International Taijiquan Day and its accompanying global celebrations now sit as a footnote to *taijiquan*'s worldwide expansion. But the art's power to unite people operates independently of that single annual observance. The core insight behind the UN's institutional recognition shines brightly: Humanity universally craves practical tools to ease internal unrest and bridge divides, and *taijiquan* fills this grassroots need. It equips ordinary people with small, transformative personal qualities to engage others with patience and restraint.

MA XUEJING / CHINA DAILY

Every opening and closing stance of *taijiquan* gently recalibrates a practitioner's emotional balance, and every calm-minded participant carries that balanced mindset into daily exchanges, adding incremental warmth and understanding to an increasingly volatile and fragmented social landscape.

As millions of people across the world embed harmony-focused ancient wisdom into their everyday lives through regular *taijiquan* practice, mutual respect may evolve from abstract ideal into a lived, accessible reality. Anchored in every extended breath and coordinated movement, humanity's collective pursuit of shared well-being develops into a persistent, embodied global practice — solid proof that age-old Chinese wisdom of balance can deliver gentle, practical guidance for people everywhere seeking kinder, more harmonious ways to live alongside one another.

Bourse seen enduring fluctuations

Equities expected to retain their longer-term investment appeal

By ZHOU LANXU in Beijing and **SHI JING** in Shanghai

Chinese equities are expected to retain their longer-term investment appeal despite spillovers from heightened global market volatility, underpinned by China's distinct technology opportunities and ongoing reforms to improve shareholder returns, experts said.

The A-share market has been fluctuating amid external volatility as rising US long-term Treasury bond yields and sticky inflation expectations — alongside ongoing geopolitical tensions — put global equities under pressure.

Domestically, concerns that the current listing wave of tech champions — such as chipmaker CXMT and Unitree Robotics — might possibly strain market liquidity also weighed on the market.

A shares ended mixed on Tuesday, with the benchmark Shanghai Composite Index edging up 0.19 percent to 3,889.44 points, while the growth-oriented ChiNext Index fell 1 percent to 3,397.52 points.

Despite the recent volatility, UBS' medium-term view on Chinese equities remains constructive. The Swiss wealth manager continues to rate China equities as attractive, while emphasizing that the opportunity set is broader and more balanced than it was earlier in the year.

James Wang, head of China strategy at UBS Investment Bank Research, said that northbound flows via the stock connect programs turned net positive in the second quarter, with a record $33 billion in net inflows into A shares.

That was compared to a $1.8 billion outflow in the previous quarter, Wang said, led by purchases in the industrials and information technology sectors.

Zhu Liang, chief investment officer for AllianceBernstein in China, said the Chinese market offers opportunities arising from both growth-oriented sectors and ongoing reforms.

"In artificial intelligence, while Chinese tech companies exposed to global export supply chains could be affected by overseas volatility, a more diversified range of AI opportunities — including those engaged in homegrown alternatives to imported technologies and cost-effective large language models — continues to offer investment value."

Nevertheless, Zhu said investors should avoid excessive concentration in a single AI theme given the historically extreme valuation gap between A-share high and low-valuation sectors, citing city commercial banks as a potential sector to help offset volatility associated with the AI theme.

On the reform front, Zhu said regulators have been advancing improvements in corporate governance, while listed companies have gradually increased dividend payouts and share buybacks. The overall market has begun to see net share buybacks rather than net financing, providing support for A-share performance.

At a meeting of the Political Bureau of the Communist Party of China Central Committee on July 30, it was stressed that comprehensive reforms of investment and financing in the capital market should be deepened to enhance its resilience and boost market confidence.

Kelvin Tay, chief investment officer for Asia at Pictet Wealth Management, said the large-scale offerings of emerging technology champions in China may create a short-term imbalance between stock supply and demand, weighing on market performance this year.

However, such near-term pressures do not undermine the longer-term investment case for China, Tay said, adding that he sees exposure to China as essential for investors' portfolios over the next five to seven years.

"The newly listed companies have strong fundamentals, with decent profitability and positive net cash flow, pointing to solid long-term growth potential for the Chinese stock market," Tay said.

Liu Jipeng, a professor at China University of Political Science and Law and a senior capital market expert, said a healthy bourse should enable the majority of investors to benefit from long-term value creation, rather than becoming a zero-sum game in which gains by a small group come at the expense of others.

Liu said regulatory efforts should prioritize market fairness, arguing that some quantitative trading strategies that rely on technological advantages to profit at the expense of ordinary investors should be better regulated.

Tian Xuan, dean of Peking University's Guanghua School of Management, suggested that policies for refinancing — as well as mergers and acquisitions — should be further optimized so that the quality of listed companies can be improved from the outset.

Briefly

Bankruptcy law draft revision reviewed

Chinese lawmakers on Tuesday began reviewing a draft revision to the Enterprise Bankruptcy Law, with the second draft incorporating refinements to provisions on individual bankruptcy, bankruptcy protection, restructuring and cross-border bankruptcy. Based on feedback from the first draft, the second draft adds a new section on pre-restructuring consultation. In addition, the draft improves provisions on cross-border bankruptcy, clarifying the extraterritorial effect of bankruptcy proceedings, the jurisdiction of Chinese courts and mechanisms for international judicial assistance. The current law was enacted in 2007. The first draft of the revision was submitted to the 17th session of the 14th National People's Congress Standing Committee in September 2025 and was later released for public comment.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 11 pips to 6.7852 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

What is behind Shein's drop in valuation?

By LI JIAYING
lijiaying@chinadaily.com.cn

Shein's Hong Kong IPO is testing how public investors value a global e-commerce model being reshaped by slower growth, rising fulfillment costs and tighter rules for low-value parcels, industry experts said.

At the top of the proposed HK$47.6 ($6.07) to HK$49.5 range, Shein would have a market capitalization of up to $27 billion, roughly 70 percent below its nearly $100 billion private valuation in 2022.

Pan Helin, a member of the expert committee for information and communication economy under the Ministry of Industry and Information Technology, attributed the valuation reset partly to the maturity of e-commerce, where growth has slowed and competition has intensified.

"Shein's rapid rise in 2022 coincided with overseas supply-chain disruptions and sharp price increases, while today's market conditions leave less room for the exceptional growth expectations reflected in its earlier private valuation," Pan said.

Pan added that Hong Kong investors generally apply more restrained valuations to mature internet businesses, particularly apparel e-commerce, which operates in a largely established market. Capital has also recently shifted toward artificial intelligence-related companies, further limiting the valuation premium available to traditional e-commerce platforms, he said.

Although HK-listed e-commerce and internet companies are currently trading at relatively low valuations, a Hong Kong listing could help Shein reduce the compliance risks associated with cross-border fundraising and facilitate its domestic operations, Pan noted.

"It would give Shein access to a market recognized by international investors while also bringing it closer to domestic investors, particularly as the Chinese mainland could become a more important growth market for the company in the future," he said.

Pan's comments came as overseas policy changes have added to the company's operating pressure. The United States ended duty-free de minimis treatment in May 2025 for covered goods from the Chinese mainland and Hong Kong that had previously entered in parcels valued at no more than $800. From July 1 this year, the European Union also abolished its customs-duty exemption for consignments valued at no more than 150 euros ($175) and introduced a temporary duty of 3 euros per item category.

The e-commerce giant is responding by shifting from its previous direct-to-consumer shipping model into a more flexible business-to-business-to-consumer pattern — consolidating goods in China, shipping them to Europe in bulk and completing delivery from local warehouses, said Chen Liteng, a senior analyst at the Internet Economy Institute, a domestic consultancy.

"This model subjects the goods to the EU's regular apparel import tariffs instead of a flat duty on each item category," Chen said. "Even after adding the cost of sorting, packing and local delivery, the model's total cost remains below the per-category duty incurred by direct shipment of small parcels."

The senior analyst added that the use of local warehouses could also reduce customs-related costs while allowing Shein to retain the inventory discipline of its signature "test-and-repeat" model, under which products are initially made in small batches and replenished according to demand.

The IPO comprises about 280 million Class B shares. At the midpoint, without over-allotment, net proceeds are expected to reach HK$13.1 billion. According to its prospectus, the company has earmarked 40 percent for technology capabilities, 40 percent for brand building and global expansion, 10 percent for corporate responsibility and the balance for general purposes.

Pool cleaning robots make global splash

By ZHENG YIRAN in Shanghai
zhengyiran@chinadaily.com.cn

With technological breakthroughs, Chinese companies are driving structural changes in the pool cleaning robot sector.

According to a recent report jointly released by global market consultancy IDC, the global shipment of pool cleaning robots is expected to hit 3.97 million units by 2029, with a compound annual growth rate of over 20 percent.

The market pattern dominated by foreign companies five years ago is gradually being rewritten by domestic manufacturers. On the cross-border export side, a group of Chinese enterprises with self-developed capabilities have transformed from simple production execution roles to technology solution exporters.

Data from market consultancy huaon.com show that in 2024, the world's top five cable-free swimming pool cleaning robots in terms of shipment were all Chinese companies — Wybotics Co Ltd, Sunwoda Electronic Co Ltd, Sensomics, Wavefuture and Shenzhen Aiper Intelligent Co Ltd. The five companies took up 51.4 percent of the world's cable-free swimming pool cleaning robot market.

Another Chinese company from Taizhou in East China's Zhejiang province, Deep Cleaner, is also making a noticeable splash in the market. Established in 2022, the company had an annual shipment volume of over 100,000 units by 2025, a customer repurchase rate exceeding 70 percent, and a product return rate controlled at 2 percent to 3 percent, far below the industry average of around 15 percent.

A pool cleaning robot seen at an expo in Tianjin earlier this year. PROVIDED TO CHINA DAILY

In addition, more than 95 percent of the company's products are sold to overseas markets, covering three major categories — underwater cleaning, water surface cleaning and swimming pool disinfection and sterilization, and all core components are self-developed.

Wang Hua, general manager of Deep Cleaner, said: "Pool cleaning robots are a category with a high proportion of plastic parts. The shell, internal structural components, transmission gears, seals — almost all are injection molding parts built on molds. The first step for a swimming pool robot from design to mass production is not the circuit board or motor, but the mold."

The factory of the company is located in Huangyan in Taizhou, the most densely populated area of China's mold industry. From mold design, steel processing, heat treatment, mold testing to injection molding mass production, Huangyan has the most complete mold industry chain cluster in China. Whether it's mold delivery time or repair response speed, Huangyan takes a lead in the country.

In terms of research and development, the company invests 7 million yuan ($1.04 million) to 8 million yuan annually, and has technical cooperation with Zhejiang University and Zhejiang University of Technology. These two universities have a deep academic accumulation in the fields of motor control, fluid mechanics and materials science, which happen to coincide with the core technology direction of swimming pool cleaning robots.

Lin Xianping, an associate professor at Hangzhou City University, said that domestic swimming pool robots are completing the transformation from original equipment manufacturer assembly to technical solution output, with the vast majority of products sold to the European, American and Australian markets.

Intensified efforts to help attract more FDI

By ZHANG CHENXU
zhangchenxu@chinadaily.com.cn

China's intensified efforts to attract foreign investment and promote two-way investment cooperation will help global businesses better tap opportunities arising from the country's vast market and innovation-driven industrial upgrading, while underscoring its firm commitment to opening-up, officials and experts said.

Their remarks came ahead of the 26th China International Fair for Investment and Trade, one of the country's key platforms for promoting mutual investment.

Scheduled to take place Sept 8 to 11 in Xiamen, Fujian province, the fair is expected to connect capital with projects across borders, reinforcing China's role as both a major destination for — and source of — global investment, they added.

"The fair has so far drawn delegations from 123 countries and regions, with 60 set to take part as exhibitors," Ling Ji, vice-minister of commerce and deputy China international trade representative, said at a news conference in Beijing on Tuesday.

Finland and Saudi Arabia will serve as guest countries of honor at this year's fair, Ling said. Saudi Arabia will send a large economic delegation to CIFIT for the first time. Investment from the kingdom into China surged 343.7 percent year-on-year in the first seven months, Ling's ministry said.

Zhao Zenglian, vice-governor of Fujian province, said the exhibition area at this year's fair will cover 200,000 square meters. The fair will feature 14 specialized zones spanning three major sections — "Invest in China", "Chinese investment" and "International investment".

Foreign firms and business associations have also shown strong interest in attending, Ling said.

Foreign investors now look beyond merely labor and land costs, placing greater weight on China's industrial ecosystem, infrastructure, access to green power and computing capacity, he added.

The latest data demonstrate that shift. In the first seven months, the number of newly established foreign-invested enterprises in China rose 4.4 percent year-on-year to 37,711, while foreign direct investment in actual use totaled 438.33 billion yuan ($65.23 billion), with the pace of decline easing from a year earlier, said the Ministry of Commerce.

Notably, FDI in high-tech industries rose 32.7 percent year-on-year, accounting for more than 40 percent of the national total, Ling said.

In a world facing rising protectionism and geopolitical tensions, foreign enterprises are looking to deepen their investment in China as a hedge against external shocks, said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

On outbound investment, Ling said China's outward FDI flows rose 11.1 percent year-on-year to $213.58 billion in 2025, while its total accumulated outward FDI value reached $3.4 trillion, ranking among the world's top three for the ninth consecutive year.

China will broaden economic and trade cooperation with other countries in the second half, expand trade in services and promote more balanced trade, according to a State Council report on the implementation of this year's plan for national economic and social development, delivered to the NPC Standing Committee for review on Tuesday.

The report also called for better outbound investment management, stronger support services for Chinese companies overseas, and further efforts to attract and make better use of foreign investment.

Hunan scenic area boosts hot spot bona fides

Wulingyuan's spiked peaks made famous in 2009 blockbuster movie *Avatar*

Top: Foreign visitors get a taste of local wedding customs in Zhangjiajie, Hunan province, on Aug 14.
Above: Visitors experience the Cili Banban Dragon boat in Zhangjiajie on Aug 14.
PHOTOS BY GENG FEIFEI / CHINA DAILY

By LI JING
lijing2009@chinadaily.com.cn

On a theater stage framed by the towering sandstone peaks of Wulingyuan Scenic Area in Zhangjiajie, Hunan province, Pablo, a Spanish tourist, donned traditional Tujia wedding attire, playing the role of bridegroom as hundreds of spectators cheered.

The mock ceremony at Charming Xiangxi Theater offered him an unforgettable introduction to local customs. For local business owners and operators, it represents something more strategic — a golden opportunity to attract tourist revenue after travelers descend from the world-famous Zhangjiajie peaks.

"We had never seen a performance like this," Pablo said afterwards. "I would like to learn more about traditional Chinese culture."

Across Zhangjiajie and neighboring historical towns in western Hunan, rising inbound arrivals are encouraging businesses to expand beyond scenic-area tickets into evening entertainment, accommodation, dining and cultural experiences.

Official data underscore the momentum. Zhangjiajie welcomed 860,700 inbound visits from 195 countries and regions in the first seven months, up by 19.01 percent year-on-year. Tourism foreign-exchange earnings increased 40.52 percent to $98.5 million.

The demographic profile of visitors is also undergoing a structural shift. European and US travelers accounted for nearly 35 percent of total inbound arrivals, with their numbers rising 211.36 percent year-on-year and helping diversify a market long dominated by travelers from South Korea.

This surge has been powered in large part by China's expanding visa-free policies. China has expanded unilateral visa-free access to citizens of 50 countries for stays of up to 30 days, while nationals of 57 countries are eligible for its visa-free transit policy, following the addition of Kyrgyzstan and Vietnam on Thursday.

Zhangjiajie Hehua International Airport is among the 65 designated ports for the transit policy. The airport operates 13 passenger routes to eight countries and regions, and long-haul travel Western visitors increasingly bundle the city into multi-stop itineraries across China.

For years, Zhangjiajie's international acclaim rested largely on its quartz-sandstone pillars, famously associated with the floating mountains in the blockbuster 2009 film *Avatar*. Today, regional stakeholders view these iconic vistas merely as the starting point of an extended consumer journey.

"The underlying business logic is to shift from one-off gate admissions to capturing spending across the entire travel chain as visitors extend their stays. Accommodation, dining, performances and immersive cultural experiences can all generate additional revenue," said Huang Yuanji, vice-president of Hunan University of Finance and Economics.

At Charming Xiangxi Theater, which showcases the heritage of the Tujia, Miao and other ethnic groups, the number of overseas visitors reached 116,000 from 188 countries and regions between January and July, up 43 percent year-on-year.

To bridge cultural divides, the theater provides subtitles in English and Korean, with Russian and Spanish in the works. Promotional materials have also been tailored. Traditional acrobatic acts, for example, are introduced using references to Chinese kung fu that foreign viewers intuitively grasp.

"Foreign visitors might not know what Xiangxi is, but they know Zhangjiajie's mountains and are interested in authentic traditions. Our job is to interpret local heritage in ways they understand," said Xu Shan, general manager of the theater.

A short distance away, Xiangxi Fu, a newly opened cultural tourism attraction in Wulingyuan, welcomes guests with traditional drum performances, ethnic folk songs and ceremonial welcome wine before ushering them into a courtyard complex dedicated to centuries of Tusi history.

The attraction says foreign visitors account for 30 to 40 percent of its tourists.

"Our goal is to transform static heritage exhibitions into participatory workshops and performances, giving visitors compelling reasons to linger in town after their mountain hikes," said Tang Linfang, the site's marketing director.

A different experiment is unfolding in downtown Zhangjiajie. On July 10, Dayong ancient town reopened after an extensive renovation led by Zhangjiajie mango cultural tourism, a joint venture involving local operators and leading broadcast media.

The riverside complex blends historical architectural style streets with television-themed shops, youth-oriented cultural merchandise, craft workshops, street performances and evening boat rides. Within its first month, it drew more than 1 million visits and generated more than 10 million yuan ($1.49 million) in business turnover.

"We want travelers who spend their daylight hours among the peaks to return downtown at night for an entirely different cultural texture," said Zhou Yang, general manager of the operating company, adding that roughly 80 percent of weekend visitors arrive after dusk.

This strategy to capture extended stays is rippling across neighboring destinations in the Xiangxi Tujia and Miao autonomous prefecture.

In the town of Furong, perched dramatically above a cascading waterfall, foreign tourists browse tea workshops, stroll through historical alleyways and stop to dine alongside locals who still live inside the centuries-old settlement.

The town received 6.53 million visits in 2025, including 338,000 from overseas, up 61 percent year-on-year, according to local official figures.

Zhong Fei, chairman of Hunan Huaxia Investment Group — which operates the destination through a JV with the local government — said international tourists accounted for roughly 40 percent of independent arrivals and about half of independent visitor spending.

Evening performances, guesthouses and hands-on workshops have helped extend average stays from half a day to one or two nights in the town, Zhong said.

Local restaurants have also adjusted. Local smoked pork appears on pizzas and in burgers, while coffee is sweetened with local ginger candy, offering foreign visitors familiar formats with local flavors.

"The visitors are not just coming for the scenery. They are interested in the culture and in seeing how local people live," Zhong said.

Crucially, the town has preserved its ancient social fabric, retaining native residents within the scenic core. The settlement hosts roughly 200 guesthouses and nearly 1,500 small nighttime enterprises, with locals making up 80 percent of the resort's workforce.

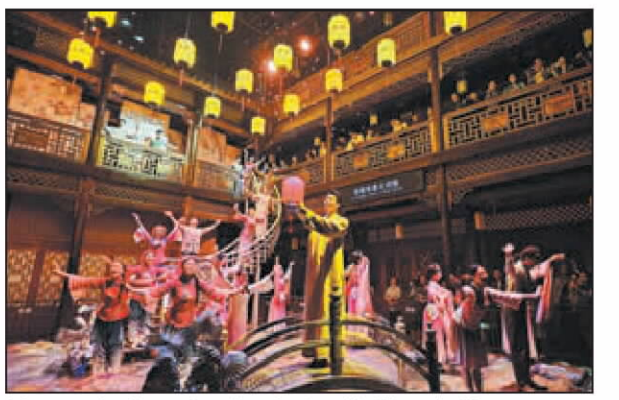
Further south, Fenghuang ancient town received 111,313 inbound tourist visits in the first half, up 5.12 percent year-on-year, while inbound tourism spending increased 15.18 percent to $44.3 million, said Xiang Yang, deputy head of the Fenghuang county government.

To connect these scattered gems, Hunan provincial authorities are accelerating development of the "Greater Zhangjiajie" international tourism zone, spanning 38 county-level areas across five cities and prefectures, including Zhangjiajie, Xiangxi and Huaihua.

The province has introduced eight inbound tourism routes and aims to attract 2 million inbound tourists annually by 2027, targeting $1.12 billion in inbound tourism spending.

Challenges persist. Huang said overseas travel agencies still tend to sell the mountain parks as standalone destinations, while fragmented administration, limited transport connections and uneven international services continued to restrict travel beyond Zhangjiajie's best-known attractions.

The provincial plan seeks to address those gaps by improving transport connections, developing cross-regional itineraries, upgrading multilingual services and encouraging tourism companies to work across administrative boundaries.



Huang emphasized that while eliminating low-cost package competition and administrative barriers takes time, the evolving mix of inbound visitors provides strong tailwinds for higher-value, tailor-made products.

The vibrant overseas reception across regional theaters, craft workshops and historic towns demonstrates that global travelers are eager to explore beyond the mountains.

"By improving regional connections and enabling travel agencies, hotels and cultural-tourism businesses to work together across the region, visitor flows can be converted into tangible and sustainable economic growth," Huang said.

He Chun in Changsha contributed to this story.

Immersive *Changde Stories* a boon to night economy

A large roving live-action show is staged in Changde, Hunan province, on Aug 13. Visitors follow performers to experience the region's history and charm. GENG FEIFEI / CHINA DAILY

By LI JING

As night falls over Changde in Central China's Hunan province, visitors board boats and follow actors along a historical riverside quarter, moving between illuminated waterways, old streets and a small theater as *Changde Stories* unfolds.

The immersive production, which blends local history, traditional opera and digital projections, has become a primary engine for the city's burgeoning night-time economy. After the show, visitors spill into nearby restaurants and handicraft shops, extending an evening of entertainment into hours of consumer spending.

This integrated model is helping the Changde River Street block convert into business for local merchants. The 1.5-kilometer block received 18.25 million visits in 2025, up 75 percent year-on-year, while revenue rose 58.9 percent to 1.24 billion yuan ($184.39 million), according to local official data.

Crucially, more than 70 percent of revenue was generated at night, underscoring the commercial value of retaining visitors in the area beyond daytime sightseeing.

Changde's success highlights the growing role of services in driving domestic consumption. National service retail sales increased 5.3 percent in the first half of 2026, outpacing the 1.1 percent rise in goods retail sales, with tourism, cultural and recreational services among the fastest categories, according to the National Bureau of Statistics.

At the block, *Changde Stories* serves as the evening's centerpiece. First staged in May 2025, the production uses the Chuanzi River as a natural stage to weave the city's history with local folk music and customs.

Spectators watch from boats and stroll through the old quarter before entering an indoor theater, becoming part of the performance amid floating live sets. More than 50,000 people have attended since its debut.

The route seamlessly channels audience traffic into restaurants, tea parlors and specialty retailers, forging a cohesive "show-shop-dine" consumption chain.

Gastronomy plays a pivotal role in that momentum.

At Changxiangyue, a 1,400-square-meter restaurant serving local specialities such as *leicha*, or pounded tea, Changde rice noodles and claypot dishes, daily customer numbers have exceeded 2,000 during peak periods.

"During holidays, customer traffic can be five to 10 times the normal level," said store manager Zhu Xueqin.

Nearby, a rice-noodle restaurant has sold more than 2,000 bowls on its busiest days, while snack and tea shops continue serving customers through lunch, dinner and late-night periods.

The integrated approach delivered standout gains during the five-day May Day holiday, when the block received nearly 1 million visits, peaking at more than 200,000 on May 1 alone.

Businesses generated 66.56 million yuan during the holiday, with food and cultural experiences accounting for more than 70 percent of revenue, according to local official data.

Rich heritage provides the lasting anchor. The block hosts 87 intangible cultural heritage projects, ranging from woodcarving and traditional incense to Changde opera and *leicha*.

More than 800 regular heritage performances drew more than 300,000 spectators between March 2024 and August 2026. Notably, half of the audience was born in the 1990s or later, suggesting that traditional art forms are finding new consumers through live performances and social media.

"A commercial district must be rooted in culture," said woodcarver Pan Nenghui, who is working with his wife on a 30-meter carving inspired partly by the writings of celebrated Hunan-born author Shen Congwen. "The essence of intangible cultural heritage is to bring our culture alive."

The block has also embraced technology-driven attractions. A traditional Chinese medicine zone launched in May features herbal dining, artificial intelligence-assisted diagnostics and a holographic installation of ancient TCM physician Zhang Zhongjing. It received nearly 100,000 visitors in its first month.

This steady influx has solidified the commercial ecosystem. Waterfront shop occupancy has reached 100 percent, while the merchant survival rate has improved by nearly 60 percent since the block's launch.

Changde's approach closely matches national initiatives prioritizing service-led consumer demand and calling for upgraded performing-arts offerings, vibrant night tours, and deeper integration among scenic sites, dining and retail. In the city, that policy has crystallized into a proven formula: captivate visitors after dark with immersive art, and sustain them with rich local culture, food and entertainment.

Scientists map rock glaciers on plateau

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese scientists have identified 132,867 rock glaciers across 16,500 square kilometers of the Qinghai-Tibet Plateau in the first comprehensive inventory of its kind.

While glaciers are what come to mind when people think of the plateau's "solid reservoir", the number and significance of rock glaciers — periglacial landforms made of ice-rich debris that slowly move downhill in cold alpine environments — have been seriously underestimated.

The figure exceeds the total number of rock glaciers previously known worldwide, suggesting a long-standing underestimation of their quantity and their role in the plateau's frozen water reserves.

The study was published recently in the journal Science Bulletin. The dataset has been made public through the National Tibetan Plateau Data Center.

Although not true glaciers, rock glaciers serve as indicators of mountain permafrost and potential reservoirs of solid-water. The Qinghai-Tibet Plateau, dubbed a core part of the "Asian Water Tower", is home to one of the largest concentrations of mid- to low-latitude permafrost on Earth, nurturing many rock glaciers.

However, a comprehensive and unified dataset tracking the movement of rock glaciers has been elusive, largely due to the challenges posed by the region's high altitude, rugged terrain and the labor-intensive nature of manual data interpretation.

The research team integrated high-resolution optical remote sensing imagery, radar data and digital elevation models to develop a deep-learning method for automatically detecting rock glaciers across the plateau. They employed multi-temporal radar techniques to extract surface deformation rates and obtained kinematic data for 99.3 percent of the cataloged features.

In addition to location and boundaries, the inventory records the morphological type, terrain attributes, glacier connectivity and motion status for each unit, supporting research into rock glacier activity and periglacial geomorphic dynamics.

Notably, the team estimated that ice stored within the plateau's rock glaciers is equivalent to roughly 92 to 186 cubic kilometers, which is comparable to the storage capacity of dozens of large reservoirs.

"This represents a solid-water reserve in the Asian Water Tower that has been largely underestimated," said Feng Min, a professor at the Institute of Tibetan Plateau Research of the Chinese Academy of Sciences who led the study.

"This discovery could have substantial implications for long-term hydrological regulation in regions lacking glaciers or where glaciers are rapidly retreating," Feng added.

The dataset also provides insights into geohazard risks. Rock glaciers creep continuously and, where they intersect roads or river valleys, can trigger ground deformation, river blockages and debris flows. By documenting the spatial relationship between rock glaciers and nearby infrastructure, the inventory offers a new tool for assessing mountain hazards, Feng noted.

"When mapping permafrost, we used to lack direct geomorphic evidence. Rock glaciers are natural markers that indicate where frozen ground exists," Feng said.

He said that the dataset is expected to support permafrost monitoring, water resource assessment, cryospheric hazard identification and surface process modeling, while providing an important baseline for reassessing the global extent and water storage of rock glaciers in cold mountain regions.

Bridging cultures through innovation

Youth from China and abroad photograph a bionic hand playing an electronic piano in Hangzhou, Zhejiang province, on Tuesday. The international science exchange event welcomed 50 offline attendees, including international students, domestic university students and experts, alongside over 5,000 online participants. The event focused on cutting-edge AI fields like brain-computer interaction and bionic technology, fostering dialogue and collaboration while advancing Hangzhou's international sci-tech ecosystem. Officials to face lifelong ecological accountability

Guideline outlines when leaders may be held liable for protection failures

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

Chinese central authorities on Tuesday unveiled a guideline on holding Communist Party of China and government leaders accountable for ecological and environmental damages, with a clear emphasis on lifelong accountability.

The document, issued by the general offices of the CPC Central Committee and the State Council, makes clear that accountability is not limited by time or position.

Where distorted views of governance performance, violations of the new development philosophy and the requirements for high-quality development, or other similar acts have caused serious ecological damage, the responsible persons shall be held strictly accountable, "regardless of whether they have been transferred to another post, reassigned, promoted, left office or retired", the guideline said.

The rule applies to leading members of local Party committees and governments at or above the county level, relevant departments of the central and State organs, and related institutions. It also refers similar cases involving township governments, public institutions, development zones and State-owned enterprises to the same framework.

In defining major accountability situations, the rule said local principal officials should be held responsible if they fail to carry out central decisions on ecological civilization, make decisions that breach laws or policies, or cross the red lines for environmental protection, minimum standards for environmental quality, and ceilings on resource utilization.

It also covered failures in promoting green transition, poor coordination in ecological protection and mishandling major pollution or ecological incidents.

For other local leaders, accountability may be triggered when they fail to supervise departments under their charge, tolerate violations, or mishandle environmental funds, it said.

For department leaders, examples include issuing rules that conflict with environmental laws or policies, greenlighting projects that fail to satisfy statutory requirements, failing to enforce inspection requirements, or ignoring public complaints and reports, according to the document.

The rule further specified that leaders who use their influence to obstruct environmental inspections, interfere in judicial handling of environmental cases, meddle in project approvals, or order the falsification of statistical, survey, assessment, monitoring or environmental impact data will be held accountable.

Accountability measures may include reminder talks, criticism and education, orders to make self-criticism and admonition; organizational adjustment and punishment; and disciplinary penalties.

Suspected criminal acts must be transferred to the relevant authorities for handling under the law, it noted.

Government bodies that are responsible for the supervision and administration of ecological and environmental protection must, upon discovering any circumstances warranting accountability as prescribed in these measures, conduct an investigation into the ecological and environmental damage in accordance with the law and within the scope of their duties, the guideline ruled.

It said, where the issues involve major ecological and environmental damage, or where complex problems cut across regions, watersheds, or departmental boundaries, the investigation may be escalated to a higher-level authority.

Disciplinary inspections, environmental and resource inspections and departure audits of natural resource assets may uncover major ecological damage or official negligence, it continued. Such cases must be referred to the disciplinary and supervisory authorities and the personnel departments under established procedures. Those bodies will then pursue accountability in line with regulations, discipline and the law.

The guideline shall take effect upon promulgation.

Gift exchange highlights duo's long-lasting green drive and friendship

By **WANG SONGSONG** in Ordos, Inner Mongolia and **YUAN HUI** in Hohhot

Yin Yuzhen, a national model worker renowned for her decades-long desertification control efforts in Ordos, Inner Mongolia autonomous region, exchanged gifts with her American friend Ronald Sakolsky on Tuesday, as part of his long-awaited reunion tour in China.

The gift-giving ceremony took place in the morning. Yin presented Sakolsky with embroidered insoles inscribed with the words "desert" and "friendship", along with the phrase "never forget". Other gifts included an embroidery piece bearing the message "one Earth, one dream", with images of the planet, trees, and the names of both individuals, as well as a plate with their portraits on it and some local specialty foods.

In return, Sakolsky, who hails from Pittsburgh, Pennsylvania, brought gifts for his Chinese counterpart, including a scarf and a hat featuring the Pittsburgh Steelers, an American football team.

He also brought two large suitcases, adding that "I brought two suitcases because I know China. They are almost full and I only just arrived. I have to take these gifts home."

Sakolsky expressed his gratitude to the China Education Association for International Exchange, saying, "Let us not forget that CEAIE. I would not be here if it were not for CEAIE. They sent me to China. Now I am back again."

Their remarkable story began in 1999 when Sakolsky, who taught English in Henan province under a China-United States teacher exchange program, organized by CEAIE, was moved by a television report on Yin's tireless efforts to turn the desert green. He raised $5,000 in donations to support her afforestation work — a sum that helped transform the barren landscape into a thriving forest of over 50,000 trees.

"I am just playing my part in a broader story. I thought it was impossible. She made it possible," said Sakolsky as he reflected on their shared mission.

He added, "She shares the same dream to make the Earth more beautiful. She made the changes. Now the Earth gives it back: all the trees, fruit, vegetables. She is the miracle hero and she never quits."

> "She shares the same dream to make the Earth more beautiful. She made the changes. Now the Earth gives it back: all the trees, fruit, vegetables. She is the miracle hero and she never quits."
>
> **Ronald Sakolsky,** a retired teacher from the United States

On the same day, Sakolsky visited the global innovation research and development headquarters of Kargobot Autonomous Driving and experienced an unmanned bus.

"I've never been in a vehicle with no driver. It is amazing and it proves that Ordos is a city of the 22nd century," he added.

According to Yao Kai, vice-president of the headquarters, the technology makes cargo transportation more efficient and environmentally friendly, contributing to ecological protection efforts.

Sakolsky arrived in Ordos on Sunday to reunite with Yin for the first time in 26 years. Their emotional reunion, which attracted wide public expectations after Yin's online search for her benefactor went viral in May, has been hailed as a vivid example of people-to-people friendship between China and the US. On Monday, the pair planted three evergreen trees together in Maowusu, China's fourth largest sandy area, fulfilling a promise made during their online reconnection months earlier.

According to previous reports, Sakolsky's trip to China will run through Sept 1 and includes visits to Henan and Beijing.

Pioneering designer of JH-7 fighter-bomber dies

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Chen Yijian, chief designer of China's JH-7 fighter-bomber and an academician of the Chinese Academy of Engineering, died on Monday in Xi'an, capital of Shaanxi province. He was 96.

Born in June 1930 in Fuzhou, Fujian province, Chen grew up amid the flames of the Chinese People's War of Resistance Against Japanese Aggression (1931-45) and completed his primary and secondary education in his home province.

In interviews prior to his death, Chen said when Japanese forces invaded his hometown of Fuzhou, he was forced to move with his father to Nanping county. With no air-raid shelters available, he and his family would often flee into the mountains whenever Japanese warplanes carried out bombing raids.

Chen explained that the Japanese pilots were so brazen that they flew extremely low — so low that people on the ground could clearly see their faces.

Chen Yijian

After graduating from high school in 1948, he applied to Xiamen University in Fujian, listing the newly established aeronautical engineering program as his only preferred choice.

"I was determined to study aviation and build aircraft — if we had no planes of our own, we would continue to be bullied by others," he said.

Three years later, following a nationwide restructuring of university departments, Chen and his classmates in the aeronautical engineering department were transferred to Tsinghua University in Beijing to continue their studies.

After graduating in 1952, the young engineer was assigned to the State-run No 122 Factory in Harbin, Heilongjiang province, now known as Harbin Aircraft Industry under the Aviation Industry Corp of China.

At the time, the War to Resist US Aggression and Aid Korea (1950-53) was underway, and a number of damaged Chinese aircraft were rushed to aircraft factories in Harbin, Shenyang and other cities for repairs. Upon reporting for duty at the factory, Chen joined the repair work and gradually acquired the knowledge required for aircraft design.

In late 1956, Chen was selected to join the People's Republic of China's first aircraft design office, the predecessor of the Shenyang Aircraft Design and Research Institute in Liaoning province. It was there that his career in aircraft design took off.

He participated in the early development of several models, including the JJ-1, New China's first domestically developed aircraft, the CJ-6 trainer and the Q-5 attack aircraft.

In 1961, the Shenyang institute was formally established. That same year, Chen was promoted to head of fuselage design at the institute.

In 1964, Chen was transferred to the Xi'an Aircraft Design and Research Institute, now known as the AVIC First Aircraft Institute, where he was mainly involved in the development of the Y-7 transport aircraft and took part in modification work on two bomber models.

During the mid-1970s, Chen took the lead in exploring the development of a next-generation tactical bomber. Their proposal was accepted by the government and military in 1977, resulting in the launch of the H-7 bomber project.

In 1978, Chen was appointed deputy chief designer of the Xi'an institute. In 1982, he was named chief designer of the new aircraft, which by then had been renamed the JH-7 "Flying Leopard" fighter-bomber.

With no prototype or reference model to draw on, Chen broke with convention and, despite considerable pressure, made the decisive call that the new jet's design standards would be brought in line with international norms.

In his 50s, Chen taught himself to write simple aircraft design software. The JH-7 became one of the earliest aircraft models in China to use computer-aided design.

In December 1988, the long-troubled JH-7 finally made its maiden flight, followed by a decade-long flight-test phase. It underwent more than 1,600 test flights before receiving design certification in August 1998.

In 1999, the JH-7 received the top-grade prize in the national science and technology advancements awards. Chen was elected an academician of the Chinese Academy of Engineering in December that year.

After stepping away from aircraft design, Chen served as a professor of aeronautical engineering at several domestic universities and took part in feasibility studies for China's domestically developed large aircraft.

CHINA

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

Fujian league attracts cross-Strait players

Taiwan soccer talent find goals, massive crowds at mainland matches

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

Clockwise from top left: Team Xiamen and Team Jinmen exchange gifts before a friendly match in Xiamen, Fujian province, on July 5. Taiwan's Peng Chia-en waves a flag for Team Xiamen. Taiwan's Huang Wei-chieh (right) dribbles during a match representing Team Fuzhou. Supporters cheer for both teams during the Xiamen-Jinmen friendly match. PHOTOS PROVIDED TO CHINA DAILY

The Fujian city soccer league is inviting Taiwan players to compete on the Chinese mainland, and welcoming residents from across the Strait to enjoy the matches firsthand to deepen compatriot affinities and bring hearts closer together.

Representing Fujian province's nine cities and the Pingtan Comprehensive Experimental Zone, 10 teams and nearly 500 amateur players are competing in the tournament, which will conclude with the final in October.

To boost cross-Strait integration, Fujian — the primary ancestral home for Taiwan compatriots — allows every participating team to add two Taiwan players to its roster. By August, 19 Taiwan players had joined different city teams, according to the Fujian provincial administration of sport.

Data shows that more than 1,500 people from Taiwan have attended matches across Fujian, and that the league serves as an active catalyst for deepening cross-Strait people-to-people exchanges.

Ni Pei-hsu, 24, from Taiwan, joined Fuzhou's soccer club in late June after learning about the recruitment online and was drawn by the massive crowds. It's his first time playing on the mainland.

At Saturday night's match, Fuzhou defeated Longyan 3-1 at the Fuzhou Strait Olympic Sports Center. Ni repeatedly tore through the opponent's defense, while his teammate Huang Wei-chieh, also from Taiwan, scored the opening goal.

"Hearing fans shout my name during the match felt incredible, an experience I've never had before," Ni said, adding that he could feel the energy from the nearly 50,000 spectators who filled the stadium.

Ni said he enjoys living, dining and training together with his teammates in Fuzhou. They visit local scenic spots and watch movies on weekends, inspiring him to stay and continue his soccer career on the mainland.

Another Taiwan compatriot, Yang Chih-po, joined the Pingtan soccer club in June through a coach he met during previous matches in Fujian.

On June 27, he made his debut in Pingtan's away match against Nanping. In the 65th minute, Yang scored the winning goal from a set piece. This marked his very first goal since joining the league, helping Pingtan secure a crucial 1-0 victory and snapping their previous seven-game losing streak.

Recalling his debut, although Yang felt nervous due to the massive crowds both in the stadium and online, he remained focused. "With such a great opportunity, I told myself to just enjoy this stage and perform well," he said.

"There are many young soccer players on both sides, and the sports environment and atmosphere on the mainland are excellent," Yang added, encouraging more Taiwan players to hone their skills and embrace the challenges on the mainland platform.

By reserving dedicated viewing areas and distributing free tickets, the league warmly welcomes both first-time and frequent visitors from Taiwan. It has also established a short-video collection event to encourage soccer fans from both sides to cheer together.

Chen Yu-hsuan, a Taiwan student at Xiamen Information School, performs as a cheerleader for Xiamen's club. Her squad wears white uniforms representing Xiamen's symbolic egrets, and ocean-blue ones representing the sea, beautifully capturing the coastal city's unique local character.

"When our team scores, the whole stadium erupts, and I stand up cheering with everyone in pure excitement," Chen said.

As a Taiwan student residing in Xiamen, Chen said that representing the city before crowds of both local and visiting fans makes her feel incredibly proud of her life and community on the mainland.

Rita Chen and her husband Joe Peng traveled from Taoyuan, Taiwan, to Xiamen over the weekend specifically to cheer for their son, who played for Xiamen on Saturday night against Putian. Prompted by the soccer matches, the trip marked the family's very first visit to the mainland.

In July, their son, Peng Chia-en, represented the team of Jinmen, an outlying island off the coast of Fujian, in an exchange match against Xiamen — a key sub-activity of the city league that drew many Taiwan spectators. After touring locally to boost cross-Strait understanding, Peng and another Taiwan player were officially invited to join the Xiamen squad, while another two joined the Nanping club.

"We discovered that so many people support soccer matches in Xiamen, which is rare in Taiwan," Chen said. "The atmosphere is incredible. I hope other Taiwan compatriots who are interested can come over, enjoy the soccer spirit, and grow."

Zhang Yuehong, assistant coach of the Xiamen team, said: "Taiwan players travel to Xiamen to play just like visiting relatives. There is a very harmonious atmosphere as soccer enthusiasts from both sides exchange ideas and build friendship."

The matches offer talented Taiwan players more opportunities to showcase their skills, Zhang said, adding that the league lays a foundation for the possibility of Taiwan soccer teams joining the tournament in the future, which is a highly anticipated wish for many Taiwan players.

"The league is like a seed planted in the hearts of sports-loving young people from Taiwan," said Lee Chen-hsuan, a Taiwan player participating in the league.

Lee, president of the Pingtan Taiwan Business Association who moved to the mainland in 2016, said the event serves as a grand platform for those from Taiwan to experience diverse local customs and Fujian's unique culture.

"Many from Taiwan want to participate in the event," Lee said, noting that participants can also integrate into coaching staff and logistical support teams to gain broader experience in the sports industry.

Lee added that the event's influence is expected to extend to other provincial leagues in Zhejiang, Jiangsu and Sichuan provinces, inspiring more young Taiwan players to explore and develop careers across the mainland.

Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, said that grassroots city soccer leagues across the mainland have ignited the passion and energy of fans from both sides of the Strait every weekend this summer.

"In the Fujian league, Taiwan players fight alongside their mainland teammates, scoring multiple goals and receiving passionate support," Zhu said. "Facts prove that anyone with passion and perseverance can win applause on an expanding stage."

Animal communicator heals pet owners' hearts

By **ZHANG YI** and **HU MEIDONG**

Tseng Yi-ju, from Taiwan, works in her pet studio in Xiamen, Fujian province. WANG JINGHAN / FOR CHINA DAILY

Tseng Yi-ju, who comes from Taiwan, has served hundreds of pet-owning families on the Chinese mainland, helping people decode the unspoken needs of their animals while healing the hearts of the owners.

With the rapid expansion of the pet market and a growing focus on the human-animal emotional bond, she has found a clear direction for her entrepreneurial career in this emerging field in Xiamen, Fujian province.

"Xiamen feels just like home to me," Tseng said, noting that her move to the coastal city in 2021 was eased by its familiar climate, warm hospitality and strong government support for Taiwan entrepreneurs — including intellectual property workshops that greatly accelerated her start-up's growth.

"People increasingly treat pets as core family members," Tseng said. Her business integrates patented animal communication training and custom pet accessories.

Tseng recalled one corporate executive who joined a session to bridge the gap with younger employees as he wanted to organize pet-centric activities to boost team cohesion, and hoped that understanding pets would help him better connect with the younger generation, as many raise pets.

"The initial and primary motivation of most clients is simply to forge a deeper, more meaningful connection with their own pets," Tseng said, noting that proper communication also offers critical solutions to severe animal behavioral issues.

Tseng shared a case where an indoor cat was constantly biting its own fur bald despite medical tests showing no physical illness. Through a communication session, she discovered the cat felt disturbed and unsafe due to its noisy environment.

This was because the cat owner's former apartment had poor soundproofing and creaky floors.

The owner later reported that the self-harming behavior stopped after she relocated to a quieter residence.

Tseng also helps owners navigate emotional crises during pets' final days. She recalled a client who enrolled because his dog was extremely old, deeply desiring to understand and accompany his companion through its final stage.

Another client sought Tseng's help for an aging cat suffering from severe organ failure following major liver surgery. During that emotional session, they spent most of their time addressing the owner's past regrets and saying a proper goodbye. The cat remarkably stabilized afterward, allowing the owner to adjust his life and maximize their remaining time.

Liu Jingruo, a Xiamen resident, experienced the deep emotional impact of this practice when she sought Tseng's help for her 17-year-old poodle, Youyou, which suffered from a painful, ruptured abdominal cyst.

"Veterinarians across the city warned me that Youyou was too old to survive an operation," Liu said. However, through a joint session with Tseng, she learned that the dog actually desired the surgery so it could leave the world with a whole body.

Tseng maintained constant communication with the owner and the dog right up to the operation. Just three hours after surgery, the elderly poodle managed to stand up independently.

"I burst into tears when I saw it. It was so tough," Liu said. "Though Youyou later passed away, the experience left me with absolutely no lingering regrets."

The experience inspired Liu to study animal communication herself, finding it deeply therapeutic. She now allows her middle-school child to join the training to help the teenager understand the pure, selfless love that animals offer.

Liu said that there are times when her child prefers to confide in the family pet rather than speak to her. "The animal might give the child a gentle gaze or a very calming feeling," she said.

Sun Xiaonan, another student, found that studying communication heightened her ability to manage multi-pet households, especially after she adopted a fierce stray cat that bullied her resident pet.

Sun discovered that her resident cat was enduring immense stress just to keep the peace and spare its owner from conflict. By providing targeted reassurance, Sun successfully gave the animal an emotional outlet, preventing further stress accumulation.

"Having reliable, trustworthy animal communicators is essential for modern families," Sun said, adding that she believes this specialized emotional support is quickly shaping up to be a major future trend across the mainland market.

Liu Yizhou and Wang Jinghan contributed to this story.

Where law meets humanity

A suspense drama follows three legal professionals to explore justice, morality and human nature beyond courtrooms.

(From left to right) Francis Ng, Zhong Chuxi and Zheng Yunlong portray three legal professionals whose lives become intertwined in a decade-spanning case in the suspense drama *The Trembling of Cicada*. PROVIDED TO CHINA DAILY

By WANG XINGWEI
wangxingwei@i21st.cn

In the courtroom, criminal defense lawyer Ding Ning methodically presents evidence and points out uncertainties she has uncovered in a rape case. Rather than simply accepting a guilty plea, the young lawyer works to protect the legal rights of her client, a young nursing home caregiver accused of rape.

The scene appears in the first episode of the suspense drama *The Trembling of Cicada*.

Starring Hong Kong actor Francis Ng, Chinese mainland actor Zheng Yunlong and actress Zhong Chuxi, the drama premiered on Zhejiang TV on Aug 20 and is also available on streaming platforms including iQIYI, Tencent Video and Migu Video.

Through the perspectives of three legal professionals, the drama gradually unveils a complex case spanning more than 10 years, using the law as a lens through which to explore justice, moral choices and human nature.

For Ng, who plays judge Yu Songfan, the role offered a new experience despite more than three decades in acting.

"It was a rare opportunity. Almost every scene carried its own emotions and meaning, so I never allowed myself to relax," Ng said.

It is his first time playing a judge on the Chinese mainland, and the role gave him an opportunity to gain a better understanding of a judge's work.

"My character, Yu Songfan, carefully researches each case before it reaches the courtroom, and judges must deal with many cases every day. It made me realize just how demanding their work can be," Ng said, adding that judges need to remain clear-headed and make balanced judgments based on evidence and legal procedures.

For Zhong, who plays criminal defense lawyer Ding Ning, the role prompted her to think about a profession that can sometimes be controversial in the public eye because it involves defending people accused of serious wrongdoing.

"It takes courage to become a criminal defense lawyer," Zhong said.

She noted that being a suspect does not necessarily mean a person is guilty, and that criminal defense lawyers work to safeguard the legal rights to which suspects are entitled.

"Cases are rarely one-dimensional. There are often many sides to them," Zhong said. "At its core, the work of a criminal defense lawyer is about upholding justice and equality, and I find that deeply admirable."

> "At its core, the work of a criminal defense lawyer is about upholding justice and equality, and I find that deeply admirable."
>
> **Zhong Chuxi,** actress

For her, Ding's story is also one of personal growth. "Ding goes through a transformation after a long period of dormancy, much like a cicada emerging from underground. In that sense, her journey also echoes the title of the drama," Zhong said.

While Ding seeks to protect the rights of the accused, Zheng's character approaches the law from a more morally ambiguous direction.

Zheng plays prominent lawyer Zhao Yijie, who is adept at reading and manipulating others while navigating the gray areas of the law.

"It's an unconventional role," Zheng said. "He has his own ambitions and difficulties, but the way he deals with them can be quite unusual."

For Zheng, portraying the character required looking closely at the relationship between the legal profession and human nature.

He believes lawyers need to interact with people and, more importantly, understand them.

"My character, Zhao Yijie, is very good at identifying people's weaknesses. He observes them, provokes them and sets traps for them, pushing them to the point where they lose their rationality," Zheng said.

"When you play a complex character, you have to understand exactly where that complexity comes from and what lies behind it," he added.

That complexity also shaped how Zheng approached the character. As a musical theater actor, he drew on his stage experience while adapting it to the different demands of television.

"Stage and television are completely different. On stage, you're always conscious that some audience members are sitting far away, so your movements and expressions often need to be larger and more pronounced," he explained, adding that television acting, by contrast, calls for greater subtlety.

But beneath Zhao's dramatic persona and the twists and turns of the plot, Zheng believes the story ultimately deals with questions that extend beyond the legal world.

"It touches on something many people may experience: when you face adversity or even injustice, how do you overcome the negative emotions that come with it?" he said. "That is a universal theme, and I think it can resonate with audiences overseas as well."

According to the production team, the drama is set to reach audiences worldwide, with priority given to Singapore, Malaysia and Brunei.

Zheng said cross-cultural communication can be strengthened by finding emotional connections that resonate with people from different backgrounds.

He cited a production of *Hamlet*, in which he performed last year, as an example. Although the play is a Western classic rooted in a different cultural tradition, its central questions about choice and uncertainty remain recognizable centuries later.

Believing sincere emotions can cross language and cultural boundaries, Zhong hopes Chinese productions can offer international audiences perspectives they have not encountered before.

She likens an actor to a transmitter. "Our job is to convey emotions, ideas, values and perspectives," she said. "Chinese culture is incredibly diverse, and we are still exploring new ways to present it. I hope this drama can offer overseas viewers a fresh take on Chinese suspense storytelling."

For Zhong, audiences encountering stories from other cultures are often searching not for differences, but for something recognizable in themselves.

"They may see something of their past, their future or the possibilities in their own lives," she said.

"As a young actress, I also hope to keep discovering new possibilities for myself," she added.

Rewriting the story together

China-Africa media cooperation is expanding through co-production, training and technology, with greater emphasis on local voices and shared storytelling.

By **SHAMIM ZAKARIA**
shamim@21stcentury.com.cn

When asked how direct media partnerships could give African countries a greater role in shaping how they are represented internationally, Chernor Bah, Minister of Information and Civic Education of Sierra Leone, returned to a fundamental question: Who gets to tell the story?

"For years, Africa has been diminished and Africa's story has been told by Western narratives," Bah said. "Those narratives do not exalt us and they never make us really the heroes of our own stories."

Bah's concern was the extent to which Africans themselves help shape coverage of their continent. Closer China-Africa media cooperation, he said, offered "a huge opportunity to learn from each other" and to "author a different story" rooted in people's experiences, cultures and aspirations.

That idea ran through discussions at the 7th Forum on China-Africa Media Cooperation, held in Beijing from Aug 19 to 21. Delegates noted that authentic representation requires practical involvement at every stage, from developing ideas and identifying sources to local-language reporting, editing and distribution.

The forum brought together about 400 representatives from China and 45 African countries, including a record 33 ministerial-level guests from African countries, according to the organizers. It was co-hosted by China's National Radio and Television Administration, the Beijing municipal government and the African Union of Broadcasting.

The forum came as 2026 marks the 70th anniversary of diplomatic relations between China and Africa and is the China-Africa Year of People-to-People Exchanges. Egypt became the first African country to establish diplomatic relations with the People's Republic of China in 1956.

Co-production emerged as a main way to give local partners a role from the outset, bringing them into story development, editorial decision-making and production, rather than simply exchanging completed programs.

Dr Ismaila Ceesay, Minister of Information, Media and Broadcasting Services of The Gambia, said agreements reached with Chinese partners, including arrangements involving the country's public and private broadcasters, should provide a foundation for moving beyond content exchange toward co-production, particularly of programs concerning young people, culture and history.

Chinese programs were already being broadcast weekly on two television stations in The Gambia, Ceesay said, while a coordinating team was being established to bring media organizations together around co-production.

He also identified modern technology, digital skills, technology transfer and newsroom modernization as pressing needs. Gambian professionals trained in China, he said, should apply and share their knowledge at home so that one training opportunity can benefit an entire newsroom.

Ceesay described young journalists as eager to demonstrate their abilities and adept at using technology to introduce their cultures and countries. Bringing Chinese and African journalists together during planning and production, he said, could also build lasting professional relationships and improve access to local languages, sources and knowledge.

Top: Journalists interview a guest at the 7th Forum on China-Africa Media Cooperation in Beijing. **Above:** The 7th Forum on China-Africa Media Cooperation takes place in Beijing from Aug 19 to 21. PROVIDED TO CHINA DAILY

Tech expands reach

Beyond policy discussions, the forum gave delegates a close look at the technologies increasingly shaping media production. They visited the 8K facilities of Beijing Radio & Television Station (BRTV) and the 33rd Beijing International Radio, TV & Film Exhibition (BIRTV 2026). The forum also featured three themed exhibition areas presenting China-Africa media cooperation, audiovisual innovation and cultural exchanges.

Displays included digital content management systems and a mobile production vehicle using 5G, AI and cloud tools.

Marie-Louise Diallo, deputy director-general of Guinea's national daily Horoya, said she was highly impressed by BRTV's technical capabilities, particularly the image quality offered by its 4K and 8K systems.

She also noted that Guinean journalists were participating in a training program in Beijing.

Infrastructure cooperation is also extending beyond broadcasting. Bah cited a project in Sierra Leone where, in July 2025, he led the signing in Beijing of a $5 million memorandum of understanding with China's Diming Yimo (Tianjin) Printing Co Ltd to modernize Sierra Leone's Government Printing Department, provide equipment and training, and support a national printing training institute.

Some displays also showed how technology could address another challenge raised repeatedly at the forum: language.

At a display by Xiaohongshu, or RedNote, an AI function translated speech and written messages in real time. An interactive map generated a postcard for a selected African country.

Speaking during a visit to BIRTV 2026, Jean Maurice Uwera, deputy spokesperson for the government of Rwanda, identified language as a practical obstacle to the wider circulation of audiovisual content.

"Chinese culture is quite rich, but there is always that barrier of language," he said, adding that dubbing and subtitles could help productions reach audiences who might otherwise be unable to engage with them.

As AI plays a larger role in media production and distribution, the issue also extends to which languages such systems can recognize. Bah said African languages should be included in AI models and African partners should participate in developing them. Such cooperation, he said, could improve translation and digital tools for the communities whose stories they carry.

Bah noted the exchange should also work both ways, with African stories reaching Chinese audiences just as Chinese stories reach Africa. Joint reporting and content creation, he added, could introduce audiences to everyday life, entrepreneurship, history, culture and the experiences of young people.

The forum released a joint declaration and announced 80 achievements in China-Africa cooperation in areas including production and exchange, professional development and media technology. According to the organizers, the declaration advocates sustained news cooperation, joint productions, program translation and mutual broadcasting, AI application and governance, and youth exchanges.

For Ceesay, the purpose of such cooperation ultimately comes back to how people understand one another.

The objective, he said, should be to "tell our story, tell the African story, tell the Chinese story" in a way that enables people to understand one another's challenges, aspirations and history.

Participants in the 7th Forum on China-Africa Media Cooperation pose for a group photo. PROVIDED TO CHINA DAILY

Seeds of health care take root in mountain villages

By **MENG WENJIE**
mengwenjie@i21st.cn

In July, as cicadas echoed through the mountain villages of Enshi Tujia and Miao autonomous prefecture, Hubei province, 20-year-old Wu Yutong followed a village doctor along winding paths to visit local residents. As she met elderly villagers, she felt an unexpected sense of familiarity.

"Their accents sound very similar to those in my hometown, so I feel like I am seeing my own grandparents," Wu said.

Wu, a clinical medicine student at Taikang Medical School (School of Basic Medical Sciences) of Wuhan University (WHU), was among 17 students who traveled to Baiguoshu village to study rural healthcare and provide health education to elderly residents and children.

The visit was part of a tradition stretching back nearly a decade. Since July 2017, when the school's first group of 19 students established a volunteer health service base in the village, successive groups of medical students have returned to continue the work.

Wei Lei, a professor at the school and the team's instructor, was leading the program for the fourth time. The program included undergraduates studying clinical medicine, stomatology and public health. Wei said serving rural communities allows students to understand what it means to be a medical worker in ways textbooks alone cannot.

Over the years, the initiative has expanded from basic health checks to chronic disease follow-ups and research on local disease prevention. This year, the students turned their attention to how digital technology is changing access to healthcare in rural areas.

Focusing on the digital empowerment of primary-level healthcare, the team conducted research in Baiguoshu and seven surrounding villages, visiting hospitals, health centers, village clinics and residents' homes to examine the use of digital medical services at different levels of the healthcare system.

Volunteers from Wuhan University teach students how to use bandages at Enshi No 3 Middle School in Hubei province in July 2026. PROVIDED TO CHINA DAILY

For team leader Li Wen, 20, the fieldwork revealed a gap between technological progress and accessibility. Questionnaires showed that many residents over 65 struggled to use smartphones or self-service registration machines when making medical appointments.

The students discussed their findings with local health authorities and proposed placing illustrated guides beside registration machines to help elderly patients better understand how to use them.

"It may not be solved overnight, but through sustained efforts, we can make progress little by little," Li said.

But the program's impact is not measured only in research findings and proposals. Years of repeated visits have also brought tangible changes to villagers' lives.

Wu recalled the case of a villager named Long Fubing. In 2024, the team discovered during a medical consultation that Long had severe hypertension and began monitoring his condition. When Wu met him again this year, she found that his health had improved significantly. He was taking medication regularly and no longer stopped treatment without consulting doctors.

"Standing there, I felt I was seeing the results of years of work by previous teams," Wu said.

Long's experience reflects broader changes across the village. In 2017, 45.7 percent of residents had fallen into poverty because of illness, while only 2.49 percent put health knowledge into practice in daily life. By 2025, 87.5 percent of surveyed villagers were receiving regular checkups, and all surveyed patients with chronic diseases were taking medication as advised.

"These figures show that an important idea has gradually taken root among villagers — health should be managed proactively rather than addressed only after illness occurs," Wu said. "This is the most valuable achievement of the past 10 years."

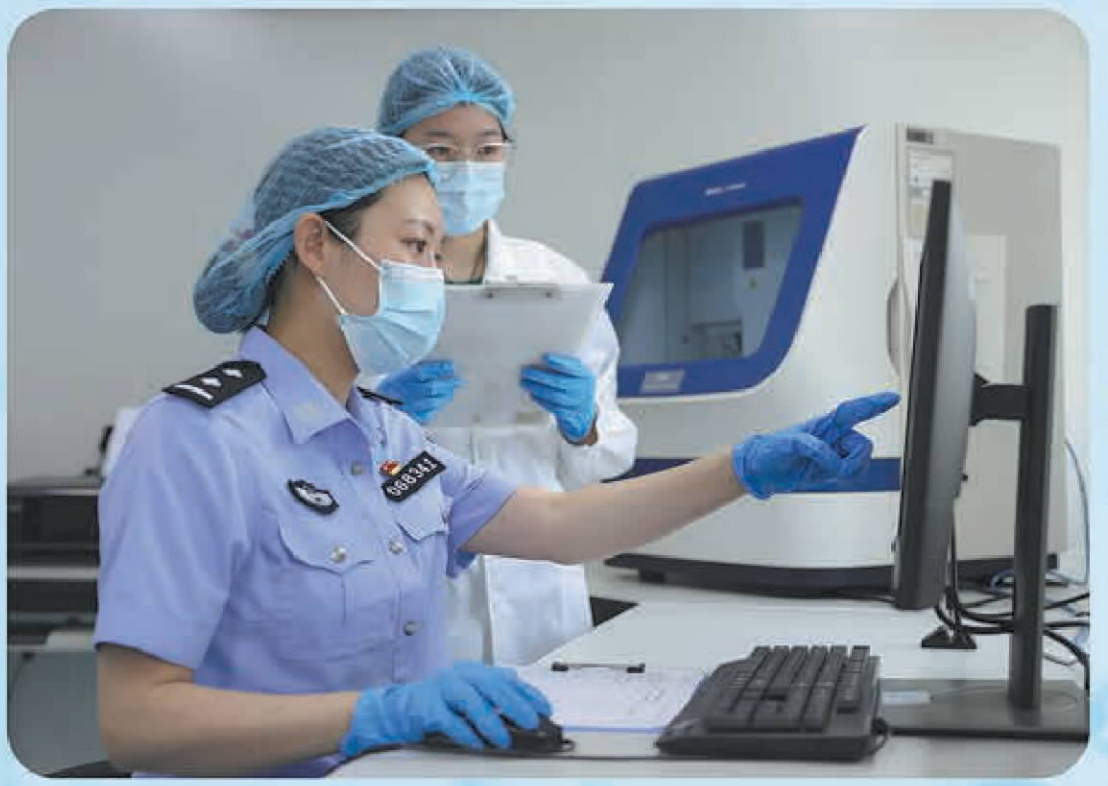
A decade of visits has brought more than medical services to Baiguoshu — it has also forged a lasting bond between the students, villagers and younger generations.

That bond was clear to Ning Zhenghao, 22, a basic medicine student who led the team in 2025. Although many villagers were meeting him for the first time, they immediately recognized the WHU T-shirts worn by the students.

"They told me that our team's story had even been recorded in the village archives," Ning said.

Ning and his teammates also gave health education classes at Baiguoshu village primary school, where he was encouraged by the children's enthusiasm for learning and their grasp of basic health concepts.

"Every health education class we give plants a seed in children's minds — an awareness of the importance of caring for their health," Ning said. "Perhaps one day, some of them may enter the medical field and use their knowledge to improve healthcare in their hometown."



Li Bo contributed to this story.

Truth found in tiny traces

Zhang Mengting combines biotechnology training with police work, helping investigators identify suspects, crack difficult cases and bring families back together.

Left: Zhang Mengting (front), a forensic DNA analyst with the Xiangyang Public Security Bureau in Hubei province, analyzes results on a computer with a colleague. **Right:** Zhang conducts laboratory work.
PROVIDED TO CHINA DAILY

By GUI QIAN and **LIU KUN**

On a sweltering afternoon in August 2020, mosquitoes and other insects swarmed around a dilapidated shack in Gucheng county, Xiangyang, Hubei province.

Police believed a suspect who was on the run after committing a serious crime might have spent the night there.

After receiving the call, Zhang Mengting, a forensic DNA analyst with the Xiangyang Public Security Bureau, went to examine the scene.

Bending over, she searched the entire shack inch by inch. Once. Twice. Ten times.

Finally, on a worn sleeping mat, Zhang spotted a dark-red bloodstain measuring only about 2 millimeters across. It was not human blood, but blood left behind by a mosquito that had been swatted.

She carefully collected the almost imperceptible trace and took it back to the laboratory for analysis.

"Evidence doesn't reveal itself," Zhang said. "Only by staying focused and examining a scene meticulously can we find the crucial clue among countless traces."

DNA extracted from the blood eventually led police to the suspect, who had fled elsewhere, and the case was solved.

Zhang, however, stresses that solving cases is a team effort.

"Tracing the suspect's escape route and figuring out how he got there all depended on colleagues from other police units," she said. "I simply did my part."

Her ability to spot such an unlikely clue grew out of her scientific background and an unconventional path into policing.

Zhang, 32, is a native of Xiangyang. After graduating from Qingdao University in Shandong province in 2016 with a degree in biotechnology, she worked in new media and advertising.

In 2019, when the Xiangyang Public Security Bureau began recruiting DNA analysts from outside the police academy system, Zhang applied.

The decision brought her back to an ambition she had expressed years earlier. In middle school, when her English teacher asked students what they wanted to be when they grew up, Zhang answered, "A police officer."

"I found it fascinating that a tiny detail could help reconstruct the truth step by step," she said.

A changing profession

Her scientific training soon found a practical application in police work. The criminal technology unit where Zhang works covers a range of disciplines, including DNA analysis, trace evidence examination, forensic medicine, chemical and physical analysis, document examination, imaging and electronic evidence.

"Police academies usually focus more on training officers in investigation and case handling," Zhang said. "But policing today also brings together specialists from different fields, combining traditional investigative experience with better teamwork and procedures, as well as technologies such as big data and artificial intelligence. This makes investigations more efficient and precise."

> "If I could say one thing to the person I was back then, I would tell her: 'I hope you always hold on to your respect for science, your determination to pursue the truth and your commitment to serving the people.'"
>
> **Zhang Mengting,** a forensic DNA analyst

In recent years, more people without police academy backgrounds have entered the public security system through open recruitment, including some from fields outside the sciences. Zhang's career reflects that broader shift toward a more professionally diverse police force.

For Zhang, combining her biotechnology expertise with police work has yielded concrete results.

In 2024, a bottle was thrown from a high-rise residential building in Xiangyang and it struck a car below. With more than 1,000 people living in the building, investigators faced the challenge of narrowing down a suspect.

Rather than recommending that blood samples be collected from every resident, Zhang extracted DNA from the rim of the broken bottle. The DNA profile provided investigators with a crucial piece of evidence as they worked to identify the suspect.

Another case took her work in a very different direction. It involved a family separated for half a century.

In 1974, a 3-year-old boy referred to by the pseudonym Zhao was abducted and trafficked. His mother provided a blood sample for inclusion in a DNA database in 2017, but the search stalled because no DNA sample was available from Zhao's father, who had died.

Zhang and her colleagues proposed an unconventional solution: collecting blood samples from Zhao's biological brothers and using algorithms to infer their deceased father's genetic information.

The approach eventually helped establish the family connection, and mother and son were reunited after 50 years apart.

In more than six years as a police officer, Zhang has examined over 16,400 biological samples without error. Her DNA work has contributed to identifying suspects in more than 320 difficult cases, locating 35 missing or trafficked people and reuniting 42 families.

On April 29 this year, Zhang was awarded the Hubei May 1 Labor Medal.

But the moments she values most do not come with an honor or a title. As a technical officer who spends much of her time in the laboratory, Zhang rarely gets to meet victims or receive their thanks in person. After a case is closed, however, she often asks colleagues the same question: "How did the case turn out?"

Hearing that a difficult case has been solved or that her work has helped someone gives her a sense of fulfillment. "I realize that my expertise can really make a difference for victims," she said.

For Zhang, that sense of purpose goes back to what first drew her to detective work as a schoolgirl: the idea that something small, examined carefully, can reveal something much larger.

"If I could say one thing to the person I was back then, I would tell her: 'I hope you always hold on to your respect for science, your determination to pursue the truth and your commitment to serving the people,'" Zhang said.

China's C919 through an AI student's eyes

On July 13, at 10:20 pm, I boarded a flight from Harbin in Northeast China's Heilongjiang province to Beijing, where I would transfer to another flight to Budapest and return home to Europe. The trip marked the end of my first academic year at Harbin Institute of Technology (HIT).

I expected the Harbin-Beijing flight to be an uneventful first leg of a long journey home. Instead, it became my first experience aboard the C919 — China's domestically developed narrow-body passenger jet — and it gave me a new perspective on the country's technological progress and my own studies in artificial intelligence.

Because we boarded via a jet bridge, I did not get a clear view of the aircraft from the outside. I realized it was a C919 only after entering the cabin and noticing that the interior looked different from those of the aircraft I usually flew on.

This discovery immediately excited me and gave the flight an unexpected sense of significance.

Although the cabin layout was familiar, several details on this Air China aircraft made the experience feel modern. The first was the wireless in-flight entertainment system. After connecting my phone to the onboard network, I could open a portal offering films, television programs and games. It did not provide regular internet access, but it allowed passengers to use their own devices as personal entertainment screens.

Another practical feature was a dedicated phone holder above the tray table. I could place my phone at a comfortable angle, connect my headphones and watch a Chinese action movie without having to hold the device throughout the flight.

I was beginning my journey back to Europe, yet I was still surrounded by the Chinese language, Chinese entertainment and an aircraft that represented one of the country's major engineering achievements.

Silent precision

The flight felt calm and comfortable throughout, but what stayed with me most was the fact that everything worked exactly as it should.

As a passenger, I experienced only a quiet cabin and a smooth flight. Behind that ordinary experience, however, countless electronic, mechanical and software systems had to work together with exceptional precision and reliability.

Bartosz Turczynski shares his perspective on China's technological development through his experience aboard the C919. PROVIDED TO CHINA DAILY

As a first-year AI major at HIT, I began to think more deeply about those hidden systems. My courses included electronic circuits, computational thinking and practical programming in C, a widely used programming language. Until then, much of what I had learned existed mainly in the form of diagrams, exercises and small programs.

Sitting inside the aircraft connected those subjects to a much larger world of engineering. It made me consider how sensors, electronic components and software systems must cooperate continuously to keep a modern aircraft operating safely.

The area that interests me most is AI-assisted and increasingly autonomous aviation. Such technologies could help pilots interpret sensor data, identify abnormal conditions, optimize routes and make safer decisions.

For me, this area represents an exciting combination of AI, electronics, software and physical engineering.

I had already encountered this combination on a much smaller scale during a two-week robotics program at HIT over the winter vacation. At the end of the program, my group built a small autonomous vehicle that could receive information from sensors, process it and respond through movement.

The vehicle was simple but seeing it act according to our code changed my understanding of robotics. We were no longer only reading about autonomous systems; we had created one ourselves.

Before coming to China, I knew that the country was developing rapidly, but that knowledge was mostly abstract. During my first year here, I began to encounter technology not only as a topic in the news, but also through my studies and daily life.

The robotics program gave me the opportunity to help build a small autonomous system. The C919 flight allowed me to experience a far more complex engineering achievement as an ordinary passenger.

By the time we landed in Beijing, my initial surprise had developed into something more lasting. The flight gave me a clearer sense of why I had chosen to study AI and how much I still had to learn. It also strengthened my confidence in my decision to study in China, where the connections among research, engineering and everyday life are becoming increasingly visible.

Written by Bartosz Turczynski, a Polish undergraduate student majoring in AI at Harbin Institute of Technology. He has studied Chinese for five years and is particularly interested in AI, robotics and China's technological development.

BASKETBALL

Team China players pose on the podium after finishing second in the FIBA U18 Asia Cup with an 89-79 loss to Australia, its best finish since winning the tournament in 2014. FIBA

China celebrates silver lining

Under 18s narrowly miss out on Asia Cup glory, but runner-up finish hints at a golden future

Team China players celebrate reaching a first U18 Asia Cup final in 12 years after beating New Zealand 79-66 in Saturday's semifinal. FIBA

The rise of school-league prospects, such as Lyu Feiyan (center) of Tsinghua University High School, shows China's youth basketball pipeline is evolving. FIBA

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

It might have been a near-miss, but an inspiring run at the FIBA U18 Asia Cup has delivered a silver lining for the future of Chinese basketball, with the national program committed to revamping its talent development system.

For a second straight summer, Chinese men's basketball has fallen just short of continental glory, but its youth squad's runner-up finish at the Asian showpiece, after being overpowered by Australia 89-79 in Sunday's final, was anything but a disappointment.

The squad's gutsy final run, which marked the country's best result at the biennial U18 tournament in 12 years, has served up as encouraging a boost for the national program's rebuild as the senior squad's narrow one-point defeat to the mighty Aussies at the Asia Cup a year ago.

The last time China's U18 team won the continental title was in 2014, when Australia and New Zealand were not yet included in FIBA's Asian zone.

Despite coming up short against the Emus in the final in Ahmedabad, India, the Chinese team successfully avenged its 15-point loss to New Zealand in the 2024 semifinal, taming the Junior Tall Blacks 79-66 at the same stage on Saturday to reach its first title decider in over a decade — while securing a spot to next year's U19 World Cup in the Czech Republic.

Head coach Wang Jianjun, who guided his young squad to tournament bests in assists per game (27) and three-point shooting (43 percent), took pride from the teenagers' fighting spirit and future potential.

"From start to finish, everyone fought for every possession in every minute and every second of the game. I'm grateful for all the hard work these players have put in and I am really proud of them," Wang said in his post-final news conference.

"We have regrets about missing out on the title, but youth is our biggest advantage.

"This silver medal proves the huge potential of this young team. This precious international tournament experience will lay a solid foundation for their future growth.

"I hope they can show the world what they've got at next year's World Cup."

Talented, but lacking some physical and mental maturity, the Chinese team was dominated in the paint, out-rebounded 57-35 by the Emus with a stark 26-6 disparity in offensive rebounds, which allowed the Aussies 36 second-chance points.

However, the fact that Team China was the youngest among all quarterfinal contenders, with an average age of 17.2 years old and with four key members born after 2010, signifies a bright future for the squad.

Sixteen-year-old starting forward Zhang Yizhaojie, a versatile 6-foot-7 (2.03 meters) scorer, led China with a game-high 20 points in the final, before being selected into the All-Star Five as the youngest player in the tournament's best lineup.

He didn't get carried away by the recognition, though. "Playing against such a physical, high-intensity team like Australia has made me realize just how much we have to improve," said Zhang, who also led the team's scoring across the whole tournament, averaging 14.3 points per game.

"We need to further improve our ability to keep up with the physical nature and high intensity of international play."

Young center Li Junxian, a raw, 18-year-old talent that stands at 2.12 meters, notched a double-double of 15 points and 12 rebounds in the final, while sharp-shooting guard Zhang Yuchen, another 16-year-old prospect, added 13 points and seven assists on Sunday.

Zhang Yuchen also led the entire tournament field in three-point accuracy, shooting 56.2 percent from 16 attempts beyond the arc.

His rise from China's high-school league to the international spotlight, after leading Tsinghua University High School to the national championship in May, underlines China's evolving youth development system.

Once relying heavily on State-run sports schools and professional league clubs' youth reserves, the drafting scope of Chinese basketball is now expanding to school leagues, overseas academies and commercial training institutes.

Four of the 12 players on the current U18 squad were selected from outside the traditional pipelines, with Zhang Yuchen emerging as the brightest prospect and turning heads of North American scouts.

According to Li Qun, a former Chinese national team guard and a youth training promoter, Zhang Yuchen has attracted serious interest from Arizona-based Bella Vista College Prep School and the Royal Crown School in Canada, suggesting a potential move this fall with an eye on earning a future NCAA scholarship.

"A young guard like Yuchen, who attacks aggressively to make plays for teammates, fits into the modern style of basketball, and we should make it possible for him to tap into his full potential," said Li.

Zhang Bin, a former youth training director with the Chinese Basketball Association, stressed it's critical to give developing talent more international exposure and more competitive opportunities as early as possible.

"We have more games at home for junior players than ever, but the intensity and quality are still not enough," he said. "We should encourage more young talent to explore pathways to develop and study overseas."

Zhang Yizhaojie, China's top scorer at the tournament, was selected into the FIBA U18 Asia Cup's All-Star Five. FIBA

Klay joins Heat, set to team up with Adebayo, Antetokounmpo

MIAMI — Klay Thompson has signed his deal with the Miami Heat, which waited patiently for weeks to see if it would get the chance to add the sharpshooter to its reworked roster.

Thompson — who is No 4 on the NBA's all-time three-pointers list with 2,899 — cleared waivers Sunday afternoon and wasted little time finalizing a two-year deal worth about $11.5 million. The second season of the deal is at Thompson's option.

In many ways, the deal makes sense for both sides. Thompson makes no secret about how much he loves the water and boating; the Heat plays its home games at the edge of Biscayne Bay. He's of Bahamian heritage; the island nation is a short flight from Miami and is home to a sizable base of Heat fans. And, perhaps most importantly, the Heat knew it wanted to add shooting to surround the newly acquired Giannis Antetokounmpo and incumbent center Bam Adebayo.

"Klay is one of the most iconic players to ever suit up in the NBA," Heat president Pat Riley said. "A four-time battle-tested world champion who will fit perfectly into his role as an all-around player at both ends of the court. We all talk about his shooting skill, but there is so much more he brings to the game. We are blessed that Klay chose the Heat in our quest to challenge for championships."

Thompson, a 36-year-old about to enter his 14th season (not counting two missed because of injury), fits that bill perfectly. He's a career 41 percent shooter from beyond the arc, and last season marked the 11th time that he's made more than 200 three-pointers in a season. For context, only seven times in its history has the Heat had a player make 200 threes in a single year.

Following his contract buyout Klay Thompson will join the Miami Heat to play alongside Bam Adebayo and Giannis Antetokounmpo. AP

There's also the winning pedigree that Thompson brings. He paired with Stephen Curry to be part of Golden State's famed "Splash Brothers" duo that helped lead the Warriors to four NBA championships. He's a five-time All-Star, holds the league record with 14 made threes in a game, has connected on at least 10 threes in a game nine times and will enter this season just 74 three-pointers behind Ray Allen — a former Heat guard — for third place on the league's all-time list.

It's the latest big move for the Heat this summer. It acquired Antetokounmpo and Bobby Portis from Milwaukee in a deal that saw it send Tyler Herro, Jaime Jaquez Jr, Kel'el Ware and Kasparas Jakucionis to the Bucks. It also signed another big-time three-point threat in Tim Hardaway Jr, who grew up in Miami while his father was playing for the Heat.

Thompson and the Dallas Mavericks agreed on a contract buyout that was executed Friday, the end of his two-year run there that didn't get anywhere close to what either side originally envisioned — especially after the shocking trade of Luka Doncic by the Mavs to the Los Angeles Lakers.

Thompson joined Dallas in a sign-and-trade with Golden State, giving the Mavericks one of the league's all-time great three-point shooters to complement Doncic and another high-scoring guard in Kyrie Irving.

But the high hopes for that threesome imploded after the Mavericks sent Doncic to the Lakers for Anthony Davis in a deal before the trade deadline in 2025. Irving tore the ACL in his left knee a month later and hasn't played since, while Davis was traded to the Washington Wizards just before the February trade deadline last season.

GLOBAL EDITION 中国日报 THURSDAY, AUGUST 27, 2026

Chinese rescue personnel assemble at Chengdu Shuangliu International Airport on Thursday morning, preparing to depart for the disaster site in Gyirong, Xizang autonomous region. The deployment follows massive flash floods that struck on Wednesday near the China-Nepal land port, killing at least 157 people. XINHUA

Xi calls for all-out rescue efforts

Many missing after deadly mudslide hits border port in Xizang

By JI HAISHENG in Beijing and **PALDEN NYIMA** in Shigatse, Xizang

President Xi Jinping has ordered all-out rescue and relief efforts after a mudslide on Wednesday in Nepal caused heavy casualties and left many people missing at a border port in the Xizang autonomous region.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made the instruction after the mudslide struck the Gyirong border port, a major land port linking China and Nepal, in Shigatse at around 10:30 am, according to Xinhua News Agency.

The death toll reached 157 on Wednesday night, while another 41 injured are in hospitals, Xinhua quoted local authorities as saying.

The president stressed that the top priority now is to make every possible effort to search for and rescue missing people, evacuate residents at risk and provide timely medical treatment to the injured. He also underlined efforts to strengthen monitoring and early warning, carry out rescue work in a scientific manner and prevent secondary disasters.

Noting that the country is at a critical stage of flood control, Xi emphasized that all local authorities and relevant departments should prepare for worst-case scenarios and extreme situations, and earnestly implement measures for flood and typhoon prevention. They must also step up efforts to identify and defuse potential risks and hazards, resolutely prevent serious and major disasters and accidents, and effectively protect people's lives and property, he said.

Satellite images of valleys near the China-Nepal border show the situation before and after the disaster. REUTERS

Inside

See more, **page 11**

Premier Li Qiang has urged prompt efforts to verify the number of people missing and affected, conduct all-out relief operations and evacuate people at risk. He urged the Foreign Ministry to strengthen communication and coordination with relevant countries to share information in a timely manner and work together to properly handle rescue and relief efforts.

Vice-Premier Zhang Guoqing has led a team to the site to guide rescue and response efforts.

Video footage released by China Central Television showed muddy water gushing, carrying tree branches and debris, and some buildings were buried as the mudslide struck. Meanwhile, the disaster has cut off roads, communication networks and power supply in the border area on the Chinese side, Xinhua reported.

In the wake of the disaster, China has activated a Level-II emergency response for disaster relief and a Level-II emergency response for geological disasters, the second-highest in the country's four-tier emergency response system. Governments at all levels have responded with immediate measures, making every effort to carry out disaster relief as well as search and rescue operations.

Three central government departments — the Ministry of Finance, the Ministry of Emergency Management and the National Development and Reform Commission — have altogether allocated 220 million yuan ($33 million) to support Xizang in carrying out emergency rescue and disaster relief work.

The Ministry of Emergency Management has deployed 249 personnel from the national comprehensive fire and rescue force, along with 325 engineering rescue personnel from China Anneng Construction Group, PowerChina and other State-owned enterprises. A total of 30,000 central relief items, including tents, quilts and moisture-proof mats, have been sent to support relief work.

At the local level, as of Wednesday afternoon, the Xizang Fire and Rescue Corps had deployed 72 vehicles and 431 fire and rescue personnel at the site, along with rescue dogs, life detectors and boats.

Five repair workers from the State Grid Xizang Electric Power Co — the first group of emergency power repair personnel to arrive at the site — rushed there with a medium-voltage power generator vehicle and two small emergency lamps, and started work to ensure basic power supply and lighting for nighttime rescue operations.

The local meteorological bureau has forecast continued rainfall across the county of Gyirong through Sunday, warning of possible floods, landslides and other secondary disasters.

Xi to attend SCO summit, visit Kyrgyzstan and Egypt

By MO JINGXI
mojingxi@chinadaily.com.cn

President Xi Jinping will attend the Shanghai Cooperation Organization summit in Bishkek, the capital of Kyrgyzstan, and pay state visits to Kyrgyzstan and Egypt from Sunday to Sept 3.

During the summit, Xi will have in-depth exchanges of views with participating leaders on deepening SCO cooperation in various fields under the new circumstances and major international and regional issues of the times, Foreign Ministry spokesman Lin Jian said on Wednesday.

The leaders will provide guidance for the SCO's high-quality development and participation in the reform and development of the global governance system, Lin told a regular news briefing in Beijing.

This year marks the 25th anniversary of the SCO, which was founded in Shanghai in June 2001 by China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan.

The organization has since expanded to 10 member states, with a combined population of more than 3.4 billion, and accounts for about one-fourth of global gross domestic product.

Lin said that over the past 25 years, SCO members have upheld the Shanghai Spirit, which features mutual trust, mutual benefit, equality, consultation, respect for diverse civilizations and the pursuit of common development.

By expanding cooperation, the SCO has developed into a comprehensive regional organization with the world's widest geographical coverage, largest population and enormous development potential, he said.

The group has explored a new model of regional cooperation and set an example for a new type of international relations, Lin added.

The SCO summit held in Tianjin last year adopted a development strategy for 2026-35, setting out the organization's priorities for the coming decade and opening a new stage of high-quality development.

"If the Tianjin summit drew up the blueprint, the core task of the Bishkek summit is to put it into action," said Su Chang, a researcher at the Chinese Academy of Social Sciences' Institute of Russian, Eastern European and Central Asian Studies.

Su said Xi's attendance is expected to help translate consensus into action by putting the four SCO centers inaugurated at the Tianjin summit into operation, advancing projects in energy, green industries and the digital economy, and improving coordination among its expanded membership while strengthening its role in global governance.

"China stands ready to work with various parties to build consensus and write a new chapter of cooperation in Bishkek, and contribute to the security, stability, development and revitalization of regional countries and the building of a community with a shared future for humanity," Lin said.

In Kyrgyzstan, Xi will have an in-depth exchange of views with Kyrgyz President Sadyr Japarov on bilateral relations, cooperation in priority areas and international and regional developments, and will attend various state events, according to the spokesman.

"China looks forward to working with Kyrgyzstan to take this visit as an opportunity to promote high-quality development of mutually beneficial cooperation on all fronts, add new dimensions to the China-Kyrgyzstan community with a shared future, and bring more benefits to the two peoples," Lin said.

China and Kyrgyzstan established diplomatic relations in 1992. Bilateral relations have developed rapidly in recent years, supported by stronger political trust, Belt and Road cooperation, expanding people-to-people exchanges and closer international coordination, the spokesman said.

NIGHT REVEALS BEAUTY OF LONGMEN GROTTOES

Luoyang's heritage site leverages visa-free policy, immersive tours to draw visitors

By SHI BAOYIN in Zhengzhou and **QI XIN** in Luoyang, Henan

As darkness descends over the Yi River, the stone carvings of the Longmen Grottoes, a UNESCO World Heritage Site in Luoyang, Henan province, begin glowing softly in the light of hidden lamps, as if stirring to life.

For Russian visitor Ilya Demurin, 20, the awe-inspiring spectacle was enough to make him want to learn Chinese so that he might fully grasp the stories behind what he was seeing.

Among the many wonders at the grottoes, none is more recognizable than the Fengxian Temple, with its nine giant statues of Buddhist deities. The scale of the carvings is staggering, and the expressions on the stone faces are strikingly lifelike.

The largest figure, that of the Vairocana Buddha, gazes out over the river with an expression that has endured nearly 1,300 years of sun, rain and history.

Aleksandr Savchenko, another 20-year-old from Russia, found the grottoes breathtaking. "Every small cave and statue makes this place so wonderful," he said.

For those taking the night tour, the route feels less like a tourist trail and more like a slowly unfurling scroll painting. Each niche, carved 1,500 years ago, is subtly illuminated — just bright enough to reveal the ancient chisel marks.

"Nighttime sightseeing is an exercise in subtraction," said Ma Jialun, a docent at the Longmen Grottoes Academy. "Visitors stand facing the grottoes, shoulder to shoulder with the ancients, and experience a profound spiritual resonance."

He has also observed a universal thread. "Regardless of nationality, visitors share a common appreciation for beauty when standing before the Longmen Grottoes," he said.

AI must serve people, not diminish human agency

WORLD WATCH
By Kenneth Morolong

Artificial intelligence is no longer waiting in the wings as a promising new technology. It is becoming part of the infrastructure through which modern economies produce knowledge, deliver services, communicate with citizens and compete in the global economy. Journalism is already being reshaped in profound ways, from reporting and translation to fact-checking, distribution and the way audiences discover information.

For South Africa, the important question is no longer whether AI will change society. It will. The real question is what kind of change.

We want an AI transition that expands opportunity rather than deepening inequality, that supports development rather than simply increasing efficiency and that remains accountable to people.

That is why South Africa increasingly sees AI as more than a technology issue. It is also a development, an industrial policy, a labour-market and a governance question. Perhaps most importantly, it is a question about the health of the information environment on which any democratic society depends.

Our starting point is our Constitution. Technology, ultimately, must serve human dignity, equality and freedom and contribute to better lives. That requires us to look beyond how quickly AI is being adopted. We also have to ask who is building these systems, who controls the data behind them, whose languages and knowledge are reflected, who benefits from the value they create and who is responsible when an automated system gets an important decision wrong.

These questions will determine what the AI economy looks like in countries such as South Africa.

For us, the first principle is that machines should expand human capability, not diminish human agency. AI can help people work faster and make better use of information, but there are decisions where responsibility cannot be handed over to an algorithm. A system can make recommendations, but it cannot bear democratic accountability.

The second principle is that AI must contribute to economic development. For developing countries, productivity is not enough. We should also be asking whether AI is helping small businesses grow, whether it is creating new industries, whether workers are gaining valuable skills and whether young people are finding new opportunities.

For South Africa, the ambition should go beyond consuming AI products to developing the capacity to produce and innovate with AI.

That requires governance as well as innovation. Regulation is sometimes portrayed as an obstacle to technological progress, but the opposite can also be true. Transparency, fairness, privacy, security and human oversight are not enemies of innovation. They are part of the foundation on which lasting innovation is built. People will trust powerful technologies only when they know there are rules around them.

Low-altitude economy nears commercial horizon

Regulations, infrastructure and business models must keep pace with rapid tech advances, experts say

By **LI FUSHENG**
lifusheng@chinadaily.com.cn

China's low-altitude economy is entering a critical transition phase.

New regulations, breakthroughs in electric vertical takeoff and landing aircraft, expanding manufacturing capacity and growing market demand have pushed the emerging sector into the spotlight as a potential driver of new quality productive forces.

Yet behind the ambitious trillion-yuan market forecasts and frequent technological milestones lies a fundamental challenge: transforming industrial strength and technological breakthroughs into sustainable commercial operations.

China's revised Civil Aviation Law, which took effect on July 1, 2026, introduced a dedicated chapter on low-altitude economic development, providing a legal foundation for the sector's expansion.

The new framework establishes classified airspace management for low-altitude zones below 300 meters and replaces some case-by-case approval procedures with more streamlined filing mechanisms for qualified flights.

The regulatory shift is expected to help move the industry from scattered regional trials toward a more standardized development model.

Along with the evolving regulatory environment, China has made notable progress in manned eVTOL commercialization, although most applications remain at an early demonstration stage.

EHang's EH216-S — a pilotless passenger-carrying aerial vehicle — became the world's first eVTOL model to obtain type certification, air carrier certification and production certification from Chinese civil aviation authorities.

The aircraft began commercial trials in Hefei, Anhui province, in August, allowing public reservations and flight experiences within designated demonstration zones.

The milestone marked one of the earliest attempts globally to move autonomous passenger aircraft toward commercial operation.

However, such services are still limited to specific parks and tourism routes rather than serving as a widespread urban air-mobility solution for daily commuting.

Another example is Aridge, formerly known as Xpeng Aeroht, which highlights a different challenge facing the industry: strong manufacturing capabilities but incomplete commercialization conditions.

In August, Aridge's flying car manufacturing base in Guangzhou, Guangdong province, produced its 1,000th set of 800-volt high-voltage electric propulsion units, demonstrating China's growing ability to manufacture key eVTOL components at scale.

The company's modular Land Aircraft Carrier has completed a series of tests, including automatic separation, independent flight and docking between its ground vehicle and detachable aircraft cabin.

It has attracted more than 7,000 global preorders and purchase intentions from individual consumers, government and enterprise customers, as well as overseas markets.

However, the aircraft has not yet obtained the suitable certificate required for formal manned commercial operations and its planned mass deliveries remain dependent on the completion of airworthiness reviews.

Realistic applications

The situation reflects a broader challenge across the industry — technological readiness is advancing faster than regulatory approval and commercial deployment.

Industry forecasts nevertheless point to enormous growth potential.

According to CCID Consulting, China's low-altitude economy is expected to surpass 1 trillion yuan ($148.4 billion) in market scale in 2026, with the figure projected to reach 3.5 trillion yuan by 2035.

The consulting firm said there were more than 127,000 companies in China involved in low-altitude-related businesses by the end of June, covering areas ranging from aircraft manufacturing and airspace management to operations and technical services.

Industry participants, however, caution that the sector remains in an early development stage.

While China has identified promising growth areas, large-scale commercialization is still constrained by airspace management, digital supervision systems, infrastructure development and business model innovation, said participants at the 2026 China Entrepreneur Future Star Annual Forum held in Guangzhou in July.

Executives from aircraft manufacturers, intelligent solution providers and industrial service companies also discussed the opportunities and challenges facing the market at the annual event.

Compared with passenger eVTOL services, agricultural, logistics and industrial applications are expected to achieve commercialization sooner, they said.

"Agricultural drone operations currently account for the largest share of our civilian business, with mature and large-scale applications already established," said Meng Yuehua, director and deputy general manager of Gifore, a subsidiary of United Aircraft that specializes in drone R&D, production and service.

United Aircraft's products are also used in emergency rescue, low-altitude logistics and power industry services.

For logistics applications, United Aircraft has developed a product portfolio covering different payload capacities.

Lightweight drones carrying about 5 kilograms are mainly used for urban patrols and inspections, while 10-kg-class models can support short-distance delivery services in urban areas.

Meng said United Aircraft has also accumulated operational experience in medical supply delivery, including drone transportation of medical materials in Shenzhen, Guangdong, and county-level healthcare logistics services in cities such as Dongtai, Jiangsu province.

United Aircraft is cooperating with MT Aerospace, based in Suzhou, Jiangsu, to develop a nationwide drone-based medical distribution network, supporting the transportation of biological samples, emergency medicines and other supplies.

"Urban medical delivery scenarios with small payloads have strong practical demand and broad market potential," Meng said.

For larger payload applications, aircraft such as the TD550 and T1400 are designed to provide supplementary aerial logistics capacity for urban and suburban distribution networks.

Looking further ahead, the company's R6000 heavy-lift drone, with a maximum takeoff weight of 6 metric tons and a payload capacity of 2 tons, targets long-distance logistics routes in remote areas not covered by traditional aviation networks.

"Low-altitude logistics will become an important growth area in the next stage, creating opportunities for manufacturers with heavy-lift aerial vehicle technologies," Meng said.

Airspace resources

Beyond logistics, industrial inspection has emerged as one of the most commercially mature applications of low-altitude technology.

> "Developing airspace resources is similar to urban land development. It requires top-level planning and supporting infrastructure. ... Loose supervision may create safety risks, while overly rigid restrictions could limit innovation."
>
> **Hu Yongchao,** vice-president of Beidou Fuxi

Wang Haibin, chairman and CEO of Skysys, a company that focuses on drone products and services, said low-altitude applications can be divided into three categories: data collection, material transportation and passenger mobility.

At present, data-driven inspection services represent the most mature commercial scenario, while logistics applications are still expanding rapidly.

Inspection of power infrastructure has become a major driver of drone adoption, he said.

China's expanding wind and solar power facilities are creating growing demand for efficient maintenance and monitoring solutions.

Equipped with visible-light and infrared sensors, drones can quickly detect equipment faults, potential fire risks and abnormal operating conditions at distributed photovoltaic sites that generate electricity at or near where it will be used.

The technology is also being applied in industrial parks, municipal facilities and high-temperature equipment inspections, reducing reliance on traditional manual operations.

Skysys has developed an integrated system combining aerial inspection with ground-based robotic operations.

The company's drone-deployed robotic equipment can perform tasks including photovoltaic panel cleaning, dust removal, deicing and snow removal.

Such systems can carry out around 100 maintenance cycles annually and improve power generation efficiency by about 10 percent, according to Wang.

"The low-altitude economy is closely connected with embodied intelligence," Wang said.

Future competition, he added, will not depend only on aircraft hardware, but on integrated capabilities combining aerial sensing, autonomous decision-making and precise execution.

Hu Yongchao, vice-president of Beidou Fuxi, a technology company focusing on low-altitude traffic management and intelligent networking, said digital infrastructure will become a key foundation for the sector.

"The low-altitude economy cannot develop without a powerful background management system and digital brain," Hu said.

The company has developed low-altitude intelligent supervision platforms for nearly 30 major cities, providing digital management of flight applications, monitoring and traceability.

Hu pointed out that the rapid growth of drones has created new challenges for traditional aviation management systems.

While China has just over 7,000 traditional civil aviation and general aviation manned aircraft, the number of active drones in a major city can exceed 10,000.

To address this imbalance, Beidou Fuxi has developed a three-dimensional grid airspace management model, dividing urban low-altitude areas into standardized units and enabling more precise flight planning, monitoring and control.

"Developing airspace resources is similar to urban land development. It requires top-level planning and supporting infrastructure," Hu said.

He emphasized that safety supervision and industrial development should advance together.

"Loose supervision may create safety risks, while overly rigid restrictions could limit innovation," Hu said.

Streamlining deliveries

Shenzhen provides a glimpse of how low-altitude logistics could develop in large cities.

Hu said the city handles about 12.5 million express delivery orders every day, creating different levels of logistics demand.

While around 10 million routine low-value deliveries are better suited to traditional ground transportation, about 2.5 million time-sensitive orders, such as same-day and hourly deliveries, could potentially benefit from drone-based transportation.

These high-value logistics demands are concentrated in areas such as Shenzhen's Nanshan technology hub, Futian financial district and Luohu commercial center, offering potential opportunities for small and medium-sized logistics drones.

Hu said large-scale commercialization of low-altitude logistics would require three key foundations.

First, cities need intelligent networked management systems capable of monitoring and scheduling flights in real time.

Second, supporting infrastructure, including vertiports and takeoff and landing facilities, must be established across urban and suburban areas.

Third, communication, navigation and safety monitoring systems need to be widely deployed to ensure that flights remain traceable and controllable.

The shortage of such supporting infrastructure remains one of the biggest obstacles preventing the industry from reaching its full potential.

Shared challenges

From a global perspective, China's low-altitude economy has distinct advantages when dealing with challenges shared by the rest of the world.

European and US markets have deeper experience in general aviation and air traffic management, and are advancing eVTOL certification standards and urban air mobility pilot programs.

China's advantages lie in its complete manufacturing supply chain, strong policy coordination and ability to test emerging technologies through large-scale industrial applications.

At the same time, the global industry faces common hurdles, including high equipment and operating costs, concerns over noise and safety, and insufficient urban infrastructure.

So far, no country has achieved large-scale profitable commercial operations of manned eVTOL urban transportation. Advanced air mobility remains largely in the stage of pilot projects and scenario exploration worldwide.

For China, the gap between expectations and reality is becoming increasingly clear.

On the one hand, the country has established a regulatory foundation, developed strong manufacturing capabilities, attracted significant investment and created a large number of potential application scenarios.

On the other hand, many current projects remain limited to demonstration flights and localized pilot programs, with sustainable and replicable business models still under development.

Challenges including cross-regional airspace coordination, limited urban vertiport networks and strict safety requirements for heavy-lift operations continue to slow the transition from technological demonstration to commercial success.

Industry insiders believe the sector will develop in stages.

In the near term, industrial inspection, emergency rescue and high-value logistics are likely to become the first large-scale commercial applications, providing the foundation for future market expansion.

Passenger eVTOL services, while attracting significant attention, will require a longer period of testing, certification and infrastructure development before becoming a common mode of urban transportation.

The trillion-yuan market target represents a long-term vision rather than an immediate outcome, said analysts.

China's low-altitude economy has entered a new stage driven by technological progress, manufacturing expansion and scenario exploration.

But its next breakthrough will depend on whether regulation, infrastructure and business models can evolve at the same pace, they said.

Visits: Beijing eyes deeper ties, cooperation

From page 1

Noting that Xi and Japarov met three times in 2025, Lin said the two heads of state had guided China-Kyrgyzstan cooperation into a "golden period" of development.

Su, the researcher, said that "head-of-state diplomacy is the most important link in turning political consensus into projects on the ground". She said Xi's visit and the summit could give fresh impetus to the China-Kyrgyzstan-Uzbekistan railway and other major projects, helping to translate political trust into tangible results.

Closer cultural and people-to-people exchanges between China and Kyrgyzstan, as well as between China and other Central Asian countries, would provide important support for political and economic cooperation, Su added.

Xi's visit to Egypt will be his first state visit to the country in 10 years and will coincide with the 70th anniversary of the establishment of diplomatic relations between China and Egypt.

Egypt became the first Arab and African country to establish diplomatic relations with the People's Republic of China on May 30, 1956. The two countries established a comprehensive strategic partnership in 2014.

During the visit, Xi will hold talks with Egyptian President Abdel Fattah El-Sisi on bilateral ties as well as international and regional issues of mutual interest, Lin said.

"Through the visit, China looks forward to working with Egypt to carry forward traditional friendship, render each other firm support, expand mutually beneficial cooperation and bolster each other's modernization," Lin said.

The visit is also expected to open a new chapter in China-Egypt relations and make positive contributions to peace and stability in the region and beyond, he added.

ZOU HONG / CHINA DAILY

Robots rapidly adapt to real-world tasks

By YANG CHENG and **HU QING**

The second World Humanoid Robot Games, which concluded in Beijing on Wednesday, demonstrated the rapid advances being made in the field of embodied artificial intelligence, with humanoid robots breaking records and completing increasingly complex real-world tasks.

Rather than just being a showcase for cutting-edge technology, the five-day event put robots to the test in demanding physical and practical scenarios, helping turn technological breakthroughs into solutions for everyday applications, experts said.

They said these breakthroughs were driven by advances in algorithms, hardware and reinforcement training, among other factors.

One of the highlights of the games was the tug-of-war competition between humanoid robots. Debuting as an official event, it tested the robots' balance, coordination and grip. Unlike humans, who have flexible toes and rich tactile senses, robots' feet usually only have two flat surfaces the size of a palm.

The tug-of-war adopted a two-on-two format, with each game lasting two minutes. The team that first pulled the red mark in the middle of the rope over its own boundary was the victor. The entire competition was completed autonomously through AI algorithms — the robots needed to sense changes in tension, adjust their posture and center of gravity, and coordinate with teammates — while staying upright and pulling forcefully.

Gong Xiao, a member of the games' organizing committee and deputy director of the China Software Testing Center, said that for humanoid robots, the tug-of-war tested far more than just strength. It tested their agility and intelligence. They had to remain stable under sustained pulling forces, keep both feet behind the line and continue exerting force with arms.

During the tug-of-war final on Tuesday, the Yobotics Team from Shandong province won the lightweight tug-of-war title for robots weighing no more than 40 kilograms.

Kong Deran, Yobotics' algorithm engineer, told local media that the team made the robots imitate the posture of humans during the tug-of-war to learn to perform autonomous tug-of-war, analyze opponents' strength and adjust posture.

She said that the robots' hands were programmed for maximum grip, adding that her team had an ingenious design: One hand was positioned palm-down and the other palm-up to reduce the risk of the rope slipping.

Kong said that, in the near future, these hands could be applied in real-life scenarios. If robots are expected to enter households and assist people with everyday tasks, they will need capable hands. The ability of robots to grip a rope in a tug-of-war match can facilitate their practical application.

Liu Weiliang, deputy director of the Beijing Municipal Bureau of Economy and Information Technology, said that this year's World Humanoid Robot Games featured 51 events, 21 of which were scenario-based competitions.

He said that these events recreated real-world tasks ranging from sorting medicines and cleaning homes to opening bottles, tightening screws with dexterous hands, assembling power tools, picking up beans with tweezers and connecting cables.

Robots were also required to cope with complex surfaces, changing lighting conditions and unexpected task changes, he added.

During the games, a new generation of young developers emerged as a driving force.

Beijing Information Science and Technology University sent 49 teams and took part in 119 categories. One of the university's teams reached the final of the super heavyweight free-style combat event this year, while its 5-versus-5 large-team soccer squad finished fourth globally.

Li Lianpeng, deputy dean of the university's College of Future Digitelligence Industry, said the university has used competitions to enhance learning, teaching and innovation.

US-Iran talks still possible, says Pak envoy

United Nations' role in maintaining global peace and security stressed

By MINLU ZHANG in New York
minluzhang@chinadailyusa.com

Despite the memorandum of understanding between the United States and Iran expiring last week, the window for further negotiations between Washington and Tehran toward a final deal "is not closed", Pakistan's envoy to the United Nations said.

Asim Iftikhar Ahmad, Pakistan's permanent representative to the UN, said that Pakistan is "still very committed" to facilitating dialogue between the two sides.

"Our leadership is in touch with both sides. We are also working closely. We continue to work closely with the other friends," Ahmad told China Daily in an exclusive interview.

Inside
See story, **page 12**

He said the expired Islamabad MoU still provides a framework for the US and Iran "to engage and to hold further negotiations" toward "a conclusive and comprehensive settlement, or a final deal".

However, Ahmad said it remains unclear on how the conflict will eventually end and what impact it could have on the region.

"I think the overall situation is still in flux," he said. He noted that countries in the region are assessing "how this will evolve in the future and what kind of steps they need to take" to ensure long-term peace and stability, amid discussions over possible changes to regional security arrangements and political alignments.

On Tuesday, Pakistani Interior Minister Mohsin Naqvi said that Pakistan and Iran made "significant progress" in talks seeking to end the US-Israeli operations against Iran and find a path to peace, according to a Reuters report.

Talks between the two sides focused on measures to prevent further escalation, reopening of the Strait of Hormuz and an expedited termination of the conflict, Reuters reported, citing a Pakistani military statement.

Given the prolonged uncertainty resulting from the US-Iran conflict, regional security arrangements are already beginning to shift. Earlier this month, Saudi Arabia, Turkiye and Pakistan signed the Makkah Joint Defense Agreement, under which an armed attack on one member is considered an attack on all three.

"Our objective is to ensure that we move forward in a way that will guarantee peace and stability for the longer term in the Middle East," Ahmad said.

> "Our objective is to ensure that we move forward in a way that will guarantee peace and stability for the longer term in the Middle East."
>
> **Asim Iftikhar Ahmad,** Permanent representative of Pakistan to the United Nations

UN 'not sidelined'

The diplomatic efforts surrounding the US-Iran crisis have also raised questions about the UN's role, as some of the most consequential negotiations over current international conflicts are increasingly taking place outside the UN and the Security Council.

Ahmad said that such diplomacy does not necessarily diminish the UN's role.

"If you look back in history, there are several situations in which the UN was not the primary actor," he said, adding that negotiations conducted elsewhere have often eventually been brought back to the UN. "It doesn't mean that the UN's role is sidelined or undermined," he said.

He cited the Gaza conflict as a recent example. Negotiations took place outside the UN Security Council before being brought back to the body to give it "the stamp of authority and credibility".

The UN Security Council in November voted and adopted a resolution endorsing US President Donald Trump's peace plan and establishing the Board of Peace as a transitional administration for Gaza.

According to Ahmad, the same principle would apply to a US-Iran agreement. Once a comprehensive and conclusive final deal is agreed, it would be brought to the UN Security Council for approval and for the establishment of a mechanism to oversee its implementation, he said.

"The role of the Security Council as the principal organ for maintaining international peace and security remains important," he said. Long-running conflicts around the world also continue to test the UN's ability to prevent and resolve crises.

Ahmad said that resolving these long-running conflicts requires "a comprehensive approach from conflict prevention to resolution", including UN peacekeeping.

There is a strong view among the wider UN membership that peace and security cannot be considered separately from development, he said.

For developing countries, Ahmad added, the UN should focus on prioritizing the concerns and interests of those countries.

"As part of the reform and improving efficiencies, we want to ensure that the UN will continue to prioritize the concerns and the interests of developing countries," he said. "That means both peace and security, addressing the conflicts and advancing the development objectives."

Technology: Risk of reproducing inequality highlighted

From page 1

Data is central to this discussion. AI cannot function without vast amounts of it, which makes questions of privacy, ownership, security and access impossible to ignore. Developing countries need the capacity to protect their citizens' data while ensuring that data can also support research, innovation and economic development.

Then there is language. South Africa has 12 official languages, including South African Sign Language. Yet many AI systems work far better in languages that already have enormous digital datasets. That imbalance may look like a technical limitation, but it can become a social one. If a technology understands some people better than others, it risks reproducing inequality through a new medium.

The possibilities are also enormous. A community radio journalist could report an important public-interest story in an African language and use AI to translate it quickly for a much wider audience. Better speech recognition and translation could make information more accessible in education, healthcare, emergency response and public services. This is what an inclusive AI revolution should look like: technology helping people participate more fully in society without requiring them to give up their language or identity.

But the same tools can also make deception cheaper and faster.

Generative AI has made it possible to create convincing fake images, voices and videos at a scale that traditional verification systems were never built to handle. Imagine a fabricated video appearing days before an election in which a presidential candidate seems to make a racist remark. The campaign denies it. The public argues about it. The video spreads faster than anyone can verify it. By the time it is exposed as a deepfake, the damage may already have been done.

The challenge is therefore not to choose between innovation and oversight. It is to make innovation responsible. That means stronger cooperation on content authentication, deepfake detection, fact-checking, media literacy and the governance of synthetic media.

Journalism itself also needs protection. AI systems are gaining enormous value from news reports, books, films, photographs and other human-created works. African media organizations should not become unpaid suppliers of the raw material for a global AI economy while seeing little of the value created from it. Intellectual property must be respected, creators must receive fair compensation and societies must continue to have access to credible public-interest journalism.

This is an area where China-Africa cooperation could move from discussion to practical results.

The focus should be on building capacity together: developing high-quality African-language datasets with Chinese research institutions and technology companies; training people who can design, audit and govern AI rather than merely use it; improving access to computing power and digital infrastructure; working together on deepfake detection and media literacy; and supporting African companies in creating their own technologies and intellectual property.

Technology sovereignty does not mean isolation. Africa should seek interdependence without falling into dependency. We should be partners in building the technologies of the future, not simply consumers of technologies built elsewhere.

The standard by which we judge AI should therefore be broader than speed or productivity. Does it widen opportunities? Does it reduce inequality? Does it strengthen public trust? Does it respect language and culture? And does it give developing countries a genuine voice in shaping the technologies that will define their future?

South Africa is optimistic about AI, but optimism should not mean surrendering our judgment to technology. We should remain open to innovation while insisting on accountability, and open to international cooperation while protecting African agency.

This matters especially in journalism. AI can assist reporters, but it cannot take on the human responsibility at the heart of journalism: finding the truth, testing claims, exercising judgment and serving the public.

The next chapter of the digital revolution should not simply be written for Africa. Africa must help write it. Its languages, knowledge, people and innovators must be part of the story — not an afterthought.

The author is the deputy minister in the Presidency of South Africa. The views do not necessarily reflect those of China Daily.

Grottoes: In-depth cultural experience gains popularity

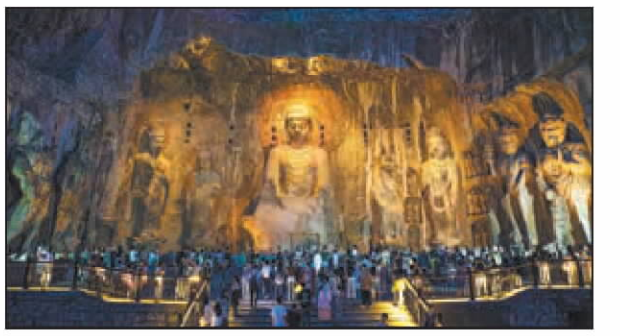
From page 1

The grottoes first launched night tours in 2007. But the real surge in foreign visitors began when China introduced its 240-hour visa-free transit policy, cementing Luoyang's status as a must-see destination.

"With the growing influx of foreign tourists, we've assembled a professional team of multilingual docents to bridge the cultural gap," said Zhang Zhimin, deputy director of the academy, adding that the night tours are a huge draw.

The Longmen Grottoes comprise more than 100,000 Buddhist statues carved into 2,345 caves and niches over a period of 400 years. UNESCO has called the sculptures "an outstanding manifestation of human artistic creativity".

"The beauty of the grottoes transcends borders and resonates deeply with people from diverse cultural backgrounds," Zhang said.



On social media, creators from around the world post videos from the famous stone steps.

Some visitors arrive in the late afternoon to see the carvings in daylight first, then linger for the evening spectacle. Others come dressed in traditional Chinese clothing, drifting past the illuminated niches like figures from the Tang Dynasty (618-907).

Wang Linsheng, 39, brought her 8-year-old son at dusk. She hoped the visit would inspire him to delve into the history behind the carvings, cultivate a sense of reverence for the past and foster a deeper appreciation of China's cultural heritage.

As the night settled, the last visitors made their way down the steps. The river mirrored the light in long, wavering lines and the lit-up stone faces maintained their silent vigil.

COMMENT

Editorials

EU needs to build stronger foundations beneath its economy not a wall around it

When Slovak Prime Minister Robert Fico urged the European Union on Tuesday to treat China as a competitor in a friendly spirit rather than an enemy to be walled off, he highlighted a contradiction at the heart of Brussels' China policy: Europe wants the benefits of economic engagement with China while increasingly adopting a strategy designed to constrain the country.

China is not a marginal trading partner that the EU can simply replace. In 2025, EU goods exports to China reached €199.6 billion ($232.88 billion), 37 percent higher than a decade earlier. Machinery, vehicles, pharmaceuticals and precision instruments made up much of those exports, while the EU recorded a €21.3 billion surplus in its services trade with China. For many large EU companies, China is a major market, a supplier of essential raw materials, a production base, a source of corporate revenue and now an innovation hub.

Yet some in Brussels try to frame this mutually beneficial economic relationship through the vocabulary of "de-risking", punitive tariffs, investment screening and export controls, citing the EU's goods trade deficit with China. That risks confusing the symptoms of the EU's competitiveness problem with its causes.

The EU's industrial weakness did not begin with Chinese electric vehicles. It reflects high energy costs, fragmented capital markets, regulatory complexity, slow decision-making and an innovation culture that often rewards compliance more readily than risk-taking. Many EU policymakers are still living comfortably in the bubble of the old division of labor in which China provided manufacturing capacity and increasingly sophisticated products, Russia supplied cheap energy, while the United States provided security and much of the digital infrastructure.

That model no longer applies. Yet the bloc's response has been to protect itself from competition rather than build the capacity to compete.

Artificial intelligence makes this particularly obvious. The AI era rewards enormous computing capacity, abundant capital, entrepreneurial risk-taking and rapid commercialization. The EU instead remains weighed down by regulatory fragmentation and a tendency to debate the risks of technologies before securing a leading position in creating them.

That is why Chinese competition should be treated as a spur to the EU, not as a justification for protectionist policies and measures.

The EU won't gain from aligning its China policy with that of the US. The way the US has treated Canada in their latest trade negotiations should serve as a wake-up call for the EU.

Strategic autonomy means having enough economic strength to compete and policy independence to engage. This is where Fico's notion of constructive competition deserves attention. Competition does not require hostility. What it demands is respect for market rules — not the vague and politically convenient notion of "fairness" that some EU politicians narrowly reduce to a numerical trade balance.

EU companies remain competitive in pharmaceuticals, advanced machinery, environmental technologies, financial and professional services. But Brussels bans high-tech exports to China, which naturally expands the EU's trade deficit.

The China-EU trade and investment consultations launched in June provide a channel to settle these disputes before they escalate to a tariff war.

There is also a human dimension that the China debate in Brussels sometimes misses. In the first half of 2026, China recorded 22.9 million foreign entries, with European bookings surging 275 percent year-on-year amid China's visa-free policy. European travelers experiencing China firsthand encounter a safe and dynamic society. The "China threat" narrative dissipates when confronted with reality.

EU policymakers should also take note of a Pew Research Center survey published last month, which found that public opinion of China is more positive than that of the US in a number of major European nations.

China is not the cause of the EU's economic, trade or industrial challenges. The problems lie closer to home. The EU does not need a wall around its economy. It needs stronger foundations beneath it. The way to compete with China is to make the EU stronger, not to make China weaker.

As Chinese Foreign Minister Wang Yi said last month during a meeting with a cross-party delegation of the European Parliament in Beijing, the EU should stick to the overarching positioning of its ties with China as a partnership, refrain from politicizing economic and trade issues and overstretching the concept of security in exchanges, and work for an upward and dynamic balance of trade from a long-term perspective.

Words ring hollow till Tokyo mends its ways

Japanese Ambassador to China Kenji Kanasugi said, in a TV Asahi program aired on Tuesday, that he cannot be "optimistic" that strained China-Japan ties will improve at the Asia-Pacific Economic Cooperation Economic Leaders' Meeting in Shenzhen in November, adding that he hoped to "mobilize diplomatic resources to help relations stabilize even a little, making the most of this rare opportunity".

The ambassador is attempting to signal a "willingness" to talk as if it is China that hinders Japan's efforts to repair ties. But the actions of the Sanae Takaichi government clearly show that Tokyo remains unwilling to confront the underlying causes of the current difficulties in bilateral ties.

Chinese Foreign Ministry spokesman Lin Jian urged the Japanese government to abide by the four political documents between the two countries, and create the conditions necessary for normal exchanges between China and Japan through concrete actions.

Yet Tokyo persists in its hostile posturing toward China. During his visit to Australia and India last week, Japanese Defense Minister Shinjiro Koizumi sought to build military alliances to counter what Japan baselessly perceives as "China's expansion" in the region.

In the technology sector, Japan has recently upgraded its high-tech restrictions against China, implementing export controls on advanced machine tools and related technologies, with the aim of hindering the development of China's high-tech industries. This undermines Sino-Japanese economic and trade cooperation.

Tokyo's reluctance to address historical issues is a blatant affront to its neighboring countries that suffered from Japan's invasion. On Aug 15, the 81st anniversary of Japan's unconditional surrender to the Allied Powers that marked the end of World War II, Takaichi made an offering to the notorious Yasukuni Shrine and paid tribute to it from a distance, while about 90 Japanese politicians visited the shrine in person. The shrine enshrines 14 convicted Class-A war criminals of WWII.

On Tuesday, China's Ministry of State Security published an article on its official WeChat account explaining why the Yasukuni Shrine should be referred to as the "shrine of war criminals", describing it as a symbol of Japanese militarism. A spokesman for China's Foreign Ministry said the true intentions of the Japanese politicians visiting the shrine are to change the verdict on the war criminals, cover up Japan's war crimes, distort historical facts, and pave the way for accelerating its remilitarization.

This was reinforced in Takaichi's speeches earlier this month marking the 81st anniversary of the atomic bombings of Hiroshima and Nagasaki, where she avoided reaffirming Japan's commitment to its "Three Non-Nuclear Principles" — non-possession, non-production and non-introduction of nuclear weapons.

Japan's "readiness" to use the APEC meeting to improve relations with China and reap the benefits of engagement contrasts sharply with its unwillingness to abandon its policy of antagonizing China, and its consistent refusal to confront history and correct its mistakes. This "double-faced diplomacy" cannot bridge the trust deficit between the two countries that it has caused.

Unless Tokyo reflects on why its relations with Beijing have soured since Takaichi made erroneous and dangerous remarks on China's Taiwan region in November, addresses Japan's history of aggression, halts military expansion and removes its trade and technology barriers, its "hopes" of improving relations with China will remain a wishful thought.

If Japan genuinely wants to repair the relationship, it must take concrete actions rather than make empty statements. The Japanese government should wake up to this reality.

In fact, Japan's right-wing forces are conscious of the tricks they play. For decades, they have mastered the art of recasting Japan from aggressor to victim — whether over the atomic bombings or the current tensions with China that Japan itself has created. They may regard that as a "clever" way to evade responsibility. But such brazen hypocrisy only draws greater attention to the very truth they are trying to bury.

Volatility and hunger shouldn't be allowed to walk hand in hand

Food insecurity is a humanitarian problem, but it is also a symptom of the consequences of war, disrupted trade, blocked aid, weak development and climate shocks. That was the message of the United Nations Security Council's high-level open debate on conflict and food security on Tuesday.

Some 318 million people worldwide face acute hunger, with conflict-affected regions in Africa and the Middle East among the hardest-hit. The question is no longer simply whether the world produces enough food. It is whether food can be grown, moved and delivered to those who need it.

War is often the fastest route from food insecurity to famine. Fighting drives farmers from their land, destroys irrigation and storage facilities, disrupts transport and sends food prices soaring. Look at Gaza. Meanwhile, the Ukraine crisis has affected agricultural production and international flows of grain and fertilizer.

Chinese Ambassador to the UN Fu Cong said at the debate that hunger shouldn't become an instrument of war. International humanitarian law provides the baseline. Agricultural infrastructure should be protected, food aid needs unimpeded access, and the security of humanitarian workers must be guaranteed. Relief cannot function when it becomes hostage to war calculations.

The same logic applies beyond battlefields. Food security depends on logistics. A blockage in a major shipping route can quickly become a problem for farmers thousands of kilometers away, particularly when fertilizer and grain markets are already tight. The international community has a common interest in keeping land and sea corridors open and ensuring that essential commodities continue to move. China's support for a UN initiative to establish a time-bound operational mechanism for the Strait of Hormuz reflects this broader principle.

Artificial barriers, excessive protectionism and the abuse of unilateral sanctions can raise the cost of food and agricultural inputs, with the poorest countries carrying much of the burden. Food security becomes more fragile when commercial flows are subordinated to geopolitical rivalry.

Less-developed countries also need the productive capacity to feed themselves. That means investment in irrigation, farmland, storage, agricultural technology and resilient supply chains. It also means climate finance. Droughts, floods and other extreme weather events are increasingly capable of wiping out harvests and reversing development gains. Developed economies therefore have a particular role to play in providing development assistance and climate finance, helping vulnerable countries build resilience rather than remain permanently dependent on emergency relief.

China offers a notable case of what long-term food-security policy can achieve. The country feeds more than 1.4 billion people with less than 9 percent of the world's arable land and produces more than one-fifth of global grains. Its progress has rested on domestic production, institutional reform, investment in farmland and water conservation, technological innovation and grain reserves. The lesson is less about a single model than about the value of building productive capacity before a crisis arrives.

China has also shared its experience to strengthen the resilience of other countries. It has agricultural cooperation with more than 140 countries and regions, promoted more than 1,000 agricultural technologies in developing countries and trained more than 14,000 professionals in hybrid rice. Under the Food and Agriculture Organization's South-South cooperation framework, it has provided substantial funding, experts and projects.

Food security affects every country but the institutions governing food and agriculture do not always give developing economies commensurate representation and influence. The UN, FAO, International Fund for Agricultural Development and World Food Programme can play a stronger coordinating role, while emerging markets and developing countries deserve a greater voice.

There is enough productive capacity in the world to make hunger far less common. What remains scarce is peace, resilience and reliable access. China's Global Development Initiative and Global Governance Initiative, centered on development, multilateralism and more balanced global governance, offer a framework for delivering those prerequisites.

The choice before governments is therefore practical rather than rhetorical: reduce conflicts, keep humanitarian and commercial corridors open, finance climate resilience and build a food-governance system in which developing countries have a meaningful stake. Food should be a foundation of stability. Turning it into another instrument of geopolitical competition only makes a hungry world more dangerous.

— LI YANG, CHINA DAILY

What They Say

Greening computing infrastructure imperative

Editor's note: *Accelerating the transition to green and low-carbon computing infrastructure is crucial for supporting the rapid development of artificial intelligence. China Environment News spoke to Su Ming, a researcher at the Energy Research Institute of the National Development and Reform Commission, on the development of green computing. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The biggest challenge to developing green computing is matching computing loads with renewable power generation. Wind and solar power are inherently volatile, while AI inference workloads tend to fluctuate due to unpredictable user demand.

The second challenge is economic. Computing facilities are energy-intensive, and participating in green power trading or purchasing green power certificates entails a "green premium", which increases the cost of electricity to some extent.

Facilities opting for direct green power supply or integrated source-grid-load-storage models must invest in substantial new energy storage capacities. Additionally, maintaining operational safety requires a certain level of grid-connected capacity, which may not reduce the cost of using green electricity safely and reliably.

To achieve a green and low-carbon transformation of computing facilities, several strategic measures are necessary. First, emissions should be reduced at source by strengthening coordination between computing capacity and electricity supply. Computing facilities should maximize their use of renewable electricity. They should optimize their green energy supply models based on local conditions, participate in green power trading and purchase green power certificates.

New business models, such as direct green power supply, green microgrids and integrated source-grid-load-storage systems, should be encouraged. Additionally, exploring surplus cooling resources in surrounding areas can help meet the cooling demand of computing facilities.

Second, emissions should be reduced during operations by setting higher access standards and upgrading existing facilities. This aims to continuously lower the average power usage effectiveness, a core indicator of the energy efficiency of data centers that is calculated as the total facility energy divided by the IT equipment energy.

It is vital to deploy efficient cooling and heat-dissipation technologies, including liquid cooling, evaporative cooling, heat pipes and refrigerant pumps.

Enhancing the utilization of waste heat from computing facilities is also important, with facilities encouraged to develop heat-recovery systems for applications such as industrial-park heating, urban heating and agricultural facilities. Their intelligent operation and maintenance capabilities should be improved, alongside smarter management of energy consumption.

Finally, technological innovation must be strengthened to reduce the power consumption of computing itself.

AI models should be continuously optimized to improve computational efficiency, meeting the demands of inference, data storage and retrieval with lower power consumption rather than simply scaling up the number of computing cards, storage devices or model parameters. This will fundamentally improve energy efficiency and reduce power costs.

Physical AI the biggest opportunity ahead

With the advent of superintelligent agents, there is a consensus that true intelligence goes beyond understanding static texts and requires grasping dynamic physical causality. This has given rise to physical artificial intelligence. It excels in multimodal environmental perception — seeing, listening, touching — and real-time interaction, bridging the gap between the digital and physical worlds.

Currently, AI development is converging toward physical AI, exploring it through multiple technological pathways.

By integrating LLMs with multimodal capabilities, physical AI provides intelligent brains for embodiment, bringing digital agents into the real world and heralding a new era of the intelligent economy.

Digital LLMs and intelligent agents are rapidly advancing toward self-iteration. The United States' models such as GPT-5.6, Claude Fable 5 and Grok 4.6, alongside Chinese open-source models from Zhipu AI, Moonshot AI and MiniMax, rank among the world's top performers. China's multimodal large models have closed the gap with the US, and in some areas even surpassed them. Seedance 2.0, for instance, has raised concerns in Hollywood.

From Manus to Openclaw, Harness and Hermes, disembodied agents are gaining autonomy and interconnectivity, emblematic of agentic AI.

In physical AI, advancements in vision-language-action alignment, world models and spatial intelligence are enhancing the sophistication of AI "brains", while lightweight visual and radar-based sensor navigation are boosting precise physical perception.

Humanoid robots, autonomous vehicles, and components such as dexterous hands, motors and advanced skins are rapidly enhancing agility. Currently, humanoid robots are the primary research focus, while autonomous vehicles are the most mature, with significant commercial potential.

The "jagged intelligence" in physical AI, highlighted by Moravec's paradox, means AI can surpass doctoral students in logic, math, and coding but still struggles with the perception, action, and emotional interaction skills of a toddler.

SONG CHEN / CHINA DAILY

While LLMs create limited new jobs and rapidly displace a wide range of jobs, causing anxiety among coders and clerks, the "jagged intelligence" of physical AI will slow its economic integration and job creation.

The 2026 World Artificial Intelligence Conference signaled a trend toward physical AI. China's high-performance, low-cost open-source models, especially multimodal large models, are bolstering this trend, enhancing the capabilities of physical AI and embodied agents.

This advancement is expected to significantly boost the efficiency and safety of China's manufacturing, services, and mining sectors while creating new demand and jobs.

The rise of physical AI is an opportunity to shift the economy from K-shaped divergence to K-shaped integration. By coordinating industries — from new growth drivers to traditional drivers — within the "scissor gap" of K-shaped divergence, this trend can drive sustainable economic growth and facilitate effective industrial upgrading.

One imperative measure is to launch a "physical AI+" initiative in the scissor gap to boost emerging industries and upgrade traditional sectors to prevent their collapse. By integrating traditional, emerging, and future industries and phasing out outdated capacities, such an initiative can give momentum to sustainable growth.

Enterprises, especially small and medium-sized ones, along with financial institutions, should embrace this trend. By adopting a long-term perspective, they can establish themselves within the embodied intelligence industry chain, similar to how today's "new trio" — electric vehicles, lithium batteries and solar products — were developed. This will prepare them for a pivotal moment in the AI industry.

The embodied intelligence industry, well-aligned with China's manufacturing strengths, offers a strategic opportunity for industrial upgrading.

Models are advancing, enhancing both the cognitive and behavioral layers of embodied intelligence. Rapid developments in body components include the shift from hydraulic to electric actuation, offering lightweight, fast-response and precise control.

Progress also spans the perceptual layer with sensors, radar, vision and tactile sensing, as well as components such as dexterous hand joints, batteries, motors, harmonic drives, servo systems, lead screws, materials, and thermal management systems.

"Physical AI+" has the potential to transform industries fundamentally by reshaping equipment, spatial layouts, and human-machine interactions, among others.

This transformation can lead to logical restructuring and systemic enhancement, creating significant opportunities. Importantly, not every sector needs the most advanced AI.

Often, integrating stronger AI technologies with weaker ones results in higher efficiency and greater benefits.

Also, the governance of physical AI can generate new demand and employment opportunities. Its ethical, safety, and social governance is complex and involves multiple disciplines and stakeholders.

This can lead to the creation of various sectors and roles, such as model safety auditing, data privacy review, data cleansing, system security assessment, ethical evaluation, and social impact assessment.

AI is designed to benefit humanity. Embracing embodiment is crucial to enhancing industries, expanding demand, and boosting employment.

China-Indonesia 2+2 defines strategic autonomy

The Second Ministerial Meeting of China-Indonesia Joint Foreign and Defense Ministerial Dialogue (the 2+2 mechanism) in Jakarta last Friday marks an important change in bilateral ties.

The latest meeting suggests that this balance is shifting as political and defense cooperation becomes more institutionalized, giving Indonesia a chance to make strategic autonomy practical.

That opportunity should not be confused with alignment. What matters is whether they expand Indonesia's capacity to make independent choices. Strategic autonomy is not demonstrated by having many partners. It is demonstrated by having enough capability and leverage to prevent any one partner from determining Indonesia's options.

The 2+2 mechanism matters because it pushes Indonesia-China relations beyond episodic diplomacy. Beijing is attaching particular importance to the mechanism as it is its first ministerial-level 2+2 arrangement with another country. For Indonesia, the value lies in whether regular dialogue produces capabilities that Jakarta was struggling to build.

Defense cooperation offers the clearest test. Indonesian officials have discussed cooperation with China in ammunition production, missiles, rockets, and technology transfer. These areas matter for a country seeking to modernize its armed forces and reduce reliance on any single supplier.

China brings capabilities that few partners can match. Its manufacturing base, expanding defense industry, technological capacity, infrastructure experience, and ability to mobilize capital provide Indonesia with resources to support its modernization.

Buying from more countries is diversification. Being able to operate, maintain, adapt, and eventually produce critical technologies is a form of autonomy.

Global Lens

A diversified procurement portfolio may provide flexibility, but it can also create costly fragmentation.

Cooperation with China will have greater value if it helps Indonesian engineers acquire knowledge, strengthens domestic production, and enables local firms to move beyond low-value assembly. That is the difference between suppliers and capability.

Indonesia's challenge is straightforward. External partnerships create opportunities, but domestic institutions still have to convert them into national capability. Clear priorities, better implementation, and technological absorption matter more than diplomatic announcements.

Strategic autonomy is ultimately domestic before it is diplomatic.

More partnerships can generate more activity without producing more leverage. The contribution of the 2+2 mechanism will depend on whether Indonesia uses it to build domestic capabilities while expanding cooperation abroad.

Maritime cooperation provides another test. Indonesia and China do not approach every maritime issue from the same position, and a serious partnership should not require them to do so. Different interests and legal interpretations will remain. The question is whether both governments can manage those differences while protecting cooperation. Regular dialogue can reduce misperceptions, clarify sensitivities, and address problems before they become political crises.

If maritime cooperation expands into sensitive areas or joint development arrangements there will be greater clarity. Diplomatic flexibility can help governments manage difficult questions, but implementation works best when legal and operational boundaries are understood by both sides. Indonesia should not assume that broad political language will automatically translate into workable arrangements. China also has an interest in ensuring that cooperation is viewed in Indonesia as expanding national capability and policy space.

The consequences extend beyond bilateral ties. Indonesia and China are central to Southeast Asia's political and economic architecture, while developments in the South China Sea continue to affect regional confidence. More predictable communication between Jakarta and Beijing can reduce the risk of bilateral frictions leading to greater instability.

Practical cooperation on maritime security, cyber threats, transnational crime, and crisis management can also strengthen regional resilience when both sides maintain credible communication channels.

This regional dimension gives the 2+2 mechanism significance beyond another bilateral forum. Indonesia is ASEAN's largest country, while China is the region's largest trading partner and a major security actor. Better communication cannot resolve every regional dispute, but it can lower the risk of miscalculation and make cooperation more routine. That is a concrete contribution to regional peace and security.

Jakarta's deeper cooperation with China should not be interpreted as a decision to choose Beijing over other major powers. An autonomous Indonesia will cooperate with China where interests converge, seek alternatives where useful, and reject pressure from any partner when national interests diverge.

A stronger Indonesia may, in fact, be a more durable partner for China. Dependence can create short-term convenience, but it also produces political vulnerability and domestic resistance. Cooperation built on greater Indonesian capacity is likely to be more stable because Jakarta can defend the relationship as a strategic choice rather than a necessity.

China, likewise, benefits from dealing with a partner capable of implementing agreements, sustaining projects, and managing domestic concerns around sovereignty and national control.

A durable Indonesia-China partnership does not require Indonesia to become less autonomous. It should do the opposite. More meetings, mechanisms, agreements, and strategic labels can create the appearance of influence without changing what Indonesia is actually able to do. The 2+2 dialogue should be judged over time by its effect on defense capability, industrial capacity, maritime coordination, crisis management, and both sides' ability to manage disagreement.

If the 2+2 mechanism helps Indonesia build capabilities it can sustain, gives China a more capable and predictable partner, and allows both countries to manage differences without sacrificing cooperation, the relationship will gain something more valuable than diplomatic symbolism.

It will gain resilience, making mutual benefit more durable while contributing to a more stable regional order.

Zhang Yiwu

Hollywood's renewed interest signals country's cultural confidence

In a notable cultural shift this year, Hollywood has once again turned its attention toward the Chinese market.

Timothée Chalamet was seen sipping tea from a *gaiwan*, or lidded tea bowl, in a Chengdu teahouse in Sichuan province while promoting *Marty Supreme*. Dwayne "The Rock" Johnson interacted warmly with fans in Shanghai. Tom Holland, best known for his role in *Spider-Man*, went viral after being spotted shopping in the city. Christopher Nolan, meanwhile, visited Beijing, accompanied by the cast and crew of *The Odyssey* for promotional events.

Hollywood's renewed enthusiasm for China reflects a deeper shift in the global film industry.

If we look back at Hollywood's relationship with China, the changes are striking. In the 1990s, blockbusters such as *Titanic* and *Jurassic Park* entered China, leaving audiences in awe of Hollywood's cinematic sophistication.

However, during the early 2000s, Hollywood often viewed China from a position of superiority. China was largely regarded as another emerging market in Hollywood's global business map — a destination for its products rather than a genuine partner in cultural dialogue.

But that attitude gradually changed as China's film market expanded. Hollywood is no longer content with simply releasing films in China. It is increasingly eager to come here, engage with audiences and learn more about the country.

Chalamet played table tennis and sampled *gaiwan* tea in Chengdu, Johnson tried speaking Chinese in Shanghai while Nolan engaged seriously with Chinese moviegoers about filmmaking and creativity. Of course, such appearances are partly marketing exercises, but the shift in attitude behind them should not be overlooked. Hollywood is moving from telling Chinese audiences, "This is what we have for you," to asking, "What do you want to see?" It is transitioning from one-way cultural output toward two-way interaction.

Hollywood's renewed enthusiasm for China reflects a deeper shift in the global film industry.

The most immediate reason for this shift is the changing weight of the Chinese market. As a market grows large and important, what was once peripheral can move toward the center. China is already the world's second-largest film market, and no globally oriented film industry can afford to ignore a market of this scale. When a movie is released earlier in China, it is not out of generosity by the studio but a natural response to market realities.

At the same time, China's film market is also undergoing structural changes. The roaring success of domestic films has created a competitive "catfish effect", forcing Hollywood productions to compete directly with high-quality Chinese movies. Hollywood can no longer expect easy success in China. It must deliver genuinely good films to win audiences.

Chinese moviegoers also have far more choices than before. Spectacle and formulaic storytelling alone are no longer enough. Audiences increasingly expect compelling stories, emotional depth and distinctive cultural expression. Hollywood itself has faced considerable challenges in recent years, with relatively fewer outstanding films capable of generating broad public excitement. Winning over Chinese audiences has therefore become increasingly difficult, prompting Hollywood to treat the Chinese market with greater seriousness.

If market logic explains the surface-level reasons for Hollywood's renewed "China enthusiasm", a deeper explanation lies in changing cultural attitudes. For a long time, Hollywood films in China were more than entertainment products. They were cultural symbols. Hollywood represented ideas of being "advanced", "fashionable" and "international", and its films carried images of an imagined way of life. Watching a Hollywood movie meant something beyond the film itself.

That mindset is changing. As China's economy and society have developed, and as cultural confidence has grown, the way Chinese audiences view Hollywood has also changed. Hollywood films are no longer seen as synonymous with "superior", but simply another category of films available to viewers. Chinese audiences now go to see Hollywood blockbusters just as they go to see domestic films: primarily on the basis of their own interests and judgments, without attaching an additional layer of cultural prestige.

This ability to look at other cultures as equals is itself an expression of cultural confidence. A society sufficiently confident in its own culture no longer needs recognition from others to validate its own worth. Nor does it need to worship or fear other cultures.

