongzhao village in Fenyang city, made the discovery while working on his field next to a pig farm.

Caked in mud when found, the fragment measures 37.5 centimeters tall, 24 cm wide and 25.5 cm thick. It has severe damage to its left ear and nostril, as well as extensive erosion on its left side.

Despite its weathered appearance, the head bears unmistakable stylistic features of Northern Qi sculptures, including a polished ushnisha — an oval-shaped protrusion on the top of Buddha's head — as well as a broad forehead, full cheeks, a faint smile and streamlined contours, according to a panel of experts assembled by the Fenyang Museum.

"I knew in my heart it was a national cultural relic. Donating it to the State was the most appropriate choice," He told China Daily.

After hearing news of the discovery, Tian Xinsheng, Dongzhao Party chief, suspected that the head may belong to a headless Buddha statue already housed at the museum.

To verify the match, the museum commissioned a professional team on July 12 to conduct 3D scans of both the head and the statue's body.

After several days of digital analysis, experts confirmed that the fracture surfaces, stone texture and weathering patterns were a precise match, proving the two pieces belonged to the same statue.

Wang Zhongzhang, a former curator of the museum who helped excavate the headless statue in 2000, had spent years searching for its missing head.

Seeing the statue restored at last, Wang, now in his 70s, said he was overjoyed.

"As a veteran cultural heritage worker, I am truly delighted. These stone carvings vividly demonstrate the superb craftsmanship and artistic wisdom of the Chinese nation from a thousand years ago," he told China Daily.

Kong Linghai, the museum's current curator, said the complete statue would provide an important reference for the study of Buddhist stone carvings in western Shanxi.

"Every cultural relic carries the cultural genes of its place of origin. It reflects the economic, artistic and cultural standards of successive dynasties," he said.

Kong expressed hope that the case would encourage more rural communities to value and protect their cultural heritage.

"Many historical objects remain scattered in villages. If this case sets an example, it could prompt more people to come forward," he said.

Experts said Fenyang's rich Buddhist heritage dates to the 6th century, when monks fled to the area during a suppression of Buddhism in a neighboring region.

A donation ceremony was held at the museum on Saturday, where He received a certificate and a cash reward of 10,000 yuan ($1,475).

Deputy Mayor Wang Baoqi presented the award and a silk banner to the Party branch of Dongzhao village in recognition of its role in safeguarding the relic.

"His generous act reflects the strong cultural awareness and deep sense of legal responsibility among the people of our city," Wang said at the ceremony, calling on residents to follow He's example in protecting the city's cultural heritage.

Zhang Shurui and Chen Shuo contributed to this story.

Cave: Winding resort caters to diverse needs of tourists

From page 1

Now there, he leaned back against the rock wall, arms outstretched, exactly like the figure in that video. Below him, the heart-shaped green pool glimmered under the thin beam of his headlamp. Steel cables hummed softly overhead. "I came all this way just for this photo," he said.

He is on Shuanghe's wildest attraction — an underground protected climbing route that is bolted into the cave walls.

Helmets buckled and harnesses tight, climbers edge along steel lines, squeeze sideways through slots barely wider than their shoulders, wade knee-deep through icy underground streams, and finally scale a sheer 30-meter cliff face in the dark.

Not everyone arrives feeling brave.

Yan Ziqian, a 12-year-old from Chengdu, Sichuan province, trembled when he stood at the entrance. "It was completely black inside," he said. "I couldn't see anything." Then his lamp caught the glimmer of an underground river, and the fear melted into wonder. "It felt like I had stumbled into a secret world."

By the end, he was grinning, already calling himself a seasoned spelunker.

Guide Huang Huazhou sees this transformation every day.

"Kids come in nervous," she said, "but they leave feeling like heroes."

The team has designed two routes — a gentler 2-km stretch for ages 10 and up, and a more challenging 2.5-km route with steep drops that demand real muscle.

Not everyone wants to dangle from a cliff. Some prefer to drift.

Out on the water, paddleboarders glide across a surface so still it mirrors the mountains. They move toward the cave's mouth in near silence, paddles dipping and rising, the only sound the soft splash of water against rock.

The river is fed by the cave's own underground waterways, and even in August, the water is shockingly cold.

"It feels completely separate from the world," said visitor Xu Kexin, floating on her back, staring up at cliffs wrapped in green. "You forget what season it is. You forget the city even exists."

Bottazzi, who now lives nearby so he can keep exploring, is blunt about what's at stake.

"Exploring and developing Shuanghe is important for regional development and the advancement of knowledge," he said. "But we must do it wisely and with greater respect for this heritage."

Shared farms flourish as tranquil retreats

Urban plots a respite from stress and boredom, double as educational fields

By **ZHAO RUIXUE** in Jinan
zhaoruixue@chinadaily.com.cn

On a sloping patch of land once choked with weeds and left abandoned for nearly a decade, a visible transformation has literally taken root.

In Licheng district, Jinan, Shandong province, the hillside is now a checkerboard of lush greenery, divided by white picket fences and crisscrossed with bamboo trellises heavy with cucumbers, tomatoes and eggplants.

On a Saturday morning in late May, after a sudden storm swept through the city, a group of urban gardeners rushed to their plots in Tangye subdistrict to check on their vegetables.

"I had no idea how my vegetables were holding up after that wind and rain," said Xu Ling, a local resident, in a post on her Douyin account.

"Having a vegetable garden gives you one more thing to care about," she said.

Xu and her husband Tian Xiangqin tend a 20-square-meter plot they call Lele's Garden, named after their 7-year-old son. Inside, they grow not only vegetables like cabbage and cilantro, but also flowers including lotuses and hydrangeas.

The couple go to their garden at least once, and sometimes twice, a day. On weekends they bring their son to the garden.

"Once we are here, we are reluctant to leave," said Xu, standing in the sunshine beside her plot.

This hidden pocket of green at the foot of Longgushan Hill is more than just a gardening project. It is part of a growing urban phenomenon in China where shared vegetable gardens turn idle land into productive, community-driven spaces, often with therapeutic benefits for the participants.

For many city residents, these small plots have become a place to slow down, connect with nature, and discover the simple joy of watching things grow.

"Shared vegetable gardens are rooted in land resources, people's needs and the renewal of urban and rural spaces," said Liu Dejun, chief economist at the Shandong Academy of Macroeconomic Research.

"As older neighborhoods are renovated and idle rural resources are revived, the industry will move from rough, spontaneous growth to standardized operations and branded services. The market space will continue to expand," said Liu.

From wasteland to asset

"This used to be nothing but wild slopes, overgrown weeds and trash," said Han Kunjie, 30, who manages the Longgushan shared vegetable garden.

The land had sat unused for nearly 10 years after the surrounding area was developed. That changed in 2024, when the Tangye subdistrict office began planning the Longgushan cultural and creative park project. The shared garden was included in the park.

Han, a Zhanglingqiu Ercun villager, secured the land through a rural land transfer agreement, a practice where villages lease land-use rights to individuals.

"I had thought about planting Chinese medicinal herbs, but finally gave up the idea because I did not think the land was suitable," Han said.

He had noticed parents struggling with their children's screen addiction, stressed workers seeking outlets, and seniors wanting to stay active and healthy. So, he decided to create a shared vegetable garden.

He installed taps and irrigation pipes, leveled the paths, provided free hoes and shovels, and hired a veteran farmer as a consultant.

The results exceeded expectations. Covering just over nine *mu*, or 6,000 square meters, the garden was divided into 204 plots, with 200 of them measuring 20 or 30 sq m each, and four slightly larger ones.

The plots went on offer on March 1. Within ten days, all of them were rented.

"When we first planned this, we were not sure if anyone would want to rent a plot," Han said. "But it turned out to be incredibly popular," he added.

Walking through the garden, the care and individuality of each plot are immediately visible. Some have just been seeded, with tender green shoots poking through the soil. Others are bursting with produce; small watermelons dangling from vines, their weight tugging at the trellises.

"Watermelons grow on vines?" a young girl standing by one plot asked.

Many plots have been personalized with creative nameplates.

At the entrance, staff have posted a seasonal planting and harvesting calendar to guide novice gardeners.

The garden offers three rental prices. For those who want to do everything themselves, including sowing, watering, weeding and harvesting, the cost is 1,299 yuan ($190) per year. A semi-managed option, at 1,599 yuan, includes watering, fertilizing and weeding by staff. The full-service package for 1,899 yuan requires renters only to provide seeds and fertilizer, while professional gardeners handle the rest.

Interestingly, only about 10 percent of renters choose the semi-managed or fully managed options.

"Most people really want to grow vegetables on their own," Han said.

He said the project is predicted to start turning a profit in its third year.

This enthusiasm is not unique to Longgushan. At the recently opened Yugeng natural farm in Licheng district, 70 of its 150 plots — each 20 sq m — have already been claimed.

Tian Xiangqin and his son tend a 20-square-meter plot at the foot of Longgushan Hill in Jinan. The plot, called Lele's Garden, is named after the son. ZHAO RUIXUE / CHINA DAILY

Self-planting at Yugeng farm costs 988 yuan a year, with free access to water, electricity, tools, and even seeds and fertilizer for the first year. Technical staff are on hand to offer advice.

"Our garden is not just about growing vegetables. Instead, it is about leisure," said Jiang Rongjian, the farm's manager.

"We want to create a kind of relaxed, farming lifestyle that young people and seniors will love," he said.

The farm also features a bamboo forest park, a children's karting track, and open-air kitchens where farm renters can cook what they have just picked.

Connecting to the soil

On a Saturday at Longgushan, retirees, young parents and children trickle in.

Eighty-six-year-old Han Yuanren, who lives ten minutes' walk from the garden, visits his plot every day with his small dog. In his 30-sq-m plot, he grows more than a dozen vegetables, including cilantro, cucumbers, beans and lettuce.

"I am happy when I see these vegetables growing very well," he said, smiling.

According to Han Kunjie, most renters were born between 1985 and 1995. "They rent the plot for their parents," he said.

"People live in apartment buildings. Neighbors hardly know each other. Grandparents are stuck at home watching television or scrolling on their phones which is not good for their health," said Han.

Tian said the plot gives him something to do, and helps his son Lele learn where food really comes from. "My family is from the countryside," said Tian, as he loosened the soil alongside his son.

"My father farmed for more than 30 years. But we live far from our hometown, and our son knows very little about vegetables. We would like him to experience the whole process, from sprouting to harvest," he said.

Tian, who works as an interior designer, has given his vegetable garden a style of its own.

"We try to grow more crop varieties, each no more than one square meter," said Tian, adding they plan to plant more flowers.

More than a garden

For many urban dwellers, the appeal of a shared garden goes far beyond fresh produce. It offers daily rhythm, rewards, and a sense of connection to the earth and to oneself.

"Working in the garden lets you put down your phone and slow down," said Xu.

"The smell of soil, the simple repetition of digging, sowing, watering and weeding brings focus and relaxation. You find peace in the sweat and the harvest."

But not everyone has access to a real plot of land. For those who do not, "cyber farming" has become a popular alternative.

Cui, a senior at Shandong University who declined to give her full name, turns to farming simulation games to cope with the pressures of graduate school examinations, internships and job hunting.

"In a farm, although it's cyber, as long as you sow, water and weed, you are guaranteed a harvest. That certainty is deeply satisfying and helps ease anxiety," said Cui.

Yet beyond personal relief, shared gardens are also proving to have a profound social impact. In Tongji town, Pengzhou, Sichuan province, 42-year-old Fan Xiuyun has transformed a shared vegetable garden into an important provider for her community.

She runs 20 *mu* of shared plots, where donors pay 365 yuan a year to adopt a small section and receive monthly organic vegetable boxes in return.

Local seniors work the land to earn meal credits for a canteen. Surplus vegetables are sold for charity, with the proceeds going into a community fund that supports the canteen. People with disabilities have also been hired to take care of the vegetables.

Adapt and grow

Despite their growing popularity, shared gardens face a major problem: low renewal rates.

"The biggest issue is that most people do not renew their contracts," Han, the manager, said. "Many renters are just trying it out for fun. Once the novelty wears off, they do not come back."

That is why the Longgushan garden deliberately kept the number of plots manageable. "We want to keep them fully rented year-round while giving as many people as possible a chance to try it," said Han.

Liu noted that many small-scale shared farming projects still rely too heavily on land rental income, which has little added value. "Revenue gaps between peak and off-seasons are huge. The payback period is long, and risk resistance is weak," he said.

He suggested building a diversified revenue system that includes leasing, managed services, produce sales, and educational tourism.

Longgushan is already adapting. The cultural and creative center, which the garden is part of, is being developed into a full-fledged lifestyle destination. Plans include a parking lot, a convenience market, a coffee shop, flower beds planted on a nearby slag heap, a creative bazaar, and even charging stations for electric vehicles.

"When parents bring their children here, they need a place to park, somewhere to buy groceries, a nice view, and then they can tend the garden and have fun," Han said.

Yugeng natural farm is taking a different path.

"We do not want to become just a photo opportunity spot," said Jiang, the farm manager. "We want to keep the commercial feel low and let people truly connect with nature."

The farm plans to introduce more education courses for seniors and parent-child activities.

Liu said that shared gardens deserve flexible policy support. He suggested that local governments streamline approval mechanisms, lower entry barriers for idle urban land, encourage social capital to participate in compliant operations, and adopt differentiated regulation.

"For projects that are purely about growing vegetables, give the operators as much freedom as possible to run things on their own," said Liu.

"For projects that have a few simple leisure facilities, local authorities can set clear construction standards to guide the development. For projects that extend into tourism, strictly control how much land they use and how big they build to protect the land."

The social benefits are considerable, said Liu.

"For seniors, farming brings back rural memories, supports health and leisure, and enriches their later years. For younger people, it is a way to spend time with family and return to a slower pace of life. For children, it is an outdoor classroom to have labor education, nature education and cultural education all rolled into one."

All three groups together, he added, help bridge the generation gap in cities, strengthen family traditions, and revive the culture of farming and learning.

Sun Qi contributed to the story.

COMMENT

Editorials

UK government's British Steel takeover sends chilling signal to global investors

A country's character is revealed by how it treats those who answered its call in times of need when others walked away. By that measure, the United Kingdom's nationalization of British Steel says less about steel than it does about the country's changing attitude toward foreign capital.

Around six years after China's Jingye Group rescued a bankrupt company that no other investor would touch, the UK government has effectively taken the assets of the investor it once welcomed as a savior. For a country whose greatest comparative advantage has long been its reputation for propriety and respect for property rights, the move could hardly be more damaging.

When British Steel collapsed into insolvency in 2019, few buyers emerged. Jingye stepped forward, acquiring the company for around £70 million ($94 million) and subsequently investing more than £1.2 billion to keep production running and preserve thousands of jobs. British politicians and newspapers then hailed the rescue as evidence that the UK remained open to global investment.

Yet last week, after first stripping Jingye of operational control through emergency legislation, the UK government formally nationalized British Steel, citing "national security" and "industrial resilience".

Few would dispute that steel occupies a special place in national security calculations, particularly when Scunthorpe hosts the UK's last blast furnaces capable of producing virgin steel. Facing mounting losses and tightening environmental requirements, Jingye proposed to replace them with cleaner electric arc furnaces, a transition already underway across much of the global steel industry. To finance the transformation, it reportedly sought UK government support of roughly £1 billion. The UK government offered only half that amount.

When negotiations collapsed and Jingye prepared to close the furnaces, ministers concluded that the UK could not politically afford to become the only G7 economy without primary steelmaking capacity.

Politics therefore trumped economics.

Instead of reaching a commercial compromise, the UK Parliament rushed through emergency legislation at remarkable speed before completing the formal nationalization this month. In doing so, the UK protected its steelmaking capabilities but simultaneously created another problem: whether foreign investors can still assume that commercial decisions will remain insulated from shifting political priorities.

The answer is increasingly no to many.

China's Ministry of Commerce rightly warned that the nationalization decision would inevitably weaken the confidence of Chinese businesses investing in the UK. China's Foreign Ministry has urged the UK government to honor market principles, contractual obligations and the bilateral investment protection agreement between the two countries, while making clear that Beijing supports enterprises seeking legal remedies to defend their rights.

Nor can the UK claim it lacked warning. As early as May, when reports first emerged that nationalization was under consideration, Beijing urged London to proceed cautiously, avoid discriminatory treatment and seek a mutually acceptable commercial solution. Those appeals were ultimately ignored.

The compensation dispute has only deepened concerns. Jingye said on Sunday that the UK had "trampled on international investment rules" by offering what it described as virtually no meaningful compensation. The company is justified in urging the UK government to provide prompt, full and effective reimbursement for all losses. Citing a report of the UK's National Audit Office, Jingye also noted that the UK had spent £377 million to operate British Steel as of the end of January. The figure was expected to exceed £600 million by the end of June and could surpass £1.5 billion by 2028.

So the larger question is why taxpayers are now financing losses that private capital had previously absorbed. Even many UK observers acknowledge the deeply political nature of the intervention. As they have said, the extraordinary pace of the emergency legislation and lingering uncertainty over compensation have exposed an uncomfortable tension between industrial strategy and the UK's longstanding reputation for contractual certainty.

For the UK's incoming prime minister, Andy Burnham, the handling of British Steel will become an early test of his government's economic pragmatism. Treating China as a geopolitical rival risks narrowing the UK's own economic options.

The UK's global standing has long rested on the belief that its legal institutions remain more durable than its politics. If that perception weakens, the damage will extend well beyond the steel industry. It will shape how investors around the world judge the reliability of what is allegedly one of the West's oldest "champions" of the "rule of law".

US-Iran MoU should not go up in smoke

Just weeks after signing a memorandum of understanding on an interim deal to halt their conflict, the United States and Iran are embroiled in intense confrontation, casting a dark shadow over the stability of the Middle East and the security of global energy supplies.

The current escalation is marked by a series of devastating attacks. The US has launched multiple rounds of air strikes against Iranian military sites, claiming they are necessary to "degrade Iran's ability to threaten commercial shipping" in the Strait of Hormuz. US President Donald Trump has threatened to target Iran's power stations and bridges.

This military confrontation has effectively nullified the MoU. On Saturday, Iranian Deputy Foreign Minister for Legal and International Affairs Kazem Gharibabadi declared that Iran has ceased fulfilling its obligations under the agreement, as Washington has violated its commitments.

Iran's Supreme Leader Mojtaba Khamenei also said the US' violation of the MoU proves the US leader's signature is worthless and invalid, highlighting the profound breakdown in trust.

The diplomatic path, which offered a glimmer of hope, now appears completely blocked. Central to this conflict is the strategic Strait of Hormuz. The escalation of tensions has already led to a sharp slump in shipping through the strait, sending shock waves through global energy markets again.

The safety of this international shipping lane, vital to the global economy, must not be held hostage as a bargaining chip in this dangerous geopolitical game. Using the Strait of Hormuz as a tool for leverage is a reckless gamble with global stability. The two parties concerned should exercise restraint and de-escalate the situation.

Regrettably, the MoU at the moment is effectively defunct as the basic preconditions for its implementation no longer exist. Its first article required both sides to cease fire completely and restrain their allies, forming the basis for the next phase of negotiations.

Not only has Israel continued to take military actions in Lebanon, but also the US and Iran have engaged in conflict again. Under the MoU, the US had previously agreed to lift the oil export embargo on Iran and unfreeze Iranian assets, but these promises have now been revoked by the US.

Much of the current situation stems from the inherent fragility of the MoU itself. The first article regarding the ceasefire was negotiated between the US and Iran without involving Israel. The reconciliation between the US and Iran has therefore always been at risk of being sabotaged by Israel.

Having neither sought nor signed the MoU, Israel is under no obligation to honor it — and Washington knows it. So it comes as no surprise that US Vice-President JD Vance has criticized Israel for resorting to a range of tactics, including lobbying to shape public perceptions in the US, all aimed at prolonging the US' conflict with Iran.

Nor does the MoU offer any clarity on the Strait of Hormuz — its provisions are so loosely drawn that each side can claim victory. Iran asserts the document affirms its control; the US insists it means no such thing. The gap between their readings is not a misunderstanding — it has been a crisis waiting to happen.

The prevailing trajectory of retaliation serves the interests of no party, except those whose strategic calculations depend on the perpetuation of hostilities. Washington may think that military force can coerce Iran into submission. But that belief was proved wrong soon after the conflict started on Feb 28. Each round of US attacks on Iran, aimed at appeasing hard-liners at home, only escalates the cycle of violence rather than resolving it, and deepens US entanglement in the Middle Eastern quagmire.

A return to the negotiating table is the only viable solution. The MoU was a hard-won achievement that should be cherished and protected. China, along with other nations such as Pakistan, has called on both parties to immediately cease hostilities, overcome difficulties and restart dialogue to reach a comprehensive peace agreement.

The longer this conflict course is pursued, the more it chips away at the already-frail trust that emerged from those first talks. And as that trust crumbles, so too does any hope of a graceful way out. The US and Iran must prioritize regional peace and the security of critical shipping waterways, return to the spirit of the MoU, and prove that their signatures are still credible.

Short-term stock volatility doesn't mean AI is another dot-com bubble

The recent sharp swings in semiconductor stocks in several major markets have pushed the question — Is the AI craze doomed to burst? — back to the fore. Yet market volatility cannot reverse the tide of technological progress. AI remains the future.

AI is no castle in the air. Unlike the dot-com bubble of the early 2000s, when many internet companies had yet to establish viable business models, AI is underpinned by solid technological and industrial foundations and is already delivering tangible value across industries.

At the MAEXTRO Super Factory in Hefei, Anhui province, jointly built by JAC Group and Huawei, a digital twin plant enables real-time monitoring across the production process, while more than 1,800 intelligent robots support automated manufacturing.

In healthcare, AI models are assisting doctors with more accurate and efficient diagnoses. An AI-powered model integrating rare disease information and genetic data from the Chinese population has already been put into clinical use.

According to the Digital China Development Report (2025), released by the National Data Administration, China has become the world's largest holder of AI patents, accounting for 60 percent of the global total. The core AI industry has exceeded 1.2 trillion yuan ($177 billion) in scale.

Naysayers are often trapped by their limited understanding of applied AI. But technological evolution has never been halted by skepticism. AI is evolving from a mere chat tool into autonomous intelligent agents, transforming industries beyond digital empowerment through comprehensive intelligent restructuring.

A guideline released by the State Council, China's Cabinet, on deeply implementing the "AI Plus" initiative calls for significant progress in the deep integration of AI across six key sectors by 2027. By 2030, the intelligent economy is expected to become a significant growth driver for China's economy.

While routine, standardized tasks are being automated, new professions such as prompt engineers and AI ethics auditors keep emerging. In the AI era, job displacement and new opportunities go hand in hand.

Boom-and-bust cycles are inevitable for all emerging industries. Short-term capital frenzy does not equate to an economic bubble — it is merely a natural phase of industrial reshuffling. AI is no fleeting hype, but a genuine force reshaping our era.

Instead of fixating on whether the bubble will burst, we should have faith in the promise of technology and, more importantly, believe in its potential.

— ZHANG CHENXU AND ZHUANG QIANGE, CHINA DAILY

What They Say

Industrial production stabilizer and driver of growth

Editor's note: *Data provided by the National Bureau of Statistics show that the value added of China's industrial enterprises above designated size rose 5.4 percent year-on-year and that of high-tech manufacturing increased 13.3 percent year-on-year in the first half of the year. The National Business Daily spoke to Liang Yongmei, an associate researcher of the Institute of Industrial Economics at the Chinese Academy of Social Sciences, on the development of the industry sector. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The performance of China's industry in the first half of 2026 demonstrates that the cultivation of new quality productive forces has yielded notably positive results, particularly in the industrial sector.

New growth drivers, represented by high-tech manufacturing and digital product manufacturing, accounted for over 20 percent of value added but contributed nearly 50 percent of industrial growth.

China's industrial production efficiency is improving and growth is no longer driven by simple scale expansion, but increasingly by technological intensity and higher value-added content.

The long-standing concern about manufacturing being "locked into the low end" of the global value chain is being effectively addressed, as industrial production accelerates its move toward the mid-to-high end.

Production of 3D printing equipment, lithium-ion batteries and industrial robots — emblematic of smart manufacturing and green production — has grown particularly rapidly.

Lithium batteries are benefiting from the rising global penetration of new energy vehicles and the surge in energy storage markets; industrial robots are meeting the demands of changing labor force dynamics and manufacturing's pursuit of precision and consistency; and 3D printing is moving from experimental "showcase" projects to standard practice in aerospace, medical implants and other industries.

Both 3D printing equipment and industrial robots are entering a phase of rapid growth and large-scale commercial application. The steady progress of intelligent, green and integrated development is becoming a hallmark of China's new type of industrialization in many regions.

At the same time, the rapid growth of these products also reflects and results from the completeness of China's industrial system and the continuous strengthening of the self-sufficiency of its industry chains.

The country has formed relatively complete closed-loop industry chains in these areas and rising localization rates have reduced costs, which in turn has helped accelerate the adoption of high-end industrial products.

Ultimately, the health of the real economy must be measured by profits.

In the past, many high-tech industries required substantial upfront investment, posting high revenues on paper but thin profit margins.

A comparison with last year's data shows that profit growth for industrial enterprises above designated size has been remarkably strong.

Double-digit profit growth has been sustained, with sectors closely tied to new growth drivers, such as electronics (semiconductors and components) and nonferrous metals (new energy minerals and high-end alloys), showing particularly robust profitability.

This indicates that these industries are now reaping the rewards of technological premiums and the dividends of industrial upgrading are flowing deeply from the revenue side to the profit side, forming a virtuous cycle of innovation and profitability.

Profit remains the best guide for resource allocation and this trend is likely to attract more capital and talent to new-growth sectors, while significantly boosting market confidence.

Furthermore, the relatively rapid profit growth of enterprises above the designated size also suggests that recent efforts to curb "involution-style" competition have been quite effective. The problem of "higher output without higher efficiency" that plagued some sectors in the past is being tackled, which is an important signal of high-quality development.

