CPC to hold key meeting in October

Leadership pledges policy support for economic growth in second half of year

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

The fifth plenary session of the 20th Communist Party of China Central Committee will be held in Beijing in October, with a focus on studying major issues on consistently advancing the Party's full and rigorous self-governance.

The announcement came on Thursday after a meeting of the Political Bureau of the CPC Central Committee, which was presided over by Xi Jinping, general secretary of the CPC Central Committee.

A statement issued after the meeting said that with the profound changes in the international landscape, national conditions and the Party's development, there are new circumstances and issues in advancing the Party's self-governance.

In exercising full and rigorous Party governance, efforts should be focused on enhancing the Party's long-term governance capability, maintaining its advanced nature and integrity, and preserving the close bond between the Party and the people, in order to ensure that the Party always remains the strong leadership core in developing socialism with Chinese characteristics, the statement said.

The meeting also analyzed and studied the current economic situation and made arrangements for economic work in the second half of this year.

During the meeting, the Political Bureau of the CPC Central Committee, the Party's top decision-making body, pledged to step up macro policy support, and underlined the need to implement a more proactive fiscal policy and a moderately loose monetary policy, fully leverage the effectiveness of existing policies and roll out practical and effective incremental measures in a timely manner.

It is essential to strengthen countercyclical adjustments, intensify efforts to expand domestic demand and optimize supply, enhance development momentum and stimulate social vitality in order to achieve sustained, innovative and improved economic growth, the meeting said.

The meeting emphasized the need to accelerate the pace of fiscal spending and the use of bond funds, effectively utilize monetary policy tools and adjust them in a timely manner, and optimize fiscal-monetary coordination to boost domestic demand.

It is important to expand mutually beneficial international economic and trade cooperation, vigorously develop service trade, and promote balanced trade development, the meeting said, urging efforts to actively attract and utilize foreign capital.

The meeting emphasized the importance of stabilizing the real estate market. It also underlined the need to take solid steps to build the "six networks" — water, new-type power grids, computing power, next-generation communication, urban underground pipe and logistics.

The meeting also called for efforts to accelerate the development of a modern industrial system and strengthen long-term and steady support for basic research.

While calling for deeply implementing the "AI Plus" initiative, fostering new forms of the smart economy and improving the governance system for artificial intelligence, the meeting underscored the need to seek breakthroughs in cutting-edge technologies and the development of future industries.

Efforts should be made to build emerging pillar industries, while continuously driving the transformation and upgrading of traditional industries, the meeting said.

The meeting emphasized the need to create a level playing field for market entities, comprehensively address "rat race" competition, further deepen the reform of State-owned assets and enterprises, and optimize the development environment for the private economy.

Prior to Thursday's Political Bureau meeting, the CPC Central Committee held a symposium on July 24 with non-CPC personages to solicit opinions and suggestions on the current economic situation and economic work for the second half of the year.

While presiding over the symposium, Xi said that in the first half of the year, China's economy made steady progress despite headwinds, demonstrating strong resilience and vitality.

In the second half of the year, efforts should focus on enhancing the effectiveness of macroeconomic policies, Xi said.

Key priorities include tapping into the potential for expanding domestic demand, promoting the deep integration of technological and industrial innovation, and deepening reform and expanding high-standard opening-up, he said.

Robotic greeting

Journalists and social media influencers from member countries of the Association of Southeast Asian Nations interact on Wednesday with a robotic dog in Shenzhen, Guangdong province. More than 20 journalists and social media influencers from ASEAN countries visited Shenzhen as this year marks the fifth anniversary of the establishment of the China-ASEAN Comprehensive Strategic Partnership. China, US hold video talks on economic, trade issues to uphold leaders' consensus

By **ZHANG CHENGXU**
zhangchengxu@chinadaily.com.cn

Vice-Premier He Lifeng held a video call with United States Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer on Thursday, with both sides pledging to strengthen communication and promote stable economic and trade ties.

He, the Chinese lead for China-US economic and trade affairs, held candid, in-depth and constructive discussions with the US side on implementing the important common understandings reached by the two heads of state at their meeting in May in Beijing. They also exchanged views on maintaining stable bilateral economic and trade relations, expanding practical cooperation and properly addressing each other's concerns.

During the talks, the Chinese side expressed serious concerns over the recent US restrictive economic and trade measures against China.

Both sides agreed to make further good use of the China-US economic and trade consultation mechanism under the strategic guidance of the two heads of state, enhance communication, build mutual trust, clear up misunderstandings, expand practical cooperation, and promote the steady and sound development of bilateral economic and trade relations.

A smooth trade relationship between the US and China is vital and a reduction in US tariffs on imports of Chinese goods would help multiple industries in both countries, said Gary C. Hufbauer, a nonresident Senior Fellow at the Peterson Institute for International Economics, who has written extensively on international trade and investment.

Hufbauer told China Daily: "Many US manufacturing industries would benefit from better access to Chinese intermediate goods. My calculation is that an extra $100 billion of two-way trade will boost US GDP by about $20 billion and Chinese GDP by about $50 billion. These are significant gains, if US tariffs are cut."

Also on Thursday, the Ministry of Commerce said that China has been actively implementing the consensus reached at the inaugural meeting of the China-EU trade and investment consultation mechanism, and stepping up preparations for its second meeting this autumn.

He Yadong, a spokesman for the ministry, said China is ready to work with the European Union to explore practical and feasible solutions to each other's economic and trade concerns.

CHINESE BEAUTY BRANDS ENJOY A SURGE IN POPULARITY

Advanced production and traditional elements give domestic cosmetics a growing edge globally

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

From Xiaohongshu to TikTok, and from bloggers to everyday users, a growing number of foreign faces are sharing their stories of discovering C-beauty, also known as *guohuo meizhuang*, or made-in-China beauty.

In one such video by beauty influencer Mikayla Nogueira, she holds up makeup products from Flower Knows, a Chinese brand targeting younger consumers, and exclaims: "This has to be one of the craziest makeup brands I've ever seen!"

After applying the products to her face, she's completely won over. "I'm obsessed with the brand, I want more."

On the lifestyle platform Xiaohongshu, or RedNote, a French woman named Sarah lays out her haul from Shanghai in a video before returning home: lotions, perfumes, eye shadow palettes, lip glosses and face masks, all from Chinese beauty brands.

Foreign buyers select Chinese beauty products at the Yiwu International Expo Center in Zhejiang province on June 13. YANG MEIQING / FOR CHINA DAILY

"I always knew Chinese products were good, but buying them in person made me realize just how incredible the quality is," she said in Mandarin. "They're such a treasure to discover — so good that I want to fly back to China immediately to restock."

For many, the appeal of Chinese beauty brands lies in their thoughtful and authentic integration of traditional Chinese elements.

Thais Teixeira Mendes, a 28-year-old Brazilian master's student at Shanghai Jiao Tong University, has attended almost every beauty expo in Shanghai, testing products from major and niche domestic brands.

WORLD WATCH
By Jayanath Colombage

Beijing helps safeguard maritime commerce

Long before the Strait of Hormuz became a critical and highly vulnerable choke point for global energy trade, the maritime world witnessed the threat posed by non-state actors engaged in piracy off the Gulf of Aden in the Arabian Sea starting around 2008.

The Gulf of Aden became a focus of attention due to the activities of a small group of Somali pirates. A large number of merchant vessels that were engaged in legitimate maritime trade were attacked, many were hijacked, and billions of dollars were lost through ransom payments, increased insurance premiums and the rerouting of vessels around the Cape of Good Hope.

No single navy in the Indian Ocean region could handle this maritime security threat on its own. In view of the grave threat to freedom of maritime commerce, the United Nations Security Council adopted several resolutions authorizing international naval cooperation against piracy. Numerous naval forces — including those of the United States, the European Union, NATO, India, Japan, Russia, the Republic of Korea and China — deployed warships to safeguard freedom of navigation in the region.

Toward the end of 2008, China dispatched its first escort task force comprising two guided-missile destroyers and one replenishment ship to the pirate-infested Gulf of Aden to protect Chinese commercial ships and those of other countries. This marked the first operational deployment of Chinese naval forces beyond the first island chain in modern history and initiated one of the longest continuous overseas naval missions undertaken by any navy.

INDEPTH

Urbanites head north for budget homes, rural tranquility

By ZHAO RUINAN
zhaoruinan@chinadaily.com.cn

Golden rice fields line the banks of the Huma River in the Greater Hinggan Mountains in Northeast China's Heilongjiang province. XIAO DIANCHANG / FOR CHINA DAILY

An aerial photo captures the snowy winter landscapes of Bishui town in Heilongjiang. LYU ZUOWEI / FOR CHINA DAILY

By the time Lyu Zuowei reached Bishui town in Northeast China's Heilongjiang province he had driven more than 3,000 kilometers over four days.

The final 100 km of the journey that started in Wuhan, Hubei province, followed a country road into the Greater Hinggan Mountains.

At the entrance to Bishui, Huzhong district, he stopped the car and lowered the window. "I had never breathed air so fresh," said 32-year-old Lyu. "It felt as if it went through my body and cleaned me out."

The stillness was just as striking. The former forestry town is ringed by mountains, with the Huma River nearby. Its broad, orderly streets had been laid out when thousands of forestry workers and their families lived there, but many of its homes are now empty.

Lyu said it was so quiet he could almost hear a pin drop.

He had come in August 2024 to inspect a courtyard he had already bought online for 16,500 yuan ($2,440) without seeing it in person. Advertised on social media, it included an old brick house, a wooden shed, and a narrow vegetable plot.

Lyu had recently left a publicity job with a State-owned construction company in Wuhan and was searching for a place to stay in the Greater Hinggan Mountains. He had read about the area in textbooks when he was a child, and had always wanted to go there.

He first thought of the place as a northern retreat. Somewhere to visit when the summer was too hot and stay before driving back to Wuhan.

But that first visit lingered in his mind.

In October of that year, when a detached courtyard house with a garage became available, he paid 40,000 yuan for it. The land covered more than 800 square meters. He later bought a third, row-style courtyard dwelling for another 40,000 yuan, bringing his total spending on the three properties to 96,500 yuan.

From July 2025, Lyu began spending longer periods in Bishui. On summer days, he sometimes rose before 4 am. He practiced tai chi and dance, wrote calligraphy, chopped firewood, cooked, tended the yard, and edited photographs and videos for his social media account.

Lyu, who studied dance at university and has always wanted to make it his career, said he felt like he was "actually living".

"A house with a yard here is cheap and the environment is so good. I plan to live and stay here for a while," he said. "I see this as a stage of my life — a time to adjust myself and think again about work and what kind of life I want."

He recently moved to Beijing looking for work, and a young woman is staying in one of his courtyard homes. She teaches Chinese online to students overseas and hopes to spend some time living in the region.

Although he is currently in Beijing, Lyu still feels that big-city life is not for him. In the longer term, he hopes to return to the Greater Hinggan Mountains and transform the courtyard homes he bought into a retreat combining cultural tourism, wellness and arts-based healing.

Breaking free

Lyu is part of a small but increasingly visible trend. In recent months, a growing number of social media posts have appeared about buying old homes in the Greater Hinggan Mountains.

Young people have shared stories about moving from major cities to Bishui and Yitulihe in the Inner Mongolia autonomous region, as well as their plans to renovate budget homes, tend vegetable plots and spend a season away from urban life.

In Yitulihe, outside buyers have been looking at low-priced apartments and courtyard homes for several years.

The dwellings in Bishui that caught Lyu's eye were built to accommodate a different economy. Many date to the 1980s and 1990s, when logging supported settlements scattered across the mountains. As forestry production changed and workers retired or moved away, rows of houses were left unused.

Pan Shiyu, who has lived in Bishui since arriving from Guangdong province in 2009, began helping meet the growing demand for such properties about five years ago. Sometimes she buys a home and sells it on, while other times she acts as an agent for sellers and buyers.

Her first purchase followed a meeting with an elderly couple preparing to join their children in Shanghai.

"They stood in front of the old house and were upset. They did not want to abandon it, but they could not stay," Pan recalled. She bought the roughly 50-square-meter home for 5,000 yuan and later began acquiring other vacant properties, arranging ownership documents and matching them with buyers.

Pan said she has helped put more than 300 homes back into use. At first, most buyers were approaching retirement. Over the past two years, more people in their 20s and 30s have made inquiries, she said.

"Some young people stay for a few months, some stay longer," she said. "When they have rested and recharged, they set off again."

The changing demographic is noticeable in Bixing community, Bishui.

Zhao Qingguang, head of the community residents' committee, has worked there for more than 20 years.

He estimated that "nonlocal households" have risen from just over 10 to more than 30 today. The number could reach 50 or 60, if buyers who have not yet arrived were included, he said.

The community has about 500 to 600 households. During busy times, it has 700 to 800 residents, Zhao estimated. In winter, the population drops to about 300. Only a handful of nonlocals remain throughout the cold months.

The houses are inexpensive, but many lack indoor bathrooms and modern heating. To deal with the cold, residents burn firewood or install electric systems themselves.

"Heating is a real problem in winter," he said. "The winter here is long."

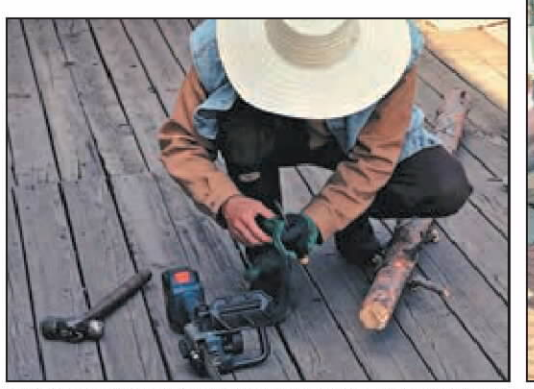
However, many homebuyers renovate their courtyards and return in summer. Others discover that the distance, cold, or the daily work involved in maintaining the property and their desire for a comfortable existence are too much for them, and they put their homes back on the market.

Desire for land

It's not the first time that urbanites' retreat to greener pastures and search for bargain homes has made headlines.

In 2019, Hegang, a former Heilongjiang coal city, went viral after apartments sold for tens of thousands of yuan. A 2024 media survey found at least 24 cities in 10 provincial-level regions in similar situations. More than half were in Northeast China.

Fuxin and Linghai in Liaoning province also attracted buyers to cheaper old apartments. Some settled permanently, while others kept jobs elsewhere and returned only occasionally.



But the forest-town version of the migration to quieter locations offers something many bargain apartments do not: land. Bishui homes often include a courtyard, shed or vegetable plot. The low price buys shelter and the chance to plant vegetables, split firewood and organize life around manual work.

For Lyu, the yard is not purely decorative. He had tried to grow vegetables, adding another task to his routine of chopping wood, cooking and looking after the property.

Sun Jiashan, a researcher at the Academy of Chinese Culture, said improved transportation links, internet access and changing ideas about work have made it possible for more people to move around the country.

Remote work enables "geographical arbitrage", that is, earning income tied to a large city while living more cheaply elsewhere, he said.

Lyu's axe used for chopping firewood.

Lyu practices calligraphy in his spare time.

"Some can take a gap period in the Greater Hinggan Mountains and then return to a big city," Sun said. "People no longer have to work in an office building or a cubicle."

Retirees use the seasons as their compass.

Fan Xiuchun, 55, from Zhejiang province, paid a little more than 30,000 yuan for a house in 2023. She usually arrives in April, as the snow begins to melt, and stays until mid-September. Known as "China's coldest town", Huzhong averages 16 to 20 C in summer, while winter temperatures often fall below -40 C.

"The environment is excellent here. My sleep is better here. I spend the whole summer and then go back," Fan said.

She lived and worked in Chongqing for decades, and later spent a lot of time in Yunnan province.

She has a car in Bishui and treats the town as just one stop in a life divided among several places. Such an arrangement, she said, requires retirement income, savings or remote work.

"If you still have to struggle to make a living, this place is not very suitable," she said. "There are not many job opportunities even for local people, let alone for outsiders."

Last year Fan bought three more town houses in Huzhong district. She plans to take her family and friends there every summer to enjoy the cool weather.

In for the long haul

Wang Jiayan is among the few outsiders who have made the move permanent. The 42-year-old from the Ningxia Hui autonomous region has lived in the area continuously for six years.

He bought his first house, without visiting it, for 15,000 yuan after seeing an advertisement on a short-video platform in 2020.

Wang supports himself with his savings. Once the house was bought, he said, daily living has cost very little.

He has kept his home close to its original state, preferring a wood-burning stove and doing manual chores to a modern renovation. In summer, he rises at 3 or 4 am and tends his vegetable garden. He is usually in bed before 9 pm.

Wang's existence, however, is not solitary. "They treat me like a son," he said of the older residents nearby.

The care and concern is mutual. He has a car and drives his neighbors to hospital when they need help. When he fell ill, they came to check on him — one household brought steamed buns, another dumplings.

"People are social animals," Wang said. "Helping one another makes us happy."

He has no plans to return to city life. "I will live here for good," he said. "I like this place very much."

Unlike most outsiders, Wang looks forward to the coldest months. He enjoys chopping wood and stoking the stove when the streets grow quiet.

"Winter is when it is quietest," he said. "Burning firewood is where the warmth of everyday life comes from."

By contrast, Fan plans to leave Bishui by mid-September and return south.

Most of the summer residents will also be gone, but Wang will remain. From his courtyard, he has watched the newcomers grow younger. Many tell him that work and competition in the cities have exhausted them.

Bishui's low costs allow some to spend a summer, or even a year or two, outside their old routines — living differently, slowing down and thinking about what should come next. But family responsibilities and the need to earn an income eventually draw many away.

"Most young people cannot stay here for long," Wang said. "Some come only in summer. Others stay for a year or two to regain their balance, but many eventually return to the cities."

TOP NEWS

Talks: EU trade promoted

From page 1

The two sides held the inaugural meeting of the China-EU trade and investment consultation mechanism last month, during which they agreed that China and the EU are each other's stable and balanced key trading partners. They also tentatively agreed to hold the mechanism's second meeting this autumn.

Commerce Minister Wang Wentao and European Commissioner for Trade and Economic Security, Interinstitutional Relations, and Transparency Maros Sefcovic have remained in close contact through exchanges of letters and other channels, guiding their respective teams in advancing the work in an orderly manner, He Yadong said.

Working teams from the two sides have since held more than 20 rounds of consultations, with in-depth and professional exchanges conducted under four workstreams on their respective economic and trade concerns, he added.

"China is ready to maintain frequent communication with the EU, uphold mutual respect, and work in the same direction," He said.

The aim is to promote more bilateral trade balance and expansion to maintain a stable and key trading partnership, He added.

Draft law unveiled to combat cyberbullying

By **CAO YIN**
caoyin@chinadaily.com.cn

A newly released draft law on combating cyberbullying has been praised by experts as a people-centered initiative that would establish a collaborative governance framework, uniting all sectors of society to effectively curb and prevent online abuse.

The 60-article draft was published on Wednesday by the Cyberspace Administration of China, the nation's top internet regulator, for public consultation, which will last until Aug 28. If enacted, it would become China's first dedicated law specifically targeting online bullying, providing robust legal safeguards for building a comprehensive governance system, experts said.

The draft defines cyberbullying as concentrated or sustained online acts that infringe on lawful rights — including reputation, honor, privacy, portrait rights and personal information — through insults, rumors, hate speech, divisive content, threats, discriminatory remarks, unlawful disclosure of personal data and persistent online intimidation or harassment.

Liu Yanhong, vice-president of China University of Political Science and Law, said cyberbullying not only infringes upon the lawful rights and interests of individuals and organizations, but also disrupts online order, breeds toxicity in cyberspace and gives rise to widespread social risks.

"It has severely eroded public trust in online safety and become a deeply entrenched ill of the digital world," Liu said, emphasizing that the draft law directly addresses public concerns and embodies a people-first approach to cyberspace governance.

Wang Zhiqin, deputy head of the China Academy of Information and Communications Technology, said the legislation will close institutional gaps in tackling online abuse and steer cyberspace governance toward a more systematic, law-based and sustainable path.

As the internet becomes deeply woven into every aspect of work and daily life, the online ecosystem is being reshaped. Yet it has also become a breeding ground for rampant cyberbullying, including doxing (publicly identifying or publishing private information about someone, especially for the purpose of punishment or revenge), smear campaigns and traffic-driven manipulation. Such misconduct harms internet users and poses a threat to national security and public interests.

Several high-profile cases have drawn widespread attention to the issue in recent years. In April, a diving enthusiast in Guangdong province was given 10 days of administrative detention and fined for repeatedly cyberbullying Olympic champion Quan Hongchan.

In 2023, the death of Zheng Linghua, who had been subjected to online abuse for dyeing her hair pink, sparked public outrage. She became a target after posting on social media a photo of herself proudly showing her postgraduate admission letter to her grandfather in his hospital bed. Trolls attacked her for her pink hair and made disparaging remarks, while others reposted the photo and fabricated rumors that it depicted an elderly man married to a young woman. The case prompted many people, including national lawmakers and political advisers, to call for legislation to remedy cyber abuse.

According to the draft, internet service providers would be required to offer users tools to block strangers and have the authority to restrict or close accounts that are found to be spreading bullying content. Cyberspace regulators, together with departments responsible for education, public security, telecommunications, civil affairs, culture and tourism, health and broadcasting, would be tasked with building a governance framework that adopts a tiered approach to handling cyberbullying.

The draft also prohibits any organization or individual from providing technical support — such as internet access, server hosting, data storage or communications transmission — if they know that cyberbullying activities are being conducted.

In addition to establishing a coordinated governance mechanism, the draft would require platforms to provide users with quick on-screen buttons to record suspected bullying content, with enhanced protection for children, the elderly and people with disabilities. It also urges judicial authorities to inform victims and their families of their right to apply for legal assistance and clarifies that psychological counseling and legal support from social organizations are available.

Cyberbullying poses a common governance challenge worldwide, with countries including the United States, the United Kingdom and Australia having introduced laws to tackle online abuse. Wang said China's draft follows this global trend by establishing a multistakeholder collaborative governance framework.

"This approach with Chinese experience will enrich global digital governance rules and advance the vision of building a community with a shared future in cyberspace," she added.

New US curbs slammed as act of bullying

Targeting advanced manufacturing a ruse to blunt China's industrial edge, experts say

By **ZHANG CHENXU** and **ZHONG NAN**

Inside
Editorial, **page 4**

The latest restrictions imposed by the United States on new models of foreign-produced power inverters and advanced robotic devices are less of a response to genuine security concerns and more of a politically driven attempt to blunt China's growing industrial edge, officials and experts said on Thursday.

The US is once again "overstretching the scope of national security" to impose restrictions that risk further fragmenting global industrial and supply chains, while shifting the economic costs onto US businesses and consumers without addressing the structural weaknesses in the country's own industrial competitiveness, they added.

"Despite repeated representations from China and the restraint it has exercised, the US Federal Communications Commission has continued to introduce and escalate restrictive measures, seriously harming China's legitimate trade interests and undermining the stability of China-US economic and trade relations," a spokesperson for the Ministry of Commerce said in a statement.

The remarks came after the FCC added foreign-produced power inverters and advanced robotic devices to its "Covered List" on Tuesday, effectively barring relevant new models from obtaining FCC equipment authorization and entering the US market.

The FCC said in a statement that the products were deemed to pose "an unacceptable risk to the national security of the US or the safety and security of US persons".

The ministry spokesperson said that the move harms others without benefiting the US, and it constitutes "a typical act of market distortion and unilateral bullying". Under the guise of nondiscrimination, the move actually discriminates against and suppresses Chinese companies and products, the spokesperson added.

Dai Mingfeng, a researcher at the Chinese Academy of International Trade and Economic Cooperation, said the move underscores the widening scope of US security-based trade curbs, which have expanded from traditional telecommunications equipment to new energy and advanced manufacturing. He added that it is aimed at restricting market access for Chinese products and erecting new barriers for industrial competition.

Beijing has urged Washington to immediately revoke the move and stop its wrongful practices. "If the US insists on going its own way, China will take resolute countermeasures to safeguard its legitimate rights and interests," the spokesperson said.

Shipping sanctions

In a separate move on Wednesday, the US sanctioned 10 Chinese shipping companies based on the Chinese mainland and the Hong Kong Special Administrative Region, along with eight tankers, alleging that they had transported Iranian oil despite US restrictions.

The move freezes the companies' assets in the US and prohibits US companies and individuals from doing business with them.

Chen Jianwei, a researcher at the University of International Business and Economics in Beijing, said the measures were imposed under US domestic law, rather than a United Nations framework, raising long-standing concerns over the extraterritorial application of unilateral sanctions and their impact on normal international commerce. He added that China is capable of safeguarding the legitimate rights and interests of its shipping companies.

Hanging in balance

A resident navigates wrecked railway tracks in a flooded area in Sheikhupura, Pakistan, on Wednesday, after the Ravi River overflowed due to heavy monsoon rains. Downpours and flooding have killed at least 109 people and damaged hundreds of homes across the country since June. ARIF ALI / AFP

Security: Humanitarian operation receives recognition

From page 1

The People's Liberation Army Navy also provided humanitarian assistance and medical support and conducted search-and-rescue operations in the region. Thanks to the efforts of the PLA Navy and other navies, incidents of piracy gradually declined and maritime trade resumed.

These anti-piracy operations helped transform the Chinese Navy into a blue-water navy capable of projecting power far from home and playing a crucial role in protecting and helping govern the Indian Ocean as part of the global commons. Through this uninterrupted, long-term deployment, China has demonstrated a high level of operational sustainability and logistics management. Chinese Navy vessels have reportedly safely escorted more than 7,000 merchant ships from many countries. In addition to conducting anti-piracy operations, the Chinese Navy successfully evacuated citizens of several countries who were trapped by the worsening security situation in Yemen in 2015. This humanitarian operation received widespread international recognition and illustrated China's expanding role as a provider of maritime public goods.

Maritime security and safety are increasingly becoming a grave concern for maritime trade, and collaborative mechanisms are needed to ensure them. China's contribution to protecting international maritime trade, maintaining global supply chains, facilitating energy transportation and supporting humanitarian shipping has clearly demonstrated that China is acting beyond its own national and commercial interests. It has supported international maritime governance and demonstrated its ability to work closely with multinational maritime forces as well as individual countries outside China's territorial waters. During these escort missions, China engaged in protecting transit corridors, information exchange, deconfliction mechanisms, communication protocols and joint search-and-rescue coordination. Such practical cooperation has reduced operational risks while strengthening international maritime governance. These long-term, sustained operations far from China's shores have also provided the PLA Navy with experience in long-distance navigation, fleet replenishment, maintenance at sea, extended crew endurance, overseas logistics, operational readiness and capabilities for expeditionary maritime operations. The operations have also helped the PLA Navy develop command skills and expertise in the rules of engagement, international communication, crisis management, boarding operations and maritime law enforcement.

A significant development was the establishment of China's support facility in Djibouti in 2017. This is China's first overseas logistics base, operating alongside bases run by Japan, the United States, France and Italy. The base has facilitated the replenishment of PLA Navy ships deployed for extended periods and provided repair and maintenance services, medical facilities and rest areas for crews. The base has substantially reduced the logistical constraints associated with sustained deployments for the PLA Navy.

From the Chinese perspective, the Gulf of Aden is a vital part of the China-proposed Belt and Road Initiative. Furthermore, China is a net importer of oil and depends heavily on energy shipments passing through the region. Hence, the escort missions have broader implications for China. Protecting ships engaged in maritime trade also enhances China's global trade connectivity and investment security. It is a win-win situation for China and the wider world. China is also leading by example in line with its Global Security Initiative, which advocates common, comprehensive, cooperative and sustainable security.

The escort missions demonstrate China's evolution from a regional maritime power into a country assuming greater responsibility for maintaining international maritime stability. Furthermore, China has proved to the world its commitment to contributing to a community with a shared future for humanity, particularly in areas where international cooperation is essential.

The author is the 18th Commander of the Sri Lanka Navy, a retired four-star admiral of the Sri Lanka Navy, the former secretary of the Ministry of Foreign Affairs of Sri Lanka and ambassador to Indonesia and ASEAN. Products: Traditional ingredients boost appeal

From page 1

"I could see, touch, smell and try various products," she said. "Many ingredients have been used traditionally for hundreds of years and are embedded in Chinese culture."

Chinese herbals such as ginseng, Chinese angelica and green tea are now widely used in domestic beauty products. It reflects the ancient philosophy of gentle and natural skin care, according to officials from domestic beauty brand Chando.

Behind this consumer enthusiasm lies the accelerating global expansion of Chinese beauty brands.

The Shanghai-based Chando Group has focused on tech-driven skin care, and now operates in 15 countries and regions. Zhang Yinggui, general manager of the group's overseas sales department, attributed the rising global recognition to its breakthroughs in independent research, a differentiated Eastern philosophy and cultural values.

Beyond brand growth, the Oriental Beauty Valley in Shanghai is also elevating its manufacturing capabilities to a new level. Flexible magnetic levitation production systems enable a single production line to switch seamlessly between eyeliner and cushion compact production, while artificial intelligence-powered unmanned workshops are paving the way for fully realized "lights-out factories".

This forward-looking advanced manufacturing approach allows Fengxian to meet the surging demand from fast-growing domestic brands and take on high-end, small-batch orders from leading European and United States beauty giants.

Editorials

US' unilateral sanctions about leveraging engineered volatility for hegemonic profit

When international rules constrain the actions of the United States, they are usually dismissed or bypassed. But when they can be invoked against other countries, they suddenly become indispensable. Extraterritorial sanctions, secondary sanctions and restrictions on third-country companies have become routine instruments of US foreign policy.

The irony is that these tactics may ultimately weaken the very system they seek to preserve. By encouraging countries to diversify payment systems, reduce reliance on the dollar and strengthen alternative economic partnerships, unilateral sanctions are accelerating the emergence of a more multipolar global economy. The US may succeed in delaying that transition, but every new round of sanctions makes it harder to claim that principle, rather than profit, guides its policy.

The latest demonstration of that came on Wednesday, when the US State Department announced sanctions on a group of Chinese mainland and Hong Kong shipping companies for allegedly transporting Iranian crude oil to China and the United Arab Emirates.

Let us dispense with the fiction that this is primarily about nonproliferation or Israeli security. The Donald Trump administration has been unusually candid about its real priorities. Asked on Monday where the $13 billion in Venezuelan oil revenue seized by Washington had gone, US President Donald Trump first replied, "It goes toward running the country." Pressed further, he admitted, "It can go to the military. Congress has to approve it."

The Financial Times reported last week that six months after Venezuela's political upheaval and two devastating earthquakes, the money remains unaccounted for, reportedly held in an offshore Qatari account. Trump was even more revealing aboard Air Force One: "Venezuela, we paid for that war many times over. And that'll happen with Iran also. We paid for the war many times over."

The implication was unmistakable. Wars are expected to finance themselves. Oil revenues cover the costs of military operations and generate additional returns. Iran's nuclear program and its alleged threat to Israel become moral justifications for what is fundamentally a contest over energy, finance and geopolitical leverage. Israeli Prime Minister Benjamin Netanyahu described Tuesday's White House meeting with Trump as a "full partnership" to ensure Iran never acquires nuclear weapons "and other goals as well". Those "other goals" deserve at least as much scrutiny as the nuclear issue itself.

The Chinese companies targeted by the latest US sanctions are portrayed as part of Iran's so-called "shadow fleet". Yet the longest shadow is cast by Washington's own extraterritorial sanctions. Such unilateral measures are unlawful as they lack authorization from the United Nations Security Council.

In early May, China prohibited domestic organizations and individuals from recognizing or complying with the US' Iran-related sanctions imposed on five Chinese petrochemical companies. The Ministry of Commerce rightly pointed out that Washington was unlawfully restricting normal commercial activities between Chinese enterprises and third countries, violating international law and the basic norms governing international relations. The measures were adopted under China's rules on counteracting unjustified extraterritorial application of foreign legislation and other measures.

China possesses sufficient legal and economic tools to protect the legitimate interests of its companies. If Washington continues to weaponize finance and energy for geopolitical advantage, Beijing has every reason to respond with further legal and economic countermeasures.

The broader objective extends well beyond Iran. Energy security and financial power remain inseparable pillars of US hegemony. By maintaining dominance over the international energy system, Washington protects the petrodollar, limits alternatives to dollar-based settlements and constrains efforts by emerging economies to build more independent financial arrangements.

Every escalation reinforces the strategic importance of US influence over global energy flows and the dollar-denominated oil trade. Oil prices surged after renewed military tensions involving Iran, while concerns over the Strait of Hormuz once again rattled global markets. This has become a recurring pattern. Washington tightens sanctions to squeeze supplies, eases pressure when markets require stability, then restores restrictions as negotiations falter. The cycle preserves US influence over energy markets while reinforcing the central role of the dollar in global oil transactions. Geopolitical volatility has become an instrument of financial leverage for the US.

'Excess capacity' allegations false panacea

Nearly five decades after the launch of reform and opening-up, China has secured its place in the global market and supply chains. The country has not only embraced the opportunities of globalization, but also emerged stronger from the challenges of international competition, becoming an important contributor to the global economy.

But competition, one of the defining features of globalization, has faced higher barriers from some countries that were once among the most ardent champions of the process which connects economies around the world. Some economies, for specific purposes such as geopolitics and trade protection, have concocted various new standards to define so-called "excess capacity", simply, mechanically or generally, in an attempt to contain China's development and set obstacles to normal international economic and trade cooperation. These so-called "conceptual" standards are neither consistent with the laws of development, nor can they be detached from the realities of countries or how the global economy has evolved, as pointed out by the Chinese Ministry of Commerce in a document released earlier this week.

It's neither well-founded nor fair to attribute China's exports to "excess capacity".

Responding to some Western countries equating China's trade surplus in goods with "excess capacity", the position paper provides a wealth of examples to prove that this argument is untenable. It says the country's export growth stems not only from the improvement of its economies of scale and innovation capabilities, but also from the demand driven by other countries pursuing their green transition and industrial development, as shown by the popularity of Chinese products such as new energy vehicles and solar panels.

Over the past decade, for instance, the average cost of electricity from wind and solar power worldwide has fallen by more than 60 percent and 80 percent respectively, in large part thanks to Chinese manufacturing capacity — a dividend that has made a great contribution to the global energy transition.

Artificial intelligence models developed by Chinese companies are also rapidly gaining ground in overseas markets because they deliver strong performance on a cheaper basis, thanks to both the country's unwavering pursuit of innovation and its solid energy infrastructure.

Some Western countries blame China's development for their own problems such as slowing economic growth and lagging industrial transformation. Yet the data show China is providing more market, development and innovation dividends to the world through the utilization of its market advantages, industrial development and sci-tech progress. Instead of "China Shock 2.0", the reality is "China Opportunity 2.0".

Take for example the rise of China's electric vehicle industry. Not only are international companies collaborating with Chinese enterprises to develop their own products, but Chinese EV makers are also cooperating with their counterparts in Europe and other parts of the world by investing in local factories, reviving production lines, improving the supply chain and creating jobs.

Attempts to stifle competition under the pretext of "excess capacity" won't stop weaker industries lagging further behind.

Experience gained over the past decades of globalization demonstrates that openness unlocks shared opportunities, and an international trade and investment system that runs smoothly is in line with the interests of all countries.

A robust manufacturing foundation and rapid technological advances constitute key benefits China has reaped from globalization and passed on. Its contribution to the world economy should be fairly recognized, not stigmatized.

Software pioneer helps build defense shields with dedication

The past two years have marked an obvious acceleration in the technological upgrading and equipment modernization of the Chinese People's Liberation Army, which has a growing array of world-class, domestically built weapon systems, many of which were publicly displayed during the magnificent military parade last September and subsequent interservice combat exercises.

Among the systems made public are the DF-17 hypersonic missile, which maneuvers at extreme speeds to penetrate missile defense layers; the J-35, China's first carrier-borne stealth fighter, which has been deployed aboard the CNS *Fujian* — the country's third aircraft carrier and its first with a domestically developed electromagnetic launch and recovery system; and the JL-1 air-launched long-range ballistic missile that has equipped the PLA Air Force with a reliable, powerful capability to execute a nuclear counterstrike.

Last year's parade also featured a dedicated unmanned combat formation, including loyal wingman drones that form a core part of the PLA's next-generation air combat plan, and ground-fighting robots that promise round-the-clock mobility and reduced human casualties. While some next-generation programs, such as the widely speculated sixth-generation fighter jet models, remain unannounced, their expected development underscores sustained investment in frontier defense technologies.

Such hardware advances cannot be separated from the people inventing them. At the core of China's tech-empowerment strategy is a years-long push to nurture high-caliber research talent, embodied by Senior Colonel Wang Ji, a National University of Defense Technology scientist who has just been given a top national honorary title.

Specializing in high-confidence software verification — a technology critical to the operational reliability of military hardware and space systems — Wang has dedicated his career to building an independent domestic platform in this once-overlooked domain.

High-confidence software serves as an invisible safety backbone for sophisticated military equipment. Using mathematical verification methods, it identifies hidden logical vulnerabilities deep within core operating code that standard testing is unable to detect — flaws that could derail missions in stealth fighters, missile systems or aircraft carrier command networks.

Breaking through numerous technical obstacles, Wang and his team developed a full-stack, self-reliant verification framework now deployed across dozens of major defense and space programs. His work has become a cornerstone of quality assurance for China's new-generation weaponry, directly supporting the rapid operational rollout of new platforms.

Equally vital is his role in talent cultivation: he has built a vibrant youth-led research team, with many early-career scholars leading key project tasks, creating a sustainable pipeline of expertise for future innovation in defense technology.

Wang's story is representative of a broader trend. As China deepens its technology-driven military transformation, improved incentive mechanisms and research platforms are drawing more top professionals to defense technology research, ensuring military modernization advances in lockstep with economic growth.

What They Say

Plan calls for full-caliber climate response

Editor's note: *China aims to reduce carbon dioxide emissions per unit of GDP by 17 percent from 2025 levels by 2030, according to the national climate change response plan for the 15th Five-Year Plan (2026-30) period. In a Q&A posted on the Ministry of Ecology and Environment website, the person in charge of the climate change response department elaborated on the policy, while Chai Qimin, director of the strategic planning department at the National Center for Climate Change Strategy and International Cooperation, outlined the significance of the plan in an interview with China Central Television. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

China has introduced a climate change response plan to make further progress in addressing climate change and achieving carbon peaking and carbon neutrality goals. The plan also sets out goals to establish a comprehensive carbon footprint management system and bring improvements to the climate adaptation framework.