Hollywood has its strengths, but also its limitations. Its good films deserve appreciation, but mediocre ones do not deserve special treatment. Such a rational, calm and self-assured cultural outlook is exactly what a mature society should possess.

Hollywood's renewed interest in China also reinforces this more equal relationship in cultural exchanges. When a leading filmmaker such as Nolan comes to China, or when Hollywood stars make an effort to speak Chinese and understand the country's culture, Chinese audiences see it as a form of cultural respect.

That, in turn, can further strengthen cultural confidence and audiences' independence in judging art, creating a positive cycle. It also pushes Hollywood to make greater efforts in localization, both in content and marketing, as it seeks to bridge cultural gaps and win over Chinese audiences.

Film is both a cultural product and a reflection of the spirit of its time. Hollywood's growing interest in China signals a changing global cultural landscape. Amid this broader trend, China should remain open to the world while staying grounded in its own cultural identity — engaging with others as equals and learning from one another with confidence.

GLOBAL VIEWS

WANG SIDAN

Closing the taps

Establishing effective global governance on plastic pollution remains a difficult journey, due to the pervasive use of the material in modern life

According to the United Nations Environment Programme, the world produces over 430 million tons of new plastic every year. If that trend continues at the current pace, the production level will be approximately triple in 2060. Just a year ago, negotiators walked away from Geneva without a global plastics treaty. It was a setback, though an entirely predictable one. Addressing global environmental challenges usually requires a long-term journey across different steps including agenda-setting, raising policy discussions, negotiating solutions, establishing international law and implementing policies. While global policymakers and stakeholders have paid attention to plastic pollution issues, the evolution of global plastic pollution governance reflects the complicated global environmental politics.

Identifying a single, clear and concrete target remains difficult and complex in plastic pollution governance. Unlike other global environmental challenges, global actions on addressing plastic pollution have been locked in a range of different definitions and understandings of plastics-related issues and solutions. For instance, while climate change governance similarly has encountered various difficulties, it has a very clear and consistent goal of limiting the average global temperature rise to 1.5 C. This objective does not compromise itself simply because we have been witnessing heatwaves and extreme weather events across the planet.

In the context of global plastic pollution, however, the scope and definitions of plastics have been interpreted very differently by various state actors and stakeholders. It is difficult to filter the specific plastic materials to be controlled and restrained. According to a 2025 report by the OECD, packaging is a main sector consuming plastics, representing 32 percent of global plastics use followed by construction (15 percent) and transportation (12 percent). Plastic accounts for nearly 60 percent of clothing materials such as polyester, acrylic and nylon. They are daily-life products and important materials for supporting human life. In the negotiations, which types of plastics and to what extent actions are required remain ambiguous and contentious. This has led to deadlock in the plastics negotiations.

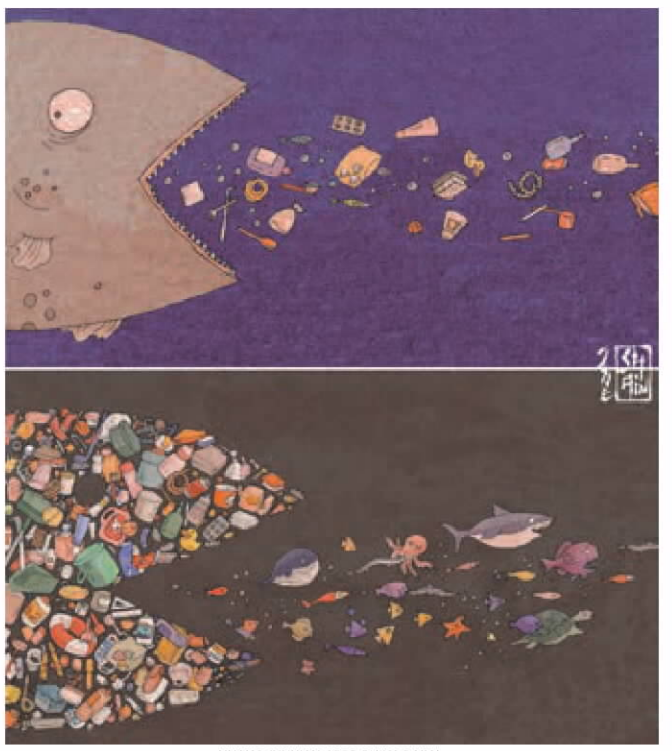
A variety of stakeholder roles — including producers, consumers, investors, exporters, importers and polluters — has further fragmented global plastic pollution governance and aggravated the dichotomy between developed and developing countries by redistributing the differences along value chains. The North-South gap persists in mapping global environmental governance and redistributing environmental responsibilities. Consequently, the criteria for responsibility distribution become harder to discern and demarcate.

For instance, while widely embedded in various environmental policies, the principle of the polluter pays has been inappropriate in the case of plastic pollution, as it unduly forces developing countries to undertake the main responsibility for addressing plastic pollution. The principle of Extended Producer Responsibility has instead been introduced in order to shift the responsible actors from the marine polluters to the plastic producers. But, plastic production has been closely linked to plastic manufacturers and producers of fossil fuels. The fundamental industrial structures of many developing countries matter here.

Developed countries should not shirk their responsibilities for leading actions on controlling plastic pollution by labeling developing countries as the producers and polluters. A very clear fact is that Western countries have long invested in plastics-related industries, achieved economic growth and industrialization, and enjoyed a modern plastic-based lifestyle. A range of leading global companies in plastic manufacturing are located in the United States and European countries. Particularly, many of the recycled plastic wastes are traded to developing countries in the name of the circular economy. For instance, Japan, Spain and Germany were the three largest exporters of plastic waste to Malaysia in 2023, accounting for 33 percent, 17 percent and 16 percent of its total imports respectively, according to 2025 Environment Working Papers of the OECD.

The emerging architecture of global plastic governance must therefore coordinate with the diverse array of existing international institutions already addressing plastic pollution. Functionally, any proposed global plastics treaty will have to engage with established instruments such as the UN Convention on the Law of the Sea, the International Convention for the Prevention of Pollution from Ships and the Plastic Waste Amendments to the Basel Convention. These existing frameworks are primarily designed to control marine plastic pollution and regulate the global trade of plastic waste, rather than addressing plastic production and consumption at source. As a result, competing or conflicting functions may arise between the proposed treaty and these institutional arrangements.

Institutionally, the global governance structure requires a more coherent and coordinated model of cooperation. Horizontally, the institutional arrangements of global plastic governance require their coordination with a range of existing international environmental institutions such as the UN Framework Convention on Climate Change, the Convention on Biological Diversity, and the Basel, Rotterdam and Stockholm Conventions (BRS conventions). This alignment is essential because plastic pollution is intrinsically linked to other global environmental challenges such as climate change, biodiversity loss and the management of chemicals and hazardous waste. Vertically, national and regional proactive measures — such as plastic bag fees and waste import bans — are increasingly being adopted, while subnational efforts concentrate on local priorities such as urban waste management. A consistent framework linking top-down guidance with bottom-up action remains significant for governance alignment.



China is making important contributions to plastic governance. It issued a restriction on importing solid waste including plastic waste in 2017. This policy led to a sharp decline in China's plastic waste, reshaping the global plastic waste trade. Domestically, China released the Action Plan for Plastic Pollution Control of the 14th Five-Year Plan (2021-25) in 2021. On Aug 15, China's Ecological and Environmental Code took effect. This code has clear rules banning and restricting the production, sales and use of single-use plastic products.

As an example of the globally recognized full-life-cycle approach for plastics, China launched the world's first 200,000 ton per year plastic recycling plant in Jieyang, Guangdong province, in July 2025. Various efforts to address plastic pollution have also been made across multi-level governance frameworks and different sectors.

The European Union has taken decisive action adopting the European Strategy for Plastics in a Circular Economy in 2018, and the Association of Southeast Asian Nations issued its Regional Action Plan for Combating Marine Debris in 2021. These institutional efforts are positive measures to control plastic pollution, but they remain insufficient to establish effective global plastic pollution governance.

The metaphor of "mopping the floor while the tap is still on" has rightly captured the frustration at the heart of the plastics treaty talks. Yet the reality is even more complex. There is not one tap but many — production, consumption, markets, investments, waste and trade — and each is controlled by different actors and embedded in different governance systems. To shut them off one by one is not enough; what is needed is a coherent global framework that integrates upstream controls with downstream management, reconciles the North-South divide along the value chain and bridges existing institutional mandates with the new treaty's ambitions. Only by redesigning the system itself, rather than chasing each leak separately, can the world move from metaphor to mandate — and finally keep the floor dry.

SONG CHEN / CHINA DAILY

YU HONGYUAN AND HUANG XIA

Cleaning up

China's transition to low-carbon energy is a key contribution to advancing sustainable development

Over the past four decades, China has achieved extraordinary progress in economic and social development, emerging as the world's second-largest economy and contributing more than 30 percent to global economic growth. Meanwhile, resource constraints are growing increasingly tighter, and environmental carrying capacity is nearing its upper limit. An extensive, low-efficiency growth model that relies on low-cost factors can no longer be sustained, which means China must shift toward a high-quality energy transition and green development.

Yu Hongyuan

Huang Xia

Most recently, China has emerged as a global leader in clean technology and clean energy. In 2025, China's total electricity consumption reached 10.37 trillion kilowatt-hours. Non-fossil energy accounted for 61.7 percent of total installed power generation capacity, while non-fossil energy and renewable energy took up 42.9 percent and 38 percent of total power generation respectively, according to the China Electricity Council.

Wind, solar and biomass power generation contributed 97 percent to the growth in national electricity consumption, while power generation from renewable energy sources has led to an approximate reduction of 3 billion metric tons of carbon dioxide emissions. In the first half of 2026, installed renewable energy capacity reached 2.455 billion kW, accounting for 60.7 percent of total installed capacity, while renewable energy power generation hit 1.96 trillion kWh, making up 41.2 percent of total national electricity generation. According to a report by Xinhua News Agency, China supplies around 70 percent of the world's wind power equipment and 80 percent of the world's photovoltaic panels, which has helped reduce the global average cost of wind and solar power by 60 percent and 80 percent respectively.

To realize the dual goals of peaking carbon emissions before 2030 and achieving carbon neutrality before 2060, China has advanced top-level design and institutional planning for green low-carbon development. It has strictly controlled coal-fired power projects while pushing for the high-quality development of wind and solar power. China has announced that it has strictly limited the growth of coal consumption from 2021 to 2025, and will gradually reduce coal consumption between 2026 and 2030. By 2030, China's CO2 emissions per unit of GDP will drop by more than 65 percent compared with 2005 level, the share of non-fossil energy in primary energy consumption will reach around 25 percent, and total installed wind and solar capacity will exceed 1.2 billion kW. China continues to promote institutional reform in the electric power industry, actively advance the development of the carbon emissions trading market, and devote particular effort to building a well-regulated energy market.

The National Development and Reform Commission and the National Energy Administration have leveraged policy tools to prioritize the development of renewable energy and guarantee the purchase of clean energy. By prioritizing clean renewable power generation and procurement, the market is enabled to play a decisive role in resource allocation, which guarantees the clean, low-carbon, safe and efficient operation of the power system. From 2021 to 2025, China's energy consumption per unit of GDP saw a cumulative drop of more than 16 percent, according to the National Bureau of Statistics. In 2025, the country's CO2 emissions per unit of GDP decreased by 5.0 percent compared with the previous year. China has intensified its efforts to curb the expansion of energy-intensive and high-emissions projects, shut down outdated production capacity, and strictly implemented market access standards for industries including steel and coking. From 2021 to 2025, energy consumption per unit of GDP decreased by more than 16 percent cumulatively; in 2025, non-fossil energy accounted for 21.7 percent of total national energy consumption.

As a responsible major country, China is actively advancing its energy transition and participating in the global response to climate change. China attaches equal importance to both its energy transition and energy supply stability. The power rationing that occurred in some Chinese regions in 2021 exposed the irrationality of the coal-dominated energy mix, strengthening China's resolve. The role of coal in the power system is shifting from the core energy source to a peak-shaving energy source.

China will develop green finance covering green credit, bonds, insurance and development funds, establish market-based green development funds, and refine the green credit guidance catalogue. The country is also introducing new financing models to drive independent innovation of enterprises in green low-carbon technologies. It can also focus on building digital energy systems, constructing a new-type electric power system, promoting multi-stakeholder participation in international energy transition and advancing the depoliticization of energy governance.

Accelerating China's domestic energy transition will promote greater coordination across the global energy system. Through supporting renewable energy growth, directing capital toward low-carbon sectors, driving technological innovation, and transforming consumption patterns, China can secure a competitive position in global green industrial, supply and value chains.

As President Xi Jinping has pointed out, the decision to create a new development pattern with the domestic economy as the mainstay, and the domestic economy and international engagement providing mutual reinforcement, is a strategic choice to reshape China's advantages in international cooperation and competition.

In recent years, overseas market growth has weakened while China's domestic demand has kept an upward trend. Low-carbon development has become a core benchmark of national competitiveness around the world.

In the context of global governance reform and economic recovery, China's transition to low-carbon energy serves as an important instrument for advancing sustainable development and building a clean world. China has integrated the carbon peak and neutrality goals into the overall master plan for ecological conservation. As the largest developing country and a responsible major nation, China can offer solutions to the current challenges in the global low-carbon transition through its own experience and international cooperation.

Looking ahead, China will drive the energy transition across the world by accelerating its domestic transition, coordinating major-country cooperation in the transition process, advancing global ecological conservation and the construction of a community with a shared future for humanity and establishing ecological civilization as the mainstream norm of global environmental governance.

TALES & TRAILS

Editor's note:
China Daily reporters leverage local expertise to devise diverse itineraries that showcase a blend of historical landmarks and natural wonders in highly recommended cities and sites, offering practical guidance to experience the country.

RIDING THE TIDES

Qingdao, a former fishing settlement, now sails forward, balancing architectural memories with beer, beaches and blue-water pursuits, **Xing Wen** reports.

Located on the southern coast of the Shandong Peninsula, bordered by the Yellow Sea to the east and south, Qingdao in Shandong province serves as a vital gateway linking China's inland regions with the wider Asia-Pacific market. Endowed with rolling hills, winding shorelines and natural harbors, the city has a distinctive landscape where hills, sea and urban fabric intertwine.

Once a quiet fishing settlement and coastal defense outpost, Qingdao was occupied by Germany from 1897 to 1914. This period left a visible architectural legacy, particularly in the old town, where German-influenced buildings now stand alongside Chinese urban structures. Together, they reflect the city's complex history and layered cultural character.

Among its best-known heritage areas are Badaguan, a historical residential quarter dotted with European-style villas under sprawling plane-tree canopies, and Dabaodao, home to distinctive *liyuan* courtyards that blend Chinese and Western architectural traditions.

Today, Qingdao is a popular tourist destination celebrated for seafood, such as spicy clams, and its iconic Tsingtao Beer. First brewed in 1903, Tsingtao Beer has become a global emblem of the city, while the Qingdao International Beer Festival showcases its exuberant summer carnival culture.

What distinguishes Qingdao most is its reputation as China's "sailing city". After hosting the sailing events of the 2008 Beijing Olympics, the city developed a thriving outdoor urban culture centered on its coastline.

Visitors can take part in a range of active experiences, from sailing and surfing to coastal cycling and speedboat trips, reinforcing Qingdao's status as one of northern China's leading destinations for coastal sports tourism.

Since watching a Clipper yacht leave his hometown's harbor at age 10, professional sailor now races internationally and inspires youth to see sailing as a career, **Xing Wen** reports.

QINGDAO'S SHORES MAKE DREAMS COME TRUE

Few cities in China allow you to sail straight from the heart of downtown. From the docks of the Qingdao Olympic Sailing Center, you can cast off and ride the wind across Fushan Bay, with the CBD's high-rises looming behind you — a geographical quirk that sets it apart from nearly all other coastal destinations.

Built for the 2008 Beijing Olympics sailing competition, the center is a source of pride for Qingdao native Zheng Yi, whose dream also set sail there.

In the spring of 2006, the Clipper Round the World Yacht Race fleet made its first-ever stop in China, docking in Qingdao, Shandong province.

A grand send-off ceremony packed with crowds and the beat of drums and gongs was held near the Qingdao Olympic Sailing Center.

It was there that 10-year-old Zheng, on a family spring outing, happened to witness the scene, watching the big boat bearing the name *Qingdao*, the first Clipper yacht ever named after a Chinese city, sail out of the harbor.

Aiming the crew was Guo Chuan, the first Qingdao native to compete in the Clipper race.

"That moment planted a seed in my heart: I want to become a sailor, too, representing my hometown and sailing across the oceans," Zheng recalls.

Fortunately, the following year, while in the fifth grade, Zheng was selected, simply because he could swim, for a 10-day summer camp organized by the city's "Sailing into Schools" initiative.

During the camp, he lived and trained with other elementary school students from across the city, learning to sail OP dinghies every day.

"There seemed to be hundreds of sailboats sailing on the water at the same time. It was a spectacular scene," he recalls.

"Qingdao's sailing atmosphere at the time gave ordinary kids like us the chance to get involved in this sport."

When the 2008 Beijing Olympics torch relay reached the Qingdao Olympic Sailing Center, Zheng joined other young sailors in a flotilla of small dinghies, serving as a backdrop fleet as they witnessed the torch being passed through the harbor.

"That was the first time I realized how big the stage for sailing really is; it can take you far," Zheng says.

And he went far.

The Qingdao Olympic Sailing Center's role as a tourist destination has expanded significantly, receiving over 130,000 sailing tourists each year.

In the 2017/18 Clipper Round the World Yacht Race, Zheng was selected as an ambassador crew member aboard *Qingdao*, competing in the first leg of the season — a journey from Liverpool, the United Kingdom, to Punta del Este, Uruguay.

In 2019, as the youngest Chinese sailor in the fleet, he took part in the 2019/20 Clipper Race, racing all eight legs of the global circuit for the first time.

"Circumnavigating the globe taught me little by little how to communicate, collaborate and connect with sailors from different countries. It not only improved my language skills but also helped me stay emotionally steady in the face of uncertainty," he says.

Now racing for China One Ningbo, Zheng has come a long way — from a wide-eyed 10-year-old staring up at sailboats from the dock to a professional sailor competing regularly on the international stage.

Since the "Sailing into Schools" program's initiation in 2006, the city has trained approximately 45,000 young sailors, according to the Qingdao Sports Development Center.

Zheng observes that, for the most part, children in Qingdao have no fear of the sea.

"Growing up alongside the sea, eating seafood, and spending days by the shore give Qingdao kids a natural bond with the ocean," he says.

"There's no barrier, no fear. It's in our bones: we love the water, and we're not afraid to take risks."

Today, while preparing for various M32 sailing competitions, Zheng continues to manage his social media accounts, hoping more people will learn about his sailing journeys.

"What I really want to do is inspire more Qingdao children to dream of sailing," he says.

"Many local kids love it, but not all of them know it can be a career, a path that leads to the world. I hope my story will show young people in Qingdao, just like the boy I once was, that sailing isn't just a fun activity. It's a road that can take you anywhere, a path to realizing who you are."

Xin Kejiang, deputy director of the water sports development and promotion department at the Qingdao Sports Development Center, notes that the public sailing experience events hosted at the center are always well received. In a recent release of 500 spots, all were fully booked overnight.

He adds that while the Qingdao Olympic Sailing Center continues to serve as a training ground for primary and secondary school students, as well as local university sailing clubs, its tourism function has grown significantly in recent years, offering catamaran and monohull sailing experiences for both adults and children.

The center now receives more than 130,000 sailing tourists annually.

Xin himself prefers monohull sailboats. "The greatest thrill comes from battling the wind and waves — especially in strong winds, when the boat can heel at a 45-degree angle, and waves wash over the deck. It's highly athletic, intensely stimulating, and a real test of skill," he says.

For Xu Xiaoxiao, a visitor from Hangzhou, Zhejiang province, opting for the more stable catamaran experience during her trip in early August turned out to be a highlight of her visit to Qingdao.

"Lying on the deck of the sailboat at dusk, watching the sunset glow over the skyscrapers onshore as the boat gently rocks with the swell, not too rough, just the right amount, is incredibly therapeutic," she says.

"Next time, I'd like to try the more thrilling monohull."

Nearly two decades after the Olympic flame left Qingdao, the sailing center remains a place of beginnings. For Zheng, it's where a childhood dream took wing. Today, it offers the same wind to anyone who steps aboard, whether chasing a trophy, a sunset or a future they haven't yet imagined.

If you go

Getting there: Over 20 high-speed trains depart daily from Beijing South Railway Station, serving Qingdao Station and Qingdao North Station. The fastest journey takes just over three hours. Located in the old-town area, Qingdao Station is the preferred stop for tourists. Upon arrival, take Metro Line 3 to Wusi (May Fourth) Square Station. From there, it's about a 20-minute walk to reach the Qingdao Olympic Sailing Center.

Sailing experience: Various sailing experiences for adults and children can be purchased in advance on online platforms such as Dazhong Dianping and Douyin, with prices ranging from 50 to 200 yuan ($7.4-29.6). Popular options include luxury catamaran tickets and two-person monohull sports sailing tickets. Chartering a seven-passenger sailboat costs over 600 yuan.

An iconic installation at May Fourth Square.

Coasting along the seaside on foot

By XING WEN

If you can only spend one day in Qingdao, Shandong province, explore it on foot.

The city's old town, with its seaside views, red-roofed churches and cafe-lined lanes, is a place best discovered not by map, but by wandering.

A widely recommended classic route for your first day in Qingdao is a laid-back walk through the old town, which combines coastal scenery, German-style buildings, highly photogenic streets lined with eclectic cafes, and authentic local street life.

Once you arrive at Qingdao Railway Station, a 10-minute walk will take you to Zhanqiao Pier. Built in 1892 and stretching 440 meters into the sea, it is the city's oldest surviving modern pier and its number-one landmark, always bustling with visitors. In winter, it also attracts large flocks of seagulls that migrate from Siberia, circling and hovering over the waters.

After leaving the pier, stroll along the century-old commercial street, where there are both time-honored local shops and trendy new boutiques.

After walking about 600 meters, you will reach an intersection. Turn right and follow a gentle uphill slope to St. Michael's Cathedral. Completed in 1934 and built with granite, its Gothic spires and red-tiled roof dominate the old town's skyline.

Standing before its heavy stone walls is like viewing the city's layered past, etched in stone with solemn gravity.

A bird's-eye view, perhaps, might soften the overwhelming presence of such grand architecture. Continue the climb to the nearby Xinhaoshan (Signal Hill) Park. Its summit, barely 100 meters high, is crowned with a red mushroom-shaped revolving pavilion.

Encased in floor-to-ceiling glass, the pavilion rotates a full circle every 20 minutes or so, allowing you to soak in the 360-degree panorama without leaving your seat.

After winding your way down from the hill, it's just another 10-minute stroll to the neighborhoods that young travelers tend to fall in love with: Daxue Road, with its plane trees and old German-style villas, and Longjiang Road, where a long wall covered in Hayao Miyazaki-inspired murals has become something of an open-air gallery.

The streets are stuffed with little shops peddling handicrafts, quirky cultural creations and vinyl records — the kind of places you didn't know you needed until you walked in.

Cafes pop up on almost every corner. You can order something frothy while staring dreamily at the dappled sunlight playing tricks on the yellow walls. If you're lucky, a shop cat might wander over and demand your attention.

Frankly, this is where your city walk could, and probably should, come to a gentle, purring halt. Because once you've started petting a cat, leaving becomes a serious moral dilemma. You could easily lose an entire afternoon here, and honestly, that's perfectly fine.

When the light starts to soften and the day begins to wind down, you can reluctantly peel yourself away and drift over to Qinyu Road.

By then, the sunset will be doing its thing, painting the red-rock coastline in shades of tangerine, casting a golden glow over the winding S-curve of the seaside path, and lighting up the white lighthouse like a postcard come to life. It's the kind of view that doesn't just beg for a photo; it practically insists on one.

Of course, if you have more days to spare in the city, you'll find that there's another, more active way to experience this coastal destination from land, sea and air.

For a gentle introduction on two wheels, try the 20-kilometer cycling route along the West Ring Road of Xuejia Island. The path is mostly flat, hugging the shoreline all the way, with hardly any steep climbs, minimal traffic, and a sunset view that'll make you want to keep pedaling to chase the light a little longer.

If you prefer to be on the water rather than beside it, a half-hour sailing experience at the Qingdao Olympic Sailing Center will take you across Fushan Bay, where you can admire the city's skyline of glassy skyscrapers from a whole new angle — one that comes with a gentle rocking motion and a nice sea breeze.

If you're feeling brave, tandem skydiving is an option worth considering.

You'll climb to 3,000 meters in a small aircraft, take a deep breath, and leap out. The moment the parachute opens, the air catches you like a giant invisible hand, and suddenly you're floating above it all, taking in the lush green mountains and the serpentine coastline stretching into the distance.

Whether you have one day or several, Qingdao is a city that rewards those who show up with open eyes and comfortable shoes. Walk it, cycle it, sail it, or fall through it — however you choose to meet this city by the sea, it will meet you back.

TALES & TRAILS

From drone shows to historical streets, beer festival offers a unique blend of modern attractions and cultural heritage, and, of course, a pint, **Xing Wen** reports.

This year's Qingdao International Beer Festival, running from July 17 to Aug 15, draws 7.18 million visits and sees the consumption of about 3.1 million liters of beer. PHOTOS PROVIDED TO CHINA DAILY

A toast to tradition and innovation

Zoom in on any beer tent at Qingdao's Golden Beach during this summer's Qingdao International Beer Festival, which ran from July 17 to Aug 15, and you would have found the city's summer pulse racing at full throttle.

On stage, a live band whipped the crowd into a rhythmic frenzy; below, thousands of revelers swayed to the beat with tipsy enthusiasm, clutching hefty glass mugs that clanged together in deep, resonant thuds, whether with friends or strangers.

This was the everyday scene of the festival.

The monthlong carnival drew 7.18 million visits and saw the consumption of about 3.1 million liters of beer. Three separate venues, each with its own character, catered to a broad spectrum of visitors.

"I really liked the atmosphere of the festival: fun, joy, and the kindness of the locals. I was impressed by the fireworks, the drone show and the parade of musicians," says Alena Maior from Moscow, Russia.

She and her mother recently chose Qingdao as their first destination in China and stayed for seven days. Back in Moscow, whenever she dined at Asian restaurants, she would order Tsingtao Beer.

"My favorite is wheat beer. I was pleased to visit the city and try the original taste right from the place of production," she says.

"I would advise all my friends to visit Qingdao in August to enjoy the sea, the sun and the beer festival. I'm sure the city is no less beautiful in autumn and spring. But we Russians love to swim and sunbathe, so the brighter the sun, the better."

The main venue at Golden Beach offered a family-friendly atmosphere that appealed to all age groups. Night skies were illuminated by 1,500 drones in synchronized flight, blooming fireworks and a 3D light show, their radiance flickering across the waterfront.

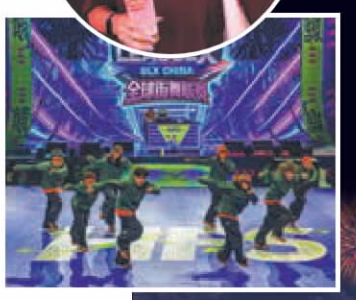
Nine large beer tents housed both globally renowned brands and local craft brews. A new highlight this year was the futuristic beer tent, where smart food-making services and interactive performances were offered by robots. The integration of multiple intelligent robots added a cutting-edge, tech-driven dimension to the venue experience.

The square area featured a packed schedule of events such as drinking contests, street basketball tournaments, balloon volleyball matches and street dance battles.

The sub-venue in Laoshan district, on the other hand, created an amusement-park-like vibe that appealed to young crowds. Over a dozen beer-themed games were offered, allowing visitors who completed challenges to earn festival "coins" that could be used for purchases throughout the venue. Trendy music gigs, stand-up comedy and other performances added to its appeal.

Another sub-venue in Dabaodao, located in the city's old town, took a different approach by integrating highly interactive activities into the historical neighborhood. It featured city music corners, street art performances and role-playing tours, enabling visitors to enjoy an immersive experience. This sub-venue received approximately 3.98 million visits during the festival, a year-on-year increase of 1.5 percent, with a single-day peak of 195,000 visitors.

Bi Wenmeng, brand manager of a local beer-themed homestay, says the property was nearly fully booked throughout the festival.



"We served fresh beer directly from the Tsingtao Brewery, decorated the property with beer-themed elements, and offered hop soap DIY workshops alongside Tsingtao Beer Museum souvenirs, all of which were popular gift choices," Bi adds.

Local residents gather at the beer festival to enjoy the summer evenings.

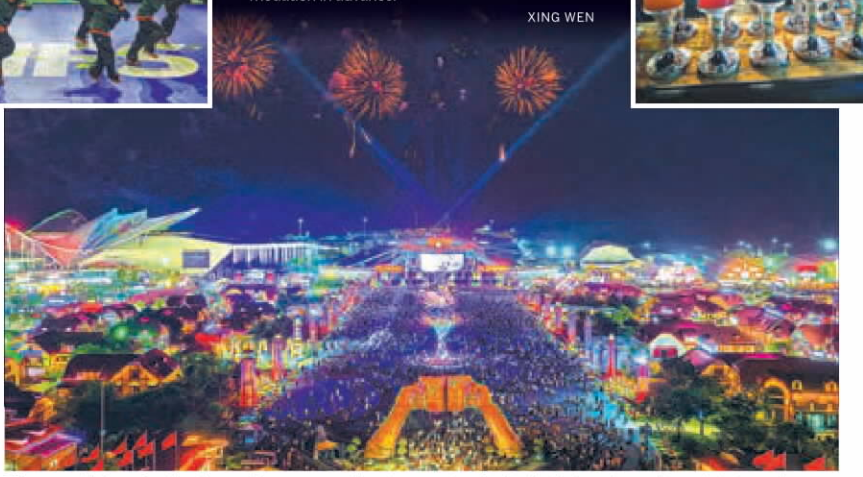
For future visits

The main venue of the Qingdao International Beer Festival is Golden Beach Beer City on the West Coast, usually open from mid-July to mid-August. Entry to the venue is free, while fees apply for beer, food, tent seating and special performances.

Public transport is strongly recommended. Take Metro Line 1 to Tianmushan Road Station and transfer to the festival shuttle bus. Metro services are usually extended during the festival, but visitors should check the latest schedule. Driving is not advised, as heavy traffic and limited parking are common on weekends and evenings.

Arrive after 4 pm to avoid strong daytime sun and enjoy the sunset plus evening drone light shows. Weekdays are less crowded and may offer better discounts on beer, whereas weekends are much busier with almost no promotions.

Food prices inside beer tents are relatively high; better-priced snacks are available on the outer food street. Bring a light jacket, as it gets cool by the sea at night. Drink responsibly, especially when eating seafood.



Hotel prices rise sharply during the festival, especially on Fridays and Saturdays. Book accommodation in advance.

XING WEN

The monthlong festival provides an excellent opportunity for both locals and tourists to enjoy beer and food together. Featuring over 2,300 beers from more than 50 countries and regions, the festival also attracts visitors with a variety of events, including street dance competitions, performances, street basketball games and fireworks displays.

The festival brought together over 2,300 beers from more than 50 countries and regions, alongside a sprawling food street highlighting local seafood, delivering an authentic taste of the coast.

Qiu Yi, from Zunyi, Guizhou province, organized a beer festival trip for her parents and their friends.

"In Guizhou, when we gather, we enjoy having a few drinks, sharing some food, and having a good time. The lively atmosphere of the beer festival provided the perfect setting for our parents to socialize and enjoy themselves," she says.

In 2023, she visited Oktoberfest in Germany, the famous folk beer festival held annually in Munich, Bavaria. She says that by comparison, the Qingdao International Beer Festival offered a wider variety of food, more diverse performances and more amusement facilities, though she feels it lacked some of the cultural distinctiveness that gives Oktoberfest its strong sense of identity.

According to Wang Defang, a former worker at Tsingtao Brewery, the inspiration for launching the Qingdao International Beer Festival came from the brewery's technical staff members who were sent to Germany in the 1980s to study brewing techniques and experience the grandeur of Oktoberfest firsthand.

On June 23, 1991, the first Qingdao International Beer Festival kicked off in Zhongshan Park. Drinking contests, fashion shows and float parades were staged one after another, drawing more than 300,000 visitors over eight days.

"At that time, there were only about 40 to 50 domestic beer varieties and a few international ones, but it still excited the local residents and visitors alike," Wang recalls.

"Back then, there weren't many entertainment options. In summer, people would gather there, whether they knew each other or not, and they'd clink glasses, chat, sing and dance. It was a particularly carefree time," says Xi Wei, a Qingdao native who has witnessed the festival grow in scale and attract more out-of-town visitors.

Many of her childhood summer memories are tied to beer.

"When summer arrived, small shops in the alleys would put out tables on the street. Five or six people would crowd around each one, and every restaurant's doorstep was packed with diners. Every eatery had a draft beer dispenser. I often took plastic bags or other containers to fetch beer for my dad from those machines," she recalls.

Today, her home is just a 10-minute walk from Golden Beach, and she often takes a stroll to the beach during the festival.

In her view, everyone can find something to enjoy at the festival.

Those who love a lively atmosphere can watch performances and clink glasses with friends inside the beer tents; those who prefer quieter moments can watch the festive fireworks from the nearby beach.

"When the fireworks go off, I can smell the sea breeze mixed with the scent of gunpowder. At moments like that, whether the people around me are friends or strangers, we all look up and cheer together, and that doubles the joy," Xi says.

When the final firework fades, and the last mug is emptied, the city's summer lingers on — in shared cheers, in the froth of beer, in the salt on the breeze, and in the promise of next year, when the tents rise again.

Floods in Nepal kill nearly 160 people

KATHMANDU — An avalanche of ice and rocks triggered massive flash floods in northern Nepal on Wednesday, killing nearly 160 people and leaving hundreds of others missing while causing widespread damage to villages and infrastructure, Agence France-Presse reported.

Abi Narayan Kafle, spokesperson for Nepal Police, confirmed the death toll on Wednesday, adding that some 28 police personnel were also missing, AFP said.

Rescue teams in Nepal had recovered 95 bodies so far, police told Reuters. Local media reported 65 people were being treated in different hospitals.

The massive flash flood swept through areas along the Bhote Koshi River at 9 am, affecting three districts — Rasuwa, Nuwakot and Dhading, officials said.

Nepal's tourism ministry said some 403 tourists — 341 of them foreigners — were missing from the region, including more than 100 Indians, three US citizens and 12 British nationals.

Sunil Sharma, spokesperson at the Nepal Tourism Board, said the missing tourists also included Australians, Dutch, Malaysians and South Africans, among others. Dozens of local people were also missing.

Widespread damage

The worst damage has been reported in Rasuwa, where the flood swept away several houses, damaging markets, hydropower projects, roads and other infrastructure.

Nepal's Prime Minister Balendra Shah called an emergency cabinet meeting to discuss rescue and relief measures and urged the nation to stand united.

"Please be patient. The government takes full responsibility for your rescue, treatment, food and shelter. In times of such a disaster, we all need to stand together," Shah said in a statement posted on social media on Wednesday.

The Nepali Army, backed by other security forces, has intensified search and rescue operations.

Initial reports suggested an earthquake in the area could have triggered an avalanche and caused the floods, Nepal's Foreign Minister Shisir Khanal told the country's parliament on Wednesday, local media reported.

XINHUA — CHINA DAILY

Kenya faces maize harvest shortfall

By **EDITH MUTETHYA**
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

Kenya is facing growing concerns over food shortages after a prolonged dry spell severely affected crops in the country's North Rift grain basket, particularly in Trans Nzoia and Uasin Gishu counties.

The North Rift is one of Kenya's major maize-producing regions, but inadequate rainfall during the March-to-May long rains season — the main wet period across most parts of the country — left crops severely stressed, with extensive crop losses reported in some fields.

The concerns come amid forecasts of a strengthening El Nino weather event later this year, which could further disrupt agricultural production. Recent international forecasts indicate that the developing 2026-27 El Nino could become exceptionally strong.

Jonathan Bii, governor of Uasin Gishu County, said the county could record a 60 percent drop in food production, particularly maize, due to the inadequate rains.

In Trans Nzoia, county officials said about 20,000 hectares of maize were destroyed by hot, dry weather, representing 20 percent of the county's total maize production.

Meanwhile, the national government has moved to secure additional maize supplies. Mutahi Kagwe, cabinet secretary for agriculture and livestock development, said last week that the government had made arrangements to facilitate the import of up to 25 million 90-kilogram bags of maize to bridge the anticipated supply deficit.

Deputy President Kithure Kindiki issued similar assurances on Monday, saying the government had put measures in place to cushion the country against hunger and famine, as well as the potential impacts of the projected El Nino-related rains.

"The ministry of agriculture is engaged and the National Treasury has been very supportive," he said. "We need to put everything in place to make sure that our country does not struggle."

Intensify preparations

Kindiki urged the national and county governments to intensify preparations for the anticipated October-to-December rains amid forecasts of a possible El Nino event.

Kindiki said the two levels of government were coordinating efforts to prepare for possible flooding and other rain-related emergencies.

"We are prepared in pre-positioning food and nonfood relief supplies at the nearest points possible in the counties before the rains start," he said.

Against the backdrop of increasingly unpredictable weather patterns, the government has also called for greater investment in irrigation to reduce the country's dependence on rain-fed agriculture.

One of the government's major food security projects is the Galana-Kulalu Food Security Project in Kilifi and Tana River counties. The project covers about 700,000 hectares in the Galana-Kulalu area, with the National Irrigation Authority playing a central role in its development.

The government is also advancing the Athi-Galana Dam project, which China Communications Construction Company is constructing. The dam is intended to provide irrigation water in the Galana-Kulalu area, strengthen agricultural production and enhance food security.

Children walk across an open field carrying water amid a prolonged drought in Nadunga Village, Turkana County, Kenya, on Feb 6. PATRICK NGUGI / AP

SYRIA

Kurdish forces disband under integration deal

The leader of the Kurdish-led Syrian Democratic Forces, Mazloum Abdi, announced Tuesday that the group had been dissolved as an independent military force after its fighters were integrated into brigades of the Syrian army. The SDF, which spearheaded the fight against Islamic State in Syria, had about 100,000 fighters at its peak. The move followed a deal reached with the Syrian government earlier this year after January clashes saw government troops take control of large parts of territory previously held by the Kurdish forces.

RUSSIA

Moscow, Kyiv discuss major prisoner swap

Russia and Ukraine are discussing a new "quite big" swap of prisoners of war, Russian news agency TASS cited Human Rights Commissioner Yana Lantratova as saying on Wednesday. Thousands of prisoners have been exchanged in the Russia-Ukraine conflict since February 2022. An agreement in May to swap a further 1,000 captives each was one of the main tangible results of recent negotiations between Russia and Ukraine.

Fire at gas complex kills 7, including 6 Chinese

A fire at the Amur Gas Chemical Complex in Russia's Far East killed seven people, including six Chinese nationals, and injured 152 others, the project officials said Wednesday. Nine Chinese nationals remain missing, while 36 of the injured were hospitalized. The fire has been extinguished, and search and rescue operations are underway. Preliminary information showed the project's main equipment was not damaged, while experts are investigating the cause. A working group from the Chinese Consulate General in Khabarovsk has arrived at the site to handle follow-up matters.

UNITED STATES

SpaceX plans $100b rocket launch site

Elon Musk's SpaceX plans to spend $100 billion to build a massive new rocket launch site on Louisiana's southern coast, state officials and the company announced Tuesday. The roughly 50,600-hectare spaceport would be SpaceX's fourth and largest launch site and support its reusable Starship system. Construction is expected to begin in 2027, with the first launch targeted for as early as 2029.

East Africa eyes role of medical tourism hub

Experts call for stronger links, shared standards and easier patient movement

By **SHARON NAKOLA**
in Addis Ababa, Ethiopia
sharon@chinadailyafrica.com

East African countries are seeking to position the region as a medical tourism destination by linking their healthcare systems, sharing specialized expertise and creating common standards that could give patients greater confidence in seeking treatment within the region.

Health leaders and private sector representatives speaking at a side event of the 13th East Africa Healthcare Federation Conference and International Exhibition in Addis Ababa, the capital of Ethiopia, over the past weekend, said the region already has important pieces of a medical tourism market, but needs stronger cooperation, investment and easier cross-border movement to turn them into a regional proposition.

The discussions highlighted the need for East African countries to work together rather than develop isolated centers of excellence, with speakers saying individual countries may struggle to provide and sustain every specialized medical service on their own.

Kanyenje Gakombe, chairman of the Kenya Healthcare Federation, said that medical travel presents an opportunity for East Africa's health sector, particularly the private sector, but the region needs to understand why patients continue to seek care outside their countries.

He identified gaps in specialized care, affordability and privacy among factors driving patients abroad, while noting that individual countries often lack the population base needed to sustain expensive centers of excellence.

"Together we are 500 million people. Together we can deliver economies of scope and scale," Gakombe said, arguing that regional cooperation could help countries mobilize the technology, capital and expertise required for specialized care.

Gakombe said the COVID-19 pandemic offered another lesson for the region, demonstrating the risks of depending on overseas destinations for specialized treatment when international borders can suddenly close.

He argued that building regional capacity would therefore serve both medical tourism and health system resilience. "Borders can be closed, and therefore resilience and the capacity to provide care must be built here," he said.

Medical tourism is already emerging in East Africa, although it remains relatively small and fragmented. Globally, about 14 million people travel internationally for medical treatment each year, according to an estimate by the Global Medical Tourism Association, reflecting growing demand for care that may be unavailable or unaffordable in patients' home countries.

East Africa is also seeing patients cross borders for treatment. Tanzania's former health minister Jenista Mhagama told the parliament in June last year that the number of international patients seeking treatment in the country had more than doubled, from 5,705 in 2021 to 12,180 between January and March 2025. Most of the patients came from African countries, including South Africa, Ethiopia and Kenya, she said.

Kenya, which boasts several advanced medical institutions, is similarly attracting patients from across the region. Data from Kenya's Tourism Sector Performance Report 2024 showed that about 7,944 people from the East African Community traveled to Kenya for medical reasons that year.

For Ethiopia, medical tourism is increasingly being viewed as more than a health sector issue. Endegena Abebe, Ethiopia's state minister for tourism, described it as a "new form of high-value tourism market" and said the country has developed a 10-year medical tourism and wellness model.

He said Ethiopia's approach includes improving hospital accreditation and quality assurance while creating incentives to attract investment into the sector.

Regional connectivity

A key priority, Abebe said, is to create a seamless patient journey that connects medical facilities with visa services, airports, accommodation and support for accompanying family members. "We need to integrate that one with different regions, with different sectors," he said, stressing the need to connect the different stages of a patient's journey.

He said Ethiopia is also considering changes to medical visa arrangements, including longer-term and multiple-entry options, as part of the efforts to make the country more accessible to medical travelers.

Egina Francis Makwabe, president of the Association of Private Health Facilities in Tanzania, said East Africa needs a stronger "Made in Africa" approach to medical tourism. He said the region must first build confidence among its own populations by ensuring that local facilities offer quality care at competitive prices.

He also called for a regional platform that would allow patients to identify hospitals, specialties and treatments available in different countries.

Makwabe said some advanced services already exist in East Africa but remain poorly known outside the countries where they are offered.

Edgar Kalimba, board chairman of Africa Health Sciences University in Rwanda, said East Africa's challenge is not necessarily a shortage of medical talent, but the creation of an environment that encourages highly trained African specialists working abroad to return and practice in the region.

He also called for easier movement across borders, including fewer visa restrictions, arguing that existing air links provided by Ethiopian Airlines, Kenya Airways and RwandAir could support greater regional medical travel.

Shooting probe

Authorities investigate a crime scene on Tuesday where a man is said to have killed eight of his relatives, including four children, as they gathered for Sunday dinner at home in Billings, Montana, United States, before the house went up in flames. A family member told The Associated Press that the tragedy unfolded weeks after the man's parents asked him to move out.
MATTHEW BROWN / AP

Economy in 'tug-of-war': IMF chief

WASHINGTON — The International Monetary Fund chief on Tuesday compared the global economy to a "storm-tossed vessel", caught between high inflation, debt and trade wars while being driven by tailwinds from the AI revolution.

Kristalina Georgieva told journalists in Washington that the global economy had so far "weathered the energy shock caused by the closure of the Strait of Hormuz better than we feared".

Worldwide energy prices have skyrocketed since the United States and Israel launched their war on Iran, engulfing the Middle East in violence as Tehran's retaliatory action targeted US allies and blocked the vital Strait of Hormuz.

In July, the IMF cut its global growth projection for the second time this year, flagging "uncertainty and risks" related to the conflict in the Middle East.

Global economic growth is estimated at 3.0 percent this year, the IMF said in its update to its World Economic Outlook at the time, down from 3.1 percent in its April forecast.

Georgieva on Tuesday said the impact of the conflict had been "asymmetric", based on countries' exposure to Gulf oil imports and their overall macroeconomic stability.

Global inflation — driven by high energy prices — was also being pushed in a "tug-of-war" by the "positive demand shock from AI", she said, referring to an increase in economic demand due to massive investments in the new technology.

"Risks to the outlook are more balanced than they were around our Spring Meetings (in April), but still tilted to the downside, and uncertainty remains high," she said.

Georgieva warned that with winter approaching in the Northern Hemisphere, energy demand would only increase, possibly pushing a renewed rise in prices.

"This means the energy shock is not over. A renewed rise in oil prices could fuel inflation, forcing central banks to retain a restrictive policy stance with knock-on implications on debt service costs and on economic activity."

She was, however, optimistic about the broad impact of AI on the world economy, and said positive effects were being seen in more countries than just the United States.

Georgieva warned that there were "significant unknowns" when it came to AI, and that the risk of falling behind was "most profound" in developing countries.

Despite the global economy showing more resilience than feared to the shock of the Iran conflict, there was "no room for complacency", she said. She called on countries to address fiscal imbalances — especially with regard to debt — and for central banks to be "laser-focused" on inflation.

The IMF chief joined the media roundtable weeks before the 2026 Annual Meetings of the IMF and the World Bank Group, scheduled to take place in Bangkok, Thailand, in October.

Hormuz remains shut despite promising talks

De-escalation signals emerge as IRGC says deal reached on revenue sharing

By **CUI HAIPEI** in Dubai, UAE and **JAN YUMUL** in Hong Kong

While Iran and Oman have floated proposals for a temporary transit corridor and joint mine-clearing operations for the Strait of Hormuz, Tehran warned on Wednesday that the critical waterway would stay shut unless the United States brings an end to the nearly six-month-old conflict.

Iran's Islamic Revolutionary Guard Corps said that agreements were reached on the share of the Strait of Hormuz's waters allocated to Iran and Oman, as well as their respective shares of revenues generated by the waterway, during talks between the two countries, Tasnim news agency reported on Wednesday.

The development came as Washington has rolled out what it calls the "toughest economic sanctions" designed to further isolate Iran, with US Treasury Secretary Scott Bessent threatening the country with "economic asphyxiation".

In Tehran, foreign ministers from Iran and Oman discussed a "phased framework" that included setting up a "joint temporary navigational corridor through the Strait of Hormuz and an agreement to implement a joint project to clear the Strait of mines", according to a statement.

Iranian Deputy Foreign Minister Kazem Gharibabadi told state television the two sides had reached an understanding on a temporary route. Vessels sailing into the Persian Gulf from the Gulf of Oman would travel entirely through Iranian waters, while outbound traffic would travel through both countries' waters. He added Iran and Oman would then hold negotiations over 30 to 60 days to "reach an understanding on a new permanent and sustainable route".

Showing commitment

Iran's Foreign Minister Abbas Araghchi said on Tuesday that the proposed framework is "a case in point", demonstrating his country's "commitment to peace and stability matched by steadfast diplomacy with our neighbors".

Omani Foreign Minister Sayyid Badr bin Hamad bin Hamood Albusaidi said on Tuesday that he hoped Iran and Oman would "soon announce" the temporary corridor. "Future management of the strait and a permanent solution will follow in due course," he wrote on social media.

It remains unclear whether the US will endorse the emerging deal. US President Donald Trump threatened last week to bomb Oman should it "get in the way" of Washington's push to reopen the strait.

Nearly six months after the US-Israeli military campaign against Iran began, shipping traffic across the Strait of Hormuz remains largely paralyzed, roiling global oil markets.

Trump previously said on social media, citing the US Navy, that "all mines have been removed and/or detonated from within the international waters of the Strait of Hormuz".

But Gharibabadi warned on Wednesday that no military vessel would be allowed to pass through the strait. "We closed the Strait of Hormuz before the US imposed an economic blockade because the US failed to fulfill its commitments under the memorandum of understanding," he told state news agency IRNA.

Meanwhile, the US has begun returning diplomatic staff members to some Middle East missions that were evacuated or downsized during the conflict, two people familiar with the matter told Reuters, suggesting Washington sees a lower risk of the conflict with Iran escalating in the near term.

The New York Times earlier reported the return of diplomats and the easing of emergency measures, saying embassies in Jordan, Oman, Kuwait and Qatar were also expected to restore higher personnel levels, citing an internal document.

US embassies in Israel, Jordan and Oman would ultimately return to full staffing, while missions in the United Arab Emirates, Saudi Arabia, Qatar and Lebanon would initially be capped at 85 percent staffing.

Russian news agency RIA Novosti reported on Tuesday that the US and Iran had reached a ceasefire agreement, including free navigation in the strait, citing Pakistani military and Iranian security sources.

Moldova eyes expanding cooperation with China

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

This year marks the 35th anniversary of the Republic of Moldova's independence, offering an opportunity to reflect on the steady development of Moldova-China relations over the past three and a half decades and to look ahead with confidence to the next stage of the bilateral partnership, said the Moldovan ambassador to China.

Looking back on 35 years of independence, one of Moldova's major achievements has been its transformation from a predominantly agricultural economy into a more diversified and competitive one, Petru Frunze told China Daily.

Moldova is renowned for its wines, agricultural products and rich cultural heritage. Today, Moldovan wine is exported to more than 70 countries worldwide, with around 60 percent of exports destined for European markets. The wine industry accounts for about 3 percent of GDP and nearly 8 percent of the country's total exports, according to the National Office for Vine and Wine of the country.

"When people think about Moldova, one of the first things that comes to mind is our wine. Wine is an important part of our identity and culture, and Moldovan wines are already appreciated by many Chinese consumers and wine lovers. Our wine routes and underground wine cellars offer visitors a unique experience that combines tradition, history and hospitality," Frunze said.

"Agriculture remains one of our strongest advantages. Moldova is among the top 20 global exporters of plums, walnuts, cherries, apricots, rapeseed, apples and grapes. We are also among the top 20 wine exporters worldwide, and our country is home to the world's largest wine collection by the number of bottles, recognized by Guinness World Records," he said.

At the same time, through reforms, active economic diplomacy and mutually beneficial partnerships, Moldova has developed new strategic sectors, including automotive, electronics, agri-food processing, construction materials and textiles. "Today, Moldova is increasingly integrated into regional and global supply chains," he said.

Frunze said the country has been dedicated to enhancing international economic connectivity in recent years.

"Although Moldova has a population of only 3 million people, our free trade agreements provide access to a market of over 870 million consumers, including through agreements with the European Union's EFTA (European Free Trade Association) countries," he said.

Frunze took up his post in Beijing in March as Moldova's new ambassador to China. He said his arrival in China and firsthand experience of the country's rapid development had given him new perspectives and a deeper understanding of the nation.

"I greatly appreciate the way China combines modernization with the preservation of its rich historical and cultural heritage. For me, China represents a valuable example of how technology, cultural heritage and people-oriented development can come together to build modern, sustainable and livable cities," he said.

He noted that Moldovan Deputy Prime Minister and Foreign Minister Mihai Popsoi's visit to Beijing in May marked an important milestone in the development of bilateral relations, during which the two sides held comprehensive discussions on expanding cooperation across a broad range of areas.

Petru Frunze

"The visit reaffirmed our shared commitment to strengthening bilateral relations and translated that commitment into a practical agenda for future cooperation," Frunze said.

It strengthened institutional dialogue, identified new areas for collaboration and created favorable conditions for further expanding economic ties, he added.

"Over the past three decades, our relationship has been built on mutual respect, friendship and constructive dialogue. Today, we have the opportunity to open a new chapter: one that is more dynamic, more practical and more result-oriented," he said.

"Nowadays, China is Moldova's second-largest trading partner, and we are confident that the complementarity between our two economies offers substantial opportunities to increase trade, attract new investment, and develop mutually beneficial projects in the years ahead," he said.

Moldova is pursuing closer integration with Europe, Frunze said, adding that the process could help strengthen cooperation and dialogue between China and the European Union.

"We believe that China and Europe are two major economic partners whose cooperation is important not only for their own development, but also for global stability and prosperity," he said.

European path

Frunze said that, as Moldova advances on its European path, closer integration with the EU and constructive relations with China are not contradictory. Moldova has consistently supported balanced, open and mutually beneficial cooperation with all its partners.

"Our role can be that of a bridge: promoting dialogue, economic cooperation and people-to-people connections. With our geographic position, European perspective and experience of cooperation with different regions, Moldova can contribute to creating more opportunities for understanding and practical partnerships between China and Europe," he said.

He is confident that the future of Moldova-China relations is very promising. The objective of both countries is to build a partnership that is practical, forward-looking and mutually beneficial.

"As ambassador, I will work actively to bring our institutions, businesses and peoples closer together and to help transform opportunities into concrete projects that create value for both Moldova and China," Frunze said.

Dai Yan contributed to this story.

Israel criticized over raid on UN compound

RAMALLAH/JERUSALEM/UNITED NATIONS — Israeli forces took control of a vocational training center run by the UN agency for Palestinian refugees in an East Jerusalem suburb on Tuesday, in its latest move targeting the beleaguered organization.

The center was established in 1952 and offers vocational training to around 340 Palestinians from the West Bank every year, according to UNRWA.

The raid has drawn condemnation from the UN.

UN Secretary-General Antonio Guterres on Tuesday condemned the Israeli takeover of a training center of the world body in East Jerusalem, said Stephane Dujarric, chief spokesman for Guterres.

"The secretary-general condemns in the strongest terms today's actions by the Israeli authorities, including security forces, to unlawfully enter and remain on the UNRWA Kalandia Training Centre in occupied East Jerusalem and carry out unauthorized works in those premises," said Dujarric.

UNRWA is the UN Relief and Works Agency for Palestine Refugees in the Near East.

"The secretary-general is greatly alarmed at this development, as it will deprive young people of the vocational education they were receiving," said the spokesman.

"For over 70 years, the center has supported thousands of Palestine refugees through vocational education and pathways to work."

About 20 UNRWA staff members who were at the center at the time of the unauthorized entry were allowed to leave, Dujarric said.

Dujarric said the secretary-general urged the Israeli government to immediately cease interference with UNRWA premises, vacate and return all affected premises to the United Nations without delay, and protect those premises from further interference or damage.

Also in the West Bank, Israeli settlers set fire to an aluminum factory in the Palestinian village of Ein Siniya, causing extensive damage to the structure, stored materials and nearby farmland, said the UN Office for the Coordination of Humanitarian Affairs.

"Civilians must be protected and perpetrators must be held to account," it said.

Meanwhile, the US-led board supervising a Gaza peace plan on Tuesday warned Hamas against flying kites, after Israel threatened retaliatory strikes.

"All militant activity in Gaza must stop, including the flying of kites. We have conveyed this message directly through the established mechanism," an official on the "Board of Peace" said on condition of anonymity.

"Israel, too, must comply with the ceasefire. Military action cannot extend beyond responding to genuine and imminent threats," the official said. Israeli Prime Minister Benjamin Netanyahu on Sunday warned Hamas that Israel would step up operations in Gaza if Hamas launches kites, drones or balloons.

Services seen having bigger role in GDP

Efforts intensified to steer economy to more consumption-led growth model

By **ZHANG CHENXU** and **LI JIAYING**

Services consumption is poised to assume a more important role in driving China's economic growth this year, officials and experts said, pointing to a structural shift in domestic demand, with services accounting for a growing share of household spending.

As external uncertainties continue to escalate, policymakers are doubling down on efforts to build on the shift and steer the economy toward a more consumption-led growth model, they added.

"Consumers tend to spend more frequently on services, and such spending generates strong spillover effects. Expanding services consumption will therefore remain a major engine of overall consumption growth," Wang Guanhua, spokesperson for the National Bureau of Statistics, said at a news conference earlier this month.

Service retail sales rose 5 percent year-on-year in the first seven months, 3.9 percentage points faster than retail sales of goods, NBS data showed.

Luo Zhiheng, chief economist at Yuekai Securities, said the figures point to a continued upgrade in China's consumption mix, with services becoming an increasingly important source of growth.

Unlike goods, services are less constrained by diminishing marginal utility and therefore offer greater room for spending growth, Luo said.

Tourism has stood out, with retail sales of tourism-related consulting and rental services rising 11 percent year-on-year in the first seven months, the NBS said.

Morgan Stanley expects China's tourism revenue to reach 12 trillion yuan ($1.78 trillion) by 2030. Tourism's share of GDP is projected to rise to about 6.7 percent by then, from 4.8 percent in 2024.

Yuan Haixia, dean of the research institute at China Chengxin International Credit Rating, said the experience of developed economies shows that consumption typically becomes the main engine of growth once a country enters the ranks of high-income economies.

Echoing this view, Xiong Yuan, chief economist at Guosheng Securities, said the shift toward services still had considerable growth potential, with the share of per capita spending on services in total consumption expenditure rising 0.2 percentage point year-on-year in the first half.

A high-level meeting convened by China's top leadership in late July placed a high premium on efforts to expand the supply of quality goods and services, and tap the potential of services consumption. The meeting held by the Political Bureau of the Communist Party of China Central Committee also called for improving fiscal-financial coordination to bolster domestic demand.

Further measures are in the pipeline. "We are working on additional fiscal-financial coordination measures, which will be rolled out in the second half," Liao Min, vice-minister of finance, said at a separate news conference on Friday.

Alongside efforts to improve the supply of services, faster growth in household disposable incomes will be key to sustaining the expansion in services consumption, experts said.

"Income elasticity for many services exceeds one, meaning spending on services tends to rise more than proportionately as household incomes grow," Luo said.

On July 13, the State Council approved the plan for expanding consumption during the 15th Five-Year Plan (2026-30) period, which calls for "steadily raising minimum wages".

Guangdong province will raise the monthly minimum wage to 2,680 yuan in Guangzhou and 2,700 yuan in Shenzhen, effective Sept 1, up 7.2 percent and 7.1 percent, respectively, according to the provincial government. Shanxi province and the Xinjiang Uygur autonomous region will follow suit on Oct 1, raising their monthly minimum wage rates to 2,350 yuan and 2,270 yuan, respectively, according to separate official notices.

Turning tech edges into growth engines

By **LI JIAYING**
lijiaying@chinadaily.com.cn

China will turn frontier technologies into new growth engines by putting emerging and future industries, artificial intelligence-enabled manufacturing and next-generation communications at the center of its 2026-30 industrial agenda, the country's industry regulator said on Wednesday.

The approach is designed to turn technological breakthroughs into large-scale industrial applications and build an innovation-led modern industrial system during the country's 15th Five-Year Plan period (2026-30), said Xin Guobin, vice-minister of industry and information technology, at a news conference in Beijing.

According to Xin's ministry, integrated circuits, aerospace, biomedicine, the low-altitude economy, new energy storage and intelligent robots will be developed into emerging pillar industries. China will also foster future growth points including quantum technology, biomanufacturing, hydrogen and nuclear fusion energy, brain-computer interfaces, embodied intelligence and 6G.

AI is expected to be a central link between frontier research and industrial upgrading. On the technological supply side, the ministry will support the research and development of key technologies such as high-end training chips and multimodal algorithms, and pursue breakthroughs in frontier technologies including brain-inspired intelligence and world models, Xin said.

On the ecosystem front, high-standard AI open-source communities will be leveraged as key platforms to develop a group of high-quality open-source projects for AI-facilitated manufacturing, the senior official added.

As new information and communications infrastructure provides another foundation for emerging industries, the country is also looking to push forward the development of next-generation communications and computing networks, and expand the industrial use of 5G and the industrial internet, according to the ministry.

"6G will be a top priority during the 15th Five-Year Plan period," said Liu Yulin, head of the ministry's information and communications development department. The ministry will accelerate research on core 6G technologies, continue technical trials and standards development, and promote the maturation of the 6G industry and development of its ecosystem to lay the groundwork for commercialization, Liu added.

Smaller firms will also be integral to the new-growth agenda. "Small and medium-sized enterprises are closely linked to technological innovation and industrial-chain resilience, as well as employment and people's livelihoods," Xin said.

In this regard, the ministry will improve its tiered system for cultivating high-quality companies, foster specialized and innovative small and medium-sized enterprises, and develop more "little giant" firms and single-product champions in manufacturing. It will also provide greater support in digital services, talent, financing and data, while strengthening protections for intellectual property and mechanisms to prevent overdue payments.

"A national plan promoting high-quality SME development will be released soon," Xin said, adding that the ministry will also establish the second phase of the national SME development fund, strengthen inclusive financing and listing support, and improve a nationwide service network for smaller businesses.

The future-facing agenda is anchored in a manufacturing base that continued to expand during the 14th Five-Year Plan period (2021-25). China's manufacturing value-added rose from 26.5 trillion yuan in 2020 to 34.7 trillion yuan during the period, while its share of GDP remained about 25 percent, data showed.

Energy partnership sees notable progress

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Energy cooperation between China and other Asia-Pacific Economic Cooperation economies has made significant strides across traditional energy, renewable power and infrastructure, playing an increasingly crucial role in stabilizing regional supply chains and driving sustainable growth, according to a recently released think tank report.

The report, released by the Economics and Technology Research Institute under China National Petroleum Corp, notes that a comprehensive energy partnership has taken root across the region, characterized by complementary supply and demand, green investments and stable infrastructure connectivity.

Energy security remains a paramount concern for APEC member economies, particularly as many face mounting pressures to decarbonize and restructure their domestic power grids, said the report.

Amid geopolitical volatility — including recent conflicts in the Middle East that underscored Asia's vulnerability to external supply disruptions — building a resilient Asia-Pacific energy security framework has become a shared priority, it said.

According to Lu Ruquan, president of the CNPC Economics and Technology Research Institute, energy cooperation has consistently served as an area where APEC economies can forge the broadest consensus.

Traditional energy remains a foundational pillar of this collaboration, as more than 30 percent of China's imported crude oil and nearly 60 percent of its imported natural gas originate from fellow APEC economies, with trade volumes maintaining steady growth, he said.

Concurrently, Chinese energy enterprises have actively invested in upstream oil and gas exploration and liquefied natural gas infrastructure across economies including Australia, Indonesia, Papua New Guinea and Peru, he said.

At the same time, shared climate targets are accelerating bilateral and multilateral green collaboration. This shift is creating immense opportunities for joint research into renewable technologies, cross-border green investment and the alignment of low-carbon standards, Lu added.

Landmark green infrastructure projects highlight this momentum. In Indonesia, the Jatigede Hydropower Station — constructed by Chinese contractors — has delivered a dependable supply of clean electricity to support local economic development.

Meanwhile, in Malaysia, Chinese enterprises helped develop the country's largest single floating photovoltaic facility. Adopting an innovative "PV plus abandoned mine" model, the project serves as a blueprint for integrating renewable energy generation with ecological rehabilitation in tropical regions.

The report emphasizes that APEC has developed deeply intertwined regional supply chains, where reliable energy circulation safeguards regional economic integration.

Protecting energy security is intrinsically linked to safeguarding these supply chains — a core mutual interest that forms the bedrock of regional cooperation, it said.

"Infrastructure connectivity is a vital aspect of energy cooperation between China and other APEC economies, spanning oil and gas pipelines, LNG shipping routes and ultra-high voltage power transmission networks," Lu said. "This physical connectivity is backed by deeper, multidimensional partnerships in investment, trade and regulatory policy."

China is stepping up efforts to work with other APEC economies to better align customs rules to improve regional connectivity and trade facilitation.

According to customs data, China's total goods trade with other APEC economies reached 18.03 trillion yuan ($2.68 trillion) in the first seven months of 2026, up 21 percent year-on-year and outpacing the country's overall trade growth during the same period.

Briefly

EV charging facilities expand

China's electric vehicle charging infrastructure has continued to expand swiftly, with the total number of charging points reaching 23.68 million by end-July, up 41.9 percent year-on-year, the National Energy Administration said. Of this total, public charging facilities numbered 5.099 million, an increase of 21.3 percent. Private charging facilities totaled 18.58 million units by the end of last month, surging 48.8 percent.

Better care lifts rail staffers' well-being

Amid the country's urge to improve people's livelihoods, Chinese rail operators are working to better the well-being of rail staffers. To answer the call, Houma North Locomotive Depot joined local enterprises and public institutions to organize networking events in Linfen, Shanxi province. It established a studio in June 2023 to help expand young single employees' social circles. With surveyed information files, it helped young employees engage in get-togethers, building friendships through games and other interactions. So far, the studio has helped over 200 employees find life partners.

XINHUA - CHINA DAILY

Huawei, HP agree to patent cross-licensing deal

By **CHENG YU** and **MA SI**

Huawei Technologies signed a multiyear global patent cross-licensing agreement with United States' computer maker HP Inc on Wednesday, highlighting a broader shift as foreign companies increasingly pay for access to Chinese technologies even as Washington maintains restrictions on some of China's biggest tech firms.

The agreement — including a license for HP to use certain Huawei Wi-Fi patents — is a strong testament to the Chinese firm's persistent independent innovation in cutting-edge fields in information and communications technology, said Alan Fan, Huawei's chief intellectual property officer.

"Through patent licensing, Huawei shares its innovation with the industry, particularly in the area of standardized technologies, which brings leading technological experiences to consumers worldwide," Fan said.

In fact, Huawei has emerged as a major holder of standard-essential patents, or SEPs — patents covering tech that manufacturers must use to make products compliant with widely adopted technical standards. The company is one of the world's largest holders of declared SEPs for Wi-Fi 7.

By end-2025, Huawei held about 165,000 active granted patents globally and had signed more than 260 patent licensing and cross-licensing agreements with major patent holders.

View of Huawei's booth during an expo in Xi'an, Shaanxi province in June. PROVIDED TO CHINA DAILY

Companies including Amazon, Ericsson, Nokia, Samsung Electronics, Oppo, Xiaomi as well as major European automakers including Mercedes-Benz, Audi, BMW and Porsche, have inked patent agreements with Huawei.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said: "The shift is beginning to rewrite a decades-old narrative around China's role in global industry. US companies are finding it increasingly difficult to bypass Huawei's own technology while the US government is still trying to restrict Huawei's access to US technology. Washington can restrict the physical flow of certain US chips and equipment, but it cannot reverse the broader trend of global technological cooperation."

Across industries, Chinese companies are moving beyond exporting finished goods and increasingly supplying the technology, engineering and intellectual property.

Ford Motor's lithium iron phosphate battery plant in Michigan, for example, uses technology licensed from Chinese battery giant Contemporary Amperex Technology Co Ltd.

CATL has in recent years promoted its license royalty service (LRS) model, under which it provides overseas partners with battery manufacturing technology, production processes and operational expertise in return for licensing royalties and service fees.

Volkswagen has also worked with Chinese electric vehicle maker Xpeng on a China Electronic Architecture for locally produced vehicles. Volkswagen said the architecture could cut development time by as much as 30 percent and costs by up to 40 percent compared with its older platform, and it plans to use the architecture in the majority of its made-in-China vehicles by 2030.

The China National Intellectual Property Administration said China's imports and exports of IP royalties reached 425.35 billion yuan ($63.29 billion) in 2025, up 6.7 percent year-on-year, with exports rising 26.3 percent.

Li Huiying, director of the intellectual property institute at the National Industrial Information Security Development Research Center, said: "Chinese companies are increasingly shifting from treating overseas intellectual property protection as a defensive necessity to using it as a competitive tool. More and more companies are leveraging their IP portfolios to build global technological advantages and move from followers to industry leaders."

DPP slammed for ignoring public will

Tourism, business sectors in Taiwan push for easier cross-Strait exchanges

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

As the Democratic Progressive Party authorities in Taiwan tightened restrictions on cross-Strait exchanges, the Chinese mainland condemned them for going against public opinion and continuing to engage in political manipulation.

At a regular news conference on Wednesday, Zhang Han, a spokeswoman for the State Council Taiwan Affairs Office, urged the DPP authorities to heed calls from the island's business and industrial communities, promptly remove unreasonable restrictions that obstruct cross-Strait exchanges and facilitate cross-Strait integrated development.

On Monday, Taiwan's federation of industries, the island's largest business organization, issued a white paper calling on the DPP authorities to simplify the screening process for mainland professionals traveling to Taiwan.

Regarding calls from Taiwan's business and industrial communities for smoother cross-Strait exchanges, Zhang said they reflect the will of the people and the broader trend, adding that the mainland has been taking measures to facilitate travel and exchanges between people on both sides.

The tourism sector in Taiwan has also called for greater exchanges with the mainland. The tourism association of Penghu county recently urged Taiwan's "mainland affairs council" to resume the "mini three links" connecting Penghu with mainland coastal cities. The DPP authorities responded that there are currently no plans to resume the links, citing so-called security concerns.

The "mini three links" refer to direct passenger, postal and trade links between coastal areas of Fujian province and Jinmen and Matsu, which serve as major channels for personnel exchanges between Fujian and Taiwan.

As the mainland has promoted the resumption of travel by residents of Shanghai and Fujian to Jinmen and Matsu, about 350,000 trips have been made by residents of the two mainland regions to Jinmen and Matsu via the passenger routes of the "mini three links" since August 2024, Zhang said.

Zhang accused the DPP authorities of disregarding public opinion and engaging in political manipulation, saying their actions have lost public support.

"The DPP authorities are the biggest obstacle to cross-Strait exchanges," she said.

Taiwan's education authorities recently said the "registration platform", which requires schools on the island to submit information when taking part in exchange activities on the mainland, has been further improved. Schools that provide false information could face reductions in future subsidies for exchange activities.

"The DPP authorities have resorted to every possible means to disrupt normal educational exchanges and interactions between young people and students on both sides of the Taiwan Strait," Zhang said, adding that the move exposed the authorities' ulterior motive of obstructing personnel exchanges and escalating confrontation and hostility across the Strait.

She also criticized the DPP authorities for fabricating data to justify banning mainland social media platforms. Taiwan's "interior affairs department" recently claimed that the number of fraud cases had declined after RedNote, or Xiaohongshu, was banned on the island in December last year, and said the app could face another one-year ban.

Describing the DPP's moves as depriving Taiwan people of their right to know and their freedom to use social media platforms, Zhang said such misguided actions cannot dampen Taiwan people's enthusiasm for communicating through mainland social media platforms, nor can they stop the growing public desire on both sides of the Strait to strengthen ties and draw closer to each other.

NPC amending Water Law to align with eco code

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

China is revising its Water Law to better align it with the Ecological and Environmental Code, as a draft amendment was submitted for second reading to the ongoing session of the Standing Committee of the National People's Congress, the country's top legislature.

"Some members of the NPC Standing Committee, NPC deputies, national government bodies and local governments suggested that ... in coordination with relevant provisions of the Ecological and Environmental Code, the draft should further improve the overall requirements for the protection, development and utilization of water resources," Cong Bin, a senior legislator of NPC's Constitution and Law Committee, told the session when reporting on the amendment work.

The Constitution and Law Committee proposed adding provisions to the second reading draft to strengthen coordinated governance of water resources, the water environment, water ecology and water-related disasters, Cong said.

It also suggested adding language that calls for a modern industrial system compatible with water resource carrying capacity, as well as a stronger commitment to water conservation.

Under the draft, China would keep in place its rigid water resource constraints and continue to follow the principle of ensuring that the availability of water resources is taken into account in urban development, land use, population growth and industrial planning.

The amendment would also reaffirm the country's water-saving priority policy, advance the national water conservation campaign and strengthen water-saving efforts in agriculture, industry and urban areas, while building a water-saving society.

Taking effect on Aug 15, which coincided with National Ecological Day, China's landmark Ecological and Environmental Code marks the country's second formal statutory code after the Civil Code.

Adopted by the NPC Standing Committee in March, the legislation comprises 1,242 articles across five chapters, addressing pollution control, ecological protection, and green and low-carbon development, among other areas.

The code brings together more than 30 existing laws, over 100 administrative regulations and more than 1,000 local laws and regulations.

The Constitution and Law Committee also proposed adding a clause to prioritize the construction of a national water network, with a focus on improving water resource allocation, basin-level flood control and disaster reduction as well as water ecological protection and governance, Cong said.

The second reading draft calls for enhanced synergy between water allocation and flood mitigation. Under strict safety conditions, it would allow for repurposing floodwaters and capturing wet-season runoff for dry periods — ultimately boosting available water supplies.

Additionally, the draft introduces targeted measures for the rehabilitation of ecologically degraded rivers and lakes. Governments at the county level and above would be required to intensify restoration efforts by employing ecological water replenishment, biological purification, ecological dredging and river-lake connectivity projects.

The revision further proposes the unified allocation of unconventional water resources, including harvested rainwater, both raw and desalinated seawater, mine water and brackish water.

Local governments at or above the county level would be obligated to promote the use of reclaimed water that meets quality standards, prioritizing its application in urban greening, road cleaning, vehicle washing, construction and ecological landscaping.

China reports poverty fight gains, income growth

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Rural residents in counties lifted out of poverty saw their per capita disposable income rise to 18,627 yuan ($2,772) in 2025, up from 12,588 yuan in 2020, as China consolidates gains in its fight against poverty, according to a State Council report.

The report on consolidating poverty alleviation achievements and advancing rural vitalization was submitted for deliberation at the ongoing session of the Standing Committee of the National People's Congress, the country's top legislature, which opened on Tuesday.

Delivered by Maierdan Mugaiti, vice-minister of the Ministry of Agriculture and Rural Affairs, the report details that these counties have seen an average annual growth rate of 8.2 percent.

Development-oriented assistance has been highlighted in the report, with industries and employment playing a key role in driving growth.

More than 60 percent of central government funds earmarked to support rural vitalization have been used for industrial development. All 832 counties that were lifted out of poverty have developed two to three distinctive industries with local advantages, generating a combined annual output of more than 2 trillion yuan, according to the report.

Nearly three-quarters of people lifted out of poverty have established mechanisms linking their interests with new types of agricultural businesses, helping them share in the benefits of industrial development.

Employment among people lifted out of poverty has also remained stable. Their employment numbers have stayed above 30 million for five consecutive years, supported by expanded employment policies and labor-service programs.

More than 130,000 rural craftspeople have been trained, while more than 4 million people lifted out of poverty have found work through public welfare positions, the report said.

Regional cooperation has further strengthened support for rural development. Eight eastern provinces have paired with 10 western provinces to promote complementary industries, personnel exchanges and technology sharing.

During the transition period, eastern provinces provided more than 110 billion yuan in fiscal assistance to their western counterparts, while companies invested more than 750 billion yuan in those regions.

Despite these achievements, the report warned that the risk of people falling back into poverty will persist and that less-developed areas still face weak foundations for growth.

Rural depopulation and population aging have become more pronounced. Problems such as low utilization of age-friendly facilities and insufficient supplies of elderly care services have emerged.

In some areas, rural residents have limited access to cultural and recreational activities, while some households lack sufficient motivation for self-development. More efforts are also needed to address difficulties in promoting changes in outdated customs and practices in rural areas, the report said.

Looking ahead, China will incorporate regular assistance into its rural vitalization strategy, focusing on households at risk of falling back into poverty and less-developed areas after the transition period ends.

The government will promote development-oriented assistance to strengthen local capacity for self-sustaining growth while improving social security systems to safeguard basic livelihoods, the report said.

It called for longer-term policy support, more standardized assistance measures and more efficient management to consolidate poverty alleviation gains and steadily advance rural vitalization.

Artifacts return

Workers check a gold mask at the Jinsha Site Museum in Chengdu, Sichuan province, on Wednesday. A total of 108 artifacts from the museum, showcased at an exhibition at the National Museum of China in Beijing, have returned to Chengdu. ZHANG LANG / CHINA NEWS SERVICE

Capillaries can form coronary collateral arteries

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Chinese researchers recently revealed that capillary vessels could give rise to coronary collateral arteries, which are expected to serve as a natural bypass system and inspire a gentler and more effective new treatment for ischemic heart disease.

The findings were published in the journal Science on Friday. The study was conducted by a research team led by Zhou Bin from the Center for Excellence in Molecular Cell Science at the Chinese Academy of Sciences, in collaboration with Kathy Lui from the Chinese University of Hong Kong.

Coronary artery disease remains a leading cause of mortality and disability worldwide. Following coronary artery blockage, insufficient blood supply usually results in myocardial ischemia and infarction. Although clinical interventions, such as coronary stent implantation and coronary artery bypass surgery, can restore blood flow, these approaches are invasive and may cause complications.

On the other hand, coronary collateral arteries, which are naturally present in some people's hearts, can function as a natural bypass system. They can supply blood to ischemic regions and can generate better clinical outcomes.

The researchers compared the entire vascular network to a transportation system, where arteries are like wide highways and capillaries are like narrow, intricate paths. They discovered that when a highway is interrupted, these narrow paths rapidly initiate an "upgrade and renovation project", continuously widening and strengthening themselves to acquire the structure and function of arteries. Eventually, they develop into new "highways" connecting the two main arteries, restoring the supply of blood and nutrients to the damaged heart muscle.

Researchers have been making efforts for years to find the origins of de novo coronary collateral arteries. Traditionally, collateral artery formation has been attributed to the migration and reassembly of preexisting arteries. But traditional genetic models have some limitations, raising a fundamental question regarding the real cellular origin of collateral arteries.

To address the question, the research team developed a series of advanced genetic lineage-tracing tools to trace arterial endothelial cells and capillary endothelial cells, and investigate the origins of newly formed coronary collateral arteries after myocardial infarction.

The team disclosed that they established multiple high-precision lineage-tracing strategies, including their globally acclaimed dual recombinase-based systems and a synNotch-based genetic recording system that precisely identifies endothelial cells associated with mature arterial structures.

With these approaches, they discovered that de novo coronary collateral arteries arise predominantly from capillary endothelial cells, with a modest contribution of preexisting arterial endothelial cells. It offers a new understanding of coronary collateral artery formation after cardiac injury, and such capillary-to-collateral conversion is seen to be functionally crucial for cardiac repair.

The researchers also found that transient activation of vascular endothelial growth factor A using modified mRNA can promote the formation of functional collateral arteries and improve cardiac repair. Based on the discovery, the study further revealed a regulatory pathway that drives capillary-to-artery transition, providing fresh insights into vascular regeneration and potential therapeutic strategies for ischemic heart disease.

"We see the findings as very meaningful. For those who were not luckily born with coronary collateral arteries, we could potentially use the capillaries to regenerate the arteries. Moreover, the solid approaches used in the study, especially the dual recombinase-based system, can be effectively applied in other research as well, such as lung and liver repair and regeneration. Over 1,000 labs across the globe are using it in various fields, and we hope the system can benefit a wider world in the future," said Zhou.

POLICY REVIEW

‘Fitness for all’ taking strides ahead

Five-year plan aims to build nation of regular exercisers

By **JI HAISHENG** in Beijing and **YUAN HUI** in Hohhot

JIN DING / CHINA DAILY

China’s national push for “fitness for all” is reshaping everyday life across the country, driven by high-level government policy, ambitious infrastructure goals and a surging public appetite for sports.

The strategy takes shape under the State Council’s latest five-year plan for public fitness released in July, which outlines key targets, including increasing per capita sports venue space to about 4 square meters, supplying 3.3 social sports instructors per 1,000 people, and raising the proportion of regular exercisers to roughly 40 percent.

Increasing the number of people who regularly exercise is expected to reduce cases of long-term hospitalization and chronic disease management costs, as well as maintain mobility among China’s aging population, and reduce health issues caused by sedentary lifestyles among young people.

Recent data from the General Administration of Sport highlights rapid expansion. By the end of 2025, the country boasted over 5 million sports venues totaling 4.37 billion square meters, largely establishing a “15-minute fitness circle” in urban and rural communities. Physical fitness monitoring shows 84.9 percent of survey respondents met basic fitness criteria — up 0.8 percentage points from 2020.

Policy experts point out that this momentum is the product of sustained top-down planning. China designated Aug 8 as National Fitness Day in 2009, a nod to the date of the opening ceremony of the Beijing Olympic Games held in 2008. Fitness for all was elevated to a national strategy in 2014, and four consecutive five-year plans have been rolled out since 2011.

The national fitness plan acts as preventive infrastructure, shifting public health policy from reactive treatment to proactive wellness.

Ma Liang, a professor at Peking University’s School of Government, said, “High-level emphasis on public fitness, reinforced by specific targets written into successive five-year plans, has mobilized coordinated efforts and full support from government departments at all levels, creating a favorable environment and strong momentum for the cause.”

Chen Yuanxin, dean of Wuhan Sports University’s Economy and Management School, said, “China’s national fitness initiative has entered a new development phase — shifting from a focus on ensuring the supply of basic, safety-net public fitness services toward a more sustainable, high-quality model that values both universal access and targeted services, while balancing scale with quality and efficiency.”

Steps taken in line with these goals will “expand access to public fitness services, improve the quality of professional fitness guidance, diversify service offerings and standardize industry operations”, he said in an article for China Sports Daily published in July. “This will in turn raise the public’s sense of fulfillment and overall well-being.”

To meet evolving demand, the newest plan emphasizes repurposing underused spaces, such as industrial plants, warehouses, commercial rooftops and space under overpasses, to construct accessible sports facilities. Other priorities include leveraging artificial intelligence, providing scientific guidance and expanding public-service systems into rural regions.

He Zhonghui, director of the Center for Sports and Health Research at Peking University, emphasized the necessity of differentiated fitness services that cater to people across all stages of life. This endeavor would build physical literacy in early childhood, support youth sports, deliver workplace fitness programs, and roll out wellness interventions for the elderly.

Rather than grouping people merely by occupation, she said in an interview with China Education Television that services should adopt finer-grained segmentation based on life cycles, gender, family units and new-form employment groups.

Feng Qiang, deputy director of the China Institute of Sport Science’s National Physical Fitness and Scientific Exercise Research Center, said that in recent years, he has witnessed “growing public enthusiasm for sporting events and fitness activities, as people seek to improve physical fitness, refresh their minds and enhance their health through exercise”.

To reach the 2030 targets, Feng explained that boosting policy support and promotional campaigns will help raise people’s awareness of fitness. “The key is to change their lifestyles and habits and enable people to take the initiative to embrace exercise as a way of life,” he said.

He also underscored the value of scientific guidance over unvetted online rumors, using technology to map activity zones, and ensuring equal resource access for remote areas. This macro-level policy structure directly reflects how sports are integrated into daily routines nationwide. Across China, public participation is evident in overflowing weekend hiking trails, packed gyms during lunch breaks, dawn and dusk square dancing, urban marathon crazes, the Northeast Super League soccer competition, and the wildly popular “Village BA” basketball tournaments.

Regional sporting events are increasingly building their rosters around ordinary people. The 16th Inner Mongolia Autonomous Region Games showcased this transition by featuring 11 mass participation sports, including soccer, basketball, volleyball, table tennis, tennis and badminton.

It is on these local courts that the human impact of China’s national fitness strategy is felt most clearly.

Wu Kun, a 41-year-old Baotou native and longtime tennis enthusiast, signed up for the regional games’ mass participation division. Some 20 years earlier, he had competed in the 11th games, in an era that, as he recalled, was all about winning medals.

“Getting good results matters less now. What stays with me is the process and the simple joy of sports, as a way to stay fit,” Wu said.

During the recent games, Wu was paired purely by age with a physical education teacher in the men’s doubles 35–45 bracket. In the round of 16, they were knocked out by a public security bureau team — fellow Baotou locals Wu frequently plays alongside in his free time.

“The popularity of mass participation events in the games shows that sport isn’t just for professionals anymore,” Wu said. “It brings sport back into the lives of ordinary people.”

Today, Wu continues playing tennis three times a week, passing his passion for staying active down to the next generation. “Every Friday afternoon, I coach my 10-year-old son. I’ve also taught him how to swim. I hope that he will grow to love sports from an early age,” he said.

Lesser-known sports in China gain traction

By **JI HAISHENG**

Once confined to professional arenas or little known to the general public in China, a growing number of niche sports are finding their way into the daily lives of ordinary Chinese, adding fresh choices to the nation’s fitness landscape.

For people across the country, nowhere is this shift more visible than in ice and snow sports, as the successful hosting of the 2022 Beijing Winter Olympics has left a lasting legacy.

According to the General Administration of Sport, ski resorts nationwide recorded 118 million visits between November 2025 and January 2026.

As the national campaign to engage 300 million people in ice and snow sports has deepened public appreciation for winter activities, ice and snow sports have become a key engine for deepening the national fitness campaign, said Zhu Yongguo, dean of the School of Winter Sport at the Capital University of Physical Education and Sports.

Zhu, also president of the Beijing Curling Association, highlighted curling as a prime example. He cited public access to the Ice Cube — the iconic Winter Olympics venue — for curling experiences, and a curling tournament that attracted more than 300 competitors from over 20 cities, as evidence that “curling is evolving into a vehicle for mass participation”.

Unlike speed skating, skiing or ice hockey — which emphasize speed and power — curling features a steady rhythm and minimal body contact. “It delivers clear fitness benefits while being gentle on the body, making it suitable for people of varying fitness levels and of all age groups,” Zhu said.

Innovations such as floor curling and tabletop curling further reduce the need for professional ice surfaces and seasonal conditions, allowing for year-round practice, he added.

Zhu suggested promoting senior-friendly adaptations like tabletop curling, integrating into the sport’s outreach the concept of “primary prevention” to help prevent diseases among elderly people before they develop.

Beyond winter sports, other once-uncommon activities are also gaining traction. Wei Zihan, a former champion of the Beijing Collegiate Cricket Tournament, founded the Bird’s Nest Youth Fitness Club in 2024 after her graduation, aiming to leverage the reputation of the Olympic venue to promote cricket as a tool for physical training and youth fitness.

Cricket is arguably one of the most popular sports in terms of global fan base, Wei said. “But in China, most people still see it as a new sport.

“That gap is exactly what we aim to fill — introducing a fresh option to enrich the choices available in the national fitness movement,” she said.

With cricket added to the 2028 Los Angeles Olympics and the Chinese women’s team securing its Asian Games berth at a qualifying tournament in May, attention on this sport is growing, she said.

During this year’s National Fitness Day, which fell on Aug 8, Wei’s club, with support from the General Administration of Sport’s Multiball Games Administrative Center, hosted a series of events to promote cricket: free beginner sessions, exhibition matches between university teams, and a youth training camp.

As her club is dedicated to youth fitness, Wei said that cricket training serves as a supplement to physical education classes for schoolchildren. “Sports are not a burden for students — they add value to their development,” she said.

She noted that parents’ attitudes toward sports have shifted significantly. “Parents no longer see sports only as a path to a professional athletic career. They want their children to have strong, healthy bodies,” she said.

Beyond actual competitions, Wei said her club also introduces cricket’s global status, its Olympic future and the policy support behind the sport.

“When parents understand these things, they get interested. Once kids try it, they fall in love with it,” she added.

Policy Digest

Community-level posts optimized for graduates

China has issued a circular on optimizing community-level posts in both urban and rural areas to recruit college graduates, aiming to provide a solid talent pool to support the modernization of grassroots governance and capacity.

The circular was issued by the Ministry of Human Resources and Social Security, the Social Work Department of the Communist Party of China Central Committee, and the Ministry of Civil Affairs.

It outlines policy measures to broaden grassroots employment channels for college graduates, create new positions, and strengthen support and guarantees.

The circular calls for expanded hiring of college graduates majoring in sociology, social work, psychology, and law, with a focus on emergency response, services for the elderly and children, care and assistance for special groups, and psychological counseling.

In principle, all new positions are open to college graduates, and local authorities are encouraged to set aside a significant number of posts for targeted recruitment of graduates, it said.

Safety of agricultural irrigation water bolstered

China has rolled out targeted measures to protect agricultural irrigation water safety and prevent pollution risks stemming from industrial and livestock breeding wastewater, according to a recent notice.

Issued by the Ministry of Ecology and Environment, the Ministry of Industry and Information Technology, and the Ministry of Agriculture and Rural Affairs, the document identified four key priority areas: spatial planning, sewage treatment, water quality monitoring, and regulatory oversight.

The notice calls for upgrading centralized sewage treatment facilities in industrial parks surrounding farmland, and carrying out investigations to cope with water-related violations from industrial operations and livestock breeding.

It urges local authorities to draw up agricultural irrigation water quality monitoring plans tailored to local realities, and set clear requirements for information notification, data sharing and emergency response.

The document also mandates strengthened on-site law-enforcement efforts, focusing on cracking down on illegal discharges of industrial wastewater and livestock manure via karst caves, seepage pits and rock fissures.

Guidelines to advance service-oriented social aid

The Ministry of Civil Affairs and the Ministry of Finance have issued guidelines on developing service-oriented social assistance — the first supporting policy document since the Social Assistance Law took effect on July 1.

The guidelines seek to shift social assistance from mere material aid toward an integrated model combining both material support and services, so as to secure people’s basic livelihoods, forestall social risks and foster development for vulnerable groups, the two ministries said in a policy document.

Priority beneficiaries of service-oriented assistance include people living in extreme poverty, particularly those who remain in their own homes instead of welfare institutions, and households receiving the basic subsistence allowance, the document said.

Local authorities shall draw up supply lists for service-oriented social assistance, taking into account local economic and social development levels, government fiscal capacity, demands of beneficiaries and availability of resources, and deliver targeted services, it said.

The guidelines also encourage elderly care institutions, disability service organizations, social work agencies, volunteer groups, as well as professional social workers and public welfare volunteers, to engage in service-oriented social assistance.

CRICKET

Curbing boozy antics has England stumped

Skipper Root says he's 'hacked off' by latest incident

Below: England's T20 captain Harry Brook got in trouble on a night out in New Zealand in October. **Right:** Ben Duckett was filmed drunk and disoriented while on tour in Australia in December. **Bottom right:** Fast bowler Brydon Carse is the latest England cricketer to find himself in hot water after being handcuffed outside an Irish bar in Derby, England, by police on Sunday. AP

It was a telling remark, especially when revisited two months later.

"I probably won't be real happy and smiley," then-England cricket captain Ben Stokes told reporters after beating New Zealand in a hard-fought test match at Lord's in June, "until I get up there and share a proper beer with the boys."

After all, having a post-match drink with teammates, and sometimes rivals, in the dressing room is a cricketing tradition as old as time.

But is English cricket taking it to the extreme?

The off-field conduct and drinking habits of England's men's squad are back under scrutiny this week after another after-hours incident involving one of its players.

This time it was Brydon Carse, a 31-year-old fast bowler and one of the team's success stories in recent years. The images of him outside a bar in the early hours of Sunday in handcuffs and surrounded by police officers were hard to ignore, especially as the saga came days after a plea by newly appointed England captain Joe Root.

"Ultimately you're grown adults," said Root, speaking after England's leadership opted to scrap a midnight curfew that had been imposed on the men's team following a string of controversial late-night incidents.

"You know what it takes to play for England, you know what your responsibilities are off the field, and we need to make sure we don't find ourselves with any little situations off the field."

Seems the message didn't get across to his players.

"If I'm being brutally honest, I'm really hacked off. I'm really disappointed," Root said in a news conference on Tuesday.

"It's not the isolated incident itself," Root added. "It's the fact we continually keep making stupid mistakes away from the game and it's detracting from what we're doing on the field."

And so, with England's Cricket Regulator getting down to work investigating another off-the-field issue, it's back to square one.

Is it time for a cultural reset? In this age of sports science and ultra-professionalism, there are wider questions over whether cricketers should have a beer after a match. Or do players just need to be a bit smarter?

"Just have some kind of brain cells amongst you, seeing what's just gone on," former England captain Alastair Cook said on the *Stick to Cricket* podcast on Tuesday.

"Surely someone says either don't go to that place. Or, at 12 am or 1 am, say: 'Let's go and find ourselves somewhere quieter if we want to carry on'."

Here's a look at the late-night incidents that have brought shame on English cricket:

Brook struck by a bouncer

Before going to Australia for what proved a humiliating Ashes series in December, England traveled to New Zealand in October for a white-ball tour (a series of limited-overs internationals).

A day before the third and final one-day match, team captain Harry Brook was hit by a doorman after being denied entry to a club in Wellington. Teammates Jacob Bethell and Josh Tongue were also present on the night out.

Brook was fined about 30,000 pounds ($40,300) at the time and given a final warning about his future conduct — sanctions not made public until months after England's 4-1 Ashes series loss.

"I want to apologize for my actions," Brook said.

"I fully accept that my behavior was wrong and brought embarrassment to both myself and the England team."

Duckett's night in Noosa

Between the second and third tests in that Ashes series, England visited the resort town of Noosa on the Sunshine Coast for some downtime in the midst of its long tour.

While there, footage was taken of England opening batter Ben Duckett looking disorientated as he talked to a group of people on a night out and saying he was unable to remember how to get back to his hotel.

"I am sorry for that incident, it was not professional and shouldn't have happened," Duckett later said. "There is no hiding away from it."

Rob Key, England managing director of men's cricket, said he would investigate the drinking habits of the England team.

Post-Lord's revelry

Chastened by the Ashes hammering in the winter, England began its so-called "reset" with a home series against New Zealand in June.

After winning the first test, Stokes and fast bowler Gus Atkinson continued their post-match celebrations at Lord's by going on a night out in London, during which a member of England's security staff was reportedly struck by a player from English rugby club Saracens.

The fallout was huge: Stokes and Atkinson were left out of the second test amid an investigation that ultimately found that no "regulatory breach" had occurred. Stokes then returned for the third match, only to announce his retirement from international cricket midway through it, saying the past few months had "taken its toll".

Brendon McCullum then was fired as test coach, while Key said the England and Wales Cricket Board was considering imposing an alcohol ban on the team.

Carse hits sticky wicket

Strictly speaking, Carse's night out wasn't while he was on England duty.

It came after his club side Durham had completed a big win over Derbyshire in the domestic County Championship on Saturday.

Carse was among the players selected in the England squad for the first test against Pakistan last week, but wasn't picked to play in the match and was released to feature for Durham.

Ahead of his ill-fated night out, Carse had been retained in England's squad for the second test starting Thursday.

He was dropped on Monday because an investigation was ongoing into the incident, which saw Carse held in handcuffs by police after, according to Britain's Press Association, being briefly arrested.

England bowler Matthew Potts was with Carse on the night out, while footage that circulated on social media showed Stokes watching on as Carse was in handcuffs.

With Carse yet to comment on the incident, it was left to Root to say that his teammate is "very upset, has been very apologetic, and understands his actions".

"I don't think it has been a very good look, the recent past, if I'm being brutally honest," Root said. "At all."

AP

ICC sees mountains of potential in Nepal's rapid rise

For years, Nepal has been one of cricket's great stories-in-waiting: a country of extraordinary public passion, flashes of on-field promise and crowds that treat every international as a national event.

Now, even the game's global governing body believes the Himalayan nation of 30 million could be the next Associate member of the International Cricket Council to take its place at the sport's top table.

"They could be tomorrow's Afghanistan, or tomorrow's New Zealand for that matter," ICC chief executive Sanjog Gupta told reporters.

"They have developed an elite player pool, which is consistently breaking through the ICC pathways and not only featuring at our marquee events, but proving that they belong on the global stage."

The Afghanistan comparison is hard to escape.

From its Associate beginnings, a war-torn Afghanistan fell in love with cricket, impressed in shorter formats and eventually earned test status in 2017.

Like Afghanistan, Nepal may not bring the game huge riches but will be a welcome expansion of the sport, which remains popular in certain pockets and is played by a dozen teams at the elite level.

"Nepal represents enormous potential and opportunity for cricket," explained Gupta.

"Not because the country is a significant commercial market, but because of their rapidly improving standards of performance and the scale of fandom the sport enjoys in the country."

Passionate fan base

The ICC has pumped nearly $5 million into Nepal's cricket development in the last two years and has awarded the country co-hosting rights for next year's under-19 Women's World Cup.

"Nepal benefits from the biggest endowment any sport can wish for — a large, deeply passionate fan base," said Gupta, adding, "fans today are also the players of tomorrow.

"One of my personal highlights from the Twenty20 World Cup 2026 was the sea of red at the Wankhede (Stadium in Mumbai) that turned up to support Nepal against Scotland."

Nepal beat Scotland by seven wickets to claim its first T20 World Cup victory since 2014, although both teams had already been eliminated.

Qualifying for the T20 World Cup for the first time in 2014 was the turning point for Nepal.

In a region dominated by cricketing heavyweights India, Pakistan and Sri Lanka, Nepal had long watched others, and, suddenly, it had a team of its own.

A boy plays cricket on an empty street in Lalitpur, Nepal, during the general election in March. REUTERS

> "Nepal represents enormous potential and opportunity for cricket. Not because the country is a significant commercial market, but because of their rapidly improving standards of performance and the scale of fandom the sport enjoys in the country."
>
> **Sanjog Gupta,** ICC chief executive

Achieving one-day international status in 2018 helped cricket overtake soccer as the country's favorite sport.

"It really skyrocketed this sport into Nepali households," former captain and secretary of the Cricket Association of Nepal Paras Khadka told reporters.

"Qualification meant people started to have faith in the team. All of a sudden, it brought out national sentiments, and a sense of pride in Nepalis."

'Festival of Himalayas'

Two seasons of the Nepal Premier League have added significant revenue to sustain the game's growth.

"If we are to grow as a cricketing nation, the NPL will be a pivotal part of the growth," Khadka said of the T20 league, underlining the commercial and entertainment value of the "Festival of Himalayas".

"Whatever money NPL generated has been used in cricket itself. It's a strong commercial avenue for us now.

"If this keeps growing, we'll create that cushion for us to start development programs and build infrastructure, which requires a lot of financial stability."

The country's cricket fervor rivals that of India, but Khadka, who captained Nepal for over a decade before stepping down in 2019, said sustained performance remains non-negotiable.

"You could have everything around you, but if you don't play good cricket, people don't follow you," he said.

Nepal showed it can compete in the 20-overs format, nearly pulling off upsets against England and South Africa at the World Cup in India earlier this year.

"You only become a better cricketer when you play against better cricketers, and you become a better team when you play against better teams," said Khadka.

That need for exposure anchors Nepal's next phase, with the board planning bilateral cricket against test-playing nations.

"We are in conversations, and hopefully this materializes very soon," Khadka said.

Nepal has also rolled out player contracts for men and women, introduced red-ball cricket and is expanding infrastructure.

For Khadka, Afghanistan's rise is a model worth emulating.

"There's a blueprint for sure," he said. "We definitely would like to follow the same journey."

Rescue, relief efforts intensify in Xizang

Teams, equipment, supplies rushed to mudslide-hit area

By **PALDEN NYIMA** in Shigatse, Xizang, and **CAO YIN** in Beijing

Rescue efforts were ramped up on Thursday at the Gyirong border port in Shigatse, Xizang autonomous region, after a massive mudslide in Nepal caused extensive damage to the port area on Wednesday.

As of press time on Thursday, three people had been reported killed, 558 others remained missing, and two local villagers had been rescued. Among the missing were 260 foreign nationals.

After the mudslide struck Gyirong, a major land port linking China and Nepal, at around 10:30 am on Wednesday, Chinese authorities activated emergency response mechanisms and scaled up the deployment of rescue teams, equipment and relief supplies to assist those who have been affected.

Entrusted by President Xi Jinping, Premier Li Qiang led a group of senior officials from relevant departments to guide and oversee relief operations after arriving in the mudslide-hit area on Thursday afternoon. They also visited affected residents and rescue workers.

On Thursday, a guidance team of the Chinese People's Liberation Army Western Theater Command arrived at a high-altitude airport in Xizang aboard a Y-20 transport aircraft to join local rescue efforts, with more than 500 personnel, four helicopters and multiple drones deployed, according to China Central Television.

An elite fire and rescue team, sent by the Ministry of Emergency Management and the National Fire and Rescue Administration, brought more than 500 sets of equipment for detection, lifesaving, demolition, communications and medical support, along with four search-and-rescue dogs, to the area hit worst by the disaster.

Rescue forces from China Anneng Construction Group, a State-owned enterprise specializing in engineering and emergency response, have dispatched 310 technical experts and rescuers, including geologists and engineers, from cities including Beijing, Chengdu in Sichuan province, Chongqing and Lhasa, the capital of Xizang, to the port. Their mission is to assist with on-the-ground relief operations, focusing on restoring damaged roads, communications and power supplies.

As of 6 pm on Thursday, about 800 meters of the 3-kilometer section of road leading to the Gyirong port had been cleared. To navigate the remaining section, Xizang's transportation department dispatched four emergency buses and three trucks for transporting personnel and rescue materials.

The China Anneng rescue team rushed to the hardest-hit area, bringing 120 sets of advanced equipment, including multifunctional survey drones, 3D laser scanners, life-detection devices, large excavators and loaders.

Foreign Ministry spokesman Lin Jian said on Thursday that China and Nepal are in close communication and coordinating efforts for search and rescue operations.

Police authorities in Nepal said that as of 5 pm on Thursday, the death toll from flash floods there reached 359, with hundreds more people still missing.

Lin said that nearly 100 Chinese nationals remained missing on the Nepalese side of the border after the mudslide, adding that the Chinese embassy is seeking further verification from the Nepalese authorities.

Beijing is ready to provide emergency assistance based on the needs of Kathmandu, said the ministry spokesman.

According to China's Ministry of Natural Resources, the disaster began with a high-altitude glacier collapse in Nepal. The falling ice and rock traveled rapidly down a mountain slope, collecting loose glacial debris along its path and developing into a debris flow before becoming a mudslide.

"The flow then struck facilities at the Gyirong port and areas beyond the border, continuing downstream and causing heavy casualties on both sides," said Guo Zhaocheng, an expert associated with the ministry who is in charge of geological disaster monitoring.

The debris flow generated by the glacier collapse traveled at about 50 meters per second, which left virtually no time for warning, and its impact stretched over 20 kilometers, resulting in devastating losses, Guo added.

AI adoption powering industrial profit rise

By **ZHOU LANXU**
zhoulanxv@chinadaily.com.cn

China's industrial profits maintained double-digit growth in the first seven months of the year, as the broader application of artificial intelligence supported earnings expansion and underscored the sector's accelerating upgrade.

However, profit growth moderated in July for the third consecutive month as sectoral divergence continued, highlighting the need to expand domestic demand more proactively to ensure a smooth transition between old and new growth drivers, analysts said.

Profits at key industrial enterprises reached 4.58 trillion yuan ($682 billion) in the January to July period, up 17.6 percent year-on-year, the National Bureau of Statistics said on Thursday. The growth stayed robust, even though it eased from 18.7 percent in the first half. The electronics sector was a major contributor, with its profits surging 110 percent year-on-year. Profits in the integrated circuit industry, including computing and memory chips, jumped 18.5 times year-on-year.

Yu Weining, chief statistician at the NBS' department of industrial statistics, attributed the growth to the accelerating AI applications and sustained increase in computing-power demand.

The broader industrial upgrade also continued as profits at major high-tech manufacturers rose 50.1 percent. Meanwhile, nonferrous metal producers saw 91.8 percent profit growth. Analysts attribute this in part to the AI boom, which has driven sustained demand for key mineral resources and kept their prices elevated. However, some traditional industries and those in the midstream and downstream segments of industrial chains remained under pressure.

The NBS data showed that profits in electrical machinery and equipment manufacturing fell 7.6 percent in the first seven months, while automobile manufacturers registered a 20.4 percent decline. Earnings in ferrous metal smelting and processing, which is closely linked to the property sector, plunged 51.2 percent.

In July, profits at major industrial enterprises rose 11.2 percent year-on-year, slowing from 15.1 percent in June as both industrial production and producer-price growth moderated.

Overall, Yu said, industrial profits are maintaining rapid growth, but warned that the international environment remains complex and challenging, while the domestic imbalance between strong supply and weak demand remains prominent, requiring coordinated efforts to facilitate a smooth transition between growth drivers.

Analysts said the divergence and moderation in industrial profit growth reflect the challenges of China's economic transition. New growth drivers have yet to generate income on a sufficient scale, constraining the recovery in domestic demand and, consequently, weakening demand for industrial output and the sustainability of profit growth.

Su Jian, director of Peking University's National Center for Economic Research, said new drivers now account for over 40 percent of economic growth, but remain less capable of creating jobs than traditional drivers such as property and infrastructure.

Wen Bin, chief economist at China Minsheng Bank, said that industrial profits still have room to recover in the coming months, although cumulative growth may gradually ease.

Children, society benefit from inclusive education

WORLD WATCH
By Amakobe Sande

Next week, children across China will return to school. They will be packing their bags, putting on new uniforms and looking forward to seeing their friends and teachers again. It is a moment that reflects the importance that families and communities across China place on education and the opportunities it creates for every child. It is also an opportunity to reflect on how schools can become even more welcoming and supportive for children with different learning and developmental needs, including children with disabilities.

Around the world, nearly 240 million children live with disabilities. In China, there are at least 5 million. They are part of our families, schools, communities and workplaces. Like all children, they have hopes for the future, talents to develop and valuable contributions to make to society.

Inclusive education is one of the most effective ways to ensure that every child has the opportunity to learn, participate and thrive. It means children learning together in the same schools and classrooms while receiving the support they need to succeed. It recognizes that children learn in different ways and that education systems work best when they respond to the diverse needs of all learners.

Importantly, inclusive education benefits not only children with disabilities, but also strengthens the learning environment for everyone. When children learn alongside classmates with different backgrounds, abilities and experiences, they develop empathy, respect and collaboration skills that will serve them throughout their lives. Inclusive schools help create more inclusive societies.

Globally, UNICEF's experience shows that successful inclusive education requires action at multiple levels. Schools need teachers who are equipped with inclusive teaching approaches, accessible learning materials and supportive learning environments.

ROBOT CHEFS BRING INTUITION TO THE MIX

Next-generation cooking aids are machines that can watch the wok, not the clock

By **LI JING**
lijing2009@chinadaily.com.cn

Midway through cooking a batch of mapo tofu at an exhibition during the 2026 World Robot Conference in Beijing last week, a demonstrator poured about 100 milliliters of water directly into the sizzling wok. Instead of blindly following its preset timer, a cooking robot analyzed and adjusted the heat and preparation time until the sauce reached its ideal glossy consistency.

The moment illustrated what researchers said is a genuine shift in culinary automation: machines that respond to what they observe, not just what they're told.

For years, cooking machines have operated on fixed programs. But cooking is rarely so orderly. Meat isn't always fully thawed, vegetables carry more moisture after a humid week and sugar can go from caramelized to scorched in seconds.

"Real kitchens are not standardized laboratories," said Yang Jiancheng, founder and chairman of the Beijing-based Xianglu Robotics, a company that works on sensor-equipped cooking systems. "I don't care whether the chili peppers have been in the wok for exactly five minutes. What matters is whether their skins have properly blistered," he said.

Yang's company has developed a cooking robot equipped with three industrial cameras and additional sensors that capture visual data at 30 frames per second.

Healthy ecosystems buzz with dragonflies

Insect's reemergence in Beijing an indication of positive changes

By **CHEN NAN**
chennan@chinadaily.com.cn

For Zhang Shuren, 78, who took his 10-year-old grandson to the Peking Insect Museum recently, dragonflies are inseparable from his memories of old Beijing.

Growing up in the 1950s and 1960s, he spent summer afternoons near ponds, canals and patches of open land, chasing dragonflies with other children.

"Back then, you didn't go somewhere specifically to look for them," he said. "They were just there."

The children sometimes used insect nets, but catching a dragonfly with their bare hands was more difficult. "You had to wait for it to land and move slowly," Zhang recalled. "If you rushed, it was gone."

Over the decades, however, he began seeing fewer dragonflies as Beijing's cityscape changed and natural spaces disappeared.

"That was when I realized that some things you take for granted can disappear," he said.

Now, when Zhang spots a dragonfly above a park pond, he always stops to watch.

"For children today, it may just be a beautiful insect," he said. "For me, it brings back an entire summer."

The museum in Fengtai district, which opened in April, has more than 20,000 insect specimens as well as living insects and hands-on activities for visitors.

Feng Ruochen, a 36-year-old Beijing native and co-founder and director of the museum, remembers when catching insects was simply what children did for fun.

Growing up in Beijing, Feng spent summer afternoons along the North Moat in Andingmen subdistrict, where dragonflies seemed to be everywhere. Children waited for them to land or swung insect nets through the air, competing with each other to catch one.

As Beijing expanded, natural spaces gave way to roads, buildings and other urban infrastructure. Waterways deteriorated, while pesticides used in landscaping affected insects both in the water and on land.

The dragonflies of Feng's childhood became harder to find, but in recent years — in places like the Liangshui River in southern Beijing — healthy populations of the insect now abound.

For years it was notorious for being heavily polluted, but following water treatment and environmental restoration, the river and its surrounding landscape have been transformed.

Green space now runs alongside parts of the waterway. And with the return of suitable habitats, wildlife has begun to reappear. "Dragonflies have come back in large numbers," Feng said, adding fish, frogs, beetles and birds have also become more common.

"When you restore the environment, it is not just one species that comes back," he said. "The whole ecosystem begins to recover."

Nature's barometer

Huang Yue is an ecological restoration designer who has spent years rebuilding wetlands and urban water systems. She believes a dragonfly tells a more complicated story than simply whether a river looks clean.

In the summer of 2017, Huang was working on the restoration of a small 2,000-square-meter wetland on the outskirts of Beijing. It once contained a small pond, but changes to the surrounding river system and Beijing's low groundwater levels had caused it to leach away.

Huang and her colleagues restored the wetland. To keep the water from leaching again, an impermeable liner was put down on the ground surface.

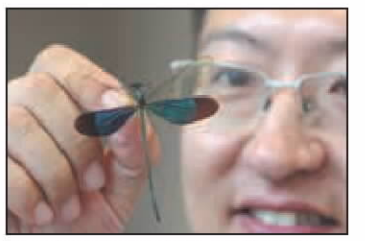
"We then reintroduced native aquatic animals and planted submerged vegetation. As the ecosystem recovered, more dragonflies returned," she said.

"I remember one blade of grass with five dragonflies on it," Huang said, adding she was impressed by the sight.

In that small patch of wetland, she and her team identified between 20 and 30 species of dragonflies.

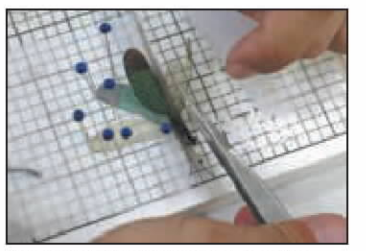
For Huang, who studied landscape architecture and urban biodiversity at Tsinghua University, the dragonfly is a useful way of reading an ecosystem.

But to thrive, a dragonfly needs more than just clean water. It requires aquatic vegetation for shelter, hunting and reproduction. It also needs suitable places along the shoreline to emerge from the water, and a food chain capable of supporting both predators and prey.



"To understand why dragonflies disappear — or why they return — you have to look at the whole ecosystem," Huang said.

Dragonfly larvae spend their early lives underwater, hiding among aquatic plants and ambushing prey such as mosquito larvae, tadpoles and small fish. Different species also use plants in different ways for reproduction. Some insert their eggs into the stems of aquatic vegetation, while others lay their eggs near aquatic plants.



When the larvae are ready to become adults, they climb out of the water and attach themselves to plants or other surfaces. The adult dragonfly slowly emerges, then unfolds and dries its wings before taking flight.

Rich diversity

China is one of the world's most important homes of dragonfly diversity, with more than 980 known species. Yet most people are familiar with only the handful that occasionally flash past their eyes on a summer afternoon.

Feng shows a dragonfly specimen he prepared for display. ZOU HONG / CHINA DAILY

Feng carefully works on a dragonfly specimen. ZOU HONG / CHINA DAILY

Zhang Haomiao, a researcher at the Kunming Institute of Zoology, published *The Illustrated Guide to Dragonflies of China* in 2019, a two-volume work that documents 820 dragonfly species found in the country.

The book runs to 1,460 pages and includes more than 3,500 color photographs. It represents one of the most comprehensive attempts to document China's dragonfly diversity. Zhang's guide is, in part, an attempt to make that diversity visible.

A dragonfly hovering over a pond may belong to a species of the insect that has its own habitat requirements and ecological role. The more closely entomologists look, the more complicated the picture becomes.

That complexity is why Huang believes that improving water quality, while essential, is only the beginning.

For years, urban water management focused primarily on pollution. Was the water black and foul-smelling? Did it meet the required environmental standard?

Those questions remain important. But Huang believes people's understanding of a healthy water system is becoming broader.

The question is increasingly not just whether the water is clean, but whether it can support life.

When a restored river has clean water but little wildlife, Huang asks a simple question: What is missing?

Perhaps there are too few aquatic plants. Perhaps there are not enough small organisms to support larger animals. Perhaps the shoreline provides nowhere for wildlife to hide, feed or reproduce.

The answer is not simply to release more fish into the water. "A healthy ecosystem needs different levels of life," Huang said.

She said ecological restoration is not only about creating a finished landscape, but also setting a process in motion.

One major challenge is that cities often prefer nature to look neat. Old reeds are cut down, dead vegetation is removed, riverbanks are straightened and shorelines are covered in stone or concrete. But what looks tidy to humans may offer little to wildlife.

Huang recalled observing a rare dragonfly in Beijing that to the untrained eye is easy to miss. Brownish in color, it blends into dry, yellow reeds.

Its breeding habitat includes reed beds in early spring, before the landscape has turned green. But old reeds are often removed as part of routine maintenance or fire prevention work. "When the yellow reeds are all removed, the breeding habitat becomes very limited," Huang said.

She and other nature enthusiasts have encouraged park managers to leave more vegetation standing where possible.

The benefits extend beyond dragonflies. Old reeds can also provide habitats for birds during winter.

Urban disconnect

For Huang, the issue reflects a disconnect between ecological health and ideas about what a city should look like.

A healthy wetland may contain withered plant stems that are dormant during the winter, and the aboveground vegetation can appear dry or decaying.

Riverbanks pose a similar challenge. A gently sloping shoreline with vegetation is generally more welcoming to wildlife than a vertical concrete wall. Plants create shelter and the gradual transition between land and water allows birds and small animals to move between the two environments.

The soil itself is also important, Huang added. Gently sloping soil banks provide bottom-dwelling species with both food and habitats.

However, Huang is also pragmatic about the realities of urban infrastructure designs that need to coexist with ecological systems. She accepts that urban rivers need to carry floodwater, that space is limited, and that soft riverbanks can erode.

The challenge is not to eliminate infrastructure, but to make it more hospitable to wildlife, Huang said.

She cited examples of sensitive design ideas such as stone embankments with gaps and irregular surfaces to provide shelter for wildlife. Sloping gabion banks are more wildlife-friendly than stepped ones and provide a gentler transition between land and water and better habitats for wetland species, she said.

Ecological restoration, Huang said, is ultimately about finding the best possible balance within the limitations of a particular site.

As for dragonflies, she believes their worth in balancing an ecosystem goes beyond preying on mosquitoes. They are both hunters and a food source for animals such as frogs and birds. "If one part of the chain disappears, the system changes," Huang said.

She said one of the most important contributions city residents can make to helping maintain this balance is simply acting as observers of nature.

The return of dragonflies to parts of Beijing does not mean the work of restoring urban ecosystems is finished. Clean water alone is not enough, and a healthy ecosystem cannot be rebuilt overnight.

On Friday evenings, Feng and his team take children to the Liangshui River for outdoor insect observation activities. There, participants encounter creatures they might otherwise never notice.

For Feng, this reflects a broader shift in the way people see nature in urban settings.

A river is not simply infrastructure carrying water through a city. A park is not just a landscaped space filled with trees and lawns.

With the right conditions, both can become habitats. And dragonflies, he believes, are among the most visible signs of whether those conditions exist.

Residents fish along a lake at Cuihu National Urban Wetland Park in suburban Beijing on June 10. The city has been working on rebuilding wetlands and urban water systems to restore its ecology in recent years. GUO YUE / FOR CHINA DAILY

US urged to fix hurdles, aid exchanges

FM meets with envoy, stresses building constructive, strategically stable relations

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

Foreign Minister Wang Yi has urged Washington to remove disruptions and overcome obstacles to high-level exchanges between China and the United States, saying that both countries should earnestly implement the important consensus reached by the two heads of state.

Wang, who is also a member of the Political Bureau of the Communist Party of China Central Committee, made the remarks on Wednesday during a meeting in Beijing with David Perdue, the US ambassador to China, according to a statement released by the Foreign Ministry on Thursday.

Under the guidance of the two heads of state, China and the US are working to build a constructive relationship of strategic stability, Wang said.

He said facts show that improving bilateral relations, coexisting peacefully on the basis of mutual respect and achieving win-win cooperation serve the fundamental interests of the two peoples and meet the common expectations of the international community.

Noting that the China-US relationship still faces various risks and challenges, Wang emphasized the need for both sides to focus on a constructive agenda and properly manage differences to promote stable, healthy and sustainable development of bilateral ties.

Perdue said the two heads of state have provided important strategic guidance for advancing bilateral ties, noting that US President Donald Trump's visit to China in May was a success.

The US is willing to strengthen communication with China, advance cooperation, make preparations for the next stage of important high-level interactions, and build a constructive relationship of strategic stability on the basis of respect and reciprocity, the ambassador added.

On behalf of the US, Perdue expressed condolences over the casualties caused by a deadly mudslide that struck the Gyirong land port along the China-Nepal border in Southwest China's Xizang autonomous region.

Later, Perdue said in a post on social media that he had productive meetings with Chinese Foreign Ministry officials.

During his trip to China in May, Trump invited President Xi Jinping to visit the US in the autumn.

At a regular news conference on Thursday in Beijing, Foreign Ministry spokesman Lin Jian said that China and the US are maintaining communication on the arrangement of interactions between the two heads of state within the year.

Tariff threat

Wang's meeting with Perdue came amid the US reportedly planning to impose a 7.5 percent tariff on Chinese goods on the pretext of excess manufacturing capacity.

Huang Ling, a spokeswoman for the Ministry of Commerce, said on Thursday that the US, citing "overcapacity", has initiated an investigation against 16 economies, including China, under Section 301 of its Trade Act of 1974, which politicizes economic and trade issues.

The US-China Business Council released its annual member survey report in June, indicating that 95 percent of respondents considered China to be "somewhat" to "very important" for maintaining global competitiveness. The survey also found that US tariffs continue to increase costs for its own citizens, while the country's export controls unnecessarily undermine US businesses.

Around half of the affected US companies are losing sales to Chinese or international competitors, leading to lost market share in many cases, the report said, adding that the curbs failed to achieve their purported goal of denying China access to key technologies.

Craig Allen, former president of the US-China Business Council and a nonresident senior fellow at the Asia Society Policy Institute's Center for China Analysis, said Chinese investors in the US play a very important role in local economic stability.

"In my view, the largest growth areas are probably in the services industries, also probably any industry touched by AI (artificial intelligence). But I think that there's room for growth across the board," Allen said in a recent interview with Chinese media. "We want to see more enthusiastic trade and investment going both ways across the Pacific Ocean."

Feast for gamers

Inclusion: Society grows stronger by learning together

From page 1

Families need confidence that their children will be welcomed and supported. Communities need greater understanding of the benefits of inclusion. And education systems need policies, resources and data that help ensure every child can participate and learn.

China has already made important progress in expanding educational opportunities for children with disabilities. Continued investments in education, combined with policies and programs supporting children with diverse learning needs, have helped more children access learning opportunities closer to their communities. The next opportunity is to build on this progress by ensuring that even more schools are equipped to support all learners and that children receive the individualized support they need to participate meaningfully in school life.

This matters because inclusive education is not only about what happens in the classroom today. It is also about preparing children for the future. Global evidence shows that children with disabilities are more likely to flourish when they grow up in supportive family and community environments and learn alongside their peers. Inclusive education helps children develop confidence, social connections and skills that support participation in society and the workforce later in life.

It also contributes to broader social and economic goals. As China continues to advance high-quality development and create greater opportunities for people with disabilities, ensuring that children can participate fully in education from an early age will help lay the foundations for lifelong learning, employment and meaningful inclusion.

To support this goal, UNICEF and the Chinese Ministry of Education are working together to strengthen inclusive education in around 2,000 schools and kindergartens across China. In these schools, teachers are being better equipped to respond to diverse learning needs, learning environments are becoming more accessible and supportive, and children are learning together in ways that help every student succeed.

Earlier this year, UNICEF visited Jitian Primary School in Tianfu New Area, Chengdu, Sichuan province, where we met children with disabilities and their families. One of them was 10-year-old Manman. Her mother, Chen Lili, described enrolling Manman in a mainstream school as "the best decision I ever made".

"By the end of first grade, I could already feel a remarkable change in Manman," Lili told us. "Now she smiles much more. She's able to express herself more confidently. Her every little growth is a wonderful surprise for me. I'm truly happy."

Stories like Manman's remind us that inclusion is ultimately about children, families and opportunities. When barriers are reduced and support is available, children can participate more fully, build friendships and realize their potential.

To help bring these opportunities to more children, UNICEF is also working with partners through the public advocacy campaign "Childhood, Without Barriers". The campaign seeks to increase understanding of children with disabilities, promote more inclusive attitudes and encourage practical action by schools, families and communities. It also supports efforts to strengthen inclusive education systems, improve data and evidence, and expand access to quality services for children with disabilities.

Lasting progress requires both strong systems and supportive social attitudes. Policies, investments and professional expertise all matter. So does our willingness to recognize the strengths and potential of every child.

Children with disabilities do not want a different future from other children. They want what all children want: opportunities to learn, develop their talents, build friendships and pursue their dreams.

As a new school year begins, let us continue working together to create learning environments where every child feels valued, supported and able to participate. By investing in inclusive education, we are not only supporting children with disabilities. We are helping build stronger schools, stronger communities and a more inclusive society that benefits everyone.

When every child belongs, every child can thrive. And when every child can thrive, society as a whole moves forward.

The author is UNICEF representative to China. The views don't necessarily reflect those of China Daily.

Rescue: Barrier lake formed in severely hit area

From page 1

Local resident Karma Dondrub, who routinely monitors border activity, was on duty and patrolling Lapher village when the mudslide struck. "Suddenly, the house began to shake and the trees were swaying," he said. "I thought it was an earthquake, so I rushed out of my post to see what was happening around me.

"Within seconds, floodwater came rushing down from the mountain above me into the river below," he added. He then made his way from the village to the nearby safe haven of Saleg township.

The Red Cross Society of China has sent a working group and relief supplies to regions affected by the disaster, along with a total of 2,500 relief items, including tents, family kits, hygiene packs, quilts, folding beds and winter jackets.

Search and rescue operations were progressing but faced challenges due to the complex terrain and hydrological conditions in the affected area.

A barrier lake that was created after the mudslide near a river confluence in the severely hit area had collected an estimated 2 million cubic meters of water and was already in overflow condition, the Ministry of Water Resources said.

Another 3 million cubic meters of water could flow into the lake over the next three days, posing a high risk of a breach.

To support emergency rescue and relief work, the Ministry of Natural Resources is closely monitoring the lake's development and conducting calculations and analysis regarding the risk of an outburst flood.

Hu Jiaojiao, a glacier expert, said in an interview with CCTV that it remained unclear whether further ice-rock avalanches or mudslides might occur, given that the stability of the area where the avalanche originated was not known, upstream conditions were uncertain, and the terrain is narrow and marked by dramatic changes in elevation.

"The unstable natural environment is a major challenge for rescue efforts, and the local high altitude poses physical difficulties for rescuers," said Hu.

Robot chefs: Automation making way for creativity

From page 1

Staff members of the Chinese cooking-robot maker Xianglu Robotics introduce the 3K Vision AI cooking robot at the 2026 World Robot Conference in Beijing on Sunday. PROVIDED TO CHINA DAILY

The robot's software, named CookingMuse, adjusts heat, duration, stirring speed and liquid seasoning in response to what the cameras observe. The technology, however, is still navigating the nuances of culinary physics.

Yang noted that while the model achieves over 99 percent accuracy on well-trained signature dishes, precision can slip to roughly 77 percent when unfamiliar ingredients are thrown into the mix. A neural network adept at reducing tofu sauce still requires substantial retraining to judge the glaze on braised pork belly.

As the catering sector looks to cushion rising labor costs and standardize quality across restaurant chains, developers of artificial intelligence are racing to move kitchen hardware from basic automation to sensory-driven "embodied AI". The commercial incentive is vast. China's catering sector generated nearly 5.8 trillion yuan ($863 billion) last year, according to the National Bureau of Statistics.

However, penetration of automated cooking systems remains below 2 percent domestically and even lower abroad.

To expand its reach, Xianglu has rolled out RobotCook, an all-in-one mobile container kitchen that handles ingredient refrigeration, cooking, plating and self-cleaning. For an outlet serving 100 meals daily, Yang estimated that the unit costs roughly the equivalent of one kitchen worker's annual salary, offering a return on investment within 12 to 15 months.

The rise of culinary automation is reshaping kitchen labor rather than simply replacing it, industry insiders said. "Robots can take on the heavy and repetitive physical strain, liberating chefs to focus on menu development and creative research and development," said Wu Xianming, a recognized master chef of Jiangxi cuisine.

The next step is an ecosystem where seasoned culinary masters license their digitized recipes to global franchise chains and automated kiosks, earning royalties per dish cooked. The primary growth areas outside the domestic market lie in Western and Southeast Asian markets, where skilled Chinese chefs are in critically short supply and kitchen wages run high.

"Embodied AI does not need to look like or mimic a human; its form factor must adapt to the functional demands of real-world scenarios," said Liu Xingliang, president of the Data Center of China Internet's Internet Research Institute.

Actions key to China-India consensus

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

India should faithfully implement the latest eight-point consensus it reached with China on the boundary question to ensure that liaison mechanisms function properly and help avoid friction, observers said.

On Wednesday evening, the Chinese Foreign Ministry released a statement regarding the eight-point consensus reached during the 25th Round of Talks Between the Special Representatives of China and India on the Boundary Question, which took place in Beijing on Tuesday.

Inside

Editorial, **page 6**

A major highlight of the consensus was the founding of the Expert Group on Boundary Delimitation and Working Group on Border Management under the Working Mechanism for Consultation and Coordination on China-India Border Affairs.

According to the Foreign Ministry statement, the two groups will "respectively advance discussions on an Early and Substantial Harvest of boundary delimitation and Border Management", and their first task would be to agree on their respective Terms of Reference.

Another highlight was the two sides agreeing to establish an additional two meeting points for holding the General Level Mechanism/Senior Highest Military Commander meeting. Also, two additional channels of border military hotline in the Eastern and Middle Sectors were agreed upon.

The two sides underlined their commitment to "advancing negotiations on a framework for the settlement of the boundary question", and agreed that "any situation on the ground would be addressed promptly through existing diplomatic and military channels", the statement said.

According to the Foreign Ministry, the special representatives' talks is the main channel for negotiations between China and India on the boundary question, as well as an important platform for communication on issues of mutual interest.

Lin Minwang, a professor of South Asian studies and vice-dean at Fudan University's Institute of International Studies in Shanghai, said the eight-point consensus introduces "a slew of fresh, significant institutional arrangements to improve management and control of the border situation and resolve the boundary issue", such as the formation of the expert group on boundary delimitation.

"Both sides are trying to arrive at more substantial outcomes in tackling these issues," he said.

While reviewing the progress made on trans-border cooperation in the consensus, the Indian side appreciated the efforts made by the Chinese side to increase the number of Indian official pilgrimage groups to Mount Gang Rinpoche and Lake Mapam Yumco, the sacred mountain and lake in China's Xizang autonomous region.

Both sides appreciated the reopening of the three designated border trading points. The two sides agreed to strengthen exchanges and cooperation in border trade, pilgrimage and other areas, with a view to working together to create an atmosphere featuring dialogue, peace, consultation and cooperation in the border areas, the statement said.

In terms of setting new items on the calendar for further official talks, the two sides agreed to hold the 26th round of the special representative talks in India next year.

Beijing and New Delhi also agreed to hold the next meeting of the China-India Expert-Level Mechanism on Trans-border Rivers in September and maintain communication on issues including hydrological data sharing.

Lin, the Fudan University professor, said that Beijing and New Delhi should "sustain the benign, positive interactions between the two sides under these mechanisms".

President Xi Jinping and Indian Prime Minister Narendra Modi met in Russia's Kazan and China's Tianjin, in 2024 and 2025, respectively, reaching a series of important consensuses on the development of China-India relations.

Tariffs may hit both US, Canada

Levies to deepen economic pain as countries to bear costs, analysts say

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

Canada's new retaliatory tariffs will deepen the economic pain from its trade fight with the United States, with experts saying both countries will bear the costs.

Canada announced on Tuesday that it would impose retaliatory tariffs on about C$27.6 billion ($20 billion) worth of US goods, matching the value of Canadian products targeted by Washington's new 50 percent tariffs.

The measures, which will take effect on Sept 8, cover about 700 US products, with tariffs ranging from 15 percent to 50 percent.

"The new tariffs in both countries are going to hit both, though the larger American economy will suffer less," Ronald Stagg, a history professor at Toronto Metropolitan University, told China Daily.

In the United States, particular industries and states that trade heavily with Canada are likely to feel the effects more acutely, Stagg said.

"This includes the American alcohol producers who already are feeling the pinch from the removal of American wine, beer and spirits from sale by eight of the 10 provincial governments, which control alcohol sales," he said.

For Canada, however, the consequences could be more severe.

"In Canada, the automotive industry will be devastated if the American tariffs continue, and small-scale exporters may be driven out of business," Stagg said.

The Canadian government is taking steps to cushion the economic impact, he added, but "it cannot prevent all damage to the economy".

Mesbah Fathy Sharaf, an economics professor at the University of Alberta, said the US tariffs would put significant pressure on Canadian exporters. "The first impact will be on Canadian companies that sell heavily into the US market," Sharaf told China Daily.

The tariffs will affect industries ranging from steel and dairy to wood and paper products, furniture, appliances, electronics, agricultural equipment, wine and clothing, he said.

"A 50 percent tariff is huge," Sharaf said. "Some Canadian products may simply become too expensive for US buyers."

If the tariffs remain in place, "I would expect exports to fall, profits to shrink and some of the affected industries to start worrying about jobs", he said.

But Sharaf said the United States would not be insulated from the consequences.

"The US importer pays the tariff when the Canadian product enters the country," he said. While businesses may absorb some of the additional costs, "part of it will likely end up in higher prices for consumers".

US companies that rely on Canadian materials and parts could also face higher costs, he said.

"So this is not something that hurts Canada and leaves the United States untouched," Sharaf said. "Both countries will end up paying a price for this."

The effectiveness of Canada's retaliation, however, will depend on how Ottawa uses the measures, Sharaf said.

'Targeted measures'

"Canada can put pressure on the US, but we have to be smart about how we do it," he said. "I would rather see targeted measures than tariffs simply for the sake of retaliation, because Canadians can also end up paying more."

Sharaf also pointed to Canada's energy exports as a potential source of leverage.

The US Commerce Department's Wednesday report showed prices rose 3.7 percent in July compared with a year earlier.

"The US relies heavily on Canadian oil, gas and electricity," he said. "I am not saying Canada should cut off supplies. But that dependence gives Canada some leverage, and we should not forget that when we sit down with Washington."

Stagg, however, offered a more cautious assessment of how much leverage Canada actually has.

"Unless Canada responds further by limiting or canceling trade in oil, hydropower and potash, steps which would cause their own problems ... the amount of leverage that Canada has is limited," he said.

Stagg said Canada's response was driven not only by economic considerations but also by growing frustration over repeated US demands during the negotiations.

"The Canadian response to the new American tariffs is driven by two things," he said, citing the Canadian government's belief that the US administration would continue to demand more from Ottawa and growing anger among Canadians over the repeated demands.

"However, it is clear now that every time Canada gives a little, the United States makes new demands," Stagg said.

He said tension over sharing toll revenue generated by the newly opened Gordie Howe International Bridge and the "endless list of demands" has intensified nationalist sentiment and put additional pressure on the Canadian government to take a stronger position.

For Canada, the row could also accelerate a long-discussed effort to diversify trade away from the United States, Sharaf said.

"Canada has talked about diversifying its trade for a long time, but this dispute gives us a much stronger reason to actually do it," he said.

That means looking more seriously toward Europe and Asia while also reducing barriers to trade between Canadian provinces, he said.

Canadian Prime Minister Mark Carney will address the European Parliament next month, said a statement from Carney's office on Wednesday.

Still, Sharaf said Canada should not expect to quickly replace the US market. "The point is not to turn away from the US. It is to make sure that next time there is a serious dispute, Canada has more choices than it has today," he said.

Sharaf also agreed with Carney that the tariff dispute represents a fundamental change in the bilateral relationship.

"I don't see this as just another trade disagreement," he said. "Even if the tariffs are eventually removed, I don't think the relationship will simply go back to where it was before."

African experts call for investment in bioeconomy

By EDITH MUTETHYA
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

African policymakers and experts have called for greater coordination, investment and commercialization of the continent's biological resources to unlock the potential of the bioeconomy.

Speaking at the Africa Bioeconomy Workshop held in Nairobi on Tuesday and Wednesday, they said the bioeconomy could transform Africa's food systems while supporting sustainable construction materials, biochemicals, biopharmaceuticals and bio-packaging, as well as accelerating the transition to low-carbon, nature-positive economies.

Abdou Tenkouano, director general of the International Centre of Insect Physiology and Ecology, said the bioeconomy is becoming an important pathway to a greener future.

"Let us work together across government, the private sector, civil society, and academia to develop bioeconomy pathways that reflect our local aspirations while contributing to global goals on climate, biodiversity, and food security," he said.

Tenkouano said agriculture contributes between 23 and 35 percent of GDP in many sub-Saharan African countries and generates significant biomass, providing a key foundation for the bioeconomy.

"By adding value to this biomass, strengthening supply chains, and enabling distributed manufacturing, the bioeconomy can help diversify growth in a sustainable and inclusive way," he said.

Tenkouano called for greater support for innovation, entrepreneurship, value addition and agro- and bioprocessing to create jobs and incomes, particularly through university-industry partnerships.

He also urged stronger regional cooperation on standards, financing, education, research and training, with greater youth participation.

Isata Kamanda, Sierra Leone's deputy minister of agriculture and food security, called for affordable financial instruments to help domestic agro-processors scale their innovations and develop competitive products for regional and international markets.

She said bioeconomy financing should reach local businesses, rather than being concentrated among research institutions and large companies.

Kamanda also called for shared regional infrastructure, particularly in West Africa, saying countries don't need to establish costly facilities such as genomic laboratories in every capital. "One can serve the region better," she said.

She emphasized the importance of food sovereignty, noting that disruptions to global trade can expose African countries to shortages because of their dependence on imports.

Sierra Leone, she said, is seeking to industrialize cassava production to produce flour that can substitute imported wheat in products such as bread and confectionery.

Building value chains

"The goal is not simply to increase agricultural production but to build value chains that retain more economic value domestically," she said.

Shaukat Abdulrazak, principal secretary in Kenya's State Department for Science, Research and Innovation, called for regional centers of excellence and greater collaboration among countries.

"We need to break the silos, build collaboration, build cooperation, and be able to have exchanges," he said, calling for greater mobility of students and researchers as well as stronger regional research networks.

Niall O'Connor, director of the Stockholm Environment Institute Africa Centre, said Africa must move beyond exporting raw biological resources and retain more value locally through processing and manufacturing to realize its bioeconomy potential.

He also called for a shift from isolated pilot projects to coordinated clusters that bring together producers, suppliers, researchers, processors and investors.

Abdulrazak also urged universities and research institutions to work more closely with industry and establish mechanisms for moving innovations from laboratories to the market.

Africa also needs to facilitate the movement of goods, services, capital and people across borders, he said, noting that the African Continental Free Trade Area provides an important framework for expanding the market for African innovations.

China's 'grass tech' helps reap rich harvest in Fiji

SUVA, Fiji — On a stretch of land once scarred by salt, rows of lush green grass now ripple in the Pacific breeze. Just a few years ago, little could grow here.

Today, the field stands as living proof of how a single plant is helping reshape both the landscape and the lives of local people.

The grass is known as Juncao. The Juncao technology was developed in China and introduced to Fiji more than a decade ago.

Originally designed as a substrate for cultivating edible mushrooms, Juncao has since become a tool for restoring degraded land, supporting livestock farming and creating new sources of income for rural communities.

For Fiji, where soil salinity has long constrained agricultural development in some coastal areas, the technology has brought tangible results.

According to Huang Zhixin, an expert at the China-Fiji Juncao Technology Demonstration Center, planting Juncao for just four months reduced the soil's salt content from 1.67 percent to 0.4 percent.

The impact is also visible on supermarket shelves.

Inside a large supermarket in the western city of Nadi, locally grown oyster mushrooms sit neatly among fresh vegetables.

"Just a few years ago, almost all mushrooms sold in Fiji were imported, selling for more than 30 Fijian dollars ($13) per kilogram, making them unaffordable for many families," said Mere, a supermarket employee.

After the introduction of Juncao cultivation technology, local production gradually expanded, bringing prices down by nearly half.

To adapt mushroom production to Fiji's tropical climate, Chinese technicians worked with the local partners to develop cultivation methods suited to high temperatures, including shaded production areas, suspended growing bags and temperature-controlled storage.