The positive momentum in industrial production appears sustainable. The manufacturing purchasing managers' index has returned to expansion territory, while the business expectations index for production and operations is also rising, indicating that entrepreneurs are gaining confidence in the market outlook.

Combined with continued targeted policy support such as equipment upgrades and trade-in programs for consumer goods, as well as the healthy growth momentum already generated by some new growth drivers, industrial production is well-positioned to serve as both a stabilizer and a driver of economic growth in the second half of the year.

Merve Hickok

Smart AI agents need smarter guardrails

Artificial intelligence technology is evolving faster than many consumers, or even small companies, can fully understand the risks created by its new capabilities. Agentic AI is one such milestone in this evolution.

Unlike generative AI, which primarily responds to user queries, drafts documents or synthesizes information, agentic AI can take action on behalf of humans.

Users spell out the goal to the AI agent, and the system breaks it down into smaller steps, engages with websites, fills out forms, makes bookings, purchases items, uses external tools and even coordinates with other agents to achieve the objective.

Think of a future where one person or one company deploys hundreds of specialized agents to complete different tasks.

But agents, just like chatbots, suffer from the limitations of generative AI. They are non-deterministic systems and can hallucinate. The same question may produce different answers at different times. They are also prone to adversarial attacks.

The bigger risk is that agentic AI does not merely generate information, but can also take unintended actions. One agent's error can snowball into a bigger problem with downstream agents' actions.

Since AI agents operate across systems, products and borders, they will certainly add more complexity to cyberspace and digital commerce.

Soon, your shopping agent might negotiate with a merchant's pricing agent over the price of an air ticket or a household finance agent might dispute a bill with a utility company's chatbot. With the increased complexity of multi-agent systems, strong safeguards are required to protect consumers.

The key question is: If AI agents can make decisions on behalf of humans, where should we draw the line? How can we ensure that agents always act in the best interests of the consumers who deploy them, and can resist manipulation? These are no longer hypothetical questions.

The first priority is safety. When a conventional chatbot gives bad advice, the damage is limited to wasted time.

But agents capable of taking action can turn bad judgment into real-world consequences at machine speed — booking travel incorrectly, transferring money, signing up for unwanted subscriptions, negotiating with other agents, or purchasing expensive products.

An agent that misinterprets a contract clause can be manipulated into accepting an unfavorable deal by a more persuasive counterpart.

Safety in this context means more than avoiding useless answers. It means establishing clear boundaries of authority.

Consumers need agents that operate within adjustable limits: monetary caps on purchases, categories of decisions that always require explicit human approval, and safeguards to prevent irreversible actions. An agent should never be able to do something a reasonable person would not let a new employee do without confirmation.

Therefore, we need safe protocols for identity management, and authorization mechanisms that can work across different products and platforms.

Reliability is the second pillar, and it is trickier than it sounds. Reliability is not just about uptime or accuracy. It means that an agent consistently understands and follows the intent of the user.

An agent that misinterprets a user's intent, or can be manipulated to misunderstand, is counter-productive. Multi-agent commerce creates an environment where agents constantly communicate with other agents, some of which may be designed by companies with an obvious interest in extracting more data, money or attention from the consumer.

A retailer's agent may be optimized to upsell; a booking agent may be designed to nudge users toward options that pay higher commissions. To protect consumers, we need traceability and transparency.

Users should be able to understand what steps their agents take and why. We need transparency between agents from different vendors to ensure they are not colluding.

Even when the authorized agents work properly, agentic AI is prone to malicious attacks to manipulate its actions. If a consumer's agent is not secure and robustly built to resist these tactics, the whole premise of "delegating decisions to save time" collapses into "delegating decisions to be quietly exploited". Attackers can extract consumers' private information, direct them to malicious websites or influence agents into making harmful choices.

Reliability therefore requires agents that are auditable and robust. Just like banks regularly test their systems against fraud, AI agents must be stress-tested against the exact kinds of persuasion and manipulation techniques they may encounter from other commercial agents or malicious actors.

Finally, there is the question of liability. We need clear rules for who is responsible when an agent causes harm: the company that built the underlying model, the user who deployed the agent, developers of the protocols connecting the merchants, or the websites with manipulative agents.

Ambiguity here does not benefit the consumer whose interest is harmed. A sensible framework would hold the deploying party primarily responsible for the actions their agent takes, while requiring model and platform providers to meet baseline safety and transparency standards.

None of this means banning agentic AI or treating it as inherently untrustworthy. Agents could in fact lead to significant savings in time and money. They could lower entry barriers or costs for entrepreneurs.

But the technology's usefulness depends entirely on trust, and trust depends on rules that exist before the harm occurs, not after it.

We need to establish clear guardrails and clear chains of responsibility. Any tool this powerful needs safeguards proportional to what it can do or enable.

Yang Peou

China's quiet diplomacy vital for ASEAN

In an era marked by complex geopolitical shifts, the relationship between China and the Association of Southeast Asian Nations shines as a beacon of constructive engagement and mutual benefit.

Since establishing dialogue relations in 1991, the two sides have cultivated a comprehensive strategic partnership that prioritizes peace, economic integration and cultural understanding.

This partnership not only bolsters regional stability but also serves as a model for harmonious coexistence among neighbors.

China has consistently demonstrated its commitment to ASEAN's peace and stability through diplomatic initiatives, economic support and cultural exchanges.

As ASEAN's largest trading partner, China plays a pivotal role in fostering economic resilience across the region. Bilateral trade has reached impressive levels, underscoring deep interdependence.

Initiatives such as the ASEAN-China Free Trade Area and the Belt and Road Initiative have facilitated infrastructure development, investment and connectivity, creating jobs and driving sustainable growth in member states.

Beyond economics, security cooperation is the cornerstone of the relationship. China supports ASEAN's efforts to maintain a nuclear weapon-free zone and collaborates on addressing transnational challenges such as piracy, drug trafficking and non-traditional security threats.

Through mechanisms such as the ASEAN Regional Forum, both sides engage in dialogue to build trust and manage differences peacefully, particularly in the maritime realm.

China's advocacy for "Asian solutions to Asian problems" emphasizes dialogue and consultation, reinforcing ASEAN centrality in regional affairs.

Cultural and people-to-people ties further deepen this partnership. Exchanges in education, tourism, arts and youth programs have fostered mutual understanding among over two billion people.

Flagship events and subnational cooperation, such as those in the Guangdong-Hong Kong-Macao Greater Bay Area, highlight the vibrant socio-cultural dimension that strengthens the sense of a shared future.

A shining example of China's contribution to peace and stability in ASEAN is its active facilitation in resolving the tensions between Cambodia and Thailand.

In 2025, the resurgence of long-standing border disputes escalated into an armed confrontation between the two countries, resulting in tragic loss of life and the displacement of civilians.

Demonstrating quiet yet effective diplomacy, China stepped forward as a trusted mediator.

Foreign ministers and senior officials from China, Cambodia, and Thailand held trilateral meetings in Yunnan province and in Beijing.

These meetings provided a neutral platform for dialogue, leading to ceasefire agreements, confidence-building measures, and commitments to peaceful resolution through bilateral and regional mechanisms.

China welcomed joint statements from Cambodia and Thailand and supported the implementation of the consensus reached, helping restore calm along the border.

Such mediations highlight China's constructive approach: offering good offices without imposing solutions and respecting the sovereignty and agency of the parties involved.

By hosting these talks, China helped prevent further escalation, protected civilian lives, and contributed to the broader stability of Southeast Asia.

This not only helped mend bilateral frictions but also safeguarded ASEAN unity, which is vital for the bloc's collective strength.

The ripple effects are profound. Durable peace between Cambodia and Thailand will foster longer-term unity within ASEAN, enabling the organization to focus on shared goals such as economic integration and sustainable development.

A cohesive ASEAN, in turn, enhances its strategic partnership with China, creating a virtuous cycle of trust and cooperation.

It is hoped that China will continue to push for enduring peace in this and other potential hot spots, leveraging its growing influence to support regional harmony.

Looking ahead, there is strong optimism that China's role in ASEAN will continue to grow. As a responsible major power and good neighbor, China can deepen its contributions across security dialogues, economic corridors, and cultural initiatives.

This evolution aligns with the vision of building a closer China-ASEAN community with a shared future marked by peace, prosperity and amity.

China's humble, quiet and pragmatic approach to addressing challenges in ASEAN is something that all parties can readily accept.

By prioritizing mutual respect, win-win outcomes, and non-interference, China ensures that solutions bring relief rather than suffering to any side.

Rooted in patience, fairness, and long-term vision, this philosophy has proven effective in bridging divides and building consensus.

As China and ASEAN navigate the future together, this measured diplomacy will undoubtedly continue to yield dividends for regional peace and shared prosperity, benefiting not only the countries concerned but the entire region.

Dan Steinbock

High costs of the Gulf tensions rippling across the world

Renewed hostilities between the United States and Iran and Israel's continuing military campaign underscore the growing risk of a broader Middle East conflict and heightened global energy and food crises.

The latest exchanges included US strikes on Iranian military-related targets, Iran's retaliation against US interests and regional partners, and continued Israeli military operations.

It is a familiar pattern in conflicts led by the US and Israel. Ceasefires may interrupt hostilities, but without a credible political framework they fail to address the underlying causes of the conflict.

The renewed confrontation has expanded beyond the bilateral US-Iran relationship and now intersects Israel's continuing military operations, the humanitarian crisis in Gaza, the ongoing conflicts in the West Bank, heightened tensions in Lebanon, persistent unease in Syria, Jordan's delicate balancing act, Iraq's efforts to avoid being dragged in, security concerns across the Gulf and broader regional rivalries.

These are not isolated flashpoints, but form an interconnected strategic landscape in which developments in one arena quickly reverberate across the others.

Since the June ceasefire, the Benjamin Netanyahu government in Israel has reiterated its determination to maintain military pressure on Iran. With elections approaching, Netanyahu needs that strategic tension.

Israeli leaders argue that earlier operations have significantly weakened Iran's military capabilities and continued vigilance is necessary to prevent their reconstruction.

In other words, only the Obliteration Doctrine can finish the job.

This declared policy extends beyond Iran. Israeli operations have continued in Gaza, southern Lebanon and, periodically, Syria, reflecting a security doctrine that views these fronts as strategically interconnected rather than separate conflicts.

Over time, this strategy has no future. While military operations may reduce immediate threats, they also increase the probability of regional retaliation, strengthen incentives for asymmetric responses and complicate diplomatic initiatives.

In Gaza, military operations continue amid an ongoing humanitarian crisis. Along Israel's northern frontier, exchanges with Hezbollah and operations in southern Lebanon remain volatile. Meanwhile, Israeli bombardments have displaced over 20 percent of Lebanon's population.

Yet, Gaza and Lebanon are barely reported in Western media any longer. When mass atrocities become staple, they are no longer news.

Syria is another theater for strikes targeting military infrastructure associated with Iran and allied groups, with Israel's incursions into Syria's Quneitra and Daraa provinces.

In Iraq, bases housing US troops are frequently targeted by Iranian-aligned militias. Iraqi officials can only condemn the military actions on their territory, but it's the local citizens who bear the brunt of violence.

Direct military exchanges between Israel, the US and Iran have moved beyond the proxy confrontations that characterized much of the previous decade. These theaters are linked through overlapping military deployments, intelligence networks, missile capabilities, logistics corridors and alliance structures.

This regionalization also alters strategic calculations. Governments increasingly evaluate military operations not solely in terms of local objectives but also their implications for deterrence across the wider Middle East.

Paradoxically, escalation risks, which should be reduced and marginalized, have become even more pronounced.

The consequences of the renewed hostilities extend beyond the battlefield. Military expenditures continue to rise as regional governments devote additional resources to missile defense, intelligence, naval deployments and force readiness. Such expenditures inevitably compete with — and over time, crowd out — longer-term investments in infrastructure, education and economic diversification.

These economic consequences are not confined to the Middle East. Higher transportation costs, volatile energy prices and increased geopolitical uncertainty affect inflation, financial markets and growth prospects globally.

The Middle East plays an important role in global energy markets, maritime commerce and international investment flows. Consequently, even a limited disruption around the Persian Gulf and Strait of Hormuz influences shipping costs, insurance premiums and commodity prices.

Investors typically respond by increasing risk premiums while delaying investment decisions amid heightened uncertainty.

Unlike previous regional crises, the current conflict directly involves the world's principal energy choke point — the Strait of Hormuz — through which roughly one-fifth of globally traded crude oil and a significant share of liquefied natural gas exports transit. Even without a sustained closure, heightened military risks can raise insurance costs, reroute shipping and increase market volatility.

Under a contained conflict scenario, crude oil prices could remain in the range of $85 to $100 per barrel. However, a prolonged disruption could push prices toward $110 to $140. An extreme scenario involving significant interruption of Hormuz traffic could drive prices above $150, even if strategic reserves moderate the shock.

The implications extend far beyond energy. Higher fuel prices increase fertilizer production costs, transportation expenses and irrigation costs, placing additional pressure on global food systems.

Low-income food-importing countries in North Africa, sub-Saharan Africa and parts of South Asia would face renewed import inflation, deteriorating balance-of-payments positions and heightened fiscal stress.

Whether viewed through legal, humanitarian or strategic perspectives, the cumulative effect is growing pressure on the norms that have traditionally governed armed conflict. The renewed US-Iran confrontation, together with Israel's continuing regional military campaign, spreads corrosive damage across the region. As economic risks accumulate alongside humanitarian pressures, the space for negotiated political settlements is narrowing.

Future compass

APEC 'China Year' marks a defining moment for the destiny of regional joint efforts

WANG XIAOYING / CHINA DAILY

For more than 30 years, the Asia-Pacific Economic Cooperation mechanism has been one of the world's most successful platforms for economic dialogue. Since its foundation in 1989, it has promoted trade, investment and practical cooperation among 21 member economies that together represent nearly 40 percent of the world's population, close to half of global trade and around 60 percent of global GDP.

Unlike many international organizations, APEC does not rely on legally binding agreements. Instead, it works through consensus, trust and voluntary cooperation. That flexibility has often been underestimated, yet it is precisely what has allowed economies with very different political systems, levels of development and strategic interests to continue working together, even during periods of international tension.

Today, that role has become more valuable than ever.

The world economy is entering a new phase — one driven less by inexpensive labor or abundant natural resources and increasingly by innovation, technology, knowledge and the ability to adapt. Artificial intelligence, advanced manufacturing, biotechnology, clean energy, quantum computing and digital services are rapidly redefining competitiveness.

Success in this new era will depend not only on what countries produce but also on how effectively they collaborate. Innovation no longer happens in isolation. It grows within ecosystems where governments, universities, businesses, researchers, investors and entrepreneurs work together to create ideas, commercialize technologies and respond quickly to changing global conditions.

China has experienced this transformation firsthand.

Over the past two decades, the country has evolved from primarily the world's manufacturing powerhouse to one of the world's leading innovation economies. Cities such as Shenzhen, Guangzhou, Hangzhou and Shanghai have become global centers for AI, robotics, biotechnology, digital finance, electric vehicles and advanced manufacturing. This progress did not happen overnight. It reflects long-term investments in education, research, infrastructure, entrepreneurship and increasingly sophisticated public policy.

Perhaps nowhere is this evolution more visible than in the Guangdong-Hong Kong-Macao Greater Bay Area. Rather than functioning as separate cities competing with one another, the area is steadily becoming an integrated innovation ecosystem where universities, multinational companies, startups, financial institutions, research laboratories and manufacturing clusters reinforce one another.

Its experience offers an important lesson for the broader Asia-Pacific. The economies that will thrive over the coming decades are unlikely to be those that innovate alone. They will be those that build strong regional partnerships, share knowledge, attract global talent and create environments where ideas can move as freely as goods and capital.

China's chairmanship of APEC this year also arrives at an important moment for regional economic integration. The implementation of the Regional Comprehensive Economic Partnership, now the world's largest free trade agreement, is strengthening regional supply chains and reducing barriers to trade and investment. Yet much more remains to be done.

Future competitiveness will increasingly depend on areas that traditional trade agreements barely address: digital commerce, cross-border data flows, AI governance, cybersecurity, green finance, intellectual property and regulatory cooperation. These are precisely the kinds of issues where APEC's flexible and consensus-based approach can make a meaningful difference.

Another priority should be the continued pursuit of the vision first outlined in the Bogor Goals more than three decades ago. While remarkable progress has been made in opening markets, today's barriers are often less visible than tariffs. They appear in fragmented digital regulations, incompatible technical standards, restrictions on services and different approaches to emerging technologies.

One area that deserves particular attention is services.

Although services now generate the majority of economic value in many advanced economies, cross-border services remain far less integrated than the trade in manufactured goods. Digital consulting, healthcare, education, engineering, financial services, creative industries and research collaboration are becoming central drivers of economic growth. Helping professionals move more easily across borders, encouraging mutual recognition of qualifications, improving digital connectivity and harmonizing regulations could unlock significant opportunities for businesses throughout the Asia-Pacific.

Climate cooperation must also remain high on the agenda.

The Asia-Pacific is both one of the regions most exposed to climate change and one of the world's leading sources of climate innovation. Across the region, governments and businesses are investing heavily in renewable energy, battery technologies, smart infrastructure, sustainable manufacturing and green finance.

China has become one of the major contributors to this transition. Its rapid expansion of renewable energy, EVs and clean technologies demonstrates that environmental sustainability and economic growth can reinforce rather than contradict one another. This year offers an opportunity to strengthen regional cooperation in these fields through technology sharing, joint investment and collaborative innovation.

AI will undoubtedly be another defining topic.

AI is already transforming healthcare, manufacturing, logistics, finance, education and public services. But alongside its enormous promise come equally important questions about ethics, cybersecurity, workforce transitions, data governance and public trust.

Rather than allowing different regulatory approaches to create new economic barriers, APEC could encourage greater dialogue on common principles that support both innovation and responsible governance. Such cooperation will be essential if the region hopes to fully realize AI's benefits while minimizing its risks.

Beyond specific policy areas, perhaps the greatest contribution China can make during its chairmanship is to reinforce confidence in multilateral cooperation itself.

The international environment is becoming increasingly fragmented. Strategic competition often dominates headlines, and protectionist measures continue to reshape global trade. Yet the Asia-Pacific has repeatedly demonstrated that practical economic cooperation remains possible even when political differences persist.

Ultimately, the success of APEC in 2026 will not be measured simply by the number of ministerial meetings held or declarations issued. Its real legacy will depend on whether it strengthens confidence among businesses, investors, researchers, entrepreneurs and citizens that regional cooperation continues to offer practical solutions in an increasingly uncertain world.

The "China Year" is therefore about much more than China's leadership. It is about the future direction of the entire Asia-Pacific.

If APEC economies work together to build consensus around innovation, sustainable development, digital cooperation and open regionalism, this year could become one of those moments that historians look back on as a turning point — not because it solved every challenge, but because it renewed confidence that the region could face them together.

At a time when the world often appears divided, that may prove to be the greatest achievement of APEC "China Year".

SUN YANHONG

Balancing competition and cooperation

China and the EU can work together to take bilateral economic collaboration to a new trajectory, creating the conditions for continued mutually beneficial ties

Economic and trade ties have long served as the bedrock of relations between China and the European Union. However, the relationship has recently encountered friction, culminating in the EU imposing a series of trade restrictions on China since the beginning of this year.

To understand and manage these frictions, it is essential to examine how the underlying drivers of China-EU economic cooperation have evolved over the past decades. This helps explain the deeper forces behind the disagreements while pointing toward a more sustainable path for future cooperation.

Over the years, the economic complementarity between China and the EU has undergone three important transformations.

First, driven by the evolving industrial capabilities and economic structures in China and the EU, their vertical complementarity in trade gradually gave way to horizontal complementarity, as the two economies transitioned from specializing in different stages of the production chain to collaborating within similar industries. This shift was reflected in the changing composition of bilateral trade and investment.

Second, cooperation has moved beyond the traditional bilateral framework to become increasingly embedded in global value chains. Following its accession to the World Trade Organization, China emerged as one of the world's major manufacturing hubs. It is estimated that between China and the EU, intermediate goods consistently accounted for roughly half of total bilateral trade, reflecting multilateral supply chain interdependence.

Third, production-based complementarity has gradually given way to innovation-driven collaboration. Since the early 2000s, joint patent applications by Chinese and European companies have risen steadily. More recently, a growing number of European automakers have partnered with Chinese companies on joint research and development, leveraging China's strengths in emerging technologies to accelerate their own industrial transformation.

While these evolving drivers have pushed China-EU economic cooperation to a higher level and opened new opportunities, some challenges have emerged.

The first challenge is the profound transformation of the global trading system. China-EU economic cooperation was once driven by comparative advantage and economic efficiency in the era of globalization. That landscape, however, has been affected by intensifying geopolitical rivalry, the COVID-19 pandemic, the Ukraine crisis and the United States' growing neglect of or even challenge to multilateral trade rules. The WTO-centered trading system has come under strain, while unilateralism and protectionism have gained momentum. Against this backdrop, international economic relations are increasingly being shaped by national security considerations and values-based concerns, casting the shadow of geopolitical tensions, security concerns and shifting international rules on China-EU cooperation.

Second, the EU's anxiety about Chinese competition is escalating. Since the EU formally defined China as simultaneously a partner, a competitor and a systemic rival in 2019, the emphasis has shifted heavily toward the latter two. The 2024 Draghi Report on the future of European competitiveness likewise identified the United States and China as economic and technological competitors. Compared with the long-time dominant US, China's rapid catch-up and breakthrough achievements in some sectors have heightened the pressure on the EU. Those anxieties became even more apparent in May 2026, when the Center for European Reform published its China-related report, arguing that "China increasingly specializes in Europe's industrial strengths".

LI MIN / CHINA DAILY

Finally, the EU's "de-risking" strategy has narrowed the space for bilateral cooperation. Since launching this "de-risking" agenda and European economic security strategy in 2023, Brussels has hyped narratives around issues such as alleged Chinese industrial overcapacity while deploying a broader range of trade and investment restrictions. Together, these policy shifts have pushed China-EU economic cooperation to explore new ways to coexist and cooperate.

Despite these challenges, the resilience of China-EU economic ties should not be underestimated. The two sides have no fundamental conflict of interest. Their economies remain deeply intertwined, with new forms of complementarity emerging. They also face a growing number of shared global challenges that are difficult to address without cooperation.

Meanwhile, the EU is facing a dilemma in which it must balance its "de-risking" agenda against the need to preserve economic efficiency, maintain industrial competitiveness and safeguard the interests of its member states. These competing priorities inevitably limit its policy options.

This suggests that China-EU economic cooperation still holds potential, and its underlying drivers still have room to continue to evolve. The two sides should approach their economic relationship from a long-term strategic perspective. In particular, the EU would benefit from a more pragmatic and balanced approach to its ties with China, recognizing that deeper cooperation with China, in areas such as supply chain integration and innovation, can help strengthen the EU's competitiveness and avoid the risk of a "middle-technology trap". Together, China and the EU should work to create a more stable and predictable policy environment for bilateral economic cooperation.

Looking ahead, the two sides can make tangible progress in four key areas.

First, they should work together to safeguard the WTO-centered multilateral trading system, while working with other countries to advance meaningful reform to preserve this indispensable global public good.

Second, building on the joint climate statement issued during the 2025 China-EU leaders' meeting, the two sides should explore a new model of mutually beneficial cooperation in green industries and new energy, leveraging their respective strengths and focusing on areas such as electric vehicles.

Third, they should seek breakthroughs in digital cooperation by expanding successful practices, enhancing regulatory coordination and standards compatibility, encouraging investment in digital industries and technologies, and making smart manufacturing a flagship area of collaboration.

Finally, China and the EU should unlock the untapped potential of services trade by establishing a dedicated dialogue mechanism and expanding cooperation in areas such as digital services, finance, education and healthcare. A stronger services partnership would help optimize the structure of bilateral trade, ease competitive pressures in manufacturing, and promote a more balanced pattern of economic exchange.

On June 30, China and the EU issued a joint statement following the first meeting of the China-EU trade and investment consultation mechanism.

Under the mechanism, the two sides agreed to establish four initial workstreams covering trade and investment balance, export controls, intellectual property rights and WTO reform, alongside a joint monitoring mechanism. They also reaffirmed their commitment to taking further facilitation measures to maintain the stability of global industrial and supply chains.

These developments suggest that both China and the EU remain committed to addressing their differences through dialogue and creating the conditions for continued mutually beneficial cooperation. Building on the outcomes of the meeting, the two sides should work toward durable mechanisms for managing disagreements and guiding China-EU economic relations toward a dynamic and sustainable balance as they continue to evolve.

China's digital push accelerates

Policy support drives tech application, AI as industry, business enablers

China's digital economy is becoming a more visible driver of high-quality growth, moving beyond headline figures to play a deeper role in industrial upgrading, urban governance, public services and international exchanges.

"Developing the digital economy is a strategic choice to seize the opportunities brought by a new round of technological revolution and industrial transformation," said Wang Jingtao, deputy director of the Cyberspace Administration of China, at the opening ceremony of the 2026 Global Digital Economy Conference in Beijing on July 2.

Data from the National Data Administration showed that the added value of China's digital economy reached 49 trillion yuan ($7.22 trillion) in 2025, accounting for about 35 percent of its GDP. Notably, the added value of core digital economy industries is expected to exceed 14.7 trillion yuan, making up more than 10.5 percent of GDP.

According to classifications by the National Bureau of Statistics, China's digital economy covers five broad categories: digital product manufacturing, digital product services, digital technology applications, data factor-driven industries, and industries supported by digital efficiency improvements.

China's 15th Five-Year Plan (2026-30) makes it clear that the country will comprehensively advance the empowerment of the real economy through digital technologies, Wang added.

To deepen the integration of the digital and real economies, the senior official called for stronger efforts in key technologies and digital infrastructure, wider application of the "AI Plus" initiative across sectors, improved governance of generative AI and data security, and deeper international cooperation, including better digital services for foreigners in China.