The plan comes at a time when global temperatures have likely reached their highest levels since modern record-keeping began. Rising temperatures have accelerated the melting of glaciers, contributed to the rise in sea levels and caused widespread degradation of coastal coral reefs. These changes threaten the ecological balance, undermine biodiversity and increasingly disrupt livelihoods, economic activities and sustainable development, resulting in economic losses worldwide.

Against this backdrop, it is necessary to build stronger foundational capacities, including the development of sponge cities and the implementation of comprehensive emergency preparedness and response systems to better protect communities from the growing risks of extreme weather and other climate-related events.

The plan sets out key goals for 2026 to 2030, including accelerating the green and low-carbon transition of the economy and society, enhancing the carbon sequestration capacity of ecosystems and advancing coordinated efforts to reduce pollution and carbon emissions.

It has also stressed strengthening methane emissions control, enhancing nitrous oxide emissions management and advancing the control of fluorinated greenhouse gas emissions.

Other goals include accelerating the development of the national carbon emissions trading market, actively fostering a high-quality national voluntary greenhouse gas emissions reduction trading market, enhancing the vitality and efficiency of carbon markets and expanding the international influence of China's carbon market.

Also on the agenda are improvements in carbon footprint labeling, certification and governance mechanisms, broadening the application of product carbon footprints and promoting international alignment of carbon footprint standards and rules.

China will play a major role in advancing multilateral climate governance, fulfilling its transparency obligations in a robust manner, deepening bilateral and multilateral international exchanges and cooperation, and continuing to strengthen South-South cooperation on climate change.

Recognizing that addressing climate change requires coordinated action across sectors and government agencies, the plan adopts a systematic approach to ensure effective implementation. It identifies three priorities for strengthening governance and policy execution.

The first is to deepen interdepartmental coordination. The Ministry of Ecology and Environment will strengthen policy coordination and operational cooperation with relevant government departments while guiding local governments and key industries in advancing climate initiatives in a coordinated manner. Enhanced information sharing and joint coordination mechanisms will help ensure that all stakeholders work toward common objectives.

The second priority is to strengthen public engagement and capacity building. Through broader public communication, education and professional training, the government aims to improve climate awareness and enhance society's ability to respond to climate change. These efforts are expected to encourage greener, lower-carbon lifestyles while expanding public participation in climate action.

The third priority is to strengthen monitoring and evaluation. Authorities will establish dynamic monitoring mechanisms, conduct midterm and final assessments, and ensure that the targets outlined in the plan are achieved on schedule.

VIEWS

Fang Ke

A nuclear shortcut to greater insecurity

Japan is steadily treading the dangerous path toward nuclear armament. Citing shifts in the global security landscape and adjustments in Europe's nuclear posture, Japanese Defense Minister Shinjiro Koizumi recently argued that Japan should "discuss nuclear-related policies without taboos".

His remarks challenge the country's long-standing "Three Non-Nuclear Principles" and are intended to garner public support and clear the legal hurdles for Japan's nuclear armament.

Koizumi's remarks are neither accidental nor isolated. Rather, they reveal a systemic push by Japan's right-wing forces to accelerate remilitarization and challenge the postwar international order. Shortly after Prime Minister Sanae Takaichi took office, several of her close aides expressed pro-nuclear sentiments.

Calls for nuclear-powered submarines and repeated attempts by the ruling coalition to scrap the "Three Non-Nuclear Principles" during revisions of Japan's security documents reveal that the die-hard nuclear ambitions of right-wing forces are resurfacing.

Japan may frame such moves as a response to its growing "security anxiety", but history and reality show that pursuing nuclear armament is counterproductive.

It would upset the strategic balance in Northeast Asia, intensify regional tensions, drag Japan back to militarism and plunge it deeper into a security dilemma.

After World War II, guided by pacifists' reflection on its history of aggression and constrained by restrictions of the postwar international order, Japan adopted an "exclusively defense-oriented" policy and embraced the "Three Non-Nuclear Principles" — not possessing, producing or introducing nuclear weapons. This commitment to peaceful development laid the foundation for decades of political stability and economic recovery for the country.

Instead of ensuring security, nuclear weapons would make Japan a prominent target while eliminating its strategic security buffer.

However, amid significant shifts in the international landscape, Japan's right-wing factions have increasingly exaggerated "external threats" to justify dismantling the constraints imposed by its pacifist Constitution and the postwar international order. This rise of neo-militarism, exemplified by Koizumi's overt calls for nuclear armament, reflects a dangerous drift away from pacifism.

By equating nuclear deterrence with "absolute security", Koizumi framed nuclear weapons as the ultimate weapon for coping with potential security risks and for elevating Japan's strategic standing. Koizumi's rhetoric is fundamentally flawed because it overlooks geopolitical realities, Japan's historical responsibilities, and the international constraints it should abide by.

The notion that nuclear weapons can ensure a country's security is also not correct. In fact, nuclear weapons will prove counterproductive for Tokyo by triggering a regional arms race.

Instead of bringing "absolute security" to Japan, they will endanger the security of all regional countries.

Northeast Asia is already one of the world's most strategically sensitive regions. Japan's nuclear aspirations will disrupt the strategic equilibrium maintained for decades, and force other countries to upgrade their necessary nuclear deterrence or conventional military capabilities. This would replace the strategic stability in Northeast Asia with escalating confrontation.

Geography also doesn't favor Japan. The country's long, narrow territory, limited strategic depth and densely concentrated population and industrial centers make it more vulnerable than its larger neighbors in a potential nuclear standoff. Instead of ensuring security, nuclear weapons would make Japan a prominent target while eliminating its strategic security buffer.

As a non-nuclear-weapon signatory to the Treaty on the Non-Proliferation of Nuclear Weapons, Japan's pursuit of nuclear arms blatantly violates the international non-proliferation regime and undermines global nuclear governance.

The country's history of aggression and "Peace Constitution" strip Japan of any legitimacy to acquire nuclear weapons. More importantly, Japan has yet to fully reckon with its wartime crimes. Nuclear weapons would only bolster its historical revisionism and military ambitions.

As a defeated aggressor in WWII and the only country in the world to have suffered atomic bombings, Japan knows all too well how devastating nuclear weapons are. That painful history should reinforce, not weaken, its commitment to nuclear restraint.

Koizumi's advocacy of nuclear weapons for "security" is essentially an attempt to break from the postwar order and reestablish Japan as a major military power.

Its nuclear ambitions can trap Japan in a dual "security dilemma". For decades, the country has relied on the United States-Japan alliance and Washington's nuclear umbrella and military presence for its security. Developing its own nuclear capability would run counter to Washington's strategic layout in East Asia and invite US suspicion.

It would gradually erode the security umbrella provided by the US-Japan alliance. On the other hand, intensified tensions with neighboring countries would leave Japan politically isolated and diplomatically disadvantaged.

The warning signs are already visible. Japan's rapid military buildup — including substantial increases in defense spending, development of offensive arms, hyping of nuclear weapons, and interference in regional disputes — has already put its neighbors on high alert.

This might-makes-right security strategy will drag Japan into a vicious cycle of arms and insecurity, potentially reviving the militaristic path it followed during WWII.

Lasting national security does not come from military expansion or nuclear armament but from a stable regional order, mutual trust among neighbors, strategic restraint, and sustainable development.

Koizumi's fallacy that "nuclear brings security", along with the re-militarization and nuclear agenda pushed by Japan's right-wing forces, is a short-sighted gamble that threatens the country's national security, regional peace, and the shared future of humanity.

Tokyo must recognize that peaceful development, security and stability depend on adhering to the "pacifist" Constitution, committing to non-nuclear principles, and integrating into regional cooperation.

Indulging in militarism and pursuing the so-called "absolute security" through nuclear arms would only lead to disaster.

China's open-weight AI a boon for the world

The 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, hosted by Shanghai earlier this month, was themed "AI Partnership for a Brighter Future" and focused on the global development and governance of AI technology.

Global Lens

Currently, China and the United States are the only two nations with the resources to develop AI technology on a large scale. Therefore, their approaches to AI development significantly shape the global trajectory of AI evolution. While one country emphasizes AI as a tool accessible to all, the other has adopted a model where AI is controlled by the elite.

The success of the two approaches will depend not only on the capabilities of individual models but also on their global adoption. In recent months, the performance gap between Chinese and US frontier models has narrowed significantly. Moonshot's Kimi K3, for instance, recently achieved benchmark results rivaling those of Anthropic's Claude Opus 4.8 and OpenAI's GPT-5.5.

However, the more consequential divergence lies in governance philosophy. While US companies often retain proprietary control, China's leading labs and tech giants have embraced open-weight models. This means their model parameters are publicly accessible for modification and deployment, enabling global adaptation and innovation. Although this is not without the risks of misuse, it offers a viable alternative to AI monopolies.

The WAIC's emphasis on openness signals that this ethos is now central to Beijing's AI vision. As President Xi Jinping stated on July 17 in his address at the WAIC, "AI development should not be a solo performance by a single country, but a symphony of international cooperation. We should seize this rare, historic opportunity to encourage open source, openness, collaboration and sharing."

MA XUEJING / CHINA DAILY

This message is like a beacon to the Global South, indicating that this powerful technology will not remain under the control of US tech giants. It allows developers from Southeast Asia, Africa, and Latin America to finetune Chinese models for their own languages and contexts while avoiding high costs. Countries that were previously limited to consuming technology can now actively participate in shaping its development.

Thanks to this ethos, since August 2025, Chinese AI has surpassed Western AI in terms of cumulative downloads in the open-source community, highlighting its widespread adoption across the globe. Many startups and companies, including those from the US, are increasingly using Chinese large language models to build their own AI programs.

For the world to enter the AI age equitably, there must be equal access to this technology. Otherwise, it could become another tool of hegemony and domination.

We have already observed that in Australia, where US companies are embedding themselves into the process of legislating AI and data center standards. The Australian government is resisting these influences, hoping to put in place measures to support Australian artists and the energy grid, but the threat to Australian digital sovereignty persists.

Recent moves by the US government to possibly ban US companies from using Chinese open-source models highlight its apprehensions concerning Chinese AI — not just its performance, but how ubiquitous it can potentially become.

Similarly, measures are being considered to ensure that US AI stays in the hands of US users.

In June, the US government went so far as to briefly ban Claude's highest-performing model, Fable 5, from use by anyone who is not a citizen of the US.

However, this pursuit of absolute control over AI may lead to its isolation from global AI development, ultimately weakening its position in the long run.

China's embrace of open-weight models in AI is a boon to the world. It will ensure that AI is accessible to all, and does not remain in the hands of corporate tech giants.

Without this ethos, AI is likely to become another divide between developing and developed nations — another form of fragmentation that breeds inefficiency and mistrust.

If AI is to become a force for good, then it must be developed through multilateral cooperation, allowing all stakeholders to guide the technology and the changes it will bring.

Preserve the authenticity and charm of old towns

Over the past year, I must have visited some 50 old towns during my travels across China. Some are deservedly famous, including Lijiang and Dali in Yunnan province and the Xijiang One Thousand Household Miao Village in Guizhou province.

But perhaps the most impressive are those little-known places tucked away from the tourist trail. Among them is the Tianmen Bouyei Ancient Village, a 600-year-old traditional village of ethnic Bouyei people nestled deep in the mountains of Guizhou province, about a three-hour drive from Liupanshui.

Its traditional wooden stilted houses stand as they have for centuries, and have not been given cosmetic facelifts to please tourists. In fact, there are hardly any tourists there because the village is so difficult to reach.

By sheer coincidence, we arrived there during the Bouyei people's June Sixth Festival, which is celebrated on the sixth day of the sixth month of the lunar calendar. The entire village gathered for a festive meal, sharing food and laughter like an extended family. It was a living tradition, not a staged performance for visitors.

Another memorable stop was the Suoga Miao Village, about a two-hour drive from Liupanshui. It too has preserved much of its traditional way of life. With many old wooden houses, it is known for the distinctive headdresses of women — massive wooden horns wrapped with white wool and their own hair, symbolizing reverence for nature and their ancestors.

One woman patiently demonstrated how she creates the elaborate longhorn headdress for her teenaged granddaughter, passing on a tradition from one generation to another.

There is no doubt that tourism helps showcase China's rich cultural heritage to more people and boosts the local economy. But excessive commercialization can change the authentic character of a place, as it has in many old towns and villages across the country.

There should be a balance between developing tourism and preserving local culture, traditions and lifestyles that give old towns their identity.

The Xijiang One Thousand Household Miao Village is one such example. As the largest ethnic Miao settlement in China, it has more than a thousand traditional wooden stilt houses built along steep mountain slopes. It presents a breathtaking view, especially at night when the whole village lights up like a constellation of warm yellow lights.

Today, most homes there have been converted into family-run hotels, restaurants and shops catering to the swarm of tourists flocking to this National AAAAA attraction.

Tourism has helped lift local people out of poverty and created prosperity, but to me the touristy village is less appealing than the authenticity of the Tianmen and Suoga villages.

I am reminded of an article I wrote about 25 years ago in the Shanghai Star, a tabloid run by China Daily, after visiting two scenic canal towns near Shanghai.

Zhouzhuang had already become a commercial tourism success, while Wuzhen was relatively unknown and far less crowded. I wrote then that I hoped Wuzhen would retain its tranquility.

Of course, history had other plans. Wuzhen today is even more famous than Zhouzhuang.

It is regarded as a model of balancing commercial success with the preservation of its historical character.

However, most old towns in China have become too commercialized. It's disheartening to see nearly every house in Xijiang One Thousand Household Miao Village turned into a business.

It reminds one of Zhouzhuang in the 1990s, when shop after shop was selling the town's well-known pig's knuckle delicacy.

Even more dismaying is the craze to build "old towns" purely for commercial purposes over the past two decades. Many such newly built "old towns" are eyesores. They look more like theme parks than old towns because there are hardly any "old" houses there. Strictly speaking, they should not be allowed to be labeled as "old towns".

Despite enormous investment, few of these heritage projects have been successful in attracting tourists. Many have become ghost towns.

There should be a balance between developing tourism and preserving local culture, traditions and lifestyles that give old towns their identity.

For example, zoning is necessary so that local people can live there just like their parents and grandparents did, while commercial activities should be confined to designated areas.

Old towns are very charming, but that charm is also very fragile. It could quickly be lost if authenticity is replaced by excessive tourism development.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

TIAN QING AND WANG XINGXING

Why robots dance

China's robot dancers are not only a new expression of Chinese culture, but also the precursors of embodied intelligence for real-world applications

"Dancing robots" has repeatedly trended on social media after a series of high-profile public performances, including the *yangge* dance and Chinese martial arts shows at the Spring Festival Gala. Alongside admiration and applause from the public, there has also been persistent skepticism that this is simply "showing off" or even "useless".

Tian Qing

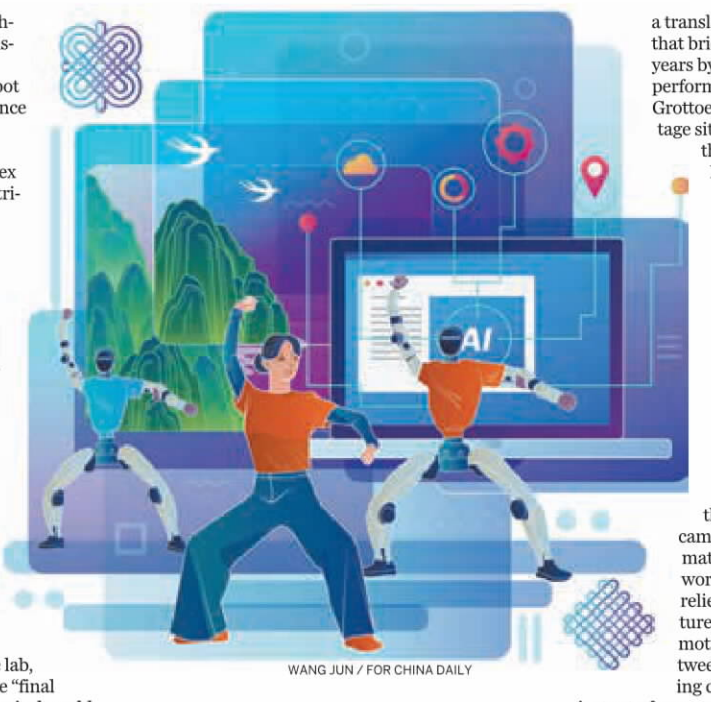
Wang Xingxing

Why should robots dance?

From a technological perspective, most artificial intelligence today is essentially a "brain in a vat" — skilled at processing symbols, but without a body. Humanoid robots represent the next frontier of AI: embodied intelligence, which allows AI to truly "inhabit" a body and move from the digital world into the physical one.

A robot can be thought of as having its own versions of a human brain, cerebellum and body — the "brain" decides what movement comes next and at what rhythm; the "cerebellum" controls how much force each joint exerts and where the center of gravity shifts; and the "body" consists of motors, sensors and limbs.

For a robot to complete a three-minute dance, its "cerebellum" must make hundreds of real-time decisions every second — continuously shifting its center of gravity, synchronizing more than a dozen joints and staying in time with the music. A delay of just 0.05 seconds in any one of these processes can cause the robot to lose its balance, fail the movement and fall.



An even deeper challenge lies in the transition from simulation to reality. Even a model trained to perfection in the lab can still lose its balance in the real world, because real-world environments are always more complex than any simulation.

Mastering the skill of dance means AI can both "conceive of" a movement and "execute" it. As robots' ability to learn from training data advances, their movement precision improves accordingly. The more complex the dance movements, the higher the demands on balance and multi-joint coordination — and the stronger the robot's ability to withstand unexpected disturbances in real environments. A robot that can perform dance movements reliably has the potential to take on more complex tasks, such as industrial inspection, emergency rescue and household services.

In other words, a robot dancing at a heritage site today could be conducting rescue work at a disaster site tomorrow. Dancing isn't a performance stunt — it's a rigorous, real-world test.

From the perspective of application scenarios, when a robot operates in a lab, it is answering "questions it has already studied". When it operates outside the lab, it is stepping into the "final exam" of the real physical world.

In the AI field, there is a specific term: "out-of-distribution", referring to the real-world situations that robots have never encountered in the training set. Completing a performance smoothly and safely in a real-world setting is the most direct test of an embodied intelligence system's robustness, or its ability to resist interference. Data collected in real environments is itself valuable training material — it records how a robot responds to unpredictable variables such as lighting, ground conditions and sound, offering samples that are difficult to replicate in a lab and feeding into further algorithm iteration. Through the continual accumulation of this kind of data, robots can gradually progress from completing a single performance to genuinely entering homes, hospitals and communities — serving people's daily lives and empowering countless industries.

WANG JUN / FOR CHINA DAILY

And from a cultural perspective, dancing turns robots into narrators of human civilization.

Choreographing a robot dance of random movements is technically possible, but doing so yields relatively uniform data, and squanders the rich potential of cultural elements to empower new technology.

A team of developers recently completed a translation of cultural elements that bridges a span of about 1,500 years by staging flash mob robot performances at the Yungang Grottoes, a UNESCO World Heritage site. They used AI to convert the dynamic postures of the Northern Wei Dynasty (386-534) guardian statues at the grottoes into data, and then had a fleet of robots physically render that data — so that this piece of cultural heritage could truly come "alive" before people's eyes.

The process began with dance archaeology, analyzing the physical tension, center of gravity and muscle orientation of 10 sets of the statues at the site one by one. Next came AI-based 3D pose estimation, in which a neural network translated the 2D stone reliefs into 3D skeletal structures. This was followed by motion completion, or in-betweening: since a stone carving captures only a single instant of a movement, AI was used to fill in the preceding and following frames of continuous motion — in keeping with the principles of human biomechanics — so that these static guardian figures could "move". Next came motion retargeting: since the skeletal proportions of humans and robots differ, each movement had to be precisely mapped before it could be applied to a specific robot body. Finally came physical feasibility verification, in which the movements were tested through simulation before being transferred to the hardware itself.

This work also raises a deeper question worth exploring over the long term: Most AI models today are trained on data from specific cultural backgrounds. Data from English-speaking countries teaches AI to understand and interpret the world through the logic of the English language, leaving such models ill-equipped to grasp the body language of Northern Wei Dynasty guardian statues from China. Using data on Eastern cultural rhythm and posture to train embodied intelligence is a way of building a "cultural body" for Chinese AI — and more than that, it adds Eastern cultural elements to the broader landscape of artificial intelligence, helping align AI with values shared by all of humanity, and promoting exchange and mutual learning among different civilizations.

The significance of embodied intelligence extends beyond any single country or civilization. It represents a technological leap that belongs to all of humanity — one that takes AI out of the virtual "brain in a vat" and into the physical world, while giving the cultural elements of different civilizations an entirely new medium of expression that global audiences can understand.

Film and new media technologies once drove the cross-regional spread of culture and art. Today, AI and robotics go a step further, bringing ancient civilizations "alive" in the real world as tangible, interactive presences. China's robot dancers are not only a new expression of Chinese culture, but also a new starting point for exchange and mutual learning among civilizations.

Just as Chinese robots can now perform the poses of Yungang's guardian figures, in the future they may perform Greece's Hera dance or India's Bharatanatyam. Such performances would enrich the cultural diversity within the AI world, so that each civilization's beauty can shine in its own way and, together, create a shared beauty — making robots a new vessel for the diversity of world civilizations and the uniqueness of national cultures.

Tian Qing is a member of the Beijing Dancers Association, a cross-media artist, and the director of the robot dance show at "Macau 2049" and "The Awakening of the Yungang Guardians". Wang Xingxing is the founder of Unitree Robotics. The authors contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

MA HANZHI

Modernizing together

China, Africa and other Global South countries can rely on multilateral cooperation platforms such as WAICO to jointly enhance AI governance

Among the 29 founding member countries that signed the agreement on the establishment of the World Artificial Intelligence Cooperation Organization — the first intergovernmental international organization dedicated exclusively to AI — on July 16, Africa stands out with 10 seats, accounting for about one-third of the total. This reflects the fruitful outcome of China-Africa cooperation in the field of AI in recent years.

China has been steadily improving Africa's foundational conditions for AI development by assisting in the construction of fiber-optic networks, cross-border connectivity and new-generation mobile communication networks and other digital infrastructure. In August 2021, then-assistant foreign minister Deng Li introduced China's proposals for the China-Africa Partnership Plan on Digital Innovation at the China-Africa Internet Development and Cooperation Forum, which made digital infrastructure a key area of cooperation. At the 2024 Beijing Summit of the Forum on China-Africa Cooperation, Chinese President Xi Jinping pledged to "build with Africa a digital technology cooperation center and initiate 20 digital demonstration projects so as to embrace together the latest round of technological revolution and industrial transformation".

Today, China-Africa digital infrastructure cooperation is accelerating. On Nov 7, 2025, the eastern segment of China Mobile's 2Africa submarine cable was officially activated in Kenya's capital Nairobi. With a total length of about 45,000 kilometers, the 2Africa cable runs along the African coastline and connects over 30 countries and regions across Africa, Asia and Europe, providing high-quality, low-latency and reliable international communications services to an estimated 3 billion people along its route. Once fully operational, it will reduce data transmission costs across Africa and boost regional online connectivity.

In August 2025, the second phase of the Zimbabwe Center for High Performance Computing, built with Chinese assistance, was handed over to Zimbabwe. The computing platform provided by China's Huawei delivers powerful support for local cutting-edge scientific research and high-level talent development. According to allAfrica, a website that aggregates and produces news primarily on the African continent, Chinese-backed projects have accelerated access to digital infrastructure that might otherwise have taken years to develop. In the AI space, this translates into opportunities to adopt technologies that enhance public service delivery, improve financial inclusion, and drive efficiency in sectors such as agriculture and transport.

China adheres to a philosophy of openness and sharing, working hand-in-hand with Africa to reap the dividends of AI development. In building an open-source ecosystem, Chinese open-source large models such as DeepSeek, with their high cost-effectiveness and localization advantages, are winning wide favor among African developers, in contrast to the often hefty licensing fees charged by mainstream Western models. According to Microsoft's Global AI Adoption in 2025, DeepSeek usage in Africa is estimated to be two to four times higher than in other regions. As AI applications gain traction across the continent, more developers are choosing Chinese open source models as the foundational platform for local-language AI. In terms of application scenarios, Chinese AI technologies are now penetrating multiple sectors in Africa, presenting a diverse and flourishing landscape.

China's intelligent meteorological early-warning solution MAZU has been deployed in Ethiopia and several other countries, advancing the use of AI in numerical forecasting, extreme weather identification and risk management. In Mozambique, plant protection drones based on China's BeiDou navigation technology are widely used for farmland mapping, rice seeding and pesticide spraying, greatly improving harvest efficiency. In South Africa, Huawei has deployed intelligent systems for local railways, reducing accidents, and improving inspection and maintenance efficiency.

On talent cultivation, in July 2024, China and 26 African countries jointly issued the Action Plan for China-Africa Digital Cooperation and Development, explicitly committing to train 1,000 digital technology professionals for Africa over the following three years. On July 17, it was announced that in the next five years, China will provide developing countries with 5,000 opportunities in AI training and seminar programs, continuously contributing to global AI capacity-building.

As practical China-Africa AI cooperation deepens, consensus on improving global governance is also growing. In October 2023, China took the lead in issuing the Global AI Governance Initiative, establishing the principle of developing AI for good. Guided by the principles of extensive consultation, joint contribution, and shared benefits, this initiative has garnered broad international support and response by building cooperative consensus for global AI development.

At the Opening Ceremony of the 2026 World AI Conference and High-Level Meeting on Global AI Governance in July, President Xi called for enhancing "alignment and coordination on AI development strategies, governance rules and technical standards, so as to form a consensus-based global governance framework at an early date to make this frontier technology better benefit humanity". These propositions resonate with the shared concerns of the Global South and embody the common aspiration of developing countries to seek development and participate in rule-making amid the new technological revolution. Documents such as the Africa Declaration on Artificial Intelligence show that Africa's AI governance philosophy centers on safeguarding sovereignty, upholding shared values, putting people first, balancing development and security — principles that are highly consistent with China's emphasis on sovereign equality and its governance tenets of people-centered approach and developing AI for good. Crucially, both sides firmly oppose the monopolization of AI governance by a few countries or blocs, and are committed to building a fairer and more inclusive global governance system. This is the underlying reason why African countries actively joined the WAICO. South Africa, Algeria, Ethiopia, and Kenya — countries with more rapid AI development — along with other African signatories, demonstrate Africa's positive stance toward WAICO and its strong endorsement of its principles.

YANG MEINI / FOR CHINA DAILY

Africa still faces multiple challenges in participating in global AI governance, including weak infrastructure, talent and data gaps, insufficient institutional voice and risks of technological dependence. Nevertheless, China, Africa and other Global South countries can rely on multilateral cooperation platforms such as WAICO to deepen innovative collaboration, promote inclusive development, strengthen coordinated governance, and jointly enhance the capacity and level of all parties in global AI governance. AI can be developed in a sound, safe and fair direction, and AI can effectively serve the modernization efforts of all countries.

TALES & TRAILS

Editor's note:
China Daily reporters leverage local expertise to devise diverse itineraries that showcase a blend of historical landmarks and natural wonders in highly recommended cities and sites, offering practical guidance to experience the country.

BORN *by* RIVER *and* SEA

A coastal city in northern China has developed into a thriving hub where history, culture and modernity converge, **Deng Zhangyu** and **Yan Dongjie** report in Tianjin.

Nestled along the Haihe River and facing the Bohai Sea, Tianjin is a vibrant coastal city in northern China that hosts a unique blend of history, culture and modernity.

Born from the river and thriving by the sea, the city has long been a gateway between China and the world.

In ancient times, the Haihe River, which runs through the city center, made Tianjin a vital trade and transportation hub.

In 1860, following China's defeat by the invading Anglo-French forces, the city was forced to open its doors as one of China's early treaty ports under the terms of unequal treaties, which allowed foreign countries to establish concessions.

Agonizing for the country's collective memory, this turning point in history also inadvertently launched Tianjin's connection with the rest of the world in a modern context, and its legacies remain ubiquitous in the city: Western-style buildings, tree-lined avenues and entire neighborhoods that feel like a journey through European capitals.

For a different perspective, take a nighttime cruise along the Haihe River, where traditional Chinese structures and Western-style buildings light up, creating a skyline unlike any other.

But Tianjin hasn't forgotten its roots. Today, Ancient Culture Street is a treasure trove of traditional Chinese architecture, where cobblestone alleys lead to shops selling intangible cultural heritage products, such as Yangliuqing New Year paintings and Niren Zhang clay figurines. Each is a living expression of the city's one-of-a-kind story.

Visitors can watch artisans at work or even try their hand at these time-honored traditional crafts.

Travel just a bit further to Binhai New Area to discover Tianjin's coastal charm. Stretches of sandy beaches offer sunset walks and sunrise boat rides. The TEDA Aircraft Carrier Theme Park and the National Maritime Museum of China provide family-friendly fun with a marine twist.

A visit to Tianjin would not be complete without tasting its food. Seafood lovers will enjoy local specialties such as *badacha* (eight great simmered delicacies) and mantis shrimp potstickers. But the city's most iconic bite is the *jianbing guozi*, a crispy, savory Chinese pancake that can be found on nearly every street corner. It's more than breakfast; it's a taste of everyday life in Tianjin.

From its historical streets to its modern coastline, Tianjin offers a memorable journey, whether exploring centuries-old architecture, watching the sunrise over the sea, or savoring street food. This city invites everyone to discover a side of China that's both familiar and fascinatingly new.

BLUE HORIZONS IN BINHAI

From maritime history and an aircraft carrier to sunrise fishing, a new area offers an easy coastal escape from Beijing, **Deng Zhangyu** reports in Tianjin.

Dreaming of a seaside escape? Hop on a high-speed train from Beijing and, in just an hour, you'll arrive at Tianjin's Binhai New Area, home to one of the capital's nearest stretches of coastline.

If Tianjin's city center is a canal-laced old town, Binhai New Area, about a 30-minute drive away, is a vibrant port shaped by the Bohai Sea, where maritime culture and modern attractions come together.

To understand the story of this coastline, I began at the National Maritime Museum of China. Perched beside the Bohai Sea, the museum is one of Binhai's biggest draws. Admission is free, but visitors should reserve tickets online well in advance, as same-day tickets are rarely available.

The gleaming white building immediately catches the eye. Its sweeping curves resemble a school of fish gliding through the waves or a sail billowing in the wind.

Two observation decks extend over the water, offering uninterrupted views of the Bohai Sea.

Standing there with the sea breeze on my face and the horizon stretching endlessly ahead, I easily lost track of time before my friend Chang Xiaojing, who works at the museum, brought my attention back to the exhibits.

Since opening in May 2019, the museum has welcomed more than 3 million visitors each year, Chang says.

During the summer holidays, tickets are especially hard to secure, with families and young travelers flocking from across the country.

The museum houses 13 permanent exhibition halls spanning three floors, covering themes like Ancient Ocean, Today's Ocean, Future Ocean, and Chinese Maritime Civilization. It is also hosting a special exhibition on China's underwater archaeological discoveries.

The museum's star attraction is impossible to miss — a 9.4-meter whale shark specimen suspended dramatically above visitors.

Nearby are a preserved pregnant hammerhead shark, a life-size model of a giant squid measuring more than 10 meters, and a display of plankton, crabs, shrimp and shellfish.

It isn't just marine life. The Age of Dinosaurs hall is also breathtaking, displaying precious fossils that vividly prove the ocean is the cradle of life.

My favorite was the Future Ocean gallery, where immersive digital displays imagine underwater communities, transport systems, farms and deep-sea cities. Moving from prehistoric oceans to futuristic blue worlds, the exhibition feels like a journey across millions of years of maritime history.

Before leaving, I stopped at the museum's popular seaside cafe. Floor-to-ceiling windows frame panoramic views of the Bohai Sea.

Coffee in hand, I watched the waves roll in and understood why many visitors linger long after their museum tour ends.

1. The National Maritime Museum of China is a new cultural landmark perched beside the Bohai Sea in Tianjin's Binhai New Area. **2.** The Dongjiang Bay scenic area is a popular venue for water sports performances. **3.** The stunt car show is a crowd favorite at the TEDA Aircraft Carrier Theme Park. **4.** A former aircraft carrier is transformed into a tourist attraction. **5.** Visitors enjoy horseback riding at the Dongjiang Bay scenic area.

The beach at the Dongjiang Bay scenic area offers plenty of fun for families traveling together.

Prime attraction

After a leisurely morning, I took a 30-minute taxi ride to my next stop: TEDA Aircraft Carrier Theme Park. For 220 yuan ($32.50), I stepped aboard a real aircraft carrier for the first time.

Commissioned in 1975 in the former Soviet Union, the ship was decommissioned in the 1990s and was later brought to Tianjin and transformed into a tourist attraction.

Inside, visitors can explore more than a dozen areas, from the expansive flight deck and combat command center to the crew's living quarters and missile and torpedo bays.

Wandering through its maze-like corridors, I was surprised to come across a fried chicken outlet, a cafe and a trendy souvenir shop. The contrast between the carrier's steel-gray military interior and its modern leisure spaces was as unexpected as it was entertaining.

Stepping onto the open flight deck felt like walking onto a movie set. Instead of fighter jets preparing for takeoff, children ran across the deck, tourists posed for photos and one visitor quietly practiced tai chi against the backdrop of the Bohai Sea.

The park's stunt car show is another crowd favorite, delivering high-speed chases, precision drifting and daring driving displays worthy of an action film.

Thrill-seekers can even pay 300 yuan for a 30-second drifting experience with a professional driver.

One foreign visitor emerged grinning, saying it felt like starring in his own *Fast & Furious* scene.

After spending about three hours aboard the carrier, I headed to my final stop of the day — Dongjiang Bay scenic area. The shift from the imposing military setting to soft sand and gentle waves was instantly calming.

Stretching for 2 kilometers, the beach is one of the best places in Binhai New Area to watch the sunset.

Visitors can also try jet skiing, speedboating and sailing before settling in for the evening spectacle.

Swings set in the middle of the water provide an ideal spot for photographs.

As the sun dipped toward the horizon, the Bohai Sea glowed in shades of gold and orange. I found a beach chair, sat back and watched the last light shimmer across the water, ending a day that had taken me from maritime history to military hardware and, finally, to the simple pleasures of the seaside.

Sea of surprises

The next day began long before dawn with another highlight of the trip — a fishing excursion with local fishermen to watch the sunrise over the Bohai Sea.

Several fishing docks in Binhai offer charter trips, with boats accommodating about 10 people for around 1,500 yuan.

Just after 4 am, my friends and I arrived at the dock while the sky was still dark. Captain Li Ning had checked the weather and tides. After putting on our life jackets, we set off into the Bohai as the boat's engine broke the morning silence.

The morning sea was quiet and gentle, with only the sound of wind and waves. As we sailed, the horizon slowly changed from inky blue to a faint orange glow. Suddenly, a red sun broke free from the sea, slowly rising, spreading golden light across thousands of waves.

This is the romance that only early-morning sailors can experience.

When we reached the designated fishing ground, the crew expertly operated the equipment, lowering a huge trawl net into the sea. After 40 minutes of waiting, it was time to haul it in — the most exciting moment. As the winch slowly turned, the heavy net emerged, and lively mantis shrimp, fresh fish, and small crabs tumbled onto the deck.

Captain Li laughed, comparing fishing to opening a blind box — you never know what the sea will offer. Some days bring an abundant catch, others less so, but that unpredictability is part of its enduring appeal.

As we sorted the morning's catch, a cool sea breeze accompanied us back to shore, bringing an unhurried end to the voyage.

My two-day journey through Binhai New Area proved that a memorable seaside escape doesn't require a long journey.

Just beyond Beijing lies a coastline where maritime history, unexpected adventures and quiet moments by the sea come together, offering a refreshing change of pace within easy reach of the capital.

Yan Dongjie contributed to this story.

Old villas and bold designs define historic cityscape

By DENG ZHANGYU in Tianjin

From top: Wudadao is home to a large number of Western-style mansions. Zhongshuge bookstore is popular among readers and tourists alike. Visitors enjoy a sunset cruise along the Haihe River. PHOTOS BY DENG ZHANGYU / CHINA DAILY; PROVIDED TO CHINA DAILY

When it comes to cities made for slow, leisurely strolls, Tianjin always makes the list.

All you need is a comfortable pair of shoes. Follow the streets at your own pace, and around every corner, you'll find century-old mansions.

"Ten yuan ($1.5), 10 yuan to Italy!" As soon as I arrived in downtown Tianjin, I couldn't believe my ears when I heard a pedal-cart driver shouting that.

Yep, 10 yuan would take me to the Italian Style Area, the former Italian concession.

As one of China's early treaty ports, Tianjin was forced to open up in 1860, allowing foreign nations to establish concessions.

China's victory in World War I and World War II helped to gradually reclaim the concessions. By 1945, all foreign concessions in Tianjin had returned to full Chinese administration.

Italian Style Area is a well-preserved architectural complex designed entirely by Italian architects. There are 137 Italian-style villas. The heart of the neighborhood is Marco Polo Square, laid out in concentric circles.

Every building around the square is unique and no two look exactly the same. Scattered piazzas, delicate corner gardens, and clever arcade designs — every detail hides 100 years of architectural ingenuity.

On top of its century-old history, the Italian Style Area now perfectly blends old and new.

Hidden in the streets is the wildly popular bookstore Zhongshuge. Its ultra-modern design features layered staircases and mirrored ceilings, creating a high-end, light-filled space that young people love for photos.

Even Starbucks here stands out, with a theme of intangible cultural heritage that breaks the usual store design, blending Tianjin's local folk traditions into the decor. Details of Yangliuqing New Year paintings and Niren Zhang clay figurines can be spotted.