Today, over ten varieties of edible fungi, including oyster mushrooms, king oyster mushrooms and wood ear mushrooms, are produced locally.

The technology has also encouraged the emergence of homegrown mushroom brands that now supply supermarkets, restaurants and hotels across the country.

For villagers, however, the biggest change often begins in their own backyards.

In Muanaira Village near Suva, 76-year-old Alusio Tawakevoudua tends rows of mushroom-growing bags beside his house. The cultivation area occupies only about 10 square meters, yet it provides a steady source of income throughout the year.

Mushrooms can be harvested every six to 10 days. Annual production reaches about 1,200 kg, earning his family roughly 18,000 Fijian dollars in additional income, Tawakevoudua said.

Beyond mushroom cultivation, Juncao is also helping address another long-standing challenge in Fiji's agriculture.

During the dry season, fresh forage shortages have traditionally driven up feed costs and exacerbated overgrazing, putting pressure on natural grasslands.

Sustainable alternative

According to Zhong Siqin, another expert at the demonstration center, Juncao offers a sustainable alternative. Once planted, it can be harvested continuously for more than 20 years, producing 300 to 500 tons of fresh grass per hectare annually. With a crude protein content of 8 to 16 percent, it provides nutritious feed for cattle while reducing pressure on natural pastures.

Since 2014, the China-Fiji Juncao Technology Demonstration Center has carried out three phases of technical assistance projects. To date, it has organized 67 training sessions, trained more than 2,900 local technicians, promoted Juncao cultivation on over 2,500 hectares of land, and helped more than 3,500 households achieve sustained income growth.

As preparations begin for a new round of technical cooperation, Sufuawana Safara Hussein, a researcher with Fiji's Ministry of Agriculture and Waterways, is looking forward to expanding the program.

"China's Juncao has changed our land, and it has changed ordinary people's lives," she said. "We hope to continue working with China so that more villages and more families can benefit from this technology."

NOTICE

The property located at Room 303, No. 77, Lane 319, Liuying Road, Jing'an District, Shanghai, was owned by Wu Hanchang (deceased), whose heirs include Wu Tieji, Wu Junji and others. The aforesaid house falls within the scope of expropriation for the Old City Reconstruction Project for Plot 128 Neighborhood in Jing'an District.

On June 2, 2026, the People's Government of Jing'an District, Shanghai, issued a House Expropriation Decision (Hu Jing Fu Fang Zheng [2026] No. 1). As of July 3, 2026, the contract-signing rate stood at 99.37%, meeting the required threshold.

To safeguard the legitimate rights and interests of the aforesaid property owner(s), the relevant heirs are requested to contact the expropriation authority at the site of the Old City Reconstruction Project for Plot 128 Neighborhood in Jing'an District within two weeks to negotiate matters concerning house expropriation compensation. Failure to make contact within the specified period will result in the matter being handled in accordance with applicable laws and regulations. The house expropriation compensation plan and relevant matters concerning the aforesaid owner(s) will be posted on the public notice board at the project site for a period of two months.

Contact Address: No. 45-A, Lane 319, Liuying Road, Jing'an District, Shanghai, China; **Contact Person:** Mr. Ju; Telephone: +86 21-5299 9303; **Business Hours:** Monday-Friday, 9:00-11:00 and 14:00-16:00
House Expropriation Implementation Entity: Shanghai Jing'an No. 1 House Expropriation Service Co., Ltd.

公 告

上海市静安区柳营路 319 弄 77 号 303 室，权利人为吴汉昌（已故），其继承人为吴铁基、吴俊姬等。上述房屋被列入“静安区 128 街坊片区地块旧城区改建项目” 征收范围。2026 年 6 月 2 日，上海市静安区人民政府作出房屋征收决定（沪静府房征［2026］1 号），截止到 2026 年 7 月 3 日签约率为 99.37%，达到生效比例。

为确保上述房屋权利人的合法权益，请上述房屋权利人于两周内前往静安区 128 街坊片区地块旧城区改建项目基地与征收单位联系，洽谈房屋征收补偿事宜。逾期未联系的，将依照法律法规予以办理，并通过本基地公示栏公告上述权利人的房屋征收补偿方案及相关事宜，公示期为两个月。

Rescue continues after deadly floods in Nepal

Beijing says it stands with neighbor as deaths exceed 350, hundreds missing

By PRIME SARMIENTO
in Hong Kong
prime@chinadailyapac.com

Police in Nepal said on Thursday that the death toll from flash floods that tore through three northern districts a day earlier had exceeded 350, with hundreds more people still missing.

"As of 5 pm Thursday, 359 people have died," Nepal Police said in a statement. Officials said the disaster could be one of the country's deadliest in decades.

The floods struck after an avalanche blocked the Lhende tributary of the Bhotekoshi River, sending a wall of water crashing into Timure, a bustling settlement in Rasuwa district near the border with China.

The torrent swept away entire neighborhoods, bridges, hydropower projects and other infrastructure, The Kathmandu Post reported. The worst-hit areas are popular with trekkers, river rafters and Hindu and Buddhist pilgrims.

Home Minister Sudhan Gurung said the focus remained on finding survivors, as rescue teams located 100 missing Indian visitors, mostly pilgrims, in the worst-hit area around the Trishuli river.

More than 650 foreigners remained unaccounted for, while Nepali authorities had yet to determine the number of missing locals.

Prime Minister Balendra Shah extended "heartfelt condolences" to the bereaved families and wished the injured a speedy recovery.

The national disaster authority held an emergency meeting to accelerate search, rescue and relief operations, Shah said. The Nepali Army has rescued 116 people from Timure.

Essential supplies, including generators, portable mobile towers, medical kits and tents, were being sent to the hardest-hit districts, he said.

Temporary mobile connectivity and phone-charging stations will soon be set up to help families stay in contact with loved ones, he added. The measures are aimed at restoring communications in communities where bridges, roads and power lines have been damaged.

Shah visited the hard-hit district of Nuwakot on Thursday to assess the damage and meet local officials on rescue and relief efforts, rehabilitation, and infrastructure restoration, local media reported.

Jai Kamakhya Prasad Kalwar, a shopkeeper in Dhunche town, Rasuwa, recalled how he and his neighbors fled as floodwaters swept through the area.

"We ran to save our lives, and we are safe for now," Kalwar said. He left everything behind, including his home and shop.

"No one here has a house left," he added.

Chinese Ambassador to Nepal Zhang Maoming expressed China's deepest condolences and sincere sympathies to the bereaved families and all those affected, as well as to the government and people of Nepal.

"China stands firmly with Nepal at this difficult time," Zhang told Nepal's state-run NTV World.

Beijing will continue to closely monitor the developments and do its utmost to provide all possible support and assistance, he said.

"We have been working closely with the Nepali side and supporting each other in responding to the disaster," he said. "I'm sure by joining hands together, we will overcome the difficulties and rebuild our beautiful homes."

The Chinese embassy has activated its emergency response mechanism, assessed the situation of Chinese citizens and enterprises in the affected areas, and urged the Nepali government and relevant authorities to make every effort to carry out rescue operations, Zhang said.

The embassy has also dispatched a working team to the affected areas to coordinate and facilitate rescue efforts on the ground, he added.

Rajneesh Bhandari in Trishuli Bazaar, Nepal, and agencies contributed to this story.

US sees generational gap over China policy

By SHI GUANG in New York
shiguang@chinadailyusa.com

A generational shift in US public attitude toward China may signal a long-term change in how Washington interacts with Beijing, according to a newly released survey.

Conducted by the Chicago Council on Global Affairs, US broadcaster NPR and market research firm Ipsos, the survey found that younger people in the United States were less likely than older generations to view China as a threat.

"Younger Americans have come of age in a more interconnected world shaped by digital exchange and cross-border education, where social media trends have made engagement with Chinese culture increasingly ordinary," survey authors Craig Kafura and Debi Jin wrote.

While only 43 percent of Millennials and 34 percent of Generation Zers viewed China's development into a world power as a "critical threat" to the US, the share was 62 percent among Boomers and 56 percent among Generation Xers.

The survey defines Boomers as those born from 1946 to 1964, Generation X as 1965 to 1980, Millennials as 1981 to 1996, and Generation Z as 1997 to 2013.

Ashley Breinholt, a student at Brigham Young University in Utah, said "young Americans should learn about China because it can open your mind to global awareness".

"It can open your mind to a whole other country and culture that's different from our own, but also very similar," Breinholt told China Daily.

Ilaria Luna, a Harvard student who studied at East China Normal University on an exchange program, said the experience had helped her form her own views.

"I know what the news tells us in the US about China and the things that they want us to feel and believe," she said. "But coming (to China) and being able to form my own opinions and experience the people and the kindness and the warmth has been really, really important."

Not surprisingly, a majority of Generation Zers and Millennials, 59 percent and 58 percent respectively, favored a policy of friendly cooperation and engagement with China, compared with 48 percent for both Boomers and Generation Xers.

Millennials and Generation Zers also strongly opposed higher tariffs and restrictive policies targeting Chinese students.

While 86 percent of Boomers and 85 percent of Generation Xers believed China wants to become the world's "dominant power", fewer than two-thirds of Generation Zers agreed.

"Younger cohorts are instead more open to the possibility that China's desired global role might be more collaborative, or that China may not want any leadership role in the world," the authors wrote.

Significantly, one-fourth of Generation Zers said China poses no threat to the US at all, compared with 16 percent of Millennials, 11 percent of Generation Xers and 4 percent of Boomers.

The survey highlighted broad agreement on reducing tariffs on Chinese imports in exchange for increased US agricultural exports, as well as on prohibiting US companies from selling sensitive high-tech products to China.

However, "on other restrictive measures, intergenerational splits become more evident", the authors wrote.

While older generations favored limiting the number of Chinese students studying in the US — 56 percent of Boomers and 63 percent of Generation Xers — a majority of Millennials and Generation Zers, 65 percent and 64 percent respectively, opposed such restrictions.

"As generational replacement continues and younger generations make up a larger proportion of the electorate, that gap between the assumptions driving Washington's China policy and the attitudes of the public it answers to may widen, raising real questions about what kind of relationship with China the next generation of Americans will want," the authors said.

The survey of 1,025 respondents across a range of demographic groups was conducted from March 13 to 15.

Japan urged to mend strained relations

By ZHOU JIN
zhoujin@chinadaily.com.cn

A senior Chinese official on Thursday urged Japanese political figures with insight into China-Japan relations to work to bring bilateral ties back on the right track, expressing hope that Tokyo will take practical steps to create the conditions needed to overcome difficulties in ties.

Lu Kang, vice-minister of the International Department of the Communist Party of China Central Committee, made the remarks at a meeting with a bipartisan group of Japanese lawmakers visiting China, led by Shinichi Isa, a Lower House member of the Centrist Reform Alliance.

The visit marks the first trip to China by a group of Japanese lawmakers since bilateral relations became strained following remarks by Japanese Prime Minister Sanae Takaichi in November suggesting possible military involvement in the Taiwan Strait.

Lu said relations between China and Japan are facing serious difficulties and that the causes are clear.

He underscored that historical issues, the Taiwan question and other major matters of principle affect the political foundation of bilateral relations and the fundamental trust between the two neighbors.

Lu called on Japanese political parties and politicians to distinguish right from wrong and push those in power to abide by the principles embodied in the four political documents between China and Japan, learn from history, and handle the Taiwan question honestly and strictly in accordance with the one-China principle.

'Deeply concerned'

For his part, Isa said relations between Japan and China are important not only to the two countries but also to Asia and the wider world.

Japan is deeply concerned about the current difficulties in bilateral ties and hopes to maintain communication with China and help improve their relationship, he said.

Commenting on the visit, Chinese Foreign Ministry spokesman Lin Jian told a daily news conference on Thursday that the root cause of the serious difficulties in China-Japan relations lies in the erroneous remarks and actions by Japanese governing authorities on Taiwan and in the fields of military and security.

"They should heed and value the voice of reason in Japan, repent for and correct the wrongdoings, and safeguard the political foundation of China-Japan relations with concrete actions," Lin said.

The delegation — comprising Isa, Liberal Democratic Party Lower House lawmaker Gaku Hashimoto, and Komeito Upper House member Yudai Kawamura — arrived in Beijing earlier this week, The Japan Times reported.

Isa, who has served as a diplomat at the Japanese embassy in China, wrote on X earlier this month that bilateral ties have sunk to their worst since the 1972 normalization of relations.

The situation is not in the national interest of either side, Isa said at the time, adding that the Chinese side accepted a request from Japanese lawmakers for a window of dialogue.

Launched by the All-China Federation of Trade Unions, this series shines a spotlight on the responsibility and resilience of the modern Chinese working class, documenting their struggles and stories from the front lines to showcase the dedication, craftsmanship and pioneering spirit driving progress across every sector.

Wang Jibing, known as the "takeaway poet", rides a moped through the streets of Kunshan, Jiangsu province, to deliver a meal. XINHUA

By YUAN SHENGGAO

On July 21, at the symposium for laureates of the ninth Lu Xun Literary Prize, Wang Jibing choked up several times. "No matter what, I have always been a quietly flowing river," said the 56-year-old, who is a takeaway rider in Kunshan, Jiangsu province. "I will answer the years with one piece after another."

Wang is widely known as the "takeaway poet". Born in Pizhou, Jiangsu, he left school early and worked as a builder in Shenyang, Liaoning province, a scrap collector and a street vendor. He currently runs a small convenience store with his wife. In 2018, then nearly 50, he registered as a food-delivery rider.

He once wrote: "For those racing against the clock, there are no seasons — only this stop, and the next." The lines are from his viral 2022 poem *A Man in a Hurry*.

Since seriously turning his hand to poetry in 2009, Wang has composed more than 6,000 poems. On delivery runs, he jots lines on order receipts, cigarette boxes or his own sleeve, then types them into a computer at night. "If I can't write a poem in a day, I can't sleep," he said. "The next day I go out delivering like crazy."

One time, after winning a cash prize of 8,000 yuan ($1,190) in Haikou, Hainan province, Wang walked 26 kilometers from his hotel to the airport, documenting the scenery along the way. "The money came too easily; I needed to push myself the hard way," he said. He keeps spare raincoats and a rope in his delivery box. "After being pulled up from a well, I have a duty to reach down for others," he said.

He has turned down commercial offers that clashed with his principles. For example, a car commercial because he has no driver's license. Also, a dairy advertisement. "I don't even drink milk," he said. His rule is simple: "I write on blank paper for people to read. If there is a stain, the paper turns black and I cannot write on it anymore."

"You must build an inner moral compass. Once your values are shaken, life will collapse." Wang said he read those words in a work of literature and they have guided his every choice since.

The Lu Xun prize has upended his schedule. In August, he spent more than 20 days traveling through five cities. Yet back in Kunshan, he wakes at 5:30 every morning, tends to the shop, writes and still slips out at lunchtime for delivery runs.

"I remain that same river," he said. "Throw me off a cliff and I become a waterfall. Throw rocks in my path and I become waves." In *Low Flight*, he gives voice to fellow riders: "Who says that spreading wings means flying high? Flying low is still flying."

Wang, who dropped out after the second year of junior high, once compared delivery riders to migratory birds and sparrows; constantly on the move, yet calling the city home. "A professor said food couriers are a safety-net job for the city. I couldn't agree more, as long as we are willing to run, the city will give us its roads," he said.

Recalling a fall from a footbridge during a delivery, when passersby rushed to help, he reflected: "Don't think of yourself as just passing through. Every move you make might leave someone with a lifelong impression of an entire city."

To him, ordinary people on the run are like blades of grass on a prairie; individual blades that together form the vast landscape of an era.

"When we love life and love the city, we'll find that life is truly beautiful," Wang said. "As a writer, I have always believed in literature, and I believe that those who walk toward the light leave their shadows behind. That is what city life has taught me."

Dialogue conducive to stabilizing border areas and Sino-Indian ties

The 25th round of talks between the special representatives of China and India on the boundary question, held in Beijing on Tuesday, concluded with an eight-point consensus.

The meeting was co-chaired by Foreign Minister Wang Yi, China's special representative on the boundary question between China and India, and India's Special Representative and National Security Advisor Ajit Doval. Its outcomes will help stabilize the border areas of the two neighbors.

The consensus includes the establishment of an expert group on boundary delimitation and a working group on border management under the existing China-India border affairs consultation and coordination working mechanism. The first task of these groups will be to agree on their respective terms of reference so they can advance discussions on boundary delimitation and border management to realize early and substantial progress.

With the aim of improving border management, two additional meeting points were agreed upon for holding the General-Level Mechanism/Senior Highest Military Commander meeting. Similarly two more channels for the border military hotline in the Eastern and Middle sectors were agreed.

Moreover, both sides noted the progress on trans-border cooperation and agreed to strengthen exchanges and cooperation in border trade, pilgrimage and other areas, with the view of working together to create an atmosphere featuring dialogue, peace, consultation and cooperation in the border areas. These outcomes reflect the willingness of both sides to de-escalate border tensions.

During the talks, Wang expressed Beijing's readiness to work with New Delhi to manage their relations from a strategic and long-term perspective. By strengthening communication, enhancing mutual understanding, resolving differences and overcoming obstacles, the two neighbors can be good friends and partners that help each other succeed.

As Wang said, both sides should learn from historical experiences, place the boundary question in its proper context within the bilateral relationship, and continue to move forward "without stagnation, regression, or deviation" so as to gradually foster a positive narrative on China-India boundary affairs, making dialogue, peace, consultation and cooperation the mainstream of their relations.

Indeed, by transcending historical and political differences over the boundary question and deepening cooperation in areas such as trade, technology, climate change and public health, both nations can unlock the potential that exists in relations. Their interests are inextricably linked: a stable, peaceful border allows for the free flow of trade and personnel. The focus should therefore shift from what divides the two sides to the opportunities that can be seized by working in tandem.

It is important that New Delhi resists the temptation to encourage nationalism on the border issue for domestic political gains. Stirring nationalist sentiment over the boundary question only creates a toxic public opinion environment that makes it difficult for both countries to be flexible and engage constructively.

The mainstream narrative in both countries should be one of dialogue, peace, consultation and cooperation. This, rather than confrontational rhetoric, will foster the necessary trust and goodwill for the long-term, healthy and stable development of bilateral ties.

The latest round of China-India talks happened against the backdrop of increasing global uncertainty. The world order is under immense strain, with the ongoing crisis in the Middle East and the protracted conflict in Ukraine causing widespread instability. The global economy remains fragile. Against this complex and volatile backdrop, it is encouraging that both sides reaffirmed their commitment in the meeting to uphold the guidance of the leaders of the two countries, maintain peace and tranquility in the border areas and create an atmosphere for healthy and steady development of bilateral relations.

As members of the Shanghai Cooperation Organization and BRICS, China and India demonstrated through this week's Beijing talks that they possess the strategic wisdom and patience to manage their differences constructively — thereby contributing to regional peace and stability.

Restrictions a disservice to US interests

The US administration has been trying to wall off China from the United States' robotics industry only to discover that US robots have already been learning to walk on Chinese feet.

An internal review by the Association for Advancing Automation of the US found that 28 of 31 research papers led by US universities on humanoid or quadruped robots used products made by China's Unitree Robotics. This is a snapshot of institutional dependence, embedded in the very laboratories where the US administration seeks to maintain technological leadership.

The finding also exposes the contradiction in Washington's strategy: the more aggressively the US tries to "decouple" from China in high-tech, the more it reveals how deeply the two countries' innovation systems have become intertwined.

The Federal Communications Commission updated its "Covered List" late last month to include "advanced robotic devices" produced in foreign countries, stating advanced robots assembled in the US must contain more than 65 percent domestic components by value by 2028, rising to 75 percent in 2029. The ambition is clear enough. The mechanism is not.

China occupies important positions across the robotics supply chain, producing almost everything from sensors, motors and batteries to actuators, lidars and motor controllers. Take the actuators, which determine how humanoid robots move, for example; they can account for 40 to 60 percent of hardware material costs.

The FCC has issued a mandate without first building the industry base needed to fulfill it. The consequences will fall most heavily on US laboratories, start-ups and consumers.

Specialization and the division of labor allow people and economies to become dramatically more productive; prices help allocate scarce resources; and competition provides a powerful incentive to innovate. Globalization extended those principles across borders, building supply chains in which components are produced wherever companies can make them most efficiently.

Washington now appears to be betting on the reverse proposition: that productivity can be raised by dismantling international specialization; that bureaucratic restrictions can allocate resources better than markets; and that competition from Chinese companies will weaken the US.

That is a risky bet. The White House raised the stakes on Wednesday with a national emergency declaration that could curb US imports of foreign power grid equipment — and potentially force utilities to replace gear already online.

Every such arbitrary restriction creates compliance departments, supplier audits, certification requirements and legal uncertainty.

For robotics and AI companies already operating at the frontier of capital expenditure, such costs can become significant. They are ultimately absorbed by companies, consumers or both, adding to the inflationary pressures already confronting the US economy.

If restrictions depend heavily on executive action and can be reversed by a subsequent administration, companies have little incentive to make the long-term investments that Washington says it wants. Industrial policy requires patience and predictability. The US' current regulatory whiplash provides neither.

In an article published on Wednesday, "The turbulent AI era is here. The choices we make now are critical", Bill Gates rightly argued that since AI will be one of the most disruptive technologies in history, the US and China need to cooperate on AI governance before competitive pressures make cooperation impossible. He also observed that much cutting-edge robotics research is taking place in China, something many in US policy circles have yet to appreciate fully.

The history of technological revolutions offers little support for the idea that innovation flourishes behind walls. Previous periods of major-country rivalry did not require dismantling the international division of labor. Today's technology ecosystem is vastly more interconnected, making such an effort even more costly.

As Chinese Foreign Minister Wang Yi said in a meeting with US Ambassador to China David Perdue on Wednesday, after the US threatened to impose an additional "overcapacity" tariff of 7.5 percent on Chinese goods, China and the US should focus on a positive agenda, manage differences and remove obstacles to high-level exchanges.

If Washington decides that competition itself is a "security threat", it risks confusing national strength with national isolation. A technology superpower should want its companies to win because they are better, not because their competitors have been administratively excluded.

Building climate-adaptive society a task that cannot be delayed

Despite being hit hard by Typhoon Maysak last month, parts of the Guangxi Zhuang autonomous region had by late August moved from emergency rescue to recovery and reconstruction mode. But whether local livelihoods are better protected before the next disaster strikes is where climate resilience is truly tested.

On Wednesday, a massive flash flood caused heavy casualties along the China-Nepal border.

These disasters, caused by extreme weather, not only highlight the need for fast-rescue responses, but also stronger forecasting, better land-use planning, resilient infrastructure and closer coordination among departments and countries.

On Aug 22, the Copernicus Climate Change Service of the European Union said the daily global average sea surface temperature over the extra-polar ocean had reached 21.1 C, the highest on record since 1979. Warmer oceans raise sea levels through thermal expansion, strengthen marine heatwaves and can feed more moisture and energy into extreme rainfall and some storm systems.

On Tuesday, Panama's government declared a nationwide state of emergency over the climate impacts of El Nino, citing risks of drought, floods and possible effects on Panama Canal shipping, agriculture and energy supply. It said El Nino was forecast to strengthen from October this year through March 2027.

The policy response to climate risk cannot stop at emergency relief or emissions reduction alone. If climate change is testing communities in Guangxi, causing sudden flood risks across borders, warming the world's oceans and threatening canal shipping and agriculture in Panama, adaptation has to become a normal part of national planning, public investment and grassroots governance. This is the context in which China's pledge to basically establish a climate-adaptive society by 2035, included in China's 2035 Nationally Determined Contributions under the landmark 2015 Paris Agreement, should be viewed as a part of its broader efforts to strengthen climate resilience.

China is among a relatively small number of countries that have explicitly included the building of a climate-adaptive or climate-resilient society in their national climate pledges. That sends a clear message: adaptation is integral to the country's modernization.

Without deeper emissions reductions, climate risks will continue to rise, and adaptation costs will become heavier. When the next extreme event comes, will communities, infrastructure and institutions be ready?

The Guangxi floods show that flood control is not only about rescue after the roads are inundated or residents are trapped. It also involves weather monitoring, early warning, reservoir safety, urban drainage, land-use planning, transport, power supply, communications, healthcare and post-disaster recovery. In rural areas, such weather events affect crops, livestock, drinking water safety and the resilience of local livelihoods.

A climate-adaptive society cannot be built by environmental authorities alone. Climate risk must be incorporated into economic planning, urban construction, agricultural policy, infrastructure investment and grassroots governance. Standards for roads, bridges, reservoirs, power grids and drainage systems need to reflect the changing climate, not only historical averages. Early warnings must reach vulnerable communities in time. Local governments need the technical capacity and financial tools to shift from emergency response to risk prevention.

Building a climate-adaptive society is not a defensive slogan. It is a modernization task. It means using better science, stronger planning, more resilient infrastructure and fairer public services to reduce losses before disasters strike. As extreme weather tests communities from Guangxi to the Himalayan region and beyond, the priority is to translate climate adaptation goals into actions.

What They Say

APEC pillar of openness, cooperation in Asia-Pacific

Editor's note: *The 33rd Asia-Pacific Economic Cooperation Economic Leaders' Meeting will be held in Shenzhen, Guangdong province, in November. The 21st Century Business Herald spoke to Zhai Kun, a professor at the School of International Studies at Peking University, about APEC's significance in the regional and global economy and China's role in promoting cooperation among APEC economies. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

At a time when many regional cooperation mechanisms are weakening and exclusive blocs are on the rise, APEC's institutional strengths are its principles of openness, inclusiveness, nonbinding commitments, voluntary participation and consensus building. The "APEC approach" respects diversity and emphasizes flexibility and gradual progress, making it uniquely vital across the Asia-Pacific region where member economies vary significantly.

APEC is the only economic cooperation platform that covers the entire Asia-Pacific, bringing together 21 economies that account for roughly 60 percent of global GDP and nearly half of world trade. Its nonbinding nature, characterized by voluntariness, lowers participation barriers, enabling cooperation among countries with diverse economic systems and development stages. APEC upholds open regionalism and opposes closed, exclusive groups, contrasting sharply with the "small yard, high fence" approach pursued by some economies.

In today's complex international landscape, APEC is still an important platform for safeguarding openness and cooperation in the Asia-Pacific. While some mechanisms have weakened due to geopolitical confrontation, APEC has become an indispensable "pressure relief valve" and "buffer" among major countries.

As the host of this year's APEC Economic Leaders' Meeting, China has proposed the theme "Building an Asia-Pacific Community to Prosper Together", with three priorities — openness, innovation and cooperation. These elements form a framework that provides systematic solutions to challenges facing the Asia-Pacific region.

Openness is the cornerstone. The biggest risk facing the Asia-Pacific economies today is the erosion of the open order. Prioritizing openness reaffirms China's fundamental commitment to free trade. Innovation acts as the engine. APEC cooperation has expanded beyond conventional trade and investment into new areas such as the digital economy, artificial intelligence governance, green and low carbon development, and supply chain resilience, illustrating that regional cooperation in the 21st century should be innovation-driven. Cooperation is the pathway. No single economy can tackle the challenges confronting the region on its own.

These three priorities make it clear that China advocates countering closure with openness, facilitating growth through innovation and replacing confrontation with cooperation.

Since it joined APEC in 1991, China's role within APEC has evolved from being a participant and beneficiary to a provider of public goods, helping shape the APEC agenda.

China collaborates with many developing economies to prioritize development issues within APEC cooperation, ensuring that the benefits of cooperation are shared more equitably by all parties. During this process, APEC cooperation and the Belt and Road Initiative could generate important and strategic synergies. Efforts could focus on the following aspects.

First, deepening the integration of "hard connectivity" and "soft connectivity" will allow the progress made by the BRI in infrastructure development to better align with APEC's efforts to facilitate trade and promote digital economy cooperation.

Second, linking the Digital Silk Road with APEC's digital economy cooperation is important. China's experience in fields such as cross-border e-commerce and mobile payments is worth sharing with more Asia-Pacific economies through the APEC framework.

Third, fostering collaboration between the Green Silk Road and APEC's green and low carbon development agenda will drive the advancement of clean energy, carbon markets and sustainable supply chains.

VIEWS

Anupam Chander

Drawing the line on AI liability

Who should be held liable when an artificial intelligence model is used in a way that causes harm? The question is being debated both in classrooms and courtrooms across the United States. The answer has enormous implications for US technology companies that offer some of the world's leading AI systems. And it is equally relevant for Chinese companies offering similar models.

At the dawn of the internet age, the US Congress intervened to limit the liability of online platforms for their users' speech. In the AI era, by contrast, governments are debating an opposite approach: increasing rather than reducing the responsibility of technology companies.

The key question is who bears the responsibility when an AI system goes wrong. We might all agree that a driver who puts a car into self-driving mode remains responsible for an accident. But what about the company that made the self-driving system? Should it be liable even when the driver used it improperly? If an airline's customer service chatbot mistakenly reports a fare policy that never existed, must the airline be required to honor it? A Canadian court recently concluded that it should. When a chatbot's conversation with a teenager ends in tragedy, as families now allege in US courts, is the company that built the model liable?

Global Lens

These cases raise the same question: to what extent should AI developers be held liable for the harms their systems may cause?

Legal scholars in the US remain divided. Some advocate what is called strict liability, under which manufacturers are responsible for any harm caused by their product. This would mean that the AI developer would be liable regardless of intent and even if it were not at fault. Supporters of strict liability argue that such an approach would create a strong incentive for AI developers to ensure their systems are completely safe before they are put into operation.

The European Union seems to be moving toward strict liability for AI systems. It recently broadened its Product Liability Directive to cover software, including AI systems, making any AI system manufacturer liable for damage caused by any defect. A 2024 revision to the rules has made it easier for consumers to claim compensation. If the technical complexity of an AI system makes it difficult to prove a defect or if the manufacturer fails to provide sufficient information to the plaintiff, the Product Liability Directive presumes the system was defective. Even failing to provide necessary cybersecurity updates might be enough to establish liability.

Chinese technology companies, many of which release AI models as open source, may find some comfort in the fact that the European Product Liability Directive exempts developers of open-source models from liability. However, this exemption is not available when the open-source software is incorporated into commercial products. This raises some important questions. If a third party integrates an open-source AI model into a smart city project that later causes an accident, would the open-source model provider possibly be liable under the Directive? Such ambiguity undermines efforts to promote open-source models.

In a recent paper, Yale law professor Ketan Ramakrishnan argues persuasively that a strict liability approach to general purpose AI models will ultimately do more harm than good. If companies are expected to compensate for every misuse of their technology while receiving only a fraction of its social benefits, they may simply choose not to release models that could otherwise deliver enormous public value. Since it may be virtually impossible to eliminate all harmful usage, excessive liability could discourage innovation rather than improve safety.

Professor Ramakrishnan uses two examples to demonstrate how strict liability might be excessive. What if a novice programmer uses an AI model to learn how to program well enough to hack into other people's computers; or when an AI model helps people email more quickly, enabling someone to send harmful malware to others in bulk. Strict liability does not seem reasonable in such cases, he argues.

Consider another scenario. There have been cases of attorneys submitting legal briefs citing cases that were entirely fabricated by chatbots. Judges have fined the attorneys, but not the companies that made the chatbot on which the attorneys foolishly relied. This is because it would not seem fair to hold a chatbot maker liable because attorneys failed to do their homework. Notably, the cases thus far seem to have involved general purpose AI models, not ones marketed for accurate legal work.

As courts and lawmakers grapple with these issues, one thing is clear: we have yet to figure out what the basic rules governing AI systems should be.

The author is professor of Law and Technology at Georgetown University, US. The views don't necessarily reflect those of China Daily.

Yao Shuai

Western nations demand more while offering less

The United Nations' 2026 Sustainable Development Goals Report, released on July 7, presents a sobering picture. Of the 139 measurable targets, only 36 percent are on track or showing moderate progress, while 15 percent have slid below their 2015 baselines. Escalating conflicts, climate change, sluggish growth, rising debt, and a record fall in official development assistance were the primary forces that slowed progress, with the world's most vulnerable communities paying the heaviest price.

LI MIN / CHINA DAILY

The numbers paint a stark picture. According to the OECD, net official development assistance from Development Assistance Committee members plunged by 23.3 percent in 2025 — the largest annual drop on record — with the United States alone accounting for 70 percent of the decline. A further 6.9 percent contraction is projected for 2026, pushing development aid volumes to their lowest level since 2014. Several major donors have announced multi-year reductions in the future. Against this backdrop of unprecedented withdrawal, a narrative has emerged suggesting that a "post-aid era" has arrived, and that developing countries should embrace it as a step toward self-reliance.

This is a trap. After World War II, international development assistance has served as a vital global public good — funding health systems, responding to humanitarian emergencies, addressing displacement and climate change, and preventing local risks from cascading into global crises. When aid is reduced, shared risks increase for everyone. The "post-aid" story is not about liberation; it is a convenient pretext for wealthy nations to walk away from their obligations — that they promised since the 1970s to devote 0.7 percent of their GNI to foreign aid — just when needs are increasing.

Meanwhile, the UN estimates that the annual SDG financing gap has surpassed $4 trillion and continues to widen. Humanitarian funding has shrunk by nearly a third since 2023, reaching a decade low as 239 million people require life-saving assistance.

More troubling than the scale of this retreat is the transformation of what remains. In the past, donors who failed to meet their commitments at least offered explanations. Now, they are not only walking away but also recasting what remains as a commercial transaction. Developing countries are being told that accepting aid cuts is "for their own good", even as remaining engagements are restructured to serve the commercial, political and security interests of the donors.

In April this year, the US launched its "trade over aid" doctrine. Under the guise of "mutually beneficial private-sector partnerships" grounded in free-market principles, it demands pro-business market reforms from developing countries, downplays the role of aid, and reframes development cooperation as trade and investment on Washington's terms. Washington has put this doctrine into practice, signing bilateral agreements with 32 countries under its "America First" global health strategy. Zimbabwe, Ghana and Zambia have refused, citing concerns that range from data sovereignty infringements to clauses tying health assistance to preferential mineral access.

This bilateral retreat by the US is matched by a systematic withdrawal from the multilateral system. The US has exited institutions that span climate change, global health, human rights, development assistance and other key domains of global governance — most prominently the World Health Organization, the Paris Agreement and UN Women. When national self-interest becomes the guiding principle, development cooperation loses its purpose and turns into a transaction disguised as partnership.

This is the fundamental flaw of the "post-aid" narrative. It presents the collapse of assistance as a natural path to self-reliance, but obscures the dismantling of the very instruments that could make self-reliance possible. What must be challenged is not aid itself, but "aid without development" — resources that never lead to lasting progress.

The human cost is clear. In Africa, a global public health emergency caused by an Ebola outbreak required $1.4 billion, the amount initially estimated. But by mid-June, only 13 percent of the pledged funds had materialized, and the Africa CDC warned of imminent collapse. In stark contrast, South-South cooperation has delivered swift, practical solidarity: China has dispatched three medical expert teams to the Democratic Republic of the Congo, the latest arriving in Kinshasa on Aug 1 to reinforce ongoing efforts alongside local authorities, the WHO and the Africa CDC.

This contrast reflects a broader philosophy. Across the Global South, a different model of partnership is taking shape — pragmatic, needs-based, and rooted in shared development experience. The benchmark is not the most expensive or technologically advanced option, but what is most suitable, affordable and adaptable to local conditions.

This is a collective strength of the Global South — a growing capacity to support one another not as donors and recipients in the traditional sense, but as partners navigating shared challenges.

At a time when traditional donors are retreating, China's 15th Five-Year Plan (2026-30) signals a clear commitment to increasing foreign aid and providing more international public goods.

Equally instructive is the experience of many emerging economies as former aid recipients: external resources, when integrated into nationally owned plans and priorities, can strengthen rather than undermine sovereignty. This history offers a credible alternative to the false choice between dependency and abandonment.

The path forward requires three shifts. First, the international community must reject the "post-aid" narrative for what it is — a self-serving justification for disengagement — and insist on better aid: demand-driven, respectful of national ownership, and focused on building lasting capacity.

Second, the diversity of development actors should be treated as an asset. Different partners bring different strengths; the challenge is coordination around common goals. Emerging technologies offer new tools to improve efficiency and targeting. The World Bank's 2026 World Development Report, released on Aug 4, finds that AI could help developing countries achieve in a decade what might otherwise take a century. But it also warns that without proactive investment in digital infrastructure and skills, the same technology risks widening the gap between and within nations.

Third, the UN must reclaim its anchoring role by moving beyond forums to make developing countries' concrete needs visible, produce the public goods — norms, standards, knowledge — that build confidence, offer networks and practical solutions tailored to diverse country contexts, and translate consensus into coordinated action.

We are not entering a "post-aid era", but an era of cascading crises that demands better aid that is a genuine global public good. Choosing solidarity over selfishness is the only path to a just, resilient and genuinely shared future.

China's aspiration for multipolar world explained

China's foreign policy has long been misinterpreted or deliberately distorted in the West, with many assuming that a rapidly rising China will behave just like the United States as a hegemonic power.

China, however, rejects such claims. Its foreign policy is based on the Five Principles of Peaceful Coexistence: mutual respect for sovereignty and territorial integrity; mutual non-aggression; non-interference in each other's internal affairs; equality and mutual benefit; and peaceful coexistence.

While the term "multipolar world" is missing in official US vocabulary, it is central to China's vision for a global order where developing countries, especially those in the Global South, have a bigger say in global governance.

The recently published book, *China's Foreign Policy and the Making of a Multipolar World — Changes Unseen in a Century*, edited by London-based China specialists Keith Bennett and Carlos Martinez, offers valuable insights into China's foreign policy, its historical context, its positions on global issues and its vision for the future.

Published by Praxis Press this month, the book features 10 essays by nine Chinese and international experts and scholars on China, each providing unique perspectives on critical questions, such as whether China is an expansionist and imperial power or whether the Belt and Road Initiative for building connectivity is a "debt trap" as labeled by some China hawks.

China's peaceful rise is remarkable, achieved over a few decades without waging wars, engaging in colonization, pursuing regime change or carrying out assassinations.

According to Bennett and Martinez, the 10 essays share a common premise that China's emergence as a global power, far from being a threat to humanity as claimed by many in the West, is in reality a beacon of hope for a just, peaceful and multipolar world.

In their joint essay on "the world is undergoing profound changes unseen in a century", a phrase used by President Xi Jinping, the two argue that the collective rise of the Global South, with China in the vanguard, is bringing a decisive end to the unipolar moment briefly enjoyed by the US following the dramatic changes in the international landscape in the 1990s.

The authors commend Xi's strategic vision of building a community with a shared future for humanity, highlighting the initiatives proposed by China on global security, development, civilization and governance.

Ken Hammond, professor emeritus of East Asian and Global History at New Mexico State University, provides a historical perspective on China's foreign policy since the founding of the People's Republic of China in 1949.

He traces it back to China's bitter experience under Western and Japanese imperialism in the "century of humiliation" that followed the Opium War. This history is critical to understanding China's current mindset.

Jenny Clegg, a China specialist who first visited the country in 1971, elaborates on the Five Principles of Peaceful Coexistence as a guiding framework for China's foreign policy over the decades.

In "How China's Peaceful Rise is Changing the World", an essay by Cheng Enfu, former president of the Academy of Marxism of the Chinese Academy of Social Sciences, the author discusses China's global impact across six domains: science and technology, economy, politics, culture, ecology and people's livelihood.

With anti-China smear campaigns reaching hysterical levels in recent years, this book provides a more accurate portrayal of China's foreign policy, its philosophy of win-win cooperation in contrast to the zero-sum game pursued by the US, and China's strong opposition to a new Cold War that threatens to divide the world into confrontational blocs.

China's peaceful rise is remarkable, achieved over a few decades without waging wars, engaging in colonization, pursuing regime change or carrying out assassinations.

China firmly believes that countries with different histories, cultures and political systems can coexist and should cooperate for the benefit of their peoples and the world. BRICS, which includes a diverse group of countries, exemplifies this belief.

The world is undeniably shifting toward a multipolar global order.

It is an unstoppable trend that aligns with China's foreign policy vision and is also the aspiration for most countries in the world.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

POU SOTHIRAK AND **HIM RAKSMEY**

New ways to grow together

With increased cooperation in emerging green energy sectors and AI, ASEAN and China can bring mutual benefits to each other as well as to the wider world

WANG XIAOYING / CHINA DAILY

The Association of Southeast Asian Nations and China have had enduring relations ever since both sides established a dialogue partnership in 1991. Anchored by a shared commitment to a cordial neighborly relationship and an eagerness to pursue practical cooperation of mutual interest, the relationship between both sides has progressed substantially over the past 35 years.

Pou Sothirak

Him Raksmey

The depth and breadth of these ties are remarkable and multifaceted, ranging from political security to economic and sociocultural aspects. Given the depth and breadth of the practical cooperation between ASEAN and China, Beijing is poised to be one of the most important natural partners for the region. According to the ISEAS-Yusof Ishak Institute's State of Southeast Asia 2026 Survey Report, since 2019, China has been the most influential political and strategic power, as well as the most influential economic power in Southeast Asia. Based on the Lowy Institute's 2025 Southeast Asia Influence Index, China has the deepest economic relations, the most diplomatic influence, and the most regional engagement in the region.

Built upon extensive cooperation, ASEAN-China ties are currently on an upward trajectory. Both parties have maintained the tradition of focusing on practical cooperation that yields mutually beneficial, tangible results. In fact, as a result of close ASEAN-China relations, several outstanding outcomes have become visible.

On economic integration, ASEAN and China have forged close relations deeply rooted in robust trade and growing investment. China has been ASEAN's largest trading partner since 2009, while ASEAN has been China's largest trading partner since 2019. Data from China's General Administration of Customs show that in 2025, the China-ASEAN trade volume amounted to about $1 trillion. In terms of investment, China has been one of the largest investors in ASEAN. It is estimated that in 2024, foreign direct investment from China to the region totaled $19.3 billion, making China the third-largest source of FDI among ASEAN dialogue partners.

This excellent economic interaction has been driven, in part, by the implementation of key agreements such as the Regional Comprehensive Economic Partnership. Signed in 2020 and entering into force in 2022, RCEP is one of the world's largest free trade agreements, involving ASEAN members, Australia, China, Japan, New Zealand and the Republic of Korea. It covers tariff elimination and promotes unified supply chain rules. In addition, the signing of the ASEAN-China Free Trade Area 3.0 Upgrade Protocol in October 2025 was a significant step toward bolstering economic integration between both sides. The upgrade includes modernizing the free trade agreement by expanding its scope beyond traditional trade to include the digital economy, green economy, supply chain connectivity and consumer protection.

In terms of regional security, China and ASEAN share a strong commitment to upholding the rules-based regional architecture designed to maintain peace, security and open trade through agreed-upon legal principles rather than raw power politics.

Energy and artificial intelligence have become critically important to the future of ASEAN and China. Collaborative frameworks including the ASEAN Plan of Action for Energy Cooperation and joint AI-related initiatives help both sides manage surging resource demands and technological shifts.

While ASEAN and China have long-standing cooperation in energy, both sides are committed to working even harder in this area in light of the oil price fluctuations arising out of the ongoing conflicts in the Middle East. At the ASEAN-China Foreign Ministers' Meeting in July in Manila, both sides agreed to carry out the exchange of information on energy policy and practical cooperation and to explore the possible establishment of cooperation mechanisms to enhance regional energy security and resilience, thereby contributing to sustainable development in the region. The two parties also pledged to strengthen cooperation in regional power interconnectivity, energy supply chains, clean low-carbon and renewable energy, energy technology innovation, and other relevant areas.

In the Plan of Action to Implement the ASEAN-China Comprehensive Strategic Partnership (2026-30) adopted last year, the two sides agreed to promote cooperation, primarily on clean energy, through policy exchanges, joint research and dialogue, and to establish a dedicated institution called the ASEAN-China Clean Energy Cooperation Center to support these important undertakings.

With the affirmation of a stronger political commitment built upon existing cooperation mechanisms, the ASEAN-China energy partnership is likely to grow more substantively in the years to come and yield positive tangible outcomes for both sides.

Collaboration on AI represents another significant area of practical cooperation. Both ASEAN and China regard AI as an important instrument to promote regional prosperity, and seek to develop rules and norms for AI governance and explore opportunities to work together. There has been important progress toward this end. During the 28th ASEAN-China Summit in Kuala Lumpur in October 2025, both sides underscored the importance of strengthening exchanges and cooperation in the field of AI. This political commitment has been translated into concrete actions. The China-ASEAN AI Industry Innovation Center was officially inaugurated in May, while the China-ASEAN Digital Academy is set to be launched within this year.

In addition, the recent establishment of the World Artificial Intelligence Cooperation Organization in Shanghai marks another cooperation opportunity for ASEAN and China, particularly in capacity building. Twenty-nine countries — including five ASEAN members — are founding members of the organization. At the launch of WAICO, Chinese President Xi Jinping stressed the need to adhere to the principles of openness and win-win and boosting innovation-driven development, strengthening risk-awareness and ensuring that AI is secure and controllable, encouraging inclusiveness and promoting mutual learning between civilizations, and advocating solidarity and improving global governance.

In conclusion, the milestones of the 35th anniversary of dialogue relations and the fifth anniversary of the comprehensive strategic partnership signal a new era of maturity and depth in ASEAN-China relations. The future prospects of ASEAN-China relations look quite promising as we have witnessed the resounding multitude of practical cooperation between ASEAN and China over the past 35 years.

For ASEAN, China is one of the most influential partners, as well as one of the most influential economic powers for Southeast Asia. For China, ASEAN is not only the largest trading partner and a major source of AI application scenarios and potential green energy market, but also a sturdy partner that can jointly uphold the rules-based regional architecture in which China and ASEAN can jointly inject vitality, despite the increased geopolitical rivalries among the great powers and the challenging external environment.

Both sides have been consistently stepping up their existing excellent relations through increased economic integration through trade and upgrading their ACFTA, as well as strengthening regional stability amid a complex global landscape. With increased cooperation in emerging green energy sectors and AI, ASEAN and China can bring mutual benefits to both sides and to the wider world.

Pou Sothirak is a former minister of industry, mines and energy of Cambodia and a distinguished senior advisor to the Cambodian Center for Regional Studies. LIU HONGKUI

Bytes into growth

Open cooperation in digital trade has emerged as a new breakthrough for promoting economic integration and shared prosperity in the Asia-Pacific region

In recent years, the deep integration of digital technology and international trade has accelerated the growth of digital trade, which has emerged as a new engine for global trade and economic growth. According to the 2025 Report on the Development of Global Digital Trade, jointly compiled by the United Nations International Trade Center and the organizing committee of the Global Digital Trade Expo, the scale of global digital trade exports increased from $4.59 trillion to $7.23 trillion between 2020 and 2024, with an average annual growth rate of 12.1 percent, surpassing the global trade growth rate of 9.7 percent during the same period. The Asia-Pacific region, with its vast market size, diverse industrial structure and close economic ties, has become a frontier for digital trade innovation.

China's digital trade development has also accelerated in recent years. According to the Ministry of Commerce's report on China's development of digital trade 2025, the country's trade in digitally deliverable services exceeded $406.72 billion, a 5.4 percent increase from the previous year, while cross-border e-commerce trade reached 2.71 trillion yuan ($403 billion), a 14 percent increase, both setting new records. China's digital trade development not only contributes to its own high-quality trade growth but also injects new momentum into the collaborative development and shared prosperity of the Asia-Pacific region through spillover effects.

The Asia-Pacific region has developed a multilayered, broad-coverage and differentiated digital trade cooperation system, combining institutional foundations and market advantages to strengthen the basis for regional digital economic and trade cooperation. Various regional and bilateral trade agreements continue to improve digital economic and trade rules. For instance, the Regional Comprehensive Economic Partnership, the world's largest free trade agreement by population and economic size, includes a dedicated e-commerce chapter with systematic and flexible arrangements for e-commerce, electronic authentication and online consumer protection, providing institutional guarantees for Asia-Pacific digital trade development.

Additionally, the Asia-Pacific Economic Cooperation mechanism continues to advance regional digital connectivity, while the Digital Economy Partnership Agreement focuses on high-standard digital economic and trade rules, offering important prerequisites for cooperation in the Asia-Pacific digital sector.

The digital economies of Asia-Pacific countries are highly complementary, creating significant opportunities for coordinated development. For example, China has advantages in digital technology, the platform economy and digital industries, while the digital economies of the ASEAN members are rapidly emerging, with market demand continuously expanding. This creates broad space for industrial division of labor in digital products, services and technologies within the region. However, it is important to note that the digital economic development in the Asia-Pacific region remains uneven, with some economies lagging behind in digital infrastructure and digital transformation capabilities, widening the digital divide. Fragmented rules and inconsistent standards also hinder regional digital trade integration, necessitating a consensus on cooperation to address development challenges collectively.

China can share the benefits of its consumption upgrade by opening its vast market. As the world's largest online retail market for 13 consecutive years, China's online retail sales reached 15.97 trillion yuan in 2025. Through mature cross-border e-commerce platforms and digital services trade systems, goods, professional services and high-quality digital content from other Asia-Pacific economies can enter the Chinese market at lower cost and with high efficiency, sharing the benefits of China's market openness.

SONG CHEN / CHINA DAILY

China has enhanced regional supply chain resilience through industrial chain cooperation. The widespread application of digital technology significantly reduces the organization and coordination costs of regional industrial chains, fostering new digital trade formats and industry chain divisions. In 2025, China's offshore service outsourcing execution volume with other RCEP member countries reached 321.1 billion yuan, accounting for 27.5 percent of the national total. Chinese digital platforms leverage their resource integration advantages to link numerous small- and medium-sized enterprises in the Asia-Pacific region, promoting deep integration and coordinated linkage of the digital industrial chain, effectively enhancing the stability and competitiveness of regional industry chains.

China can help narrow the regional digital development gap through inclusive growth. Digital trade significantly lowers the barriers to international trade participation, enabling more developing economies and small and micro enterprises to engage in international trade and integrate into global value chains through China's digital trade platforms. This inclusiveness helps address regional development imbalances and promotes inclusive and sustainable development.

China facilitated regional trade connectivity through digital infrastructure. Leveraging the Digital Silk Road, China continues to promote open cooperation in digital infrastructure and technology services, aiming to unblock bottlenecks in the Asia-Pacific region. It is also promoting mutual recognition of cross-border electronic signatures and the establishment of cross-border settlement service platforms, strengthening the foundation for Asia-Pacific digital trade connectivity.

Looking ahead, the potential of China's digital trade development will be increasingly unleashed. The key lies in how to better leverage this positive factor to foster shared prosperity in the Asia-Pacific region.

First, openness in the digital sector needs to be deepened and the institutional foundation for regional cooperation strengthened. By actively aligning with international high-standard digital economic and trade rules and deepening openness in the digital sector, the momentum for China's digital trade innovation and development will be more robust, and its contribution to regional shared prosperity will be greater. It is essential that China fully utilizes the open platform roles of free trade pilot zones, national digital service export bases and national digital trade demonstration zones to explore new models of digital trade development and promote stable development of Asia-Pacific digital trade cooperation.

Second, joint construction of digital infrastructure should be promoted to narrow the regional digital divide. China and other Asia-Pacific countries should actively explore new cooperation models in areas such as 5G base stations, big data centers and smart ports. The focus should be on carrying out digital technology training, talent exchanges and technology transfer assistance to build an inclusive, interconnected regional digital infrastructure system. This will help address the digital shortcomings of less developed countries.

Third, the areas of digital cooperation should be expanded to unlock shared development dividends. China and other Asia-Pacific countries should actively expand their cooperation in offshore service outsourcing, digital content trade, telemedicine, online education and other fields. China should promote the improvement of supporting service systems such as cross-border logistics, overseas warehouses and cross-border payments, helping small and micro enterprises and more people in this region benefit from regional digital trade.

Fourth, it is crucial for China to use multilateral regional cooperation platforms such as RCEP and APEC to actively promote dialogue and consultation on digital-trade rules among Asia-Pacific economies, build regional consensus and continuously reduce barriers in order to promote a more open, inclusive, balanced and win-win Asia-Pacific digital trade governance system.

China voices opposition to potential tariff

Nation reserves the right to take all necessary measures, ministry says

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China has voiced firm opposition to a potential move by the United States to impose an additional 7.5 percent tariff on Chinese goods, and said it would keep a close eye on any follow-up steps Washington makes while reserving the right to take all necessary measures, the Ministry of Commerce said on Thursday.

Successive rounds of tariff hikes have done little to revive US manufacturing or narrow trade imbalances with its major trading partners, officials and analysts said, urging Washington to lower trade barriers and pursue mutually beneficial economic cooperation.

Their remarks came as Washington was reportedly weighing an additional 7.5 percent tariff on Chinese goods under a Section 301 probe launched in March into alleged "structural excess capacity and production in manufacturing sectors" across 16 economies, including China.

"The investigations politicize economic and trade issues and represent a typical act of unilateralism and protectionism," Huang Ling, spokeswoman for the Ministry of Commerce, said at a news conference on Thursday in Beijing.

The ministry last month released a document on the so-called "overcapacity" issue, calling for a comprehensive, objective and fair approach to capacity concerns and for differences to be addressed through open and mutually beneficial cooperation.

The US was "set to impose" the levy, which would bring the additional tariffs introduced during US President Donald Trump's second term back to around 20 percent, Bloomberg reported on Monday, citing people familiar with the matter.

The final rate has yet to be settled. One option under discussion is to announce a higher tariff but suspend part of it, bringing the effective rate down to 7.5 percent, the report said.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the additional tariff, if imposed, would do more harm than good to efforts to revive US manufacturing, as it would raise trade costs and erode efficiency gains from global specialization.

Similar concerns were raised in an analysis released earlier this month by the Center for Strategic and International Studies, a Washington-based think tank.

Examining potential tariffs stemming from the Section 301 probe into alleged manufacturing overcapacity, it said Washington's high-tariff strategy had yet to deliver the promised gains. "None of these benefits has yet been realized," the analysis stated.

While the US trade deficit with China had narrowed, deficits with other trading partners have widened, leaving the country with "no reduction in its overall trade deficit", according to the analysis.

High tariffs have "contributed to growing prices and uncertainty", the analysis stated, citing a Yale Budget Lab estimate that they would cost each American household roughly $1,100 per year.

Zhou said a lasting revival of US manufacturing would require openness and cooperation rather than confrontation and economic coercion. "Otherwise, any recovery would be difficult to sustain," he said.

Cui Fan, a professor of international trade at the University of International Business and Economics in Beijing, echoed that view.

"Shifting blame onto China will do nothing to solve the problem," he said, adding that China remains willing to deepen industrial and supply chain cooperation in manufacturing with countries around the world.

State Grid unveils plan to add 200 GW of wind, solar capacity annually

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

State Grid Corp of China aims to lift the share of renewable power generation across its operating footprint to over 30 percent by 2030, committing to meet all incremental electricity demand with clean energy under a comprehensive decarbonization blueprint unveiled for the 15th Five-Year Plan period (2026-30).

To deliver on its targets, the world's largest power utility plans to connect an average of 200 gigawatts of new wind and solar capacity annually through the end of the decade.

The company has pledged to guarantee the seamless grid connection of mega renewable bases in desert and Gobi regions, alongside offshore wind and distributed energy projects.

State Grid's ambitious targets are designed to keep pace with China's broader, world-leading renewable energy rollout.

According to the latest data from the National Energy Administration, the country's cumulative installed power generation capacity reached 4.08 billion kilowatts by end-July, representing a robust 11 percent year-on-year rise, with the rapid expansion of renewable energy to continuously headline the sector's growth.

Solar power capacity grew 16.1 percent to 1.29 billion kW, while wind power capacity surged 19.5 percent to 690 million kW, it said.

As this green footprint rapidly expands, the pressure on the grid to safely integrate and absorb intermittent power has never been higher.

To manage the inherent intermittency of these green power sources, the grid operator is significantly ramping up system flexibility. State Grid aims to have over 120 GW of pumped-hydro power storage in operation or under construction by 2030, while an additional 140 GW of new energy storage capacity will be integrated into its network during the 2026-30 period.

Concurrently, the utility will support the low-carbon and flexibility retrofitting of traditional coal-fired power plants. By lowering their average minimum output to 35 percent of rated load, the grid will free up critical peak-shaving capacity to accommodate more renewables.

Optimally allocating this surging clean energy requires massive physical investments. State Grid will accelerate the construction of ultra-high voltage transmission corridors, planning to commission 15 new cross-regional direct current lines by 2030. This build-out will elevate cross-provincial transmission capacity to an unprecedented 500 GW.

According to the NEA, grid infrastructure investments are rapidly accelerating this year.

National grid investment reached 302.7 billion yuan ($45.04 billion) in the first half of this year, up 4.0 percent year-on-year. State Grid completed over 310 billion yuan in fixed-asset investment, facilitating 3.48 trillion kilowatt-hours of marketized electricity trading and providing critical support for cross-regional power sharing and new energy consumption, it said.

At the local level, the utility is overhauling its distribution networks to absorb more than 60 GW of distributed clean power annually. By deploying agile virtual power plants and rural microgrids, State Grid aims to maximize on-site power consumption and sharpen real-time demand response.

Industry experts point out that this massive grid overhaul is necessary because greening the grid goes far beyond just building more solar panels.

"High-quality development and absorption of renewable energy is not solely an issue for power generators and grid operators; it is a systemic engineering feat that involves multiple sectors including power, heating, industry, transportation and construction," said Chen Guoping, vice-chairman of the China Energy Research Society. "Currently, the spatial and temporal mismatch between renewable energy output and load demand is the primary contradiction in its development."

APEC eyes need for standards to cover AI

By **ZHANG XIAOMIN** in Dalian, Liaoning and **LI JIAYING** in Beijing

Representatives from the Asia-Pacific Economic Cooperation Sub-Committee on Standards and Conformance recently gathered in Dalian, Liaoning province, for in-depth discussions on issues including harmonizing standards and disseminating good regulatory practices that support the responsible use of artificial intelligence and the broader deployment of clean energy.

"The two issues that China has raised this year are important. They're a new type of matter that we need to take into serious consideration and keep going in that direction," said Byung Goo Kang, vice-chair of the APEC SCSC.

There will be a new type of regulation on AI, he said. Economies need to exchange information on standards or conformity assessment related to AI, as well as products or compliance embedded in AI.

The SCSC held its second plenary meeting of 2026 on Aug 21-22 in Dalian, as a key component of the Third APEC Senior Officials' Meeting (SOM3) this year. More than 70 delegates attended the event, representing APEC member economies, regional partnership bodies and international standardization organizations.

They exchanged views on the year's key work priorities, consolidating the foundation for standards-related cooperation in SOM3.

"It's important to build trust among the economies," said Kang.

He pointed out that mutual recognition looks very good, but in practice there are many barriers to accepting or recognizing each other's testing reports or certifications.

"We hope that with standards or conformity assessment there shouldn't be any barriers, so we are sharing information and trying to build a better regulatory system or better standards to help our industry," he said.

During the two-day session, participants reviewed annual reports from regional partnership bodies and discussed ongoing SCSC projects and new proposals.

Under the SOM3 framework, China organized a series of high-level thematic seminars focusing on areas of shared interest among APEC economies, including the silver economy, cross-border e-commerce, road transport and voluntary sustainability standards.

Bilateral and multilateral consultations were held to align project proposals and promote joint endorsement, advancing regional harmonization of standards and mutual recognition of conformity assessment.

Delegates reaffirmed that standards and conformity assessment serve as "intangible infrastructure" for trade and investment facilitation in the Asia-Pacific region.

Through regulatory alignment, technical standard coordination and mutual recognition of assessment results, barriers to cross-border compliance can be effectively reduced, unlocking the region's growth potential.

"The APEC region is a great market. We have to deal with making technical barriers in this market less and less," said Anton Shalaev, head of Russia's Federal Agency on Technical Regulating and Metrology, adding that the SCSC can be a very good tool through which the economies can exchange their views on how to reduce these technical barriers.

For emerging technologies such as the bioeconomy and AI, he said that economies need very unified rules and special terms in conformity assessment, as well as measures to eliminate trade and technological barriers.

Data from the State Administration for Market Regulation showed that during the 14th Five-Year Plan period (2021-25), China implemented 14 cooperative projects under the SCSC, covering the digital economy, green transition, the silver economy and food safety.

Briefly

Meitu sees robust revenue growth in H1

Chinese selfie-enhancing internet company Meitu said its revenue in the first half had increased by 22.1 percent year-on-year to 2.21 billion yuan ($326 million). During this period, Meitu recorded an adjusted net profit attributable to the parent company of 650 million yuan, up 39.5 percent year-on-year. The company said the core photo, video and design products business segment saw revenue reach 1.77 billion yuan in the first half of the year, marking a year-on-year increase of 30.9 percent and accounting for 80 percent of total revenue.

200 key standards made for AI sector

China has so far formulated nearly 200 key standards for artificial intelligence to steer the sector toward sound and orderly development. AI has now been largely integrated across the entire chain in China, including research and development, design, production, manufacturing, quality inspection, as well as operations and maintenance, said the Ministry of Industry and Information Technology.

XINHUA - CHINA DAILY

UBS sees broader RMB funding role

By **ZHOU LANXU**
zhoulanxv@chinadaily.com.cn

UBS's inaugural panda bond — the first issued by a Swiss financial institution — highlights the renminbi's growing role as a funding currency for international institutions and UBS's commitment to China, as financial opening-up and technology-driven growth create new opportunities, a senior executive said.

The Swiss banking group has priced the 2 billion yuan ($297 million), five-year bond at a coupon rate of 1.78 percent, the lowest on record for a five-year panda bond issued by a foreign financial institution, UBS said.

Panda bonds are yuan-denominated bonds issued in the Chinese mainland by overseas institutions.

Janice Hu, China country head of UBS and chairperson of UBS Securities, said China's bond market has become increasingly connected internationally, while its growing maturity and relevance have made it a natural funding market for international institutions.

"We see the onshore RMB market as an important component of UBS's diversified funding toolkit," Hu said in an exclusive interview with China Daily, adding that panda bonds and RMB financing can play an increasingly meaningful role as international institutions diversify their funding amid heightened global financial volatility.

Tourists seen in front of a UBS bank in Switzerland. IMAGO

China will further improve policy arrangements for panda bonds to facilitate more issuances and trading by overseas institutions, the People's Bank of China, the country's central bank, told China Daily earlier.

The bond issuance comes amid a broader expansion of UBS's presence in China. The group increased its stake in UBS Securities from 67 percent to full ownership in April 2025 and raised the unit's registered capital from 1.49 billion yuan to 2.21 billion yuan in December.

UBS Futures, meanwhile, raised its registered capital from 540 million yuan to 640 million yuan in February and then to 740 million yuan in April.

"These are not isolated capital deployments. They are part of one overarching vision — to build a stronger, more integrated and more competitive UBS platform in China for the long term," Hu said, adding that the additional capital supports investment in the group's platform, technology, talent and risk-management capabilities. China is one of UBS's most important strategic markets, where the group aims to reinforce its investment-banking position while expanding its wealth and asset management businesses.

A key opportunity for foreign financial institutions such as UBS is the listing wave among Chinese artificial intelligence and technology companies, Hu said, and such financing needs are gradually extending from IPOs to more sophisticated financing and cross-border mergers and acquisitions.

Since the start of 2025 until now, UBS Global Banking has helped clients complete about 80 transactions in the Chinese mainland and Hong Kong, raising more than $50 billion, according to the group.

Hu said participation by foreign investors in Chinese tech IPOs has been increasing, with active involvement from sovereign wealth funds, global long-only asset managers and specialist technology funds.

One reason for that interest is scarcity, she said, explaining that such listed Chinese companies offer foreign investors scarce exposure across the AI value chain, spanning large language models, robotics, data infrastructure, semiconductors and sensors, with a distinctive cost-performance advantage.

Hu also expressed a constructive medium-term view on Chinese equities despite recent volatility, as UBS's chief investment office continues to rate Chinese equities as "attractive", with net northbound flows from stock connects into A shares turning positive at $33 billion in the second quarter.

Further opening-up of China's futures market could also create more opportunities for UBS Futures, Hu said, particularly as international investors seek broader market access and more sophisticated risk-management tools.

China's NEV pioneer looks to the future

Nation strives for global role as collaborator, trailblazer and leader

A customer checks out a new energy vehicle at a dealership in Qingdao, Shandong province, on Aug 5.
ZHANG YING / FOR CHINA DAILY

A robot performs welding operations at an auto manufacturing workshop in Qingdao on Aug 18.
LIANG XIAOPENG / FOR CHINA DAILY

BEIJING — In Wan Gang's Beijing office, three objects present a compact history of China's rise in electric vehicles.

One is a kerosene lamp, a reminder of his youth spent in rural Jilin province, where he often read by its light.

Another is the Nicolaus August Otto Award, presented to him in 2023 by German engine maker Deutz in recognition of his pioneering work, including contributions to EVs and hydrogen technology. The prize is named after the inventor of the four-stroke engine.

The third is a transparent bottle holding a miniature scene of Christopher Columbus' voyage — a symbol, he told Xinhua, of exploring an unfamiliar frontier.

Wan, 74, is honorary president of the China Association for Science and Technology and former minister of science and technology. He was chief scientist of the major EV project under the National High-tech R&D Program, or the 863 Program, a national initiative launched in 1986 to advance China's capabilities in strategic high-tech fields.

In a wide-ranging interview with Xinhua News Agency, Wan looked back at why China chose the EV path and set out his views on what comes next — from competition at home and new battery technologies to the overseas development of Chinese automakers.

The interview comes as China's auto transition reaches another milestone. New energy vehicles — China's official category covering pure EVs, plug-in hybrid EVs and fuel-cell vehicles — accounted for 60.4 percent of all new vehicle sales in July. NEV sales reached 9.007 million in the first seven months of 2026, up 9.6 percent year-on-year.

Globally, China produced nearly three-quarters of the world's electric cars in 2025, according to the International Energy Agency. BloombergNEF estimated that China accounted for 63 percent of electric cars sold worldwide that year.

Wan's assessment is measured: China has reached the global forefront in NEVs, he said, but "there is still much to do".

Wan traced China's EV strategy to three practical concerns at the turn of the century: rising dependence on imported oil as car ownership grew, worsening air pollution and the risk that Chinese manufacturers would remain dependent on foreign core technologies if they continued to follow the established internal-combustion route.

EV and hybrid technologies were still in their early stages globally, leaving more room for competition. China also chose a diversified approach rather than relying on a single technology.

The 863 Program's EV project pursued pure electric, hybrid and fuel-cell vehicles in parallel, while also supporting research on batteries, motors and electronic controls.

That strategy was followed by years of research, demonstration projects, infrastructure development and market building.

As purchase subsidies were gradually phased out, the industry entered fully market-oriented competition.

The economics have changed markedly. The IEA estimates that, even before government incentives, nearly 70 percent of battery-electric cars sold in China in 2025 were cheaper than their internal-combustion equivalents.

China also accounted for more than 80 percent of global battery-cell production, while battery-pack prices were around 30 percent lower than in North America and 35 percent lower than in Europe.

Recent 2026 analyses pointed to several drivers behind that cost advantage.

McKinsey said some Chinese companies have achieved battery-pack cost advantages of 25 to 40 percent through simplified architectures, lower-cost chemistries such as LFP and component optimization. CSIS highlights how private firms and technology-focused entrants have intensified competition and experimentation in manufacturing, software, battery management and autonomy.

This influence is spreading beyond China.

BloombergNEF said EV demand in emerging markets, including Southeast Asia and Latin America, is growing rapidly. In Thailand, EVs accounted for 27 percent of new car sales in 2025, with Chinese brands making up 88 percent of EVs sold.

China's EV deployment is also reducing oil use. The IEA estimates that the global EV fleet displaced about 1.7 million barrels of oil demand a day in 2025, with China accounting for roughly 1 million barrels a day.

China's role in the global EV transition is therefore no longer only about production volumes. Its scale has helped expand the supply of affordable EVs and lower some of the cost barriers to electrification.

Rapid growth has also brought new challenges.

Wan pointed to anxiety as one factor behind the "involution-style" competition in China's auto industry.

The sales of all automobiles in China expanded from about 26 million units in 2021 to 34 million units in 2025, with NEVs contributing a big portion of the growth. Companies rushed toward a fast-growing market, while traditional automakers had to maintain conventional vehicle businesses and compete in NEVs at the same time. Wan said this anxiety sometimes has escalated into irrational competition.

His prescription is practical: know the customer, focus on clearer market segments and improve after-sales service.

What automakers learn from existing owners, he argued, should feed directly into the next generation of products.

The need for that shift is becoming clearer. The profit margin of China's vehicle manufacturing sector fell to 1.5 percent in the first five months of 2026.

> "Pure EVs are a long-term solution, but plug-in hybrid EVs, including extended-range models, will retain a substantial role."
>
> **Wan Gang,** honorary president of the China Association for Science and Technology and former minister of science and technology

The authorities have also stepped up efforts to regulate disorderly price competition and encourage companies to compete more through quality, technology and value.

Wan also rejects the characterization that China simply has too much auto capacity.

He pointed to vehicle ownership of a little over 260 cars per 1,000 people — far below levels in major developed markets — and to room for demand to grow at home and overseas.

More recent data provide additional context. China's NEV exports reached 2.909 million in the first seven months of 2026, up 120 percent year-on-year, according to official industry data.

BloombergNEF expected 23.3 million passenger EVs to be sold globally in 2026, an 11 percent increase from 2025.

For an industry that serves both domestic and international markets, production numbers alone don't tell the whole story.

Wan emphasized that the next phase of growth should focus on better products, clearer market positioning and stronger service rather than simply increasing volume.

Wan is equally direct about the next stage overseas.

Chinese automakers, he said, should establish local production bases to better navigate trade barriers and build the after-sales, marketing and training systems needed for long-term operations.

He pointed out that overseas service networks remain an area where Chinese brands have room for improvement.

The direction is already visible. Trade barriers and industrial policies are pushing more Chinese automakers toward local production in overseas markets.

The shift is increasingly visible in Southeast Asia, with Thailand and Indonesia among the markets building deeper local EV manufacturing capabilities.

For Wan, overseas production and service are part of the same task: Chinese automakers need to understand local customers and build stronger local capabilities rather than rely only on vehicle exports.

The technology roadmap also remains open.

Wan said: "Pure EVs are a long-term solution, but plug-in hybrid EVs, including extended-range models, will retain a substantial role. Pure EVs could eventually account for about 65 to 70 percent of the combined market for the two technologies, with plug-in hybrids taking about 30 to 35 percent."

On solid-state batteries, Wan is cautious about dramatic claims on range and charging speed. The key questions, he said, are whether difficult materials and engineering problems can be solved and whether the technology makes economic sense. He expects large-scale industrialization around 2030.

That timetable is broadly consistent with recent industry assessments.

McKinsey said commercial-scale production of all-solid-state batteries is unlikely until after 2030, with manufacturing hurdles around interfaces, yields, performance, longevity and cost still to be overcome.

Wan also sees hydrogen fuel cells playing a role in commercial vehicles and intelligent connected vehicles as another important direction for the industry.

Twenty-five years after China's major EV project began, the basic question is no longer whether China can build a globally competitive EV industry.

The next challenge, as Wan described it, is to improve quality and services, foster healthier competition, advance new technologies and build stronger businesses overseas.

He summed up the role he hopes China's NEV industry will play globally in three words: collaborator, pioneer and leader.

China should encourage its automakers to expand overseas while continuing to welcome foreign companies to invest and innovate in the Chinese market, he said.

The miniature ship in Wan's office remains a fitting symbol. China's EV industry is no longer exploring an empty field. It is navigating a larger global market — with more opportunities still ahead.

More EV charging facilities added as sector booms

BEIJING — China's electric vehicle charging infrastructure has continued to expand swiftly, with the total number of charging points reaching 23.68 million by the end of July 2026, up 41.9 percent year-on-year, the National Energy Administration said on Monday.

Of this total, public charging facilities numbered 5.099 million, an increase of 21.3 percent from a year earlier.

Private charging facilities totaled 18.58 million units by the end of last month, surging 48.8 percent year-on-year.

The data, sourced from the national charging infrastructure monitoring and service platform, highlight the continued expansion of China's EV support network alongside a surge in EV sales.

41.9 percent
year-on-year growth of total charging points by end July

26.8 percent
year-on-year growth of NEV output in July

China's new energy vehicle sales in July 2026 accounted for more than 60 percent of monthly new car sales for the first time, industry data showed earlier this month.

In July alone, NEV output and sales reached over 1.57 million and 1.56 million units, respectively, up 26.8 percent and 23.7 percent year-on-year, according to data from the China Association of Automobile Manufacturers.

As NEV sales continue to soar, China has been accelerating the improvement of its charging network to keep pace with growing demand.

In October, China unveiled a three-year action plan to improve the country's EV charging infrastructure, aiming to establish a nationwide network of 28 million charging facilities, with public charging capacity surpassing 300 million kilowatts by the end of 2027.

China aims to increase the share of NEVs in its total vehicle fleet to 30 percent by 2030, according to an action plan for carbon peaking during the 15th Five-Year Plan period (2026-30).

Birthday centenary

Community workers and villagers hold a birthday party to celebrate Xi Meiqiu's (center, wearing a birthday hat) 100th birthday at a relocation center due to Typhoon Saudel in Wulian new village, Wenling, Zhejiang province, on Thursday. According to the National Meteorological Center, Typhoon Saudel is expected to make landfall between Zhejiang's Sanmen and Fujian's Xiapu early on Friday, bringing heavy rainfall to multiple provinces. Residents affected by the typhoon have been relocated to safety shelters. SUN JINBIAO / FOR CHINA DAILY

High-altitude glacier collapse in Nepal triggered mudslide

Disaster highlights impact of climate change on Qinghai-Tibet Plateau

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

The deadly mudslide that swept through a major China-Nepal border crossing was triggered by a high-altitude glacier collapse in Nepal, China's Ministry of Natural Resources said on Thursday, highlighting the growing risks posed by unstable mountain environments as the climate warms.

The disaster occurred on Wednesday morning on the Nepal side of the border, sending a torrent of ice, rocks and debris toward Gyirong Port in Gyirong county, a major land crossing linking China and Nepal in Shigatse, Xizang autonomous region.

The disaster caused heavy casualties and left hundreds missing in China and Nepal.

According to the ministry, the disaster began with a high-altitude glacier collapse in Nepal. The falling ice and rock traveled rapidly down a mountain slope, scouring loose glacial debris along its path and developing into a debris flow before entering the Gyirong Zangbo River and becoming a mudslide.

The flow then struck facilities at Gyirong Port before continuing downstream toward Nepal, said Guo Zhaocheng, director of the geological disaster investigation and monitoring center at the China Aero Geophysical Survey and Remote Sensing Center for Natural Resources.

The debris flow generated by the glacier collapse traveled at about 50 meters per second. The extreme speed left people little time to react and allowed the flow to affect an area more than 20 kilometers from its source, contributing to the heavy losses, the ministry said.

> "Global warming is driving changes in glaciers, permafrost and snowfall that can increase the frequency and complexity of high-altitude disasters."
>
> **Du Jun,** director of the climate center of the Xizang regional meteorological bureau

The combination of ice, water, loose rock and steep slopes can make high-altitude disasters particularly fast-moving and difficult to predict, experts said.

"If an ice-rock avalanche can be detected upstream, it is theoretically possible to provide downstream communities with about 20 minutes of warning," said Kang Shichang, director of the Institute of Mountain Hazards and Environment at the Chinese Academy of Sciences in Chengdu, Sichuan province.

But the disaster occurred in a remote Himalayan area characterized by deep valleys and high mountains, where monitoring infrastructure is limited. The floodwater also reached the border rapidly, further shortening the available warning time, Kang said.

The disaster highlights a concern that climate change is reshaping the hazards of the Qinghai-Tibet Plateau and surrounding mountains.

Du Jun, director of the climate center of the Xizang regional meteorological bureau, said global warming is driving changes in glaciers, permafrost and snowfall that can increase the frequency and complexity of high-altitude disasters.

Glacier retreat can expand glacial lakes and increase the volume of water they hold, raising the risk of glacial lake outburst floods. "It also exposes more loose glacial debris, increasing the amount of material available to mudslides, while greater meltwater can strengthen erosion and the capacity of rivers to transport debris," Du told China Daily.

At the same time, permafrost degradation weakens slopes and foundations, and changes in groundwater and runoff can intensify erosion.

In southern Xizang, the number of snow-cover days has declined significantly since 1981, falling by an average of 12.36 days every decade, according to Du.

A shorter snow-cover season can alter the timing and intensity of spring snowmelt, while reducing the buffering effect of snow cover and increasing erosion, he said.

Multiple changes can overlap in both time and space, with glacier melt, permafrost degradation and heavy runoff interacting across different elevations. "The result is a shift in highland disasters from isolated events toward more frequent, cascading and interconnected disasters," Du said.

The Qinghai-Tibet Plateau has already experienced rapid warming and wetting. From 1961 to 2022, average temperatures across the plateau rose by about 0.37 C per decade, faster than the global and national averages, while average precipitation increased by 9.4 millimeters per decade. Satellite observations show that the plateau's glacier area shrank by about 18 percent from 1985 to 2020, from roughly 83,000 to 68,000 square kilometers, according to the China Meteorological Administration.

Zhang Xingying, a member of the 14th National Committee of the Chinese People's Political Consultative Conference and an official with the China Meteorological Administration, warned during China's annual two sessions in 2025 that glacier surges, ice avalanches and glacial lake outburst floods could become more frequent as glaciers melt.

"The risks of glacier-related mudslides, major disasters and catastrophes could also increase," he said.

Zhang has called for a monitoring system integrating ground, air and satellite observations across the plateau and surrounding areas, as well as stronger research into glacier-related disaster mechanisms and improved forecasting and risk assessment.

Li Menghan contributed to this story.

Conservation efforts revamp Zoige Wetland into thriving ecosystem

CHENGDU — On a monitor in his office, Sonam Dorchi watched a family of black-necked cranes move slowly through the shallow waters of Zoige Wetland.

The chick had grown tall, much of its down already gone. In another two or three months, it would learn to fly and follow the flock south for winter.

Nineteen years ago, Sonam Dorchi would have had to walk or ride for a long time across marshland to see the same scene.

Sonam Dorchi, an ethnic Tibetan, joined the administration of the Zoige Wetland National Nature Reserve in Southwest China's Sichuan province in 2007 after working as an elementary school teacher. A fresh hand in wildlife conservation, he began by following experts into the fields, studying plant samples by day and comparing them with illustrated guides at night.

He rode along the edges of marshes, marking wetlands and nesting sites on hand-drawn maps. Years of fieldwork eventually made him so familiar with the reserve that colleagues came to regard him as a "living map".

In 2019, monitoring cameras were installed. When black-necked cranes return to nest in April, Sonam Dorchi no longer has to head into the field every day. Once a nesting site is spotted, he alerts local herders hired as rangers, asking them to keep people and livestock away.

Yet technology has not replaced fieldwork.

Every June, Sonam Dorchi and two younger colleagues spend five days surveying 90 sites along four routes, crouching in the grass to count adult cranes and chicks and check which nests have produced twins.

The reserve covers more than 166,000 hectares, too vast for the administration's several dozen staff members to patrol on their own. Around 200 local herders now serve as rangers across 28 administrative villages, generally two or three in each village, though some have more.

Reserve officials say years of conservation outreach have helped local residents recognize the importance of protecting the grasslands they call home, while the ranger program provides an additional source of income.

Gu Haijun, a nature reserve protection official with the Sichuan provincial forestry and grassland administration, described the black-necked crane as a living indicator of wetland health.

The species has exacting habitat requirements, he said. A decline in its population could signal degradation of the grasslands on which local residents depend, while a stable or growing population indicates that the grasslands and wetlands remain healthy.

Over the years, the number of nationally protected first-class species in the reserve has risen from nine to 18, while the number of second-class species has increased from 25 to 52. The black-necked crane has also been reclassified from "endangered" to "near threatened".

Asked whether he was disappointed by the change, Sonam Dorchi laughed.

"I'm glad," he said. "It means our work has not been in vain."

His work is increasingly about passing on what he has learned. He taught one of his two younger colleagues to identify waterbirds, telling him that to record changes in the wetland, he first had to know what was in the frame. The apprentice can now identify most of the reserve's waterbirds, and his social media account is filled with images of wetland wildlife.

Another colleague, the daughter of a local herder, has become so familiar with the terrain that visiting researchers often specifically ask her to guide them during field surveys.

The lessons have reached home, too. Sonam Dorchi's younger son accompanied him into the field as a child, collected fallen crane feathers and learned to draw the birds before starting school. In third grade, he gave his classmates a presentation on Zoige wildlife using photographs taken by his dad.

Each November, the black-necked cranes leave Zoige. Around the same time, whooper swans arrive from Siberia to spend the winter.

"The cranes leave, and the swans come," Sonam Dorchi said. "It is like a changing of the guard."

After 19 years, he too is beginning to pass the torch and leave the watch to others.

Resection extends survival in liver cancer patients

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

A pioneering Chinese study has established that surgical resection can offer additional survival benefit in patients with advanced-stage liver cancer who respond to systemic therapy.

The study, published on Saturday in the journal The Lancet, focused on addressing the question of whether patients with advanced-stage liver cancer, or hepatocellular carcinoma, should undergo surgical resection after systemic therapy or continue with the therapy.

Led by Zhongshan Hospital, affiliated with Fudan University in Shanghai, the trial involved 24 hepatobiliary tumor centers across China. With high-quality evidence supporting the procedure, the findings suggested that surgical resection — removal of part of the organ — in patients with advanced liver cancer who respond to systemic therapy can greatly extend their time to treatment failure, and may offer them the opportunity for tumor-free survival.

Liver cancer poses a serious threat to the health of many Chinese people. Most liver cancer patients are found in the intermediate or advanced stages at the time of diagnosis, having lost the opportunity for resection and curative treatment, which often results in a poor prognosis.

In recent years, with continuous advances in systemic therapies, such as immunotherapy and targeted therapies represented by the combination of atezolizumab and bevacizumab, the median survival of patients with advanced liver cancer has increased from about one year to nearly two years. But the overall therapeutic efficacy still remains unsatisfactory.

Clinically, some patients with advanced liver cancer see tumor shrinkage or tumor downstaging after systemic therapy, making them eligible for surgical resection. However, whether such patients should undergo surgery or maintain the therapy presents a difficult decision for clinicians, patients and their families.

Although surgery can remove residual drug-resistant tumor cells to offer patients the opportunity for curative treatment, patients are usually left with surgical incisions that are challenging to recover from. Additionally, systemic therapy has to be suspended before and after surgery, which may also lead to loss of tumor control. Thus, whether surgical resection is superior to continued systemic therapy requires evidence from high-level evidence-based medical studies.

To address this question, Fan Jia, an academician with the Chinese Academy of Sciences and honorary president of the hospital, led a team to start the randomized, open-label, multicenter, phase 3 trial about seven years ago.

Between April 2021 and July 2024, the team enrolled 489 treatment-naive patients with hepatocellular carcinoma, macrovascular invasion and no extrahepatic metastasis from 24 hospitals across China. They were first treated in the induction phase with systemic therapies for four cycles, and 201 of them entered the next stage.

They were later randomly assigned to two groups. Patients in the surgery group underwent surgical resection followed by one year of sequential treatment with atezolizumab and bevacizumab, while those in the other group received maintenance therapy.

After a median follow-up of over 18 months, the team found that the combination of resection and systemic therapy can significantly extend patients' time to treatment failure, with a nearly twofold increase to 20.4 months. Survival follow-up for this study is ongoing, and preliminary survival analyses indicate that survival in the surgery group also shows a trend toward superiority over the maintenance therapy group.

"The results indicate the success of our study," said Sun Huichuan, a first author of the article and professor at the hospital.

"We have rigorously demonstrated that about 40 percent of patients with advanced liver cancer can meet the criteria for surgery following systemic therapy. Patients in the surgical resection group derive greater benefits than those in the maintenance therapy group, and have the opportunity for curative surgical resection."

In a commentary on this article in the same issue, Spanish professor Alejandro Forner spoke highly of the team's work. He noted that the study suggested that resection of the tumor and its visible vascular emboli may help prevent systemic dissemination, thereby transforming temporary systemic disease control into long-term disease remission.

"Resection is agreed to be the best way to treat liver cancer. Clinical solutions for its treatment have been advancing step by step, bringing new opportunities to patients in the advanced stage.

"Despite interpatient heterogeneity, the study is expected to provide new insights into the treatment of overseas patients with advanced liver cancer. It can also inspire the treatment of other tumors such as cholangiocarcinoma, pancreatic cancer, lung cancer, gastrointestinal tumors and more," said Fan, corresponding author of the article.

Engineering China's enhanced road safety

Motorsport circuit designer draws on racing principles to refine traffic infrastructure

By LI LEI in Shanghai
lilei@chinadaily.com.cn

For decades, the rigorous safety engineering behind Formula One, the pinnacle of motorsport, has been a closely guarded secret.

However, pioneering circuit designer Yao Qiming is bringing these elite-level safety standards to China's public roads. Yao, deputy chief engineer at Tongji Architectural Design Group, has spent her 23-year career in the racing industry meticulously translating technology used on the racing circuit to China's own road network.

Her breakthroughs have not only been applied on the circuit but also for autonomous-vehicle testing and smart traffic infrastructure.

That trajectory is rooted in a childhood dream. Before Yao was born, her father survived a serious road accident that left him reliant on medication for years. She said that experience forged a lifelong ambition to mitigate conditions that lead to traffic casualties.

"All my life, I just want to do one thing right: make roads safer," she said.

Commitment to precision

Yao has long distinguished herself in motorsport engineering through an unyielding pursuit of microscopic precision — with her work centered on safely pushing race cars to their mechanical limits.

Every curve, banking angle and gradient on racing circuits is scientifically calibrated to maximize performance while mitigating catastrophic failure at high speeds. "In circuit design, there are numerous details. We must rely on scientific means to try to find the most extreme conditions and every potential accident that might occur," Yao said.

She said racing circuit design demands construction precision accurate to a single millimeter.

Such accuracy is indispensable in motor racing, where margins are exceptionally thin. The slightest irregularity in track geometry can alter vehicle dynamics, compromise driver control and pose serious safety risks.

Despite there being no universal standards or uniform protocols, racing circuit design integrates more than a dozen technical disciplines, demanding rigorous oversight and meticulous attention to detail.

Colleagues describe Yao as relentlessly precise — she enforces a strict ban on vague terms such as "maybe", "probably" and "approximately" in all technical assessments.

Dismantling barriers

Motorsport circuit design has long been a male-dominated engineering field. Yao broke into the niche sector with a mission to design world-class race circuits in China, championing domestic expertise for more than two decades in a sector long led by Western engineers.

Her career in circuit engineering began in 2003, when she joined a Shanghai municipal research institute and contributed to the design of supporting facilities for the Shanghai International Circuit, as the city prepared to host the inaugural F1 Chinese Grand Prix in September 2004.

In 2004, she was appointed chief designer for Shanghai's DTM street race, a circuit winding through the financial district around the Oriental Pearl Tower.

During research for her master's degree, Yao published some 10 academic papers on safety barriers.

That expertise helped her master strict regulations set by motorsport's governing body, the International Automobile Federation.

She revised a long-standing FIA safety barrier design, developing a new dual-purpose barrier suitable for both race circuits and urban roads while cutting material costs by a quarter — a feat that earned praise from the governing body.

Fresh off the DTM street-race success, Yao set her sights on a permanent circuit.

It just so happened that the northeastern city of Changchun in Jilin province had plans to build one. She wrote to event organizers and sports bureau officials and expressed her interest in taking on the project. The authorities gave her three months.

Yao locked herself in a 10-square-meter attic in Shanghai. She had no codes, no standards — just an uneven plot of land where the race circuit was to be developed.

She contacted a foreign design agency for assistance, but their responses were blunt: their standards were proprietary, and while they could design the circuit for her, it would come at a cost. At the time, China's circuit-design field was virtually nonexistent, and Yao recognized the country lagged behind Western nations by nearly a century in circuit design, with the latter holding far more case histories and data.

To close the gap, she resolved to pursue technological breakthroughs. "I decided right then, I'm going to do this myself," she said.

Yao, who holds a national-level computer proficiency certificate from her college days, soon realized manual calculations would not keep pace with the design demands.

Drawing on her coding skills, she built a circuit simulation system from scratch — writing programs, running computations and refining the system through countless iterations.

At a later FIA meeting in Paris, international experts unanimously endorsed her design proposal for the Changchun circuit, while expressing surprise at China's rapid advances in a field it had long trailed in.

While the Changchun circuit remains to be built, the project marked China's entry into international circuit design.

Driving innovation

In 2009, at the height of her professional career, Yao made a strategic move, taking a position as a designer at Tongji Architectural Design Group to anchor her work in deeper academic research, and simultaneously pursued a doctoral degree in road safety at Tongji University.

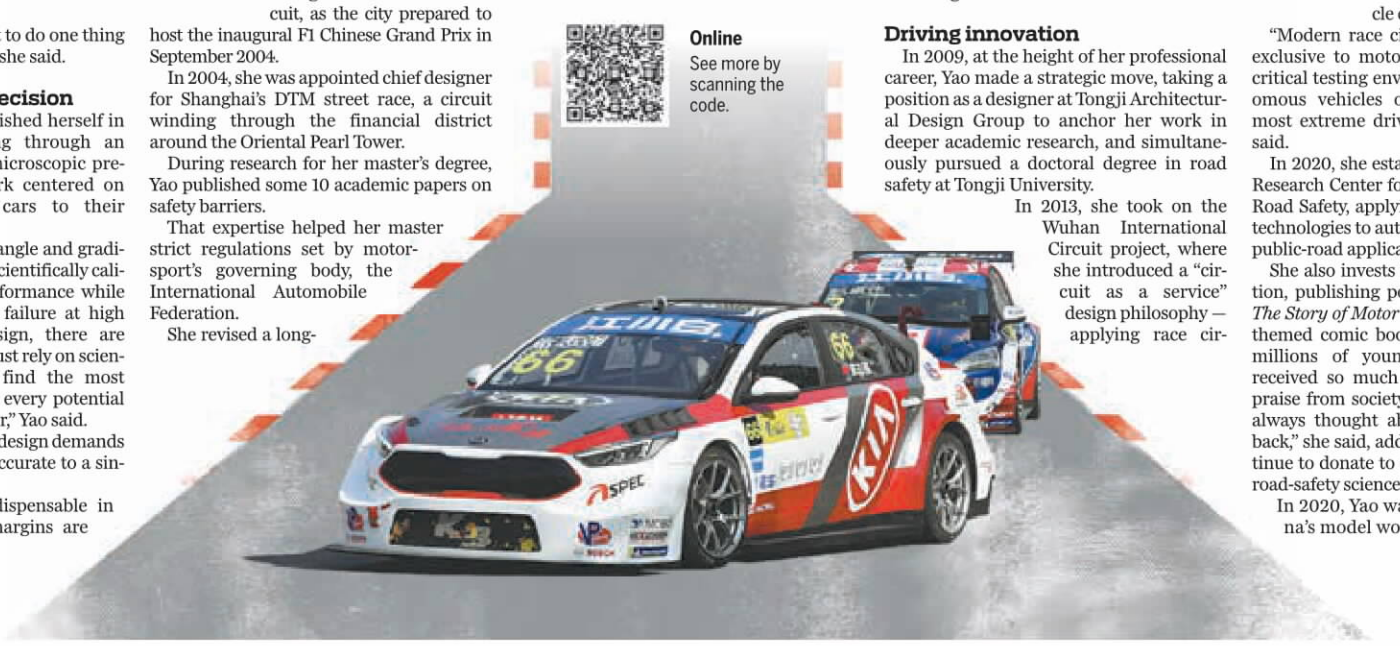
In 2013, she took on the Wuhan International Circuit project, where she introduced a "circuit as a service" design philosophy — applying race circuit-level safety principles to autonomous driving and public roads. That same year, while pregnant, she continued running simulations and refining the design right up until giving birth.

The effort translated into results in 2014, when the circuit's safety simulation data closely aligned with the FIA's parameters, drawing global recognition. The finished, butterfly-shaped circuit also became an integrated venue for both racing and autonomous-vehicle testing, helping bridge circuit technology and everyday road safety.

Over the course of her career, Yao and her team have designed more than 200 motorsport circuits and secured over 40 industry-first achievements for China and the wider motorsport sector.

In recent years, circuit engineering, however, accounts for only a third of her professional work, Yao said.

The bulk of her time is devoted to researching intelligent traffic safety and innovative mobility, repurposing racing circuits as high-standard testbeds for civilian vehicle development.



"Modern race circuits are no longer exclusive to motorsport; they provide critical testing environments for autonomous vehicles operating under the most extreme driving conditions," Yao said.

In 2020, she established the Shanghai Research Center for Smart Mobility and Road Safety, applying race circuit safety technologies to autonomous-driving and public-road applications.

She also invests time in public education, publishing popular books such as *The Story of Motor Sports* and a karting-themed comic book that have reached millions of young readers. "I have received so much encouragement and praise from society in this era, and I've always thought about how I can give back," she said, adding that she will continue to donate to efforts geared toward road-safety science popularization.

In 2020, Yao was named one of China's model workers.

LIFE

The streets of Shangxiahang in Fuzhou, Fujian province, are packed with visitors exploring its historical buildings and modern offerings.
PHOTOS PROVIDED TO CHINA DAILY

Giving old streets a fresh scent

In Shangxiahang, ancient buildings are becoming places visitors can experience instead of simply observing history, **Yang Feiyue** reports in Fuzhou.

Left: A nighttime show is a major draw in the historical neighborhood. **Right:** Folk performances are staged at major festivals to enhance travelers' experiences in Shangxiahang.

Amid the summer heat in Shangxiahang in Fuzhou, Fujian province, visitors sit beneath the eaves of an old courtyard house, sipping chilled jasmine tea and sampling pastries infused with the same floral fragrance. Some browse books, while others chat over tea or wander into nearby shops selling fragrances, handicrafts and cultural products. The scenes offer a glimpse of how historical buildings and old traditions are being woven back into everyday life in the Shangxiahang neighborhood on the north bank of the Minjiang River, once one of the city's major commercial centers.

For guide Xin Xiaoqi, the best way to understand the neighborhood is to start with the river.

More than 1,000 years ago, sediment carried by the Minjiang gradually formed sandbanks in the area. Changing tides created two routes used by boats — one farther north during high tide and another farther south as the tide receded. The routes came to be known as Shanghang and Xiahang, referring to the upper and lower waterways. The names were later carried over to the two commercial streets that developed in the area, which together gave the neighborhood its name, Shangxiahang, Xin says.

As land developed around the waterways, the area grew into a bustling commercial hub. By the Ming (1368-1644) and Qing (1644-1911) dynasties, merchants were trading goods from across Fujian and beyond.

Tea was among the commodities that passed through the district, alongside Dehua porcelain, textiles, medicinal materials, and dried foods.

One old trade was known as the *jingguo* business, dealing in dried foods and other goods exchanged between northern and southern China. Northern merchants brought grain and other staples south, while southern traders supplied dried fruit, seafood and other local products, Xin says.

The trade also drew merchants from across Fujian, whose communities left their mark through guild halls, shops and residences, she adds.

The district's recent revival has sought to preserve that commercial character while giving it new uses. Its current layout retains the logic of the historical neighborhood, with four horizontal routes connected by Longping Road along a central north-south axis.

The riverside section, along Sanjie River, has become a more relaxed leisure area, with teahouses, cafes, cultural and creative shops and evening activities. Longping Road brings together traditional Fuzhou snacks and newer food concepts. Xiahang Road focuses on intangible cultural heritage experiences, while Shanghang Road is being developed as a quieter cultural space with bookstores, exhibitions and other venues.

"The idea is to let different parts of the neighborhood offer different experiences," Xin says.

Discovering new rhythms

At Caifeng Villa, a residence built in 1920 with funding from overseas Chinese businessman Yang Hongbin, much of the original architecture remains.

The 2,500-square-meter villa is a provincial-level protected cultural relic and one of Fuzhou's best-preserved examples of a modern residence combining Chinese and Western architectural elements.

Its old window decorations, tiles and other architectural details have been retained. Rather than becoming a building that visitors can only view as a historical relic, it now houses a cafe, restaurant and bookshop.

Yang Jiayu, a staff member at the venue, says customers usually come for drinks, food and conversation, but some stay for hours.

"A customer can spend the whole afternoon here," Yang says.

Average spending is around 100 yuan ($14), while visitor numbers can reach 200 to 300 on holidays, Yang says.

The transformation of Shangxiahang is also reflected in the ways local traditions are being adapted for contemporary consumers.

At Fuzhou Teahouse, manager Zeng Xiang has witnessed the neighborhood's recent changes firsthand.

The teahouse was among the first new businesses to move into the area during the pandemic, when the streets were still relatively quiet.

"When we first arrived, there were very few people walking around, especially in winter," Zeng recalls. "Now the streets are packed, particularly on weekends and in the evenings."

The shop specializes in Fuzhou jasmine tea, but its offerings extend well beyond traditional tea leaves. Jasmine-flavored mung bean cakes, pastries, fragrances, essential oils and cultural products introduce the city's signature floral scent in different forms.

The strategy is particularly aimed at younger customers, Zeng says.

Traditional Fuzhou jasmine tea is often brewed in a *gaiwan*, a small lidded bowl used for tea preparation. But younger consumers may find more contemporary formats easier to approach.

"We have introduced cold-brewed tea and modern tea drinks to make it more attractive for younger consumers," he says.

Foreign visitors have joined in as well. Zeng recalls receiving international students who came to experience Chinese tea culture.

Their first reaction, he says, was often to the tea's fragrance.

For those visitors, the fragrance is only the beginning of the story.

At a tea experience center in the neighborhood, Yan Jinhua, an inheritor of Fuzhou jasmine tea scenting techniques, demonstrates the craft behind the aroma.

Jasmine flowers are picked during the day and allowed to bloom at night, when they release their strongest fragrance. The flowers are then combined with prepared green tea, so the leaves absorb the floral aroma, he explains.

The scenting can be repeated several times, with higher-quality teas undergoing more rounds.

Before scenting begins, the tea must first be prepared to the right condition. The flowers also need to be "nurtured" after picking so they can fully open.

During his demonstration, Yan shows visitors key steps such as mixing and separating the tea and flowers, revealing the role of timing, weather and craftsmanship in producing the finished tea.

For Yan, such experiences are part of a broader effort to bring Fuzhou's jasmine tea culture closer to visitors and younger consumers. The same idea is shaping the development of Shangxiahang itself.

Chi Yingyue, deputy general manager of Fuzhou Shangxiahang Protection and Development Co, says the aim is not simply to restore old buildings, but to give them new functions while retaining their connection with the neighborhood's commercial and cultural history.

That approach can be seen in the mix of businesses and cultural activities now filling the district. The neighborhood has brought in intangible cultural heritage enterprises, cultural and creative businesses and food and beverage outlets, while festivals, performances and evening activities draw people onto its streets.

The district received nearly 13 million visitor trips in 2025, according to Chi.

The next stage, Chi says, will explore more ways to activate historical residences associated with notable Fuzhou figures, creating cultural experiences that can further connect the area's buildings with the people and stories behind them.

The result is a neighborhood where history is no longer confined to preserved facades or museum displays. It can be encountered over a cup of jasmine tea, through a traditional craft demonstration, in a century-old residence turned cafe, or along the riverside as the old commercial quarter finds a new rhythm, she adds.

China and Brazil turn musical differences into harmony

By ZHANG KUN in Shanghai
zhangkun@chinadaily.com.cn

Left: The Shanghai Chinese Orchestra played in six cities in Brazil from July 29 to Aug 14. **Right:** Chinese flutist Zhao Yunmeng performing with the Shanghai Chinese Orchestra during its debut tour in Brazil.
PHOTOS PROVIDED TO CHINA DAILY

"We didn't know each other's language, but music connects us all," says Zhao Yunmeng, a bamboo flute player with the Shanghai Chinese Orchestra, recalling a performance of *Tico-Tico* with Brazilian musicians during the ensemble's debut in Rio de Janeiro last month.

As the flagship project of the 2026 China-Brazil Culture Year, the orchestra toured Brazil from July 29 to Aug 14, performing for nearly 6,000 people across six cities: Rio de Janeiro, Sao Paulo, Brasilia, Belo Horizonte, Curitiba, and Porto Alegre.

"We prepared *Tico-Tico* for the tour because it is a Brazilian song that everyone knows," Zhao told China Daily after returning home to Shanghai.

The orchestra invited musicians from a local ensemble to join onstage. "When the music started, our instruments naturally came together and became one. It was a magical experience," she says.

Tico-Tico was performed as an encore after Digital Splendor, a nine-movement concert that takes traditional Chinese colors as its narrative thread.

Jointly produced by the Shanghai Chinese Orchestra and TME Lyra Lab under Tencent Music, the concert is the first AI-co-created Chinese orchestral concert in China.

An AI composition system generated the emotional arc of the nine movements, blending Chinese plucked-string instruments, including *guqin* and *pipa*, bamboo flute, and other instruments with classical poetry and visual art. But the musicians did not simply reproduce what AI produced.

"We tried playing it as soon as we received the AI-generated sheet music," Zhao says. "You can feel that the overall melody is really nice, and the basic structure is very solid, but the performance sounds somewhat stiff and lacks emotional expression."

The performers then reshaped the work, making adjustments to playing techniques, breath control and dynamics, while fine-tuning the interplay and responses between the instruments.

"It was important for us to bring the music to life," Zhao says.

Since its founding in 1952, the Shanghai Chinese Orchestra has sought to bring together folk traditions, contemporary sensibilities and international expression, according to Zhu Jianxin, deputy director of the orchestra, who led a 29-member ensemble on the Brazil tour. This concert is an experiment in blending traditional folk music with modern aesthetics, he says.

The approach resonated strongly with Brazilian audiences.

Painter Hileia Pedersen says the music awakened all her senses: "I saw birds, heard the wind, smelled flowers — the melody sparked so many creative ideas."

Aline Machado, a Brazilian student of Chinese language and culture, was equally taken by the unfamiliar sounds. "We couldn't name the instruments, but everything felt fresh — they make me want to go to China now!" she says.

American-Brazilian musician and music critic Harold Emert observes: "The concert took the audience through thousands of years of musical history with instruments that predate the great masters of Western classical music by centuries — even millennia.

"These remarkable instruments existed long before Bach, Telemann, Mozart, Beethoven, Brahms — or even The Beatles. Yet they communicate the same universal emotions that music has always inspired."

Claudia Jannuzzi, chairperson of the Brazil-China Innovation Economics Research Institute, notes that "the combination of traditional music, Chinese colors, ancient instruments, Eastern aesthetics and modern technology was a completely different artistic experience".

The collaboration also inspired the Brazilian musicians who joined the Chinese ensemble.

Cellist Bryan Victor describes the experience as "explosive with new ideas", while violinist Maria Cecilia says the differences between the musicians ultimately brought them closer.

"Even though we have different cultures, languages and play different instruments, we share the same language of music," she says.

Zhu Qingqiao, Chinese ambassador to Brazil, says the exchange reflects the deep civilizational ties between the two countries. "China and Brazil are both nations of profound and diverse civilizations. Cultural exchange resonates across mountains and time, building the popular foundation for a China-Brazil community with a shared future."

Among those in the audience were members of Brazil's Chinese community, including one Chinese-Brazilian who has lived in the country for more than 30 years and flew to Rio especially for the concert.

He brought with him a broken *sheng*, a mouth-blown free-reed instrument made up of multiple bamboo pipes. No local craftsman had been able to repair it.

Wang Yang, a member of the Shanghai Chinese Orchestra, spent 10 painstaking hours repairing and retuning the instrument.

In doing so, they restored not only the *sheng*, but also, for its owner, the sound of home.

Left and middle: A graduate of the inaugural Shanghai house stewards program, An Xiaojiao balances her daily organizing with her studies. **Right:** An (right) with her classmates. PHOTOS PROVIDED TO CHINA DAILY

Program helps organize better lives for all

By training and certifying domestic workers, skills and salaries improve, while employers receive greater understanding in childcare, housekeeping and elderly assistance, **He Qi** reports.

After eight years as a home organizer, An Xiaojiao finally feels her profession is receiving the recognition it deserves.

A graduate of the inaugural Shanghai house stewards program, An took first place in home storage and organization at the 2026 Shanghai women's domestic service vocational skills competition this year. Her salary has risen 10 percent since completing the program.

"Before, I only addressed surface-level behavioral problems with elderly clients. Now I dig into the psychological needs behind those behaviors and match them with targeted professional skills," says An, who works at a local community service development center.

When organizing a home, she no longer simply arranges items but guides clients through decluttering and builds a storage system around their daily habits. "Clients witness how a cluttered home transforms into sustainable order, and they can directly perceive the value of professional service."

The second term of the program launched at the Zhongyuan campus of Shanghai Open University on Aug 8, when over 50 selected workers began a five-month systematic curriculum.

Guided by the Shanghai Municipal Commission of Commerce and led by the university, the initiative aims to elevate Shanghai's domestic service industry to a high-quality level.

Strong outcomes

Last summer, 67 students graduated from the inaugural program. The results were impressive: 85 percent received client commendations and salary increases, 56 percent achieved significant career advancement, and several won municipal vocational awards, according to the university.

Behind these outcomes lies a profound transformation in Shanghai's domestic service sector.

In October 2025, six municipal departments led by the Shanghai Municipal Commission of Commerce issued a three-year action plan to develop employee-based domestic service enterprises. Official data show that the first 16 pilot firms have helped 2,741 people find domestic service jobs, with 97.8 percent holding vocational certificates. Their revenue grew 32 percent year-on-year in the first half of 2026.

Policy support has expanded across multiple dimensions.

Domestic service workers and infant development guides have been added to the city's urgently needed skilled talent list, with skill-upgrading subsidies raised by 30 percent. By this April, 11,774 people obtained domestic service vocational certificates. The government has also built dedicated housing for workers and provides free commercial insurance.

"Domestic work is no longer low-end labor many assume it to be," says Yu Haiqun, president of the Shanghai Home Service Industry Association. Since entering the industry in 2019, he has witnessed three major shifts: increased industry recognition, clearer regulatory responsibilities, and a younger workforce.

"In the future, home care for the elderly and children will implement an occupational access licensing system. Domestic service is a high-end livelihood sector," he says, revealing that Shanghai plans to lead the formulation of unified national standards for the industry.

A well-planned initiative

The second term of the program builds on 13 core modules with new courses in smart home management, medical accompaniment, pet care, and family psychological counseling, aligning with emerging market demands.

"Domestic workers should evolve from being mere helpers to becoming professional family life service specialists," states Jia Wei, dean of Shanghai Open University. He emphasizes that high-end talent must not only possess diverse professional skills but also understand family culture and living habits to help families improve their lives.

Above: An Xiaojiao speaks at the opening ceremony of the second term of the Shanghai house stewards program on Aug 8.
Left: On the first day of the program, a national model worker teaches students how to integrate aviation-level service standards into housekeeping scenarios.

"Our first lesson is to 'see the family' — to look beyond housework and recognize the emotional needs and relationship dynamics within a household, allowing them to apply their skills where they are most needed," Jia explains. Trainees learn to identify and bridge emotional gaps in families, transforming from ordinary domestic workers into professional service providers.

The trainee profile has improved significantly.

The average age of the students is 39.8 — 1.2 years younger than the first term — with 42.3 percent holding a bachelor's degree or higher, up 14 percent. Nearly a quarter have over 10 years of experience, and all were chosen through resume screening, psychological testing, written exams, and interviews.

Zhong Wenfeng, a new trainee and former children's art teacher with a degree in fine arts, now works as a child companion.

"Many people don't understand my choice. They think a college graduate is wasting her education in domestic work," Zhong says. "But domestic service is far from just cleaning. I apply my art expertise — teaching children painting and crafts, designing learning spaces, and guiding their cognitive development through art."

All training hours are recorded in the university's credit bank and can be converted into credits for domestic service degree programs. Shanghai Open University is the city's only institution accredited to offer undergraduate degrees in domestic service studies.

Upon graduation, trainees will have access to academic credit pathways and priority hiring at employee-based enterprises. Eligible graduates will be prioritized for the Shanghai high-skilled domestic service talent pool.

"The domestic service industry is a sunrise industry, and more importantly, a heartwarming livelihood cause," says Zhang Jingjing, director of the livelihood service industry development division at the Shanghai Municipal Commission of Commerce.

For An, the professional organizer, the program has meant more than skill upgrading. She now trains new practitioners, researches market demands, and develops standardized service protocols. Her former classmates remain in close contact — some have transitioned into high-end private chefs, while others promote professional services through new media.

"There are no shortcuts in this profession. Short-term experience can only get you through the moment. Continuous learning is what carries us forward," An says. "We have chosen a career related to family happiness. Stand on professionalism, deliver service with warmth, and we will earn society's respect for the domestic service industry."

City's landmark Ferris wheel set to reopen in 2027 at new heights

By **WANG YING**
wang_ying@chinadaily.com.cn

The Ferris wheel at Shanghai's Jinjiang Action Park, which operated for decades and holds local residents' cherished childhood memories, has officially begun reconstruction at its original site. The landmark is expected to return next year at a new height of 118 meters, 10 meters taller than its previous version, according to the designer and developer of the facility.

Unveiled on Aug 9 at the project's launch ceremony, the new Ferris wheel will feature 36 cabins, each offering panoramic views of the city. Upon completion, it will be the first single-tube Ferris wheel structure in China to stand more than 100 meters tall, the Shanghai Observer reports.

More than an amusement facility offering panoramic views from above, the new Ferris wheel is designed as a three-dimensional cultural tourism landmark that combines sightseeing, leisure and urban tourism, according to the Shanghai Morning Post, citing its designer, Shanghai Institute of Architectural Design and Research Co, affiliated with the Chinese architecture firm Arcplus Group.

Left: The design for the updated Ferris wheel at Jinjiang Action Park, now under construction. COURTESY OF SHANGHAI INSTITUTE OF ARCHITECTURAL DESIGN AND RESEARCH **Right:** The Ferris wheel captured in November 2024. PROVIDED TO CHINA DAILY

The new Ferris wheel's cabins will serve multiple purposes, with some featuring themed restaurants, wedding spaces and small meeting areas.

Once one of the city's most distinctive landmarks, the original 30-meter-high Ferris wheel has created cherished childhood memories for generations of Shanghai residents since the park opened in 1984.

Completed in 2002, the second-generation Ferris wheel stood 108 meters tall, becoming China's first Ferris wheel to exceed 100 meters and the world's third-tallest at the time. It also ranked among the first in China to offer air-conditioned cabins.

Situated in Shanghai's southwest Minhang district, the Jinjiang Action Park was the city's first major amusement park and one of the closest to downtown. To meet upgraded tourism needs, the park announced it would temporarily close in January 2025.

On Feb 12, 2025, Jin Jiang International Holdings Co announced it had signed a joint venture framework agreement with Warner Bros to open a Harry Potter studio tour. *Warner Bros Studio Tour Shanghai — The Making of Harry Potter* will be located in the renovated Shanghai Jinjiang Action Park.

Scheduled to open in 2027, the theme park will take visitors behind the scenes of the Harry Potter films, bringing their iconic scenes to life. Unlike its counterparts in London and Tokyo, the Shanghai edition will incorporate Chinese elements and offer enhanced interactive experiences powered by digital technology, according to thepaper.cn.

It will be the third Harry Potter-themed attraction in the world, following those in London and Tokyo, and the first of its kind in China.

As part of the park's renovation and upgrade, all existing rides and attractions will be dismantled, with the hotel and Ferris wheel being the only facilities retained.

Zhu Zhengzheng, general manager of the Ferris Wheel (Shanghai) Tourism Development Co, says that the project will prioritize safety and quality.

According to Zhu, construction will be conducted strictly in accordance with all management requirements, and the company will prepare for subsequent operations in advance.

To allow more residents and visitors to witness the development of the new-generation Shanghai grand Ferris wheel, the project operator is considering giving away around 100,000 tickets.

LIFE

Mo Yan, the winner of the Nobel Prize in Literature, in conversation with Song Fangjin, a screenwriter, TV director and novelist, during the launch of Mo Yan's new book at this year's Shanghai Book Fair. PHOTOS PROVIDED TO CHINA DAILY

Renowned author sparks frenzy at book fair

More than 18,000 fans vie for limited seats as Mo Yan publishes his new short story collection after a six-year hiatus, reports **Zhang Kun** in Shanghai.

The launch of Mo Yan's new book, *Ren Na* (*Being Human*), broke the ticketing system as more than 18,000 fans tried to make a reservation for the event on Aug 15.

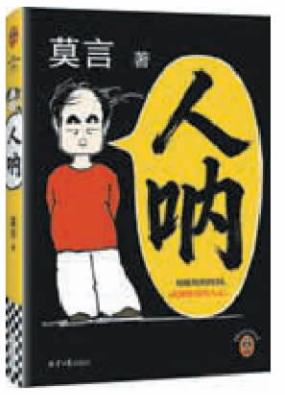
It's been six years since the 71-year-old writer published his last book, and his latest is a collection of 81 tightly crafted short stories, the shortest consisting of no more than 71 Chinese characters.

The book launch at the Shanghai Exhibition Center was the highlight of this year's Shanghai Book Fair, as the writer had not attended the largest reading festival in the city for 14 years.

Within minutes of the event opening for reservations, enthusiastic fans crashed the booking platform connected with the publisher's account on the social media platform Xiaohongshu. The publisher, Dook Media Group, had to move it to Damai.cn, the leading ticketing platform for concerts, theater and sports events in China.

In all, more than 18,000 people competed for the 770 seats in the Friendship Auditorium at the Shanghai Exhibition Center, which were taken within seconds.

"I've been lucky," a senior middle school student who preferred to remain anonymous told China Daily.



"My hobby is collecting the autographs of renowned authors, but I only go for writers that I really like. Mo Yan is a great writer, and I also like how he interacts with readers on the Internet."

One of the most translated Chinese authors in contemporary China, he is the winner of the Nobel Prize in Literature, which he won in 2012 for his body of work that "with hallucinatory realism merges folk tales, history and the contemporary".

He is best known for his novel *Red Sorghum*, which was adapted into the Golden Bear-winning film of the same title in 1988. He is also active on several Chinese social media platforms and his WeChat account features a comic cartoon portrait and a simple sentence: "I want to chat with young people."

The book launch for *Ren Na* featured Mo Yan in dialogue with Song Fangjin, a screenwriter, TV director and novelist. Song started the session by asking about his experience working with director Zhang Yimou on the movie adaptation of his novel *Red Sorghum*.

"When the movie was being shot in Gaomi (Mo Yan's hometown in Shandong province), I went to visit the set, and Zhang Yimou showed me the final draft of his script. It was just a thin few dozen pages," Mo Yan recalls. But then he witnessed how a simple line in the script was turned into the most intense dramatic scene in the movie.

Mo Yan's latest book, *Ren Na (Being Human)*, is a collection of 81 tightly crafted short stories. It's been six years since the 71-year-old writer published his last book.

Zhang went on to work with other writers, and created a series of movies.

Mo Yan says: "Zhang grafts his cinematic art onto novels by different writers. His films naturally have this diversity.

"I think we, as novelists, can learn some useful lessons from the director's approach. That means we have to constantly change our narrative angles, explore new story types, create new characters and try to use fresh, creative language.

"You could say that the movies played a big role in introducing contemporary Chinese literature to the world."

The international success of Chinese movies evoked Western publishers' interest in the original novels from which these films were adapted, Mo Yan says.

Soon after the movie came out, *Red Sorghum* was translated into multiple foreign languages. The same happened to the novels of other Chinese writers such as Yu Hua, Su Tong and Liu Heng. Writers and filmmakers "worked together — everyone's efforts complemented each other", Mo Yan says.

Song, a strong advocate of micro dramas, reveals that like many others, Mo Yan is addicted to short videos, and spends up to eight hours a day binge-watching them on his mobile phone.

Mo Yan says that he searches for inspiration while watching micro-dramas, and goes on to recommend a mini video series — *Yimengshan Ga Laotai* (*A Little Boss of Yimengshan*) — depicting trivial incidents in a village in the Yimeng Mountains in Shandong.

The vivid characters, authentic storytelling, and dynamic dialogues in the local dialect have all brought him new inspiration, he says.

As a writer, "we need our language to be vivid and precise, metaphors especially apt and fresh, things that others haven't used before", he says, adding that this skill needs to be learned from everyday life. "I feel that watching short videos like this is rewarding and helpful for my own creative work."

Literary icon launches the Chinese edition of her latest work

By **ZHANG KUN** in Shanghai

British author Jeanette Winterson concluded her third book tour in China earlier this month, during which she shared insights about creative writing in the time of artificial intelligence.

During her stay from Aug 10 to 19, the 67-year-old writer participated in the Shanghai Book Fair and launched the Chinese edition of her latest publication, *Love*, in Shanghai and Beijing.

Winterson is known internationally for her unconventional, quirky and darkly comic storytelling. Her first novel, *Oranges Are not the Only Fruit*, was published in 1985 and examines the relationship between a young gay woman and her devoutly religious mother. The book has since been translated into multiple languages and sold in more than 30 countries.

The Chinese edition, translated by Yu Shi, came out in 2010, and has sold more than 1 million copies.

The book has been loved by generations of readers and has inspired countless young people who feel out of place in the world to bravely pursue their own paths, according to the literary center of Thinkingdom Media Group, Winterson's Chinese publisher, when discussing the enduring popularity of the novel in China.

Jeanette Winterson, British author of the best-selling novel *Oranges Are not the Only Fruit*, launches the Chinese edition of her new book, *Love*, in Shanghai and Beijing from Aug 10-19. PHOTOS PROVIDED TO CHINA DAILY

"*Oranges Are not the Only Fruit* has become an iconic work representing love, growth and the pioneering spirit, but its significance goes far beyond that — it is about the collapse and rebuilding of faith, bravely exposing the lie of the 'one and only truth' and about how everyone finds their own language to tell their own story," says You Yanqing, a representative of the literary center of Thinkingdom Media.

The book has helped Winterson build a solid fan base in China, among whom are some of China's renowned writers and web influencers, such as Zhang Yueran and Zhan Qingyun.

Thinkingdom Media has so far published eight books by Winterson in Chinese. The latest one, *Love*, is not a novel but a selection from her previous books "about that impossible, essential force, stories and truths that search for the mythical creature we call love", according to its English publisher, Penguin Books.

At the book launch event at Sinan Literary Home in Shanghai on Aug 12, enthusiastic readers began to line up at the gate hours ahead of the event. A security staff member asked in amazement, "Is this a star singer giving a concert tonight?"

Winterson's last visit was in 2017. Before that, she came in 2011 for the inaugural Shanghai International Literary Week, which has since become a regular part of the annual Shanghai Book Fair.

"Every time I come to China, I have to work so hard that I don't see anything," she says.

But meeting with readers is the most precious. "It's the energy that comes between us... That's the thing that makes writing and reading worthwhile, because we meet on the steps of a story."

She recounts her journey to becoming a writer. Like the heroine in *Oranges*, she was raised by adoptive parents who were devoted evangelical Christians, and wanted her to be a missionary.

Growing up, she found a passion for creative writing. She talks about the superpower of imagination.

"When you're doing something using your imagination, you're not thinking about money and power.

"You say I'll make it anyway, because I love this," she says. "Then this is an act of resistance to the dominant values of the world."

Today, AI has infiltrated cultural and leisure experiences worldwide. Winterson has worked with the AI company Anthropic, which used her books in its corpus.

She was happy about the payment from this, but then, "we see books as beautiful, wonderful things, and the tech world sees books as training data".

All the tech world wants is the product, she says, "but we love the process".

She compares it to cooking dinner: "You want to get all the ingredients, and do it beautifully. You want to be creative, and change things around a little bit. We want to have the process. We like it, and they are taking that away."

She also notices that "China is grappling with artificial intelligence because it's affecting young people tremendously in your country".

She suggests, "Maybe you can solve this problem, because you want a future. Europe and America are not solving this problem, so maybe it's going to be you guys."

China's humanoid robots take the lead

Engineering edge results in record performances and offers platform for global applications

Spectators cheer a robot competing in the 1500m race during the World Humanoid Robot Games in Beijing on Aug 23 ACHMAD IBRAHIM / AP

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

China is leading global humanoid robot shipments driven by its strong manufacturing chain and electric-vehicle ecosystem, an industry investor said, and the smarter response is to build specialized applications on top of Chinese hardware rather than replicate it.

Global humanoid robot shipments reached about 19,100 units in the first half of 2026, up from 5,100 a year earlier. Chinese vendors accounted for more than 97 percent of global shipments during the period, according to a report by US-based market research firm Smart Analytics Global.

Shanghai-based AgiBot shipped about 8,400 units, accounting for 44 percent of the global total, while Hangzhou-based Unitree Robotics shipped about 5,900 units, or 31 percent, the firm said.

Other research firms have also placed Chinese companies at the top of the global humanoid robot market by volume, although their estimates use different measures. International Data Corporation estimated that about 18,000 humanoid robots were shipped worldwide in 2025, with AgiBot and Unitree each shipping approximately 5,000 units. Counterpoint Research estimated about 16,000 installations in 2025 and said China accounted for more than 80 percent of the total.

Andrew Young, vice-chairman and managing partner of IPG Capital, said China's lead is built on a manufacturing ecosystem that allows companies to develop products quickly and drive down costs as production scales.

"China has a very strong supply chain. It is the same in the auto industry: as long as you have a strong supply chain, you can bring products to market, and then it becomes very difficult for others to compete with you," he said.

Young, based in Hong Kong and specializing in green technology and robotics, spoke with China Daily during a visit to Silicon Valley.

China also benefits from a large pool of engineers, a complete manufacturing supply chain, software capabilities and rapidly developing artificial intelligence, he said.

"Once you achieve scale, costs can fall even further," Young said. "China has a relatively high level of engineering and strong software capabilities. AI, in particular, is developing very quickly. China has a large talent pipeline in AI, as well as strong energy and infrastructure support."

His opinion echoes findings in an April report by consulting firm McKinsey & Company.

How that supply chain matures will help determine the pace and economics of humanoid robot deployment over the next decade, says the report examining the humanoid robot supply chain.

Many components used in humanoid robots overlap structurally with the electric-vehicle value chain, giving China an advantage because of its strong EV ecosystem and its significant manufacturing capacity in several critical components.

China accounts for 90 percent of global capacity for permanent magnets used in motors, according to the McKinsey report. It also holds 40 percent of global capacity in precision bearings, 35 percent in motors and 30 percent in power electronics.

China's manufacturing base also provides cost advantages through economies of scale, clustering of component suppliers, competition among suppliers and the reuse of mature EV-grade manufacturing ecosystems, the report says.

> "China has a relatively high level of engineering and software capabilities. AI, in particular, is developing very quickly."
>
> **Andrew Young,** vice-chairman and managing partner of IPG Capital

Those advantages become more difficult for competitors to overcome as production expands, Young said.

"Once you do something well, it becomes very difficult for others to catch up," he said.

As humanoid robot hardware matures, Young said companies and investors outside the robot-manufacturing sector could focus on developing applications that use existing platforms rather than attempting to build competing robots from the ground up.

Smart Analytics Global estimated that more than 70 percent of humanoid robot shipments in the first half of 2026 went to industrial or commercial applications. At the same time, the firm said rapid expansion in hardware continued to outpace improvements in reliability, manipulation, AI and safety, as well as reductions in cost.

Young said his strategy for startups is to take advantage of already advanced robot platforms and concentrate on specialized use cases.

He pointed to a robot developed by Hong Kong researchers that adds an AI-powered dual-arm system to a Unitree four-wheeled and legged robotic platform to pick blueberries.

"Because we can't compete with Unitree, we can focus on application scenarios," Young said.

Another example is San Francisco startup Tau Robotics, which offers an invitation-only home-cleaning service using Unitree humanoid robots at $30 per hour. Tau sources the robot hardware from Unitree while designing the cameras, claws and onboard computer in-house.

However, companies such as Tau Robotics that source hardware from China may face growing regulatory restrictions in the United States.

US regulators have moved to restrict some foreign-produced advanced robotic devices. In July, the Federal Communications Commission added such devices to its Covered List, which the agency describes as a list of communications equipment and services determined to pose an unacceptable risk to US national security under the Secure and Trusted Communications Networks Act of 2019.

The FCC said the category includes mobile robots such as humanoids and quadrupeds. According to the agency's published guidance, covered foreign-produced advanced robotic devices generally cannot receive the equipment authorization required before they can be imported, marketed or sold in the US unless a conditional approval or another applicable authorization is granted.

Young acknowledged that recent US policies targeting China would have an effect on the sector, but said the market would ultimately adjust around demand for products that can perform tasks that alternatives in the local market cannot.

"If we focus on specific application scenarios, we will still have a competitive advantage," he said. "If the local market does not have a product with the same functionality, and customers genuinely need that product, then a market will naturally emerge."

Rather than viewing China's manufacturing strength only as competition, Young said companies could identify areas where mature hardware can be combined with local technologies and applications to create commercial value.

"We believe that technology can often transcend political factors," he said.

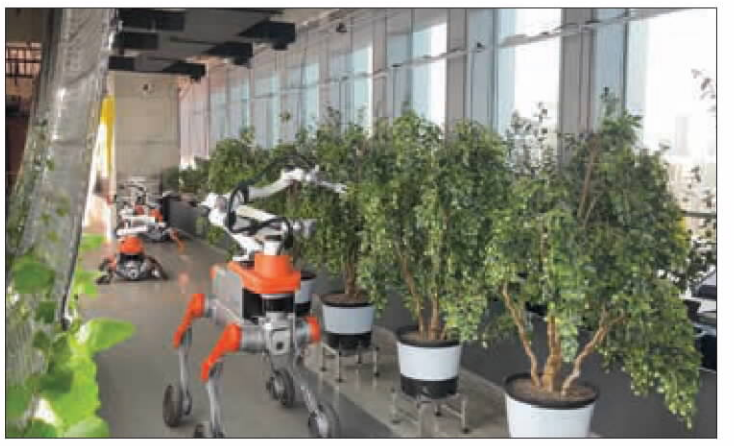
"Of course, politics will have an impact, but from an investment and application perspective, we will still look for markets where products can be deployed and create value."

HK agri-tech projects eye US to tackle farming challenges

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

Two agri-tech projects from Hong Kong are seeking to tackle some of the most pressing challenges facing agriculture, from resource scarcity and labor shortages to rising greenhouse gas emissions, while eyeing the US market for deployment.

The first is a regenerative, solar-powered air-to-fertilizer production platform developed by Amonova, a Hong Kong-based agri-tech startup with manufacturing on the Chinese mainland.



The system uses air, water and light to produce nitrogen fertilizer locally, allowing farms to reduce their dependence on large centralized production plants and long international supply chains.

"Our ambition is to change where fertilizer is made. Today, farmers around the world depend on nitrogen produced in a small number of large plants, often thousands of kilometers away," said Simson Wu, founder and CEO of Amonova.

Amonova is part of a Hong Kong delegation visiting Silicon Valley to showcase technologies and meet potential investors.

Wu said the core technology is a light-driven catalytic process that enables nitrogen fertilizer to be produced on-site, effectively "shrinking large factory systems into farm-scale units".

According to the company, a modular unit occupying about 1 to 2 square meters can produce nitrogen fertilizer for a field of around 10,000 square meters. The technology can be deployed in greenhouses, vertical farms and outdoor farming operations, with pilot projects underway in India, Japan and China.

An "Intelligent Blueberry Harvesting Robot", developed by the Hong Kong Center for Logistics Robotics, harvests fruit. By combining a dual-arm mobile platform with artificial intelligence, the robot is capable of identifying ripe blueberries, analyzing suitable grasping positions and harvesting the fruit without damaging it, according to the center. PROVIDED TO CHINA DAILY

"The strongest use case is in regions that are highly dependent on imported fertilizer or fertilizer raw materials. Japan, for example, relies on imports for most of its major fertilizer raw materials, and South Korea also relies substantially on imported urea. In these markets, the value is not only the potential to reduce emissions but also greater supply resilience," he said.

Wu pointed to recent disruptions of transportation through the Strait of Hormuz as an example of the vulnerability of global fertilizer supply chains. He said the technology could also help reduce the carbon and environmental footprint of conventional agriculture, an area where he sees particular potential in the United States.

> Our ambition is to change where fertilizer is made. Today, farmers ... depend on nitrogen produced in a small number of large plants."
>
> **Simson Wu,** founder and CEO of Amonova

Food waste and compost can provide useful recycled nutrients, he said, but they may not always deliver nitrogen in the form, concentration or timing required by a crop. A locally controlled nitrogen production system could therefore complement them.

Over-application of nitrogen can also contribute to water pollution, greenhouse gas emissions and soil acidification, making more precise nutrient management increasingly important, he said.

California offers a potential use case because of its abundant solar resources. The state experiences periods when the grid cannot absorb all available solar generation, and surplus electricity could be used to produce fertilizer, said Wu. Amonova's solar-ammonia process uses sunlight more directly as an energy input.

While Amonova is addressing fertilizer supply and resource efficiency, another project is targeting labor shortages that threaten agricultural production.

The "Intelligent Blueberry Harvesting Robot", developed by the Hong Kong Centre for Logistics Robotics, combines a dual-arm mobile platform with artificial intelligence to identify ripe blueberries, analyze suitable grasping positions and harvest the fruit without damaging it.

Andrew Young, head of the Hong Kong delegation, said the technology could have strong deployment potential in the United States, where labor shortages have long been a challenge for agriculture, contributing to higher production costs and risks to crop harvesting.

"The equipment may just be a four-wheel mobile platform. But once you add different systems on top of it, it can be used to pick blueberries, strawberries and blackberries. You can also build a larger robot to pick cherries. All of these applications are possible," said Young, vice-chairman and managing partner of IPG Capital, which focuses on green technology and robotics.

Young said the two projects reflect what he sees as a direction for Hong Kong's emerging industries: focusing on high-value applications while taking advantage of the Chinese mainland's deep and highly competitive industrial supply chains.

Rather than competing directly in basic manufacturing, Young said Hong Kong could concentrate on products that are more precise, smaller-scale and higher value-added, building strengths in areas such as system integration, software and specialized applications.

Envoy says trust drives bilateral cooperation

By ZHAO JIA
zhaojia@chinadaily.com.cn

Political trust and regular high-level exchanges have created favorable conditions for Kyrgyzstan and China to deepen practical cooperation in transportation, trade, energy and emerging technologies, said Aktilek Musaeva, the ambassador of Kyrgyzstan to China.

"Kyrgyz-Chinese relations are currently at a very high level and are characterized by sustained political dialogue, mutual trust and dynamic development across virtually all areas," Musaeva said in a written interview with China Daily as President Xi Jinping arrived in Bishkek, the capital of Kyrgyzstan, on Sunday and kicked off his third visit to the Central Asian country.

"The main driver of this dynamic is, above all, the political will of the leaders of the two countries and regular dialogue at the highest levels," she said, adding that political trust had provided the conditions needed to implement large-scale projects and steadily expand cooperation.

China is one of Kyrgyzstan's most important trade and investment partners. According to statistics, bilateral trade reached a record $27.2 billion in 2025.

"For us, however, it is important not only to increase the overall figures, but also to make trade more balanced and create greater opportunities for Kyrgyz producers and exporters," she said.

Connectivity occupies an important place in bilateral cooperation. Musaeva said the China-Kyrgyzstan-Uzbekistan railway is of strategic importance not only to the three countries, but also to the wider region.

"This is not simply a project," she said. "We see the future railway as a new economic corridor that can expand trade, reduce delivery times and create new opportunities for Kyrgyzstan and Central Asian countries."

She also highlighted efforts to improve border crossings and expand agricultural trade. Kyrgyzstan wants to develop processing, generate greater added value and establish joint production chains rather than simply export raw materials, she said.

Artificial intelligence is another area of cooperation. Kyrgyzstan, a founding member of the World Artificial Intelligence Cooperation Organization, hopes the organization will become a practical platform for sharing experience, technology and expertise, she said.

"For Kyrgyzstan, it is important that the development of AI should not create a new technological divide between countries," Musaeva said.

Xi arrives for SCO summit, visit

President hails long history of friendly ties with Kyrgyzstan

By **MO JINGXI** in Bishkek
mojingxi@chinadaily.com.cn

President Xi Jinping said on Sunday that he looks forward to working with Kyrgyz President Sadyr Japarov to draw up a new blueprint for building a China-Kyrgyzstan community with a shared future, as he arrived in Bishkek, the Kyrgyz capital, for the Shanghai Cooperation Organization Summit 2026 and a state visit to Kyrgyzstan.

In written remarks delivered upon his arrival, Xi extended sincere greetings and best wishes to Japarov and the Kyrgyz people on behalf of the Chinese government and people.

Xi said the traditional friendship between China and Kyrgyzstan has a long history, with the majestic Tianshan Mountains bearing witness to friendly exchanges between the two peoples spanning more than a millennium.

Over the 34 years since the establishment of diplomatic ties, China-Kyrgyzstan relations have withstood changes in the international landscape, maintained sound and steady development, and reached the high level of a comprehensive strategic partnership for a new era, he said.

In recent years, bilateral cooperation has entered a "golden period" of rapid growth, Xi said, noting that bilateral trade and visits between the two countries have reached record highs, while major projects, including the China-Kyrgyzstan-Uzbekistan railway, have made smooth progress.

Kyrgyz President Sadyr Japarov and his wife Aigul Japarova welcome Xi and his wife, Peng Liyuan, at the Manas International Airport in Bishkek. XIE HUANCHI / XINHUA

Inside
Editorial **page 7**

Tangible outcomes of mutually beneficial cooperation have brought extensive benefits to the two peoples, he added.

Statistics showed that trade in goods between China and Kyrgyzstan reached $27.2 billion in 2025, up 20 percent year-on-year.

In a signed article published in Kyrgyz media outlets ahead of the visit, Xi said that China has for years ranked as Kyrgyzstan's largest trading partner and biggest source of foreign investment.

Xi wrote that Chinese smartphones and electric vehicles had become "trendy choices for Kyrgyz consumers", while an increasing number of quality Kyrgyz farm products were making their way into Chinese kitchens.

Xi's current trip marks his third visit to Kyrgyzstan as Chinese president, following visits in 2013 and 2019.

During his stay, Xi will hold in-depth discussions with Japarov on China-Kyrgyzstan relations, bilateral cooperation in various fields, and international and regional issues of common concern.

Last year marked a high point in China-Kyrgyzstan diplomacy, with the two leaders meeting three times. Key engagements also included their back-to-back meetings on the sidelines of the second China-Central Asia Summit in the Kazakh capital of Astana in June and the SCO summit in the Chinese port city of Tianjin in August.

In the written speech, Xi also said he looks forward to attending the SCO summit in Bishkek and working with all parties to promote the organization's continued development.

This year marks the 25th anniversary of the SCO. Since its founding in Shanghai in 2001, the organization has grown into the world's largest comprehensive regional organization in terms of geographical coverage and population, with cooperation expanding across security, economic development and cultural exchanges.

At the SCO summit in Tianjin last year, Xi announced three China-SCO cooperation platforms for energy, green industry and the digital economy, as well as three cooperation centers for scientific and technological innovation, higher education, and vocational and technical education.

During the Bishkek summit, Xi will exchange views with other leaders on deepening SCO cooperation under the new circumstances, as well as major international and regional issues, and make plans for the organization's high-quality development and its participation in reforming and developing the global governance system, according to the Foreign Ministry.

Upon arrival at Manas International Airport in Bishkek, Xi and his wife, Peng Liyuan, were warmly received by Japarov and his wife, Aigul Japarova.

Japarov presented flowers to Peng, while young Kyrgyz women offered Xi and Peng traditional bread and honey, welcoming them with a traditional ceremony reserved for the most distinguished guests.

With honor guards standing in salute on both sides of the red carpet, the two presidents and their wives watched performances featuring traditional musical instruments and singing, as well as cultural displays of falcons, hunting dogs, traditional warriors, horsemen and yurts. Local teenagers also sang a Chinese song.

WORLD WATCH
By Nurlan Yermekbayev

At 25, the SCO is still evolving and growing

The story of the Shanghai Cooperation Organization began on June 15, 2001 in Shanghai, where the heads of six states — Kazakhstan, China, Kyrgyzstan, Russia, Tajikistan and Uzbekistan — took the momentous decision to establish a new international organization. This step marked the birth of a fresh format for regional interaction.

From the very outset, the leaders laid down the foundational values that have enabled the SCO's steady advancement over the past 25 years. Essential to this has been the "Shanghai Spirit" — a set of principles centered on mutual trust, mutual benefit, equality, mutual consultation, respect for cultural diversity and the common aspiration for shared growth.

The SCO Charter signed in 2002 enshrined the key principle of consensus in decision-making within the organization, underlining the full equality of all members, regardless of territorial size or economic weight.

Since then, the SCO has expanded to include India (2017), Pakistan (2017), Iran (2023), and Belarus (2024), bringing its membership to 10 states. Together, they cover nearly one-fourth of the world's landmass, are home to almost half of the global population and generate 25 percent of global GDP. With two observer states, 15 Dialogue Partners, and over a dozen applications pending, the SCO's appeal speaks for itself.

The organization's current institutional framework includes the Council of Heads of State, the Council of Heads of Government, the Council of Foreign Ministers, 30 sectoral meetings and the Council of National Coordinators. The main executive body is the SCO Secretariat in Beijing, alongside which there is a specialized Regional Anti-Terrorism Structure headquartered in Tashkent, Uzbekistan.