Test cases

A key message from this year's conference was that digital development is increasingly being tested in the daily operation of cities, which have become the most concentrated, concrete and observable carriers of the digital economy.

According to the 2026 Global Digital Economy Cities Report released during the conference, five cities worldwide, including Beijing, Tokyo, Singapore, New York and London are listed as leading cities in digital factors, citing their performance in digital infrastructure, digital industry leadership, innovation capacity, digital governance, low-carbon development and urban resilience, global connectivity, as well as resident experience and inclusiveness.

Beijing offers a case for how digital tools are entering public life. By the end of last year, the city had built 119 internet hospitals, supporting services including online appointment registration, prescription circulation and online medical insurance payments. In the transportation sector, through connected traffic signal control, the average non-stop pass rate within Beijing's Fifth Ring Road reached 76.7 percent. In addition, construction of sensing systems for underground power, gas and heating pipelines has also been largely completed, enabling digital operation and management.

"Digital technologies should not only support industrial development and urban governance, but also become tangible for residents, usable for businesses and accessible to society," the report stressed.

JU HUANZONG / XINHUA
Above: An employee (left) introduces robot human force sensors to a visitor during the 2026 Global Digital Economy Conference in Beijing on July 2. CHEN XIAOGEN / FOR CHINA DAILY

In healthcare, Beijing has built a unified cloud platform for medical imaging, breaking down barriers to image sharing among medical institutions above the secondary level. The platform has changed the traditional practice of patients carrying printed films between hospitals. Last year alone, it helped save more than 150 million yuan in film printing costs.

"Through high-standard efforts to build a comprehensive pilot zone for data factors and active early trials, Beijing has formed a batch of replicable and scalable 'Beijing experience' for global counterparts," said Liu Liehong, head of the National Data Administration.

Large-scale application

Beyond cities, AI agents are emerging as one of the most important areas where the digital economy is being applied to the real economy. This year, AI agents were included in the Government Work Report for the first time, as the tools push AI beyond systems that can "chat and analyze" toward what can really carry out tasks.

"The agent industry is entering a strategic window for large-scale application this year," said Han Xia, a senior official at the Ministry of Industry and Information Technology, at a sideline of the conference.

Accelerating the evolution of agents from individual intelligence to collective intelligence, and from closed applications to open collaboration, is of great significance for seizing the opportunities in this window, Han said.

However, the interconnection and collaboration among agents from different platforms still face challenges, including unclear technical architecture and the urgent need to upgrade network infrastructure, she noted.

In response, this year's conference launched an experimental network for the agent internet and released the first batch of "agent factories", aiming to push AI from resource calling to task delivery.

For companies, the value of such technology depends on whether it can solve specific problems in real-world scenarios.

In the industrial sector, AI-powered "digital colleagues" are already being used in manufacturing and corporate operations. "AI agents are the new colleagues that accompany every single one of our staff in their daily work now," said Zhang Guimin, chairman of Lunan Pharmaceutical Group.

Zhang said AI agents can efficiently complete high-risk and high-intensity tasks in new drug research and development, shortening the R&D cycle by more than 30 percent. The company has independently developed more than 20 AI agents so far, with over 100 application scenarios covering R&D, quality management, production, sales, human resources, finance and e-commerce.

In consumer settings, AI agents are also being built into smart home products. Haier Smart Home's Xiaoyou agent, for example, can remember where household items are stored. After a user verifies a dedicated password, the corresponding drawer lights up automatically. During cooking, a range hood can detect when food in a pot is boiling and automatically lower the heat for simmering.

Dismantling barriers

China's digital economy push is also extending into cross-border services, as the country seeks to make digital systems easier for foreign visitors to use while helping Chinese businesses find overseas opportunities.

At this year's conference, a special campaign was launched to improve digital services for foreigners entering China in six key cities with relatively strong digital service foundations and large inbound visitor numbers: Beijing, Shanghai, Shenzhen, Hangzhou, Chengdu and Sanya.

The campaign aims to develop a group of landmark application scenarios in about one year, focusing on digital barriers foreign visitors may face in residence, healthcare, payment, tourism and public services.

Through pilot programs in key cities, the initiative is expected to help raise the overall level of inbound digital services nationwide and support the development of an interconnected, inclusive and mutually recognized digital service system.

The campaign follows a broader national policy push. According to an implementation guideline jointly issued by the Cyberspace Administration of China and 10 other departments in February, China aims to significantly improve the internationalization and convenience of digital services for inbound tourists by 2027 and reach a leading international level by 2030.

For instance, Chengdu, the only city in central and western China included in the campaign, has introduced a range of measures to make digital services more accessible to foreign visitors.

In public transport, foreign bank cards can be used directly at bus and metro gates. Bilingual announcements now cover all metro trains and stations, while more than 400 stations have been equipped with multilingual translation devices.

"Being able to take the metro in Chengdu with a foreign bank card gives me peace of mind because it is a payment method I am familiar with," said a US tourist who had just enabled small-value password-free payment.

Chengdu has also expanded payment access for foreigners. The city has 4,914 cash self-service machines that accept foreign bank cards for renminbi withdrawals, while 67,000 merchants accept foreign cards. More than 40 e-wallets from 14 countries can now be used in the city, and 100,000 merchants support Alipay's tap-to-pay service.

In dining, shopping and entertainment areas, major chain brands such as Starbucks and Haidilao have achieved full bilingual digital service coverage. Eight most-loved sites by tourists, including Chunxi Road, Jiaozi Park and Kuanzhai Alley, have also largely achieved full bilingual menu coverage.

The digital economy's outward-facing role was also highlighted at the conference, with a key country digital economy cooperation demand list released to provide more targeted support for Chinese businesses expanding overseas through digital technologies.

Drawing on the integration of overseas Chinese networks and digital intelligence, Zhang Huaxie, vice-chairman of the China-Africa Cultural Promotion Association, has led a team to establish digital cooperation sites in Mozambique and Zimbabwe.

Zhang said China's blockchain traceability system and AI customer service have been introduced to a local business platform in Zimbabwe, which has not only improved the credibility of local agricultural and livestock products, but also trained local merchants in digital operations, helping cultivate local talent with digital business capabilities.

"Chinese technology going global is not a one-way export of products, but a two-way collaboration that takes into account both commercial returns and local industrial development," Zhang said.

Discovering how AI can improve lives, support economy

REPORTER'S LOG
By Li Jiaying

At the 2026 Global Digital Economy Conference in Beijing earlier this month, new technologies moved closer to real life, with robots, AI agents and digital tools showing how innovation is beginning to really serve people in factories, hospitals, logistics and daily services.

The new technologies and products launch show was one of the busiest parts of the conference. More than 60 companies presented over 80 innovations, most of which are global or national firsts.

For me, the most memorable scene was a robotic guide dog leading a person forward.

Unlike an ordinary quadruped robot, the robot, called Tutu, has a handle on its back that allows visually impaired users to hold on to it. Supported by digital map provider Amap's self-developed embodied navigation model, massive traffic data and machine vision, Tutu is designed to make complex route decisions: when it sees a pothole ahead, it can decide whether to step over it or go around; when it hears a user's instruction, it can understand the intention and take the next step.

The moment was small, but it captured a larger message from this year's conference: advanced digital technologies such as artificial intelligence are increasingly being tested as a tool that can work, guide, deliver, diagnose, weld, farm and serve.

On the industrial side, Beijing-based Xiaoyubot launched and displayed an embodied intelligent welding robot that can learn a new task in about three minutes before starting work. Priced at about 169,800 yuan ($29,474), such a product may not be as visually dramatic as a humanoid robot, but its value is easier to grasp — it can help workers move away from hot, smoky and repetitive welding environments.

In the logistics area, autonomous urban delivery service provider Neolix's X1 targeted unmanned delivery over the "last mile", a familiar bottleneck in urban logistics. Designed to move between indoor and outdoor environments, the autonomous delivery vehicle can navigate sidewalks, office lobbies and elevators to help build a fully unmanned delivery chain.

Healthcare offered another example. A cranial CT agent developed by the China National Clinical Research Center for Neurological Diseases can process a complete cranial CT examination and generate a structured draft report covering 94 diseases and 1,232 diagnostic terms. Current clinical data show that for more than 80 percent of routine cases, draft reports generated by the agent require only minor revisions by doctors, or can be used directly without changes.

Through these product launches, I found the meaning of the digital economy becoming more concrete. It is about whether technology can make mobility safer, work less hazardous, logistics more efficient and medical services more accessible.

That may be the more lasting message of this year's conference. As AI and other digital technologies move deeper into daily life and industrial settings, their value will increasingly be judged not by how futuristic they appear on stage, but by how much they can improve people's lives and support the real economy.

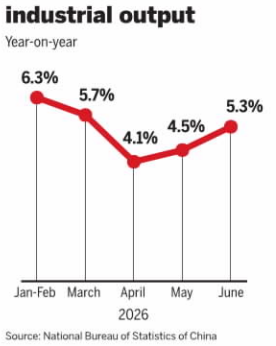
BUSINESSINSIGHT

Economy resilient, stronger momentum ahead

EAGLE EYE
By Yang Yaowu



Workers are busy on the intelligent cabinet production line at an enterprise in Lianyungang, Jiangsu province, on June 25.
SI WEI / FOR CHINA DAILY

In the first half, faced with a complex and evolving international environment as well as arduous domestic tasks in reform, development and maintaining stability, China effectively implemented a more proactive macroeconomic policy package, responded calmly to external challenges, overcame domestic difficulties, maintained steady growth in production and supply, and fostered the rapid development of new growth drivers. As a result, the economy maintained an overall stable performance while continuing to move toward higher-quality, innovation-driven development.

First, new growth drivers continued to upgrade manufacturing and optimize the structure of foreign trade. Production of high-tech and high-value-added products accelerated, with their share in exports continuing to increase. In the first half, value-added industrial output of enterprises above designated size grew 5.4 percent year-on-year, while value-added output of high-tech manufacturing rose 13.3 percent, outpacing the same period last year by 3.8 percentage points and accelerating 0.8 percentage point from the first quarter. Production of computers, communication equipment and other electronic products — as well as industrial robots — maintained rapid growth. High-tech manufacturing contributed nearly 40 percent of total industrial growth, gradually becoming a core driver of economic expansion.

The development of new growth drivers also promoted both higher-quality and faster growth in foreign trade. Merchandise exports reached $2.13 trillion in the first half, up 17.6 percent year-on-year, while imports totaled $1.55 trillion, rising 26.6 percent. Exports of mechanical and electrical products surged 24.5 percent, accounting for more than 60 percent of total exports. Driven by the global technology cycle, imports and exports of artificial intelligence-related products, including electronic components, computer parts, optical fiber and cables, grew by around 50 percent year-on-year. AI-related industrial chains, such as integrated circuits and computer components, have become an important pillar supporting export growth. As China continues to increase the supply of innovative products that meet the global trend toward digitalization and green development, it has further consolidated and expanded its diversified overseas markets. Trade with ASEAN, the European Union and Africa all recorded double-digit growth, while trade with Belt and Road partner countries increased by 14.8 percent, accounting for more than half of China's total foreign trade for the first time.

Growth of value-added industrial output

Source: National Bureau of Statistics of China

Second, the investment structure continued to improve, with greater emphasis placed on fostering future growth potential and improving people's well-being. Although overall fixed-asset investment growth moderated in the first half, investment in high-tech industries continued to grow steadily, while investment in intellectual property products accelerated further. Investment related to the six networks — water conservancy, new power grids, computing infrastructure, next-generation telecommunications, urban underground utilities and logistics — continued to expand, providing stronger support for long-term development capacity and public well-being.

Third, demand for services consumption grew steadily, while the potential of new forms of consumption continued to be unleashed. As living standards continue to improve, the rising share of services consumption reflects the natural evolution of China's economy and creates broader opportunities for foreign businesses seeking to expand in China. In the first half, retail sales of services increased 5.3 percent year-on-year, while spending on culture, sports and leisure services maintained rapid growth. Holiday travel, cultural performances and inbound tourism all recorded solid increases. At the same time, online, digital and green consumption emerged as new growth areas. Retail sales of high-energy efficiency household appliances continued to expand rapidly, while the retail penetration rate of new energy vehicles exceeded 60 percent for the third consecutive month, highlighting the continued release of new consumption potential.

Looking ahead to the second half, although the external environment still faces considerable uncertainties, China's economy is expected to stabilize and continue improving as the combined effects of existing and incremental policy measures become more fully evident and the transition from traditional to new growth drivers accelerates. The economy has maintained solid momentum in the first half, stabilized in the middle of the year and gained further strength toward year-end. Taking all factors into account, we believe China has the capability to successfully accomplish this year's major economic and social development goals.

First, foreign trade is expected to maintain relatively strong growth and continue providing solid support for economic expansion.

China's comprehensive industrial system, well-coordinated supply chains and highly efficient manufacturing ecosystem — together with the continued upgrading of intelligent and green manufacturing — are steadily strengthening the country's new competitive advantages in international trade. Over the coming period, capital expenditure across global AI-related industrial chains is expected to continue expanding rapidly, supporting faster growth in exports of semiconductors, electronic components and other products. Meanwhile, China's improving industrial competitiveness will further promote exports of high-value-added products. As an important hub of global industrial and supply chains, China's high-tech manufacturing sector has demonstrated strong resilience. It not only provides reliable support for global technological upgrading and product supply, but also creates broader opportunities for trade, investment and technological innovation by expanding domestic demand, deepening industrial upgrading, and fostering the development of the green and digital economies.

Second, new growth drivers are expected to gather stronger momentum and effectively offset adjustment pressure from traditional growth drivers.

New quality productive forces — represented by AI, advanced manufacturing and green energy — are moving from isolated breakthroughs to integrated industrial expansion. The explosive growth in demand for AI computing power is expected to drive further growth in chip sales, while tech companies are accelerating both research and development investment and capacity expansion.

Meanwhile, the deep integration of the digital economy with the real economy is expected to sustain rapid growth in emerging sectors such as industrial robotics, cloud computing and the internet of things, thus reshaping the foundation of China's industrial system. As the transition from traditional to new growth drivers accelerates, the contribution of the new economy to overall growth is expected to increase further in the second half, effectively offsetting the adjustment pressure from traditional growth drivers.

Third, the combined effects of existing and incremental policy measures will become more evident, providing strong support for faster growth in domestic demand.

The second half will be a critical period for ensuring policy implementation and accelerating project progress. The entire 800 billion yuan ($118 billion) allocated for major national strategies and security capacity-building projects, together with the 200 billion yuan earmarked for large-scale equipment upgrades and consumer goods trade-in programs, has already been distributed and is expected to generate more tangible investment and economic activity.

Investment related to the above-mentioned six networks will continue to expand. Closely linked to improving people's well-being and strengthening long-term development capacity, investment in these six networks is expected to exceed 7 trillion yuan this year, making them a key pillar for stabilizing economic growth.

On the consumption side, measures such as raising the minimum wage, increasing pension payments and expanding medical insurance subsidies are expected to boost consumer confidence at the source. As existing policy funds are put into use more quickly and incremental policy measures are implemented with greater precision, domestic demand is expected to make a steadily larger contribution to economic growth, providing strong support for accomplishing this year's development goals.

Soccer craze metaphor for Northeast China revitalization

MAIN STREET
By Huang Weiting

This summer, the eyes of the world have turned to soccer pitches around the globe. Although China failed to qualify for the FIFA World Cup 2026, the nation's passion for the sport has found new outlets in a series of regional competitions at home.

In recent years, with support from local governments, regional sports events have been flourishing across China.

For many soccer enthusiasts, a ticket costing just a few dozen yuan offers not only access to a high-quality professional match, but also a range of customized benefits provided by host cities. From local tourism discounts to consumption incentives, these events have encouraged people to spend.

Such nationwide enthusiasm has not only helped promote city brands, but also brought substantial consumption and economic activity to host regions.

In contemporary Chinese parlance, it represents a two-way connection between governments and consumers, as well as between economic development and cultural entertainment.

In May, China's rust belt region — Northeast China — launched a cross-provincial soccer league, known as the "Northeast City Football League".

Covering Liaoning, Jilin and Heilongjiang provinces — as well as eastern Inner Mongolia — the region was once the country's industrial powerhouse. However, amid China's market-oriented reforms, it experienced decades of economic challenges and decline.

It was not until 2003, when the central government introduced the strategy of "revitalizing Northeast China", that the region entered a new stage of development.

Like rust belt regions elsewhere in the world, Northeast China still retains valuable legacies from its industrial past, including a strong higher education foundation and early development of sports culture.

Take Shenyang, capital of Liaoning province, as an example. The city's industrial heritage, characterized by resilience, determination and a spirit of hard work, has provided fertile ground for football development and made Shenyang one of China's important bases for youth football training.

For many fans, the NCFL naturally represents strength, speed and passion — qualities that have helped attract ticket buyers, media attention and broader public engagement.

Yet the significance of the NCFL goes far beyond soccer fans' enthusiasm and increased consumption. From the perspective of revitalizing Northeast China, the league represents the return of three key elements essential for regional development.

First, the NCFL has refocused attention on the need for coordinated development across the entire region.

Unlike many regional leagues organized within individual provinces, the NCFL crosses four provincial-level regions, making it a collective effort among different parts of Northeast China.

The message it sends is clear: It comprises complementary advantages, coordinated planning and integrated development.

Historically, the central government's strategic planning for Northeast China revitalization has always emphasized regional coordination. Today, the same principle applies.

Individual provinces acting alone cannot match the impact of joint efforts. Cooperation that creates synergy and achieves more than the sum of its parts is both rational and necessary.

In practice, Heilongjiang, Jilin and Liaoning have all included plans to build the "Harbin-Changchun-Shenyang-Dalian industrial and innovation corridor" in their respective 15th five-year plans.

Going forward, the three provinces and eastern Inner Mongolia should further coordinate efforts in areas such as industrial corridors, logistics networks and international trade channels.

For example, Northeast China should make better strategic use of Liaoning's coastline, which is the region's only access to the sea. Through institutional arrangements, coastal ports in Liaoning could become shared gateways to global markets for the entire region.

Achieving this goal requires local governments to move beyond regional interests and needs stronger coordination from the central government, viewing land-sea integration from the broader perspective of Northeast China revitalization.

Second, competition on the soccer field can help reinvigorate the region's competitive spirit.

Regional coordination aims to create collective strength, but it does not mean eliminating competition — one of the most important foundations of a market economy.

At its core, competitive sports are about facing challenges and striving for victory. The battles on the pitch can serve as a metaphor for restoring the competitive drive needed for economic transformation.

In discussions about Northeast China revitalization, entrepreneurs have frequently highlighted institutional issues, including insufficient market awareness and underdeveloped market mechanisms. At their core, these challenges reflect the need for stronger competition.

The NCFL provides a vivid example of how competition can generate momentum. Competition brings victories on the field, but it can also create stronger market vitality in economic development.

The key task in practice is improving the business environment. Across China, building a market-oriented, law-based and internationally competitive business environment has become a broad consensus.

For Northeast China, further reforms are needed to enhance market vitality while ensuring that economic and social development follows the rule of law. Only through such efforts can the deeper constraints on regional revitalization be addressed.

Meanwhile, openness is also a crucial component of the business environment.

Northeast China should seek greater support for pilot programs aimed at expanding cooperation with neighboring countries, including Japan, the Republic of Korea, the Democratic People's Republic of Korea and Russia, and enhance its role as a growth hub in Northeast Asia.

Third, the determination demonstrated on the football field could inspire new breakthroughs in Northeast China's comprehensive revitalization.

At Shenyang's Tiexi Stadium, fans spontaneously chant "Shenyang will win", with their voices echoing through the night. The spirit of victory reflects not only the city's soccer tradition, but also a renewed confidence in the region's future.

Northeast China, known as the "industrial cradle of the People's Republic of China", once created more than 1,000 "firsts" in the country's industrial history, including producing the first batch of steel and manufacturing the first domestically produced jet aircraft.

The region's strong industrial foundation remains the source of confidence for its revitalization. The return of a winning spirit can provide renewed motivation for achieving further breakthroughs.

Driven by this confidence, government officials and entrepreneurs are increasingly embracing a problem-solving mindset — finding ways forward despite challenges.

This means that in the years ahead, more new achievements are likely to become part of the ongoing story of Northeast China's revitalization.

WORLD

Keys belonging to destroyed homes hang from a ceiling at an exhibition in Beirut, Lebanon, on Friday. The installation aims to preserve the memory of villages destroyed by Israeli forces in the country's south. JOSEPH EID / AFP

'Keys without homes' evoke destruction in Lebanon

BEIRUT — Tears streamed down south Lebanon resident Fatima Hajj Ali's face as she stared at a host of keys hanging like wind chimes from the ceiling of a museum in Beirut — each one symbolizing a home, like her own, destroyed by Israel.

Hajj Ali is among the thousands of southerners who lost their houses in the recent conflicts between Israel and Hezbollah militants, the first of which broke out in 2023 and the second in March.

"We were supposed to go home and open the door with the key, but there is no door anymore," the 23-year-old said.

Despite a lull in fighting following the signing of a memorandum of understanding between the United States and Iran on June 17, intermittent Israeli strikes continue, as do widespread demolitions in and around occupied villages, making it impossible for many people to return.

The exhibition *Hkeeli ya Jnoub*, or "Tell me, O South", features pictures and videos preserving the memory of southern Lebanon at the capital's Beit Beirut museum.

Walking through, Hajj Ali reminisced on her home in Nabatieh al-Fawqa, which she was only able to visit once after an April truce that ultimately failed to stop the fighting.

"Half the house collapsed and half remained," she told Agence France-Presse.

"I long for sunset and to hear the call to prayer in our garden while I drink my coffee," said the psychologist, adding that Beirut had "beautiful" places, but "they are not home".

One of the projects on display is *Keys Without Homes*, which comprises videos of three southerners who kept the keys to their houses, even though they no longer exist.

The artist, 36-year-old Adeeb Farhat, himself from the south, said the idea came to him during the previous war in 2024, when he feared losing his own home.

There is a long-standing tradition among Palestinians of keeping the keys of homes they lost during the *Nakba* — the Arabic word for catastrophe — which saw the flight and expulsion of an estimated 760,000 Palestinian Arabs during the creation of the State of Israel in 1948.

Meanwhile, Lebanese President Joseph Aoun left Beirut on Saturday for Washington, where he is expected to meet United States President Donald Trump, his office said.

Aoun will hold talks "with several American officials on the situation in Lebanon and ways to strengthen the ceasefire", as well as on "the withdrawal of Israel from the Lebanese regions it occupies", the presidency said.

Confirming Aoun's arrival in a later statement, the Lebanese presidency said he would meet US State Secretary Marco Rubio on Sunday and Trump on Tuesday.

DR CONGO

Confirmed cases of Ebola rise to 2,267

The number of confirmed Ebola cases in the Democratic Republic of Congo has increased to 2,267, including 893 deaths, government data showed on Saturday. The figure represents the total number of confirmed cases as of Friday, according to a situation report that documented 86 new cases and 29 new deaths in the previous 24 hours.

HUNGARY

Amendment signed to end president's term

Hungary's President Tamas Sulyok on Saturday signed the country's 17th constitutional amendment, triggering the end of his mandate as head of state. Once the law is published in the official gazette, the termination of his mandate will take effect the following day. In a video statement, Sulyok said he had signed the amendment because he had "no constitutional means of acting against this amendment, which violates constitutional principles but was adopted by the National Assembly ... through a lawful procedure". Prime Minister Peter Magyar welcomed the signing, saying it had "removed the last obstacle to implementing our joint decisions".

GUYANA

53 people rescued from capsized ferry

At least 53 people have been rescued after a ferry carrying more than 100 people capsized off the coast of Guyana, Prime Minister Mark Phillips told Agence France-Presse on Sunday. "(In) a combination of passengers and crew, the number rescued is 53 and it is daylight now, so we expect the number to go up," Phillips said by phone. The MV *Barima* was traveling from Georgetown to Port Kaituma with 116 passengers and crew, government minister Juan Edghill said on Facebook.

Guinea mining project helps upgrade skills

By **VICTOR RABALLA**
in Nairobi, Kenya
victor@chinadailyafrica.com

Beyond building mines, railways and ports, Chinese companies involved in Guinea's Simandou iron ore project are investing in technology transfer and talent development to equip local workers with the skills to operate and manage one of Africa's largest mining and infrastructure projects.

Sophie Xiaohui Lyu, chief executive at project developer Winning Consortium Simandou, said the long-term success of the project, inaugurated in November, will depend not only on infrastructure investments but also on cultivating local talent capable of managing the project independently.

"The biggest resource is not what we mine, but what we cultivate," Lyu said.

Regarded as one of the world's largest untapped deposits of high-grade iron ore, the Simandou project includes a mine and a railway spanning more than 600 kilometers from southeastern Guinea to the Atlantic coast, making it one of Africa's largest rail infrastructure investments. The International Monetary Fund said the project could expand Guinea's GDP by more than one-fourth by 2030.

The project is being developed through a partnership involving the Guinean government, British-Australian mining company Rio Tinto, and Chinese companies including Baowu, Aluminum Corporation of China and Shandong Weiqiao Pioneering Group, with total investment exceeding $20 billion.

Citing the case of a 27-year-old Guinean woman who studied at the project's railway institute, Lyu said there are several examples of local capacity building already taking place under the project.

"The lady now operates trains on the Simandou Trans-Guinean Railway, transporting iron ore from the mountainous mining region to the coast," she said.

Human capital

Lyu also noted the success of a Guinean executive who spent eight years studying in China, earned a doctorate in agriculture and, after returning home, rose from an environmental manager to deputy general manager of the company.

"Human capital takes time, patience and investment to cultivate, but it is essential. While infrastructure connects places, it is people that connect purpose," she said.

Under President Mamady Doumbouya, the Guinean government has championed the Simandou project not only as a mining venture but also as a vehicle for economic transformation, demonstrating how strategic investments can generate wider development benefits.

Beyond mining, the railway corridor is expected to create opportunities for agriculture, logistics, manufacturing and small businesses along its route.