In the early 20th century, Tianjin was home to many prominent Chinese political, cultural, and military figures: Liang Qichao (1873-1929), a reformist thinker; playwright Cao Yu (1910-96); artist Li Shutong (1880-1942); and warlord Yuan Shikai (1859-1916). Their former residences are scattered among the streets. Each villa is a witness to modern Chinese history.

Leaving the Italian area, I strolled along old streets and arrived at the highlight of Tianjin's city walk: Wudadao.

This was once the British concession, and it's the best-preserved, largest collection of Western-style mansions in the city.

The area consists of five main roads, with a large number of Western-style buildings tucked into the crisscrossing lanes.

These elegant old villas, with their green bricks, red tiles and ivy-covered walls, may look peaceful, but every brick and tile holds a story.

When walking along Wudadao, you don't need to rush to see landmarks. Just follow your heart. Sunlight filters through the plane trees, casting dappled shadows across the streets. Vintage villas, quiet lanes and sculptures at every turn — one step, one view; one house, one story.

When I got tired, I stopped at a cafe for a drink, or just sat on a street-facing bench.

As night fell and the lights came on, Tianjin's romance truly began.

After a day of wandering, I took a Haihe River cruise strongly recommended by locals to experience the city's nightscape at its finest.

The river runs through the city center, connecting all its beauty and romance. Cruise docks are scattered along the river. A night ticket costs 168 yuan. The best times are the 7:30 pm and 8 pm departures. In summer, when days are longer, these two cruises let visitors catch sunset, twilight, and night views all in one ride.

As the boat glided gently along the river, the evening breeze softly brushed my face. The sky changed from golden sunset to deep blue night. The lights along the riverbanks came on, revealing the city's full skyline.

Near the water are rows of European-style red-roofed villas. Behind them, modern skyscrapers put on a dynamic light show, colors shifting and changing in perfect sync. Old meets new in a stunning visual feast.

The boat moved forward, and ahead, the iconic Ferris wheel — also called the Tianjin Eye — stood quietly on a bridge, glowing with dreamy lights, the most dazzling landmark in the night.

The evening breeze, flowing water, city lights, old villas, and the Ferris wheel, all reflecting off the river, showed Tianjin's gentle beauty and grand scale.

If you go

Transportation: From Beijing South Railway Station, dozens of high-speed trains depart daily for both Tianjin and Binhai New Area. The journey to downtown Tianjin takes about 30 minutes, while reaching Binhai New Area takes approximately one hour. Ticket prices are generally under 60 yuan (around $8.87). Tianjin is also served by its own airport, Tianjin Binhai International Airport. Within the city, you can conveniently use the metro or taxis, with most attractions being less than a 30-minute ride away.

Accommodation: Tianjin offers a wide range of accommodation options, from five-star luxury hotels to budget-friendly chains, with prices ranging from 200 to 1,000 yuan.

A light show featuring the iconic Ferris wheel attracts a large crowd at the Italian Style Area in Tianjin.

TALES & TRAILS

The sea's freshest bounty takes center stage on the dining tables of Tianjin residents. PROVIDED TO CHINA DAILY

Dive into the culinary soul of a coastal community, where seafood dishes and street snacks create a tapestry of flavors, **Deng Zhangyu** reports in Tianjin.

Locking in the taste of the ocean

Tianjin has a long coastline, and its food is a beautiful blend of two worlds: half the flavor comes from the Bohai Sea, and the other half hides in the smoky, bustling breakfast stalls tucked away in the city's alleys. This is the relaxed, passionate soul of the people of Tianjin.

Just an hour's drive from downtown Tianjin will bring you to Binhai New Area, hugging Bohai Bay. With 153 kilometers of coastline, the sea's freshest bounty takes center stage on every local table, all year round.

Locals here have a unique cooking method passed down for over 1,000 years: *cha*. It's the fishermen's secret to locking in the pure taste of seafood and preserving it for leaner times.

The technique is simple but clever: boil water with sea salt, soy sauce, ginger, scallions, peppercorns, and other spices to make a spiced broth. Then drop in fresh seafood, let it simmer slowly over low heat, and leave it to cool completely before eating or saving for later.

Seafood prepared this way is collectively known as *badacha* (eight great simmered delicacies). It often includes fish, shrimp, cuttlefish, conch, clams, squid, and other specialties from the Bohai Sea. The result? Salty, umami-packed bites that preserve the ocean's original aroma.

This style of food was born from the hardworking lives of fishermen and salt workers in days gone by.

Back then, the coast was dotted with fishing villages and salt fields. Fishing and salt-drying were heavy labor, and sea salt helped replace salt lost through sweat and preserve seafood.

The sea was generous, but winter made it hard to find fresh fish and shellfish. Simmered seafood was easy to store, and was cheap and tasty with rice, so it became a household staple.

The older generation made it quite salty — a practical choice for those tough times. Today, to fit modern health habits, the saltiness has been reduced, making the fresh taste even more prominent.

In 2013, *badacha* was officially listed as a Tianjin municipal intangible cultural heritage. Now, almost every local restaurant features it as a signature dish.

At Xiaoman Seafood, a popular and trendy restaurant, founder Kang Yahui has been diving deep into this traditional dish. He says the secret to simmered seafood is all about heat control and timing.

"Each type of seafood has its ideal level of heat, spices and salt content," he explains.

Once cooled, the seafood hits diners' mouths with a rich, salty aroma, and layers of freshness burst out.

The restaurant is packed every weekend, and you have to be lucky to find a seat.

Besides the traditional *badacha*, food lovers have found another must-try dish: *pipixia guotie* (mantis shrimp potstickers).

Each thin sheet of dough is wrapped around three whole mantis shrimp. The bottom is fried until golden and crispy, while the top remains soft and tender.

One bite, and sweet, briny shrimp juices burst out. Many tourists come all the way just for this unique coastal treat.

Top: A dazzling variety of snacks at a restaurant in Tianjin. **Center:** Mantis shrimp potstickers. **Above:** Savory Chinese pancake. PHOTOS BY DENG ZHANGYU / CHINA DAILY; PROVIDED TO CHINA DAILY

The vast mudflats of Tianjin's Binhai New Area produce plump, sweet mantis shrimp, and during low tide in summer, locals buy dozens to freeze for later. They toss fresh shrimp, shrimp paste, or fish sauce into everyday stir-fries. Seafood is woven into every meal — even breakfast.

Yang Kangping runs a seafood restaurant in Tanggu, Binhai New Area, that has been open for about 26 years.

By 7:30 am, the place is buzzing. Long tables are loaded with fried shrimp, fried yellow croaker, beltfish, sea bass, shrimp paste, fish paste, and various seasonal seafood side dishes.

Diners either wrap them in thin pancakes or enjoy them with jellied bean curd — a real energy-packed start to the day.

Born and raised in Tianjin, Yang says local residents have a rule: every meal must have a taste of the sea. Without seafood, the meal just feels incomplete.

On weekends, families gather around tables piled high with seafood at Yang's restaurant, turning breakfast into a lavish banquet.

The sea shapes Binhai's unique coastal food culture, but there's another kind of breakfast that unites all of Tianjin — a completely different street food vibe. *Jianbing guozi* (savory Chinese pancake) is a universally recognized symbol of the city.

The morning energy of Tianjin comes alive mostly through *jianbing guozi* stalls. The base is a thin pancake made from mung bean flour batter, then one or two eggs are cracked on top. It's spread with Tianjin's special sweet bean sauce and fermented tofu paste, and sprinkled with scallions.

In the middle, you can wrap either a thin, crispy, fried sheet of dough or a soft, fried dough stick. Rolled up hot, the aroma of grains, sauce and oil mingles — simple, yet unforgettable.

In Tianjin, stalls selling this are everywhere — on street corners, and in small community shops. The funny thing is, locals don't have a single "best *jianbing guozi* place". They'll all say: "The one downstairs from my apartment is the most authentic."

There's even a unique way to buy it: many residential buildings have a window on the first floor with a simple sign. Residents can buy *jianbing guozi* right from their neighbor's home kitchen, freshly made on the spot. And it's cheap. Less than 20 yuan (about $3) will fill you up.

Bohai seafood is rich and satisfying; *jianbing guozi* is simple and comforting. But Tianjin's charm doesn't stop there. People here are naturally laid-back, unhurried and easygoing. They don't like being rushed.

This relaxed vibe is reflected in every street snack you'll find, like the sweet, sticky *erduoyan zhagao* (deep-fried glutinous rice cakes) and the crispy, layered *mahua* (fried dough twists).

Just wander the streets and turn a corner, and you'll naturally discover your own favorite bite of Tianjin.

Exploring a city's spirit: Iconic prints and figurines await

By **DENG ZHANGYU** in Tianjin

When people think of Tianjin, their minds often jump straight to the delicious street food or the stunning foreign-style buildings that line the streets. But the real souvenirs one can tuck into a bag and take home — the ones that carry the city's true spirit — are two of its most famous intangible cultural heritage items: Yangliuqing New Year woodblock prints and Niren Zhang clay figurines.

To explore both in one trip, head straight to Ancient Culture Street along the Haihe River. This charming street is lined with houses with green-tiled roofs and wooden signboards, and shops dedicated to traditional Tianjin-style handicrafts.

Above left, below left and below right: Clay figurines are popular souvenirs for visitors to Tianjin.
Above center: A visitor gets hands-on experience in creating a Yangliuqing New Year woodblock print.
Above right: Chubby children are often featured in the New Year paintings. PHOTOS BY DENG ZHANGYU / CHINA DAILY

The most iconic stop is Yangliuqing Arts Store, a shop that has been operating for decades. Inside, you will immediately spot classic images that have been beloved for centuries: the legendary demon hunter Zhong Kui with his bushy beard, the God of Wealth, chubby babies holding a giant carp, and elegant beauties from ancient stories.

During the Spring Festival holiday, families often hang a picture of Zhong Kui at their front door to chase away evil spirits and bring good fortune, and display a picture of a baby with a carp to represent wishes for abundance and prosperity.

Yangliuqing New Year paintings originated during the Ming Dynasty (1368-1644) and flourished in the Qing Dynasty (1644-1911). Every Spring Festival, families would buy them to decorate their homes, hoping for a bright and lucky new year.

The technique combines woodblock printing with hand-painting, resulting in warm, rich colors that have become a symbol of Tianjin's culture.

As the store manager Wang Yan explains, the shop sees long lines just before Chinese New Year, with locals coming to buy pictures for their homes. On regular days, however, young people are the main customers.

The store continuously launches trendy new products, including book-sized door-god magnets, fun blind boxes featuring characters from New Year paintings, and refrigerator magnets adorned with cute gods and playful wishes such as "May you have both good health and good luck".

Prices range from a few dozen yuan for these cute little items to thousands of yuan for hand-painted masterpieces.

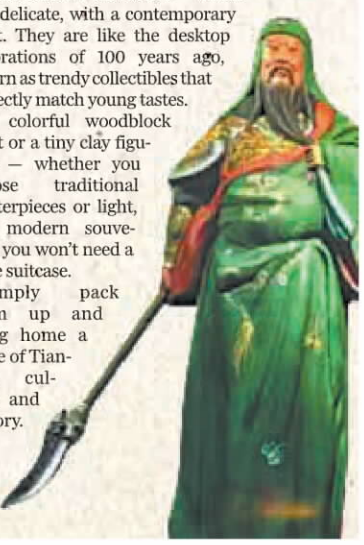
If you want to get your hands dirty, the store has a workshop where you can try woodblock printing and coloring, creating your very own New Year picture.

On weekends, inheritors of this ancient craft come to demonstrate the whole production process and share the rich stories behind each image.

If Yangliuqing paintings freeze good luck on paper, then Niren Zhang figurines freeze the everyday lives of people in clay.

On the street, visitors can find several stores, but the most famous one is run by Zhang Yu, a descendant of Zhang Mingshan (1826-1906) who became famous by combining traditional Chinese clay figurine techniques with Western aesthetics.

The art was born during the Qing Dynasty. Legend has it that Zhang Mingshan would hide a lump of clay in his sleeve during casual conversations, and within moments he could produce a tiny figurine that perfectly captured the person he was talking to.



Today, artisans use local clay and follow a long process of pounding, shaping, firing, and painting. The sculptures range from tiny street vendors to grand opera scenes, and every detail is full of life and expression.

At Zhang Yu's gallery-like store, visitors can view a permanent display of more than 100 representative clay figurines — from antiques created by Zhang Mingshan to Zhang Yu's contemporary works — and can also attend workshop sessions to learn how to make the figurines themselves.

To draw young buyers, modern-day Niren Zhang has broken away from its "old-fashioned" image. Many stores now offer playful, youthful clay figures, such as cute cartoon characters — small and delicate, with a contemporary twist. They are like the desktop decorations of 100 years ago, reborn as trendy collectibles that perfectly match young tastes.

A colorful woodblock print or a tiny clay figurine — whether you choose traditional masterpieces or light, fun modern souvenirs, you won't need a huge suitcase.

Simply pack them up and bring home a piece of Tianjin's culture and history.

Police officers killed in overnight raid

At least nine police personnel and 15 militants were killed after militants attacked a police post in Pakistan's northwest Khyber Pakhtunkhwa Province, police said on Thursday. The attack targeted the Khazina Banda check post in Hangu district, where police repulsed the assault. Reinforcements sent to the area were ambushed en route, damaging an armored personnel carrier, police said. Police noted that 15 militants were killed in the ensuing operation, which was still underway.

Mideast conflict widens amid tit-for-tat strikes

Continued attacks drag in more powers as mediators appeal for talks to resume

By **JAN YUMUL** in Hong Kong
jan@chinadailyapac.com

The United States Central Command said it launched strikes against Iran following Tehran's attempted attacks on US forces in the Middle East, heightening concerns about a widening conflict that has dragged more countries into the fray this week.

The US command said its forces completed a heavy wave of strikes against Iran at 10 pm on Wednesday "in response to yesterday's attempted missile attacks on US forces".

The security situation continues to claim lives in the region.

On Thursday, the Chinese embassy in Kuwait said a Nepali driver working for a Chinese company had been killed as Washington and Tehran engaged in tit-for-tat strikes. The Chinese embassy also confirmed that no Chinese citizens were killed or injured in the incident.

Kuwait's Ministry of Defense said an Iranian attack targeted a building belonging to a Chinese company in the north of the country, killing one worker and causing extensive material damage to the facility and property losses for the company.

Jordan's military said on Thursday that its air defenses shot down five Iranian missiles targeting its territory, adding that the attack caused no casualties.

Iran's Islamic Revolutionary Guard Corps later confirmed launching an attack on Jordan's al-Azraq base, saying that three F-35 aircraft were completely destroyed.

In a statement, the IRGC said the US "used the occupied bases in your country (Jordan) to launch an airstrike with bunker-buster bombs on two residential houses, targeting two modest homes belonging to local residents on Qeshm Island".

In Iran, three members of a family — a two-year-old toddler along with his parents — were killed, while two other children from the same family were injured following a US strike in Qeshm, the IRNA news agency reported.

The latest violence came immediately after the US conducted a joint precision strike with Saudi Arabia targeting Iran-backed groups in Iraq.

The exchanges saw Iran draw condemnation from Gulf Arab countries while Washington and Riyadh's actions also drew rebukes from Iran and Iraq.

During a daily news conference of the United Nations Office of the Spokesperson for the Secretary-General on Wednesday, Deputy Spokesman Farhan Haq told reporters that UN Secretary-General Antonio Guterres had raised concerns that the conflict could widen if the parties do not return to the negotiating table.

US President Donald Trump told Fox News in an interview that the US would be "hitting Iran hard" and vowed to give Iran a beating.

This followed the Iranian Foreign Ministry condemning joint US-Saudi attacks in Iraq and days after Trump said the US was holding talks with Iran.

The IRGC warned on Thursday that countries "involved in assisting the aggressor will face harsh consequences if they do not correct their behavior".

In a statement that day, the IRGC announced that two oil tankers attempted to leave the "unsafe southern route" of the Strait of Hormuz on Tuesday night after being prompted by US aircraft.

Pakistan Foreign Ministry spokesman Tahir Andrabi told reporters in Islamabad that the country is trying to bring Iran and the US back to the table under the memorandum of understanding aimed at ending the conflict that Pakistan brokered last month.

"We are doing our utmost to bring all parties back to the Islamabad MoU," Andrabi said, adding that Pakistan was encouraging the countries to "fully adhere to their commitments to hold technical talks".

US tariffs pose threat to India's pharma sector

By **ARUNAVA DAS** in Kolkata, India, and **XU WEIWEI** in Hong Kong

The tariffs proposed by the United States on generic medicines, featuring a 200 percent duty by 2029, not only represent a medium-term risk to India's $9.7 billion pharmaceutical export market but also hurt US patients, analysts said.

They added that Indian pharmaceutical companies can take the challenge as an opportunity to diversify their export destinations and innovate.

US President Donald Trump announced a phased tariff schedule for imported generic drugs: zero duty until August 2028, followed by 100 percent for one year, and 200 percent thereafter. He said in a social media post that the US aimed to push generic drugmakers to move production onshore.

The US accounts for roughly one-third of India's pharmaceutical exports while Indian manufacturers supply nearly half of generic prescriptions dispensed in the US by volume, meaning tariffs will have a material midterm impact on India, said Lekha S. Chakraborty, a professor at the National Institute of Public Finance and Policy, or NIPFP, an autonomous research institute of India's Ministry of Finance.

"While the two-year transition period limits immediate disruption, the scale of the eventual duties underscores structural vulnerabilities with high concentration in a single high-value market, thin margins on many commodity generics, and continued reliance on complex global supply chains," Chakraborty told China Daily.

"In this sense, the announcement serves as a timely signal for the industry and policymakers to accelerate diversification of export destinations, deepen domestic APIs (active pharmaceutical ingredients) and formulation capabilities, and invest in higher-value innovative and complex generics."

Swaran Singh, a professor of international relations at Jawaharlal Nehru University in New Delhi, said that since India's pharmaceutical sector operates on thin margins, the potential imposition of a 100-200 percent duty from August 2028 is bound to disrupt supply chains and cause shortages.

Pharmaceuticals rank among India's largest export earners, Singh said.

However, the question is whether Washington can easily replace India as its supplier of generic medicines given the scale of India's supplies, noted the expert.

"For onshoring production lines, this two-year runway (until tariffs take effect in August 2028) is too short for typical US plant-validation timelines," he said.

"The February 2026 US-India framework for an interim trade agreement had reportedly carved out 'negotiated outcomes' for generic medicines, though things remain unclear as we speak," Singh said.

"Finally, for India, this threat of tariffs could as well be a (US) negotiating strategy rather than a certain outcome."

Singh said that an increase in tariffs will result in higher drug prices and out-of-pocket expenses for US patients — from antibiotics to cancer treatments — if manufacturers cannot absorb costs or relocate quickly. The move would also risk the supply of low-cost generic medicines that fill over 90 percent of US prescriptions, he added.

'Wake-up call'

While a two-year transition allows for adjustment, the policy has been seen as a "wake-up call" for India to diversify export destinations, reduce API reliance on global chains, and shift toward high-value innovative generics, said Chakraborty.

Krishnendu Paul, founder of Qbox Sciences Private Limited, said that though the proposed tariffs may create short-term difficulties, they also create an opportunity for the Indian pharmaceutical industry to mature.

"India should reduce its dependence on one market, develop better medicines, strengthen manufacturing, and expand to new countries," Paul said, adding that pharmaceutical companies that adapt now will be stronger in the future.

Paul said this is the right time for India to strengthen innovation and to invest more in research, new medicines, biotechnology, and healthcare startups.

Trinanjan Sarangi, chief intensivist and consultant neuro-anesthesiologist at the Kolkata-based Kothari Medical Centre, said that, from the perspective of a clinician with 25 years of practice, this is a wake-up call for India.

India should diversify its pharmaceutical exports across emerging markets while continuing to serve established markets, Sarangi said.

Israel's decades-old support risks losing Democrats

WASHINGTON — For generations, support for Israel united Washington. Now Israel's attacks on Gaza, the Iran conflict and Prime Minister Benjamin Netanyahu's close ties to US Republicans are eroding Democratic backing, threatening to turn one of the US' closest alliances into a partisan divide.

Support for Israel among Democratic voters has plummeted, candidates critical of Israel are winning Democratic primaries and even moderate lawmakers are increasingly willing to challenge decades of US support for Israel.

The shift is evident in Congress. This month, nearly half of House Democrats voted for a failed amendment to cut off aid to Israel, legislation that once likely would have been defeated by an overwhelming bipartisan majority. Israel receives $3.8 billion annually in US military aid and received billions more in emergency funds in recent years.

House Democratic Leader Hakeem Jeffries and some of his lieutenants opposed the measure, calling it overly broad. But former speaker Nancy Pelosi and House Democratic Whip Katherine Clark were among those voting yes.

Democrats are increasingly divided over whether military aid should continue unchanged, be restricted to defensive weapons or be halted altogether.

US Senator Chris Coons of Delaware, the leading Democrat on the Senate Foreign Relations Committee, said he hopes Israeli elections in October will help restore bipartisan US support while opening a new chapter beyond Netanyahu's leadership.

"New governments get to change direction," Coons told Reuters, adding, "Netanyahu has kept Israel at war for years now, partly to avoid the political consequences of his choices."

Overall sentiment toward Israel is declining. A June Quinnipiac University poll found 48 percent of voters and 66 percent of Democrats believe the United States is too supportive of Israel, up from 16 percent and 20 percent when the question was first asked in 2017.

"Yes, there is a vigorous debate, but across broad segments of the parties, support for Israel remains firmly in the mainstream," said Danny Danon, Israel's ambassador to the United Nations, in an interview.

The shift faces a major test in Tuesday's Democratic US Senate primary in Michigan where voters will weigh competing visions of US foreign policy, one of many races with Democrats openly questioning long-standing support.

Israeli policy has been a factor in other battleground congressional races, including New York, Florida and Colorado.

Meanwhile in Gaza, the strikes continue. Israeli strikes killed at least three people, including two children, in the Gaza Strip on Thursday, health officials said, as mediators held new talks with Hamas leaders to work toward full implementation of the US-brokered Gaza peace plan.

Medics said an Israeli airstrike on a tent encampment in Khan Younis killed a man and an eight-year-old girl. In the Bureij refugee camp in the central Gaza Strip, another Israeli airstrike hit a house killing an 18-month-old child and wounding at least eight people, medics said.

The Israeli military said both strikes targeted Hamas militants.

In Cairo, Hamas leaders were holding talks with mediators from Egypt, Qatar and Turkiye, over the implementation of the second phase of President Donald Trump's Gaza plan, as presented to them by his Board of Peace, that oversees its implementation.

The plan called for a surge in humanitarian aid, governance by a civilian Palestinian administration, the disarmament of Hamas, the withdrawal of Israeli forces from Gaza and the deployment of an international force to help maintain security.

Washington urged to preserve improved ties

By ZHAO HUANXIN
huanxinzhao@chinadailyusa.com

China's top envoy to the United States has called on Washington to work with Beijing to preserve hard-won improvements in relations and implement the important consensus reached by President Xi Jinping and US President Donald Trump during their May summit in Beijing.

"The most important thing now is to take concrete actions to faithfully implement the common understandings reached between the two presidents, translate the new vision of a constructive China-US relationship of strategic stability into real actions, and keep expanding the list for cooperation while shortening the list of problems," Xie Feng, Chinese ambassador to the US, said on Tuesday.

Speaking at a reception at the Chinese embassy in the US marking the 99th anniversary of the founding of the People's Liberation Army, Xie said the two countries have "every obligation to pursue dialogue and cooperation, and no single reason for conflict or confrontation".

He said that during their summit in Beijing, the leaders made clear that the two countries will work toward a relationship with cooperation as the mainstay, competition within proper limits, manageable differences, an expectable peace, and explore the right way to get along in the new era.

As the world's two largest economies, permanent members of the United Nations Security Council and nuclear-weapon states, the two countries share a special responsibility for maintaining world peace and stability and advancing global development and prosperity, he said.

"It needs to be noted that the stabilizing and improving momentum in China-US relations has not come easily, and should be doubly cherished," Xie said.

Xie's remarks echoed the call made by Foreign Minister Wang Yi during a meeting with US Secretary of State Marco Rubio on July 22 in Manila, the Philippines.

During the meeting, Wang noted that it is now the duty of both sides to "follow the course set by the two heads of state, eliminate disturbances and overcome obstacles", to ensure that the leaders' consensus is translated into whole-of-government consensus and action across all fields.

Last week, Vice-Foreign Minister Ma Zhaoxu traveled to Washington and held "in-depth exchange of views" with the US side on implementing the important consensus reached by the heads of state of China and the US, and advancing the building of a constructive China-US relationship of strategic stability, according to a Foreign Ministry readout.

Despite the intensified exchanges, Washington has continuously overstretched the concept of national security to target Chinese businesses and institutions.

On Tuesday, citing national security, cybersecurity and supply-chain concerns, the Federal Communications Commission added foreign-produced advanced robotic devices to its "Covered List", preventing such devices from receiving the equipment authorization required to be imported into and marketed in the US.

On July 23, the Pentagon added several Chinese research institutions to its so-called "list of foreign institutions engaging in problematic activities".

He identified four Chinese "red lines" that should not be challenged: Taiwan, democracy and human rights, path and system, and development rights.

Xie said that "Taiwan independence" and peace across the Taiwan Strait are "as irreconcilable as fire and water". He called on the US to adhere to the one-China principle and the three Sino-US joint communiques, and exercise "extra caution" in handling the Taiwan question.

Highlighting potential areas for cooperation, Xie said that Chinese advances in the digital economy, artificial intelligence, electric vehicles and the low-altitude economy offer opportunities for global development.

He said artificial intelligence also poses governance, security and ethical challenges. China welcomes the US and other countries to participate in the China-initiated World Artificial Intelligence Cooperation Organization.

Xie said history and present-day realities show that the world is large enough for China and the US to develop and thrive together. With countries facing numerous global challenges, Washington and Beijing should fulfill their shared responsibilities for the global good, he said.

He urged the US to work with China to advance international cooperation through constructive engagement and promote world peace through bilateral strategic stability, "so as to jointly explore a right way to get along in the new era based on mutual respect, peaceful coexistence and win-win cooperation, and make new contributions to human peace and development".

Rising demand drives TCM service expansion in Rwanda

By VICTOR RABALLA
in Nairobi, Kenya
victor@chinadailyafrica.com

Traditional Chinese medicine is gaining a firm foothold in Rwanda's healthcare system with government support, increasing referrals from local physicians and rising patient demand accelerating its integration into mainstream medical care.

As more patients seek relief from chronic pain and musculoskeletal disorders that are often difficult to treat through conventional approaches, the Rwandan government has backed the expansion of acupuncture and other TCM therapies beyond the capital, Kigali.

The move has led to the opening of a second TCM center at Kibungo Level Two Teaching Hospital in eastern Rwanda last week, expanding access to specialized care.

The expansion follows the success of Rwanda's first TCM center, established at Masaka Hospital on the outskirts of Kigali in 2023.

Between Jan 1 and June 30 this year, the 26th Chinese medical team to Rwanda, which set up the new TCM center, provided more than 13,000 TCM consultations at its centers in Masaka and Kibungo.

The decision to establish a TCM center in Kibungo was driven by the Rwandan government's push to expand TCM services to rural provinces.

Located about 110 kilometers southeast of Kigali, Kibungo serves as a regional referral hub for a largely rural population, many of whom previously traveled several hours to Kigali for specialized treatment.

"The new center allows residents of the eastern province to access affordable treatment closer to home," Zhang Shengmao, leader of the Chinese medical team working at Masaka and Kibungo hospitals, said.

The new center reflects Rwanda's broader efforts to improve equitable access to healthcare while diversifying treatment options for noncommunicable diseases and chronic conditions, which are becoming increasingly common as the country's population grows and ages.

"Many local residents suffer from chronic pain, muscle soreness and bone and joint disorders," Zhang said, adding that most patients are farmers affected by years of physically demanding work.

He noted it as encouraging that many local general practitioners now actively refer patients with chronic pain to the TCM centers.

"Initially, many Rwandans knew little about TCM and were skeptical. After seeing the treatment results, public confidence has grown significantly," Zhang stated.

He said patients now travel from across Rwanda for acupuncture treatment, with more local hospitals expressing interest in opening their own TCM clinics.

To support the expansion of TCM services, the Chinese medical team is providing lectures and bedside training for local doctors and nurses in acupuncture techniques and clinical skills.

Chinese medical teams have been serving in Rwanda since 1982, contributing to clinical services, surgical care, disease prevention and capacity building.

China's vision for reforming global governance lauded

Experts praise Beijing's call for building equitable intl order to address trust deficit

By WANG MINGJIE in London
wangmingjie@mail.chinadailyuk.com

Experts have responded positively to China's vision of a United Nations-centered international system, where geopolitical tensions are eased, protectionism is countered and unilateralism is discouraged.

In a white paper titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions", Beijing has suggested nations support the Global Governance Initiative, or GGI, as a way to improve the UN-centered international system.

Under the comprehensive vision for reforming global governance, China argues that strengthening multilateralism and building a more just and equitable international order are essential if the world is to address growing deficits in peace, development, security, and trust that are confronting many nations.

The proposal calls for a larger voice for developing countries, a broader international consensus, more effective responses to shared challenges, and stronger global cooperation.

China also reaffirmed in its proposal the continued central role of the UN in safeguarding the international order, based on international law.

Lawrence Loh, director of the Center for Governance and Sustainability at the National University of Singapore, described the white paper as "a most timely and critical statement for global governance now, even when the world is fragmenting and institutions of international cooperation are breaking down".

The current deficits in global harmony have to be resolved urgently, as the world is seriously threatened by unilateral actions that will break down years of effort in building a cohesive and inclusive international order benefiting all countries, he said.

Loh said the document demonstrates China's evolution from participating in the international system to playing a more active role in improving it.

"China has clearly transited from a rule-taker to a co-architect of credible global governance — it is emerging as an effective arbiter and convener of the new world order," he said, adding that China is also becoming "a natural defender of the United Nations, whose core purpose is to upkeep the international system and multilateralism".

The paper reaffirms support for the UN-centered international system while advocating reforms that would make global institutions more representative and responsive to the interests of developing countries.

Tom Harper, a China specialist at the United Kingdom's University of East London, said the document shows the kind of global order that China aspires to, noting that many of the ideas in the white paper have featured in Chinese foreign policy for more than a decade.

"It ... shows how China, in some ways, is a status quo power, since it is emphasizing established international institutions, which contradicts the traditional path of a revisionist power that seeks to subvert or destroy these institutions," he said.

Harper added that China's continued emphasis on multilateral institutions reflects its efforts to present itself as a stabilizing force at a time when many global challenges can no longer be addressed by individual countries.

He said the paper's references to a multipolar world are also significant, suggesting a response to what he described as Washington's increasing reluctance to shoulder global responsibilities. China, he said, is likely to pursue this vision by working within existing institutions while encouraging greater participation from Global South countries.

Business implications

Michael Schumann, chairman of the German Federal Association for Economic Development and Foreign Trade, said the initiative carries important implications for businesses.

"China's Global Governance Initiative sends a clear signal: fair rules, inclusive multilateralism, and technological cooperation must go hand in hand," he said. "High-tech sectors — from AI to green technologies — can only develop their full potential through open and rules-based market access, not fragmentation."

Schumann said China's commitment to equal standards and a people-centered approach provides "a constructive framework for deepening EU-China trade", and added that pragmatic economic cooperation based on mutual interests and transparency remains "the most effective path toward stable and productive relations".

Climate action also features prominently in the white paper, with Beijing calling for stronger international cooperation to tackle global environmental challenges.

Loh said the world has lost valuable time that should have been spent addressing climate change, because of policy reversals by some countries.

"The Chinese document places key priority on building a climate-resilient world to safeguard humanity's future," he said, adding that China is increasingly acting "as a promoter of global governance by design".

Jenny Clegg, author of the book *China's Global Strategy: Towards a Multipolar World*, said the Global Governance Initiative reflects China's emphasis on collective security and shared development.

"In seeking to safeguard the UN-centered system, the GGI emphasizes both the mutuality of security — that nations cannot gain security at the expense of others — and the importance of a people-centered approach," she said.

Clegg argued that reforming global governance requires addressing structural imbalances in the international economic system, so trade and investment better support development, rather than focusing solely on shareholder returns.

Zhang Zhouxiang in Brussels contributed to this story.

Wildfires hit UK amid heat wave and drought

By JULIAN SHEA in London
julian@mail.chinadailyuk.com

The east of England has become the latest part of Europe to suffer from wildfires caused by extreme heat, as holiday homes and a caravan park were evacuated in coastal regions of the county of Suffolk.

Although not on a comparable scale to the devastating blazes that have caused major incidents in southwestern France or near the Spanish capital, Madrid, the fires in an area called Dunwich Heath, close to the Sizewell B nuclear reactor, are serious enough for local authorities to have declared a major incident.

The plant, which began operations in 1995, is Britain's largest nuclear power station, generating around 3 percent of the country's electricity. It has safety measures in place to protect against wildfires and is not currently considered at risk.

Local fire station manager Dan Davis called the blaze a "large-scale, wind-driven forestry fire", and Suffolk Fire and Rescue Service has urged people to steer clear of beaches in the region "due to the ongoing nature and seriousness of the fire".

"We understand that the warm weather makes a trip to the coast very appealing, but for everyone's safety we are asking people to stay away from the area at this time," said a spokesperson from Suffolk Fire and Rescue Service. "It is essential that the area and surrounding roads are kept clear to allow emergency services to carry out their work safely and effectively."

Water stress

Counties across England have experienced weeks of extreme heat and exceptionally low rainfall, creating ideal conditions for wildfires to break out.

Britain's Environment Agency said more than half of England is now officially suffering drought conditions, with some 78 percent of England's rivers below normal levels and reservoir storage falling to 75.3 percent of capacity. The Scottish Environment Protection Agency said much of its territory is also suffering from "significant scarcity" of water.

Areas of the Cairngorms National Park in Scotland have been burning for two weeks, causing environmental damage described as "apocalyptic", but it is hoped that lower temperatures and some much-needed rainfall will help bring the situation at least partly under control.

Hosepipe bans are already in place for 23 million customers in England, mainly in regions across the east and south, with the Environment Agency blaming the restrictions on recent high temperatures and record-low rainfall, and the consequences expected to last until October.

This summer marks 50 years since the UK's record-breaking heat wave of 1976, which remains a benchmark for extreme heat in the country. Water Minister Emma Hardy has warned people must be "prepared for this new normal" as droughts become "increasingly common".

Royal Parks workers water young trees in Greenwich Park, London, on Wednesday, as more than half of England faces drought conditions. RICHARD BAKER / GETTY IMAGES

Coal-fired power falls below 50%

Landmark achievement backed by rapid expansion of renewable energy

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China's energy sector has crossed a historic threshold, with coal-fired power generation accounting for less than 50 percent of the nation's total electricity output for the first time, according to official data.

Coal power generation stood at 2.5 trillion kilowatt-hours in the first six months, bringing its share down to 49.7 percent, said Xing Yiteng, deputy director-general of the National Energy Administration's development planning department, during a news conference in Beijing on Thursday.

"Falling below 50 percent of total power generation for the first time is a landmark achievement in China's long-term push for renewable energy alternatives, signaling a new breakthrough in the country's green and low-carbon transition," Xing said.

The NEA said the nation's expansion of renewable energy continued at a rapid pace. As of end-June, the combined installed capacity of wind and solar power reached 1.95 billion kilowatts, up 16.8 percent year-on-year.

Renewable energy generation surpassed 40 percent of total January-June output, producing nearly 2 trillion kWh of clean electricity, up about 9 percent year-on-year, accounting for 41.2 percent of the country's total power generation, it said.

Xing said that despite navigating complex global headwinds, China's energy security and effective investments continue to see robust advances.

Investment in new energy storage surged 74.3 percent year-on-year in the first half, while funding for the hydrogen sector skyrocketed by over 160 percent.

On the other hand, investments in new power grid construction and charging infrastructure also rose 13.5 percent and 21.8 percent, respectively, providing solid macroeconomic support, Xing said.

The nation's renewable capacity is expanding at an unprecedented scale, with its total installed power generation capacity breaking the 4-billion-kW mark, achieving a scale that far outstrips the rest of the world's major economies.

Of this, renewable sources account for 2.45 billion kW, or 60.7 percent of the total. During the first six months, China added 117 million kW of renewable capacity, accounting for nearly 74 percent of all newly installed power capacity. Notably, total solar power capacity reached 1.27 billion kW, putting it virtually on par with the country's coal-fired capacity.

China's domestic momentum is also driving global decarbonization.

The International Renewable Energy Agency said that over the past 10 years, the average cost of electricity globally for wind and solar projects plummeted by over 60 percent and 80 percent, respectively. Experts widely attribute this massive cost reduction to China's continuous technological innovation, unrivaled manufacturing scale and highly efficient supply chains.

Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University, said that China's green and low-carbon transformation serves as both a vital cornerstone for its high-quality domestic development and a landmark contribution to global sustainability.

"Crossing the 50 percent threshold for coal generation is a watershed moment. It proves that our new energy system is rapidly maturing, moving from a supplementary role to the primary driving force of national power supply," Lin said.

"As grid flexibility improves and new energy storage scales up at a record pace, variable renewables will be able to take on an even larger share of the baseload," he added.

Ministry to issue treasury bonds in HK

China's Ministry of Finance said that it will issue this year's fourth batch of renminbi-denominated treasury bonds in the Hong Kong Special Administrative Region on Aug 5. The scale of the bonds will be 15 billion yuan ($2.2 billion). Specific issuance arrangements will be announced via the Hong Kong Monetary Authority's Central Moneymarkets Unit, according to the ministry.

Profits of electronics sector up in H1

China's electronics sector posted a 96.9 percent year-on-year increase in profits in the first half, contributing 8.5 percentage points to the overall profit growth of major industrial firms, the National Bureau of Statistics said.

XINHUA - CHINA DAILY

China seen as global innovation engine

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

Kering Chief Executive Officer Luca de Meo has upgraded China's strategic role in the group's long-term transformation, positioning the market not just as a core consumption hub but a pivotal driver of global innovation and operational change, as he addressed the recent 7th edition of Kering China Innovation Day in Shanghai.

"For Kering, China is not simply a market. It is a source of innovation for the entire group: from technology, to business, to client trends," de Meo said.