Over time, as envisioned by the heads of member states, the SCO has evolved beyond military-political issues into a universal platform for dialogue and cooperation across political, security, trade, economic, transportation, scientific, cultural and educational fields.

On security, the SCO maintains a strong focus on traditional and emerging challenges, continuing the fight against terrorism, separatism, extremism, as well as drug trafficking. A multi-level system of interaction has been established in these fields.

Rescue teams intensify searches in Gyirong

By **PALDEN NYIMA** and **WANG XIAOYU** in Gyirong county, Xizang and **YANG ZEKUN** in Beijing

Rescue teams are advancing by air, land and water routes into the hardest-hit area of the Gyirong border port in Gyirong county, Shigatse, Xizang autonomous region, as search operations for hundreds of people missing after Wednesday's devastating mudslide were stepped up.

The disaster has so far left 16 people dead and 546, including 261 foreigners, missing.

In a major development, the first emergency communication base station at the Gyirong port was put into operation on Sunday afternoon.

Inside
• Comment, **page 7**
• See more, **page 6**

Located 1.2 kilometers from the border gate, the base station fills a communication coverage gap, providing stable and reliable support for rescue operations, road clearance, material transportation and front-line workers, Xinhua reported.

Communication signals have reached the core rescue site, Nyima Dorje, director of the regional communications administration, confirmed on Sunday.

According to regional authorities, 499 residents from five at-risk villages had been evacuated to hotels and guesthouses.

Gama Cedain, chairman of the Xizang regional government and head of the emergency rescue headquarters, said the region activated its highest-level emergency responses shortly after the mudslide struck on Wednesday.

So far, 2,141 personnel from the People's Liberation Army, armed police, fire and rescue services, border defense and public security authorities, as well as from China Anneng Group, have been mobilized, along with 269 rescue vehicles and 3,922 sets of equipment, he said.

XI'S VISIT

More Kyrgyz youths opt for Mandarin tests

Candidates rush to embrace broader opportunities as bilateral ties flourish

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

The number of people appearing for Mandarin proficiency tests in Kyrgyzstan has surged more than threefold over the past five years, reflecting a growing interest in the Chinese language amid deepening economic ties and educational cooperation between the two countries, the administrator of the HSK examination said.

Li Peize, general manager of Chinese Testing International Co, which administers the exam, said the total number of HSK candidates across all levels grew from 3,139 in 2021 to 12,611 in 2025 in Kyrgyzstan.

According to Li, in the first half of the year, more than 7,600 candidates took the test, with the annual total expected to exceed 15,000. The number is projected to surpass 20,000 by 2028, making Kyrgyzstan the first Central Asian country to reach that milestone, he said.

He said that Kyrgyzstan's interest in China shows that the bilateral relationship has entered a golden era. "Economic and trade needs have created a broad market, policy support has built a solid bridge, and the desire to study in China and cultural identification have injected endless vitality," he added.

The Chinese Embassy in Kyrgyzstan has for years run a scholarship program that requires applicants for full scholarships to have completed at least HSK Level 3. Four Confucius Institutes and more than 20 Confucius classrooms have been established in the Central Asian nation, along with a Luban Workshop and a Silk Road School for cross-border e-commerce — initiatives that link language learning with vocational training and employment, he said.

Li noted that a growing number of young Kyrgyz people also consider Chinese as a gateway to better opportunities. China's world-class educational resources, increasingly convenient visa policies and transportation links have made studying in China more attractive than ever.

The profile of Chinese learners in Kyrgyzstan has also diversified. Test-takers now include university students, civil servants, translators, business professionals and skilled workers — evidence that Chinese is shifting from a cultural interest to a practical tool for career advancement, he added.

For many Kyrgyz students, learning Chinese has opened doors to new experiences and opportunities.

Ayana Bazarkulova, 20, a student at Beijing Foreign Studies University, said that after two years in China, she found the country "highly developed and modern, especially in terms of technology".

She added that Chinese people are "friendly, kind and welcoming" toward international students.

Erkemai Zarylbekova, 19, a student at Beijing International Studies University, said after two years of study, she found China a modern, safe and convenient country to be in with its excellent public transportation and advanced technology.

Nuraiym Aibekova, 27, a second-year PhD student at the University of International Business and Economics in Beijing, first came to China in 2018. She returned to campus in 2023 and said China has become "like a second home". She praised the country's safety, cleanliness and convenience.

"At first, I learned Chinese because it was necessary for my studies and daily life," she said. "However, as my language skills improved, I realized that Chinese opened many new opportunities for me."

YAN YAN / XINHUA

High-tech hub aids farm growth in member states

By **DI FANG** and **HU QING**

Across the vast landscape of northern Kazakhstan, rows of rapeseed plants thrive. The seeds of the plants traveled more than 3,000 kilometers from Yangling in Shaanxi province to reach these fields.

The crop was grown from seeds supplied by an agricultural company based at the Shanghai Cooperation Organization Demonstration Base for Agricultural Technology Exchange and Training, an agricultural high-tech hub in Yangling.

The company has been working to grow high-quality crop varieties and test their adaptability in different environments, with the aim of bringing Chinese agricultural technologies and varieties to overseas markets.

Last year, trials of the rapeseed variety started in Kazakhstan. The results showed that its yield was 32 percent to 51 percent higher than that of traditional local varieties, according to the company.

The variety also performed well in terms of key quality indicators, including thousand-kernel weight and protein content, and showed strong adaptability to Kazakhstan's high-latitude and drought-prone conditions, as well as its large temperature swings.

Li Yiya, the company's general manager, said the successful introduction of the variety marked the first commercial-scale introduction of rapeseed from Shaanxi province into Kazakhstan and diversified the local supply of high-quality seed varieties.

With the production license for import and export of its crop seeds approved, the company has established an integrated operation spanning variety selection, overseas trials, seed production under standardized practices and large-scale exports.

The company plans to expand its presence in major markets across Russia and Central Asia, aiming to secure a 10 percent share of the regional commercial rapeseed market within the next three to five years, Li said.

Rapeseed is not the only crop being used to test how agricultural expertise developed in the demonstration base can adapt to conditions in SCO countries.

In Kyrgyzstan's Chui region, where high elevation, drought and relatively poor soil conditions have long hampered apple production, Yangling Modern Agriculture International Cooperation Co and Baoji Haisheng Modern Agriculture Co jointly established a 3.3-hectare apple demonstration orchard using standardized cultivation practices in May 2025. After more than a year of intensive management, the trees are growing well and have started to produce young fruit.

"We hope to introduce high-quality new domestic apple varieties to Kyrgyzstan so that the local people can enjoy apples that are crisp and sweet," said Wang Xiaoqing, assistant general manager of Baoji Haisheng.

The company has introduced cold-resistant, drought-tolerant and poor-soil-tolerant rootstocks developed by a team at China Agricultural University, and paired these with high-quality cultivars in order to develop a diverse planting system suited to local conditions.

Wang Zhigao, director of the Park Services Center of Yangling Modern Agriculture International Cooperation Co, said that future projects include exporting advanced planting equipment. Large-scale growers from Kyrgyzstan will also be regularly invited to China to study agricultural techniques.

These projects are part of Yangling's broader effort to promote agricultural exchanges and cooperation among SCO countries.

Since the agricultural demonstration base was launched in October 2020, it has established 11 agricultural science and technology parks in countries including Uzbekistan and Kazakhstan, with more than 110 technology demonstration projects conducted jointly, local authorities said.

They added that the achievements included high-quality wheat varieties that have increased yields by as much as 60 percent, and integrated water and fertilizer irrigation systems that have cut water use by 50 percent.

Meanwhile, more than 100 training sessions have been held in Yangling, providing agricultural expertise to more than 3,000 officials and professionals from SCO countries and those participating in the Belt and Road Initiative. In addition, 60 online lectures have also been organized, attracting over 60,000 participants, according to local authorities.

In June 2024, Pakistani Prime Minister Shehbaz Sharif visited Yangling and announced plans to send 1,000 students to the agricultural demonstration base for training.

Hafiz Muhammad Bilal Ather, previously a scientific officer with Pakistan's federal government, was among those students. He was enrolled as a doctoral student in the animal genetics, breeding and reproduction program at Northwest Agriculture and Forestry University in 2025.

"Modern breeding and genomic tools can help us develop animals that are more resistant to disease and heat, and produce more milk and meat," he said, adding that his studies had given him new knowledge, skills and ideas.

"After my doctoral program, I aim to go back to Pakistan as a scientist and researcher and bring Chinese knowledge and research experience back to my country to help improve Pakistan's agricultural research system," he said.

Agricultural trade has grown alongside the exchanges in technology and human resources. In 2025, trade between Shaanxi and SCO countries reached 776 million yuan ($115.4 million), 30.6 times the level when the base was established, official data showed.

Yangling is also home to the China Yangling Agricultural Hi-Tech Fair, which has so far held 32 editions and attracted more than 10,000 agricultural enterprises as well as research and educational institutions from more than 80 countries and regions, helping to bring more than 1,000 agricultural technologies to international markets each year.

Since 2022, Yangling has hosted the SCO Agricultural Expo, bringing together participants from all SCO countries and further deepening their pragmatic agricultural cooperation.

Envoy: Systematic steps to modernization lauded

From page 1

"On the contrary, new technologies should help narrow development gaps and make modern services more accessible."

She said Kyrgyzstan is interested in working with China on specialist training, scientific research, computing capacity and practical AI applications.

Aktilek Musaeva

As Kyrgyzstan is to host the Shanghai Cooperation Organization Summit 2026, Musaeva said the SCO over the past 25 years has produced a distinctive cooperation model based on the Shanghai Spirit, featuring mutual trust, mutual benefit, equality, consultation, respect for the diversity of civilizations, and pursuit of common development.

While regional security remains a key priority, the SCO has expanded into economic, transportation, energy, digital, environmental and humanitarian cooperation.

Musaeva said Kyrgyzstan expected the summit to further strengthen the SCO's role as an effective and influential organization, with attention to security, connectivity, trade and investment, digital transformation, and energy, food and environment.

China has played an important role in the SCO's development by helping to build its institutional framework and advance practical cooperation, she said.

Musaeva also spoke positively of the four global initiatives proposed by Xi, saying that they shared an emphasis on strengthening dialogue, mutual respect and international cooperation.

Having lived and worked in China for more than 15 years, Musaeva said that she is impressed by the country's ability to combine scale with attention to detail.

"The most important lesson of China's modernization is not any single technological achievement. It is the systematic approach," she said.

Organization: SCO's intl profile continues to expand

From page 1

Recognizing the need to adapt, the member states decided in 2024 to comprehensively modernize the organization. In 2025, this led to a decision to create new specialized security bodies: the SCO Anti-Drug Center in Dushanbe, Tajikistan, and the Universal Center for Countering Challenges and Threats in Tashkent. The latter will include an information security center, as well as the Center for Combating Transnational Organized Crime in Bishkek. The work is underway to establish these mechanisms so that the SCO can respond more effectively to both traditional and emerging threats.

The SCO's profile on the international stage continues to grow. When unforeseen situations arise that threaten peace, security and stability in the region, the SCO member states respond collectively, drawing on an agreed set of political and diplomatic response measures. Political and diplomatic statements on situations challenging regional peace remain the principal instruments — demonstrative of the organization's united approach. Such political statements are subject to unanimous approval by all member states.

The organization also operates an observer mission for presidential and parliamentary elections, as well as referendums. This work is based on the principles of objectivity and noninterference in internal affairs.

Besides observation missions, following the results of the electoral activities held in the SCO area, the Secretary-General extends congratulatory messages to the leadership of the countries which are members, observers or partners of the organization.

The SCO takes a comprehensive approach to security, believing that economic development is integral to the broader security agenda. Permanent cooperation mechanisms are operational in trade, finance, transport, agriculture, energy, and customs, while new areas of cooperation such as the digital economy, the creative economy, green development and antitrust regulation are also emerging.

The SCO Development Strategy until 2035, adopted last year, sets ambitious yet realistic targets to enhance practical cooperation: deepening cooperation in trade, the economy, finance, investment, and high technology, including digital and green development, in order to create new areas of growth, ensure sustainable development, and improve the well-being and living standards of peoples in the SCO area.

To name a few practical outcomes, in transport, the Concept on Ports and Logistics Centers is being implemented and international road transport routes are being expanded. In 2025, member states made a political decision to establish the SCO Development Bank in a format of interested parties. In the digital sphere, work is underway on e-commerce and data-exchange platforms.

China has played a responsible role in the organization, implementing projects such as the SCO Demonstration Base for Agricultural Technology in Shaanxi province and the China-SCO Local Economic and Trade Cooperation Demonstration Area in Qingdao, Shandong province, that now serve as successful zonal platforms. During China's chairmanship in 2024-25, three cooperation platforms were established — on energy, green industry and the digital economy — along with three centers for scientific innovation, higher education and vocational education.

The SCO is not resting on its laurels and it remains confident that the goals we have set will be successfully attained.

Beyond politics and economics, the members believe in fostering mutual understanding and cultural ties among the SCO peoples.

The member states cooperate in music, theater, movies, the fine arts, archives, libraries, museums and heritage protection.

An important role in strengthening cultural ties is assigned to public diplomacy. The institution of SCO Goodwill Ambassadors has been functioning since 2022.

Youth engagement remains a priority, with the SCO Youth Council and SCO Model providing a space for dialogue among the younger generation.

Sport is also in focus with many sports events taking place in SCO countries, including such landmark ones as the International Kunming Marathon and the International Issyk-Kul Marathon.

In 2025, the SCO presidency passed to the Kyrgyz Republic. The theme of its presidency — 25 Years of the SCO: Together Toward Sustainable Peace, Development and Prosperity — reflects the continuity of the agenda and the organization's firm focus on the future. Kyrgyzstan has been successfully fulfilling its presidential responsibilities, with the Bishkek Summit set to serve as the culmination of its chairmanship.

In June 2026, the SCO members widely celebrated the 25th anniversary of the organization. The anniversary is a moment to take pride in the collective journey and to draw inspiration for the road ahead. Over the past quarter-century, the SCO has matured into a unique community of nations bound not by force, but by trust; not by self-interest, but by shared purpose.

The values and principles of the SCO, such as noninterference, the rejection of the use and threat of use of force, equality, respect for the diversity of cultures and civilizations and multipolarity, are all attractive to many states. This is evidenced by the growing number of countries and organizations wishing to join the SCO in one capacity or another.

As the SCO members look ahead, they do so with optimism, knowing that the bonds they have built and the principles they hold dear will continue to guide the region toward a future of peace, shared prosperity and mutual understanding.

The author is the secretary-general of the Shanghai Cooperation Organization. The views do not necessarily represent those of China Daily.

XI'S VISIT

25 YEARS OF SCO: COOPERATION IN ACTION

China's Trade Relations with Other SCO Member States

In 2025, China was the largest trading partner of eight of the other nine SCO member states. For Belarus, China was the second-largest trading partner overall and its largest trading partner in Asia.

Key Facts about the Shanghai Cooperation Organization

Founding Date
June 15, 2001

Member States (10)
China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan, India, Pakistan, Iran, Belarus

Observer States (2)
Afghanistan, Mongolia

Dialogue Partners (15)
Azerbaijan, Armenia, Cambodia, Nepal, Turkiye, Sri Lanka, Saudi Arabia, Egypt, Qatar, Bahrain, the Maldives, Myanmar, the United Arab Emirates, Kuwait and Laos

Permanent Bodies (2)
SCO Secretariat (Beijing, China); Executive Committee of the SCO Regional Anti-Terrorist Structure (Tashkent, Uzbekistan)

Official Languages (2)
Chinese and Russian

Geopolitical Significance
The SCO represents nearly half of the world's population and a quarter of the global economy, standing as a key pillar of regional stability and practical cooperation.

"Shanghai Spirit"
Mutual trust, mutual benefit, equality, consultation, respect for diversity of civilizations and pursuit of common development.

China-SCO Trade (2025)
China's trade in goods with the other SCO member states totaled approximately $524.1 billion in 2025.

Chinese Investment (2025)
As of July 2025, China's stock of various types of investment in the other member states exceeded $84 billion.

China-Europe Railway Express
As of July 28, 2026, China-Europe Railway Express had made more than 130,000 trips in total and transported goods worth over $520 billion.

Shanghai Cooperation Organization summits (2001–26)

June 2001 — Shanghai, China: Adopted the Declaration on the Establishment of the SCO and the Shanghai Convention on Combating Terrorism, Separatism and Extremism

June 2002 — St. Petersburg, Russia: Signed the SCO Charter and the Agreement on the Regional Anti-Terrorist Structure

May 2003 — Moscow, Russia: Signed the Moscow Declaration of the Council of Heads of State of the SCO

June 2004 — Tashkent, Uzbekistan: Launched the Regional Anti-Terrorist Structure; Mongolia became an observer state

July 2005 — Astana, Kazakhstan: Granted observer status to Pakistan, Iran and India

June 2006 — Shanghai, China: Signed the Declaration on the Fifth Anniversary of the SCO

August 2007 — Bishkek, Kyrgyzstan: Signed the Treaty on Long-Term Good-Neighborliness, Friendship and Cooperation among the Member States of the SCO

August 2008 — Dushanbe, Tajikistan: Adopted the Dushanbe Declaration by the Heads of Member States of the SCO and the Regulation on the Status of Dialogue Partner of the SCO

June 2009 — Yekaterinburg, Russia: Granted dialogue partner status to Sri Lanka and Belarus

June 2010 — Tashkent, Uzbekistan: Approved the Regulation on Admission of New Members to SCO

June 2011 — Astana, Kazakhstan: Signed the Astana Declaration of the 10th Anniversary of the SCO

June 2012 — Beijing, China: Signed 10 documents and accepted Afghanistan as an observer state and Turkiye as a dialogue partner state

September 2013 — Bishkek, Kyrgyzstan: Approved the Action Plan for Implementation of the Treaty on Long-Term Good Neighborliness, Friendship and Cooperation of SCO Member States in 2013-2017; China announced the establishment of the SCO Committee on Good Neighborliness, Friendship and Cooperation

September 2014 — Dushanbe, Tajikistan: Signed the Dushanbe Declaration by the Heads of the Member States of the SCO

July 2015 — Ufa, Russia: Approved the Development Strategy of the SCO until 2025; started the procedure for admitting India and Pakistan to the SCO as members

June 2016 — Tashkent, Uzbekistan: Signed the Tashkent Declaration of the 15th Anniversary of the SCO

June 2017 — Astana, Kazakhstan: Officially admitted India and Pakistan as full members

June 2018 — Qingdao, China: Adopted the Qingdao Declaration of the Council of Heads of State of the SCO

June 2019 — Bishkek, Kyrgyzstan: Signed the Bishkek Declaration of the Council of Heads of State of the SCO and focused on combatting terrorism, separatism and extremism

November 2020 — Moscow, Russia (virtual): Adopted the Moscow Declaration of the Council of Heads of State of the SCO

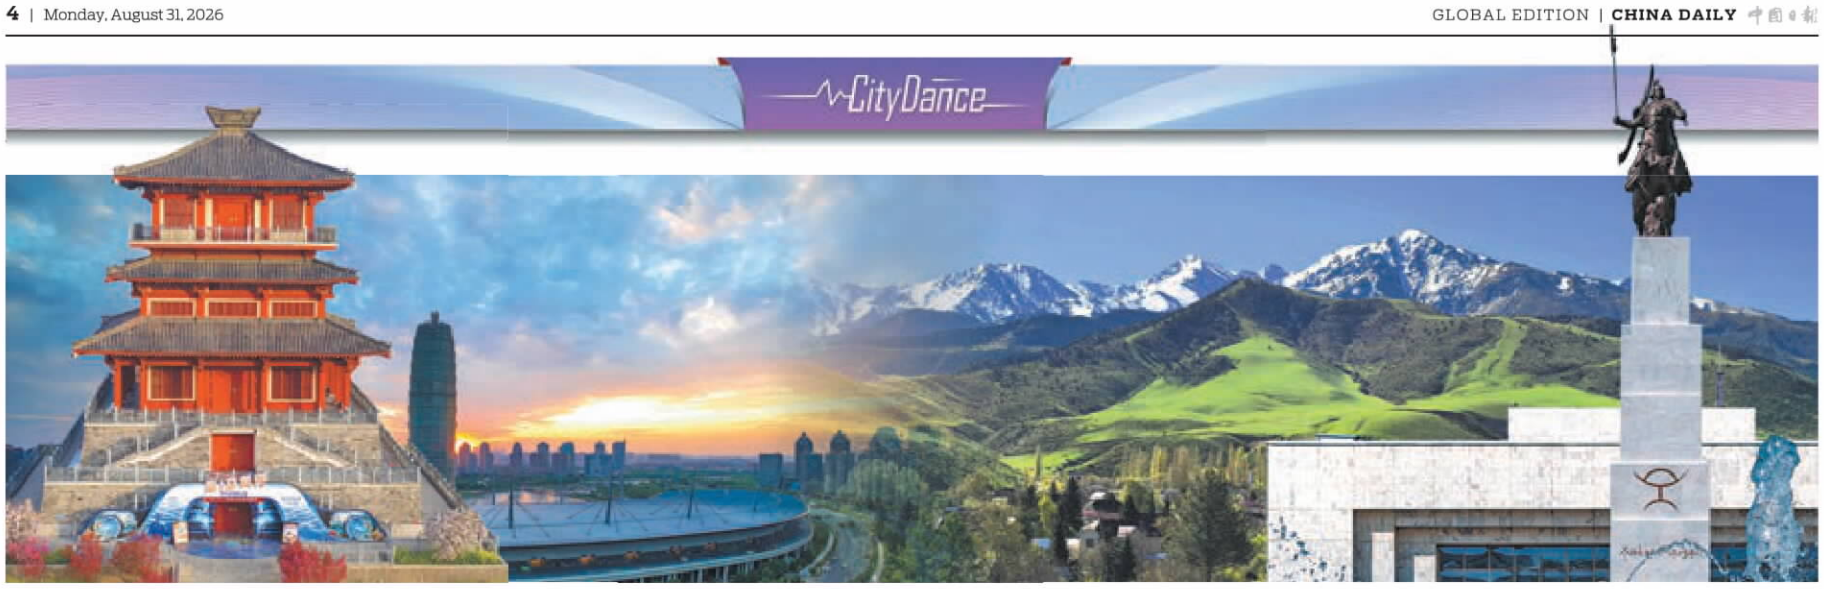
September 2021 — Dushanbe, Tajikistan (virtual): Signed the Dushanbe Declaration on the 20th Anniversary of the SCO

September 2022 — Samarkand, Uzbekistan: Signed the Samarkand Declaration of the Council of Heads of State of the SCO and issued statements concerning energy security and food security

July 2023 — New Delhi, India (virtual): Signed the New Delhi Declaration of the Council of Heads of State of the SCO and Iran was formally admitted as a member state

July 2024 — Astana, Kazakhstan: Held the first "SCO Plus" Meeting; China assumed the rotating presidency after the summit; Belarus officially joined the SCO

August 2025 — Tianjin, China: The summit adopted the Tianjin Declaration and approved a SCO development strategy for the next 10 years (2026–35). The summit granted Laos the status of an SCO dialogue partner



August 2026 — Bishkek, Kyrgyzstan: Theme of Kyrgyzstan's SCO presidency: 25 Years of the SCO: Together Towards Sustainable Peace, Development, and Prosperity

Blessings beyond buses and beverages

Sister-city ties between Zhengzhou, Bishkek bring new opportunities to China, Kyrgyzstan

By **WANG HAORAN**, **SHI BAOYIN** and **CHEN FENGYUE** in Zhengzhou

Clockwise from top: Leonid Mitrofanov introduces Tokmok to Chinese visitors as a tour guide. PROVIDED TO CHINA DAILY Passengers in Bishkek board a Yutong bus during their daily commute on Aug 7. WANG YANG / FOR CHINA DAILY A view of Zhengzhou International Land Port in Henan province. PROVIDED TO CHINA DAILY

"Hi, my name is Li Bai," Leonid Mitrofanov often tells Chinese visitors as he prepares to lead them through the boulevards of his hometown, Bishkek, the capital of Kyrgyzstan. For the tourists, this introduction by the Chinese-speaking tour guide is a delightfully memorable icebreaker.

Mitrofanov, 28, took a liking to poetry when he was young, and his life took a decided turn when he was 16 and took up Chinese studies in Zhengzhou, Henan province. After more than three years, he gained a solid command of the language.

It was after gaining fluency that his literary curiosity led him to classical poetry, specifically the works of his namesake Li Bai (701-762), one of ancient China's most revered poets.

After learning that the poet was said to have been born in the ancient city of Suyab, near present-day Tokmok in Kyrgyzstan and just a short drive from Bishkek, Mitrofanov adopted the moniker as his own.

"Li Bai is far more than a fun Chinese name for me," Mitrofanov says. "It's a cultural symbol that bridges my life today in Bishkek with my student years in Zhengzhou, symbolizing the deep bond between Kyrgyzstan and China."

On May 28, Zhengzhou and Bishkek established sister-city relations. The agreement developed their ties into a comprehensive partnership, bridging aspects of urban life — from consumer goods and public transportation to education — into a framework for mutual growth.

Lu Kang, president of the Henan Chamber of Commerce in Kyrgyzstan, who has lived in Bishkek for nearly 30 years, says he has felt ties between Henan and Kyrgyzstan have grown even closer through the Belt and Road Initiative, which was proposed in 2013.

"Walking through the streets of Bishkek today, you can feel a Henan touch. You can enjoy Henan *huimian* (braised noodles) and *hulatang* (spicy soup), and Henan-made instant noodles have entered local supermarkets and convenience stores, becoming everyday consumer goods for locals."

For Mitrofanov, Henan's presence in Bishkek brought back memories of his years in Zhengzhou. During his studies, he grew fond of the city's ubiquitous milk tea spots. He relived those memories in June when the Zhengzhou beverage chain Mixue Bingcheng opened outlets in Bishkek.

After stopping by one of the new, bustling outlets to try the brand's signature soft serve ice cream, Mitrofanov recognized the familiar flavor immediately.

"Now I can taste Zhengzhou right here in Bishkek," he said, adding an enthusiastic "*Zhong! Zhong! Zhong!*" — meaning "terrific" in Henan dialect.

Economic and trade collaboration between China and Kyrgyzstan is thriving, something reflected in daily life in Bishkek and beyond, says Rashid Yusupov, director of the Belt and Road Research Center of Kyrgyz National University for Nationalities in Bishkek.

The arrival of Chinese beverage brands in Bishkek, for example, has done more than just enrich consumer choices, he says. "It also drives the development of the service industry and fosters the growth of a modern urban consumer culture."

Beyond daily consumer culture, Henan's presence in Bishkek is visible along the capital's busy transport arteries.

As a tour guide, Mitrofanov frequently travels the city's roads. "When I take tour groups around the city, I'm constantly on buses. Over time something dawned on me: most of Bishkek's buses, as well as the tour coaches we rely on, come from one firm — Yutong Bus of Zhengzhou."

Yutong entered Kyrgyzstan in 2019, where it now has a fleet of more than 350 vehicles. As of July, Yutong buses account for more than 65 percent of public buses in Bishkek, says Shan Yao, account manager for Central Asia at Yutong Bus. Diesel and compressed natural gas models dominate the fleet, but small-batch trials of electric buses have already begun.

"Kyrgyzstan is a key market in our Central Asia strategy," Shan says. "Its mountainous terrain and extreme climate place extraordinarily high demands on vehicle reliability. Buses that perform well here give us even greater confidence in other markets."

Yusupov says Chinese technology and enterprises are increasingly woven into daily life in Bishkek, spanning service sectors, infrastructure and logistics.

Economic agreements deliver practical benefits, but human connection forms the true foundation of long-term collaboration, he says, noting that thousands of Kyrgyzstanis are now studying in China, including in Zhengzhou.

Among them is Bekzat Tashbolotov, 19, from Bishkek, who is studying at Zhengzhou University of Industrial Technology. Tashbolotov, encouraged by a friend's firsthand experience, found an engaging academic environment with attentive teachers who tailor their lectures to ensure international students can thoroughly understand and master the material.

For Tashbolotov, mastering Mandarin is central to his long-term goal.

Bridge for communication

"I know language is the bridge for cross-border communication. I hope eventually to work in Kyrgyz-Chinese translation, business liaison and people-to-people exchanges, drawing on my strengths to build a communication bridge and serve as a youth ambassador for bilateral friendship."

Tashbolotov describes Zhengzhou as an inclusive and vibrant city steeped in thousands of years of history. It has also offered an unexpected personal connection, he said.

"After arriving in Zhengzhou, I was surprised to learn that the Yutong buses I used every day to commute back home were made right here in the city where I study."

Dong Pengfei, associate dean of the School of International Education at Zhengzhou University of Industrial Technology, who oversees international student administration and exchanges, views youth dialogue as the most fundamental and enduring tie between countries.

The university works closely with Kyrgyz higher education institutions on degree programs, joint research and two-way cultural exchanges, Dong said.

"Kyrgyz students come to China to experience its development and deepen their professional knowledge, and our faculty and students travel to Kyrgyzstan to share Chinese culture and understand Central Asia. This interaction fosters deep dialogue, cultural identity and emotional ties between young people of both countries," Dong added.

Young people in Kyrgyzstan and China have far more opportunities for communication, study and cooperation than previous generations, Yusupov says.

Lu of the Henan Chamber of Commerce in Kyrgyzstan says that under the Belt and Road Initiative, Henan and Kyrgyzstan have deepened their ties and worked together for a China-Central Asia community with a shared future.

"Zhengzhou, as a national transportation hub and an inland gateway for opening-up, and Bishkek, as a pivotal city in Central Asia, complement each other and foster mutual empowerment in the framework of the Shanghai Cooperation Organization," he said.

"I hope that within the SCO framework, highly fruitful ties between Zhengzhou and Bishkek continue to strengthen, allowing more Henan brands and China's Central Plains culture to take root in Central Asia."

Mitrofanov said: "I feel a deep bond with Henan and the people of Zhengzhou. I hope more young people study in China, and more Chinese come here to explore business. That exchange is how we truly get to know each other."

Firsthand experience allays doctor's concerns about traditional medicine

By **WANG HAORAN, SHI BAOYIN** and **CHEN FENGYUE** in Zhengzhou

Traditional Chinese medicine practitioner Chang Guanglin (right) checks the pulse of a patient in Bishkek, Kyrgyzstan, in August. PROVIDED TO CHINA DAILY

Chinara Kaparova regarded herself as being fairly familiar with traditional Chinese medicine and open-minded about it, but she said she nevertheless nursed a fear about some of its procedures.

The pediatric neurologist, 59, in Bishkek certainly appreciated its value, having studied TCM in Beijing for a month several years ago. Yet when it came to her own ailments — headaches, high blood pressure, insomnia and icy feet that dragged down her quality of life — she hesitated. It was only after her sons, who had received effective treatment from a TCM practitioner, urged her to visit him that she decided to take that step.

Through a tailored regimen of acupuncture, massage and cupping, along with lifestyle advice — going on walks outdoors and eating more fresh produce — her health began to steadily recover, she said. To be sure, there was no miraculous overnight cure, just a palpable, day-by-day return of her vitality.

"TCM is a unique, highly individualized treatment in the hands of true professionals, a treasure the Chinese people can be proud of," Kaparova said.

Her experience reflects a growing openness to traditional Chinese medicine in Kyrgyzstan, and practitioners such as Chang Guanglin, who treated Kaparova, are making these traditional therapies more accessible than ever.

Chang's journey abroad was deeply rooted in his youth. Raised and educated in Zhengzhou, Henan province, he mastered Russian during his secondary school years. After studying traditional Chinese medicine at Henan University of Chinese Medicine, he practiced domestically for years before taking up postings in Europe and Central Asia, until he retired in 2008.

"Studying in Zhengzhou cemented my Russian-language skills and fueled my devotion to TCM, sealing it as my lifelong vocation," Chang said. "Zhengzhou is the place that is dearest to me, and to which I owe a debt of gratitude.

"However, when I retired, I felt my mission as a doctor remained unfinished. Taking TCM to Central Asia was not just about treating patients but also about building cultural bridges and friendship across countries involved in the Belt and Road Initiative."

Drawn by Kyrgyzstan's temperate climate, cuisine and the warmth of its people, he traveled to Bishkek in 2015 to open a practice, eventually founding the Zhongjing Traditional Chinese Medicine Research Institute, named after Zhang Zhongjing, a pharmacologist, physician of the Eastern Han Dynasty (25-220) and native of Henan.

"Since 2015 I've watched our patient base grow steadily as more locals welcome TCM's approach to wellness," Chang said.

"We don't do any advertising. Our patients arrive here through word of mouth. Gaining the recognition of the local community has been deeply rewarding."

For Kaparova, the true test of trust came this spring during a health crisis. With her blood pressure spiking dangerously high, Chang and his medical assistant Yao Meirong administered emergency treatment, performing a fingertip bloodletting technique, alongside targeted acupuncture on her head and legs.

"It was incredibly effective," Kaparova said, noting that she has since recommended Chang to her family, friends and even her own patients.

During the pandemic, in addition to offering clinical care, Chang offered free lectures on medical classics to local students such as Nargiza Duishongazieva to promote TCM thinking. Duishongazieva now serves as his apprentice, honing her skills under his guidance in both TCM theory and hands-on clinical practice.

Chang does far more than treat patients, Duishongazieva said, constantly explaining the rationale behind the treatment he is dispensing.

"Thanks to him, I have gained immense practical knowledge," she said.

"My dream now is to pursue postgraduate studies in China to elevate my professional skills so I can bring that expertise back here to help even more patients."

Rashid Yusupov, director of the Belt and Road Research Center of Kyrgyz National University for Nationalities, said practitioners such as Chang do far more than enrich the lives of people — they exchange complementary medical knowledge and cross-cultural dialogue, quietly yet effectively deepening the friendship and mutual understanding between the two nations.

CHINA

Shenzhen and Hong Kong authorities conduct the second cross-boundary stress test at the Huanggang Port in Shenzhen, Guangdong province, on Saturday. EDMOND TANG / CHINA DAILY

Port to aid single-document travel

Shenzhen crossing to simplify entry, exit from mainland for HK residents

By ATLAS SHAO in Hong Kong and **LI BINGCUN** in Shenzhen

Hong Kong residents will be able to use a single travel document — either their Mainland Travel Permit or Hong Kong identity card — to enter and leave the mainland through the new Huanggang Port when it opens.

The arrangement was announced by Chris Tang Ping-keung, secretary for security of the Hong Kong Special Administrative Region, on Saturday following the largest stress test to date at the revamped port.

The SAR government has coordinated closely with the central government and Guangdong provincial authorities to implement the arrangement, Tang said.

Under the existing immigration clearance system, Hong Kong residents making a two-way trip to the mainland are required to present two documents: their Mainland Travel Permit, also known as the Home Return Permit, to enter the mainland, and their Hong Kong identity card when returning to Hong Kong.

Once the new Huanggang Port begins operation, Hong Kong residents using e-channels will be able to use a single document for immigration clearance in both directions — either their Mainland Travel Permit, including permits issued to non-Chinese Hong Kong and Macao permanent residents, or their Hong Kong identity card.

A similar arrangement is already in place at three checkpoints connecting Zhuhai in Guangdong with the Macao Special Administrative Region — the Hong Kong-Zhuhai-Macao Bridge, Hengqin and Qingmao ports. The three crossings use a "collaborative inspection and joint clearance" model, which the new Huanggang Port will also adopt. Under the model, travelers need to wait in line only once for document inspection.

The new Huanggang Port, located in Shenzhen's Futian district, will replace the existing facility, which opened for passenger clearance in 1991 and is currently the only 24-hour checkpoint between Shenzhen and Hong Kong.

Hong Kong and Shenzhen authorities on Saturday conducted the largest stress test to date at the new port, involving 20,000 personnel and over 1,000 vehicles, to comprehensively assess customs clearance and emergency response capabilities during peak hours.

Tang said the exercise demonstrated the smooth operation and effective management of the facility by the Hong Kong and Shenzhen authorities. However, he noted that several areas still required improvement, including limited Wi-Fi capacity.

The exercise included drills covering key aspects of cross-boundary passenger and vehicle clearance, including pick-up and drop-off operations at public transportation hubs, inspection procedures for cross-boundary vehicles, the operation of joint inspection channels, passenger clearance procedures and a fire emergency response drill.

One drill simulated the arrival of 15,000 passengers from Shenzhen, divided into five batches of 3,000 people each. The batches arrived at five-minute intervals, corresponding to the train arrival schedules at Huanggang Port station on Shenzhen metro's Line 7.

Tang said the full-process pressure test, involving twice as many participants as a similar drill conducted a week earlier, proceeded smoothly. The maximum waiting time for immigration clearance was no more than 15 minutes.

The drill also marked the first test of the joint one-stop vehicle lanes for cross-boundary vehicle clearance.

The lanes integrate inspection functions across five departments in Shenzhen and the HKSAR, covering customs, immigration, border control and health and quarantine. The arrangement reduced vehicle clearance time to slightly more than one minute per vehicle, according to an on-site port employee responsible for the operation.

About 300 cross-boundary private cars were deployed to test the joint one-stop vehicle clearance lanes.

"The drill has achieved the expected results," Tang said.

On the Shenzhen side, the tests focused primarily on tiered and segmented crowd-control mechanisms, the capacity of security scanners and vehicle inspection procedures.

Liu Weixiang, director of the Office of Port of Entry and Exit of Shenzhen Municipal People's Government, said the exercise achieved its desired results.

The Shenzhen and Hong Kong authorities will carefully review and refine their plans to ensure that final preparations for the opening of Huanggang Port proceed smoothly and meet the highest standards, he said.

Kevin Lam, a Hong Kong resident who took part in the trial operations, said he was particularly impressed by the port's collaborative passenger inspection system, which reduced his clearance time from about 30 minutes to about five minutes.

Lam said he frequently visits Shenzhen for its food and that the new 24-hour facility would make it more convenient for him to return to Hong Kong in the evening.

However, given the hot weather and large crowds, he said he hoped the temperature inside the port could be lowered slightly to provide a more comfortable environment for travelers.

William Xu contributed to this story.

Lu Xun literary prize winners celebrated

By ZHANG KUN in Shanghai
zhangkun@chinadaily.com.cn

Delivery worker Wang Jibing was among winners of the Lu Xun Literature Prize, one of China's most prestigious literary awards, celebrated at a ceremony held in Shanghai on Friday.

The ceremony was held for the first time at the AIA Grand Theatre, where awards were presented to honorees across seven categories.

Wang, 58, won the poetry award for his collection *Flying Low*.

Having worked as a deliveryman for eight years, Wang said his collection was inspired by his daily work and conversations with more than 140 of his fellow delivery workers.

"I love my life and take it seriously, just as I love literature and take it seriously," Wang said after accepting his award.

"I believe literature can make the world warmer and softer," he said. "I portray a group of people who live life with the same seriousness, holding light in their hearts.

"Not all wings can soar high; flying low is also flying."

Quan Yongxian, 60, one of five winners in the novella category, said his generation had experienced civilizational progress and tremendous social changes that would normally take humanity hundreds or even thousands of years to undergo.

"Winning the Lu Xun Literature Prize has special significance to me," Quan said. "In our writing careers, having the chance to connect our own works with Lu Xun's name is an immense honor for us."

Ban Yu, who was awarded the prize for short stories, spoke about the mission of writers.

"Writing is about using yourself as a stepping stone to reveal everything in your heart," he said. "What we do is tell the stories that urgently need to be told, cast our sight on those lovable, gentle, kind and just people, and let literature illuminate a wider world."

Organized by the China Writers Association, the Lu Xun Literature Prize was founded in 1996 and is conferred every four years. This year's event coincided with the 90th anniversary of the death of Lu Xun (1881-1936), who is widely recognized as one of 20th-century China's greatest writers.

A day before the ceremony, the Shanghai Literature Museum was officially opened to the public.

Located at the intersection of Jiangxi North Road and Wujin Road in Hongkou district, the museum consists of a main building and three historical structures.

Its opening exhibition features the development and achievements of Shanghai literature through writers' manuscripts, rare vintage books, historical documents and immersive audiovisual experiences.

At the opening ceremony of the museum and the launch of Lu Xun Literary Week on Tuesday, Sun Ganlu, chairman of the Shanghai Writers' Association, announced that from this year on, the Lu Xun Literature Prize will be held in Shanghai permanently.

"This is an honor for the city, as well as its duty," he said.

Guests present awards to winners during the poetry award segment of the Lu Xun Literature Prize in Shanghai on Friday. GAO ERQIANG / CHINA DAILY

SOCIAL MEDIA FUELS CHINESE YOGA WEAR BOOM

Online marketing campaigns, stores help drive international interest in domestic brands

By ZHENG YIRAN in Shanghai
zhengyiran@chinadaily.com.cn

Amid the global yoga culture boom, Chinese yoga wear brands have expanded overseas and found favor with international consumers.

On TikTok, a young girl from the United States shared her thoughts on her recently discovered favorite brand CRZ YOGA — a sportswear brand from Guangzhou, Guangdong province.

In front of the camera, she tried on four sets of yoga wear. "The quality is good. The material is super light. I like the texture of the clothes. The color is what I look for. I wear CRZ YOGA to the gym every day," she said.

The video received thousands of likes and comments, and many other users also praised the Chinese brand.

Ashton and Ryan, a couple from the US, tried on yoga wear together in a video posted on TikTok. "I already went to the gym today, but I feel like going to the gym again," Ashton said. They also favor yoga wear from Halara — another Chinese brand.

Relying on a mature, flexible supply chain in China, domestic yoga clothing brands have established a high cost-effectiveness advantage. With platforms such as TikTok and Instagram, they are gaining popularity among overseas consumers.

On US online shopping giant Amazon, CRZ YOGA performs well, often occupying nearly half of the top 10 spots on the women's yoga pants bestseller list, and often taking the top spot on the women's sports short skirt list. Among its products, the high-waisted nude yoga leggings priced at $26 are the best-selling product under the brand, with over 26,000 user reviews on Amazon alone. Additionally, CRZ YOGA has also expanded its men's clothing line.

To enhance visibility and trust, CRZ YOGA has established a matrix of Instagram, TikTok and YouTube accounts in social media marketing, producing content based on the characteristics of different platforms.

On TikTok, it collaborates with small- and medium-sized influencers to shoot "one outfit, multiple wear" lifestyle videos, and showcase the versatility of products and achieving significant results. According to data from market researcher Jungle Scout, one of the brand's $32 yoga pants sold more than 80,000 units on TikTok in a month, with a monthly revenue of $2.84 million.

Yoga enthusiasts practice at a park in Lujiang county, Hefei, Anhui province, on Aug 6. CHAO ZHIBIN / FOR CHINA DAILY

Halara, a sportswear company based in Beijing, entered the US market in 2023. It opened several official TikTok accounts, including a main account with 700,000 followers, with content focused on dressing up and interacting with cute pets. Its popular topics have drawn more than 1 billion views.

Data from cross-border information platform Crosspie revealed that Halara ranked second in sales in the US sportswear category on TikTok in March 2025 and topped the charts in April.

The total sales of its four small stores in the US exceeded $63 million, and its flagship store Halara US has been ranked first in TikTok's sports and outdoor categories for four consecutive months. Influencers account for 58.23 percent of total sales. The independent website has received more than 13 million visits in the past three months, with 84.46 percent of the traffic coming from the US.

Gabby Hirata, president of Halara, said that going forward, the company will adjust the marketing style and content on social media, while increasing a new round of brand building.

"Our website will be optimized and adjusted based on the brand's tone and user habits.

"Also, we will continue to diversify our content creator team and continue to release some guidelines to encourage users to share what they want completely freely," she said.

Lin Xianping, executive deputy secretary-general of China Urban Expert Think Tank Committee, and associate professor at Hangzhou City University, said: "The reason behind domestic yoga clothing brands quickly opening up overseas markets is the flexible supply chain in China. Also, scenario-based product positioning meets the real consumption needs overseas, with high cost-effectiveness forming a strong market penetration, and short-video social media model reconstructing the overseas marketing path."

According to data from China Sporting Goods Federation, China's export value of sports equipment reached $28.39 billion in 2024, a year-on-year increase of 6.77 percent.

Mudslide: Temporary shelters established

From page 1

Ren Wei, executive vice-chairman of the regional government, said the rescue operations have been complicated by unstable geological conditions.

The disaster severely damaged National Highway G216, the main route to the Gyirong port. "The overall difficulty level of the rescue operation is far more than in a conventional geological disaster," Ren said.

Rescue teams opened a mountain route and used ropes to lower firefighters into the core area. Engineering teams were working to reopen G216 while searching for survivors and missing people along the road and nearby river. Two helicopters have flown into the core area to deliver supplies and transport personnel and victims, while specialized drones are providing communications support.

Basang Dondrub, a soldier from a unit of the Xizang Armed Police corps in Shigatse told China Daily that the force was continuing with road clearing and transportation work. "The machinery assisted in clearing roads and moving large rocks that couldn't be done manually. Meanwhile, personnel used shovels, pickaxes and their hands to dig and clear the ground and roads," he said.

Meanwhile, the barrier lake that had formed above the Gyirong port has basically drained, the Ministry of Water Resources said on Sunday, citing drone footage and images captured in the morning.

The ministry said an impact crater upstream of the barrier lake still warrants attention. Located about 5.6 km upstream at an altitude of around 3,700 meters, the crater is roughly 800 meters higher than the barrier lake.

Authorities are using satellite remote sensing, radar, hydrological monitoring and video surveillance to monitor the lakes, river channels and surrounding slopes. Eighty-six specialists have been sent to identify possible secondary hazards.

For evacuees, five temporary accommodation sites have been established, said Norbu Tsering, acting mayor of Shigatse.

The city has mobilized 380 Party members and officials, township workers and medical staff members to provide round-the-clock assistance. Special arrangements have also been made for the elderly, children, pregnant women and infants, he said.

Nyima Chozom, 28, from Kopa village in Salhe township, located adjacent to the mudslide stricken zone, said she was cutting grass in a field on Wednesday when she saw debris rolling down the mountainside opposite her village.

"It sounded deafening, almost like an earthquake," she said, adding that trees were swept away and objects outside her home shook violently.

All eight members of her family were safely evacuated to a hotel. "We are safe now, and the conditions here are good," she said.

She said most of her family's crops had already been harvested and she was reassured after learning that troops were helping villagers with farmwork.

Wang Chao, deputy director of the disaster relief department of the Ministry of Emergency Management, said that more than 100,000 relief items had been allocated, enough to meet current rescue and resettlement needs.

Glacier collapse underscores need for regional monitoring

Experts probe how climate warming may amplify Himalayan geological risks

By **ZHAO YIMENG** in Beijing and **ZHAO JUNFENG** in Chengdu

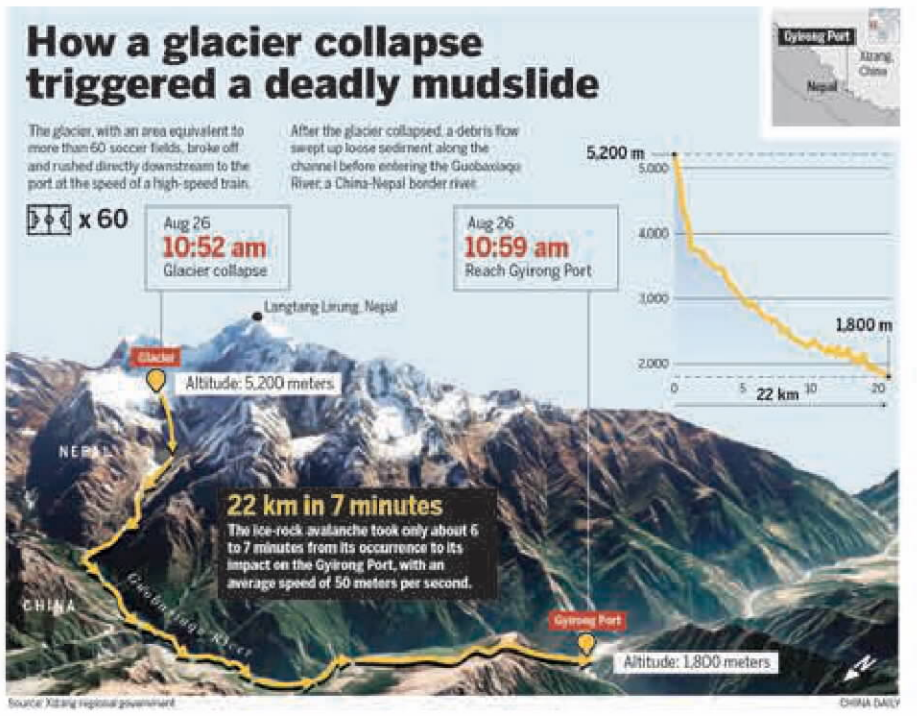
The collapse of a high-altitude glacier in Nepal triggered a deadly mudslide at a major China-Nepal border crossing. Experts said the underlying instability may be linked to a warming climate that is rapidly altering glaciers, permafrost and mountain slopes across the Himalayas.

The disaster occurred on Wednesday morning on the Nepal side of the border, sending a torrent of ice, rocks and debris toward Gyirong Port in Gyirong county, a major land crossing linking China and Nepal in Shigatse, Xizang autonomous region. The mudslide caused heavy casualties and left hundreds missing in China.

It was triggered by the collapse of a glacier at an elevation of about 5,200 meters on the southern slope of Langtang Lirung in Nepal. The glacier broke apart at about 10:52 am on Wednesday, triggering an ice-rock avalanche, the Xizang regional government said on Sunday.

The avalanche rapidly descended to an elevation of about 4,000 meters, scouring the mountain slope and generating a massive debris flow. It traveled 22 kilometers in seven minutes before reaching Gyirong Port, at an elevation of about 1,800 meters.

The disaster flattened about 0.7 square kilometers of the area and destroyed 27 buildings and associated facilities, authorities said.



The findings were based on an analysis of remote-sensing data and information transmitted from the disaster site, combined with field inspections and interviews conducted by a cryosphere emergency disaster mitigation team from the Chinese Academy of Sciences' Institute of Mountain Hazards and Environment in Chengdu, Sichuan province.

Xu Qiang, president of Chengdu University of Technology, said the disaster's extreme destructive power was driven by geological factors, including the huge elevation drop of more than 3,000 meters.

The massive volume of debris and the sudden onset of the collapse also left little time for warning or response, Xu said.

The US Geological Survey similarly found that the disaster was likely triggered by a rapid slope failure involving a glacier in the Langtang National Park in Nepal.

Ben Mirus, a research geologist with the USGS, said glacier collapses combined with debris avalanches are relatively uncommon, but large landslides and rockfalls can cause devastating damage.

> After the disaster, we immediately contacted experts in Nepal, but they also lacked data from relevant weather stations to confirm the conditions at the site."
>
> **Fan Xuanmei,** director of the State Key Laboratory of Geohazard Prevention and Geoenvironment Protection

However, while scientists have identified the immediate mechanism, they have yet to determine why the glacier and surrounding rock became unstable and collapsed at that particular moment.

"It's really hard to attribute the exact trigger for this particular glacial collapse," Mirus said.

According to local meteorological data, there was no heavy rainfall near the outlet of the debris flow at the time of the disaster, making it unlikely that intense rainfall alone could explain the event.

Fan Xuanmei, director of the State Key Laboratory of Geohazard Prevention and Geoenvironment Protection at Chengdu University of Technology, said that, based on current evidence, the collapse was likely the result of a combination of the region's geological setting and a warming climate.

The Himalayas are located along the collision boundary between the Indian and Eurasian tectonic plates. Continued tectonic activity has fractured mountain rock and contributed to frequent earthquakes, leaving slopes vulnerable to failure.

"Against this long-term tectonic backdrop, climate warming is acting as an important 'amplifier'," Fan said.

She added that rising temperatures are accelerating the melting of snow and ice, intensifying freeze-thaw weathering of rock and reducing the stability of snow cover and glaciers, "thereby increasing the likelihood of large-scale avalanches, glacier collapse and rockfalls".

As glaciers retreat, they can also expose and leave behind large quantities of loose rock and sediment that can later be mobilized by a collapse, she said.

Since the Industrial Revolution, the world has warmed by about 1.4 C, according to the Copernicus Climate Change Service.

China Meteorological Administration data shows that the Qinghai-Tibet Plateau's average temperature increased by 0.37 C per decade between 1961 and 2022, faster than global and national averages.

The changing climate is also affecting the region's water systems. The area of lakes in 12 major river basins on the plateau increased 36.7 percent from 1990 to 2020, according to the administration.

Experts warn that these changes can create interconnected hazards rather than isolated disasters.

"Detecting such failures before they occur is extremely difficult," Fan said.

Potential source areas are often above 5,000 meters, where conventional field monitoring is difficult. Satellite observations can be limited by snow and ice cover and steep terrain, while monitoring equipment has to operate in extreme cold and high-altitude conditions.

"We also lack mature models capable of reliably predicting the complete chain from glacier or rock collapse to debris flow, mudslide and downstream flooding," she said.

The disaster also revealed gaps in cross-border monitoring. The debris flow reached China from the apparent source in Nepal within minutes, leaving little time for information to be transmitted to communities downstream.

"After the disaster, we immediately contacted experts in Nepal, but they also lacked data from relevant weather stations to confirm the conditions at the site," Fan said.

The changing Himalayan environment has made cooperation increasingly important, experts said.

China and Nepal could jointly build high-altitude meteorological and hydrological monitoring stations, share satellite remote-sensing and seismic data and establish rapid cross-border disaster notification mechanisms, Fan said.

Such efforts could also expand across the Himalayas, bringing together China, Nepal, India, Pakistan and international research institutions to develop shared monitoring networks and early-warning technologies, she added.

261 foreigners missing in disaster-hit Xizang

By **PALDEN NYIMA** in Gyirong, Xizang and **CAO YIN** in Beijing

A total of 261 foreign nationals remained unaccounted for after a massive mudslide hit a border port in Gyirong county, Shigatse, Xizang autonomous region, local authorities said on Sunday.

The foreigners, from 23 countries, include 104 from Nepal, 49 from India, 18 from the United States, 15 from the United Kingdom, six from Canada, six from Australia, four from South Africa and three from Russia.

The figures were announced at a news conference held by the regional government's information office, following joint searches and the cross-checking of information by authorities responsible for foreign affairs, public security, culture and tourism and emergency management.

After multiple rounds of inspections and population verification at the border port, no foreign tourists remained in Gyirong county, said Zhao Peng, vice-chairman of the regional government.

According to Zhao, who also serves as the deputy head of the disaster emergency and rescue command headquarters, the sudden and severe mudslide caused extensive damage to infrastructure and personnel records in the affected area, significantly hampering efforts to trace and verify information about those who are unaccounted for.

He said information on the unaccounted-for foreign nationals had been reported to their respective embassies. Two 24-hour English-language hotlines — 0086-891-6817165 and 0086-183-08026705 — have also been established for the families of the missing foreign nationals.

Foreign nationals currently registered in the county are primarily Nepali border residents, cross-border vehicle crews and Nepali individuals involved in international marriages, all of whom are safe, Zhao added.

> For Nepali border residents wishing to return to their home country, we will carry out transfer, transportation and customs clearance processes in a careful and orderly manner."
>
> **Zhao Peng,** vice-chairman of Xizang autonomous region and the deputy head of the disaster emergency and rescue command headquarters

"For Nepali border residents wishing to return to their home country, we will carry out transfer, transportation and customs clearance processes in a careful and orderly manner," he said. "For those who voluntarily choose to stay in Xizang, we will provide security and living support."

He emphasized that staff members will consistently respect the wishes and reasonable demands of the Nepali side, adhering to the principles of friendly consultation and prioritizing humanitarian needs.

A thorough evaluation will also be conducted to assess the departure needs of foreign tourists in Xizang, Zhao said, adding that authorities will facilitate their exit through ports in Lhasa, Burang and Zhangmu while ensuring their safe and smooth departure.

Additionally, communication with embassies in China will be maintained and strengthened to report work progress in a timely manner, he added.

Clearing the way

Officers of the Chinese People's Armed Police Force clear debris and inspect damaged sections of G216 national highway in Gyirong county, Shigatse, Xizang autonomous region, on Sunday.
WEI XIAOHAO / CHINA DAILY

China dispatches supplies, rescuers to render aid

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

China delivered 50 metric tons of emergency relief supplies to Nepal on Sunday and dispatched nine tunnel rescue experts to assist with rescue operations following a deadly mudslide on Wednesday.

According to the Chinese embassy in Nepal, two Y-20 transport aircraft operated by the People's Liberation Army Air Force carrying 13,200 relief supplies arrived at Tribhuvan International Airport in Kathmandu on Sunday morning.

The supplies included tents, blankets, sleeping bags, compressed food items and first-aid kits. They will be distributed in disaster-hit areas to help meet the basic living and emergency medical needs of those affected.

Four Chinese tunnel rescue experts and their equipment arrived in Kathmandu with the supplies, while five others had already reached the disaster area by helicopter from Gyirong county in China's Xizang autonomous region on Saturday and begun working at a hydropower station.

> **13,200**
>
> items of relief supplies arrived in Kathmandu on Sunday morning aboard two PLA Air Force Y-20 transport aircraft, according to the Chinese embassy in Nepal.

The delivery of relief supplies and the expert missions marked the latest progress in implementing China's assistance package for Nepal, which Foreign Minister Wang Yi said during a phone call with his Nepali counterpart Shisir Khanal on Saturday included emergency cash assistance and humanitarian aid.

Wang said a sudden glacier collapse in the China-Nepal border area had triggered severe mudslides, causing significant casualties and leaving people missing on both sides.

He described it as the most serious cross-border disaster between the two countries in recent years, adding that the complexity and difficulty of the rescue and relief operations were unprecedented.

Wang said a meeting of the Political Bureau of the Communist Party of China Central Committee had called for emergency aid to Nepal's disaster-hit areas and international rescue cooperation, noting that it was an important political decision reflecting China's friendship with Nepal.

China has also shared important information with Nepal, including imagery, satellite and hydrological data from the disaster-hit area, as well as early-warning information on upstream barrier lakes, Wang said.

Regarding Nepali citizens stranded on the Chinese side, Wang said China had made proper arrangements for them and would help them return to Nepal as soon as possible.

He thanked Nepal for its efforts to rescue and evacuate Chinese citizens in need, expressing hope that the Nepali side would continue such efforts.

In the face of the disaster, Wang called on China and Nepal to stand firmly together, work together to overcome the difficulties and demonstrate their traditional friendship across the Himalayas through concrete actions.

Khanal expressed sincere gratitude for China's emergency humanitarian assistance.

He said that although both Nepal and China had been affected by the disaster, China had overcome its own difficulties to convey sympathy and provide assistance to Nepal at the earliest opportunity, fully demonstrating the high level of Nepal-China relations.

Nepal will continue to work closely with China and make every effort to rescue Chinese nationals who remain trapped or missing, while working together to locate and rescue all missing foreign nationals, Khanal said.

He added that Nepal is ready to strengthen cooperation with China and further advance the strategic partnership between the two countries through post-disaster reconstruction and efforts to prevent and mitigate disasters, including responses to climate change.

Figures released by Nepal's National Disaster Risk Reduction and Management Authority showed that workers had recovered 734 human remains from mudslide-hit areas as of 9 am local time on Sunday, with 2,498 people still missing.

Netizens hail officers stranded at Gyirong Port

By **CAO YIN**
caoyin@chinadaily.com.cn

Thousands of netizens have left messages of support on the social media account of the local border inspection station in the Xizang autonomous region, after a mudslide originating in Nepal hit Gyirong Port in Shigatse on Wednesday, leaving personnel out of contact.

The official WeChat account of the Xizang general station of entry and exit border inspection, which oversees Gyirong Port, said on Saturday that it had been inundated with messages, prayers and good wishes from netizens across the country since Wednesday.

The post also featured a short video of officers at Gyirong Port. As of Sunday afternoon, the video had received about 130,000 likes, been forwarded over 11,200 times and had about 12,000 comments.

One netizen, with the username "Nanshanxianke", commented on the video: "They (the station officers) guard the nation's gateway with their lives." Others responded with prayers, saying, "May a miracle be with them, and may they all return safely."

"They are the pillars of their families. This is a tragedy for so many households," wrote a netizen named "Hezhouhuaer".

Another user, "Wuxibancaijiejie", posted a photo of a young woman in uniform sitting on a sofa, with a caption that read: "We are all waiting for you to come back. You have never made us worry during your more than a decade of service at the border. We believe you will return safely this time too. Your 1-year-old son calls out 'mom' every day."

Netizen "Yanjun" wrote: "Tears welled up in my eyes. Though we are strangers to one another, our hearts are connected. You are the people I respect the most."

The station concluded the post with an appeal for hope: "We seek no grand ode to heroism — only a miracle that endures. May it come, and may our fellow officers return safely."

Editorials

Strengthen genuine partnerships through dialogue, cooperation and concrete results

In response to the evident need for a more just and equitable global governance system, President Xi Jinping put forward the Global Governance Initiative at last year's "Shanghai Cooperation Organization Plus" Meeting in Tianjin. The theme of this year's SCO Summit in Bishkek, Kyrgyzstan — "Together Toward Sustainable Peace, Development and Prosperity" — and its agenda highlight that the organization can help put the GGI into practice.

Xi is attending the SCO Summit 2026 and paying state visits to Kyrgyzstan and Egypt from Sunday to Thursday. The SCO's thriving development over the past 25 years demonstrates the appeal of a new type of international relations based on multilateralism and cooperation rather than unilateralism and bloc confrontation. The steady development of China's relations with Kyrgyzstan and Egypt over the decades shows how genuine partnerships can translate into tangible benefits for people.

The symbolic value of the Bishkek summit lies in underscoring the model of global governance the SCO represents. Sovereign equality, the rule of law, multilateralism, people-centered development and concrete actions are not abstract principles. They can be tested and demonstrated through security cooperation, connectivity, trade, technological innovation, cultural exchanges and improved livelihoods, as shown in the development of relations between China and Kyrgyzstan.

Over the 34 years since the establishment of diplomatic ties, their relationship has withstood the test of a changing international landscape, maintained sound and stable development throughout, and reached the high level of a comprehensive strategic partnership for a new era.

As Xi said upon his arrival in Bishkek on Sunday, China-Kyrgyzstan cooperation has ushered in a "golden period" of rapid development.

The development of the bilateral relationship, which is defined by good-neighborliness, friendship and shared prosperity, is measured not simply in trade volumes or infrastructure projects, but in better connectivity, greater opportunity and closer human ties. Two-way visits exceeded 400,000 last year, and 30 pairs of sister provinces and cities enjoy close ties, cementing the foundation for lasting friendship.

As founding members of the SCO and members of the Global South, the two countries share an interest in upholding international fairness and justice, opposing unilateralism and bloc confrontation, and promoting an equal and orderly multipolar world and a universally beneficial and inclusive economic globalization.

Kyrgyzstan's election as a nonpermanent member of the UN Security Council provides another opportunity for the two countries to strengthen coordination within the UN and promote a more just and equitable global governance system.

This year is the start of China's 15th Five-Year Plan (2026-30). Kyrgyzstan is implementing its National Development Program until 2030 and making all-out efforts to build a "New Kyrgyzstan". Pursuing mutual benefit and win-win results is essential for the enduring vitality of their cooperation. The two neighbors should take a long-term view, focus on high-quality Belt and Road cooperation, and continuously upgrade practical cooperation in not only trade, investment, connectivity and green mining but also the digital economy, clean energy, artificial intelligence and other emerging fields.

Xi's visit to Egypt will also inject vitality into China-Egypt relations. This year marks the 70th anniversary of their diplomatic relations. The two countries have developed a comprehensive strategic partnership through political trust, economic cooperation and people-to-people exchanges.

China stands ready to work with Egypt to deepen cooperation in economy, trade, military, AI and other sectors, enhance coordination on multilateral affairs, and jointly build a China-Egypt community with a shared future in the new era. The two countries share extensive common ground in international and regional affairs and shoulder significant responsibilities in maintaining international and regional stability.

As evidenced by the development of China-Kyrgyzstan and China-Egypt relations, differences in history, culture, social systems and stages of development should be a source of dialogue and cooperation.

The growth of the SCO likewise shows that countries can manage their differences through dialogue, pursue common interests through cooperation and build trust through concrete results. By carrying forward the Shanghai Spirit, deepening cooperation and translating the GGI's principles into action, the SCO can make new contributions to regional peace, stability and prosperity.

US unilateral economic coercion hegemonic

In an attempt to tighten the noose on Iran's economic lifeline, the United States administration launched "Operation Economic Outcast: Total Isolation of the Iranian Regime", seeking to sever the country's financial connections around the world. Yet one of the grave consequences of this aggressive restrictive measure is the collateral damage it inflicts on the global economy. By weaponizing the US financial prowess and targeting any entity that allegedly does business with "blacklisted" Iranian companies, the US seems ready to turn a regional conflict it started, along with Israel, into a global economic disruption and a potentially existential threat to the very "rules-based" order it claims to uphold.

Kameng Trading Ltd, a Hong Kong-registered company, has become the latest Chinese victim of the US administration's escalating enforcement drive, after the US Treasury Department announced on Friday it would sanction the company over alleged "money-laundering" ties to an Iranian institution — claims that, as ever with such US allegations, have not been substantiated. The move comes only days after the US imposed a fresh round of Iran-related sanctions against multiple Chinese entities. The US administration has also hinted at possible sanctions against major Chinese financial institutions over their alleged "links" to Iran.

The reckless moves by the US constitute a flagrant abuse of extraterritorial jurisdiction, and are in blatant violation of international law and the basic norms governing international relations. These measures not only threaten to disrupt global energy markets and exacerbate inflation, but also hurt countries that are not party to the US-Iran conflict. The punishment the US metes out against third parties is about the US leveraging its control over the global financial system to force other countries into doing what it wants.

The Chinese government has expressed firm opposition to these unilateral and unlawful sanctions, and has made it clear that it will take all necessary measures to resolutely protect the legitimate rights and interests of Chinese entities.

Over six months after the US and Israel launched "Epic Fury" against Iran, the promised "quick victory" has failed to arrive. Not a single preset goal — regime change or the dismantling of Iran's nuclear and missile programs, has been met. The White House's prediction that the war would last only "four to six weeks" now stands as proof of strategic miscalculation, shattered by a protracted stalemate that has exposed the limits of the US' military reach. Faced with this impasse and confronted with mounting domestic discontent, the US administration has reverted to its old standby of maximum economic pressure. Yet this coercive approach will likely meet the same dead end as the military campaign that preceded it.

Iran has already endured US sanctions for decades, and not been brought to its knees under external pressure. If anything, each new round of restrictions only reinforces its "defiance". Washington's calculus — that squeezing the Iranian people with sanctions will spark a popular uprising — comes at a high cost. The immediate result will be deeper suffering for the Iranian people, and along with that, more resentment toward the US.

To coerce other countries into unquestioningly following the US' lead, the US administration is threatening to cut off disobeying nations from the dollar system, a move that will only accelerate the global push for de-dollarization.

History shows that the more the US imposes unilateral sanctions, the more likely it is to incentivize the rest of the world to build work-arounds, such as creating alternative payment systems, developing parallel financial infrastructure, or conducting trade in currencies other than the dollar. The US is therefore hastening the de-dollarization of the global economy with its economic attack on Iran, undermining the very foundation of its own financial hegemony.

The US cannot bomb or sanction Iran to shape it to its liking. A true resolution to the hostilities demands a strategic pivot from coercion to diplomacy. Dialogue, not isolation, offers the only viable path to resolve the conflict. Military options breed endless cycles of retaliation; and sanctions punish civilians and harm the world economy. Negotiation is the harder choice, yet it is the means to deliver peace and avert another cycle of conflict.

Mudslide disaster grave warning the world can't afford to ignore

The speed at which a glacier can become a disaster was revealed high in the Himalayas, at an elevation of roughly 5,200 meters, when a glacier on the Nepalese side of the China-Nepal border fractured, unleashing a cascade of rock and ice. But what began as an ice avalanche soon became a high-speed debris flow and then turned into a catastrophic mudslide. By the time it reached Gyirong Port in China's Xizang autonomous region, it was hurtling at roughly 50 meters per second — about 180 kilometers per hour. The entire sequence from the initial collapse to the devastating arrival of the mudslide at Gyirong Port took only about seven minutes, leaving no time for prewarning and causing heavy casualties.

Scientists have long warned that glaciers around the Qinghai-Tibet Plateau and the broader Himalayan region — the so-called Third Pole and the largest body of ice outside the Arctic and Antarctic — are becoming increasingly unstable as the planet warms. Glaciers are extraordinarily sensitive to temperature changes. Human-induced warming has been the primary driver of widespread glacial retreat since the 1990s. This continued melting does not merely make glaciers smaller but also destabilizes them, markedly increasing the likelihood of ice, rock and water moving together. As the climate warms, such glacial chain disasters are becoming more frequent, more widespread and more destructive.

The glacier is, in this sense, more a messenger than a culprit. The years from 2015 through 2025 were the 11 hottest on record. Global greenhouse-gas emissions reached a record high, while glaciers worldwide lost an estimated 408 gigatonnes of mass in 2025 alone — equivalent to filling five Olympic-sized swimming pools every second of the year. The Himalayas are among the regions that suffered the greatest losses.

Yet, when such disasters occur, responsibility is often discussed as though emissions were neatly confined within national borders.

They are not.

A smartphone assembled in Asia does not become environmentally benign because its eventual buyer lives in California. National emissions inventories generally count pollution where production occurs, even if production serves consumption elsewhere. The result is a peculiar accounting system in which wealthy societies consume carbon-intensive goods while much of the associated pollution appears on somebody else's ledger. For instance, while the US' territorial energy-related carbon dioxide emissions reached roughly 4.9 billion metric tons in 2025, its consumption footprint is significantly higher, revealing the carbon cost of outsourcing production.

This matters because the climate crisis is fundamentally a question of cumulative emissions. The US alone is responsible for roughly one-fifth of all cumulative carbon dioxide emissions since 1850, with the European Union accounting for about 12 percent. Taken together, developed nations have emitted 60 to 65 percent of all greenhouse gases while representing less than 15 percent of the world's population.

The developed economies have benefited enormously from more than two centuries of carbon-intensive industrialization. They cannot plausibly present themselves as innocent bystanders when the consequences of their prosperity manifest in poorer and more vulnerable parts of the world.

Nor is climate finance charity. The principle of common but differentiated responsibilities recognizes a basic fact: countries share a common interest in stabilizing the climate, but they do not share identical histories or capacities. The Paris Agreement explicitly requires developed countries to provide funds and technological support to developing nations. The pledge made in 2009 to mobilize $100 billion annually by 2020 was met two years late. Even now, the new target of $300 billion per year by 2035 remains a fraction of the $2.4 trillion that UN experts estimate developing countries actually need every year.

This makes the upcoming COP31 meeting in Antalya, Turkiye, more than just another diplomatic gathering. It should be a test of whether climate promises can evolve into practical solidarity. The conference is expected to address climate finance, the transition away from fossil fuels and measures for building climate-resilient societies.

Will wealthy countries provide developing countries the finance and technology needed not merely to reduce emissions but also to survive the consequences of warming that are already unfolding? The old answer — that everyone is responsible, therefore everyone is equally responsible — is morally convenient but scientifically inadequate. A glacier does not know where a factory is registered. Carbon dioxide does not carry a passport.

The mudslide along the China-Nepal border should therefore be seen as a warning from our warming planet. The question at COP31 is whether the world's wealthiest economies will heed this warning and acknowledge that helping vulnerable countries confront the consequences is not generosity, but part of the bill for a crisis from which they have benefited for generations.

— LI YANG, CHINA DAILY

What They Say

Deeper China-ASEAN ties can boost regional growth

Editor's note: *This year marks the fifth anniversary of the comprehensive strategic partnership between China and the Association of Southeast Asian Nations. China News Service spoke to Xu Liping, a professor of the National Institute of International Strategy at the Chinese Academy of Social Sciences, to discuss the outcomes of this collaboration and the opportunities presented by China's 15th Five-Year Plan (2026-30). Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The China-ASEAN Free Trade Area 3.0 Upgrade Protocol is expected to accelerate institutional opening-up, enabling both sides to play a more active role in shaping international rules in emerging sectors such as the digital economy, green economy and e-commerce supply chains.

The Global South countries should cooperate across multiple levels and channels to reform and make global governance more equitable. This involves promoting reform of the United Nations Security Council and increasing the influence of the Global South in the World Bank, the International Monetary Fund and the World Trade Organization.

New multilateral mechanisms, such as the Shanghai Cooperation Organization, offer the Global South a fresh model of cooperation based on equality and non-bloc confrontation, while the Asian Infrastructure Investment Bank addresses gaps in the current financial system by funding infrastructure development.

The China-ASEAN Free Trade Agreement and its subsequent upgrades have ensured steady bilateral cooperation. As both sides accelerate their modernization efforts and connectivity networks take shape, the region has become one of the world's fastest-growing and most promising unified markets.

Since establishing dialogue relations in 1991, China and ASEAN have continuously upgraded their ties. To date, China has reached agreements with eight ASEAN member countries to build a community with a shared future, fostering growing political trust. For the past six years, China and ASEAN have remained each other's largest trading partners, with annual bilateral trade exceeding $1 trillion.

ASEAN countries are key partners in the Belt and Road Initiative. Infrastructure projects such as the Phnom Penh-Sihanoukville Expressway, the Siem Reap Angkor International Airport, the China-Laos Railway and the Jakarta-Bandung High-Speed Railway have significantly enhanced local connectivity. The Sihanoukville Special Economic Zone in Cambodia and the China-Malaysia industrial parks in China's Guangxi Zhuang autonomous region and Pahang, Malaysia, have boosted industrialization in the region.

China's 15th Five-Year Plan calls for expanding high-standard opening-up, providing fresh impetus for deepening China-ASEAN cooperation. By emphasizing further opening up of the country's service sector, the plan will create new opportunities for service-sector workers on both sides. It also highlights high-quality development and the growth of new quality productive forces, opening up new avenues for cooperation in high-tech industries, especially artificial intelligence, the low-altitude economy and the green economy.

Furthermore, the plan stresses investment in human capital, which will enhance bilateral cooperation in human resources, including the joint cultivation of high-tech talent and cooperation in vocational education.

VIEWS

Djoomart Otorbaev

Marking a new stage for SCO

The Shanghai Cooperation Organization will celebrate its 25th anniversary with a summit in Bishkek on Sept 1, following preparatory events on Aug 31, a date that holds special significance as Aug 31 is Kyrgyzstan's Independence Day.

Since its founding in Shanghai in 2001, the SCO has grown to a scale that was hard to imagine 25 years ago. The SCO now has 10 member states: China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan, India, Pakistan, Iran and Belarus.

Together they cover about 36 million square kilometers and are home to more than 3.4 billion people. The organization therefore represents one of the world's largest concentrations of territory, population and economic potential.

For much of its early history, the organization was primarily a security mechanism. The fight against terrorism, separatism, extremism, drug trafficking and transnational crime formed the core of its institutional development.

That function remains essential, but the theme of this year's summit, "25 Years of the SCO: Together for Sustainable Peace, Development, and Prosperity", highlights the broadening of the expanded group's focus from security to economic development across Eurasia.

Recent SCO decisions have established new specialized structures, including the Universal Center for Countering Security Challenges and Threats, the Anti-Drug Center, and mechanisms for dealing with information security and organized crime.

But the economic dimension is impossible to separate from security and it has come to the fore. A railway, energy pipeline, digital network or payment system can be as strategically important as a security agreement. This is where the Bishkek summit becomes a test of the organization's maturity.

The expected Bishkek Declaration will provide the political framework for the next stage of SCO development.

Other documents under preparation concern security cooperation, information security, combating illegal drugs and the functioning of specialized institutions.

Yet the most consequential question may be economic.

Kyrgyzstan has placed transport connectivity, financial cooperation and digitalization among the priorities of its chairmanship. The proposed SCO Development Bank is particularly important. When established, the bank could eventually provide a mechanism for financing infrastructure and investment in the SCO region without relying exclusively on Western financial institutions.

This does not mean that the SCO should attempt to create an isolated economic bloc. Such an approach would contradict the interests of most member states, which pursue multi-vector foreign policies and maintain extensive relations with Europe, the United States, Japan and other economies.

Three concepts should define the SCO's next stage: connectivity, pragmatism, and autonomy.

Connectivity means more than constructing railways. It requires compatible customs procedures, digital documentation, logistics platforms, energy networks, telecommunications, and financial settlements. The China-Kyrgyzstan-Uzbekistan railway is particularly significant because it can reshape Central Asia's economic geography.

It is not simply another railway; it can connect China more directly with Central Asian and, subsequently, European, Middle Eastern, and other markets.

The same idea holds for the Trans-Caspian International Transport Route. Unlocking Central Asia's full potential requires faster border procedures, reliable cargo insurance, digital customs systems, predictable tariffs and solid physical infrastructure.

Pragmatism is equally important. The SCO contains countries with different political systems and strategic interests. Yet these differences need not prevent its members from pursuing common interests and practical cooperation.

The third concept is autonomy. SCO members are increasingly interested in reducing vulnerabilities created by excessive dependence on external financial and technological systems. This trend includes expanding settlements in national currencies, greater use of the yuan, developing alternative payment infrastructure, and the proposed SCO Development Bank.

At the May 2026 meeting of SCO finance ministers and central bank governors in Bishkek, participants discussed national-currency settlements, financial digitalization and new mechanisms for financial cooperation.

China occupies a special position in this transformation. Over the past two decades, China's role in Central Asia has changed fundamentally. Chinese companies now participate in the construction of roads, railways, energy projects, telecommunications, electric transport, digital commerce, and advanced manufacturing.

This transformation is visible in everyday life. Chinese electric buses have entered the public transport systems of Central Asian cities. Chinese electric vehicles increasingly dominate new-car imports. Chinese smartphones, digital platforms and consumer electronics have become ordinary features of urban life.

The Belt and Road Initiative is central to this process. Its particular importance for Central Asia is geographical: the region's greatest historical disadvantage — its landlocked position — can become an advantage if Eurasia develops efficient continental transport corridors.

China's broader international role also matters for the SCO. Beijing has increasingly combined infrastructure, finance, technology and diplomacy. The China-SCO Artificial Intelligence Application Cooperation Center, whose construction plan was unveiled at the China-SCO Artificial Intelligence Cooperation Forum in Tianjin in May 2025, highlights the growing technological dimension of China's engagement with the organization.

The SCO should nevertheless resist the temptation to define itself as an anti-Western alliance. That would weaken rather than strengthen it. Its members have no common interest in bloc confrontation.

The more powerful message is constructive: Eurasia needs additional institutions capable of protecting trade, financing infrastructure, managing supply-chain risks and facilitating technological cooperation.

This is particularly important in an era of geopolitical volatility. The SCO's next task, therefore, should be to build resilience through payment and clearing mechanisms, liquidity arrangements, cargo insurance, transport coordination, energy cooperation and digital-security systems that allow commerce to continue when external financial or political pressures increase.

The organization is not replacing the existing world order. Nor should it claim to. Its significance is more practical.

For Kyrgyzstan, the Bishkek summit is more than just a diplomatic gathering. It tests whether a relatively small Central Asian country can bring together leaders from 10 major Eurasian nations and turn symbolic gestures into concrete agreements.

For the SCO itself, the anniversary marks a significant milestone in its development.

Twenty-five years ago, the organization was founded with a focus on regional security. Today, at 25, its goal is broader: to transform geographic closeness into economic ties, turn differences into practical cooperation, and leverage economic influence to build lasting institutions.

If Bishkek succeeds in driving this change, the summit will be remembered not only as an anniversary but as an important step toward shaping the future of Eurasian collaboration for the next twenty-five years.

The author is a former prime minister of the Kyrgyz Republic.

Gulzada Kuvanychbekovna Turdubaeva

Helping to break the ice on climate cooperation

Climate change is no longer a distant environmental concern, but has become a matter of water and food security, particularly for countries like Kyrgyzstan.

With more than 90 percent of Kyrgyzstan being mountainous, its glaciers and snowfields play a critical role in sustaining river systems across Central Asia. The World Bank describes these high-elevation glaciers as the "Water Tower of Central Asia", underscoring their importance to regional agriculture and hydropower.

But the changing climate is putting this system under strain. Kyrgyzstan is experiencing more frequent and intense storms, landslides, floods, droughts and heat waves, while rising temperatures are increasing pressure on irrigation and agricultural productivity.

This is why climate cooperation deserves a more prominent place on the Shanghai Cooperation Organization agenda.

The organization is already moving in this direction. Environmental protection has become an established area of cooperation, supported by regular meetings of environmental authorities and expert mechanisms.

One promising area is joint environmental and glacier monitoring. Climate risks do not respect national borders, while climate data is often collected and processed nationally.

The 2024 Joint Communiqué of the SCO Council of Heads of Government called for accelerating the work of the Special Working Group on Climate Change.

Such a mechanism would allow countries to maintain control over national data while agreeing on common indicators, technical standards and procedures for exchanging selected information.

China, with its advanced capabilities in remote sensing, satellite observation, digital technologies and environmental monitoring, could make contributions to such cooperation.

A second priority should be establishing early warning systems for regional disasters. Mountain ecosystems are particularly vulnerable to cascading risks. Rapid snow and glacier melt can lead to floods and mudflows, while changing precipitation patterns and prolonged dry periods can strain agriculture and water systems.

The SCO could develop an interoperable early-warning network linking meteorological, hydrological and emergency-management institutions.

Cross-border information exchange is particularly valuable in river basins and mountain areas where hazards can affect neighboring territories.

LI MIN / CHINA DAILY

Technology exchange for climate adaptation is another crucial area. Climate cooperation should not be limited to measuring the problem.

It should help countries adapt their economies and infrastructure to evolving conditions.

Cooperation between China and Central Asian countries can be particularly significant. Kyrgyzstan is already investing in modernizing irrigation, improving water measurement and monitoring, strengthening water regulation and enhancing agricultural resilience.

The SCO could provide a platform for countries to share such experiences and connect technological solutions with local needs. Rather than treating climate technology as a one-way transfer, cooperation should encourage joint research, pilot projects, training and localization of technologies.

The protection of mountain ecosystems and glaciers is also vital. Kyrgyzstan has particular experiences and interests in this area.

International cooperation has supported efforts to strengthen monitoring of glaciers, snow cover and mudflows, as well as sustainable landscape management and regional cooperation among Central Asian countries.

The SCO could build on these efforts by creating a network of mountain research institutions and analytical centers.

Climate resilience is an investment in regional development. Investment in resilient water systems, renewable energy, sustainable agriculture and green technologies can create new economic opportunities.

For the SCO, this creates a natural connection between environmental cooperation and the organization's broader economic agenda. Climate-resilient infrastructure can support connectivity. Efficient water use can strengthen food security.

Thus, climate cooperation should not be viewed as a separate environmental track. It can become a cross-cutting component of the SCO's work on development, connectivity, agriculture, energy, science and technology.

The SCO is well positioned to contribute because its member states combine substantial scientific, technological and financial capabilities with diverse environmental conditions and practical experience.

The question is no longer whether climate issues belong on the SCO agenda, but whether the organization can turn existing environmental cooperation into a practical system for building regional resilience.

For Kyrgyzstan, glaciers are a reminder that environmental security and human security are inseparable. For the SCO, climate cooperation offers an opportunity to turn a common vulnerability into a new pillar of practical partnership.

The author is a chief expert of the Department of International Cooperation at the National Institute for Strategic Initiatives under the President of the Kyrgyz Republic.

Hu Qimu

The hidden cost of permanent daylight saving time

An hour may seem trivial, but in Washington it has triggered a significant political debate. The US leader is advocating for the Sunshine Protection Act, which aims to implement daylight saving time throughout the year, thus ending the ritual of adjusting clocks twice a year.

Supporters of the move see an obvious benefit: no more fiddling with clocks, more daylight after work and, perhaps, more time for shopping, dining and recreation.

It is an appealing proposition, but also an incomplete one.

The fundamental question is not whether US citizens would like an extra hour of evening light, but who benefits from that hour and who bears the cost.

Daylight saving time was not designed as a permanent fixture. Germany introduced it during World War I as an emergency measure to conserve fuel and electricity. Other nations soon followed.

The logic was straightforward: shift an hour of daylight from the morning, when many people are asleep or beginning their day, to the evening, when they are more likely to need artificial light.

After the war ended, the clocks moved back. The idea returned during World War II and persisted in some countries long after the emergency that created it had passed.

This history matters because daylight saving time is fundamentally a bargain with geography. It makes more sense at higher latitudes, where there is a significant difference between summer and winter daylight. Near the equator, the gains are minimal.

In a country as vast as the US, the same hour holds different meanings across regions.

Permanent daylight saving time may indeed spare millions of people the twice-yearly ritual of resetting their clocks.

Consider the consequences when Washington moves the clock forward, and labels it a national solution. In Florida, a later sunset in winter would mean an extra hour for restaurants, retailers, golf courses and tourist attractions.

But in the northern parts of the country, that same hour gets deducted from the morning. The sun rises later, leaving children waiting for school buses in darkness and workers commuting before daylight.

The US previously tried this experiment during the 1973-74 oil crisis, when President Richard Nixon enacted a law putting the country on year-round daylight saving time, partly to reduce energy consumption. Public enthusiasm initially ran high, but quickly waned due to concerns about dark winter mornings, particularly for school children.

The experiment was abandoned well before its intended conclusion, serving as an important reminder that a seemingly simple national policy can have very different implications depending on the location.

This encapsulates the problem with the politics of the clock: there is no national sunrise. But there are substantial economic interests on both sides of the argument.

Retailers, restaurants, bars and leisure businesses naturally favor more daylight after working hours, because an extra hour of sunshine encourages people to spend time and money outside their homes, benefiting a consumption-driven economy.

At the same time, technology and financial companies support a fixed clock because it eliminates the technical challenges of biannual changes in trading systems, databases, scheduling software and global operations.

However, some of the costs are not easily quantified on a balance sheet. Sleep specialists have long argued that if seasonal clock changes are eliminated, permanent standard time is preferable to permanent daylight saving time, as morning light is crucial for regulating the body's circadian rhythm.

The American Academy of Sleep Medicine, for example, has called for year-round standard time rather than year-round daylight saving time.

This distinction is crucial. The issue is not merely the inconvenience of adjusting clocks twice a year, but also whether convenience should come from permanently moving social schedules away from the sun.

Farmers face a different problem altogether. Livestock and crops do not adhere to clocks or congressional mandates. Agriculture relies on daylight, weather and biological cycles, irrespective of whether Washington decrees that 7 am should be treated as 8 am.

None of this implies that permanent daylight saving time is inherently flawed. Rather, it underscores its political aspects.

Every time policymakers adjust the clock, they redistribute a resource that cannot be manufactured: daylight. Some get more of it at the end of the day; others get less at the beginning. One industry gets a longer window for consumption; another must adapt to the adjustment. Some commuters gain brighter evenings. Others lose brighter mornings.

Therefore, the debate should not be reduced to whether US citizens are tired of adjusting their clocks. They are, but the more important question is what kind of society they want their clocks to serve.

Permanent daylight saving time may indeed spare millions of people the twice-yearly ritual of resetting their clocks. But it cannot alter geography, human biology or the sun. An hour gained by one part of the US is an hour taken somewhere else.

The clock may be set, but the debate over who pays for the hour will continue.

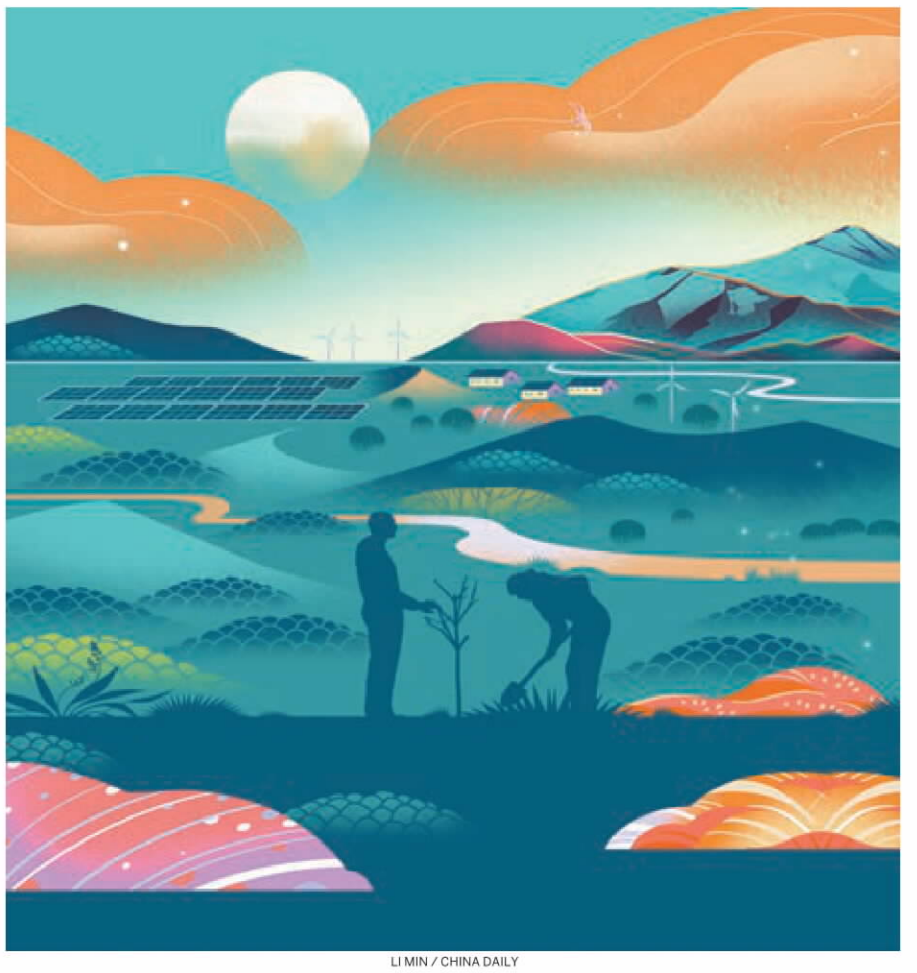
GLOBAL VIEWS

ANTHONY MORETTI

Roots of rapport

Without question, people who work together can change the world, even if only a small part of it



Ronald Sakolsky is not famous in the United States. But to one woman in China, he is one of the most important people in the world. And their friendship, which spans 27 years, should inspire anyone who believes in the power of people-to-people exchanges.

The story begins in 1999 when Sakolsky was teaching English in Luoyang, Henan province, and he watched a news report about a woman named Yin Yuzhen. She was recognized as a fierce champion in the fight against desertification and someone who was eager to see as many trees as possible planted in the Inner Mongolia autonomous region, which was her home, in order to improve the environment and people's lives. Inspired by her efforts, Sakolsky raised $5,000 to assist Yin. That could have been the end of the story as he eventually returned to the US.

But in fact, it was just the beginning. Even though he planted none of the trees, his generosity led to what are now more than 50,000 trees in the area. One Chinese woman motivated one US man. And look at the results.

Communication was not as convenient in the late 1990s as it is today, and that meant the pair quickly lost track of each other. But fast forward to 2026 and thanks to modern technology, Chinese netizens found Sakolsky, and he and Yin soon began to converse. Almost immediately, plans were put in motion so that he could see the contribution he had made to improving the region — and, of course, to see his friend one more time.

LI MIN / CHINA DAILY

Sakolsky and Yin met again on Aug 23. Photographs and videos captured upon his arrival at the airport in Ordos, the Inner Mongolia autonomous region, show the absolute joy both felt upon seeing one another again after 26 years. They cried. They hugged. They posed for pictures. He called her "the hero" of this story because she made a promise 27 years ago and she kept her promise to foster the planting of trees. Sakolsky said that the two should now be thought of as "brother and sister".

> I hope that one day I might bring a group of students to China, a country that I have never been to. Should such a trip happen, one of the key ingredients would be seeing the sites and perhaps meeting influential people.

Before his flight to China, Sakolsky said that he and Yin "communicate through the heart and we always have". That is a powerful reminder to not only US citizens, but also billions of non-Chinese-speaking people worldwide: The bonds of connection with the Chinese people can be made in many ways. Perhaps it is through education, sports or music. Maybe it results from research partnerships, video games or photography. No matter how they happen, those bonds are more valuable than ever in the 21st century because ordinary people can consistently take actions to build bridges even when some in political circles insist that building walls is the right way to conduct international relations.

Yin is, as Sakolsky suggests, a "hero" for her tireless work to improve the quality of the natural environment around her. That service can encourage more people from China, the US and beyond to take part in afforestation and environmental protection. Think of it this way: Yin might never make it into a history book, but for generations the people near her home will positively remember her. She had a dream that first attracted a US teacher and soon ignited the same positive energy in countless others. But none of that would happen if people-to-people exchanges were not in place. The doors of friendship must always be kept open.

Literally and figuratively more trees need to be planted, and the work to improve the climate in and around the Inner Mongolia autonomous region and around the world must continue. Related to this, as some governments challenge the need to invest in green technologies, China has blazed a trail most notably through photovoltaics and electric vehicles to combat climate change. Each tree makes a difference. Each piece of green technology makes a difference.

I hope that one day I might bring a group of students to China, a country that I have never been to. Should such a trip happen, one of the key ingredients would be seeing the sites and perhaps meeting influential people. But another important component is meeting Chinese people who are seeking to make the world a better place. Yin Yuzhen most definitely is.

JIANG XIANCHENG

Friendship across frontiers

A small donation has grown into a forest, testifying to the enduring strength of China-US people-to-people bonds

The very land that US friend Ronald Sakolsky helped rejuvenate is now a thriving forest and ecological garden. It stands as a living testament to how transnational people-to-people bonds can advance the common interests of humanity. A $5,000 donation led to more than 50,000 trees flourishing amid the sands. That reads almost like a fairy tale, doesn't it? Yet this is a documented fact. It is the realization of a dream nurtured by Sakolsky, a teacher from the United States, and a promise kept by Chinese farmer Yin Yuzhen over decades.

In 1999, while teaching in Henan province, Sakolsky was moved by a television report about Yin's relentless fight against encroaching sands, or desertification. Inspired by her determination, he raised $5,000 over the following two months to support her tree-planting efforts. In May 2000, Sakolsky traveled to the Inner Mongolia autonomous region and met Yin for the first time. The funds he had raised helped Yin purchase and plant saplings, which over the following decades grew into a forest of more than 50,000 trees.

What Yin accomplished was anything but easy. The Mu Us Sandy Land, where her forest stands, covers some 42,200 square kilometers. Once severely affected by desertification, the region has undergone a remarkable ecological transformation through decades of sustained efforts by generations of people such as Yin. Such has been the transformation. Chinese media described it by saying the Mu Us Sandy Land is close to "disappearing" from the map, as the once-barren landscape has made way for lush greenery and more sustainable livelihoods for local communities.

On Aug 23, Sakolsky returned to China and met Yin again after 26 years. The following day, standing in the forest, he saw the tree they had jointly planted 26 years ago, now a towering giant. It stands as a living testament to how a friendship across frontiers can redefine the ecological frontier between desert and forest, inspiring people across diverse nations to unite in the global cause of environmental sustainability.

The story demonstrates a cultural value that gives people-to-people exchanges their enduring power: a commitment to keeping one's word. For 26 years, Yin held that promise close to her heart, driven by a simple desire to show Sakolsky in person that the Chinese people keep their word. As the ancient Chinese proverb goes, "A promise carries the weight of a thousand gold pieces". This enduring commitment carried Yin through the 26 years before she met Sakolsky again.

It is the very same spirit that propels China's growing contributions to a greener planet, as well as to wider affairs of global development and governance. In recent years, China has successively launched the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative — all dedicated to addressing humanity's common concerns. These efforts have steadily bolstered China's global credibility.

As highlighted in a Pew Research Center survey released in July, China's international image has markedly improved. Its standing is particularly strong across middle-income nations, where many people view China as a reliable partner and a contributor to global peace and stability.

The story also offers another powerful lesson: The Chinese people deeply cherish the goodwill shown by friends from the US and around the world.

A parallel story of Sino-US people-to-people friendship unfolded in Kuliang, Fujian province. Beginning in the 1880s, a growing number of US residents settled in Fuzhou and gathered in Kuliang each summer to escape the heat. They built villas, hospitals, post offices and recreational facilities, while forging deep bonds with local residents and offering them sincere assistance. More than a century later, these cherished memories continue to blossom into new chapters of friendship. In much the same spirit, the story of Sakolsky and Yin stands as a new milestone — one that has inspired, and will continue to inspire, people from diverse nations to unite in working toward a better shared future for all humanity.

Indeed, this story reinforces our conviction that Sino-US people-to-people friendship remains indispensable. During their Beijing summit in May, the leaders of China and the US agreed to pursue "constructive strategic stability" as the new orientation for bilateral ties. Fostering closer people-to-people interactions to advance state-to-state relations is a cause China has always supported. By May, the five-year initiative to invite 50,000 young US citizens to China for cultural exchanges and studies had reached its target two-and-a-half years ahead of schedule. Sino-US people-to-people exchanges not only cultivate mutual trust but also enable shared achievements. Both nations face common challenges — climate change, artificial intelligence governance and cross-border pandemic preparedness — all of which demand the wisdom of cooperation.

SONG CHEN / CHINA DAILY

The story also invites reflection on how international communication can foster cross-border friendship in a changing media landscape. In 1999, it was broadcast television that first connected Sakolsky to Yin, a woman he had never met. More than two decades later, social networking platforms have become the major gateway through which people encounter and share information. Yin's search for Sakolsky drew global attention and crowd-sourced assistance, ultimately facilitating their second meeting.

Since Sakolsky's return to China in August, social networking platforms are filled with heartwarming clips documenting their journey. This vividly demonstrates that in the digital age, human connections can cross the barriers of time, space and language, allowing uplifting emotions to be shared universally.

Yin and Sakolsky's shared legend offers a unique lens for audiences in the US and across the globe to recognize the immense efforts behind ecological restoration, as well as the enduring value of transnational people-to-people friendship. Broader interactions and joint efforts between the people of China and the US in priority domains — such as environmental protection, cultural exchanges, and AI governance — remain highly anticipated. Meanwhile, transnational social media platforms hold immense potential to carry these stories across linguistic, cultural and national frontiers, ultimately fostering global friendship and mutual trust.

Experts warn cascading risks could become more frequent

Warming to affect patterns of freezing and thawing, weakening mountainsides

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

Rescue teams continued searching for survivors on Sunday after a devastating glacier-triggered flood swept through the China-Nepal border region, while experts warn that a combination of interacting hazards in a warming Himalayan environment could make such disasters increasingly difficult to predict.

The disaster struck on Wednesday after a high-altitude glacier collapse on the Nepali side sent a massive volume of rock and ice into a river, triggering a fast-moving mudslide and flooding downstream.

The United States Geological Survey determined on Wednesday that glacial collapse and debris flow caused subsequent catastrophic impacts downstream.

Benjamin Horton, dean of the School of Energy and Environment at the City University of Hong Kong, said the disaster in Nepal could be an example of a "compound event" in which different hazards interact to produce a more complex and damaging disaster.

The cascading effect was what made climate-driven changes in high mountain regions particularly concerning, he told Reuters.

Simon Cox, chief scientist at the Mountains to Sea program at Earth Sciences New Zealand, told Reuters that climate change is "generating conditions that can destabilize high-mountain rock and ice".

That could make collapses and cascading hazards of the kind seen last week more frequent, Cox said.

Experts have cautioned against describing climate change as the sole, immediate trigger for Wednesday's collapse, but said rising temperatures and melting glaciers probably played a role.

Warming can reduce ice support on steep slopes, boost meltwater, and alter patterns of freezing, thawing and rainfall, which can weaken mountainsides and make large collapses more likely in some locations, Cox said.

Dorothy Heinrich, a researcher at the University of Reading in England, told Agence France-Presse that such floods are among the hazards posed by a warming planet in the region.

"There is high confidence of more heat waves, glacial retreat, permafrost reduction, these sorts of things that can drive things like landslides and glacial outburst floods," Heinrich said.

Limits revealed

In addition, experts said the speed at which the disaster unfolded highlights the limits of conventional flood warning systems.

Hatim Sharif, a hydrologist at the University of Texas at San Antonio, told AFP that what struck him was the absence of rainfall beforehand.

"That defeats essentially every operational flood warning system in the world," he said.

By the time the mud flow becomes visible, it is too late to escape on foot or by vehicle, Sharif said, because mud and water moving at high-speed form a lethal combination "like liquid concrete".

"Running will not help," he said, estimating that the only option is to climb at least 6 meters up a hill.

A possible long-term remedy would be river level gauges that relay changes to authorities in real time, giving residents 20 to 30 minutes of warning, Sharif said.

However, the immediate danger has not disappeared.

The barrier lake above the mudslide-hit region has basically drained, forming a flowing state of the river channel, China's Ministry of Water Resources said on Sunday, citing drone footage and reports from emergency response teams.

Rescuers were pushing deeper into the disaster-hit area, while authorities worked to clear damaged roads and maintain emergency communications.

Agencies and Xinhua contributed to this story.

Nepal cautions against fresh flooding as death toll rises

DHADING, Nepal — Authorities in Nepal warned of possible fresh flooding on Sunday and urged residents in flood-affected districts to remain on high alert after water levels rose in the Bhotekoshi River.

Flood warning notices were sent to people's phones early on Sunday as rescue crews worked to clear a major highway connecting Kathmandu to one of the areas worst hit by Wednesday's catastrophic floods.

Nepal's disaster agency said on Sunday that the death toll had climbed to 781 with 2,502 missing.

In Dhading, one of the worst-hit regions, some residents began returning to ruined homes to see what can be salvaged.

Residents sat in homes with walls washed away by the floods, shoveling sludge-like mud and rubble off balconies or window frames. Others scanned the ground for items they could pick out of the mud and rinse off. One man had returned for his chickens, which he found alive. He tied them up and put them in the cabin of his truck.

"Everything is finished. Nothing is left. Not even our home," Sharmila Tamang, a Dhading resident who was trying to salvage items from her home, told The Associated Press.

At a key power plant that was severely damaged by the floods, workers started inspecting the facilities on Sunday to survey the destruction. The plant serves more than 20,000 people across four districts.

In the town of Galchhi, a group of residents sought higher ground on a nearby bridge and watched as the river roared by. Some pointed to enormous rocks washed downriver during the earlier floods, while others standing on a suspension bridge were warned off with whistles.

Along the river, homes, vehicles and farm tractors could be seen jutting from the thick gray-brown sediment that enveloped entire villages in the worst-hit flood areas. Parts of rice terraces along the riverside had dropped into the river after landslides hit them.

Large concrete and smaller suspension bridges were destroyed, leaving communities on the other side of the river with less easy access.

"Those who are there are now stuck there. Those who are here are stuck here. It's going to be very difficult," said Sattan Singh Tamang, 47, who was working near a bridge when Wednesday's floods came.

The flash floods started after a glacial collapse high in the Himalayan region. Scientists who studied satellite images said bedrock underneath the glacier had collapsed, taking part of the glacier with it. The rockfall was so extreme that it registered as magnitude 5.2.

The rocks and melted water then swelled the rivers in the valleys below, causing a torrent of water that swept buildings, bridges and earth downstream.

Homes and businesses affected by the floods were still without electricity on Sunday, as twisted power line poles and wires lay tangled in the mud.

Prithvi Highway is a crucial supply route for food, fuel and other goods entering Kathmandu from other parts of the country. While most of the highway is operational, other parts still face repair challenges.

Iran says MoU with Washington in interests of Tehran

TEHRAN — Iranian President Masoud Pezeshkian said on Saturday that the peace memorandum of understanding signed between Iran and the US is in the interests of Iran, West Asia and the world.

At a ceremony in Tehran, Pezeshkian said that with the MoU's implementation, the United States and Israel will not be able to cause chaos, aggression and insecurity in the region, and regional states will be able to pursue the path of stability and development, according to a statement published by his office.

The president highlighted the need for foiling the "enemies' sinister plots" through the promotion of unity and solidarity among Muslim states.

Iran did not start the war, he said. "We do not welcome war, but will stand strongly against any aggressor, and no power can force a nation that is standing with all its might and will into surrender."

On Sunday, Iran's Supreme Leader Mojtaba Khamenei urged Muslim countries to recognize their "true enemies", understand their plots and confront them.

In a written message marking the birth anniversary of Prophet Muhammad, Khamenei said the solution to the problems of the Islamic world lies in maintaining unity, friendship, and cooperation in the pursuit of goodness and virtue.

"My strong and repeated advice to the rulers of Islamic countries, especially those in the West Asia region and the Persian Gulf, is to recognize your true enemies, understand their plan, and confront them," he said.

Meanwhile, Iranian Foreign Minister Abbas Araghchi warned in a social media post on Saturday that "major" efforts are underway to manipulate global energy markets for personal gains and prolong the US-Israeli war against Iran.

On June 18, the US and Iran signed the MoU on ending the war in the region on all fronts. Under the MoU, they were scheduled to hold negotiations within 60 days to reach a final agreement, but the fate of the talks remains unclear following the escalation between the two countries last month.

Iran's Deputy Foreign Minister Kazem Gharibabadi reiterated on Saturday that the Strait of Hormuz would not open until the US meets its agreements under the MoU, Iran International English reported, citing Iranian media.

"The Strait of Hormuz remains closed, and any vessel passing through the strait does so in coordination with Iran," he said. "We will continue our own defensive measures and are prepared for any scenario."

Japan's commitment to rule of law tested amid US sanctions on ICC

By HOU JUNJIE in Tokyo
houjunjie@chinadaily.com.cn

US sanctions on Tomoko Akane, president of the International Criminal Court and a Japanese judge, followed by Tokyo's restrained response, have stirred controversy in Japan, putting the country's professed commitment to the rule of law to a practical test.

Critics say the episode highlights tensions between Japan's alliance with the United States and its attempt to stick to legal principles in diplomacy.

Japan joined the Rome Statute of the International Criminal Court in 2007 and has since been a major supporter and financial contributor to the ICC, with strengthening the "rule of law" becoming a long-standing pillar of its diplomacy.

The ICC, however, has also sparked controversies over some of its actions, with calls for it to uphold the principle of complementarity, exercise its powers prudently in accordance with the law, and guard against politicization and double standards.

Hiroshi Shiratori, president of the Japan Political and Legal Studies Association and a professor at Hosei University in Tokyo, said Japan is facing an important "crossroads": whether to side with its US ally for political reasons and accept what he called Washington's "trampling on the rule of law", or remain committed to what it regards as "international law".

The United States sanctioned Akane and another ICC official on Aug 18, accusing them of being "directly engaged in efforts by the ICC to investigate, arrest, detain, or prosecute officials whose government has not consented to ICC jurisdiction".

In recent years, Washington has sanctioned ICC judges and prosecutors over investigations involving US personnel and arrest warrants for Israeli Prime Minister Benjamin Netanyahu and former defense minister Yoav Gallant.

In July, the US administration intensified pressure on the court in a campaign aimed at weakening its ability to operate.

Japanese Prime Minister Sanae Takaichi initially called the US sanctions "very unfortunate", drawing criticism that Tokyo's response was too restrained.

A week later, Takaichi said the US action was "incompatible with Japan's position" and that Tokyo had pressed Washington "at various levels until the last moment" not to sanction Akane.

Shiratori said calling the sanctions "very unfortunate" did not amount to criticism of Washington. If the measures were incompatible with Japan's position, Tokyo should criticize the US more strongly, he added.

In the longer term, he warned that failing to firmly support the ICC and oppose what he described as Washington's disregard for "international law" could leave Japan being seen as prioritizing its US alliance over its international legal stance.

Tokyo has remained cautious over US pressure on the court. Last year, it did not join a statement by 79 ICC member states opposing US sanctions. Then-prime minister Shigeru Ishiba said Japan was following developments with "serious concern".

Calls for a clearer stance have grown since the latest sanctions targeted Akane. A cross-party group of lawmakers has urged the government to protest and demand that the sanctions be lifted.

Little political cost

Ukeru Magosaki, former director-general of the Japanese Foreign Ministry's International Intelligence Bureau, said the criticism of Washington had failed to gain traction because most Japanese prioritize coordination with the US. As a result, the government faces little domestic political cost for making concessions to the US.

Japanese diplomacy once centered on coordination with international organizations, Western countries and Asian nations while emphasizing "international law", Magosaki said. Over time, however, coordination with the US has become the overriding priority.

Japan now emphasizes "international law" when it aligns with US interests but tends to remain silent when the two conflict, he said.

Although Japan and the US have channels for policy coordination, there is little room for dialogue through which Tokyo could persuade Washington to change its position, he said.

On Wednesday, Akane urged Tokyo to use its relations with Washington and diplomatic influence to explain its stance on the ICC and help prevent further US pressure.

Shiratori warned that if Japan yields to US pressure to the point of being unable to defend its own citizen, while changing its position for political reasons, it risks losing public trust and diplomatic influence.

Traditional strengths power chip-sector forays

Chinese companies tap expertise, R&D to open new growth avenues

By LI JIAYING
lijiaying@chinadaily.com.cn

Middle: Visitors get information at the exhibition area of Yoke Technology during the SEMICON China 2026 expo in Shanghai on March 26. PROVIDED TO CHINA DAILY
Above: Employees are busy on the intelligent production line of a semiconductor manufacturing company in Jiujiang, Jiangxi province, on Feb 2.
WEI DONGSHENG / FOR CHINA DAILY

For Hubei Dinglong, a business built on printer toner is increasingly being reshaped by materials that polish and pattern silicon wafers.

The Wuhan-based company reported 3.66 billion yuan ($544 million) in revenue in 2025, with semiconductor material and chip business contributing 57 percent of the total, after growing 37.3 percent year-on-year. Revenue from printing consumables, once its defining business, fell 13 percent to 1.56 billion yuan, according to its annual report.

Dinglong's shift began with an internal question: Could the chemistry used to make printer toner particles be redirected toward chipmaking?

"The opportunity came when our toner team found that previous experience in high-purity inorganic synthesis, surface modification and colloid chemistry could be applied to CMP (chemical mechanical planarization) slurry's nanoscale abrasive particles," said Zhu Shunquan, general manager of the company.

CMP materials have long been a weak link constraining China's advanced chip manufacturing. Zhu said the main bottleneck in developing domestically produced CMP slurries lies in the supply of abrasive particles, a key upstream raw material that accounts for as much as 70 percent of total slurry costs.

The global supply of such materials, however, has long been dominated by a handful of international companies, which have erected formidable market barriers and created closed supply-chain ecosystems through close joint-development arrangements and exclusive agreements, he noted.

"This structural imbalance has long left domestic CMP slurry producers with formulas but without the essential abrasive particles needed to put them into production, making it difficult to achieve stable mass production and independently improve high-performance products," Zhu added.

Against this backdrop, Dinglong moved into the CMP slurry business in 2021, targeting research and development toward four core abrasives: high-purity silica, ultra-pure silica, alumina and ceria.

Zhu said producing these abrasive particles in-house could give researchers more control over particle size and surface properties, allowing materials to be adjusted for a customer's process.

To date, the company has overcome technical barriers in alumina abrasive particles, a field previously dominated by a single global supplier. Its product has entered mass production at a major domestic manufacturer, with monthly deliveries now running into hundreds of drums, the company said. It has also completed the development of a ceria-based CMP slurry for more advanced memory chips, which is undergoing a key qualification process before being introduced into mass production.

Notably, one of the company's proprietary CMP slurries had even outperformed an incumbent supplier's product in a key defect-control metric. "It delivered better scratch control than the incumbent product, helping us secure repeat orders from customers," Zhu said.

Dinglong said it has invested more than 1.4 billion yuan in slurry and abrasive-particle operations. In Xiantao, Hubei province, it built annual capacity for 10,000 metric tons of particles and 20,000 tons of slurry.

Dinglong's transformation story is part of a wider change in China's traditional manufacturing sector. As artificial intelligence development lifts demand for chips, fine-chemical producers, equipment makers and even a consumer outdoor brand are using old skills or acquired technology to find a place in the semiconductor supply chain.

No crossover appears more unlikely than Toread's, a Beijing-based consumer brand well known for its outdoor apparel and equipment. Since 2021, however, the company has positioned itself as an "outdoor plus chips" player.

Since adopting such a dual-track strategy, Toread has built a broad semiconductor portfolio through acquisitions, business integration and continued in-house R&D.

Its four principal product lines now cover touch-control integrated circuits through South Korean electronics manufacturer G2 Touch, Mini and Micro LED display-driver ICs through Beijing Xinneng, fingerprint-recognition chips through Shenzhen-based Betterlife, and intellectual property for AI model compression through Shanghai-based Tongtu Semiconductor.

The company said the strengths of the individual businesses were becoming increasingly visible. G2 Touch's single-layer On-Cell touch-control chips have entered the supply chains of major global brands, including Samsung and Ferrari, giving the business a presence in automotive displays and high-end consumer electronics. Betterlife's fingerprint-recognition chips, used in smart locks, have long ranked among the global market leaders and serve major device makers including Huawei and Xiaomi.

Tongtu Semiconductor, meanwhile, has developed a full-stack AI data-compression technology that the company said can reduce video data to one-fifth of its original size, cut intermediate data generated by large models by 50 percent, and compress model parameters by 30 percent.

During the first half of this year, Toread's chip business generated 359 million yuan in revenue, up 212.83 percent year-on-year and accounting for 38.6 percent of its total revenue. The increase was driven in large part by the consolidation of Betterlife and Tongtu, which were added to Toread's financial statements in January.

Toread is also exploring ways to build links between its established outdoor business and its newer chip operations. In March, the company unveiled a second-generation powered exoskeleton weighing 1.8 kilograms and capable of recognizing more than 10 movement modes, alongside a smart hiking shoe equipped with sensors, gait-analysis algorithms and an AI agent that provides personalized guidance.

The group said its outdoor business could provide product settings and sales channels for such smart hardware products, while its semiconductor businesses could contribute capabilities in sensing, visual interaction and edge AI.

Elsewhere, two other traditional manufacturers took a more industrial route into the semiconductor supply chain: they acquired specialized overseas businesses, retained their engineering expertise and gradually connected those capabilities with production and customers in China.

Beginning as a producer of flame retardants, Jiangsu Yoke Technology moved into semiconductors in 2016, when it completed the acquisition of a 96.28 percent stake in South Korea's UP Chemical, gaining access to semiconductor precursor technology and establishing customer relationships.

Precursors are high-purity chemicals used to deposit thin films on wafers. Building on the acquisition, Yoke became one of China's leading suppliers to have achieved domestic substitution of semiconductor precursor materials, while also expanding into other segments including photoresists and related reagents, electronic specialty gases and spherical silica powder used in chip packaging.

The electronic material sector generated 5.08 billion yuan in revenue for Yoke in 2025, accounting for nearly 59 percent of its total and increasing 12.7 percent year-on-year. Semiconductor chemical materials contributed 2.11 billion yuan, while photoresists and related reagents generated 1.96 billion yuan, according to its annual report.

Some of those products have begun reaching advanced memory applications. "We have products in stable supply for customers' HBM production," Shen Qi, chairman and general manager of Yoke, said at the company's annual results briefing in May. HBM, or high-bandwidth memory, is a type of computer memory designed to provide both high-bandwidth and low power consumption.

Zhengzhou, Henan province-based GL Tech has applied a similar approach to the equipment used in semiconductor packaging and testing.

Founded in 1994, GL Tech initially made monitoring systems for coal mines and other industrial facilities. It entered semiconductor equipment through a series of overseas transactions, acquiring the UK's Loadpoint Ltd in 2016 and Israel-based Advanced Dicing Technologies afterwards.

The deals gave GL Tech technologies covering precision dicing machines, air-bearing spindles and cutting blades. The company then set up a subsidiary in Zhengzhou, sent Chinese engineers to work with teams at Loadpoint and ADT, and adapted the acquired technologies for domestic production.

Long road behind unlikely industrial leaps

REPORTER'S LOG
By Li Jiaying

From a manufacturer of printer-toner making materials that polish silicon wafers to an outdoor clothing brand assembling a chip portfolio, the changes look abrupt, even improbable.

After the stark contrasts in business functions first caught my attention, I looked into the companies' histories and that made the evolution behind the changes clearer.

At first glance, their stories resembled a familiar tale of companies chasing a fast-growing sector. However, the dates and technical records told a different story — each leap was anchored in an older competence, and every new product had to survive the grind of trial, failure, adjustment and customer scrutiny.

Hubei Dinglong began developing CMP pads in 2012 and secured its first order in 2017. Its first order for a 12-inch CMP pad came in 2019. A company filing said qualification of a single pad model could take at least six months to a year even when testing proceeded smoothly.

Outdoor apparel and gear company Toread adopted its "outdoor plus chips" strategy in 2021. About five years later, chips accounted for 38.6 percent of its revenue in the first half of 2026.

GL Tech acquired the United Kingdom-based Loadpoint in 2016. Its domestically developed dicing machines began achieving batch sales in 2021, another five-year journey.

Qin Hongjian, chief financial officer of Jiangsu Yoke Technology, said in 2025 that once primarily a flame-retardant producer had spent 10 years completing its transformation into a diversified semiconductor materials supplier.

Taken together, those timelines changed how I understood the phrase "from zero to one". The starting point is rarely the day a company announces a new strategy. The breakthrough comes when a product passes qualification, enters a customer's production line and performs consistently enough to be ordered again.

That makes a comment by Zhu Shunquan, general manager of Dinglong, especially apt.

"In semiconductor materials, there are no shortcuts and no 'overtaking on a curve'," Zhu said in a recent interview. "The slowest path is, sometimes, the fastest."

The slowness comes from the industry itself. A material or machine may work in a laboratory and still be far from a production line. Customers require lengthy qualification, stable batches and proof that a supplier can protect yield and deliver consistently. One successful order is a technical milestone, but repeat orders show that manufacturing has caught up with invention.

Company disclosures show the scale of investment behind the transitions. Dinglong said it had invested more than 1.4 billion yuan ($208.18 million) in CMP slurry and abrasive-particle operations, while GL Tech said research and development spending had remained above 12 percent of revenue for five consecutive years, with technical personnel accounting for 47 percent of its workforce.

China's wider investment in research also helps explain why more of these transitions are emerging. Data from the National Bureau of Statistics show that the country's R&D spending rose from 2.4 trillion yuan in 2020 to 3.9 trillion yuan in 2025, while R&D intensity increased from 2.36 percent to 2.8 percent of GDP.

Industrial upgrading rarely happens in a single leap. These companies had spent years transferring knowledge, absorbing acquired technology and passing customer tests before new businesses began to reshape their revenue.

BUSINESS

Why the 'China squeeze' argument does not add up

EAGLE EYE

By Shao Yujia, Jing Rui and Chen Xi

AI PRODUCED BY CAI MENG / CHINA DAILY

The claim that China is "squeezing" developing countries out of manufacturing opportunities is built on flawed assumptions, selective use of data and questionable methodology, resulting in conclusions that are misleading and at odds with the realities of global trade.

In May, the Washington-based Peterson Institute for International Economics published a report titled "China's mercantilist squeeze on developing countries". Its central argument is that even as China moves toward higher incomes and more technologically advanced industries, it retains an unusually large share of global exports in labor-intensive manufacturing.

The report argues that this has cost low and middle-income economies hundreds of billions of dollars in exports and large numbers of jobs, making it harder for them to follow the traditional path from low-cost manufacturing to advanced industrialized status.

It goes further, attributing China's competitiveness to policy distortions rather than fair competition, and suggests Beijing should voluntarily make room for economies in lower-end manufacturing.

The report's conclusions do not stand up to scrutiny. They are built on a zero-sum view of global trade, selective use of data and country samples, and questionable benchmarks that disregard productivity differences and profound changes in the global economy.

Modern global value chains rarely operate so neatly. Over the long term, a country's export growth can generate demand elsewhere through higher incomes, supplies of intermediate goods and overseas investment. In many labor-intensive industries, China and other developing economies increasingly function as complementary parts of the same production networks rather than simple substitutes.

The textile and garment industry illustrates this. The United Nations Commodity Trade Statistics Database shows that in 2024 more than 60 percent of fabric imports into Vietnam, Indonesia, Colombia and Thailand came from China.

Data from the Bangladesh Trade and Tariff Commission show that China has become the largest supplier of machinery, raw materials and accessories to Bangladesh's textile and garment industry. These inputs support a ready-made garment sector worth about $47 billion and have helped Bangladesh become the world's second-largest clothing exporter after China.

Competitiveness cannot simply be reclassified as "excess" whenever one producer performs better than its rivals. Nor should productivity gains, supply-chain efficiency and industrial clustering automatically be treated as evidence of unfairness.

Nor do broader trade figures suggest that developing economies have simply been crowded out. According to UN Trade and Development, global trade surpassed $35 trillion for the first time in 2025, rising 7 percent from a year earlier. Developing economies' share of global exports increased from 29 percent in 2000 to about 46 percent in 2025. Even excluding China, their combined share rose by 6.1 percentage points.

The report's definition and measurement of China's supposedly excessive share of low-skilled manufacturing are also fundamentally flawed. It acknowledges that China's share of global low-skilled exports has declined since 2015, but argues that conventional customs statistics understate China's position. Using value-added trade calculations, it puts China's share at 64 percent.

Yet that number is highly sensitive to the comparison group. The calculation excludes developed economies with substantial textile, leather and footwear industries, including Italy and Portugal, and compares China primarily with developing countries. Recalculations using the report's own underlying data show that including developed-country producers would reduce China's share of value added in low-skilled manufacturing from 64 percent to 49 percent.

More fundamentally, the report's benchmarks for determining what China "should" export are difficult to justify.

One benchmark assumes that a country's share of global exports in labor-intensive manufacturing should broadly correspond to its share of the world's low-skilled labor force. Exports above that level are treated as excessive. On this basis, the report estimates that China has displaced about $110 billion of exports in garments, textiles, leather and footwear and roughly $365 billion across all low-skilled sectors.

But workers are not interchangeable units of production. Labor productivity varies enormously across different economies. China's manufacturing wages are already several times those in countries such as Bangladesh and India. If Chinese factories can remain competitive despite paying substantially higher wages, productivity, infrastructure, industrial clustering, supply-chain efficiency and business organization must form part of the explanation.

The 1960s were characterized by higher tariffs, expensive shipping, limited international production networks and no cross-border e-commerce. China industrialized in an era of much deeper global integration, sophisticated supply chains and technology-enabled manufacturing. Comparing export penetration across these two periods fails to take into account the fundamentally different economic structures that have evolved.

The report also gives insufficient weight to the sources of China's competitiveness. It notes that wages in China's garment industry are about five times those in Bangladesh and four times those in India. Yet Chinese manufacturers have retained significant market share through automation, flexible supply chains capable of handling small and rapidly changing orders, dense industrial clusters, efficient logistics and digital platforms such as cross-border e-commerce.

China has helped developing countries address infrastructure bottlenecks through overseas construction and development projects, transferred manufacturing capacity through investment, technology cooperation and training, and built overseas economic and trade cooperation zones that support industrial clusters.

A pattern is emerging in which China supplies intermediate goods, machinery and components, partner economies undertake processing and assembly, and finished products are sold around the world. Rather than eliminating industrialization opportunities, such networks can lower the initial cost of building manufacturing capacity and shorten the time required for developing economies to join global supply chains.

Against this backdrop, attributing the broader industrialization difficulties of developing countries principally to Chinese exports overlooks constraints closer to home, including inadequate infrastructure, electricity shortages, substandard ports, weak business environments and inconsistent economic policies.

It also overlooks barriers imposed by advanced economies themselves. Carbon-related trade measures, stringent rules of origin and other regulatory requirements can raise the cost of entering rich-country markets for low and middle-income economy exporters.

Global monetary tightening can compound those pressures by triggering capital outflows, currency depreciation and heavier debt-service burdens, leaving governments with fewer resources for infrastructure and education.

Competitiveness cannot simply be reclassified as "excess" whenever one producer performs better than its rivals. Nor should productivity gains, supply-chain efficiency and industrial clustering automatically be treated as evidence of unfairness.

Developing countries therefore need more than another economy being told to surrender manufacturing market share. They need better infrastructure, access to technology and finance, functioning supply chains, and a more open and transparent international trading environment.

The debate ultimately comes down to how global development is understood. If manufacturing is a fixed pie, and trade is a zero-sum game, China's gains must indeed be somebody else's losses. But the experience of the past two decades points to a more complex reality: global trade has expanded, developing economies have increased their export share and production has become increasingly organized through, and structured around, cross-border networks.

The challenge is not to decide which country should voluntarily produce less. It is to ensure that more developing economies acquire the infrastructure, skills, investment and market access needed to produce more themselves. On that test, the claim that China must "make room" for the Global South mistakes the nature of both modern manufacturing and economic development.

The writers are assistant research fellows at the Chinese Academy of International Trade and Economic Cooperation.

Why 'creative destruction' is no longer enough; the case for creative transformation

MAIN STREET

By Richard Li-Hua

Joseph Schumpeter's "creative destruction" has ruled business strategy for a century. Innovate or die. Disrupt or be disrupted. The old must burn so the new can rise. But look at the world's biggest electric vehicle market today. Something different is happening, and it demands a new playbook.

BYD, now the world's largest EV maker, did not achieve dominance by destroying its past. It began as a battery company in 1995. For two decades, it mastered electrochemical engineering. When the EV revolution arrived, BYD did not abandon its factories or dismiss its workforce. It repurposed its core competence, and its battery expertise became the engine of its automotive quantum leap.

Last year, Shenzhen, Guangdong province-based BYD sold more electric vehicles than Tesla globally. It did not disrupt its heritage. It transformed it.

The same pattern holds for CATL, the world's largest battery producer. CATL did not dismantle existing supply chains to build something entirely new. It embedded itself within the global automotive ecosystem and pushed the technological frontier forward while harmonizing with its many partners. Today, one in every three EVs worldwide is powered by a CATL battery.

These are not stories of destruction. They are stories of transformation.

For decades, Western business orthodoxy has insisted on a binary. You are either an innovator who destroys incumbents, or you are an incumbent awaiting destruction. This framework has shaped corporate strategy, investment criteria and antitrust policy.

But it contains a critical blind spot. It assumes that progress requires the annihilation of existing capabilities, institutional memory and productive ecosystems. Tradition is treated as baggage and heritage is seen as a burden. In an age of climate crisis, supply chain fragility and geopolitical fragmentation, this assumption is proving dangerously costly.

Here is where China Harmonious Innovation offers a different lens.

At its core lies a simple but powerful idea. Innovation need not be a zero-sum collision between old and new. Instead, it can be a symbiotic evolution where existing strengths are preserved, upgraded and integrated with emerging technologies.

This is not conservatism masquerading as strategy. It is the recognition that the most sustainable competitive advantages often reside in the adaptive recombination of established capabilities with new knowledge. I call this "creative transformation" rather than "creative destruction".

The distinction is strategic, not semantic.

Creative destruction externalizes costs. It writes off factories, dismisses workforces and abandons institutional knowledge in the name of efficiency.

Creative transformation, by contrast, internalizes continuity. It asks a different question — what existing assets, relationships and competencies can be reconfigured to meet new market needs and demand?

BYD's battery expertise was not a legacy liability to be discarded. It was the foundational asset that enabled its automotive quantum leap. China's manufacturing ecosystem was not an obsolete industrial relic to be disrupted by software platforms. It was the substrate upon which a new generation of smart hardware enterprises could flourish.

This has profound implications for innovation economics.

For too long, the field has been dominated by an obsession with the new combination that annihilates the old. But what if the more powerful economic force is the new integration that elevates the old?

What if the firms defining the next industrial era are not those that burn bridges, but those that build them? It connects legacy industries to digital infrastructure, marries traditional craftsmanship with artificial intelligence, and aligns environmental sustainability with commercial viability.

The evidence is accumulating worldwide.

In Germany, industrial firms pursue Industry 4.0 not by dismantling their *mittelstand* (medium-sized businesses) manufacturing base, but by digitizing it. In Japan, Toyota transitions to electric mobility while preserving its *kaizen* (continuous improvement) production philosophy. In India, the Unified Payments Interface payment platform did not destroy existing banking infrastructure. It harmonized with it, creating a hybrid system that scaled faster than any pure-disruption model could have accomplished.

The future belongs not to the destroyers, but to the harmonizers.

This reframing carries direct consequences for economic theory.

Paul Romer — co-recipient of the 2018 Nobel Prize in Economics — who transformed our understanding of endogenous growth, demonstrated that ideas are non-rival. Romer argued that the non-rivalry of ideas is ultimately behind the rise in living standards over various lengths of time. Ideas can be shared without being depleted. If ideas compound through sharing, then the model that maximizes value creation is not one of competitive annihilation, but of collaborative accumulation.

Innovation need not be a zero-sum collision between old and new. Instead, it can be a symbiotic evolution where existing strengths are preserved, upgraded and integrated with emerging technologies.

Edmund Phelps, awarded the 2006 Nobel Prize in Economics, argued that innovation thrives in societies encouraging grassroots creativity rather than top-down displacement.

Both insights point toward an innovation model that is inclusive, cumulative and harmonious.

In other words, not throwing out the proverbial baby with the bathwater.

The question for business leaders is therefore not whether to innovate, but how to innovate without unnecessary destruction.

In an era of constrained resources and climate imperatives, the luxury of burning down the old to make way for the new is diminishing. The most resilient organizations will be those that treat their histories not as liabilities, but as platforms for improvement and even metamorphosis.

As we approach the 50th anniversary of China's reform and opening-up, the world needs an economic narrative that transcends the theology of disruption. China Harmonious Innovation is not a rejection of market dynamism. It is a refinement of it.

The future belongs not to those who destroy creatively, but to those who transform harmoniously.

CULTURE

Tourists visit the Jingdezhen Imperial Kiln Museum in Jingdezhen on Aug 16, following the official inscription of Jingdezhen's Handicraft Porcelain Industry Sites in Jiangxi province on the UNESCO World Heritage List in July. PHOTOS PROVIDED TO CHINA DAILY

A dedication to guardians of porcelain

Recently released book celebrates Jingdezhen's achievements as it attains world heritage status and also serves as a guide to the historic city, reports **Yang Yang**.

On July 25, the Jingdezhen Handicraft Porcelain Industry Sites in Jiangxi province were inscribed on UNESCO's World Heritage List, marking them as the world's first World Heritage site dedicated entirely to porcelain and ceramics.

A book, *Cidu Hui* (*Porcelain Capital Illustrated: A Visual Guide to the Culture and Life of Jingdezhen*), was recently released as the city's first comprehensive illustrated guide.

The creative team from Jingdezhen Information Design Studio, China National Geography and Ciduhui Studio spent years visiting 45 core heritage sites, meticulously hand-drawing 72 traditional porcelain-making processes, detailing kiln architecture, and providing a year-round guide to local market delicacies.

Cidu Hui (*Porcelain Capital Illustrated: A Visual Guide to the Culture and Life of Jingdezhen*) is launched at PageOne Bookstore in Beijing in August as Jingdezhen's first comprehensive illustrated guide.

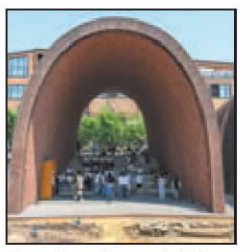
Liu Zili, a Jingdezhen native and the founder of Taoxichuan Ceramic Art Avenue, describes *Cidu Hui* as a "wormhole through time and space" leading to the porcelain capital. It not only portrays porcelain and old buildings but also conveys the enduring dedication of generations of guardians of the porcelain industry, he says.

The book's cover design features the iconic blue-and-white Yuan Dynasty (1271-1368) plum vase from Jingdezhen. Inside, it captures the vibrant lives of kiln workers, artisans and newcomers.

Divided into five sections — heritage, porcelain, towns, architecture, and experiences — it connects the city's history from ancient imperial kilns and major state-run porcelain factories to the modern blend of local and migrant artisans, serving both as a professional resource on UNESCO's World Heritage List and as a travel guide for the public.

Wei Weijia, the book's initiator and chief planner, shared her 10 years of life and work experience in Jingdezhen, as well as the process of creating the book at its Beijing launch event in early August.

In 2016, Wei, who had just graduated from Cambridge University with a master's degree in architecture and urban studies, first came to Jingdezhen to work on urban renewal projects. At that time, the city was much less developed than it is today.



Over the past 10 years, friends have often asked her for advice on visiting the city, such as where to go and how to buy porcelain. This sparked the idea of creating a book that organizes the city's culture into a readable, engaging and easy-to-understand guide for everyone.

In late 2024, when she learned that Jingdezhen was applying for world heritage status in 2026 for its handcrafted porcelain heritage, she began planning the book to showcase the city from all angles, not just its porcelain.

From top: Cover of *Cidu Hui*. Artists from Germany carry the fired ceramics in Jingdezhen. Tourists visit an ancient kiln. The Jingdezhen Imperial Kiln Museum. ZHOU MI / XINHUA

After spending a decade in Jingdezhen, Wei offers a fresh perspective as an outsider drawn to the city in the book's "Experience" section, which highlights the lively urban life, featuring streets, markets, food, and the coexistence of artisans, locals and young creators.

"This book captures Jingdezhen in the 2020s. The city has a glorious history, but its modern life is just as vibrant, filled with lively interactions and ongoing creativity," she says.

This modern life is also what Zhang Jie, an urban planner and professor at Tsinghua University who leads urban renewal projects, such as the Taoyangli historical and cultural district and the Taoxichuan cultural and creative district, is glad to see in Jingdezhen.

"The true success of Taoxichuan is seen in the lights shining through factory windows late at night — people are living, creating, and interacting there," he says.

Speaking of the unique value of Jingdezhen as a World Cultural Heritage site, he says, unlike any other city, Jingdezhen has thrived for 1,000 years on its porcelain industry. While Venice's glass industry had a brief period of success, Jingdezhen's craftsmanship continues to thrive, with tens of thousands of artisans still engaged in handmade production. "This makes it one of the most vibrant examples of living industrial heritage worldwide," he says.

The book illustrates how Zhang and his team have transformed the city over the past 15 years.

Reflecting on the transformation of areas like Taoxichuan and Taoyangli, Zhang notes that, unlike many industrial heritage sites that become mere tourist attractions, Jingdezhen's renewal efforts focus on the real needs of the residents, veteran artisans and young creators. Instead of large-scale demolitions, they have preserved the original structures of old kilns and factories, allowing history to be a part of everyday life, he adds.

Zhang also emphasizes the "cultural and green integration" approach in urban renewal. This involves using existing factory structures to minimize new material consumption and employing recyclable materials, such as kiln bricks, to promote low-carbon practices. This strategy preserves historical continuity while meeting the lifestyle needs of modern youth.

"This approach, which balances heritage protection with youth development, offers a valuable model for urban renewal projects nationwide," he says.

Since Jingdezhen's handmade porcelain heritage is a complete, regionally dispersed chain, with production and life deeply intertwined, illustration requires a different approach, says Song Zhuangzhuang, co-founder of DDH Studio and executive producer of the book.

Apart from the chapters about Jingdezhen, the team also dedicates a whole chapter to porcelain, compiling vast amounts of glaze colors, dynastic reign marks, and hand-drawn diagrams of the 72 porcelain-making processes, he explains. Additionally, the large-format pages allow for horizontal comparison of hundreds of porcelain patterns, enabling readers to understand the complex ceramic techniques visually.

He notes that in today's world of fragmented information, *Cidu Hui* invites readers to engage in immersive reading. Through two-dimensional hand drawings, it integrates scattered heritage sites and craft knowledge, clarifying the intrinsic connections between landscapes, minerals, kilns, and human habitation.

"This makes the complex knowledge of world heritage accessible and readable," he says.

Libraries reach grassland herders by horseback

By BAI SHUHAO and **MAO WEIHUA**

Writer Li Juan once described life on the summer pastures deep in the Xinjiang Uygur autonomous region as a season when "the days grow longer, and the afternoons seem to stretch endlessly."

Each spring and summer, when the grasslands turn green, herders across Xinjiang pack up their families and drive their sheep and cattle into the mountains in search of fresh pasture. They spend three or four months there before descending to the towns as the weather chills. The seasonal migration, known as *zhuanchang*, is a way of life shaped by the rhythms of the grasslands.

For months, many herding families live in portable yurts high in the mountains, without television or internet. Their days can be quiet and repetitive: tending livestock, milking animals, and sitting around talking together.

Three years ago, however, the routine in parts of Shawan in Tacheng prefecture, Xinjiang began to change. The city's library launched a program known as the "Library on Horseback," sending volunteers into three mountainous areas with books strapped to horses. The program reaches roughly 1,000 herders, according to Liu Shuya, an official with the Shawan Library.

Top: A volunteer hands books to a herder. **Above:** A Shawan Library staff member recommends books to herders. PHOTOS PROVIDED TO CHINA DAILY

"Is it free?" Tangnuer Nuerdawulieti, a staff member at the Xigebi township library in Shawan, is often asked when she arrives in the mountains with books and is quickly surrounded by curious herders.

Yes, she tells them. The books are part of a free public program.

"The policies are really good now," some herders respond.

Children, meanwhile, are usually the most eager readers. During the summer vacation, they have more time to browse through the books, often making a beeline for picture books and other titles that catch their eye.

Xigebi is home to about 1.83 million *mu* (about 122,000 hectares) of pastureland, and about 60 percent of its residents are from the Kazak ethnic group. The books delivered by volunteers include titles in both Chinese and Kazakh, ranging from novels and health guides to practical books on raising livestock.