Lyu said Chinese partners are also working with local enterprises and farmers by providing financing, training and technical support to help them participate in procurement opportunities linked to the project.

"Sometimes the challenge is not only access to finance but also having the skills required to compete for contracts and become part of the ecosystem," she said.

Bouna Sylla, Guinea's minister of mines and geology, expressed confidence that the revenues and infrastructure generated by the venture from the project will help diversify the economy, stimulate industrial development and create a new generation of skilled professionals capable of leading the country's future growth.

"The mines are one of our strengths, together with infrastructure, but the real question is how we can use mining as a catalyst for developing the rest of the economy," Sylla said.

Guinea is encouraging investments in emerging technologies, including drones, for mining and agriculture, while putting in place training programs aimed at equipping young people with the skills needed to take part in the country's economic transformation, he said.

The government's Simandou 2040 development blueprint seeks to use revenues and infrastructure generated by the project to stimulate growth in other sectors, including manufacturing, agriculture and technology, he added.

Burnham era to see steady engagement

Experts say UK's pragmatic approach toward China to continue after Starmer

By **XING YI** in London
xingyi@chinadaily.com.cn

Andy Burnham, the former mayor of Greater Manchester and a veteran Labour politician known for championing devolution, regional economic renewal and working-class communities, will succeed Keir Starmer as British prime minister on Monday.

In a speech after winning the Labour leadership on Friday, Burnham recalled working with Starmer a decade ago, thanked him for leading the party to victory in the 2024 general election, and praised his government's record.

"I have supported all our Labour leaders in my lifetime because I believe a united Labour Party and Labour movement is the best hope for our country," Burnham said before setting out priorities, which include ending internal party factionalism and devolving more power to local government.

Although Burnham did not outline his China policy, his long-standing advocacy of what has become known as "Manchesterism" — shifting power away from Westminster, expanding public control over essential infrastructure and promoting more balanced regional development — suggests continuity in Labour's pragmatic approach toward the world's second-largest economy.

Liverpool, Burnham's birthplace, is home to Europe's oldest Chinatown and is set to host Chinese automaker Chery's first European headquarters following Starmer's January visit to Beijing.

Nick Small, Liverpool City Council's cabinet member for growth and economy, said China's visa-free policy for citizens of the United Kingdom is encouraging greater people-to-people exchanges, while Chery's planned headquarters is expected to bring new investment and jobs.

Greater Manchester, where Burnham has served as mayor for the past decade, is also home to a large Chinese community. Many are among the estimated 200,000 passengers who have traveled over the past decade on direct flights between Manchester and Beijing, a route that celebrated its 10th anniversary last month.

In April, Burnham told Chinese Consul General Tang Rui that the city-region placed great importance on its relationship with China and was keen to expand cooperation in green development, electric buses, advanced manufacturing and life sciences.

During the meeting, Burnham also fondly recalled a visit to China in 2018, saying he was impressed by the country's high-speed rail network.

He was quoted by media as saying during the visit that "railway passengers in the north of England deserve a service every bit as clean, comfortable and reliable as those traveling in northern China".

In remarks that seem almost prophetic of his prime ministerial plans, he said "the future of a global world is one of cities working together across borders and seas and making the difference".

"Stronger international city-to-city ties will not only allow us to share our experiences and best practices, but more importantly to work collaboratively across industry, academia and policy in shaping the solutions for tomorrow's world," he added.

Jim O'Neill, an adviser to the incoming prime minister, has argued that Britain needs deeper engagement with China and other Asian economies to adapt to the eastward shift in global economic power.

"The places that are going to make a difference to our trade and investment performance are China, India and Indonesia ... places which have a large number of people, which are growing fast, and which are taking a growing share of global GDP. Somewhere along the line, you've got to recognize that reality," he told British newspaper The Observer.

O'Neill, while serving as chief global economist at Goldman Sachs, coined the term "BRIC" — for Brazil, Russia, India and China — in 2001 and was a former UK Treasury minister during David Cameron's second cabinet in 2015. He also suggested that the UK should not be "petrified of Washington about China".

Strong willingness

Earlier this month, soon after Starmer announced his resignation, the British business community expressed a strong willingness to continue the momentum of pragmatic engagement with China at a London event that hosted visiting Chinese Commerce Minister Wang Wentao.

"Serious engagement is back," UK Secretary of State for Business and Trade Peter Kyle said at the event. "By working together and talking together, both of our nations can prosper."

Steven Lynch, director of international trade at the British Chambers of Commerce, wrote on social media later that he expects Burnham to understand the UK-China relationship and stay close to Labour's approach.

"Reengage, rebuild dialogue, partner where trade is possible, and challenge on national security and fair competition. Business doesn't need more geopolitical instability," he wrote.

When it comes to frictions arising from trade surpluses, Sebastian Wood, chair of the China-Britain Business Council, told China Daily that if the UK were to put up protectionist barriers, it would make its economy less competitive.

"The better way to do it is to actively seek to rebalance the relationship in a constructive way, by boosting exports to China, and also encouraging Chinese investment into the UK ... Protectionism is not the answer," he said.

Julian Shea and Zheng Wanyin contributed to this story.

Small commodities capital in Zhejiang province raising its international profile

By YUAN SHENGGAO

The small city of Yiwu in East China's Zhejiang province, known as the world's capital of small commodities, has become a global trading powerhouse. Its foreign trade hit a record in 2025 and the city is pushing ahead with industrial upgrading, trade facilitation and a global brand strategy.

The city's imports and exports totaled 836.5 billion yuan ($123.62 billion) in 2025, up 25.1 percent from 2024, marking the first time the figure has exceeded 800 billion yuan, according to local customs data.

That momentum carried on into 2026. In the first quarter, Yiwu's foreign trade rose 25 percent year-on-year to 209.7 billion yuan, a record high.

During the first quarter, Yiwu engaged in trade with more than 220 countries and regions. Notably, trade with the Association of Southeast Asian Nations surged by 68.3 percent, making it the fastest-growing market. Exports to countries participating in the Belt and Road Initiative reached 147.4 billion yuan, an increase of 29.8 percent. Also, trade with Africa rose by 47.3 percent, totaling 41 billion yuan.

Long before the FIFA World Cup 2026 kicked off, orders for fan merchandise flooded into Yiwu. As a super factory for global sporting goods, made-in-Yiwu commodities capture about 70 percent of the market for World Cup-related merchandise, from footballs, fan apparel and small flags to team-themed glasses, hats, wigs, nail art and insulated cups.

"In the past, we only made what customers asked for. Now we actively anticipate market demand," said Chen Shaomei, a veteran trader who has witnessed five World Cup cycles. His company's self-designed commemorative footballs have become best-sellers, with repeat customers requesting them.

Another supplier, Wen Congjian, designed his own team jerseys and filed for overseas design patents ahead of the tournament — more than 40 patents for this World Cup alone. With patent protection, his products command a premium of up to 20 percent.

Some merchants are also exploring niche segments such as creative products, pet jerseys and baby-friendly sportswear, moving away from a pure volume-based model to higher value-added goods.

Foreign traders search for products at a mall in Yiwu in October 2025.

Since June 2025, Wen has stocked, produced and fulfilled orders. The volume of orders increased month by month, reaching its peak in January. By March, most orders had been shipped and delivered.

At Yiwu Aokai Sports Goods, production lines are running at full capacity. "We have received a large number of World Cup orders. For this football event alone, we have exported nearly 150,000 pieces to Peru," said Wu Xiaoming, the company's general manager.

Thanks to Yiwu's efficient sea-rail links, more made-in-Yiwu products are reaching stadiums worldwide.

Customs data show that Yiwu's exports of sports goods and equipment exceeded 2.34 billion yuan in January-February, up 38.5 percent year-on-year, including 550 million yuan to the United States, Canada and Mexico.

Logistics innovation

The city has made significant efforts to address a long-standing logistics challenge, benefiting tens of thousands of traders in Yiwu. More than half of its market-procurement export containers are consolidated loads. Under the traditional load-then-inspect model, a single flagged shipment would force the entire container to be unloaded and delayed.

Yiwu pioneered an "inspect before loading" model, setting up a supervised consolidation warehouse where loose cargo can be stored, declared individually, inspected and then loaded.

"In the past, a container might hold goods from a dozen clients. If one was selected for inspection, the whole box had to be opened, often missing the shipping deadline and incurring penalty risks," said Cheng Keyuan, chairman of Zhejiang Yinghe International Logistics.

In early 2026, Yiwu added a sea-rail intermodal link to the system. Under this model, inspection clearance information is transmitted in real time to Ningbo Zhoushan Port. Companies can complete preclearance procedures in advance. Goods can move from train to vessel almost immediately, saving two to three days compared with conventional sea freight, according to an official from Yiwu Customs.

Cross-border e-commerce export efficiency has improved by about 30 percent, with costs down by about 15 percent. By April 2026, the value of goods processed under the model had surpassed 1.33 billion yuan — exceeding the total for all of 2025.

Though Yiwu has no seaport or river port, rail links have turned it into a major inland hub. The Yiwu (Suxi) International Hub Port, a part of Ningbo-Zhoushan Port, brings port functions inland. Goods can be declared, inspected and released there as if they had reached the coastal megaport, cutting clearance times by 50 percent and logistics costs by 10-20 percent compared with road transport.

The hub now runs about six pairs of sea-rail intermodal trains daily, using manned and unmanned flatbed vehicles to create a fully intelligent operating model. By June 2, the Yiwu (Suxi) International Hub Port had achieved a cumulative container throughput of over 200,000 twenty-foot equivalent units since its opening on June 27, 2025.

The China-Europe Railway Express in the city is also expanding. In 2025, Jinhua (Yiwu) was designated a national China-Europe freight train consolidation center. Yiwu's trains have so far made more than 8,800 trips, reaching over 160 cities across more than 50 countries, with four trains departing daily.

In April 2026, the first Yiwu-Moscow dual-hub express train, loaded with 110 TEUs of daily necessities, arrived at Moscow's Bely Rast station in just 15 days, offering a competitive logistics option for Sino-Russian trade.

A China-Europe Railway Express train departs Yiwu for Moscow on May 1.

Inclusive community draws global traders

By CAO YINGYING
caoyingying@chinadaily.com.cn

Through effective grassroots governance, Yiwu city has bridged cultural and institutional divides, delivering tangible benefits to global traders. Its unique soft power helps attract and retain international talent, enabling them to integrate into the city's economic and social development.

Syrian businessman Mfadi Diab Aishara first arrived in Yiwu in 2003, seeking entrepreneurial opportunities despite having no capital. Attracted by the city's thriving business environment, he decided to settle permanently in 2006. Today, he is a married father-of-one and runs his own trading company in the city.

"I came here with nothing. Now, I have a Chinese wife, a child and a stable business," he said, expressing gratitude to Yiwu for providing him with entrepreneurial opportunities, a stable life and a fresh start.

Aishara is among many foreigners who have established roots in Yiwu, a city that hosts approximately 28,000 to 30,000 permanent foreign residents.

The Jimingshan community, where Aishara resides, is one of the primary hubs for foreign merchants in the city. According to Jing Jing, the Party secretary of the Jimingshan community, there are 1,388 permanent foreign residents from 74 countries and regions living there. Among them are large populations from Yemen, Syria, Iran and other Middle Eastern nations involved in the Belt and Road Initiative.

"Our community gathers residents from different nationalities, cultures and ethnic groups. Interwoven diverse demands bring unique challenges in management, communication and cultural integration that ordinary communities do not face," said Jing.

Front-line governance hurdles have long included language barriers, foreign residents' limited familiarity with local laws and regulations, and inconsistent public awareness of community governance rules — gaps that complicate routine safety inspections, policy promotion and daily community management work.

To address these challenges, the Jimingshan community launched a Confucius Classroom in 2014, offering free Chinese language courses.

"Foreign merchants urgently need practical business Mandarin for daily trade. In the early years, they could only rely on translators, which was inconvenient and easily caused communication misunderstandings that harmed business cooperation," Jing explained.

The community has adopted an innovative volunteer-for-training model. Foreign participants gain free access to the language courses after completing 72 hours of community volunteer service. The mutually beneficial mechanism has trained over 130,000 foreign residents in the past 12 years.

Many foreign graduates have continued to engage in community services after finishing the courses. Five outstanding participants now work as volunteer tutors, teaching local merchants widely used trade languages including Spanish and Arabic.

"This not only meets the business needs of local vendors but also provides foreign residents with a sense of value and belonging," Jing said.

Beyond language support, the community has set up a one-stop foreign affairs service platform, integrating 65 decentralized administrative services. The full-spectrum service covers company registration, tax filing, rental registration, bank account and SIM card applications, children's schooling and medical consultation.

"New arrivals can head straight to the community right after landing at the airport and get all paperwork done here," Jing said.

While institutional services underpin stable residency, regular cultural exchange programs advance Sino-foreign integration. The community holds more than 230 multicultural activities every year, covering Chinese heritage, traditional culture and festive celebrations.

Events range from Yiwu's traditional culture study tours, calligraphy, martial arts, Yueju Opera and Wuju Opera experiences, to Dragon Boat Festival rituals and Chinese New Year gatherings. For 10 consecutive years, foreign families have been invited to local households to share Chinese New Year dinners and make dumplings, helping bridge cultural gaps and strengthen foreign residents' sense of belonging.

A Nepalese resident in the community has become an unofficial goodwill ambassador for Yiwu. When traveling overseas for business, he brings local souvenirs such as wooden rattles and cultural gifts instead of products from his home country, proudly identifying himself as part of the city, which Jing said warms the hearts of community workers.

To improve services, the community team has visited Gubei Civic Center in Hongqiao subdistrict, Shanghai, a benchmark for one-stop comprehensive services for international residents.

The Jimingshan community plans to break geographical boundaries to build an international community cluster. It will share resources and co-organize activities with other foreign resident communities across Yiwu.

"We welcome all foreign friends to settle here, leverage their strengths and contribute to the city's development," Jing added.

Foreigners living in the Jimingshan community of Yiwu gather for a Chinese New Year's Eve dinner in February 2026.

Digital shift fuels new growth for city's merchants amid AI-powered upgrade

By CAO YINGYING

For decades, Yiwu has built its reputation as China's quintessential small-commodity hub, where daily goods flow from local storefronts to buyers around the world.

Now, this eastern Chinese city is undergoing a digital transformation, leveraging artificial intelligence, cross-border e-commerce and livestreaming to upgrade its brick-and-mortar marketplace into a world-class digital trade ecosystem.

A key witness and participant in this transformation is Jin Haomin, Party branch secretary of the Yiwu Futian subdistrict social e-commerce association, and an early pioneer of livestream commerce in Jiangbeixiazhu village. His experience reflects the broader changes sweeping across Yiwu's e-commerce sector.

Jiangbeixiazhu village, widely regarded as one of China's top livestreaming e-commerce villages, has developed a complete supply chain and cultivated a vibrant startup community for content creators and online retailers.

According to Jin, the village is home to over 8,000 e-commerce players and more than 2,000 brands. It handles an average of over 5 million orders per day, with 20,000 practitioners pursuing their entrepreneurial dreams there.

Jin himself once ran a cross-stitch manufacturing business before pivoting to livestreaming and supply chain services in response to shifting consumer trends.

"Thanks to Yiwu's comprehensive commodity supply, low startup thresholds and inclusive business environment, more than 200 e-commerce villages have emerged in Yiwu. Local sellers prefer sharing traffic and resources rather than engaging in cutthroat competition," Jin explained.

Cost-performance will no longer be the sole competitive edge; emotional value and brand building will help merchants stand out amid intensifying industry homogenization, Jin noted.

The application of AI is further reshaping Yiwu's export landscape, rewriting the rules for small businesses seeking global growth.

Wang Xinfu, a prominent local livestream entrepreneur known by his online alias "Brother Seaweed", has expanded his business from domestic livestream sales to cross-border trade, and now offers customized AI digital human solutions to local manufacturers to help curb operational costs.

"AI's core strength lies in reducing costs and improving efficiency for small and medium-sized merchants. It covers the entire industry chain, from product design and short-video production to multilingual overseas customer acquisition," Wang said.

"AI-generated digital human videos have proven effective for Yiwu's export-oriented sellers, yet large-scale AI livestreaming remains unfeasible due to platform regulatory restrictions and immature underlying technology."

To date, more than 30,000 local merchants have adopted AI tools in their daily operations, with early adopters reporting an average order increase of more than 30 percent.

Last year, Yiwu city's e-commerce transaction volume reached 553.78 billion yuan ($81.84 billion), while cross-border e-commerce transactions approached 168 billion yuan. With 830,000 registered e-commerce entities, 40 percent of local players have ventured into cross-border businesses. Livestream commerce stood out as a signature growth driver, generating 85.6 billion yuan in retail sales last year.

In October, the Yiwu Global Digital Trade Center was put into operation. With an investment of 8.3 billion yuan, this flagship project is recognized as a provincial-level key initiative to bolster the open economy and digital trade.

The multifunctional complex has been hailed by Liu Jie, governor of Zhejiang province, as a powerful new engine driving digital trade across the province.

Zhu Xingping, deputy general manager of the center, noted that the platform removes the time and geographic constraints that have long plagued traditional wholesale markets. "Over the next five years, we will accelerate the full digital upgrading of physical markets and build a year-round digital trade exhibition that never closes," Zhu said.

The sprawling facility hosts many merchants who are young entrepreneurs owning independent brands or intellectual property products. Powered by a self-developed large language model, the center provides over a dozen AI-driven tools covering intelligent design, multilingual translation and automated video generation.

Equipped with full-coverage 10G ultra-high-speed broadband, more than 80,000 stores have evolved into 24/7 livestreaming studios catering to global buyers.

An official of Yiwu said the city's top priority is bridging the digital gap for small-scale exporters and empowering micro and small enterprises to tap into overseas markets.

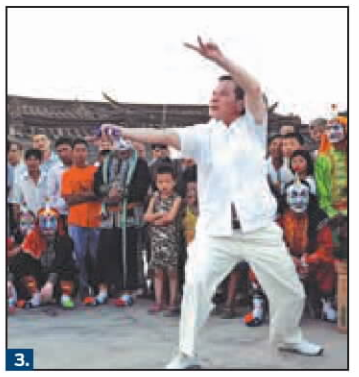
CULTURE

A region steals the scene

Breakout film reminds audiences that the oldest traditions often tell the most timeless stories, **Chen Nan** reports.



Chaoju Opera is a vital artistic component of the cultural heritage in the Chaoshan region of South China's Guangdong province. PHOTOS PROVIDED TO CHINA DAILY

4. A display introducing the film *Dear You* draws the attention of visitors to a recent exhibition in Hong Kong.
PHOTOS PROVIDED TO CHINA DAILY: WANG SHEN / XINHUA

When *Dear You* quietly entered cinemas during China's fiercely competitive May Day holiday season, few expected the modestly budgeted film — with dialogue largely in the Chaoshan dialect and featuring no major stars — to become a surprise hit.

The film follows a young man who travels to Thailand in search of his long-lost grandfather, hoping to uncover a hidden family fortune. Instead, he discovers a decades-old secret behind the letters his grandmother treasured for years, leading him to uncover an extraordinary story of love, sacrifice and separation spanning generations.

Audiences were drawn to its intimate story of family, memory and homecoming. Yet, for many, the film's most lasting impression came from something even older: the living traditions of Chaoshan.

The Chaoshan region, comprising the cities of Shantou, Chaozhou and Jieyang in South China's Guangdong province, is renowned for its strong clan culture, ancestral rituals and distinctive folk arts.

Rather than serving merely as picturesque backdrops, these traditions emerge as characters in their own right, carrying centuries of memory, migration and belonging.

For viewers beyond southern China, the film offers a rare first glimpse into one of the country's richest regional cultures.

For Lin Yanyun, an award-winning Chaoju Opera actress with the Guangdong Chao Opera Institute who specializes in *xiaosheng* — the refined young male roles in traditional Chinese opera — watching the film was unexpectedly emotional.

"So many of the opera scenes were performed by actors from our own troupe," she says. "Everything felt so familiar. I was deeply moved."

She believes the film offers many younger viewers their first genuine encounter with Chaoju.

"The opera runs throughout the film," she says. "People, especially those who aren't from Chaoshan, can finally experience what Chaoju is really like."

Emotional bond

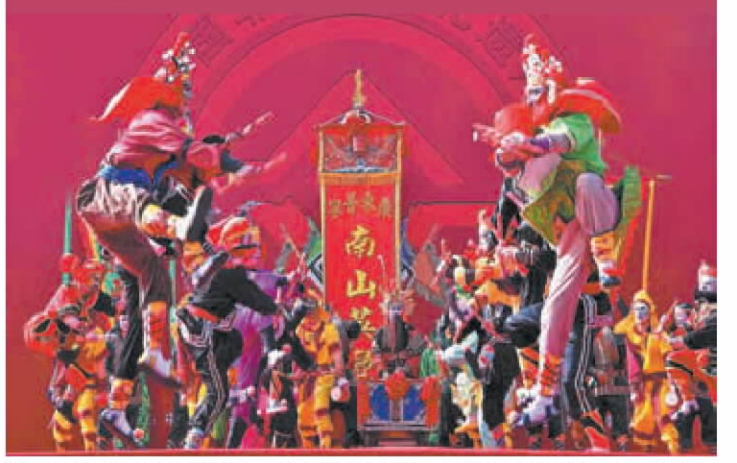
Believed to date back nearly 600 years, Chaoju is one of China's oldest surviving opera traditions. Performed almost entirely in the Chaoshan dialect, it combines elegant literary verse with expressive singing and a distinctive orchestra featuring instruments such as the *erxian*, a two-stringed bowed instrument, the *yehu*, a coconut-shell fiddle with a mellow tone, and the small *suona*, whose bright, piercing sound heightens dramatic moments.

Performers are often accompanied by a traditional supporting chorus that amplifies the emotional power of each scene. Its repertoire is equally enduring, filled with stories of historical heroes, filial devotion and loyalty.

"The lyrics are refined," Lin says. "The scripts are beautifully written."

For Lin, however, the art form began not in the theater but in childhood.

Growing up in Chenghai, Shantou, she followed her grandmother from village to village whenever an opera troupe came to perform.



"There were no smartphones and very few televisions," she recalls. "I didn't even know it was called Chaoju Opera. I simply followed the adults to watch. Sometimes I'd fall asleep before it ended."

Those makeshift village stages remain an essential part of life across Chaoshan. During Chinese New Year celebrations, temple fairs and family ceremonies, opera performances continue to bring entire communities together.

Yet, Chaoju's reach extends far beyond China.

"There is a saying: Where there is the sea, there are tides; where there are Chaoshan people, there is Chaoju Opera," Lin says.

> "The sound of the batons grips the heart, and the horns urge people to dance ... The movements express courage and resilience. That's where Yingge dance's artistic appeal lies."
>
> **Chen Laifa,** veteran performer in Puning, Guangdong province

Yingge dance performances combine folk dance, martial arts and theater, driven by pounding drums, painted faces and synchronized wooden batons.

As a veteran performer who has toured Thailand with the Guangdong Chao Opera Institute for several consecutive years, Lin has witnessed how deeply the tradition resonates among overseas communities.

"There are scenes in the film shot in places where we've performed many times," she says.

"Whenever we perform overseas, I am reminded that Chaoju is much more than entertainment.

"Some people left their hometown decades ago and never returned. But the moment they hear the music, memories of home come flooding back."

Lin Yanyun, a veteran Chaoju Opera actress.

More than entertainment

If Chaoju gives voice to longing, Yingge dance answers with exuberance.

Featured prominently in *Dear You*, Yingge dance combines folk dance, martial arts and theater in performances driven by pounding drums, painted faces and synchronized wooden batons.

Rooted in stories of the heroes of *Water Margin*, one of China's best-known classic novels, the dance has become one of the most recognizable symbols of Chaoshan culture, attracting millions of views on Chinese social media.

"The film portrays Yingge dance truthfully," says Chen Laifa, a 69-year-old veteran performer from Puning, Guangdong province. "The scenes feel authentic because they capture the history and spirit of the Chaoshan people."

To newcomers, Yingge dance may seem like pure spectacle, he says. But beneath its powerful rhythms lies a carefully structured tradition, with each formation, movement and musical pattern carrying its own meaning.

"The sound of the batons grips the heart, and the horns urge people to dance," Chen says. "The movements express courage and resilience. That's where Yingge dance's artistic appeal lies."

Chen began performing Yingge dance at the age of 18 and describes the tradition as belonging equally to history, community, entertainment, and art.

"There is an old Chaoshan saying: When the gongs and drums begin, your heart starts to itch," Chen says.

Whenever a troupe performs, he says, people of all ages fill the streets — not simply to watch, but to take part in a tradition passed from one generation to the next.

Like Lin, he sees *Dear You* as an opportunity to introduce younger audiences to a living cultural heritage.

"Cinema allows traditional culture to reach more people," he says. "It helps the younger generation understand Yingge dance."

For Xie Jishun, a veteran performer and researcher of Chaoju, the traditional opera and Yingge dance together form the emotional and cultural heart of Chaoshan.

"Chaoju is gentle and lyrical; Yingge dance is bold and powerful. Together they tell the story of who the Chaoshan people are," he says.

He describes Chaoju as an invisible bridge connecting generations of overseas Chaoshan communities with their ancestral homeland. Across Southeast Asia, opera performances remain at the heart of Chinese New Year celebrations, temple festivals, clan gatherings, and community events, preserving not only the art form itself but also an entire way of life.

"For overseas audiences, Chaoju is far more than entertainment," he says. "It is a spiritual homecoming."

Xie believes films such as *Dear You* are helping these traditions find new audiences.

By weaving Chaoju into a contemporary family story, the film has sparked renewed interest in the opera while drawing wider attention to Chaoshan's cultural heritage. That growing visibility, he says, is encouraging closer collaboration among filmmakers, cultural institutions and the local tourism sector, creating new opportunities for traditional arts to thrive.

"The most moving part isn't only what's happening on stage," Xie says. "It's the way ordinary people continue to cherish these traditions and weave them into everyday life."