Under the luxury group's ReconKering mid-to-long term transformation framework, China takes on three layered strategic functions: a core consumption engine supporting top-line growth, a regional innovation hub powering Asia-Pacific operations and a testing ground for next-generation luxury models that can be scaled globally.

China's elevated status rests on its unmatched industrial and digital advantages, according to industry analysts. "China is the world's manufacturing base. So manufacturing innovation will become a huge advantage here," said Jeffrey Chang, an associate partner at consultancy McKinsey & Company. He noted that China's complete supply chain, massive user data pool and mature super-app ecosystem make it the world's fastest-growing and largest artificial intelligence deployment market.

De Meo echoed that assessment. "This is the manufacturing platform of the world," he said, citing mature industrial infrastructure, abundant data resources and a vibrant market environment as China's unique strengths. Domestic digital platforms such as Xiaohongshu also boast unrivaled penetration and sophistication, he added, and since AI fundamentally runs on data volume, markets with richer data and faster iteration naturally breed stronger technological progress.

This year's Innovation Day featured nine local AI startups across three tracks — creativity and brand communication; omnichannel retail and e-commerce; and client experience — to integrate local innovation into Kering's global business ecosystem.

So far, Kering's China Innovation Hub in Shanghai has launched more than 50 innovation pilots, spanning 3D virtual try-on, AR experiences, live commerce, generative AI content creation and other end-to-end use cases. Internal tools such as a mobile AI data dashboard have also been rolled out group-wide, drastically cutting repetitive work from manual data consolidation to presentation preparation.

Yet de Meo stressed that pilot volume alone does not equal real competitive value. "Pilots are never the destination. An innovation that stays a pilot is a curiosity. An innovation that scales is a competitive advantage."

To drive wider adoption, Kering is rolling out company-wide AI upskilling programs to lower the technology threshold, encouraging cross-functional teams to explore use cases tailored to their daily work.

On the broader debate over AI's role in luxury, de Meo struck a cautiously optimistic tone.

"A lot of people in the space of AI will sell you the idea that AI will become the destination of your mind," he said, noting that many technology providers overstate AI's capabilities to inflate their own valuation.

"At this stage, I still see it as a very powerful tool to support human beings. It's like putting a turbocharger in a traditional engine," he added. "I'm not sure you're going to do things better, but for sure you're going to do them faster, which is also important."

De Meo acknowledged widespread hesitation within the luxury sector toward AI adoption. "I don't know right now if AI usage can help us boost creativity," he said. "The luxury industry is a lot about heritage, craftsmanship and human touch."

Therefore, his solution lies in balancing both dimensions. "The best thing we could do is actually combine art and science," he said, merging creative intuition with data-driven rationality.

Guangdong bolstering server, computing strengths

By **ZHENG CAIXIONG**
in Guangzhou
zhengcaixiong@chinadaily.com.cn

Guangdong province is building on its robust server industry strength and experience to advance the upgrade of computing infrastructure for higher efficiency, technological self-reliance and low-carbon growth, transforming the province from a major manufacturing center into a global intelligent computing hub.

Dongguan, a heavily industrialized city in the Guangdong-Hong Kong-Macao Greater Bay Area, recently launched a global investment promotion for construction of its computing power industry island.

Under the municipal top-level plan, Dongguan plans to invest 100 billion yuan ($14.75 billion) in developing and constructing the industry island over the next five years with separate development targets, said Zeng Jianpeng, executive vice-mayor of Dongguan.

Zeng made the remarks at a server industry supply-demand matching event held recently in Dongguan.

By 2030, the island — which covers a planned area of about 6 square kilometers — will grow into the core growth engine of Dongguan's 500-billion-yuan AI server industry cluster, he said.

Wang Lijuan, deputy director of the Guangdong department of industry and information technology, said Dongguan serves as Guangdong's core carrier for computing hardware.

"The department will fully support Dongguan in scaling up its AI server industry, enabling Guangdong to contribute to boosting the global competitiveness of China's AI server sector," Wang said.

In 2025, Guangdong produced about 2.95 million servers, accounting for 49.3 percent of China's total output, claiming nearly half of the national market, according to official statistics.

Guangdong boasted a total of 1,533 industrial enterprises above designated size engaged in computer manufacturing last year, accounting for 45.1 percent of China's total computer makers.

Home to leading firms such as Huawei and Foxconn Industrial Internet, the province has fostered a complete industrial chain spanning chips, components and finished computers.

Authorities said that as the "mother machine of computing power" in the era of the digital economy, the server industry has emerged as a key driver for Guangdong to transform from a major manufacturing province into a global intelligent computing hub.

Xu Xiaomin, secretary-general of Guangdong's electronics and information industry association, said that as generative AI applications are rolled out at an accelerated pace, Guangdong's server shipment share of inference servers is expected to surpass 50 percent for the first time in 2026, overtaking training servers to become the mainstream product in the market.

"This signals a full shift of the industry from model research and development to commercial application," said Xu.

The strength of Guangdong lies in its fully connected industrial chain and integrated production and marketing, he said, adding that as China's largest manufacturing hub for the electronic information sector, Guangdong has established a closed-loop ecosystem spanning upstream component supply, midstream complete machine manufacturing and local downstream computing power absorption.

Xu urged Guangdong to further boost the coordinated adaptation of hardware and software.

"Capitalizing on its geographic advantage of 'production sites as market destinations', Guangdong should open up application scenarios and drive the AI server industry to shift from scale expansion toward high-efficiency, self-reliant and controllable development."

Wei Cailiang, senior vice-president of Guangdong HEC Technology Holding Co Ltd, said his company has built a full-chain business covering green energy, advanced manufacturing, computing power operation and AI applications.

In April, Wei's company set up its computing power operation entity in Dongguan, and backed by computing power service orders worth 39-46 billion yuan, it achieves efficient R&D and mass production relying on Dongguan's one-hour industrial circle with 95 percent local supporting capacity.

Cooperation crucial for future of AI, expert says

By **REN QI**
renqi@chinadaily.com.cn

International cooperation is crucial for the development of artificial intelligence, said Evgeny Burnaev, a Russian AI expert and laureate of the Russian government's award in science and technology.

Burnaev, who also served as the director of the artificial intelligence center at the Skolkovo Institute of Science and Technology in Russia, noted that cooperation was the core theme of this year's World Artificial Intelligence Conference, which was held in Shanghai recently.

He explained that AI is a complex discipline that has evolved from isolated research fields into an essential "infrastructure" covering healthcare, production, logistics and climate monitoring. Building a mature AI infrastructure is impossible without international cooperation, as the technology relies heavily on massive data and immense computing power, which require multiparty collaboration.

Regarding the inclusive development of AI, Burnaev warned that existing AI technologies could greatly magnify current global development gaps. To prevent a single culture or value system from dominating, he proposed two key measures: countries should collaborate in basic education and scientific research, and the world must establish unified global benchmarks and technical standards in AI engineering to prevent operational failures across critical systems.

Burnaev's call for inclusivity resonates strongly with China's ongoing efforts. As a major AI power, China has always been an active advocate and practitioner of global AI governance, committed to ensuring that the achievements of intelligent technology benefit people of all countries more equitably.

"China will adhere to coordinating development and security, actively practice multilateralism, uphold the concept of 'people-centric and AI for good', and promote AI to always develop in a beneficial, safe and fair direction," said Zhou Haibing, deputy head of the National Development and Reform Commission.

This commitment has gained international recognition. The British journal Nature previously published an article noting that "China is leading global AI governance" and called on other nations to participate in addressing the common challenges brought by AI-related development.

China's push for global cooperation and governance is backed by its robust and rapidly growing AI ecosystem. Official data show that the country is home to over 6,000 AI enterprises, with the core AI industry scale expected to exceed 1.2 trillion yuan ($177.48 billion) this year, up nearly 30 percent year-on-year.

Furthermore, China is now the world's largest holder of AI patents, and its domestic open-source large models have surpassed 10 billion cumulative downloads globally.

The consumer market is also experiencing a continuous surge in new AI products. In 2025, annual shipments of smart terminals such as AI smartphones and AI computers in China exceeded 100 million units. With significant growth expected to continue this year, sales of AI phones and PCs are projected to surpass those of non-AI products for the first time.

The vitality of this industry was on full display at the conference, where Burnaev highlighted the abundance of smart robots. He identified embodied AI as the core track for the next stage of AI, noting that the emergence of various robot vision-language-action models and motion control models can significantly enhance industrial automation efficiency and handle operations in high-risk scenarios.

"The conference exhibited multiple types of robots and supporting models. The technological trends in this area are highly worthy of attention, and I have seen a large number of eye-catching technological achievements," Burnaev added.

Administrative public interest litigation boosts eco-governance

Dual-track mechanism enables better resolution of environmental problems

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China's procuratorial public interest litigation system has become a key legal instrument for ecological and environmental protection, helping resolve long-standing governance problems through legal supervision, administrative coordination and judicial accountability, according to a senior prosecutor.

Since the system was fully implemented in 2017, procuratorates nationwide have handled more than 600,000 environmental public interest litigation cases, accounting for 47 percent of all such cases, Zhang Xueqiao, deputy prosecutor-general of the Supreme People's Procuratorate, told China Daily.

Unlike traditional adversarial litigation, the system does not replace administrative authorities, Zhang said. Instead, procuratorates perform legal supervision through litigation-related procedures and urge government departments at all levels to fulfill their statutory duties.

Before filing lawsuits, procuratorates typically communicate with the relevant authorities and issue procuratorial recommendations. More than 95 percent of public interest damage cases are resolved before they reach the court. If an authority fails to act, procuratorates may file an administrative public interest lawsuit. If ecological damage remains unrepaired after the authority has fulfilled its duties, they may also initiate a civil public interest lawsuit to hold violators accountable for restoration and compensation.

Zhang said China's model has a distinctive institutional design. While some countries allow prosecutors to bring civil public interest lawsuits, few have established a systematic administrative public interest litigation system. China has developed a dual-track mechanism whereby administrative and civil public interest litigation operate in parallel, with administrative litigation serving as the primary approach.

River basin and marine governance has become one of the system's major priorities.

According to Zhang, basin governance is a global challenge because it spans administrative boundaries, involves multiple jurisdictions and requires coordination among various government departments, often resulting in fragmented responsibilities.

Zhang Xueqiao

To address these challenges, procuratorates have targeted weak cross-regional coordination, inadequate interdepartmental cooperation and inconsistent enforcement standards in major river basins. The SPP has directly handled or guided landmark cases involving the Wanfeng Lake, Nansi Lake, ship pollution along the Yangtze River, water governance in the Pearl River Basin and marine ecological protection in the Bohai Sea.

Those cases have promoted coordinated action among procuratorates at the national, provincial, city and county levels, helping resolve long-standing environmental problems affecting large areas and attracting widespread public concern, Zhang said.

The SPP has also established regional coordination mechanisms aligned with major national development strategies. In the Yangtze River Basin, 19 provincial-level procuratorates and relevant city-level procuratorates have established 21 cross-regional coordination mechanisms covering all river sections along provincial boundaries. The SPP and the Ministry of Water Resources have also established a Yellow River Basin coordination platform to facilitate information transfers, case handling, information sharing and consultations among nine provinces and autonomous regions.

Despite the progress, Zhang acknowledged that cross-regional and cross-basin governance still faces challenges, including inadequate information sharing, the technical complexity of evidence collection, and inconsistent standards between administrative law enforcement and judicial rulings.

He said procuratorates will strengthen cooperation with administrative authorities, focus on major river basins and key regional ecological issues, and make better use of direct case handling by the SPP and provincial procuratorates to bridge governance gaps between upstream and downstream areas and between opposite riverbanks.

Since March 2025, the SPP has launched a two-year supervision campaign on water environment governance covering the Yangtze, Yellow and Pearl rivers. Procuratorates are also focusing on industrial solid waste, mine restoration, soil pollution, livestock breeding pollution, and water and soil conservation.

The system has also supported green and low-carbon development. By May this year, procuratorates nationwide had handled 57,000 related cases involving green spatial planning, industrial transformation and urban-rural green development.

New technology

Professional assessment has long been a challenge in ecological cases because environmental damage appraisals are often costly, time-consuming and technically demanding.

To address the issue, the SPP and the Ministry of Justice have expanded the network of environmental damage appraisal institutions and promoted an "appraisal first, payment later" model, with 141 partner institutions now participating.

Nearly 500 ecological testing laboratories have been established at procuratorates nationwide, achieving full coverage at the city level. The SPP has also created a national database of more than 800 technical experts, while 28 provincial-level procuratorates have established their own expert databases.

Digital technology is increasingly being integrated throughout the case-handling process.

Zhang said procuratorates use remote sensing satellites and territorial spatial planning data, administrative enforcement data and artificial intelligence to identify clues on a large scale. In Foshan, Guangdong province, a big data model for water environment governance identified 45 clues in a single screening, leading to 39 cases.

From January 2024 to April 2025, ecological litigation laboratories at provincial- and city-level procuratorates supported more than 4,500 case-handling activities and issued more than 3,500 testing reports.

In farmland protection cases, prosecutors have used satellite imagery, land parcel records and drone-based 3D modeling to collect evidence and quantify damage caused by illegal occupation of farmland, forests, grasslands and wetlands.

Digital tools are now used throughout the process, from information discovery and investigation to supervision of duty performance, rectification assessment and follow-up reviews, helping prosecutors verify whether ecological restoration projects have achieved tangible results, Zhang said.

The SPP has promoted the Yixinweigong volunteer cloud platform, recruiting 126,000 volunteers nationwide. The volunteers have submitted 38,000 clues and participated in 40,000 activities, including hearings and follow-up visits.

China's experience has also attracted growing international attention.

A number of Chinese cases have been included in the United Nations Environment Programme case database, while cases involving Nansi Lake governance and Yangtze River ship pollution control have been featured at international conferences, Zhang said.

In June, the SPP held a roundtable with the Brazil Federal Public Prosecutor's Office and ClientEarth on prosecutorial cooperation in global environmental governance. Representatives from Australia, Mongolia, Poland, the United Kingdom, Vietnam and other countries attended. Vietnam has authorized its procuratorial organs to pilot public interest litigation, drawing on China's experience.

Looking ahead, Zhang said procuratorates will implement the provisions of the ecological environment code, support special legislation on procuratorial public interest litigation, and improve rules governing case scope, procedures, evidence collection and liability determination.

They will continue to focus on pollution prevention and control, green and low-carbon development, ecosystem protection, carbon peaking and carbon neutrality, and national ecological security. Future work will place greater emphasis on professional supervision, closer coordination with administrative law enforcement, broader public participation and wider application of legal supervision mechanisms.

"Ecological and environmental public interest litigation has entered a stage of high-quality development," Zhang said. "This requires prosecutors to handle cases with greater precision, stronger professional expertise and more effective coordination."

Digital management system puts Dunhuang's camel rides on fast track

By HU YUMENG
and **MA JINGNA** in Lanzhou

As tens of thousands of tourists flock to Dunhuang, Gansu province, during the summer peak season, keeping crowds moving smoothly across the desert landscape has become an increasingly complex task. More and more, artificial intelligence is helping lighten the load on personnel on the ground.

At the Mingsha Mountain and Crescent Spring Scenic Area, camel rides across the dunes are among the city's signature attractions. During peak travel seasons, however, surging visitor numbers once left tourists waiting up to 60 minutes.

To ease the bottleneck, the scenic area launched its Desert Camel Ride digital management system in 2025. Visitors can now reserve camel rides in advance through a mini program, online travel platforms or self-service kiosks, eliminating long lines.

The platform digitally manages ticketing, reservations, camel assignments and boarding procedures. It automatically matches visitors with camel teams and displays real-time boarding information on electronic screens.

"Since its launch, the intelligent system has cut waiting times by more than half during peak periods, making the experience much smoother and reducing visitors' frustration," said Li Xiaoqing, deputy director of the service center.

She added that tour guides have also welcomed the system, saying it has made camel ride operations more efficient and orderly.

Handlers also use a dedicated mobile app that notifies them when to bring their camels to the boarding area, rather than waiting with the animals in holding areas throughout the day.

"That means fewer camels have to remain in the waiting area for extended periods, which not only improves efficiency but also helps reduce the environmental impact in the scenic area," Li said.

Along the camel ride route, camel-shaped traffic lights — an innovation unique to the scenic area — guide camel caravans safely across intersections while doubling as a popular photo spot.

"The traffic lights help keep both camels and tourists moving in an orderly way, and everyone follows the rules," visitor Mu Xinyue said. "It's also become one of the most interesting places to take photos."

AI is also playing a growing role at the nearby Mogao Grottoes.

An intelligent command center analyzes reservation data, visitor flows and environmental conditions to optimize cave openings, tour routes and visitor distribution.

> "Since its launch, the intelligent system has cut waiting times by more than half during peak periods, making the experience much smoother and reducing visitors' frustration."
>
> **Li Xiaoqing,** deputy director of the service center at the Mingsha Mountain and Crescent Spring Scenic Area

"We've moved from managing crowds after they form to preventing congestion before it happens," said Lei Zhengguang, director of the cultural promotion department at the Dunhuang Academy.

He said the platform also coordinates tour guide scheduling, shuttle bus operations and ticket reservations, helping balance public access with heritage conservation.

The adoption of AI is expanding well beyond Dunhuang.

Huangshan Mountain in Anhui province uses AI to predict congestion and recommend personalized routes, while West Lake in Hangzhou, Zhejiang province, directs visitors toward less-crowded attractions.

In Guizhou province, the Xijiang Qianhu Miao village introduced an AI platform for ticket verification, multilingual services and personalized recommendations. According to Chinese online travel platform Mafengwo, AI-powered ticket verification has improved efficiency by up to 10 times, while complaint response times have fallen from 48 hours to four hours.

Yang Yanfeng, director of the online tourism research center at Beijing Union University, said tourism is particularly well suited to generative AI because standardized services, such as trip planning and ticket booking, make intelligent assistants both practical and effective.

He acknowledged that challenges remain, including high development costs, fragmented data systems and concerns over data security.

For Li, however, the rise of AI has come at the right time.

She believes scenic areas should embrace the technology to deliver better services, improve operational efficiency and enable smarter management.

2,000-year-old alcohol discovered in Ningxia tomb

By HU DONGMEI in Yinchuan
and **HU QING**

A cereal-based alcoholic residue, dating back to the Warring States Period (475-221 BC), unearthed by archaeologists at a cemetery in the Ningxia Hui autonomous region, is expected to shed new light on cereal processing, grain utilization and brewing techniques among the Qin people.

Experts said the discovery not only represents the best-preserved liquid alcoholic beverage sample from the Warring States Period ever reported in China, but also provides rare physical evidence of how the Qin people brewed grain-based alcohol more than 2,000 years ago.

The findings were published in the June edition of the Journal of Archaeological Science: Reports.

According to the study, the residue was discovered at the Shanjiabao cemetery in the southwest of Yuanzhou district, Guyuan. The cemetery, surrounded by a series of frontier defense facilities, lies about 2 kilometers south of the Qin Great Wall dating to the Warring States Period.

Chinese archaeologists excavated 183 tombs at the site, 179 of which belonged to the Qin people. Tomb M39, located at the northernmost edge of the cemetery, yielded a bronze bottle with a garlic-shaped mouth.

The bottle was sealed with textile on the inside and organic-tempered daub on the outside. After removing the seal with a sterile scalpel and forceps, researchers extracted about 3,740 milliliters of clear, light blue-green, odorless liquid, along with a small amount of sediment.

Wang Xiaoyang, who led the archaeological project at the Shanjiabao cemetery, said the bottle's multilayer seal effectively minimized evaporation and contamination, allowing the liquid to remain largely intact for more than 2,000 years.

To identify the beverage's composition and brewing techniques, a research team led by Wen Rui, a professor at Northwest University's School of Cultural Heritage, used a range of analytical methods, including Fourier transform infrared spectroscopy, or FTIR, as well as analyses of starch grains, phytoliths and yeast microfossils.

The analyses revealed characteristic flavor compounds, diagnostic organic acids, starches, phytoliths and yeast, providing multiple lines of evidence to identify the beverage's ingredients and reconstruct its brewing process, according to the study.

Microfossil analysis confirmed that the primary brewing ingredients were broomcorn millet and grains from the Triticeae tribe, including wheat and barley. Wang said the finding may reflect the development of the subsistence economy during the period. "Alcohol production was only possible when grain harvests generated a surplus."

Zhang Hongying, deputy director of the Ningxia Institute of Cultural Relics and Archaeology, said the findings demonstrate that the Qin people had mastered the use of cereal-based *qu*, a traditional fermentation starter that enabled simultaneous saccharification and fermentation.

Wen said the study fills a gap in research on alcoholic beverage production by the Qin people during the Warring States Period in Ningxia and helps reconstruct how they brewed grain-based alcohol.

The findings provide further evidence of China's long-standing tradition of cereal-based fermentation and offer new material evidence for research on agriculture in the pre-Qin era (before 221 BC), ancient dietary culture and the evolution of handicraft techniques, he said.

FORGING SHIELDS WITH CODE

Software pioneer builds digital backbone of national defense despite personal misfortune

Wang Ji (front) talks with his students about renowned scientists at the library of the National University of Defense Technology in Changsha, Hunan province, in May. ZHOU FUJING / FOR CHINA DAILY

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

Around 7 am, as he does every morning, Wang Ji wheeled himself into his office at the College of Computer Science and Technology of the National University of Defense Technology. For more than four decades, the campus has been where the 57-year-old has devoted himself to advancing software engineering in support of national defense — contributions that led to him being honored as a national "Role Model of the Times" on Wednesday.

His wheelchair has been a constant companion for the past 11 years, ever since he underwent an amputation below the hip. Yet just as no one could count the miles it has carried him, no one could count the keystrokes his fingers have made.

"As long as my mind is clear and my hands can still move, I can keep working," Wang said.

Regarded as a talented student by his professors and peers, Wang entered university before turning 14 in 1983. At that point, he had already made up his mind to dedicate his career to computer science research. The university's campus in Changsha, Hunan province, witnessed his transformation from a student to a researcher, and from a young boy to a military officer.

His given name, Ji, means halberd in Chinese, a traditional weapon that combines a spear and a dagger-axe. Living up to the hopes his parents placed in that name, Wang has spearheaded efforts to make defense software more predictable and reliable, even though his own life has been shaped by unexpected twists and uncertainties.

Powering ahead

"There was a spark in his eyes whenever he talked about computers," recalled Tang Yuhua, who served as a teaching assistant at the college in 1984. Compiler theory and mathematical logic were Wang's favorite subjects. Tang remembered that the young student always sat in the front row and eagerly asked questions during class.

In the early 1980s, China saw rapid development in supercomputing. In 1983, the National University of Defense Technology developed the country's first supercomputer, Yinhe-1, or Galaxy, making China the third country in the world to independently design and build a supercomputer after the United States and Japan.

Chen Huowang, chief software system lead of the Galaxy project, became Wang's mentor and quickly recognized his exceptional talent in computer science. He told Wang that the essence of computer science lies in rigorous logical reasoning and formal proof.

In 2003, under Chen's guidance, Wang published a paper on high-confidence software engineering technology. By introducing the concept of high-confidence software technology, he became one of the pioneering figures in the field in China. At the time, the discipline was still relatively niche and was widely regarded by his peers as both highly challenging and theoretically demanding.

"He is like a radar," said Mao Xiaoguang, who also studied under Chen and who is now a professor at the university's College of Computer Science and Technology. "He not only tracks the latest developments in the field but also thinks deeply about where those advances will lead."

Wang said his research has always been driven by the needs of national defense. He realized that military information systems, like the human body, could become "ill", and that tools capable of detecting hidden flaws in software were essential to ensuring military security.

Wang and his team have developed a suite of specialized tools designed to diagnose different types of software defects from multiple analytical perspectives.

The technologies developed through this research have made significant contributions to improving the safety and reliability of mission-critical software used in aerospace systems and major weapons platforms.

Promoted to associate professor at 28 and full professor at 33, Wang appeared to be on an unstoppable career trajectory, with nothing standing in the way of his remarkable talent.

However, Wang's life took an unexpected turn in January 2013. After experiencing severe chest pain accompanied by numbness in both legs, he was diagnosed with an aortic dissection, a life-threatening condition.

A grueling 13-hour operation saved his life. But the disease had already caused extensive muscle necrosis in his lower limbs.

Yu Fang, an associate chief physician in the department of orthopedics at Xiangya Hospital of Central South University in Changsha, said Wang underwent several amputation surgeries to remove the necrotic tissue. Although the operations were successful, Yu and his colleagues were devastated, knowing that Wang would never walk again.

Several days after the first amputation in February 2013, Wang's wife, Huang Chun, who is also a researcher at the college, told him what had happened. "He was remarkably calm and accepted the reality," she recalled.

Yet the interruption proved to be only temporary. Confined to his hospital bed, Wang soon began reading work messages on his phone and asking about the progress of research projects, turning his hospital ward into a makeshift office. As his condition improved, he even began holding research group meetings with his students in the ward.

Zhou Jingwen, a professor at the college who was one of Wang's doctoral students at the time, attended those meetings in the hospital ward. He recalled that the discussions were no different from their regular research meetings. Despite Wang's illness, all of his graduate students completed their studies and graduated on schedule.

"Wang is like the ocean. While enduring countless storms, he remains serene," Yu said.

In 2015, Wang returned to his office at the university in his wheelchair.

At age 8, Wang speaks on behalf of new seventh graders during the opening ceremony of his middle school in Changde, Hunan, in 1978. PROVIDED BY LIU GUIZHI / FOR CHINA DAILY

RESUME

A member of the Communist Party of China, **Wang Ji** was admitted to the National University of Defense Technology in 1983 and joined the military in April 1990. After receiving his doctorate in 1995, he stayed at the university and has worked there ever since. He is currently a researcher and doctoral supervisor at the university's College of Computer Science and Technology.

In 2003, Wang published one of the earliest academic papers in China on high-confidence software engineering technology, systematically establishing the discipline's theoretical framework and technical system. In 2004, he launched the country's first graduate course on high-confidence software technology. In 2015, he helped promote the establishment of the Formal Methods Technical Committee of the China Computer Federation.

Wang has received the first prize of the Military Science and Technology Progress Award and the second prize of the National Science and Technology Progress Award. He has been awarded one second-class and two third-class individual merit citations. Last year, he was named a national model of self-reliance. Earlier this month, he was honored as a national "Role Model of the Times".

Wang's wife, Huang Chun, is a core member of the Tianhe supercomputer compiler team at the National University of Defense Technology and a recipient of the National March 8th Red-Banner Pacesetter award. Their family was named a "national five-good civilized family" in 2016 and was recognized as one of the "third cohort of national civilized families" in 2025.

Unbroken spirit

Those around Wang considered his survival a miracle. His return to work came as yet another surprise. He applied for a defense research project immediately after his return.

When they visited Wang in the hospital, his colleagues and students all hoped that he would return to them. Wang said that knowing he was still needed gave him the determination to return.

"My goal has never changed," he said. "Only the way I pursue it has."

He continued to travel alone on business, attend academic conferences, and mentor his students. Those who work with Wang said he has always insisted on self-reliance, never asking others for help as long as he was capable of doing something himself.

To support him, the university installed wheelchair ramps at the entrances to his office building and the campus canteen. Instead of using an electric wheelchair, he insisted on using the manual one to help him exercise more.

Chen Liqian, a professor at the university on Wang's team, said Wang had become even more focused on his work since the illness. "He often points us to papers that are closely related to our research, papers we hadn't noticed yet, but he already had," Chen said.

In 2021, Wang was diagnosed with kidney failure. He now undergoes four-hour dialysis sessions three times a week. Yet instead of slowing down, he said he wants to make the most of the time he has. Even during dialysis, he reads academic papers and attends online meetings. "For him, reading papers is a form of rest," his wife said.

On days when he does not undergo dialysis, Wang keeps to a disciplined routine: arriving at the university around 7 am, taking a short break at noon, returning to work at 2 pm, and heading back to the hospital in the evening. "Even on holidays, you can usually find him in his office," said Huang Zhen, his driver.

The researcher currently supervises more than 20 master's and doctoral students. Although his own time has become increasingly precious, he remains generous in sharing it with them.

Zhao Jing, one of his students, said Wang's office door is always open for one-on-one discussions. "His smile puts me at ease whenever I run into difficulties in my research," she said.

Fan Kai, one of Wang's master's students, said his mentor's wheelchair soon faded into the background. "Whenever we discussed research, I hardly even noticed he was in a wheelchair," Fan said.

The most noticeable change may be in his diet. According to Wang Ting, who has known Wang Ji for more than 30 years, Wang Ji used to be a food lover, with a particular fondness for the rice noodles sold near the campus. However, since being diagnosed with kidney failure, he has had to strictly control his intake of water and food. To make drinking water more enjoyable, Wang bought a machine for the office to make sparkling water.

"His illness never changed who he was. Even in adversity, he remained as kind, optimistic and passionate about life as he had always been," said Wang Ting.

Vision and mission

On Wang Ji's desk, two monitors stand along with a keyboard. There is also an electronic display screen for discussions with his team.

The office is modest, but the work carried out there has long been at the forefront of the field. Since the 1990s, Wang has devoted himself to software technology research, a pursuit he describes as his lifelong dream. High-confidence software technology is part of it.

Wang Huaimin, a professor at the university and an academician at the Chinese Academy of Sciences, said he was impressed by Wang Ji's pioneering spirit and his exceptionally broad research perspective. "Even after returning to work, he has maintained a vigorous and ambitious mindset, demonstrating remarkable persistence and resilience," he added.

Wang Ji said the university's spirit and traditions have profoundly shaped his career. As the birthplace of China's first supercomputer and a leader in the country's supercomputing development, the university instilled in him the importance of technological self-reliance.

"We cannot rely on technologies controlled by others," he said. "Key and core technologies must be mastered by ourselves."

Established in 1953, the university has overcome a large number of cutting-edge technological challenges and achieved a series of breakthroughs in the research and development of advanced weapons and equipment.

As the chief technical expert, Wang led his team in developing a project that won the First Prize of the Military Science and Technology Progress Award in 2025.

Wang encourages students to base their research on reality instead of intuition. "Scientific research is not a sprint to chase the latest trends, but a marathon that keeps pace with the nation's needs," he said. So far, Wang has trained more than 120 master's and doctoral students in the field.

As defense systems undergo an intelligent transformation, Wang and his team are focusing on the reliability of artificial intelligence, aiming to ensure that AI can better serve the country's major strategic needs.

Though he cannot take part in conventional warfare, Wang said, "I can still stand on the front line of high-level scientific and technological self-reliance, forging shields with code."

Zhang Zhaoxing and Yan Jin contributed to this story.

Chinese dance troupe wows audience in New York City

Choreographer Shen Wei combines painting, dance, poetry and music at Lincoln Center

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

Hundreds of art lovers enjoyed a stunning dance performance called *MindScape* by legendary Chinese choreographer Shen Wei on Wednesday at the Lincoln Center in New York City.

The free, unique, spellbinding outdoor 45-minute performance was a part of Chinese Arts Week that ran July 22 to July 26.

Performed by a troupe of over 20 dancers from Shen Wei Dance Arts in collaboration with Guangdong Modern Dance Company, the work was co-commissioned by the Lincoln Center and American Dance Festival.

In an exclusive interview with China Daily backstage at the event, Shen described his vision for the performance that blended painting, dance, movement and poetry to illustrate the "spiritual pursuit of inner harmony and transcendence".

"This one is so complex. It has poetry, productions, video, dance, live music and painting, visual arts, performance arts, and in some way, it is blended together at the same time and it lifts people's spirits," he said.

"It's not just something that's put together. It's not just about integrating something together. It's that we go lift up people's spirits, right now. So, every time you see it, you feel good after the show and have really nice, positive energy about life."

The audience watched as the dancers, dressed in brightly-colored unitards, began the show by lining up around a massive blank, white, canvas on the ground.

A few dancers stood in The Paul Milstein's Reflection pool. Some had a large windmill on their head that spun as they danced.

On the canvas, one-by-one, the dancers dipped their hands into brightly colored paint that matched their unitards and used their entire bodies to spread the paint across the canvas while matching the tempo of the music.

Nicholas Cemalobic, 25, a member of the audience, described the performance as terrific.

"I think the topology of the space is really exciting," he told China Daily. "I think it was nice to be able to look at things in the foreground and in the water, it was like a feast for the eyes. I mean, I wouldn't even have known that these were dancers who hadn't trained together, knowing that they all come from far and wide is pretty motivating."

As the performance progressed, the large, blank, white canvas became a massive, living, painting with swirling colors.

The work embodied the key tenets of Shen's approach to dance, which is that the human body is a canvas. It brought dancers from both Eastern and Western backgrounds together.

Zak Ryan Schlegel, rehearsal director and dancer with Shen Wei Dance Arts, told China Daily: "I think that Shen Wei has spanned his entire career holding the binary of the Eastern/Western marriage. And I think his language is a common language. It's his dream of a common language. And so, I feel as though the work is a visual metaphoric full multidisciplinary expression of what's possible between the East and the West, in full, unifying harmony."

He added that the work feels like it "truly ties together Shen Wei's long legacy in the field. It feels as though from his collective experiences and the languages he's created across his long arc as a choreographer, this piece truly realizes all of those languages and brings them into a full spectrum. It feels like it sheds light on his past and it brings him into the future."

Born in Hunan, China in 1968, Shen moved to New York in 1995. This year, he celebrated 30 years of his first work at Lincoln Center after 11 productions.

He hopes *MindScape* will bring the "happiness of life" to the audience.

Shen Wei works with his team at the Lincoln Center in New York City on July 23. PROVIDED TO CHINA DAILY

"For me, born in China, growing up in China, and working in New York and the West, live in Paris and the West and the East actually for me there is so much beautiful, values of things to share rather than competing with each other," Shen said.

He chose the theme for the performance based on his journey of traveling and living around the world in China, Europe and America for over 30 years. He wanted to send the message that a person's spiritual journey is just as important as the pursuit of material things.

"You can see the team, there are Chinese people, there are American people, Western people, all different races, different backgrounds, to have that like a life, living, working together, there's no conflict through art. It shows that today, we're just people. We're just the same," Shen said.

Ricardo A. Zayas, 42, from Brooklyn, New York, took part in the show and has been a dancer with Shen Wei on and off for almost 20 years since graduating from Fordham University. He enjoys combining his Western background with Eastern art.

"It's something that we rarely, if ever, have seen put together, so it's made this alien hybrid thing that nobody really does, especially not like Shen Wei. So, it's been nice to learn this style that has a very, you know, specific mark on dance.

"This show has a lot of what I'd call his greatest hits, and his philosophies and dance, but it also has a lot of whimsy, which is a new, refresher, direction for him, which is fun to see."

Several members of the audience called the performance "amazing" and "remarkable".

Andreas Ortega, 22 from Brooklyn, New York said afterwards: "I liked it a lot! My favorite part was definitely the painting section and I really liked the way that their bodies hit the accents of the music. It was a nice fusion of Eastern and Western arts together."

Int'l cooperation, openness deemed vital to AI's global future

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

> "For AI to benefit all people, technology and international cooperation must move forward together."
>
> **Doreen Bogdan-Martin,** secretary-general of the International Telecommunication Union

At the recently concluded 2026 World AI Conference, China pressed its case for open-source artificial intelligence ecosystems and deeper international cooperation on AI governance, a push that is seen as important for continued development and for addressing global problems.

The Chair's Statement issued at the conference, which was held in Shanghai earlier this month, described open source and openness as vital pathways toward inclusive AI development. It called for the joint development of open-source ecosystems and urged more robust international cooperation to share ideas and shape solutions to the major issues and pressing challenges facing humanity in the AI era.

Richard Dasher, director of the US-Asia Technology Management Center at Stanford University, said in an interview with China Daily that he sees merit in China's approach to promoting open models and international collaboration.

"International cooperation is good. It should be promoted," he said. "I think that open source has a role. You want to give people alternatives, not make them do something only one way."

Dasher pointed to the global nature of cloud computing as a reason why cooperation across borders is not just desirable but necessary. "The world of cloud computing is sort of intrinsically global, and you need data from multiple places in order to have good enough quality models," he said. "You can't deal with just a limited data set with the current technology, and so I think there's a lot of good in what China is promoting."

The conference came at a moment when Chinese open-weight AI models have been steadily closing the performance gap with leading US systems, while undercutting them sharply on price. Adoption of these Chinese open-source models has increased rapidly worldwide, including the United States.

That momentum was on display at the conference, when Beijing-based startup Moonshot AI unveiled its newest open model, Kimi K3. The model is reported to be catching up to the top versions of Anthropic's Claude and OpenAI's ChatGPT. With 2.8 trillion parameters, Kimi K3 is said to be the world's largest open-weight AI system by that measure.

Open-weight models release an AI system's core components publicly, allowing anyone to download them. This allows users to run the models on their own computers, study their inner workings, and modify them to suit specific needs — a departure from the closed, proprietary approach favored by many Western companies.

At the same time, Dasher cautioned that openness alone does not guarantee success. "The open-source models can be good. They can be flexible. You also have to worry about the quality, though," he said.

Drawing a historical parallel, Dasher recalled the rivalry between Microsoft and Unix in the early decades of personal computing. Unix, an open-source model, splintered into more than 10 popular variants as developers modified it freely, he said, which allowed Microsoft's proprietary Windows operating system to gain the upper hand for a time. He suggested a similar dynamic could play out in AI, where proprietary players such as OpenAI and Anthropic currently hold strong positions.

Even so, Dasher argued that open-source models will remain important for the field's long-term development.

"For continued development, open source will be very important. Probably most university students who are studying how to develop models will learn from open-source models, so they'll be used to the open source," he said.

Ultimately, he said, the market will judge AI systems less on whether they are open or closed and more on practical performance. "You have to deliver something that's cost-effective. It has to be secure and support privacy, and it has to be very effective. It has to work. Those will be the characteristics that the market cares about more than whether it's open source or closed source."

The call for international cooperation in AI has echoed well beyond Shanghai. Speaking at the Global Dialogue on Artificial Intelligence Governance in Geneva earlier this month, Doreen Bogdan-Martin, secretary-general of the International Telecommunication Union, said, "For AI to benefit all people, technology and international cooperation must move forward together." An AI-driven future, she said, should include "everyone, especially the 2.2 billion people who have yet to join the digital world".