About every two weeks, volunteers carry 200 to 300 books to two or three locations where herders tend to gather, rotating the collection each time.

The narrow mountain trails make horses the most practical means of reaching the pastures.

Horseback riding is common in Xinjiang, Nuerdawulieti says. Motorcycles are also used, but not everyone knows how to ride one. She herself can ride a horse but not a motorcycle. And the gentle horses she rides make the journey less bumpy.

Nuerdawulieti usually travels with three or four colleagues. They drive as close to the pastures as possible, then switch to horseback, loading the books into saddlebags. From there, the volunteers ride for another 40 to 50 minutes before reaching their destination.

Along the way, friendly herders sometimes offer directions or help carry the books.

The scenery is part of the reward. Under blue skies and drifting clouds, cattle and sheep graze across the summer grasslands. The volunteers and local residents sometimes sit together on the grass for informal reading sessions, and share books they have recently read or tell stories.

"The people they can talk to daily are very few, so they are especially happy to see us," says Guo Jianhong, who works with Nuerdawulieti at the township library.

Recently, Guo told a group of herders about a tourist whose car had become stuck in the mud. A local man helped pull it out and refused payment, waving away the money the tourist offered.

The herders enjoyed the story, Guo says, because it reflected what they see as the straightforward and generous character of the Xinjiang people.

After three years, Liu says, the program has begun to change lives in the mountain communities in small but visible ways. Children seem increasingly interested in books and more willing to express themselves. Some herders have also begun to change long-established eating habits after reading health-related books, including reducing their reliance on diets heavy in beef and mutton to avoid digestive problems.

"It's rewarding to see the books actually being read," Liu says.

Nuerdawulieti feels the same. After spending most of her life in the township, she had not read a physical book for a long time. But in the mountains, she discovered that books could be treasured in another way.

For her, the most satisfying moment comes when a book finally reaches a herder's hands.

CULTURE

Venezuelan artist Oswaldo Vigas' show at the Guangdong Museum of Art in Guangzhou, Guangdong province, presents a selection of monumental works spanning the artist's seven-decade career, including his paintings (from left) *Gesticulating*, *Genesis*, *The Encounter* and *Inciters*. PHOTOS PROVIDED TO CHINA DAILY

Life's work returns to roots

Venezuelan artist seamlessly combines contemporary European techniques while remaining true to his Latin American traditions, **Deng Zhangyu** reports.

Vigas' paintings feature intense and vivid colors, such as *Germination I* displayed at the show.

Walking into the Guangdong Museum of Art in Guangzhou, Guangdong province, one immediately notices intense, vivid colors in the works of Venezuelan artist Oswaldo Vigas. The elongated, distorted figures on the canvases are human, yet not quite — they appear as life forms imagined from plants, stones and ancient totems. This is one of China's first large-scale exhibitions of Vigas, a towering figure in Latin American modern art.

Vigas' retrospective exhibition *Reality Is What I Imagine* showcases a selection of monumental works spanning the artist's seven-decade career, offering a comprehensive view into his life's work — an ongoing process of questioning and reimagining the world through the living heritage of his homeland.

The exhibition is jointly curated by Gabriela Rangel, a Venezuelan curator based in the United States, and Jiang Jun, a curator from China. Together, they have created a platform for cross-Pacific dialogue, contributing to the ongoing narrative of the contemporary Global South. The show will run through Nov 22.

Vigas was born in Valencia, Venezuela, in 1923, and studied medicine in his early years. At 26, he joined the artist collective Free Art Workshop in Caracas. In 1953, he went to Paris to study art.

During this period, he encountered the most avant-garde artistic language of European modernism. He connected with eminent modernist figures such as Pablo Picasso, Wifredo Lam, Victor Vasarely, Jesus Rafael Soto, and Alejandro Otero.

Vigas passed away in Caracas in 2014.

Throughout his life, he devoted himself to addressing a single question: when the standards of modern art are mainly derived from major cities in Western culture, such as Paris and New York, how can an artist from Latin America express modern art while remaining true to his own traditions?

In Jiang's view, the exhibition's Chinese curator, Chinese artists who went to Paris to study art in the 20th century face this very question. And when those Chinese artists returned home, they were challenged by the same topic: after learning from the West, how do you come to understand your own tradition anew?

"Vigas' creative path merged international language with the indigenous spirit of South America. He moved fluidly between the Western art system and local culture, drawing on multiple sources while remaining true to himself," says Jiang.

The artist did not merely occasionally borrow a few motifs from ancient art; instead, he made "returning to his homeland sources" a lifelong method.

Wang Shaoqiang, director of the Guangdong Museum of Art, says: "He neither blindly followed the universal narrative of European modernism, nor clung to a nostalgic, provincial imagination. Rather, he carved out a completely new creative form between the two."

The exhibition traces the artist's stylistic evolution in chronological order across four periods. From 1942 to 1952, while Vigas was in Caracas studying medicine, he experienced a stylistic awakening. He delved deeply into pre-Columbian myths and imagery, creating the iconic *Brujas* (witches) series that would run throughout his entire artistic life — figures that exist between human, beast, plant, and mineral forms, embodying a traditional worldview and ancestral wisdom.

During his time in Paris, Vigas engaged in diverse cultural exchanges, which prompted him to reflect on his Latin American identity while also absorbing the influence of his contemporaries. Jiang explains that the works from this period first bring to mind Mondrianesque geometric structures. Still, their graphic sources may also point to ancient Venezuelan ruins, rock paintings and primitive stone carvings.

In the 1960s, Vigas returned to Venezuela and reintroduced human figures, animals, Latin American mythology, and folklore into his works, while continuing to use the modernist formal language he had mastered.

Catherine Kwai, founder of Kwai Fung Hin Art Gallery, a co-organizer of this exhibition, believes that Vigas truly matured only after experiencing the West and returning to his roots.

"His artistic language is highly international, yet it preserves a very strong local culture, and the combination does not feel traditional or closed off," says Kwai.

In the artist's last two decades, his paintings became increasingly simple, with more direct lines. Animals, humans, and certain unnameable life forms reappeared. At times they resemble monsters casually drawn by children; at other times, they evoke figures on cave walls from tens of thousands of years ago.

According to Kwai, in Vigas' later years, the artist achieved a kind of freedom in which he no longer needed to prove anything — he became like a child, full of playfulness and humor.

Jiang says that introducing Vigas' works to a Chinese audience fosters a cultural synthesis that reflects both global and localized perspectives.

Vigas' son, Lorenzo Vigas, says that his father had always admired China and was an enthusiastic student of Chinese history and traditional culture.

"My father felt that there is a connection between Asia and South America that people have not truly recognized. Through observing and studying ancient Chinese traditions, he could see many commonalities with Latin American traditions."

Window into appraiser-painter's creative world opens in Beijing

By **DENG ZHANGYU**

What does a lifetime of studying the greatest paintings in Chinese history do to an artist's own creativity? For Yin Guanghua, it produces paintings that carry the quiet weight of centuries. Yin, now 81, is both a leading connoisseur of ancient Chinese painting and an accomplished literati artist whose works are known for their refined, classical elegance. Decades of appraising masterpieces from dynasties past have sharpened his eye and nourished his brush.

The artist's solo show, *Grand Views of Taihu Lake,* opening on Aug 25 and running until Sept 11 at the Guardian Art Center in Beijing, allows audiences to see this fusion of scholarship and artistry. The show presents more than 80 landscape and flower-and-bird paintings by the artist along with over 100 pieces from his personal collection of ancient calligraphy, paintings, and scholar's studio objects, offering a rare window into the cultural soil that nurtured his creative world.

Yin was born in Wuxi, Jiangsu province, a city that neighbors Taihu Lake, one of China's most storied waterways and a perennial favorite among classical landscape painters. The scenery that inspires Yin's paintings comes straight from this Jiangnan (the area south of the lower Yangtze River) water-town region: scattered ponds, rolling low hills, and a shifting mist that softens the landscape.

In his works, a small hill, a lone boat, a humble house, a single tree, or a piece of rock becomes the vehicle for a serene and expansive mood.

Curator Qiu Ting, dean of the Chinese Painting Academy at the China Academy of Art, says that Yin's scenes and artistic conception grow from his life beside Taihu Lake.

"He has a deep, lived understanding of the landscape. Long-term observation and meditation on these views slowly crystallized into his own personal painting language, fusing external nature with the inner heart," says Qiu.

"For Yin, Taihu Lake is not just the scenery of his hometown. It is the spiritual home where he settles his mind and lodges his feelings," Qiu adds.

Yin's flower-and-bird paintings take a similarly considered approach. Rather than chasing ornate details, he grounds his work in close observation of plants and animals, blended with traditional freehand painting techniques. Whether he's depicting everyday produce like taro and pomegranates, flowering camellias, or birds of prey and waterfowl, he captures the essential spirit of his subjects with striking precision.

Connoisseur and painter Yin Guanghua's solo show *Grand Views of Taihu Lake* at the Guardian Art Center in Beijing presents more than 80 landscape and flower-and-bird paintings, including painting of Taihu Lake (left) and red pomegranates (right). PHOTOS PROVIDED TO CHINA DAILY

Yin often notes the weather and season on his paintings. These small annotations tuck quiet fragments of daily life into his brushwork.

The exhibition also presents a substantial selection from Yin's personal collection of ancient art, including works by master artists in ancient times such as Dong Qichang, Qiu Ying, and Zhu Da (also known as Bada Shanren). Alongside these paintings are the objects of a classical scholar's study — brush pots, seals and Yixing (Jiangsu) teapots in purple clay. Together, they trace the lineage of taste and tradition that has shaped Yin's aesthetic.

For Yin, reading, appraising, researching, and painting form a continuous cycle of enrichment. "Connoisseurship sharpens one's judgment of beauty, and that accumulated learning eventually sinks into the painting itself," says curator Qiu.

Yin's art journey began early. At 16, he studied landscape painting under Qin Gulin and later learned freehand flower-and-bird painting from the celebrated master Zhu Qizhan. In 1995, he held a solo exhibition at the National Art Museum of China in Beijing — a significant milestone for any Chinese artist.

Since the beginning of the 21st century, Yin has served as a long-time appraiser for China Guardian Auctions, authenticating and researching countless national treasures that have passed through the market. His expertise has been instrumental in confirming works attributed to legendary calligraphers including Wang Xizhi and Song Dynasty (960-1279) scholar Zeng Gong.

Wang Yannan, vice-chairman of China Guardian Auctions, has known Yin for years. "Ancient painting appraisal is an enormously complex discipline requiring an immense accumulation of knowledge. Yin is very well-read and knows the lives, habits and experiences of artists through the ages in remarkable detail. He has devoted his entire life to studying ancient art, and he is a rare traditional literatus in our time," she says.

Wang adds with a chuckle: "He knows very well about the lives of ancient painters. Yet, in his daily life, he is quite absent-minded, often getting lost on his way out. His mind is always absorbed in painting and scholarship."

Through his years of appraising and authenticating the works of masters, Yin has mastered both the essence and the lineage of traditional brushwork — knowledge he has also shared through published works on connoisseurship. These rich experiences and broad artistic horizons now flow steadily into his own painting, lending it an aura of profound antiquity and refined taste.

The exhibition, rooted in the theme of Taihu, offers a complete portrait of a scholar-artist's daily life and lifelong pursuit. Through the ancient past, he nourishes his brush; through reading and study, he cultivates his mind; and through landscape, he finds his place in the world.

LIFE

Beyond the flying fists

Jackie Chan's enduring appeal brings fans together as filmmakers consider where Chinese action cinema goes next, **Bai Shuhao** and **Tian Xuefei** report in Harbin.

The closing ceremony and honorary awards gala of the 7th Jackie Chan International Action Film Week is held at Harbin Ice and Snow World on Aug 12. PROVIDED TO CHINA DAILY

From left: The jury for the "Iron Man" honorary awards of the 7th Jackie Chan International Action Film Week. A fan gifts Jackie Chan a painting depicting all his roles. A couple from Malaysia travels to Harbin to meet Jackie Chan. BAI SHUHAO / FOR CHINA DAILY

Malaysia rarely sees typhoons. So when Typhoon Dolphin struck Shanghai recently, a Malaysian couple experienced one for the first time.

Their flight was delayed, then rescheduled. After they finally boarded, the plane returned to the airport. They spent 30 hours stranded before eventually getting seats on a replacement flight to Harbin in Heilongjiang province.

They had traveled thousands of kilometers for one reason: to see their idol, Jackie Chan.

"As the plane was taxiing, I was still very nervous. I was afraid it would be canceled again," says Low Ai Ying. "The moment we left the ground, I grabbed my husband's hand, and tears just fell."

The couple are Chinese Malaysians whose families trace their roots to Fujian province in southeastern China. Growing up, they had access to just one Chinese-language channel, and Jackie Chan's movies seemed to be on constant rotation.

"He was probably the only choice. But we never got tired of watching him. Chinese people really loved Jackie Chan."

To Low, Chan's films were brave and authentic. Whenever he was beaten up on screen, she says, she would wince along with him. More important was his persistence in making films, which gave her strength during difficult periods in her own life.

The couple met through their shared love of Chan's movies. Whenever one of his new films is released in Malaysia, they still make it a point to go to the theater.

This time, they traveled to attend the seventh Jackie Chan International Action Film Week and the inaugural Sun Island Film Week, held in Harbin.

In mid-August, fans from around the world gathered in the "Ice City," where China's first movie theater was established, to celebrate the past and consider the future of Chinese action cinema.

At a meeting with fans, Chan gave an update on his health. He said he had just returned from Azerbaijan, where he was filming a new movie, when a high-pressure jet of water from a fire hose accidentally knocked him into a pillar, fracturing his shoulder blade.

"I'm fine. I can go back to work as normal," he says with a laugh. "If I don't film, it actually hurts more."

It is the kind of attitude that has carried him through much of his career. He jokes about an old saying: "Once you go to the hospital, you'll find out you're sick. If you don't go, you're fine."

At the event, Chan greeted fans from across China and 17 other countries, switching between regional Chinese dialects and foreign languages. This year marks his 42nd year in the film industry.

He recalls his early days as a young stuntman. While filming *Water Margin*, he played a minor water demon soldier. Because he is not a strong swimmer, he nearly passed out on set.

"Five decades have passed so quickly," he says. He still finds it difficult to believe that he is making movies and that so many people continue to like him.

Among those fans is Ben Lewis, from Britain, who founded a small Jackie Chan fan club in Europe with about 30 members. His favorite Chan film is *Armour of God*, which he first watched as a child, when Chan was still, in Lewis's words, a "young man".

"Before CGI, before special effects, before Western films were doing this, he was already doing his own stunts," Lewis says.

Even in his 70s, Lewis adds, Chan continues to do what has defined his career.

For Lewis, the appeal of Chan's films lies partly in their lightness. They are comedies as much as they are action films.

When Chan fights, he is rarely trying to hurt someone. He is trying to protect himself. And he gets hurt, too. Viewers can see the pain he experiences and the physical cost of the fight.

That vulnerability is part of what sets Chan apart, says Stanley Tong, who directed Chan in films including the *Police Story* franchise, *Rumble in the Bronx* and *The Myth*. Tong sees it as part of a broader distinction between Chinese and Western action cinema.

More than a fight

"We talk about chivalry and martial ethics," Tong says.

The point is not to use violence simply to win, but to use force to resolve hatred.

"In Western movies, if someone points a gun at another person, they can be portrayed as a hero," Tong says. "Chinese movies are different."

He points to Bruce Lee's films from the early days of martial arts cinema. If an opponent is unarmed, or has been knocked down and can no longer stand, the hero stops fighting.

In the 1970s, Lee's films became a global phenomenon. Tong entered Hong Kong's action-film industry around that time and had the opportunity to meet Lee once.

His earliest impression of action cinema comes through one of Lee's films, Tong says. In *Fist of Fury*, Lee's character, Chen Zhen, is a martial arts student who returns to Shanghai to find that his master has died under suspicious circumstances. Chen discovers that the Japanese dojo in the city's Hongkou district is behind the murder.

Chen storms the dojo and kills everyone inside. Then he turns himself in to the police.

"Chen Zhen is an ordinary person who is forced to fight," Tong says. "He is not a superhero. He is not a god. He is just a person who has to stand up for justice."

Tong did not think simply importing that formula onto Chinese characters made sense. The more important question, he says, is: "Why are we fighting?"

When *Rumble in the Bronx* premiered, audiences cheered Chan's stunts. But Tong believes what moved them was not simply seeing Chan leaping through the air. It was his sense of dignity and moral courage.

"Bruce Lee's films use hand-to-hand combat to express a sense of national spirit. Chan adds cars and explosions. *Crouching Tiger, Hidden Dragon* brings the *wuxia* genre to global audiences, with warriors flying over rooftops and moving through the air. More recently, films such as Wu Jing's *Wolf Warrior* incorporate military themes."

The subjects of Chinese action films have continued to evolve, Tong notes, but an emphasis on loyalty, emotion and the moral courage of ordinary people has remained.

As artificial intelligence and other technologies reshape filmmaking, Tong believes they cannot fully reproduce the feeling of watching someone actually fight, jump and put their body at risk.

"When you see an actor really giving something of himself, you naturally feel respect for that person," he says.

The film week also honored action films and filmmakers from China and abroad, presenting 16 "Iron Man" awards to performers and industry figures.

The ceremony took place amid heavy wind and rain. Ti Lung, the veteran Hong Kong actor who received a lifetime achievement award, thanked the storm.

"I want to thank the heavy rain," he said, looking at the audience, many of whom remained seated despite being soaked. "I saw so many people sitting there as steady as a mountain."

He invoked a classical Chinese line about righteousness carried on a great wind, then addressed his fellow stunt performers: Do not worry about the future. Face whatever comes, whether fortune or hardship.

Fan Jianxiong, a longtime Jackie Chan fan and admirer of Chinese action cinema, stood in the rain for the entire three-hour awards ceremony.

For years, he says, people have questioned whether Chinese action cinema has a future beyond the generation of Chan, Jet Li and Donnie Yen.

"On the surface, perhaps it looks that way, but Chinese filmmakers have never stopped persevering."

In Harbin, he was struck by the story of Xie Miao, who won the award for Best Action Actor for *The Furious*. Xie began as a child actor and, at age 9, appeared alongside Jet Li in *My Father Is a Hero*.

When he returned to the film industry as an adult, opportunities were limited. He worked in television and online films and still keeps going.

His recent performance, Fan says, is a reminder of what has sustained Chinese action cinema: performers willing to put their bodies on the line and people willing to keep going even when the industry offers little certainty.

"Only Chinese people can make action films with distinctly Chinese cultural characteristics," Fan says. "As long as there is a group of actors and filmmakers who keep persevering, Chinese action cinema will not lose its continuity."

Chinese musical voices resonate across Italian summer nights

The Wuxi Symphony Orchestra performs at the 74th Ljubljana Festival in Slovenia's capital on Aug 20, featuring traditional Chinese instruments like the *suona* (right). Their European tour included five performances in Slovenia, Austria, and Italy. PHOTOS BY ZELJKO STEVANIC / XINHUA

ROME — Under the stars on Tuesday night, the powerful, expressive sound of the *suona* played by soloist Zhang Qianyuan filled an open-air amphitheater in the Italian town of Tuscania. The vibrant notes of the traditional Chinese wind instrument evoked the ancient Silk Road heritage of Dunhuang, in northwest China's Gansu province, while the violin, cello, trumpet and harp added layers of Western orchestral color.

The performance was part of the second movement of *Flying Apsaras*, an original symphonic suite by the Wuxi Symphony Orchestra. As part of the Tuscania Summer Festival 2026, about 70 musicians performed for more than 200 Italian audience members, presenting a concert that blended Chinese musical elements with Western symphonic traditions.

In addition to *Flying Apsaras*, the orchestra performed renowned Western works, including Giuseppe Verdi's *The Sicilian Vespers* and Johannes Brahms' *Symphony No. 1*. The event was organized by the nonprofit social promotion association The Arts Crossroad Association.

"*Flying Apsaras* was composed by our orchestra's music director Li Shaosheng. It tells the story of humanity's journey from curiosity about the unknown universe to space exploration, as well as China's rapid development in aerospace technology. It celebrates the Chinese spirit of space exploration," said Wu Ximing, chairman of Wuxi Symphony Orchestra Co., Ltd.

Wu explained that the inclusion of traditional Chinese elements was intended to help international audiences better understand the cultural message behind the work. The *suona* part in the second movement and the vocal performance by Chinese tenor Xue Haoyin in the fifth movement were both designed to highlight the Chinese identity of the composition.

By combining traditional Chinese sounds with Western orchestral expression, *Flying Apsaras* offered Italian audiences a different perspective on contemporary Chinese music.

For Chieko Hata, president of The Arts Crossroad Association, the young age and dedication of the Wuxi Symphony Orchestra's musicians were among the main reasons why the orchestra was invited.

"One of the most attractive things about this orchestra is that the average age of its members is only 28," Hata said. "I really think that Chinese musicians have a very strong work ethic. They practice hard and always want to become better."

She added that the orchestra's spirit aligned with the festival's mission of supporting young musicians.

"We thought this orchestra could also inspire Italian and European young people, showing them that music belongs to everyone and that young musicians can perform at an exceptionally high level while still enjoying what they do," Hata said.

The concert drew an enthusiastic response from local audiences. The amphitheater's original stone seating soon filled, prompting organizers to add temporary chairs. Even then, some spectators stood outside the railings to watch the performance. One mother even brought her baby daughter to experience her first concert.

"I saw the orchestra perform here yesterday for the first time, and it gave me a feeling of peace and tranquility," said local audience member Marta Scriboni. "After last night's concert, I immediately bought a ticket for tonight, and I came back again with great enthusiasm."

Tuscania Mayor Fabio Bartolacci said the concert represented more than just a musical event.

"This event has an important impact from cultural, tourism, and, of course, economic perspectives," Bartolacci said. "As a very welcoming town, we hope this marks the beginning of a long-term cultural journey and a lasting relationship between the music coming from China and the artistic heritage represented by our town."

The Wuxi Symphony Orchestra's European tour included five performances in Slovenia, Austria and Italy. The Tuscania concert marked the final stop of the tour.

MMA

Left: A crowd of 16,188 fans, the biggest-ever for a UFC Fight Night in Asia, cheered on China's Song Yadong against Russia's Umar Nurmagomedov in their men's bantamweight bout during the UFC Fight Night at Oriental Sports Center in Shanghai on Saturday. **Right:** Song Yadong celebrates the biggest win of his UFC career, a stunning second-round knockout of former title challenger Nurmagomedov. AFP

Song stuns world in massive UFC upset

Second-round knockout win over Nurmagomedov in Shanghai opens the door to a title challenge

By **SUN XIAOCHEN** in Shanghai
sunxiaochen@chinadaily.com.cn

The Ultimate Fighting Championship couldn't have asked for a better finish than the way Song Yadong left Shanghai in a frenzy on Saturday night after winning, arguably, the biggest fight of his career so far.

The Chinese bantamweight contender didn't take long to cap off the UFC's Shanghai Fight Night in the greatest possible way for the home crowd, after he secured a massive knockout victory over Russia's former title challenger Umar Nurmagomedov in their main event bout at Oriental Sports Center and took a giant step closer to a shot at the division's world championship belt, currently held by another Russian fighter, Petr Yan.

After spending the first round against Nurmagomedov cautiously testing the dangerous grappler by trading punches and kicks, Song came back in the second stanza with a grin on his face, signaling it was about time to go all in.

Less than two minutes later, he made the most out of what appeared to be a fleeting chance when Nurmagomedov went for a takedown, throwing a right uppercut at the Russian's neck and knocking the betting favorite out cold to ecstatic cheers from the partisan crowd.

"Who's next?" Song shouted out loud in his post-fight interview in the Octagon immediately after the win — one which could place the currently sixth-ranked contender next in line for a title challenge.

And Song minced no words about that.

"Give me the title shot!" Song demanded, to a standing ovation from over 16,000 spectators.

"Maybe not tonight, not tomorrow, or not next month, but I guarantee you guys that I will be the UFC's first men's world title winner from China".

The 28-year-old Song, who trains at the Team Alpha Male club in Sacramento, California, has now won three of his past four fights, with his lone blemish being a narrow defeat to former titleholder Sean O'Malley in January. His career win-loss record has been improved to 24-9, including 13 victories in the Octagon since making his UFC debut in 2017, also in Shanghai.

From an obscure teen prospect nine years ago to a legitimate title threat now, Song has refused to slow down.

"Nine years ago, I was just trying to prove I belong in the UFC," Song said of his triumphant first bout at the 2017 Shanghai Fight Night, where he submitted India's Bharat Khandare in the first round.

"Nine years on, as its strongest Chinese representative, I will have to prove that I am the world's strongest in this division."

China's Song Yadong catches Umar Nurmagomedov with a left hook during their bantamweight bout at the UFC Fight Night in Shanghai on Saturday. XINHUA

> "Give me the title shot! Maybe not tonight, not tomorrow, or not next month, but I guarantee you guys that I will be the UFC's first men's world title winner from China."
>
> **Song Yadong,** after his stunning UFC upset win

Despite often being seen as the underdog since he broke into the division's top 15, Song never has lost faith in himself, owing much to the solid, and oftentimes tedious, preparatory work that his coaching team, led by UFC Hall of Famer Urijah Faber, helps put him through.

Faber, a former bantamweight title contender from the United States, believes Song is right there near the top, with his only recent losses coming against former champ O'Malley and current belt holder Yan, both via unanimous decision.

"If you looked at those fights, those guys were scared of Song," Faber said. "They were running, they were avoiding and they were trying not to get beaten up.

"Those guys know that you do not want to fight Song Yadong. Song is the best fighter in the world (right now)."

Also standing tall for his country in UFC's heavy divisions, China's Liu Ce, in an earlier men's light heavyweight bout, introduced himself to the UFC in explosive style, landing a thunderous right to send his Brazilian opponent Levi Rodrigues Jr face first onto the canvas at the 2:28 mark in the second round, clinching the Chinese contingent's first win on the main card on his Octagon debut.

Flyweight striker Sumudaerji, who hails from the Aba Tibetan and Qiang autonomous prefecture in Sichuan province, kept up the winning momentum, claiming victory in his rematch against Alex Perez of the United States via unanimous decision, after their first meeting in Macao three months ago ended in a "no contest".

As the third UFC event held in China over the past 12 months, the sold-out Shanghai showpiece stood as another strong testament to the increasing appetite for MMA in China, with Saturday's spectator turnout of 16,188 setting an all-time attendance record for a Fight Night in Asia, as well as a venue record at Oriental Sports Center.

The appearance of 12 Chinese fighters, including those featured on the card of Friday's Road to UFC tournament, spoke volumes about the country's growing presence in the sport's top echelon.

Kevin Chang, UFC's senior vice-president and head of Asia, hinted that a more prominent UFC "numbered" fight, featuring title deciders, is likely to be held in China soon.

"Tonight, it blew our minds, just exceeded all expectations as far as the fan support and the level of competition," he said in the post-fight news conference.

"Every time we do something like this, we get closer and closer to that."

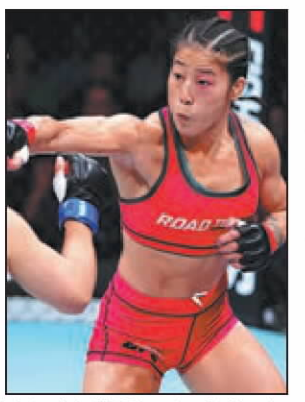
The strong appeal of UFC events in China comes down to the long-term commitment to talent development and the promotion of MMA culture, Chang added, citing the journey from signing the country's first UFC fighter, the now retired trailblazer Zhang Tiequan in 2012, to boasting an active roster of 21 Chinese fighters.

"It shows how far we've come," he said. "It's just been a really great ride and we look forward to seeing what the next chapter will hold for us."

Maheshate makes winning return, as Meng books RTU final berth

By **SUN XIAOCHEN**

Despite coming back on short notice, China's mixed martial artist Maheshate made the most out of his return to the Octagon, closing out the first day action of UFC Fight Night Shanghai with a thrilling submission win.



Waived by the Ultimate Fighting Championship a year ago after back-to-back losses, Maheshate, who hails from Ili Kazakh autonomous prefecture in Xinjiang, did not expect to get an immediate second chance to prove himself on the world's highest-profile MMA stage.

Not until he was given one on Friday, and did so in an unexpectedly stunning fashion.

Added to the card a week ago to fill in for his compatriot Taiyilake Nueraji, Maheshate couldn't have done a better job in Shanghai, as he submitted grappler Darrius Flowers of the United States with a first-round guillotine choke in their lightweight main event, announcing his comeback in style.

"I think I am a way more mature MMA athlete now than I was during my first stint with the UFC," said the 26-year-old striker, who earned his first UFC contract in 2021 as a winner on the Dana White's Contender Series.

Left: China's Maheshate aims a punch at Darrius Flowers during their lightweight UFC bout on Friday in Shanghai. **Right:** Meng Bo of China in action against Machi Fukuda of Japan during their strawweight Road to the UFC semifinal, held as part of UFC Fight Night Shanghai, on Friday. ZUFFA LLC

"I was too young when I first signed up with the UFC, and didn't make wise enough decisions (in picking opponents).

"I fight with more poise now, and I don't get panicked or feel too much pressure when facing tough situations during fights," said Maheshate, who completed his first spell with UFC with a 2-4 win-loss record.

Approached by the UFC to replace Taiyilake, who had to withdraw from the Shanghai card due to a sudden injury, Maheshate is very likely to have agreed to a minimum three-fight contract with the Las Vegas-based promotion.

He opted not to set his sights too far, or his hopes too high, this time around.

"I don't know how far I can go on my return. I just love this sport, and my priority will be working as hard as I can in training on a daily basis and only focusing on the next fight," said the product of Enbo Fight Club in Sichuan province.

Maheshate and Flowers opened the fight cautiously by pawing at one another in space, before the American veteran initiated the clinch and wrestled an off-balance Maheshate to the floor.

But Flowers left his neck exposed while trying to advance his position, offering Maheshate the opportunity to pounce and clamp onto an arm-in choke that left Flowers panicking, tapping out with a hand and a foot after just two and a half minutes.

Maheshate's quick finish salvaged what would have been an otherwise disappointing showing for Chinese fans on Friday night, where only one other home fighter managed to win their semifinal bout in the Road to UFC tournament.

In the co-main event, rising middleweight contender Yilizhati, another Chinese fighter from Xinjiang, had to settle with a split draw in his UFC debut against Tre'ston Vines of the US after three scramble-filled rounds.

In an earlier featherweight RTU semifinal, Chinese wrestler Ahejiang Ailinuer, who's also of the Kazakh ethnic group, was submitted by Australian grappler George Mangos with a rear naked choke midway through the second stanza of their bout.

Women's strawweight striker Meng Bo was the only Chinese fighter to advance victorious from the RTU semifinals, after the 30-year-old veteran outlasted Japan's Machi Fukuda via a split decision to reach the division final and keep her hopes of joining the UFC lineup alive.

Once a top prospect in the early stages of women's MMA in China, Meng, who handed UFC two-time strawweight champion Zhang Weili her only defeat to a compatriot early in 2013, has had her career ascent stalled by inconsistent results and injury woes over the past decade.

She's kept knocking, though, until the door to the biggest stage finally creaked open.

"This victory means everything to me," said Meng, who's improved her career win-loss record to 24-8.

"I've persisted and waited for this UFC opportunity for years. I've experienced losses and doubts in my career, and I've even questioned whether I could still stand in the Octagon and fight for my dream. Tonight, I proved to myself and everyone that I belong here."

Each season's division winners of the RTU talent selection tournament, launched in 2022 specifically for the Asia-Pacific market, earn official, multi-bout contracts with UFC.

MODERNIZATION FOR ALL

Kazakhstan experiences China speed

Astana's light rail shows how Belt and Road cooperation helps to advance modernization

By ZHAO JIA in Astana, Kazakhstan
zhaojia@chinadaily.com.cn

When the first phase of Astana's light rail transit system opened on May 16, Kazakh President Kassym-Jomart Tokayev took a ride on the new line and expressed thanks to the Chinese government and Chinese builders in Chinese, quoting the ancient proverb, "A journey of a thousand miles begins with a single step".

"I felt very proud," said Ji Chenglong, executive manager of the Astana light rail transit project at China Construction Sixth Engineering Bureau Co. Ji arrived in Astana with his team in July 2023. Working through winter temperatures as low as -40 C, they adapted materials and construction methods to local conditions and overcame the challenges of building an urban rail system in extreme cold.

The project applied Chinese standards and technologies across design, construction, equipment and operations, including fully automated self-driving trains and intelligent dispatching.

Ji said that average daily ridership has exceeded 70,000, well above the design-stage projection of 25,000. During construction, the project created more than 2,000 local jobs, while the project team conducted ongoing technical exchanges and provided on-the-job training tailored to the project's needs, he added.

"Seeing more and more residents enjoy the convenience brought by the light rail has deepened my understanding that infrastructure is not simply about steel and concrete. It is an important means of improving people's lives and promoting development," he said, adding that this is the true meaning of Belt and Road cooperation.

Ji said he still remembered that President Xi Jinping once said the ultimate goal of the Belt and Road Initiative is "to explore new ways for countries from near and far to achieve common development and to open up a 'path of happiness' that benefits the whole world".

The Astana light rail is a vivid example of that path taking shape in Central Asia, Ji said. "From a light rail line to a modern city, and from engineering cooperation to closer bonds between peoples, Belt and Road cooperation is not only a path of connectivity, but also a path of common development, friendship and cooperation, and greater well-being for the people," he said.

Askar Umarov, head of the Central Communications Service under the Kazakh president, said he believes that Kazakhstan and China are at a critical stage of development and revitalization, and are companions on the path to modernization.

Liz Gill, a freelance journalist from the United Kingdom, experiences the craft of making Dongba paper in Lijiang, Yunnan province, in September. WANG JIAN / FOR CHINA DAILY

TOURISTS FOLLOW PAPER TRAIL TO NAXI CIVILIZATION

Thousand-year-old craft of making Dongba sheets is finding its way around the world

By YANG FEIYUE and **LI YINGQING** in Lijiang, Yunnan

In Lijiang in southwestern Yunnan province, paper is crafted to endure. Handmade Dongba paper, once reserved for recording the sacred scriptures of the Naxi people, is now earning a place in the luggage of travelers from around the world.

A growing number of domestic and international visitors have left the UNESCO World Heritage-listed Old Town of Lijiang with Dongba paper products tucked into their luggage — notebooks filled with travel memories, postcards inscribed with ancient pictographs bearing blessings, and handmade paper lamps whose soft glow will follow them home.

Some visitors share their finds on social media, posting photos of the paper's fibrous texture and the enigmatic characters adorning it, introducing this centuries-old craft to a wider audience.

The alchemy of Dongba paper begins in the mountains surrounding Lijiang. It is traditionally made from the bark of the Wikstroemia shrub, which grows at elevations above 2,000 meters. The bark is soaked, softened, pounded into pulp, meticulously spread onto bamboo screens and then sun-dried — a process repeated dozens of times.

Migrant crisis

Migrants wait to collect food and water being distributed by Red Cross volunteers in Ceuta, a Spanish enclave in North Africa, on Monday. The autonomous city is grappling with a humanitarian crisis following mass crossings of nearly 60,000 migrants on foot and by sea from Morocco last week. Around 80 migrants reportedly died during the attempts. PEDRO NUNES / REUTERS **See story, page 4**

Beijing firmly opposes Japan's defense white paper

By LI SHANGYI in Beijing and **HOU JUNJIE** in Tokyo

China voiced firm opposition on Tuesday to Japan's newly released defense white paper, accusing Tokyo of hyping up the so-called "China threat" to justify expansion of its own military capabilities.

Chen Xi, a spokesman for the Chinese Ministry of National Defense, said the white paper is filled with false narratives and exaggerates a so-called "security crisis in the surrounding region".

Describing Japan's move as a case of "a thief crying 'stop thief'", Chen said the white paper serves as a pretext for its own military expansion. "We are strongly dissatisfied with and firmly oppose this move," he added.

Japan released on Tuesday the roughly 600-page white paper, titled "Defense of Japan 2026", which continued to portray the regional security environment as "increasingly severe".

The report claimed China's military developments "present an unprecedented and the greatest challenge" for Japan, and alleged that the Chinese mainland's military activities around Taiwan have become increasingly frequent.

The white paper retained the wording of its 2025 edition, claiming that the international community is facing its greatest challenge since World War II and has entered a new era of crisis.

In response, Chen said Japan's ruling authorities have continued to uphold the banner of an "exclusively defense-oriented policy" while accelerating revisions to its three key security documents, steadily increasing defense spending and developing long-range strike capabilities.

Japan has also promoted the weaponization and militarization of space and portrayed the expansion of its defense industry as a driver for economic growth, Chen said. He added that Tokyo is attempting to embed military expansion and war preparations into the country's institutions, economy, industries and public discourse.

Chen warned that Japan's "new militarism" has become a growing concern, posing a serious challenge to the postwar international order and a genuine threat to regional peace and stability. "The Taiwan question concerns China's sovereignty and territorial integrity and serves as the political foundation of China-Japan relations. It is a red line that cannot be crossed," he said.

The spokesman urged Japan to deeply reflect on its history of aggression, stop interfering in China's internal affairs, refrain from misleading the Japanese public and the international community, and avoid going further down the wrong path of "remilitarization".

Experts based in Japan said the country's continued military build-up has become a source of regional instability. Makoto Ito, director of the Japan Institute of Constitutional Law, told China Daily that Japan's security environment would improve if it remained committed to diplomatic and security stances that reassure its neighbors.

Ito noted that Japan's security and defense policies in recent years have deviated from its pacifist Constitution. "And yet, these policies continue to be advanced and are communicated to the public through official documents such as the defense white paper," he said.

Kumiko Haba, a distinguished professor at Josai International University in Tokyo, told China Daily that the administration of Japanese Prime Minister Sanae Takaichi is moving in an extremely dangerous direction, warning that it could evolve into a government prepared to wage war.

Haba said the current Liberal Democratic Party government has prioritized strengthening military capabilities, reopening debate on the three nonnuclear principles, expanding the defense industry and seeking to reinforce the Japan-United States alliance.

Japan's defense spending has been rising steadily, and it is already moving ahead of schedule toward the target of reaching 2 percent of the nation's GDP.

In March, Japan deployed its land-based Type 25 anti-ship missile in Kumamoto prefecture. With an upgraded 1,000-kilometer range, the missile far exceeds Japan's territorial defense requirements and possesses clear offensive capabilities. In April, Japan fully lifted restrictions on the export of lethal weapons.

Haba said that Japan is seeking to align itself with the US' agenda by abandoning its identity as a peace-oriented country and moving toward participation in war in pursuit of a new phase of national development.

Nation matching steps with UN to renew multilateralism

WORLD WATCH
By Siddharth Chatterjee

The United Nations General Assembly adopted Resolution 2758, restoring the lawful seat of the People's Republic of China in the United Nations, on Oct 25, 1971. In doing so, it restored one-fourth of humanity to the world's foremost multilateral institution, making the UN whole. Fifty-five years on, that decision endures as a defining milestone in the evolution of the international order.

The anniversary arrives at a sobering moment. Armed conflicts grind on across several regions, geopolitical rivalry is growing, trust among major powers has frayed, and humanity faces a convergence of challenges — climate change, pandemics, food insecurity, technological disruption and widening inequality — that no border can contain.

Seen across the span of 55 years, the story of China and the UN is one of remarkable evolution. A country that reentered the organization cautiously in 1971 has become one of its central pillars. As a permanent member of the UN Security Council, China is today the second-largest contributor to both the regular and the peacekeeping budgets of the United Nations. Among the Council's permanent members it deploys the most peacekeepers, with more than 50,000 Chinese personnel having served under the blue helmet from Africa to the Middle East. Some have given their lives for international peace and security.

What began as a restored seat has grown into sustained engagement across the UN's agencies — on public health and pandemic response, climate and biodiversity, agriculture and food security, digital cooperation and humanitarian relief. Through South-South cooperation, the Global Development Initiative and expanding partnerships, China increasingly shares its experience, technology and resources in support of the 2030 Agenda for Sustainable Development.

Multilateral cooperation is a vaccine reaching a remote village before an outbreak spreads. It is former child soldiers trading rifles for schoolbooks. It is a farmer planting a drought-resistant seed, or a family receiving shelter in the hours after catastrophe.

Such outcomes are possible only when governments, organizations and communities act through institutions that command global legitimacy.

Serving as UN resident coordinator in China gave me a rare vantage point from which to view China's partnership with the UN. What struck me was not merely the scale of China's engagement but its readiness to work through multilateral channels on challenges reaching beyond its borders. When the global health crisis tested every health system on Earth, I watched China reach out to many nations at once, delivering vaccines and sharing clinical experience and non-pharmaceutical interventions with countries across the Global South. The most consequential moments seldom made headlines. They took the form of patient collaboration — between Chinese ministries, UN agencies and international partners — to strengthen health systems, advance the green transition and modernize agriculture.

Is El Nino's economic risk too hot to handle?

Experts say 'climateflation' to impact bank rates, food output

By YANG GAO in Toronto

BEN MONTGOMERY/ GETTY IMAGES

Across the globe, the looming "super El Nino" is sparking warnings from economists, planners and experts about its potentially devastating impact on economies and societies.

A key area of the Pacific Ocean used to measure the strength of El Nino last week reached its warmest and most intense level ever recorded for the 15th week since it formed, which is early in its lifetime, scientists at Columbia University reported.

The El Nino weather event won't peak for several months and is expected to last through to spring 2027. The United Nations' World Meteorological Organization cautioned on Friday that it will likely trigger extreme heat, drought and rainfall well into next year.

The WMO warned of the strong chance of drought and wildfires in Indonesia, India and other parts of Asia, south and east Australia, chunks of South America and southern regions in Africa. Other areas, including much of the United States and fire-struck Southern Europe, will receive above average rainfall, the agency said.

"This El Nino, developing against the backdrop of unprecedented ocean heat and rising temperatures, provides governments and communities with a window of opportunity to anticipate risks and act before impacts unfold," said WMO Secretary-General Celeste Saulo.

For many economists, however, the consequences are already becoming evident. Investors and policymakers are increasingly concerned that climate shocks could reinforce inflationary pressures already facing economies around the world.

"Heat kills — both lives and livelihoods," said Gernot Wagner, a climate economist at Columbia Business School.

"And it is often rather small changes in the average that lead to large threshold effects," he said.

He cited research showing that "only one additional day above 32 C in any given year lowers annual payroll by 0.04 percent".

"That may seem like a small effect. It is not," Wagner told China Daily. "One hot day in any given year shows up in annual productivity statistics, and El Nino only exacerbates these effects."

Wagner said the impacts extend well beyond labor productivity.

"'Climateflation' is a real phenomenon, and one that can already be measured," he said.

"Single heat waves lead to often large spikes in prices of individual agricultural products, which reverberate throughout the economy," he said.

Emerging economies at risk

The weather phenomenon, which typically occurs every two to seven years, could take a heavy toll on emerging economies, pushing up food prices and slowing growth.

Emerging markets are particularly vulnerable as households spend a larger proportion of their income on food, experts said. Also, agriculture plays a big role in their economies, raising the risk that central banks will have to keep policy tighter for longer.

"We came into this year with many central banks thinking they had space to cut. And now we see central banks stopping cutting, and some of them are hiking (rates)," Gillian Edgeworth, a fixed income portfolio manager at Wellington Management, told Reuters.

"I don't think we're moving to a world where there's rapid rate cuts in emerging markets in the second half of the year."

India is among the most vulnerable economies as it depends heavily on the annual monsoon, which typically delivers nearly 70 percent of the country's rainfall.

The country's meteorological department has warned rainfall could be the lowest in more than a decade, threatening crop yields and raising the prospect of higher food prices.

With inflation above the central bank's 4 percent target, analysts warned a super El Nino could force it to tighten monetary policy. However, a revival in monsoon rains late last month accelerated planting of summer crops across much of India, sharply reducing an earlier sowing deficit caused by lower rainfall.

Across much of Asia, higher energy and fertilizer costs are already weighing on external balances and economic growth, complicating central banks' efforts to stabilize currencies and contain inflation.

Central banks in the Philippines, Indonesia, South Korea, Pakistan and Sri Lanka have already hiked interest rates at least once this year.

"El Nino is just going to make inflation more sticky," said Gary Tan, equity portfolio manager at Allspring Global Investments.

"People are forecasting rate hikes for the second half of the year, especially for the ... Asian countries, which are kind of the most impacted by El Nino such as India, Indonesia, Vietnam, Thailand," he said.

In South America, Colombia is among the Latin American economies most exposed to El Nino-related weather shocks, as below-average rainfall can hit food supplies and electricity prices.

The country's reliance on hydropower makes reservoir levels a key inflation indicator. Low water levels can force greater use of costlier thermal generation, pushing up electricity prices and inflation.

Analysts warn a severe El Nino could keep Colombian monetary policy restrictive for longer.

Peru's central bank has warned that inflation could exceed its target this year and growth could suffer, citing high oil prices and El Nino's impact on fishing and agriculture.

Argentina, by contrast, may benefit from higher rainfall, which could support grain output, export revenues and foreign-exchange inflows. Central banks in Brazil, Mexico and Chile are expected to take a wait-and-see approach as they assess any impact on inflation and growth.

Africa vulnerable

An impending super El Nino is likely to inflict a combined $10 billion to $20 billion hit on affected African countries and trigger mass migration from hard-hit areas, the African Development Bank's top climate expert told Reuters.

As well as the threat to food and water security, government finances and banking sectors could also be undermined if disasters damage infrastructure and leave cash-strapped countries struggling to repay the connected loans.

"Just this event is going to reduce heavily affected countries' GDP by one to two percent on average, which is about $10 billion to $20 billion across the continent," said Anthony Nyong, the ADB's director for climate change and green growth.

The development bank's most recent forecast in May, which did not take into account a super El Nino, predicted Africa as a whole would see 4.2 percent economic growth this year, rising to 4.4 percent in 2027, assuming the conflict involving the United States, Israel and Iran eases.

Governments in Africa were also getting snared in what Nyong described as the "climate finance trap", where they lack the resources to respond to crises and are forced to raid health, education or infrastructure budgets to meet costs.

The 2023-24 El Nino caused severe drought in Southern Africa and heavy rains or flooding in East Africa. These conditions led to widespread crop failures, surging food prices and record-breaking sea-level spikes along the continent's coastlines.

The ADB has estimated Africa's farmers are already facing nearly $330 million in lost income this year, while fishing industries could also be hit hard due to rising sea temperatures and storms.

"When these shocks happen, countries take two steps back," Nyong said. "We don't want our countries to slide into poverty."

He said the ADB stood ready to restructure projects to help countries manage El Nino's impacts and it would work with them to tap additional multilateral support such as the Green Climate Fund, the world's largest dedicated climate fund.

Humanitarian pressures would add to the problems, Nyong said. The bank has identified Sudan, South Sudan, the Democratic Republic of Congo, Somalia, Mali, Burundi and even Nigeria as countries that could face particularly severe impacts.

"When this El Nino comes there is going to be mass migration," he said, adding that the price of maize — a key food staple in many affected countries — was expected to double. "You are not going to stay put, you are going to move," he said.

The African Union Commission has called on its members to step up preparedness for the expected impact of El Nino.

"The 2026-27 El Nino event is projected to be the strongest since 1950. This is not a distant possibility. It is an imminent risk that demands immediate preparation at national, regional and continental levels," Moses Vilakati, AU commissioner for Agriculture, Rural Development, Blue Economy and Sustainable Environment said on Thursday in Addis Ababa, Ethiopia, while opening the extraordinary session of a special technical committee looking at the weather pattern.

Many regions of the continent are likely to experience severe droughts, devastating floods, prolonged heat waves, disruptions to food production, water shortages, disease outbreaks and increased humanitarian needs.

"These impacts will not only affect vulnerable households; they will also place considerable pressure on national economies, public finances and regional stability," he said.

"This is neither speculative nor unprecedented. We have already witnessed the devastating consequences of delayed action," he warned, citing the 2023-2024 El Nino that affected millions of people in Africa.

Strengths, weaknesses

As climate risks become more synchronized across regions, globalization has created new vulnerabilities, Wagner, the climate economist at Columbia Business School, said.

"The more globalized — and hence specialized — our supply chains become, the higher the vulnerability of such extreme events, whether heat, droughts, floods, or other weather extremes that, due to climate change, are increasingly correlated," he said.

That growing correlation, he said, is changing the economics of risk itself.

"Single extreme events are costly. Correlation due to climate change makes them all the more costly," he said.

He compared the problem to insurance.

"The way to ensure against individual extreme events is by hedging — one flood or wildfire in one region may be bad, but others will be fine.

"With climate change, that is increasingly no longer the case — droughts and floods and other extremes the world over are suddenly connected, correlated with each other. Hedging away from extremes in one place is increasingly no longer possible," he said.

The solution, Wagner argued, lies in both adaptation and emissions reductions.

"Invest, invest, invest — in resiliency measures, of course, but also in cutting greenhouse gas pollution in the first place. Only by cutting additional carbon dioxide going into the atmosphere to zero will we be able to stabilize global climate over the long term," he said.

While many economists warn that El Nino could contribute to higher food prices, agricultural scientist Walter Baethgen argues it should not be seen solely through the lens of a possible disaster.

"My view of El Nino is different from the most popular one," said Baethgen, a senior research scientist at Columbia University's International Research Institute for Climate and Society. "I see El Nino as an opportunity."

The weather event is valuable because it is one of the few major climate phenomena that can be forecast months in advance, giving governments, humanitarian agencies and farmers time to prepare, he said.

Baethgen said seasonal forecasts allow farmers to make informed adjustments that reduce risk instead of radically changing production.

"It's a smart way of using this information," he said, describing how producers may shift part of their acreage toward crops favored by expected weather conditions without abandoning diversification altogether.

He also challenged the widespread perception that El Nino necessarily leads to global food shortages.

Wetter conditions often improve crop production in parts of the US and southeastern South America, while drier weather can reduce harvests in regions such as southern Africa, Australia and parts of Asia.

"It's not bad everywhere. For some things, it's very good," he said, adding that "the negative impacts ... are typically compensated by positive impacts in other regions."

Because agricultural gains and losses often occur simultaneously across different agricultural production regions, Baethgen said the relationship between El Nino and global food prices is far more complicated than many assume.

"El Nino is one of many factors affecting world food prices," he said. Geopolitical events, energy prices and fertilizer costs can sometimes have an even greater influence on global markets than climate alone, he added.

Institution: Increasing engagement highlighted

From page 1

When catastrophic floods inundated Pakistan in 2022, I launched an emergency appeal from Beijing alongside Pakistan's then ambassador to China. China was among the first countries to respond with timely assistance, supporting both immediate relief and longer-term recovery.

Similarly, after the earthquake that devastated Myanmar in 2025, the Chinese government, together with the UN in China, quickly mobilized emergency humanitarian assistance and relief for those affected.

Such actions epitomize China's increasing global engagement, which extends beyond economic development to encompass humanitarian solidarity. They also reflect China's commitment to South-South cooperation and its willingness to work through the UN to address global challenges. Effective multilateralism rests not on rhetoric but on the discipline of showing up, again and again.

Every great test facing humanity is a shared one. No nation, however powerful, can halt a pandemic, stabilize the climate, govern emerging technologies or deliver the Sustainable Development Goals on its own. That truth does not render the UN less relevant; it makes it indispensable.

As is dialogue. In the end, every conflict arrives at a negotiating table. The only question is how much suffering precedes it. To press for political solutions is not weakness but the highest form of strategic wisdom.

Nowhere was this clearer than in Beijing in March 2023, when China helped Saudi Arabia and Iran restore diplomatic relations after seven years of rupture — an agreement to reopen embassies and revive dialogue between two rivals whose estrangement had fueled conflicts across the Middle East. Few had anticipated a breakthrough; fewer still had expected it to be brokered in the Chinese capital. Such efforts reflect a principle woven into the very fabric of the UN Charter — that durable peace is never imposed by force, but built through diplomacy, mutual respect and perseverance.

Fifty-five years after Resolution 2758, the question before us is no longer one of representation but of responsibility. The true measure of leadership lies not in the power to shape events alone, but in the willingness to strengthen the institutions through which all nations may shape them together.

Our shared future depends not on retreating from multilateralism but on renewing it — with confidence, with courage and with common purpose. In an age of fracture, that remains humanity's surest hope.

The author served for nearly three decades with the United Nations, most recently as UN resident coordinator in China (2021-26). He is currently CEO of Global Neighbours, a Vienna-based think tank, and a distinguished visiting professor at Tsinghua University.

Religious rites

Drones deliver convenience to sailors

By **CHEN MEILING** in Beijing and **LIU KUN** in Wuhan

Twelve-year-old Liu Ziqi celebrated her birthday aboard a ship docked in Yichang, Hubei province, recently. What made the day memorable was a specially delivered birthday cake, a first for the young girl.

Liu's parents operate a cargo vessel that ferries goods between Shanghai and Chongqing, and the girl has lived on board with them since she was a baby.

"She celebrates every birthday on the Yangtze River. However, we have never been able to go ashore and buy a cake," said Liu Ge, her mother.

What made this year different was the low-altitude instant delivery service extended by local authorities to meet the needs of tens of thousands of crewmembers who operate the numerous vessels plying the river every day.

Liu Ge placed the order for the cake through an app. The delivery rider collected the cake from the shop and took it to the drone base. The drone pilot located the vessel using the Yangtze Beidou app. With the cake loaded in a basket, the drone lifted off and headed straight for the ship. "It's as efficient as ordering a takeout ashore," Liu Ge said.

The family's vessel remained docked in Yichang for three days as it waited for its turn to pass the Gezhouba Dam and the Three Gorges ship locks.

Earlier for supplies, the family had to depend on mobile "supermarket" ships, in which the number of products is typically limited and the price is often higher than in shops ashore.

"The other choice was to go ashore on public ferries that run on fixed schedules, or pay for a small vessel that cost 100 yuan ($14.8) for a round trip," the mother said, adding that the drone delivery service is fast, cheap and offers more choices when it comes to shopping.

Sailors plying on the route have been making the most of the service.

For Li Wenchuan, a 22-year-old sailor, the drone delivery was a godsend as he could get medicines for a stomachache quickly by paying a nominal fee of 10 yuan. Captain Fu Yibo replaced his vessel's storage batteries after having them delivered by the drone service. First mate Zhang Zhongkun ordered chilled milk tea, fried chicken and grilled skewers to cheer up his crew, something that would have been difficult to do in the past.

After months of trials, the low-altitude instant delivery service was officially flagged off in late July. Including the trials, more than 10,000 orders have been placed so far, with the number of daily orders ranging between 30 and 40, said Huang Yuhua, who is in charge of the drone comprehensive service base.

Yichang sits at the junction of the upper and middle reaches of the Yangtze River, and hosts the Three Gorges Dam and Gezhouba Dam.

Data from Yichang maritime bureau shows that since March, around 700 vessels on average waited for lock passage each day on the Yangtze River's Yichang section. During peak periods, that number could rise to 1,000 vessels, carrying approximately 9,000 crewmembers.

Each day only about 70 to 80 ships can pass the locks.

Vessels typically wait seven to eight days to be granted passage. The maximum waiting time can stretch to 15 days during maintenance work and flood seasons. As sailors remain on board for a long time, buying fresh produce and spare parts becomes a challenge, Huang said.

"Traditional supply methods such as shuttle boats and supply vessels are time-consuming, and fresh produce tends to spoil easily. In addition, crewmembers face safety risks when taking small boats ashore to shop," he added.

The drone delivery service currently covers waters within approximately 3 kilometers. After cargo arrives at the takeoff and landing site and passes predeparture inspection, the maximum travel time for the farthest delivery takes about 80 seconds, Huang added.

Delivery fees are based on distance and weight, ranging from 10 yuan to 50 yuan. 5G-Advanced base stations are deployed along the river to ensure stable communication signals. When the drone reaches target waters, the pilot makes manual adjustments to identify the vessel name and accurately locate the waiting crewmembers.

Emergency medicine and critical supplies can be delivered to moving vessels. The drones can operate in light rain and snow. Deliveries are suspended when visibility drops below 200 meters or wind force exceeds Grade 7.

In the future, Huang said they would build a complete delivery system along the Yangtze River, establish an online shop, and add more takeoff and landing points for the drones.

"We do not merely treat sailors as passing visitors," said Zhu Hanhong, director of Yichang bureau of economy and information technology, adding that the delivery service extends the city's public services to the river.

Craft: Paper's durability surprises travelers

From page 1

"Unlike industrial paper, where uniformity is the goal, Dongba paper keeps the traces of nature," said Zhang Jian, a product designer who runs a Dongba paper workshop in the old town.

Plant fibers remain visible across the surface, creating subtle textures and organic patterns. No two sheets are ever alike.

"Every sheet has its own character," Zhang said. "We try to preserve the natural qualities of the raw material. The fibers themselves are what make the paper beautiful."

For centuries, Dongba paper was used by Naxi priests to record religious scriptures in a pictographic writing system that remains central to Naxi cultural heritage. Its natural resistance to insects and aging has helped preserve those texts for generations.

Today, the same durability has become part of its modern appeal.

"We used to see foreign tourists occasionally. Now we see them every day," said Zhang, who has spent nearly 23 years giving this thousand-year-old craft a modern makeover.

Turning Dongba paper from a religious material into everyday products was not easy.

Zhang spent his early years experimenting with ways to make the traditional paper suitable for modern life. Today, his workshop produces a range of cultural products, from journals and bookmarks to decorative pieces featuring Dongba script.

Han Yuchen, who oversees sales and outreach of Dongba paper sales, believes that its appeal goes beyond mere portability.

"Many visitors are surprised when they hear that such a delicate-looking paper can last for hundreds of years," he said. "They want to know more about how it is made."

Postcards are often the first thing overseas visitors pick up, followed by notebooks and paper lamps.

Featuring images of Lijiang's scenery alongside Dongba characters, postcards can be personalized with handwritten blessings before being sent home. The paper's natural texture gives the writing a warmth that mass-produced cards cannot replicate, Han said.

Dongba paper lamps have become an unexpected hit. Made by folding a single sheet of Dongba paper into a lampshade, they emit a soft glow that reveals the natural fibers. Each lamp has its own pattern, shaped by the plant material itself.

"Many European and US visitors say the texture fits beautifully with their home decoration," Han noted. "They like the feeling of bringing something natural and handmade into their homes."

Notebooks are another favorite. One best-selling journal, roughly A5-sized with raw edges and a leather cover, sells for more than 180 yuan ($27). Though pricier than standard notebooks, they serve as a premium repository for personal memories.

Chinese AI models gain favor overseas

Alibaba unveils latest Qwen version as businesses embrace cost-effective tech

By **CHENG YU**
chengyu@chinadaily.com.cn

Alibaba Group has launched its 2.4-trillion-parameter Qwen3.8-Max model that can analyze 200-page financial reports and process more than 100 hours of video content, putting it directly among the world's top-tier large language models.

Several sources told China Daily that Alibaba's latest Qwen model has entered the "deep testing" phase in Tesla's vehicle systems in China and is expected to be used for Tesla's in-car platform soon.

The development comes as more and more companies from the United States adopt Chinese artificial intelligence models, which they believe offer frontier-level performance at substantially lower costs.

In the latest Arena benchmark rankings, one of the most widely followed third-party evaluations of AI model performance, Alibaba's Qwen models ranked just behind US-based Anthropic's Claude series.

Alibaba said that Qwen3.8-Max is expected to become open-source next week, following the release of Qwen3.8-27B, further expanding access for developers building AI applications.

Qwen3.8-Max's application programming interface pricing in China has been set at 12 yuan ($1.67) per million input tokens and 36 yuan per million output tokens, with cached input tokens priced at 1.5 yuan per million tokens.

International pricing is also significantly lower than comparable frontier models, with input and output costs respectively at about 40 percent and 24 percent of Anthropic's Claude Opus prices.

Chinese AI models have been continuously gaining traction overseas. According to OpenRouter data, weekly usage of Chinese LLMs stood at 14.1 times that of US models as of July 27, marking the 13th consecutive week that Chinese models ranked first on the platform in terms of weekly token consumption.

Late last month, Coinbase CEO Brian Armstrong said the cryptocurrency company had adopted China-developed AI models, including Zhipu AI's GLM-5.2 and Moonshot AI's Kimi K2.7, as default tools for engineers through an internal AI gateway. Through model switching, intelligent routing and caching optimization, Coinbase has cut its AI costs by nearly half.

San Francisco-based AI startup Lindy switched from Claude to DeepSeek-V4 in June, and said its API expenses had exceeded its entire payroll costs before the transition.

"It is not about low pricing anymore," said Wang Peng, a researcher at the Beijing Academy of Social Sciences. "Companies globally are increasingly weighing performance against cost, privacy, flexibility and suitability for AI agents and enterprise workflows."

Morgan Stanley said in a research note that Moonshot AI's Kimi K3, the full model weights of which became officially open-source on July 27, represented a broader trend of Chinese LLMs catching up with US leaders in model scale, performance and pricing.

Peng Jiahao, a researcher at the Shanghai Artificial Intelligence Research Institute, said: "The pace of AI development is increasingly moving in China's favor. But both Chinese and US AI models are still facing challenges in reaching short-term breakeven and the AI industry is still far from achieving widespread profitability."

Relations: Goal is to build projects with lasting value

From page 1

Umarov said that China's achievements in economic development, digital transformation, technological modernization and the implementation of long-term national strategies offer valuable practical insights for Kazakhstan.

China is an important strategic partner of Kazakhstan, and understanding the thinking behind China's domestic and foreign policies has significance beyond academic research, he said.

"The more deeply we understand China's decision-making logic and long-term development goals, the more effectively we can improve the quality and efficiency of our cooperation," Umarov said.

Manarbek Kabaziyev, deputy chairman of the board of the Foreign Policy Research Institute of Kazakhstan's Foreign Ministry, said the next decade of Belt and Road cooperation should be evaluated not by the number of projects, but by whether they create lasting value, spur innovation and strengthen trust among countries.

Infrastructure is not an end in itself, he said, but a foundation for higher-level cooperation. Kazakhstan should build on improved connectivity to develop a future-oriented modern economy, with transportation corridors supporting not only trade but also closer industrial, investment and technological links.

Aliya Mussabekova, head of the International Security Department at the Kazakhstan Institute for Strategic Studies under the president of Kazakhstan, said bilateral economic cooperation has moved beyond traditional trade, with the focus expanding from infrastructure and resource development to manufacturing and high-tech industries. This shift is increasingly supporting the modernization of both countries.

China-Kazakhstan trade reached a record $48.7 billion in 2025, up 11 percent year-on-year, according to Chinese figures. Data from Kazakhstan's national investment promotion company shows that cumulative Chinese investment has exceeded $30 billion, with more than 8,000 Chinese-backed enterprises operating there.

Mussabekova said the two countries' development priorities also converge in digitalization and artificial intelligence. Kazakhstan has designated 2026 as its Year of Digitalization and Artificial Intelligence, while China has made digital development, technological innovation and AI national priorities, opening further opportunities in the digital economy, satellite and remote-sensing technologies and space communications.

Yet a lasting and stable strategic partnership cannot be built solely on economic indicators, she noted, saying that "long-term strength depends even more on mutual trust between the two peoples".

That trust is also being strengthened by closer people-to-people ties. A mutual visa-free agreement for ordinary passport holders took effect in November 2023, and Kazakh figures show that the number of Chinese visitors to Kazakhstan reached nearly 1 million in 2025.

Education cooperation is giving those ties a longer-term foundation. At L.N. Gumilyov Eurasian National University, a Luban Workshop jointly established with China gives students access to AI, robotics and digital manufacturing.

Gulmira Bekmanova, vice-rector for digitalization at the university, said the workshop is "not merely a laboratory or a classroom" but a practice-oriented teaching platform where students learn both advanced technologies and how to apply them to real-world problems.

"The Luban Workshop has become an important symbol of Kazakhstan-China educational cooperation," Bekmanova said.

Ceuta crisis raises EU frontier concerns

By **JULIAN SHEA** in London and **HOU CHENCHEN** in Beijing

The interior ministers of the 27 European Union member states held a virtual meeting on Tuesday to discuss tightening up internal borders following the scenes at the Spanish enclave of Ceuta in North Africa over the weekend.

The EU's migration chief said on Tuesday the bloc successfully met a "test" of its border security and "resilience to disinformation" in the handling of a migrant rush into Spain's North African territory of Ceuta.

"These past few days were a test of our European resilience, a test of the security of our external borders," EU Commissioner for Internal Affairs and Migration Magnus Brunner told reporters following Tuesday talks with the bloc's interior ministers.

"Europe, I think, has definitely passed this test."

Member states recognized Madrid's "immediate and efficient" response, Spanish Interior Minister Fernando Grande-Marlaska told reporters on Tuesday.

The minister added that Madrid had worked as fast as possible to install a maritime barrier off Ceuta's coast.

As for Schengen Area issue, Marlaska said: "It is clear that in no way was the Schengen Area compromised in this crisis" as the North African enclave is not included in the agreement.

He added that "there was no possibility of any secondary movement" of migrants from Ceuta to continental Europe.

France's interior minister also said on Tuesday that EU ministers had agreed the Schengen Area was "not the problem" after calls to suspend Spain from the bloc following the influx of migrants.

As the meeting unfolded, another migration incident was playing out in the English Channel, underscoring the multiple border pressures Europe is facing.

French and British teams rescued 157 migrants who were trying to cross the English Channel after the engine of their boat caught fire, French maritime authorities said.

Helping hand

EU has offered Spain aid, including emergency financial assistance, to help strengthen the protection of the external border in Ceuta, said Brunner, EU migration chief.

He added that the events in Ceuta last week, when about 70,000 people came over the border from Morocco into the Spanish enclave, were fueled by criminal smuggling networks and social media disinformation.

The Euronews website reports that the incident happened after false rumors began to circulate on social media saying that the border was open, with others showing where coast guard patrols were active, and more suggesting places where people could swim across.

Media agencies said there is a specific local angle that goes some way toward explaining the sudden nature and scale of the crisis, however.

The BBC noted that for decades, there has been an unresolved territorial dispute between Morocco and neighboring Algeria over the Western Sahara region, which was previously under Spanish control, making for a diplomatically sensitive three-way relationship in the area.

The broadcaster commented that a similar, smaller influx into Ceuta took place in 2021 after a regional opponent of Morocco was allowed treatment at a Spanish hospital, and that the latest incident came just two weeks after Spain's prime minister paid a visit to Algeria. It also observed that the authorities in Rabat have "already shown readiness to deploy migration pressure as a retaliatory tactic against Spain".

Happy birthday Bao Li

The Smithsonian's National Zoo and Conservation Biology Institute in Washington marks the fifth birthday of Bao Li, one of a pair of giant pandas who arrived in Washington in October 2024. The bear enjoyed a special panda-friendly "fruitsicle" cake made by the Zoo's Department of Nutrition Science on Tuesday morning, as crowds gathered at the David M. Rubenstein Family Giant Panda Habitat. SHA HANTING / CHINA NEWS SERVICE

Asian economies face risks to food security

Region sees challenges amid El Nino, Mideast energy supply shocks: Experts

By **PRIME SARMIENTO** in Hong Kong
prime@chinadailyapac.com

Asia's economies are staring down a double shock: a looming super El Nino threatens to deepen food insecurity just as the Middle East crisis drives up energy and fertilizer costs.

Analysts said a prolonged dry spell could slash crop yields and push food prices further out of reach for consumers already squeezed by surging inflation.

"The impact of El Nino is just among the many crises that we are facing at the moment," said Paul Teng, a visiting senior fellow in the Climate Change in Southeast Asia Programme at the ISEAS-Yusof Ishak Institute in Singapore.

Teng said geopolitical tensions in the Middle East, which have driven global oil prices higher, are rippling through Asia's transport and farm sectors, fueling inflation across the region. The surge has been compounded by what he called a "fertilizer shock", as the Middle East is a major exporter of crop nutrients.

He said that rising fertilizer costs are forcing farmers to cut back either on usage or on the land they plant this season. The squeeze on inputs is expected to weigh on harvests in the next crop cycle, adding another layer of pressure to food prices.

"On top of that is El Nino, which is like adding oil to fire," Teng told China Daily, referring to the periodic weather pattern that is expected to intensify further from this month, heightening the risks of extreme weather.

Oil prices started skyrocketing soon after the United States and Israel began attacking Iran on Feb 28. The Asian Development Bank, or ADB, said as the crisis in the Middle East evolved, inflation also rose across the developing Asia-Pacific region.

Headline inflation in the region increased from 2.9 percent in January to 4.1 percent in May on the back of higher global energy prices, the ADB said in its latest economic outlook report published in July.

The Manila-based lender said that since March, governments across the region have introduced measures to limit pass-through to consumer prices, including fuel subsidies, tax cuts, price controls, releases from strategic petroleum reserves and energy conservation policies. But inflationary pressures persist, with higher logistics and fertilizer costs spiking food prices.

The ADB sees inflation across the region hitting 4.3 percent by end-2026, up from the 3 percent recorded in 2025.

'Ripple effects'

Japanese investment bank Nomura said in its latest report that El Nino may lead to trade protectionism in the coming months. It noted that in the past, countries like India, Indonesia and Vietnam have resorted to export restrictions or outright export bans to prevent surge in domestic food prices. But while these measures can help in reining in local prices, the export bans have "ripple effects" as prices go up for food importers, it said.

The World Meteorological Organization, or WMO, said in a July 31 report that El Nino continues to intensify steadily and is expected to dominate global climate patterns until October 2026. The WMO also forecast a positive Indian Ocean Dipole, or IOD — a climate pattern defined by differences in sea-surface temperatures that affects regional weather. An IOD can amplify regional climate impacts, including drought, floods and wildfire risks.

Khor Yu Leng, an economist at Segi Enam Advisors in Singapore, said the El Nino plus positive IOD combination presents a "higher-risk scenario" for Asian agriculture as this will reinforce dryness in most parts of Southeast Asia.

She said that rice is the "immediate flashpoint" because the Asian staple is a thinly-traded commodity and as such, weather disruptions and export controls can trigger outsized price spikes.

Khor said El Nino's impact on palm oil, a key cash crop, "tends to be more lagged, but potentially broader". She said El Nino-linked dryness reduces fresh fruit bunch yields several months later while extreme rainfall and floods can also disrupt harvesting and logistics.

Unlike rice, palm oil is deeply integrated into the global food, oleochemical — chemical compounds derived from natural fats and oils, typically of plant or animal origin — and biofuel supply chains. Khor said this is why tighter palm oil supply can spill quickly into edible oils and energy markets.

She also cited corn as the "hidden protein inflation story" because Asian countries rely on imports from Brazil and Argentina. If El Nino hits South American corn harvest, Khor said Asian livestock raisers have to deal with higher feed costs.

China's electric buses fuel Baku's green transport

BAKU — "When I began driving electric buses, I could immediately tell that they were very different from the buses I had driven before. They run quietly and smoothly, with hardly any noise or vibration. Most importantly, they are environmentally friendly," said Nurlan Salmanli, a 34-year-old bus driver in Baku.

Salmanli previously drove buses powered by compressed natural gas. Ahead of COP29 in 2024, 160 BYD electric buses imported from China entered service in Baku, the Azerbaijan's capital, replacing the conventional buses on the routes he operated.

"Passengers really like them, especially older people and families with children. These modern buses make public transport in Baku more convenient and comfortable, and help reduce noise on the streets. I hope to see more buses like these in the future," Salmanli said.

Salmanli's experience reflects a broader transformation taking place in Baku's public transport system as Azerbaijan accelerates its transition toward greener mobility. According to BYD, an electric bus traveling 90,000 kilometers a year can save about 27,000 liters of diesel and reduce carbon dioxide emissions by approximately 66 tons annually.

Data released by the Azerbaijan Land Transport Agency in spring 2026 showed that about 2,350 buses operate in Baku each day, including more than 300 BYD electric buses. Some of these buses were assembled locally at the Azerbaijan Energy Automotive Factory, or AEAF, in the Sumgayit Industrial Park, about 30 km northwest of Baku.

"I have been involved in the AEAF project since its early stages. When the first bus rolled off the production line, we felt very happy and proud. It was the beginning of a new stage for our factory and our team," said Orkhan Gambarov, the factory's deputy director for production.

The factory was established through a joint initiative of the Azerbaijan Business Development Fund, SARDA Group and BYD. Its first locally assembled 12-meter BYD electric bus was delivered in September 2025.

According to Gambarov, major components are delivered to the factory, where assembly, quality control and the necessary inspections are carried out. To date, the factory has delivered 300 locally assembled BYD electric buses.

"Since the beginning of the project, the Chinese team has provided us with great support. Our Chinese colleagues have supported us at every stage, from technical issues to quality control. They have also shared their production experience and knowledge with our local team," Gambarov said, adding that the strong collaboration between the Chinese and local teams has been one of the main reasons for the project's success.

'Fascinating field'

The factory currently has about 100 Azerbaijani employees. Among its first technical staff members was Rizvan Gulaliyev, who is now a chief foreman at the plant.

He said electric bus production was a new and fascinating field for him, and that the project had helped him acquire valuable knowledge and hands-on experience in electric vehicle manufacturing.

"Chinese specialists conducted training directly on the production line and demonstrated the correct sequence of assembly operations. They also trained us to operate the equipment, conduct diagnostics and follow quality standards. I hope to grow with the factory and become a more skilled specialist in modern automotive technologies," Gulaliyev said.

The Project Management Department under Azerbaijan's Ministry of Economy coordinates and oversees the implementation of the AEAF project. Zamir Dibirov, head of the department, said cooperation with Chinese companies helps Azerbaijan transition from being solely an importer of green technologies to becoming a producer and operator of new-energy transport solutions, with the potential to serve regional markets.

"Azerbaijan highly values its cooperation with China and would welcome greater participation by Chinese companies in the country's new-energy and advanced manufacturing sectors. We see considerable potential in battery technologies, charging infrastructure, smart mobility systems and other fields," Dibirov said.

Jingdezhen's porcelain heritage recognition a lesson in shared protection

Yang Han
Reporter's log

FIRST PERSON VIEW

What does it mean for a country to be among the ones with the most World Heritage sites in the world?

For China, that question carried added weight on July 25, when the Jingdezhen Handicraft Porcelain Industry Sites became the country's 61st UNESCO site.

Held from July 19 to 29, the 48th session of the UNESCO panel added 25 new sites to the World Heritage List, including the first-ever inscriptions for three African countries — Comoros, Sao Tome and Principe, and South Sudan. The committee also granted emergency protection to three newly inscribed World Heritage sites and added three previously recognized sites to the danger list.

Among them, Jingdezhen stood out not only as China's sole nomination for 2026 but also as the first site explicitly themed around porcelain, and China's first-ever "industrial heritage" nomination.

Located in East China's Jiangxi province, the Jingdezhen Handicraft Porcelain Sites comprise five component areas that trace the evolution of handicraft porcelain production from the 10th to the 19th centuries in the city now often known as the "porcelain capital" of China.

But beyond the numbers, what struck me most was the shared commitment among nations to protect heritage as a legacy for all humanity, and how China's role in that effort was perceived by those I spoke with.

"China is bringing a lot to the World Heritage List," said Alessandro Balsamo, head of the Nominations Unit at the UNESCO World Heritage Centre. "And of course, this is not just an honor to be on top of this list, but it represents also a big responsibility."

"It is very important for all the countries to share their experience on their sites," said Aseela Almoalla Alhashmi, director-general of the Fujairah Environment Authority and a member of the United Arab Emirates delegation.

During the session, the UAE successfully had Wadi Wurayah, a national park in Fujairah that hosts 1,099 species, inscribed as its first UNESCO-listed natural heritage site.

When I asked about China's growing role in international heritage cooperation, Alhashmi mentioned that she had also participated in the World Congress of Biosphere Reserves in Hangzhou in 2025 and said she believes the Global Civilization Initiative proposed by China is important for the world and future generations.

For smaller nations with limited resources, this cooperation is even more practical.

Sandra Mascarenhas, scientific coordinator of the Tarrafal Concentration Camp at the Cultural Heritage Institute of Cabo Verde, told me that her country, which has only one World Heritage Site, depends on international cooperation with partners such as China to secure financial support and capacity building.

"Last year, we were in Guangzhou, (where) there was a symposium about cooperation between Africa, China and UNESCO," said Mascarenhas. "It was very good because it helped us reformulate our nomination and helped us achieve some monetary funds."

During the latest event in Busan, South Korea, there was also a series of side events co-organized by governments, institutions and companies from China, sharing China's experience in nominations, the adoption of technology in heritage protection, and the country's call to advance international cooperation in the sector.

Every one of those events saw the rooms filled to capacity and some were so packed that latecomers had to stand along the walls. Many participants stayed on after the session to exchange ideas with Chinese organizers. It was a clear sign of the international community's interest in China's heritage experience.

As Balsamo, the UNESCO official, told me during the interview, the honor of being among the top on the World Heritage List comes with a big responsibility to show the way for other countries and to become partners in multilateral cooperation.

In Busan, I saw that responsibility being acknowledged with more than just words. At a time when heritage is facing unprecedented challenges from climate change and geopolitical conflicts, that partnership feels all the more valuable in protecting the shared legacy of all humanity.

WORLD

Hostilities escalate over the Black Sea

MOSCOW/KYIV — The Russia-Ukraine hostilities have escalated over the Black Sea and its coastal areas, authorities said.

Ukrainian drones have targeted multiple Russian resort cities along the Black Sea coast, while Russia has struck Ukrainian vessels transporting military supplies.

Seven people were killed and at least 40 others were injured in a Ukrainian drone attack on Arkhipo-Osipovka, a Black Sea resort village in Russia's Krasnodar Krai region on Monday, according to the regional emergency response center.

Meanwhile, the Russian Defense Ministry reported on Monday that its unmanned aerial vehicles struck four bulk carriers ferrying military cargo that supported military operations of the Ukrainian Armed Forces.

The ministry said that two bulk carriers unloading military supplies were targeted at the port of Mykolaiv, a river port situated on the Southern Bug River, about 65 kilometers inland from the Black Sea. Two other cargo ships carrying military material were attacked in the Black Sea waters.

Escalating attacks by both sides on shipping in the Black Sea have reawakened fears that global food security could be put at risk.

Turkiye on Tuesday repeated its appeal for both Russia and Ukraine to ensure the safety of navigation in the Black Sea after two Turkish-owned ships were attacked by drones after leaving the Russian port of Novorossiysk.

A Turkish Foreign Ministry statement expressed concerns that the conflict is increasingly spreading across the Black Sea, threatening civilian shipping, and warned such incidents could have broader consequences, including for the global food supply, as important amounts of grain, fertilizers and other key produce move through those waters.

In other developments on the battlefield, five people were killed and six others injured in a Ukrainian drone attack on Tuesday morning in Moscow Oblast, regional governor Andrei Vorobyov said on his Max channel.

Elsewhere, a regional official in Sumy in Ukraine's northeast said Russian attacks killed one person in Sumy on Tuesday.

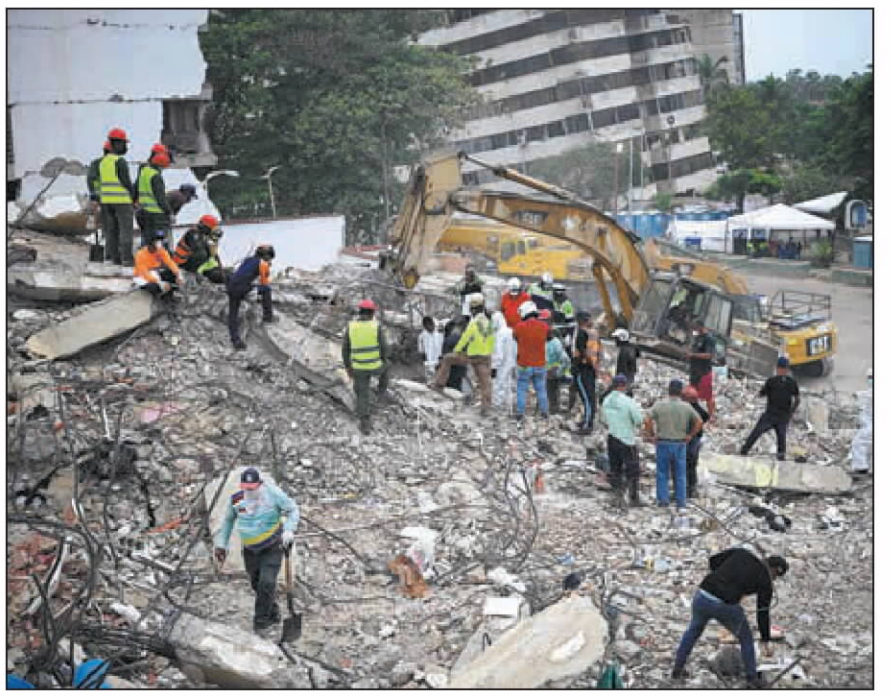
Oleh Hryhorov, the regional governor, said on Telegram that three locations in the Kovpakivsky District were struck, with private homes and infrastructure coming under attack.

One day earlier, Ivan Fedorov, a regional chief, said Russian planes dropped eight powerful glide bombs in a span of 90 minutes on residential districts of Zaporizhzhia, killing one person and wounding dozens of others.

In another development, Ukrainian President Volodymyr Zelensky dismissed Ukraine's ambassador to the United States, Olha Stefanishyna, according to a decree published by the presidential office on Monday.

Stefanishyna, who had served as ambassador since last year, said in a Facebook post that she had requested to be relieved of her duties for personal reasons. She described her service in Washington as "the greatest honor" of her life.

"We have increased the supply of American weapons and maintained support precisely when the political environment in Washington was not in our favor," she said.



Zelensky has not announced a successor to the post.

The move comes after a government reshuffle launched by Zelensky in July and at a time when Kyiv is seeking continued US military support amid its conflict with Russia.

Zelensky had appointed new national security and foreign intelligence chiefs earlier this week.

Report gauges AI's effect on developing nations

World Bank assessment sees less job risk, but higher barriers to accessing benefits

By LIA ZHU in San Francisco
liazhu@chinadailyusa.com

While developing economies face lower job displacement risks from artificial intelligence compared with developed nations, gaps in infrastructure development, institutional capacity and relevant skill sets largely restrict their access to the benefits that AI has to offer, said a recent World Bank report.

According to the World Development Report 2026, which was released on Tuesday, only 4.5 percent of existing jobs in low- and middle-income countries are at risk of automation by generative AI, compared with 14.2 percent in high-income countries.

At the same time, AI could meaningfully boost productivity in 16.2 percent of jobs in developing nations, which is not far below the estimated 18.7 percent for high-income countries.

While the labor market in developing economies is less concentrated in occupations that are most exposed to generative AI, the figures suggest that workers and businesses could still use the technology to improve performance.

The World Bank described the report as "the first comprehensive assessment" of the implications of AI for developing economies, offering a perspective that has often been overlooked in academic and policy discussions focused largely on developed nations.

"AI has thrown developing economies a lifeline, and they should seize it," said Indermit Gill, senior vice-president and chief economist at the World Bank Group in a news release.

Weakest average growth

Developing economies are currently experiencing their weakest average growth performance in three decades, the World Bank said, adding that AI could be particularly valuable in cases where shortages of skilled manpower and institutional capacity have hindered development.

According to the report, AI tools can help doctors diagnose illnesses, support teachers in adapting teaching methods, guide farmers in making planting decisions, provide advice to small businesses, and enable banks to assess borrowers without conventional credit histories.

Governments could use AI to improve tax collection, social programs, healthcare services, education curriculums and disaster response, thereby extending limited public-sector capacity across larger populations, the report also said.

Gill noted that developing economies do not require large AI models or big data centers to reap the benefits of the technology. "By adapting small, low-cost AI tools to local conditions, they can bring better medical care, education, judicial services and agricultural extension within the reach of millions," he said.

The World Bank cautioned that "such optimism should not be unbridled", indicating countries that could benefit most from AI are often the least prepared to embrace the technology.

Harnessing the power of AI calls for a dependable foundation involving a stable electricity supply, affordable high-speed internet, capable institutions and skilled workers, but many developing economies have yet to achieve universal access even to electricity and the internet, it said.

The report shows that developing economies account for just 5 percent of high-performance computing capacity and 12 percent of secure internet servers. In sub-Saharan Africa, for example, almost one-third of rural schools still lack a stable electricity supply, and more than two-thirds lack dependable internet connections.

While AI could significantly boost performance globally before the end of the decade, the opportunity is not guaranteed for all, the World Bank said. It added that the most advanced AI systems are being developed by a small number of countries and companies, while many developing economies still lack the basic infrastructure needed to effectively use AI.

Although adopting existing generative AI tools is less expensive, imported systems may perform poorly when applied to languages, cultures and public services inadequately represented in their training data. For example, more than 2,000 languages spoken in Africa are neglected in major language models, according to the report's concept note.

Another concern, the report said, is that governments that lack the expertise or data needed to embrace these systems could become dependent on a small number of AI solution vendors, and those dominant vendors could shape standards and regulatory frameworks in those countries.

Three-step strategy

The World Bank called on developing economies to follow a three-step strategy — adopting available AI tools, adapting them to local conditions and advancing toward frontier development over time.

This approach would allow governments to initially focus on practical, lower-cost applications, rather than making expensive attempts to reproduce the most advanced models before basic foundations are in place, it said.

Gaurav Nayyar, director of the World Development Report 2026, warned that the window to get it right is narrow. "Developing countries that build the foundations now — power, connectivity, skills and institutions — will be positioned to adopt and adapt AI for their people," he said.

Chinese market keeps wine exports flowing

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Australian wine exports fell to a record low in line with global consumption trends, but the Chinese mainland remained its largest export market by value in the pillar sector, according to the latest analysis.

The exports fell year-on-year by 7 percent in value to A$2.3 billion ($1.6 billion) and 6 percent in volume to 598 million liters in the year ended June 2026, statutory authority Wine Australia's export report released on July 29 showed.

It was the first time that export volume had fallen below 600 million liters since 2004, with the fall mirroring "a broader global trend of declining wine consumption over the past decade", it said.

Peter Bailey, market insights manager at Wine Australia, said the challenges facing Australian wine exporters are not unique, with other wine-producing nations facing the same conditions.

Data from multiple sources suggested that the decline in wine consumption globally reflected changing consumer behavior that is "reshaping demand around the world", he said.

'Historic downturn'

The total export figures "reflect increasingly difficult trading conditions across many of Australia's key export markets, driven by a historic downturn in global wine consumption", according to Wine Australia.

Worldwide wine consumption has fallen to its lowest level since 1961, as consumers increasingly moderate alcohol intake, face cost-of-living pressures and shift toward alternative beverages, it said.

While global trading conditions remain challenging, Australian wine continues to perform relatively well in many key markets, Bailey said.

The Chinese mainland remained Australia's largest export market by value, despite exports falling 15 percent to A$756 million, according to Wine Australia.

The Chinese market is no longer being driven by the restocking of Australian wine, Bailey said, amid "a more mature and demand-led phase" that also reflected a smaller and slower-growing sector.

Michael Harvey, senior analyst in dairy and consumer foods at global agribusiness banking cooperative Rabobank, told China Daily that the wine sector is going through a period of rebalancing and resizing.

"There are some weather conditions that played a role, but there's also been clearly a structural decline in the size of the industry. So we're actually seeing some vineyard removals, which is why we're seeing reduced production in Australia to reflect the challenging operating environment," said Harvey, who is based in Melbourne, Victoria state.

"Margins are under pressure for a lot of the wine, a lot of the vineyards and growers, which is why we're getting a supply response. So that naturally has led to less production," he said.

"There's also a structural reset in terms of the amount of alcohol we're consuming, so that's a trend you've seen in a lot of key markets and China would be part of that," Harvey said.

"At some point in time it'll find a better balance and you'll start to see some stabilization," he said, adding that there are still segments in the sector that are performing well.

"Premium wines are performing better than some of the other varieties, so it's not a linear decline everywhere."

Jack Wu, managing director Greater China for major Australian winemaker Treasury Wine Estates, noted that China has long been an important market for Penfolds, and the brand has built a strong connection with Chinese consumers over many years.

The winemaker is headquartered in Melbourne and includes the popular Penfolds label in its portfolio.

"We're focused on growing that relationship for the long term by staying close to how people are shopping and enjoying wine, supporting healthy and sustainable channels, and creating more occasions for consumers to discover and share Penfolds," he said.

Feline revival

The Amur Tiger Center releases on Monday an adult Siberian tiger named Ymit into the Ile-Balkhash State Nature Reserve as part of a joint program with Russia to repopulate the area with tigers, a species declared extinct in these parts decades ago. AMUR TIGER CENTER / TASS

Briefly

EUROPE

Romania reroutes cooling water to reactor

Romania blew up a rock outcrop on Monday to help divert vital cooling water from the drought-hit Danube River to its sole working nuclear reactor, an unprecedented measure that underscores the scale of an energy crunch across the region. In neighboring Hungary, authorities said they might be able to eke out two more days of power from their only atomic plant, which has been hit by falling levels in the Danube that it also relies on as a coolant. Heat and drought have lowered river levels across large parts of Europe, raising concerns about water supplies, river transport and power generation. Both governments have asked people and companies to cut power use to ease demand.

AFRICA

Ebola death toll rises to 1,700 in DR Congo

Ebola has killed more than 1,700 people in the Democratic Republic of Congo in the fastest-growing outbreak of the disease, data showed. As of Tuesday, 3,802 cases had been recorded, with 1,707 deaths, according to latest update. It is not clear when the outbreak will reach its peak, Africa CDC Director-General Jean Kaseya said on Tuesday.

ETHIOPIA

Landslide kills 14 in Amhara region

Fourteen people were killed in a landslide near a monastery in Ethiopia's Amhara region, the state-run Amhara Media Corporation said late on Monday. The landslide occurred near the Tsadkane Mariam Monastery in Amhara's North Shewa zone, the broadcaster said. Search teams supported by excavation machinery were working to recover bodies, it said. The Amhara Media Corporation report did not say what caused the landslide, but independent news reports said it was triggered by heavy rains. Ethiopia is in its main rainy season, which runs from June to September.

Litigation against Section 301 tariffs clear sign of growing divide in the US

The new challenge to the United States administration's tariff policy reflects the increasing discontent that is being aggravated by the inflation caused by energy price hikes due to the Middle East crisis triggered by Washington and Tel Aviv. While the litigation initiated by a coalition of 25 states, mostly Democrat-led, against the Section 301 tariffs on Monday underscores the growing partisan divide, businesses oppose the tariffs primarily because of the rising costs imposed on the economy.

Those hoping the judges of the US Court of International Trade hearing the lawsuit brought by the states will simply strike down the tariffs should temper their expectations. Unlike the earlier International Emergency Economic Powers Act case, in which the US president was judged to have exceeded his authority, the US administration enters the dispute in a stronger position.

This time the US administration has imposed tariffs under Section 301 of the Trade Act of 1974, which expressly authorizes the president to impose tariffs in response to "unfair" foreign trade practices. The government's argument is that it has acted within the limits of the authority the US Congress delegated. The court is therefore unlikely to spend much time debating whether tariffs make sound economic policy. It will instead ask two narrower questions: Did Congress authorize tariffs of this breadth, imposed in this manner?

Historically, Section 301 investigations have focused on specific countries, specific conduct and proportionate remedies. Section 301 was never conceived as a blank check for redesigning global trade policy. Congress enacted it as a targeted enforcement mechanism against identifiable "unfair" foreign practices, not as a universal tariff authority affecting nearly all US imports.

The new tariffs, covering imports from 59 economies and the European Union on the basis of alleged "forced-labor" concerns, represent a dramatic expansion of the statute's traditional reach. The plaintiffs therefore argue that Section 301 has become a substitute vehicle for policies the US Supreme Court has already rejected. As they claimed, the US administration has merely exchanged one statutory label for another while pursuing the same sweeping tariff regime.

If the "forced-labor" investigations are found merely to provide legal cover for replacing invalidated IEEPA tariffs, the US administration's position will become more vulnerable. So whether the courts are willing to scrutinize the factual basis of those "forced-labor" findings may prove just as important as interpreting the statute itself.

Judges should exercise their own independent judgment when interpreting Section 301 rather than accepting the Office of the US Trade Representative's reading of it. And the court's increasingly influential Major Questions Doctrine requires clear congressional authorization before government agencies exercise powers of vast economic and political significance. A tariff regime affecting almost the entire US import market plainly raises questions of that magnitude.

So the administrative record assumes unusual importance. The court will examine whether the USTR followed the Congress-prescribed procedures — investigations, public hearings, factual findings and reasoned explanations — or whether tariff rates were chosen first and justified later.

Tariffs remain taxes, and taxes ultimately fall on someone. The US administration's dealmaking tool has become an instrument of economic coercion directed as much at US businesses as foreign governments. The litigation is likely to take years reaching the Federal Circuit and perhaps the US Supreme Court. In that time, the tariffs will continue to tax the US economy unless they are revoked.

While many blame US tariff policies for the rise of unilateralism and protectionism, the deeper concern lies in the political and institutional soil from which those impulses have grown. The real issue is a Congress that has increasingly tolerated the expansion of executive authority for partisan interests. Courts can police the boundaries of executive power, but only Congress can redraw them. Whether the polarized legislature can still rise above partisan divisions and vested interests to reclaim its constitutional authority over trade will ultimately determine whether the US' political system can overcome its challenges through self-correction.

Hyping 'China Shock' won't benefit Germany

The claim by Tanja Gonner, chief executive of the Federation of German Industries, or BDI, in a Monday report of Frankfurter Allgemeine Zeitung, that a "China Shock 2.0" "threatens" the entire German industrial system is a lamentable and deeply flawed example of scaremongering.

Reportedly, Germany is mapping out vulnerabilities in China's supply chain in order to use this information as leverage in a possible trade war with China.

Some Western politicians and analysts find it far easier to make China a scapegoat than to confront the real challenges festering at home — whether soaring energy costs, suffocating bureaucratic red tape, or the painfully slow pipeline from lab to market. If their real objective were industrial renewal rather than political point-scoring, they would not have overlooked the "China Opportunity 2.0" that proponents of the "China Shock 2.0" narrative have intentionally erased from the debate.

The experience of German businesses in China tells a very different story from Gonner's alarmist warnings. China reclaimed its position as Germany's largest trading partner in 2025, with a bilateral trade of 253 billion euros ($299 billion), up 2.7 percent from 2024, underscoring the depth of their economic complementarity.

The point was reinforced this February, when German Chancellor Friedrich Merz arrived in China accompanied by senior executives from dozens of Germany's biggest companies, visiting some of the leading Chinese technology companies in search of deeper industrial partnerships.

If German boardrooms truly believe the rhetoric of "China Shock 2.0" and the Merz government believes a trade war with China is unavoidable, they have a curious way of showing it.

German enterprises have long been beneficiaries of China's market and supply chains. The BDI must understand that the competitive pressure its members feel is a normal feature of a dynamic global market. Instead of advocating an assertive posture, it should encourage German companies to explore the very market that has fueled their growth and to tap into the opportunities created by China's 15th Five-Year Plan (2026-30) with an open mind.

If some German industries are still not convinced, they need not look any further than Volkswagen, which has adjusted its research and development strategy based on the success of its R&D center in China. This has accelerated the company's transition from "hardware-defined vehicles" to "software-defined vehicles". Just as Volkswagen recognizes China's EV success as an "opportunity" to be seized, the German government should abandon its unfounded allegations of "currency manipulation" and "overcapacity" and play a constructive role in China-European Union trade consultations.

For multinational corporations, partnering with China today means embedding themselves in a vibrant ecosystem of innovation. It means gaining access not just to market share, but to a dynamic environment for self-iteration, technological upgrading and the cocreation of next-generation solutions.

The real and present concern for the German economy is its own inertia. Many Chinese travelers returning from Germany remark that a country once synonymous with punctuality and precision no longer feels quite the same. Train delays and disruptions to urban transport have become commonplace, while China's high-speed rail and metro systems — once seen as playing catch-up — now operate with a level of speed, reliability and punctuality that is taken for granted.

Anecdotes are not data, but they often capture broader truths. The contrast serves as a reminder that Germany, like some other advanced economies, faces its own structural challenges and would benefit from a more sober assessment of its domestic transition rather than attributing every competitive setback to China.

None of this is to deny Germany's unique strengths. It remains a global leader in advanced machinery, chemicals, industrial automation, environmental technology and precision manufacturing. Chinese companies have long regarded their German counterparts not as rivals to be feared but as partners from whom much could be learned. If a technological gap is grounds for fear, then should China have labeled the arrival of German companies in the 1980s and 1990s a "Germany Shock 1.0"?

What some in Germany appear to find harder to accept is that, in a growing number of industries, the flow of knowledge between China and Germany has become two-way. In fields such as electric vehicles, digital infrastructure and aspects of advanced manufacturing, the former student has, at least in some respects, become a teacher.

FIFA boss' profiteering risks ruining the beautiful game

Under Sepp Blatter, FIFA became synonymous with patronage and scandal to many. Yet his successor Gianni Infantino, as head of the world football body, risks eclipsing even that legacy. His failed attempt to sell a stake in the World Cup to Thrive Capital, an investment company run by Josh Kushner, brother of Jared Kushner, the son-in-law of the United States president, looked uncomfortably like an offering to Washington, using football's greatest prize as political currency.

In essence, FIFA sought to sell a 20 percent stake in a new commercial subsidiary controlling World Cup revenues to a private equity firm tied to the US president's inner circle. The plan would reportedly have earned Infantino a commissioner-style role, paying around $30 million a year — five times his current salary.

The question now being asked is what else Infantino expected in return for further strengthening his standing with a US president he has repeatedly described as a close friend.

The backlash to the plan was predictable and entirely justified. The Union of European Football Associations and others were angered not only because they learned of the proposal through media reports, but because it violated a basic principle: the World Cup is not a private asset to be monetized for a handful of investors. Should commercial partners with political connections acquire a financial stake, the pressure to influence decisions will inevitably follow. At that point, FIFA would cease to be the guardian of the tournament and become its broker.

If investors closely associated with the White House stand to profit directly from football's biggest event, can FIFA credibly claim political neutrality? Countries already facing strained relations with the US, such as Iran, would have every reason to question whether commercial interests and political preferences might shape the tournament's administration. Even the perception of such influence would damage the World Cup's credibility.

With the deal abandoned and revolt spreading inside FIFA, Infantino's swagger has disappeared. Reports suggest Infantino repeatedly tried to reach the US president by phone before seeking support from US Secretary of State Marco Rubio under the banner of promoting football as the US' "soft power". Few were persuaded. As an insider bluntly put it, this was about saving his job, not promoting the sport. On Tuesday, FIFA denied the reports.

Infantino should remember that FIFA is still rebuilding its reputation after years of corruption scandals. Fresh questions have already emerged over allegations that political pressure influenced disciplinary decisions during this year's World Cup, including controversy surrounding the overturning of a red card shown to US striker Folarin Balogun. Whether those claims withstand scrutiny or not, immediately pursuing a business arrangement that appeared to favor the associates of the FIFA boss' close pal displayed astonishingly poor judgment.

Infantino insists he is expanding football's reach. He has proposed a bigger World Cup, more teams, more matches — and as hasn't escaped notice — more money-making opportunities. Expansion looks more like commercial opportunism than sporting vision. Every additional fixture creates more broadcasting slots, sponsorship inventory and advertising revenue, while concentrating influence among an ever-smaller circle of powerful hands.

The same philosophy underpins some of Infantino's so-called "innovations" such as mandatory "hydration breaks". Officially introduced for player welfare, they also create perfectly timed commercial pauses that interrupt football's natural rhythm. Infantino presents every change as progress, yet too often the beneficiaries are broadcasters, sponsors and executives rather than supporters.

Football belongs to the people. The FIFA president is supposed to protect that inheritance, not mortgage it. Infantino's failed World Cup stake sale exposed a governing philosophy in which the game's greatest treasure is no longer a public trust, but another asset to be traded among the powerful. That is precisely why the revolt against him deserves to succeed.

— LI YANG, CHINA DAILY

What They Say

Revised rules will help boost innovation in IC design

Editor's note: *The China National Intellectual Property Administration has published explanations for revisions to the country's Regulations on the Protection of Layout-Designs of Integrated Circuits, publicized by the State Council on Monday. The experts include Huang Yunhua of the intellectual property institute of the China Industrial Control Systems Cyber Emergency Response Team, Li Shunde of the Institute of Law of the Chinese Academy of Social Sciences, and Cui Guobin of the School of Law at Tsinghua University. Below are excerpts of their comments. The views don't necessarily represent those of China Daily.*

Today, the process nodes of transistors for conventional integrated circuits are approaching their technological and physical limits. Disruptive technologies such as photonics and quantum technology have emerged, propelling the integrated circuit industry into the post-Moore's Law era, where competition revolves around new architectures, mechanisms, materials and devices.

Globally, countries are exploring ways to overcome the physical limitations of conventional integrated circuits and trying to develop new technologies for integrated circuits.

The revisions of the regulations include "the layout-designs of integrated circuits incorporating photonic, quantum and other functions" as designs eligible for protection. This reflects an accurate assessment of and proactive response to technological developments in the integrated circuit sector.

Integrated circuit design determines the performance, power consumption and competitiveness of chips. The revised regulations will enhance the protection of cutting-edge integrated circuit intellectual property and establish a system suited to the pace of technological innovation in China's integrated circuit industry.

Since 2022, there has been a rise in the number of applications filed in China for the registration of integrated circuit layout-designs incorporating photonic and quantum devices. The revised regulations are expected to further inspire innovators, boosting innovation and development in China's integrated circuit technology.

The revisions add an "originality statement" to the documents required to be submitted when registering a layout-design. This official document, submitted to the China National Intellectual Property Administration, defines the design's originality scope and demonstrates that it meets the required legal standards.

Exclusive rights to a layout-design are granted upon registration with the administration. Layout-designs which are not registered will not be protected under the regulations.

The revisions introduce a registration revocation procedure initiated by third parties. Anyone who finds that a registration fails to comply with the regulations may request the intellectual property administrative department of the State Council to revoke the registration.

To encourage the creation and utilization of layout-designs, the revised regulations say that legal persons or non-legal-person entities should grant reasonable rewards and remuneration to eligible people in accordance with the Law on Promoting the Transformation of Scientific and Technological Achievements and other relevant national rules.

The revised regulations also include a punitive damages system, saying that where an intentional and serious infringement upon the exclusive rights to a layout-design is committed, "the amount of compensation may be fixed at between one and five times the amount determined in accordance with the aforesaid methods." This provision reflects the goal of strengthening protection for layout-designs.

Li Yuheng

Clustering can rewrite the story of rural China

For years, China has invested heavily in rural revitalization, yet many villages remain trapped in a cycle of scattered resources, duplicated infrastructure, and limited industrial scale.

The core reason is straightforward: local governance and funding have traditionally treated each administrative village as an independent development unit. That approach is now changing.

China's "No. 1 central document" for 2026 advocates for a "classified, orderly, zone-based promotion of rural revitalization". The policy signals a profound shift from single-village autonomy to cluster-based, cross-village cooperation.

China's rural population has declined steeply from its 1995 peak of 859 million to 451 million in 2025, a decrease of 47.5 percent. Villages have moved along vastly different trajectories: some have grown steadily amid urban-rural integration, some have merged seamlessly into nearby towns, while others have shrunk and declined due to sustained population outflow.

The previous model allocated budgets village by village, leading to fragmented investment. A single village cannot sustain a specialty industry, build a competitive tourism brand, or attract professional operators.

Neighboring villages competed instead of cooperating, resulting in redundant roads, duplicated facilities, and price undercutting. This led to a lose-lose situation where many villages struggled to achieve economies of scale and public resources were spread too thin.

The new cluster development framework is built on three principles.

First, classified positioning assigns tailored development paths to individual villages based on their growth potential, location and resources.

Second, phased progress prioritizes improvements in transportation and public infrastructure before rolling out public services and industrial projects.

Third, spatial integration groups neighboring villages with complementary resources into functional clusters. These clusters transcend rigid administrative boundaries to integrate land, capital and talent, achieving economies of scale unattainable by individual villages.

A typical cluster may combine one village's natural scenic resources, another's specialty agricultural products, and a third's surplus rural labor. Spatial restructuring reduces redundant infrastructure spending and encourages functional specialization.

MA XUEJING / CHINA DAILY

Instead of competing for identical projects, villages within a cluster focus on differentiated roles in production, processing, tourism and logistics based on their strengths. The result is coordinated revitalization that transforms rural decline into collective growth.

Zhejiang province has taken the lead in piloting this approach. In 2025, the province identified 226 provincial-level core villages for driving the development of 1,447 surrounding villages. These rural clusters host 1,094 key projects, with planned investment nearing 33 billion yuan ($4.85 billion) over the next three years.

Three institutional innovations underpin the effective operation of rural clusters.

First, cross-village Party building alliances establish collaborative governance mechanisms, breaking administrative barriers between villages. Second, professional management teams serve as impartial coordinators, replacing outdated zero-sum competition with cluster-wide win-win planning that allows all villages to share the benefits of unified regional branding and industrial development.

Third, binding institutional rules firmly protect farmers' legitimate rights, ensuring that there are no changes in collective asset ownership, no damage to traditional rural landscapes and cultural features, and no forced merger of villages. These safeguards are critical to maintaining grassroots trust and long-term social stability.

It is important to clarify that cluster development does not aim for uniform prosperity for every village. Population decline and the gradual disappearance of some small villages are natural outcomes of demographic and economic changes.

The cluster model allows resources to shift away from shrinking settlements while maintaining basic public services for the remaining residents. This realistic approach avoids unnecessary fiscal expenditure and prevents the futile effort of sustaining unviable villages.

Rural depopulation, aging and fragmented public investment are universal global challenges, faced by both developed and developing economies alike.

Many countries have relied on village-centric rural development policies. Though well-intentioned, these programs often fall into the same trap of fragmentation and low efficiency.

China's cluster development formula offers valuable global insights. Reconfiguring governance from isolated villages to functional rural clusters can unlock latent resources and developmental potential that conventional village-level planning cannot achieve.

While no single model can be copied wholesale across borders, the core principle is universal: development requires scale, and administrative boundaries should not determine rural modernization.

Embracing cluster-based thinking will drive China's rural revitalization and offer practical references for global rural governance.

Shenzhen's journey from exports to expertise

Over the past year Chinese companies expanding overseas have drawn global attention with everything from Labubu collectibles to electric vehicles and even coffee brands. Yet beneath these eye-catching exports lies a more profound and consequential trend: the quiet emergence of truly global businesses that integrate technology, supply chains, and industrial capabilities with local investment.

Global Lens

China's outbound direct investment reached $174.38 billion in 2025, up 7.1 percent year-on-year, according to China's Ministry of Commerce. Analysts point out that a significant share of these flows is directed toward the Asia-Pacific region, where manufacturing-heavy greenfield investment and capacity development projects are expanding rapidly, particularly across ASEAN economies.

At the heart of this outward momentum is Shenzhen, long a symbol of China's reform and opening-up era, and today the country's powerhouse of foreign trade, innovation and advanced manufacturing. As China's top-performing city for foreign trade, Shenzhen is exporting not just products, but entire industrial ecosystems. Its giant corporations such as Huawei, Tencent and BYD are building strong operations across the ASEAN region.

Take BYD for example. The global leader in EVs has established a manufacturing base in Rayong in Thailand and another EV facility in Subang in Indonesia.

BYD isn't just selling cars in these markets, it is transplanting the industrial model of Shenzhen — battery technology, supply chain coordination and local employment — in a local market while building a regional manufacturing node.

To be sure, this is not a recent development. This transfer of Shenzhen's industrial knowledge and technological innovation has been going on for a long time.

When a BYD battery pack crosses the border, it carries decades of electrochemical research, a finely tuned manufacturing ecosystem built over generations, and, increasingly, a local partnership structure that transfers real industrial knowledge to the destination economy.

DJI tells a different version of the same story. The Shenzhen-based drone maker holds an estimated 70 percent of the global market for consumer drones. Its agricultural drones are widely used across Southeast Asia to automate planting and protect crops. In markets such as Thailand, Vietnam and Malaysia, the company has trained thousands of local operators and developed a dense network of dealers and service providers.

DJI did not just build a market presence, but created an embedded local ecosystem of drone pilots, distributors and service firms.

In this sense, Shenzhen's "exports" today are fundamentally different from what "Made in China" meant 20 years ago.

Today, leading Shenzhen enterprises are not just shipping products abroad; they are exporting their operational expertise and innovation frameworks to build global industrial ecosystems.

It is therefore fitting that the APEC Economic Leaders' Meeting in November will be hosted in Shenzhen. This marks the third time China has hosted APEC, after Shanghai in 2001 and Beijing in 2014. But while those editions signaled financial and political capital, Shenzhen has been chosen for its industrial capabilities and openness to global trade.

China's theme for the APEC meet, "Building an Asia-Pacific Community to Prosper Together", paired with its priorities of openness, innovation and cooperation, closely reflects Shenzhen's own development trajectory. This city has grown by keeping its doors open and promoting greater global engagement and trade.

The APEC Economic Leaders' Meeting is a genuine opportunity for Asia-Pacific economies to engage seriously with Chinese partners in new energy, AI infrastructure and advanced manufacturing.

They stand to gain not just products but production know-how, investment, and supply chain integration, building on a trend that is already underway: from Vietnam's electronics clusters anchored by Chinese supply chain investment to EV manufacturing hubs across the region.

Forty-five years ago, Shenzhen was mostly rural farmland. Today it is home to some of the world's most innovative technology companies and has become a powerful argument for what open, collaborative globalization can achieve. As APEC leaders gather there in November, they won't need a presentation to understand the Shenzhen model: outside the conference halls they will have living proof of what the next wave of international collaboration — Globalization 2.0 — looks like.

Can artificial intelligence help prepare graduates for tomorrow's jobs?

Artificial intelligence is rapidly reshaping the labor market, automating tasks such as routine copywriting, basic data analysis, conventional coding, repetitive administrative tasks and entry-level design work. As these jobs disappear or change, employers are increasingly demanding a different mix of skills from graduates.

This transformation comes at a difficult moment for higher education. While the number of university graduates continues to grow, structural unemployment has become more pronounced.

Under pressure to improve graduates' job prospects, universities across China are restructuring their academic programs. Many institutions are introducing AI-related majors, promoting "AI plus X" interdisciplinary education or adopting broader admissions models.

Responding to changes in the labor market is both reasonable and necessary. Universities cannot ignore technological, industrial and employment shifts. But they must also confront a harder question: Can they transform themselves quickly — and responsibly — to meet these new demands?

Building a robust academic program takes time. Universities need qualified faculty, coherent curricula, appropriate facilities and opportunities for practical training. These elements cannot be created simply by changing the name of a department or adding several technical courses.

Without sufficient preparation, professional restructuring can easily become an emergency response to employment anxiety.

Courses might focus narrowly on training students to use the latest tools, while education itself is reduced to preparing for currently available jobs. Though seemingly practical, such reforms risk creating deeper problems: an oversupply of similarly trained graduates, weak foundational knowledge, limited adaptability and a gradual erosion of the university's educational mission.

Introducing a new major does not automatically produce better talent. If universities rush into fashionable fields without understanding their intellectual foundations, required capabilities or real industrial demand, they may simply replace one mismatch with another.

The problem is compounded by the speed of technological change.

Technology often evolves faster than the university education cycle. A field that appears highly promising when students begin their degrees may have changed fundamentally by the time they graduate.

Specific tools may become outdated, and established methods may be replaced by new technological paradigms.

AI should be incorporated throughout teaching and learning. Students should learn to use intelligent tools effectively and responsibly.

Universities that merely chase each new trend could therefore produce graduates who are doubly disadvantaged: lacking the depth of traditional disciplinary education and also unprepared for the next stage of technological change.

Academic reform must therefore involve a deeper redesign of curricula, teaching methods and talent-development models.

Rather than building isolated AI schools or programs, universities should develop strong "AI plus X" platforms. Artificial intelligence should be integrated with engineering, medicine, agriculture, the natural sciences, the humanities and the social sciences. This requires deeper cooperation between departments and breaking down long-standing barriers.

The aim is not to turn every student into an AI specialist but to help students in different fields understand how intelligent technologies can reshape their disciplines, expand their analytical capabilities and solve real-world problems.

Universities also need to strengthen cooperation with businesses, government agencies and research institutions. External partners can provide practical expertise, industrial resources and an understanding of emerging workplace needs.

Such cooperation can help connect the education chain, the talent chain and the industrial chain, reducing the gap between what students learn and what society actually needs.

However, labor-market adaptation should not become the only purpose of universities. No matter how disruptive technology becomes, the fundamental responsibilities of education remain unchanged. Universities must cultivate moral character, foster independent thinking, transmit culture, encourage innovation and support the holistic development of the individual.

Real education reform is not about blindly following technological trends. It requires universities to embrace innovation while maintaining a clear sense of what education is ultimately for.

AI should be incorporated throughout teaching and learning. Students should learn to use intelligent tools effectively and responsibly. But universities must also place human development at the center of education. The more powerful technology becomes, the more important judgment, creativity, ethical responsibility and critical thinking will be.

Universities can adjust their academic structures to meet national and social needs. At the same time, they must preserve the diversity of the academic ecosystem. Not every institution should establish the same programs, pursue the same fashionable disciplines or adopt the same development model.

A wave of identical AI-related programs could lead to a new form of homogenization, in which universities lose their distinctive strengths while competing for the same students, teachers and resources. Higher education needs diversity, not a situation in which every university begins to look the same.

The rise of AI should be seen not merely as a disruption of higher education, but as an opportunity to reshape it.

The primary task for universities is not to create more AI majors, but to reconsider what universities should teach — and how they should teach — in an age when information and technical assistance are increasingly easy to obtain.

Knowledge acquisition alone can no longer define the value of university education. Students must learn how to evaluate knowledge, connect ideas across disciplines, identify meaningful problems and make responsible decisions. They must be able to work with machines without allowing machines to replace their own capacity for thought.

The graduates best prepared for the AI era will not be those who have merely mastered the latest software. They will be those with strong disciplinary foundations, broad humanistic perspectives, the ability to use intelligent tools and the independence to question their outputs.

Preparing such graduates is not only a practical response to employment pressure; it is essential to build a stronger education system and secure the country's long-term development.

GLOBAL VIEWS

ANDREA RENDA

Symphony, not a solo

The EU can cooperate with China on open-source solutions, and treat AI as a means to achieve sustainable solutions rather than an end in itself

At the opening ceremony of the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai, President Xi Jinping said that "AI development should not be a solo performance by a single country, but a symphony of international cooperation". And the agreement on the establishment of the World AI Cooperation Organization was signed during the meeting. This will address a real challenge. The race for tech sovereignty in the AI sector is fragmenting the global AI landscape to unprecedented levels, to the detriment of innovation and access, especially for developing countries.

AI keeps moving at breathtaking speed, with ever more powerful models topping the charts every week. US labs still lead in multiple aspects, but Chinese open-weight models — DeepSeek, Qwen, GLM and Kimi — have their own edges. In the United States, top labs announce mind-blowing compute investments while companies such as OpenAI and Anthropic chase billionaire initial public offerings to monetize their lead. Four companies have now crossed a $4-trillion valuation, a figure without precedent. The US is rolling back regulation, blocking states from legislating and fast-tracking data centers that increasingly need their own power based on the conviction that it is engaged in an existential race for AI leadership with China.

Michael Kratsios, the US administration's top AI official, has spoken openly of "promoting the export of full-stack US AI technology packages to allies and partners worldwide". At the same time, it is likely that Washington tends to weaponize other countries' AI dependence — on models, the cloud and the advanced GPUs that mostly come from Nvidia. The US' measures on non-US users access to Anthropic's Mythos and Fable 5 have only pushed other countries to double down on their tech-sovereignty plans meant to reduce reliance on single foreign suppliers.

The European Union feels this acutely. Despite years of regulation to force competition and interoperability, dependence on big tech has stayed almost the same. Amazon, Microsoft and Google own almost the entire cloud market; Alibaba gets the crumbs, and European operators barely register.

The European Commission's first answer was to build its own compute — aware that at least 70 percent of global data-center capacity sits in the US and China. In recent years, the EU has announced 19 AI factories, with at least seven "gigafactories" of at least 100,000 advanced GPUs each on the way. But this simply swaps dependence on hyperscalers for dependence on Nvidia: Almost 90 percent of these factories have chosen Nvidia GPUs. This is hardly a win for the EU's tech sovereignty.

The deeper problem is that Europe is chasing the US model — data-hungry, energy-hungry, water-thirsty infrastructure built in the obsessive pursuit of artificial general intelligence, however vaguely defined. Is that what Europe needs? Probably not. European countries don't need the most power-consuming AI; they need stacks fit for real use cases in transport, health, energy, manufacturing, government and finance. For each, the optimal solution rarely looks like a one-size-fits-all gigafactory. Emulating the US model with less money is like "chasing Icarus with smaller wings".

The EU should work together with China to steer AI toward the public interest, the global good and the benefit of humankind.

China offers Europe a more attractive template. Whatever US commentators claim, Beijing is not primarily racing toward AGI. It is leaning on cheaper, more sustainable compute — less advanced GPUs, ordinary CPUs — and deepening its use of open standards to develop solutions that are fit for purpose. Often that means smaller models on smaller data, running centrally or at the edge, sparing needless costs in energy, training, inference and fine-tuning.

This is what Europe, a global industrial powerhouse, should do. The European Commission's Apply AI Strategy points toward this goal — but it comes with almost no dedicated funding. The EU's Tech Sovereignty Package, published on June 3 — comprising two legislative proposals and two strategic frameworks — promises to boost European data capacity at scale in the form of an open-source stack offering secure, high-performing solutions across sectors. If it works, Europe could emerge as a more sovereign AI power, wrapped in a regulatory framework built for fundamental rights, competition, interoperability and sustainability — now being overhauled in the name of genuine simplification.

SHI YU / CHINA DAILY

Will the plan work? It may depend on how the EU adapts its China policy in the face of reality: Europe and China are deeply complementary. Europe depends on China for rare earths and much else; China needs the European market and technologies such as ASML's lithography for advanced chips. Duplicating such unique expertise would waste enormous resources.

No single country can set AI rules for the whole world. It is significant to promote EU-China collaboration that might be exactly the step toward a fairer, more sustainable and more sovereign AI future. The two sides are hardly "like-minded", yet they share strikingly similar perspectives: open-source solutions and the vision of AI as a means to achieve sustainable outcomes rather than an end in itself. China has initiated the establishment of WAICO, a coalition comprising 29 countries; while the EU's 27 member states enjoy privileged collaboration with several leading middle powers.

The EU and China should make deeper AI cooperation a goal — and pursue it with common agendas. Now is the moment to reckon and restart. With quantum AI and a new generation of powerful agents and robots on the horizon, the world cannot afford to wait for alignment to arrive on its own.

The author is the director of the Center for European Policy Studies in Brussels, Belgium. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

XU MINGQI

Protectionist measures could harm EU's interests

Brussels' most effective response to its trade deficit with China should be to collaborate with Beijing to boost exports of goods and services, rather than 'building walls' or 'setting limits'

The European Union recently intensified its implementation of protectionist measures targeting Chinese trade and investment. These actions, including the Foreign Subsidies Regulation, the proposed Industrial Accelerator Act, the NIS 2 Directive and amendments to the Foreign Direct Investment Screening Regulation, echo past United States' accusations that cite China's "overcapacity" and "undervalued renminbi" as grounds for imposing high tariffs and restrictions on Chinese goods. Since 2019, when the EU officially described China as "a partner for cooperation, an economic competitor and a systemic rival", China-EU relations have increasingly been influenced by geopolitical and ideological biases, undermining mutual trust. Economic and trade frictions have been politicized. The previously cooperative and mutually beneficial economic relationship has been misconstrued as a zero-sum game, leading to growing tensions despite shared goals in global governance and multilateralism.

EU policymakers and think tanks have been significantly influenced by US geopolitical and economic strategies regarding China. During his first term, US President Donald Trump adopted aggressive political posturing, imposing high tariffs against China, alongside strict export controls, while aiming for technological decoupling. This escalated China-US geopolitical and economic competition, directly impacting the EU's 2019 shift in its China policy to the "triple positioning" of a cooperation partner, an economic competitor and a systemic rival.

Although the concept of "de-risking" was proposed by European Commission President Ursula von der Leyen in 2023, its core ideas stem from US initiatives such as supply chain restructuring and "re-coupling", "friend-shoring" and "near-shoring", all aimed at "de-risking" from China. Consequently, "de-risking" has come to represent a coordinated US-EU policy toward China, with the EU aligning itself with the US' sanctions against Chinese tech companies.

WANG XIAOYING / CHINA DAILY

Despite strained US-EU relations during Trump's second term, marked by Washington's many unfriendly policies targeting the EU, political parties within the EU establishment continue to maintain their geopolitical biases. They even echo US justifications for imposing economic pressure on China in their quest for advancing unilateral trade protectionism.

There is no inherent geopolitical competition between the EU and China. Historically, both sides viewed bilateral trade and investment as mutually beneficial, forming the foundation for steadily growing trade relations. According to China's Ministry of Commerce, in 2025, bilateral trade reached $828.1 billion, and in the first half of 2026, the number was $447.88 billion, a 14.2 percent year-on-year increase. EU investments in China have exceeded $150 billion, while Chinese direct investment in the EU has reached $125 billion.

The two sides share consensus on global governance issues such as upholding a United Nations-based international order, climate action, aiding developing countries, maintaining international financial stability, supporting multilateral free trade, combating cross-border crime and tax evasion, and enhancing global health security. However, certain ideological factions within the EU seek to politicize economic differences, undermining the fundamental nature of mutual cooperation and dragging China-US competition into China-EU relations, ultimately harming the EU's interests.

In its trade disputes with the US, China has reciprocated with restrained countermeasures. This has led the US to recognize the futility of unilateral protectionism, resulting in mutual agreements to remove high tariffs and irrational export restrictions. Following Trump's visit to China in May, the two sides established trade and investment councils to discuss bilateral trade and investment issues, fostering a constructive strategic relationship.

If the EU goes ahead with its protectionist measures against China, Beijing would inevitably respond with countermeasures. Given China's effective counterstrategies against the US, the EU could face great challenges. In 2025, China-US bilateral trade saw an 18.7 percent decline, but following a compromise agreement, China's imports from the US rebounded to rapid growth, with year-on-year increases of 20.36 percent and 25.85 percent in May and June, respectively. A similar conflict between China and the EU would disrupt the 8.7 percent growth in Chinese imports from the EU in the first half of 2026.

According to General Administration of Customs, the EU's dependence on the Chinese market is greater than that of the US, with EU exports to China reaching $268.17 billion in 2025, nearly doubling the $139.7 billion of US exports to China. A trade war would inflict greater damage on the EU than it did on the US. Therefore, recognizing the underlying reasons for the declining competitiveness of industries such as automotive and machinery, reforming innovation-stifling regulations and bureaucracy, and encouraging collaboration with Chinese enterprises would be in the EU's long-term best interests.

The EU previously viewed bilateral trade imbalances as a non-issue due to its overall trade surplus. However, recent years have seen a shift in perspective. If the growing trade deficit with China is a concern, the EU can engage in technical negotiations with China to address the imbalance. Accusations of "overcapacity", "subsidies" and "undervalued renminbi", previously used by the US, overlook factors such as declining industrial competitiveness and rising energy prices due to geopolitical tensions, which have accelerated industrial relocation. Resorting to unilateral protectionism for short-term gains is counterproductive. High tariffs imposed by the Trump administration failed to revive uncompetitive US industries, and the EU cannot expect protectionism to safeguard its industries and jobs.

China's Ministry of Commerce has provided scientific explanations regarding "overcapacity", "subsidies" and "undervalued renminbi", urging the EU to understand China's position. China does not accept baseless criticisms of its economic model and industrial policies but acknowledges the EU trade concerns. The ministry reiterated China's stance of not pursuing trade surpluses, committing to increased imports, and emphasizing "constructive dialogue to dispel misunderstandings and address concerns". It is the response to the concerns of the EU that China began to increase its imports from the EU in 2026, reversing the negative growth situation. The year-on-year growth rate in the first half of the year reached 8.7 percent. The most effective policy for the EU to deal with the trade deficit with China is to increase the production and export of goods that still have a comparative advantage, and to cooperate with the Chinese government and enterprises to increase the export of goods and services to China, rather than setting restrictions.

The essence of international trade and investment is to enhance corporate profits and national welfare, while unilateral protectionism is a proved policy mistake.

Factories set to maintain healthy pace

Boosting consumption will be a leading policy priority in second half

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China's manufacturing sector is expected to remain resilient and sustain its expansion in the second half despite a slight moderation in momentum in July, as policymakers step up efforts to bolster domestic demand while ensuring a smooth transition from old growth drivers to new ones, experts said.

Their comments came as the RatingDog China General Manufacturing Purchasing Managers' Index — which gauges operating conditions in the sector — edged down to 50.9 in July from 51.7 in June, marking a four-month low but remaining above the 50-point mark, that separates expansion from contraction, for an eighth consecutive month, a private survey showed on Monday.

Highlighting the necessity of consolidating the manufacturing sector's expansion momentum, experts said boosting domestic demand will be a key policy priority in the second half, with policy support expected to place greater emphasis on coordinating demand expansion with supply optimization.

Despite the moderation, the survey showed that export activity returned to expansionary territory in July after two consecutive months of contraction, while overall new orders grew for a 14th consecutive month — the longest stretch of gains since 2018 — though the pace of growth slowed from June.

Meanwhile, cost pressures eased further, with input price inflation slowing to a six-month low — signaling that elevated inflationary pressure was being effectively contained — while output prices remained broadly unchanged, the survey said.

"China's manufacturing sector continued to expand in July, though at a slower pace, underpinned by sustained growth in new orders and a further easing of cost pressures," said Yao Yu, founder of RatingDog, adding that renewed growth in new export orders was an encouraging sign.

Looking ahead, manufacturers remain upbeat about output over the next 12 months, with optimism picking up slightly from June on expectations of stronger market demand, new product development and capacity expansion, Yao added.

That optimism, however, came amid lingering pressure on market demand. The official manufacturing PMI fell to 49.2 in July from 50.3 in June, slipping into contraction territory for the first time in five months, while the new orders subindex dropped to 48.5, the National Bureau of Statistics said on Friday.

"The decline mainly reflects still-soft domestic demand, compounded by disruptions from extreme weather," said Xiong Yuan, chief economist at Guosheng Securities, adding that the official reading pointed to continued pressure on the broader economy amid the ongoing transition from old growth drivers to new ones.

At a tone-setting meeting in late July, the Political Bureau of the Communist Party of China Central Committee made arrangements for economic work in the second half, calling for efforts to accelerate the transition from old growth drivers to new ones, step up countercyclical adjustments, expand domestic demand and optimize supply.

"This signals a stronger policy push and a growing sense of urgency to expand domestic demand," said Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities.

Luo expects faster fiscal spending and more efficient use of bond funds — alongside progress on the six major infrastructure networks — to provide a stronger boost to investment and consumption.

Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International, also saw room for additional fiscal and monetary support, and expects a package of pragmatic and effective incremental policies to be introduced around the end of the third quarter.

"By our estimates, there is room to issue an additional 700 billion yuan ($103.7 billion) in local government bonds by year-end, while the central government has greater room for additional borrowing," Wang said.

On the monetary front, Wang projects that the People's Bank of China, the country's central bank, could cut policy rates by 10 basis points and lower the reserve requirement ratio by 0.5 percentage point.

Rising demand for RMB trade settlement

By **JIANG XUEQING** in Shanghai
jiangxueqing@chinadaily.com.cn

Singapore's DBS Bank is seeing steadily rising demand for renminbi-denominated trade settlement and financing, as Chinese companies deepen commercial ties with the rest of Asia and the international use of the Chinese currency expands.

China's cross-border interbank payment system, known as CIPS, reflects this trend, with its average daily transaction value rising from about 680 billion yuan ($100.7 billion) in 2025 to roughly 830 billion yuan in June. "This clearly shows that there is greater adoption of RMB for payments to counterparties in China," said Han Kwee Juan, group executive and group head of institutional banking at DBS Bank.

Han Kwee Juan

Demand for offshore renminbi has also surged in the dim sum bond market. As of June 22, issuances of dim sum bonds had reached nearly 820 billion yuan this year, up 47 percent from a year earlier, according to market tracker Wind Info. The growing appetite for offshore RMB financing underscores rising demand for cross-border payments into China, Han said.

DBS has seen more corporate clients choosing to settle trade transactions in RMB, particularly through CIPS. Increasingly, overseas companies are asking the bank to facilitate RMB payments to their Chinese counterparties, reflecting broader acceptance of the currency in regional trade.

The bank has also expanded its RMB financing business. DBS China recently joined three other banks in providing an 8-billion-yuan leveraged buyout facility to support the privatization of ANE Group from the Hong Kong stock exchange, using a strategic seven-year term loan structured under the free trade non-resident account framework.

Han attributed the growing international use of the RMB to expanding trade between China and the rest of Asia. As trade volumes rise, more Chinese exporters are requesting overseas customers to settle transactions in RMB where possible, a trend he expects to continue.

With operations spanning the Chinese mainland, Hong Kong and Singapore, DBS is positioning itself to facilitate cross-border capital and trade flows across the region. The bank is seeing particularly strong demand to connect financial flows between China and Singapore, as well as between China and the Association of Southeast Asian Nations economies.

Trade and investment between China and ASEAN continue to strengthen. "We do see the strength of the Chinese economy and manufacturing in data centers and AI infrastructure, together with EVs, and all these will contribute to create a flow of trade and investments between China and ASEAN. And we think that trend will continue for the next few years," Han said.

Greater offshore RMB liquidity — supported by record dim sum bond issuance and the availability of the Chinese currency through free trade non-resident accounts — is also making it easier for companies to finance trade and investment with China, he added.

Han said Chinese companies are increasingly well positioned to export technology and expertise to ASEAN markets, particularly in electric vehicles and large-scale battery storage. Regional demand for these technologies is expected to support deeper economic integration.

He also said China's economic transition is progressing as policymakers intended.

"We're seeing great growth in the area of high-tech manufacturing, EVs and renewables, as well as in the area of AI infrastructure. All these are contributing to the growth that we're seeing," he said.

Taipingling plant boosts power output

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Unit 2 of the Taipingling Nuclear Power Plant in South China's Guangdong province officially began generating electricity on Monday, marking the full completion and operation of Phase I of the first "Hualong One" third-generation nuclear power project in the Guangdong-Hong Kong-Macao Greater Bay Area.

Operated by China General Nuclear Power Group, the milestone signals a major step forward for the region's green energy transition, delivering stable, low-carbon baseload power to the country's southern economic powerhouse.

Based on the average utilization hours of domestic nuclear power plants in 2025, the two units of Phase I are projected to generate more than 18 billion kilowatt-hours of electricity annually, said CGN.

This massive output is sufficient to meet the annual production and living electricity demands of nearly 2 million people, while reducing carbon dioxide emissions by approximately 16.63 million metric tons each year, delivering substantial environmental benefits, it said.

The announcement came after China greenlit 8 new nuclear reactors last week, accelerating its atomic energy expansion and cementing its dominance in the global push for next-generation clean energy.

View of the Taipingling Nuclear Power Plant in South China's Guangdong province. XINHUA

Six of the new reactors will employ the domestically designed Hualong One, China's third-generation nuclear power technology with full intellectual property rights. It is also one of the most widely accepted series of third-generation nuclear power reactors in the world.

As the inaugural batch of the 15th Five-Year Plan (2026-30) period, these projects set a definitive tone for China's energy blueprint during the most critical window for its climate commitments, said Li Jinkai, a distinguished professor at the School of Economics at the Beijing Institute of Technology.

China's nuclear power construction has entered a stage of large-scale, batched and normalized development, he said.

Located in Huizhou, the Taipingling project received official national approval in April 2019, with construction of Unit 2 breaking ground in October 2020.

A single Hualong One unit generates nearly 10 billion kWh of electricity annually, saving over 3 million tons of standard coal. Furthermore, its research and construction have integrated a complete supply chain of nearly 6,000 upstream and downstream enterprises, effectively steering the upgrading of China's manufacturing industry, according to CGN.

According to the National Energy Administration, the country's nuclear power generation reached approximately 467 billion kWh in 2025, while completed investment in nuclear power engineering hit a record 161 billion yuan ($23.84 billion) last year, with five approved projects featuring private capital participation.

Private companies are also becoming a vital force in energy technology innovation. In 2025, all 10 approved nuclear power units introduced private capital, with private shareholding reaching up to 20 percent.

According to the 15th five-year plan for new power system construction, jointly released by the National Development and Reform Commission and the NEA, China will vastly expand its clean energy capacity across a diverse portfolio by 2030, including nuclear power.

Landmark green energy shipment by Chinese firm

By **ZHENG XIN**

China's green fuel sector achieved a historic milestone last week as a vessel carrying 3,750 metric tons of green ammonia set sail from Lianyungang Port in East China's Jiangsu province bound for South Korea, marking the nation's largest single-batch export of the zero-carbon energy to date.

Produced by State Power Investment Corp, the shipment represents the first time Chinese green fuel has gained international market recognition based on its full lifecycle carbon reduction contributions.

The delivery signifies that China's entire wind-solar-hydrogen-ammonia industrial chain has officially upgraded from technical demonstration to large-scale international commercial delivery, the company said.

Completed and commissioned in July 2025, the green energy-producing facility is supported by 800,000 kilowatts of installed renewable energy capacity. It stands as the world's largest single-unit green ammonia plant with an annual output capacity of 32,000 tons of green hydrogen and 180,000 tons of green ammonia, it said.

Long utilized as a vital component in fertilizers, ammonia is now gaining traction as a viable low-carbon fuel for the shipping industry. However, conventional ammonia is largely produced using coal and natural gas, which fails to take advantage of its green-energy potential.

Meanwhile, green ammonia — made using renewable power — offers a zero-carbon alternative, but its growth has been hampered by high technology costs and a spatial gap between where renewable energy is generated and where fuel demand is located.

Industry experts believe that through proprietary core technologies and authoritative international certifications, Chinese-made green ammonia products are now officially becoming deeply embedded in the global green fuel supply chain.

"The expansion from technical demonstration to commercial export, and from product supply to standard-setting, demonstrates that this 3,750-ton export shipment does not merely represent a cross-border delivery of green fuel," said Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University.

"The international market's endorsement of Chinese products based on their lifecycle carbon reduction fully demonstrates the core global competitiveness of China's clean energy capabilities, industrial standards and development paradigms."

Lin said the country's commitment to achieving carbon neutrality before 2060 is driving growing momentum around low-carbon ammonia, particularly through pilot projects targeted at supplying green fuel to the shipping sector.

Producing and consuming roughly one-third of the world's ammonia supply — and home to some of the globe's busiest ports and shipping corridors — China is uniquely positioned to lead the deployment of clean marine fuels, he added.

Its independently developed "green power-hydrogen-ammonia" flexible coordinated control system has successfully tackled a major global technical challenge — namely, reconciling the intermittent and fluctuating nature of wind and solar power with the continuous stability required for the production of green chemicals.

State Power Investment Corp said that compared with traditional coal-based synthetic ammonia produced in China, the 3,750 tons of green ammonia bound for South Korea will reduce carbon dioxide emissions by more than 10,000 tons across its entire lifecycle — an environmental benefit equivalent to the annual carbon absorption of approximately 1 million trees.

The shipment comes as global demand for traceable and verifiable green fuels continues to climb.

Possessing a dual identity as both a clean fuel and a green industrial feedstock, green ammonia is rapidly becoming a vital commodity in the global low-carbon transition, the company added.

Briefly

Marine economy posts steady growth in H1

China's gross ocean product reached 5.5 trillion yuan ($810.09 billion) in the first half of 2026, up 5.1 percent year-on-year, according to data released by the Ministry of Natural Resources. The amount accounted for 7.9 percent of the country's gross domestic product, the ministry said, noting that the marine economy is experiencing steady growth with a positive development momentum.

Yuan weakens against greenback

The central parity rate of the yuan weakened 19 pips to 6.7917 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

Marine tourism boom fires up summer travel

Integrated fishery resorts, coastal leisure consumption spur marine economy

Top: An aerial image shows Genghai No 1, the country's first integrated intelligent large-scale ecological marine ranch complex, in Yantai, Shandong province. Genghai No 1 was built with a total investment of about $62.2 million.
TANG KE / FOR CHINA DAILY

WANG CHENGLONG / FOR CHINA DAILY

JINAN — At 9 am, a passenger ferry departs on schedule from a wharf in East China and arrives minutes later at a giant flower-shaped offshore structure over the sea.

The complex combines marine ranching with tourism under an innovative "blue granary" model, offering visitors an immersive experience including fish viewing, ecology sessions and virtual-reality movies.

Named Genghai No 1, the integrated facility beyond the Fisherman's Wharf in the city of Yantai, East China's Shandong province, was built with a total investment of 420 million yuan ($62.2 million).

Wang, a visitor from Jinan, capital of Shandong, joined the "Little Ocean Steward" program with her daughter. She fed fish in offshore cages, observed the harvesting process and learned about marine ecology through guided demonstrations.

"Taking my daughter to the seaside used to mean playing on the beach," Wang said. "Now she can learn about the ocean while seeing firsthand how technology is transforming modern aquaculture."

China boasts abundant marine resources with 18,000 kilometers of mainland coastline and another 14,000 km of island coastline, according to official data.