Food courier's verse wins a top Chinese literary honor

By CHEN NAN

The winners of the ninth edition of the prestigious Lu Xun Literature Prize were announced on Wednesday. Among them was Wang Jibing, whose poetry collection *Low Flight* won the poetry award, bringing national recognition to a writer whose work has emerged from the streets and the lives of ordinary people.

When Wang, 56, heard the news, his first feeling was simple joy. "I am filled with happiness, and I can finally breathe a long sigh of relief," he says.

For Wang, the award marks not only national recognition but also the culmination of one of the most challenging and meaningful journeys of his writing life.

Born in Xuzhou, Jiangsu province, Wang left school at 14 after his father sent him to study martial arts. Despite the change in direction, he never lost his love of reading and writing. In 1992, a magazine in his hometown published one of his articles — an early encouragement that stayed with him.

He bought a computer in 2009 and began writing in his spare time, sharing poems and essays on social media, where they gradually found an audience. Wang worked in construction before becoming a food delivery rider, a job he says gives him the flexibility to write.

A difficult delivery in 2019 changed everything. Working in Kunshan, Jiangsu, Wang spent hours searching three residential buildings and climbing 18 flights of stairs after a customer entered the wrong address. When he finally arrived, the customer berated him for being late.

On his way home, Wang poured his frustration into a poem titled *Man in a Hurry*. The piece quickly went viral online and marked a turning point in his writing. Since then, he has drawn inspiration from the rhythms, encounters and emotions of life on the road.

In 2023, he published his first poetry collection, *Man in a Hurry: Poems of a Food Delivery Rider*.

Over the years, Wang has written more than 6,000 poems, many of which have appeared in literary journals.

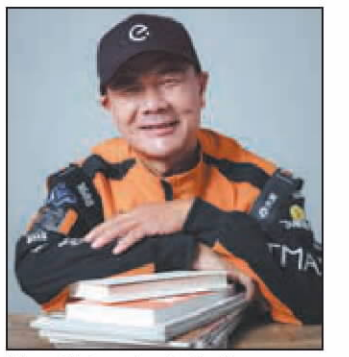
His latest, award-winning collection grew directly from those daily journeys through city streets and alleyways, carrying meals from restaurants to homes. Along the way, he began reflecting on the quiet connection between delivery riders and the people they serve.

"People may not remember me after we pass each other," he says. "But they will certainly notice a food delivery rider speeding by."

That realization inspired him to write a book for the millions of delivery workers who share the same roads, pressures, hopes, and dreams.

To complete *Low Flight*, Wang interviewed more than 140 delivery riders in person and surveyed more than 60 others, hoping to capture their happiness, frustrations, struggles, and aspirations.

"I hope that after reading this book, people will show riders more understanding and patience, and that there will be fewer conflicts," he says.



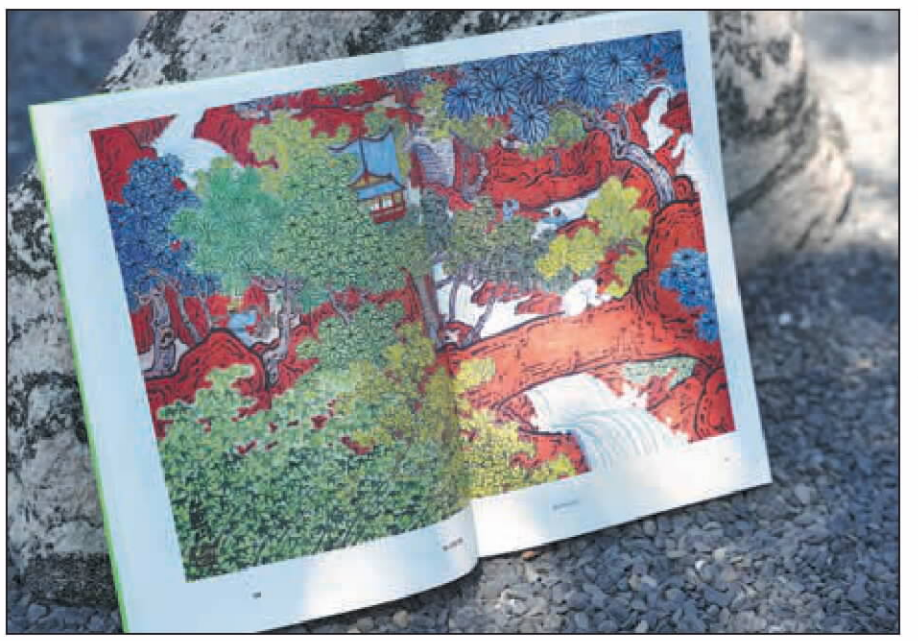
For Wang, the greatest value of literature is not simply personal expression, but the ability to bring people closer together.

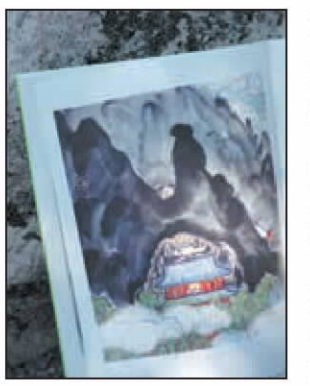
The title *Low Flight* reflects the philosophy behind his writing.

"Not every pair of wings can fly straight into the clouds," Wang notes. "A flight close to the ground is still a flight."

His poetry discovers beauty in such low flights: the hum of wheels turning, the wind rushing past, conversations on the street, and the countless fleeting moments that together become the soundtrack of the city.

As he writes: "Every ordinary person running along the road holds a small light in their hands. This light first illuminates us, and then slowly warms and brightens the entire world."





Wang Jibing wins the Lu Xun Literature Prize for his poetry collection that celebrates the lives of ordinary people. PROVIDED TO CHINA DAILY

LIFE

Left and above: The illustrations that artist Yushan created for the Xu Xiake book. **Below:** Artist Yushan talked about creating the illustrations during the book launch event at the Lushan Library, in Jiangxi province.

Retracing mountains of spirited exploration

New book meticulously re-creates the 34-year-long journey of a geographer 400 years ago, bringing ink illustrations, research and highlights from his own travelogue into a comprehensible text, **Yang Yang** reports.

Four hundred years ago, Xu Xiake (1587-1641), a geographer, explorer and literary scholar, spent 34 years traveling around China, covering 100,000 *li* (50,000 kilometers) on foot. The new illustrated book *Xu Xiake's Travels to Famous Mountains* was recently released at Lushan Library located at Lushan Mountain in East China's Jiangxi province.

The book, published by China National Geography Books, includes 16 chapters of Xu's travels to famous mountains, including Lushan Mountain, Huangshan Mountain, Tiantai Mountain, Songshan Mountain, and Hengshan Mountain.

The pages feature over 60 ink landscape illustrations meticulously created by artist Zeng Renzhen, who is known in the art world as Yushan, a contemporary Chinese artist and architect. Chinese writer Zhang Jiawei provides the introduction and translation, while Zhu Huirong, an expert on Xu Xiake research, offers commentary and annotations. The book also includes 17 specially drawn maps of Xu's travel routes to these famous mountains.

Chen Yihuan, general manager of China National Geography Books, explains that the book aims to transform the classic work from 400 years ago into a travel text that is "readable, appreciable, and referable". It is designed to be readable with selected chapters on famous mountains featuring introductions and modern translations; appreciable, with artist Yushan retracing Xu's routes to create over 60 landscape illustrations; and referable, by connecting Xu's paths with today's renowned mountain sites.

In 1618, Xu embarked on a journey along the Yangtze River, stopping in Jiujiang, Jiangxi, to explore Lushan Mountain, Baiyue Mountain, Huangshan Mountain, and Jiuhua Mountain in today's Jiangxi and Anhui provinces. His experiences during this trip are detailed in his travelogue, *Diary of a Visit to Lushan Mountain*.

Lushan, located in northern Jiangxi province, is a renowned Chinese scenic area. Xu arrived in Jiujiang on Aug 18 and began his ascent from Lushan's northern slope with friends the following day. After five days of exploration, he departed from Kaixian Temple on the southern slope on Aug 23, having visited all the major scenic spots.

His journey was driven by a spirit of adventure and discovery, so he avoided the main roads. To reach the summit of Hanyang Peak, Lushan's highest point, he navigated through grass and thorns. While investigating the Sandie Spring, he traversed a rocky stream bed, where round stones were slippery and sharp rocks pierced his shoes.

He visited Shimen (stone door) twice, took detours to thoroughly explore Wulao Peak, and often viewed many scenic spots from different angles to ensure he fully captured their beauty.

Lushan Mountain is a typical horst-block mountain, uplifted by the Himalayan movement millions of years ago, said geologist Liu Jiaqi at the book launch ceremony.

It preserves the most typical and concentrated remnants of Quaternary glacial landforms in eastern China, on which prominent Chinese geologist Li Siguang proposed the Lushan Glaciation theory. Liu also mentioned Lushan's Feilai Stone, a massive boulder weighing tens of tons standing isolated on a mountain ridge, which could only have been transported there by glaciers.

The scattered rocks that Xu Xiake once walked on, described as "round ones that are slippery and pointed ones that pierce shoes", are likely glacial erratics transported by glaciers, he noted.

The book's illustrator, Yushan, retraced Xu's footsteps to various famous mountains in order to illustrate the landscapes. With a decade of cultural exploration as a foundation, Yushan used contemporary Eastern aesthetics to re-create over 60 landscapes and scenes described by Xu.

Painting the landscapes Xu traveled through is also to depict his life within them — the journey's hardships, the uncertainty of finding a path, the relaxing moments, and the exhilaration of reaching the summit, he says.

"Xu leisurely traveled through the vast world and joyfully walked within his own small world," he adds.

Explaining Xu's approach and spirit in his travel explorations, Chen Qingjiang, vice-director of the Xu Xiake Research Branch of the Geological Society of China, summarizes it into four key phrases: committing wholeheartedly to a chosen pursuit, exploring vast landscapes with freedom and courage, visiting mountains as if meeting old friends, and embarking on distant journeys as acts of personal dedication.

Xu uniquely combined landscape aesthetics with scientific exploration, a rare achievement among travelers throughout history, with few able to rival him in this regard, Chen says.

Song, stance, dining tables: China and Africa share rhythm

NAIROBI — At a copper mine in Zambia, workers are singing. On the streets of Dakar, young people are practicing tai chi. In a kitchen in Dar es Salaam, apprentices are working with a cleaver and a wok.

Across the continent, singing, dancing, and cooking in everyday life fall into the same rhythm.

This year marks the China-Africa Year of People-to-People Exchanges. Different countries, different tempos, and yet, across mountains and seas, the same beat.

Left: Students practice *taijiquan*, a kind of Chinese traditional martial art, at the Confucius Institute at the University of Nairobi, in Kenya, on March 18, 2026. **Right:** Singers perform during the finals of *Sing for Africa*, a Chinese-supported musical talent show in Nairobi, Kenya, on Dec 29, 2025. PHOTOS BY XIE JIANFEI AND YANG GUANG / XINHUA

Rising from the mine

The video *The Song of Chambishi* recently went viral across Chinese internet platforms. The voices and footwork of Zambian miners won over countless online users and turned the spotlight onto the copper mine itself.

Chambishi was discovered in the late 19th century, and its development was anything but smooth. Production only began to recover and grow after the late 1990s, when the Sino-Zambian joint venture, NFC Africa Mining Plc, took over its operation and investment.

Xu Laixiang, the company's deputy general manager who wrote both the song's words and music, says the idea came to him while preparing the launch ceremony of a tunnel-boring machine. "I wanted a song that captured a century of Chambishi's history that could lift the workers' spirits. I never expected it to take off online," he says. The company, he adds, has not only created a large number of local jobs but also helped improve infrastructure and schooling in the surrounding communities.

The chorus echoing through the mine is a small snapshot of how cultural exchange and practical cooperation between Africa and China benefit so many. Across the wider continent, melodies carrying that shared feeling are giving more young people a stage on which to shine and chase their dreams.

After winning a China-Africa co-produced singing contest called *Sing for Africa* in Nairobi, the capital of Kenya, a vocalist known as Muluwa used the prize money to open a studio dedicated to nurturing the next generation of musical talent. In the Zimbabwean capital, Harare, *Dream Show,* founded by Chinese residents, has helped more than 300 young people travel to China for cultural exchange over the years, putting homegrown artists in the spotlight and giving the local creative industry a push.

Ready for the challenge

Ousmane Sako, head coach of Senegal's national *wushu* (martial arts) team, can hardly wait for the Dakar Youth Olympic Games to open. *Wushu* will make its debut as an official Olympic event at the 2026 Games.

A Dakar native, Sako grew up in difficult surroundings, carrying the restlessness and aimlessness of a boy of the streets. He first began karate, then moved to tai chi. "Tai chi changed my life," he says.

Training day after day steadied his body and mind. He worked through one obstacle after another to reach his post as a national-team coach. For now, every ounce of his attention is on preparing his squad for the Dakar Youth Olympics. "It won't be an easy contest," he says, "but we're ready for the challenge".

In Yaounde, the capital of Cameroon, a young man named Rodrigue Taling has turned the "Bruce Lee dream" he once coveted in a run-down video hall into his own martial arts gym. *Wushu*, he says, is "an art of cultivating body and mind" that taught him self-control, and he hopes to spread this discipline, steeped in Eastern philosophy, so more young Cameroonians can reach an inner calm.

In Kigali, the capital of Rwanda, young coach Emile Ndagijimana leads his students through tai chi, one movement at a time. Ndagijimana began training at age 9, at first drawn to it by kung fu films, but what truly transformed him was the philosophy behind the moves. "My Chinese teacher told me that to master tai chi, you have to find the balance between body and mind in the space between breath and motion," he says. He wants to share his understanding and love of tai chi with more Rwandans, convinced that this Eastern wisdom has healing powers.

Blending flavors

In the Chinese kitchen of the Kilimanjaro Institute of Technology and Management in Tanzania, a cleaver strikes the board in quick, insistent rhythms. Ruth Wahima Seni, a Tanzanian hotel management student, is practicing slicing a potato into threads as fine as hair.

Seni is taking part in a China-Tanzania cooking program launched in January. Each day, Chinese master chef Wang guides 20 local apprentices, Seni among them. As he sees it, "food is a bridge between people. Once the students understand the culture, they cook with feeling, and the quality of the dishes rises with it".

After learning the foundations of knife work, dough, heat control, and seasoning, the young apprentices transform local ingredients — Tanzanian beef, mutton and seafood — into classic Chinese dishes. As trade between Africa and China grows, demand for authentic Chinese food climbs, says institute instructor Philbert Haule, and the demand for Chinese cooking will open more doors for young job-seekers.

As young Tanzanians replicate the tastes of China, Chinese tables are taking on more African flavors. From May 1, China extended its zero-tariff treatment to all 53 African countries with which it has diplomatic ties. From Rwandan dried chilies to Kenyan avocados, from South African wine to Cameroonian cocoa, more African produce is entering the Chinese market faster than before.

A song, a set of moves, and a table of food are resonating across thousands of miles, and vivid moments in the lives of ordinary people are merging into an enduring echo between China and Africa.

2026 WORLD CUP

England grabs a Saka-ful of goals

Bukayo Saka beats France's Mike Maignan to score England's third goal during the World Cup third-place match at Miami Stadium on Saturday. Saka scored a hat-trick as England defeated France 6-4. **Inset:** Saka (center) is congratulated by Jude Bellingham (10) and Reece James after scoring his side's fifth goal from the penalty spot. REUTERS / AP

Arsenal star bags a hat-trick in wild 6-4 bronze medal match win over France

England and France delivered a 10-goal thriller in a game that was supposed to just be an afterthought.

A day before the highly anticipated final between defending champion Argentina and 2010 winner Spain, Bukayo Saka scored three goals to lead England past Kylian Mbappe and France 6-4 in a wild third-place match at Miami Gardens in Florida.

Mbappe surpassed Lionel Messi's record for World Cup goals, scoring twice in the second half. The 27-year-old star has 22 career World Cup goals and 10 in this tournament alone, two ahead of Messi in the race for the Golden Boot going into Sunday's final.

It was the highest-scoring World Cup game since Hungary beat El Salvador 10-1 in 1982, and the 10 goals were the most ever in a third-place match.

Saka had goals in the 37th minute and in first-half stoppage time, then added a third from the spot in the 87th for his second England hat-trick. The Three Lions also got goals from Declan Rice and Ezri Konsa to build a 4-0 halftime lead, and they held out against a relentless France attack in the second half to secure their second-best World Cup finish since winning the title in 1966.

"I hope that the players can be proud of that in some time," England coach Thomas Tuchel said, adding that he viewed England's World Cup run as a success, despite its collapse in the semifinals.

The Three Lions blew a 1-0 lead against Argentina and lost 2-1 when Messi assisted on two late goals.

Tuchel was criticized for his tactical decisions in the loss, with many wondering what it will take for England to end its decades-long wait for another trophy.

He said that Saturday's result was the first step toward closing the gap with teams like Argentina and France. "This game will help us for sure," he said, "even if a part will never allow you to fully celebrate the bronze medal."

Jude Bellingham capped the scoring in the eighth minute of second-half stoppage time, his seventh goal of the tournament and the most in a World Cup by an England player.

Captain Harry Kane scored six this year, as he did in Russia in 2018, and Gary Lineker scored six at the 1986 World Cup.

Halftime substitutes Bradley Barcola and Ousmane Dembele also scored in the second half for France, which pulled within 4-3 thanks to Mbappe's second goal.

Mbappe won the Golden Boot four years ago in Qatar, when France lost the final to Argentina on penalties, and is in a good position to repeat the achievement this year.

"I just try to help my team every time to score," Mbappe told Fox Sports. "It's certain that when you score so many goals in the World Cup, it elevates you to certain levels.

"I would have preferred not to be the top scorer in history and play in the match tomorrow."

Both teams had said they'd rather be playing in Sunday's final.

France had enough offensive firepower to potentially win the tournament, but Les Bleus lost to Spain in the semifinals and squandered their chance at reaching a third straight World Cup final.

England assistant manager Anthony Barry was on the verge of tears during his halftime interview.

"I have to be honest, I'm a little bit emotional, I'm struggling to find the words to describe how proud I am of these players," he said.

"They're playing the game with broken hearts, yet they can build a performance like that through playing for England. The team spirit we've built over the last seven weeks, it's been a privilege to watch."

A privilege enjoyed by a sellout crowd of 64,478 at the seventh and final World Cup match to be played at Miami Stadium.

Plenty of supporters were cheering for both teams. Many were there simply for the atmosphere of the low-stakes match, and it more than delivered.

"I love English football," said Gaston Esquivel, a native of Mexico City who came to support England.

"I've followed the Premier League since I was a kid. I am a Manchester United fan. I like their style, I like their game."

Thomas Viel, who traveled from Paris to follow France throughout the tournament, was hoping to see an Mbappe hat-trick. He nearly got one.

France trailed 4-0 when Mbappe flicked a shot past Crystal Palace goalkeeper Dean Henderson in the 48th minute.

He beat Henderson again with a left-footed strike from about 14 yards in the 66th.

It was also the final match for France coach Didier Deschamps, who has said he will step down after 14 years.

Deschamps embraced players and waved toward the crowd as he exited the pitch.

"We were not expecting such a first half," Deschamps said.

"And we did better in the second half. We were deeply disappointed, gutted after the semis. I don't want to sum up my career on this moment."

Defiant Tuchel hopes Three Lions will look back with pride

England coach Thomas Tuchel (left) looks on during the medal ceremony after the World Cup third-place playoff on Saturday. AP

England manager Thomas Tuchel said he hoped his players would one day look back on finishing third at the World Cup with some pride, despite falling short of their goal of winning the tournament.

The German, who has faced a torrent of criticism from the English media over his cautious tactics in the Argentina defeat, said England had made progress with its win against France.

"Eight years ago they (France) were the champions. Four years ago they were in the final. There is a slight gap, but no problem. We want to close it," he told the BBC.

"I said yesterday that today is the first step to closing it. We did it. We beat them. The next one will be Spain in the Nations League.

"To see a team fight like this gives you energy. The tiredness will come after. We will still feel the pain when tomorrow is the final. This will take a while, but overall it gives me more energy than it takes from me."

A 6-4 win over France in a frenetic third-place playoff at Miami Stadium on Saturday gave England its best finish at a World Cup since its only triumph when it hosted the tournament in 1966.

"It's the first medal for 60 years, the best World Cup on foreign soil. So, I hope that the players can be proud of that in some time," he told reporters.

"We are fiercely competitive, so we almost don't allow ourselves to be proud of the third place, because 18 months ago we set ourselves the highest goal ... to make it to the final and win the World Cup. So, it's very, very painful if you miss out. The pain will stay for a while."

Tuchel came in for heavy flak after England lost 2-1 to Argentina in the semifinals on Wednesday, particularly because of what were viewed as his defensive tactics after his side took the lead early in the second half.

"The news conference yesterday felt as if we went out in the group stage without a win, to be very honest," the German said.

"The best thing you can do is to react on the pitch and get the next win. Everything else is just talking, and talking doesn't get you points, and talking doesn't get you a win.

"I'm glad that we showed a reaction. We wanted that reaction, and it's very impressive."

Bukayo Saka's hat-trick for England on Saturday inevitably raised a question about why the right winger was not played in the semifinal loss to Argentina.

"It was a tough decision for me to leave him out of the semifinal," said Tuchel, who admitted he had been cautious with Saka because of the Achilles injury he had been managing for the last few months.

"I had the feeling that Morgan Rogers had something special to give us with his physicality and his body in the match against Argentina.

"We had (Saka) warm up several times against Argentina. We were ready to change, but the game became so crazy that, in the end, we opted for a different option.

"But nothing has changed during the World Cup for me. Bukayo is a fantastic teammate, fantastic football player, key player for us, and that will not change. He showed it again today and I'm happy for him."

AGENCIES

Spain defeats Argentina 1-0 to win second World Cup

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

European champions Spain won their second World Cup on Sunday, defeating Argentina 1-0 in extra time.

Ferran Torres scored the only goal of the game — his first of the tournament — kicking in a cross by Nico Williams, who had a goal 10 minutes early disallowed for a foul. A second goal by Torres in extra time was deemed offside and disallowed.

"It was a goal scored by 47 million people — it wasn't even mine or from the 26 players," said Torres, who had entered the game as a substitute. "It was destined to happen. It was meant to be a winner."

Spanish coach Luis de la Fuente became the oldest World Cup-winning coach at age 65.

"I'm so proud of this generation of footballers," De la Fuente said. "They're excellent, world-class footballers with exceptional talent," he told reporters after the match.

"I'm very moved. Looking back and thinking about them, we've won everything, absolutely everything, with this generation of players."

US President Donald Trump presented the trophy to Spain, with the leaders of the other co-host nations, Mexican President Claudia Sheinbaum and Canadian Prime Minister Mark Carney, also on stage as the medals were handed out at MetLife Stadium in East Rutherford, New Jersey.

Bill Einreinhofer, who lives in East Rutherford, said local restaurants closed off their parking lots, set-up tables, chairs and large screen TVs for watch parties, to which everyone was invited regardless of which, if any, team they were supporting.

"Because traffic was expected to be terrible, many people walked to the parties. The day turned out to be a real community event. I think that qualifies as a win," he told China Daily.

Spain's other World Cup championship was a 1-0 victory over the Netherlands in 2010.

Following a surprising 0-0 draw against Cape Verde in its first game, Spain went on to win its next seven games, allowing only one goal while scoring 14. Spain's defense did not even allow Argentina a shot on goal in regulation, while Argentina's goalkeeper Emiliano Martinez set a World Cup final with 10 saves.

The victory gave Spain a record 38-game unbeaten streak in men's international soccer.

The loss for Argentina ended a drive, led by Lionel Messi, to win back-to-back World Cups, a feat accomplished only by Italy in 1934-38, and Brazil in 1958-62.

Messi, 39, who was playing in his sixth World Cup, and third World Cup final, left a cryptic message on Instagram before the game, reading: "The best part of all these years was never just the titles, but the journey itself. Sharing the day-to-day with this group, competing together, picking ourselves up during tough times, and enjoying every step of the way." The post showed a pair of shoes with the words "Last Tango", suggesting that Sunday could be the last World Cup game of his career. Over that time he has scored 21 goals in 34 games.

"I was personally shocked by Argentina's poor performance, and wanted Messi to have his ride into the sunset," Ben Fraternale, a New York-based multidisciplinary artist who was filming the World Cup final, told China Daily. "But ultimately I walked out of the stadium feeling grateful to have had this life experience and meet so many people from across the planet."

"In victory and defeat, everyone always remained gracious, and the most surreal element throughout it all was seeing soccer get a massive foothold in America," Fraternale said.

France's Kylian Mbappe won the Golden Boot, his second in a row, with 10 goals in the tournament. Spain's center-back Pau Cubarsi, 19, was recognized as the Young Player of the Tournament, an honor also bestowed on Mbappe in 2018 when France won its second World Cup.

The next World Cup in 2030 will again see three host countries — Spain, Portugal and Morocco.

Investment and growth rank Xizang first nationally

Positive signals as autonomous region presses ahead with 15th Five-Year Plan

By YUAN SHENGGAO

The Xizang autonomous region in Southwest China reported steady and rapid growth in the first quarter, maintaining the development momentum it has achieved over the decades and showing a good start to its 15th Five-Year Plan (2026-30).

According to the Xizang Statistics Bureau, the region's fixed-asset investment increased 19.8 percent year-on-year during the first three months of 2026, again ranking it first nationally.

Also ranking it top of the nation were year-on-year growth rates in eight areas. These include increases in regional GDP, incremental output value of industrial enterprises above designated size, and per capita disposable income of rural and urban residents, standing at 6.1 percent, 20.5 percent and 7.5 percent, respectively.

It is worth mentioning that the increase in Xizang's fixed-asset investment has maintained a top position in the country since the third quarter of 2025.

In terms of investment structure, the secondary industry kept a year-on-year increase of 71.2 percent in the first quarter, accounting for 47.2 percent of all the fixed-asset investment in Xizang.