Dasher identified two areas where he believes international cooperation is especially urgent: health data and climate change.

On health, he said pooling more diverse, international data sets, while safeguarding individual privacy, would meaningfully improve the quality of medical analysis.

"I would think that health data is very important, and it's something where there are national security considerations, but to the extent that you don't damage individuals' privacy, then not only the larger data set that you use, the more diverse data set you have, the better the analysis will be," he said.

"Lifestyle in China is different from lifestyle here. Lifestyle in Europe is different from lifestyle here. It's good to have people representing all of those populations in some sort of healthcare analysis. I think that will encourage international work," he added.

Climate change, Dasher said, is a similarly borderless problem demanding a coordinated global response.

Despite persistent concerns over national security, Dasher expressed confidence that international cooperation on AI will continue to expand, as its benefits increasingly outweigh the risks. "I think that we will still see international cooperation to the extent that it doesn't have a negative impact on national security. I mean, that's a natural thing that everybody has always been concerned about," he said. "But I think that the benefits of international cooperation mean that you'll find a way to solve the security problem."

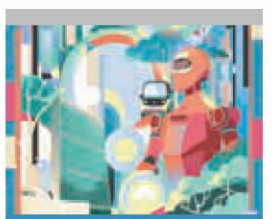
Enduring impact of Jiang's legacy

The centenary of Jiang Zemin's birth provides an important opportunity to assess one of the most transformative periods in the history of the People's Republic of China.

Under the leadership of the Communist Party of China, with Jiang as the core of the central leadership, China navigated an era of profound domestic reform and international change. Building on the historic reform and opening-up initiated by Deng Xiaoping, Jiang institutionalized these reforms, strengthened the socialist market economy, safeguarded political stability and laid the economic and institutional foundations that continue to support China's modernization today.

Under Jiang's leadership, China underwent a significant economic transformation, one of the most notable in human history, while maintaining political stability.



The figures alone highlight the magnitude of this achievement. China's nominal GDP grew from about $347 billion in the late 1980s to nearly $1.47 trillion in 2002, more than quadrupling. For most of this period, annual GDP growth surpassed 9 percent, even reaching 13-14 percent several times. These consistently high growth rates were unmatched for an economy of China's scale and significantly shifted the country's role in the global economy.

Foreign trade expanded even more dramatically. Total trade increased from approximately $111 billion in the late 1980s to more than $620 billion by 2002 and exceeded $850 billion by 2003. China rapidly evolved from a poor developing economy into one of the world's leading manufacturing and trading powers.

During the same period, annual foreign direct investment rose to more than $50 billion, while the country's foreign exchange reserves increased from less than $6 billion to nearly $290 billion, providing a powerful foundation for long-term macroeconomic stability.

These accomplishments didn't occur overnight. While Deng Xiaoping's leadership set China's reform and opening-up in motion, the period under Jiang saw these reforms further consolidated and institutionalized through the collective efforts of the Party and government.

Jiang's 'glorious life' celebrated

President addresses grand gathering in Beijing to mark centenary of late leader's birth

By MO JINGXI
mojingxi@chinadaily.com.cn

President Xi Jinping lauded on Monday the "indelible contributions" of late leader Jiang Zemin and called for efforts to continue advancing the cause of socialism with Chinese characteristics, as he addressed a grand gathering in Beijing to mark the centenary of the late Chinese leader's birth.

"Comrade Jiang Zemin lived a glorious life, a life of struggle," Xi said, noting that Jiang had made indelible contributions to safeguarding the great cause of socialism with Chinese characteristics, breaking new ground in reform and opening-up in all respects, achieving overall moderate prosperity in people's lives, and successfully advancing socialism with Chinese characteristics into the 21st century.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, called on the whole Party and the Chinese people of all ethnic groups to learn from Jiang's exemplary qualities and continuously advance the cause of socialism with Chinese characteristics.

Jiang was the core of the third generation of the Party's central collective leadership and the principal founder of the Theory of Three Represents, which stipulated that the CPC should always represent the development trends of China's advanced productive forces, the orientation of China's advanced culture and the fundamental interests of the overwhelming majority of the Chinese people.

He was born in August 1926 in Yangzhou, Jiangsu province. In 1989, he was elected general secretary of the CPC Central Committee. He passed away in 2022 at the age of 96.

During a revolutionary career spanning more than 70 years, Jiang fully demonstrated his great talent, bold vision, key role and exceptional art of political leadership as a Marxist statesman, Xi said.

Xi spoke highly of Jiang's steadfast commitment to communist ideals and his devotion to the Party and the people, calling on Party members to draw strength from his firm political convictions.

On the new journey, Xi stressed, it is imperative to uphold the overall leadership of the Party and the centralized, unified leadership of the CPC Central Committee, unswervingly strengthen full and rigorous Party self-governance, and ensure that the Party remains the strong leadership core in the cause of socialism with Chinese characteristics.

Jiang always stood with the people and cared for their well-being, Xi said, calling for efforts to learn from the late leader's dedication to and profound love for the people.

Xi noted the importance of always bearing in mind that "this country is its people; the people are the country".

President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, delivers an important speech at the gathering on Monday in Beijing. LI XIANG / XINHUA

Xi's quotes

Comrade Jiang Zemin made indelible contributions to safeguarding the great cause of socialism with Chinese characteristics, breaking new ground in reform and opening-up in all respects, achieving overall moderate prosperity in people's lives, and successfully advancing the cause of socialism with Chinese characteristics into the 21st century.

On the new journey, we should stand ready to withstand high winds, choppy waters, and even dangerous storms, resolutely safeguard national sovereignty, security and development interests, and continue to write a new chapter in the miracles of fast economic growth and long-term social stability.

OVERSEAS TRAVELERS SNAP UP CHINESE BRANDS

Perceptions have shifted from 'made in China' to 'designed in China'

By HE QI in Shanghai
heqi@chinadaily.com.cn

On an August afternoon in Shanghai, Mara-Kristin Lutz stepped out of the Songmont boutique, clutching the coveted tote bag that had topped her city break shopping list.

The Austrian fashion industry veteran — who had previously worked at Louis Vuitton — had researched the brand's latest collections on social media long before touching down in China. It was the bag's understated craftsmanship and thoughtful design language that won her over.

She was now dressed almost entirely in Chinese brands with her jacket and sun mask both from Chinese sports brand Anta. She also carried a bottle of perfume she had just purchased the day before from Chinese aromatherapy brand To Summer, and has placed other orders on Chinese online shopping platform Taobao.

Lutz's carefully curated shopping list is no longer an isolated quirk — it has become a hallmark of the surging wave of international visitors to Shanghai. As China's expanding visa-free policies fuel an inbound tourism boom, shopping for quality products from the country's homegrown brands has emerged as a cultural trend for global travelers.

According to the State Taxation Administration, the number of foreign travelers claiming departure tax refunds surged 366 percent year-on-year in the first half of the year, while the value of refunded goods and payouts grew 69 percent. From January to May, Shanghai Customs verified 201,000 tax refund applications, with sales reaching 1.92 billion yuan ($285 million) — year-on-year increases of 300 percent and 62 percent, respectively.

New growth drivers gain ground amid transition

By ZHANG CHENXU and ZHOU LANXU

China's shift toward new growth drivers gathered pace in July, with advanced manufacturing, technology-intensive exports and services consumption providing growing support for economic activity, officials and experts said.

New growth drivers contributed over half of industrial output growth in the first seven months of the year. Retail sales of services outpaced those of goods and external demand remained resilient, bolstering prospects for continued economic expansion.

However, they added that a deepening contraction in fixed-asset investment and slowing retail sales growth could weigh on the economy, and called for more forceful policy support.

The comments came as fresh data released by the National Bureau of Statistics on Monday showed that the country's industrial output rose 4.5 percent year-on-year in July, following a 5.3 percent rise in June.

The high-tech and equipment manufacturing sectors maintained robust growth in July, with value-added output rising 16.9 percent and 12.3 percent year-on-year, respectively, the bureau said.

Wang Guanhua, a spokeswoman for the bureau, said at a news conference in Beijing that new growth drivers contributed an estimated 50.9 percent to industrial output growth in the first seven months of this year.

Zhu Feng, China chief economist at JPMorgan, said that China has made solid progress in upgrading its manufacturing sector, with exports, industrial output and investment all pointing to stronger competitiveness in advanced manufacturing.

Meanwhile, the consumption mix continued to improve as spending shifted further toward services. The share of services in per capita spending rose 0.2 percentage point year-on-year in the first half, while retail sales of services grew 5 percent in the first seven months.

Growth in retail sales of goods slowed and the contraction in fixed-asset investment deepened, with the property sector remaining the main drag on investment.

Zhu from JPMorgan said a major challenge for China's economy is the pace of its growth driver transition.

Retail sales, a key gauge of consumer spending, grew 0.6 percent year-on-year in July, slowing from a 1 percent rise in June.

Fixed-asset investment declined 6.7 percent during the January-July period from a year earlier, deepening from a 5.7 percent drop in the first half, according to the NBS.

Yin Yanlin, deputy director of the Committee on Economic Affairs of the 14th National Committee of the Chinese People's Political Consultative Conference, urged policymakers to strengthen countercyclical adjustments and introduce additional measures to bolster investment.

"Policymakers should capitalize on easing imported inflation pressures to cut the reserve requirement ratio and policy rates when appropriate," Yin added.

In the latest move, the National Development and Reform Commission, China's top economic regulator, said on Monday it will accelerate the rollout of new policy-based financial instruments for 2026 and step up support for private investment projects.

China's booster shot for drug innovation

Robust regulatory reforms, greater investment and growing talent pool propel global biotech ascent

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

A visitor examines medicines at the product exhibition area during the 8th China International Import Expo in Shanghai on Nov 9. PROVIDED TO CHINA DAILY

China has emerged as a global powerhouse in drug innovation, and industry experts expect the rapid growth to continue in the years ahead.

Official data showed that China approved 38 new drugs in the first half of this year, 31 of which were developed domestically. All 11 drugs, featuring new molecular targets and mechanisms of action, were produced in China.

The approvals, combined with a record $110 billion in innovative drug out-licensing deals during the same period, have demonstrated that "China's pharmaceutical industry has achieved a systemic leap forward in innovation quality", Tao Qing, a spokeswoman for the Ministry of Industry and Information Technology, said at a recent news conference.

China's progress is also reshaping the global R&D landscape. Worldwide, the volume of early-stage drug development nearly doubled from 2015 to 2024, while the traditional United States-led model is giving way to a two-hub system centered on both the US and China, according to a study headed by health policy experts at Georgetown University in Washington.

The US share of early-stage programs during the period fell to 37 percent from 48 percent, while China's share surged to more than 32 percent from just 8 percent, said the study published online in the Journal of the American Medical Association in late March.

"China's drug development pipeline increasingly includes innovative and transformative therapies, moving beyond the older programs that succeeded in developing follow-on products," Richard Pazdur, former director of the US Food and Drug Administration's Center for Drug Evaluation and Research, wrote in an opinion piece accompanying the study.

"In some areas, including antibody-drug conjugates, bispecific antibodies and cell therapies, China now rivals or surpasses the US in scale and, in some areas, innovation. Regulators must prepare for an environment in which some therapies with substantial patient benefit may be studied primarily, or even exclusively, in China," he added.

Li Haiyan, chief director of the Drug Clinical Trial Center at Peking University Third Hospital, told an industry conference in July that while China ranks first globally in the volume of innovative drug molecules under development, only about 7 percent of the pipeline currently targets entirely new treatments, pointing to considerable untapped potential for first-in-class breakthroughs.

"We have strong momentum going forward, and the next five years are poised to see a surge in innovative drugs with truly novel targets," she said.

Reasons for rise

Robust regulatory reforms since 2015, combined with rising investment and a growing talent pool, are regarded as the key forces propelling China's biotech ascent. After more than a decade, "a virtuous cycle fostering domestic pharmaceutical innovation has fully taken shape", said Jin Chunlin, director of the Shanghai Institute of Medical Science and Technology Information.

Jin said that a thriving innovation ecosystem features a strong investor appetite for early-stage, high-risk R&D, supported by a track record of solid returns, alongside upgraded drug review and approval standards that are now fully in line with international regulatory frameworks.

"Clinical data generated in China have increasingly gained recognition from overseas regulators, including the US Food and Drug Administration, which has laid critical groundwork for the industry's global expansion," he said in a recent interview with People's Daily.

Jin also pointed out that domestic drugmakers have gradually shifted away from homogenized research efforts, moving instead toward more differentiated and higher-value target portfolios.

Among the key engines powering the growth is the national healthcare security system, which has steadily expanded coverage for innovative drugs and bolstered corporate profits.

During the 14th Five-Year Plan (2021-25) period, China added 516 medicines to the national medical insurance drug list, including 167 innovative drugs, Zhang Ke, director of the National Healthcare Security Administration, said in a recent article.

The average time for a novel drug to progress from market approval to the list has been shortened from five years to about one year, Zhang said.

As of May 2025, national medical insurance funds had spent 410 billion yuan ($61 billion) on drugs — typically innovative medicines — that were added to the list following price negotiations with drugmakers, according to official data. Their inclusion on the list is estimated to have generated more than 600 billion yuan in pharmaceutical sales.

InnoCare Pharma, founded in 2015 and headquartered in Beijing, reported its first full-year profit in 2025 and continued to post gains in the first quarter of this year. The financial turnaround was fueled by rising product sales and proceeds from global business development agreements, the company said.

Chang Jinghua, head of market access at InnoCare, said the company's core product, orelabrutinib — a novel therapy for cancers and autoimmune diseases — has had all four of its indications, the legally defined use for a drug, covered by the national reimbursement list. Since its inclusion in 2021, sales of the drug have climbed at an annual rate of nearly 50 percent.

"A number of domestic drugmakers, including us, have started turning a profit," Chang said.

"Healthcare reimbursement policy has helped create a closed-loop ecosystem that nurtures innovation. The cycle starts with heavy R&D spending, leads to better patient access and lower out-of-pocket costs, and then channels back to companies to fuel the next wave of R&D," he said.

InnoCare secured another crucial funding source from a licensing deal with global pharmaceutical company Zenas BioPharma late last year. The deal, worth more than $2 billion, grants Zenas global rights to develop and commercialize orelabrutinib.

A defining moment for China's biotech innovation came in 2024, when ivonescimab — a lung cancer drug developed by China-based Akeso — outperformed Merck & Co's immunotherapy heavyweight Keytruda in head-to-head trials. The drug gained its first market approval in China in May 2024 and was added to the reimbursement list the same year.

Xia Yu, chairwoman and CEO of Akeso, said the reimbursement listing means Chinese patients can promptly access world-class, homegrown therapies that are affordable. For domestic drugmakers, commercial returns are now increasingly tied to expanded patient access.

Medical technicians work in a research laboratory of Simcere Pharmaceutical Group in Haikou, Hainan province, on July 1. PROVIDED TO CHINA DAILY

> "In some areas, including antibody-drug conjugates, bispecific antibodies and cell therapies, China now rivals or surpasses the US in scale and, in some areas, innovation. Regulators must prepare for an environment in which some therapies with substantial patient benefit may be studied primarily, or even exclusively, in China."
>
> **Richard Pazdur,** former director of the US Food and Drug Administration's Center for Drug Evaluation and Research

Last year, the company generated 3.056 billion yuan in revenue, with product sales reaching 3.033 billion yuan, up 51.5 percent year-on-year.

Different approach

Sunshine Lake Pharma, a Guangdong-based drugmaker that began as a generic medicine producer, offers a different insight into the industry's maturation.

Zhang Yingjun, chairman of the company, said innovative drug R&D is now largely bankrolled by revenues from its generic drug business, supplemented by pre-IPO shareholder backing, platform-based financing and government grants.

The inclusion of its insulin products in the nation's centralized bulk-buy procurement program has secured large supply contracts with public hospitals, providing a stable profit stream. Last year alone, insulin sales generated 244 million yuan in revenue, up about 78.7 percent year-on-year.

"The strong cash flow feeds back into R&D, creating a virtuous cycle that sustains long-term growth," he said.

That revenue is expected to climb further, buoyed by overseas market penetration. The company has passed multiple on-site Good Manufacturing Practice inspections conducted by US and European Union drug regulators, and its insulin product officially received FDA clearance this year. The company projects sales of $30 million by year-end and more than $500 million by 2030.

Innovation and overseas expansion are now seen as two pillars for future growth, according to company executives. The company has so far secured regulatory approval for four novel drugs from China's National Medical Products Administration, three of which were authorized over the past year.

Given the intensifying competition in the biotech sector, Zhang said it is crucial to differentiate products in the pipeline. The three recently approved drugs all fall within the company's traditionally strong therapeutic areas of infectious diseases and diabetes, while four novel candidates in late-stage Phase III trials are focused on chronic respiratory diseases and oncology.

"We have steered clear of overcrowded segments such as lung cancer and breast cancer. Instead, we are actively exploring tumor types with large patient populations but limited effective treatment options, including colorectal, pancreatic, liver and kidney cancers," he said.

Li Baiyong, chief science officer at Akeso, said the favorable external environment will continue to foster innovation in the sector.

He said that the high execution efficiency of R&D in China, combined with relatively low costs for personnel, equipment and manufacturing facilities, are key draws for multiple international pharmaceutical companies seeking partnerships with Chinese firms.

Ensuring oversight

Sun Hao, a lung cancer specialist at the Guangdong Provincial People's Hospital, said clinical studies in China are moving at a faster pace than in many other countries. In global multicenter trials, data from Chinese sites often come in substantially earlier.

Sun said regulators have been stepping up oversight to keep pace with the accelerating R&D activity.

In June, the country issued a new edition of the Good Clinical Practice for Drugs guidelines, placing greater emphasis on defining clear boundaries of responsibility, risk identification, and quality management throughout trials.

In May, the nation released a data protection regulation for drugs — an important component of the pharmaceutical innovation framework. The document provides a six-year protection period for clinical trial data on innovative drugs.

"In the field of lung cancer, the volume of research focused on the Chinese population already ranks first in the world," Sun said. "Looking ahead, it is expected that both the market and the primary impetus for drug development will increasingly originate from China."

Huang Huiqiang, a professor at Sun Yat-Sen University Cancer Center, said the growing number of oral presentations delivered by Chinese researchers at international meetings reflects increasing recognition from the global medical community.

He said that for homegrown companies seeking overseas expansion, challenges persist — including high clinical trial costs abroad and a lack of familiarity with foreign markets.

"It is important to recruit talent familiar with overseas drug manufacturing and regulatory rules, and build cooperation with foreign companies for long-term development," he said.

US set to reduce drills with ROK

Washington announces decision to scale back joint exercises in move seen as overture to DPRK

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

Protesters rally to oppose joint military exercises between the United States and the Republic of Korea outside the US embassy in Seoul, capital of the ROK, on Monday. AHN YOUNG-JOON / AP

United States President Donald Trump said on Sunday that he has ordered the Pentagon to "substantially reduce" joint military exercises with the Republic of Korea, announcing the decision just before the two countries' annual drill kicked off.

Observers said the abrupt message might be interpreted as the Trump administration's intention to engage with the Democratic People's Republic of Korea for future talks, while some said it could also be an attempt, driven by domestic pressure, to shift the focus from the prolonged Iran conflict, in which the US has been mired.

"These exercises are not only costly, with much of these costs paid for by the United States of America (as usual), but send a signal that is totally inappropriate and hostile, to a country that, as long as Donald J Trump has been President, has been unthreatening and respectful," Trump wrote in a post on Truth Social, referring to the DPRK as he cited his "very good relationship" with the country's top leader Kim Jong-un.

During Trump's first term, the US and the ROK had postponed or scaled back their combined exercises to create the conditions for dialogue with the DPRK. In 2018, Trump suspended the annual exercise after his first meeting with Kim in June that year.

When asked if China would support renewed dialogue between the US and the DPRK, Chinese Foreign Ministry spokesman Lin Jian said during a regular news briefing on Monday that maintaining peace and stability in the Korean Peninsula and advancing the political settlement of the Korean Peninsula issue serve the common interests of all parties.

The ROK's presidential office said on Monday that friendly relations between DPRK and US leaders will lead to meaningful dialogue between the two countries and discussions aimed at advancing peace and stability in the Korean Peninsula.

The ROK has also been closely coordinating with the US on the joint exercises, it said, according to Yonhap News Agency.

Trump's announcement was posted at 5:04 pm US Eastern Time on Sunday, or at 6:04 am ROK time on Monday, the date of the start of the annual Ulchi Freedom Shield, or UFS, joint drill.

The ROK's military authorities said later that the UFS combined exercise, running through Aug 27, is being carried out normally and there has been no specific request from the US side regarding adjustments to the scale of the exercise, according to Yonhap.

The DPRK has condemned the US-ROK joint military exercise, criticizing it as "a rehearsal for an aggressive war" and posing "a grave threat" to the security of the DPRK as well as the region, the DPRK's official Korean Central News Agency reported on Friday.

Pyongyang also vowed to respond to a new level of threat with a new level of deterrence.

Since taking office in June last year, ROK President Lee Jae-myung has repeatedly made reconciliatory gestures toward the DPRK. On Saturday, the ROK's Liberation Day, Lee said in a speech that he hopes to begin discussions with the DPRK to formally end the Korean War as the directly involved parties, refraining from unnecessary confrontation and replacing the unstable armistice with a peace regime.

"There was an indication that he (Trump) might make some overtures toward the DPRK," Lee Sangho, a professor of political science and diplomacy at Daejeon University in the ROK, told China Daily.

Though Trump mentioned the costs paid by the US for the joint military drills and the ROK's refusal to join the US in the "denuclearization" of Iran in his post, Lee, who is also president of the Korea Association of National Intelligence Studies, said the main reason for the announcement was that Trump is looking for measures to boost his popularity as he faces challenges from the conflict with Iran and the upcoming US midterm elections in November.

Noting that Trump also posted a photo showing him standing side by side with Kim at the demilitarized zone between the ROK and the DPRK in 2019, Lee said the announcement to reduce military exercises with the ROK can be seen as something that was offered to reengage with the DPRK.

"I don't think this was fully discussed with the ROK side before the announcement was made," Lee said.

Kim Dong-yup, a professor at the University of North Korean Studies in Seoul, in a commentary published on the online news publication Pressian on Monday, said that Trump's instruction may not be the result of a carefully designed peace strategy for the Korean Peninsula, but rather a decision driven by a mix of frustrations over cost-sharing complaints, his personal relationship with Kim and transactional sentiments toward the ROK.

Reform: Industrial productivity substantially improved

From page 1

Under Jiang's leadership, the concept of a socialist market economy, officially endorsed at the 14th CPC National Congress in 1992, became China's primary guiding principle for modernization. This strategy demonstrated that market forces could function effectively within socialism, strengthening the Party's central role in the nation's development.

Jiang's rich professional background influenced his leadership style. Trained as an electrical engineer and experienced as a factory manager, he brought technical discipline and administrative pragmatism to governance. Serving as mayor and Party secretary of Shanghai gave him firsthand knowledge of urban development, international trade and technological progress.

Fluency in English and a strong grasp of international affairs enabled him to engage confidently with global leaders as China's international influence grew.

One of his most significant contributions was turning reform from a tentative experiment into a lasting institutional framework. Alongside Zhu Rongji, who would later serve as premier, he initiated a series of structural reforms that reshaped the national economy.

The 1994 fiscal and taxation reform greatly enhanced the financial power of the central and provincial governments through the adoption of a modern tax-sharing framework. This change substantially boosted central revenue, equipping Beijing with the fiscal resources needed to pursue national development plans and sustain macroeconomic stability.

State-owned enterprise reform represented another historic milestone. Under the principle of "holding on to the large while letting go of the small", China retained public ownership in strategic sectors such as energy, telecommunications, transportation and finance while restructuring thousands of inefficient enterprises. Although these reforms involved difficult adjustments, including the restructuring of tens of millions of jobs, they substantially improved industrial productivity and strengthened the competitiveness of China's State-owned champions.

Housing reform between 1997 and 1999 marked another decisive turning point. The transition from administrative housing allocation to a market-based housing system created one of the world's largest real estate markets, stimulated domestic demand, accelerated urbanization, and created an important engine of economic growth for the following two decades.

Among the major milestones of the period, China's accession to the World Trade Organization in 2001 stands out as a historic milestone. After 15 years of negotiations, China successfully entered this multilateral trading system. It further advanced reform and opening-up, modernized trade legislation, and harmonized thousands of regulations with international standards. The WTO accession accelerated China's integration into global value chains and subsequently firmly established the country as the "factory of the world".

During this period, the Chinese government also actively promoted a "going global" strategy, encouraging Chinese enterprises to acquire advanced technologies, invest abroad and participate more actively in international markets. This strategic vision anticipated China's eventual emergence as a major country with increasing global influence.

Jiang's contribution to the nation's political culture was no less significant. His contribution to the Party's theoretical development was reflected most prominently in the Theory of Three Represents, which was incorporated into the Constitution of the Communist Party of China at the 16th CPC National Congress in 2002, and it enriched the Party's theoretical foundation by stipulating that the CPC should always represent the development trends of China's advanced productive forces, the orientation of China's advanced culture and the fundamental interests of the overwhelming majority of the Chinese people.

This theory reflected the ongoing evolution of Chinese society. It allowed successful private entrepreneurs to become Party members, integrating new productive forces into the development of socialism while maintaining the CPC's leadership. This adaptation strengthened the Party's ability to govern a rapidly modernizing country.

President Xi Jinping, speaking at a gathering in Beijing to commemorate Jiang's birth centenary, praised Jiang's political conviction, dedication to the people, innovative spirit, far-sighted strategic thinking and extraordinary courage.

Jiang also made enduring contributions to China's international standing. During his presidency, Hong Kong successfully returned to the motherland in 1997 under the principle of "one country, two systems". China won the right to host the 2008 Olympic Games in Beijing, expanded diplomatic engagement worldwide and pursued a foreign policy emphasizing peaceful development, cooperation and mutual benefit.

His leadership also extended to national defense modernization. Jiang promoted the modernization of the People's Liberation Army, advanced military professionalism and required the armed forces to withdraw from commercial business activities, strengthening their focus on national defense.

The CPC regards Jiang as a distinguished Marxist, a prominent proletarian revolutionary, an esteemed statesman, a military strategist and a diplomat. These characterizations highlight both his personal virtues and the important role of his leadership in history.

China's remarkable achievements did not happen overnight. Continuous reform from one generation to the next, economic modernization, social stability, technological progress and strong Party governance combined to help China confidently and strategically enter the 21st century. Jiang's successor Hu Jintao further advanced reform and opening-up, while under the leadership of President Xi, socialism with Chinese characteristics has entered a new era.

China's development proves that socialism with Chinese characteristics can evolve with change while ensuring stable institutions.

Jiang therefore occupies an important place in the history of China's reform and modernization. His tenure represented an important stage in a broader process of continuity and renewal, in which successive generations of the Party's leadership built on what had been achieved, addressed new challenges and laid the foundations for further progress.

Shopping: Chinese brands win with design and quality

From page 1

Like Lutz, a growing number of foreign tourists touch down with meticulously curated shopping lists already in hand.

Russian traveler Evgeniya Azarenkova did extensive research before coming to Shanghai. She said she believes that Chinese brands have their own design identity. "The silhouette is different. It always has this character that makes it different."

Lutz also praised the exceptional quality of Chinese products. "There is still a stigma in Europe that it's only bad quality in China, and this is totally not the case anymore," she said. "(In some cases) it's even higher quality compared to Europe, and the pricing is more affordable."

The price advantage is clear. According to Jiefang Daily, a pair of sneakers from popular domestic footwear brand Pane costs around 800 yuan, about 30 percent lower than comparable styles from top international brands.

According to Pane, its overseas social media following surged from just over 30,000 in September 2025 to more than 140,000 by June, with overseas visitors accounting for roughly 30 to 40 percent of foot traffic at its Shanghai store.

The final push to purchase, however, rarely comes from social media or brand promotion, but from the tactile experience of seeing and touching the product firsthand.

Another Russian traveler, Irina Rudometova, bought Pane sneakers as souvenirs. "They're comfortable and I like the design," she said, highlighting the shopping experience itself. "I like the lights and geometric forms inside (the store) — the atmosphere and the smell. For me, it's about atmosphere, not about the stuff."

More important, beyond the transactions, visitors' perceptions are rapidly shifting from "made in China" to "designed in China".

"When we were growing up, seeing something 'made in China' meant something cheap, but right now it's changing a lot. It may be the same price as a well-known foreign brand, but the quality is different, the style is different — very authentic," said Azarenkova, the traveler from Russia.

Zhang Zihan, founder of An Action A Day, a domestic activewear brand launched four years ago, views this shift in a broader context.

"Chinese brands are gradually entering the global mainstream — not only through affordability, but through core product strength, culture and aesthetics. This trend is also expanding from traditional categories, such as automobiles and consumer electronics, to everyday consumer goods," she said.

Zhang noted that markets in Europe and the United States account for 85 percent of the brand's cross-border sales.

Industry insiders said the biggest edge that Chinese brands have is the all-around competitive strength they've built up in the country's massive, fast-moving local market.

"We have accumulated experience interacting with a vast and dynamic base of Chinese consumers, and we have already withstood the most direct and rigorous scrutiny from them," Zhang added.

Chen Tianyi contributed to this story.

Customers line up outside the Songmont boutique in Shanghai on Saturday, waiting for their turn to enter the shop.

Centenary: Foresight of Jiang highlighted

From page 1

Xi called for adhering to a people-centered development philosophy, maintaining close ties with the people and making solid steps in promoting the all-around development of the people and common prosperity for all.

Highlighting Jiang's innovative spirit, Xi said the late leader had continuously advanced innovations in theory, institutions, science and technology, culture and other fields in response to the evolving needs of the times and practice.

Xi called for further deepening reform and opening-up, modernizing China's system and capacity for governance and unleashing creativity across the Party and society to generate sustained momentum for economic and social development.

Jiang's far-sightedness and strategic thinking were highlighted by Xi. With an international perspective and a vision for the future, Jiang advanced the cause of the Party and the country with a slew of major decisions and measures, Xi said.

Jiang made arrangements with foresight for building a moderately prosperous society in all respects, and put forward a series of thoughts on foreign affairs and international strategies to advance the development of a multipolar world and economic globalization in the right direction.

Looking ahead, it is essential to fully and faithfully apply the new development philosophy on all fronts, accelerate efforts to create a new development pattern and make solid headway in promoting high-quality development, Xi said, calling for further efforts to build a community with a shared future for humanity and add more positive energy to world peace and development.

Xi also highlighted Jiang's extraordinary courage and vision. Jiang made resolute decisions at key historical junctures and critical moments, and responded calmly to risks and challenges, securing the steady advancement of China's reform and opening-up as well as socialist modernization, Xi said.

In particular, Jiang led China to successfully withstand the impact of the Asian financial crisis and secure complete victory in the battle against the severe floods in 1998, Xi said.

"On the new journey, we should stand ready to withstand high winds, choppy waters and even dangerous storms, resolutely safeguard national sovereignty, security and development interests, and continue to write a new chapter in the miracles of fast economic growth and long-term social stability," Xi said.

About 6,000 people were present at Monday's commemoration, which was presided over by Li Qiang and attended by Zhao Leji, Wang Huning, Cai Qi, Ding Xuexiang and Li Xi — all members of the Standing Committee of the Political Bureau of the CPC Central Committee — as well as Vice-President Han Zheng.

Also on Monday, a symposium on the life and thought of Jiang Zemin opened in Beijing and will run through Wednesday. Cai Qi attended and addressed the opening ceremony.

1.5m families in Indonesia lose aid over gambling

JAKARTA — The Social Affairs Ministry of Indonesia has suspended the distribution of social assistance to nearly 1.5 million beneficiary families enrolled in the basic food program after data cross-referencing the Financial Transaction Reports and Analysis Center, or PPATK, flagged their accounts for online gambling transactions.

Social Affairs Minister Saifullah Yusuf confirmed earlier in August that around 1.5 million beneficiary families had been identified in the latest data sweep.

Among them, 794,475 families were also recipients of the Family Hope Program, or PKH, a conditional cash transfer scheme aimed at the country's poorest households.

Aid disbursement to all flagged recipients has been temporarily frozen pending a verification process.

"There are 1,494,652 beneficiary families flagged for online gambling, based on data we received from the PPATK. We are currently investigating and examining the matter further," Saifullah said, as quoted by Bisnis.com.

The staggering figure marks a sharp increase over the 2025 data-matching exercise, which identified approximately 600,000 beneficiary families with transactions linked to online gambling.

The ministry now faces mounting pressure to tighten oversight of the multitrillion-rupiah social protection programs.

The Financial Services Authority has revealed that, based on reports submitted by lenders to the PPATK, activities with suspected links to online gambling surged 260 percent last year.

The share of suspected online gambling activities among all reported suspicious transactions rose from 18.37 percent in December 2024 to 48.83 percent in December 2025, while the figure stood at 35.28 percent as of the first quarter last year.

The probe will also form part of a broader effort to update the national integrated social economic data, a centralized database designed to improve the accuracy of social assistance targeting.

"They may no longer meet the criteria for receiving social assistance. There is evidence that the aid is being used for online gambling. We are investigating this further, which also serves as part of our data-updating process," he said.

Digital literacy

Saifullah stressed the importance of digital literacy and personal accountability among aid recipients, warning against negligence that could enable account misuse.

"People must not be careless, for instance, by letting others use or exploit their accounts. We consistently provide outreach, education and support to beneficiaries through these social support workers. We are doing this continuously," he added.

The crackdown underscores the government's growing concern over the rampant spread of online gambling, which has increasingly penetrated low-income communities.

Questions are mounting over the key figure behind the sponsorship of a Jakarta-based online gambling network, following early May's raid that uncovered hundreds of people operating across 75 domains and gambling websites from an office building in the heart of a business district in West Jakarta.

Lawmakers have urged the police to deepen their investigation into the network's funding flows as investigators are scrambling to find the financiers behind the gambling ring.

World feels the heat

Farmers struggle to secure water for irrigation amid prolonged drought, at the Donam Reservoir in Daegu, South Korea, on Aug 11. YONHAP

El Nino is expected to trigger extreme weather conditions across globe

A global insurance firm warned on July 30 of the growing risks from a predicted strong El Nino, which forecasters fear will trigger extreme weather conditions in many regions of the world, including Asia.

Insurance company Munich Re said the El Nino climate pattern that is already strengthening in the Pacific Ocean will push up global temperatures. Europe and North America have witnessed record temperatures, heat waves and wildfires since May.

The extreme summer heat, which scientists say is being fueled by climate change, comes as natural disasters caused worldwide losses estimated at nearly $112 billion in the first half of 2026, Munich Re said in its half-yearly global update on natural catastrophes.

Among the costliest disasters were twin earthquakes in Venezuela and a series of storms in the US, with both sets of disasters causing an estimated loss of $30 billion each.

Looking ahead, it is El Nino that worries insurers.

"Asia-Pacific is likely to be the region which will suffer most from El Nino. We must brace ourselves for a higher typhoon risk in Japan and Korea as well as for heat waves, drought and wildfires in other regions like Southeast Asia, India and Australia," said Achim Kassow, a member of Munich Re's board of management responsible for the Asia-Pacific, Middle East and Africa division.

El Nino is part of a natural cycle. It is a periodic warming of surface temperatures in the central and eastern equatorial Pacific Ocean, triggering worldwide changes in winds, atmospheric pressure and rainfall patterns.

It occurs every two to seven years and typically increases global temperatures by releasing heat stored in the ocean. But stronger, or "super", events that lead to very warm surface waters occur once every one to two decades and can trigger deadly and costly extreme weather.

People use umbrellas and electric fans to cool themselves in Kuala Lumpur, Malaysia, on Aug 9. ANADOLU VIA GETTY IMAGES

El Nino is the flip side of La Nina, a periodic cooling of the central and eastern Pacific Ocean. La Nina events typically cause cooler and wetter weather in Southeast Asia and eastern Australia.

The US government's Climate Prediction Center said on July 9 that the current El Nino has continued to build and is likely to be one of the strongest in more than 75 years.

Malaysia could experience temperatures of up to 40 C in early 2027 as El Nino intensifies, the Malaysian Meteorological Department said on July 7.

The department's deputy director-general of operations Ambun Dindang said El Nino was expected to peak between November 2026 and January 2027, with rainfall expected to decrease across most parts of Malaysia.

Tobias Grimm, Munich Re's chief climate scientist, said El Nino intensifies many weather extremes and shifts the global risk profile.

"While some regions may experience fewer extreme weather events, others, like parts of Asia-Pacific, face a higher likelihood of severe weather. At the same time, climate change is increasing the intensity, duration and loss potential of many weather-related hazards," he told The Straits Times.

For instance, in East Asia, the risk of typhoons is generally higher, with potential changes in storm tracks and intensity. Southern and eastern China typically receive above-average rainfall, increasing the risk of flooding, he said.

Likelihood of drought

Other regions, including parts of India, often experience below-average rainfall, raising the likelihood of drought and water stress.

"The key takeaway is that El Nino shifts the distribution of weather-related risks across Asia. Many parts of Asia-Pacific are subject to elevated natural catastrophe risks in the second half of 2026," he said.

Munich Re is a reinsurer, providing "insurance for insurance companies". For instance, such firms may help to cover large catastrophic losses.

Munich Re said that of the worldwide losses from natural disasters, estimated at nearly $112 billion from January to June, only $44 billion in losses was insured.

In the Asia-Pacific, total losses amounted to about $8.7 billion, significantly lower than in previous years, with the 10-year average losses for the same period, adjusted for inflation, at $32 billion. Just over $1 billion was insured.

Severe flooding in central and southern China in May and a large bushfire in Australia triggered major financial losses.

In Europe, severe winter storms caused extensive damage. In just over a month, nine storms affected Portugal and Spain at the start of 2026, Munich Re said.

The most destructive was Storm Kristin in late January, which caused losses of about $7.7 billion, of which around $1.8 billion was insured.

In the US, tornado outbreaks and winter storms killed scores of people and caused damage totaling $47 billion, of which $34 billion was insured.