During the peak summer travel season, coastal destinations across the country are rolling out diverse marine tourism experiences, underscoring the growing vitality of China's marine economy.

According to the operator of Genghai No 1, the complex has grown into an offshore resort integrating modern aquaculture, marine tourism, scientific research, public education, dining and accommodation.

Equipped with a "5G+ marine ranch" smart management system, it produces 150,000 kilograms of premium seawater fish annually and welcomes more than 150,000 visitor trips each year.

Similar tourism-driven growth is surging in many places along China's coastline.

In Zhelin Bay of Raoping county, South China's Guangdong province, the Xi'ao fishery-tourism platform, covering more than 3,000 square meters, features specialty restaurants, a seaside cafe, starry-sky cabins and boutique seaview guestrooms.

At the ocean pastoral fishery tourism park on Nanji Island in East China's Zhejiang province, visitors stroll along suspended floating walkways above the sea and enjoy recreational fishing.

In Haitang Bay of Sanya, South China's Hainan province, night fishing has emerged as a new coastal scenario combining sightseeing, cuisine and social interaction. The local "night fishing plus dining" projects have lifted the nighttime departure rate of recreational fishing yachts from less than 30 percent to more than 95 percent.

> "The ocean is a foundational resource and an emerging market for the modern tourism industry, as well as a new strategic space for China's efforts to build itself into a world-leading tourism destination."
>
> **Dai Bin,** president of the China Tourism Academy

The diversification of marine tourism has extended leisure activities well into the evening, and driven a rise in demand for related industries, including water sports equipment.

At Hetong (Weihai) Sporting Goods Co Ltd in the city of Weihai in Shandong, production lines are operating at full capacity as workers rush to complete a batch of inflatable paddleboards destined for overseas markets.

"The popularity of water sports tourism has fueled strong order growth," said Wang Yongfeng, the company's general manager. "Our shipments exceeded 90,000 paddleboard sets in the first half of the year, up 150 percent year-on-year."

Liu Zhiqing, deputy general manager of Weihai Heliyuan Carbon Fiber Technology Co Ltd, said the company's production capacity in 2026 has expanded three to four times compared with previous years, with water sports equipment now accounting for 55 to 60 percent of its total carbon fiber sales.

According to the Ministry of Natural Resources, China's gross ocean product exceeded 11 trillion yuan in 2025, up 5.5 percent year-on-year and accounting for 7.9 percent of the country's GDP.

Against this backdrop, China is cultivating the marine economy, including marine tourism, as a new growth engine.

Dai Bin, president of the China Tourism Academy, said, "The ocean is a foundational resource and an emerging market for the modern tourism industry, as well as a new strategic space for China's efforts to build itself into a world-leading tourism destination."

He called for stronger market connectivity, industrial cooperation and policy coordination to build a coordinated marine tourism landscape featuring closer land-sea integration and differentiated regional development.

XINHUA — CHINA DAILY

Themed tourist trains on faster growth track, driven by demand surge

BEIJING — Passengers boarding a themed sightseeing train in the eastern Chinese city of Fuzhou, Fujian province, last week stepped into a carriage that felt more like a classical Chinese garden.

Decorated with local bamboo and tea elements and Song Dynasty (960-1279)-inspired interiors, the train running through Wuyishan National Park turns the journey itself into a unique cultural experience.

This train is part of a broader boom in an emerging train-plus tourism model, in which railway operators combine transportation with sightseeing, cultural experiences and entertainment to meet a growing appetite for immersive, hassle-free vacations.

In Shangrao, East China's Jiangxi province, a tourist train brings local culture onboard through live performances and interactive theatrical experiences. "Since entering service in late April, the train has maintained an occupancy rate of more than 90 percent," said Qin Zhonghao, head of the operator's sightseeing train business.

Official data support this trend. China operated 1,797 tourist trains in the first half of the year, nearly doubling the 972 trains during the same period of 2025, according to the national railway operator China State Railway Group. Railway operators also launched 445 themed trains tailored for concerts, sporting events, exhibitions and other activities.

The rising buzz around tourist trains highlights just how quickly new ways to experience travel are taking off in China's service sector.

The country's recently released five-year plan for expanding consumption calls for fostering new business models and consumption scenarios centered on improving consumer experiences. In the first half of the year, service retail sales rose 5.3 percent year-on-year, far outpacing the 1.1 percent growth in goods retail sales.

Against this backdrop, industry experts believe a train ticket is no longer merely a means of transportation. Instead, it is now a gateway to a wider tourism ecosystem, linking travelers to fresh experiences and opening up new opportunities for spending on travel-related services.

When the Northeast China Football League tournament kicked off in May, the local railway operator introduced dedicated fan trains offering one-stop travel packages that combined match tickets with sightseeing opportunities.

"To watch the opening ceremony, three friends and I traveled from Tongliao in the Inner Mongolia autonomous region on a fan train," said Wang Lei, a football fan. "Besides the matches, we also had time to visit Shenyang Imperial Palace, Xingshun night market and Beishichang cultural district, all places I had wanted to explore. The trip was definitely worthwhile."

In Northwest China's Shaanxi province, the local railway operator has launched more than 70 themed tourist trains this year featuring study tours, wellness trips and flower-viewing excursions. Developed jointly with tourism authorities, the travel packages integrate round-trip rail tickets with admission to scenic spots, hotel stays, cruises, cultural performances, shuttle transportation and onboard cultural activities.

Passengers pose for photos inside a steampunk garden-themed carriage of the Tianjin Fantasy Express on July 29. SUN FANYUE / XINHUA

"In the past, passengers bought a point-to-point train ticket. Today, they're buying a complete travel experience," said Hui Lixia, deputy director of the passenger transport department at China Railway Xi'an Group Co Ltd.

By giving transportation an even bigger role in tourism, this trend encourages the development of local tourism resources and helps convert passenger flows into broader consumer spending, said Zhang Linshan, a researcher at the Chinese Academy of Macroeconomic Research under the National Development and Reform Commission.

Looking ahead, policymakers see further room for growth. In June, multiple authorities, including the Ministry of Commerce, the Ministry of Culture and Tourism and China State Railway Group, jointly issued a guideline to promote the integration of railways and tourism, with the goal of developing more than 160 dedicated tourist trains nationwide by 2030.

Experts said they believe the next stage of development will require a wider range of products at different prices to meet increasingly diverse consumer needs.

Wang Jia, an associate professor at the School of Tourism, Nanchang University, called for closer collaboration among rail operators, travel agencies, hotels, scenic attractions and cultural businesses.

With improved themed services and deepened cooperation with the tourism sector, the train-plus tourism model will inject fresh momentum into China's summer economy and its rapidly expanding services consumption, analysts said.

Disaster prevention stepped up

New plan highlights entire risk zones in addressing increasing geological threats

By LI MENGHAN
limenghan@chinadaily.com.cn

Facing increasingly severe geological disaster threats, China will accelerate a shift in risk management from individual hazard points to entire risk zones while advancing precise and intelligent prevention to minimize casualties and property losses, according to a new five-year plan released by the Ministry of Natural Resources.

The implementation plan for national geological disaster prevention and control during the 15th Five-Year Plan period (2026-30) comes as extreme rainfall increasingly triggers sudden, clustered and cascading disasters in areas outside traditional high-risk zones, exposing the limitations of point-based prevention.

Despite significant progress in recent years, China's geological disaster prevention and control situation remains severe. By the end of 2025, nearly 280,000 geological disaster hazard points had been registered nationwide, threatening 11.48 million people and property worth more than 760 billion yuan ($112.54 billion), according to the ministry.

During the 14th Five-Year Plan period (2021-25), deaths from geological disasters fell by 52 percent and direct economic losses dropped by 38 percent compared with the previous five-year period. The country also made significant advances in disaster prevention technology by deploying more than 75,000 automated monitoring and early warning devices and piloting comprehensive remote-sensing identification of geological disasters.

However, China's diverse terrain, complex geological conditions and active tectonic and seismic activity, combined with varied climate types, frequent extreme weather and intensive engineering activities, make geological disasters frequent and recurrent, said Yang Xudong, a senior engineer at the ministry's geological disaster technical guidance center.

Geological disasters are also difficult to predict because of their concealed nature, tendency to recur and sudden onset, Yang said, adding that prevention remains the key to reducing disaster risks.

Yang said China's geological disaster prevention has entered a third stage.

"The previous two stages — whether relying on traditional community-based monitoring and professional surveys or on large-scale, high-precision remote sensing and widespread monitoring instruments — focused on hazard points with visible deformation signs," Yang said.

"The new stage directly addresses mass shallow landslides and debris flows triggered by extreme rainfall, which often show no warning signs and typically occur during the heaviest rainfall. Traditional methods have difficulty identifying and predicting such disasters," he said.

To address the new challenges, the plan outlines seven major tasks for the next five years, including dynamic surveys, monitoring upgrades and comprehensive governance. It calls for more than 4,200 engineering treatment projects, over 6,100 hazard elimination projects and the relocation of 50,000 households.

Dual management of both hazard points and risk zones will be implemented in 1,206 key counties, cities and districts across 17 priority provinces, with management lists and accountability systems established for each area.

The plan also designates 21 key prevention zones, up from 16 during the 14th Five-Year Plan period. The zones cover about 2.97 million square kilometers for landslides, rockfalls, debris flows and ground subsidence, as well as 280,000 sq km for ground settlement and earth fissures.

Newly designated prevention zones include the lower reaches of the Yarlung Tsangpo River hydropower project area, high-altitude long-distance disaster chain regions and the Yanshan-Taihang Mountain region. The plan also further refines traditional high-susceptibility areas, including the southeastern hilly regions and the southwestern mountainous regions.

The plan emphasizes improving the precision and intelligence of geological disaster prevention. It calls for detailed surveys at a 1:10,000 scale in key towns located in extremely high- and high-risk areas and promotes the application of technologies such as artificial intelligence and digital twins to improve hazard identification and early warning.

"These changes represent a major upgrade in prevention thinking," Yang said. "The shift reflects the scientific recognition that under extreme conditions, some disasters remain beyond prevention with existing technology."

He said future disaster prevention will rely more on scientific risk assessment, precise early warning and broad public participation to enhance disaster prevention awareness across society.

Seminar stresses intl cooperation to fight terrorism

By FANG AIQING in Yining, Xinjiang and **MAO WEIHUA** in Urumqi

The International Seminar on Counter-Terrorism 2026 opened on Tuesday in Yining, Xinjiang Uygur autonomous region, drawing about 100 officials and scholars from 24 countries and regional organizations, including the United Arab Emirates, Egypt, Russia and the African Union.

Under the theme "Addressing New Challenges of Terrorism: Strengthening State Responsibilities and Fostering International Synergy", the event highlighted the need for shared commitment, state responsibility and international cooperation.

Supported by the Ministry of Foreign Affairs and the Xinjiang regional government, the seminar was organized by the region's foreign affairs office, the Institute of Chinese Borderland Studies at the Chinese Academy of Social Sciences and the World Muslim Communities Council.

Zhai Jun, the special envoy of the Chinese government on the Middle East issue, said global terrorist activities have resurged, with attacks becoming more complex, diverse, technology-driven and organized. The Middle East, Africa and South Asia have been among the regions most severely affected, while countries in the Global South are facing mounting pressure, he said.

Zhai said counterterrorism efforts should be integrated with conflict reduction, poverty alleviation, bridging civilizational divides and promoting political dialogue, with the United Nations playing a central coordinating role. He added that China has provided — and will continue to provide — public goods to strengthen international counterterrorism capacity-building. He also called for stronger governance of emerging technologies to prevent their misuse by terrorist groups.

Ali Rashid Al Nuaimi, chairman of the Defense Affairs, Interior and Foreign Affairs Committee of the UAE Federal National Council and chairman of the World Muslim Communities Council, described terrorism as a common enemy of humanity and said no country can confront the challenge alone. Defeating terrorism requires unity and a comprehensive approach that combines financial, political, military, educational and ideological measures.

Al Nuaimi said both China and the UAE have made significant progress in addressing the root causes of terrorism, offering a prevention-oriented and holistic approach that respects international law. He emphasized the importance of education in promoting coexistence, peace and national identity.

Drawing on his visits to Xinjiang, he said all levels of government and local communities have actively participated in countering extremism, safeguarding security and promoting prosperity.

Xu Guixiang, secretary of the leading Communist Party of China members group of Xinjiang's foreign affairs office, said the region once experienced multiple terrorist attacks and violent incidents but has not seen such cases for nearly a decade after years of sustained efforts.

He said that terrorist forces abroad continue to infiltrate through online and cross-border activities, and that social stability remains a top priority. Xu reiterated Xinjiang's resolve to crush any terrorist plots in accordance with the law, while adjusting tactics as appropriate to balance public convenience with stability.

Xu added that Xinjiang will deepen cooperation under the frameworks of the Shanghai Cooperation Organization, BRICS and the China-Central Asia mechanism in areas including risk assessment, cyberspace governance, joint exercises and coordinated operations.

Chinese silk went westward 4,000 years ago: Study

By LI MENGHAN
limenghan@chinadaily.com.cn

An international research team has discovered that China's domesticated silkworms reached Central Asia nearly 4,000 years ago — almost two millennia before the Silk Road — challenging the conventional narrative of how silk spread across the ancient world and reshaping our understanding of early globalization across Eurasia.

The findings are based on three dried silkworm cocoons and mulberry wood remains excavated at Sapalli Tepe, a Bronze Age site in southern Uzbekistan, by Chinese and Uzbek researchers during fieldwork between 2017 and 2019. The study, conducted by scientists from six institutions in China, Uzbekistan, Germany and the United States, was published in the journal Science Advances on July 23.

Silkworm domestication and silk production technologies originated in ancient China, with genomic and archaeological evidence tracing their origins to between 8,500 and 5,000 years ago. However, when and how Chinese silk first spread beyond the country's borders has long been debated. Many scholars have assumed that its westward transmission could not have begun before the Han Dynasty, the era during which the Silk Road was established.

The new study challenges that long-held view.

"Through protein analysis, we identified the three cocoons as belonging to the domesticated silkworm species Bombyx mori, which cannot survive without human care and mulberry leaves, and dated them to roughly 4,000 years ago," said Xia Qingyou, the study's corresponding author and a professor at Southwest University in Chongqing.

Zhou Xinying, a researcher at the Institute of Vertebrate Paleontology and Paleoanthropology of the Chinese Academy of Sciences who led the study, said the team discovered not only silkworm cocoons but also evidence of mulberry cultivation.

"This means that communities in Central Asia had begun producing silk long before the opening of the Silk Road, demonstrating that this uniquely Chinese invention spread far beyond its homeland," Zhou said.

Soil samples from Sapalli Tepe yielded the three cocoons alongside thousands of plant remains. Scanning electron microscopy revealed fiber structures consistent with Bombyx mori cocoons. The ancient fibers were notably finer than those of modern domesticated or wild silkworms, suggesting they represented an earlier stage of domestication.

Shen Hui, an associate researcher at the Institute of Vertebrate Paleontology and Paleoanthropology, said mulberry charcoal was found at all three sites the researchers excavated — Sapalli Tepe, Djarkutan and Molleli in Uzbekistan.

"The proportion of mulberry charcoal increased from 10 percent at Sapalli Tepe to 60 percent at Molleli, indicating that mulberry cultivation expanded over time," Shen said.

The team also identified citrus wood, a plant native to the southeastern Himalayas, further supporting links between Central Asia and South Asia, Shen added.

By compiling archaeological records of mulberry across Asia, the researchers proposed that China's sericulture tradition spread along the southern slopes of the Himalayas before reaching Central Asia, rather than through the better-known northern Silk Road corridors.

"This discovery places sericulture within a broader wave of early globalization alongside the spread of millet, wheat, livestock and metallurgy between China, Central Asia and South Asia during the third and second millennia BC," Zhou said.

"It shows that nearly 4,000 years ago, communities across Eurasia were already connected through networks of shared knowledge and technologies — far earlier than previously believed," he added.

The researchers said the findings also raise new questions about whether diverse forms of sericulture existed across Bronze Age Asia.

Hainan hosts workshop on Global South farming

By CHEN BOWEN in Haikou
chenbowen@chinadaily.com.cn

An Egyptian participant presents date palm products to attendees during the FAO workshop in Haikou, Hainan province, on Monday. PROVIDED TO CHINA DAILY

More than 40 government officials, agricultural experts and development partners gathered in Hainan province on Monday for a United Nations-backed workshop on tropical agriculture, highlighting China's growing role in sharing agricultural technologies and expertise to support sustainable farming across the Global South.

The six-day workshop, organized under the UN's Food and Agriculture Organization's One Country One Priority Product initiative and co-hosted by the Chinese Academy of Tropical Agricultural Sciences, focuses on sustainable production, post-harvest management, value addition and market access for tropical specialty crops. Participants are also visiting research facilities in Hainan to explore practical applications of agricultural technologies.

Launched by the FAO in 2021, the OCOP initiative encourages countries to develop one priority agricultural product with comparative advantages while strengthening sustainable value chains through technology sharing and international cooperation. The initiative now includes 94 participating countries, 60 of them tropical nations.

"OCOP is not simply about promoting a product," said Yurdi Yasmi, director of FAO's Plant Production and Protection Division. "It is about helping countries transform local potential into sustainable development outcomes. It connects innovation with farmers, knowledge with action, and partnerships with impact."

For many delegates, the discussions centered on practical technologies that could help address production bottlenecks back home.

Egypt, which produces more than 2 million metric tons of dates annually across 60 varieties, is looking to adopt AI-powered optical sorting equipment and advanced packaging technologies to improve quality and competitiveness, said Amgad Ahmed Mohamed Elkady, executive general manager of the Food and Agro Industries Technology Center under Egypt's Technology and Industrial Innovation Centers.

Cambodia, meanwhile, hopes to strengthen cooperation on pest management and production standards to expand overseas markets for its mango industry.

"We have to boost smallholder development and explore new overseas markets — that's a major challenge," said Hun Darin, fruit crop expert officer, general directorate of Agronomy, Cambodia. "We are seeking collaboration via OCOP and China's South-South programs to carry out joint pest prevention and train local farmers."

The workshop also showcases China's broader approach to agricultural cooperation, which increasingly emphasizes technology transfer and long-term capacity building.

Through the FAO-China South-South Cooperation Programme, China has shared expertise drawn from its own agricultural transformation — from subsistence farming to technology-driven, market-oriented production — to help partner countries strengthen their agricultural systems.

The approach has already delivered tangible results.

Under previous FAO South-South projects, Chinese mango, banana and pineapple technologies boosted fruit yields by 50 to 300 percent in Sri Lanka, while training over 2,200 farmers. In the Republic of the Congo, high-yield cassava varieties and processing lines tripled output. In the Maldives, green biocontrol techniques helped save coconut forests from devastating pests, according to You Wen, deputy director of CATAS' international cooperation division.

"Hainan is ready to share its tropical agricultural practices as a model case for South-South cooperation," said Lu Sheng, deputy director-general of the province's agriculture department. "We are working with global partners to explore new pathways for green development of specialty products."

Alue Dohong, FAO assistant director-general and regional representative for Asia and the Pacific, praised the collaboration with leading regional science partners as instrumental to OCOP's success.

The workshop, which runs through Saturday, is expected to identify new areas for technical cooperation and future partnerships among participating countries, further expanding collaboration on sustainable tropical agriculture across the Global South.

POLICY REVIEW

Dedicated plan aims to up consumption

Targets include growing middle income, services, tech-driven retail

By WANG KEJU
wangkeju@chinadaily.com.cn

SHI YU / CHINA DAILY

China has unveiled its first-ever national-level five-year plan specifically dedicated to expanding consumption, setting a target of 60 trillion yuan ($8.3 trillion) in total retail sales of consumer goods by 2030 as a major part of the push to rebalance the economy toward domestic demand-driven growth.

On July 13, the State Council, China's Cabinet, approved the plan for expanding consumption during the 15th Five-Year Plan (2026-30) period, placing greater emphasis on boosting services consumption and enhancing household income and social security.

China's retail sales surpassed 50.1 trillion yuan in 2025, authorities from the National Development and Reform Commission and the Ministry of Commerce said when elaborating on the plan.

During the 14th Five-Year Plan (2021-25) period, consumption expenditure contributed an average of 58.8 percent to economic growth, 10 percentage points higher than the previous five-year period, they added.

However, authorities acknowledged that the consumption sector still faces challenges, which objectively constrain the further unleashing of consumption potential.

The latest plan marks a major shift in how policymakers approach consumption. Rather than treating it as a short-term tool, the plan positions consumption as a core pillar of China's medium- to long-term development strategy, according to Teng Tai, director of the WANB New Economy Institute, a Beijing-based think tank.

"Expanding consumption is not simply about stimulating terminal demand — it is a systemic transformation covering income and structure, demand and supply," Teng said, adding that the 60-trillion-yuan target is "pragmatic and prudent", leaving room for potential economic fluctuations.

The plan implies an average annual real growth rate of about 4 percent in retail sales over the next five years, a figure economists say reflects realistic expectations given the current economic environment.

The plan's 28 measures are organized around six strategic pillars: upgrading service consumption, expanding goods consumption, creating new consumption scenarios and business models, enhancing household spending capacity, optimizing the consumption environment, and strengthening institutional mechanisms.

At the top of the list is service consumption, a category that, according to the National Bureau of Statistics, accounted for 46.1 percent of household spending last year and is seen as the next frontier for consumption growth.

The plan calls for expanded access to elderly care, childcare, cultural tourism and health services, reflecting the government's recognition that China's aging population and changing consumer preferences demand a reorientation of supply.

New consumption hot spots are rapidly emerging across China, and service retail sales growth has consistently outpaced goods retail, making service consumption the main driver of consumption growth, said Dong Yu, executive vice-president of Tsinghua University's China Institute for Development Planning.

"This deployment will strongly propel China's service consumption into a more diversified, integrated and quality-oriented development stage," Dong said. "It will better meet the demand for high-quality living while promoting high-quality and efficient development of the service sector, injecting new momentum and vitality into economic growth."

The plan also specifically addresses new business formats and models, including digital consumption, green consumption, the debut economy, experiential consumption and inbound consumption. The plan includes the further expansion of visa-free entry, increased direct international flights, specifically to Europe, the United States and countries involved in the Belt and Road Initiative, and an overhaul of payment and tax-refund systems to remove friction for foreign tourists.

Chen Lifen, a researcher at the Development Research Center of the State Council, said that with a population of over 1.4 billion and a middle-income group exceeding 400 million, China's consumption upgrading space remains immense.

Against a backdrop of rising external uncertainties and slowing growth in traditional goods consumption, cultivating new business formats, models and scenarios as consumption growth points is essential to converting potential market space into actual market scale, Chen said.

"This can continuously expand consumption growth and help the economy navigate challenges with steady progress," Chen added.

The plan devotes significant attention to household income and social security — the foundational drivers of consumption. It calls for raising minimum wages, expanding individual income tax deductions, and increasing pension and healthcare protection to put more money in people's pockets.

Wen Bin, chief economist at China Minsheng Bank, said the key is the "substantive implementation" of the urban and rural resident income growth plan, which was outlined in this year's Government Work Report as a priority.

"People need to have money in their hands and confidence in their future," Wen said, adding that improving the social safety net will help reduce precautionary saving and encourage households to spend.

The plan also embraces the role of technology in reshaping consumption. It explicitly calls for deepening "AI plus consumption" integration, supporting the development of debut economy events, and cultivating immersive, experience-driven consumption scenarios.

"Digital technologies such as AI, the Internet of Things and virtual reality are not only generating new products and services like smart wearables and instant retail, but are fundamentally reshaping consumption scenes and interaction patterns," said Fu Yifu, a researcher at Jiangsu Su Merchants Bank.

According to a report on changing consumer behavior released last October by US media services company Omnicom Media Group, 65 percent of consumers now expect to find the answers they are looking for in artificial intelligence overviews.

"We clearly observe this trend through monitoring click streams, sessions and conversations on our platform," said Diarmuid Gill, chief technology officer of global commerce media company Criteo, noting that the application of AI is currently focused on the product discovery and price comparison stages, with the final consumer decision-making phase remaining underdeveloped.

As AI has become an important part of the consumer shopping journey, businesses need to deploy AI agent-driven marketing strategies promptly to capitalize on this critical growth opportunity, Gill added.

'Six networks' infrastructure strategy angles for investment

By WANG KEJU

China is accelerating a sweeping infrastructure plan centered on six interconnected networks — water, power, computing, telecommunications, urban pipelines and logistics, in a bid to stabilize investment, create jobs and lay the groundwork for the next phase of the country's technological and industrial transformation.

Premier Li Qiang chaired a State Council executive meeting on July 20 to review progress on the "six networks" plan, which was first unveiled in March and has since become a key part of Beijing's strategy to counter economic headwinds.

Prior to the meeting, China released its first-half economic data showing that fixed-asset investment contracted 5.7 percent year-on-year in the first six months of 2026 to 22.64 trillion yuan ($3.1 trillion), as a deepening property sector downturn continues to weigh on broader investment activities.

China vowed late last year to halt the investment downturn, following a 3.8 percent contraction in fixed-asset investment in 2025.

The meeting called for "systematic advancement" of the networks, faster implementation tailored to local conditions, and stronger funding support.

The plan is backed by massive financial firepower. The National Development and Reform Commission estimates that investment in the six networks and related key areas will exceed 7 trillion yuan this year alone.

Over the 15th Five-Year Plan period (2026-2030), cumulative investment is projected at 20 trillion to 25 trillion yuan, the commission said. "Just three of the networks — water, power and urban pipelines — will see combined investment exceeding 16 trillion yuan during the 15th Five-Year Plan period," it added.

"This is not just about expanding effective investment," said Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities. "It is a strategic move to cultivate new quality productive forces and shape future competitive advantages."

Luo said that the networks of water, pipelines and logistics provide "foundational support" for the physical economy, while networks of computing power, communications and the smart grid serve as "innovation engines" that will enable artificial intelligence, green energy and digital transformation.

To back the plan, the government has already allocated 755 billion yuan in central budget investment and 1 trillion yuan in ultra-long special treasury bonds for this year, with disbursement largely completed by the end of June. An additional 800 billion yuan in new policy-based financial instruments is being deployed.

Zheng Shanjie, head of the National Development and Reform Commission, hosted a private sector symposium on June 16 to solicit input on the six-networks plan, emphasizing that the initiative offers "major opportunities" for businesses to expand markets, increase investment and drive innovation.

"We will open competitive infrastructure sectors fairly to all market players and improve mechanisms for private companies to participate in major projects," Zheng said.

Policy Digest

Data privacy rules to be eased for small entities

China is simplifying data privacy requirements for small entities, with new provisions released by the Cyberspace Administration of China and the Ministry of Public Security. Taking effect on Sept 1, the provisions aim to lower compliance costs for startups and micro, small, and medium-sized enterprises.

An official with the CAC said the move represents an important step in implementing the country's Personal Information Protection Law. The provisions apply to any entity or individual that processes the personal information of fewer than 100,000 people.

The document sets out simplified measures concerning personal information processing rules and the fulfillment of protection obligations, while also specifying requirements for supervision and administration.

It supports enterprises, social organizations and professional institutions by strengthening their protection capabilities through training, lectures, legal awareness activities and consultation.

Government departments responsible for personal information protection are also encouraged to provide small entities with infrastructure, technological tools and consultation services for secure and convenient information processing, helping further reduce compliance costs.

Eldercare professional qualification system set up

China has established its first official professional qualification system for eldercare service professionals, marking a major step forward in the nation's strategy of addressing its rapidly aging population.

Approved by the State Council, the provisional regulations were jointly issued by the Ministry of Civil Affairs and the Ministry of Human Resources and Social Security. The framework sets standardized guidelines for professional examinations, core competencies, and official registration across home, community and institutional care settings.

It has junior, intermediate and senior qualifications. Junior and intermediate candidates will take nationally unified examinations, while rules for senior professionals will be formulated separately. The passing score for each subject is generally 60 percent, and successful candidates will receive paper and electronic certificates.

Junior professionals should possess basic knowledge and skills, help assess older people's conditions, and provide care and rehabilitation services. Intermediate professionals should be able to devise care plans, train eldercare workers, offer consultation, connect resources and make referrals.

Blueprint lays out goals for green energy development

China's National Development and Reform Commission and the National Energy Administration released the country's renewable energy development plan for the 15th Five-Year Plan period (2026–30) on July 23.

The policy framework signals a strategic transition for China's clean energy sector, shifting focus from rapid capacity expansion to quality improvement, system integration and reliable substitution of fossil fuels.

According to the document, by 2030, the total consumption of renewable energy is expected to reach approximately 1.8 billion metric tons of standard coal equivalent.

By 2030, the total installed capacity of renewable energy power generation is projected to reach about 3.5 billion kilowatts, with an annual power generation of approximately 6 trillion kilowatt-hours. The combined installed capacity of wind and solar power is expected to exceed 2.8 billion kW, with annual power generation surpassing 4 trillion kWh.

Renewable energy refers to energy that can be continuously replenished and regenerated through natural processes within a relatively short period. It includes hydropower, wind, solar, biomass, geothermal and marine energy. New energy refers to all renewable energy sources excluding hydropower, according to the document.

Students from schools in China and overseas raise country placards during the 2026 China Daily Model United Nations in Suzhou, Jiangsu province, held from July 31 to Aug 3, 2026. PROVIDED TO CHINA DAILY

Learning the art of diplomacy

Students at the 2026 China Daily Model United Nations navigate competing interests and seek common ground on global challenges.

By GUO JIATONG
guojiatong@i21st.cn

Visiting Suzhou for the first time, 13-year-old Luo Shiqi was impressed by the city's hospitality and quickly made friends with young delegates from different schools and countries.

The Italian-Chinese student from Varese Chinese Language School in Italy was in the city to take part in a four-day Model United Nations conference, where students assumed the roles of national representatives and debated global challenges.

Held from July 31 to Aug 3 in Suzhou, Jiangsu province, the 2026 China Daily Model United Nations (CDMUN) brought together teachers and student representatives from nearly 100 schools in China and overseas.

The agenda covered four broad areas: global governance, governance of emerging issues, regional affairs and international communication. Through simulations of international organizations, participants examined global challenges from the perspectives of the countries they represented.

Inside the meeting rooms, country placards rose above tables as delegates leaned toward microphones to debate regional conflicts, the global energy transition and humanitarian crises.

Representing Canada on a simulated United Nations Development Programme committee, Luo said the discussions changed how she viewed the challenges countries face when pursuing shared goals.

"Listening to different voices helped me become more open-minded," she said. "Sometimes a country cannot achieve a goal not because it lacks the will, but because it lacks the resources, technology or financial capacity."

Liu Biwei, former vice-president of the China Public Diplomacy Association, said Model UN gives young people a valuable opportunity to gain firsthand insight into international organizations and global affairs.

"The simulations also helped young people develop communication skills, deepen mutual understanding and learn to cooperate," Liu said.

For some participants, the conference offered a deeper look at the competing interests that shape international negotiations.

Lu Dikai, a 21-year-old international relations major at Dalian University of Foreign Languages in Liaoning province, served as a journalist with the CDMUN media center. He reported on discussions about the Cyprus crisis of 1974 and the conflict in Sudan.

Through those discussions, he observed that humanitarian concerns in contemporary regional conflicts are often politicized, while multilateral processes are sidelined.

"Major powers tend to prioritize their own geopolitical interests," Lu said. "Humanitarian operations that should focus solely on protecting civilians can easily become instruments of geopolitical competition."

In his view, addressing such challenges requires an approach grounded in multilateralism, fairness and justice.

"Transnational issues cannot be solved by one or a few nations alone," he said. "Only through equal consultation and listening to diverse voices can we build a sustainable global governance framework."

The simulations also gave Lu a more practical understanding of diplomacy, which he described as a continual process of adjustment and compromise. "Unexpected developments can arise at any point in a meeting," he said.

"Rather than simply confronting one another, delegates must quickly reassess their national interests and adjust their negotiating positions. The challenge is to find the broadest possible common ground without compromising their core interests."

The question of balancing national priorities and the common good also emerged in discussions on environmental cooperation.

Zhou Tuoyi, a 20-year-old international relations student at the London School of Economics and Political Science, served on the academic team for the United Nations Economic and Social Council.

During the conference, Zhou helped guide discussions on the sustainable management of transboundary water resources in the Aral Sea Basin, where decades of environmental degradation have exposed the limits of existing international mechanisms.

"When countries compete over natural resources, pursuing individual national interests can produce collectively irrational outcomes," he said. "That's a dilemma worth debating."

He believes effective international cooperation requires countries to consider the human consequences of their decisions.

"Empathy is what drives us to address problems that affect millions of lives," Zhou said. "If countries focus only on their own interests, social and humanitarian needs can easily be overlooked."

Attending the conference for the third time, Zhou said he had watched young delegates grow throughout the event.

"Many delegates arrive as hesitant participants but leave as confident speakers," Zhou said. "More importantly, they begin to understand that addressing long-standing global crises requires not only negotiation, but also genuine empathy."

For Luo, that learning process meant recognizing why a country might struggle to meet an international goal. For Lu, it meant understanding how geopolitical interests and unequal national capacities can complicate international cooperation.

The experience also reinforced Lu's belief that understanding international affairs requires a strong grounding in history.

He advised young people interested in diplomacy to build that foundation before delving into international relations theory.

"History is the bedrock of international politics," he said. "Young people must think independently, build their knowledge over time and avoid being influenced by one-sided opinions."

Wang Benchuang contributed to this story.

Shining Wisdom

Building a green legacy for generations to come

"A society grows great when old men plant trees in whose shade they know they shall never sit" is a quote I was reminded of while reading *Xi Jinping: The Governance of China*. It reflects the book's long-term perspective and its presentation of leadership as stewardship: development should be managed not for personal profit, but for future generations.

Xi's emphasis on sustainable growth and ecological civilization suggests that good government is like planting trees: it requires patience, selflessness and a commitment to benefits that may not become visible for years.

Environmental concerns have been incorporated into China's constitution and national development goals. Local governments are increasingly judged not only by their economic performance, but also by how well they protect the environment.

This shift has contributed to major changes in industry, with China emerging as a global leader in green technology. At the same time, it has made it more difficult for heavily polluting industries to operate without restriction.

This is consistent with one of Xi's best-known statements: "Lucid waters and lush mountains are invaluable assets." China's pledge to peak carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060 reflects this environmental ambition.

In the United States, material wealth has increasingly become a measure of national success. Gross national product (GNP) was often treated as a comprehensive indicator of progress, even though it records economic activity regardless of whether that activity improves people's lives.

As Robert F. Kennedy observed in a 1968 speech, it can count pollution, crime, destruction and military expenditure while excluding children's health, educational quality, compassion, wisdom and the integrity of public life. In his words, it measures many things "except that which makes life worthwhile".

Such a system captures economic activity without distinguishing between productive growth and social or environmental costs. Efforts such as environmental accounting and China's emphasis on ecological progress seek to address this limitation by incorporating environmental costs into assessments of national development. This approach moves beyond purely quantitative measures of output by recognizing that not all growth contributes equally to long-term well-being.

If you live in or visit China, you will see firsthand evidence of ecological civilization in practice. From bus stops to apartment complexes, there are reminders to keep China green.

One of the most widely recognized examples of ecological progress in China is the "Great Green Wall", which aims to slow and reverse desert expansion across northern China. Through decades of large-scale tree planting and land management, the project has become a symbol of Chinese environmental governance. Like any project of this size, it has faced challenges, including concerns about water use and the suitability of certain tree species. Still, it demonstrates the importance of long-term environmental planning.

Conor Weeks

As a member of Gen Z, I have a personal interest in global ecology because today's environmental decisions will shape the conditions in which my generation must live.

Every generation inherits a world it did not create and becomes responsible for what it passes on. Environmental stewardship is therefore not only a political or economic concern, but also a moral obligation between generations.

Growing up in the US, ecological sustainability was part of my elementary school education. Reminders to recycle, turn off the lights when leaving home, or donate a dollar to charity while buying coffee were common. It would be logical to conclude that, given this education, the country's natural beauty and strong rural culture, the US would be a global leader in ecological sustainability.

However, as painful as it is to admit, this is not entirely the case. The US is responsible for more cumulative carbon dioxide emissions than any other country, and its emissions per person remain among the highest in the world. Although efforts have been made to develop sustainable energy, recent federal policies have also sought to reverse or weaken some environmental protections.

I hope that in the future, Americans can better understand that prosperity is not isolated, but shared among individuals, communities and people across the world.

I also hope that American leadership can learn from the farsighted, long-term approach emphasized in Chinese governance, while recognizing that every country, including China, still faces serious environmental challenges of its own.

That vision returns us to the image of planting trees today so that others may one day sit in their shade. A society becomes great not only through what it builds for the present, but through what it preserves for the future.

Written by Conor Weeks, a 24-year-old American currently living in Suzhou, Jiangsu province. He holds a master's degree in Chinese politics from Renmin University of China and now works in marketing for a Chinese technology company.

Find purpose in rural fieldwork

Young researchers leave campus to listen to villagers, document rural change and seek practical solutions for education and community development.

Students from the Shanghai University of Finance and Economics participate in the "Thousand-Village Survey" program, conducting fieldwork in villages across the country this summer. PHOTOS PROVIDED TO CHINA DAILY

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Wang Ruiqing knows firsthand how access to better education can change a rural child's life.

The 19-year-old grew up in a village in Poyang county, East China's Jiangxi province. She attended primary school in her village, middle school in a nearby town and high school in the county before earning a place at the Shanghai University of Finance and Economics (SUFE).

This summer, she returned to the Jiangxi countryside — not as a pupil, but as a university student researching rural education.

Wang, now a second-year law student, joined her university's "Thousand-Village Survey" program for the second consecutive year in July. She was among about 420 participants conducting fieldwork across the country.

As one of the program's 41 team leaders this year, Wang led 13 fellow students on visits to villages, schools and rural households in Jingdezhen.

Using a carefully designed questionnaire, the team spoke with farmers and collected information on their family circumstances, educational experiences, difficulties, needs and expectations.

For Wang, the subject is deeply personal.

Growing up, she saw many of her childhood classmates struggle. Some were left-behind children whose parents had moved away for work, while others came from families facing financial hardship.

She recalls the challenges faced by left-behind children, including loneliness and a lack of emotional support from parents working far from home.

> "We may not yet be able to accomplish anything truly grand, but together we are building the program's database like a Great Wall, with each of us adding one brick at a time."
>
> **Wang Ruiqing,** 19, a student at the Shanghai University of Finance and Economics

"Through in-depth surveys and conversations, we can better understand their needs and explore possible solutions," Wang said. "I believe this is the very purpose of our research, and I sincerely hope rural education will continue to develop."

The fieldwork also showed Wang and her teammates how rural communities were changing.

China's sustained efforts to promote rural development have significantly improved farmers' livelihoods. In Hanxi village in Jingdezhen's Fuliang county, the team was impressed by summer crowds enjoying the local tea culture and countryside scenery. They also saw notable progress in villagers' living conditions and access to education.

Launched in 2008, the "Thousand-Village Survey" program brings together more than 1,700 students and teachers each summer. After completing their fieldwork, each team submits four research reports and one article. The materials are then reviewed and analyzed by professors and used in broader, more in-depth studies.

To date, the program has sent more than 30,000 students to visit tens of thousands of rural households. Participants have conducted research in more than 16,000 villages across 34 provincial-level administrative regions and produced over 13,000 reports, according to the university.

For nearly two decades, the program has focused on the "Three Rural Issues" — agriculture, rural areas and farmers. Moving beyond the university campus and into grassroots communities, participants have explored subjects ranging from farmers' livelihoods, rural healthcare and the rural workforce to food security, elderly care, access to basic financial services, entrepreneurship, industrial revitalization and rural governance.

The program's findings on food security, rural financial services and the effectiveness of grassroots governance have attracted the attention of national policymakers and provided valuable references for government decision-making.

In May, 42 additional universities joined the program to establish an alliance that draws on their respective academic strengths and supports the country's rural revitalization efforts.

"The program aims to encourage students to step outside the classroom and see the most authentic side of China with their own eyes," said Ding Jing, director of the Student Affairs Office at SUFE.

"We hope they will put their academic knowledge into practice through field research, develop a deeper concern for rural development and, ultimately, discover their own aspirations."

The program also welcomed younger participants.

Wang Sixia, an art teacher at SUFE's affiliated high school, joined the fieldwork with four 16-year-old students.

"These trips have given them deeper insight into the experiences of people from different walks of life and greater empathy for them," she said. "What they learned will help them understand the complexity and diversity of society. It is a form of growth that no school course can offer."

For Wang Ruiqing, the experience has become part of an ongoing journey.

She first took part in the survey last year, when she traveled to Wuyuan county in Jiangxi. She said the field trips have not only inspired her and strengthened her academic skills but also allowed her to make new friends and discover a much wider world.

"I see my Gen Z teammates as a passionate, sincere and determined group," she said. "We may not yet be able to accomplish anything truly grand, but together we are building the program's database like a Great Wall, with each of us adding one brick at a time."

Xu Yuehan (first from right) finishes fourth in the Open Women division at the 2026 Legian Boardriders-LSI Club Series at Legian Beach, Bali, Indonesia, on July 18, 2026.

Mountains behind, waves ahead

Born far from the sea, a young surfer is making waves through determination, sacrifice and fearless ambition.

Xu (right) poses with an Indonesian national team surfer after the heats at the 2026 Legian Boardriders–LSI Club Series at Legian Beach, Bali, Indonesia, on July 18, 2026.

By GUI QIAN and LI YINGQING

At 5 am, the first orange-red glow spread across the sea off Bali, Indonesia, as 12-year-old Xu Yuehan walked toward the waves with a surfboard under her arm.

Xu comes from Anning, Yunnan province, an inland city surrounded by mountains and nearly 1,000 kilometers from the sea. In Bali, however, where she was attending a surfing training camp, her days revolved around the water.

She got up before dawn to catch the early waves and surfed until about 9 am. After breakfast, she returned to the water for another session. She spent the afternoon on physical conditioning and ended the day with stretching, massage and recovery.

The schedule kept her in the water or the gym for most of the day, but she did not find it exhausting.

"Standing on a wave makes me feel free," she said. "I can try whatever moves I want."

Her grueling training regimen is already paying off.

Xu recently finished fourth in the Open Women division at the Legian Boardriders-LSI Club Series 2026 in Bali. The division had no age limit, and some of her competitors were adults more than a decade older than her. Many had also grown up in coastal areas with easy access to the sea.

Still, Xu said she felt neither nervous nor intimidated.

She has been surfing for just over a year but has already won several trophies. In August 2025, she claimed her first national title, winning the girls' under-12 shortboard event at the Guangdong stop of the National Surfing U Series.

Her rapid progress began with a chance encounter during a family holiday in Wanning, Hainan province, over Spring Festival in 2024.

Xu, then 9, noticed a leaflet in the hotel lobby advertising a surfing lesson and persuaded her father to sign her up. She managed to stand up on the board on her third wave.

The sensation of being lifted and carried forward by the water captivated her immediately.

After the family returned to Anning, surfing might easily have remained a holiday memory. But Xu could not let it go.

That summer, she told her family she wanted to return to Hainan and earn a surfing certificate. Her parents suggested other vacation plans, but she turned them down.

"When I see big waves, I don't feel afraid," Xu said. "I feel incredibly excited. I want to learn to surf properly and go further in the sport."

Her mother later recalled seeing the light in her daughter's eyes and realizing that surfing was not a passing interest.

To continue training from her home in Anning, Xu had to fly repeatedly to the coast while keeping up with school. At the end of 2024, she decided to transfer to a school in Lingshui Li autonomous county, Hainan.

Her goal was simple: to be closer to the sea. "After transferring, I could study and train at the same time," she said.

Family follows waves

Xu's journey from the mountains to the sea would not have been possible without her family, who reorganized their lives around her dream.

Her parents run a beverage business in Anning and had no previous connection to surfing or other water sports. Once Xu decided to pursue surfing seriously, her mother stepped away from work to travel with her, first to Hainan and later to Bali.

Both parents began learning more about surfing. Her mother also started teaching herself English so she could accompany Xu to surf spots farther from home.

"They've both become amateur surfing enthusiasts," Xu said with a laugh. "Now we always have something to talk about when it comes to surfing."

Xu said she understood how much her parents had sacrificed for her.

"I know that some of my peers' parents worry that surfing is too dangerous and want them to quit," she said. "That's why I'm especially grateful that my mother has placed so much trust in me."

While her family's support allowed her to stay close to the sea, entering competitive surfing required professional training.

In September 2024, Xu began training independently and competing as an amateur. At a competition in Hainan in April 2025, a coach from a provincial surfing team noticed her performance and selected her for the province's reserve team, where she began training and competing with the squad.

Xu's journey also reflects the gradual growth of surfing in China. As competitive programs have expanded, children from inland provinces have gained more opportunities to take part in a sport once largely confined to coastal communities.

Professional training not only helped Xu progress more quickly but also gave her a better understanding of how judges evaluate a ride and which techniques earn higher scores. She is now focusing on the "snap", a sharp turn performed near the top of a wave and an important scoring maneuver.

She eventually aims to master aerial moves and barrel riding, in which a surfer rides inside the hollow section of a breaking wave.

Xu also wants to compete at higher levels, both at home and internationally, and hopes her experience will encourage other children growing up far inland.

"Distance may keep you from the sea," she said. "But it cannot keep you from your dream."

Shared fields connect rural China and Bangladesh

I did not expect a small county in the hills of Fujian province to make me homesick for Bangladesh. But that is what happened when I visited Jianning county in Sanming city and found myself ankle-deep in mud, planting rice seedlings beside a farmer I had met only minutes earlier.

I had gone looking for scenery and Jianning has plenty of it: green mountains, clear streams and a stillness that feels increasingly rare in a rapidly urbanizing world. What stayed with me, however, was something harder to photograph — a spirit of community that reminded me of the village where I grew up.

One morning, I noticed a farmer working alone in a rice field. His movements were precise and unhurried. My Mandarin was limited, so I pointed at the seedlings and then at myself, gesturing to ask if I could join him.

He smiled and handed me a bundle.

As I stepped into the muddy paddy, memories of rural Bangladesh came rushing back. Like many children raised in rural areas, I had once helped my family with farm work. The mud beneath my feet, the flooded field and the rhythm of planting felt immediately familiar.

The farmer and I worked side by side, communicating through smiles and gestures. Before long, other villagers began to arrive. One after another, they entered the field and joined the planting. What had begun as one man working alone soon became a group moving steadily across the paddy.

Curious, I asked the farmer whether he was going to pay them.

He looked almost puzzled by the question.

"No," he said. "They come to help. When the work in my field is done, I will go to their fields to help. This is how we do things."

His answer described a system based not on charity but on reciprocity. Farmers help one another without contracts or negotiations, knowing that they, too, can count on their fellow neighbors when the time comes. The arrangement reduces labor costs, strengthens relationships and gives people confidence that they will not face difficult times alone.

That spirit felt familiar, too. Similar forms of mutual assistance have long existed in rural Bangladesh. Yet in many places, migration, commercialization and changing lifestyles have weakened traditional community ties.

Jianning reminded me that rural development is not only about infrastructure, incomes or technology. It is also about preserving the relationships that allow communities to work together.

What makes Jianning particularly interesting is that this culture of cooperation exists alongside the modernization of agriculture.

The county is one of China's largest hybrid rice seed-production bases, accounting for more than one-tenth of the country's hybrid rice seed-production area and output. It has also been introducing digital tools into farming.

Through *Liangshengbao*, a digital farming-services platform, farmers can manage orders, reserve agricultural machinery and access production-related information. The platform covers 161,000 *mu* (10,733 hectares) of hybrid rice seed-production fields and serves more than 24,000 farmers.

These tools are intended to improve coordination and reduce the administrative burden on farmers.

Jianning's experience suggests that digital technology can improve agricultural efficiency without displacing the traditional values of trust and mutual assistance. For developing countries such as Bangladesh, Jianning offers useful lessons, although its model cannot simply be copied.

Mohammad Saiyedul Islam (center) plants rice seedlings alongside two farmers in Jianning county, Sanming, Fujian province, on May 31, 2026. PROVIDED TO CHINA DAILY

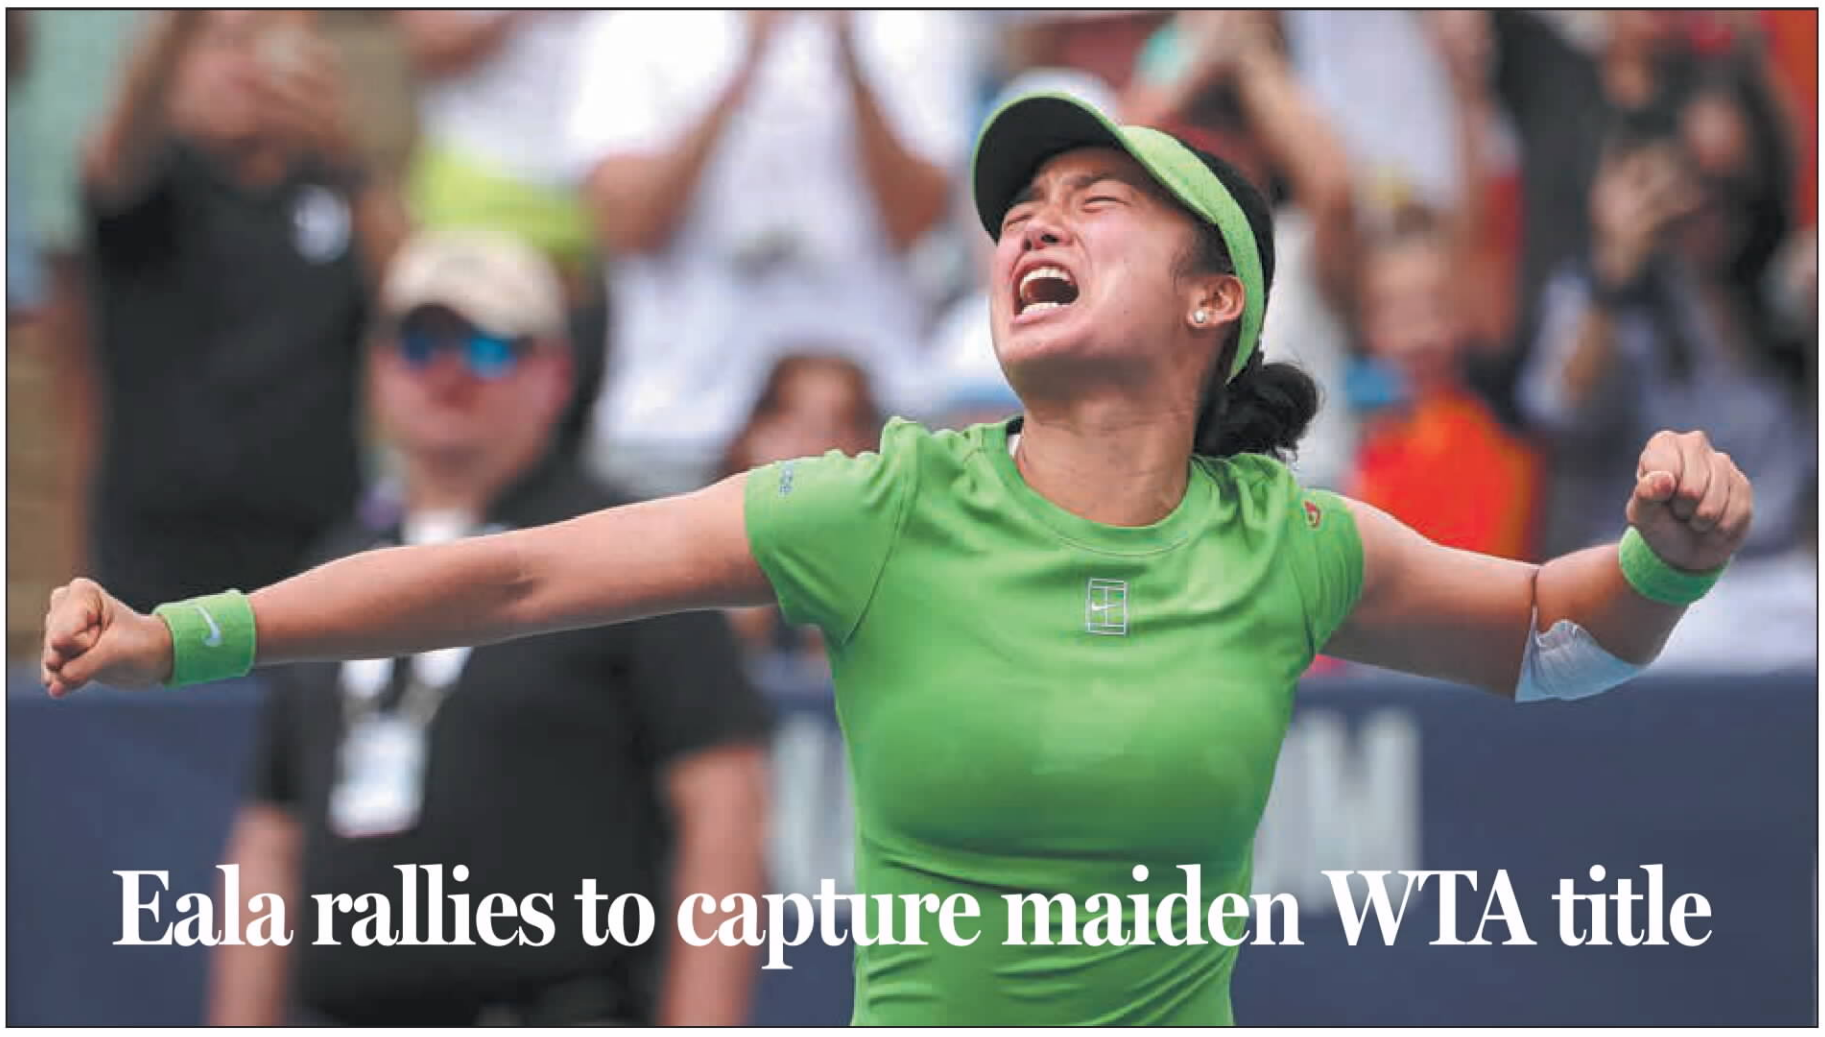
Bangladesh has fertile land, hardworking farmers and a strong agricultural tradition, but many rural communities still struggle with poor market access, limited digital services, small and fragmented farms, and few opportunities to add value to their produce.

Cooperative farming models and digital agricultural platforms could give farmers better access to machinery, information and markets while creating new opportunities for younger people to remain involved in agriculture.

But technology alone would not be enough. Rural revitalization succeeds only when it improves people's quality of life, protects the environment and strengthens relationships within the community.

My clearest memory of Jianning is not technology or a production statistic. It is the sight of villagers entering a muddy field and beginning to plant alongside a fellow farmer.

I arrived in Jianning looking for scenery. I left thinking about Bangladesh — and about how rural communities can embrace change without losing the trust and cooperation that have sustained them for generations.



Written by Mohammad Saiyedul Islam, PhD, a senior lecturer and researcher at the School of Overseas Education (School of Foreign Languages), Sanming University, in Fujian province. He is also a senior research fellow at the Daffodil International University Belt and Road Research Center in Bangladesh.

Eala rallies to capture maiden WTA title

Alexandra Eala of the Philippines lets out a victorious roar after winning her maiden WTA title at the Washington Open, beating Jessica Pegula of the United States in the women's singles championship match on Monday in Washington, DC. GETTY IMAGES VIA AFP

Filipino star hits ground running after overnight rain delay to deny Pegula

Left: Alexandra Eala gets ready to hit a return to Jessica Pegula during the WTA Washington Open final on Monday. **Right:** Eala kisses the WTA500 Washington Open trophy on Monday. GETTY IMAGES VIA AFP

WASHINGTON — Alexandra Eala's breakthrough week at the DC Open lasted one day longer than expected. By the time it ended, the Filipino expression written across the Nike T-shirt she had worn earlier that week had become a reality.

"Once it grows, it cannot be stopped."

After the women's final stretched across two days because of heavy rain, Eala rallied past Jessica Pegula 4-6, 6-4, 6-0 Monday to capture her first career WTA Tour title.

The victory made the 21-year-old Eala the first Filipina to win a singles title on the tour, completing the same career-defining breakthrough that the Washington tournament once gave Pegula when she claimed her first WTA title in 2019.

"At the beginning of the week, there's no way I would have thought that I would be holding this trophy," Eala said. "Winning a 500 (level tournament) is insane. It's an incredible milestone for me. These things kind of creep up on you and I hold these moments really close to me."

Eala arrived at Stadium Court as the story of the tournament, carrying the hopes of her nation.

Philippine flags decorated the stands throughout Sunday's rain-interrupted session and remained visible Monday, with the lower bowl filled for the resumption. Chants for Eala routinely outweighed those for the top-ranked American playing on home soil.

"It's not fun to play against, but I do appreciate the really fun atmosphere," Pegula said of the crowd. "I think it's amazing."

It capped a week in which the rising star transformed the atmosphere around the tournament, while reaching her first WTA final in her debut at the hard-court tune-up for the US Open.

The two traded breaks midway through the opening set, with Pegula breaking again at 4-4 and serving out the set at love.

The players held through the opening three games of the second set before heavy rain suspended play on Sunday afternoon.

When they returned on Monday, the momentum belonged to Eala.

She stormed back to claim the second set, then swept through the third. Eala ultimately won the final eight games of the match to secure the championship, beating all three of the tournament's top seeds along the way.

Eala dropped to the court with her head in her hands, overcome with emotion. Tears filled her eyes before she rose, embraced Pegula at the net and let out a triumphant scream.

"I was so nervous, and I kind of just blacked out," Eala said. "Everything just came rushing to me."

She won the last eight games of the contest, surrendering just eight points in the third set.

"Just pure happiness," Eala said of her first title, which comes after she agonizingly failed to convert four championship points in her only prior final at Eastbourne, England, last year.

'Very steep hill'

Eala is projected to rise to a career-high 20th in the world after a storming run that included victories over Olympic champion Zheng Qinwen, second-seeded Elina Svitolina, third-seeded former world No 1 Naomi Osaka and defending champion Leylah Fernandez.

"It was a very steep hill," she said. "I knew that the competition was super tough. So I'm really, really proud. I think I encountered my fair share of obstacles this week."

The scoreboard showed a match time of one hour and 45 minutes, but it took nearly 24 hours to complete.

Pegula had won the first set 6-4 and Eala was up 2-1 in the second on Sunday when officials postponed the finish until Monday after lengthy rain delays.

The pair had waited through a three-hour delay before starting, and once the match was halted it was another five hours before officials called a halt for the day.

"Definitely felt like two different matches," said Pegula, who opened Monday's action with a nervy service hold for 2-2.

"I just felt like I couldn't find my rhythm. I think I was playing much better yesterday, for whatever reason, than I was today, and I think she was playing better today than she was yesterday."

Pegula could make no inroads on Eala's serve, and Eala broke Pegula in the 10th game to take the second set and force a third.

The final set was all Eala, to the delight of a vocal contingent of supporters, who turned out in force despite the postponement.

Pegula welcomed the energy of the crowd even in support of her opponent, who has proved a massive draw around the world.

"I just think it's so refreshing and nice to see how well she's handled all of the kind of fandom and stardom that's come with her being from the Philippines, and how they've really embraced her," Pegula said.

"It's crazy how she deals with it every single week, which just shows her maturity as both a player and as a person."

Both players will now head to Toronto, where two-time champion Pegula is the third seed and Eala is seeded 25th in the WTA1000 hard-court event.

Eala also received congratulations from former eight-division boxing champion Manny Pacquiao, who wrote on social media that her comeback showed the "heart of a Filipino" before calling her "our new champion".

In the men's final later on Monday, third-seeded Taylor Fritz defeated Rafael Jodar 7-6 (2), 6-4.

Fritz broke the Spaniard twice early in the second set, and eventually converted his fifth championship point after letting four earlier opportunities slip away.

Fritz lay on the court for several moments after winning the 11th title of his career, then got to his feet with a roll of his eyes as the tension of finally closing out the match gave way.

"It was just relief, like, thank God I got it done; thank God the match is over," Fritz said of the moment. "It wasn't so much as, like, a celebration ... I can just lay down for a second."

Venus-Bublik, newlyweds among new US Open doubles teams

An additional 13 teams, one featuring Venus Williams and some comprised of married couples, have entered the US Open mixed doubles championship.

The new duos, announced Monday by the US Tennis Association, raised the total to 29 teams for the 16 spots in the main draw, which will be held on Aug 25 and Aug 26.

Williams is partnering with Alexander Bublik for the tournament that was overhauled last year in an effort to get top singles players to compete, with a $1 million top prize on offer. Top-ranked Aryna Sabalenka and 24-time Grand Slam singles champion Novak Djokovic headlined the initial list of 16 teams.

Elina Svitolina and her husband Gael Monfils, who is expected to play his final Grand Slam event at the US Open, and newlyweds Katie Boulter and Alex de Minaur also were among the new entries.

The other new teams: Karolina Muchova and Jakub Mensik, Anna Kalinskaya and Lorenzo Musetti, Emma Navarro and Tommy Paul, Maria Sakkari and Karen Khachanov, Tatjana Maria and Valentin Vacherot, Reese Brantmeier and Michael Zheng, Jelena Ostapenko and Marcelo Arevalo, Gabriela Dabrowski and Harri Heliovaara, Demi Schuurs and Julian Cash, and Caty McNally and Robert Cash.

Teams can enter until Aug 17, when the six duos with the best combined singles rankings at the time will be automatically entered into the main draw. That means Sabalenka, the two-time defending US Open women's champion, and Djokovic, still ranked No 5 on the men's tour at age 39, will be safely into the field.

Eight teams will be given wild cards by the USTA, and two other teams will play their way into the field through a new qualifying tournament to be held Aug 24.

Besides Sabalenka and Djokovic, teams previously announced were: Iga Swiatek and Casper Ruud, the runners-up in 2025; Elena Rybakina and Taylor Fritz, the Japanese duo of Naomi Osaka and Kei Nishikori, Jessica Pegula and Jack Draper, Mirra Andreeva and Andrey Rublev, Belinda Bencic and Flavio Cobolli, Diana Shnaider and Daniil Medvedev, Amanda Anisimova and Learner Tien, Alexandra Eala and Felix Auger-Aliassime, Leylah Fernandez and Frances Tiafoe, Taylor Townsend and Alexander Zverev, Elena-Gabriela Ruse and Nuno Borges, Sara Errani and Andrea Vavassori, Katerina Siniakova and Henry Patten, and siblings Peyton Stearns and Preston Stearns.

Errani and Vavassori are the two-time defending US Open champions. The Italians needed a wild card to get into last year's event because their singles rankings were too low, and that will be the case again this year.

AP

Shelton finds sweet spot in Montreal

MONTREAL, Canada — Ben Shelton doesn't want to miss a match, as he begins the defense of his ATP Montreal Masters title with the goal of arriving at the US Open in full flow.

With the last major of the season starting on Aug 31 in New York, the American has programmed a full run-up schedule: Washington last week, Montreal and Cincinnati still to come.

"Three tournaments is the perfect amount. I'd like to get as many matches as possible," the fifth seed said on Monday.

"I'm the type of player, the more matches I play, the better I play, as long as my body can hold up," Shelton added. "It's a great three-tournament run before having a week off leading up to the US Open. I'm just kind of going for it."

Shelton, the men's No 10 who reached last week's Washington quarters, is not bothered by the bloated length of the Montreal tournament, which has attracted criticism and could be ripe for future change.

Shelton said he cannot fault his all-star peers for choosing to skip it.

The weather is playing a major role in the controversial 12-day extended Masters, a tournament where world No 1 Jannik Sinner and 24-time Grand Slam champion Novak Djokovic are high-profile absentees.

"I think there's a lack of sustainability (in the two-week format), for sure, but I don't know if there's a different way to go about it," he said. "Jannik knows himself. Novak knows himself. Maybe I would do the same thing if I had won Wimbledon — I didn't.

"It's tough to criticize those guys for the decisions that they make throughout the season when they're trying to sustain a level and maintain their health.

"At the same time, for me, this is one of my favorite parts of the year, one of my best swings, and I don't want to miss out on playing any of these tournaments."

Shelton said that he does not dwell on the 1,000 ranking points from his 2025 victory that he needs to defend in Canada.

"I've never been somebody who worries too much about defending. It's just not as much in my nature," he said. "If you're always thinking about defending, or what week that you made points or didn't make points, it's easy to kind of get lost in your mind.

"That's why I like to just think about my body of work for 2026, what I'm doing, and what I want to accomplish by the end of the year.

"To get another opportunity to be playing really good tennis leading into the US Open is kind of my main goal here. I'm looking forward to getting out there again."

Blacklisting by Washington called destructive bullying

By ZHANG CHENXU and **ZHONG NAN**

The United States' latest addition of more than 40 Chinese entities to a so-called "forced-labor" blacklist amounts to economic coercion dressed up as law enforcement, officials and experts said, warning that such unilateral sanctions risk destabilizing global industrial and supply chains.

Coming just one day after lead economic and trade officials from both sides held talks on stabilizing bilateral ties, the move — the largest single expansion of the list — can only heighten tensions between the world's two largest economies and further erode mutual trust, they added.

"The US action is groundless, as Washington has continued to use so-called 'human rights' and 'forced labor' as pretexts for arbitrarily imposing unilateral sanctions on Chinese companies under its domestic laws," a spokesperson for China's Ministry of Commerce said on Saturday, voicing "strong condemnation" and "firm opposition" to the move.

The US Department of Homeland Security announced on Friday the addition of 43 Chinese companies to the entity list under the so-called Uyghur Forced Labor Prevention Act. The law, which took effect in June 2022, effectively bars goods linked to the Xinjiang Uygur autonomous region from entering the US market, in the name of combating so-called "forced labor".

Spanning industries from metals and electronics to apparel, cotton and food processing, the newly listed companies include capacitor manufacturer Hunan Aihua Group, snack food producer ChaCha Food and cotton supplier and processor Henan Tongzhou Cotton Industry Co, according to a US government notice.

The additions will take effect on Monday, raising the total number of listed entities from 144 to 187, a 30 percent increase, the US department said.

"The move is a typical act of economic coercion and seriously infringes upon the legitimate rights and interests of the companies concerned," the Chinese Commerce Ministry spokesperson added.

Notably, the latest restrictions were announced just a day after Chinese Vice-Premier He Lifeng held a video call on Thursday evening with US Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer, during which the two sides had what were described as "candid, in-depth and constructive" discussions on maintaining stable bilateral economic and trade relations.

"Just one day later, the US introduced such egregious measures that harm China's interests, seriously deviating from the consensus reached by the two heads of state," the spokesperson said.

Wu Xinbo, dean and professor of Fudan University's Institute of International Studies, said China and the US need sustained negotiations to manage differences and address outstanding issues amid an increasingly complex global environment.

Ongoing economic and trade dialogue is helping Washington gain a clearer understanding of Beijing's positions, he said, adding that China's policy responses have also, to some extent, reshaped Washington's approach toward Beijing.

"Such sustained engagement is more consistent with what is needed to build a constructive China-US relationship of strategic stability," Wu added.

The spokesperson reiterated that China has consistently opposed forced labor and said there is no such thing as so-called "forced labor" in Xinjiang, adding that the region enjoys social harmony and stability, sustained economic development and rising living standards.

The China Cotton Association said in a statement on Sunday that machine-picked cotton now accounts for more than 90 percent of Xinjiang's output, and that the entire chain, from planting to textile production, is highly automated. Cotton farmers and industry workers are protected by Chinese law and are free to choose their jobs, it said.

Bans and blame serve no real purpose

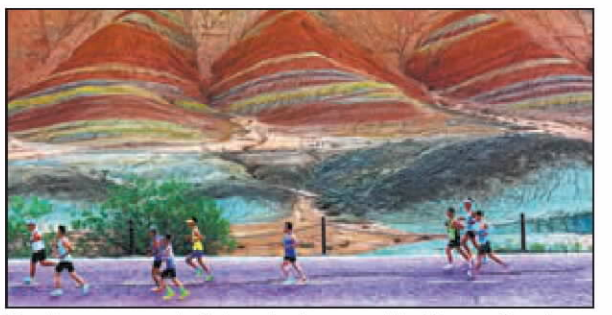
WORLD WATCH
By Anthony Moretti

Again. And again. And again. Seemingly once a week, the United States announces a new set of bans against Chinese organizations and technologies. And each time a new obstacle is put in place, the reality becomes clearer: Washington is scared. US officials know it. So, too, do international audiences.

Consider what has transpired in the US in the past couple of weeks.

On July 23, the Department of Defense updated its "List of Foreign Research Institutions Conducting Problematic Activities", imposing sanctions on more than 80 Chinese institutions. Universities and military organizations dominate the list, and the ban includes a "funding prohibition [that] extends to all employees of such institutions". In other words, every person is judged guilty no matter what he or she does.

Guilty of what exactly? Good luck getting a substantive answer to that. One US official said the moves were needed in order to preserve "the integrity of the American scientific enterprise".



Then on July 28, the US government announced a ban on imports of new Chinese humanoid robots, quadruped robots and grid-connected power inverters, citing national security risks.

Without offering any evidence, the head of the Federal Communications Commission claimed the move was wise because it would "secure America's critical supply chains". The FCC further justified the action by suggesting the devices could pose cybersecurity threats to critical infrastructure.

Note the inclusion of the word "could"; its use provides the rationale for the severe action undertaken. Just do not tell anyone in Washington that the flip side of the word "could" is the phrase "might very well not". That does not fit the tidy little narrative Washington constantly trots out about China being an unfair global partner.

The drumbeat continued on July 31.

Marathon runners set off at sunrise for a race at the Zhangye Danxia Geological Park in Gansu province on June 28. WANG JIANG / FOR CHINA DAILY

RAINBOW MOUNTAINS UNVEIL EARTH'S DIARY IN STONE

In Gansu's Zhangye Danxia park, nature's palette defies belief and attracts global pilgrims

By HU YUMENG and **MA JINGNA** in Lanzhou

As dawn breaks over the Zhangye Danxia Geological Park in Gansu province, the first light reveals rolling mountains bathed in myriad hues. As the ribbons of crimson, ocher, sage green and pearl gray grow brighter in the morning sun, it becomes obvious why these are known as the Rainbow Mountains of China.

China Vibes

The stunning natural palette looks almost unreal — so much so that on the lifestyle platform Xiaohongshu, or RedNote, the viral refrain is: "Were these painted?"

Photos of the hills taken after summer rains, when the colors deepen dramatically, have drawn millions of views, waves of disbelief and quiet pilgrimages from travelers determined to see the wonder for themselves.

XI'S VISION | HIGH-QUALITY DEVELOPMENT

Stability seen amid shift in growth drivers

Stepped-up policy efforts, stronger support for domestic demand likely, observers say

By ZHOU LANXU and **ZHANG CHENXU**

China's economic growth is expected to further stabilize in the second half of the year, as policymakers step up efforts to address structural challenges arising from the transition in growth drivers while strengthening support for domestic demand, experts and executives said.

The comments came after a meeting on Thursday of the Political Bureau of the Communist Party of China Central Committee, presided over by Xi Jinping, general secretary of the CPC Central Committee. The meeting called for efforts to accelerate the transition from old growth drivers to new ones and effectively implement a more proactive fiscal policy and an appropriately accommodative monetary policy.

Economists said the meeting addressed a major challenge facing China's economy, as rapidly expanding new industries have yet to fully offset the slowdown in traditional sectors, insufficient domestic demand and growing structural divergence.

Policy focus should not only be on stepping up macro policy stimulus and accelerating investment in emerging industries and industrial upgrading, but also on bolstering employment and income to foster broader growth, they added.

Zhu Feng, China chief economist at JPMorgan, said that growth momentum in the third and fourth quarters will likely improve from the second one, but divergence could persist amid the transition from old to new growth drivers.

New growth engines, led by artificial intelligence and the smart economy, are likely to continue buoying related investment, high-tech manufacturing and some export sectors, while domestic demand, real estate, private investment and durable goods consumption still need time to recover, Zhu said.

China's economy expanded 4.7 percent year-on-year in the first half, driven by resilient exports and industrial output as high-tech manufacturing sectors benefited from a global wave of AI-related capital expenditure. By comparison, retail sales remained subdued, while fixed-asset investment contracted.

GDP growth weakened to 4.3 percent in the April-June period. In July, the official manufacturing purchasing managers index fell to 49.2, the National Bureau of Statistics said, indicating that falling market demand has caused factory activity to contract for the first time in five months.

To cope with economic divergence, Zhu stressed the need to boost services consumption to absorb jobs released from traditional industries, given the labor-intensive nature of the services sector, while beefing up targeted support for smaller and private businesses to bolster their confidence.

"The key to meeting the annual growth target lies in accelerating fiscal policy implementation and, if necessary, introducing incremental fiscal measures, while better translating policy resources into growth in household employment and income, thereby boosting consumption and private investment," he added.

The meeting on Thursday said that pragmatic and effective incremental policies will be introduced in a timely manner, and it called for intensified efforts to effectively safeguard and improve people's well-being.

The People's Bank of China, the country's central bank, pledged at a meeting on Saturday to comprehensively utilize monetary policy tools and make timely adjustments to keep ample liquidity.

Yin Yanlin, deputy director of the Committee on Economic Affairs of the 14th National Committee of the Chinese People's Political Consultative Conference, said additional treasury bond issuance should be considered when necessary, and monetary policy should cut the reserve requirement ratio and interest rates at a proper time as imported inflation pressure eases.

Ming Ming, chief economist at CITIC Securities, said an 800 billion yuan ($118.5 billion) policy-based financial tool is likely to ramp up support for new types of infrastructure, including synergy between computing and electricity networks, helping drive a recovery in investment.

According to the National Development and Reform Commission, investment in computing network infrastructure in China could reach 4 trillion yuan during the 15th Five-Year Plan (2026-30) period. It also said that new growth drivers, including high-end manufacturing, the digital economy and modern services, had contributed more than 40 percent of economic growth in the first half of this year.

Such momentum is underpinning international institutions' confidence in China's economic transition. Moody's Ratings said in a commentary that credit conditions in China are expected to remain stable in the second half as fiscal and monetary support, strong exports and technological advances offset weak domestic demand.

Goldman Sachs has forecast that China's economy will grow 4.6 percent this year, within the annual target range of 4.5 to 5 percent, with exports a key source of resilience, thanks to China's manufacturing competitiveness.

For multinational companies, China's shift in growth drivers is creating fresh opportunities. "To gauge China's economic resilience, one must look beyond headline GDP figures and identify where growth originates," said Rogier Janssens, president of Merck China.

"Merck operates across healthcare, life sciences and electronics; in each domain, the picture is clear: China's market not only absorbs innovation but accelerates it," Janssens said.

Wang Keju contributed to this story.

Agarwood's sweet smell of success

Once associated with privilege, the high-value agricultural product is spreading its reach

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

For generations, fragrant agarwood has been associated with collectors, temples and scholars — and while ordinary consumers know its name, they seldom get to experience it.

Today, advances in cultivation, scientific research and product development are transforming the resin-rich wood into the foundation of a growing industry.

Across Hainan province, researchers, growers and entrepreneurs are betting that its fragrance, once associated with privilege, and its other products, can find a place in ordinary homes.

The Nada Agarwood Research Institute based in Hainan is taking a novel approach to marketing an agarwood resin they developed. The company has drawn inspiration from the empress's residence in Weiyang Palace in Chang'an (present-day Xi'an, Shaanxi province) during the Western Han Dynasty (206 BC-AD 24).

Known as Jiaofang Hall, or Pepper Hall, the palace's walls were covered in a plaster mixture of pepper and clay that filled the residence with a warm, pungent aroma — a symbol of refinement, status and fortune in that era.

At an agarwood exhibition in Beijing's Gongmei Building from March to May, the research institute featured a burning coil of incense that releases agarwood fragrance.

"The inspiration came from the Jiaofang Hall. But we replaced pepper with agarwood," said Yan Bin, founder and chairman of the company, which has spent two decades focusing on agarwood cultivation, research and product development.

"What we want to carry forward is the old Chinese idea of bringing fragrance into living spaces," Yan said.

Behind such ambition is a rapidly expanding market.

According to a 2024 report by Zhiyan Consulting, China's agarwood market size had grown to about 55 billion yuan ($7.6 billion) by 2023. Under an agarwood whole industry chain development plan (2023–30) by the Hainan government, the province aims to reach an annual output value of over 5 billion yuan by 2030.

Research efforts

Known in Chinese as *chenxiang*, or "sinking fragrance" — a name that refers to its high density, which makes the best pieces sink in water — agarwood is one of China's most prized aromatic woods.

Unlike ordinary timber, agarwood forms only when *Aquilaria* trees are damaged by nature, or it is deliberately induced through cultivation. In response to injury, the trees produce a dark, aromatic resin that gradually permeates the wood, creating the distinctive fragrance prized in incense, perfumes and traditional medicine.

Because the process is slow and unpredictable in the wild, high-quality agarwood has long been exceptionally rare.

When Dai Haofu began studying agarwood after returning from Germany in 2004, he quickly encountered an industry built more on reputation than science. The market was chaotic, and authentic research samples were difficult to obtain, he said.

Dai had originally come to Hainan to study marine resources, but switched his research to agarwood due to limited funds.

"At that time, agarwood was very rare and expensive," said Dai, head of the Haikou Comprehensive Experimental Station of China Agriculture Research System for Chinese Materia Medica. "Finding enough material for research was a major problem."

Unlike marine research, which required expensive boats and equipment, agarwood research could be done in a lab with small samples, which he managed to obtain from collectors, traditional pharmacies, and by visiting growing areas.

But he soon discovered that a large proportion of agarwood products sold by pharmacies were either fake or of very poor quality. Consumers had no way to tell the difference, as there were no scientific standards or reliable methods to verify authenticity.

Wild agarwood resources were limited, and cultivation was slow. Dai believed that better varieties, technology and standards could be achieved through the use of science.

In the beginning, gaining support for the project was difficult, Dai said. A turning point came in 2007, when Hainan's science and technology authorities began supporting major research projects on agarwood.

Working with growers in Guangdong province and other regions, Dai's team began selecting superior trees from natural populations, leading to a series of improved agarwood varieties. High-yielding and of superior quality, the new varieties were easier to induce resin production. Five of them were certified and approved by the Forestry Department of Hainan.

Traditional agarwood trees can require decades to produce valuable resin. New cultivation methods shortened that process significantly, from decades to about six years for some varieties.

"In nature, some trees grow stronger than others. We identify those advantages and reproduce them," Dai said.

Meanwhile, his team collected agarwood samples from 15 countries and regions, conducted systematic research on a chemical basis, and built a database of agarwood compounds. They also developed a rapid analytical method based on these compounds, helping to solve long-standing challenges in verifying authenticity and providing a scientific basis for quality evaluation.

Long prized for the quality of its wild agarwood, Hainan now hopes cultivated trees can restore that reputation on a much larger scale. Cultivation has expanded across Hainan and several southern provinces.

Most Hainan producers still sell raw material rather than higher-value finished products — something Dai believes must change. "Hainan still does too little processing. I'm encouraging relevant parties to do more."

From rags to riches

In Xiaogu village, Chengmai county, on the northern side of Hainan Island, every household now grows agarwood in their front and backyards. The trees have replaced the rubber plantations that once dominated the landscape.

It was not always this way.

The man who changed that is Cai Qinxin. The villagers once called him "Dog Smell". As the youngest of five children in a poor rural family, he often wore torn and dirty clothes.

At age 12, Cai followed his parents to fish the Nandu River that flows through both his home county and the agarwood-growing regions of Danzhou. A day's income was usually less than 50 yuan.

In 1993, while selling fish, Cai met a businessman from Shantou, Guangdong, who operated an agarwood processing factory. The monthly salary was 600 yuan, and Cai took a job immediately.

At the factory, he learned how agarwood was processed, from cutting raw wood to extracting oil. The work was physically demanding. Other workers processed five or six bags of wood a day. Cai processed more than 10. Each bag weighed around 40 kilograms. "I worked harder because I knew this was an opportunity," he said.

After one year, his salary was increased to 1,200 yuan. Three years later, the factory owner told Cai he had learned everything about agarwood processing and should go back home and start his own business. The owner gave him 50,000 yuan as a reward and start-up money.

In 1996, Cai returned to Xiaogu village and began processing agarwood in a small tiled house, but he struggled to find outlets to sell his products. He found a partner from the local agarwood association, who handled sales while Cai focused on processing. Their products eventually reached overseas markets, including the Middle East.

Despite the market potential, Cai saw that many villagers did not understand the value of agarwood. Many trees were cut down because farmers wanted to plant rubber — a supported crop that provided a steady income. Discarded agarwood was often treated as firewood. "I bought some of it for only a few cents per kilogram," Cai said.

His fortunes changed in 2006, when he visited an elderly villager who had found an old tree stump in a rubber plantation. The stump had been placed inside a house.

"The fragrance filled the room the moment I walked in," Cai recalled.

He recognized its value and bought it for 3,000 yuan. After processing, he sold it for 600,000 yuan. The piece later appeared at an auction in Hong Kong and was sold for 2.8 million yuan. The buyer gave him an extra 100,000 yuan.

"My whole family was extremely happy. We never expected this much money," Cai said.

In 2013, Hainan asked Cai to represent the agarwood industry at an international exhibition in Beijing, where he demonstrated traditional processing techniques. "The things I brought were sold out in half a day," he said. On the first day of the exhibition, his handmade agarwood bracelets sold for 460,000 yuan.

Returning from Beijing, Cai decided his village should plant agarwood. The following year, he helped establish an agarwood planting cooperative. Villagers provided land, and the cooperative provided investment, technology and sales channels. Profits were shared. Dozens of households now participate in agarwood cultivation and processing. The cooperative produces incense, bracelets, essential oils, tea and other related products.

Despite the industry's rapid growth, Cai has stuck with the traditional method of creating the resin.

"It takes hard manual work — using saws, electric drills and controlled burning — to imitate the natural forces that wound the trees so they can produce the fragrant resin," he said.

He is skeptical of attempts to accelerate production through chemicals. "Those methods may be faster, but they compromise the quality. Good agarwood needs time."

Betting on a slower tree

In 2020, Hang Yong cut down 23,000 profitable areca palms. At the time, areca prices were at an all-time high, and the trees could generate nearly 10 million yuan annually.

"Nobody understood," Hang said. "Even today, many people still don't understand."

Hang had no background in agarwood. Originally from the northern Inner Mongolia autonomous region, he worked in telecommunications before starting his own company.

In 2016, he arrived in Hainan seeking warmer winters. Like many, he imagined retirement. But instead of buying property, he wanted to build something of his own.

In 2017, when the Hainan government encouraged the building of shared farms with policy support, he established his own farm in Qiongzhong Li and Miao autonomous county, in central Hainan. At first, the farm focused on other crops, including areca palm. Then, in 2019, he met local agricultural experts who showed him the potential of agarwood.

Hang traveled to Maoming in Guangdong, a major agarwood distribution center, to visit planting bases, processing companies and markets. He saw how the industry worked and met the people who later became his partners.

"I visited the plantations, the processors and the traders," Hang said. "Only then did I decide this was an industry worth waiting for."

His decision to clear the areca, he explained, was based on the belief agarwood could provide income plus an industry — with processing, tourism, and a long-term value that a single crop could never match.

His friends thought he had lost his mind.

Since then, Hang has planted 400,000 agarwood trees. His farm, which spans 187 hectares, is now a major agarwood plantation in Hainan.

Hang also wants visitors to understand what agarwood actually is, so his farm combines agarwood forests with tourism experiences, providing camping areas, outdoor activities and ecological projects.

"Many people have heard of agarwood, but they don't know it comes from a tree. There has to be an experience," he said.

He believes filling that gap in knowledge represents the future market. "Agarwood has only just begun," he said.

Hang has signed strategic cooperation agreements with other major agarwood companies in Hainan.

"Ten years ago, all agarwood products could fit in a 10-square-meter room. Today, you couldn't fit them in a large exhibition hall. The market is still in its infancy. It's big enough for everyone," he said.

TOP NEWS

China Coast Guard personnel conduct drills on Saturday in the waters near Huangyan Island. According to the China Coast Guard spokesperson, the drills focused on operations such as visit, board, search and seizure, interdiction of forced entry and forced towing. PROVIDED TO CHINA DAILY

China carries out extensive drills off Huangyan

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

China's latest diplomatic, military and law enforcement actions with regard to Huangyan Island reflect a more targeted and coordinated response to the Philippines' increasingly aggressive maritime, legal and diplomatic moves, experts said.

On Saturday, the People's Liberation Army Southern Theater Command conducted joint naval and air exercises in the territorial waters and airspace off Huangyan Island and its surrounding areas, while the China Coast Guard carried out rights-protection law enforcement and control drills in nearby waters.

According to separate statements issued by the command and the coast guard, the exercises covered reconnaissance and early warning, deterrence patrols, sea and air control, boarding inspections, interception and compulsory towing.

Ren Yuanzhe, a professor of diplomacy and foreign affairs management at China Foreign Affairs University, said China's response has become more targeted and coordinated, with maritime law enforcement being used alongside diplomatic and public communication efforts.

"The response demonstrates China's resolve to safeguard its sovereignty and maritime rights, while maintaining restraint and leaving room for practical cooperation, including maritime search and rescue," Ren said.

The actions followed a series of Philippine activities near Huangyan Island in late July.

Over two consecutive days, Philippine government and coast guard vessels entered Chinese waters, the China Coast Guard said.

During the larger operation, the Philippines assembled seven government vessels, three coast guard ships, one fishing vessel and a large number of fishing boats near the island. Three Philippine government vessels ignored repeated warnings and deliberately entered Huangyan Island's territorial waters, prompting the coast guard to take measures including verbal warnings, interception and control, and the use of water cannons, it said.

Zhang Qiyue, assistant director of the Shanghai Institutes for International Studies' Institute for Global Governance Studies, said the latest Philippine actions were larger, more organized and more multidimensional than previous sporadic incidents.

"They combined large-scale operations at sea with legal and diplomatic moves, showing that Manila is seeking to advance its claims through several channels at the same time," Zhang said.

The Philippines also deposited with the United Nations Secretariat a nautical chart setting out its claimed baselines, territorial sea and contiguous zone around Huangyan Island.

China firmly rejected the Philippines' delimitation of the so-called "baselines of the territorial sea" in a Foreign Ministry statement on Friday, calling the move illegal, null and void.

The ministry stressed that Huangyan Island has never been part of Philippine territory, which has been defined by a series of international treaties, and that Manila's territorial claim is completely baseless under international law.

It also reiterated that the so-called "award" of the unilaterally initiated "South China Sea arbitration" is illegal, null and void and has no binding force.

The developments came as 2026 marks the 10th anniversary of the announcement of the so-called arbitration award.

Zhang said the Foreign Ministry statement represented a continuation and further clarification of China's long-standing position on Huangyan Island.

It also helped the international community better understand the historical background of the issue, the legal basis of China's position and the nature of the Philippines' actions, she said.

New measures tighten island's conservation

Mechanism improves ecological governance, curbs activities harmful to marine habitats

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China's newly released management measures for the Huangyan Island National Nature Reserve are a significant step aimed at protecting the island's rich biodiversity, officials and experts said.

The 16-article management measures for the reserve, which is a newly established protected area in the South China Sea covering 3,523.67 hectares of coral reef ecosystems and rare marine habitats, were jointly issued on Saturday by the Ministry of Natural Resources, the National Forestry and Grassland Administration, the China Coast Guard and the People's Government of Hainan Province.

According to the measures, a coordination mechanism has been established to address major issues, strengthen collaboration and share information.

Huangyan Island, which is part of the Zhongsha Islands, features unique coral reef ecosystems and distinctive geological formations. It is home to numerous rare and endangered species, including hawksbill turtles, green sea turtles, giant clams, triton shells and tiger cowries, making it a marine biodiversity hot spot of significant ecological value.

Chen Danhong, director-general of the department of international cooperation at the Ministry of Natural Resources, noted that the measures were issued in response to urgent demands to protect the ecosystem as it faces heightened risks, including an abnormal rise in sea temperatures caused by climate change and extreme weather, human activities and potential outbreaks of harmful organisms.

"The measures provide an institutional basis for protection management and law enforcement. Their implementation will significantly improve the construction and management of the reserve, and they are of great significance for maintaining the health and stability of the South China Sea marine ecosystem," Chen said.

Under the measures, the Ministry of Natural Resources is responsible for boundary surveys, planning review, resource protection and utilization management, asset accounting and registration, as well as the protection of territorial sea baseline points. The National Forestry and Grassland Administration supervises the reserve and reviews adjustments, planning and construction. The South China Sea bureau of the Ministry of Natural Resources, the designated management institution, handles daily protection, resource monitoring and ecological restoration.

The Hainan provincial government cooperates with the China Coast Guard on administrative law enforcement, while the local government assists the management institution with disaster prevention, safety management and emergency response measures.

The reserve is divided into a core protection zone of 1,242.55 hectares and a general control zone of 2,281.12 hectares. The measures prohibit entry except for activities authorized by laws and regulations or organized by the management institution for protection and management purposes. Fishing, mining, excavating corals, coral reefs and giant clams, and other activities that damage rare marine species and natural ecosystems are prohibited without approval.

The coast guard will establish a routine patrol system in collaboration with the management institution, deploying patrol personnel and equipment to deter and report violations. Violations will be prosecuted under applicable laws including the Ecological and Environmental Code, the Sea Areas Administration Law, the Island Protection Law, the Wildlife Protection Law, the Coast Guard Law and the regulations on nature reserves.

Jin Yongming, a distinguished professor at Ocean University of China's School of International Affairs and Public Administration in Shandong province, said the multiagency management model of the Huangyan Island reserve is shaped by its marine environment and geopolitical sensitivity, noting that it involves foreign affairs, politics and security — issues no single department can handle alone.

"The release of these management rules represents a significant step forward in safeguarding China's lawful maritime rights and interests at Huangyan Island," Jin said.

Bans: US refuses to accept a multipolar world order

From page 1

On that day, the Department of Homeland Security added 43 more Chinese companies to the Uyghur Forced Labor Prevention Act Entity List in its largest-ever single expansion. Justifying the sweeping import bans under a "rebuttable presumption" of guilt, officials once again leaned heavily on broad rhetoric of national security and economic protectionism.

Two themes connect the bans announced in July.

First, there is a flawed belief inside the White House and among many who make up the political elite in Washington that the US is capable of going it alone in creating and sustaining the most sophisticated technologies. During both of his terms, the US president has spoken of a rebirth of US manufacturing; he has talked in tones of returning the US to those days long gone in which the country was the envy of the world because of what it produced and then sold domestically and internationally. There therefore needs to be a rationale as to why manufacturing is not returning and why the technological resurgence Washington has promised has not materialized, and it can't be because of decisions made in Washington.

Enter China. Claiming that China does not play by "the rules" allows for finger-pointing at a bogeyman. The sanctions offer fuel to the suggestion the US is responding forcefully and ethically.

More fundamentally, Washington increasingly appears to be redefining competition itself. Traditionally, economic leadership rested on producing better technologies, attracting more talent and creating more competitive industries. Increasingly, however, leadership is being pursued by restricting competitors' access to markets, capital, research partnerships and advanced technologies. Competition is no longer confined to outperforming rivals; it extends to shaping the conditions under which rivals are allowed to compete. That marks a significant shift in how economic power is exercised.

Second, the activities deliver a violent slap in the face to the US' long-standing professed belief in free trade.

In order to protect select domestic industries, Washington has repeatedly kicked to the curb one of its fundamental tenets: free trade is the best trade. Here again, one Washington insider after another will say that if only China played by "the rules" — yes, there is that phrase again — then these pesky bans might just go away.

Of course, those rules were written by the US. They are supported by other Western democracies. They are endorsed by the World Bank and other international agencies that are absolutely beholden to Washington. With all of that as the backdrop, maybe "rules" is not the correct word. Perhaps diktats is.

No, the US is not coming right out and saying it is running scared, but only the most naive of people cannot see the truth.

The US no longer holds sway on the international stage as it once did. It lacks the moral authority to lead by example. It alone does not produce the most cutting-edge items. It refuses to accept that a multipolar world defines the 21st century. Solid leadership would acknowledge those facts and adjust accordingly. But that is not Washington's way.

The world does not like that. Just a few days ago, a new poll released by the Pew Research Center found that people in 25 of the 36 surveyed countries held a more favorable view of China than of the US.

A nation confident in its people and in its ability to compete on the intricately connected world stage would roll up its sleeves and find real solutions. A scared nation blames and blames and blames.

Park: Views shift continuously depending on the weather and season

From page 1

The landscape was recognized as a UNESCO Global Geopark in 2020. Voted one of CNN's "24 Most Unusual Landscapes in the World" in 2025, the park is renowned for its otherworldly display of colors.

The Chinese name for the landscape, *danxia*, literally means "rosy clouds". It evokes the colors of the sky at dusk. First appearing in an ancient verse, the term was borrowed by Chinese geologists to describe these colorful landforms, conjuring up an image of the heavens spilling onto the earth.

A hashtag roughly translated as "Nature's Canvas" on social media has seen visitors from across China and beyond posting their own unedited proof of what they saw.

"The landscape is entirely natural," said Li Junling, deputy director of the scenic area's comprehensive management department.

Beneath the multicolored surface lies a geological epic: The thick layers of sandstone and mineral deposits from the time when dinosaurs still roamed the Earth were thrust upward by tectonic forces over millions of years and were then sculpted by wind and rain.

Some 35 distinct colors can be found in the park, each a page from the Earth's own diary — telling the story of a dry season, a flood, a shallow sea — a record of an ancient climate system.

The park, covering around 1,290 square kilometers, also straddles ancient Silk Road routes. Zhangye, known in ancient times as Ganzhou, was a crucial oasis in the Hexi Corridor, where merchants from Persia, Sogdiana and the Mediterranean once rested their camels and traded silk for spices. Centuries later, the Venetian merchant Marco Polo lingered here, describing a city adorned with temples and monasteries.

Today, travelers retrace his route on tour buses, yet the sense of wonder remains unchanged.

Mao Guodong, a Mexico-based traveler who returned to China for a two-month journey to explore its natural wonders, was awestruck.

"The landscape is breathtaking. It's truly one of nature's masterpieces," he said. Understanding how geological forces shaped the terrain turned a sightseeing stop into the highlight of his entire journey.

Chloe Choo, a visitor from Singapore, described the landscape as "absolutely breathtaking".

"I could hardly believe these colorful rocks were formed entirely by nature," she said. "The vibrant colors and straight layers look like the Earth painted itself."

Depending on the weather, season and angle of the sun, the views shift continuously, making the park a paradise for photographers. After rains, the colors deepen into jeweled tones; at sunrise and sunset, the hills blush as if lit from within.

For some families, the park serves as an outdoor classroom. At the No 4 viewing platform, Yang Ziwei from the Ningxia Hui autonomous region watched her daughter hold up a textbook — the cover image an exact match for the view before them. "Travel brings knowledge that can't be found in the classroom alone," Yang said.

WORLD IN FOCUS

Crumbling edifice

Cost of rebuilding more than damage for quake-hit Venezuela, experts say

Two people stand beside the rubble of a collapsed building in Caraballeda, Venezuela, on July 27, one month after an earthquake struck the area. FEDERICO PARRA / AFP

Two earthquakes that rocked Venezuela on June 24 caused $19.6 billion in direct physical damage, but the cost of rebuilding could be twice that much or more, the World Bank said in an early assessment released on July 23.

The 7.2 and 7.5 magnitude quakes killed about 5,000 people, according to the government, destroying residential buildings, infrastructure and nonresidential buildings in the northern areas of the country, including the capital Caracas.

The government estimates that nearly 17,000 people were injured and nearly 18,000 remain homeless. The disaster, the country's deadliest earthquake since 1812, came at a time when socioeconomic conditions were already precarious, with a poverty rate of over 76 percent.

"The earthquake caused an estimated $19.6 billion in direct physical damage, a staggering figure for any economy and one that demands a coordinated response," said Susana Cordeiro Guerra, the World Bank vice president who oversees Latin America and the Caribbean.

"Without timely additional investment, the negative impact on productive capacity and living standards will slow the path to recovery," she said.

The bank completed its global rapid damage estimation using remote-based earthquake modeling, local seismic data, satellite imagery and damage reports from government, humanitarian agencies and others on the ground. The estimate does not include the cost of "building back better" through structural improvements or upgrading the construction type. Those costs, including debris clearance, could be two to two-and-a-half times the replacement costs, which could drive the total bill to close to $50 billion.

PHOTOS BY LEONARDO FERNANDEZ VILORIA / REUTERS

'Far from over'

A month on, search efforts continue for bodies buried underneath rubble, but operations have evolved to focus on post-earthquake humanitarian aid and rebuilding. Recovering from the earthquakes in Venezuela will take years, according to the Red Cross.

"This disaster is far from over," said Scott Craig, spokesman for the International Federation of Red Cross and Red Crescent Societies.

Craig said that while in the immediate aftermath the focus had been on saving lives, now it was on caring for survivors.

"Survivors are living with anxiety, fear, sadness and sleeplessness as they grieve relatives, homes, jobs and livelihoods lost," he told reporters in Geneva.

Healthcare, mental health support and access to safe drinking water were the immediate priorities, he added, as many families were still relying on bottled water for drinking, cooking and washing.

"Recovery here will be measured in years, not weeks," said Craig. "Health centers, schools, water systems, power and sewerage were destroyed or badly damaged."

The pace of reconstruction would be a decisive factor in shaping the country's economic recovery and social outcomes. Without higher public and private investment, productive capacity and GDP would likely remain below pre-quake levels until at least 2036, the World Bank said.

Additional borrowing would add to Venezuela's already large debt stock, but could stoke stronger growth, which would gradually strengthen the country's fiscal position, it said.

China backs UN on AI governance

New agency seeks wider tech access, shared development for Global South

By **ZHAO HUANXIN**
at the United Nations
huanxinzhao@chinadailyusa.com

China will consult and cooperate with other countries through the broad platform of the United Nations on major issues concerning the future of global AI governance, guided by principles of openness, open-source cooperation, mutual benefit, joint contribution and shared benefits, China's Permanent Representative to the United Nations Fu Cong said on Friday.

Fu made the remarks during a briefing at the UN headquarters, organized by China's UN mission. The briefing took place two weeks after the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance was held in Shanghai.

Fu said the conference was more than a platform for dialogue, exchange, and cooperation; it brought stakeholders together to facilitate the global flow of innovation resources for AI development and inject fresh momentum into international cooperation.

"More importantly, it focused on the defining issue of our times: how to ensure that artificial intelligence develops in ways that benefit all humanity," he told representatives from more than 70 countries and international organizations at the briefing.

Fu noted that Chinese President Xi Jinping outlined China's vision for building a just and equitable global AI governance system, presenting four observations: boosting innovation-driven development, ensuring AI remains secure and under human control, promoting mutual learning between civilizations, and improving global governance.

One of the conference's major outcomes was the launch of the World Artificial Intelligence Cooperation Organization, or WAICO, the world's first intergovernmental international organization dedicated to AI. Representatives of 29 countries signed the founding convention.

"It represents China's concrete response to the aspirations of the Global South and an important step toward bringing countries together for AI development and global governance," Fu said, adding that the organization welcomes the participation of all countries.

The ambassador said WAICO is designed to complement and reinforce the UN's work on AI governance by focusing on capacity building, policy dialogue, technical cooperation, and AI applications.

"China stands ready to strengthen policy coordination, institutional cooperation, and practical collaboration with the United Nations, and to support the UN in playing an even greater role in global AI governance," he said.

"We see the UN as the main channel and the main platform for global governance on AI," he said during a question-and-answer session.

Asked about regulation, Fu said governments must balance innovation against risk. "If you have too much regulation, then you stifle innovation," he said, while warning that giving companies free rein could expose societies to AI's inherent dangers.

Speaking at the briefing, Amandeep Gill, the UN secretary-general's envoy on technology, described this year's World AI Conference as "qualitatively different".

'Step forward'

He also said the Shanghai gathering marked "a significant step forward" in making AI capacity-building an international priority.

Gill said the UN secretary-general focused on capacity, safety and sustainability, and stressed that different initiatives should complement one another, with the United Nations retaining a central role.

"I think the UN should remain the inclusive home for AI governance," Gill said at the Q&A session of the briefing.

The briefing also heard talks by other representatives from countries across Asia, Africa, Europe, Latin America and the Caribbean.

Moses Jere, a counselor and cyber/digital expert of Zambia's UN mission, said that computing remains the binding constraint for most African countries. The obstacle is neither ambition nor talent, but access to computing infrastructure, quality data, and comparable standards.

"The undertakings given in Shanghai on access to computing infrastructure and AI standards frameworks are therefore of real consequence," he said.

Asim Iftikhar Ahmad, Pakistan's permanent representative to the United Nations, said the establishment of WAICO is timely and significant, as it provides a platform for countries, particularly those of the Global South, to strengthen national capacities and promote shared development.

The ambassador said that developing countries need more than access to finished AI products. They also need the data, computing capacity, models, tools, and the technical support to develop and adapt AI themselves.

"In this regard, the outcomes of the conference and the high-level meeting provide a clear and action-oriented framework for future international progress," he said.

Other speakers welcomed the establishment of WAICO and called for the conference's initiatives to be translated into practical capacity-building support for developing countries, with the broader goal of making AI more inclusive, widely accessible and mutually beneficial.

Vol. 38 — No.1884

Migrants pass through a broken fence as they leave Spain's North African enclave of Ceuta toward the Moroccan town of Fnideq following an attempted crossing at the Bab Sebta border, on Saturday. ABDEL MAJID BZIOUAT / AFP

Migrant influx adds to Europe's woes

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Several European nations will push for a stronger border between the European Union and the world at a special meeting on Tuesday.

The talks were hastily arranged after more than 50,000 migrants swept over and around the border separating the North African Spanish enclave of Ceuta from Morocco on Thursday.

At least 72 people died during the mass influx, local officials said on Sunday. Most of the people who rushed into Spain's North African territory have returned to Morocco since the territory's largest mass migrant crossing.

"The latest figure that we have is 72," the government's delegate to Ceuta, Miguel Angel Perez Triano, told reporters, when asked about the number of fatalities.

Spain said on Friday it had escorted almost all of the migrants who entered Ceuta back over the border, but the sudden arrival of so many people demanding asylum and entry into the bloc led Italy to immediately suspend its participation in the EU's border-free travel area, known as the Schengen zone, a move Denmark and Finland supported.

The influx triggered a joint statement from 22 of the EU's 27 member states, calling on the bloc to strengthen its external borders and not allow weaknesses to "create the perception that illegal entry into the European Union is possible" because it would "encourage further attempts, undermine confidence in our common migration policy and have repercussions for all member states".

Spain responded to the criticism from fellow EU countries by saying most of the migrants who illegally entered Ceuta had headed back, and that nations that criticized its border enforcement in Ceuta had been "selfish, polarizing, and unlawful".

Spain's Prime Minister Pedro Sanchez wrote to President of the European Commission Ursula von der Leyen saying his country had quickly secured its border and prevented any "unauthorized onward movement toward continental Europe".

Fernando Grande-Marlaska, Spain's interior minister, said on Saturday the situation in Ceuta was almost back to normal.

"Almost all of (the migrants) have already left Ceuta," he said.

Tuesday's emergency talks are likely to be both a debriefing about what happened and a look at how to stop it happening again. And they will also likely include debate about the EU's Schengen Area.

The border-free travel zone that encompasses more than 450 million people and 29 countries in Europe means there is no need for checks at the borders between nations for people who are already within its external border.

Critics say it acts as a magnet for people who know they only need to crack one external border at its weakest point to have full access to the European continent.

Denmark's Prime Minister Mette Frederiksen said she wants the EU to look at all options, "including a suspension of Schengen cooperation".

Migrants who returned to Morocco on the weekend said hunger, exhaustion, and the lack of a warm welcome were their reasons for giving up on the idea of relocating to mainland Europe.

A waiter from Morocco told Reuters local people in the enclave had closed all the stores and made it clear they were not welcome: "They imposed a siege to force us to leave Ceuta by ourselves … They succeeded in their plan."

China, US business leaders seek deeper ties

By **MINLU ZHANG** in Washington
minluzhang@chinadailyusa.com

Chinese and US business leaders hold a meeting in Washington DC on Friday. SHA HANTING / CHINA NEWS SERVICE

Chinese and US business leaders met in Washington DC to explore opportunities for deeper cooperation as the two countries continued high-level engagement and economic and trade exchanges while managing differences.

The meeting, held on Friday, came a day after Chinese Vice-Premier He Lifeng, who is also China's lead person for China-US economic and trade affairs, held a video call with US Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer. The two sides had "candid, in-depth and constructive exchanges", while China expressed serious concerns over recent US trade and economic restrictions, according to Xinhua.

"There's this myth out there that American companies don't want to do business with China, that American companies are leaving China, or that they aren't investing in China or welcoming Chinese companies in the United States," Sean Stein, president of the US-China Business Council, or USCBC, said.

"All of those are myths. All of those are false," he said. "American companies are committed to being in China. They're committed to partnering with Chinese companies."

Stein made the remarks on the sidelines of a meeting between a Chinese business delegation and representatives of USCBC member companies. The event was organized by the China Council for the Promotion of International Trade, or CCPIT, and the USCBC.

The USCBC is a nonprofit association representing around 270 US companies doing business in China, with members including major US companies such as Apple, Nvidia, Boeing, Ford, Amazon, Coca-Cola, JPMorganChase and ExxonMobil. The CCPIT is the largest trade and investment promotion agency in China, representing China's business community.

Ren Hongbin, chairman of the CCPIT, said the Chinese delegation's visit was aimed at implementing the consensus reached by the two countries' leaders and creating more room for cooperation between the Chinese and US business communities.

'Improvement in relations'

"We have seen improvement in bilateral relations, especially after the meeting between the two heads of state," Ren said.

According to the USCBC member survey released in June, 92 percent of surveyed US companies in China were profitable last year and 95 percent said the Chinese market helps them "stay globally competitive".

"Those are huge numbers," Ren said, adding the survey results reflected "the commitment and strong interest of US companies in China".

Ren also said US companies are expected to make up the largest national group of business participants at the Asia-Pacific Economic Cooperation CEO Summit when China hosts the 2026 APEC Economic Leaders' Meeting later this year.

"APEC is an incredible magnet. It brings together some of the world's most advanced and dynamic economies," Stein told China Daily.

"It's an unparalleled opportunity not just to talk with one company or one country, but to engage with officials and businesses from across the region and build consensus on issues that matter to companies and economies alike," he said.

"This is really about plurilateral and multilateral diplomacy and creating an environment across multiple economies where companies can thrive and economies can grow."

The Washington DC meeting followed stops by the CCPIT-led Chinese business delegation in Utah and Illinois, where Ren said the group sought to strengthen ties and create more opportunities for cooperation between Chinese and US businesses.

Africa takes lead in BRI investment, report says

By **EDITH MUTETHYA** in Nairobi
edithmutethya@chinadaily.com.cn

Africa retained its position as the leading destination for the Belt and Road Initiative investment in the first half of this year, attracting $33.5 billion in Chinese investment, up 254 percent from the same period last year, as manufacturing and energy projects gathered pace amid shifting global trade dynamics.

A report, jointly published by the Green Finance & Development Center at Fudan University in Shanghai and the University of Queensland Business School in Australia, said Africa's strong performance was driven by increased investment in manufacturing, energy and infrastructure.

Ethiopia recorded the largest growth in BRI engagement globally, attracting more than $18.9 billion.

The East African country has secured the world's largest Chinese energy investment through green energy development agreements worth more than $14 billion between the Ethiopian Investment Commission and China's Ming Yang Smart Energy Group.

The project is expected to greatly facilitate Ethiopia's green transformation. In the first phase, the project will include a $7.5 billion 8.4-gigawatt renewable energy project comprising both wind power and solar energy.

In the second phase, the Chinese company will invest an additional $7.3 billion in green ammonia production, as well as the manufacturing of electric transmission and wind turbine equipment.

The investment is expected to accelerate industrial development, create jobs, facilitate technology transfer and boost foreign exchange earnings.

Egypt also recorded a sharp rise in Chinese investment announcements in the first half of the year, reaching $12.2 billion during the period, according to the report.

China's Xinfeng Steel is investing $10 billion in Egypt to develop an industrial and steel manufacturing complex in the Ain Sokhna industrial zone. The facility will focus on producing automotive steel and other large-scale industrial steel products.

Since its launch in 2013, the Belt and Road Initiative has significantly boosted infrastructure development, trade, and investment across Africa. Flagship projects continue to expand their positive impact on local development.

Highest level

Globally, BRI engagement reached its highest level for any first half since the initiative was launched, totaling $49.8 billion in investments and $76.5 billion in construction contracts.

Energy remained a major driver of Chinese overseas engagement. Total energy-related BRI investment reached $36.3 billion in the first half of this year, nearly double the level recorded during most first-half periods since 2013, surpassed only by 2025.

Investment in green energy reached a record high, with $14.3 billion committed to wind, solar and waste-to-energy projects, alongside $5.3 billion in hydropower. Overall, China's investment in green energy and hydropower more than doubled in the first half of the year, compared with the same period last year.

Since the launch of the BRI, cumulative Chinese engagement has exceeded $1.5 trillion, comprising $926 billion in construction contracts and $614 billion in investments.

Christoph Nedopil Wang, founding director of the Green Finance & Development Center, said he expects BRI engagement to remain strong through the rest of the year despite global economic uncertainty driven by US trade measures and volatility in fossil fuel markets linked to tensions around the Strait of Hormuz.

"With strong engagement in sectors requiring significant investment such as mining, manufacturing, and increasing ability to scale energy investment as well as data centers, I expect deal size to also remain large (in the future)," he said.

Editorials

Bessent's 'underwater kicking' allegation perfect metaphor for US' 'water polo' play

While it is a memorable metaphor, it is also an almost perfect inversion of reality. Speaking to Fox Business, US Treasury Secretary Scott Bessent compared Sino-US economic relations to a water polo match, claiming that "Under the water, the Chinese seem to have done a lot of kicking lately", and that "If we have to, we'll kick back".

But Washington has not ceased expanding restrictions on Chinese technology and industry. In May, it tightened artificial intelligence chip export controls by closing so-called "loopholes" for Chinese-headquartered companies operating overseas, extending US jurisdiction far beyond its borders.

In June, the Pentagon baselessly added 65 Chinese entities to its Section 1260H List of alleged "Chinese military companies". Then, in late July, the US Federal Communications Commission moved to block imports of Chinese-made advanced robotics and power inverters, despite acknowledging the restrictions would raise costs and slow aspects of the US' own AI development.

The pattern continued on Friday, when Washington placed over 40 Chinese entities on its so-called "Uyghur Forced Labor Prevention Act Entity List" — just one day after Chinese Vice-Premier He Lifeng held what both sides described as a candid and constructive video call with Bessent and US Trade Representative Jamieson Greer.

This is not evidence of Chinese "kicking", but a US campaign of "underwater kicking" that has become broader, more systematic and increasingly disconnected from its stated goal of stabilizing relations.

Bessent's metaphor therefore reveals more than what he perhaps intended. The US administration casts itself as the reluctant "rules-abiding" player, forced into a defensive posture by what it projects as Chinese "dirty tricks". Yet it is Washington that is resorting to such unsporting behavior, erecting new barriers across semiconductors, artificial intelligence, advanced manufacturing and trade.

The US has stretched "national security" to cover virtually all major sectors, disregarding the strong appeals of the US business community. By using administrative powers to disrupt commercial exchanges, Washington continues to push its de facto "decoupling" and "supply chain fragmentation" strategy. These coercive actions benefit no one — they are classic cases of market distortion and unilateral coercion.

Reuters recently photographed Bessent's own handwritten notes during a Cabinet meeting, revealing plans to purchase billions of dollars' worth of Japanese yen. The carefully visible notebook might be an exercise in signaling financial markets without making an official announcement — the very sort of below-the-surface maneuvering that Bessent hypocritically accused China of.

The US seeks to contain China's development while preserving stable ties. In practice, however, Washington treats periods of stability as tactical pauses — opportunities to secure what it still needs from China, notably rare earths, before pressing ahead with its broader strategy of constraining China's rise. That explains why before and after almost every dialogue between the two sides the US introduces another round of restrictions.

US Secretary of State Marco Rubio acknowledged this week that any economic or military conflict between the US and China would be catastrophic for both countries and the wider world. On that point, at least, there should be little disagreement.

Despite this, the US administration remains hellbent on pressing ahead with its ill-advised China policy — a strategy that has increasingly come to weigh on the US economy itself. It is no coincidence that Bessent's remarks coincided with second-quarter US GDP figures showing annualized growth slowing to 1.5 percent, down from 2.1 percent in the first quarter. Washington has long had a familiar instinct when domestic headwinds gather: redirect attention outward.

Bessent tried to dismiss the figures as "very noisy", blaming "technical factors". But a neutral observer might reach a rather different conclusion.

Bearing the bigger picture of Sino-US relations in mind, Beijing, for its part, has responded rationally to the US moves to protect China's legitimate rights and interests.

The US Treasury chief should remember one lesson from the sport he invokes. In water polo, the player kicking beneath the surface often does so because he is struggling to stay afloat. The US' technological lead remains in some sectors. But preserving that advantage requires confidence, not perpetual escalation. If Washington continues mistaking competition for a zero-sum game, it may find that the turbulence it complains about is largely of its own making.

Tokyo further dismantles postwar order

Japan's National Intelligence Bureau — the country's first centralized foreign intelligence body since the end of World War II — held its inaugural meeting on Friday, chaired by Prime Minister Sanae Takaichi.

This represents another troubling shift in Tokyo's security policies, as it is a significant step in Japan's systematic push toward remilitarization and a challenge to the postwar international order.

The 730-person bureau, set up under the National Intelligence Council Establishment Act that passed Japan's upper house in May, ends a postwar arrangement that left the country's intelligence divided across the Cabinet Office, the Foreign Ministry, the Ministry of Defense, the National Police Agency and the Ministry of Justice.

This design breaks with the long-standing tradition of decentralized intelligence checks and balances in postwar Japan. Even more concerning are the bureau's vague functional boundaries and the near absence of oversight. The concentration of power and the lack of supervision make it easy for the intelligence system to become a tool for right-wing politicians to manipulate politics and suppress dissent, rendering the checks and balances of the Diet and public opinion ineffective.

Viewed from a historical perspective, this system bears dangerously similar genetic traits to the espionage governance of Japanese militarism before and during World War II. The so-called "Special Higher Police", known as *Tokko* and established in 1911, once suppressed progressive forces domestically and acted as a vanguard of aggression abroad. The so-called "Cabinet Intelligence Bureau", established in 1940, provided an integrated intelligence hub for the invasion of China and the waging of the Pacific War.

Japan's wartime intelligence agencies were compulsorily dissolved following its defeat. However, the postwar settlement left the deeper structures of militaristic thinking largely intact. With Tokyo now establishing a modern intelligence framework under revised security legislation, the prospect of a militaristic intelligence ethos being revived — albeit in contemporary guise — is a risk that warrants serious attention.

Tokyo's deeper intention is to pave the way for military expansion. Since the Takaichi government took office, it has accelerated the push to lift the ban on "collective self-defense" and amend Article 9 of the pacifist Constitution.

Japan's military budget for the fiscal year 2026 exceeded 9.04 trillion yen ($57.36 billion) for the first time, a record high. The Japanese government has abandoned the principle of "exclusive defense", accelerated the development of long-range offensive weapons, relaxed arms exports and participated in joint military exercises with many other countries. Against this backdrop, the core task of the National Intelligence Bureau is precisely to build an all-encompassing intelligence hub for military expansion, forming a complete chain of "intelligence coordination — high-level decision making — military implementation".

Article 9 of Japan's Constitution renounces the country's right to remilitarization. But the Takaichi government is systematically abandoning its postwar commitments. From the "Special Higher Police" to the new intelligence system, the right-wing forces of Japan are revisiting the path of intelligence centralization.

For nations that suffered from Japanese aggression in WWII, the number "731", the code name of the Imperial Japanese Army's germ warfare unit, carries painful memories. For Japan to choose July 31 as the date to launch the new intelligence agency is nothing but an open insult and provocation.

Japan's push for intelligence system reform poses a serious threat to regional peace and stability. The international community must be highly vigilant against the moves being taken by Tokyo. In the face of the rise of neo-militarism in Japan, China should take targeted countermeasures with a firm commitment to safeguarding its national security. It is necessary for China to continuously enhance all-weather, multi-domain counterintelligence reconnaissance and deterrence capabilities.

Japan's intelligence-gathering and military activities should be closely monitored to ensure that China's core interests are not violated. A robust security firewall for technology, the economy and digital supply chains must also be established to tightly guard against Japanese intelligence infiltration and cognitive warfare threats.

Proposed law part of efforts needed to curb cyberbullying

At the end of July, China solicited public feedback on the draft of long-awaited legislation targeting online bullying. This legal framework is both necessary and timely, yet it represents just one step in a broader effort to combat the pervasive issue of cyberbullying.

Cyberbullying has become cross-platform and organized, impacting real-world lives. It disrupts online order, inflicts lasting psychological harm on victims and damages the online business environment. The harm caused by cyberbullying is as real and damaging as physical violence.

In recent years, incidents of online abuse have become alarmingly common, ranging from doxing — publicly revealing private information about someone with the intention of harassing or seeking revenge — to coordinated smear campaigns. Liu Xuezhou, a young man looking for his biological parents, took his own life after enduring relentless online speculation and harassment. Similarly, Zheng Linghua, a young woman known for her distinctive pink hair, ended her life following vicious attacks on her appearance. These heartbreaking tragedies are not isolated cases but rather indicative of a widespread social problem.

Dismissing online abuse as mere "internet quarrels" is a grave injustice to those who are the victims of it. Words can hurt deeply, and the anonymity and viral nature of social networking sites make it difficult to delete and escape torrents of abuse. Most victims feel powerless to fight back, often choosing silence and retreating into a shell in search of peace and safety.

The proposed legislation is a direct response to the pernicious nature of such deeds. If enacted, it would provide victims with the legal recourse they need to defend themselves, clearly define the responsibilities of governments, platforms, institutions and users, and ensure that offenders face real consequences for their actions.

This coordination across various fronts in the draft law is crucial because online bullying requires collective efforts. Platforms, in particular, must not prioritize engagement and online views over responsibility and user safety. They should take proactive measures to prevent and address abuse — through early warning systems, content moderation and accessible reporting channels — while cooperating with law enforcement agencies to identify and penalize offenders. Early intervention is essential to prevent harmful comments from spiraling out of control.

No victim should feel isolated or helpless in the face of online abuse. The cyberspace regulators need to conduct routine oversight, and the public security authorities must act swiftly on complaints — investigating, gathering evidence and providing timely support to victims. The rule of law must underpin online safety, ensuring a secure digital environment for all users.

It's encouraging to see the draft legislation requires educational authorities and schools to include anti-bullying content in their curricula, as individual internet users also have a crucial role to play in enhancing their legal awareness and digital literacy. Under the draft, if students are involved in online abuse, schools must intervene promptly and take preventive action to address the issue and support affected individuals. True progress will occur when every individual and institution embraces the values of respect for others, reverence for the law and accountability for their words and actions.

Ultimately, only by fostering a culture of respect and responsibility can we build a digital environment that protects everyone from harm and prevents us from harming others. This collective effort will help create a cleaner, more orderly cyberspace for all, where individuals can engage freely and safely without fear of abuse or harassment. The proposed law is part of that effort.

— CAO YIN, CHINA DAILY

What They Say

Plan aimed at developing more high-value patents

Editor's note: *The State Council, China's Cabinet, recently issued a plan to protect and utilize intellectual property. Officials of the China National Intellectual Property Administration attended a news conference at the State Council Information Office late last month to outline what China will do to improve IP production in the coming years. Below are excerpts of the remarks made by one of the officials, Liang Xinxin, who is director general of the administration's Strategic Planning Department.*

High-value invention patents cover four categories. The first are those in emerging industries of strategic importance, such as next-generation information technology and new energy sectors. The second are invention patents with an overseas patent family. The third are patents that have been maintained for more than 10 years. The fourth are invention patents that have won the National Science and Technology Awards or the China Patent Awards.

At present, patents in emerging industries of strategic importance account for over 70 percent of China's high-value invention patents. This share is expected to rise further during the 15th Five-Year Plan (2026-30) period.

A target was set to increase the number of high-value invention patents per 10,000 people to more than 22 during the 15th Five-Year Plan period, an increase of more than six compared with the end of the 14th Five-Year Plan (2021-25) period. This reflects the country's confidence in improving its innovation capacity.

The country has set out five priorities for protecting and utilizing intellectual property during the 15th Five-Year Plan period.

First, to further bolster the development of an innovation-driven economy, the country will continue refining patent laws, regulations and policies and ensure timely and effective protection for major scientific and technological innovations. It will also promote the commercialization of patents on a regular basis.

Second, the country will strengthen policy guidance to foster more renowned trademark brands with global influence and boost the development of the "brand economy".

In recent years, China has vigorously advanced the building of brands, cultivating a growing number of domestic brands that enjoy popularity both at home and abroad.

Third, China will continue to boost growth of different regions by promoting local special products. During the 14th Five-Year Plan period, the country's geographical indication products played an active role in creating jobs in rural areas and raising farmers' incomes. The country will further strengthen the protection of GIs to provide stronger support for comprehensive rural vitalization.

Fourth, China will work to better support the development of the digital economy. It will keep enhancing the protection of intellectual property in the integrated circuit sector by effectively implementing the newly revised Regulations on the Protection of Layout-Designs of Integrated Circuits. Meanwhile, it will advance efforts to formulate rules governing the protection of data-related intellectual property.

Fifth, the country will continue to uphold an open economy. It will strengthen the research on foreign intellectual property laws and policies, and improve its guidance for Chinese companies to handle overseas intellectual property disputes.

It will also align closely with high-standard international economic and trade rules, continue to provide equal protection for the intellectual property of both domestic and foreign-invested enterprises, deepen intellectual property cooperation with major trading partners, and strive to build a market-oriented, law-based and world-class business environment.

VIEWS

Pu Yixing

Spark curiosity to build the bridge

Every generation worries that the next is drifting away from classical culture.

The proposed remedies are consistently the same: teach more history, assign more classics, build more museums and preserve more heritage.

Yet, the anxiety never disappears.

Perhaps that is because we keep mistaking preservation for transmission. Culture survives not because it is protected, but because it is rediscovered. And for each generation, rediscovery begins not with obligation but with curiosity.

I learned this lesson in an unlikely place: a video game. As a child, I struggled through *Romance of the Three Kingdoms*, the Chinese historical epic that shaped generations of East Asian imagination. The novel is one of China's greatest literary achievements, but to a young reader it can feel forbidding.

Its language belongs to another era, the cast of characters is immense and the political intrigues demand patience that many children simply do not yet possess. I finished it because I thought I was supposed to.

Years later, I found myself playing a strategy game set in the Three Kingdoms period. For the first time, history became immersive rather than instructional. Instead of trying to remember alliances and famous battles, I was making decisions and fighting battles myself.

When the game ended, I did something no teacher had ever persuaded me to do: I began reading history voluntarily.

Soon I was searching historical records, comparing fact with fiction, reading *Records of the Three Kingdoms*, and eventually writing a song about Sun Shangxiang, a legendary figure of the era — sister of Sun Quan and wife of Liu Bei.

Only later did I discover that my story was not unique. Across Chinese social media, countless young people trace their fascination with the Three Kingdoms not to a classroom but to a game.

That should tell us something. For decades, educators have debated how to convince young people that classical culture matters. Many creators have quietly found an answer: they stopped trying to persuade and started making culture irresistible.

The medium is not the point. Curiosity is. This realization shaped my work when I began writing my first solo album, drawing inspiration from figures including Pu Songling, a Qing Dynasty (1644-1911) writer, the fourth-century calligrapher Wang Xizhi and the Venetian traveler Marco Polo.

MA XUEJING / CHINA DAILY

Marco Polo fascinated me for a particular reason.

In China today, many children recognize his name before they know anything about the man who crossed Eurasia in the 13th century. They know him instead as a hero in a mobile game.

A fictional character can be the door to a real historical figure.

When I decided to write a song about Marco Polo, I did not want to summarize his travels.

History textbooks already do that well enough. Instead, I immersed myself in the details of his journey — his years in what is now Beijing, his visits to Zhejiang, Jiangsu and Sichuan provinces in China, the vast distances he crossed, and the civilizations he encountered along the Silk Road.

Those discoveries reshaped my understanding of him.

So rather than retelling history, I embedded it inside a metaphor.

A worn pair of sheepskin boots carries the dust of Persian deserts. Silver coins bloom into lotus flowers. A scimitar leaves its trace on bamboo slips. These images do not explain history outright. Instead, they invite listeners to wonder about their origins.

Curiosity is more powerful than explanation because it nudges people to explore.

The lyric I value most says, "The greatest adventure is admitting you have never truly discovered."

It sounds paradoxical. Explorers are remembered for making discoveries.

But genuine discovery begins with abandoning certainty.

Marco Polo did not come to China merely to confirm what he already believed. He encountered a civilization larger, more sophisticated and more surprising than anything he had imagined. The real breakthrough was not geographical but intellectual. He recognized that his previous understanding had been incomplete.

That may be the most valuable lesson his journey offers.

Every society is vulnerable to inherited assumptions about places it has never seen. Every culture can get trapped in stories told by someone else. The only lasting antidote is curiosity — the willingness to look again, and to discover that reality is richer than imagination.

This is also why I hope more young people around the world will experience China for themselves. Not because they should travel out of obligation, and certainly not because a song tells them to.

The purpose of art is to inspire questions, not give instructions.

If a listener finishes my song about Marco Polo and decides to explore the Silk Road, to learn why a Venetian merchant traveled so far east, or simply to wonder what he actually found here seven centuries ago, then the song has already succeeded.

That is how classical culture survives. Not by demanding reverence, but by rewarding curiosity.

Creators often speak about preserving tradition, but preservation is only the beginning. Our responsibility is not to enshrine the past behind glass cases, but to make it resonate in the present — through film, games, music, animation, short videos or whatever form allows a new generation to encounter it as something living rather than distant.

The bridge matters more than the monument.

When I was a child, no bridge connected me to *Romance of the Three Kingdoms*. A game built one. Music allowed me to build another.

If my work inspires someone else to cross that bridge — to Pu Songling's strange spirits, to Wang Xizhi's calligraphy, to Marco Polo's long journey across Eurasia — then I have fulfilled what I believe every creator should aspire to.

Not simply preserve the past. But make someone eager to discover it.

Reimagining education in the era of AI

The intelligent society is a new stage of social development in which artificial intelligence is deeply embedded in daily life. From production lines to classrooms, AI reshapes how we learn, work and govern. This era is characterized by human-machine collaboration, cross-sector integration and co-creation.

In education, this transformation is bringing about systemic changes, reshaping knowledge generation, educational institutions and talent cultivation. The 2026 Stanford AI Index Report indicates that AI's influence on society has never been more pronounced. But while AI capabilities and adoption accelerate rapidly, education systems are still struggling to adapt.

The fundamental purpose of education is still human development. Education should enable learners to develop judgment, responsibility, creativity, cooperation and moral agency. AI undoubtedly creates significant opportunities for education.

It can support personalized learning, adaptive feedback, language access, remote tutoring and more responsive learner support.

However, these opportunities are accompanied by substantial risks. Without clear educational goals, ethical safeguards and institutional guidance, AI may intensify inequalities, encourage superficial learning and weaken learner agency.

Therefore, the key issue is not whether AI should be used in education, but under what educational principles, institutional arrangements and social responsibilities it should be used.

This concern resonates with UNESCO's call for a new social contract for education, which emphasizes education as a public endeavor and a common good grounded in human dignity, social justice, cultural diversity, care, reciprocity and solidarity, all geared toward sustainable development. AI isn't just another educational tool; it is reshaping the educational contract and the relationship among stakeholders in education. Education systems must therefore renew the foundational pact of learning and education to support human development, social responsibility and sustainable futures.

Three long-term tensions are particularly important in this process. First, the conflict between immediate gains and long-term human development. AI can improve efficiency, convenience and performance.

It can generate answers, summarize texts and produce polished outputs rapidly. But education cannot be evaluated only by short-term productivity or visible outcomes. It must also cultivate long-term capacities such as attention, judgment, character, resilience and responsibility. If education is organized primarily around efficiency, its formative function will be weakened.

Second, the tension between individual awareness and collective consciousness. In AI-rich environments, information, opinions and emotions are increasingly mediated and amplified by platforms and algorithms.

Learners may be exposed to collective judgments before they have developed the capacity for independent reflection. Education must therefore strengthen learners' ability to ask questions, evaluate evidence, resist conformity and form reasoned judgments.

Last, the tussle between instrumental rationality and habitual dependence. While AI tools can assist learners in solving problems more efficiently, excessive reliance on them may result in cognitive outsourcing, whereby learners mistake the acquisition of answers for the development of understanding. The educational challenge is not to keep learners away from AI, but to ensure that AI complements but doesn't substitute cognitive engagement, inquiry and reflection.

To address these tensions, education must cultivate Intrinsic, Authentic, Agentic and Active learners. IAAA learners are intrinsically motivated by curiosity, meaning and autonomy; authentically connected to real-world problems, personal identities and meaningful social contexts; agentic in exercising voice, choice, goal-setting and responsibility; and active in constructing knowledge through inquiry, experimentation, creation and reflection.

Such learners are not passive recipients of information or algorithmic recommendations. They are self-directed, using AI responsibly without becoming dependent on it, maintaining human judgment, and linking personal growth with public responsibility.

However, learner self-commitment requires more than individual will. It depends on the coordinated efforts of multiple stakeholders. The renewed education pact should be a multilayered agreement connecting society, government, schools, families, teachers and learners.

Society and culture provide the value foundation of the common good, equity, inclusion and shared responsibility. Government and policy provide institutional guarantees through public resources, regulation, accountability and governance.

Schools and families translate social expectations into learning environments, curriculum, pedagogy and developmental support. Teachers and students sustain the core human relationship of education through care, engagement, feedback and adaptation. At the center are IAAA learners, whose self-commitment and development give the entire pact its educational meaning.

China's recent strides in becoming a leader in education, advancing a learning society and promoting AI-enabled educational transformation provide a meaningful reference for this renewal. The Smart Education of China platform reflects the idea of digital education as public infrastructure, expanding access to quality learning resources and supporting lifelong learning.

The AI Plus Education Action Plan integrates AI with curriculum reform, teacher development, rural education support, talent cultivation and education governance. Its significance lies not just in AI application, but in building a coordinated educational ecosystem that supports high-quality education, lifelong learning and modernization.

The future of education in the intelligent society will not be determined solely by technological innovation.

It will depend on whether societies can embed AI within a broader educational pact that protects human dignity, strengthens learner agency, supports the development of IAAA learners, and advances inclusive, equitable and lifelong learning. Only when AI serves human development and sustainable futures can it truly serve education.

Sustainable procurement driving green growth and decarbonization

China's 15th Five-Year Plan period (2026-30) places new emphasis on green manufacturing and low-carbon industrial upgrading. This supports the national goal of peaking carbon emissions before 2030 and realizing carbon neutrality by 2060.

However, much of the debate around this transition focuses on factories, technology and finance. Less attention goes to procurement — the daily decisions buyers make about which suppliers to select and which contracts to sign.

Sustainable procurement means building environmental criteria into sourcing decisions from the start, not after price and quality are settled. This idea is moving from principle into practice worldwide.

Procurement carries more weight than its quiet reputation suggests. In many manufacturing sectors, the majority of a product's total carbon footprint sits upstream, in the materials and components a company buys rather than in what it makes. This means a buyer's sourcing decisions often shape a company's climate performance more than what its factory floor does.

Consider a common scenario. A senior buyer compares two suppliers of the same component. One offers a lower price. The other charges more but can document its energy use, water use and recycling.

When sustainability criteria exist from the beginning, buyers can make this choice with confidence. When those criteria are added later, they tend to disappear once cost pressure rises.

The calculation also looks different over time. A supplier with cleaner processes may cost more today but often proves more stable tomorrow, since it faces fewer regulatory penalties, less exposure to carbon pricing and steadier access to export markets with strict environmental rules. Buyers who weigh total cost over several years, rather than the price on a single invoice, tend to reach a different conclusion than those who do not.

This is where much of the real work of decarbonization happens. A buyer managing sourcing across China and wider Asian supply networks increasingly negotiates supplier commitments on emissions reporting as a routine part of contracting, alongside price and delivery timelines.

Global Lens

Training and shared investment in cleaner equipment matter more than strict rules on their own.

Phased supplier development programs help smaller manufacturers meet basic environmental benchmarks step by step. Training and shared investment in cleaner equipment matter more than strict rules on their own. Some call this buyer-led greening.

This kind of collaboration is expanding beyond manufacturing processes into product design itself. European buyers increasingly work with suppliers on packaging, durability and repairability, not simply requiring compliance but helping suppliers get there. As companies prepare for the EU's Packaging and Packaging Waste Regulation, this has become a routine part of supplier development rather than a one-time audit.

One of us witnessed this directly in a recent sourcing decision. Two suppliers offered similar products. The lower-cost one used conventional plastic packaging and could provide only limited documentation on material compliance. The other was willing to redesign its packaging with recycled materials, cut unnecessary plastic and provide full documentation, including PFAS-free and RoHS declarations. The second supplier was chosen. It reduced compliance risk, aligned with upcoming EU packaging rules and met customers' sustainability expectations.

A related factor is whether a supplier can provide replacement parts across a product's life cycle. Suppliers that support repair over full replacement help extend product life and reduce waste, a core principle of the circular economy the EU is promoting. This is also an opening for Chinese suppliers to strengthen their competitiveness by supporting longer product life cycles.

Digital tools are making this easier. Supplier traceability platforms and simple emissions-tracking software now let even mid-sized buyers verify claims that once required lengthy audits. As these tools become cheaper and more common, verifying a supplier's environmental performance is turning from a specialist task into a standard part of sourcing work.

International practice offers useful reference points. In the European Union, large retailers require tiered supplier disclosure, starting with basic energy reporting and expanding to full carbon accounting over several years. In Germany, automakers pair procurement standards with joint supplier training, so upstream vendors do not bear the full cost alone.

These examples show that the pace of change depends less on the strictness of a rule and more on the support that comes with it.

China's State-owned enterprises have already moved in this direction. A growing number of centrally administered firms build green criteria into procurement design, from supplier scoring systems to long-term sourcing contracts.

Extending this approach into private manufacturing supply chains, especially among small and medium-sized exporters, could speed progress further.

Smaller exporters often want to meet these standards but lack the resources. A shared, cross-provincial registry of green suppliers would build on the momentum already underway. It would allow a supplier that has been verified once to serve as a trusted partner for many buyers, rather than repeating the same disclosure work for each new customer.

This would also make China's own progress easier to see and measure. Consistent supplier data, gathered through routine procurement rather than special reporting exercises, gives policymakers a clearer picture of how the low-carbon transition is unfolding on the ground.

Supply chains do not decarbonize on their own. They decarbonize one sourcing decision at a time, repeated across thousands of buyers and suppliers every day.

As China advances its low-carbon transition, procurement deserves a bigger place in that story. It is not a technical afterthought.

It is the mechanism through which national targets turn into results on the ground, one contract at a time.

When village paths meet the world

China's booming rural inbound tourism builds new cross-border cultural connections

The "China Travel" map is experiencing a quiet shift. Overseas visitors who once contented themselves with city walks in Beijing and Shanghai are now boarding early-morning buses bound for rural areas, walking into tea terraces, ancient pear orchards and Miao embroidery workshops in Yunnan and Guizhou provinces, and other parts of China.

The rural turn in China's inbound tourism is not a fad. Behind it are practical enablers: relaxed visa waivers, smoother payment and language services, and a rural transport grid that now reaches once-isolated valleys. But the deeper pull is cultural. Foreign travelers are tired of algorithm-fed sameness; they want variety, warmth and the texture of other people's ordinary lives. Chinese villages — with their 100-year trees, harvest rituals and courtyard hospitality — offer exactly that.

Tourism, in this sense, is no longer a transactional industry. It is a medium through which the world re-encounters China outside the metropolis, and through which villagers meet the world without leaving home.

The keyword is resonance. Rural tourism works only when multiple actors see one another: Farmers want income yet wish to keep their rhythm of life; visitors seek novelty yet treasure sincere encounter; operators expect returns; and government must balance development, conservation and the public good. The task is not to erase these differences but to convert them into shared values. The most moving village scenes are about how a craft survives, why an old tree is never cut down, and how a festival turns a Tuesday into a ceremony. They are entries into Chinese society, written not on the page but in soil, thread and blossom.

The ancient pear orchard system, home to more than 9,400 pear trees over a century old in Shichuan town, Gansu province, was inscribed in 2025 as a Globally Important Agricultural Heritage Systems site by the United Nations Food and Agriculture Organization. The village did not fence the trees into a museum. It banned new construction in the core zone, gave every old tree a digital file, paired traditional pruning maintenance with modern sensors, and stretched a seasonal economy into a year-long cycle of blossoms, homestays, pear vinegar and farming workshops. During the 2026 pear-blossom season, Shichuan town drew over 1 million visitors; more than 85 percent of local households now earn from tourism-related work.

Conservation of the agricultural heritage is funded by the very revenue it helps generate. Heritage, in other words, is not the opposite of development. Handled well, it is the engine.