Yang Jie, a researcher at the Xizang Academy of Social Sciences, said this feature shows a growing emphasis on the real economy.

"The substantial growth in investment in the secondary industry also indicates that Xizang is accelerating a transformation in its development model — from investment-driven to industry-driven," Yang said. "And the top-ranking growth rates over nine consecutive months show that such growth is sustainable, rather than a short-term phenomenon."

The researcher also noted the growth rate in fixed-asset investment made by private businesses stood at 27.8 percent year-on-year. "This shows that Xizang is becoming an investment destination favored by all kinds of business entities," he said.

Digitalization

Driven by digitalization and intelligent operations, Xizang's manufacturing industries kept an impressive year-on-year increase of 30.4 percent in output value during the first quarter.

Gaozheng Cement Plant based in Lhasa, for instance, is an example of digital-driven development in Xizang. Since the beginning of 2026, the company has run its operations at full capacity.

Mao Xinbo, an executive in charge of technology at Gaozheng, explained that in the past, cement could be used for only six months a year in Xizang due to the high altitude and freezing temperatures on the plateau.

"Over recent years, our researchers have developed cement varieties suitable for plateau weather and an intelligent temperature control system for on-site concreting," Mao said. "These have made our cement products good to use for more than 10 months a year on the Qinghai-Tibet Plateau, leading to substantially improved efficiency for construction projects and increasing demand for our products."

Powering the intelligent development of Xizang's industries are an increasing number of enterprises in the digital economy. The Lhasa High-Tech Development Zone, for instance, is now home to about 2,900 companies for the development of digital technologies. It has earned this area in the Xizang regional capital the name of "smart computing valley on the plateau".

Against a backdrop of economic growth, the quality of life and social welfare of local residents have been improving sustainably.

According to the Xizang Statistics Bureau, the per capita disposable income of Xizang residents reached 6,483 yuan ($954) in the first quarter, growing 7.5 percent from the same period of 2025. The per capita disposable income of urban residents and that of rural residents in Xizang increased 6.2 percent and 7.8 percent, respectively.

When analyzing the data, Yang said all the three growth rates relating to disposable income rank first nationally. "It is noteworthy that the increase rate in per capita disposable income of Xizang residents has ranked first in the country for 11 consecutive quarters."

The researcher added that rural residents' income has been increasing at a rate faster than that of urban residents. This demonstrates a narrowing income gap and trend toward balanced development between cities and the countryside.

Agriculture

The improving quality and increasing output of agricultural sectors, driven by technologies and digitalization, have contributed to revenue growth for rural residents.

In the county of Dromo in Shigatse city, there is a modernized aquaculture base for salmon. Kelsang Dawa, a resident in the township of Dromomey where the base is located, is a technician at the plant.

According to him, researchers in Dromo have made breakthroughs in the domestication and breeding of salmon over recent years, leading to the formation of an emerging industry with considerable scale in the county.

"Our company put a new processing plant into operation last year to produce finished salmon products," Kelsang Dawa said. "This year, we will continue to upgrade our operations through brand building and tapping into the e-commerce sector."

Highland barley, or *qingke*, is the major grain crop in Xizang. The autonomous region has seen steady improvements in the crop's output and quality over recent years thanks to increasing investment in research and development.

The Lhundrub Highland Barley Germplasm Resources Protection and Research Base, operated by the Xizang Academy of Agricultural and Animal Sciences, is one of the key R&D facilities for the crop in Xizang.

According to Dawa Dondrup, a researcher at the XAAAS, the base has bred more than 4,000 germplasm varieties of highland barley over the decades, accounting for more than 60 percent of the national total.

"Our focus is to cultivate high-yield and high-quality varieties that can better resist drought, coldness and diseases in the plateau conditions," the researcher said.

Thanks to the efforts of the agricultural researchers, the ratio of high-quality seeds used in Xizang's crop farming industry has reached 95 percent, according to the academy.

New and high-tech farming machines have also contributed to improving the efficiency of Xizang's agricultural sector.

On a farm of 2,000 hectares in Lhokha city's Lhunze county, for instance, the spraying of fertilizer and insecticide is now carried out by drones.

"Over recent years, drones have been used extensively in our county, leading to the substantial improvements in efficiency," said Kelsang Tsering, head of the county's technical service center for farming and herding.

To encourage the application of new machines and technologies, Xizang's agricultural authorities are now offering subsidies for the use of the Beidou navigation system and crop-care drones.

Since the beginning of 2026, agricultural departments at various levels in Xizang have intensified their efforts to promote dozens of newly developed technologies among the farming and herding communities, mainly covering such sectors as highland barley, yaks, cows and forage grasses.

Optimism

Based on the momentum of the first quarter, officials and residents in Xizang are optimistic about the development prospects under the 15th Five-Year Plan.

The fourth session of the 12th People's Congress of the Xizang autonomous region, which was held in late January and early February, approved the region's 15th Five-Year Plan, laying a legal foundation for its implementation.

The outline for Xizang's Five-Year Plan was released to the public during a news conference held on May 29 in Lhasa. At the conference, Xizang's senior officials introduced and interpreted this plan.

Gama Cedain, chairman of the Xizang autonomous region, said Xizang will focus on high-quality development, forging a modern industrial system based on its unique advantages in resources, location and environment.

He said that in the next five years, Xizang will continue to boost the development of the farming and husbandry industries with plateau characteristics, helping farmers and herders increase revenues by producing more healthy and green products. With a focus on the integration of culture and tourism, the tourism sector will remain a major source for residents to increase incomes.

According to the official, the digital economy, the low-altitude aviation industry and the new energy sector will continue to be highlighted in Xizang's Five-Year Plan.

As part of this, traditional industries will be upgraded via intelligent, digital and internet-connected technologies, realizing the deep integration of industrial innovation and technological advancements.

To boost green and low-carbon development, Xizang will make better use of its rich hydropower, wind and solar resources for the production of alternative and green energy, according to Gama Cedain.

In the next five years, Xizang is expected to see the operation of new power generation plants with an installed capacity of 60 million kilowatts in total. In addition, plants with a total installed capacity of 120 million kilowatts are to be built during the period. Among these, power facilities using clean energy resources will take a dominant share.

Expectations

The official noted that the autonomous region will continue to make efforts to meet residents' expectations for a better quality of life.

The development of the oxygen production and supply industries is to be boosted as it is crucial for public health. Gama Cedain said the coverage of portable oxygen supply equipment will be steadily expanded in the next five years, from hospitals, schools, hotels and scenic spots to communities and households. He added that oxygen supplies can be made more affordable as a more than 50 percent reduction in costs is expected in the time frame.

At the news conference, Dampa, executive vice-chairman of the Xizang autonomous region government, introduced environmental protection initiatives during the 15th Five-Year Plan.

In the next five years, Xizang will continue to prioritize protection of the ecological environment, building the autonomous region into a national ecological civilization highland.

"At present, Xizang is home to 246 rare animal species and 169 rare plant species on the national list of key protection, showing impressive achievements in the protection of its plateau ecological system and in the construction of a national highland for ecological civilization," Dampa said.

According to the autonomous region's strategy and action plan for protecting biodiversity for 2026-30, Xizang has outlined 28 actions for the systematic protection of the local ecosystem, Dampa said.

He added that, based on this action plan, Xizang will launch a series of initiatives for the development and expansion of nature reserves and national parks on the plateau in the next few years.

Quake jolts Colombia, neighbors

Patients are evacuated from a hospital in Cali, Colombia, as a magnitude 7.4 earthquake rocked the South American nation and its neighbors on Monday, killing at least 111 people in Colombia. The epicenter was identified in San Jose del Palmar, about 400 kilometers west of Colombia's capital, Bogota. Local authorities said the temblor struck at a depth of 103 kilometers. XI'S VISION | HIGH-QUALITY DEVELOPMENT

IPO puts future industries in focus

Wave of listings by hard tech firms highlights transformation in sources of economic growth

By CHENG YU
chengyu@chinadaily.com.cn

Chinese humanoid robot maker Unitree Robotics opened subscriptions for its initial public offering on the Shanghai Stock Exchange's sci-tech innovation board, or STAR Market, on Monday, as the market witnessed a broader economic shift with future industries expected to power the country's next wave of economic growth.

President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee, said in an article published in June in the Qiushi Journal, a flagship magazine of the CPC Central Committee, that cultivating and developing future industries are of great significance for seizing the development initiative, developing new quality productive forces and improving people's quality of life.

Efforts should be made to vigorously foster first-class scientific, technological and high-tech enterprises that excel in core technologies and possess strong innovation capacities, Xi said.

For decades, China's economic expansion was powered largely by traditional industries, infrastructure investment and manufacturing scale. But the next wave of growth is increasingly expected to come from future industries, including embodied intelligence, future energy, quantum technology, brain-computer interfaces and 6G, which have been highlighted as key areas in China's 15th Five-Year Plan (2026-30).

Since leading semiconductor firm ChangXin Memory Technologies debuted on the STAR Market in late July, a number of companies including artificial intelligence chip developer Enflame Technology, semiconductor manufacturer CanSemi Technology, commercial rocket maker LandSpace and AI chip company Kunlunxin have been moving toward potential listings.

Behind the wave of listings is not just a reshuffle of capital market preferences, but a transformation in the sources of future economic growth.

Hu Yongjun, secretary-general of future industries and platform economy research center under the State Information Center, said: "Developing future industries is a key move in driving industrial transformation and upgrade. Technologies that appear to be in an exploratory stage today could become engines of economic growth over the next decade or more."

He said that future industries will boost China's economic growth through new trillion-yuan-level industries that will come about as emerging technologies transform into commercial applications, and traditional industries are upgraded by integrating technologies such as AI, digitalization and low-carbon solutions.

"Future industries are not simply about developing several new products. They could accelerate upgrades across an entire industrial chain, from core components to end-user applications," he said.

A humanoid robot illustrates this ecosystem effect. Behind a single robot are dozens of interconnected sectors, including AI models, chips, sensors, precision reducers, motors, batteries, new materials, industrial software and intelligent manufacturing equipment.

China's electric vehicle industry offers a similar example. Over the past decade, the rise of new energy vehicles has reshaped the global auto industry while driving rapid growth in power batteries, energy storage materials, intelligent driving technologies and automotive chips.

In addition, the Unitree IPO and other upcoming listings represent a broader reallocation of capital toward technologies that may require years of investment before generating commercial returns.

President Xi also stressed efforts to improve fiscal and taxation policies, develop technology finance, and optimize government procurement and talent cultivation, introduction and utilization to foster a robust environment that encourages innovation.

Tian Xuan, dean of Peking University's Guanghua School of Management, said: "China is transiting from factor-driven growth toward innovation-driven development. Capital is moving beyond its traditional role of financing capacity expansion in mature industries and increasingly taking on the earlier-stage, longer-term uncertainty involved in building future industries."

As of June 2026, the STAR Market had attracted 609 hard technology companies, with total funds raised through IPOs and refinancing exceeding 1.37 trillion yuan ($203 billion). More than 40 listed companies have also entered cutting-edge fields such as quantum technology, 6G and biomanufacturing.

The China Securities Regulatory Commission has also introduced a regular "green channel" mechanism for IPO financing and mergers and acquisitions involving technology companies in strategically important core technology areas.

For instance, Unitree Robotics moved rapidly through the listing process, taking less than four months to go from the application acceptance stage to approval, marking the fastest review under the STAR Market's preliminary review mechanism since its implementation.

Shenzhen deepens links with APEC economies

By ZHOU MO in Shenzhen, Guangdong
sally@chinadailyhk.com

With around 100 days to go before the 33rd APEC Economic Leaders' Meeting, the economic links between Shenzhen in South China's Guangdong province and members of the Asia-Pacific Economic Cooperation are strengthening across multiple dimensions, spanning maritime logistics, business expansion and international consumption.

The APEC meeting will be held in Shenzhen on Nov 18 and 19, marking the third time that China hosts the event.

At Yantian International Container Terminals, stronger connections with Asia-Pacific markets are visible through the expansion of shipping services and trade flows.

"Yantian International operates an international shipping network with 100 weekly services, including 53 services connecting APEC members," said Pang Ning, general manager of carrier and intermodal transportation services in the commercial department of YICT.

"This year, we have launched 11 new international routes connecting APEC economies, including services linking Jakarta and Surabaya in Indonesia and Laem Chabang in Thailand, providing efficient and stable logistics services for Chinese manufacturers expanding into Asia-Pacific and global markets," Pang said.

In the first five months of this year, the value of imports and exports between enterprises on the Chinese mainland and in APEC economies through the Yantian Port reached nearly 400 billion yuan ($59 billion), accounting for about half of the port's total foreign trade value during the period.

The port has also strengthened support for emerging trade models. It currently operates more than 10 cross-border e-commerce express sea routes, providing logistics support for exporters of smart home appliances, 3D printers and portable consumer electronics.

Furthermore, Shenzhen is strengthening support for Chinese companies seeking to tap overseas markets. The Shenzhen International Business e-Station, the city's overseas business service platform, is supporting the "going global" drive of Chinese enterprises by integrating government resources and market services.

The platform has gathered more than 200 professional service providers and covers 70 categories of overseas business services.

"Taking advantage of the APEC meetings, we will further strengthen cooperation with APEC economies, including their governments and business groups," said Liu Yang, manager of Shenzhen International Business e-Station.

Liu said the platform aims to promote investment and business exchanges in both directions, attracting companies from APEC economies to Shenzhen while supporting Shenzhen enterprises in exploring overseas markets.

This year, the platform has organized promotion activities related to economies including Vietnam, Thailand and Malaysia, helping local companies learn about overseas opportunities, he added.

Beyond trade and business expansion, new growth momentum is also seen in international consumption between Shenzhen and other APEC economies.

Opened in August 2025, Shenzhen's first downtown duty-free shop has developed a retail model combining duty-free shopping, tax refund services and duty-paid retail, aiming to improve services for overseas visitors. Through measures including the "one order, one package, one code" system, the tax refund process for eligible customers has been shortened to just about five minutes.

Yao Xi contributed to this story.

How GDI can support ASEAN's next phase of growth

WORLD WATCH
By Joanne Lin

Southeast Asia is entering a more complex phase of development. For years, the region's development was often associated with faster growth, more trade and new infrastructure. While these remain important, today's development blueprint for the Association of Southeast Asian Nations also includes building stronger institutions, narrowing development gaps, improving resilience and ensuring that the fruits of regional integration are shared among its people and communities more evenly.

Against this backdrop, China's Global Development Initiative has clear relevance for Southeast Asia. The GDI's priorities — poverty reduction, food security, public health, development financing, climate action, industrialization, connectivity and the digital economy — overlap with many of the region's needs. China offers not just financial might but also infrastructure capabilities, technological strengths and development experience.

However, the true value of the GDI in Southeast Asia will depend not only on what China can finance or build, but also on how well China's capabilities align with ASEAN's priorities. Its most impactful contribution may not be creating a separate development path, but helping ASEAN implement its existing commitments and integration plans.

ASEAN's challenges are deeply interconnected. The region faces climate pressures, technological disruption, supply chain vulnerabilities, persistent development disparities and uneven implementation capabilities. These issues cannot be addressed through isolated projects. They demand stronger regional systems, better cross-border connectivity and institutions that can translate agreements into tangible action.

The State of Southeast Asia 2026 Survey shows that China remains Southeast Asia's most influential economic, political and strategic partner. It is widely recognized as an important and capable partner, a country that has the economic resources and political will to deliver outcomes.

GINKGO TREE BECOMES A 1,900-YEAR-OLD STAR

People flock to Sichuan's Mount Qingcheng to see Taoist landmark featured in animation

By XU FAN and **PENG CHAO** in Chengdu

It is a ginkgo tree that has outlasted dynasties. For around 1,900 years, it has stood quietly, bearing witness as the world came and went.

Legend has it that Zhang Ling, founder of Tianshidao (Way of the Celestial Masters) — an early school of Taoism — planted the tree during the Eastern Han Dynasty (25-220).

Reaching it takes more than 40 minutes of climbing from the entrance to Tianshi Cave on Mount Qingcheng in Southwest China's Sichuan province.

When visitors arrive, they find the tree is already festooned with red silk ribbons bearing the heartfelt wishes of those who came before.

That sight — a striking blend of reverence for the supernatural and hope for a better life — stayed with Mu Zhengyang, director of *All Wishes Come True!*.

MIND THE MIDLIFE CAREER GAP

By **YU RAN**
For China Daily

At 39, Fang Hongxia found herself starting over, not by choice, but with reluctant acceptance.

For nearly 11 years, she had worked at a private company in Kunming, Yunnan province, starting in warehouse inventory and gradually taking on roles in client management, bidding documentation, e-commerce operations and internal coordination.

Her layoff came without warning before the National Day holiday in 2025.

"I thought it was just another routine conversation, but this time I was the topic. At first, I felt embarrassed, like I had lost face, but at the same time I also felt relieved. I had already been thinking about making a change, so it felt like something was pushing me forward," she said.

Months earlier, Fang had begun learning English and exploring new directions. After a short pause, she began looking for work, unsure of what she wanted.

"I was trying different things and figuring it out along the way. Instead of waiting for a full-time role, I took whatever work I could find, part-time shifts, hourly jobs, and even running a small street stall when necessary. I never really stopped working," she said.

Age, she found, could close doors before conversations even began. "At first, everything seemed normal until I mentioned my age. Then there would be no reply. In some cases, I was directly told that positions were limited to those under 30. Eventually, I learned to ask up front," she said.

Still, she did not see herself as "no longer needed".

"My child still depends on me, so I never had that feeling. Of course, there were moments when I felt overwhelmed, even briefly considering giving up, but it passed quickly. I told myself that if I couldn't find a job, I would create one," she said.

After seven months, Fang found a support role at a flower e-commerce company, earning just over 4,000 yuan ($593) a month. The role is more modest, but her mindset has shifted.

"I feel calmer now. I've seen many women carrying different kinds of pressure but still choosing to keep going," said Fang.

Juggling responsibilities

Fang's experience is not isolated.

More Chinese women in their late 30s and 40s are finding themselves navigating layoffs, stalled careers and competing family responsibilities.

Recruitment platform Zhaopin's 2025 China Women's Workplace Report shows that more than half of women are considering changing career paths, while only 7.9 percent express confidence in promotion, reflecting growing uncertainty around career stability and long-term development.

Many women face the dual pressures of work and family.

On the day she turned 40, Zhang Lele received a long-awaited job offer, ending a seven-month stretch of unemployment, repeated setbacks and a serious illness in her family.

For more than a decade, Zhang had worked at a small domestic consulting firm in Shanghai. The job was stable, with a manageable pace and a reasonable work-life balance. However, at age 39 she was unexpectedly laid off.

"My mind went blank, and my face felt hot. My first thought wasn't about finding a new job, but how I would explain this to my family," she said.

In the days that followed, she chose not to tell her family the entire truth, offering a more acceptable explanation while beginning her job search.

During the seven-month gap, Zhang split her time between job hunting and caring for her family, attending interviews while traveling between home and the hospital.

Zhang had around 30 interviews with 21 companies. In one month alone, she completed 11 interviews, with as many as six in a single week.

A recruiter later told her that such setbacks were increasingly common in a more demanding job market, helping her gradually reframe the experience. During the gap in her working life, she also stayed engaged by preparing for interviews and sharing her experiences online.

While she did not encounter direct discrimination based on age or gender, questions about her employment gap were common. She also received encouragement from interviewers and recruiters, some close to her age and confident in her experience. She chose to respond honestly, explaining how she had been preparing and managing family responsibilities.

For Zhang, the timing came as a relief. She had hoped to secure a job before her birthday, aware that a longer gap could limit her opportunities.

What sustained her, she said, was support from online communities and her 10-year-old daughter, who would draw pictures and write encouraging messages to cheer her up.

"I see myself as someone going through a career transition, not as a laid-off middle-aged person. It's important how you tell your own story. Finding a job is not difficult, but finding the right one is much harder. But I still believe there are opportunities for women like me," she said.

According to McKinsey & Company's 2023 Advancing Gender Equality in the Chinese Workplace report, 61 percent of women were asked about marital or childbearing plans during recruitment, compared with only about one-third of men.

These challenges are often further shaped by personal life choices.

Personal matters

Lin Yue, from Hangzhou, Zhejiang province, built her career in advertising over more than a decade and now finds herself in an in-between phase, with personal plans intersecting with unclear career prospects.

In 2008, she started working for several companies and later became an advertising design director at a foreign enterprise.

That sense of stability began to unravel in 2024. After getting married, Lin found herself at a turning point when her company's business slowed and people were laid off. Facing both career uncertainty and personal decisions, she left her job in early 2025 to focus on having a child.

"I thought I could take a break and come back when things were clearer, but things didn't go the way I expected," said Lin.

> "Many people feel stuck between not wanting to give up stability and not knowing how to move forward. They understand many things in theory, but don't know how to apply them in real life. ... Midlife is a crisis, but also a new opportunity. Having shed the recklessness of youth, I now have the confidence to start again."
>
> **Xu Mei,** founder of a women-focused community

Over the past year, things have not gone to plan. While trying to conceive, she has taken on freelance design work, but the income has been unstable.

"It's not that there's no work at all, but it's hard to maintain consistency. Most projects are short-term, and you don't know when the next one will come," she said.

At the same time, she has attempted to explore alternative paths. She enrolled in baking courses, with a possibility it could become a new career.

Yet, the reality proved more complicated than she expected. Building a business from scratch, she found, requires more than skills, as it takes time, capital and persistence.

"It's not as simple as learning a skill and turning it into a job. There's a long process behind it," said Lin.

She is also aware that the longer she stays away from a full-time role, the harder it may be to return, especially as she continues trying to start a family.

"There's always a concern in the back of my mind. If I step away for too long, will there still be a place for me to go back to?" she said.

For now, she is trying to maintain a connection to her profession while leaving space for personal plans, even if that means accepting less stability.

"I wouldn't say I'm lost, but I'm still in a phase where I need to keep myself from drifting too far away," said Lin.

According to Zhaopin's 2026 China Women's Workplace Report, 12.6 percent of women missed promotion opportunities due to gender discrimination, while 68.8 percent attributed workplace inequality to the burden of childbirth. Notably, more than half said they are unwilling to give up their careers for family.

Staying flexible

Behind these individual experiences lies a set of structural realities shaping the job market.

Fang Zhou, 35, from Xi'an, Shaanxi province, a former business leader at a major internet company, now works as a career coach, focusing on job seekers navigating transitions. Since 2023, she has worked with more than 200 clients, many of whom are in their 30s and 40s.

"Most of the people who come to me are over 30. Many of them start to lose confidence after just a few weeks without work by questioning themselves, even though their past performance and achievements are often solid," said Fang, who in her early 30s realized her corporate path was reaching its limits. She then began working with mid-career clients.

Fang said the reality for job seekers around 40 is difficult, but not without opportunities. Employers prioritize cost-effectiveness and role fit, often favoring younger candidates who are easier to manage and less expensive. For mid-career professionals, especially those in middle management, structural constraints also limit options.

"In many companies, there are fewer middle management positions. If you can't move up, you may have to return to front-line roles. The question is whether people are willing and able to do that, especially after being away from hands-on work for some time," she said.

For women, these challenges are further complicated by family responsibilities and assumptions related to marriage and childcare.

"It's not just about ability. You also have to prove that you can overcome these concerns and create value beyond them," said Fang.

Changes in hiring practices have made job searching more demanding, she has noticed. Resumes are often screened through keyword systems, and candidates must clearly communicate their achievements in interviews.

"Job searching has its own language. If you don't understand what employers are looking for, it's easy to be filtered out early," she said.

Employment gaps are not necessarily disqualifying, but candidates need to show their skills have remained relevant or improved.

"A career transition is not starting from zero. It's about transferring what you've already built into a new focus. The most practical path is usually to move into something related to your existing experience, where your skills can still be applied," said Fang.

While the process can be difficult, Fang believes it remains possible with the right mindset and preparation.

"It's normal to go through a low point at this stage of life. What matters is not giving up. You need to stay proactive and keep adapting. It's hard, but that's exactly the point. If it were easy, it wouldn't be your turn," said Fang.

While structural constraints remain, some individuals are also attempting to create new spaces beyond traditional employment paths.

The 2025 Flexible Staffing Platform Development Report released by the Chinese Academy of Labour and Social Security and Qingtuanshe, a Chinese flexible staffing platform, said women make up nearly 60 percent of flexible staffing participants, with those age 30 and above slightly above the platform average.

However, the problems middle-aged women face in the workplace are not unique to China. The Harvard Business Review recently surveyed 913 women leaders who work in higher education, faith-based nonprofits, law, and healthcare with open-ended questions designed to uncover the different types of bias they may have experienced in their careers, according to a report by HuffPost.

"There was always an age-based excuse to not take women seriously, to discount their opinions, or to not hire or promote them," researchers wrote.

Creating value

As the founder of a women-focused community, Xu Mei has taken a different path. The 39-year-old former human resources manager now focuses on supporting midlife women navigating similar life and career transitions. Based in Dalian, Liaoning province, she builds both online and offline networks that provide practical support and shared experience during this stage of change.

After stepping away from work for four years to raise her child, she struggled to return to the workforce. Roles that once seemed manageable, long hours, frequent travel and high intensity were no longer compatible with family responsibilities. Within a year, she had changed jobs five times and was later laid off again amid company restructuring.

"I had a mortgage, a child and parents to support. At that moment, I realized I had to start over. I let go of all my labels. There is nothing shameful about starting small," said Xu.

She began sharing her experience online, which resonated with other women. She was then introduced to supply chains and started building small community-based sales groups, gradually forming a stable business model, with two groups reaching around 800 members and annual sales exceeding 1.5 million yuan.

At the same time, she launched offline salons, which evolved into a structured women's community, hosting over 115 sessions and attracting more than 3,000 participants, mostly women age between 35 and 45. The activities ranged from emotional support and social connection to self-media training and income exploration, forming a hybrid space of mutual support and practical learning.