Munich Re also pointed to growing risks from severe heat, noting that record-breaking heat waves dominated the first half of the year in North America and Europe.

"Studies show a clear link between heat waves and climate change," it said. "Heat waves are the natural hazard that claims the most lives.

"It is difficult to quantify the financial impact of heat waves, as they do not usually result in any direct damage to property."

Pointing to the risks of increasing temperatures globally, it added: "Instead, the damage is chiefly caused by falling productivity and production standstills, but also by damage to infrastructure, transportation breakdowns and crop failures."

THE STRAITS TIMES, SINGAPORE

Vietnam becomes ASEAN's 2nd-largest aviation market

BANGKOK — UK-based aviation data provider OAG reported that total airline capacity in Southeast Asia fell by 1.2 percent from July 2025 to 50.4 million seats in July 2026.

Vietnam has overtaken Thailand to become Southeast Asia's second-largest commercial aviation market, as overall airline seat capacity across the region declined, OAG said.

In Southeast Asia, domestic airline capacity declined by 1.3 percent and accounted for 45 percent of the region's commercial aviation market, while international capacity fell by 1.5 percent and represented the remaining 55 percent.

The contraction was attributed to rising fuel costs driven by tensions in the Middle East, which prompted several Southeast Asian airlines to reduce international services.

Indonesia retained its position as Southeast Asia's largest commercial aviation market, with 10.9 million seats in July, up 0.3 percent from the same month last year.

Vietnam moved ahead of Thailand into second place after recording 7.4 million seats, an increase of 5.6 percent year-on-year.

7.4
million seats
Vietnam moved ahead of Thailand into second place after recording 7.4 million seats in July, an increase of 5.6 percent year-on-year.

Vietnam Airlines, the country's national full-service carrier, also became the largest airline in Southeast Asia by seat capacity. It offered 2.81 million seats during the month, up 0.1 percent from July 2025.

Thailand, previously the region's second-largest aviation market, fell to third place with 6.9 million seats, down 3 percent year-on-year.

Malaysia ranked fourth with 5.2 million seats, down 8.3 percent, followed by the Philippines with 4.9 million seats, down 4.1 percent.

OAG data showed that Thailand, Malaysia and the Philippines all recorded declines in commercial airline capacity.

The reductions were linked to disruption caused by the conflict between Iran and the United States, as well as renewed tensions surrounding the Strait of Hormuz.

Jet fuel prices rose sharply and remained elevated as the situation intensified, increasing operating costs for airlines.

As a result, several carriers reduced or suspended direct and connecting services between the Middle East and the three Southeast Asian countries.

THE NATION, THAILAND

Poll to decide Malaysia's national fruit

KUALA LUMPUR — The Ministry of Agriculture and Food Security of Malaysia is proposing that the Department of Statistics Malaysia conduct a nationwide survey to gather public views on the choice for national fruit.

This will provide the government with a reference point before deciding which fruit should get the title, says Chan Foong Hin, deputy minister of agriculture and food security.

Currently, Malaysia does not have an officially recognized "national fruit".

Replying to a question on Tuesday on the option of a national fruit in Dewan Negara, or the upper house of the Parliament of Malaysia, Chan said the ministry has so far received two applications: one from the Durian Manufacturer Association nominating the durian, and another from the Malaysian Pineapple Industry Board nominating the pineapple.

"The government will not directly select one over the other, as all fruit industries must be treated fairly. Therefore, we propose conducting a survey so that the people can vote for their preferred national fruit," he said.

He explained that the survey aims to comprehensively understand the people's choices and analyze the factors influencing their preferences — including national identity, cultural value, popularity, and economic value.

He cited the example of India which chose the mango as its national fruit, while Bangladesh selected the jackfruit.

When asked by Sin Chew Daily when the nationwide survey would commence, Chan later clarified that the Agriculture Ministry is leaving the exploratory work to the Department of Statistics, and that the initiative remains at a very preliminary stage.

Hamas urges pressure on Israel

Group calls on key players to press for ceasefire road map

CAIRO/JERUSALEM — Palestinian militant group Hamas on Sunday urged mediators and guarantors to press Israel to approve the road map for the second phase of the Gaza ceasefire agreement.

The call was made in a statement issued following a meeting in Cairo between a Hamas delegation — led by Khalil al-Hayya, head of the group's political bureau — and representatives of the mediators and guarantors of the ceasefire agreement.

The delegation urged the mediators and the United States-led "Board of Peace" to push Israel to implement all its commitments under the first phase of the agreement, halt killings and ground incursions, and approve the road map for the second phase of the agreement, the statement said.

Hamas also said it had accepted the road map, citing its aim to secure a permanent ceasefire, full Israeli withdrawal from Gaza, sustained humanitarian aid, and the start of work by the National Committee for the Administration of Gaza, according to the statement.

Israeli Prime Minister Benjamin Netanyahu said earlier this month that Israel rejected the US-backed road map and would not withdraw its forces from Gaza until Hamas was fully disarmed.

The "Board of Peace" published a 15-point road map on July 31 for implementing the next phase of the Gaza agreement.

It includes an end to military operations, the transfer of civilian governance to the National Committee for the Administration of Gaza, and the decommissioning of heavy weapons, weapons stockpiles, military production facilities and tunnels, alongside arrangements for an Israeli withdrawal.

Meanwhile, US President Donald Trump's envoy Jared Kushner met Netanyahu on Monday after holding talks with Hamas leaders.

A diplomatic official confirmed to Agence France-Presse that the meeting had begun late on Monday morning.

Kushner — Trump's son-in-law — met al-Hayya in the Egyptian city of El-Alamein on Sunday, sources with knowledge of the discussions told AFP.

Kushner demanded that Hamas verify it is giving up its weapons, a key sticking point for Netanyahu, and that the group renounce any future role in governing the Palestinian territory, the sources said.

Netanyahu is expected to meet behind closed doors with Kushner and Nickolay Mladenov, the high representative for Gaza on the "Board of Peace".

Awaiting response

A Hamas official said the group told Kushner it was committed to the Gaza plan and wanted pressure on Netanyahu.

"Hamas is awaiting the US administration's response regarding Israel's position on the agreement," the official told AFP.

Netanyahu, who is facing elections in October that polls show will be tight, has increasingly been willing to defy Trump, whose support he once highlighted in his campaign.

After initially voicing muted criticism of the Gaza plan, Netanyahu last week told his cabinet that he rejected it and vowed not to pull troops from the Palestinian territory.

In an interview, Itamar Ben-Gvir, a far-right national security minister in Netanyahu's cabinet, called for mass killings in Gaza.

"I think targeted eliminations should be carried out in Gaza every night. Take out 30 or 40," Ben-Gvir said in comments that surfaced on Sunday on a podcast with a former Gaza hostage.

Until recently, Israel was striking Gaza nearly every day, attacks that have killed more than 1,250 people since an October truce deal came into effect, according to Gaza's Health Ministry.

On Sunday, the foreign ministers of eight Muslim-majority countries condemned Israel's declared rejection of the road map.

"Such rejection confirms that Israel now bears responsibility for obstructing the efforts to bring peace in Gaza," the foreign ministers of Egypt, Qatar, Jordan, the United Arab Emirates, Indonesia, Pakistan, Turkiye and Saudi Arabia said in a joint statement.

XINHUA—AGENCIES

Beijing slams Takaichi's remarks for blurring war crimes

By JI HAISHENG
jihaisheng@chinadaily.com.cn

China has condemned Japanese Prime Minister Sanae Takaichi's address at the National Memorial Ceremony for the War Dead, saying her remarks shunned reflection on historical lessons and blurred Japan's responsibility for its acts of aggression.

Foreign Ministry spokesman Lin Jian made the comment on Monday at a regular news briefing following Takaichi's speech at the ceremony held in Tokyo over the weekend.

Takaichi avoided the words "remorse" and "lessons learned", spoke ambiguously about Japan's war crimes, and attempted to turn back the wheel of history, Lin said.

"This once again exposes the sinister attempt of the Takaichi administration to cover up, distort and reverse the verdict on Japan's history of aggression, which has drawn strong condemnation and widespread opposition from all parties," he said.

On the day marking Japan's defeat and surrender in World War II on Saturday, Takaichi made a monetary offering to the "shrine honoring war criminals", while Defense Minister Shinjiro Koizumi and other senior officials and politicians went to pay homage in person, Lin said.

Such moves have further heightened the vigilance of Asian neighbors and the international community over Japan's future trajectory, he said.

Lin cited Japanese observers as saying that a country unable to reflect on its past cannot earn trust, and that the defense minister's actions amount to supporting the war of aggression.

As this year marks the 81st anniversary of the victory in the Chinese People's War of Resistance Against Japanese Aggression (1931-45) and the World Anti-Fascist War, as well as the 80th anniversary of the opening of the Tokyo Trials, Lin underscored the importance of fostering a correct view on history.

"Only by facing up to history and drawing lessons from it can people avoid repeating mistakes made in the past and straying down the wrong path again," he said.

"We once again urge the Japanese authorities to listen earnestly to the voices of justice from within Japan and the international community, deeply reflect on their war crimes, and make a complete break with militarism, rather than going further down the wrong path," he added.

China's zero-tariff policy boon for Zimbabwe trade

By LAWRENCE PAGANGA
in Harare, Zimbabwe
For China Daily

Zimbabwean exporters to China have received a major boost after Beijing implemented a zero-tariff policy, opening vast opportunities for Zimbabwean products in one of the world's largest markets.

Early this year, China announced the zero-tariff policy on goods from Zimbabwe and 52 other African countries from May 1.

Archford Mabuka, a Zimbabwean analyst, said the move comes as China has emerged as one of Zimbabwe's most dynamic export destinations.

"The facility provides duty-free access for a wide range of products, including agricultural commodities, processed foods, horticultural products, textiles, leather goods, industrial inputs and selected manufactured products," Mabuka said.

"The growth in exports over the past five years demonstrates both the strength of demand in the Chinese market and the potential for further expansion under the new arrangement," he said.

"This remarkable growth reflects China's increasing appetite for Zimbabwean products and underscores the strategic importance of market diversification."

The development aligns well with Zimbabwe's industrialization agenda, which seeks to move beyond raw commodity exports toward greater value addition and beneficiation, he added.

ZimTrade, the national trade promotion organization, launched a practical guide last week to help exporters navigate China's zero-tariff policy and meet Chinese market requirements.

The guide outlines applicable rules of origin for exported products, as well as compliance with China's sanitary and phytosanitary requirements, product standards and customs procedures.

It also highlights the need to strengthen logistics systems to ensure goods can be moved into the Chinese market reliably and cost-effectively, while encouraging exporters to move beyond raw commodities toward value-added products that capture a larger share of the value chain.

ZimTrade assured exporters that it would support them "from origin certification to market intelligence and buyer linkages" in China.

"This is one of the most significant trade openings Zimbabwean exporters have been offered in recent years," said Allan Majuru, the organization's CEO.

"Understanding exactly what is required will determine their success in utilizing the benefit of this window," he said.

"The zero-tariff treatment is an opportunity to change that picture and to bring new products into the Chinese market that previously faced tariff barriers, diversifying Zimbabwe's export base beyond raw materials," he added.

Zimbabwe's minister of information, publicity and broadcasting services, Zhemu Soda, described the zero-tariff policy as "low-hanging fruit" for Zimbabwean businesses.

"Those who are into agriculture and other sectors should take advantage of it to increase trade with China. It's a good opportunity for expanded trade," he said.

Strategic opportunity

Jimmy Psillos, chairman of Zimbabwe's Competition and Tariff Commission, said the policy presents a strategic opportunity for the country's export sector.

"By allowing qualifying products to enter the Chinese market duty-free, the initiative opens access to one of the largest and most dynamic consumer markets in the world," he said.

The arrangement is unilateral and reflects China's broader commitment to strengthening economic cooperation with Africa, creating "a critical window for Zimbabwean firms to position themselves in the Chinese market", he added.

As Africa's third-largest blueberry producer, Zimbabwe has already begun taking advantage of the policy, recently exporting its first shipment of blueberries to China.

Trade between Zimbabwe and China reached a record $4.4 billion last year, up 15 percent from 2024, according to the Zimbabwe National Chamber of Commerce.

"For Zimbabwe, this is more than a trade concession — it is an industrialization opportunity," the chamber said.

The writer is a freelance journalist for China Daily.

CHINA

Chile's foreign minister to pay 5-day official visit

Chile's Foreign Minister Francisco Perez Mackenna will begin a five-day official visit to China on Tuesday, Chinese Foreign Ministry spokesman Lin Jian announced at a regular news conference on Monday. Over more than half a century since the two countries established diplomatic ties, China-Chile relations have stayed at the forefront of China's relations with Latin American and Caribbean countries, Lin said. China looks forward to using this visit to have in-depth exchange of views with the Chilean side on bilateral relations and international and regional issues of mutual interest, so as to carry forward friendship, expand consensus, deepen cooperation and push bilateral relations to a new level, he added.

DR CONGO

Ebola outbreak now nation's deadliest ever

A fast-spreading Ebola outbreak in the Democratic Republic of the Congo is now the country's deadliest ever after killing more than 2,300 people in three months, government figures showed on Monday. The United Nations says the Ebola outbreak is "the fastest-growing on record" and is killing a victim every 30 minutes in the DR Congo. Declared on May 15, the outbreak is thought to have already been spreading for several weeks by that point. In its latest toll on Monday, the Congolese authorities said that 2,325 people had died in the current outbreak, from 4,945 confirmed cases. The deadliest Ebola outbreak ever hit western Africa in 2013-16, killing more than 11,300 people.

Editorials

Unswervingly advancing cause of socialism with Chinese characteristics in the new era

A grand gathering was held on Monday in Beijing to commemorate the birth centenary of the country's late leader Jiang Zemin.

President Xi Jinping delivered a speech at the gathering in which he recalled the "indelible contributions" Jiang made to safeguarding the great cause of socialism with Chinese characteristics and successfully advancing it into the 21st century by breaking new ground in reform and opening-up in all respects and achieving overall moderate prosperity in people's lives.

Jiang's political career unfolded during a period of profound changes. The country faced complicated domestic and international circumstances following the end of the Cold War, and it was navigating the difficult transition toward a socialist market economy and deeper integration with the world economy. Against that backdrop, Jiang demonstrated a rock-solid political conviction, profound dedication to the people, an innovative spirit, farsighted strategic thinking and extraordinary courage in addressing risks and challenges.

These qualities are still relevant today.

Jiang had remained unswervingly firm in communist ideals, utterly loyal to the Communist Party of China and the people, and resolutely committed to the cause of the Party and the people. He emphasized the importance of strengthening the Party's leadership and effectively improving Party building as the country advanced reform and opening-up and developed its economy.

Xi highlighted Jiang's view that the farther the country advances along the path of reform and opening-up and the more its economy develops, the more crucial it becomes to strengthen the Party's leadership and improve Party building.

Jiang also demonstrated a profound love for the people, always standing with them, caring about their well-being and stressing that development ultimately serves the people. Under his leadership, major initiatives, including the large-scale development of the country's western regions and poverty alleviation, helped improve people's living standards and contributed to the country's historic transition to moderate prosperity.

Today, learning from that people-first approach means adhering to the philosophy of development centered on the people, helping them resolve difficulties and promoting common prosperity through the country's modernization.

Lauding Jiang's achievements, Xi hailed his efforts in continuously advancing innovations in theory, institutions, science and technology, culture and other fields.

By pooling the wisdom of the whole Party, Jiang created the Theory of Three Represents, which further answered the questions of what socialism is and how to build it, and creatively addressed what kind of Party to build and how to build it.

The establishment of the socialist market economy as a reform objective and China's accession to the World Trade Organization reflected the innovative and pragmatic spirit of adapting to changing circumstances while firmly pursuing development. The same spirit is indispensable today as China confronts a rapidly changing world marked by technological transformation, economic restructuring and geopolitical uncertainty.

We must now properly respond to the questions facing China, the world, the people and the times, and constantly break new ground in adapting Marxism to the Chinese context and the needs of the times, Xi said.

Jiang's farsightedness and strategic thinking were highlighted by Xi. With an international perspective and a vision for the future, Jiang advanced the cause of the Party and the State with a slew of major decisions and measures.

That strategic vision is also necessary today, when it is essential to fully and faithfully apply the new development philosophy on all fronts, accelerate efforts to create a new development pattern, and make solid headway in promoting high-quality development.

Jiang's courage in critical moments is equally instructive. He made resolute decisions at key historical junctures and critical moments, and responded calmly to risks and challenges, securing the steady advancement of China's reform and opening-up as well as socialist modernization.

The commemorative gathering can help the country effectively draw strength from Jiang's legacy to face new challenges.

"On the new journey, we should stand ready to withstand high winds, choppy waters, and even dangerous storms, resolutely safeguard national sovereignty, security, and development interests, and continue to write a new chapter in the miracles of fast economic growth and long-term social stability," Xi said.

In the process, it is imperative to uphold the overall leadership of the Party and the centralized, unified leadership of the CPC Central Committee, unswervingly strengthen full and rigorous Party self-governance, and ensure the Party remains the strong leadership core in the cause of socialism with Chinese characteristics.

'China push' in Asia fabricated alarmism

A New York Times article, titled "As China Pushes to Expand in Asia, Trump Focuses on Iran", published on Saturday, encapsulates a typical trope among the political circles and media in the United States: when in trouble, blame others.

The piece attempts to paint an alarmist picture of the region trembling under the shadow of "Chinese ambition" as the US administration focuses its attention on the Middle East.

Beneath its surface concern for the US' Asian allies are dialectical currents that are logically flawed, historically selective and dangerously misleading. It serves less as a report on regional sentiment and more as a projection of US anxieties masquerading as analysis.

Its reasoning is built on the bedrock of breathtaking ironies: It is the US that launched the conflict with Iran that has become another costly quagmire in which the US finds itself trapped. It is Washington that is seeking to cultivate a Cold War-like division in Asia by pushing a narrative of bloc competition and pressuring countries to choose sides, often at the expense of their economic interests. And it is the US that is resorting to economic coercion, tariff wars and technological "decoupling" in a bid to restructure the global supply chains in its favor, harming the very economies it claims to protect.

It is the misjudged self-serving US foreign policy that is the source of instability in the region, not so-called Chinese "expansion".

The New York Times article's primary "evidence" for the so-called "Chinese expansionism" is a recent incident at Ren'ai Reef in the South China Sea. Here, the reporting is not just flawed but deliberately obfuscating and biased.

While it did admit that for decades the Philippines has sought to claim the reef in the disputed waters by rotating troops to a World War II-era ship it grounded there, it fell short of criticizing Manila for its ploy to occupy the Chinese reef.

Manila's illegal grounding of its warship at Ren'ai Reef in 1999 is the root cause of tensions between China and the Philippines. An objective analysis of the current situation would inevitably trace the current frictions to that unilateral provocation instigated by the Philippines.

Instead, the article deliberately presents the current frictions as the result of unprovoked Chinese "acts of aggression". This is a clear case of agenda-driven journalism, where the historical context is dismissed to fit a preordained narrative of "Chinese bullying".

Yet the most manipulative aspect of the article's narrative is its claim of palpable "Asian anxiety". While there may be concerns in capitals such as Tokyo and Manila, these are not representative of the broader Asian sentiment. In fact, the findings of a Pew Research Center survey in July reveal a starkly different picture.

The poll found that in a majority of the 36 countries surveyed, favorable views of China have surpassed those of the US, including in key US allies such as Canada and Australia. This shows that it is the US that suffers from a lack of trust, not China.

The true intent of the article is to express dissatisfaction with the Donald Trump administration's entanglement in the Iran conflict, and to raise concerns that Washington may be too distracted to focus on the Asia-Pacific region, thereby allowing China's influence there to surpass its own. This is typical US sleight of hand.

The article is simply projecting Washington's anxieties about its declining influence and costly misadventures in Asia. By fabricating and selectively using facts and viewing China through a biased lens, it constructs a narrative of a new Cold War that serves its own ideological agenda.

While some politicians in Tokyo and Manila are betting on the US for political gain, in general, Asian countries hope to achieve development together. The anxiety the article tries to sell is not germane to the majority of people in Asia. Instead, it is a fiction manufactured for political purposes.

US' endless science frontier risks receding to 'golden age' of a few

In November 1944, as Allied armies pushed across Europe and the United States raced to develop nuclear weapons, US President Franklin Delano Roosevelt asked Vannevar Bush, head of the US Office of Scientific Research and Development, how wartime science could serve peace. Bush's answer, *Science: The Endless Frontier*, became one of the most consequential policy documents of the modern era. Its premise was simple: let the federal government fund basic research, give scientists room to follow curiosity and trust that discoveries would eventually produce prosperity, health and national strength. For over eight decades that bargain helped define science in the US.

Now, White House Office of Science and Technology Policy Director Michael Kratsios' *Science: A New Golden Age* proposes something different. Where Bush trusted institutions, Kratsios distrusts "legacy" ones. Where Bush emphasized exploratory research, Kratsios emphasizes national missions. Where the postwar system tried to protect scientific judgment from political direction, the new model places science more explicitly in the service of national competition.

The contrast reflects two different countries. Bush wrote from a position of confidence. The US had emerged from World War II with its industrial base intact, its universities ascendant and a flood of European scientific talent arriving at US laboratories.

Kratsios writes out of anxiety. Manufacturing has migrated overseas. China is viewed by Washington as a scientific and technological competitor. Artificial intelligence is compressing the distance between discovery and application. The proposed revolution in the government's policies on research is driven by the anxiety that the US invents while others manufacture.

The report published last month argues that federal money is too concentrated in elite universities. It proposes directing more money toward individual researchers, start-ups, focused research organizations and industry-linked laboratories. Peer review is portrayed as too conservative. In its place would come challenge prizes, Advanced Research Projects Agency-style programs, "golden tickets", longer-term grants, and mission-driven initiatives in AI, quantum computing, nuclear fusion, robotics and advanced manufacturing.

The postwar system worked because authority was distributed among government, universities, industry and philanthropy. It was inefficient, competitive and sometimes maddening. Yet its "looseness" created room for discoveries whose uses nobody could foresee. The transistor, the internet, biotechnology and countless advances in medicine did not arrive because a government mission statement correctly predicted them.

Science is not an assembly line. A government can announce a mission to build a fusion reactor; it cannot order the next transistor or modify the DNA of living organisms.

The geopolitical stakes are even larger because the report is ultimately a response to China, as some observers said. But it is here that the change of approach becomes self-defeating. China is not the Soviet Union. China combines extensive public support with powerful companies, enormous manufacturing capacity, market scale and deep integration into global trade and scientific networks.

Consider Apple. Washington has reportedly pressed the company not to source memory chips from Chinese suppliers. Apple may ultimately comply. But finding alternatives can cost more.

This is the paradox of the new strategy. In trying to compete with a comprehensive Chinese system, Washington risks technically nationalizing a science enterprise whose greatest strength has been its openness.

Political priorities can also make collaboration more difficult. US allies and partners may increasingly be asked to align their research, supply chains and standards with Washington. China, meanwhile, will have incentives to deepen its own international networks. The world could gradually develop two parallel scientific ecosystems.

Bush's frontier was endless because it was open. Kratsios' frontier risks becoming fortified, directed and inward-looking.

The reform of the US' research system should make it more open not merely more obedient to political missions; more connected to industry, without sacrificing basic science; and more resilient, without confusing openness with weakness.

The first golden age of US science was built on confidence that the future could not be completely planned. The danger of the new one is that, in trying too hard to plan the future, Washington may close off the very frontier it is trying to conquer.

— LI YANG, CHINA DAILY

What They Say

Enhancing safety equipment industry critical

Editor's note: *China has released a five-year plan for the development of the safety and emergency equipment industry. Xinhua News Agency spoke to Ao Li, vice-president of the China Academy of Information and Communications Technology, and Gao Hong, vice-chair of the China Safety Industry Association, about the country's emergency response capabilities. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

The plan outlines 15 specific tasks in four key areas of the industry: fostering innovation, promoting the use of safety and emergency equipment, nurturing industry players and enhancing the industry ecosystem.

Among these, innovation is prioritized, with dedicated sections highlighting the need for breakthroughs in critical technologies and the integration of emerging technologies. The plan calls for leveraging artificial intelligence, embodied intelligence, brain-computer interfaces and satellite remote sensing to drive the development of safety and emergency equipment.

Standards serve as an important bridge between technological innovation and practical application, while also providing the foundation for the safe and orderly development of the industry.

The plan calls for the rapid development and implementation of a range of essential standards, including those for technologies and equipment that are adaptable for both routine and emergency use. It also places emphasis on international technical exchanges and cooperation on standardization.

Its forward-looking approach to building a standards system provides clear guidance for the industry's development. Authorities are accelerating work on standards for emerging and integrated fields, including AI-enabled applications and safety and emergency response robots. The development of a system of standards will be advanced in parallel with technological research and development, testing and verification, and demonstration projects. China will also actively participate in the formulation of international standards, translating its extensive engineering expertise into an advantage in standard-setting.

Ultimately, the value of equipment lies in its performance in real-world operations. The plan calls for developing a number of key application scenarios for safety and emergency equipment and promoting the wider adoption of equipment featuring advanced technologies and proven effectiveness in practical applications.

The household and community safety and emergency response sector, along with urban and rural fire protection, has strong market potential. The plan aims to increase the penetration of household and community safety and emergency products at the grassroots level.

Demand for products such as electrical fire monitoring equipment and rapid-response systems for fires involving new energy vehicles is growing rapidly, driving the growth of the fire protection market.

The plan outlines measures for upgrading fire protection infrastructure, promoting the iteration and upgrading of smart firefighting equipment, and supporting urban renewal. These measures will help sustain market momentum in the fire protection sector and expand the application of safety and emergency equipment.

VIEWS

Robert Lawrence Kuhn

Jiang's engineering of a nation endures

Centenaries invite the long view. They ask, looking backward, what changed because that person lived and led. Aug 17 marks the 100th anniversary of former Chinese leader Jiang Zemin's birth, and my answer is both historical and personal. The reforms he consolidated and the scientific ambition he envisioned have come to full fruition in President Xi Jinping's new era. At a gathering commemorating Jiang's birth centenary on Monday, Xi called for learning from Jiang's extraordinary courage and vision, his dedication to and profound love for the people.

I should declare a personal interest. I spent several years writing Jiang's biography. When I woke up to the news of his death on Nov 30, 2022, I felt as though I had lost a member of my own family — the occupational hazard of biography, and also its privilege.

When historians explain how China moved from the margins of the world economy to its center — the ascent that defines the new era under Xi — part of the explanation will run through the 13 years in which an electrical engineer from Yangzhou, Jiangsu province, led a country he was called upon to lead.

Xi's "new era" has its own historical circumstances, priorities and methods. Yet it rests on foundations consolidated during Jiang's leadership. Deng Xiaoping launched reform and opening-up in 1978 and revived its momentum through his southern tour in 1992. Jiang's indispensable achievement was to preserve, institutionalize and extend that course when domestic uncertainty and international pressures placed China's future direction in doubt. He and his successor Hu Jintao helped make reform and opening-up the irreversible operating system of the country.

The turn did not come easily. When Jiang said "I now understand that the market economy is critical for China" that admission was revelatory. He possessed an engineer's respect for results and an intellectual's ability to revise his understanding. Under his leadership, the socialist market economy became established doctrine. State-owned enterprises were restructured under the then premier Zhu Rongji. Zhu passed away on Aug 12.

During that era, fiscal, banking and regulatory institutions were rebuilt; foreign investment expanded; and China entered the World Trade Organization in 2001, the act that welded China's productive capacity to global demand. Ideologically, Jiang's Theory of Three Represents brought entrepreneurs and other emerging groups into the Party framework, modernizing the Party and enabling it to lead a diversifying economy.

Jiang's most deeply held strategic conviction, however, concerned science and technology. As an engineer and minister of the electronics industry, he believed national strength ultimately depended on scientific capacity, education, industrial upgrading, and mastery of advanced technology. "Rejuvenating the nation through science and education" became State strategy. He called for Chinese universities to be world-class and helped cultivate the institutions and talent from which China's contemporary technological capabilities have blossomed.

Nowhere was the conviction bolder than in space. In 1992, when China's GDP per capita was under $400, Jiang approved China's human spaceflight program and its patient three-step design: spacecraft, then orbital laboratory, then space station. Jiang named the spacecraft himself — Shenzhou, or "divine vessel". On Nov 30, 2022, Shenzhou-15 docked with the Tiangong space station, and for the first time six Chinese astronauts were in orbit together, completing the handover that finished the station's construction. Jiang passed away that afternoon. Thirty years from the vision to its fulfillment.

It is this inheritance that Xi's new era has carried to fruition, and well beyond. The economy Jiang bound to world trade is now, by purchasing power parity, the largest on earth, and China is the foremost trading nation, producing roughly 30 percent of global manufacturing value added.

The industrial-scientific ecosystem, begun under Jiang, strengthened by Hu and championed by Xi, now supports leadership in electric vehicles, batteries, renewable energy, high-speed rail, and is a formidable competitor in artificial intelligence, quantum computing, and biotech. And the military modernization Jiang began has accelerated under Xi into forces of another order, with a large navy and reaching into cyberspace.

The continuity is structural and institutional. In Jiang's era, China sought entry into the international system, while in the new era, China is helping to shape it and contributing to global governance. The 20th National Congress of the Communist Party of China fused science, education, talent, development, and security into a unified program of Chinese modernization; Xi's "new quality productive forces" and the 15th Five-Year Plan (2026-30) call for advanced manufacturing, green transition, and technological self-reliance.

A centenary tribute should not become hagiography. The Jiang era's rapid growth was not without cost, and China's arrival at the center has drawn friction as well as admiration. A serious accounting holds both sides in superposition. The enduring logic is adaptation: learning from experience, correcting what fails, safeguarding stability without allowing it to become stagnation, and opening to the world while strengthening indigenous capability.

Jiang deserves to be remembered whole. He loved languages — serviceable English, Russian and Romanian, fragments of others — and delighted in using them in diplomatic exchanges.

At one private dinner he decreed that only English be spoken, teasingly instructing the interpreter not to translate for a minister who had neglected to learn it, and chiding another who kept his excellent English quiet for fear of embarrassing his leader. "You wouldn't embarrass me," Jiang told him. "You would help me improve." Then he confided that he had been secretly studying Spanish for a year, to prepare for a trip to South America.

I chose to write Jiang's biography because I was convinced that his life offered a singular way to tell China's story across eight historic decades of transformation. The book's Chinese edition became one of China's bestselling books of 2005. When Jiang passed away in 2022, the biography briefly returned to number one. History, I wrote then, will be kind to Jiang Zemin.

History is kind not because it forgets imperfections. It is kind when distance permits perspective — when personality is separated from caricature, consequences from slogans, and durable achievement from transient fashion.

Jiang did not initiate reform and opening-up, but he made them irreversible. He did not invent China's technological ambition, but he made science, education and human spaceflight pillars of national strategy.

Xi's new era has brought those long investments to their fullest fruition, moving China decisively toward the center stage of the world. On Jiang's centenary, I remember the leader, the engineer, the insatiably curious man — and I remain confident that history will be kind to him.

Robert Lawrence Kuhn is the author of The Man Who Changed China: The Life and Legacy of Jiang Zemin (2005)*, and the creator and host of Closer To Truth on science and philosophy. He received the China Reform Friendship Medal in 2018. The views don't necessarily reflect those of China Daily.*

Abdul Wahed Jalal Nori

Connectivity keeps global trade on even keel

The tensions around the Strait of Hormuz are often viewed through the familiar lens of Middle Eastern geopolitics. While this is understandable, it misses the broader picture. The real issue lies in a structural weakness that has quietly been building for decades: the world economy has become extraordinarily efficient, but remains dangerously dependent on a handful of strategic corridors. The lesson from Hormuz is therefore not about a single waterway, but about the future of globalization itself.

For much of the post-Cold War era, globalization was based on the assumption that deeper economic interdependence would gradually reduce geopolitical risks.

As production networks expanded, trade volumes surged and supply chains stretched across continents, many believed that disrupting global commerce would be too costly for any rational actor. Yet recent events suggest that interdependence has merely changed the nature of vulnerability rather than eliminating it.

This paradox has become more visible over the past five years. The COVID-19 pandemic exposed the fragility of concentrated manufacturing networks. The 2021 Suez Canal blockage revealed how a single incident could disrupt global commerce. Attacks on commercial shipping in the Red Sea forced vessels to take longer and costlier routes, while the recent tensions in Hormuz reminded the world that even the perception of disruption can trigger higher insurance premiums, volatile energy prices and renewed inflationary pressures. These are not isolated events. Together, they reveal a common structural reality: the arteries of globalization have become its biggest strategic vulnerability.

History offers a valuable perspective. Civilizations have seldom thrived solely due to abundant resources or superior military power. Their influence rested equally on securing the routes through which goods, technology and ideas moved. The ancient Silk Road connected civilizations across Eurasia. Venice flourished by protecting Mediterranean commerce. Britain's maritime supremacy opened the door to global trade. While the strategic geography has changed, the underlying principle has not. Today's shipping lanes, energy corridors, undersea communication cables and digital networks perform the same function. They are the invisible infrastructure upon which modern prosperity depends.

What distinguishes the present era is the unprecedented degree of interdependence. Businesses pursued efficiency by minimizing inventories, concentrating production and relying on just-in-time delivery. Governments encouraged open markets, assuming that commercial integration would naturally reinforce stability. This model generated remarkable growth, lifted millions out of poverty and accelerated technological progress. But resilience was sacrificed in pursuit of efficiency. The more optimized the system became, the less capable it was of absorbing unexpected shocks.

LI MIN / CHINA DAILY

This marks a profound shift in international politics. During much of the 20th century, strategic competition revolved around territory, ideology and military alliances. Today, it increasingly revolves around the resilience of connectivity. Maritime chokepoints, ports, logistics hubs, semiconductor supply chains, energy infrastructure and digital networks have become strategic assets whose uninterrupted functioning is essential not only to economic prosperity but also to national security. The central question is no longer who controls the largest territory, but who can sustain the networks upon which global commerce depends.

For Asia, the implications are especially significant. The region has become the center of global manufacturing, innovation and trade, yet its success remains closely tied to secure maritime connectivity. Energy imported through the Strait of Hormuz fuels industries in Asia. The Strait of Malacca is one of the world's busiest commercial arteries. Disruptions in the Red Sea affect exports from East Asia to European markets. Geography has once again emerged as a decisive factor in economic strategy — not because borders have become more important, but because connectivity has become indispensable.

This changed environment calls for a different strategic mindset. Instead of viewing resilience as the opposite of efficiency, policymakers should recognize that resilience is now a prerequisite for sustainable growth. Diversified transport corridors, robust regional logistics, digital infrastructure, strategic reserves and supply-chain flexibility are no longer optional economic policies; they are essential components of long-term national security.

China's long-term emphasis on connectivity should be seen within this broader context. Initiatives to strengthen infrastructure, expand transport corridors and improve regional connectivity are often discussed primarily in terms of trade and development. But they also help build a more resilient international trading system. In an era characterized by geopolitical uncertainty, diversified connectivity reduces systemic risk, bolsters regional stability and supports continued economic integration.

The Association of Southeast Asian Nations is equally central to this evolving landscape. Positioned at one of the most strategically significant locations in the global economy, ASEAN's significance extends beyond facilitating trade. It can play a larger role in strengthening maritime governance, improving regional information sharing, coordinating emergency shipping arrangements and promoting practical cooperation on supply-chain resilience. Such initiatives would reinforce ASEAN's long-standing commitment to dialogue, openness and regional stability while contributing to the security of global commerce.

Looking ahead, three priorities deserve greater attention. First, governments should diversify critical transport and supply networks so that no single corridor becomes an overwhelming point of failure. Second, strategic foresight should become a core function of economic governance through regular stress-testing, scenario planning and horizon scanning. Third, major trading nations should deepen cooperation on protecting the global commons — from shipping lanes to digital infrastructure — because the stability of these systems serves a shared international interest rather than the interests of any one country alone.

The Strait of Hormuz is not simply another geopolitical flashpoint, but a reminder that globalization is entering a new phase. The first era of globalization rewarded efficiency above all else. The next will reward resilience, diversification and strategic foresight. Nations that recognize this transition early will be better equipped to navigate an increasingly uncertain international environment.

The defining competition of the 21st century will not be determined solely by military capabilities or economic size. It will also be shaped by the ability to keep the world's essential arteries open, resilient and trusted. In that sense, the real lesson from Hormuz is not about the Middle East. It is about how the international community chooses to safeguard the future of globalization itself.

Rural schools promise to leave no single kid behind

For the past month, my wife and I have been living in my village in Fuyuan, China's easternmost city, in Heilongjiang province, to escape Beijing's summer heat. During our routine daily walks, we often passed a village school, a few hundred meters from Wusulijiang, a river along the China-Russia border.

As a former researcher of comparative education, my wife suggested we go in and take a look.

The campus was empty as the summer vacation was on. The only faculty member present there was friendly. He not only allowed us in but also showed us around. The school has a four-story academic building with about a dozen classrooms.

It has a football field covered with artificial turf and surrounded by a synthetic 200-meter racetrack apart from a playground for basketball and other sports.

"Guess how many students we have," our guide asked us with a smile. We knew that the number of students in China's rural schools had been dwindling for some years now, and the dip could be sharper in this sparsely populated frontier area.

Before I could say there might be around 100 students, our guide answered his question himself: "Nine students in nine grades from primary to junior high. And we have more than 20 faculty members."

The next second, I found myself shutting my eyes and mouth as I did a quick mental calculation to conclude that the local government was spending a few million yuan each year to cover the faculty's salary and operational costs to ensure the nine students got their compulsory education.

Such a big investment in the few students' education displayed the people-centered approach of the Chinese government. No one should be left behind.

On the other hand, to speak honestly, maintaining rural schools for a shrinking student population is becoming a significant challenge for many local governments in the country.

These governments need to adopt practical, down-to-earth measures to reduce education costs and ensure sustainability.

These governments need to adopt practical, down-to-earth measures to reduce education costs and ensure sustainability.

In the past three decades or so, about 300 million rural residents have moved to the cities and counties in search of better-paying jobs. Many of them took their children along for better educational opportunities in the cities and counties.