However, rural tourism depends on a delicate social compact. A village is a place to visit, but above all, a place to live: those who do not run guesthouses still breathe the noise, traffic and price vibrations. Outside capital brings markets but can leak profits; visitor cameras amplify praise and grievance alike. Whether tourism ends in co-creation or joint destruction depends on one central thing — fairness. Not simply equal splits of the ticket money, but proportionate voice and return. Villagers, as permanent stakeholders, must share both the benefit and the decision. Young returnees must find reasons to stay, as true wealth lies not in annual dividends but in accumulated skills, collaborative abilities and market insights — assets no external investor can take away.

Digital technology connects villages to broader markets and carries travel experiences farther. Short videos can take China's tea terraces to a screen in Lisbon; a visitor who keeps posting such videos, unknowingly becomes a narrator of China's story.

Scale, too, needs redesign. A single village has finite resources and reception capacity. For rural tourism to go further, villages must form a division of labor among themselves. For instance, Xidi, Xixinan and Nanxinan villages, in Anhui's Huangshan area, coordinate rather than compete on tourist resources. Xidi leans on cultural heritage, Xixinan on eco-art and Nanxinan on tofu cuisine and suburban leisure. They greet guests together at the high-speed train station. Xidi's "village partnership" model was showcased at the UN Tourism "Best Tourism Villages" 2025 annual conference and cited as a good-practice example. Neighboring places moved from poaching tourists to piping them to one another, from solo branding to shared brand.

The numbers give the trend its spine. China now has 19 villages on the UN Tourism "Best Tourism Villages" list — the most for any country — after the 2025 round added Digang in Zhejiang province, Huanggang in Guizhou province, Jikayi in Sichuan province and Dongluo in Jiangsu province.

Rural tourism, seen this way, is not a soft sidebar to China's development story. It is a hard case of how governance philosophy becomes lived income: protect the old tree, include the quiet villagers, let the visitor become a witness, let the neighboring village be an ally. The West often narrates rural revival as preservation versus progress. China's villages are suggesting a different equation — heritage as attraction, hospitality as diplomacy, and a single blossom season as a meeting point between the local and the global.

WANG XIAOYING / CHINA DAILY

XU HONG AND HUANG CHENGKUN

From 'building villages' to 'developing villagers'

The country should combine investment in physical assets with investment in people to promote high-quality development of rural tourism

Xu Hong

Huang Chengkun

At the first meeting of the Central Commission for Financial and Economic Affairs under the 20th Communist Party of China Central Committee in May 2023, Xi Jinping, general secretary of the CPC Central Committee, stressed that "investment in physical assets should be closely integrated with investment in people".

The fourth plenary session of the 20th CPC Central Committee last October and the Central Economic Work Conference held at the end of 2025 made corresponding arrangements, while the outline of the 15th Five-Year Plan (2026-30) for national economic and social development further specified relevant tasks. The concept of "investing in people" represents a concrete application of the people-centered development philosophy in China's economic and social development in the new era.

As an essential component of Chinese modernization, rural vitalization is ultimately about the vitalization of people. In recent years, rural tourism has played an increasingly important role in promoting rural industrial integration, expanding channels for villagers' income growth, and unlocking the value of rural resources. However, it should also be recognized that rural tourism development should not be limited to "building attractions, upgrading spaces and attracting visitors". In some areas, villagers still have a limited role to play in decision-making, lack sufficient capacity to participate in tourism development and are weakly connected to the distribution of tourism benefits. Consequently, tourism development has not yet been fully aligned with the broader goal of improving the overall well-being and capabilities of rural residents. Achieving high-quality development of rural tourism requires closely combining investment in physical assets with investment in people.

First, rural tourism should shift from "building villages" to "developing villagers" by strengthening residents' capacity to participate in development. For a long time, some rural tourism initiatives have placed greater emphasis on external investment, infrastructure construction and landscape transformation, treating rural tourism simply as the process of "creating a tourism destination". Although roads have been improved, villages have become more attractive and tourist numbers have increased, local residents' capacity to participate in tourism industries, manage businesses and create value has not necessarily improved at the same pace. They are often involved only as land providers, low-skilled workers or service providers, becoming supporting actors rather than core participants in tourism development.

Sustainable rural tourism should enable local residents to become participants, operators and beneficiaries of tourism development. This requires not only continued investment in transportation, environmental improvement and public facilities, but also greater efforts to enhance villagers' entrepreneurial skills, service capabilities, market awareness and digital literacy. By helping residents develop modern tourism management skills in areas such as product design, brand marketing, customer service and e-commerce operations, rural residents can transform from passive recipients of tourism development into active creators of value.

Second, rural tourism should expand from "increasing economic income" to "improving quality of life", ensuring that local residents share the benefits of development. In the past, some regions focused primarily on attracting tourism projects and increasing consumption by visitors, while paying insufficient attention to the relationship between tourism development and villagers' everyday lives. As a result, some residents living in the tourism destinations have not been able to fully benefit from the growth of tourism.

High-quality rural tourism should integrate industrial development with community development by linking tourism initiatives with improvements in public services, living environments and cultural life. Tourism development can help upgrade rural infrastructure, improve living conditions and strengthen community cohesion through cultural activities. It can also create new opportunities to attract young people back to rural areas for entrepreneurship, transforming villages from simple tourism consumption spaces into places suitable for both living and working. At the same time, more effective benefit-sharing mechanisms should be established. Through the participation of village collective economic organizations, cooperative business models, and mechanisms such as equity participation based on local resources, tourism revenues can be distributed more equitably among residents. This can prevent tourism development from becoming a process that benefits only a small number of investors or operators.

Third, rural tourism should shift from "prioritizing investment in physical assets" to "empowering people", achieving coordinated progress between material development and human development. Physical construction alone provides only the "hardware" foundation for rural tourism. The capabilities, creativity and active participation of people ultimately determine the quality and sustainability of development. Therefore, rural tourism development requires an organic integration between investment in physical assets and investment in people. Infrastructure projects, digital platforms and tourism industries should be designed and implemented in ways that can better serve residents' development needs, allowing material investment to become a foundation for enhancing human capabilities and improving livelihoods. Meanwhile, by strengthening residents' abilities and encouraging their active participation, rural communities can further unlock the value of physical resources, enabling rural spaces, cultural heritage and tourism facilities to generate lasting vitality.

Over the 15th Five-Year Plan period, high-quality development of rural tourism requires a transition from simply investing in physical assets toward combining investment in physical assets with investment in people. Investment in physical assets provides the foundation for development, while investment in people stimulates endogenous vitality. Integrating industrial growth with human development is the essential path for rural tourism to become a sustainable force that advances rural revitalization and improves people's well-being.

Innovation boosts China's trade tempo

Industrial upgrades, robust supply chains create more choices for global consumers

By ZHONG NAN
zhongnan@chinadaily.com.cn

On the factory floor of Warsonco Intelligent Technology (Guangdong) Co in Dongguan, South China's Guangdong province, palletizing robots lifted cartons from conveyor belts and stacked them neatly onto pallets in late July, while engineers carried out routine performance checks before shipment.

Replacing labor-intensive manual handling, the palletizing robots can stack between eight and 12 cartons per minute. They can be programmed with up to 800 palletizing patterns and simultaneously handle two different product types, making them well suited for industries such as food processing, pharmaceuticals, consumer goods and printing.

The scene reflects a broader shift taking place across China's manufacturing sector, where artificial intelligence and automation are making industrial robots easier to deploy, operate and scale.

Xiao Fageng, the company's sales director, said as manufacturers worldwide face rising labor costs and growing demand for flexible production, Chinese robotics companies are increasingly developing AI-powered systems that lower technical barriers while expanding their presence in overseas markets.

Demand for the company's robots has been growing both in China and overseas. Its products are now sold in more than 50 countries and regions, and Warsonco expects total shipments to reach between 8,000 and 10,000 units this year, up about 60 percent from a year earlier, according to information released by Huangpu Customs in Guangdong.

Customs data showed China's industrial robot exports exceeded imports for the first time in 2025, making the country a net exporter of industrial robots. In the first half, China's industrial robot exports reached 6.29 billion yuan, up 18.6 percent year-on-year, with products shipped to 141 countries and regions.

Industrial robots are not the only high-end Chinese-made equipment riding the AI boom, as power infrastructure hardware has also seen surging global orders.

At a workshop of Jiangsu Yawei Transformer Co in Nantong, East China's Jiangsu province, workers were racing to complete large-capacity power transformers and dry-type distribution transformers destined for countries in the Middle East and Southeast Asia.

As power consumption per server rack at data centers has climbed from around 10 kilowatts to several hundred kWs — and in some cases even megawatt levels — reliable, high-capacity electricity supply has become critical. Once regarded as conventional grid equipment, transformers are becoming a cornerstone of AI infrastructure, said Li Luosheng, the company's manager for customs affairs.

"In the past, most of our exports were conventional transformer models," said Li. "Now, a growing proportion of our orders comes from AI data centers and overseas power grid upgrade projects, where customers place much higher demands on energy efficiency, reliability and delivery speed."

Jiangsu's exports of electrical equipment, including transformers, electrical control devices and wires and cables, reached 140.56 billion yuan in the first half of 2026, up 23.5 percent year-on-year, statistics from Nanjing Customs showed.

China's export mix has undergone a profound transformation over the past four decades. In the early years of reform and opening-up, labor-intensive products such as garments, furniture and household appliances helped Chinese manufacturers gain a foothold in global markets by leveraging competitive production costs.

With the country's industrial capabilities advancing, exports increasingly moved up the value chain, with higher-value and technology-intensive products taking a larger share.

Chen Bin, deputy director of the expert committee of the Beijing-based China Machinery Industry Federation, said the transformation has accelerated in recent years.

After electric vehicles, lithium batteries and photovoltaic products emerged as China's "new trio" of export growth drivers, a new wave of products — including industrial robots, commercial drones, 3D printers, artificial intelligence applications and innovative pharmaceuticals — is rapidly gaining global traction, said Chen.

Backed by a comprehensive industrial ecosystem, a deep engineering talent pool and sustained innovation, China's foreign trade is increasingly being driven by technological advancement rather than traditional cost advantages, he added.

The shift is already evident in China's latest trade figures. Alongside notable export growth in tech-intensive green products such as energy storage systems and electric-powered trucks, China's trade in hardware supporting computing power, including electronic components and computer parts, surged 56.6 percent year-on-year to 5.13 trillion yuan between January and June, data from the General Administration of Customs showed.

An aerial photo shows a bustling foreign trade container terminal with constant truck and vessel movements at Shanghai Port on July 14. LONG WEI / FOR CHINA DAILY

Customs officers from Ningbo Customs learn about the features and export demand for a new ice cream maker at a home appliance firm in Ningbo, Zhejiang province, on July 21. PROVIDED TO CHINA DAILY

Workers load trucks for export onto ships at Yantai Port in Shandong province on July 15. TANG KE / FOR CHINA DAILY

Wang Jun, the administration's vice-minister, said the country's AI-powered smart glasses, translation devices and robotic exoskeletons are among a growing range of intelligent products undergoing rapid innovation.

The rising contribution of these innovation-driven products has helped underpin China's broader trade growth. The country's foreign trade expanded 16.9 percent year-on-year to 25.47 trillion yuan in the first half, with imports growing faster than exports. Exports rose 13.4 percent, while imports climbed 22.1 percent, exceeding export growth by 8.7 percentage points, according to customs data.

Pushing back against the so-called "China Shock 2.0" narrative, which portrays China's development as a disruption to the global economy, Li Jiaying, an assistant researcher at Renmin University of China's Chongyang Institute for Financial Studies in Beijing, said China's export growth is increasingly driven by innovation rather than low-cost manufacturing.

The country's industrial upgrading has expanded global supply, improved production efficiency and created more choices for consumers and businesses worldwide.

"Rather than displacing other economies, China's technological progress strengthens global industrial and supply chains by delivering competitive products, accelerating innovation and supporting the worldwide green and digital transitions," she said.

Echoing that view, Ding Rijia, a professor of industrial economy at China University of Mining and Technology-Beijing, said that following Europe's energy shortage, demand for imported green equipment has risen sharply, while many developing economies are only beginning their energy transition, leaving substantial long-term demand unmet.

"China's export growth of technology-intensive and green products reflects its ability to respond to genuine global demand, with additional supply emerging because demand already exists," said Ding, adding the narrative that China's exports are driven by "overcapacity" and are undermining Western manufacturing is not supported by market realities.

That assessment is also reflected in the investment strategies of multinational companies operating in China. Stefan Floeck, ABB's division president of IEC Low Voltage Motors, said China will remain central to the Swedish-Swiss technology company's global motor business as the country's industrial upgrading and green transition continue to drive demand for more energy-efficient equipment.

"To capture these opportunities, we will continue investing in local research and development, manufacturing and supply chains to better serve Chinese customers while reinforcing China as an innovation hub and export base within the company's global network," said Floeck.

ABB's low-voltage motor business has invested more than 150 million yuan in recent years to upgrade its Shanghai manufacturing base, including research and development testing laboratories and production lines. Its domestic supply chain also supports exports from China to overseas markets.

Despite headwinds such as rising trade protectionism and persistent geopolitical uncertainties, China's exports are likely to remain resilient in the second half, said Wen Bin, chief economist at China Minsheng Bank. He attributed the outlook to the global AI investment cycle, the United States' relatively moderate tariff policy and measures to strengthen manufacturers' competitiveness.

Similar views were expressed by Lynn Song, chief economist for China at Dutch bank ING. "Exports have been one of China's primary growth engines in recent years, and this year's acceleration continues to beat expectations," he said.

"China's exports over the first half of the year already nearly match the levels seen through the first seven months of 2025, and the base case is for solid export growth to continue. Strong external demand remains one of the key pillars supporting China's industrial activity," said Song.

"It remains a key engine of growth for China and is likely to continue playing that role for the rest of the year," he said, while cautioning that potential new tariffs from the European Union and proposed US secondary sanctions related to Russian energy exports could pose risks to the country's export outlook.

Nation's shipbuilding edge runs deeper than shipyards

REPORTER'S LOG

By Zhong Nan

After covering China's shipbuilding industry for nearly a decade, I have recently noticed a new trend that is not immediately visible in global order books or production rankings.

Experts at the Beijing-based China Association of the National Shipbuilding Industry told me the industry's ecosystem is expanding beyond shipyards and traditional suppliers to include robotics, industrial software, artificial intelligence, advanced materials and clean-energy companies.

Modern shipbuilding has evolved far beyond assembling steel plates into a hull. Today it integrates millions of components and hundreds of mechanical, electrical and digital systems.

Nothing illustrates this transformation better than *Adora Magic City*, China's first domestically built large cruise ship constructed by China State Shipbuilding Corp in Shanghai.

Calling it simply a ship almost feels inadequate. It is, in many ways, a floating city. The vessel, which celebrated its maiden voyage on Jan 1, 2024, contains roughly 25 million individual parts, 107 integrated systems, 55,000 pieces of equipment and 4,750 kilometers of electrical cables, according to its builder.

What impressed me most was not simply its scale, but the way the project had to be organized. The vessel was constructed in sections before its major blocks were joined together. Electrical cabinets, piping units, cabins and interior spaces were prefabricated in workshops and later installed like pieces of a giant puzzle.

Walking through a shipyard in Dalian, Liaoning province, it became clear why robotics and digital technologies are finding a place alongside traditional manufacturing. Welding robots can work in narrow or hazardous spaces and help shipyards improve precision and productivity. Machine-vision systems can detect welding defects, while digital platforms can coordinate design, procurement, production and delivery.

Technology alone, however, is not enough. Behind every intelligent shipyard are experienced engineers, skilled workers and decades of industrial know-how. Shipbuilding remains a business where expertise is built over generations rather than acquired overnight.

During previous industry downturns, many countries lost experienced workers as shipyards cut capacity or closed. Once those skills and production knowledge disappeared, they proved difficult to rebuild without losing valuable time or knowledge.

Chinese shipyards took a different approach. Even during difficult years, major builders continued training engineers and skilled workers, investing in research and improving construction techniques.

Universities in Shanghai, Harbin, Heilongjiang province, and Wuhan, Hubei province, also maintained shipbuilding and marine engineering programs when many regarded them as offering limited career prospects. Some expanded into new maritime specialties.

When global demand recovered, Chinese shipyards already had the people needed to handle sophisticated projects. This long-term investment also explains why China's shipbuilding success cannot simply be attributed to subsidies.

Financial support, including subsidies, may help companies weather downturns or purchase equipment, but it cannot train welders, develop naval architects or rebuild supplier relationships overnight. If money is not an issue, many governments could rebuild their shipbuilding industries simply by having their finance ministries write ever larger checks. In reality, rebuilding an industrial system takes years, often decades.

The answer lies in the industrial ecosystem behind China's shipbuilding success. Building a large vessel requires hundreds of suppliers, ranging from steelmakers and engine manufacturers to cable producers, software developers, equipment makers and interior specialists. The absence of any critical supplier can delay an entire project.

Some countries still have shipyards and dry docks, but many no longer have the dense supplier networks that once surrounded them. A shipyard may be able to build a hull, but delivering a vessel requires the coordinated support of suppliers across the entire industrial chain.

As robotics, AI, batteries, alternative fuels, advanced materials and industrial software become more deeply integrated into shipbuilding, China's shipbuilding sector is evolving into a testing ground for advanced manufacturing. Increasingly, each new vessel serves as a platform where advanced manufacturing technologies are developed, tested and applied at scale.

Chinese AI strengthening economic resilience

EAGLE EYE
By Fu Minjie

ILLUSTRATION GENERATED BY AI

The technological and pricing shock brought by Kimi k3 to the large-language model ecosystem continues to reverberate through capital markets, with some US media outlets even describing it as a "DeepSeek Moment 2.0". It is widely believed within the industry that the six-to-12-month innovation gap between China and the United States in large models has been largely closed. Although product iteration may lead to periodic fluctuations in specific technical indicators, China's artificial intelligence innovation has remained among the global leading group, with its overall capabilities comparable to those of any leading AI power.

However, China's AI progress should not be assessed only by isolated benchmark scores. Its distinctive path lies in broader technological coverage, richer application scenarios and stronger empowerment of the macroeconomy. By extending AI across industries and into the real economy, China is reinforcing economic resilience and improving development quality across multiple dimensions.

The recent 2026 World Artificial Intelligence Conference, held in Shanghai, offers a vivid demonstration of China's broad-based AI innovation. With three major venues — Expo, Zhangjiang and West Bund — the exhibition covered more than 100,000 square meters and brought together over 1,100 domestic and foreign enterprises. More than 3,000 cutting-edge achievements were on display, with over 300 hard-tech products making their global debuts or industry premieres. These exhibits covered the full industrial chain, from chips and foundation models to intelligent robots and terminal devices, presenting a comprehensive picture of AI and the emerging intelligent society.

US economists originally defined AI as a technological revolution mainly in the services sector and as an extension of the internet services revolution, which led to relatively concentrated innovation tracks, limited technological penetration and expectations that the main impact would fall on mid and low-skilled white-collar workers. Yet China's AI practice has already moved beyond this early assessment, building a complete innovation chain that covers computing power, infrastructure, general-purpose large models and intelligent applications.

More importantly, China is accelerating AI's movement from the digital world to the physical world. The speed of this transition and the richness of application scenarios both rank among the highest globally. Coordinated innovation across industries and scenarios is reshaping global understanding of AI's application scope, innovation breadth and social significance. Meanwhile, diverse application scenarios can improve enterprises' digital foundations and technological adaptability, lower cross-sector innovation expenses, strengthen synergies among different fields, and continuously raise industrial technological capacity and total factor productivity.

China's technological innovation has always been anchored in the real economy, with the high-end transformation of manufacturing as its core direction. The recommendations for the 15th Five-Year Plan (2026-30) period make clear that China should build a modern industrial system supported by advanced manufacturing and accelerate high-level technological self-reliance. This requires sustained efforts to strengthen foundational manufacturing technologies, address weaknesses in basic industrial capabilities, upgrade traditional manufacturing, expand emerging manufacturing sectors and make forward-looking arrangements for future manufacturing. Taken together, these efforts are expected to systematically enhance manufacturing capacity and strengthen the ability to respond to risks.

Unlike the US path, which places greater emphasis on AI applications in service-sector innovation and substitution, China's AI development focuses more on connecting with the physical world and deeply integrating with real industries. Its core effort is to empower advanced manufacturing and connect the entire manufacturing chain. Relying on 520,000 industrial enterprises above designated size, 39 major industrial categories and 191 medium industrial classifications, China's complete industrial system can fully unleash AI's value as a general-purpose technology, accelerating full-domain penetration and forming a virtuous cycle of technological iteration and efficiency gains.

Practical cases are already abundant. Sinopec's "Fenghuo" industrial intelligence agent integrates more than 1 billion pieces of industry expert knowledge and achieves four-layer technological coupling across platform, model, digital twin and intelligent agent, helping reduce energy consumption per unit of output. Zhenhua Heavy Industries' welding defect recognition model has achieved an accuracy rate of over 98 percent, replicating the practical experience and image-recognition logic of senior craftspeople, making it a benchmark for "AI + manufacturing". Waigaoqiao Shipbuilding uses AI to streamline shipowner compliance verification, while Shanghai Turbine Works relies on intelligent algorithms to control blade production parameters more precisely. These examples show how AI is being embedded in large manufacturing enterprises.

At the policy level, the 15th Five-Year industrial internet action plan proposes that by 2028, the penetration rate of industrial internet platforms should exceed 55 percent and the total number of connected devices should surpass 120 million. The aim is to build a new-generation industrial internet ecosystem featuring ubiquitous connectivity, digital-intelligent integration, deep collaboration and open-source openness, thereby providing long-term support for the intelligent upgrading of the whole manufacturing chain.

China's AI ecosystem also contributes to global development by providing inclusive intelligent public goods.

Cost-effective open-source models are already benefiting global markets. Leading Chinese large models generally follow open-source and open-weight strategies, featuring intensive and efficient research and development models and low deployment costs. Their usage prices are only about one-tenth of comparable overseas products. Grounded in the principles of peaceful development and serving the people, these technologies provide affordable and easily deployable AI tools for developing countries. In essence, their low-cost model is strongly inclusive and has accelerated the global diffusion of large-model technologies.

Industry estimates show that Chinese open-source and open-weight large models are priced 60 to 90 percent lower than similar US products from OpenAI and Anthropic, while still covering most routine office and production needs. Their cost-performance advantage has made them popular among global tech start-ups, especially enterprises and consumers in developing countries and the Global South. Data show that US companies' use of Chinese AI models, measured by token share, averaged more than 30 percent per week and peaked at 46 percent.

Beyond market access, China is also actively supplying global AI public goods and promoting collaborative governance. China's AI development path balances industrial application with public value and actively participates in global AI governance. Following President Xi Jinping's proposal of the Global AI Governance Initiative, China has continued to position itself as a provider of international public goods in the AI field. It has released the AI Capacity-Building Action Plan for Good and for All and the "AI Plus" International Cooperation Initiative, while advocating for the establishment of a World Artificial Intelligence Cooperation Organization.

Inclusive measures are also being implemented globally. China has announced the construction of an international AI application cooperation center, promoted the wider deployment of the MAZU intelligent meteorological early warning solution in more countries, and offered 5,000 specialized AI training opportunities for developing nations. These efforts help AI technologies take root more quickly across countries, improve production and public services and strengthen developing countries' ability to manage natural disaster risks.

Ultimately, general-purpose AI can help countries address gaps in industry and scientific research, thereby strengthening overall economic resilience. This is an important expression of AI's general-purpose capability and a core value of China's AI development. Meanwhile, China is improving AI-related laws, regulations and supervisory systems, using both legal constraints and technical controls to prevent potential risks and ensure that AI always serves humanity and remains under human control.

More patient policy framework for China's economy

MAIN STREET
By Luo Zhiheng

China's economy can no longer be described simply as either strong or weak. Its defining characteristic is a structural transition accompanied by growing divergence, often described as K-shaped recovery. New growth drivers — such as artificial intelligence and advanced manufacturing — are gradually replacing traditional engines, including real estate and infrastructure. Against this backdrop, two trends stand out.

First, overall economic growth remains under pressure, as the property downturn continues to weigh on related sectors, including home appliances, furniture, ferrous metals and machinery, while also weakening local finances and local governments' capacity to support growth.

Second, economic divergence has become increasingly pronounced, as indicated by widening gaps between supply and demand, across industries, among income groups and between regions. This has created a gap between official macroeconomic indicators and the actual economic experience of households and businesses.

Over the medium and long term, China's economy has followed an L-shaped path. The slowdown began around 2010 when the country entered a period of growth deceleration and transition from old to new growth drivers. GDP growth fell from 10.6 percent in 2010 to 5 percent in 2025, more than halving in just 15 years. This year, growth has moved into the 4.5-5.0 percent range, marking the beginning of what may be called an era of "around 4 percent growth". Japan stayed in the 4-5 percent range for about two decades before slowing further, but by then its per capita GDP had reached around $30,000 and its social security system was relatively mature. China's per capita GDP remains below $14,000, making it essential to settle into a stable medium-growth range of 4-5 percent during the 15th Five-Year Plan (2026-30) period.

Each year, the economy has exhibited a U-shaped rhythm: a strong first quarter, pressure in the second, policy support in the third and a year-end lift in the fourth. After the September 2024 policy package, fourth-quarter growth reached 5.4 percent, following 5.3 percent, 4.7 percent and 4.6 percent showings in the first three quarters. This pattern reflects two underlying features: the economy remains highly dependent on policy support, while self-sustaining growth momentum is still weak and the vitality of households, businesses and local governments has yet to be fully restored.

The strong first-quarter performance is largely the result of policy-driven economic mobilization. After the Central Economic Work Conference sets annual priorities, fiscal and monetary policies are often front-loaded, and local governments accelerate projects and resource allocation, pushing construction and investment activity to a high level. By the second quarter, policy momentum naturally moderates, putting pressure on growth. This year, combined spending under the general public budget and government-managed funds rose 6.1 percent year-on-year in January-February, but fell to minus 0.3 percent in January-May, partly reflecting a limited pipeline of shovel-ready projects. The consumer goods trade-in program also boosted home appliance consumption with double-digit growth, but base effects and demand front-loading later became more evident.

Self-sustaining momentum remains weak. Falling property values have encouraged households to reduce debt, with the household leverage ratio edging down from 60.5 percent to 59 percent as many repaid mortgages early. Enterprises face weak demand, pressure along the property supply chain and low capacity utilization. Local governments' land sale revenue fell from 8.5 trillion yuan ($1.25 trillion) in 2021 to 4.2 trillion yuan last year, and declined another 28.7 percent year-on-year in the first five months of 2026, weakening their capacity and willingness to promote growth. Weaker local finances have also affected payments to firms and public services, further impeding household consumption. Government spending under the two budgets dropped from 30.6 percent of GDP in 2021 to 28.6 percent last year, meaning that 2-3 trillion yuan less flowed into the economy as income for enterprises and households.

Growth in the next stage will hinge on the performance of real estate and exports. AI-related products now account for about one fifth of China's export value and roughly half of export growth, making overall export outlook increasingly linked to AI development. Real estate is likely to remain a drag, while AI-supported exports may provide upward support, with a lower base also improving headline data.

The property downturn persists and three issues must be addressed. First, prices remain unstable. Although secondhand home prices in first-tier cities have risen for three consecutive months, national prices, sales and investment are still falling. In smaller cities, some inventory may become permanent as populations decline and outflows continue. Pressure comes from developers' cash-flow constraints, new-home discounts, higher-quality and "fourth-generation" housing products, and rising foreclosure sales. Second, a self-sustaining stabilization process has yet to take hold in the real estate sector. Local governments alone cannot break the cycle of property adjustments, falling fiscal revenue and weakened stabilization capacity. Therefore, central government support is needed to fill fiscal gaps. Third, fiscal pressure in some cities continues to worsen supply-demand conditions, as land supply increases despite high inventory. Stabilization therefore requires both supply control and demand support, backed by stronger transfer payments.

Rules regulate juveniles' liability

New measures standardize handling of cases involving suspects aged 12 to 14

By CAO YIN
caoyin@chinadaily.com.cn

China has introduced stricter and clearer rules for handling serious crimes committed by younger offenders, as part of broader efforts to curb violent crime while safeguarding the rights of juveniles.

The measures are outlined in a recent 15-article regulation jointly issued by the Supreme People's Procuratorate and the Ministry of Public Security. The regulation provides detailed guidance for implementing provisions of the amended Criminal Law, which took effect on March 1, 2021.

Under the amended law, the age of criminal responsibility in China is generally 16. However, minors aged 14 to 16 can be held criminally liable for serious violent offenses, including intentional homicide, intentional injury, rape and robbery.

Children aged 12 to 14 may also face criminal liability if they commit intentional homicide or intentionally inflict injuries that result in death or severe disability through extremely cruel means, with prosecution requiring approval from the SPP.

The regulation standardizes procedures for handling cases involving suspects aged 12 to 14 accused of such violent crimes and establishes clear criteria for prosecution.

Public security authorities must transfer such cases to the local procuratorate, which is required to investigate not only the suspect's age and details of the offense but also the individual's upbringing, family background, personality, social relationships, motives and conduct after the crime.

The findings must then be submitted to the SPP for final approval. During the review process, police may place the minor suspect in criminal detention in accordance with the law.

The regulation also specifies that determining whether a case is "heinous" should take into account factors such as the cause, motive, method, target and consequences of the crime, as well as the suspect's potential danger, likelihood of reoffending and broader social impact. In cases involving multiple suspects, each individual's role and level of participation must be assessed separately to determine whether the criteria are met.

To better protect the rights of minors, the regulation requires a suspect's legal guardian to be present during questioning and to be informed of the minor's legal rights. If the guardian is unable to attend or is also a suspect, investigators should notify another adult relative, the suspect's school or employer or a local community organization to participate.

Tian Yingjun, a lawyer from Yunnan province, said the regulation further improves China's legal framework for handling serious violent crimes committed by young minors by providing clear procedural guidance.

"The rigorous procedural design and comprehensive review requirements reflect China's cautious approach to protecting minors' rights while balancing punishment and rehabilitation," he said.

In recent years, China has strengthened measures to prevent and address juvenile delinquency while maintaining a zero-tolerance approach to crimes against minors.

According to the SPP's annual work report released in March, 24 minors aged 12 to 14 were prosecuted for serious violent crimes in 2025, underscoring the need to punish particularly heinous offenses. The Supreme People's Court reported that 2,356 juveniles convicted of serious violent crimes received prison sentences of more than five years in 2025, while 5,822 juveniles who committed relatively minor offenses received lenient treatment.

The report also said efforts are underway to strengthen the development of specialized schools and improve a graded intervention and rehabilitation system for minors engaging in misconduct as part of broader judicial measures to address juvenile delinquency.

Young Chinese embrace task of 're-raising' parents

By ZOU SHUO
zoushuo@chinadaily.com.cn

In a reversal of traditional family roles, a growing number of young Chinese people are taking on the task of "re-raising" their parents — teaching them digital skills, purchasing their health supplements, planning holidays and even escorting them to concerts — all in a bid to help them navigate a fast-changing world.

The trend, which has gained traction on social media under the hashtag "I re-raised my parents after growing up", has drawn widespread attention for redefining filial piety from passive duty to active, creative care.

At the heart of the trend is a widening digital divide. While older generations grew up in a relatively stable world, their children came of age in an era of smartphones, livestreaming and algorithm-driven recommendations.

As a result, young people often have a clear advantage in accessing information and navigating online services — skills that many parents have yet to master.

For many, re-raising begins with small but meaningful acts.

Hang Yunjie, an 18-year-old freshman at Beijing University of Chemical Technology, discovered the gap when he decided to buy fish oil for his father and reading glasses for his mother.

His parents had long relied on television advertisements or pharmacy recommendations when purchasing health supplements. Hang instead consulted online review forums and comparison blogs before making his purchases.

"My father admitted that my choice was better than his usual brand, but he still expects me to handle everything next time," Hang said. "He doesn't want to learn how to find the information himself."

Helping parents adapt to the digital age means encouraging them to recognize that some of their knowledge and habits have become outdated, he said.

"I managed to convince him that his old brand was inferior, but I failed to spark his curiosity about the digital world."

For Xu Yu, a 31-year-old office worker in Beijing, the most meaningful change came after buying his parents new smartphones and teaching them how to use food delivery apps.

"They used to come home exhausted from work and still had to cook. Now they can order whatever they want," he said.

He patiently guided them through registration, logging in, setting delivery addresses, choosing payment methods and adding notes for special requests.

"When I was a child, they worried about my meals. Now I want to make their lives easier."

Some young people are also helping their parents enjoy experiences they might never have pursued on their own.

Zhang Anning, a 22-year-old postgraduate student in Beijing, began her re-raising journey after realizing that her parents would never take the initiative to travel.

Inspired by trips she had taken with friends, she started planning holidays for them, from renting a car in Guizhou province so her father could drive to see blooming azaleas to booking sea-view rooms in Hainan province.

"I want them to experience the joy of traveling, just as they made sure I enjoyed my childhood," she said.

Zhang also serves as the family's photographer, using film cameras to document their trips.

"When I was little, they recorded my growth. Now it's my turn to record their travels and preserve these treasured memories."

> Conventional filial piety is about repaying a debt — they raised me, so I accompany them in old age. But going to concerts with my mother comes from genuine love because we have a close relationship."
>
> **Yu Tianxin,** a 19-year-old freshman at Beijing Foreign Studies University

Yu Tianxin, a 19-year-old freshman at Beijing Foreign Studies University, took an even more hands-on role by accompanying her mother to three concerts by pop singer Zhang Jie, arranging everything from tickets to hotel reservations.

Her most memorable moment came when her mother went to the restroom without her phone, forgot their seat numbers and wandered around the arena calling out Yu's name.

After concert personnel directed her mother to the general floor area, Yu eventually spotted her and, as she put it, "reeled her back" to her seat.

"It was exhausting, but also deeply satisfying," Yu said. "My mother was overjoyed. She had always wanted to see Zhang Jie, and spending that time together brought us much closer."

Yu distinguishes her actions from the traditional understanding of filial piety.

"Conventional filial piety is about repaying a debt — they raised me, so I accompany them in old age," she said. "But going to concerts with my mother comes from genuine love because we have a close relationship."

She has also stepped in to protect her parents from online scams.

When her father was about to spend 30,000 yuan ($4,400) on a fake antique promoted during a livestream, Yu uninstalled the shopping app from his phone and linked the account to her own device, preventing him from logging back in.

"He scolded me for three days, but I still think it was worth it," she said. "Both my parents are trapped by outdated perceptions. Sometimes I have to pull them into the present."

Yao Huasong, a sociology professor at Guangzhou University, views the trend as a positive evolution in intergenerational relationships.

In an article published by China Youth Daily, Yao said the phenomenon rests on three conditions: young people's stronger digital and information literacy, their willingness to invest time and patience in communicating with their parents, and parents' growing readiness to set aside traditional authority and engage in more equal dialogue.

Generational differences are inevitable, he wrote, but what matters most is how both sides respond to them.

He cited practical examples such as making regular video calls, ordering groceries online, arranging health check-ups and taking occasional family trips as meaningful expressions of "home-making".

"This represents a new interpretation of the traditional idea of raising children for support in old age," Yao wrote. "It deserves recognition and encouragement."

Abandoned coal mine cools homes in Jiangsu

By CHEN MEILING
chenmeiling@chinadaily.com.cn

This summer, 96 households in Xuzhou, Jiangsu province, have abandoned noisy air conditioners in favor of an innovative floor cooling system that provides comfortable temperatures, stable humidity and near-silent operation.

The system circulates naturally cool underground mine water through pipelines installed beneath the floor, creating radiant cooling throughout homes. Compared with conventional air conditioning, it consumes less energy and costs residents significantly less.

At the end of July, with outdoor temperatures in Xuzhou reaching about 36 C at noon, Wang Qingmei, 76, was observed at home cooking in comfort. A wall-mounted thermometer displayed an indoor temperature of 26 C.

"The floor is pleasantly cool, just the right temperature. It feels best to walk on it barefoot," she said.

Mine water is pumped to a heat exchange station, where a heat exchanger stabilizes the circulating water temperature in the pipeline network at between 20 C and 25 C before it is distributed to homes.

For Wang, the savings are substantial. In previous summers, running air conditioners to keep herself and her husband cool cost about 400 yuan ($59) a month for electricity. If the air conditioner stayed on for too long, her husband's neck would ache. If they turned it off, it became too hot to sleep.

Under the new system, residents pay 4 yuan per square meter for the entire cooling season. For Wang's home, a four-month cooling period costs about 410 yuan while maintaining a comfortable temperature around the clock.

"It's both quiet and comfortable," she said, adding that many neighbors have visited to experience the system and plan to use it next year.

What makes the project even more remarkable is that the cooling source comes from an abandoned coal mine that was once considered an environmental and financial burden.

After the Woniu Mountain coal mine was shut down, its mined-out voids gradually filled with groundwater, forming a vast underground cold-water reservoir. For years, the abandoned mine generated ongoing costs for safety monitoring and ecological restoration without creating economic value.

The turning point came when researchers from Xuzhou Coal Mining Group, which owns the mine, discovered that the mine water remains at a stable temperature of between 15 C and 20 C throughout the year and is available in abundant quantities.

The constant temperature makes the resource suitable for both winter heating and summer cooling. Heat can be extracted from the water during winter, while the naturally cool water provides cooling during summer.

The project also benefits from Xuzhou's existing infrastructure. The city operates Jiangsu's only large-scale centralized heating pipeline network, which can circulate hot water in winter and switch to cold water in summer, allowing dual-purpose use without installing an additional pipeline system.

"As a traditional industrial city, Xuzhou has many closed coal mines whose stored water is like a giant green charger, transforming abandoned resources into low-carbon energy carriers," said Zhang Tao, who oversees scientific research projects at Jiangsu Xukuang Thermal Power Co, a subsidiary of Xuzhou Coal Mining Group.

According to Zhang, surveys show strong public acceptance of centralized heating and cooling services, indicating solid market demand.

He added that the city's heating season lasts only about 110 days, from November to March. Extending infrastructure use with a 120-day cooling season from June to September can significantly improve utilization efficiency and asset returns.

The project's biggest technical challenge is Xuzhou's humid summer climate. Condensation can form on low-temperature pipelines and indoor surfaces, particularly in bathrooms and other high-humidity areas. Opening windows allows moist outdoor air inside, making condensation more likely on metal fixtures and tiled surfaces.

To solve the problem, the company partnered with Yunlong Lake Laboratory of Deep Underground Science and Engineering to develop a dedicated water-cooled dehumidifier that maintains indoor humidity at around 50 percent, a level considered comfortable for occupants.

The company is currently installing the dehumidifiers in residents' homes free of charge this year. The first group of users also received free cooling services from June 1 to July 31 and began paying for the service from Aug 1 to Sept 30.

The environmental benefits are equally significant, Zhang said.

According to the company's data, the system reduces energy consumption by about 50 percent compared with conventional air conditioners and cuts annual carbon dioxide emissions by approximately 50 metric tons.

Unlike air conditioners, which rely on air-to-air heat exchange and gradually lose efficiency because of heat waves, dust, willow catkins and restricted airflow through outdoor units, the floor cooling system uses liquid-to-liquid heat exchange, maintaining high efficiency with minimal performance degradation.

Conventional air conditioners also discharge heat into the atmosphere, contributing to the urban heat island effect. In contrast, the floor cooling system transfers heat back underground through mine water, achieving virtually zero atmospheric heat exchange, Zhang said.

The company plans to collect operational data after the cooling season ends before deciding on a broader rollout. It is also experimenting with using mine water for winter heating. Previously, the city's centralized heating relied on hot water supplied by power plants.

Zhang said a researcher from the United Kingdom visited to inspect the project and expressed strong interest in introducing the technology to a British town.

Although mine-water-based heating and cooling systems have been introduced elsewhere in China, they have all been installed in newly built residential communities. The Xuzhou project is the first to retrofit an existing residential community with the technology.

"It unlocks the energy potential of billions of existing buildings for the low-carbon transition, providing a replicable model for resource-exhausted cities across the country," Zhang said.

Guo Jun in Nanjing contributed to this story.

C919 experience

Remote prefecture turns excess solar into big data

Qinghai leverages cool climate, legal frameworks and massive solar output to create low-cost green computing hub

By **LI MENGHAN**
in Gonghe, Qinghai
limenghan@chinadaily.com.cn

On the windswept Talatan plain in Northwest China's Qinghai province, thousands of sheep graze beneath vast canopies of cobalt solar panels. For a decade, this fusion of pastoral agriculture and renewable energy turned a barren highland desert into an ecological success story. Today, however, regional authorities face a far more complex structural challenge: what to do with an overwhelming surge of green power that far outpaces local demand.

In response, Hainan Tibetan autonomous prefecture is executing a major strategic pivot, leveraging its massive energy surplus to transform from a simple power exporter into a high-altitude big data hub.

Local authorities have approved a 93-hectare green computing industry park in Chabcha town, the administrative seat of Gonghe county. The development has already secured 17 major projects representing 16.2 billion yuan ($2.3 billion) in total planned investment. The project is designed to process data for computing-intensive industries along China's populous eastern seaboard, including artificial intelligence model training, autonomous driving simulation and financial technology back-office operations.

The initiative directly addresses a severe economic imbalance. Last year, Hainan prefecture's clean-energy installations generated 47.7 billion kilowatt-hours of electricity, yet local industrial and domestic consumption absorbed just 1.7 billion kWh — less than 4 percent of the total output. While ultra-high voltage transmission lines export a significant portion of this surplus across eastern provinces, grid constraints and line capacity limits during peak production hours continue to pose long-term curtailment risks.

"We are turning watts into bits," said Ma Xianping, deputy director of the Hainan Prefecture Data Bureau, describing the strategy to consume excess energy locally rather than relying exclusively on long-distance transmission infrastructure.

Chabcha town has natural advantages for developing data centers. With an average temperature of 4 C, the town enables fresh-air cooling for 330 days a year, reducing cooling costs — which typically account for nearly 40 percent of a facility's power consumption — by an estimated 30 percent and shortening payback periods by around two years. Additionally, the thin, dust-free highland air reduces particulate buildup on server components, extending hardware lifespans.

These conditions, Ma said, make green computing a natural fit.

Clean energy makes up 97.26 percent of the park's power supply, with a power usage effectiveness of about 1.1 — well below the national average of 1.35. Electricity costs of around 0.42 yuan per kWh are among the lowest in China.

Clockwise from top: A concentrated solar power plant, with a molten salt tower at the center and heliostats around, is part of the Talatan Photovoltaic Park in Gonghe county, Qinghai province. LI XIAOGANG / FOR CHINA DAILY Sheep graze under photovoltaic panels in Talatan in July 2023. FENG LI / FOR CHINA DAILY Workers inspect panels at the industrial park in March last year. ZHANG ZHONGPING / FOR CHINA DAILY

Pastoral power

The digital expansion is being powered by the Talatan Photovoltaic Park, planned to cover 609 square kilometers on the plain. It is one of China's major gigawatt-level solar hubs and was certified in the Guinness World Records as the world's largest installed-capacity photovoltaic power generation. The green transformation is anchored in decades of ecological restoration efforts and rural livelihood gains, underpinned by legislative support.

Across Hainan prefecture, clean energy capacity has reached 36.58 million kW — 46 percent of the province's total — with cumulative investment of 180 billion yuan, and 68 major photovoltaic enterprises operating across the region.

The prefecture takes its name from its location south of Qinghai Lake. The Yellow River runs 411 kilometers through its five counties, while the headwaters of the Yangtze and Lancang rivers also originate in the broader Qinghai highland, making the region one of China's most ecologically consequential landscapes and one where the stakes of any industrial development are unusually high.

"With just one storm a year, from spring to winter's end; stones roll with the wind, and nothing will grow," said An Fengjun, deputy director of the prefecture's development and reform commission, reciting a local proverb. He said this used to be the stark reality of Talatan — roads swallowed by endless dunes, making every step a struggle.

The turnaround began in 2012, when construction of the photovoltaic park began. Local authorities realized the latent value of what had long been dismissed as wasteland. While facing severe desertification, Talatan offered nearly 3,000 hours of annual sunshine and vast stretches of flat, unused land — ideal conditions for utility-scale photovoltaics.

"What surprised us most was how quickly the land responded," An said. "The panels acted as windbreaks, cutting near-ground wind speeds by around half. Their shade reduced evaporation by about 30 percent, and rainwater together with panel-cleaning runoff seeped down along the supports, irrigating the soil."

An said that the ecological transformation came as an unexpected dividend. Within just a few years, vegetation cover, once negligible, recovered to more than 80 percent across the park. "On my way here this morning, I saw a hare darting across the road, and you can see foxes and even birds that had never been spotted here before," he said.

The lush growth, however, created a new problem: tall grass shading the panels and reducing power output, while dried winter grass raised wildfire risks. Manual clearing cost over 4 million yuan annually across the park before the arrival of what locals now call "photovoltaic sheep".

"The sheep eat the grass, and their manure fertilizes the soil, forming a virtuous cycle. Companies no longer spend huge sums on grass cutting, and herders get free pasture. It's a win for ecology, production and livelihoods," An said.

The park operates 14 photovoltaic pastures where more than 20,000 sheep graze from June through October under a scientifically managed rotation system. Panels are raised to around 1.5 meters and spaced wider to accommodate the herds. Surplus grass that the sheep cannot consume is given free to surrounding villages as winter fodder.

Zhou Jia, a deputy to the agriculture and environmental resources committee of the prefecture's people's congress, said the benefits extend beyond the fenced perimeter of Talatan. Given the plain's exceptional solar conditions, all five counties of Hainan prefecture have consolidated their village-level photovoltaic capacity — 50.5 megawatts shared across 173 villages.

"The model supports poverty alleviation," Zhou said, adding that village-level photovoltaic stations generated 32.78 million yuan in revenue in the first half of the year, averaging 189,500 yuan per village. Additionally, the stations fund 1,566 public welfare positions with monthly stipends of around 1,000 yuan.

Legal outreach

The transformation rests on a multitiered legal architecture.

At the national level, the Law on Prevention and Control of Desertification was adopted in 2001 and amended in 2023. Drawn from lessons learned in local practices, the Ecological and Environmental Code, which will take effect on Aug 15, stipulates that operators of photovoltaic projects and other commercial activities in desertified areas must implement measures to curb sand expansion. These laws have laid the groundwork for what has become the defining feature of Talatan — using photovoltaic installations as a tool for sand stabilization.

Zhou also pointed to the law on ecological protection of the Qinghai-Xizang Plateau, which came into force on Sept 1, 2023, giving statutory backing to the integrated clean-energy approach the prefecture has pioneered.

The law stipulates that the country supports building a clean-energy system dominated by sources including wind, solar, hydro, hydro-solar hybrid and geothermal across the plateau, while advancing green, low-carbon energy transitions. That provision codifies the plateau model of integrated renewable development that Hainan had been testing on the ground for more than a decade.

The Hainan model is anchored in the pairing of solar with the river. The Longyangxia Hydropower Station in the prefecture — known as the "first dam on the Yellow River" — is the backbone for China's first hydro-solar complementary system. The 850-megawatt Talatan Photovoltaic Park feeds its output into Longyangxia, with the two working as a single dispatchable unit.

"During the day, as solar output rises, hydropower dials back and water is stored. At night, the dam takes over, switching between sources within milliseconds," An said, noting that the hybrid model earned a Guinness World Record in 2022 as the world's largest water-solar complementary power station, and has since expanded past one gigawatt.

Building on these national and provincial legal frameworks, the prefecture's people's congress spent more than a year drafting its own regulation on promoting the development of the clean energy industry. The 34-article regulation, which will take effect on Sept 1, addresses grid integration bottlenecks, pricing mechanisms, storage infrastructure gaps and administrative procedures.

"Through legislation, clean energy development will become more standardized," said Ning Jianming, a deputy of the finance and economic affairs committee of the prefecture's people's congress. The drafting process began in 2024 with enterprise consultations, expert reviews and field investigations.

The regulation enshrines ecological protection as a nonnegotiable bottom line and mandates a recycling system for retired solar panels — a forward-looking provision given that the park's oldest arrays, installed around 2013, will approach their 25-year design life within a decade.

Ning said that the regulation is designed to align with those higher-level frameworks, turning policy guidance into tangible rules.

Zhou said that as legal outreach work continues, environmental stewardship has taken root in people's hearts. "The father protects the land, and the son inherits the benefit — that awareness is now deep in the bone," he said.

Rural vitalization law drives Datong's success

By **LI MENGHAN** in Xining

A plateau county in Xining, Qinghai province, has placed its yak products in 3,500 retail outlets nationwide while keeping livestock herds within ecological protection limits, supported by China's first county-level legislation on the vitalization of rural industry.

Datong Hui and Tu autonomous county is home to China's largest yak breeding base — the Qinghai Yak Breeding and Promotion Service Center — which spans more than 247 hectares and manages over 300 breeding bulls across all yak breeds found in Qinghai.

Hu Guangwei, deputy director of the center, said the Datong yak — introduced by the center in 2004 as China's first artificially bred yak variety — was developed over two decades through crossbreeding wild and domestic yaks.

"The offspring of the Datong yak are roughly 1.2 times heavier than ordinary domestic yaks, with some adult males reaching over 600 kilograms," Hu said, highlighting its potential to transform yak farming and boost herder incomes across Qinghai.

That potential is being realized at the county level. Li Cunde, deputy head of Datong's veterinary station, said that the county has promoted artificial insemination techniques for Datong yaks among local farming households, and this year alone has contributed to the upgrading of 3,700 head across 69 households.

"The Datong yak has a half wild yak bloodline, giving it strong adaptability to high-altitude, cold environments," Li said, adding that the calves grow faster than other Qinghai plateau breeds.

Li said that the county is home to 123,700 Datong yaks, accounting for 51 percent of the total cattle population, with annual sales of 38,000 head and a meat output of 5,600 metric tons. To bring these gains to herders, the county has been training farmers in artificial insemination and scientific breeding techniques.

"We shifted from traditional extensive grazing to standardized scientific breeding. Through winter-spring supplementary feeding and full-calf nursing, the growth cycle has been shortened by about half a year, and each Datong yak now brings herders an additional 2,000 yuan ($295) or more," Li said.

Three standardized slaughter facilities in the county process up to 60,000 head per year. Products carry traceability QR codes and are sold at major supermarket chains such as Metro and Sam's Club, he added.

Veterinary workers vaccinate yaks in Datong, Qinghai province, in April. PROVIDED TO CHINA DAILY

Li said that industrial expansion remains within strict ecological protection bounds. The county has six natural usable grasslands spanning over 166,700 hectares. This has created a virtuous cycle between production and ecological conservation.

Large-scale farms achieve manure resource utilization rates above 94 percent, and much of that manure is processed into organic fertilizer and applied to the county's expanding cool-climate vegetable fields, closing the loop between livestock and crop production.

"Cool-climate vegetables are varieties adapted to elevations between 1,800 and 3,000 meters, where cool temperatures, wide day-night swings and long sunshine hours give them a natural advantage," said Zhang Guangsheng, director of the county's vegetable technology service center. "They accumulate more dry matter and vitamins — they're sweeter, crisper and store longer."

Datong sits at an average altitude of 2,200 to 2,800 meters, with clean soil, minimal industrial pollution and irrigation from highland runoff — conditions that have earned the county national recognition as a "golden zone" for cool-climate vegetable production.

The county has 5,333 hectares under cultivation, producing 256,100 tons annually with an output value of 790 million yuan, Zhang said, adding that 39 products have received organic or green food certification, and pesticide residue compliance has remained above 98 percent.

More than 60 percent of output ships to areas including Shanghai, and Guangdong and Fujian provinces, with 11 dedicated supply bases covering over 667 hectares serving the Guangdong-Hong Kong-Macao Greater Bay Area. Specialty varieties such as pea shoots and broccoli sprouts can reach southern markets within 48 hours, Zhang added.

"Chemical fertilizer use has been cut by 20 percent through organic replacement, including yak manure from local farms," he said.

Through land transfers and on-farm employment, hundreds of households have joined the vegetable supply chain, boosting both incomes and local job creation.

Underpinning both industries is the regulation on the promotion of rural industrial vitalization, enacted by the county's people's congress in 2022 as China's first county-level legislation of its kind.

Drafted to address short value chains, weak branding and scattered resources, the 26-article regulation institutionalizes support for agricultural and livestock development, forming an effective policy support system — from conserving germplasm resources and building seed breeding bases, to providing financial incentives, promoting green organic production, cold-chain logistics, e-commerce, and the use of geographical indication brands such as Datong yak and locally designated vegetable labels.

"The regulation consolidates proven practices into legally binding norms, ensuring stability and continuity in our rural industry revitalization efforts," said Xie Ji, deputy head of the county government.

Bilibili World 2026 takes place in Shanghai from July 10 to 12. It's one of Asia's largest gatherings for ACGN fans. PHOTOS PROVIDED TO CHINA DAILY

Unlocking the fan-verse

International musicians and cosplayers converge at Bilibili World 2026, proving global pop culture knows no real borders, **Wang Xin** and **Wu Wanzhen** report in Shanghai.

Top: Chinese singer Tan Jing performs at the *Bilibili Macro Link* concert. **Above left:** Cambodia's Princess Norodom Jenna (right) is among the celebrity guests at Bilibili World 2026. **Above center:** Medovvika (right) and Armeyes from Russia draw attention with their cosplay of fairy-tale characters at the event. **Above right:** Cosplayers pose at the event.

Left: Voice actors attract a large crowd of fans at Bilibili World 2026. **Right:** The three-day event attracts a total of 400,000 visitors.

Viktoria Chernenkii and Denis Chernenkii — better known as Medovvika and Armeyes — are among Russia's best-known cosplayers. Recently in Shanghai, they transformed into Rapunzel and Flynn Rider from the Disney movie *Tangled*, bringing the fairy tale to life at the intersection of fantasy and reality.

Making their second trip to China, the couple flew from Moscow to attend Bilibili World 2026 from July 10 to 12 in Shanghai.

The event is one of Asia's largest gatherings for ACGN (animation, comics, games and novels).

They began preparing for their BW debut months before departure. Determined to portray her favorite character as authentically as possible, Medovvika commissioned a seamstress to handcraft her "historically accurate" costume six months in advance.

As for Rapunzel's iconic long, gorgeous blonde braid, Medovvika turned to China. About a month before leaving, she did what many Chinese cosplayers do — she reached out to a Chinese platform and placed a rush order to customize the wig.

"Only Chinese wigmakers know how to make the wig light, beautiful and detailed," recalls Medovvika excitedly.

The couple also researched BW's traditions and discovered that attendees often exchange handmade gifts. They prepared their own freebies for Chinese fans: beautifully printed cards featuring their cosplay photographs, paired with pieces of Russian chocolate.

Although they are leading cosplayers in Russia, they were still amazed by BW's scale, inclusiveness and the creativity of Chinese participants.

"Chinese cosplay is on another level when it comes to craftsmanship and detail. We don't have a venue this large in Russia. This festival isn't just huge — it has something for everyone, from gamers and photographers to anime fans," she adds.

Despite the language barrier, the eye-catching pair was frequently stopped by fellow attendees asking for photos.

They described Chinese fans as "polite, friendly, lovely and always ready to help", and hoped to meet more Chinese cosplayers in Russia in the future.

This year marked the first time BW sold tickets to overseas fans. The three-day event attracted a total of 400,000 visitors from over 30 countries and regions across the world, and featured 170 global exhibitors, more than 60,000 cosplayers and nearly 1,000 *itasha* exhibits — vehicles decorated with vibrant ACGN-themed artwork, according to video-sharing platform Bilibili, the event's organizer.

Among those spotted in the crowd was Cambodia's Princess Norodom Jenna. Kevin Feige, president of Marvel Studios, dropped teasers for the highly anticipated *Avengers: Doomsday*, drawing large crowds of fans like South Korean YouTuber Kim Chae-ho, who joined enthusiastic audiences eager for every new reveal.

Allison Franco and Alberto Franco, a couple in their 30s from the United States, even applied for passports and traveled abroad for the first time specifically to attend BW.

Wearing matching custom outfits inspired by video games, they spent six weeks preparing for the Shanghai trip and were particularly struck by the warmth and hospitality of the local people.

"We haven't had any issues that we thought we might have. Everyone has been so kind and gone out of their way to make sure we have a great experience ... I wanted to be one of the people who come over here (at BW), experience it and show my fans what it's like," says Allison Franco, a content creator with over 1.2 million social media followers.

She adds that Chinese ACGN-themed productions, such as *Heaven Official's Blessing* and *Link Click*, are "insanely popular" in the US.

Alongside the fan carnival, musicians from both China and abroad also came together for the annual ACGN-themed *Bilibili Macro Link* concert.

Now in its 14th edition, this year's concert featured music from seven popular Chinese games, including *Arknights*, *Azur Lane*, *Genshin Impact*, and *Wuthering Waves*.

Casey Lee Williams, a 27-year-old American vocalist who began recording music for animation at 14, says she is grateful to be part of the event.

After first singing for a Chinese game soundtrack in 2017, she has come to appreciate the industry's strong commitment to music and musicians.

Williams says China has given her "incredible" opportunities to perform over the past decade. Dressed as a character from *Wuthering Waves*, she performed one of the game's songs at the concert before embarking on a tour spanning Asia and the US later this year.

"Being together is the most important thing in the world. China's ACGN community really captures that spirit and brings people together in such a special way. On a global scale, togetherness is what matters most," she says.

Celebrated Chinese singer Tan Jing also drew inspiration from the passion of ACGN fans. Having released her first ACGN cover song in 2021, she performed her first video game song at this year's concert, prompting a sing-along from the audience.

"I'm delighted to see younger generations helping Chinese culture continue to evolve and gain global influence. More international participants are joining the event, and our traditional culture is crossing borders through music. I also hope to further explore cultural integration and musical innovation," Tan says.

Industry data show that in 2025, the revenue generated by China's independently developed games in overseas markets exceeded $20.45 billion.

Urban parks help in cockatoo conservation

Left: Winster Wong teaches students about cockatoos at St. Louis School in Hong Kong. **Right:** A snapshot taken by a student, Rooney Cheung, shows cockatoos flying to an artificial nest. XINHUA

HONG KONG — With fewer than 2,000 yellow-crested cockatoos left in the wild, Hong Kong may play a significant role in the species' survival.

In a recent study published in the international academic journal Evolutionary Applications, researchers from the University of Hong Kong found that these introduced cockatoos in Hong Kong retain unexpectedly high genetic diversity, potentially serving as a genetic reservoir for the species.

"It could function as a backup population for this species, which is critically endangered," says Astrid Andersson, lead author of the study.

Native to Indonesia and East Timor, yellow-crested cockatoos have seen their numbers plummet due to massive trapping for the pet trade and habitat loss. Currently, the vast majority of them are scattered across various islands of Indonesia.

Around 200 yellow-crested cockatoos have found refuge in Hong Kong, making up about 10 percent of the remaining global population. Andersson describes this number as ideal in comparison with the situation on some islands in Indonesia.

Surprisingly, instead of the countryside, these striking snowy-white visitors choose to live in bustling areas on Hong Kong Island. Victoria Park in Causeway Bay and Hong Kong Park in Admiralty serve as their main habitats.

"The cockatoos eat fruits, nuts, seeds, leaves and flowers. They find a lot of food in these urban parks," Andersson says, adding that the older, larger trees at these sites offer ideal nesting holes for the birds.

The research team has partnered with a local arborist to design and install artificial nest boxes to monitor the cockatoo population.

They place the boxes in areas where cockatoos are frequently seen, prioritizing spots where natural nests were lost to typhoons or safety-related tree pruning, thus ensuring the birds remain in familiar habitats.

Over the past year, more than a dozen nest boxes have been installed across various locations in the city, including urban parks and schools.

In October last year, Winster Wong, a teacher at St. Louis School in Sai Ying Pun, saw a pair of yellow-crested cockatoos repeatedly pecking at a hole in a campus tree, a behavior that lasted for about two weeks.

Realizing the birds were trying to nest, Wong remembered a video on the internet by the HKU team about artificial nest boxes and reached out to them. This led to the successful installation of two boxes at the school this April, with Andersson subsequently invited to speak at a morning assembly about the birds' plight.

"We want the students to be involved in it, not just bystanders. At this stage, we are trying to increase their awareness," Wong says, noting that the school plans to partner with HKU to launch cross-disciplinary activities that are professional yet accessible for students.

With the installation of the nest boxes, the cockatoos have been visiting the school more often.

Rooney Cheung, a student at the school, recalls spotting the cockatoos flying through the trees during a morning recess. He quickly grabbed his camera and captured the moment when they returned to the artificial nest, a snapshot that later clinched an award in a competition themed around the environment and humanity.

"The nest box is a human creation, while the cockatoos represent nature. I submitted the photo because it felt like a perfect fit for the theme," the 15-year-old says.

Other students have also found creative ways to engage. Owen Yu built a model tree with blocks to create an ideal habitat for the birds.

"I used to have little interest in nature, but now I know the birds are precious, and I hope to help them thrive," Yu says.

This shift in perspective resonated across the campus, even among those who initially found the birds' famously loud calls a little annoying.

The artificial nest boxes were carefully designed with Hong Kong's climate in mind, particularly its high temperatures and extreme rainfall. Built to prevent rainwater from seeping in, the structures also provide protection against predators such as civet cats, snakes and other birds.

Furthermore, each box is equipped with a live camera that enables the researchers to monitor the birds' behavior. Yet, the cockatoos, with strong beaks, frequently damage the boxes and appear particularly sensitive to cameras, sometimes breaking the devices.

Andersson notes that while the cameras are "not cheap" and pose maintenance challenges, they are vital to showing whether the nest boxes are being used. They allow researchers to track eggs, chick survival and parental feeding.

"This type of information has never been recorded for this species," she says.

Beyond scientific research, the live feeds carry significant educational value. Andersson notes that some schools use tablets in the classroom to stream the footage, so students can observe what is happening in the nest boxes in real time.

Marking a clear success for the project, at least one chick has already hatched in one of the boxes. "It's very hopeful for the continuation of this project," says Andersson, who aims to increase the number of boxes to around 50.

Moving forward, the team plans to partner with more schools, corporations and individuals, while hosting public talks and nest box design workshops to keep raising awareness.

Shedding light on ancient history

Suspended 60 meters above the valley floor, the Hanging Temple transforms into a canvas for a breathtaking show, revealing the secrets of its 1,500-year existence, report **Bai Shuhao** and **Zhu Xingxin** in Datong, Shanxi province.

Before the sun slips behind the mountains, no one quite knows how the Hanging Temple will appear after dark.

For nearly 1,500 years, the monastery has clung to a sheer cliff face in northern China's Shanxi province, suspended between rock and sky. It appears almost frozen in time, but at night it waits for light to awaken it again.

"I'd seen so many photos and videos of it on social media," says Joe Burns, a British travel vlogger visiting the temple for the first time. "But in reality, it's much smaller than I imagined."

Perched more than 60 meters above the valley floor on the cliffs of Hengshan Mountain near Datong, the Hanging Temple is one of China's oldest and best-preserved cliffside wooden structures. From a distance, its red timber columns and yellow, glazed roof tiles resemble a finely crafted wooden box tucked into the mountain.

The temple occupies just 472 square meters. Some corridors are so narrow that only one person can pass at a time. On one side stand statues representing China's three major philosophical and religious traditions — Confucianism, Buddhism and Taoism. On the other is open air. Visitors inch carefully along the walkways, gripping the railings as they search for an answer to a question almost everyone asks upon arrival: How can a temple seemingly float in midair?

"People's first reaction is always the same," says Yang Jianlin, director of the nighttime multimedia production *Why Hanging Temple Endures*. "Why was it built here? What was the purpose?"

His work, staged against the cliffs surrounding the temple, attempts to answer a mystery that has endured for more than a millennium.

The projection spans more than 37,000 sq m of cliff face and recently received Guinness World Records recognition as the world's largest cliff projection show. Since tickets went on sale in late May, every performance has sold out, drawing more than 2,000 visitors each evening.

Yang grew up in Shanxi, not far from the temple. After more than a decade working in live tourism performances, he says one unlikely source of inspiration for the show was *Black Myth: Wukong*, the blockbuster Chinese video game that introduced many international audiences to Shanxi's ancient architecture.

"It made me realize these buildings shouldn't only be places people visit," he says. "They can become immersive experiences where people step directly into history."

But transforming one of China's most treasured ancient monuments into a stage for a large-scale light show has also raised questions.

Supporters hope the production reveals dimensions of the temple that daytime visitors cannot see. Critics worry that dazzling projections might disturb the quiet dignity of a sanctuary that has overlooked the valley in solitude for centuries.

Before the performance, Burns imagines what awaits him.

"I think there will probably be lasers, projections, all kinds of effects to make the place stand out," he says.

Painter Li Zhengming, a member of the China Artists Association, is more cautious. Having sketched historic architecture across Shanxi and watched similar productions elsewhere, he worries that many light shows emphasize spectacle while neglecting the history and culture of the buildings themselves.

"Light shows are fine," Li says before the performance. "The key is whether they handle the details well."

At 8 pm, just before the show is due to begin, a loudspeaker announces a 10-minute delay because the sky is still too bright.

Then darkness arrives.

The temple disappears almost completely into the mountain. Even those who have spent the afternoon touring it struggle to locate it against the black cliffs.

The performance opens not with the temple itself but with an herbal merchant carrying astragalus, a medicinal plant long cultivated in the region. Speaking directly to the audience, he reflects on the crowds that hurry through the temple each day.

Top: A scene from the nighttime multimedia production *Why Hanging Temple Endures*. **Above:** British travel vlogger Joe Burns (in pink shirt) and other international visitors wait for the performance to begin. **Left:** The show features both digital projections and live-action performances. PHOTOS BY ZHU XINGXIN / CHINA DAILY

"People visit in daylight," he says. "It's too noisy, too rushed. They never hear what the temple is trying to tell them. That's why you've stayed — to wait for this moment."

The audience slowly follows guides toward the cliff as a narrator repeats the question that gives the production its title: Why Hanging Temple endures?

The answer unfolds not through architecture alone but through history.

The projections first transform the cliff into a battlefield. Horses charge. Weapons clash. Blood-red light washes over the mountainside.

During the Northern Wei Dynasty (386-534), when the imperial capital was established in Datong, Taoist reformer Kou Qianzhi is believed to have envisioned an "airborne temple", elevated above worldly noise and closer to the heavens. Yet, even as the monastery sought spiritual distance, the land beneath it remained a frontier marked by centuries of warfare and shifting dynasties.

Datong stood between the agrarian empires of central China and the northern nomadic peoples. Its very name — meaning "Great Harmony" — reflected a long-standing hope for peace.

The projections then reconstruct the temple's construction. Craftsmen appear suspended from the cliff, chiseling into solid rock one hammer strike at a time. The audience watches as cantilevered beams are driven into the mountainside, re-creating the engineering method that still supports the temple today.

Historical figures, including Tang Dynasty (618-907) poet Li Bai and Ming Dynasty (1368-1644) traveler Xu Xiake, also appear, recalling their own journeys to the site and their admiration for its improbable beauty.

Burns records much of the performance on his phone.

"The projections cover the entire mountain. It's hard to believe you're looking at the real Hanging Temple.

"I didn't think it would incorporate the actual Hanging Temple into it," he adds. "Now I can see why it's a world-record show. The whole cliff face becomes part of it, and the temple itself is only a small part. Really, really spectacular."

Li, who was skeptical when he arrived, finds himself persuaded.

"They've explained the entire historical process so clearly," he says. "The visual impact of every scene is beyond words."

However, Yang insists that protecting the monument remained the project's priority.

The production uses cold-light projection equipment positioned more than 100 meters away from the temple. No permanent hardware has been installed within the protected heritage zone, and the light exposure is significantly lower than ordinary sunlight, he says, allowing the performance to avoid any direct impact on the structure.

In its final movement, the battlefield disappears.

Spring blossoms spread across the mountains. Summer forests return. Autumn paints the valley in crimson leaves. Winter covers the cliffs in snow.

"Kou Qianzhi never lived to see the temple completed," Yang says. "But through technology and animation, people today can finally witness how his vision became reality."

In the end, the production returns to the question with which it began: Why Hanging Temple endures?

If its construction began with one man's aspiration, Yang suggests, it has survived because generations of ordinary people continued to repair it, preserve it and bring their own hopes there.

"A thousand years later, it is our generation that protects this ancient building," he says. "Back then, it carried people's wishes for peace and a better world. Today the country is peaceful, the mountains are beautiful. The ancient wishes have, in many ways, become our own."

Cultural performances let villagers find new voices in the arts

Left: Villagers perform in a short stage play in Yinan county, Linyi city, Shandong province, in October 2024. **Right:** Another short play presented by Yinan villagers on June 10. PHOTOS BY XINHUA

JINAN — On mornings during the slack farming season, Yang Suhua, a villager from Beicun in Yinan county, Shandong province, hurries to a scenic spot in neighboring Changshanzhuang village, where she now works as a performer in addition to her farm work, a role she never could have imagined just a few years ago.

This scenic area offers a well-preserved rural landscape that dates back to the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

Local authorities there have turned old courtyards and revolutionary heritage sites into open-air stages, with no raised platforms or elaborate lighting. The performers are largely local villagers like Yang, who, after training, stage skits and plays in the local dialect. These performances bring to life the stories of the village women who risked their lives during the war to deliver supplies, tend to the wounded and relay messages.

"Now we don't have to leave home to chase our dreams, and we get paid for it too," Yang says during a break between performances.

"As the story unfolds, the audience is often drawn into the narrative, transitioning from being mere spectators to becoming part of the story itself," says Li Xipeng, chairman of the scenic area management. "This immersive experience allows visitors to truly feel the revolutionary culture as if they were there."

These folk performances have revived the region's revolutionary heritage while also boosting the local economy. Beyond performing on stage, villagers from surrounding communities have found multiple ways to raise their income, such as leasing land, taking day jobs at the scenic site, and selling local products to tourists. Now, the annual per capita disposable income in the area exceeds 15,000 yuan ($2,208).

Across China, new forms of cultural expression are lowering the barriers for rural communities to engage in creative activities. Farmers are no longer just characters in stories told by others. Instead, they are increasingly becoming storytellers, performers and beneficiaries in their own right.

In Tandi village of Sishui township, Guangdong province, a short-drama crew had set up cameras right next to lychee orchards. Wang Youxiang, a local villager taking part in the production, stood nearby, listening to the director's instructions and occasionally offering her own suggestions on how rural life should be shown on screen.

Wang recalls that in the past, all she knew was growing lychees. During the off-season, her only pastime was watching TV. Now, she has appeared in several short-drama productions. "I get to act and I get to make friends," she says.

Short-drama crews have brought more than cameras to the village — they've brought new business. Villager He Qinghai says the productions have put money in locals' pockets through acting fees and opened up new markets for their lychees.

Keen to look good on screen, families have tidied up their courtyards and spruced up village lanes. Neighbors are now swapping acting tips and learning from each other. The village looks different and so do its people.

Meanwhile, in the mountainous regions of Guizhou province, music is playing a similar role in transforming rural lives. Yu Chengliang, a teacher from Maluhe village in Tunjiao township, has introduced "rare" instruments including the saxophone, trumpet and drum set to the local school, establishing a village orchestra.

Through self-study, he turned himself into a multi-instrumentalist proficient in over a dozen instruments, and has taught the children hands-on. With his mentorship, more than 300 students have acquired instrumental skills, and music now serves as both their hope and their driving force to be able to step out of the mountains for a different future.

Yu's efforts have also touched the left-behind elderly in the village. Luo Kailian, 74, has been a member of the village orchestra for more than a decade.

"I used to think that playing musical instruments was a pastime for city dwellers and had nothing to do with us rural seniors," she says. "But over the years, learning music from Yu has kept me cheerful every day and made life feel more promising."

LIFE

Ancient craftsmanship meets modern creators

Liao Dynasty wooden masterpieces are getting a meticulous miniature reboot, **Zhu Xingxin** and **Zhou Huiying** report in Datong, Shanxi.

Despite having visited the Yingxian Wooden Pagoda in Yingxian county, Shanxi province, and Huayan Temple in Datong, Veldesen Yaputra was still astonished when he stood before the miniature models of Liao Dynasty (916-1125) architecture at the Datong Sculpture Museum.

Yaputra, from Indonesia, is a graduate student majoring in architecture at Tsinghua University. As an internet celebrity blogger, he was invited to participate in Discovering Shanxi's Ancient Chinese Architecture — A Visual Journey Through Cultural Heritage held from July 15 to 20.

More than 10 visual artists and overseas bloggers from nine countries explored Shanxi's rich architectural heritage, including a visit to an exhibition on the construction techniques behind the "eight great Liao structures", which opened on June 13 at the Datong Sculpture Museum.

It is the first time that the eight surviving wooden structures from the Liao Dynasty in China have been showcased together in the form of detailed models.

"These models faithfully reproduce the buildings' colors, carvings and intricate decorative details," he says. "When viewing the actual buildings, it's impossible to appreciate every element at once. But in miniature, the relationships between the structures — especially the complex *dougong* interlocking bracket system — become immediately clear.

"Visiting the original sites gives you a sense of how the architecture blends with the surrounding mountains and streets, while the miniature models offer a completely different perspective, allowing you to closely examine the construction techniques," he adds.

Liao Dynasty wooden structures inherited the robust style of the Tang Dynasty (618-907) and incorporated the intricate elegance of the Song Dynasty (960-1127), holding a significant place in the history of ancient Chinese architecture.

Renowned architect Liang Sicheng once described these buildings as "millennial national treasures".

Today, only eight complete Liao Dynasty wooden structures remain in China — the Mahavira Hall of the Shanhua Temple, and the Bhagavad Sutra Hall of the Huayan Temple, both in Datong, and the Wooden Pagoda of the Fogong Temple in Yingxian county, all in Shanxi province; the Manjusri Hall of the Geyuan Temple in Laiyuan county, and the Mahavira Hall of the Kaishan Temple in Gaobeidian city in Hebei province; the Guanyin Pavilion and the gate of the Dule Temple in Tianjin's Jizhou district; and the Mahavira Hall of the Fenguo Temple in Yixian county, Liaoning province.

A young visitor looks at a model of the Guanyin Pavilion of Tianjin's Dule Temple at the exhibition. ZHU XINGXIN / CHINA DAILY

"With two national-level precious relic sites — the Mahavira Hall of the Shanhua Temple and the Bhagavad Sutra Hall of Huayan Temple, Datong naturally bears the responsibility of preserving this architectural heritage and passing on its construction techniques," Yin Xuenian, director of the city's cultural relics bureau, said at the exhibition's opening ceremony.

"In recent years, Datong has been actively promoting the restoration, research, and utilization of ancient buildings from the Liao and Jin (1115-1234) dynasties, continuously improving the protection system for cultural relics, exploring the craftsmanship and architectural philosophy embedded in Liao buildings, and breathing new life into these thousand-year-old masterpieces."

The exhibition showcases physical models of the "eight great Liao structures", covering eight major ancient construction techniques, including brickwork, tilework, stonework, large woodwork, small woodwork, ridge decoration, and ironwork.

It also displays traditional building tools, offering visitors a comprehensive look at the craftsmanship and aesthetic principles behind ancient Chinese architecture.

Wang Xiaolong, deputy director of Shanxi Academy of Ancient Building and Painted Sculpture & Fresco Preservation, says Liao Dynasty wooden structures represent a crucial stage in the evolution of Chinese architecture and reflect the cultural integration of multiple ethnic groups.

"The 'eight great Liao structures' are essential benchmarks for the study of architectural styles and historical periods," he says. "Shanxi preserves three of the finest surviving Liao buildings, each possessing exceptional architectural and research value.

"Timber-frame construction, defined by its wooden framework, *dougong* bracket system and mortise-and-tenon joints, is one of the most distinctive achievements of Chinese civilization," he says. "The Yingxian Wooden Pagoda, for example, demonstrates remarkable innovation through its alternating bright and hidden structural layers, reflecting ancient builders' exploration of stability in tall wooden buildings."

Treasure house

Shanxi is widely regarded as a treasure house of ancient Chinese architecture. According to Wang, every major surviving Tang Dynasty timber structure is located in the province, and wooden structures from the Five Dynasties and Ten Kingdoms (907-960) period, Song Dynasty, Jin Dynasty (1115-1234), and Yuan Dynasty (1271-1368) here account for more than 70 percent of the nation's surviving examples from each period.

Wooden structures from before the Yuan Dynasty make up 82.5 percent of the national total.

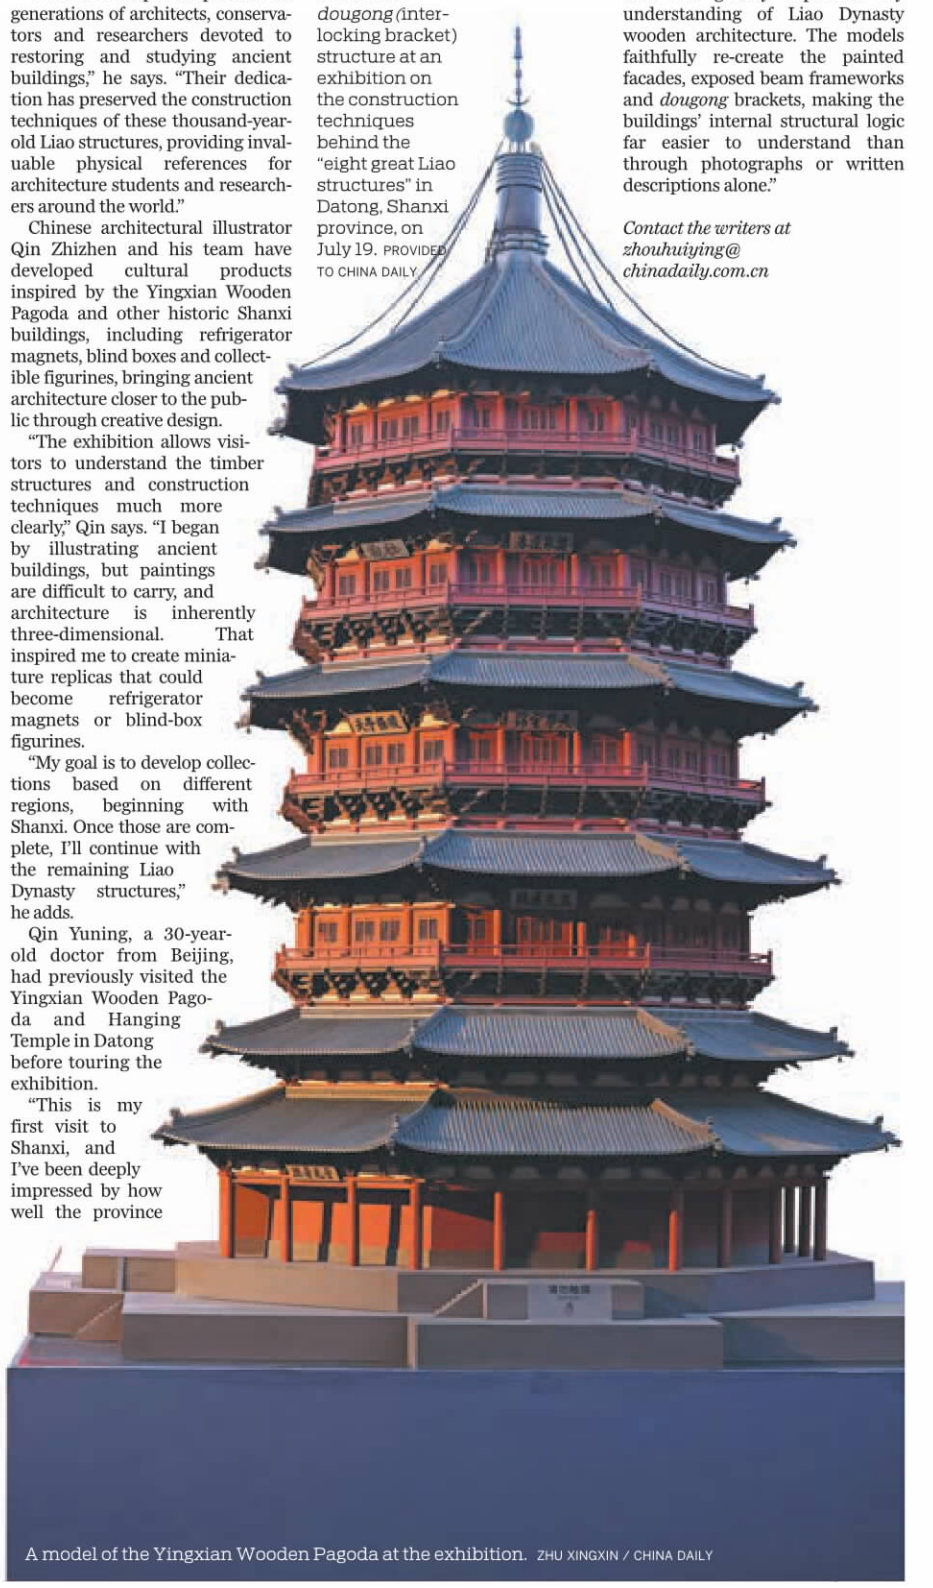
"Although Shanxi also has the largest number of surviving Liao Dynasty wooden structures, they account for only 37.5 percent of the national total," Wang says. "The province's three surviving examples are exceptionally valuable and were included among China's first group of nationally protected cultural relics in 1961."

As a young architectural creator and international cultural communicator, Yaputra believes the preservation of ancient architecture should resonate with today's generation.

"Young people today cannot simply repeat the construction methods of ancient craftsmen," he says. "Every era has its own cultural mission, and new technologies and fresh perspectives are how contemporary society can continue this cultural legacy.

"I have the deepest respect for the generations of architects, conservators and researchers devoted to restoring and studying ancient buildings," he says. "Their dedication has preserved the construction techniques of these thousand-year-old Liao structures, providing invaluable physical references for architecture students and researchers around the world."

Chinese architectural illustrator Qin Zhizhen and his team have developed cultural products inspired by the Yingxian Wooden Pagoda and other historic Shanxi buildings, including refrigerator magnets, blind boxes and collectible figurines, bringing ancient architecture closer to the public through creative design.



"The exhibition allows visitors to understand the timber structures and construction techniques much more clearly," Qin says. "I began by illustrating ancient buildings, but paintings are difficult to carry, and architecture is inherently three-dimensional. That inspired me to create miniature replicas that could become refrigerator magnets or blind-box figurines.

"My goal is to develop collections based on different regions, beginning with Shanxi. Once those are complete, I'll continue with the remaining Liao Dynasty structures," he adds.

Qin Yuning, a 30-year-old doctor from Beijing, had previously visited the Yingxian Wooden Pagoda and Hanging Temple in Datong before touring the exhibition.

"This is my first visit to Shanxi, and I've been deeply impressed by how well the province has preserved its ancient architectural heritage," he says. "The exhibition has greatly expanded my understanding of Liao Dynasty wooden architecture. The models faithfully re-create the painted facades, exposed beam frameworks and *dougong* brackets, making the buildings' internal structural logic far easier to understand than through photographs or written descriptions alone."

China's scenic peaks welcome a new robotic workforce

JINAN — On the misty stone trails of Mount Tai in East China's Shandong province, an unusual new worker is turning heads. A robotic dog now carries supplies uphill and hauls waste back down, blending cutting-edge technology with one of China's oldest pilgrimage routes.

About a meter long and finished in silver-gray, the four-legged robot climbs the mountain's steep stone steps with remarkable stability. Strapped to its back is a bulging nylon canvas bag filled with bottled water. Moving at a constant pace alongside tourists, this four-legged machine is not a sci-fi prop, but the latest member of the mountain's workforce.

Famed for its challenging terrain, Mount Tai has relied on human porters for centuries to transport goods. Now, robotic dogs are taking on part of that physically demanding work.

Despite its compact size, the machine can carry a static load of up to 120 kilograms and operates for four to six hours on a single charge. Equipped with high-resolution cameras, LiDAR, and multiple sensors, it can detect obstacles and negotiate slopes of up to 45 degrees, according to officials at the scenic area.

The technology is also helping tackle a long-standing environmental challenge. Mount Tai generates about 24,000 metric tons of waste every year, and removing it across the rugged landscape has traditionally depended on manual labor.

"The robotic dog is expected to significantly reduce physical strain while improving efficiency," says Wang Yunpeng, a manager at the scenic area.

Each trip carries 30 to 45 kilograms — similar to what a human porter would transport. With quick battery replacements, the robot can keep working throughout the day. Since entering service, it has also become a tourist attraction, with hikers regularly stopping to photograph its sure-footed climb.

A robotic dog that would be deployed to deliver heavy loads including garbage on a test run at the Mount Tai scenic area in Tai'an, Shandong province, in 2024. SUI XIANG / XINHUA

Posing for a picture alongside the robotic dog, Wang Liang, a visitor from Qingdao, Shandong province, says he hopes the machine will see continuous upgrades to better serve Mount Tai's tourism.

The robotic dog is part of the broader Smart Mount Tai initiative. Last year, the scenic area introduced AI-powered climbing exoskeletons, among the first large-scale deployments of the technology in tourism.

Weighing just 1.8 kilograms, the wearable device uses artificial intelligence algorithms to reduce a climber's physical effort by over 30 percent.

These technological integrations are part of a comprehensive digital transformation at Mount Tai, which has incorporated AI, IoT, cloud computing and VR/AR to build an intelligent management system covering fire dispatch, crowd control and smart tourism services.

This localized evolution aligns with China's broader push to integrate AI into daily life and key industries, a strategy outlined in national guidelines last year. The AI Plus Initiative targets extensive AI adoption across six key areas by 2027: technology, industry, consumption, social services, governance and global cooperation.

Other scenic destinations are moving in the same direction. At Mount Huangshan in Anhui province, AI travel assistants, cargo drones and climbing exoskeletons have already been introduced.

In Hangzhou, East China's Zhejiang province, tourism departments have introduced biomimetic robotic fish to West Lake, one of China's most iconic and historic scenic destinations. This autonomous device patrols the water to monitor temperature and pH levels, detect invasive species, and transmit real-time ecological data to command centers.

Together, these projects illustrate how AI is rapidly moving beyond research labs and into practical, everyday use across China's tourism sector.

SPORTS

BASKETBALL

Just like LeBron James on July 26, back in 2019, first baseman Bryce Harper chose Philadelphia in free agency. He led the Phillies to the 2022 World Series, but couldn't quite finish the job. "The city loves a winner," Harper said of the 76ers' new signing. **Inset:** James, then with the Los Angeles Lakers, talks with Philadelphia 76ers' forward Joel Embiid (right) after an NBA game in 2022.
AFP / AP

Like Harper, James wants to win Philly a title

Both chose the city as free agents on a mission to fulfill their respective teams' championship ambitions

LeBron James and Bryce Harper spent their careers on a parallel path toward stardom.

They were teenage phenoms who graced the cover of Sports Illustrated (back when magazines were cool) and both prodigies were No 1 overall draft picks straight out of high school.

When Harper earned his first chance at testing free agency, there was only one city, one contract that was right for him.

Philadelphia.

It took a few years, but Harper has some company to fight with him on the short list of top elite athletes who have signed in Philadelphia.

Harper and the Phillies in MLB.

Pete Rose and Kyle Schwarber and the Phillies.

Saquon Barkley and Reggie White and the Eagles in the NFL.

With perhaps the most significant signature to be scrawled in Philadelphia in any July since 1776, James has followed Harper from free agency to Philly, rocking the NBA and signing a two-year deal for the bargain-basement price of $8 million — only a smidge more per season than the 76ers' first-round pick Labaron Philon Jr will earn — that stamped the Sixers as the most compelling team in the league this season.

Keeping tabs on the much-hyped deal, Harper noted: "He's going to have a great couple of years here, and obviously everyone's going to expect him to win a championship here like everywhere else."

"So nothing new for him. He's had all the pressure since he was in high school, or younger than that."

Here's the difference between James and all the superstars in the city that played before him.

He's LeBron James.

Meaning, his reach is so far beyond the court — from fame around the globe and his bank account, to the cash register and pop culture — that there is no fair comparison. He is No 4 on Forbes' real-time list of wealthiest athletes at $1.4 billion, so his pay cut may not even be noticed in the ledger book. James has commercials and movie roles, and endorsement deals that alone would out-earn every single player on the Sixers.

Joel Embiid, league MVP and two-time scoring champ. He's not LeBron.

Jaylen Brown, NBA Finals MVP and champion. He's not LeBron.

Tyrese Maxey, an All-Star and the real franchise player in Philly. He's not LeBron.

"I think it's pretty cool to have one of the greatest basketball players ever to play in the same city," Phillies shortstop Trea Turner said. "So I'm excited for those who haven't gotten a chance to see him play."

Who those people might be is anyone's guess. James is a 22-time All-Star, a 21-time All-NBA selection, a four-time Most Valuable Player, a four-time NBA Finals MVP, a three-time All-Star Game MVP, and was a member of the NBA's 75th anniversary team.

Back in 2018, three billboards near a highway in Cleveland tried to entice LeBron James, then with the Cleveland Cavaliers, to sign for Philadelphia. Eight years on, and it seems James finally took notice. AP

He's also coming off a season where he averaged 20.9 points, 6.1 rebounds and 7.2 assists per game. For his career, he's averaged 26.8 points, 7.5 rebounds and 7.4 assists in more than 1,600 games.

"He's played in big markets before," Harper said. "He knows exactly what he needs to do."

Harper has largely lived up to the 13-year, $330 million contract signed ahead of the 2019 season, when he spurned the Washington Nationals for the Phillies and owned the richest contract in baseball history. He led the Phillies to the 2022 World Series, but came away empty-handed, won the National League's MVP award in 2021 and helped win back-to-back NL East titles.

Barkley rushed for more than 2,000 yards in his first season with the Eagles and led them to a Super Bowl championship, and Rose was the missing piece to help Hall of Famers Mike Schmidt and Steve Carlton win the Phillies a World Series in 1980 — the first MLB title in the franchise's history.

The 76ers have almost seemed to wait as long for a parade down Broad Street.

They have won titles in Philadelphia in only 1967 and 1983 and have improbably failed to advance out of the second round of the Eastern Conference playoffs since 2001.

And yet, somehow, one of the most famous athletes — strike that, people — walking and dunking in America today decided he wanted to play in Philadelphia.

"I'm not going for money. I'm not going for family," James posted on social media on July 24. "What am I really playing for at this point? I still want to sacrifice. I still want to work. I still want to grind. I still want to compete, to win and to have a chance at the feeling of winning."

James celebrated his decision on Instagram with a career highlight reel set to Philadelphia rapper Meek Mill's *Dreams and Nightmares*, the adopted sports anthem of the city's teams that is blasted ad nauseam throughout Philly's respective sports complexes.

The video ends with the lyric, "hold up, wait a minute. Y'all thought I was finished?" and cuts to a 76ers' logo.

James isn't finished — even if his best isn't yet to come.

He won NBA titles at each of his three previous NBA stops in Cleveland, Miami and the Los Angeles Lakers and could be the first player to ever win a title with four teams.

The countdown to opening night is on.

The stakes have really never been higher for the franchise. If they can't win with LeBron, Embiid, Brown and Maxey — can they ever?

Get ready, everyone.

And skip the advice.

James doesn't need any tips on surviving the deep fryer of fandom in Philly.

"He can do whatever the hell he wants," Harper said.

"But the city loves a winner. So win."

AP

RUGBY

Lafaele was a star for Japan, now he's not sure he belongs

TOKYO — Timothy Lafaele is among the many rugby players who have not only made their lives and playing careers in Japan, but hold Japanese passports, even though they were born outside the country.

In Lafaele's case, he has played 28 times for Japan's national team, including a monumental victory over Ireland in the 2019 Rugby World Cup, which Japan hosted.

He was a star back then, as Japan's rugby prowess shocked many.

But, under new rules proposed by local rugby officials that are set to go into effect in December when the Japan Rugby League One season opens, Lafaele and the others will be classed as foreigners, clouding their future in Japan.

This will limit their playing opportunities on domestic teams where Japan-born players are given preference.

Seiji Makino, a lawyer who is representing 24 players in a suit pending before several Japanese courts, said he's hopeful changes can be made before the season opens — through the courts or through negotiations with rugby officials.

"This is a very simple story," Makino said Thursday. "It is about players who built their lives and careers in Japan under one set of rules and are now having the ground moved from under their feet."

He and Lafaele spoke on Thursday in Tokyo at a news conference hosted by the Foreign Correspondents' Club of Japan.

Lafaele said the rule change came "out of the blue".

He declined to discuss any link to current politics around immigration in Japan, and also declined to talk about the effect on his contract.

The rugby rule change comes as Japanese Prime Minister Sanae Takaichi has been pushing tougher policies on immigration and foreigners. Many Japanese complain of struggling with stagnant salaries and rising prices — and some link it to a surge in foreigners to sustain a shrinking workforce as Japan's aging population declines.

> It quite saddens us. To come to Japan, having given so much to the rugby here and the community, and being treated this way, it just saddens us."
>
> **Timothy Lafaele,** on Japanese rugby's changing eligibility rules

Lafaele, who is Samoan-born, came to Japan at 18, played for a Japanese university and now has a Japanese passport.

But that's no longer good enough to guarantee playing time in Japanese rugby's top professional league.

The new rules specify that players had to reside in Japan for "at least six of nine years" of elementary and junior high school to qualify for the highest category of eligibility.

"I probably could answer for all the boys that are represented on this case," Lafaele said.

"It quite saddens us. To come to Japan, having given so much to the rugby here and the community, and being treated this way, it just saddens us."

Lafaele added. "To me, when this rule first came, I did feel insulted."

Of the 24 players who filed the case, only five want to be identified. Many fear that speaking out could cause more problems.

Makino was asked if there was a racial element to the new rules, and he said he didn't think "of it as racism" at the core of the dispute.

Players, though, are left in the lurch wondering about their future.

"It's been a hard time for the players these last couple of months," Lafaele said. "Some players are forced into retirement. Some players are just waiting at home at the moment for this decision to change so they can have the opportunity to provide for their families and get playing contracts. It's been a tough time for most of the players."

Many sports bodies across the globe consistently bend eligibility rules for commercial reasons, or to gain a competitive edge, and changing eligibility rules often faces pushback, particularly when local players seem to be sidelined.

Japanese rugby officials say the player pool of Japan-born players is shrinking, and limiting foreigners will help boost it.

Lafaele said he supports the idea of nurturing more native players, but doubts limiting the foreign influence will help.

"I don't think kids will look at this competition and say 'there are too many foreigners, I'll stop playing,'" Lafaele said.

"I see both sides of it. I see where the Japanese boys are coming from. They see it as more opportunities for them to play."

By Jeppe Søe

Narrative a comforting illusion for bruised egos

Before visiting Wuhan, I carried an image of the city shaped largely by distant impressions and secondhand narratives. I expected a place defined by concrete, technology and surveillance. Instead, I found something far more familiar: neighbors sharing food, children playing and people gathering in courtyards between apartment buildings.

The experience revealed a simple truth: distance is not always measured in miles. Sometimes it is created by the assumptions we carry about people and places we do not truly know.

That same distance is now shaping the way nations see one another. We have replaced genuine global cooperation with silent trenches and protectionist walls. We have stopped talking to each other. Instead, we are exclusively talking about each other.

If you listen to the political debates in Western Europe right now, the narrative around China is too often reduced to a trade deficit and supply surplus. It is a comforting illusion that nurses our bruised egos. Since Europe lags severely behind in artificial intelligence and other technologies, we console ourselves with arrogance.

A TRIP TO PINGSHAN MOUNTAIN WILL REALLY FLOAT YOUR BOAT

Overseas tourists looking to escape sweltering summer temperatures are discovering a slice of paradise in a Hubei province canyon

By LI LEI in Beijing and **LIU KUN** in Enshi, Hubei

Jonathan Ng, a 37-year-old financier from Singapore, had never heard of Enshi in Hubei province until a social media clip caught his eye.

The footage showed a wooden boat drifting across water so crystalline that it seemed to float in midair, flanked by sheer karst cliffs — a scene reminiscent of Malaysia's famed Semporna archipelago.

But it was the climate that sealed the deal. With summer averaging just 22 C — a welcome respite from Singapore's tropical heat — he booked a flight within weeks.

After touring Pingshan Canyon, Ng was full of praise. "The boat ride, the scenery, the cool air — it was all stunning," he said, adding that he would recommend it as a summer escape to friends back home.

Ng is part of a growing tide of travelers fleeing sweltering city summers for wallet-friendly cool retreats in China. With temperate climes and tour packages costing a fraction of those in Semporna, Enshi stands out as a particularly tempting option.

The canyon's signature attraction is the "suspended boat" effect, created by exceptionally clear water and narrow cliff walls that minimize surface ripples.

Chen Kun, operations director at the Pingshan Canyon scenic area, has repeatedly witnessed how the canyon overwhelms first-time foreign visitors. Many arrive having seen its "China's Semporna" nickname on social media, but the actual experience, he said, far exceeds the online hype.

"Most people stop in their tracks and fall silent," Chen said. "They look down at the water, then up at the boat, checking the reflection again and again, and say it feels like it's floating in the sky — like a sci-fi movie."

He added that nearly all foreign guests immediately reach for cameras or drones, jockeying for the perfect light. European and US photography enthusiasts sometimes linger for one to two hours just to capture the ideal shot. Many share their footage in real time during their visit and continue posting on YouTube, Instagram and Facebook long after they have left.

"The feedback is unanimous," Chen said. "Pingshan is an unparalleled wonder — karst cliffs, primeval forest and crystalline water all in one, with no equal anywhere else."

XI'S VISION | EAST-WEST COLLABORATION

Once-barren region now a growth hub

Xi's long-term view for Ningxia partnership plan helped turn area into land of prosperity

By XU WEI, HU DONGMEI and **ZHANG CHUNYAN** in Yongning county, Ningxia

Even today, Hai Guobao still vividly remembers the moment his family first stepped into their new home in Minning township more than a decade ago.

The family moved into a house in the new settlement near the Helan Mountains in the Ningxia Hui autonomous region, where rows of brick homes and broad, paved roads stood in sharp contrast to the rugged mountain villages they had left behind.

After the long journey from Xihaigu, long known as one of China's harshest environments for human settlement, his family paused at the doorway before doing anything else.

Inside, they tested the most basic features first: a switch on the wall, then a tap in the kitchen. A light came on. Water flowed immediately. "We could never have imagined it even in our dreams," Hai recalled. "It was the first time we were leaving our home in Xihaigu for good. Many of us shed tears — both out of sadness and hope."

For his family, that moment marked the end of a way of life defined by scarcity. In Xihaigu, drinking water seeped through cracks in the rocks and had to be carried long distances back to villages scattered across steep hillsides. Droughts frequently brought crop failures, trapping generations of families in a cycle of hardship.

Hai's journey to Minning was part of a vision first set in motion nearly three decades earlier. In 1996, Fujian province and Ningxia were paired under a national poverty-reduction initiative designed to channel resources, investment and expertise from China's more developed eastern coast to its less developed western interior.

Xi Jinping, then deputy secretary of the Communist Party of China Fujian Provincial Committee, played a leading role in advancing the cooperation mechanism.

During a research trip to Ningxia in April 1997, Xi visited a relocation site in Xiji county, where he proposed building what would become Minning township. He called for pooling resources and investment to create a model of Fujian-Ningxia cooperation, whereby relocated residents could move out of the mountains, settle down and build prosperous lives.

At a Fujian-Ningxia poverty alleviation coordination meeting in 1998, Xi stressed that the partnership should focus on meeting the basic needs of poor residents.

In the years that followed, he continued to advocate expanding cooperation, innovating assistance mechanisms and broadening participation, laying the groundwork for a partnership that evolved from poverty relief to long-term regional development.

The idea gradually took shape at the foot of the Helan Mountains. Waves of migrants left Xihaigu for Minning, where irrigation from the Yellow River turned arid land into farmland and where new roads, schools, clinics and homes replaced the barren landscape.

Over the past three decades, Fujian has provided 7.68 billion yuan ($1.14 billion) in assistance funding for infrastructure projects in Ningxia's formerly impoverished areas and encouraged more than 1,600 enterprises to invest in the region, bringing over 100 billion yuan in actual investment.

The impact has been profound. According to Wang Jian, head of Ningxia's regional department of agriculture and rural affairs, all 803,000 rural residents who once lived below the poverty line in the region have been lifted out of poverty. Xihaigu has shed its long-standing reputation for extreme hardship, while 1.13 million people have gained access to safe drinking water.

Annual per capita disposable income for rural residents in Ningxia has risen from about 1,400 yuan in 1996 to more than 20,000 yuan in 2025.

Intervention on yen seen as short-term fix

By HOU JUNJIE in Tokyo
houjunjie@chinadaily.com.cn

The first coordinated intervention by the United States and Japan in 15 years to prop up the Japanese yen can only offer the currency a temporary boost, as reversing the yen's long-term downward trajectory will require broader fiscal and monetary policy adjustments, experts said.

They made the remarks after Japanese Finance Minister Satsuki Katayama confirmed on Monday that Japan conducted a coordinated yen-buying intervention with the US Department of Treasury on Friday. The move was aimed at countering "excessive volatility and disorderly movements", she said, adding that Japan "will not hesitate to conduct further coordinated interventions in the future" and remains in close communication with the US Treasury.

At 5 pm on Monday, the yen strengthened to 156.76 against the dollar after briefly hitting 155.20, its strongest level since early May.

US President Donald Trump said on Sunday that the US intervened in Japan's currency market on its request to boost the weakening yen.

Data from the Bank of Japan, the country's central bank, indicated that Tokyo may have sold almost $59 billion to buy yen when it intervened in New York markets on Thursday, before the joint move.

The yen has been under sustained pressure this year, weakening to around 164 per dollar in late July, a 40-year low. The Japanese government and the central bank carried out large-scale yen-buying interventions between late April and May. However, the effects quickly faded, and the yen continued to decline.

Joint intervention by Japan and the US is extremely rare outside periods of financial crises or major disasters. The last such action took place in 2011, when the yen surged following the Great East Japan Earthquake.

Naomi Muguruma, chief bond strategist at Mitsubishi UFJ Morgan Stanley Securities, said the coordinated intervention reflects growing concerns in Japan and the US over the yen's rapid depreciation.

The yen's depreciation stems from concerns over Japan's fiscal expansion and the perception that its central bank is "behind the curve" on interest rate hikes, she said, adding that currency intervention could only provide temporary relief without addressing the underlying causes.

Takahide Kiuchi, executive economist at Nomura Research Institute, said that strengthening the yen and sustaining that strength would require improved economic fundamentals or weaker expectations of further US Federal Reserve rate hikes.

To ease market concerns over Japan's fiscal outlook, Kiuchi said the government should present a stable funding source for its planned consumption tax cut and dispel the notion that it has pressured the central bank into delaying further rate hikes.

In late July, Japanese Prime Minister Sanae Takaichi unveiled a plan to reduce the consumption tax on food and beverages from 8 percent to 1 percent for a two-year period starting in April 2027. The measure, which is aimed at mitigating the impact of rising prices, has sparked a debate within the ruling coalition and among opposition parties over the absence of a clear alternative source of revenue.

Masafumi Yamamoto, chief foreign exchange strategist at Mizuho Securities, told the Asahi Shimbun newspaper that the joint intervention appears to be intended to slow the yen's decline while leaving the broader policy stance of the Takaichi administration unchanged.

The move could buy time against the yen's rapid depreciation and help avoid inflation that could weigh on the government's approval ratings, he said, but warned that the pressure on the yen would continue unless broader fiscal and monetary policy concerns were addressed.

Chinese wines' potential uncorked in Australia

Restaurants, sommeliers and sellers trumpet international quality of Ningxia varieties

Chinese wines from Ningxia are displayed at a bottle shop in Perth, the capital of Western Australia.

By **XIN XIN** and **ALEXIS HOOI** in Sydney

In June, Australian wine shop owner Ann Marie Tamburri made a personal trip to Northwest China's Ningxia Hui autonomous region and visited five wineries in two days.

"I was curious and wanted to learn more. So I paid for my own trip there," said Tamburri, who owns the La Vigna wine and liquor store in Perth, Western Australia.

Tamburri's interest in Chinese wines began when she first tried them about a year ago.

"We tasted about 18 wines from China. We were impressed with some of the wines ... They're outstanding," she said. "We were curious to know more, and that's how it started. And so from there, we went on to list some (Chinese) wines in our wine shop."

Her positive take reflects how one of China's top winemaking areas is making headway in Australia, a leading player in the global industry.

Niu Xiaotong, general manager of Australia Northwest Liquor Trading company in Perth, promotes wines from the eastern foothills of the Helan Mountains in Ningxia.

Reaping the rewards from decades of major investment, the winemaking hub in Ningxia's capital, Yinchuan, with its high-altitude, desert-like climate near the Yellow River, has won international acclaim for its products.

Niu, who introduced Ningxia wines to Tamburri, said Western Australia's strong economy and consumer purchasing power made it a suitable location to introduce the region's premium wines.

He started promoting Chinese wines in Australia in October 2023, when the first shipment of Ningxia samples, including about 200 cases, arrived in the country.

"After about a year and a half of market promotion, research, and exploration, we selected 18 products from the initial range and shipped another 803 cases to Australia in mid-2025," Niu said.

By then, the number of distributors selling Ningxia wines had grown to 86 across Australia, covering mainly local bottle shops, fine dining restaurants, and wine bars, he said.

"At present, we are the largest importer and wholesaler of Chinese wines in Australia."

Niu said another key reason Ningxia wines have been relatively well received in Western Australia is their similarity to local wine styles.

"Australian wines are generally known for their prominent floral and fruit aromas, approachable style, and easy-drinking characteristics, while wines from the eastern foothills of the Helan Mountains share some similarities with those from Western Australia's renowned Margaret River region," he said.

The advantage of Ningxia wines in Australia lies in their novelty. They also satisfy the curiosity of many local consumers, he said, adding that the differences in grape varieties and winemaking methods allow Ningxia wines to complement Australian ones.

Experts impressed

Gianmattia Giordano, group sommelier for Hunter Street Hospitality, which is behind award-winning, high-end restaurants in Sydney, Melbourne, and Perth, said the company recently introduced a selection of Chinese wines. Diners can explore not only Ningxia's wines but other leading Chinese products.

While it is a relatively new category, awareness is growing and Chinese wines have generated strong interest, particularly in Australia's sommelier community, he said.

"We believe it's important to showcase outstanding wines regardless of where they come from, and Ningxia has established itself as one of the world's most exciting emerging wine regions," he said.

"Ningxia's high altitude, dry climate and significant day-to-night temperature variation produce wines with concentrated fruit, fresh acidity and well-structured tannins," Giordano said.

The region is best known for its cabernet sauvignon and French Bordeaux-style wine blends, although varieties such as marselan are also showing great promise, he said.

"One of Ningxia's greatest strengths is that it combines exceptional natural resources with the expertise of leading winemakers and viticulturists from around the world, many of whom have been drawn to the region's potential and are helping shape its evolution into a world-class fine wine region," Giordano said.

Jase Wong, owner of Shanghai-inspired Modu Bar and Kitchen in Perth, said it introduced Ningxia wines this year as part of its commitment to showcase the diversity of modern Chinese food and beverages.

"As an Asian fusion venue, we wanted our wine program to go beyond the familiar and offer guests something unique that complements our cuisine," he said.

"We currently feature a selection of premium wineries from Ningxia, with an emphasis on cabernet sauvignon blends that pair well with our menu."

Tamburri said one of the things that stood out during her Ningxia visit was the strong presence of women winemakers.

Many were entrepreneurial, had studied or worked overseas, and were bringing international experience back to their own estates.

There is also a cultural shift in Ningxia, similar to what is happening in Australia, with younger winemakers "beating the drums for the region", she said.

Feedback from her customers has been very positive, she said. Many didn't know that China produces wine, where Ningxia is located, or even that there was a wine region in China, she said.

Tamburri said customers became interested after she explained the story behind the wines and were pleasantly surprised by how good and well-made they were, which she described as "the exciting part for us as retailers".

"Consumers are coming back and repurchasing, like they would any wines from other international regions."

Rapid development

Ningxia's wine industry has recorded rapid development in recent years, with the Helan Mountains area now producing 140 million bottles a year, nearly half of China's total estate wine production, according to regional statistics.

Last year, Ningxia's wine exports reached about 14.49 million yuan ($2.14 million), a year-on-year increase of more than 5 percent.

Gao Tianshu, director of the marketing division of the management committee of the Ningxia Helan Mountain East Foothill Wine Industry Park, said as the region pursues high-quality development and greater international openness, Australia provides many benefits.

Rather than simply viewing Australia as an export market, Ningxia sees it as an important platform for benchmarking against international standards, strengthening two-way exchanges, and expanding its overseas presence, he said.

Ningxia can learn from Australia's well-established wine industry, while the Australian market itself offers many advantages, including a mature consumer base, Gao said.

China is the top destination market by value for the Australian wine sector, accounting for 36 percent of exports in 2024-25, according to statutory authority Wine Australia.

"In recent years, China-Australia economic and trade ties have continued to recover, bilateral exchanges have become smoother, and the overall export environment has steadily improved, creating favorable external conditions for us to further develop the Australian market," Gao said.

Ningxia's short-term goal is to establish a solid presence in mainstream local sales channels and promote the brand of wines from the eastern foothills of the Helan Mountains, he said.

They will be marketed as a distinctive expression of "Eastern terroir" — a combination of soil, climate and sunlight that gives grapes their distinctive character.

In the longer term, Ningxia hopes to leverage Australia's mature and well-regulated market to develop a replicable overseas marketing and operating model, he said.

This will also help accumulate international experience, and support establishing the eastern foothills area as a world-renowned wine region.

A pleasant alternative

Michael Tamburri, Ann Marie's father and former chair of the International Wine and Food Society's Asia-Pacific zone, said marketing Chinese wines to Australian consumers is a crucial step in the expansion of the Chinese industry.

Varieties like marselan that go beyond the strong, heavier styles of cabernet and shiraz that are popular in Australia, could gain a foothold if appropriately priced.

"They (buyers) shouldn't think they're going to get an Australian wine, they've got to think traditional, very well-made Chinese wines," he said.

He also praised Chinese white wine varieties as "very good". "They're very fresh and modern. White wine can be a little bit more delicate, a little softer, easier, and it goes well with all foods, especially Asian cuisine," Tamburri said.

Gaining international exposure for Chinese wines will require winemaking regions like Ningxia to attract tourists to witness the impressive development of the sector, he added.

"China is the best place in the world to see all of that ... Their vineyard management, nothing compares to it," he said, citing the example of how Ningxia grape growers bury their vines in the ground every winter to shield them from the extreme cold.

"It's an incredible practice, but also an incredible story," he said.

Giordano from Hunter Street Hospitality said compared with Australian cabernet wines, those from Ningxia often have a slightly more restrained style, with firm structure, freshness, and excellent aging potential.

"While they remain distinctly Chinese in identity, they are increasingly demonstrating the precision, complexity, and sense of place expected of the world's leading wine regions," he said, adding that Sydney, one of Australia's most dynamic dining and wine scenes, is an ideal city to introduce emerging wine regions.

Educating the public

Restaurants with experienced sommelier teams can educate guests, recommend pairings with food, and build confidence in the category, he said.

Premium dining venues are often where consumers first discover new wine regions before they become more widely recognized.

"Including myself, we're still quite new to the world of Chinese wines," Giordano said. "My sommelier team, our guests, and I, are all on a journey of discovery, and that's what makes it so exciting."

"We want to explore these wines and support what we believe is one of the most promising emerging wine regions in the world. While there's still a lot for us to learn, we're eager to deepen our understanding and share that experience with our guests," he said.

Wong, from Modu Bar and Kitchen, said, the restaurant's philosophy is to celebrate contemporary Asian flavors while respecting tradition. "Ningxia wines align perfectly with that vision — they represent a new generation of Chinese craftsmanship that is innovative, ambitious, and world-class," he said.

Offering Ningxia wines allows Modu to introduce diners to another side of China beyond its cuisine, creating a more complete dining experience and encouraging cultural discovery through food and wine, he said.

Compared with many Australian reds, Ningxia wines often show greater freshness and elegance while still offering good structure. Wong described them as sitting somewhere between the richness of some New World wines and the restraint often found in classic European styles.

Perth is a multicultural city with a vibrant food and wine culture. Diners are curious, adventurous, and open to trying new experiences, making it an ideal market for introducing premium Chinese wines, he said.

"Wine dinners, tasting exhibitions, and staff recommendations all play an important role in building awareness and confidence among consumers," Wong said.

As more Australians discover the quality of Ningxia wines, he believes they will receive greater recognition alongside wines from established areas like Australia, France and Italy, he said.

"The biggest challenge isn't the wine itself — it's familiarity. Some customers are initially hesitant simply because they haven't heard of Ningxia before," he said.

"Once they taste the wines and learn about the region's winemaking story, many become enthusiastic supporters and are happy to recommend them to friends."

Xi's thought resonates with Latin America

Nation's modernization path offers valuable insights for Global South, researchers say

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

There is growing interest in Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era and China's development philosophy in Latin America, driven by China's economic achievements, its expanding global role and its deepening engagement with the Global South, scholars in the region said.

Luis Antonio Paulino, a professor of international relations at Sao Paulo State University in Brazil, said the number of researchers and students interested in different aspects of Chinese development, culture and Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era has increased exponentially in recent years.

"In Brazil, we have a research network on China, with over 500 members from across the country, and new members apply every month.

"All major Brazilian universities house centers for China studies, and the publication of books and articles on China by the Brazilian academic community has increased significantly in recent years," he said.

Paulino attributed the growing interest to China's development achievements and its vision for international cooperation.

"There is growing recognition and acceptance of President Xi Jinping's proposals for building a more peaceful and just world for all, particularly the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative," he said.

Asked which elements of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era resonate the most with Latin American audiences, Paulino pointed to issues closely linked to the region's development priorities.

For Gustavo Alejandro Girado, director of the postgraduate program on contemporary China studies at the National University of Lanus in Argentina, Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era offers a framework for understanding China's long-term vision and its approach to international relations.

"President Xi's thinking is a valuable tool available for us in Latin America to better understand the thinking of the leadership of the world's second-largest economy," Girado said.

"It is an excellent collection of solid and well-structured arguments that summarizes what China intends for itself and for the rest of the world," he added.

He said that Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era helps explain China's priorities in its engagement with developing countries.

Discussing the significance of China's role in global governance, Girado argued that many developing countries are seeking new approaches after decades of uneven development.

"The current global governance models haven't helped us escape poverty and destitution, nor have they improved income distribution.

"This is why China's presence is so beneficial to us. Its presence and it becoming the voice of the voiceless are crucial to ensuring our demands are met," he said.

On Chinese modernization, Girado said that China's experience is inspiring though every country must find its own path.

"It's excellent that China allows us to observe the political and economic process it follows to achieve this modernization," he said.

"For me, it is very useful to know that 'it can be done', that there are possible paths, and that China points them out based on its own experiences," he said.

China and Latin American and Caribbean countries have deepened cooperation in the areas of trade, investment, finance, science and technology, and infrastructure, among others, in recent years. In 2015, the China-CELAC Forum, a ministerial-level dialogue between China and Latin American and Caribbean states, was established, and in May 2025, the fourth ministerial meeting of the forum was held in Beijing.

Last year, trade between China and LAC states exceeded $500 billion for the first time. The two sides also maintain close academic exchanges, which Girado sees as a bridge to foster understanding.

China narrowing gap in high-end phone memory

By **LI JIAYING**
lijiaying@chinadaily.com.cn

China is inching closer to plugging a crucial gap in high-end mobile phone memory, with the latest progress made by ChangXin Memory Technologies expected to further deepen coordination among domestic chip designers, handset makers and suppliers in the era of on-device artificial intelligence, said industry experts.

Their comments came as the Chinese company nears the end of its research and development validation for its first LPDDR6 chip — a dynamic random-access memory chip that promises more bandwidth, lower latency, better energy efficiency and stronger reliability.

As the CXMT chip eyes commercial production, experts said they believe the core design is largely settled and has undergone systematic testing for performance, power consumption, compatibility and mechanical reliability. "Under an optimistic timetable, small-batch introduction could begin as early as the second half of this year, followed by volume production in the first half of 2027," said Guo Tao, a member of the Chinese Association for Artificial Intelligence.

According to media reports, the CXMT chip is designed to reach a data rate of 12.8 gigabits per second, with a base operating rate of 10.7 Gbps when paired with a system-on-chip integrated circuit. Its power efficiency and reliability, availability and serviceability, or RAS, functions have been improved compared with the company's previous memory chips.

Guo noted that the CXMT chip is set to enter the leading group of global products in the same technology generation offered by South Korean companies Samsung and SK hynix. "There is no longer a generational gap in the technology. The main differences will lie in process stability after large-scale production and the accumulation of long-term reliability data," he said.

The CXMT chip's peak speed is expected to help meet the high-bandwidth demands of on-device AI, while stronger RAS functions could reduce data errors during sustained AI workloads, Guo added.

Jiang Han, a senior researcher at market consultancy Pangoal, said higher bandwidth could ease a key bottleneck in running large AI models locally, while lower latency would support high-frame-rate gaming and smoother multitasking.

"Flagship smartphones will be the first to generate demand, as their users are most sensitive to such performance upgrades and can afford to pay a premium," he said.

Beyond the chip's hardware specifications, local coordination is also a core strength, Jiang said. "It enables rapid customization backed by strong demand from Chinese phone manufacturers and creates a valuable market opportunity as supply-chain security gains importance."

Suicide bombing

People evacuate an injured man on Sunday after a suicide bomber struck at the site of a protest in Khyber Pakhtunkhwa Province, Pakistan. At least 19 people were killed and several others were injured in the attack. The blast occurred when protesters were demanding government action against escalating violence in the region. Bias: We must travel and disagree openly

From page 1

When we fall behind, we do not run faster or innovate more. We build legal walls, impose tariffs and try to regulate our way out of competition, convincing ourselves that we can thrive in isolation.

But reality tells a different story. Not long ago, I stood in the dusty Gobi Desert in Gansu province and looked straight into the future. I saw a massive solar thermal power plant, its central tower rising 263 meters into the sky — taller than the pylons of Denmark's proudest engineering marvel, the Great Belt Bridge. While European politicians sit at home debating whether China can invent anything of value, China is literally capturing the sun. Europe is coughing in the sand, holding on to a fading illusion of supremacy.

Yet, the geopolitical divide is not just about solar panels, AI, or supply chains; it is fundamentally about how we view humanity. When we stop conversing — because of a war in Europe, political shifts in the United States, or trade panic — we lose the concept of a shared planet. We reduce entire nations to enemy algorithms.

After my visit, some European friends asked whether Wuhan was merely a high-tech metropolis of surveillance systems and concrete towers. Their question reflected how easily a complex society can be reduced to a single image.

What I encountered was something much more ordinary and universal: people sharing meals, chatting with neighbors, raising children and building communities in the spaces between modern buildings. These moments were not uniquely Chinese; the desire for connection, belonging and warmth is equally present in everyday life in Denmark and around the world. No algorithm can fully capture these realities. They cannot be reduced to data points, headlines or political narratives.

Visiting the Hubei Provincial Museum, I looked at the incredible Bronze Bells of Marquis Yi, cast more than 2,400 years ago. I stood there thinking that China essentially invented heavy metal music 2,500 years ago. When you witness millennia of deep cultural history, you realize how foolish it is when the West treats China like a newcomer on the world stage.

But you also realize something else: Great civilizations do not grow in isolation.

In Denmark, the philosopher N.F.S. Grundtvig shaped our entire modern society. He believed that books, laws and written rules are cold and dead if they stand alone. He believed in what he called "The Living Word" — the spoken conversation between two human beings looking each other in the eyes. Grundtvig taught us that society only progresses when we dare to meet the people we strongly disagree with.

Think about how physical warmth is created. If you rub your hands together gently without touching, nothing happens. But if you press them together firmly — if you create friction — you get heat. Friction is warmth. Disagreement is energy.

When countries build trade walls or retreat behind digital and cultural boundaries, we remove the friction. We create sterile echo chambers. If Europe and China only listen to their own voices, both of our civilizations will eventually stagnate. Throughout my political career, I have advocated for listening to "everyday experts" — the people whose lived experiences are often ignored by out-of-touch political systems. On a global scale, our nations are the everyday experts of our own cultures. We must listen to each other's lived realities.

True friendship and genuine dialogue require absolute honesty. I have clearly stated that Europe has lost its way by being arrogant and using tariffs to hide its own weaknesses. But conversation is a two-way street.

China's remarkable technological and social achievements are becoming an increasingly important part of the global conversation. Continued engagement with diverse perspectives and experiences can help foster greater mutual understanding, trust and cooperation. In the long run, global influence is shaped not only by economic and technological progress, but also by the ability to connect, communicate and work with others in an increasingly interconnected world.

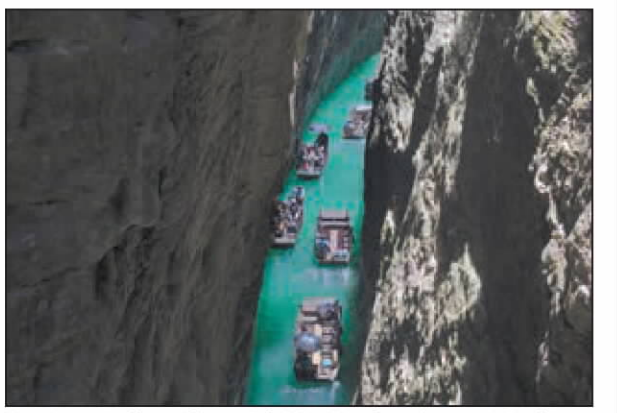
We live on a single, fragile planet currently defined by geopolitical fear. The easiest path for any politician today is to build a wall, point at foreigners, and declare self-sufficiency. But that is the road to ruin. We must choose the difficult path. We must choose the Living Word. We must travel, disagree openly, trade ideas and challenge each other's convictions face-to-face.

In the end, understanding between nations begins with understanding between people. When we take the time to meet one another face-to-face, we may discover that what connects us is far greater than what divides us.

The author is former deputy speaker in the Danish Parliament. The views do not necessarily reflect those of China Daily.

Canyon: Connectivity, services upgraded

From page 1



According to the National Immigration Administration, foreign arrivals in China hit 22.9 million in the first half of this year, a 20.4 percent year-on-year increase, while summer inbound bookings have surged more than sixfold as of July 24 — a sign of growing momentum.

That appeal is reinforced by affordability. At Pingshan, a bundled ticket covering entry and the boat ride costs 210 yuan ($31) — roughly one-fifth of a comparable day trip to Semporna, with no mandatory add-ons, according to Chen.

Ng, the Singaporean visitor, said the overall cost — from accommodations to food and transportation — was reasonable and delivered great value compared with other nature destinations.

The Pingshan Canyon scenic area said that foreign visitor numbers surged more than 60 percent year-on-year in the second quarter, with tourists from Thailand, Malaysia and Singapore accounting for over 60 percent of overseas arrivals.

Enhanced air connectivity has further propelled inbound travel. Enshi Xujiaping International Airport now operates direct flights to China's Hong Kong Special Administrative Region and seven international routes serving destinations including Seoul, Daegu and Busan in South Korea, Hanoi and Ho Chi Minh City in Vietnam, Ulaanbaatar in Mongolia and Bangkok in Thailand.

Tourists enjoy boat rides on July 15 in Pingshan Canyon in Enshi, Hubei province. YANG SHUNPI / FOR CHINA DAILY

"That combination of direct flights and visa-free access has dramatically improved convenience," said Shi Bo, deputy general manager of China Youth Travel Service's Hubei branch, which organizes inbound tours.

To accommodate the growing number of overseas visitors, Enshi's tourism bureau said that it has offered foreign-language tour guide training and talent programs to raise service standards in hotels, restaurants and transportation.

Growth: Emphasis on rural vitalization

From page 1

Minning's evolution continues to influence China's broader development agenda.

In an instruction published on June 17, President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee, called for further improving the country's east-west collaboration mechanism and urged officials to draw on the experience of Fujian-Ningxia cooperation.

He said the model had played a key role in poverty alleviation and coordinated regional development over the past three decades, calling for deeper industrial cooperation, personnel exchanges and technological collaboration while advancing rural vitalization and common prosperity.

For a younger generation, Minning represents something very different from the place their parents first encountered.

Wu Juan, a university graduate and online content creator whose family relocated from Xihaigu when she was a child, the contrast between her early memories and life today could hardly be greater.

"Before I was seven, our staple food was always potatoes," she said. "I'm not exaggerating when I say there are many kinds of fruit I had never even seen."

Water was so scarce that bathing was a luxury, she recalled.

Today, she sees a different future. "If we hadn't moved out of the mountains, we would still be scraping out a living from the land. But here, I feel there are infinite possibilities ahead," Wu said.

For Zhao Chao, head of Minning township, those opportunities are the result of decades of planning and sustained commitment.

"Over the past 30 years, we have witnessed General Secretary Xi's vision of turning a 'sandy land' into a 'land of prosperity' gradually becoming a reality," he said.

According to Zhao, the relocation strategy fundamentally addressed the dilemma that had defined Xihaigu for generations — local conditions could no longer sustain the population.

"The development of Minning did not emerge out of thin air," he said. "It reflects a deep understanding of poverty alleviation, ecological restoration and industrial development."

That confidence is increasingly being reinforced by a new chapter in Fujian-Ningxia cooperation.

The partnership is now turning its focus toward high-quality development, with green energy and the digital economy emerging as new engines of growth.

Ningxia has become one of China's fastest-growing renewable energy bases, thanks to its abundant wind and solar resources, competitive electricity prices and favorable natural conditions.

According to regional government statistics, renewable energy capacity expanded 17 percent on average annually between 2021 and 2025, reaching 57.32 million kilowatts and accounting for 63 percent of the region's total installed power capacity.

Against that backdrop, a growing number of sci-tech companies from Fujian and elsewhere are expanding their presence in Ningxia to boost their computing power resources.

Li Yuanyuan, vice-president of Xiamen Kehua Digital Energy Tech Co, said the company chose to invest in Minning because of both national development priorities and Ningxia's long-term market potential.

The region's transportation network also allows companies operating in Ningxia to serve markets across Shaanxi, Gansu and Qinghai provinces and the Xinjiang Uygur and Inner Mongolia autonomous regions.

"We hope to take root here for the long term and help Minning develop green industries," Li said.

"Our goal is to help transform what was once a sandy land into a digital golden land."

Editor's note:

In this weekly feature China Daily gives voice to Asia and its people. The stories presented come mainly from the Asia News Network (ANN), of which China Daily is among its 20 leading titles.

A boy plays on a hill as the chimneys of Suralaya coal power plant loom in the background, in Cilegon, Indonesia, in 2023. AP

Kicking up dust

Indonesia villagers pay the price for expansion of coal mining

In South Sumatra's Muara Maung village, coal mining has become an inescapable part of daily life, with expanding operations choking the community's air, land and water, leaving residents to grapple with worsening environmental degradation.

For 47-year-old Sumhayana, the impacts are impossible to escape. Since several coal mines began operating near the village, flooding has become a recurring reality.

This year alone, her home has been flooded three times. The latest deluge, in late April, inundated her neighborhood, swept away crops in her farmland, and left her house coated in 10-centimeter-thick mud.

"Flooding brings so much hardship. I spend hours cleaning my house after the water recedes, and I have to be more vigilant about diseases that usually spread during floods," she told The Jakarta Post recently.

Sumhayana said life in Muara Maung has changed profoundly as coal mining operations continue to expand around the village.

The relentless roar of coal trucks now rattles through the village day and night, shattering its once-peaceful atmosphere and leaving roads cracked and damaged under the weight of heavy vehicles.

In the dry season, clouds of coal dust billow through the village, settling on rooftops, yards and furniture, forcing residents to clean their homes almost every day. When the rains come, many roads turn into muddy, waterlogged tracks.

The nearby Kungkilan River, once the village's lifeline, is no longer fit for daily use. As its water quality has deteriorated, residents have been forced to drill wells or buy clean water instead.

Muara Maung village sits in Merapi Barat District, Lahat Regency, at the heart of one of South Sumatra's coal-producing areas.

In 2023, Lahat recorded 171 active mining permits. Mining activities, together with the 220-megawatt coal-fired power plant in the regency, have long been promoted as important pillars of the local economy and a key source of electricity for southern Sumatra.

Yet for communities living alongside these industrial operations, the benefits of development are accompanied by growing environmental pressures.

Melia Santri, a 24-year-old resident of Muara Maung, has spent years struggling with recurring allergies that she attributes to prolonged exposure to coal dust from nearby mining operations.

"It feels as though something is stuck inside my nose, like there is something trying to come out, but nothing does. It is extremely disruptive to my daily activities," she said.

Seeking relief, Melia visited the local community health center, hoping to obtain a referral to see a specialist at a hospital. Instead, she said, her request was rejected, leaving her to manage the condition on her own.

Barges loaded with coal anchor in Samarinda, East Kalimantan, Indonesia, in 2022. AP

Women shuck clams on Jan 29 in Cirebon, West Java, Indonesia, where local people have complained about the decline in marine yields since a coal power plant began operations. BAY ISMOYO / AFP

> "Flooding brings so much hardship. I spend hours cleaning my house after the water recedes, and I have to be more vigilant about diseases that usually spread during floods."
>
> **Sumhayana,** a resident in South Sumatra's Muara Maung village which is influenced by coal mining

Frustrated by the worsening environmental impacts of coal mining around Muara Maung, Sumhayana and other villagers visited PT Muara Alam Sejahtera, or PT MAS, one of three coal mining companies operating near the village, on July 16. The residents urged the company to take responsibility and help address the recurring floods that have plagued the community for years.

Compensation demand

During a meeting with PT MAS representatives and officials from two other mining companies who later joined the discussion, villagers called for compensation, river normalization and the construction of flood barriers to reduce the risk of future flooding.

Sumhayana said the companies' response left villagers disappointed. Instead of offering immediate solutions, she said, representatives asked for a week to consult with their respective management teams.

"I was disappointed with their response. Flooding has happened repeatedly. They should have acted faster. It has been ignored for months, and now they are delaying it again," Sumhayana said.

The Jakarta Post contacted PT MAS seeking clarification on Muara Maung residents' complaints about flooding and environmental impact. The company confirmed the July 16 meeting with residents but declined to address the specific concerns raised.

According to Statistics Indonesia, the country exported roughly 524 million metric tons of coal for all uses in 2025. Data from the International Energy Agency confirms Indonesia holds its spot as the world's largest exporter of thermal coal used for power generation.

The Iran war triggered a brief price spike, increased Asian gas-to-coal switching, and caused Jakarta to loosen strict planned production cuts.

Indonesia initially planned to cut 2026 production down to 600 million tons, but the war prompted the government to raise output quotas back up and consider centralized state export controls, according to Heatmap News, a new media company focused on climate change.

THE JAKARTA POST—AGENCIES

524 million tons

According to Statistics Indonesia, the country exported roughly 524 million tons of coal for all uses in 2025.

The women nursing Malaysian rainforests

As Taisa Mating, a grandmother of nine, bends down to pick up a seed from the forest ground, she sometimes pauses and whispers to it.

"Please don't die. I'm going to take care of you," she would tell the seed. "When you're big enough, I'm going to give you a big playground where you can grow into the tree you're meant to be."

The seeds that Taisa, 67, gathers are destined for Lower Kawag, part of the Ulu Segama-Malua Forest Reserve, where Sabah is restoring one of its most degraded rainforest landscapes. Decades of intensive logging between the 1980s and 2007, together with major El Nino-induced fires, have left large swathes of the forest degraded and vulnerable to recurring fires.

Taisa is one of the women from Kampung Tampenau, a small village on the edge of Sabah's rainforest, who have been trained to sow the seeds of forest regeneration under a scheme that started in 2021. The seeds collected are sown in backyard nurseries in their villages and eventually grown into young trees to replenish the rainforest.

Whenever their backyard nurseries run low on seedlings, the Kampung Tampenau women head to the forest's edge carrying plastic pails or any containers they have at hand. Their eyes scan the ground for fallen seeds — hidden beneath leaves and forest debris.

Most of the seeds are collected from forest fringes surrounding the village, where many native species naturally regenerate. On other days, when certain species can no longer be found nearby, the villagers obtain permits to venture deeper into the shaded forest reserve to gather "wildings" — fragile, inch-tall sprouts which can be found growing quietly in the damp, silt-rich earth where the river slows.

Sabah, in eastern Malaysia, was home to nearly 1.5 million hectares of oil palm plantations in 2025. It is Malaysia's largest producer of the crop while also ranking among the world's richest biodiversity areas.

The palm oil industry has long faced international scrutiny over its role in tropical deforestation. However, through the Malaysian Palm Oil Green Conservation Foundation, or MPOGCF — funded by levies collected from the industry — Sabah has brought the sector into initiatives to help the rehabilitation of 2,500 hectares of degraded forest in collaboration with local communities.

In Kampung Tampenau, the seeds are nurtured in small nurseries beside the villagers' homes. The community nursery raises native seedlings for the restoration program.

To the untrained eye, one seedling looks much like another. The women of Tampenau know better.

Long before the nursery program began, they already understood the forest. The training, conducted jointly by MPOGCF and the Sabah Forestry Department, focused on nursery management and improving the survival of seedlings rather than teaching them how to recognize the trees.

Since the program began five years ago, the community has produced about 80,000 native saplings.

Villagers receive a total of RM7 ($1.7) for every sapling. Out of this, they earn RM5, while the remaining RM2 covers operational and transportation costs.

Once the saplings reach between 1 meter and 1.5 meters tall, they are moved deep into the forest.

Restoring native vegetation improves the habitat of Sabah's estimated 10,800 critically endangered orangutans and other wildlife while helping reduce human-wildlife conflict around the reserve.

Firebreaks, which are nonflammable gaps in vegetation, have also been incorporated into the restoration area to reduce the risk of future fires in a landscape that remains vulnerable during prolonged dry spells.

Fast-growing native species like Laran, Binuang and Talisai Paya — termed pioneer trees — are the first type of trees to be replanted. They quickly establish a canopy over degraded land, shielding the ground from direct sunlight and creating favorable conditions for slower-growing hardwoods to take root. In just three years, some pioneer trees can reach the height of a two-story building.

"You cannot start with hardwoods because they need shade," explained Daniel Pamin, conservation specialist at MPOGCF. "The pioneer trees prepare the forest for everything that comes after."

Only after the canopy is established are hardwoods such as Seraya and Kapur, members of the dipterocarp family that dominate Borneo's lowland rainforests, introduced. They may take between 10 and 20 years to mature but can live for centuries, gradually restoring the layered structure of a tropical rainforest.

Fauna benefits

The sequence is equally important for wildlife.

Orangutans prefer building nests in the softer branches of pioneer trees because they are easier to bend and break, a Sabah Forestry official said. As the forest matures, the returning mix of native trees gradually restores food, shelter and nesting habitats not only for orangutans, but also for sun bears, rhinoceros hornbills and many other species that depend on an intact rainforest.

"Rainforests can regenerate naturally, but the process is much slower once they have been severely degraded," Daniel added.

"Human intervention helps accelerate that recovery."

Jackly Ambrose, a conservation officer at the Sabah Forestry Department, said the primary hurdles in natural regeneration in degraded areas include a severe lack of seed sources, nutrient-depleted soils, and invasive weeds that choke out saplings.

So far, restoration work has been carried out across 225 hectares under the pilot project, which comprises the first and the second phases of the 10-year conservation plan launched in 2019. The pilot project is about 90 percent complete.

The third phase, to commence in October 2026, aims to rehabilitate another 332 hectares through the planting of about 132,800 native saplings, many of them raised in local community nurseries.

For Taisa, however, the work has never been about making money.

The payment is modest, she said, but caring for each seedling over months demands patience more than anything else.

She knows she may never sit beneath the shade of many of the trees she has helped nurture. But she hopes future generations will.

Border barrier

Relatives and friends wait by a fence topped with barbed wire for the return of people who had previously crossed into Spain's North African enclave of Ceuta, at Morocco's Bab Sebta border crossing on the outskirts of Fnideq on Sunday. As many as 60,000 migrants entered Ceuta in recent days, mostly swimming around the small border post that juts into the Mediterranean Sea, in an unprecedented surge that prompted an international crisis for Spain. The mass crossing resulted in at least 72 deaths. ABDEL MAJID BZIOUAT / AFP

Tariffs risk fragmenting trade

Increasingly institutionalized US policy will cause damage to economies: Analysts

By **YANG RAN**
yangran1@chinadaily.com.cn

As a new wave of sweeping US tariffs took effect, experts warned that Washington's tariff policy is becoming increasingly institutionalized, a shift that risks deepening the fragmentation of global trade and causing lasting damage to both the US and world economies.

The latest round of tariffs, ranging from 10 to 12.5 percent on imports from 60 economies, was imposed on July 24 under Section 301 of the Trade Act of 1974, seamlessly taking effect after the expiration of the previous 10 percent global tariffs.

The move is part of a concerted effort by the US government to restructure the legal foundations of its tariff strategy, following the Supreme Court's decision in February to strike down its previous reciprocal tariff policy.

A series of further trade measures are anticipated in the coming months, including the ongoing Section 301 investigations into "excess capacity and production in manufacturing sectors" and pending probes initiated under Section 232 of the Trade Expansion Act of 1962 on national security grounds, which could soon translate into new tariffs.

John Ferguson, global head of trade and geopolitics at Economist Enterprise, said the US tariff policy is becoming more institutionalized as the administration seeks a more durable legal footing.