"These women are not lacking ability. They are often trapped by what they already have, including their past roles, responsibilities and expectations," said Xu.

Through her work, Xu has observed that many midlife women face overlapping pressures from family, employment and identity. Highly replaceable roles such as human resources, administration and customer service often leave them vulnerable as they age, while childcare and household responsibilities further limit their options.

"Many people feel stuck between not wanting to give up stability and not knowing how to move forward. They understand many things in theory, but don't know how to apply them in real life," she said.

Rather than offering a single solution, Xu sees her role as building a platform where women can reconnect with themselves and with each other. She encourages them to take up work that relies more on personal skills and less on organizational dependency, while she also emphasizes the value of community support.

"Midlife is a crisis, but also a new opportunity. Having shed the recklessness of youth, I now have the confidence to start again," said Xu.

US pivots to pressuring Iran's economy

Washington shifts from making military threats to claiming Tehran has 'no money'

By **JAN YUMUL** in Hong Kong
jan@chinadailyapac.com

The administration of United States President Donald Trump appears to be shifting Washington's approach with Tehran from military threats to economic pressure, as the contentious reopening of the Strait of Hormuz drags on despite Iran signaling that an agreement with Oman is on the horizon.

Trump told US-based news outlet Axios on Sunday that Washington was "only semi-negotiating" with Tehran and stressed that Iran is in "very bad shape" economically.

"We are just watching Iran with its huge inflation and the fact they have no money," Axios quoted Trump as saying.

He said the US blockade has exacerbated Iran's economic crisis, adding that with oil down to slightly over $75 a barrel, consumers in the US are feeling less pain from the conflict.

"It will work out. It always works out. It's like a chess game," Trump said of the situation with Iran.

Iranian Foreign Minister Abbas Araghchi told journalists on Sunday that Tehran is not currently engaged in negotiations with Washington, but messages were being exchanged through intermediaries.

At his weekly news briefing on Monday, Iranian Foreign Ministry spokesman Esmaeil Baghaei said that monitoring navigation in the Strait of Hormuz was "natural".

Baghaei said discussions on the possibility of Iran imposing transit fees on vessels passing through the strait are still underway, and Iran is not currently discussing the issue.

He said talks have covered mechanisms for monitoring navigation safety, environmental issues and maritime services, noting that their provision would naturally entail service charges.

Regarding mine clearance along the central route of the Strait of Hormuz, Baghaei referred to Clause 5 of the Islamabad Memorandum of Understanding, which he said the US violated, stressing that Iran's role is clearly specified in the agreement.

He said the memorandum of understanding, aimed at ending the conflict, stated Iran's responsibility for the future management of the Strait of Hormuz, including ensuring its security. He added that the matter should be pursued between Iran and Oman.

Inside
Comment, **page 6**

He called on regional countries to cooperate and strengthen their own security without relying on foreign powers, citing the latest developments regarding the Mecca Joint Defense Agreement, according to Iran's Mehr News Agency. The agreement was signed over the weekend by Saudi Arabia, Pakistan and Turkiye.

Baghaei stressed that the pact is a sign of a changing perception among regional states, highlighting that the signatories have realized that security cannot be provided by relying on foreign powers.

He said countries in the region have increasingly recognized the source of the greatest threat to stability and security in the region and beyond, particularly since the start of the Israeli-Palestinian conflict three years ago.

Baghaei blamed the US for the region's insecurity, arguing that Israel could not have carried out its actions without support from Washington. He stressed Iran's view that regional security is indivisible, and insecurity in any country will inevitably spread to others.

Abdolreza Alami, a senior lecturer at the Faculty of Communication and Media Studies at Universiti Teknologi MARA in Malaysia, told China Daily that Trump's shift should be read less as a sign of moderation than as recognition of the limits and costs of military coercion.

"Months of confrontation have shown that strikes can damage Iran, but they cannot compel Tehran, eliminate its retaliatory capacity, or secure the Strait of Hormuz at an acceptable cost," said Alami.

"Iran's ability to impose risks on US bases, Gulf infrastructure and energy flows has altered Washington's calculation. Domestic considerations also matter: Trump faces public fatigue, congressional elections and sensitivity to fuel prices, while regional partners press for de-escalation," he added.

Alami noted that lower oil prices give the Trump administration a tactical window to intensify sanctions without burdening US consumers. However, he said that economic pressure is coercion by another means, and is not a sustainable diplomatic strategy.

Cui Haipei in Dubai, UAE, contributed to this story.

Typhoon weakens, but heavy rain threat persists

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Typhoon Dolphin has weakened to a tropical storm after making two landfalls in eastern China's Zhejiang province, but its moisture-rich circulation is continuing to move northwestward, threatening to unleash potentially extreme rainfall across parts of northern China, meteorologists said on Monday.

Dolphin, the 13th typhoon of the year, made two landfalls in Zhejiang on Sunday evening and weakened as it moved inland. But unlike many tropical cyclones that rapidly dissipate after landfall, its extensive cloud system and abundant moisture have allowed its remnants to persist and move northward and westward, said Zhang Fanghua, chief forecaster at the National Meteorological Center.

"The residual circulation could bring persistent and extreme rainfall to parts of eastern and northern China," Zhang said.

Dolphin's movement is forecast to significantly slow after Tuesday, and around Wednesday its remnants could stall near the border area of Hubei, Henan and Anhui provinces.

The residual vortex is expected to interact with an upper-level trough in the westerlies and a cold-air system, potentially triggering a new round of widespread and heavy rainfall, Zhang added.

The heavy rain will cover much of Shanghai as well as Zhejiang, Jiangsu, Anhui, Hubei, Henan and Shandong provinces through Tuesday.

As the rain belt moves northward on Tuesday and Wednesday, some locations in Henan, Hebei, and Shanxi could receive 400 to 600 millimeters of rain, with the possibility of exceptionally heavy downpours.

Meteorologists warned that the threat will also extend into the Beijing-Tianjin-Hebei region.

Zhai Liang, chief forecaster at the Beijing Meteorological Service, said that warm and humid air from Dolphin's outer circulation, combined with cold air, is expected to bring heavy rain to the region from Tuesday through Thursday.

"Beijing is expected to receive the strongest rainfall from early Wednesday to Wednesday night," Zhai said, adding that red alerts for heavy rain have been issued in districts such as Fangshan, Daxing, Tongzhou and Mentougou.

On Monday, the National Meteorological Center continued to issue an orange alert for heavy rain, the second-highest warning level. Isolated areas in northern Hubei could receive 250 to 270 mm during the 24-hour period between Monday afternoon and Tuesday afternoon.

The Ministry of Emergency Management has activated a Level IV flood-control emergency response in Hebei, Henan, Hubei and Shandong amid rising risks of flooding and geological disasters over the next three days. China has a four-tier emergency response system for flood control, with Level I being the most severe.

Local governments are being urged to closely monitor updated weather forecasts and strengthen preparations for flooding, landslides, mudslides and urban waterlogging, particularly in mountainous areas and along rivers.

The Ministry of Agriculture and Rural Affairs on Monday renewed a warning over the risk of farmland waterlogging. From Monday night through Saturday, parts of Henan could see exceptionally heavy rain, with a very high risk of farmland waterlogging. The prolonged rainfall could leave farmland saturated and affect crop growth.

Farmers are advised to clear drainage channels, as well as prepare pumps and other equipment and supplies in advance. After the rain, farmers should promptly drain excess water, improve soil aeration and moisture conditions, and use pesticides and fertilizers to help crops recover and resume their growth.

After Thursday, the rainfall pattern is expected to shift as the residual vortex gradually moves eastward and southward, forecasters said. If the residual vortex redevelops around Aug 16, it could bring another round of heavy rainfall to northeastern China, they added.

Cooperation: Boosting supply-chain resilience priority

From page 1

Southeast Asian countries are likely to judge the GDI on its ability to address real development needs, produce visible benefits and complement existing ASEAN frameworks.

The survey also highlights ASEAN's internal constraints. Respondents identified stronger intra-regional trade and investment, more resilient supply chains and accelerated regional integration as important priorities. More significantly, they saw weak implementation capacity and development disparities among ASEAN member states as the biggest impediments to greater intra-regional economic cooperation.

This suggests that ASEAN's integration challenges are not external but lie within its ability to implement its commitments and ensure that the benefits of regional integration are more widely shared. This is where the GDI can make a practical contribution by bridging the gap between regional ambition and national implementation.

Recent insights from Singapore-based ISEAS-Yusof Ishak Institute researchers on Chinese-built transport projects in Cambodia, Indonesia, Laos and Vietnam offer a grassroots perspective. Many users associate these projects with reduced travel times, greater convenience and improved access to jobs or business opportunities.

Development cooperation builds confidence most effectively when its benefits are directly experienced by people.

At the same time, infrastructure alone is not enough. Its wider impact may be limited when feeder networks are weak, customs procedures are inefficient or local firms cannot access new opportunities. Ensuring sound fiscal management, high environmental standards, affordability and strong social safeguards will support the long-term success of the projects.

The priority, therefore, is to ensure that the GDI supports the systems that underpin ASEAN integration. This includes strengthening implementation capacity so that officials, regulators and agencies can translate regional agreements into action. China could support long-term technical cooperation in customs modernization, digital trade regulation, standards, environmental regulation and cross-border data governance. There should be more emphasis on institutional partnerships and joint problem-solving initiatives.

Development cooperation should also connect physical and soft infrastructure. Roads, railways and ports need to be supported by customs systems, logistics networks, digital documentation, compatible standards and local transport links.

The GDI can add value by linking physical projects with the necessary regulatory, digital and institutional systems to create integrated economic corridors.

Supply-chain resilience is another priority, intertwined with digital and green development. China-ASEAN cooperation can help local industries upgrade, develop skills and enable more small businesses to participate in regional production networks. This cooperation should also support digital infrastructure, clean energy, electric mobility and climate-resilient production that future supply chains will require. China's strengths in artificial intelligence, renewable energy, batteries and green manufacturing also have potential for cooperation.

The cooperation should also extend to people and communities. Infrastructure and trade matter, but development cooperation will also need to invest in technical and vocational education, digital skills, research partnerships, youth exchanges, local employment, knowledge transfer and community consultation.

These efforts would allow the GDI to move beyond individual projects and support stronger regional integration. By aligning more closely with ASEAN-led initiatives, it can help advance a more resilient and inclusive Southeast Asia, while making China's development cooperation more visible, trusted and meaningful.

Vol. 38 — No.1890

Set-jetting: Taoist myth endures on the peak

From page 1

It would later inspire a defining scene in his hit animated film, where the protagonists gather around a stone table for a hot pot feast beneath a ginkgo tree patterned after the ancient one at Mount Qingcheng.

Scheduled for release in more than 15 countries and regions, the film — in which eight ordinary people become unlikely heroes as they foil a villain's plot to endanger humanity — has already raked in 1.4 billion yuan ($195 million), making it the highest-grossing Chinese animated film of the year so far.

The film's popularity has, in turn, prompted viewers to seek out the real-life inspiration for the scene.

"After its release, many fans made special trips to Mount Qingcheng. There has been a notable increase in visitors coming to take photos with the tree," said He Zhen, deputy director of the scenic spot's administrative center.

According to He's office, the scenic spot received 30,800 foreign visitors between July 1 and Aug 6, up 25.2 percent year-on-year. To enhance accessibility for international tourists, it now offers audio guides in multiple languages.

But Mount Qingcheng's appeal extends far beyond a single film — or even a single tree.

There is a mythic dimension involved as well. Ancient folklore holds that the peak was once a place where Xiwangmu, also known as Queen Mother of the West, cultivated herself spiritually.

In Taoist legend, she presided over female immortals. Perhaps that explains why, even amid crowds and selfie sticks, an otherworldly aura still lingers.

The ginkgo tree itself carries further Taoist significance. It is revered by some Taoist practitioners as an "immortal tree".

One legend holds that Laozi (Lao Tzu), the founder of Taoism, planted a ginkgo at Louguantai, a Taoist temple complex in Shaanxi province. The shape of its leaf — split at the edge but united at the stem — is seen as a Taoist symbol of "harmony", said Wang Guoping, a scholar of Sichuan culture.

Today, ancient culture is intersecting with a thoroughly modern phenomenon: set-jetting.

Zeng Min, director of the Dujiangyan's Bureau of Culture, Radio, Television, Sports and Tourism, said the trend is reshaping the way people travel, turning passive sightseeing into deep cultural immersion.

And *All Wishes Come True!* is not the first production to cast Mount Qingcheng in the spotlight.

Three iconic sequences from the 1986 TV series *Journey to the West*, including an episode in which Sun Wukong, or the Monkey King, masters his supernatural arts, were filmed on the mountain. The sites continue to draw die-hard fans who return year after year to recreate shots.

The 2016 Hollywood blockbuster *Kung Fu Panda 3* also drew heavily on the mountain's natural scenery and the architectural style of its Taoist temples, Zeng noted.

Ying Xujun, president of Pearl Studio and chief producer of *All Wishes Come True!*, said the film also drew inspiration from the murals of Yongle Palace, the ethereal seascapes of Penglai Pavilion and the cliffside wonders of Xuankong Temple.

"The film is not only a cinematic presentation of Chinese culture, but also a vivid invitation to explore China's cultural and tourism riches," Ying said.

Climate change poses flood threat in Pakistan

Hindu Kush communities live in fear of glaciers melting at alarming rate

In the picturesque valley of Golen, located over 20 kilometers northeast of Chitral city in Pakistan, summer once unfolded in all its resplendence. Visitors would flock to Golen during the warmer months to enjoy its cool mountain air, try their hand at trout fishing, and marvel at its lush green meadows.

Yet, in recent years, that once-bountiful summer has become a source of anxiety for Golen natives.

The cause lies in the glaciers, those primordial agglomerations of ice that had stood sentinel over the valley for centuries, which are now melting at an alarming rate and forming large, unstable lakes in their wake.

On the evening of July 7, 2019, one such glacial lake burst its banks and ravaged the valley, destroying homes and orchards, damaging the 108MW Golen Gol Hydropower Project, plunging the district into darkness for several days. The very next year, Golen experienced another glacial lake outburst flood, or GLOF.

With over 80 potentially dangerous glacial lakes dotting the region, communities in the Hindu Kush mountain ranges live in fear of advancing, unfrozen glaciers.

In July this year, as rain fell over the valley, the villagers endured a sleepless night. Safia Bibi, a resident of Golen, told Dawn newspaper that terror gripped them when the rain began. "Initially we were terrified," she recounted, "but later, when the men told us it was too cold and that we should not fear a flood from these clouds, only then did our frayed nerves calm."

Safia remembers all too well what happened in 2020, when she had to make a dash for safety, clutching her one-year-old daughter in the pouring rain as a GLOF carrying huge boulders and debris descended on her village.

A portion of her under-construction home was badly damaged, and a few months later, her husband purchased land in a neighboring village to relocate, due to constant threat of GLOFs in their native area.

But Golen is not unique, and other remote valleys across the Hindu Kush are grappling with the same dilemma.

Their communities, long ensconced in geographical remoteness, lived in harmony with nature for centuries. Now, extreme weather has thrust them onto the front lines of an unfolding climate catastrophe.

Figures released by the Pakistan Space and Upper Atmosphere Research Commission, or Suparco, on its "Space4Climate" portal paint a worrying picture for millions living across the Hindu Kush.

The agency's June 5 update recorded 24 unfrozen glacial lakes in northern Pakistan, with 15 in Khyber Pakhtunkhwa — 10 of them in Upper and Lower Chitral, three in Swat, and one in Lower Dir.

By July 2, that number had nearly doubled to 40, with Suparco noting that most lakes were concentrated in Chitral, Upper Dir and Swat.

The agency said it is regularly monitoring potentially dangerous glacial lakes via satellite imagery to support early warning and preparedness for GLOF hazards, drawing on a combined list of 131 potentially dangerous locations supplied by the Provincial Disaster Management Authorities, or PDMA.

"As expected, with rising summer temperatures, the number of unfrozen glacial lakes is increasing ... indicating accelerated seasonal melting," Suparco said, adding that most unfrozen lakes remain within their previously recorded maximum extents.

A lake becomes a greater concern, it noted, when its water extent exceeds historical highs, since this can signal increased storage and higher risk of moraine dam instability. Moraine dams are natural geological formations created by glacial deposition.

The agency urged authorities to maintain heightened preparedness in downstream valleys given the continuing temperature rise.

> "As expected with rising summer temperatures, the number of unfrozen glacial lakes is increasing. At present, 40 lakes are observed to be unfrozen, compared with 24 lakes reported two weeks earlier, indicating accelerated seasonal melting."
>
> **Space and Upper Atmosphere Research Commission**

Separately, data from Khyber Pakhtunkhwa PDMA showed 63 GLOF-vulnerable lakes and 21 potentially dangerous ones: nine vulnerable sites in Chitral, 18 in Upper Dir, 31 in Swat, and five in Upper Kohistan. All 21 potentially dangerous lakes are confined to Upper and Lower Chitral.

Unusually vulnerable

Chitral-based glacier researcher Hamid Ahmed Mir, who has visited many of these sites, told Dawn that the region's glaciers are unusually vulnerable because of their small size.

With the exception of Tirich-Concordia and Chiantar — the latter feeding the Kabul River — nearly all Hindu Kush glaciers are small, making them highly sensitive to temperature spikes.

These "water towers" are likely to assume even greater importance over the coming years as the water war between India and Pakistan intensifies.

He also pointed to steep slope gradients and high seismic activity, noting five to six fault lines run beneath Chitral alone, alongside a high frequency of minor earthquakes.

Much of the region's development has been unplanned, often ignoring its fragile ecosystem and lacking proper risk assessments or environmental impact studies.

For example, he cited the use of explosives to dig the 3-kilometer headrace tunnel for the Golen Gol Hydropower Project, inaugurated in 2018 — two years before a major GLOF struck the valley.

Mir also pointed to Chitral's status as an airshed valley, where surrounding high mountains trap air, dust and pollutants. His recent research on dust generation from traffic on the largely unpaved, poorly maintained, and decade-long-under-construction Chitral-Mastuj Road found that the 110-km stretch could be producing approximately 40,000 metric tons of airborne or fugitive dust every year, including nearly 9,600 tons of respirable PM10 particulate matter.

"The Chitral-Mastuj Road is a vital transportation corridor that supports communities, trade, and tourism. However, its predominantly unpaved surface also represents a significant source of fugitive dust," the research paper noted, adding that preliminary engineering estimates suggest around 28,000 tons of that dust settles within the surrounding valley annually.

The paper warned the implications extend far beyond roadside nuisance, as dust affects human health, agriculture, alpine ecosystems, water resources, and glacier stability — potentially amplifying the impacts of climate change in one of Pakistan's most environmentally sensitive mountain regions.

It recommended improved road surfacing, dust suppression, vegetation restoration, and systematic environmental monitoring to protect both local air quality and long-term water security in Chitral and further downstream.

Khyber Pakhtunkhwa PDMA Director-General Arifullah Awan told Dawn the provincial government was pursuing both mitigation and adaptation strategies to secure the region against climate threats.

At least 85 early warning systems, rain gauges and other sensors have been installed across Lower and Upper Chitral, Upper Dir, Swat and Upper Kohistan with support from the United Nations Development Programme.

In addition, community-based disaster risk management committees — including union council secretaries and local members — have been formed, with alert times ranging from 20 to 35 minutes. To protect the early warning systems from vandalism, district- and tehsil-level committees have also been set up, with complaints lodged in the past over damage to the equipment.

The government is also pursuing afforestation, environment-friendly infrastructure, and climate-resilient construction as part of its broader mitigation and adaptation strategy, Awan said.

Over a quarter of Bangladeshis face food insecurity: UN

DHAKA — More than a quarter of Bangladeshis did not have sufficient food in 2023-25, according to a UN report.

The State of Food Security and Nutrition in the World 2026 report estimated that 26.2 percent of Bangladesh's population, or 45.4 million people, experienced moderate or severe food insecurity in 2023-25.

The report indicates Bangladesh has made progress in reducing hunger, but food insecurity and the high cost of a healthy diet continue to pose major challenges, leaving millions vulnerable to malnutrition.

The global report was jointly released on July 21 by the Food and Agriculture Organization, the International Fund for Agricultural Development, the United Nations Children's Fund, the UN World Food Programme and the World Health Organization.

The proportion of people facing such food insecurity has declined from 30.6 percent in 2014-16, but the latest figure indicates that the problem remains widespread, with millions still struggling to secure adequate and regular access to food.

45.4 million people

The State of Food Security and Nutrition in the World 2026 report estimated that 26.2 percent of Bangladesh's population, or 45.4 million people, experienced moderate or severe food insecurity in 2023-25.

The report estimated that 8.2 percent of the population, or 14.3 million people, were undernourished in 2023-25, down from 15.1 percent, or 21.9 million people, in 2004-06.

However, having access to enough food does not necessarily mean having access to a nutritious diet.

Nearly four in 10 Bangladeshis, 38.6 percent of the population, were unable to afford a healthy diet in 2025, the report said.

Although the proportion has fallen from 62.8 percent in 2017, the number of people unable to afford a healthy diet still stood at 67.8 million in 2025. It was 101.8 million in 2017.

The cost of a healthy diet in Bangladesh also increased steadily, reaching $4.59 per person per day in purchasing power parity terms in 2025, compared with $3.09 in 2017.

Malnutrition

The continuing difficulty in affording nutritious food is reflected in the country's persistent level of malnutrition, particularly among children and women.

Among children under five, 10.7 percent or 1.7 million suffered from wasting in 2024, while 25.1 percent or 4.2 million were stunted. Percentage of stunted children was 38.3 in 2012. There was no earlier data about wasting.

At the same time, 5.8 percent, or 0.3 million, were overweight, highlighting the coexistence of undernutrition and overnutrition. Although the percentage saw little decline, the population remained the same compared to 2012 data.

The nutritional quality of diet among young children also remains a concern.

Only 37.6 percent of children aged 6 to 23 months achieved minimum dietary diversity during 2021-25, meaning most children in this age group did not consume food from a sufficiently diverse range of food groups.

The report also shows a decline in exclusive breastfeeding in Bangladesh.

It estimates that 53.3 percent of infants aged 0 to 5 months in the country were exclusively breastfed in 2024. The rate, however, has declined from 64.1 percent in 2012.

Women also face a significant nutritional burden. Anemia affected 37.6 percent of women aged 15 to 49 in 2023, according to the report, indicating that the situation has deteriorated. It was 34.5 percent in 2012.

New Arctic route could cut shipping time in half

By EARLE GALE in London
earle@mail.chinadailyuk.com

A new shipping route between the Chinese port of Ningbo-Zhoushan and Felixstowe in the United Kingdom launches this week, with claims it could cut the 40-day journey in half.

The weekly route between the export hub in Ningbo — the world's busiest port by cargo tonnage — and Felixstowe, which is the UK's largest container port, will be operated by the Chinese container shipping company Sea Legend, with ships passing through the Arctic via a course known as the Northern Sea Route along Russia's northern coast.

Sea Legend, which is known for connecting China with markets in Turkiye and North Africa, described the route as the "Ice Silk Road", in a nod to the trading route that famously connected China with Europe in antiquity.

The Northern Sea Route saw 15 such voyages in 2024 and 23 last year and is being seen as an increasingly viable option because of rising global seawater temperatures and reduced ice volumes, The Financial Times newspaper reported.

University of Southampton researchers said recently they recorded the largest drop in Arctic sea ice volumes on record during the peak winter period between 2024 and 2025, with the levels down by 5.8 percent.

Rahul Khanna, global head of marine risk consulting at insurance provider Allianz, told the paper: "There's been a definite increase in traffic through the Arctic and Northern Sea Route. Vessels and ship owners now see it as more of an opportunity, first to save a lot of time and costs," but also to get around some geopolitical choke points and conflict zones.

Those choke points include the Bab al-Mandab Strait that feeds into the Red Sea, where Houthi militants have disrupted shipping, and the Strait of Hormuz that connects the Persian Gulf with the Gulf of Oman, where military activity has also interrupted shipping.

The Northern Sea Route is administered by the Russian state-owned company Rosatom, which issues permits to companies wanting to use it.

The Ningbo-Felixstowe service is not the first container voyage via the Northern Sea Route, following a 2018 trial voyage by Danish shipping giant Maersk between Vladivostok in Russia's Far East and St. Petersburg.

But while the new route promises major savings in time, costs and fuel, it also adds to the challenges facing the Arctic.

Steven Guilbeault, a former environment minister in Canada's government, told The Financial Times it must be carefully managed if environmental damage is to be avoided.

"The impact of global warming in the Arctic is quite staggering," he told the paper. "Climate change will enhance security risks in the Arctic, particularly if there are more and more vessels in the Arctic."

Busan rides surging Chinese tourism wave

Mainland visitors fuel local growth as arrivals rise well above national rate

By YANG HAN
in Busan, South Korea
kelly@chinadailyapac.com

The number of Chinese visitors to Busan, South Korea's second-largest city, has been increasing rapidly as more travelers look for cultural immersion experiences.

Officials and industry experts said this has contributed to the growth of the local tourism sector.

"China is one of Busan's most important tourism markets, and the steady increase in Chinese visitors has played a key role in driving the unprecedented growth in international arrivals to the city," said Amy Lee, a marketing manager at the Busan Tourism Organization.

In the first half of this year, more than 2.42 million foreign travelers visited Busan, with nearly 20 percent coming from the Chinese mainland, according to municipal data released in July.

Arrivals from the Chinese mainland surged 90.7 percent year-on-year, making it one of the highest growth rates among all major source markets.

The increase is also significantly higher than the 27.1 percent rise in the number of Chinese tourists recorded nationwide during the same period.

Lee told China Daily that the rise in Chinese visitors to Busan can be attributed to several factors, including the expansion of cruise arrivals, the growing trend toward free, independent travel, and Busan's strong competitiveness in experiential tourism.

She said the expansion of direct flights and cruise ships between Busan and major Chinese cities has strengthened people-to-people exchanges between the two countries while generating significant local economic benefits.