As a result, the rural schools are seeing a dramatic outflow of students. Statistics show that from 2018 to 2023, the number of rural primary school students decreased by 31 percent. That means millions of rural students have left their rural schools.

The school we visited, for instance, once hosted several hundred students from nearby villages. Now that about one-third of the households in the village have moved to the urban areas with their children, the dwindling of the village school was anything but unexpected.

Most of the villagers I spoke to said they would rather send their children to boarding schools in the headquarters of Fuyuan city 50 kilometers away rather than the next-door village school.

If the children are too young, they even arrange to rent an apartment in the city and send the mother or grandparents to stay with the kids.

For many years now, an increasing number of village schools have been shutting down as students move to the so-called central schools — the school in my village being one of them — for compulsory education. Now, even these central schools are finding it difficult to survive as fewer students enroll each year.

The No. 1 Central Document released in February 2026 has emphasized the need to strengthen the coordinated provision of basic public services in county areas.

The document calls for the careful optimization of the layout of rural primary and secondary schools and kindergartens, ensuring the retention and effective operation of necessary small-scale rural schools and kindergartens.

It also proposes the implementation of a county-level high school revitalization action plan, the promotion of urban-rural school community construction, and the strengthening of coordinated allocation of teachers within counties.

Additionally, it encourages the online sharing of quality classes between urban and rural schools and calls for comprehensive measures to increase efforts in preventing school dropouts and ensuring education retention in rural areas.

The document points the right direction.

Effective problem-solving measures — such as teacher-exchange programs, long-distance education, and predesigned small-scale rural school models — should be studied and implemented to get rural schools out of the condition they find themselves in now.

GLOBAL VIEWS

CAI CUIHONG

Widening scope of digital and AI governance

China and the US can expand communication channels to mitigate shared risks and help build a constructive relationship of strategic stability

In July, China submitted its position paper on global cyber governance in the digital intelligent age to the Global Mechanism on Information and Communications Technologies in the Context of International Security, the first plenary meeting of which opened at the United Nations headquarters in New York. The paper identifies rising artificial intelligence-related cyber risks, growing threats to critical infrastructure, a lower threshold for cyberattacks and interstate cyber conflict, and the deliberate fragmentation of global digital industry and supply chains. It calls for peace and stability in cyberspace, respect for digital sovereignty, inclusive development and multilateralism. It also proposes that countries should promote the establishment of global standards for assessing cybersecurity risks associated with large AI models and principles for cross-border data flows. The document offers a new perspective on the next phase of major countries' motivations in digital and AI governance.

First, China's move from cyber sovereignty to digital sovereignty reflects the widening scope of global technology governance. Its 2010 white paper, The Internet in China, placed the internet within China's sovereign jurisdiction. The 2017 International Strategy of Cooperation on Cyberspace identified peace, sovereignty, shared governance and shared benefits as principles of international cooperation. Building on these positions, the 2026 paper argues that states have the right to choose, according to their national conditions, their development paths in AI and other digital technologies, as well as the technologies, products, and services they adopt.

This extends sovereignty beyond cybersecurity, jurisdiction, and internet governance to include AI development, technological choice, data security, supply chains and participation in international rulemaking. In practice, digital sovereignty comprises autonomy in development, freedom of technological choice and equal participation in rulemaking.

That sovereignty, however, requires material capacity. According to the International Telecommunication Union, about 2.2 billion people remained offline in 2025. Although 5G covered 55 percent of the global population, coverage reached 84 percent in high-income countries but only 4 percent in low-income countries. Weak infrastructure, limited digital skills and unaffordable technologies mean that autonomy remains more a principle than a reality for many developing countries.

China and the United States are major providers of digital technologies and infrastructure. Their technological pathways, export policies and standards shape the options available to other countries. Their influence will therefore depend not only on technology and standards, but also on whether they can offer reliable, affordable and sustainable solutions without foreclosing alternatives. Narrowing the digital divide will be an important measure of the appeal of their governance models.

Second, China-US competition and cooperation in the AI sector is expanding beyond individual technologies into a broader contest over technological ecosystems and governance rules. Chips, computing power and foundation models remain central, but long-term advantage will increasingly depend on three capabilities: building an integrated ecosystem that links hardware, cloud services, models, applications and digital infrastructure; shaping rules for safety testing, data governance, conformity assessment and technical standards; and encouraging other countries to adopt cost-effective technologies and governance frameworks.

SHI YU / CHINA DAILY

Both countries' policies reflect this shift. China's position paper stresses each state's right to choose its development path and technologies, while opposing forced alignment, exclusionary arrangements and supply-chain fragmentation. In July 2025, the US released Winning the AI Race: America's AI Action Plan, centering on innovation, AI infrastructure and international leadership. A related executive order in July 2025, Promoting the Export of the American AI Technology Stack, called for an "American AI Exports Program" offering allies and partners full-stack packages covering hardware, data center storage, cloud services and networking, AI models, systems and standards.

As the performance gap between leading Chinese and US models narrows, the next phase of China-US digital and AI governance is likely to exhibit four interrelated trends: persistent structural competition; further divergence between their technological ecosystems; continued but limited interdependence; and growing selective cooperation.

Third, institutional differences do not remove the need for joint risk management. AI can strengthen cyber defense, but it can also amplify risks arising from malicious-code generation and exploitation, online fraud, deepfakes and disinformation.

Drawing on the AI Incident Database, Stanford University's 2026 AI Index Report states that recorded AI-related incidents rose from 233 in 2024 to 362 in 2025, an increase of about 55.4 percent. Together with weak responsible-AI benchmarking and disclosure — which refer to systemic gaps where tech companies publish vague ethical principles or superficial test scores that fail to measure real-world safety, operational fairness, or human rights impacts — this rise is placing greater pressure on safety testing, incident reporting, and governance mechanisms. Neither country could easily contain the consequences of a major attack on electricity grids, financial systems, hospitals, or transportation networks, or the cross-border spread of severe AI risks.

The two countries already have a foundation for dialogue. On May 14, 2024, they held their first intergovernmental AI dialogue in Geneva. At the May 2026 China-US presidential meeting, they discussed AI and agreed to hold further intergovernmental dialogue. AI governance thus remains one of the areas in which official communication can survive strategic competition. Cooperation need not wait for broad strategic trust; it can begin with their common interest in preventing major risks.

A practical agenda could proceed on three fronts. At the operational level, the two sides can strengthen emergency communication, information sharing, technical verification and crisis de-escalation for major cyber and AI incidents, especially those affecting critical civilian infrastructure such as hospitals, electricity grids, water systems, financial networks and civil aviation.

At the regulatory level, China and the US can seek basic compatibility in terminology, thresholds and procedures for large AI model safety testing, severe-incident classification, vulnerability disclosure, risk notification, and low-sensitivity cross-border data flows serving the public interest.

At the multilateral level, both countries can work through the United Nations to help developing countries strengthen digital infrastructure, emergency-response systems, governance capacity and multilingual safety tools, without tying such assistance to political alignment or exclusionary procurement.

The aim is not strategic convergence, but to preserve the communication channels and risk-reduction mechanisms needed to manage competition, mitigate shared risks and help build a constructive China-US relationship of strategic stability.

SHEN YUJING AND DONG JIMENG

Dividends not division

The two major countries should work together to address risks posed by AI and ensure the technology is harnessed for the global good

JIN DING / CHINA DAILY

While pursuing healthy competition, China and the US should deepen practical cooperation to enable AI technologies to serve the well-being of people across the world. This serves the fundamental interests of both countries and meets the shared expectation of the international community.

Shen Yujing

Dong Jimeng

A new round of the artificial intelligence revolution driven by large language models is accelerating at a rapid pace. AI has evolved far beyond a purely technical issue to become a core strategic variable reshaping the global competitive landscape. As a transformative technology spearheading the new scientific and industrial revolution, AI is comprehensively reshaping modes of production and industrial structures. Competition and collaboration centered on AI will help shape the balance of power among major countries in the 21st century.

Over the past two years, major economies have stepped up efforts to formulate top-level national AI strategies, embedding AI in national development blueprints and mobilizing nationwide resources to sustain their competitive edges in this field. In July 2025, the United States released Winning the AI Race: America's AI Action Plan, charting a decisive course to cement US dominance in AI. In November 2025, the US launched the Genesis Mission, described as a historic nationwide initiative comparable in urgency and ambition to the Manhattan Project during World War II. It integrates supercomputing resources, research datasets from several national laboratories and private-sector large-scale model capabilities to build a unified computing platform. In July 2026, the White House published the report Science: A New Golden Age, advocating an overhaul of the US research system.

China and the US are leading the global development of AI. According to core AI indicators in Stanford University's 2026 AI Index Report, China and the US account for the vast majority of global resources and outputs in computing capacity, industrial application and high-impact academic papers — a lead unlikely to be challenged by other nations in the near term. In computing supply, both countries maintain advantages in high-end chip reserves and the scale of computing hubs. An Oxford University study titled AI Compute Sovereignty: Infrastructure Control Across Territories, Cloud Providers and Accelerators, found that major AI computing clusters are concentrated in the two nations: 26 in the US and 22 in China.

Stanford's report also indicates that the US retains an edge in developing top-tier frontier models, yet China is closing the gap rapidly. While the US leads in quantity, Chinese models are catching up fast in quality. The comprehensive performance gap between leading Chinese and US frontier models stands at just 2.7 percent, with models from both sides alternating at the top of rankings since early 2025, marking a phase of parallel technological progress. Regarding supporting factors such as AI talent and data, the US still hosts the world's largest pool of elite AI researchers and retains advantages in attracting top original innovators. According to China's National Development and Reform Commission, China possesses one of the biggest cohorts of AI engineers, producing more than 5 million STEM graduates every year. In 2025, according to the National Data Resource Survey Report (2025) released by China's National Data Administration, China generated 52.26 zettabytes of data, accounting for 27.44 percent of the global total and ranking among the world's largest data resource holders. These scale advantages in talent and data lay a solid foundation for sustained long-term AI growth.

AI is a shared endeavor of humanity, and its sound development bears on the common well-being of all. As the two major forces driving global AI progress, China and the US can transcend zero-sum competition, strengthen their collaboration, jointly address global challenges arising from AI and advance the ethical and beneficial development of AI.

First, China and the US can work together to support AI cooperation between the Global North and the Global South as well as South-South cooperation to build an open and inclusive global AI governance system. Severe imbalances persist in global AI development, with many developing countries facing bottlenecks in computing power, data, talent and technology. Both sides should abandon zero-sum thinking, uphold the principle of extensive consultation, joint contribution and shared benefits, and help developing countries build their AI capacity through technology transfer, capacity building and talent training.

Second, China and the US can jointly guard against AI risks. While rapid AI innovation unlocks enormous opportunities, it also brings risks including algorithmic bias, privacy breaches and ethical conflicts, with potential implications for international security and global stability. Faced with these transboundary risks, China and the US can deepen dialogue and cooperation on AI safety governance, ethical norms and standard-setting, and jointly improve early-warning and response mechanisms to ensure AI evolves along a secure and reliable track.

Finally, the two countries can jointly harness AI to benefit humanity and tackle global challenges. AI offers new tools to address climate change, public health emergencies, food insecurity and energy shortages. The two nations can pursue pragmatic cooperation in AI-enabled low-carbon transition, pharmaceutical research and equitable access to quality education, turning AI into a powerful instrument for resolving shared challenges facing humankind.

History shows that the dividends of technological revolutions can reach all humanity only through positive interaction and responsible leadership among major countries. While pursuing healthy competition, China and the US should deepen practical cooperation to enable AI technologies to serve the well-being of people across the world. This serves the fundamental interests of both countries and meets the shared expectation of the international community.

CIFTIS set for heavy turnout in Beijing

Services sector fair confirms some 300 Fortune Global 500 firms will attend

By **REN QI**
renqi@chinadaily.com.cn

The 2026 China International Fair for Trade in Services, which is scheduled to be held from Sept 9 to 13 in Beijing, has entered its final preparation stage with a strong focus on facilitating enterprises' overseas expansion.

Since its inception, CIFTIS has resonated with the development of global trade in services, becoming an important platform for countries to showcase innovative achievements in the services sector, promote policy exchanges and foster trade cooperation, said Wei Mingqian, deputy general manager of Beijing North Star Co Ltd.

Wei said the successful hosting of the event relies heavily on media attention, recalling that the 2025 CIFTIS attracted over 3,200 registered journalists and achieved record-high coverage, fully demonstrating the innovative achievements of China's high-quality services sector.

This year's event will feature exhibitions, promotional negotiations, achievement releases and support activities, Wei added.

Demonstrating a continuously rising level of international engagement, nearly 300 Fortune Global 500 companies and industry-leading enterprises have confirmed their on-site participation.

For the first time, the 2026 CIFTIS will debut a "going global services promotion roadshow area".

This innovative section will feature professional institutions and enterprises related to finance, law, accounting, intellectual property, advertising and human resources to conduct promotional pitches and information sharing.

Centered on key themes such as the commercialization of achievements, open cooperation and new quality productive forces, the area aims to provide enterprises with one-stop services geared to help them expand overseas. More than 40 related roadshow activities have already been scheduled.

"The registration of exhibitors is drawing to a close, with those from nearly 70 countries, regions and international organizations having confirmed their participation to set up exhibitions," Wei said. He highlighted that Norway, as the guest country of honor, and Guangxi Zhuang autonomous region, as the guest provincial region of honor, will be setting up dedicated pavilions.

The upcoming fair will also highlight major debuts. More than 80 enterprises and institutions — including Alibaba, Schneider Electric and GE Healthcare — plan to release over 180 innovative achievements covering artificial intelligence, healthcare, cultural exports and green development.

"Relevant countries, international organizations and provinces will host over 190 forums, conferences and promotional activities," Wei said.

Highlighting long-term cooperation, the fair has expanded its sponsorship roster to include new partners like Beijing Data Group. Furthermore, the event will launch 28 new cultural and creative products, including co-branded chocolates, Wei said.

To provide an immersive consumption experience, the 2026 CIFTIS will feature over 70 support activities, extending beyond the main venue to multiple areas across the city.

Furthermore, the fair is prioritizing technological integration to upgrade its service quality.

"We are fully integrating digital technology into the entire process of the exhibition," Wei said, adding that the event will utilize AI translation devices, intelligent recommendation platforms and AI itinerary assistants to help participating enterprises efficiently connect with global partners.

Catering services have also been upgraded, with fixed seating tripled to accommodate up to 10,000 visitors, complemented by smart coffee and ice cream machines, while optimized shuttle buses will feature smart positioning and real-time information.

Ticketing for the 2026 CIFTIS has officially opened to the public via its official website, app and mini-programs, Wei added.

Dow eyes growth in multiple sectors

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Dow, a United States-based materials science company, sees massive opportunities in China in sectors such as advanced manufacturing, artificial intelligence, data centers, new energy, mobility and circular economy solutions, and vows to continue expanding its investment as the country deepens its transition toward high-quality development.

Amid a complex global economic landscape, this steadfast commitment underscores the country's enduring appeal to foreign investors, driven by clear policy direction and rapid industrial upgrading, said a senior Dow official.

For Crystal Huang, president of Dow Greater China, the nation stands out for its policy clarity, industrial resilience and long-term commitment to innovation-driven growth. These factors, she noted, are providing global businesses with greater confidence to invest, innovate and grow alongside China's economic transformation.

"China combines scale, a highly integrated manufacturing ecosystem, world-class infrastructure, and increasingly sophisticated customer demand," Huang said. "This is critically important for materials science companies like Dow, which seek to carry out localized research and development, manufacturing and application-driven innovation."

China currently represents Dow's second-largest market globally and its largest outside the US. Despite global headwinds, Huang highlighted that the country's economic performance this year has demonstrated remarkable resilience, characterized not just by the pace of growth, but by an ongoing pivot toward higher-value development.

As China's innovation ecosystem becomes an increasingly vital engine of growth, frontier technologies are fundamentally reshaping industrial capabilities, she said.

"AI and other high-end technologies are becoming powerful catalysts for productivity growth and industrial upgrading in China," Huang said. "For multinational companies like Dow, this creates opportunities to accelerate collaborative innovation on next-generation solutions and achievement transformation with our Chinese customers."

To capitalize on these shifts, Dow is actively reinforcing its local footprint. Last year, the company launched its first global cooling science studio in Shanghai, designed to deliver sustainable cooling solutions for booming industries like AI, the internet of things, robotics and automation. By March 2026, Dow had already expanded this lab to support key industry trends including vehicle electrification, autonomous driving and smart technologies across the mobility value chain.

The company is simultaneously upgrading its manufacturing network to match the country's industrial ascent. Following the completion of a major silicone expansion in Zhangjiagang, Jiangsu province, last year, Dow announced last month a fresh series of targeted investments to expand its global specialty silicones capabilities.

New liquid silicone rubber, or LSR, manufacturing expansions in Zhangjiagang are expected to begin operations in 2027, catering to high-performance applications in mobility and healthcare.

Amid significant shifts in international commerce and capital flows, China is fortifying its manufacturing and supply networks, said Li Xingqian, vice-chairman of the China Council for the Promotion of International Trade.

Simultaneously, the nation is deepening its global integration by lowering market entry barriers, optimizing the corporate climate and implementing targeted policies to stabilize foreign investment, Li said.

"China's dual emphasis on expanding domestic demand and pursuing high-standard opening-up is strengthening its long-term economic resilience and cementing its role in global value chains," said Huang.

Looking ahead to the second half, Dow remains highly optimistic about sectors aligned with the country's development priorities. "We believe China's strengths — including its innovation ecosystem, manufacturing capabilities, talent pool and market scale — will continue to support high-quality development," Huang said.

Luxury brands shine bright in China

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

A growing number of international fashion and footwear brands are posting robust sales growth in China as affluent consumers continue to spend on brands with distinctive positioning and disciplined retail strategies.

Ralph Lauren Corp, Tapestry Inc and Birkenstock Holding all reported double-digit growth in the Chinese market in their latest quarterly results, suggesting demand remains resilient for brands that combine premium positioning with localized marketing and product offerings.

The results contrast with a broader luxury sector that has struggled with softer consumer spending in China over the past two years.

Ralph Lauren delivered one of its strongest performances globally in the first quarter ended June 27, with revenue in China surging more than 40 percent from a year earlier. Asia revenue increased 24 percent, driven by growth across all major markets, while North America also posted double-digit gains.

View of a Ralph Lauren shop in Shenzhen, Guangdong province.
PROVIDED TO CHINA DAILY

Ralph Lauren executives said during an earnings call that they do not expect quarterly growth above 40 percent to continue, but forecast low double-digit growth in China for the full fiscal year, underscoring the market's increasing strategic importance.

The Chinese market accounted for about 10 percent of Ralph Lauren's global revenue in the latest quarter, compared with roughly 2 percent before COVID-19.

The New York-based company attributed the performance to strong demand for womenswear and handbags, brand marketing and a disciplined retail strategy focused on six key cities. Management also confirmed Ralph Lauren will participate in the China International Import Expo for the first time later this year, signaling further investment in the market.

The company has also invested heavily in brand building. Recent campaigns have included a Beijing polo tournament, Wimbledon-themed marketing as the tournament's official outfitter and Ralph's Coffee shops inside select stores, offering consumers a lower-cost entry point into the brand.

Women's apparel, outerwear and handbags all grew by more than 20 percent globally during the quarter, outperforming the broader business.

Tapestry Inc, the New York-based owner of Coach, Kate Spade and Stuart Weitzman, also reported another strong quarter in China. The company said Asia-Pacific revenue rose 19 percent in both the fiscal fourth quarter and full year ended June 27. Sales in China increased 28 percent during the quarter and 35 percent for the full year.

Coach remained the group's primary growth engine, posting double-digit revenue growth in every quarter of fiscal 2026. Demand for leather goods remained particularly strong, helping lift average handbag selling prices by the mid-double digits.

The company added more than 2.5 million new customers globally during the quarter and about 11 million during the fiscal year, with Generation Z accounting for about 35 percent of new customers.

German footwear maker Birkenstock also continued to outperform in China despite weakness across parts of the global footwear sector.

For the fiscal third quarter ended June 30, revenue increased 13 percent to 720 million euros ($835 million), while Asia-Pacific sales rose 18 percent, or 23 percent on a constant-currency basis.

Revenue in China surged 50 percent from a year earlier, making it Birkenstock's largest market in the Asia-Pacific.

The results suggest that international brands with differentiated positioning continue to find growth opportunities in China, even as discretionary spending remains uneven.

"Demand for quality fashion has not disappeared," said Cheng Weixiong, a fashion industry analyst.

Cheng said Ralph Lauren's classic aesthetic, broad price architecture and disciplined discount strategy resonate with the country's middle-income consumers seeking versatile, premium apparel without the volatility seen in the broader apparel market.

Briefly

Inclusive loans to small firms rise

China's inclusive loans to small and micro enterprises maintained steady growth in the second quarter, said the National Financial Regulatory Administration. Outstanding inclusive loans to small and micro enterprises reached 38.9 trillion yuan ($5.73 trillion) at the end of the second quarter, up 8 percent year-on-year.

Moves to ensure rail safety amid rains

Chinese railway operators have bolstered measures to better safeguard the safety of rail transport amid heavy rainfall. In Shanxi province, the Taiyuan High-Speed Railway Engineering Section strengthened manpower, physical and technical defenses to solidify such efforts. Prior to forecasted downpours, the section utilized aerial drone inspections, manual foot patrols and dynamic observations to enhance hazard identification capabilities. Post-rainfall, it sent staff to check tracks, bridges, tunnels and drainage systems, with timely repairs executed. It shifted its flood prevention from reactive measures to proactive forecasting, ensuring the safe operation of high-speed railways.

XINHUA - CHINA DAILY

Etihad to expand China flights

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

With high expectations for China's long-term growth, Etihad Airways, the national airline of the United Arab Emirates, has unveiled plans to increase its passenger services to China to 35 flights per week by the end of March, up from the current seven flights per week, making China its fastest growing market in 2027.

The airline is further expected to double capacity in China in the coming five to seven years, which would make the country the group's top three market in terms of revenue, said the top executive of the Abu Dhabi-based carrier.

"We have very big expectations. Our vision is to have at least two flights a day per destination in China together with China Eastern," said Antonoaldo Neves, chief executive officer of Etihad Aviation Group, during an exclusive interview with China Daily.

"I don't see any reason why our capacity of 35 weekly flights, together with China Eastern, can't double over the next five to seven years. We're really excited about the opportunities in the Chinese market," said Neves, adding that the group's growth in China is strengthened by its two partners, China Eastern Airlines and SF Airlines.

"We're currently flying only to Beijing, but we'll soon add services to Shanghai as well as to Shenzhen and Guangzhou (Guangdong province), Hangzhou (Zhejiang province) and Chengdu (Sichuan province). Expanding our passenger network will also increase the belly cargo capacity," he said.

According to the CEO, the carrier transports 2,600 metric tons of cargo every single week from the Chinese mainland to Abu Dhabi, with about 40 percent of that cargo being exports from China to Abu Dhabi, and 60 percent going beyond Abu Dhabi.

Although China currently accounts for only two of Etihad's roughly 300 daily flights, the planned capacity expansion is expected to make it one of the airline's three fastest-growing markets.

"In terms of both cargo and passenger revenue, China will become one of our five largest markets next year, and it won't take long before it ranks among our top three," said Neves.

The decision to launch the new services was driven by several factors, including growing tourism between China and Abu Dhabi, rising demand for both passenger and cargo transport, and the need to strengthen the carrier's partnerships through additional capacity.

"I truly believe that the world is getting more connected. Aviation grows two times the GDP in markets like China, like the UAE. So if GDP in China is growing 5 percent, aviation is going to grow 10 percent. If GDP in the UAE is growing 5 percent, it's going to grow 10 percent," he added.

According to the CEO, robust demand continues to underpin the aviation industry's growth, with Etihad's passenger capacity now 20 percent higher than a year ago. He said the biggest challenge facing airlines was the limited availability of new aircraft, as delivery lead times have stretched to three or four years. Even so, he said the long-term trend remained firmly positive.

The executive said he remained strongly bullish on the country's long-term prospects. He pointed to China's advances in information technology, artificial intelligence, the digital economy, robotics, automation, electric vehicles and renewable energy as evidence that the country's growth still has significant room to run.

Balancing green power, grid stability

Solar capacity on track to surpass coal-fired capacity in third quarter

By ZHENG XIN
zhengxin@chinadaily.com.cn

Driven by the surging electricity demands of high-end manufacturing and a rapidly expanding digital economy, China's energy landscape is witnessing a historic paradigm shift.

Solar power capacity is on track to officially surpass coal-fired capacity in the third quarter, driven by an explosive surge in electricity demand from new quality productive forces such as high-end manufacturing, artificial intelligence and electric vehicle infrastructure.

According to a comprehensive mid-year report released by the China Electricity Council, the nation's power sector is accelerating its green and low-carbon transition during the 15th Five-Year Plan period (2026-30), entering a new stage characterized by scaled-up quality and systemic modernization.

China's total installed power generation capacity reached 4.01 billion kilowatts by the end of May, making it the first country to cross the 4-billion-kW threshold, said the CEC's recently released report on the analysis and forecast of the national electricity supply and demand situation in the first half.

By the end of June, total solar power capacity had caught up with coal, effectively tying it as the country's largest power source. New energy sources have now firmly established themselves as the undisputed main body of newly added power capacity, the CEC said.

"In the first half, total nonfossil energy power generation grew by 8.5 percent year-on-year, accounting for 44.5 percent of total power generation — an increase of 1.4 percentage points from the same period last year," said Hou Wenjie, director of the statistics and data intelligence department at the CEC. "More remarkably, the incremental growth of nonfossil energy power generation accounted for 70.7 percent of the total incremental power generation nationwide."

Conversely, traditional fossil fuels are seeing their dominance wane. Coal-fired power generation accounted for 49.7 percent of total power generation in the first half, dropping below the 50 percent mark for the first time in the nation's modern industrial history, Hou added.

Industry experts believe that China's installed power structure is seamlessly continuing its green and low-carbon transformation, a shift that is generating immense dividends not just domestically, but also globally.

Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University, said the continuous climb in installed capacity has significantly boosted overall power generation performance.

The incremental output from nonfossil energy already accounts for 70 percent of the country's total power generation increase, Lin said.

"China's massive manufacturing scale and technological innovation have reduced the global levelized cost of solar and wind power by more than 60 percent and 80 percent, respectively, over the past decade," Lin added.

High-quality Chinese new energy products have significantly enriched global supply and accelerated the world's low-carbon transition in recent years, according to a document titled "China's Position on the So-called Excess Capacity Issue" by the Ministry of Commerce.

China's green and low-carbon transformation serves as both a vital cornerstone of its high-quality development and a landmark contribution to global sustainability, the document said.

In terms of newly installed capacity, the first half saw the nation add 160 million kW of power generation capacity. Wind and solar power combined accounted for 110 million kW of the total, representing a staggering 70 percent of all new capacity added to the grid, said the CEC.

While the supply side of the grid goes green, the demand side is undergoing an equally profound structural transformation. The CEC said electricity consumption driven by the digital and smart economy is experiencing "explosive growth".

"In recent years, China has accelerated the development of new quality productive forces," said Jiang Debin, deputy director of the statistics and data intelligence department at the CEC. "New growth drivers represented by high-end manufacturing and the digital-intelligent economy continue to expand rapidly ... The robust growth in power consumption in these related industries has become the core engine driving the overall electricity consumption growth of the entire society."

The CEC report shows that electricity consumption in high-tech and equipment manufacturing stood out remarkably in the first half, surging 9.8 percent year-on-year. The growth rate was 6 percentage points higher than that of the same period last year, contributing to 32.8 percent of the total growth in industrial electricity consumption.

A worker is busy fulfilling orders for solar photovoltaic modules at Ronma Solar Technology (Jinhua) Co in Jinhua, Zhejiang province, on July 28. SHI KUANBING / FOR CHINA DAILY

Notably, every single subsector within this category recorded positive power consumption growth, the report said.

Simultaneously, within the digital economy, emerging business models — particularly internet data services such as AI data centers and EV charging and battery-swapping services — are exhibiting exponential power demand.

"In the first half, the combined monthly incremental electricity consumption of internet data services and battery swapping and charging services remained between 5.5 billion and 8.5 billion kilowatt-hours. These two sectors consistently accounted for 15 percent to 25 percent of the total societal incremental electricity consumption each month," said Jiang.

From January to June, these two sectors accounted for 59.3 percent of the total increase in electricity consumption in the tertiary industry, acting as the critical force driving that growth.

The EV sector's power appetite is particularly striking. The number of new energy vehicles on the road has surged. In the first half, the national EV charging and swapping service sector consumed 81 billion kWh. In June alone, power consumption hit 14.8 billion kWh, representing a year-on-year growth of 57.1 percent.

Internet data services are following a similar upward trajectory. The explosive boom in AI applications drove the sector's power consumption to 49.4 billion kWh in the first half, nearly matching the total consumption recorded for the entirety of 2024.

"Currently, the AI industry is shifting from a 'training-centric' phase to a phase where 'training and inference are equally important,'" said Jiang. "The volume of AI token calls remains in an exponential climbing channel, meaning the related electricity consumption will continue its high-speed growth for the foreseeable future."

Overall, high-tech manufacturing, data centers and EV infrastructure are rapidly evolving from marginal contributors into the "core increment" of China's power consumption, he added.

Despite the massive strides in renewable deployment, experts warn that the transition is not without operational hurdles.

"The power system is currently facing multiple pressures encompassing security of supply, renewable consumption and economic viability," Zhang said. "There is an urgent need to enhance the reliable output, active grid support and coordinated regulation capabilities of new energy during critical periods of peak system demand."

To address this, the recently drafted plan for renewable energy development during the 15th Five-Year Plan period has, for the first time, incorporated reliable substitution and peak power generation capabilities into its target system.

The plan proposes that by 2030, the average reliable capacity value of wind and solar power should be increased to 8 percent. Furthermore, it aims to increase the share of wind and solar electricity during summer and winter evening peaks to 20 percent, and to boost the newly added reliable peak power generation capacity of renewables by 300 million kW.

"At present, achieving these targets presents certain challenges," Zhang said.

To enhance the reliable substitution capability of new energy, she urged the industry to accelerate the construction of "grid-friendly" new energy stations, while upgrading older legacy wind and solar plants, encouraging capacity expansion and the rational pairing of energy storage systems to steadily improve their grid-connection performance.

"On the technical level, we must increase research, development and application of advanced technological equipment, such as grid-forming technologies, high-precision power forecasting and integrated dispatch systems, while also significantly increasing the proportion of long-duration energy storage," Zhang said.

Looking ahead, the CEC forecasts that as new quality productive forces continue to expand, related industries will see their share of power growth in the industrial sector and the tertiary sector climb even higher, pushing China's electricity consumption structure toward a more technology-intensive and green direction.

The report projects that newly added power generation capacity for 2026 will reach 400 million kW.

By the end of this year, total installed capacity will reach approximately 4.3 billion kW. Of this, nonfossil energy capacity is expected to hit 2.7 billion kW, accounting for about 63 percent of the total. Wind and solar power will officially comprise half of the nation's total capacity, while coal power's share will shrink to roughly 31 percent, the report said.

Hou projects that total electricity consumption will grow by 5 to 6 percent year-on-year in the second half, with the maximum unified grid load reaching between 1.57 billion and 1.63 billion kW.

Looking toward 2030, the CEC anticipates a fundamentally restructured grid characterized by growth in green power and stabilization of coal power.

"By that time, the power industry will have formed a completely new paradigm where new energy serves as the main body of installed capacity, and clean energy dominates actual electricity generation," said Ye Jing, director of the power supply and demand analysis division under the CEC's statistics and data intelligence department.

Under this new framework, solar power will firmly hold its position as China's largest single power source. Concurrently, legacy coal assets will be strategically optimized. Rather than serving as traditional baseload power, coal will be relegated to a supporting role, providing vital safety backup, flexible peak shaving and gap-filling support when the sun is not shining or the wind is not blowing.

This dual approach is designed to ensure the grid can handle the explosive demand from emerging technologies without sacrificing stability.

By successfully balancing this massive green expansion with rigorous grid stability, China is actively engineering a clean, low-carbon power sector — one fully equipped to fuel the nation's next wave of technological and industrial innovation, Ye said.

Energy storage bolstering nation's electricity system

By ZHENG XIN

China continues to maintain the world's largest installed capacity in new energy storage, marking a historic transition for the technology from a supplementary role to a critical backbone supporting the nation's modern power system, according to a newly released official report.

Surging past previous records, the country's installed capacity of new energy storage reached 136 gigawatts by the end of 2025, marking an 84 percent increase year-on-year and a massive 40-fold expansion compared to the end of 2020, said the China New Energy Storage Development Report (2026) issued by the National Energy Administration.

The sector's rapid growth has delivered immediate operational benefits to the national grid, the report said.

In 2025, new energy storage capacity broke the 100 GW milestone for the first time — more than double the total capacity of traditional pumped-hydro storage. Over the year, these facilities successfully absorbed more than 30 billion kilowatt-hours of renewable electricity, boosting the national renewable energy utilization rate by approximately 2 percentage points.

Investment in new energy storage, together with charging and battery swapping infrastructure, hydrogen energy, and integrated source-grid-load-storage systems, has also been rising in recent years, according to the NEA.

Xu Jilin, deputy director-general of the NEA's Department of Energy Conservation and Technology Equipment, said during the 14th Five-Year Plan period (2021-25), China's new energy storage sector progressed from early-stage commercial application to a new phase of large-scale development, building a solid foundation for high-quality industry growth and multi-dimensional value creation.

In addition to rapid volumetric growth, the sector has demonstrated deepening technological innovation. A diversified development model has taken shape, led by lithium-ion battery storage while incorporating various advanced technological routes, according to the NEA.

Concurrently, the operational effectiveness and regulation capabilities of these storage systems have steadily improved.

The annual equivalent utilization hours for new energy storage nationwide rose from 611 hours in 2023 to 911 hours in 2024, and reached 1,195 hours in 2025, reflecting its expanding role in balancing power supply and demand, said the report.

This enhanced storage infrastructure played a pivotal role during recent summer electricity demand spikes driven by sustained economic growth and hot weather, during which national electricity loads broke historical records three times.

According to the report, storing energy during normal operations allows the system to stand firm at critical moments.

For instance, in July 2025, when national peak electricity demand exceeded 1.5 billion kW, major industrial provinces such as Jiangsu and Shandong mobilized centralized dispatch of new energy storage facilities during peak hours. Peak discharge power reached 7.14 GW in Jiangsu and 8.04 GW in Shandong — equivalent to operating seven to eight 1,000-megawatt coal-fired units at full capacity — with a simultaneous dispatch rate exceeding 95 percent.

This reliable performance was further supported by broader grid infrastructure upgrades, including the commissioning of the Shaanxi-Anhui ultra-high voltage direct current project, bringing the total number of operational UHV corridors nationwide to 46, with a cross-regional transmission capacity exceeding 340 GW.

Looking ahead, the report outlines key tasks for 2026 and plans for the 15th Five-Year Plan period (2026-30). Key initiatives include supporting breakthroughs in core technologies, planning the construction of national energy research and development innovation platforms in the new energy storage domain, standardizing project management, and promoting efficient and value-driven market competition.

Technicians from State Grid Chuzhou Power Supply Company conduct an inspection at a smart energy storage sharing station in Chuzhou, Anhui province, on Aug 2. SONG WEIXING / FOR CHINA DAILY

Energy storage, coupled with auxiliary systems such as smart microgrids and vehicle-to-grid networks, plays a critical role in maintaining grid stability, said Zhu Gongshan, chairman of GCL Group, China's largest private power enterprise.

These technologies are indispensable for swiftly balancing power output against shifting demand. "By offering dependable backup electricity, they help forge a highly resilient and adaptable energy network," Zhu said.

Guangxi's courts bank on mediation

AI also plays key role in expediting intl commercial dispute resolutions

By **CAO YIN** in Nanning
caoyin@chinadaily.com.cn

Courts in the Guangxi Zhuang autonomous region are making significant strides in establishing themselves as a preferred venue for resolving international commercial disputes, with mediation and artificial intelligence playing key roles in the effort.

As China's gateway to the Association of Southeast Asian Nations, Guangxi shares a dynamic border with Vietnam. Each day, trucks laden with tropical fruits and a steady flow of traders and travelers cross the border for business and family visits. Such frequent exchanges naturally give rise to disputes.

Between January 2020 and June 2026, courts across Guangxi handled 3,250 foreign-related civil and commercial cases involving 75 countries, including the United States, Vietnam, Japan and Canada. The cases covered a wide range of issues, from divorce and private loans to trademark infringement and contract disputes. In 2025 alone, courts in the region handled 1,059 such cases, with the number rising annually, according to the Guangxi High People's Court.

To position itself as a preferred destination for resolving international commercial disputes, the region's judiciary has made mediation a cornerstone of its approach, tailoring it to the distinctive nature of cross-border cases.

> "Our goal is to prevent commercial conflicts from escalating."
>
> **Liu Qiangqiang,** a border police officer in the Guangxi Zhuang autonomous region

At Youyiguan, or the Friendship Pass, in Pingxiang, a city on the Vietnam border, local judges work with police, market regulators, officials from the border economic zone and trade associations to address commercial disputes. When a cross-border trade dispute arises, police often first stabilize the situation and identify the key issues. If the dispute involves border trade, they alert the local court to conduct joint mediation.

"Our goal is to prevent commercial conflicts from escalating," said Liu Qiangqiang, a border police officer, highlighting how expedited mediation keeps trade flowing and prevents minor misunderstandings from becoming major disputes.

Zhou Meichu, head of the Puzhai community in Youyi township, also underscored the importance of mediation in resolving disputes involving perishable goods such as durians and jackfruits.

"Some businesses can wait, but fruit cannot. Time is money," he said. "Quick resolutions do more to ensure the stability of cross-border trade between China and Vietnam than simply announcing verdicts."

With years of experience in international trade and community management, Zhou has earned the trust of many merchants, both Chinese and foreign. He subsequently became a civilian mediator, assisting judges in resolving foreign-related commercial cases. To better understand the needs of Vietnamese traders, Zhou has enlisted three Vietnamese nationals with a strong grasp of cross-border business practices as his colleagues.