> "The global supply chain will become more fragmented and divided."
>
> **Tu Xinquan**, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing

"Measures introduced under Sections 301 and 232 are on firmer ground," he said. "Tariffs imposed under these mechanisms are likely to prove more durable because they follow a well-defined statutory process. That gives businesses greater certainty about how tariffs are imposed, but it also makes them harder to challenge in court."

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, echoed this view, saying the tariff policy is likely to persist for a considerable period, even surviving administration changes. He attributed this to a growing belief in the US that globalization has harmed US interests.

"They see tariffs as correcting past errors in trade policy," Tu said.

Daniel Tannebaum, a partner at Oliver Wyman, an international management consulting firm, highlighted the self-reinforcing nature of restrictive policies in an article for the World Economic Forum.

He said the reallocation of capital and production under such policies creates constituencies that benefit from their continuation, making them politically difficult to reverse.

If the US persists with protectionist tariffs for years, experts warned, the result will be a deeply fragmented global trade and supply chain system.

Wang Yong, a professor at Peking University's School of International Studies, said the US is unilaterally discarding the WTO's principle of nondiscrimination to build a tariff framework that serves its "America First" policy, using its market leverage to force concessions from other nations.

Such a discriminatory tariff policy will further erode the WTO's authority and push the global economy back toward a framework governed by bilateral negotiations, he said.

Ferguson said that companies increasingly expect higher US tariffs to remain in place for years. "In response, many are adopting a 'world-minus-one' strategy, treating the US as a distinct market requiring its own supply chains, sourcing decisions, and investment plans, while expanding elsewhere."

This shift is reinforced by other nations' policymakers signing free-trade agreements to signal their commitment to open and predictable commerce, he said.

Bifurcated supply chain

Tu predicted a bifurcated global supply chain.

"The sheer size of the US market will compel companies to build industrial systems tailored to US policy, creating a system largely separate from the rest of the world," Tu said.

"Meanwhile, a more open system will emerge outside the US, with the Asia-Pacific and Europe playing key roles. Though more integrated and liberalized, it will remain constrained by the US system. Overall, the global supply chain will become more fragmented and divided."

The economic fallout is already visible. A World Economic Forum report released in June estimates that current fragmentation is reducing global GDP growth by between $213 billion and $307 billion and raising inflation by 0.2 to 0.3 percentage points.

For the US, the costs are also substantial. The Tax Foundation estimates that the announced and imposed tariffs will increase household taxes by an average of $900 in 2026 and reduce long-run US GDP by 0.4 percent.

Tu warned that prolonged tariff policies will keep the US economy in a state of high inflation and high costs, raising production costs for US companies and reducing their international competitiveness.

Ferguson said tariffs are likely to weigh on growth over time by reducing trade, competition and productivity.

"But those effects will take time to emerge. The economy continues to benefit from a powerful wave of investment in artificial intelligence, while trade accounts for a relatively small share of US GDP. As a result, the near-term outlook remains stronger than the longer-term trajectory implied by a more protectionist trade policy."

UK's AstraZeneca eyeing $400b merger, report says

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

The United Kingdom's second-most valuable listed company, pharmaceutical firm AstraZeneca, has been revealed to have been holding talks for some time with United States-based rival Bristol Myers Squibb, or BMS, about a merger, which could result in a global pharma giant worth nearly $400 billion.

The Financial Times reports that talks have been taking place for some months, although a deal is not yet thought to be close. If the merger between the British company, valued at $264 billion, and its US counterpart, worth around $133 billion, goes through, it would result in the global drug sector's fourth-largest company.

AstraZeneca declined to comment and BMS did not immediately respond to requests for comment, according to the FT.

Around the world, AstraZeneca generated $58.7 billion last year, and it has set itself a target revenue figure of $80 billion by 2030, which is why it is so keen to make further inroads into the US market, which already accounts for almost half of its revenue.

Key role

But the company's involvement in China will also play a key role in efforts to reach that target, especially since in January this year, during then-prime minister Keir Starmer's visit to China, AstraZeneca announced investments worth $15 billion in China up until 2030, to expand its medicine manufacturing and R&D.

Pascal Soriot, AstraZeneca's CEO, said the investment, which will see existing manufacturing facilities in Wuxi, Taizhou, Qingdao, and Beijing developed, plus the establishment of other sites yet to be revealed, "begins an exciting next chapter for AstraZeneca in China, which has become a critical contributor to scientific innovation, advanced manufacturing, and global public health".

In 2014, the US drug company, Pfizer, made a bid for AstraZeneca valuing the drugmaker at around $94 billion, when its reputation had suffered after the late-stage clinical trial failure of several drugs. Soriot was one of those who rejected the bid, and in the subsequent years, under his stewardship, the company's reputation and finances have been restored, with its cancer treatment drugs performing particularly well.

If a deal is reached between AstraZeneca and BMS, however, that would not necessarily be the end of the story, as such a merger would be subject to both political and business scrutiny.

Given that BMS also has a significant cancer division, antitrust scrutiny may be applied to the companies' combined presence in the cancer drug market, and there could also be concerns in the UK that AstraZeneca may use a major trans-Atlantic deal to relocate the heart of its business from its current headquarters in Cambridge, England.

Israel voices concern over Hamas disarmament deal

TEL AVIV/GAZA — Israel has shared "serious security concerns" with the White House regarding the proposed disarmament deal with Hamas, an Israeli official said as Israeli strikes overnight and into Sunday evening killed at least 18 people, including children, in Gaza.

The remarks by Doron Spielman, spokesman for Israeli Prime Minister Benjamin Netanyahu's office, were some of the first public comments since US President Donald Trump announced the agreement.

Spielman told The Associated Press that Israel's intelligence assessment is that Hamas remains committed to rebuilding its military rather than genuinely demilitarizing. He said the Israeli military would not withdraw from Gaza — where it controls more than 60 percent of the territory — before Hamas disarms.

"Our assessment is that if we redeploy before Hamas is truly disarmed, it will quickly expand its presence throughout Gaza, rebuild its terrorist infrastructure, once again threaten Israeli communities, and seek to carry out another Oct 7-style attack," he said, referring to the militant attack on Israel in 2023 that set off the latest conflict in the Gaza Strip.

His comments come days after Hamas said it would begin disarming as part of the US-brokered ceasefire signed nine months ago to end the nearly three-year-long conflict. It marks a potential breakthrough in ending the conflict, but many hurdles, conditions and long timelines remain.

Trump's 20-point ceasefire plan calls on the militant group to surrender its weapons and destroy its vast network of tunnels. It also envisions Israeli forces withdrawing from Gaza, the arrival of a new technocratic Palestinian government, deployment of an international security force and the rebuilding of the battered Palestinian enclave.

The disarming of Hamas has been a sticking point and has deadlocked negotiations for months. In announcing the deal on social media on Thursday, Trump said it would be carried out in "carefully structured phases".

A copy of the agreement obtained and verified by the AP said all weapons held by the Hamas-run police will be transferred to the US-backed Palestinian technocratic committee, known as the National Committee for the Administration of Gaza, upon its arrival in the enclave.

A process to decommission and store heavy weapons and to dismantle military production sites and tunnels will begin after the arrival of the Palestinian committee and the deployment of international forces. The process will be linked to a phased Israeli withdrawal, according to the agreement.

Since the ceasefire was signed last October, Israel has continued its strikes in Gaza, saying it's targeting Hamas and its infrastructure.

Strikes continue

Israeli airstrikes hit Gaza for the second straight day on Sunday, killing at least 18 Palestinians, medics said. The strikes have continued despite announcements of progress in efforts to implement a ceasefire agreement.

Mahmoud Basal, spokesman for the Civil Defense in Gaza, told Xinhua that Israeli drones and helicopters had carried out more than 10 airstrikes since the early hours of the morning in various parts of the enclave.

The strikes targeted residential apartments, tents sheltering displaced people, civilian vehicles, and Palestinian gatherings from the north to the south of the Gaza Strip, resulting in the deaths of at least 18 people, including four children and two women, said Basal.

In a news statement, Hamas called on the mediators and guarantors of the ceasefire agreement to assume their responsibilities, condemn these "Israeli crimes against the Palestinian people", and to take immediate action to pressure Israel to cease its aggression in accordance with the agreement.

Briefly

UNITED STATES

Fires in Washington state burn 600 homes

Wildfires in eastern Washington state forced the evacuation of 60,000 people in the Spokane area while destroying at least 600 homes, businesses and other structures, authorities said on Sunday. The fires in and around Spokane, the state's second-largest city, burned about 21 square kilometers over the weekend and were among dozens of wildfires across Western US that stretched the ability of federal, state and local agencies to fight them. About 1,000 square kilometers have burned across the state, and some of the fires, including those in the Spokane area, remain uncontained.

UKRAINE

Umerov to head foreign intelligence service

President Volodymyr Zelensky put Ukraine's chief negotiator in charge of foreign intelligence on Monday, the latest move in an ongoing shake-up that included replacing the defense minister in July. Zelensky said Rustem Umerov, who moved to the post of spy chief from his previous job as head of the advisory Security Council, would remain in charge of peace talks, tasking him with continuing to seek a diplomatic end to the Russia-Ukraine conflict. Former interior minister Ihor Klymenko would take over as head of the Security Council. Zelensky has been moving senior officials among top posts since an abrupt cabinet purge last month.

EGYPT

Quake strike activates quick response plans

A magnitude 5.5 earthquake shook eastern Egypt early on Monday, prompting authorities to activate response plans although there were no immediate requests for emergency help. The tremors were felt across a wide area, waking AFP journalists across Cairo and reaching as far as El-Arish near Egypt's border with the Gaza Strip. The quake struck about 40 kilometers north of the city of Suez, according to Egypt's National Research Institute of Astronomy and Geophysics, which revised an earlier estimate of 5.2. The US Geological Survey put the shallow tremor at magnitude 5.0, revising down an earlier reading.

COMMENT

Editorials

When sneakers, sunflower seeds are policed, 'rights' become a joke

An opinion article published in The Hill on Saturday has an all-too-familiar ring to it. In the article, Sam Brownback, former US ambassador-at-large for international religious freedom, and former NBA player and activist Enes Kanter Freedom argue that NBA superstar Stephen Curry's commercial partnership with Chinese sportswear company Li-Ning is a moral failing.

The article makes the so-called Xinjiang "forced labor" issue less a subject for careful inquiry than a convenient stage prop in Washington's favorite geopolitical drama.

Ever since Washington officially embraced its politicized "allegations" surrounding the Xinjiang "forced labor" issue in 2020, a growing chorus of politicians, advocacy groups and commentators have treated normal commercial interaction involving the Xinjiang Uygur autonomous region as an ethical litmus test.

In the article, Brownback and Freedom write, "These are not careless accusations. They are specific charges documented by the US government and corroborated by international investigators."

But, documented by whom? The US Department of Labor's own report on the situation in Xinjiang is a principal foundation for the claims. Yet the report itself was produced by the department's Bureau of International Labor Affairs. Its reference list is replete with mentions of US government agencies and congressional bodies, alongside German "anthropologist" Adrian Zenz and reports from Washington- and Taipei-sponsored think tanks.

That does not automatically invalidate the report. But it does complicate the confident image of broad, independent corroboration presented by Brownback and Freedom. When the same network of institutions quote one another to support the same conclusion, skepticism is only due diligence.

The same scrutiny extends to Adrian Zenz, who has become perhaps the most frequently cited Western "researcher" on Xinjiang. But his institutional affiliations, advocacy commitments and methodology deserve far more examination than they typically receive in media coverage. His work is often treated less as a contribution to a contested academic debate than as settled scripture paid for directly or indirectly by Washington.

Curiously, those who constantly urge others to "follow the evidence" seldom encourage readers to follow the footnotes.

Meanwhile, the political economy behind the US' Xinjiang sanctions receives remarkably little attention. On Friday, another 43 Chinese companies were added to the so-called "Uyghur Forced Labor Prevention Act Entity List", bringing the total number of sanctioned Chinese entities to 187. Related restrictive measures take effect on Monday.

The restrictions now extend well beyond cotton to industries ranging from metals and mining to electronics, agriculture and food products. Even Chinese sunflower seeds are regarded as a "concern" to US "national security".

These measures are commonly framed as "human-rights" enforcement. But they are in essence reshapers of markets. By excluding Chinese competitors from US supply chains, they inevitably create opportunities for US producers, alternative overseas suppliers and an expanding compliance industry built around supply-chain auditing, legal consulting and regulatory certification.

Commercial consequences must not be treated as incidental as the "Entity List" becomes longer and longer. What emerges is an ecosystem in which politicians, advocacy groups, think tanks, lobbyists, researchers and "sympathetic" media outlets reinforce one another's narratives, each citing the others as confirmation of a consensus they have collectively constructed.

This echo chamber is presented as the appearance of overwhelming "certainty" while discouraging serious examination of underlying assumptions.

That is why Brownback and Freedom's article ultimately says less about Stephen Curry or Li-Ning than about a political culture increasingly inclined to convert normal business deals into a geopolitical battlefield. It is easier to police sneakers than to scrutinize evidence. It is easier to stage another morality play than to confront the possibility that, in the age of strategic competition, conscience can become just another instrument of a zero-sum game.

Manila's double game puts peace at risk

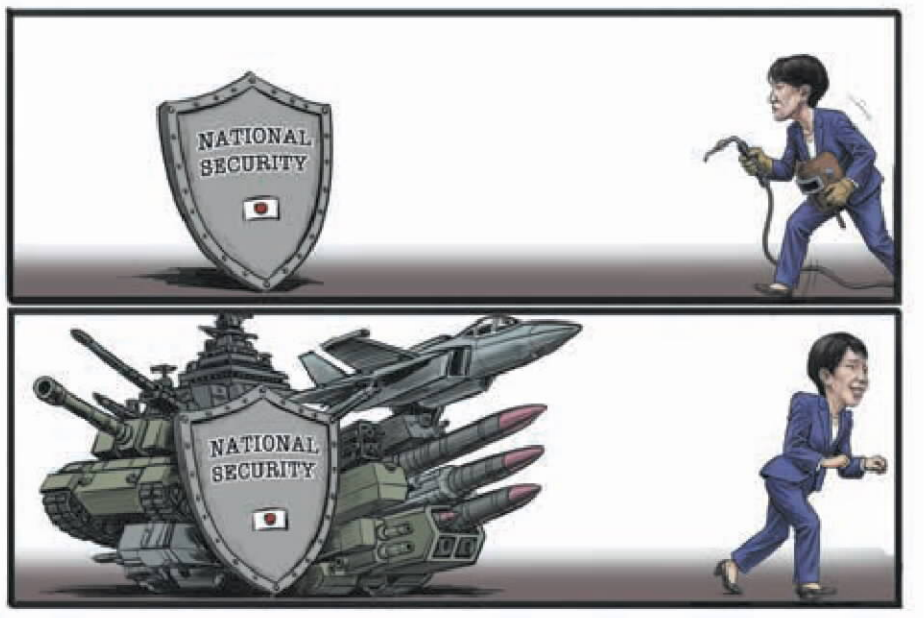
The contradictory approach the Philippines adopts in its handling of maritime disputes makes one wonder what exactly Manila is hoping to achieve. The recent remarks of Philippine Defense Secretary Gilberto Teodoro Jr serve as the latest evidence of such inconsistency.

According to reports, Teodoro Jr, who has already been sanctioned by Beijing for making unfounded remarks which undermined China's interests and bilateral ties between China and the Philippines, called for Philippine officials "who side with China" on the "West Philippine Sea issue" to resign at a forum on July 29, ignoring the fact that the "West Philippine Sea" is just a term unilaterally coined by Manila to support its unlawful claims in the South China Sea. He is attempting to foster an atmosphere within Philippine political circles in which those who hold differing views on the South China Sea issue from his faction are expected to be silenced or penalized.

On the same day, Manila announced a "nautical chart" of the "baselines of territorial sea" of China's Huangyan Island, a provocation that met with a firm response from China.

On Saturday, the China Coast Guard conducted law-enforcement patrols in the territorial sea of the island; the Chinese People's Liberation Army Southern Theater Command conducted joint naval and air exercises near the island; and China issued a set of regulations to enhance the management of the Huangyan Island National Nature Reserve.

Less than two weeks ago, Philippine Secretary of Foreign Affairs Maria Theresa Lazaro told China's Foreign Minister Wang Yi that her country looks to address maritime disputes through dialogue and improve relations with China. But the latest development of the situation caused by the continued provocation by Manila, as well as Teodoro Jr's dangerous remarks, only raises doubt over whether the Philippines is sincere about engaging in dialogue or just obstinate in following the wrong path of challenging China's sovereignty.



The territory of the Philippines has been defined by a series of international treaties, and Huangyan Island has never been a part of it, rendering the Philippines' claims over the island completely baseless under international law.

After two Philippine Navy boats confronted China Coast Guard's vessels near China's Ren'ai Reef on July 20, Manila said the next day that it wants to avoid similar incidents and "reset" relations with China, only for the Philippines to then send more ships to intrude in the waters of Huangyan Island on July 24.

Whenever China and the Philippines prepare to launch dialogue, certain forces within the Philippines, particularly those from the military and law enforcement, such as Teodoro Jr, deliberately stir up trouble to derail dialogue progress. These parties harbor malicious intentions: rather than prioritizing the well-being of the Filipino people, they act on the instructions of external forces to advance personal interests.

Manila should be wary of these forces' damaging effects, rein in their dangerous games, and get rid of delusions that the Philippines will obtain illegal gains by acting as a proxy for external forces to contain China.

Opinion Line

Washington's 'renewed negotiations' tactical pause to manage expectations

Just two days after learning US economic growth slowed to 1.5 percent in the second quarter, down from 2.1 percent in the first, Washington called off an imminent strike on Iran on Saturday and announced a restart of diplomatic negotiations.

The scenario is familiar: a social-media proclamation, a promise of diplomacy and a reminder that the US military remains "locked and loaded". This is less a commitment to peace than a tactical pause driven by oil prices, midterm electoral arithmetic, financial markets and the mounting economic costs of another Middle East conflict.

The Strait of Hormuz is a barometer of presidential economic stewardship in the United States. Any prolonged disruption would reverberate through fuel prices, inflation, shipping costs and consumer confidence. For a president who campaigned on lowering living costs, an energy shock would be politically toxic. The sharp decline in oil prices after Washington announced the suspension of military action reflected investors' judgment that the risk of escalation had eased. Markets interpreted diplomacy, however tentative, as preferable to another cycle of confrontation.

The calculation extends beyond the battlefield. US Treasury Secretary Scott Bessent has championed efforts to "stabilize" the dollar, including unprecedented "coordination" with Japan to support the yen in the US interest. Those initiatives would prove unsustainable if the Gulf conflict sends crude prices soaring. As one of the world's largest energy importers, Japan would suffer a deteriorating trade balance, reigniting pressure on the yen and undermining broader financial campaigns. It makes little sense to devote political and financial capital to outmaneuvering markets, while simultaneously permitting a regional escalation to undo the very US profits those efforts are meant to capture.

Domestic politics reinforces the same conclusion. Public appetite for another prolonged Middle East crisis remains limited, while inflation and living costs continue to rank among the foremost concerns of the US public. Gasoline prices are one of the most visible measures of US economic performance. Every rise at the pump carries far greater political weight than distant military gains.

A pause in military operations therefore allows the White House to project strength while avoiding the immediate economic costs of escalation.

Perhaps the most intriguing aspect is the confusion openly expressed by Israel. According to Israeli media, Israeli Prime Minister Benjamin Netanyahu and senior officials learned of the suspension only after the US president's public announcement — which looks like a smokescreen itself — allegedly leaving Tel Aviv scrambling to determine whether the move was genuine or merely another negotiating tactic.

With these reports, Tel Aviv wants to indicate that Washington's priorities do not always perfectly align with those of its closest regional ally. Publicly highlighting differences can also serve Washington's political interests by reinforcing the perception that US policy is driven by its own calculations rather than by Israeli preferences.

That further proves that the latest pause announced by Washington is anything but a window for real ceasefire talks. Israel knows it and nods to it, but pretends otherwise. In putting on that performance Israel shows its "thoughtfulness" to the US' acute needs to simultaneously manage inflation, financial markets, alliance politics, domestic elections and global economic stability.

Washington is not pursuing a single objective — least of all peace for its own sake. It seeks to pressure Iran without becoming mired in another round of costly conflict, reassure Israel without surrendering strategic flexibility, contain oil prices without appearing weak and project strength while limiting the economic consequences of military escalation. The announcement of renewed negotiations serves primarily as an exercise in managing expectations, rather than signaling a diplomatic breakthrough. Iran, meanwhile, has its own incentives to avoid uncontrolled escalation. Tehran has continued consultations with regional countries while Omani-mediated discussions over the Strait of Hormuz reportedly continue.

Neither side wishes to appear to retreat, yet neither has much to gain from a new escalation that would impose enormous economic and political costs.

The strikes have been postponed, not abandoned. Negotiations have been announced, not concluded. Military pressure remains available if diplomacy falters. This is not simply the "art of the deal"; it is the art of preserving options. For Washington, the pause itself may be the strategy — buying time, calming markets and maintaining leverage while keeping every path, diplomatic or military, open.

But a sustainable ceasefire and long-term stability in the Middle East cannot be achieved through short-term, improvised calculations; they require a genuine and steadfast commitment to peace. It is earnestly hoped that the US and Israel, as the parties that initiated the conflict, will take the lead in demonstrating that commitment and bring about an early resolution to the crisis they have engendered.

— LI YANG, CHINA DAILY

What They Say

Corporate governance will be crucial benchmark

Editor's note: *Four Chinese financial regulators have jointly released a document outlining 22 targeted measures to improve the governance of financial institutions. The 21st Century Business Herald spoke to Dong Ximiao, chief economist at Merchants Union Consumer Finance and executive director of the Shanghai Institution for Finance and Development; and Lou Feipeng, a researcher at Postal Savings Bank of China, about the measures. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

By 2029, China will establish a desired governance framework for financial institutions. The document focuses on strengthening and improving shareholder governance. It underscores the importance of identifying major shareholders and actual controllers, which is a manifestation of thorough supervision. This approach extends regulatory oversight beyond registered shareholders to the individuals who ultimately control and are accountable for institutions, shifting the focus of supervision from mere compliance to substantive governance.

The framework also operationalizes the higher-level legal principles set out in the draft revision to China's banking supervision and regulation law. It refines the law's regulatory mandate over major shareholders and ultimate controllers into actionable rules for ownership identification and monitoring of related-party transactions.

Regulatory oversight will examine the genuine commercial purpose of related-party dealings, significantly reducing the scope for regulatory arbitrage through complex corporate structures.

The document calls for stronger risk monitoring and early-warning mechanisms in corporate governance. Tougher penalties for violations, together with a lifetime accountability mechanism, are expected to have a cleansing effect on the financial sector.

The new framework will also prevent individuals with serious compliance issues from moving freely between financial institutions, thereby reducing the risk of misconduct spreading across the sector.

In addition to stronger disciplinary measures, the document aims to improve internal governance by guiding financial institutions to establish incentive and accountability mechanisms that support sustainable development and long-term strategic objectives.

Institutions with sound governance, clear allocation of responsibilities and robust risk management will be better positioned to earn regulatory confidence and market recognition.

For large financial institutions, the primary challenge lies in managing extensive business operations and subsidiary networks, where sheer size can make effective oversight difficult. Their priorities should therefore include strengthening top-level governance, improving board oversight, checks and balances, and building group-wide look-through risk management frameworks to prevent risks from spreading across different business lines.

Smaller financial institutions should focus on removing noncompliant shareholders, eliminating hidden related-party transactions and establishing streamlined internal control systems with clearly defined responsibilities, rather than attempting to replicate the governance models of large institutions.

Institutions with stronger governance will enjoy superior risk management and greater capacity for sustainable, long-term growth, while the traditional growth model driven primarily by rapid expansion will become increasingly unsustainable, reshaping the competitive landscape.

VIEWS

Selçuk Ünal

From Bosporus to Yangtze: Turkiye-China ties at 55

Relations between the Republic of Turkiye and the People's Republic of China have gone through significant phases since the establishment of diplomatic relations in 1971. Turkiye-China relations, actually, date back to centuries. This historical bond forms the foundation of our ever growing diplomatic, economic and cultural ties.

The centuries-long trade along the Silk Road forged a path for cultural interaction between the Turkish and Chinese peoples, leading to many cultural similarities in our daily life rituals and traditional beliefs, especially regarding the importance of family and community.

Interactions between Turkish and Chinese people increased between the Ottoman Empire and Ming (1368-1644) and Qing (1644-1911) dynasties, with many Turkish and Chinese travelers journeying through the Silk Road and emperors exchanging gifts including Ottoman rifles, Chinese porcelain and silk.

In addition to those cultural interactions, both peoples also share similarities in their history. They faced external pressures, changed power balances in the international system and experienced significant transformations throughout the 19th and 20th centuries.

Turkish victory in the War of Independence was hailed by many Chinese intellectuals and political leaders of the time. Communist Party of China leaders such as Cai Hesen stated that the Anatolian victory of the Turkish people against imperialism was a development that would encourage all oppressed nations.

Turkiye has supported China's territorial integrity. Establishment of the diplomatic ties in 1971 marked the beginning of a new era in the Turkiye-China relations.

As both countries underwent processes of opening up to the outside world in the 1980s, the relationship took on a more dynamic character. Mutual contacts increased, political dialogue strengthened, and economic and trade relations gained new momentum.

Our relations have further advanced by the Chinese state visit to Turkiye in April 2000 at the invitation of Turkiye. The Joint Communique signed during the state visit expressed both sides' determination to expand the friendship and mutually beneficial cooperation, while pointing out the need for the restoration of the ancient Silk Road, paving the way for our early support to the Belt and Road Initiative.

Following that mutual visionary approach, today, connectivity is encompassing trade security, supply chains, energy flows and digital networks in our ties. For this reason, Turkiye's Middle Corridor Initiative and China's BRI provide two complementary visions. The will to align the two initiatives shows that two countries can view Eurasian connectivity from a shared perspective.

This joint perspective was underlined by the presidents of the two countries. The shared commitment of our President, H.E. Recep Tayyip Erdogan, and President Xi Jinping to develop bilateral relations provides a strong political foundation for our future. Numerous meetings between the two leaders, the latest being the meeting at the Shanghai Cooperation Organization Tianjin Summit on Aug 31, 2025, constitute a concrete demonstration of this dialogue.

Within the context of this shared vision, our economic relations developed in recent years. Trade volume increased 40-fold in the last two decades, transportation projects multiplied and mutual investments expanded.

While current economic relations unfortunately still do not fully reflect the true potential of both countries, we believe that this can be remedied by investments, tourism and other measures that are at our disposal to have a more fair, balanced, diversified and mutually beneficial relationship.

In this vein, high-quality direct investments from China into our country will create a true win-win foundation for the sustainability of our economic relations, while offering Chinese companies significant advantages in terms of access to markets adjacent to Turkiye.

Airlines connectivity have an important role not only in our economic relations, but in people-to-people contacts as well. Since tourism is the strongest point of convergence in people-to-people ties, increasing frequency of flights to 56 times per week in 2026, strengthens direct connections for tourism, trade and business. Our decision, on the occasion of the 55th anniversary, to grant visa exemptions to Chinese citizens for touristic travel and transit starting on Jan 2, 2026, demonstrates our strong commitment to increasing people-to-people contacts.

Today our world is undergoing a profound transformation. Turkiye and China stand as two ancient civilizations at the heart of this transformation.

In such an atmosphere, Turkiye's commitment to multilateralism and strengthening its relations with China is a natural reflection of our multi-dimensional foreign policy. At a time when conflicts, instabilities and uncertainties are rising, increasing mutual dialogue is more important than ever.

Turkiye-China relations should further develop on this framework. What needs to be done today is to translate this political will into more concrete projects, efficient mechanisms and active private sector participation.

We hope that the 55th anniversary of the establishment of Turkiye-China diplomatic relations will present more opportunities to transform our connection through history into a vision of partnership that is richer, more balanced and more sustainable.

The author is ambassador of the Republic of Turkiye to China.
The views don't necessarily reflect those of China Daily.

Imran Khalid

NDB building bridges, not barriers in global finance

Monopolies in international affairs rarely collapse overnight. They tend to erode quietly, losing their grip as alternative choices emerge and parallel pathways take shape.

For generations, the plumbing of global finance was routed through a single, heavily guarded intersection in the West. If a sovereign nation wanted to build a road, modernize a power grid or stabilize a national currency, it had to navigate a rigid labyrinth of conditionalities and approvals managed by institutions headquartered in Washington and Geneva.

But now, that map is being redrawn. The change is not happening through loud diplomatic confrontations, but through the quiet architecture of institutional choice.

Zimbabwe's recent admission to the BRICS New Development Bank, announced by the country's Finance Minister Mthuli Ncube in Harare, is a striking example of this global realignment.

After years of struggling with a complex economic landscape constrained by Western sanctions, limited liquidity, and restricted access to traditional international lending markets, Zimbabwe has unlocked a vital alternative channel for development finance by joining the Shanghai-based multilateral institution.

Focused squarely on infrastructure, industrialization, and long-term economic resilience, the NDB offers Harare an opportunity to pursue its development priorities through a broader range of financing options.

This milestone is more than a routine bureaucratic measure. It is a practical blueprint for how emerging markets facing economic duress can bypass traditional bottlenecks and secure sustainable growth outside Western-dominated corridors.

The significance of this shift becomes clearer against the backdrop of starkly divergent global economic policies. In the United States and Europe, policymakers increasingly treat global commerce as an instrument of national security, erecting protectionist tariffs, subsidizing domestic manufacturing through heavy state intervention, and weaponizing financial networks to isolate perceived adversaries. The underlying philosophy in these traditional centers of power is exclusion.

Smaller and vulnerable economies are routinely expected to absorb the collateral damage of these fractured trade policies, facing sudden capital outflows and inflationary pressures driven by decisions made far beyond their borders.

By contrast, the institutional machinery in the Global South is built on a foundation of inclusiveness and connectivity. The NDB was established not to replace the existing global financial system, but to correct historical imbalances and bridge the wide infrastructure gaps across the developing world. Traditional multilateral lenders often imposed stringent, politically punitive conditionalities that compromised local sovereignty and destabilized domestic societies.

LI MIN / CHINA DAILY

The center of economic gravity is shifting, and the future belongs to nations that choose open connectivity over defensive containment.

The NDB offers a financing model centered on tangible infrastructure and sustainable development without political interference.

When nations locked out of conventional markets gain access to these independent credit lines, the unipolar monopoly of Western finance naturally begins to fray.

The implications of this model extend well beyond infrastructure development. Membership in alternative multilateral institutions offers developing nations greater flexibility in managing macroeconomic risks.

For decades, dependence on a single global reserve currency and centralized lending hubs meant that emerging economies absorbed every shock generated by foreign monetary authorities. Diversified sources of financing, and the possibility of lending in local currencies, provide a structural cushion to mitigate the risk of sudden debt distress and shield domestic markets from exchange rate volatility. It is a sophisticated mechanism for risk management, allowing sovereign states to conduct trade and development planning with greater predictability.

Zimbabwe's decision also reflects a broader trend across Africa, Asia and Latin America. Increasingly, governments are unwilling to tie their economic fortunes to a single, Western-centric system that leaves them acutely vulnerable to unilateral policy shocks, arbitrary sanctions, and sudden currency shifts.

Participation in alternative multilateral networks enables these states to insulate their domestic markets from external volatility, ensuring that local development plans are driven by national priorities rather than foreign oversight.

Moreover, this institutional expansion highlights the growing maturity of South-South cooperation. For generations, development finance was used as a tool of geopolitical compliance, ensuring that recipient nations toe a specific ideological line.

The emergence of alternative credit sources introduces a healthy element of competition and choice into the global marketplace. Sovereign states can now shop for development partners, negotiate terms that align with their domestic growth targets, and integrate more fully into regional and global supply chains without sacrificing their political autonomy.

Ultimately, the widening gap between Western economic fragmentation and the institutional growth of the Global South will dictate the contours of the global order in the 21st century.

While Western policymakers persist in building protective silos and deploying restrictive measures, the rest of the world is quietly constructing a parallel, resilient framework for international cooperation.

Zimbabwe joining the NDB is a clear reminder that when global financial institutions are weaponized for political leverage, emerging economies will inevitably build other doors. The center of economic gravity is shifting, and the future belongs to nations that choose open connectivity over defensive containment.

How to make citizens permanent residents in name and nature

Chinese cities planning to expand in scale should rethink their approach. Besides creating jobs to attract newcomers, they will also have to invest much more in housing, education and healthcare.

A document issued by the State Council, China's Cabinet, earlier this year made it clear that all city governments are obliged to provide basic public services — including education, housing, social security, and medical care — to all permanent residents who have not formally registered their household registration (*hukou*) in the place where they live.

In China, permanent residents traditionally referred to people who had *hukou* in the place of their birth. But thanks to millions of farmers migrating to the cities in search of jobs in the past decades, permanent residents can even include those who might have their *hukou* elsewhere but have been living, working and studying in a particular city. Of late, such numbers have been rising rapidly, as millions of university graduates get jobs in big cities where they don't have a local *hukou*.

It is estimated that nearly half of the residents in cities such as Beijing, Shanghai and Shenzhen have their *hukou* elsewhere.

China had been an agricultural society for thousands of years. Until 50 years ago when I was young, about 70 percent of the country's population lived and worked in rural areas.

Today, it is the opposite. Under the household registration system, people used to be registered in their place of birth and relied on the local government there for social welfare benefits.

To make their environment more migrant-friendly, many cities have taken their own measures to help migrants settle down.

That system made human mobility difficult, if not impossible. But with the gradual elimination of the ration system in the late 1980s, millions of farmers left home for higher-paying jobs in the cities.

It is estimated that about 300 million former farmers and their families now live and work in cities other than the ones where they have their *hukou*.

But despite living, working and studying in the cities for years, they and their families remain "farmers from outside the city". In the absence of local *hukou*, they have been denied the benefits of many welfare projects, such as low-rent housing, seats in public schools, urban medical insurance and other benefits that residents with *hukou* take for granted.

Transferring *hukou* from their hometowns to the cities they live in now remains a difficult task. China is promoting urbanization and many cities, in order to grow in population size and influence, are working hard to attract migrant workers from other regions. However, the migrants are not being welcomed unconditionally.

Some tier-1 cities offer *hukou* only to those who are young, have at least a bachelor's degree or hold stable professional jobs. Smaller cities are willing to accept those who purchase houses or run businesses in the area.

As for those who don't have a good educational background and/or substantial money, a point-based household registration system has been adopted. Under this system, applicants for *hukou* can keep accumulating points on the basis of duration of stay, taxes paid, investments made and professional positions held until they have enough points to obtain a local *hukou*.

For years, there have been suggestions to do away with the *hukou* system. But apparently the central authorities have decided to take a more cautious approach. The *hukou* system has been in place for a long time and a hasty withdrawal may lead to consequences we are not prepared for.

To make their environment more migrant-friendly, many cities have taken their own measures to help migrants settle down.

Social security and medical insurance now cover more permanent residents, including those who don't yet have a local *hukou*. Local public schools are offering more seats to migrants' children.

The new State Council document can be regarded as a nod in this direction and requires local governments to do more. When making future development plans, urban planners will have to increase the supply of low-rent housing not only for the disadvantaged groups with local *hukou* but also for the permanent residents without *hukou*.

The cities may have to build more kindergartens, public schools and other facilities for children of these new residents.

According to the document, all permanent residents, with or without local *hukou*, should be treated equally with regard to housing, job opportunities, poverty relief, education, social security, medical care and access to public services.

Once all these requirements are effectively met, *hukou* would become less important and permanent residents would become permanent residents both in name and nature.

GLOBAL VIEWS

POMPEO DELLA POSTA

Change of perspective

The problem is not economic globalization per se, but the neoliberal belief that it does not need to be regulated and managed

For many years, economic globalization was presented in developed countries as a great promise. The opening of markets, the expansion of international trade and the integration of economies were expected to generate greater prosperity for everyone. The most common metaphor was that of a rising tide lifting all ships: If the global economy grew, all countries and social groups would eventually benefit. Moreover, trade liberalization, the removal of economic barriers and the expansion of global value chains were considered almost inevitable processes. The dominant belief was even that there was no real alternative to a more open global economy, as synthesized by the famous slogan "There is no alternative" (TINA), coined by the former United Kingdom prime minister Margaret Thatcher.

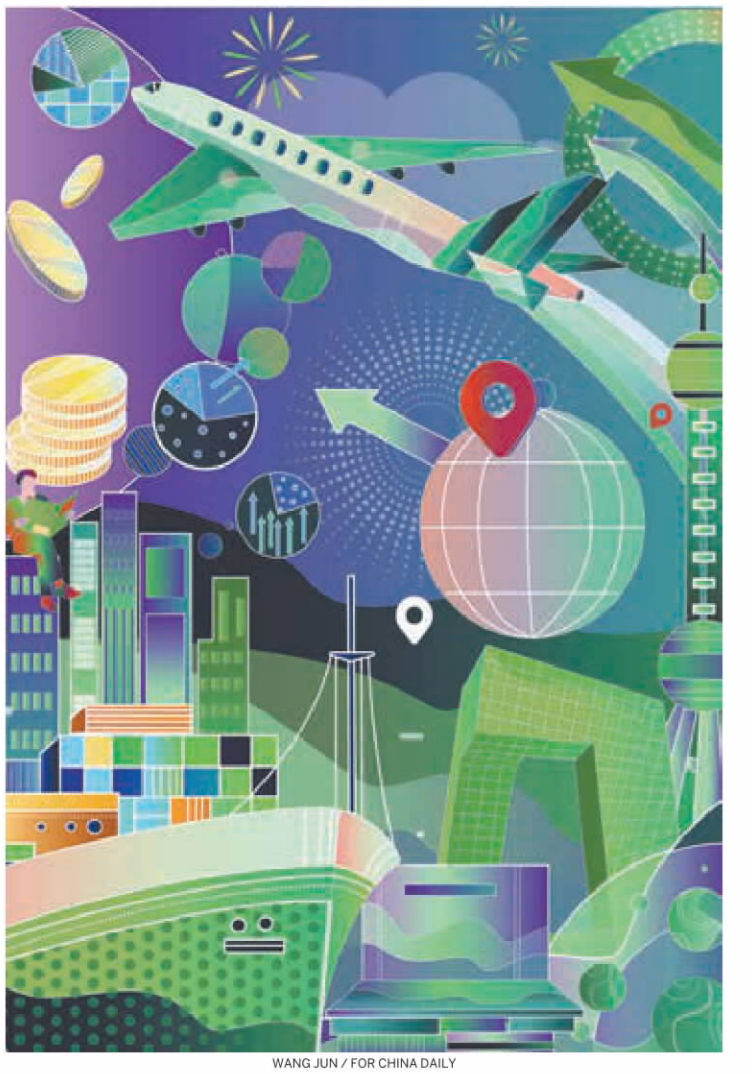
Today, however, in advanced economies that narrative has changed dramatically. Economic globalization is increasingly portrayed as one of the causes of their industrial decline and growing inequality, despite the fact that the GDP per capita of the United States, for example, has continued to grow faster than that of most other advanced economies.

At the same time, advanced countries accuse China of being one of the main beneficiaries of economic globalization due to the adoption of what they usually call "unfair" measures, resulting in a development strategy, which is different from the model promoted by Western economies.

It is certainly true that China combined openness to international trade with a strong role for the government in building productive capacity, infrastructure and technological capabilities. Yet the Chinese approach is not an unprecedented exception in economic history. Practices that are now criticized as unfair or distortionary were used by today's advanced economies during their own rise. The UK protected its economy before embracing unconditional free trade, made possible by the technological superiority it had gained through the Industrial Revolution. In France, in the late 17th century, Jean-Baptiste Colbert theorized mercantilist policies to favor his country's economic development. The US, following Hamilton's "Report on Manufactures" (1791), protected emerging (infant) industries through moderate tariffs, "bounties" (subsidies) and other public policies designed to foster industrialization. Those policies were instrumental in transforming the US into the world's leading industrial economy. Germany emphasized the importance of building domestic productive capabilities before fully exposing its economy to international competition. Japan's postwar economic transformation was supported by close cooperation between government and industry through the Ministry of International Trade and Industry, which promoted targeted industrial policies.

To borrow a famous metaphor, all of today's advanced countries developed by "climbing a ladder" made of mercantilism, industrial policies and public subsidies, but once they reached the top, namely their economic development, they "kicked that ladder away", arguing that public intervention would not be legitimate anymore and embracing neoliberal policies, those that allowed them to preserve their technological and economic leadership: it is probably no coincidence that when Western economies held a dominant position in many technological sectors, they were widely in favor of global openness, while today, as China has become a major competitor in several high-value industries, their view has changed.

Economic globalization has undoubtedly produced enormous benefits both in advanced and emerging economies. It has allowed consumers around the world to access cheaper products and enabled Western companies, aided by technological advances, to expand internationally and dramatically increase their profits. It has also contributed to lifting hundreds of millions of people — especially in China — out of poverty.



However, it has also imposed costs on specific social groups in advanced economies. Some industrial regions, unskilled workers and vulnerable communities experienced significant disruption, mostly because of the lack of sufficient support to adapt to new economic conditions, while gains concentrated at the top. The faith in the self-regulating virtues of free markets and in neoliberal principles was such that they refused the idea that economic globalization should be accompanied by regulatory and compensatory measures.

When the financial crisis of 2008 hit Western middle classes as well, after the disruptions suffered over the previous couple of decades by blue-collar and unskilled workers, however, confidence in that promise began to weaken and the narrative on economic globalization changed dramatically.

When that happened, China became the ideal scapegoat and started being blamed, especially because it emerged as a credible competitor in areas such as electric vehicles, batteries, semiconductors and artificial intelligence: the same governments that for decades had been preaching free markets started rediscovering the vocabulary of industrial policy, national security and strategic autonomy, and tariffs on Chinese EVs, export controls on chips and investment screening mechanisms started being introduced.

The problem, however, is that rather than acknowledging the economic, protectionist nature of those measures, the US-led Western countries mostly justify them with the need to protect their national security. Protecting certain strategic economic sectors, investing in research, supporting technological capabilities and caring about the most vulnerable citizens, can be legitimate and even necessary protectionist policies: however, they should not be disguised as measures of "protection" against generic, hypothetical and unjustified foreign threats, since doing so risks undermining peaceful relationships between countries, therefore creating an unnecessary and dangerous new Cold War environment.

Advanced countries should not fear calling "protectionism" by its proper name, instead of disguising it as "protection" of national security. They should recognize explicitly that the problem is not economic globalization per se, whose overall benefits are undeniable, but its lack of management and regulation, implemented through redistributive policies.

WANG JUN / FOR CHINA DAILY

The world needs a different form of globalization, what I would call "enlightened globalization": One that abandons the prescriptions resulting from neoliberal economics, is better governed and is capable of protecting those who bear the costs of economic transformation. This objective can only be achieved by combining a cooperatively open international environment with effective domestic public policies: advanced economies should invest in education and skills, support innovation and strategic infrastructure, adopt redistributive policies to be financed through progressive taxation, and implement measures to contain their quasi-monopolistic market structures.

ZHANG GUIHONG

A call for transformation

In the age of multilateralism, a new leadership will herald a more efficient, fair and powerful 'UN 2.0', steering it forward against multiple challenges to its authority, efficacy and representation

The world is watching closely as seven candidates move into the final stages of the race to become the 10th secretary-general of the United Nations.

In recent months, UN General Assembly President Annalena Baerbock has facilitated interactive dialogues and held a town hall debate among the candidates, member states and civil society representatives. Each candidate has articulated his/her vision for the UN's three pillars — peace and security, development, and human rights — and answered rigorous questions.

According to current rules, the secretary-general must be recommended by the Security Council and appointed by the General Assembly. The Security Council will conduct closed-door straw polls, and a candidate must secure at least nine votes without a veto from any of the five permanent members to move forward. Traditionally, from the perspective of regional rotation practices, the next secretary-general should come from Latin America. From the perspective of historical fairness, the UN has never had a female secretary-general in its 80-plus years of existence, and the calls for a woman to hold the position are growing louder. Four candidates meet both criteria, yet none has secured unanimous support from the five permanent members.

However, the question of "how to lead" outweighs "who will be elected". UN General Assembly President Baerbock emphasized the need for strong, principled and effective leadership.

The multilateral system centered on the UN faces its toughest time since the end of the Cold War, including erosion of its authority, ineffectiveness of its resolutions and operations, geopolitical fragmentation, distrust among major powers, financial crises and unbalanced global governance. The UN requires a transformative leader; not a conventional "chief administrative officer", but a "new leader" who is bold, connective and courageous.

WANG XIAOYING / CHINA DAILY

This new leadership should manifest in nine key dimensions.

First, rebuilding trust and reducing division. Amid unilateralism, major-power competition and regional conflicts, the international community suffers from a severe trust deficit. The new secretary-general should act as a bridge-builder, fostering trust not only among member states but also between the UN and the global public. This role demands not just an administrative leader but a political leader capable of uniting a divided world.

Second, balancing the three pillars of peace. Peace and security, development and human rights are intrinsically linked and interdependent. While balancing these pillars is a global consensus, member states have divergent interests. The new secretary-general should possess systemic thinking and strategic coordination skills to find common ground and translate ideals into practical results.

Third, resolving financial crises. With some major powers chronically defaulting on dues, the UN faces a liquidity crisis, forcing budget and staffing cuts. The new secretary-general should drive fundamental financial reforms to restore member states' trust in the UN, demonstrating excellent management skills to both "increase new revenue" and "cut expenses", while exploring new partnerships with the private sector for diverse and stable funding.

Fourth, upholding UN authority and effectiveness. In a rapidly changing global landscape, maintaining the UN's authority and effectiveness is the secretary-general's most fundamental and challenging mission. The future leader must reform the UN to reclaim its credibility, helping it better balance the interests of all member states and grow into an effective platform to lead global agendas and solve practical problems.

Fifth, accelerating the 2030 agenda and planning beyond. With only four years left until 2030, Sustainable Development Goals lag significantly behind schedule, with massive funding gaps amid multiple crises. The future secretary-general must act as both mobilizer and designer, sprinting toward current goals while strategically planning the post-2030 global development agenda, requiring diplomatic wisdom and strategic foresight.

Sixth, addressing underrepresentation of developing countries. This issue is not just about human resources but fundamentally concerns the UN's credibility and legitimacy. Many small and medium-sized countries are long underrepresented — a structural institutional flaw. The next secretary-general should go beyond symbolic appeals and traditional manager roles, driving substantive change with political resolve, diplomatic skill and execution capability.

Seventh, advancing systematic UN reforms. From Our Common Agenda to the Pact for the Future and the UN80 Initiative, the vision, goals and paths for reform are clear. The key lies in execution. The next secretary-general should steer reforms to strengthen the UN, including translating visions into actionable plans, enhancing work quality and efficiency, and leading the UN's active role in governance of emerging fields, such as artificial intelligence, to tackle future complex challenges.

Eighth, strengthening relations with civil society and the private sector. As transnational challenges grow more complex, global governance demands higher standards. The next secretary-general should connect governments, civil society and the private sector — a necessity for achieving the 2030 goals and rebuilding trust and effectiveness in multilateralism. The secretary-general must have political appeal and action-oriented leadership, innovatively building inclusive, effective partnership networks to inject new vitality into the UN.

Ninth, building relationships with the secretariat, member states and global citizens. The post of the UN secretary-general carries extremely heavy responsibilities and the new secretary-general must build a team that efficiently serves member states and global citizens as the Secretariat's "chief executive officer". As a servant and coordinator of 193 member states, the secretary-general must carefully balance service and independence; they must advocate for the vulnerable. Building these relationships requires moral courage, political wisdom and excellent communication skills.

As a permanent member of the Security Council, China plays a crucial role in the election of the UN secretary-general. China has expressed its commitment to participating responsibly in the electoral process, supporting the UN in revitalizing its authority and energy to better serve as the core of global governance. China's criteria for the next secretary-general are clear and firm: adherence to the Charter, outstanding capability, fairness and accountability.

The world stands at a crossroads of multilateralism. A secretary-general with new leadership could help transform the UN into a more efficient, fair and powerful UN 2.0, helping the UN overcome its current difficulties, shortcomings and deficiencies.

8 new nuclear reactors given full approval

Nation cementing dominance in global push for next-generation clean energy

By ZHENG XIN
zhengxin@chinadaily.com.cn

China recently greenlit eight new nuclear reactors, accelerating its atomic energy expansion and cementing its dominance in the global push for next-generation clean energy.

With a pledge to construct and operate the units according to the world's highest safety standards, the move underscores the nation's commitment to achieving its ambitious climate targets — peaking carbon emissions before 2030 and achieving carbon neutrality before 2060.

Six of the new reactors will employ the domestically designed Hualong One, China's third-generation nuclear power technology with full intellectual property rights. It is also one of the most widely accepted series of third-generation nuclear power reactors in the world.

For industry observers, the timing of these approvals carries immense strategic weight. As the inaugural batch of the 15th Five-Year Plan (2026-30) period, these projects set a definitive tone for China's energy blueprint during the most critical window for its climate commitments.

The 15th Five-Year Plan period represents the decisive sprint toward China's goal of peaking carbon emissions before 2030, said Li Jinkai, a distinguished professor at the School of Economics at the Beijing Institute of Technology.

"As a clean and stable baseload power source, the approval and construction of these new projects signal that China's nuclear power construction has firmly entered a stage of large-scale, batched and normalized development," Li said.

Nuclear projects also help promote investment growth, stabilize economic operations and attract private capital, he added.

The maturity of Hualong One has been fully validated through its large-scale deployment. Currently, 10 Hualong One units are in commercial operation domestically and internationally, with another 37 approved or under construction.

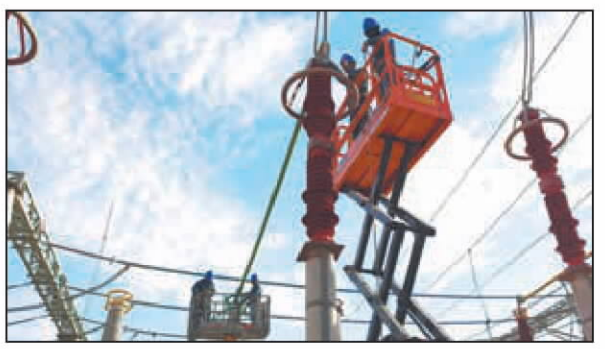
This cements its position at the forefront of global third-generation nuclear power, according to China General Nuclear Power Group.

A single Hualong One unit generates nearly 10 billion kilowatt-hours of electricity annually. This output can meet the demand of a medium-sized city of over 1 million people for a year, it said.

Furthermore, its research and construction have integrated a complete supply chain of nearly 6,000 upstream and downstream enterprises, effectively steering the upgrading of China's manufacturing sector, it said.

The steady approval pace — with 10 or more reactors greenlit annually from 2022 to 2025 — has translated into robust green energy output.

According to the National Energy Administration, the country's nuclear power generation reached approximately 467 billion kWh in 2025, drastically cutting standard coal use and reducing carbon dioxide emissions.



The China Nuclear Energy Development Report 2026 blue book, released by the China Nuclear Energy Association earlier, showed that by the end of 2025, China had 59 commercial units in operation with a total installed capacity of 62.52 gigawatts.

An additional 35 units totaling 41.90 GW were under construction, maintaining China's global top spot for under-construction capacity for 19 consecutive years. Completed investment in nuclear power engineering hit a record 161 billion yuan ($23.84 billion) in 2025, with five approved projects that year featuring private capital participation.

Looking ahead, China's nuclear footprint is set to expand significantly.

Yang Changli, rotating chairman of the CNEA, estimates that with socioeconomic demand for energy and electricity providing ample room for the development of nuclear power, China's installed nuclear power capacity is expected to reach 200 million kW by 2040.

Power play

Staffers from State Grid Changji conduct equipment renovation at the 220-kilovolt Shiqiantan substation in the Wucaiwan area in the Xinjiang Uygur autonomous region. Adhering to the high-voltage electrical installation standards, the on-site workers rigorously manage key aspects to eliminate potential safety hazards in equipment connections, ensuring reliable power supply to the Wucaiwan industrial zone and surrounding areas in Changji Hui autonomous prefecture. AO LIN / FOR CHINA DAILY

Briefly

Domestic flight fuel surcharges cut further

Chinese airlines will further cut fuel surcharges on domestic routes for tickets sold from Wednesday, following a reduction in July, according to announcements released by carriers. Under the revised standard, passengers will pay a fuel surcharge of 40 yuan ($5.89) per flight segment on routes of up to 800 kilometers, and 70 yuan on longer routes.

Yuan weakens against greenback

The central parity rate of the yuan weakened 4 pips to 6.7898 against the US dollar on Monday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

A freight train loaded with containers on a sea-rail intermodal railway line departs Xiamen, Fujian province. LIN SHANCHUAN / XINHUA

Automated sea-rail line launched

By REN QI
renqi@chinadaily.com.cn

The launch of China's first automated dedicated sea-rail intermodal railway line will significantly reduce transit bottlenecks, slash logistics costs and link the country's landlocked hinterlands with global markets, officials and experts said.

The pioneering railway line, featuring a unique design that directly connects the coastline to the terminal, officially launched operations last Thursday in Xiamen, Fujian province.

"The sea-rail intermodal transport at Xiamen ocean gate terminal achieves a seamless connection between trains and ships, solving the persistent challenges of cargo collection and distribution," said Lin Zhicheng, vice-mayor of Xiamen.

"It will extend the port's inland transport capacity, enhance land-sea intermodal channels, and boost the construction of smart ports and the Belt and Road development," Lin said.

Stretching nearly 1.6 kilometers, the dedicated railway line boasts an annual designed throughput capacity of 250,000 twenty-foot equivalent units and 250,000 metric tons of bulk cargo.

Breaking from conventional designs where railways are built on the periphery of port areas, the new line is situated at a right angle to the coast, occupying the core operational zone of China's first fully automated terminal and terminating a mere 70 meters from the waterfront.

This engineering innovation allows containers and bulk cargo to be directly loaded from ships onto waiting trains. The setup transforms the traditional three-stage "train-yard-ship" transit into a streamlined two-stage direct connection system.

By bypassing intermediate yard transfers and secondary hoisting, the comprehensive logistics cost per container is 15 percent less expensive, while overall transit times are shortened by two to three days.

Additionally, the integration of an automated railway with an automated terminal enables a highly efficient "70-meter transfer and nine-minute interchange" operating system, significantly reducing cargo damage and boosting supply chain reliability.

Lin Ji, president of China COSCO Shipping Corp, highlighted the strategic importance of the project.

"Through a unified data interface and intelligent dispatch system, the railway line clears import and export channels for inland hinterlands such as Jiangxi, Hunan and Hubei provinces. It is a landmark project serving Fujian's opening-up and promoting domestic and international dual circulation, as well as a national paradigm for zero-kilometer seamless sea-rail connections," he said.

Designated as a Class D railway line, the newly opened project is open to the entire market with transparent pricing, thus breaking down barriers for various market entities to enjoy inclusive logistics services.

Technologically, the facility is equipped with four automated rail-mounted gantry cranes and three parallel loading lines. In the port area, driverless container trucks navigate autonomously among ships, terminals and railways, ensuring 24-hour uninterrupted operations.

The complex's efficiency is complemented by an innovative customs clearance model. Authorities have implemented a "one declaration, one inspection, one release" policy.

The enhanced connectivity is expected to inject new vitality into regional economies.

Wu Chengzhong, deputy general manager of China Railway Nanchang Group, pointing to the long-standing port-rail collaboration between Fujian and Jiangxi, said: "The opening of this dedicated line opens new opportunities for strategic cooperation. We will continue to link all parties, open land-sea logistics channels and rely on the Maritime Silk Road to assist in dual circulation construction, ultimately empowering the high-quality economic development of the Fujian-Jiangxi region."

Backed by the terminal's 21 ocean-going routes covering Europe, the Americas, Australia, the Middle East and Southeast Asia, the new railway line links global maritime networks with over 20 inland railway channels.

Interest rate, RRR cuts may be on table

By ZHOU LANXU
zhoulanxu@chinadaily.com.cn

China has both room and growing necessity to cut interest rates in the coming months, as top policymakers step up efforts to stabilize growth amid weakening economic momentum, analysts said.

Song Yu, chief China economist at UBS Securities, said that with top policymakers placing greater emphasis on stabilizing growth to ensure a solid start to the 15th Five-Year Plan (2026-30) period, monetary conditions are likely to remain accommodative in the coming months, with ample market liquidity and low interbank funding rates.

Song said China still has room to cut interest rates and the RRR — the proportion of deposits banks must keep in their vaults as reserves — in the coming months to lower financing costs for businesses, and such tools may be deployed in a flexible, data-based manner.

"While uncertainty over the US Federal Reserve's policy path remains elevated, past experience suggests that China's cross-border capital flows and exchange rate are primarily determined by domestic economic and market conditions, rather than the interest rate differential with overseas markets," Song said, adding that the inflation outlook also strengthens the necessity for easing.

"As imported inflationary pressure from international oil prices recedes, China's consumer inflation is expected to soften in the coming months, leaving ample room for monetary easing and potentially reinforcing the need for additional policy support to stabilize prices and bolster domestic demand."

A top-level meeting on Thursday called for effectively implementing a more proactive fiscal policy and an appropriately accommodative monetary policy, saying that pragmatic and effective incremental policies will be introduced in a timely manner.

Analysts view this as policy fine-tuning that signals a greater intensity of macro policy stimulus in the second half, as GDP growth in the second quarter had fallen to 4.3 percent year-on-year, putting some pressure on achieving the full-year target of 4.5 to 5 percent growth.

The People's Bank of China, the country's central bank, pledged at a meeting on Saturday to comprehensively utilize monetary policy tools and make timely adjustments to keep ample liquidity, while maintaining the low level of overall social financing costs.

While room for further monetary easing exists, the key question is how to calibrate the timing and magnitude of any policy moves to maximize their impact, analysts said, as the effectiveness of such measures may depend on stronger fiscal support and a recovery in private sector confidence.

Zhu Feng, China chief economist at JPMorgan, said that monetary policy should correspond with fiscal policy in the second half to maintain ample liquidity, focusing on structural monetary tools and re-lending facilities to lower financing costs for the real economy and stabilize the property sector.

"We expect a 10-basis-point interest rate cut. Yet with interest rates already at relatively low levels, the stimulative effect of further rate cuts could be limited," Zhu said.

He said such a move would mainly signal the authorities' commitment to maintaining an appropriately accommodative monetary stance, rather than be sufficient on its own to reverse weak domestic demand.

Zhu added that China's economy is likely to stabilize in the second half, with fiscal policy, external demand, high-tech manufacturing and services consumption to help cushion the pressures from the property market and external uncertainties.

MNCs plug into China's AI solutions

SHANGHAI — From factory floors to logistics hubs, global corporations are embedding China's artificial intelligence into their real-world operations — and bringing these innovations to the global stage.

PwC China launched its AI Innovation Center in Shanghai in July. The center helps clients chart practical roadmaps for AI adoption and navigate the many complexities associated with digital transformation.

A recent PwC study places China in the top tier globally for AI deployment effectiveness in the real economy. According to the new center, a growing number of overseas clients are now voluntarily adopting China's open-source AI ecosystem when upgrading their digital operations.

The PwC findings are borne out by cosmetics giant L'Oreal. In its Suzhou smart fulfillment center, the group's first such facility globally, smart sorting systems and AI-powered packaging optimizers help the hub process 7,000 consumer parcels per hour, and ensure that 99 percent of its orders are processed within 48 hours.

Vincent Boinay, president of L'Oreal North Asia and CEO of L'Oreal China, points to China's AI ecosystem — its rapid iteration cycles, vibrant homegrown innovation, strong policy backing and growing talent pool — as the driving force behind the company's AI push in the country.

Beyond back-end support, AI is now stepping into the driver's seat for global firms in China. Siemens offered a glimpse of that shift on July 18, when it debuted Eigen Engineer Agent, an AI agent for industrial automation engineering, at the 2026 World AI Conference in Shanghai.

Eigen was already at work before the official launch, deployed on an electric vehicle brake assembly line at CASMT (Changzhou) Automation Co Ltd. Engineers there can simply tell the agent what they need in plain language, and it takes care of the rest. On that line, programming time is cut by roughly 30 percent, with equipment debugging time decreased by a similar margin.

Vasi Philomin, executive vice-president and head of Data and AI at Siemens, said China's complete manufacturing system, its scale and speed of technology deployment and the openness of local manufacturers to innovation all provide fertile ground for AI to grow. He believes AI will become a core force driving industrial transformation in the country.

Behind this growing embrace of AI by global firms is a policy environment that has kept pace. From national strategies to local initiatives, recent policy measures have given foreign companies greater confidence to tap into China's AI opportunities.

In Shanghai, rules issued early this year encourage foreign-funded research and development centers to invest in high-growth areas like intelligent terminals and embodied intelligence. Shenzhen adopted similar measures late last year to attract foreign companies to set up innovation facilities in the city.

In July, the National Development and Reform Commission and other government departments released an action plan to strengthen international AI collaboration.

David Blair, vice-president of the Center for China and Globalization, said China's diverse manufacturing sectors — particularly the highly competitive industrial clusters along the southeastern coast — will generate even more AI applications in the years ahead, through open and mutually beneficial cooperation.

AI rewiring how China's energy is managed

Large models do not simply crunch numbers, they guzzle electrons

By ZHENG XIN
zhengxin@chinadaily.com.cn

To generate a mere five-second, high-definition video out of the digital space — perhaps a lifelike sunset or a virtual city street — an artificial intelligence model does not simply crunch numbers; it guzzles electrons.

Producing those few fleeting seconds of digital reverie requires roughly the same amount of electricity as fully charging 10 smartphones, said Wang Hongzhi, head of the National Energy Administration.

"The AI boom is triggering a ravenous new appetite for electricity," Wang said.

In China, the AI sector is expanding at a breakneck pace. Projected to surpass a valuation of 10 trillion yuan ($1.48 trillion) by the end of the decade, the industry's explosive boom in computing power is driving a precipitous spike in power consumption.

The government is confronting this colossal appetite head-on. Yet, rather than merely throwing more coal into the furnace, Chinese planners are orchestrating an intricate, nationwide symbiosis between the machines that think and the grid that feeds them.

To prevent the AI boom from short-circuiting the nation's climate goals, Beijing is effectively redrawing its infrastructural map, which Wang describes as "powering computing with electricity and promoting electricity with computing".

In the sun-drenched, wind-swept expanses of the western provinces, national computing hubs are being deliberately tethered to colossal new renewable energy bases, while in the densely populated east, planners are nesting distributed computing facilities alongside local microgrids and virtual power plants so that data centers can scavenge power close to the source.

The government is also actively encouraging data centers to plug directly into green power and participate in green electricity trading, said Wang.

Conversely, delay-tolerant tasks — the massive, slow-cooking data-training runs — are nudged to operate during off-peak hours. This essentially uses the data centers as massive, flexible shock absorbers to balance the grid, he said.

But this relationship, Wang said, is far from a one-way street. While the power grid fuels the rise of algorithms, the algorithms are, in turn, rewiring how the nation's energy is managed.

The two industries have entered a fast lane of mutual empowerment, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

While AI operations do consume a substantial amount of power, the technology has been acting as the nervous system for an increasingly complex energy landscape — optimizing grid operations, smoothing out renewable energy volatility and ultimately driving broader energy efficiency, Lin said.

In the petroleum sector for example, a large model known as "Kunlun" has accelerated the computational efficiency of oil and gas exploration by more than tenfold, cutting through geological guesswork to optimize drilling strategies, said Wang.

Operated by China National Petroleum Corp, the upgraded platform marks a crucial leap from passive question-answering to "active intelligence", allowing the AI to autonomously plan, dispatch tools, analyze data and execute tasks across the production line.

As the first large model in the domestic energy and chemical industry to achieve large-scale, full-chain application, Kunlun — currently deployed across 152 scenarios — boasts a drilling risk warning system with an accuracy rate exceeding 85 percent, issuing over 300 early warnings in the past six months to prevent accidents, CNPC said.

Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute, said AI is proving to be the perfect antidote to the inherent chaos of renewable energy.

As immense volumes of wind and solar power flood the national grid, the system becomes jittery, subject to the whims of passing clouds and dying breezes, he said.

Here, an AI model dubbed "Yudian" acts as a tireless dispatcher. It predicts weather-driven fluctuations in real time and dynamically adjusts the grid to ensure that no clean energy goes to waste.

This intelligence is also moving from the control room out into the field, graduating from merely offering diagnostic advice to executing autonomous operations.

When a fault occurs in the power distribution network, an AI model called "Guangming Power" steps in like an attending physician. It senses line anomalies, pinpoints the exact location of a failure and coordinates intelligent repairs without waiting for human intervention.

Ultimately, it is a bold blueprint for an engineered feedback loop. The algorithms will consume the sun and the wind to grow smarter, and, in their newfound brilliance, they will figure out how to harness the Earth's elements ever more perfectly.

AI systems need an ocean of electricity to keep expanding. Over the last 10 years, China has built a colossal power grid perfectly scaled to power these machines.

By the end of May, China's total installed power generation capacity reached 4.01 billion kilowatts. To put that figure in perspective, it exceeds the combined power capacities of the United States, the European Union, India, Japan and Russia.

The pace of this expansion is compounding at a dizzying rate. It took the country eight years to double its capacity from 1 billion kW in 2011 to 2 billion kW in 2019. Reaching the 3-billion-kW mark took five years, achieved in April 2024. Adding this latest billion took a mere two years.

Overall, between 2010 and 2025, China's power generation capacity maintained an average annual growth rate of 9.7 percent — eclipsing the equivalent rates of the US (1.7 percent) and the EU (3.2 percent).

Industry experts view this hypergrowth as a testament to the country's formidable manufacturing base. Jiang Debin, deputy director of the statistics and data center at the China Electricity Council, said the fundamental driver behind this acceleration is the explosive rise of renewable energy, primarily solar and wind.

"This not only illustrates the continuous improvement in the efficiency and scale of China's power grid expansion, but also reflects the comprehensive advantages of the country's manufacturing system, engineering prowess and institutional mechanisms," Jiang said.

In an era where geopolitical conflicts have triggered energy shortages and price spikes globally, China has managed to keep its lights brightly on.

As the electricity demand of emerging sectors — particularly AI and high-end manufacturing — continues to surge, this massive 4-billion-kW foundation provides ironclad energy security for the nation's broader economic ambitions, said Jiang.

Crucially, this is not just a story of scale, but of transformation. The rapid expansion has been overwhelmingly driven by a structural shift toward clean energy.

Consequently, the national energy mix has been radically reconfigured. In the first half, China's coal-fired power generation totaled 2.5 trillion kilowatt-hours, accounting for less than 50 percent of the nation's total electricity output for the first time, said the NEA.

The installed capacity of renewable energy has been steadily expanding. In the first half, the country added 117 million kW of renewable energy capacity, accounting for 73.9 percent of all newly installed capacity. As of the end of June, the nation's total installed renewable energy capacity reached 2.46 billion kW, accounting for approximately 60.7 percent of China's total installed capacity.

Renewable energy electricity generation has also risen steadily. In the first half, national renewable energy power generation reached nearly 2 trillion kWh, an increase of about 9 percent year-on-year, accounting for 41.2 percent of total electricity generation, an official of the NEA said on Thursday.

This green revolution is underpinned by brutal, brilliant economics. Over the past decade, solar module prices have plummeted by more than 90 percent, while onshore wind generation costs have fallen to match or undercut coal. Driven by technological advancements and economies of scale, renewable energy has evolved from a heavily subsidized experiment into a fiercely profitable sector.

China boasts the world's most comprehensive renewable equipment supply chain, manufacturing about 80 percent of global solar modules and 60 percent of wind power equipment.

The accelerated rollout of supporting infrastructure — including ultra-high-voltage transmission lines, pumped hydro and new energy storage systems — ensures that massive new capacity can be effectively built, transmitted and absorbed by the grid, said Jiang.

Now, this staggering capacity is beginning to spill over China's borders. Leveraging its robust grid infrastructure, the country has steadily expanded power interconnectivity with neighboring countries — particularly in Southeast Asia — helping to alleviate regional power shortages while sharing its green energy dividends.

The China-Laos 500-kilovolt power interconnection project, for example, which marks the first time that foreign new-energy electricity has participated in China's marketized power trading system, had delivered nearly 200 million kWh by the end of May, demonstrating the massive potential of cross-border solar infrastructure.

As the largest cross-border grid project and the highest-voltage power link between China and Laos, the project is expected to transmit roughly 1.1 billion kWh of solar-generated electricity to China this year alone, said its operator China General Nuclear Power Group.

As industry experts note, China's most significant export extends far beyond raw electricity.

"The same industrial ecosystem that built this 4-billion-kW leviathan is now exporting complete, turnkey green energy solutions — advanced solar, wind and smart-grid technologies," said Jiang from the CEC. "This is positioning the country as an indispensable engine of the global energy transition."

The transmission lines of the China-Laos 500-kilovolt power interconnection project are connected at the border between Mohan in Southwest China's Yunnan province and Luang Namtha province in Laos on Feb 5. PROVIDED TO CHINA DAILY

Nation sets green power usage benchmarks

By ZHENG XIN

China has taken a landmark step in its green transition by establishing its first-ever mandatory minimum consumption target system for renewable energy, a move experts say represents a fundamental paradigm shift from supply-driven expansion to demand-led integration in the country's pursuit of its carbon peak and neutrality goals.

Jointly issued by four ministries — including the National Development and Reform Commission and the Ministry of Industry and Information Technology — the measures for implementing the minimum target of renewable energy consumption and the responsibility weight of renewable energy power absorption officially took effect on Saturday.

"The policy fundamentally transforms the responsibility structure of China's energy transition as it enters deep waters," said Wang Yongli, deputy director of the Energy Internet Research Center at North China Electric Power University.

"In the past, the main challenge was insufficient grid capacity to absorb rapid supply growth. Now, by shifting mandatory green consumption obligations from local governments and grid companies down to key energy-consuming enterprises, the policy uses demand to anchor renewable energy investments and market expectations."

According to the National Energy Administration, the new framework establishes a dual-driven mechanism combining "rigid obligations on the consumer side" with "territorial responsibilities on the absorption side".

While provincial administrative regions will continue to optimize the regional allocation of green power, key energy-intensive industries will face strict, quantifiable baselines for renewable energy use in their total energy mix, it said.

The initial wave of monitoring and assessment will target sectors with high emissions or rapid electricity demand growth, including electrolytic aluminum, steel and cement, polysilicon production, as well as newly built data centers at national computing hubs.

Analysts note that for these enterprises, green power procurement capabilities and energy structure optimization will rapidly evolve into core market competitiveness.

"High-energy-consuming, high-emission industries and those with rapidly growing power demand will be the first to face tougher green energy constraints," said Wang.

"The ability to procure green electricity and certificates, along with the capacity to adjust energy consumption structures, will become a defining core competitiveness for enterprises."

Crucially, the regulation integrates non-electric renewable consumption — such as green hydrogen, ammonia, methanol and biomass heating — into the national assessment for the first time.

According to the NEA, this expansion aims to ease grid bottlenecks and unlock new avenues for deep industrial decarbonization by promoting localized, multiscenario utilization of clean energy.

By diversifying how renewable energy can be legally consumed, the policy addresses the structural mismatch between large-scale clean energy bases in western China and the consumption limits of local power grids.

Another game-changing shift is the elevation of Green Electricity Certificates into legally binding compliance instruments. Companies failing to meet their quarterly or annual targets must purchase GECs to bridge the gap or face regulatory penalties, including public reprimands and credit downgrades.

"This thoroughly clarifies how companies calculate and execute their green targets, which will effectively boost market demand for green power and GEC trading," said Tao Ye, deputy director of the renewable energy development center at the NDRC's energy research institute.

Regarding market concerns over potential price surges, experts emphasize that the policy aims to form a credible, stable and predictable green premium rather than fuel speculation.

The GEC market will see internal differentiation based on certificate credibility, said Wang.

"The future value of a GEC will hinge on its availability, verifiability and its alignment with carbon markets, product carbon footprints and international supply chain standards, rather than just raw supply volume," he said.

Wind turbines generate green energy at a wind farm on Dongchu Island in Rongcheng, Shandong province, on July 20.

Guangxi seeks to better protect digital creative IPs

By CAO YIN in Nanning
caoyin@chinadaily.com.cn

Judges in the Guangxi Zhuang autonomous region are preparing to issue a "risk notification" to local animation and short drama industrial parks, a preemptive judicial measure aimed at helping emerging creative industries stay within legal boundaries before copyright disputes spiral out of control.

The notification, expected in the coming weeks, will urge creators and online platforms to obtain proper authorization before adapting existing works and avoid producing content that violates public order or good morals, even in pursuit of online traffic, said Wei Meiyun, deputy chief judge of the Nanning Intellectual Property Tribunal.

The move comes as China elevates intellectual property protection to a strategic national priority. On July 20, the State Council, China's Cabinet, approved the 15th Five-Year Plan (2026-30) for IP protection and commercialization, calling for faster legal updates, stronger policy support and a more favorable environment for innovation-driven development.

The Supreme People's Court also released its implementation road map for the same five-year period, emphasizing stronger IP protection in emerging sectors and greater judicial support for developing new quality productive forces.

The work of the Nanning tribunal reflects these national priorities while addressing the practical challenges of a rapidly expanding creative economy.

Established in January 2026, the tribunal has seen a sharp increase in disputes involving the adaptation of literary works into videos, short dramas, animated series and AI-generated content.

Wei said judges are frequently handling cases involving novels adapted into short dramas as well as AI-assisted video production.

"We encourage creative reinterpretation, but not at the expense of public interest or the law," she said.

Since the start of 2025, courts in Nanning, including the tribunal, have handled 93 disputes involving short dramas.

One representative case involved the short drama *The Return of the Warrior Spirit*. The tribunal found that the producer had copied the original work's character settings, plot structure and visual scenes, and ordered the producer to pay 10,000 yuan ($1,400) in damages.

Tu Yuanyuan, the judge who handled the case, said AI has dramatically shortened production cycles while making infringement more difficult to detect.

During the trial, she spent considerable time comparing the disputed work with the original in terms of character design and narrative structure.

She said the ruling recognized both the original work's market value and the defendant's clear intent to imitate it, although the damages awarded were relatively modest.

"There is no uniform legal threshold for what constitutes substantial similarity," she said. "Every case turns on its own specific facts."

Tu added that many short drama lawsuits are filed not by original authors but by companies or individuals that have acquired adaptation rights to literary works.

In many cases, plaintiffs are only able to provide evidence of infringement on individual online platforms rather than across cyberspace, a limitation that often results in relatively low damage awards, she said.

To address such challenges, Wei said the tribunal has promoted both prelitigation and in-court mediation, encouraging parties to resolve disputes through licensing agreements or settlements facilitated by professional mediators.

The tribunal has also published typical copyright cases to provide guidance for creators, platform operators and online platforms. Public awareness initiatives, including lectures and open hearings, have also been launched to foster greater respect for intellectual property rights, she said.

Lan Dandan, chief judge of the third civil division of the Guangxi High People's Court, said courts across the region have strengthened IP adjudication in recent years to support innovation and improve the business environment through the rule of law.

From 2023 to 2025, courts in Guangxi handled more than 22,000 IP disputes involving copyrights, trademarks, patents and trade secrets, and concluded more than 19,000 of them, she said.

To improve the quality of case handling and better resolve disputes involving emerging industries and technologies, Guangxi established the specialized tribunal early this year.

It has so far accepted 626 cases and concluded 394.

Beyond the digital creative sector, the tribunal is also strengthening IP protection in the seed industry.

Wei Wubin, president of the Nanning Intermediate People's Court, said Guangxi is one of China's leading agricultural regions, ranking first nationwide in fruit production, with crops including rice, corn, lychees, passion fruit and jasmine.

He described the seed industry as the "chip" of agriculture, saying that innovation lies at its core and effective protection is essential to translating innovation into productivity.

He added that the tribunal is prepared to establish judicial protection bases and circuit trial teams tailored to Guangxi's distinctive agricultural brands, including its renowned sugar tangerines and other geographical indication products.

From the fast-paced world of short dramas to the long-term work of seed breeding, the tribunal is carving out a role as a pragmatic and forward-looking institution, reflecting China's broader ambition to build a world-class intellectual property protection system one case at a time.

Crew harvests rice samples on Tiangong

Shenzhou XXIII astronauts carry out a series of scientific and medical tasks

By ZHAO LEI
zhaolei@chinadaily.com.cn

More than two months after arriving at the Tiangong space station, the Shenzhou XXIII mission crew has harvested the first batch of experimental rice samples after meticulously cultivating the plants in orbit.

A video released by the China Manned Space Agency on Sunday shows the astronauts — mission commander and spaceflight engineer Colonel Zhu Yangzhu, spacecraft pilot Colonel Zhang Zhiyuan and science payload specialist Lai Ka-ying — collecting and storing the rice samples.

The experiment, titled "Molecular Mechanism Study on Multigenerational Genetic Stability and Environmental Adaptation Regulation of Space Rice", aims to achieve the world's first continuous cultivation of two generations of rice in orbit, completing two consecutive life cycles.

Its primary objective is to reveal the biological mechanisms through which long-term exposure to microgravity affects the genetic stability of rice.

The rice seeds carried aboard the Shenzhou XXIII mission are Chinese japonica varieties known for their strong environmental adaptability and growth cycle of three to four months. They were divided into two groups: ordinary seeds that have never been to space and direct descendants of seeds harvested aboard the Tiangong space station in 2022 that have since undergone three generations of propagation on Earth.

According to China Central Television, the experiment consists of four independent cultivation units, each containing six seeds. The units are divided into two parallel groups, each testing a different rice reproduction method.

In addition to harvesting panicles and seeds, the astronauts will preserve stem and leaf samples at low temperatures for their return to Earth. Scientists will conduct detailed analyses of the samples to provide scientific support for developing production models for future space agriculture.

The latest experiment builds on earlier breakthroughs. In 2022, the Shenzhou XIV mission crew carried out the world's first full life-cycle rice cultivation experiment aboard the Tiangong space station. Six rice seeds spent 120 days in orbit and produced 59 first-generation space rice seeds, which were returned to Earth with the Shenzhou XIV astronauts.

Besides tending the rice experiment, Zhu and his crewmates carried out a series of scientific and medical tasks last week.

Working together, they used an ultrasound diagnostic device to conduct bilateral examinations of the carotid, radial and dorsalis pedis arteries. The data collected will support research on pan-vascular blood flow spectroscopy and the development of a spatiotemporal atlas of blood flow evolution.

The astronauts also carried out a lighting environment experiment by adjusting the space station's interior lighting and recording their work performance before and after the changes. The research aims to examine how lighting conditions affect psychological perception and work efficiency in the space environment.

The crew completed an in-orbit emergency rescue drill under a simulated fire scenario to strengthen their emergency response and fault-handling capabilities.

As part of their routine health management, the astronauts underwent a series of medical examinations, including electrocardiograms, vision tests, intraocular pressure measurements and fundus examinations. They also measured their body mass using a specialized mass measurement device to monitor physiological changes caused by prolonged exposure to microgravity.

China testing AI-powered patrol vessel in Shenzhen

By LUO WANGSHU in Shenzhen
luowangshu@chinadaily.com.cn

On a busy stretch of water in Shenzhen, Guangdong province, a 12-meter-long maritime patrol vessel adjusted its course, followed its assigned route and scanned the surface for potential hazards — all without an officer having to steer it through every maneuver.

The vessel, *Haixun 14102*, is China's first maritime law enforcement boat to receive an integrated digital and intelligent upgrade. Equipped with an intelligent navigation module, multiple sensing devices and a platform linking the vessel with a shore-based control center, it entered trial operation in early July, according to the Maritime Safety Administration under the Ministry of Transport.

The pilot reflects China's broader push to integrate artificial intelligence, connected navigation systems and remote monitoring into one of the world's largest water transport networks.

China's ports handled 18.34 billion metric tons of cargo and 354 million 20-foot equivalent units of containers in 2025, while its navigable inland waterways extended for 128,700 kilometers, according to the Ministry of Transport.

As the network has expanded, the focus of water transport development has broadened beyond ports, berths and shipping channels to improving coordination among vessels, navigation facilities, shore-based platforms and maritime authorities.

The Smart Shipping 2030 Action Plan, jointly issued by the Ministry of Transport and three other central government departments earlier this year, calls for deeper integration of AI with vessels, ports, waterways, navigation support services and maritime supervision.

By 2027, China plans to establish at least three comprehensive smart shipping pilot regions, open more than five pilot routes, develop over 10 replicable application scenarios and put more than 100 intelligent vessels into operation. Priority applications include emergency rescue, navigation at night or in fog, operations in narrow and winding waterways, waterborne construction and short-distance transport.

In Shenzhen, those ambitions are being put into practice on a compact, highly maneuverable patrol vessel operating in some of the country's busiest waters.

Haixun 14102 is capable of automated patrols, obstacle avoidance, object recognition and remote operation under shore-based supervision. During one test, it traveled 14.2 nautical miles while keeping its deviation from the planned route within 1 meter. In a simulated rescue exercise, the system detected, identified and approached a person in the water within three minutes.

Rather than replacing officers, the technology is designed to improve situational awareness and support faster decision-making.

"A search-and-rescue operation can stretch to 36 or even 48 hours," said Hao Xianlin, head of an airport maritime patrol unit under the Bao'an maritime safety administration. "The integrated sensing system can greatly improve our ability to detect and identify the person we are looking for."

With a top speed of 36 knots, the vessel was selected for the pilot because it is used extensively for routine patrols, emergency response and rescue operations.

Shenzhen sits at the heart of the Guangdong-Hong Kong-Macao Greater Bay Area, where commercial ships, passenger ferries and smaller vessels share busy and often congested waterways. Long hours of visual observation can cause fatigue, while darkness, fog, rough seas and heavy traffic further increase the challenges facing maritime officers.

Video and sensing data collected by *Haixun 14102* are transmitted to the shore-based command center, allowing officers to monitor surrounding conditions in real time and provide operational support when needed.

The project also offers a more economical path toward intelligent shipping. Instead of replacing an existing patrol boat, engineers equipped the vessel with navigation, sensing, communication and ship-to-shore systems without altering its main structure or reducing its original performance. Shenzhen maritime authorities said upgrading existing vessels can lower costs and shorten deployment time compared with building purpose-designed intelligent ships.

Yin Yong, a professor at Dalian Maritime University's Navigation College, said intelligent shipping should not be viewed simply as adding sensors to vessels or removing crews.

"However advanced a laboratory simulation may be, it cannot reproduce every wave, current or unexpected situation at sea," he said.

At the university's shore-based digital operation and control center, researchers monitor real-time data from the intelligent research and training vessel *Xin Hong Zhuan*, including its position, engine performance, energy use and surrounding sea conditions.

The center serves as a shore-based cockpit, providing crews with navigation advice while allowing operators on land to offer support or take remote control when vessels encounter narrow channels, severe weather or emergencies.

"The most practical model at the present stage is cooperation between ships and shore-based operators," Yin said. "In open waters, the vessel can rely more on autonomous navigation. In narrow waterways or difficult weather, people on shore can step in. That allows us to use the advantages of AI while keeping human judgment available when it is needed most."

The ship-to-shore model is also being extended to navigation infrastructure.

At Jiangyin port in Fujian province, authorities have equipped navigation aids with weather-monitoring and Automatic Identification System devices. Drones conduct routine inspections, while connected buoys warn approaching vessels of reefs and other hazards.

"The navigation aids can now see, hear and give warnings," said Chen Jingui, a manager at Fuqing Strait Power Generation. "We have a much clearer picture of the conditions when our vessels enter or leave."

On the Minjiang River in Fujian, sightseeing vessels are monitored throughout their night cruises through a digital maritime platform, enabling shore-based authorities to track their movements and respond more quickly to abnormal situations.

The 12-meter-long *Haixun 14102* is the first maritime law enforcement vessel in China to receive an integrated digital and intelligent upgrade and is now in use in Shenzhen, Guangdong province.
PROVIDED TO CHINA DAILY

Digitalization is only part of the transformation taking place on China's waterways. On the Minjiang River and the Lijiang River in the Guangxi Zhuang autonomous region, electric and other new energy vessels are gradually replacing older diesel-powered boats to reduce engine noise, exhaust emissions and pollution risks in scenic waterways.

Wastewater, oily residues and garbage generated by sightseeing vessels are stored onboard and transported ashore for treatment rather than discharged directly into rivers. The Lijiang River has also introduced a pure-electric maritime law enforcement vessel designed for shallow waters, sharp bends and narrow channels.

Although many of these projects remain on a relatively small scale, they demonstrate how digital and green technologies can improve daily maritime operations through quieter sightseeing trips, more efficient patrols and faster emergency response.

Authorities acknowledge that intelligent shipping remains a work in progress. Wider deployment will require further testing, inspection and certification, as well as operational standards, cybersecurity safeguards and clearly defined responsibilities for vessel crews and shore-based operators. Electric vessels will also depend on reliable charging infrastructure, battery safety systems and maintenance and recycling arrangements.

As trials of *Haixun 14102* continue, Shenzhen maritime authorities are refining training, inspection and certification procedures, law enforcement protocols and maintenance standards. The experience gained from the pilot will help determine whether similar upgrades can be applied to more maritime patrol and rescue vessels.

Judicial system gives prosecutors power to ensure authorities act responsibly

By YANG ZEKUN

Left: Prosecutors fly a drone to secure evidence for public interest litigation in Yuping, Guizhou province, in March. HU PANXUE / FOR CHINA DAILY
Right: Technicians run lab tests on water samples for a public interest lawsuit in Tongling, Anhui province, in June last year. HONG WEI / FOR CHINA DAILY

Public interest lawsuits clean up bad governance

Prosecutors collect water samples from a river and carry out quick tests on water quality in Zhengzhou, Henan province, in July last year. WANG FUXIAO / FOR CHINA DAILY

For years, a 3,000-square-meter plot along the Mangdao River in Yangzhou, Jiangsu province, sat choked beneath 3,000 metric tons of garbage and concrete rubble. As a key tributary of the Yangtze River and vital source area for the South-to-North Water Diversion Project, the site along the Mangdao River was more than a local eyesore. Despite the obvious threat to a crucial national water supply, local authorities allowed the dump to fester.

Today, the contaminated lot has been transformed into a lush ecological park, thanks to a growing mechanism in China's judicial system known as procuratorial public interest litigation. This institutional framework empowers prosecutors to haul negligent government agencies into court when shared public resources are left unprotected.

Unlike ordinary litigation, which usually resolves disputes between specific parties, procuratorial public interest litigation focuses on interests shared by society as a whole, including environmental protection, food and drug safety, cultural heritage, data security, workplace safety, accessibility, and the rights of minors, women and people with disabilities.

The system does not allow prosecutors to replace administrative agencies. Its core is legal supervision. Prosecutors identify harm to public interests, urge responsible authorities or infringers to act, and, when necessary, bring cases before courts to clarify responsibility and push rectification.

From waste to court

A turning point came in December 2024, when prosecutors in Yangzhou's Jiangdu district received a tip-off from local water conservancy officials. Because the original illegal dumpers could not be identified, prosecutors turned their attention to the administrative bodies duty-bound to keep the area safe: the Jiangdu district urban management bureau and the Xiannyu township government.

After informal consultation yielded no results, prosecutors issued formal legal notices to the two bodies demanding action. But when investigators returned to inspect the site after the deadline, they uncovered a classic superficial fix. Rather than removing the hazards, officials had simply buried the 3,000 tons of waste beneath a thin layer of topsoil.

The procuratorate then filed an administrative public interest lawsuit against the two bodies. During court proceedings, the urban management bureau commissioned a third party to dispose of the waste, while the township government helped coordinate the work. Environmental testing later showed that the soil met national standards.

Yet, even after the trash was gone, prosecutors refused to drop the case. Rather than accepting the belated cleanup as a resolution, they asked the judge to issue a formal ruling declaring that both government bodies had acted unlawfully by failing to perform their duties in time. The township argued it lacked administrative penalty powers over illegal dumpers, while both agencies insisted that the completed cleanup made the lawsuit moot.

The move by the prosecutors reflected a key point: restoring damage is necessary, but clarifying responsibility is also important. If delayed or superficial rectification can erase earlier inaction, similar problems may return.

In January, the court rejected the arguments and confirmed that both bodies had failed to perform their duties in accordance with the law.

The court held that the township government had direct environmental protection responsibilities in its jurisdiction, and that later rectification during litigation could not offset earlier inaction.

For Xu Xiangchun, head of the public interest litigation department of the Supreme People's Procuratorate at the time, such cases show why the system must be precise and restrained.

In administrative public interest litigation, the key is to clarify the boundary of administrative duties and responsibilities, Xu said. In civil public interest litigation, the focus is on identifying infringers and the form of liability they should bear. In environmental cases, this also reflects restorative justice. The goal is not simply to win a case, but to stop damage, repair the environment, prevent recurrence and improve governance at the source.

China's procuratorial public interest litigation system has developed rapidly since it was rolled out in 2017. Since July that year, procuratorial organs have handled more than 608,000 public interest litigation cases involving ecological environment and resource protection, accounting for about 47 percent of all such cases.

In 2025, procuratorial organs handled 133,194 public interest litigation cases across 14 statutory fields, with 47,228 involving ecological and resource protection. Administrative public interest litigation accounted for 91.5 percent of filed cases.

The predominance of administrative cases reflects a key feature of the system. In many public interest problems, harm continues not only because of an individual violation, but also because responsible departments fail to act in time, lack coordination or misunderstand the scope of their duties.

More than 90 percent of administrative public interest litigation cases are resolved before trial through procuratorial suggestions and other pre-litigation procedures. This allows many problems to be addressed at lower judicial cost, while litigation remains available when supervision does not lead to effective action.

The system has expanded beyond environmental protection to fields such as food and drug safety, personal data security, cultural relics protection, workplace safety, accessibility, anti-monopoly issues, telecom fraud, and the protection of specific groups.

A draft procuratorial public interest litigation law has been reviewed by the Standing Committee of the National People's Congress, marking a step toward dedicated legislation. Technology is also changing case handling. By the end of 2025, procuratorial organs had built 291 big data legal supervision models related to public interest litigation. In 2025, these models screened more than 51,800 clues and supported over 30,000 cases.

For Qin Qianhong, a professor at Wuhan University Law School, procuratorial public interest litigation has a distinctive Chinese character. He said the system goes beyond confrontation and pursues coordination.

Its institutional logic, Qin said, is not to replace administrative power, but to provide legal supervision that helps responsible bodies correct mistakes and improve governance.

Qin said a combination of force and restraint is central to the system. It helps prevent public interest protection from falling through the gaps, while respecting the lawful space of administrative agencies to perform their duties.

Global relevance

This model is also drawing international attention. The Supreme People's Procuratorate has shared its experience in Vietnam, Brazil and France. China's river basin cases have become part of these exchanges, with the Nansi Lake case included in the United Nations Environment Programme database.

Elizabeth Maruma Mrema, assistant secretary-general of the United Nations, said that China has made inspiring progress in environmental legislation and enforcement. Environmental public interest litigation, she said, helps translate environmental laws into strong enforcement, promotes accountability and closes the implementation gap between law and practice.

She added that prosecutors are essential actors in the environmental rule of law because environmental challenges are complex, interdisciplinary and often cross borders, requiring cooperation among judges, lawyers, prosecutors, law enforcement agencies and the public.

China's Ecological Environment Code, adopted earlier this year, has further strengthened the legal foundation for environmental governance. The code requires people's procuratorates to strengthen ecological and environmental procuratorial work and legal supervision, giving prosecutors greater responsibility in ecological protection under the rule of law.

As environmental damage, data risks, food safety and rights protection issues become more complex, public interest litigation is expected to play a larger role. The next challenge is not simply to handle more cases, but to handle better ones — cases that are necessary, precise, legally sound and capable of guiding future governance, according to prosecutor Xu.

The Mangdao River case shows how the mechanism works at ground level. A polluted plot that had remained unresolved for years was cleaned, administrative duties were clarified, and a court confirmed that later rectification could not erase earlier failure to act.

"Public interest litigation must ensure that prosecutors neither fail to act nor overstep. That balance is what allows the system to protect public interests through the rule of law," Xu said.

Litigation brings down barriers to accessibility

By YANG ZEKUN

A legal worker sends a guidance booklet on pressing civil lawsuits in Braille to a partially sighted villager in Zibo, Shandong province, in April. ZHANG WEITANG / FOR CHINA DAILY

China is using procuratorial public interest litigation to strengthen barrier-free environment construction to protect the rights of people with disabilities, the elderly and those with accessibility needs, according to the country's latest human rights action plan.

The National Human Rights Action Plan of China (2026-30), released by the State Council Information Office in June, calls for stronger procuratorial public interest litigation in areas including barrier-free environment construction.

Qiu Jinghui, deputy director of the Supreme People's Procuratorate's Public Interest Litigation Procuratorial Department, said the requirement recognizes the progress made during the previous action plan period and sets higher expectations. He added it would enable China to contribute its experience to global human rights governance.

From 2021 to 2025, procuratorates nationwide filed more than 14,000 public interest litigation cases related to barrier-free environment construction. The SPP has included data and cases on such work in its annual work reports for six consecutive years, Qiu said.

The Law on Building Barrier-Free Environments, which took effect in 2023, provides a clear legal basis, with Article 63 stating that when acts violating the law harm public interests, procuratorates may issue procuratorial recommendations or file public interest lawsuits.

Qiu said procuratorial public interest litigation has evolved from correcting problems in public facilities, information access and social services to promoting more integrated accessibility development. Prosecutors are also paying greater attention to public participation, technology-based supervision, prevention and long-term governance.

Accessibility is no longer viewed only as a special service for people with disabilities and the elderly. Under the law, others with barrier-free needs may also enjoy related conveniences. In cases involving transport, medical services, culture, sports and tourism, prosecutors have found that young people carrying heavy loads or recovering from injuries, caregivers, domestic and nursing workers, and emergency responders may all have practical accessibility needs.

Information barriers caused by the "digital divide" also affect groups beyond people with disabilities and the elderly, Qiu said. Barrier-free environment construction is therefore a basic right linked to sharing the benefits of economic and social development across all groups and all stages of life.

In October 2024, the United Nations Human Rights Council adopted by consensus a China-led resolution on promoting human rights for all through barrier-free construction, the first UN resolution on the topic. Qiu said China's procuratorial public interest litigation practice demonstrates institutional and rule-of-law strengths in implementing that concept.

Since the barrier-free environment law took effect, prosecutors have handled cases in healthcare, transport and tourism. Under the SPP's guidance, procuratorates in Shanghai and Jiangsu, Guangdong and Hunan provinces have pushed for larger-print and electronic drug instructions, as well as drug traceability codes, to address safety risks caused by tiny print on medicine instructions.

In Fujian province, prosecutors have promoted text, video and message-based emergency call functions across 71 emergency centers, opening barrier-free access to 120 emergency services for more than 160,000 people with hearing or speech disabilities. In the Inner Mongolia autonomous region, a medical accessibility project pushed 648 medical institutions to carry out barrier-free and elderly-friendly renovations. In Sichuan province, prosecutors promoted accessible sightseeing vehicles at Jiuzhaigou Scenic Area.

In 2025, procuratorates handled 4,723 public interest litigation cases involving barrier-free environment construction, according to the SPP. The top procuratorate also issued trial guidelines on handling such cases and carried out a public interest litigation supervision campaign on railway accessibility to better meet the travel needs of people with disabilities, the elderly and other groups.

The SPP, the Ministry of Civil Affairs and the China Disabled Persons' Federation have released six typical cases on barrier-free and elderly-friendly public interest litigation. Chinese procuratorial practice in this field was also displayed at a thematic exhibition during the 59th session of the UN Human Rights Council.

However, challenges remain. Qiu said rectification after individual cases may rebound without follow-up supervision. More fundamentally, sustainable accessibility requires removing barriers in social attitudes.

During the 15th Five-Year Plan (2026-30), Qiu said procuratorates should further improve the quality of public interest litigation for accessibility. Priorities include improving accessible medical and public services, promoting employment for people with disabilities, narrowing the digital divide, and implementing the Marrakesh Treaty to facilitate access to published works for people with vision disabilities.

Prosecutors will continue to deepen supervision over accessible transport and promote accessibility in electronic products, office software, apps and mini programs, Qiu said. The goal, he added, is to allow everyone to share a better life with dignity.

CULTURAL 文明中国 HERITAGE

Heart of Hongshan still beats

Archaeologists say a 5,600-year-old ritual center reshapes our understanding of China's earliest state, report **Yang Feiyue** and **Wu Yong**.

On the green hills of western Liaoning province, a newly excavated platform has revealed that Hongshan people could determine true north and south with remarkable precision 5,600 years ago.

This Neolithic culture tracked the sun's shadow with a vertical pole — a technique known as *gui biao ce ying* that would become fundamental to Chinese astronomy, surveying and urban planning.

The conclusion comes from Platform No 2 at Locality 1, the northern section of the Niuheliang site in Chaoyang, Liaoning, that was discovered in the 1980s. It is the most important ceremonial center of Hongshan culture that flourished in northeastern China from around 6,500 to 4,800 years ago, spanning parts of what is now Liaoning and Hebei provinces, as well as the Inner Mongolia autonomous region.

Renowned for its sophisticated jade craftsmanship and monumental ritual architecture, Hongshan is widely regarded as one of the earliest foundations of Chinese civilization beyond the Yellow River heartland.

The platform is a rectangular structure measuring 64.61 meters north to south and 41.39 meters east to west, one of nine such platforms that archaeologists identified in 2021 as a massive architectural complex at the site.

Its builders used a mix of earth and stone — compacted soil on flat ground, large stones topped with gravel in low-lying areas — a method that combined durability with drainage. The platform sits slightly north of the center of the complex.

The discovery is the latest in a series of findings that have transformed the site from a burial ground into what scholars now recognize as the ritual capital of an early Chinese state, complete with temples, altars, elites' tombs and a north-south axis that echoes that of Beijing.

Feng Shi, an academician of the Chinese Academy of Social Sciences, says the platform's precise north-south alignment reflects mastery of the *er sheng* system — two perpendicular reference lines running north to south and east to west.

According to Feng, shadow-measuring techniques date back at least 8,000 years.

Clear evidence of the system appears on pottery at sites dated 7,000 years ago, like Liulinxi in Hubei province. By 6,500 years ago, the Xishuipo site in Henan was already laid out along a meridian line. Niuheliang's Platform No 2, he says, is a direct application of this ancient astronomical tradition.

Yet, it lacks what many would consider an essential feature of a capital — city walls.

Guo Dashun, honorary director of the Liaoning Provincial Institute of Cultural Relics and Archaeology, points out that walls are not, in fact, essential.

Yinxu, the last capital of the Shang Dynasty (c.16th century-11th century BC), had no known city walls. Neither did Erlitou, widely regarded as a capital of the Xia Dynasty (c.21st century-16th century BC).

"Yet both are widely recognized as capitals," Guo says.

Recent excavations have further strengthened Niuheliang's claim to that status.

At Locality 1, archaeologists have identified two temples — an upper temple to the north and the famed "goddess temple" to the south. Although the upper temple's above-ground structure has disappeared over five millennia, the finely crafted artifacts uncovered there rival those found in the goddess temple.

From the upper temple southward, past the goddess temple and sacrificial pits, the axis extends roughly one kilometer to Locality 2, where a three-tiered circular altar and burial mounds stand.

The layout is strikingly coherent: temples to the north, an altar to the south and elites' tombs aligned along the central axis.

Guo draws a parallel to Beijing, where the Forbidden City and Imperial Ancestral Temple stand in the north and the Temple of Heaven in the south.

Niuheliang, he says, contains the same core elements — an ancestral temple, sacrificial altar, tombs and a north-south axis — leading him to conclude that it was the capital of the Hongshan ancient state.

A bridge to the divine

In the highest-status tombs at Niuheliang, almost nothing accompanied the dead except jade. Scholars call this practice *wei yu wei zang* — "jade-only burial".

"Jade was the ultimate luxury, the high technology of its time," says Zhou Xiaojing, a research fellow at the Liaoning Provincial Museum, who has spent more than three decades studying Hongshan jade.

"Rarity made it precious — the difficulty of quarrying, transporting, and crafting it was precisely what made it a marker of status," she adds.

Most Hongshan jade artifacts can be traced to deposits in Xiuyan Manchu autonomous county, Anshan, Liaoning, which supplied the bulk of the culture's jade. A smaller number may have come from areas near Heilongjiang province and Russia's Lake Baikal.

Hongshan jade is renowned for its depictions of sacred animals — dragons, phoenixes, tortoises and silkworms. The *jue*-dragon and C-shaped dragon are among the most iconic, considered early prototypes of the Chinese dragon totem.

More intriguing, Zhou says, is what these objects reveal about Hongshan beliefs. A tubular jade object found near the head of a burial — the direction associated with heaven — is believed to have served as a medium for communicating with the divine. A large cloud-shaped jade piece placed on the chest likely signified the highest social rank.

Guo, the senior archaeologist, points to a recent discovery at the Yuanbaoshan site in Inner Mongolia, where archaeologists uncovered more than 100 jade objects embedded in a stone mound rather than inside tombs. The practice of "hiding jade in the mound", he says, appears to have been a ritual offering to heaven rather than part of a burial.

Guo believes this reverence for jade endured long after Hongshan culture, eventually finding expression in Confucian thought, where jade came to symbolize moral virtue.

Two peoples, one identity

Zhang Xingde, a professor of archaeology at Liaoning University who has spent more than four decades studying Hongshan culture, believes the reason that jade played a central role in Hongshan society lies in the very composition of the culture itself. It was a story of two distinct peoples who came together and forged a shared material and spiritual identity.

"Although the Hongshan people were relatively less developed in material terms, they also wanted to learn new things," Zhang says.

"And their absorption was not simple 'take-and-use' — it was innovation on the basis of what they took — in today's words, 'upholding tradition while breaking new ground'"

The breakthrough came from pottery. Between 2008 and 2010, the late archaeologist Zhang Zhongpei noticed something striking at the Weijiawopu site, a Hongshan culture settlement in Inner Mongolia. Pottery unearthed from different Hongshan sites had been made using two entirely different techniques.

One — the "clay-ring joining method" — was local to western Liaoning. The other — the "clay-strip coiling method" — was characteristic of regions south of the Yanshan Mountains.

"This Hongshan is not that Hongshan," Zhang Zhongpei told her, and urged her to investigate further.

Years of research led Zhang Xingde to conclude that Hongshan culture emerged from the convergence of two distinct populations.

One group was the indigenous people of western Liaoning, descended from the earlier Xinglongwa and Zhaobaogou cultures — the region's earliest farming communities dating back some 8,000 years.

The other consisted of Neolithic migrants from the eastern foothills of the Taihang Mountains. Driven northward by population pressure as agriculture expanded, they entered the Liaohe River basin around 6,500 years ago.

According to Zhang, the two groups initially clashed, even engaging in warfare. The newcomers pushed the indigenous population north toward the Xar Moron River basin in what is now Inner Mongolia, the northern edge of the Hongshan cultural sphere.

It explains why Hongshan culture's early phase had no jade in the southern part of the region, even though the earlier Xinglongwa culture to the north was rich in jade, Zhang says.

Over time, however, the two peoples learned to coexist. They adopted each other's vessel forms while preserving their own pottery-making techniques. At Niuheliang, Zhang says, they built a shared ceremonial center where different communities could worship together.

For her, this cultural fusion explains jade's elevated status. The southern migrants brought no jade tradition, but they encountered a northern people for whom jade was already sacred. In the process of forging a shared identity at Niuheliang, jade was elevated from a regional tradition to the unifying symbol of a new society, invested with new cultural meaning.

Guo, the archaeologist, sees evidence of this fusion in Hongshan painted pottery itself. Hongshan painted pottery bears three distinct patterns — the rose from China's Central Plains, the dragon native to Hongshan and geometric diamond-grid patterns from the vast Eurasian steppe. They testify to a "pottery road" that linked east and west, north and south some 5,000 to 6,000 years ago, with the western Liaohe River basin as a crucible of cultural fusion.

Many scholars in China and abroad have described Chinese civilization as a civilization of continuity, distinct from the cycles of rupture and replacement often associated with the ancient West.

Rooted in northeastern China's traditions while embracing influences from neighboring regions, Hongshan culture exemplifies that enduring pattern, they argue.

Guo believes this openness to outside influences helped shape Chinese civilization and ensured its continuity across millennia.

Niuheliang, he says, proves the continuity of Chinese civilization and is the root of ancient Chinese culture.

Key Hongshan discoveries of recent years

1. Ma'anqiaoshan site in Chaoyang, Liaoning province

The Ma'anqiaoshan site is a Neolithic settlement dating from about 7,700 to 5,500 years ago. Archaeological findings show that an early settlement of Hongshan culture has been remarkably well preserved at the site. The residential area was carefully planned, with large house foundations serving as central hubs surrounded by smaller dwellings and

pits. Scientific analysis indicates that people had already begun cultivating crops on a large scale during the early Hongshan period. The growth of agriculture boosted productivity, allowing communities to settle permanently and sustain long-term production. These discoveries suggest Hongshan society was becoming increasingly complex, laying important foundations for the emergence of a diverse yet unified Chinese civilization.

2. Dongshantou site in Chengde, Hebei province

Between 2022 and 2025, archaeologists excavated the Dongshantou site, which dates from about 5,500 to 5,300 years ago. They uncovered 69 archaeological features and more than 100 pottery, stone and jade artifacts. Archaeologists find the building ways of the round rubble mound tombs, the tomb structure, burial customs and features of the unearthed artifacts basically follow those from the Niuheliang site in Liaoning, which is commonly believed to be the nucleus of Hongshan culture. However, Dongshantou also revealed unique stone-piled remains believed to represent an "earth mother deity". Archaeologists believe it reflects the Hongshan people's early worship of maternal fertility and the symbolic link between the earth and childbirth.

3. Naotegai site in Chifeng, Inner Mongolia autonomous region

The site, which covers three million square meters, is one of the largest settlements of Hongshan culture discovered to date. It has been found to have a long cultural development spanning nearly three millennia. It peaked in the late period of Hongshan culture from 5,500 to 5,000 years ago. The settlement features clearly defined residential and ritual zones arranged in a layout similar to Niuheliang. Well-developed farming tools point to a thriving agricultural economy, while finely crafted jade artifacts reflect a ritual system centered on jade, suggesting the emergence of social hierarchy and status.

4. Yuanbaoshan site in Chifeng, Inner Mongolia

Excavations in 2024 confirmed Yuanbaoshan as a Hongshan ceremonial complex of tombs and sacrificial remains dating from about 5,100 to 5,000 years ago. More than 100 jade artifacts have been unearthed, including one of the largest jade dragons ever found in northern China. Human remains, pits, and ceramic, stone, bone and clamshell artifacts were also found. Particularly notable is the discovery of jade objects embedded within and beneath the walls of a circular stone mound tomb, a burial practice that offers fresh clues to Hongshan ritual traditions and their role in the development of Chinese civilization.

5. Zhengjiagou site in Zhangjiakou, Hebei

Since 2022, archaeologists have excavated the Zhengjiagou site, uncovering nine characteristic Hongshan circular stone mound tombs and more than 600 pottery, jade, stone and bone artifacts. Dating from about 5,300 to 4,800 years ago, the site extends the known lifespan of Hongshan culture by about 200 years beyond the previously accepted end date of 5,000 years ago. The discovery also overturns the earlier view that northern Hebei lay on the culture's fringe, showing instead that it served as an important regional center during Hongshan's final phase. Its elaborate burial and sacrificial traditions, together with its rich jade assemblage, suggest that Zhangjiakou was already advancing toward an early civilization around 5,000 years ago.

Above: The 2026 Xinjiang Is a Nice Place intangible cultural heritage showcase staged in Shihezi, the Xinjiang Uygur autonomous region, attracts a big crowd. **Top right:** A chef pulls noodles at the gourmet food section of the event. **Right:** Cultural creative items featuring local elements show their appeal.
PHOTOS PROVIDED TO CHINA DAILY

Mixing crafts on new ground

A cultural festival merges shadow puppets, traditional music, and rare paper into new art, **Yang Feiyue** reports in Shihezi, Xinjiang.

Under the stage lights in Shihezi, a leather shadow puppet slowly raises an arm, swaying gracefully to the rhythm of melodies unique to the city in northern Xinjiang Uygur autonomous region.

Its movements are inspired by a traditional dance of the Uygur ethnic group. The music comes from local performers playing classic Uygur instruments such as the *dutar* and *rawap*. Yet, the figure dancing behind the screen belonged to Beijing's centuries-old shadow puppet tradition.

For the performers, it was an opportunity to explore how intangible cultural heritage can travel across regions, connect with new traditions and continue to evolve.

The performance was created for the 2026 Xinjiang Is a Nice Place intangible cultural heritage showcase, which opened on Thursday.

Organized by the Ministry of Culture and Tourism, the Xinjiang government, and the Xinjiang Production and Construction Corps, the five-day event brought together more than 650 representative intangible cultural heritage practices and over 540 inheritors from 31 provinces, autonomous regions and municipalities, as well as the Xinjiang Production and Construction Corps.

Rather than simply showcasing traditions from different regions, the event highlighted exchanges and cooperation, encouraging artists and craftspeople to learn from one another and create new forms of expression.

For Lu Baogang, an actor with the Beijing shadow puppet troupe, adapting the performance for Xinjiang audiences became the troupe's first challenge.

"When we received the invitation, we were honestly a little nervous," Lu says. "We kept asking ourselves what kind of program Xinjiang audiences would connect with."

Instead of bringing an existing production, the troupe chose to weave local cultural elements into a brand-new performance.

The result was a short piece inspired by the story of Wan Tongshu, a cultural worker who contributed to the preservation of Twelve Muqam — a traditional Uygur musical suite inscribed on UNESCO's Representative List of the Intangible Cultural Heritage of Humanity in 2008.

The Beijing artists created two shadow puppet figures based on Wan and his wife, paying tribute to generations of cultural workers who dedicated themselves to safeguarding Xinjiang's rich musical heritage.

For Lu, the most rewarding part of the project came when the Beijing performers began working closely with musicians from Xinjiang.

"At first, communication was not easy because we speak differently," Lu says. "But we share something in common — we are all committed to protecting traditional arts."

After several rehearsals, the two sides gradually found ways to blend the movements of the shadow puppets with the rhythms of Xinjiang's traditional music.

Lu says he learned a great deal from the local artists, particularly how to capture the distinctive movements of Xinjiang dance.

"One example is the posture of a Xinjiang woman dancing," he says. "Previously, our puppet simply placed one hand on its waist. The local artists suggested raising the other hand and adding movements that flowed with the rhythm. It instantly made the character feel more natural."

For Lu, the collaboration was about "absorbing elements from each other".

The troupe hopes the cooperation can continue beyond the short performance.

"We believe that one day we can create a full-length production together, combining the two sides' music and storytelling techniques," Lu says.

The troupe has also launched a workshop during its Xinjiang visit, introducing local children to the craft of making shadow puppets.

"We hope this traditional craft can take root among young people here and help promote their culture," he adds.

Fresh expressions

Across the exhibition hall, the Xinjiang mulberry-bark paper, known as *sangpi* paper, was embarking on a different path toward renewal.

Sheets of paper were placed beneath the carved woodblocks used in art studio Rongbaozhai's centuries-old woodblock watermark printing technique, producing a series of collectible artworks.

The experiment was not easy.

According to Li Yang, deputy director of Rongbaozhai's woodblock watermark center, the team has worked with different types of mulberry paper from various regions, including paper used in restoration projects at the Palace Museum.

Each region produces mulberry paper with its own texture and characteristics, he explains.

For the Xinjiang collaboration, Rongbaozhai used local mulberry paper to print images including the "Five Stars Rising in the East" brocade, discovered at the Niya archaeological site in Hotan prefecture, Xinjiang, as well as a panda-themed design.

The results showed both challenges and possibilities.

Compared with papers traditionally used in Chinese painting, Xinjiang's mulberry paper has a coarser texture and more prominent fibers, making precise printing more difficult.

Top and above: Ethnic singing and dancing performances are among the highlights of the intangible cultural heritage showcase in Shihezi, Xinjiang.

During the printing process, the team had to repeatedly apply additional layers to achieve the desired effect.

But Li believes the paper's distinctive texture could eventually become an artistic advantage.

"Its weakness could also become its strength," he says.

If artists create works specifically suited to the texture of mulberry paper, its rough surface and natural fibers often seen as limitations could become unique visual features, he adds.

"In the future, if artists create directly for this material, we may discover a new artistic language," Li says.

The current works represent only an initial exploration. The team hopes to collaborate with Xinjiang artists to develop designs and techniques that make the best use of local materials.

"When two elements come together, neither should lose its own character," he says. "The value lies in finding the point where they can meet."

Silk Road connections

Cross-regional cooperation from the partnership between Quanzhou in Fujian province and Changji Hui autonomous prefecture in Xinjiang has delivered a special rendition of the popular Fujian song *Ai Pin Cai Hui Ying* (Only By Striving Can One Win) which drew large crowds at the showcase in Shihezi.

The familiar melody was reimagined by blending Fujian folk instruments with Xinjiang traditions, including the *dombra*, the traditional two-stringed Kazak instrument, and Xinjiang folk singing.

The performance is part of an ongoing partnership linking Quanzhou, one of the key ports along the ancient Maritime Silk Road, with Changji, a region historically connected to the overland Silk Road. Over the years, the collaboration has created platforms for performances, training and exchanges among craftspeople from both regions.

Beyond performances, the Changji delegation brought a variety of local crafts and foods, including dough figurines, embroidery, traditional dairy products and folk handicrafts.

Among the exhibits was a collection of dough figurines representing different regions. Each figure combined symbols from Xinjiang and Fujian, illustrating how two distinct local cultures could come together through a single art form.

The delegation also showcased different embroidery traditions, including ethnic Kazak and ethnic Hui embroideries.

"Kazak embroidery is known for bright colors, bold patterns and motifs such as horn designs, while Hui embroidery often features finer stitching and delicate color combinations," explains Meng Yushan, an intangible cultural heritage specialist at the Changji prefecture cultural center.

Rather than merging them into a single style, the exhibition highlights their unique characteristics side by side.

For Meng, the partnership with Fujian has also opened new opportunities for local artisans to broaden their skills.

"Many of our inheritors have traveled to Fujian for training," she says.

They have studied areas such as lacquer painting and craft development, learning not only the techniques but also ways to transform traditional skills into sustainable creative industries, she adds.

When Lu Baogang first walked into the exhibition hall, he says he was struck by the diversity of traditions gathered under one roof.

"After walking around the venue, I realized that every province and region had brought its finest works, and every exhibition area had something unique to offer," Lu notes.

For Lu, the gathering was a reminder that intangible cultural heritage is not confined by geography.

Preserving tradition today is not only about safeguarding old techniques, but also about creating opportunities for different forms of heritage to interact, inspire and evolve, he says.

A Brazilian artist's dream forged in porcelain

NANCHANG — Against the red-brick backdrop of the Taoxichuan cultural and creative district in Jingdezhen, Jiangxi province, Brazilian artist Viviane Diehl stands out with her striking red hair.

For the 62-year-old visual artist, her presence in this ancient porcelain capital is the realization of a long-time dream. "The moment I began learning about porcelain, I knew I had to come to China," Diehl says.

Her journey to the heart of Chinese ceramics began with fellow artists who had worked in Jingdezhen's Sanbao village. After returning to Brazil, they shared stories about the city at exhibitions and art events, sparking Diehl's fascination.

"I've loved art since childhood," she says, recalling how she began studying ceramic painting at 15, learning every step from glazing to firing.

That passion has blossomed into tangible creations. Her artwork titled *Afforest*, which is on display at the Taoxichuan Art Museum until the end of August, was created during an artist residency in Jingdezhen in 2024.

"Ceramic art and nature guide human beings toward inner reflection, giving meaning to cycles and coexistence, providing a pause and reconnecting freedom to well-being and unity," Diehl wrote in the introduction.

Mastering this medium in a foreign land has been an expressive journey. Before arriving in Jingdezhen, Diehl completed a residency in Longquan, where she began experimenting with local clay and celadon glazes.

Longquan, a city in Zhejiang province, is known for its centuries-old celadon tradition, and the firing techniques of Longquan celadon were added in 2009 to UNESCO's list of Intangible Cultural Heritage of Humanity.

"Working with China's local clay is an expressive challenge. Experimentation in construction, surface design with celadon glazes, and gas firing techniques is a continuous process," she says. "I am learning something new all the time."

An art teacher since 1989, Diehl describes herself as an "educator-artist". While modern technology has made ceramic knowledge more accessible worldwide, she believes Jingdezhen remains unmatched.

"We don't have another place with such quality and special techniques to make porcelain," says Diehl. This unique appeal is rooted in the city's geography and heritage.

"There's nowhere else with this level of craftsmanship and these unique porcelain-making techniques," she says. That uniqueness is rooted in the city's natural resources and centuries-old heritage.

Nestled among the hills of northeastern Jiangxi, Jingdezhen is rich in kaolin, or China clay, along with other essential materials for porcelain production. Over generations, local artisans have refined every stage of the process, from preparing clay to firing kilns.

The world has taken note. The Jingdezhen Handicraft Porcelain Industry Sites were added to UNESCO's World Heritage List last month, filling a long-standing gap in the list for porcelain heritage. It is China's 61st World Heritage site.

Today, Jingdezhen's complete ceramics industry continues to attract artists from around the world. At peak times, more than 5,000 ceramic enthusiasts gather in the city.

Brazilian artist Viviane Diehl (center) visits China Ceramics Museum in Jingdezhen, Jiangxi province, on June 28. XINHUA

Beyond its thriving industry, Jingdezhen has introduced initiatives to encourage artists to stay. In 2015, the Taoxichuan cultural and creative district launched the Migratory Bird Program, partnering with art institutions in more than 50 countries and regions and attracting some 3,600 artists from across the globe.

As Jingdezhen continues to evolve, it remains a magnet for global creators. "Jingdezhen is opening doors to the world," Diehl says.

LIFE

'Living like a local' reshapes tourism

Hotels, retailers, and urban developers are shifting from traditional sightseeing models toward a more experience-driven form of vacation, **Yang Feiyue** reports.

A young woman checks into a hotel in Shenzhen's Nantou ancient town on a Friday evening. At the front desk, she is handed a room key and a small blue mesh bag.

Inside is cat food.

"There are stray cats all over the old town. Take a walk. Feed them," the receptionist says.

The bag, printed with hand-drawn illustrations of local cats and a small map of surrounding streets, serves as an informal guide to the neighborhood. It is part of the guest experience at Tiaohai Living Youth Hostel, located in one of Shenzhen's remaining urban villages in South China's Guangdong province.

In the narrow lanes around the property, open-front kitchens, small shops and long-time residents form a dense urban fabric. The hostel's slogan, written on a chalkboard near the entrance, reads, "Check in. Step out."

The concept encourages guests not to remain indoors, but to explore the surrounding community.

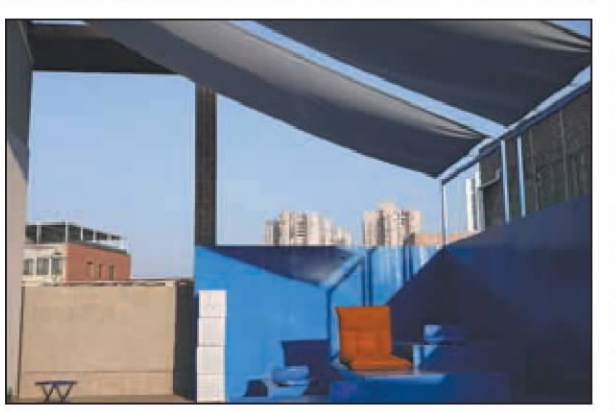
Inside one of the rooms, curtains are made from two patchworks of faded denim, floral cotton and striped fabric stitched together from secondhand clothes donated by nearby residents.

"These are the colors that once flowed through the streets of Nantou," says Sui Yi, cofounder of Tiaohai Living.

In the hallway, a "Give and Take" table allows departing guests to leave behind everyday items such as toiletries, snacks or travel essentials for others to use. In dormitory rooms, magnetic boards let guests indicate preferences such as "early sleeper", "late return", or "open to chatting".

Sui says the idea for the hostel came during frequent business travels.

He recalls staying in a mid-tier hotel in a Chinese city where, upon waking, he could not immediately identify where he was. The rooms, he says, felt identical across locations.



"The hotel gave me a place to sleep, but it couldn't tell me anything about the city I was actually in," he says.

That experience, he adds, became the starting point for Tiaohai Living, which opened in 2025. The concept aims to turn accommodation into a gateway for understanding the surrounding city.

He notes that some guests have stayed for extended periods, including job seekers who remained for several weeks or longer, and that others have returned after leaving, seeking to reconnect with people they met during their stay.

PHOTOS PROVIDED TO CHINA DAILY

The development of such hospitality models reflects broader changes in China's tourism sector, where traditional sightseeing patterns centered on ticketed attractions are gradually giving way to more experience-oriented travel.

Industry participants say the focus of travel demand is increasingly shifting toward local immersion, with younger tourists showing greater interest in everyday urban life and neighborhood culture.

At a recent tourism industry gathering in Xiamen, Fujian province, practitioners from across hospitality, retail and cultural sectors discussed the evolving structure of domestic tourism.

Xiong Xiaojie, a long-time tourism marketing executive and former chief brand and marketing officer at Chimelong Group, says that cities are increasingly becoming tourism destinations in their own right rather than just gateways to scenic spots.

He notes that demand is shifting toward "living like a local", while urban renewal has expanded the range of spaces available for tourism, including former industrial sites, alleys and community markets. Social media platforms tend to amplify overall urban "vibes" rather than individual attractions.

He also points out that different cities are increasingly developing distinct cultural identities, citing examples such as Chengdu's leisure culture, Harbin's hospitality style and Jingdezhen's artistic atmosphere.

"One strong, shareable moment matters more than 10 perfect attractions," he says.

In the retail sector, companies are also adjusting to changing consumption patterns.

Kou Weixuan, global vice-president of lifestyle brand Miniso, says that consumer demand is increasingly driven by personal interest and emotional value, particularly among younger groups.

Miniso has shifted its focus toward intellectual property (IP) development and themed retail environments, combining product sales with experiential store design, he says.

At the company's flagship store on Shanghai's Nanjing Road, which covers about 1,500 square meters, daily visitor numbers exceed 10,000. According to company figures, cumulative revenue reached more than 250 million yuan ($37 million) within around one and a half years after opening.

Kou says that such spaces are designed not only for retail but also for traffic generation and cultural engagement.

Urban redevelopment projects are following a similar trajectory.

In Chongqing, finance and real estate professional Zhou Yaxin transformed a former printing factory into a cultural and creative complex in 2014, incorporating galleries, studios and public spaces while retaining much of the original industrial structure.

The site gained wider attention after being used as a filming location for the 2016 film *I Belonged to You*, attracting an increasing number of visitors.

In 2018, Zhou's team developed an open-air venue in Shancheng Lane by repurposing a sunken plaza behind a former church. The space, named the "Wilderness Theater", now hosts performances, community gatherings and cultural events.

Zhou says that many cities have underused industrial and historical spaces that can be reactivated through adaptive reuse rather than large-scale reconstruction.

"Every city has old factories, old neighborhoods, old buildings sitting empty. We need to see what's already there and see it differently," he says.

The cultural sector is also adapting to changing visitor expectations.

Qiu Tong, founder of Meet You Museum, observes that younger audiences increasingly prefer interactive and visually engaging exhibitions over traditional static displays.

The museum group has opened seven physical locations across China and staged exhibitions in more than 20 cities, attracting around 3 million visitors.

One exhibition features a projection-based interpretation of Yongle Palace, a Taoist temple from the Yuan Dynasty (1271-1368), where visitors use flashlights to activate animated visual elements on wall drawings.

Another exhibition includes a dinosaur installation featuring a 10-meter-long rib cage that visitors can walk through.

Qiu says that the audience composition has shifted in recent years, with family and parent-child visitors now forming a larger share of total attendance compared with earlier years when young urban women made up the majority.

She also notes that placing exhibitions in shopping malls and city centers, rather than peripheral museum sites, has helped integrate cultural experiences into daily urban life.

In Tianjin, one of the group's projects was the first tenant in a converted parking garage, later followed by other cultural businesses, she says.

According to the Ministry of Culture and Tourism, China recorded 6.5 billion domestic tourist trips in 2025, an increase of 16.2 percent year-on-year.

Back at Tiaohai Living Youth Hostel, small gestures continue to define the guest experience. A visitor leaves a bottle of makeup remover on the "Give and Take" table for another guest. Another adjusts a dormitory sign to indicate a late return, and is thanked the next morning by a roommate.

"In the end, we're not selling a room. We're selling a reason to stay," Sui Yi says.

Heritage comes alive as visitors flock to immersive cultural attractions

Clad in traditional Chinese robes, a group of young overseas visitors of Chinese descent stepped into a lantern-lit cultural district in the ancient city of Xi'an, Northwest China's Shaanxi province, immersing themselves in a world they had seen only on screen.

"The moment I walked through the gate, the whole setting made me feel like I was traveling back more than a thousand years," said a group member from Singapore.

During their visit last week, these visitors snapped photos, watched live performances, and played street games in the re-created streetscape modeled on Chang'an, capital of the Tang Dynasty (618-907).

As the country's first immersive block featuring Tang-style street life, the project, which opened in 2022, was upgraded earlier this year to create a more engaging atmosphere. To date, it has recorded over 7.5 million visits.

"We aim to attract more people through the modern expression of traditional aesthetics," says Zou Linfeng, head of the tourism project.

The attraction offers a glimpse into a broader trend. This summer, traditional Chinese culture has been gaining new appeal as global tourists embrace offerings rooted in China's heritage.

Today, visitors are not satisfied with just sightseeing at cultural landmarks. Instead, they are seeking immersive experiences that forge a deeper connection with traditional Chinese culture. *Guofeng* (Chinese-style) immersive tours have thus become a draw for visitors this summer. Data from Tongcheng Travel, a leading Chinese online travel agency, show that as of July 23, searches for keywords such as "*guofeng*" and "immersive" on the platform had more than doubled month on month.

Langfang, a city adjacent to Beijing in North China's Hebei province, has recently ranked among the top 10 destinations for such tours, according to the platform. Many visitors flock to this place for a theater complex drawing inspiration from a Chinese literary classic.

Named *Unique Dream of Red Mansion*, the attraction features 55 innovative plays, including those inspired by the seminal 18th-century novel *A Dream of Red Mansions* and independent ones, turning traditional Chinese literature into accessible, tangible, and interactive cultural spaces.

Dancers perform at "Twelve Hours of Chang'an", a re-created streetscape for tourism in Xi'an, Shaanxi province. SHAO RUI / XINHUA

A recent highlight is a debut production consisting of 35 micro-theaters, where visitors draw and swap cards to chart their own viewing journey. Within each theater, viewers sit just steps from the actors, becoming part of the narrative itself.

Wang Chaoge, general director of the theater complex, explains that such productions are designed to allow each viewer to participate in the play as it unfolds, while delivering even greater emotional intensity within a short span of time.

Since its opening in 2023, the theater complex has staged approximately 24,000 performances and received over 14 million visits.

Zhao Yu, a second-time visitor from North China's Tianjin, says that the venue provides a different experience from traditional theaters. "Instead of watching a single play for several hours, we can enjoy performances here throughout the day, stay for a night, and continue our experience the next day."

Students are a major group of travelers during the summer travel rush. The summer vacation provides them with an opportunity to gain hands-on experience in the traditional Chinese culture that they learn at school.

Li Jinhan, 15, tried her hand at restoring a replica mural panel at an intangible cultural heritage experience base in Dunhuang, a vital ancient Silk Road hub in Northwest China's Gansu province. From injecting consolidants to filling cracks, the girl realized how challenging yet significant it is to keep the historical treasure alive.

"Reading about it is one thing, but doing it is another," says Jinhan. "The restoration allows me to slow down and appreciate the timeless beauty of Dunhuang murals."

Her experience was part of a study tour that emerged from growing demand among students and parents for a deeper understanding of the country's cultural heritage.

"The study tours can sow the seeds of culture in young minds," says Du Yongwei, the base's founder. "With new scenarios and fresh expressions, we build a bridge for that passion to grow."

Similar on-site classes are thriving nationwide.

Meanwhile, international tourists are getting on board. More overseas visitors are taking dedicated trips to China to participate in culturally themed study tours, amid the country's expanding visa-free entry policies.

Earlier this month, a 30-member Italian group finished a study tour in Hainan, China's southernmost island province. During the two-week program, teenagers engaged in courses and activities involving language learning and handicraft making, among others.

With more firsthand experience of the country and a better understanding of its culture, views of China have turned more positive. According to a Pew Research Center study published this month, a median of 46 percent of respondents across the 20 countries surveyed annually since 2023 holds a favorable view of China, up from 32 percent in 2023. The figure now surpasses the median favorability rating for the United States.

Han's building a dynasty Down Under

NY Liberty center leads the charge for Chinese players in Australia's WNBL, as she signs up for a second season

Chinese New York Liberty center, Han Xu, goes up for the basket during a WNBA game against Toronto Tempo in Montreal on July 13. XINHUA

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

When Han Xu reflected on her first season in Australia's Women's National Basketball League in March, the Chinese center was already looking beyond her own achievements.

"I hope my experience can serve as a signpost for those who come after me," she wrote on social media. "One day, someone will follow in my footsteps and arrive here."

Just months later, that pathway is becoming crowded.

The Geelong Venom announced last week that Han and her compatriot, forward-guard Zhang Wanglai, had signed one-year contracts for the 2026-27 WNBL season, pending league approval.

Together with Wang Siyu, who has joined the Southside Melbourne Flyers, and Yang Shuyu, who has signed for the Sydney Flames, four Chinese players are now set to compete in the WNBL next season.

For Han, the move to Geelong represents another chapter in a career spanning China, the United States and Australia.

Standing 2.11 meters tall, Han has established herself as one of the country's most successful basketball players on the international club stage.

The 26-year-old was selected by the New York Liberty with the 14th overall pick in the 2019 WNBA Draft.

She has since won three Women's Chinese Basketball Association Most Valuable Player awards and two WCBA championships. She was also part of the Liberty squad that won the 2023 WNBA Commissioner's Cup.

Currently in her fourth WNBA season, she is averaging 5.8 points and 2.2 rebounds per game.

On Saturday Han reached a milestone 500 league points during the Liberty's 94-92 road win over the Phoenix Mercury.

Playing as a reserve, Han scored a season-high 17 points on 6-for-9 shooting from the field, including 3-for-6 shooting from 3-point range, to go with six rebounds and one assist.

Han has been equally influential for the Chinese national team. She helped China claim silver at the 2022 FIBA Women's Basketball World Cup and was selected in the tournament's All-Star Five.

A year later, she was named MVP as China won the FIBA Women's Asia Cup.

Her first season in Australia provided further evidence of her ability to adapt to and succeed in different basketball environments.

Playing for the Perth Lynx in 2025-26, Han averaged 16.2 points, 7.3 rebounds and 2.2 blocks in 18 games. She anchored Perth's defense and helped the team reach the Grand Final Series, where it finished runner-up to the Townsville Fire.

Her strong performances around the basket earned her the league's Defensive Player of the Year award and a place on the All-WNBL Second Team.

Han's combination of size, rim protection and offensive versatility made her one of the most sought-after players on the WNBL market. Australian media reported that several clubs had pursued her, before Geelong eventually secured her signature.

Venom head coach Cheryl Chambers described Han as one of the world's most dominant post players.

"Her shot-blocking and rebounding are genuinely elite," Chambers said.

"Adding that size and experience to our roster gives this team a real edge, and we can't wait to see what she brings to the club this year."

Han's arrival has raised expectations at Geelong as the relatively new club seeks to turn itself from a finals contender into a championship winner.

Veteran guard Rebecca Cole said having an elite shot-blocker behind the team's perimeter defenders would give them the confidence to apply greater pressure to opposing ball handlers.

"Her presence on the floor at both ends of the court is going to change the entire game for us," Cole told Australian basketball media.

Han offers much more than interior defense.

She can run the floor, finish efficiently around the basket and stretch defenses with her outside shooting. Her mobility and touch are rare for a player of her height, giving Chambers a wide range of tactical options.

Already familiar with the WNBL's physical style and competitive intensity, Han said she was excited about returning to Australia.

"I know how passionate this league's fans are and how much the competition has grown," Han said.

"I'm looking forward to bringing everything I've built over my career — from China to the WNBA — into this team, and pushing for something special with my new teammates."

Geelong has further strengthened its roster with Zhang, an experienced competitor in both five-on-five and 3x3 basketball.

The 32-year-old won consecutive WCBA championships in the 2022-23 and 2023-24 seasons. She also won the Chinese 3x3 league title in 2023 and was named MVP.

Most recently, she helped China win bronze at this year's FIBA 3x3 Asia Cup.

Zhang said moving to Australia would give her an opportunity to step outside her comfort zone and experience a different style of basketball.

"I'm really looking forward to soaking up the basketball vibe in Geelong," she said.

"I've no idea what's ahead, but I'm going to keep loving the game and take it one step at a time. I can't wait to get settled in, learn the system and go to battle with my new teammates."

The growing presence of Chinese players in overseas leagues reflects a broader trend in the development of women's basketball in China.

Overseas leagues such as the WNBA and WNBL expose Chinese players to faster-paced games, stronger physical contests and different tactical systems. Such experience helps improve their decision-making, defensive awareness and their ability to handle pressure against the world's top teams.

Han remains one of the clearest examples of that process. Following the conclusion of the WNBA regular season, she is expected to represent China at the FIBA Women's Basketball World Cup in Berlin in September.

After completing her national-team commitments, she will join Geelong ahead of the WNBL season, which tips off on Oct 15.

Her journey represents a growing connection between Chinese basketball and the international game, with more players willing to step out of their comfort zone and test themselves in more demanding overseas competitions.

In her March message, Han hoped her journey would become a signpost for those coming after her. With four Chinese players now committed to WNBL clubs for the new season, others are already beginning to walk alongside her on the path she helped forge.

TENNIS

Shang returns to winning ways in Montreal to set up Rublev rematch

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

He's not quite there yet, but Shang Juncheng is starting to look like a history-making prodigy again.

Having his trademark agility and precision back at his disposal certainly made the difference on Sunday at the ATP1000 Masters tournament in Montreal, where Shang claimed his first ATP Tour-level win in over six months after being sidelined by a long injury layoff.

Shang's straight-sets upset of 66th-ranked Adolfo Daniel Vallejo of Paraguay at the National Bank Open secured his first main-draw win on the men's pro circuit since his opening-round victory at the Australian Open in January, serving up a much-needed confidence boost for his comeback from a nagging foot injury.

It's been the second year in a row that the 21-year-old Shang has been sidelined for the first half of the season due to a number of fitness issues that have slowed down his meteoric career rise.

The resilient young talent — creator of many "youngest-ever" records for Chinese men's tennis — has taken pride in overcoming the grueling rehab again, although admitting he's far from showing his top form yet.

"Honestly, I felt a lot of things were not going so well, even yesterday. I had issues with my baseline strokes, volleys and returns in training," Shang said after ousting Vallejo 6-3, 6-3 in 82 minutes, before a heavy downpour put Sunday's other matches at the IGA Stadium on hold.

"My dad and my coach told me to just focus on every single shot and to not overthink things. They told me 'it's totally normal if your opponent plays better than you, because they've been playing all year long, while you've just come back'.

Shang Juncheng hits a return to Adolfo Daniel Vallejo in Montreal on Sunday. REUTERS

"Rehab is an incredibly tedious process. I hope no young player ever has to go through this ordeal, but if they do, (they should) just treat it with patience and persistence, and stick to what's needed (to recover).

"I couldn't figure this out at first, but I've gradually come to terms with the setbacks, which are part of the job," said Shang, who reached his career-high ranking of No 47 in October 2024 after winning his first ATP Tour title in Chengdu.

Shang will need to step up his game quickly, as the challenge gets tougher with a round-of-64 match against Russian former World No 5 Andrey Rublev on Tuesday.

Rublev beat Shang in their only previous meeting, the semifinals of an ATP250 tournament in Hong Kong in 2024.

Having maintained a friendly relationship with the Russian power-hitter, Shang said he will cherish the opportunity to test himself physically and mentally against the 10th seed in Montreal.

"It will be a tough match, for sure, because his ability is now is well above mine," said a candid Shang, who, at world No 281 this week, entered the Montreal main draw via protected ranking.

"This will be another chance to learn from a top-15-caliber opponent. I've played many of them, and I just want to do my best this time and, win or lose, just enjoy the match."

With power never being his strength, Shang leans on his quick legs, resilient defense and tactical variety to outwit size and force.

His best form in 2024 saw him become the youngest Chinese man ever to register a main-draw win at the ATP1000 level with victory over Jordan Thompson at Indian Wells, California, in March, before becoming the youngest Chinese man to break into the top 100 in May that year.

On Sunday, relying on his fast movement, combined with pinpoint accuracy and long rallies, Shang dispatched Vallejo using his familiar winning formula, evoking fond memories of the teen star in his prime.

More drills are needed, though, as Shang, who's racked up six career wins at the Masters level, is aiming for a strong resurgence, as the season heads into its final stretch with a number of Chinese players struggling with poor form of late.

"I came here with confidence built through training, but match intensity is definitely a different story," Shang said.

"I've made some progress today, but I can't guarantee I'll be in perfect form for the next match.

"No matter the result of my next game, I want to maintain a positive attitude."