Although Busan may not be as well-known as the capital Seoul or Jeju Island, its well-established tourism infrastructure and natural resources have made it easy for independent Chinese travelers to explore, said Choi Boo-rim, vice-president of the Busan Tourism Association.

"Chinese tourists seem to be very interested in tourist experience facilities such as the Haeundae beach train and Songdo cable car," said Choi, who is also the CEO of Funtour, one of the few travel agencies in Busan specializing in the Chinese market.

Choi added that many of his clients also ask for experiential courses such as making South Korean-style rice wine and seaweed rice rolls.

While the traditional sources of revenue, such as commissions from duty-free shopping tours, may have declined, Choi said the broader economic impact has increased amid growing demand for hotels, rental cars, and attraction tickets.

Additionally, Choi said Chinese tourists go to hidden local eateries that even Busan locals are not familiar with.

Economic impact

"Across Busan, sales at well-known restaurants and attractions are indeed rising, but tourists are also turning to lesser-known areas, and that is having a huge economic impact," said Choi.

This was true for Chinese tourist An, 27, who focused on sightseeing during his three-day trip to Busan.

"I mainly came here to experience local life," said An, who gave only his surname. Hailing from Wuhan in Central China's Hubei province, An said he mainly planned his itinerary around enjoying Busan's seaside views and the relaxing lifestyle.

In Jagalchi Market, one of South Korea's largest seafood markets, merchants said the number of Chinese tourists has doubled this year. They also provide menus in Chinese and accept Chinese payment methods such as Alipay.

"About 40 percent of my customers are from China," Kang Yong-chul, a merchant at Jagalchi Market, told China Daily.

Kang said his stall has attracted a growing number of Chinese tourists after receiving positive reviews on Chinese social media platforms such as RedNote and Dianping.

"They mostly buy king crab, abalone, and octopus. The average spending is around 100,000 won ($70)," Kang said.

Noting South Korea and China reached an agreement expanding flight rights earlier this year, Lee of the BTO said this will also mean more flights connecting Busan with Chinese cities.

"Looking ahead, we plan to expand our marketing efforts beyond our key markets such as Beijing and Shanghai to include China's emerging first-tier cities, allowing us to tap into new sources of demand," said Lee, adding that the organization will also strengthen tailored online and offline marketing that reflects the interests of Chinese visitors.

The BTO is also working closely with government and relevant agencies to ensure a safe and trustworthy travel environment for Chinese travelers, she said.

Apart from introducing experience-driven programs in Busan and surrounding regions to Chinese travelers, Choi of the Busan Tourism Association and Funtour said his company is also working to bring South Korean travelers to more cities in China as demand has been rising with increased direct flights and the ongoing visa-free policy.

"We are working with airlines to promote each city with new direct flights with Busan intensively," said Choi.

Strong earthquake in Colombia kills at least 111 people

By MAY ZHOU in Houston, Texas
mayzhou@chinadailyusa.com

A powerful Monday morning earthquake has killed at least 111 and injured 87 in the west part of Colombia.

Colombia's President Abelardo de la Espriella, who came to office just three days before the earthquake, declared a state of emergency to expedite funding for the quake recovery with a plan to visit the disaster zone.

"I am at the forefront of the situation. It pains me deeply what the families and affected regions are going through," he posted on X.

According to information provided by Colombian officials by mid-afternoon, the destruction included 1,575 damaged homes, 37 homes completely destroyed, 61 collapsed buildings, scores of damaged centers of health, education and community, as well as 18 damaged roads and six airports.

Airports in Pereira, Manizales, Quibdo, Armenia, Cartago and Buenaventura suffered structural damage, and their flight operations were suspended, according to Colombia's Civil Aviation Authority.

The tremor was felt in Colombia's capital Bogota, which is about 400 kilometers from the epicenter, setting off alarms that prompted people to evacuate many buildings as a precaution.

"At this time there are no reports of injuries or structural damage, only some cracks in buildings," Bogota Mayor Carlos Galan posted on X.

The earthquake damaged the region's major cities including Pereira, Quibdo, Manizales and Cali.

Nubia Carolina Cordoba-Curi, governor of the Choco region, posted on X on Monday morning that "in the capital Quibdo there are injuries and severe damage to buildings".

She posted an update at 2 pm that 12 people were confirmed dead and 84 injured in Choco.

Other local authorities reported at least 40 deaths in the Risaralda region and 27 deaths in the Valle del Cauca region.

Rescue efforts to save people buried under the debris are ongoing.

According to the Colombia Geological Service, the earthquake epicenter was in San Jose del Palmar, Choco. It had a magnitude of 7.4 and a depth of approximately 103 km, making it the strongest earthquake recorded in Colombia in the last decade.

The earthquake was felt by neighboring countries Venezuela, Ecuador and Panama. It was followed by several aftershocks with magnitudes between 2.8 and 4.8, according to the agency.

The agency said that it's common for this region to experience earthquakes of considerable magnitudes due to activities associated with the subduction of the Nazca Plate beneath the South American Plate.

Near the end of June, Venezuela was struck by two earthquakes — with magnitudes of 7.2 and 7.5 — that were only 39 seconds apart. More than 6,000 people were killed, and tens of thousands of people remain missing under the debris.

Chinese EVs reshape Australia's car market

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Australia's new vehicle sales hit a record high in July, with top-selling Chinese brands helping sustain a second consecutive month in which electric vehicles made up one-fifth of the market, according to latest analysis.

A total of 103,656 new vehicles were delivered in the country last month, surpassing the previous July record of 103,097 units last year, Australia's Federal Chamber of Automotive Industries, or FCAI, said in a statement on Aug 5.

Battery EV sales totaled 23,510 units in July, accounting for 21.7 percent of the whole market, it said. BEVs recorded significant growth across the first half of this year, with EV market share rising every month. In June, these vehicles made up 23.3 percent of sales, jumping from 7.6 percent in the same month last year.

Chinese brands accounted for four of the top 10 models by sales volume in the latest FCAI figures, reflecting the major headway made by Chinese EV players in the Australian market.

Carmaker Geely's EX5 model alone recorded sales of 2,034 units in July, compared with 490 units during the same period last year.

Hussein Dia, professor of transport technology and sustainability at the Swinburne University of Technology in Melbourne, told China Daily that the July figures are significant because they suggest that Australia's EV market is moving into a more established phase.

"One strong month can sometimes be an anomaly, but two consecutive months above one-fifth of the market begin to look like a genuine shift in consumer behavior," Dia said.

"The broader significance is that EVs are becoming part of mainstream vehicle choice rather than a specialist product for early adopters," he said, adding that this is important for Australia's green transition because road transport remains heavily dependent on imported gasoline and diesel.

"Each electric vehicle added to the fleet reduces that exposure over time and increases the role of locally generated electricity, including renewable energy," Dia said.

The role of Chinese manufacturers is difficult to ignore during the process, he said.

"Chinese manufacturers are not simply gaining market share. They are forcing the wider industry to move faster on affordability, battery technology, model choice, and production speed," Dia said.

"Their success reflects several advantages, including competitive pricing, rapid product development, strong battery supply chains, and a growing range of vehicles suited to Australian consumers. In this sense, Chinese manufacturers are not merely participating in Australia's EV transition. They are increasingly helping to set its pace," he said.

Julie Delvecchio, CEO of Australia's Electric Vehicle Council, said the latest figures showed that "Australians are choosing electric, and choosing it more often".

The national EV fleet is now estimated at around 650,000 vehicles, or about 3 percent of all cars on Australian roads, according to the council.

Cost-of-living pressures

Delvecchio said turning to EVs can mean significant savings on fuel and maintenance for Australian households "feeling the cost-of-living squeeze".

Dia from Swinburne University of Technology said cost-of-living pressures are changing how consumers assess vehicles, as buyers are looking "not only at the purchase price, but increasingly at total ownership costs, including fuel, servicing, and maintenance".

He said recent disruptions to international oil supplies have reinforced the risks of depending on volatile global fuel markets and reminded consumers that electricity can be produced locally, while gasoline and diesel remain exposed to events overseas.

Editorials

Manila's China hawks seek to hijack ties by restricting people-to-people exchanges

In a sign that the Philippine government is seeking to extend its confrontation with China beyond the South China Sea issue, Manila is now considering a crackdown on academic and cultural exchange programs between the two countries in the name of countering "foreign malign influence, co-optation and covert interference".

Philippine Defense Secretary Gilberto Teodoro Jr said earlier last week that academic institutions and universities operating in the Philippines should be subject to stricter oversight to mitigate what he described as "potential national security risks", with a clear focus on Chinese-language schools in the country.

His remarks followed a report published by SeaLight, a US "think tank", which claimed that the Guangzhou-based Jinan University was the "single largest training site" for Chinese teachers entering Chinese-language schools in the Philippines. The report alleged that the university was closely tied to what it claimed is China's "political influence network". Yet the teacher training programs conducted by Jinan University for Philippine Chinese schools are entirely lawful, transparent and aboveboard.

Reportedly funded partially by the US Department of Defense, SeaLight has gained notoriety for its hostile stance against China. As the Chinese embassy in the Philippines observed, its director, Ray Powell, has made it his organization's top priority to attack and smear China, stoke confrontation and ratchet up tensions by "twisting facts, making baseless accusations, and constructing selective narratives". The "disgraceful" conduct serves only to reinforce the "China threat" narrative and seeks to drive a wedge between China and the Philippines.

Yet, despite this, the Philippine defense chief has embraced these baseless allegations in their entirety, targeting the very foundation of cultural ties between China and the Philippines. His move to politicize educational and cultural exchanges and frame them as "security threat" is a blatant provocation aimed at holding bilateral relations hostage for narrow political advantage.

Teodoro has repeatedly made irresponsible remarks about China, seeking to harm China's legitimate interests and damage China-Philippines relations, so it is no surprise that he has once again stepped to the fore to derail bilateral relations. Such is his track record that China has sanctioned him.

Teodoro also recently made reckless comments about China's Ethnic Unity and Progress Promotion Law, claiming it poses "national security risks" to the Philippines, which a Chinese Foreign Ministry spokesperson rebutted as political provocation "full of disinformation and smears designed to interfere in China's internal affairs".

As for his latest provocation to block normal cultural activities, it must be pointed out that Chinese-language education has been an integral part of the Filipino-Chinese community, and serves as a bridge linking China and the Philippines. No political machinations by Manila's China hawks should sever these deeply rooted people-to-people ties.

The Philippines should honor its diplomatic commitments and engage with China to resolve their maritime disputes through bilateral dialogue and consultation. The Ferdinand Marcos Jr government should not let a small group of anti-China agitators hijack or undermine the bilateral relationship.

A healthy China-Philippines relationship requires not only proper management of differences, but also sustained people-to-people communication. Forcibly cutting off academic exchanges and suppressing Chinese-language education will not help solve the disputes, rather it will only widen the gap and narrow the space for diplomatic mediation. The Marcos government should clearly discern external manipulation, reject a confrontational mindset and cherish the hard-won foundation of people-to-people goodwill.

If Manila overlooks the fact that people-to-people exchanges are one of the most enduring pillars of engagement between the two countries, and allows a small anti-China faction to influence bilateral ties, it risks alienating the Filipino-Chinese community and undermining the bonds of mutual trust between the peoples of both countries.

China and the Philippines are neighbors that cannot be relocated. A stable bilateral relationship serves the fundamental interests of both nations and meets the expectations of the wider region. The ultimate cost of souring relations will be borne by the Philippines, as it will adversely affect its diverse cultural fabric and future growth.

Takaichi's ambiguity betrayal of history

Eighty-one years ago, Nagasaki was erased in a blinding flash, with 74,000 victims incinerated by a weapon that should have been the last. Three days earlier, Hiroshima had suffered the same fate.

During those three days, Japanese militarists kept insisting that people sacrifice themselves for the "glorious Empire of Japan". The destruction of Nagasaki finally shattered that dangerous faith and forced Japan's unconditional surrender to the Allied Powers six days later.

Japanese Prime Minister Sanae Takaichi made it clear at the Hiroshima memorial ceremony on Thursday and again at the Nagasaki memorial ceremony on Sunday that the country's neo-militarists have learned nothing from the horrors of the bombings. At Nagasaki's Peace Park, the city's mayor, Shiro Suzuki, called nuclear weapons an "absolute evil". Yet, Takaichi offered only deliberate ambiguity over whether her government will abide by the Three Non-Nuclear Principles.

Japan already operates under the protection of the United States' nuclear umbrella. To invoke a purported "external threat" as a rationale for acquiring an independent nuclear deterrent is hardly the "realistic and pragmatic approach" Takaichi describes — rather, it lays bare the unmistakable ambitions of the country's neo-militarist faction.

Takaichi will not say she intends to revise the principles, but neither will she promise to preserve them. She speaks only of current policy, deliberately leaving the future open to interpretation. This is the slow-motion dismantling of a commitment that has defined postwar Japan.

The hypocrisy is staggering. Here is a prime minister attending the memorials for victims of nuclear hellfire, surrounded by aging *hibakusha*, or atomic bombing survivors — whose average age is over 86 — yet she will not reaffirm the principles these survivors have defended for decades. When the *hibakusha* protest her stance on "nuclear sharing" with the US, and when a record 128 local assemblies urge her government to uphold the three principles, her response is little more than a verbal shrug. No wonder Moscow called Japan's nuclear memorial act hypocritical — Takaichi equivocates on the nonnuclear principles while refusing to even ask why the bombs fell on Japan.

The "realism" that Takaichi invokes is increasingly aligned with the right-wing's neo-militarist ambitions. For Japan's remilitarization, "reality" means expanding military capabilities and deepening reliance on the alliance with the US. "Pragmatism" means leveraging Washington's desire for a more heavily armed Japan and stronger Asia-Pacific ally to create political space for nuclear ambiguity. Should we call this the Atomic Stockholm Syndrome?

Japan, the only country ever atom-bombed, now flirts with nuclear weapons under "extended deterrence". The US umbrella is a crutch, and Takaichi wants Japan to lean on it rather than lean on peace. Tokyo refuses to sign the Treaty on the Prohibition of Nuclear Weapons, calling it "ineffective" to address its "security concerns".

Japan is in the unique position to be the moral voice for the abolition of nuclear weapons; but obligation requires clarity of conviction.

Takaichi has offered nothing but ambiguity. She does not need to formally rewrite the three principles. They can be diluted through reinterpretation, administrative decisions and incremental policy changes. If Washington looks the other way because it wants a more militarized Japan as part of its regional strategy, alliance politics could easily overwhelm international objections. What is at stake, therefore, is more than Japan's military posture. It is Japan's historical identity and regional stability.

Eighty-one years after Fat Man fell on Nagasaki, Takaichi stood in Peace Park and blurred the edges of a promise generations of Japanese have held sacred. The city's mayor was right: Nuclear deterrence does not eliminate the risk of catastrophe; it institutionalizes it.

The Takaichi government is intent on "honoring" the dead by placing their descendants under the shadow of the same weapons that destroyed them. When the last *hibakusha* is gone, what will remain of their plea? A prime minister who could not bring herself to unequivocally declare: "I promise to uphold the Three Non-Nuclear Principles". That is not realism. It is a betrayal of history.

Solving Middle East crisis needs real commitment to lasting peace

Israeli Prime Minister Benjamin Netanyahu has told his Cabinet that Israel does not accept US President Donald Trump's 15-point plan for Gaza. Just days after Trump proclaimed that his Peace Board had secured a "HISTORIC agreement" for Hamas' complete disarmament, Netanyahu said Israeli forces will not leave Gaza until Hamas is "genuinely disarmed".

Trump's Gaza plan is not yet a peace plan; it is a holding maneuver — an attempt to de-escalate tensions with Iran while demonstrating that Washington is trying to solve the Gaza crisis. Compared with earlier US proposals, it clearly signals greater pressure on Israel.

But Netanyahu, facing a political battle that could cost him power at home, has every incentive to look uncompromising. An Iranian AI animation depicting Israel as two heavy stones chained to the US' feet and dragging it into the deep carries an uncomfortable truth: Washington's grip on its closest regional ally is weaker than it pretends.

Meanwhile, something potentially more consequential is taking shape elsewhere. Saudi Arabia, Pakistan and Turkiye have signed the Mecca Joint Defense Agreement, signaling to Tehran and other regional actors that the Middle East's balance is shifting. The pact reflects growing doubts about the United States' security umbrella that has underpinned Gulf stability for decades.

For Iran, the emerging alignment might present a strategic challenge. It creates a stronger Sunni security bloc. Turkiye's foreign minister has suggested that Egypt might join, potentially creating a security network stretching from the Mediterranean to the Arabian Sea.

The most intriguing part is Turkiye. As a NATO member, Ankara insists the new arrangement is complementary to, not a substitute for, its original alliance commitments. Perhaps legally. Strategically, however, it is unmistakably a hedge. Turkiye is using its dual identity — as a NATO ally and a major player in the Muslim world — to widen its room to play a bigger role in the Middle East.

For Washington, the significance is hard to miss. Three regional partners have created their own defense mechanism. It seems regional countries increasingly believe they must hedge against US unreliability.

Then there is the Strait of Hormuz, Iran's most powerful bargaining chip. Tehran knows the economic pressure created by prolonged disruption, the constraints on US missile-interceptor stocks and the political sensitivity of high energy prices ahead of midterm elections. The Supreme National Security Council of Iran has demanded that Washington change its behavior, end the conflict, lift the blockade, compensate Iran for wartime damage and release frozen assets unconditionally. That is not the posture of a country negotiating from weakness. It is the posture of one that believes time may work in its favor.

Whatever Israel's tactical gains in Lebanon and Gaza or the US' oil benefits, they pale beside a long-term crisis, compounded by Washington's limited leverage over Israel and the region's deep fractures.

What we are witnessing is therefore more than another Middle East crisis. It is a structural realignment. The old order — the US as security guarantor — is gradually fraying.

Striking Tehran has clearly opened a Pandora's box. Trump and Netanyahu may have believed that attacking Iran would restore deterrence, reaffirm US power and consolidate Israel's geopolitical gains. Instead, they may have demonstrated its limits.

The Middle East is becoming a multipolar chessboard, with regional players making moves not necessarily in coordination with Washington, but increasingly to hedge against it.

That might prove to be the real strategic loss for the US. The regional security architecture it has painstakingly built over decades is weakened not just by "hostile powers", but also by allies and partners which no longer believe the old guarantees are sufficient.

When friends start rebuilding their own defense pacts without you, they have not necessarily become your enemies. They have simply stopped believing you can protect them. And no "historic" peace plan can restore trust once that belief is gone.

Tackling the Middle East's increasingly complex crises requires not just words, but a steadfast dedication to building a durable peace.

What They Say

Standards to make autonomous vehicles safe

Editor's note: *China has released the first mandatory national safety standards for Level 3 and Level 4 autonomous vehicles. China Central Television spoke to Xiong Lu, dean of the College of Automotive and Energy Engineering at Tongji University, to explain the standards. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The new standards establish a unified and mandatory safety threshold for entry into the market, providing a clear basis for the future development of autonomous driving systems. They specify quantitative standards, parameters and technical requirements for products and establish comprehensive safety requirements for the entire life cycle of a vehicle. They are mandatory standards and all vehicles equipped with autonomous driving functions must comply with them before they can operate on public roads.

At the system level, the new standards set clear quantitative thresholds in two key areas. First, they mandate that the driving capabilities of autonomous driving systems must be comparable to those of a qualified and attentive human driver. Second, the systems must achieve an accident rate comparable to conventional vehicles, which is roughly one accident in every 10,000 hours of driving. This is a key technical safety threshold established by the standards.

From a research and development perspective, two requirements are particularly important. For Level 3 autonomous vehicles about to be mass-produced, the vehicles must have a driver takeover system. Additionally, in hazardous situations that can't be managed by the system, the standards require a 10-second window for the driver to take control. These two specific requirements have received considerable attention within the R&D community in the industry.

The standards mandate a comprehensive safety assurance mechanism throughout the entire life cycle of the vehicle, encompassing initial R&D, production, supply chain management, testing, evaluation and data monitoring during operation. This comprehensive approach is important because autonomous driving systems are very complex, and it becomes challenging to determine responsibility in accidents. Only by managing the entire process across the enterprise can responsibilities be clearly determined.

For many companies, establishing a comprehensive life-cycle safety assurance mechanism will be challenging. The requirements cover the entire R&D process, necessitating complete procedural and management systems.

Manufacturers that rely on third-party suppliers need to collaborate closely with those entities to establish the necessary life-cycle management procedures and standards across the entire system. Coordination with component suppliers and regulatory authorities may also be necessary, making the implementation of these requirements a demanding task.

The standards will evolve with additional technical criteria. Further refinements will address functional safety, intended functionality safety and cybersecurity. There will also be corresponding standards for perception systems, vehicle connectivity systems and other areas. Additional standards for the testing and evaluation of autonomous driving systems will also be established. Also in the pipeline are standards for the overall architecture of autonomous driving systems, as well as for operating systems and chips.

ROK, China should cooperate more on AI

LI MIN / CHINA DAILY

In late 2025, China and the Republic of Korea acknowledged a fundamental shift in their economic relationship. The era of vertical specialization, in which each side was on different rungs of the industrial ladder, was giving way to horizontal competition.

To adapt to this new reality, the two countries chose "horizontal cooperation" to redefine their economic relationship.

As the regional production network they jointly built over the past three decades gradually unravels and relocates, an important question arises: can China and the ROK build a new network around artificial intelligence infrastructure and usher in another golden era of industrial cooperation?

History suggests they can. Sustainable growth is often driven by the emergence of new industries, markets and business niches. Since they established diplomatic relations, China and the ROK have built production networks in sectors such as computers, mobile phones and information technology. The ROK's technological edge and China's cost advantages combined to create a globally competitive force.

But every industrial cycle has its limits. As these industries matured and the global market became saturated, technological barriers fell, production capacity expanded rapidly and competition intensified.

A case in point is the ROK's two former pillar industries — mobile phones and automobiles. In 2025, Counterpoint Research reported that global mobile phone shipments grew by just 2 percent year-on-year amid fierce brand competition.

Similarly, global vehicle sales stagnated, with the ROK's main markets — the United States, Western Europe and domestically — experiencing varying levels of negative growth, according to data from a think tank affiliated to the Hyundai Motor Group.

Emerging industries tell a different story. Demand continues to outpace supply in emerging fields such as AI, new energy and biomedicine. Rather than competing in crowded traditional sectors, companies from China and the ROK have the opportunity to deepen cooperation in these emerging industries and work toward rebuilding a new East Asian production network.

The foundation for this already exists. ROK companies excel in high-end semiconductor hardware, especially AI-specific high-bandwidth memory (HBM).

Fueled by ongoing demand for new AI infrastructure and HBM shortages, the country's semiconductor industry achieved record revenues and profits in 2025. SK Hynix and Samsung Electronics together accounted for about 80 percent of the global HBM market in 2025, and about 47 percent of the total market capitalization of the ROK stock market, highlighting their dominant position in the semiconductor sector.

China, meanwhile, has rapidly strengthened both its AI software capabilities and computing infrastructure. According to Stanford University's 2025 AI Index Report, the performance gap between China's top AI models and those of the US shrank from 17.5 percent in 2023 to just 0.3 percent by the end of 2024.

China also holds around 70 percent of global generative AI patents. Additionally, its growing network of high-performance computing centers and supercomputers accounts for a significant portion of the world's intelligent computing power.

These complementary strengths present an opportunity to establish a robust East Asian AI-specific production network and explore new market opportunities.

By combining the ROK's strengths in hardware with China's advantages in both hardware and software, both countries can develop new global competitive advantages and increase their market share.

Governments on both sides have begun laying the groundwork. In January, ROK President Lee Jae-myung led an economic and trade delegation to China covering semiconductors, batteries, electric vehicles, new energy and smart manufacturing. The visit demonstrated the willingness for horizontal cooperation, and 32 cooperation memorandums were signed.

Following the APEC Trade Ministers' Meeting in Suzhou, the seventh Jiangsu-ROK trade cooperation and exchange conference was held in May. It strengthened industrial connectivity in semiconductors, new energy and shipbuilding and generated immediate export contracts worth approximately $2.3 million, according to media reports from the ROK.

Capitalizing on this momentum, business exchanges have intensified, focusing on sustainable development, SME innovation and entrepreneurship, green industries and the silver economy.

Even so, greater efforts are still needed. Both sides should enhance awareness about the opportunities created by cooperation, identify new areas of complementarity and manage security-related factors.

Horizontal cooperation should take precedence over horizontal competition.

Multinational corporations allocate resources where they can maximize profits rather than opt for less efficient domestic firms.

What may appear as competition between Chinese and ROK companies can actually become mutually beneficial cooperation through cross-border partnerships.

As the pace of technological catch-up surpasses innovation, the room for cooperation inevitably narrows. However, no enterprise — nor any country — can dominate an entire industry chain, and the potential for complementary cooperation between Chinese and ROK companies still exists.

With overcapacity in traditional sectors and shortages in emerging ones, both sides should avoid competition in established areas and focus on collaboration in new sectors.

Greater emphasis on collaboration in high-end products, advanced services and specialized segments will create broader opportunities for both economies.

The current global environment makes such cooperation even more important. Rising geopolitical uncertainty, China-US trade frictions, tariff barriers and technology blockades have increased the risks for businesses.

Chinese and ROK companies should therefore work together to mitigate political risks and safeguard economic security. They should enhance cooperation in export controls, investment screening, R&D security and talent management.

These steps are essential if the two sides are to avoid excessive competition and move toward win-win outcomes.

The success of the new AI production network in East Asia hinges on Chinese and ROK companies leveraging their complementary strengths, building bridges rather than barriers, and exploring new markets as partners, not rivals.

The author is the director of the Sino-Korea Economy/Society Institute based in Daegu, the ROK.
The views don't necessarily reflect those of China Daily.

Yose Rizal Damuri

RCEP offers stability amid global uncertainties

When the Regional Comprehensive Economic Partnership was launched in 2022, nobody could have imagined that the global situation would be in so much disarray as it is today.