"Mediation only works when it stays within the legal framework. That's what gets to the heart of a dispute and keeps business relationships alive in the long run," he added.

In Dongxing, another city in Guangxi, Du Yimiao serves as one of the region's bilingual, business-savvy mediators. Located just across a narrow river from Vietnam, Dongxing sees daily cross-border trade. Since a circuit judicial team was established in the border area in 2014, it has resolved more than 1,400 border trade disputes, with a mediation success rate of nearly 50 percent.

Du, an overseas Chinese, holds positions in the local chamber of commerce and women's federation, giving her deeper insight into business practices and cultural norms on both sides of the border. Over the past four years, she has participated in 57 dispute resolutions.

"Language barriers and cultural differences may easily turn minor disagreements into major conflicts," she said, describing her role as a bridge between the two sides.

"The law sets the baseline — I make sure both sides understand their legal standing while reminding them of the long-standing business relationships we have built across the border," she added.

To strengthen the institutional framework for mediation, the Guangxi High People's Court has issued guiding documents to support the Belt and Road Initiative and improve the business environment. The region has also established the China-ASEAN Free Trade Area Nanning International Commercial Tribunal, further helping foster an institutional system for standardized mediation in cross-border cases.

The tribunal is also turning to AI to address one of the key challenges in international commercial disputes: identifying and applying foreign laws where applicable.

In 2025, the Guangxi Department of Justice and Guangxi Minzu University launched an artificial intelligence-powered legal service assistant. The platform has since incorporated more than 100,000 legal texts from ASEAN member countries, covering 100 core laws in seven languages. It provides legal consultation, policy interpretation and risk assessment, along with multilingual translation and cross-jurisdictional services.

Dang Shu, director of the rule of law research center at the Guangxi Department of Justice, said that compared with other AI tools, the dedicated legal assistant draws on official data sources from ASEAN countries and follows a rigorous translation process to ensure judicial accuracy.

Wu Xiaofan, president of the Guangxi Commercial Mediation Association, praised the platform's reliable database, saying it helps parties reduce the costs and time involved in mediation.

In a late-2025 durian contract dispute, for instance, the tribunal used the AI tool to retrieve, cross-reference and translate applicable Vietnamese laws for the litigants, resolving within minutes a dispute over the characterization of the business relationship that had long eluded consensus.

Since its establishment in September 2022, the tribunal's caseload has grown from 438 cases in 2023 to 610 in the first half of this year. Yang Ding, deputy chief judge, said she and her colleagues are embracing the technology to improve judicial efficiency and quality.

"We hope to build a fully integrated, digitally empowered dispute-resolution system tailored for ASEAN partners to advance the region's goal of becoming a preferred venue for international commercial disputes and supporting high-level opening-up," she added.

Generational efforts turn desert green

By **ZHAO JIA** in Beijing and **MA JINGNA** and **HU YUMENG** in Lanzhou

At Babusha Forest Farm on the southern edge of the Tengger Desert in Gulang county, Gansu province, 41-year-old Guo Xi can now use a drone to patrol 5,000 hectares of farmland for fire risks and pests, a once laborious task his grandfather's generation did on foot.

The transformation is just as striking when it comes to irrigation.

"My grandfather's generation hauled water on donkey carts, my uncles switched to farm vehicles, and by our generation we had 15-metric-ton water trucks. Now we have drip irrigation," said Guo, a third-generation desert-control worker whose grandfather, Guo Chaoming, was one of the founders of the farm.

Water trucks once struggled to reach remote stretches of sand. Today, Guo said, smart drip-irrigation systems can be managed remotely, making water delivery more precise and efficient.

"Desert control today is no longer simply about hard physical labor. We have to use technology to make desert control and forest management more efficient," he said.

Guo has observed the transformation since childhood.

"When I was young, wherever you looked, there was yellow sand," he said. "Now, wherever you look, it is green. The previous two generations worked for decades to leave us this oasis."

Now a father of three, Guo hopes one of his children will eventually return to Babusha after receiving a good education.

"I hope the next generation can use more professional and advanced technology to protect Babusha," he said.

The generational relay began in 1981, when six villagers from Tumen township — Guo Chaoming, He Falin, Shi Man, Luo Yuankui, Cheng Hai and Zhang Runyuan — all aged 50 or older, banded together to manage 5,000 hectares of shifting sand. They began planting trees and stabilizing dunes as desertification crept closer to villages and farmland.

As the original founders aged, their children took up the mantle. Guo Wangang, Communist Party of China secretary and head of Babusha Forest Farm, stepped in as a second-generation worker to continue his father Guo Chaoming's work.

For Guo Wangang, now 74, carrying on his father's legacy requires persistence.

"The most valuable thing in desert control is perseverance," he said. In summer, he still gets up at 5 am to arrange the day's irrigation and forest maintenance.

"There is a saying in desert afforestation: one part planting, nine parts tending," he said. "Planting a tree is only the beginning. What matters more is keeping it alive over the long term."

Since 2019, Babusha Forest Farm has completed desert control and afforestation on 13,900 hectares and restored about 10,587 hectares of degraded forest, according to local authorities. Vegetation coverage in the front-line areas under its management has exceeded 70 percent, forming a green windbreak about 10 kilometers from north to south and 8 km from east to west.

Water remains one of the farm's biggest challenges.

"A big tree takes decades to grow. Without water, it can disappear just like that," said Guo Wangang, gesturing with his hand.

In 2024, as a deputy to the provincial people's congress, Guo Wangang submitted a motion to address Babusha's water shortage. To resolve the issue, a 500,000-cubic-meter reservoir was constructed alongside an accompanying drip-irrigation network, ensuring a stable water supply source for the entire forest farm.

"One of the biggest worries on my mind has finally been lifted," he said. "The survival of the trees now has a fundamental guarantee."

The forest farm's progress is also reflected in the lives of the people who have worked there.

Reflecting on decades of labor, He Zhongqiang, another second-generation desert-control worker, said the work has brought a deep sense of fulfillment.

A severe sandstorm had earlier convinced him and his peers that controlling desertification on Babusha's original 5,000 hectares was not enough. They also needed to tackle surrounding sources of sand, he said.

They later expanded treatment to another 7,600 hectares of desertified land and, from 2003, spent a decade carrying out desert-control work around Wudaogou village.

"Seeing the land improve and people's lives become more secure makes all the hardship worthwhile," he said.

Ma Shengrong, a forest ranger at the farm, remembers how wind and sand once threatened local harvests.

"When I was a child, crops we had worked hard to plant were often buried in the sand or destroyed by strong winds, and a whole year's harvest could be lost," Ma said. "That no longer happens."

Another witness to Babusha's transformation is Liu Wancheng, 57, who joined the farm in 1991 after moving from the mountainous southern part of Gulang.

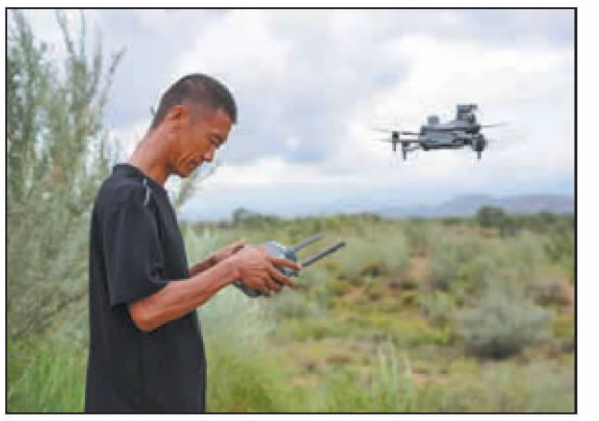
"It used to be 'sand advances, people retreat'. Now it is 'people advance, sand retreats'," Liu said. "When I first arrived, I earned just over 40 yuan ($5.93) a month. Now I can make more than 50,000 yuan a year through farm wages, seasonal desert control, and harvesting cistanche."

"We have not only brought the sand under control — but people can also earn an income from it," he said, adding that watching the desert turn green gives him a deep sense of achievement.

Today, Babusha's green economy goes far beyond individual harvesting. A free-range chicken farm sells more than 10,000 birds annually, generating more than 1.2 million yuan in output, while six Babusha-branded products — including cattle, sheep, goji berries and vegetables — are helping expand local agricultural industries.

For Wang Jiguo, deputy director of Gulang county's forestry technology center and a senior engineer, Babusha's core lesson is that desertification control must respect natural laws and local conditions.

"First make the land green, then help people prosper," Wang said, emphasizing that long-term restoration requires giving local people a direct stake in protecting the environment.



What species to plant and how to develop supporting industries, he noted, must be tailored to local soil, rainfall and climate.

"Restoring desertified land is not a short-term project," Wang said. "It demands a long-term commitment so that ecological protection becomes a mission passed from one generation to the next."

Offering a broader legal guarantee for such generational efforts, China's Ecological and Environmental Code, which took effect on Saturday, includes a dedicated section on desertification prevention and control.

Tong Yunshan contributed to this story.

Carnivorous plant find validates Darwin

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Scientists have confirmed the discovery of the first carnivorous plant in the Saxifragales order — a group of non-woody flowering plants widely spread across temperate and cold mountain regions. The breakthrough validates a prediction made by British naturalist Charles Darwin in 1875.

The findings were published in the international journal Nature Communications on Aug 4. The study was conducted by a joint team of researchers from the Kunming Institute of Botany of the Chinese Academy of Sciences in Yunnan province, the CAS Wuhan Botanical Garden in Hubei province, Jishou University in Hunan province, and the University of Florida in the United States.

The plant, *Saxifraga candelabrum*, grows in rock crevices located between 2,500 and 3,300 meters above sea level across the Hengduan Mountains on the southeastern edge of the Qinghai-Tibet Plateau. Its entire body is covered in dense, sticky hair-like structures called glandular hairs that trap small insects.

In his 1875 book *Insectivorous Plants*, Darwin studied two European species from the same family and noticed their sticky hairs could catch insects. He suggested that some species in the group might actually feed on their prey. However, the analytical tools of his era were not advanced enough to test his theory, leaving the question unanswered for nearly 150 years.

An insect is captured by *Saxifraga candelabrum's* sticky hairs. PROVIDED TO CHINA DAILY

The discovery began during fieldwork in Shangri-La, Yunnan province, when researchers noticed *Saxifraga candelabrum's* sticky hairs were packed with bugs — averaging 71 insects per plant.

To prove that insect trapping was a permanent evolutionary trait rather than an accidental event, the team surveyed 45 historical plant samples collected between 1888 and 2016. Forty-three of them still had insects stuck to their hairs, proving the plant has been preying on insects for well over a century. Scientists also discovered that the plant uses floral scents to lure insects. However, its sticky traps mostly catch midges — small flies that do little to help fertilize the plant. Larger and more effective pollinators, such as hoverflies and wild bees, rarely get stuck. This smart tactic allows the plant to hunt for food without accidentally killing the insects it relies on to reproduce.

Many plants use sticky hairs purely to keep harmful bugs away. To prove *Saxifraga candelabrum* actually digests its catch for nutrients, researchers tested for digestion-aiding proteins. They found phosphatase — an enzyme that breaks down animal matter — right inside the plant's sticky hairs. They then used chemical tracking with nitrogen isotopes, which are special elemental markers, to confirm that the plant absorbs nitrogen from the digested bugs to fuel its flowering and fruit growth.

In addition, the research team mapped out a complete high-precision genome of the species.

Zhang Xinjian, first author of the study and a postdoctoral researcher at the Kunming Institute of Botany, noted that the findings challenge long-held botanical assumptions.

Zhang explained that while most known carnivorous plants use dramatic, specialized traps like pitchers or snapping jaws, this discovery serves as a reminder that quieter insect-eaters exist in nature. Sticky hairs traditionally viewed as simple self-defense mechanisms may actually double as feeding tools.

This suggests that insect-eating behavior among flowering plants may be far more common than previously realized, opening the door for the discovery of many more carnivorous species in the future.

Uncovering a soaring scale of biodiversity

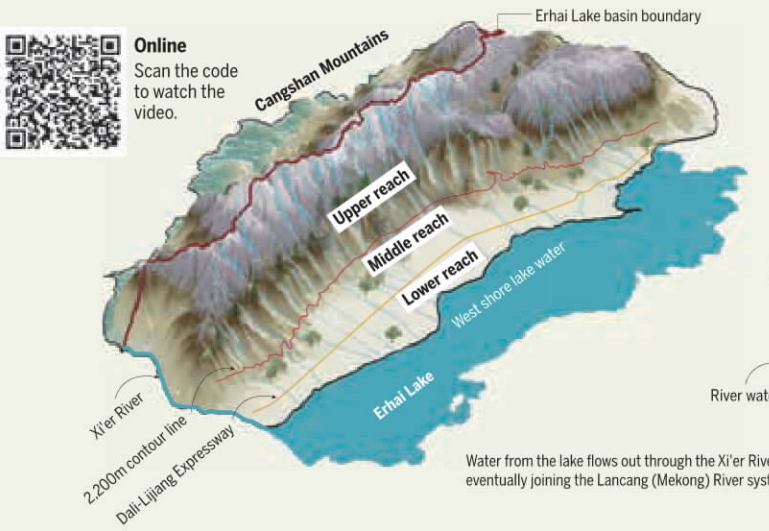
Survey of the Cangshan Mountains reveals wildlife paradise. **Yan Yujie** reports from Dali, Yunnan, with **Zheng Jinran** in Beijing

The Cangshan Mountains in Southwest China's Yunnan province have long been known as one of the country's richest reservoirs of biodiversity, home to forests, alpine meadows and thousands of animal and plant species.

After the results of a comprehensive three-year survey were released in April, the true and expanded scale of the mountains' biodiversity and intertwined ecosystems has been uncovered.

The scientific expedition, which featured some 4,000 visits by researchers from eight institutes at the national and provincial levels, covered an area of 966 square kilometers — roughly the size of New York City.

Surveying flora and fauna across elevations ranging from 1,360 meters to 4,122 meters, the researchers documented ecosystems, plants, fungi, wildlife and land use across the mountain.



For Chai Yong, project secretary and head of the vegetation research team at the Yunnan Academy of Forestry and Grassland, the expedition was as much about humility as discovery.

"The mountain constantly reminds us how little we know," Chai, 50, said.

In 2023, Chai and three colleagues were conducting vegetation surveys near Xieyang Peak, the southernmost of Cangshan's 19 peaks, when they strayed from their planned route and became trapped in dense shrubs.

"We could see the city below us, but we couldn't find a way down," Chai recalled.

Online
Scan the code to watch the video.

Water from the lake flows out through the Xi'er River, eventually joining the Lancang (Mekong) River system.

The team eventually found a narrow gully and followed it to safety. The experience reinforced a lesson Chai now often shares with younger researchers: understanding nature begins with respecting it.

That respect has been matched by a growing understanding of the mountain's complexity.

Researchers on the survey established Cangshan's first comprehensive vegetation classification system, identifying 10 vegetation types, 20 subtypes, 79 formations and 131 plant communities. They also documented 10 previously unrecorded plant communities and discovered the distribution of monsoon evergreen broad-leaved forests on the mountain.

The expedition recorded 4,600 species of higher plants and 418 large fungi, as well as 578 vertebrate and 787 invertebrate species.

"Cangshan is not a collection of separate ecosystems," Chai said. "It's a living system in which forests, water and wildlife are deeply interconnected."

The expedition also shed new light on Cangshan's relationship with nearby Erhai Lake, an iconic attraction of Dali city.

Using stable isotope analysis, researchers traced the movement of water across the region and found that surface water and groundwater originating from Cangshan contribute more than 65 percent of Erhai's west shore water supply in the rainy season, confirming the mountain's role as a critical ecological barrier and natural reservoir.

The findings have provided important scientific evidence for conservation efforts in the area.

Researchers found that vegetation cover on Cangshan has generally increased since the late 1980s, while protected areas within the Cangshan-Erhai National Nature Reserve consistently outperformed unprotected regions in ecological health, highlighting the long-term benefits of conservation.

For those involved in the project, however, the expedition's significance extends beyond scientific papers or statistics.

The findings will help guide future conservation, ecological restoration and environmental education, ensuring that the mountain's forests, rivers and wildlife continue to thrive.

After years of trekking across ridges and valleys, Chai said he now sees Cangshan differently. "People often admire it for its scenery," he said. "But the more you study it, the more you realize its greatest beauty lies in the connections that hold the whole system together."

CULTURAL HERITAGE

Dunhuang Academy's protection techniques have been successfully applied to the Jiaohe Ruins in Turpan, Xinjiang Uygur autonomous region.

Left: Mural restoration is carried out in one of the Mogao Caves in Dunhuang, Gansu province. **Right:** Guo Qinglin (second from right), director of the Dunhuang Academy, checks a multi-field coupling environmental simulation laboratory. **Below:** A distant view of the Mogao Caves. PHOTOS PROVIDED TO CHINA DAILY

Part of a mural restored in Dunhuang.

Taking Silk Road science global

Experts use advanced research to protect fragile earthen ruins and assist overseas partners, report **Wang Ru** and **Ma Jingna** in Dunhuang, Gansu.

Guo Qinglin still remembers a visit to Yumen Pass not long after he joined the Dunhuang Academy in 1999, in Dunhuang, Gansu province. He had followed senior colleagues to inspect the strategic Han Dynasty (206 BC-AD 220) fort, a vital gateway on the ancient Silk Road, and nearby sections of the Great Wall in Gansu. As he watched the crumbling fortifications, he noticed the expression on Li Zuixiong's (1941-2019) face grow increasingly grave.

"We cannot let such heritage disappear on our watch. We must accelerate research and development of conservation techniques for earthen sites," he recalls Li, then deputy director of the academy, saying.

That moment set Guo on a path from geology graduate to one of the world's leading experts in the conservation of earthen sites. Now 50, Guo is director of the academy which oversees the Mogao Caves — a UNESCO World Heritage site comprising hundreds of Buddhist caves adorned with murals and statues dating from the 4th to the 14th centuries. Over the years, he has watched the academy's conservation capabilities steadily evolve. Today, he leads his colleagues in sharing their expertise abroad, helping safeguard treasures that belong to all of humanity.

Guo's entry into the field was almost accidental. After graduating with a degree in geology from Lanzhou University in Gansu, Guo was introduced to the Dunhuang Academy by his teacher. At the time, he had only a vague sense that cultural heritage protection was something "sacred".

"I remember I told Wang Xudong, who worked as a staff member recruiting graduates from my university and later became director of the academy, that I didn't know much about cultural heritage conservation," Guo recalls. "He replied, 'That's okay. You can learn gradually.'"

Conditions at the academy were tough in those days. Located on the outskirts of Dunhuang, the institution had limited amenities, and staff members could take a shuttle bus to downtown only twice a week to bathe or make phone calls. At the same time, a lack of domestic expertise in conservation prompted extensive international cooperation. Before Guo joined the academy, cooperation with institutions in Japan and the United States in the 1980s had already brought advanced conservation philosophies and techniques to Dunhuang's conservators.

"Building on that foundation, our professionals made further innovations and eventually developed three major technology systems surrounding the protection and repair of ancient murals, protection and consolidation of earthen remains, and digitization of wall paintings and painted sculptures in cave temples," Guo says.

From a team of four members in the 1960s, the academy's conservation workforce has grown to nearly 200 people.

Mural conservation offers a telling example. China had long possessed traditional techniques, but many relied on artisans' personal experience rather than scientific analysis. Through collaboration with US experts, Chinese professionals gained a deeper understanding of the causes of mural deterioration. They refined their methods through scientific research, transforming experience-based practices into science-based conservation.

The cooperation also helped improve procedures. Overseas experts introduced a value-analysis step that Chinese professionals had previously overlooked, helping establish a comprehensive workflow for cultural heritage conservation: value analysis, on-site investigation, environmental monitoring, deterioration mechanism analysis, plan formulation and final implementation.

"Later, we applied these procedures to more than 300 cultural heritage projects across 21 provinces, municipalities and autonomous regions, including the restoration of murals at the Potala Palace in Lhasa, Xizang autonomous region," says Guo. "When our methods are scientifically sound, we can largely ensure good outcomes."

Of the academy's three major technology systems, the conservation of earthen relics has posed the greatest challenge and remained a key focus for decades. Of China's 767,000 immovable cultural heritage sites, about one-third are earthen relics, many of which have been listed as World Heritage sites.

"Made of earth, such relics are relatively fragile, as they are often exposed outdoors and can easily collapse or weather, leading to their fast disappearance, along with the precious historical information they carry," Guo says. "Protection of earthen sites is a world-class challenge."

The academy's attempt to protect such sites started in 1992. Early attempts involved adding chemical consolidating materials. Later, geotechnical engineering techniques, such as grouting reinforcement, were introduced, gradually evolving into a comprehensive system. The system has been successfully applied to the Jiaohe Ruins in Turpan, Xinjiang Uygur autonomous region, since 2006, and the Xixia Imperial Tombs in Yinchuan, Ningxia Hui autonomous region, since 1999, both of which are on the World Heritage List.

As protection techniques matured, the next frontier was understanding long-term effects of the environment. In 2020, the academy launched a multi-field coupling environmental simulation laboratory for mural and ruin protection.

The lab can simulate temperature ranges between -30 C and 60 C and relative humidity from 10 to 90 percent, as well as various climatic conditions across all four seasons, including wind, rain, snow, and sunlight for experimental testing. This allows researchers not only to understand a site's present condition, but also to glimpse its past and future, says Guo.

With these systems now well established, the Dunhuang Academy is increasingly taking its conservation expertise abroad. "Cultural heritage is a witness to a country's history, so every nation wants to protect it," says Guo. "Having benefited from international cooperation ourselves, we feel a responsibility to share our experience with counterparts abroad, to help them safeguard their heritage, which actually belongs to all of humanity."

In 2024, the academy signed memoranda with cultural heritage institutes in Uzbekistan, Kyrgyzstan, Sri Lanka, and Cambodia, covering joint site protection, exchanges of theories and techniques, cultural exhibitions, academic activities, and professional training. In 2025, the China-Kyrgyzstan Belt and Road Joint Laboratory on Cultural Heritage Conservation was approved for construction to advance these efforts. "Local people understand their own culture best," says Guo. "We offer techniques and discuss protection ideas together. In this way, we cooperate to protect their cultural heritage."

This year, academy professionals arrived at the ruins of the ancient city of Suyab in Kyrgyzstan, a key city on the ancient Silk Road that is now recognized as a World Heritage site, to establish a comprehensive experimental platform for heritage protection.

Aisin Duishanalieva, director of the Republican Inspectorate for the Protection of Historical and Cultural Monuments of the Ministry of Culture of the Kyrgyz Republic, told Global Times earlier that the lab, built under the Belt and Road Initiative, has established systematic research capacity and will continue to develop. "Through this joint collaboration, we can study and excavate cultural relics along the Silk Road and better popularize them in our two countries," she said.

Guo says: "Our academy will remain engaged in domestic and international cooperation, protect grottoes and share their art with an increasingly open approach, and attract more scholars, especially young ones, to join us.

"We will conduct comprehensive, multidisciplinary research on Dunhuang sites in the broader context of human civilization, dig deep into their historical, artistic and scientific value, and contribute to the cultural diversity of the world," he adds.

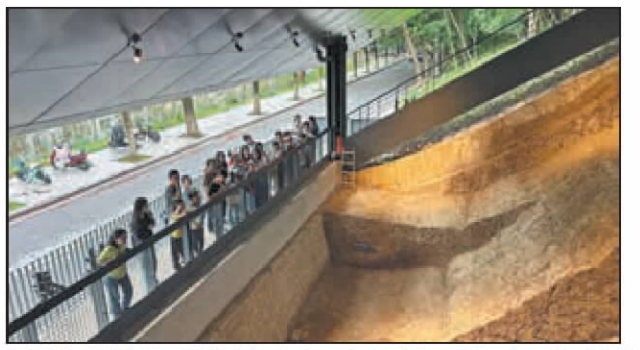
Living history book opens at Jingzhou city wall

By DENG ZHANGYU
in Jingzhou, Hubei
dengzhangyu@chinadaily.com.cn

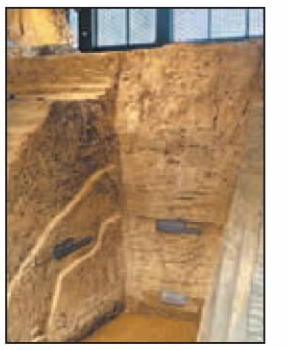
The ancient city wall of Jingzhou in Hubei province stands like a living history book. More than 2,000 years old, it has quietly "grown taller" in virtually the same location through successive dynasties, with its position shifting by less than 50 meters.

The Exhibition Hall of the Archaeological Site of Jingzhou City Wall, which opened earlier this year, offers visitors a clearer and more intuitive view of the wall's historical evolution and construction techniques over the past millennium.

Inside, the city wall is presented almost as a cross-section of history. Layers of brick and rammed earth dating from the Five Dynasties and Ten Kingdoms (907-960) through the Ming (1368-1644) and Qing (1644-1911) dynasties are stacked one upon another, recording the passage of time as clearly as tree rings.



"The city wall is the only city defense and flood-control system in southern China that has remained in continuous use for more than 1,000 years. This exhibition hall turns an archaeological site into vivid history that can be understood at a glance," says Tian Yong from Jingzhou Museum.



The exhibition hall was carefully built around the archaeological excavation site of Horse-face (*mamian* in pinyin) No 11. In 2019, during the restoration of the structure, archaeologists discovered an earlier brick wall beneath the Ming Dynasty wall. Since then, the archaeological team led by Tian has conducted three excavations at the site.

According to Tian, *mamian* is a specialized structural term for rectangular bastions projecting from a city wall. They reinforce the wall, enhancing its defensive capabilities. The Jingzhou City Wall stretches 11.28 kilometers, and has six ancient city gates and 25 horse-face-shaped bastions. Horse-face No 11 is located in the northern section of the wall.

Tian says archaeologists had never previously excavated deep into the wall out of concern for its structural integrity. Historical records show that the city wall existed during the Three Kingdoms (220-280) period, but there is no rigorous archaeological evidence.

The excavation has traced the wall back to the late Tang Dynasty (618-907). A rammed-earth wall from the Tang period was followed by a brick wall built during the Five Dynasties and Ten Kingdoms period, making it the earliest brick city wall discovered through archaeological excavation in China.

Left: The Exhibition Hall of the Archaeological Site of Jingzhou City Wall in Hubei province offers a close-up view of history. **Right:** The interior of a rectangular bastion shows various building techniques from different periods in history. PHOTOS BY LIU QING / FOR CHINA DAILY

The bricks of the Five Dynasties and Ten Kingdoms period are quite distinctive. They were salvaged from aristocratic tombs dating from the Han (206 BC-AD 220) to the Tang dynasties and are carved with images of maids and floral patterns. Historical records note that the ruler of the local kingdom at the time ordered nearby tombs to be excavated for their bricks, which were then used to build the city wall.

By the Song Dynasty (960-1279), the wall served both military and flood-control functions. Its exposed interior reveals a well-preserved brick drainage ditch, built with a carefully calculated slope to channel rainwater away quickly and prevent the wall from becoming waterlogged and collapsing.

Above this layer are blackened bricks and earth left by fires during the war-torn Yuan Dynasty (1271-1368). The main body of the wall visible today dates from the Ming Dynasty. Its most distinctive feature is the inscribed bricks, each bearing detailed information about its manufacturing date, place of origin, and the officials responsible for its manufacture. If a brick was found to be of poor quality, responsibility could be traced through the inscription.

"These inscribed bricks formed a rigorous quality traceability system in ancient China," Tian says.

Horse-face No 11 is about 14 meters high, roughly the height of a three-story building. Historically, Jingzhou's location along the Yangtze River made it vulnerable to frequent flooding, with historical records indicating water levels rose by as much as 17 meters. To withstand floods, the city wall was repeatedly raised, reaching over 30 meters at its peak. Therefore, the wall was not only a military barrier but also a lifeline that protected people from floods, Tian says.

The exhibition hall is free to the public and, unlike a traditional museum, has no enclosing walls. It connects seamlessly with the surrounding streets through gentle slopes and steps. People can stop by while walking or cycling, taking in the views while exploring the history.

"It perfectly combines excavation, protection, display and utilization. Here, history becomes tangible in an instant. People can see a thousand years at a glance and observe the construction periods, evolution process and building techniques of the city wall," says Yang Kaiyong, director of Jingzhou Museum.

LIFE

Translating for the palate

Chef Cheng shares his experiences interpreting cross-cultural cuisine, bringing his expertise to a cooking show as he joins the judging panel, **Li Yingxue** reports.

A piece of aged fish maw is turned slowly over charcoal until its surface takes on the dark shine of lacquer. Fermented black garlic adds depth, while sand ginger cuts through a buttery French sauce, creating a dialogue between chef Vicky Cheng's favorite dried seafood ingredient and French cooking techniques.

In another kitchen, the same ingredients might have been simmered for hours into a restorative Cantonese soup.

At Estuary by Vicky Cheng, which opened at Galaxy Macau in May, dishes are presented through the lens of contemporary French cuisine: controlled fire, carefully constructed sauces and precise tableside service.

The dish offers a concise portrait of its creator. Hong Kong chef Cheng has spent much of his career moving between culinary languages, searching for ways to make unfamiliar ingredients immediately appealing without erasing their origins.

Cheng's career reflects contemporary Chinese cuisine's growing global recognition.

Through his restaurants and his role as a judge on the cooking show *Chef of China*, Cheng has explored how Chinese cuisine can reach wider audiences without losing its identity.

At VEA, a one-Michelin-star restaurant in Hong Kong, Cheng established his "Chinese x French" cuisine. WING, ranked No 2 on the 2026 Asia's 50 Best Restaurants list, became his expression of "Boundaryless Chinese Cuisine". Estuary now completes the trio with what he calls "Indulgent and Nourishing French Gastronomy" — French cooking reconsidered through an Asian palate.

Estuary is not simply a return to Cheng's early French cooking. Named for where rivers meet the sea, it reflects his Hong Kong roots, Canadian upbringing and French training.

Born in Hong Kong and raised in Toronto, Cheng grew up with Chiu Chow (Chaozhou) food and his grandmother's Shanghai dishes. In Canada, however, his daily life became overwhelmingly Western.

"I grew up on a Western palate, but I am Chinese at heart," he says.

Cheng began cooking professionally as a teenager. During his six and a half years working at a Canadian restaurant, he progressed from novice to working across its kitchen stations.

"Since I was young, I was given many opportunities to compete in culinary contests," he says. He was taught "discipline of time" and "organization" — lessons he believes are unique to such high-pressure settings.

Those early experiences later gave Cheng a personal connection to *Chef of China*, where he joined the judging panel. Moving from competitor to judge allowed him, as he puts it, "to be on the other side of things" and "hopefully be able to help the industry as well".

The program exposed him to chefs from across the mainland and Hong Kong, each drawing on different regional styles of Chinese cooking. Their ingredients, knife skills and techniques were "not just inspiring, but also new and fresh", particularly for "somebody who's been cooking Western cuisine most of his life".

What interested him was what the high pressure revealed: "How quickly they adapt and how well they work as a team and also how well they perform as individuals".

As the field narrowed, judging became more difficult. "You're keeping only the best, and it's at a point where it starts to get very difficult to make a decision," Cheng says. "But in the end, it all comes down to taste. You can have the most creative dishes and the most amazing stories, but if there is no substance, you will not generate deliciousness."

In his early 20s, Cheng moved to New York to refine his skills at Daniel Boulud's three-Michelin-starred Restaurant Daniel. The kitchen quickly challenged his confidence.

Above: Chef Vicky Cheng presents some ingredients for his dishes. **Top left:** House preserved pork, clay pot rice with dried velvet shrimp. **Top right:** Botan shrimp with Chiu Chow sauce. PHOTOS PROVIDED TO CHINA DAILY

The restaurant served about 300 guests a night while demanding precision. When he arrived at noon, it left too little time to prepare, so Cheng began coming at 11 am, then 10 am, and sometimes as early as 8 am.

"I went to New York, and I had realized that I was nothing," he says.

It is a lesson he has carried with him: no title or accolade removes the need to improve. "I know that even if I am the best today, I may not be tomorrow," he says. After about a year and a half, colleagues recognized his exceptionally orderly station and willingness to help others.

The missing piece

New York sharpened Cheng's French techniques, but also drew him toward Asia. On days off, he searched for dim sum, sushi and kimchi. "I realized that there's an Asian part of me ... that I had yet to discover," he says. "So I made a decision to come back to Hong Kong."

He continued cooking French food, but as he prepared to open VEA in 2015, he realized that a conventional French restaurant no longer fully represented him. Simply adding soy sauce, wasabi or a Chinese mushroom to a Western dish was not enough, either.

Meaningful fusion requires an understanding of how both cuisines think. A chef using mushrooms from Yunnan province should first understand how local people prepare them and why that tradition exists. Only then can it be reinterpreted rather than used as decoration. "That, for me, is true fusion," Cheng says.

His Chinese education was less formal. At Hong Kong markets, Cheng bought unfamiliar produce, asked vendors how they cooked it, and tested the ideas on friends at late-night suppers.

This education shaped VEA and led to the founding of WING, which opened in 2021. The restaurant takes its name from the Chinese character *yong* — pronounced "wing" in Cantonese — in Cheng's name.

In Chinese calligraphy, the character is traditionally used to demonstrate eight fundamental brush techniques, reinforcing his belief that innovation must begin with a strong foundation.

Launching a Chinese restaurant without training in the traditional Chinese kitchen hierarchy was risky, but it encouraged him to develop his own culinary language.

His Western-raised palate helped him identify where international diners might struggle. Sea cucumber, for instance, can be challenging in appearance and texture. At WING, he placed it inside a crispy spring roll.

"Everybody understands spring rolls," Cheng says. "Everybody understands and loves crispy." He hopes this accessible version encourages diners to try traditional preparation.

This idea reflects his broader hopes for Chinese cuisine. "Food is a universal language," Cheng says. He believes it can evolve only when chefs understand what came before: "Without tradition, there is no innovation."

That foundation, rather than rigid regional boundaries, informs WING. Cheng hopes contemporary interpretations can lead international diners toward traditional dishes. "I hope the world will see Chinese cuisine differently because ... it is for me, one of the most important, most interesting, and tasty cuisines in the world," he says.

Balancing act

At Estuary, the direction of translation changes again. The techniques, service and structure are rooted in French cuisine, but the food is reconsidered through the palate Cheng developed in Asia.

Clear broths, fermentation and extracted oils help him balance indulgence with restraint. Cheng is not re-creating the French food he learned decades ago, but reconsidering it through his years of immersion in Chinese culinary culture, one that nourishes through ingredients.

Food critic Xiong Wei, also known as Teddy Xiong, believes Cheng's greatest achievement at Estuary is his balance of abundance and boundaries. "The most outstanding characteristic of his cooking is that it is generous yet light, following a path that combines nourishment with indulgence," Xiong says. "You finish feeling satisfied, but neither greasy nor uncomfortably full."

For Xiong, the fish maw best captures Cheng's cultural fluency. "It perfectly embodies Vicky's idea of bringing together charcoal grilling, the ingenuity of fermentation and the river-and-sea character of the (Guangdong-Hong Kong-Macao) Greater Bay Area," he says.

Estuary may mark a return to Cheng's French roots, but it is not the end of his journey. After more than two decades in kitchens around the world, he continues to search for new ways to let different culinary languages speak to one another. Like the meeting waters that gave the restaurant its name, those languages continue to reshape each other.

For Cheng, cooking is not a search for a final answer but an ongoing conversation between cultures.

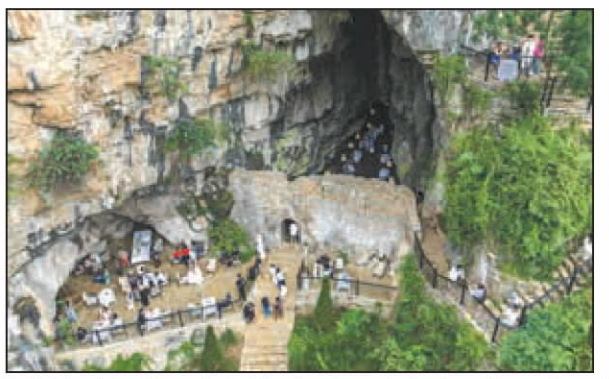
From caves to cafes: China's 'cool resources' fan summer tourism

GUIYANG — With summer heatwaves sweeping across China, the country's southwestern karst areas are getting creative, offering unique tourism experiences deep within their cool caves.

Following a guide, tourist Chang Ting ducked into a natural cave in Guizhou province. After trekking about 100 meters along a narrow rocky path, her mobile signal disappeared.



"It felt like stepping back in time, and all the noise faded away," says Chang, from Xi'an, Shaanxi province.

This unique escape has emerged as a new travel fad among young Chinese people during summer vacations. The fresh approach to cave-based sightseeing gives tourists more to explore while boosting summer spending.

Viral videos tagged "Guizhou cave exploration" have gained over 5 million likes on major lifestyle and short-video platforms, with related topics racking up hundreds of millions of views.

Karst landforms cover more than 60 percent of the mountainous province, and a total of 42,800 karst cave entrances have been identified.

Leveraging these resources, Guizhou has developed diverse experiential forms of cave tourism to cater to different types of visitors. Options include outdoor cave adventures with semi-extreme sports, in-depth underground river tours with social media-friendly photo ops, and relaxing cave visits featuring themed dining spaces.

Left: Tourists visit a cafe inside a karst cave in Anshun city, southwest China's Guizhou province, on Aug 8. **Right:** People enjoy the cave cafe's coolness and drinks in the summer. PHOTOS BY CHEN XI / XINHUA

Song Yuanqiao and Zhao Fei, two veteran cave explorers with cave-rescue experience, run an adventure project in Yanzidong, or Sparrow Cave, in Guiding county. Relying on the natural cave passages, they have designed outdoor activities such as zip lines and tightrope bridges.

To turn this niche hobby into a standardized commercial operation, Song and Zhao visited Hungary, Spain, and other countries to learn cave route design, industrial codes and safety management standards.

Song recalls that back in 2018, cave exploration drew little public attention. In 2023, inquiries spiked dramatically as inexperienced tourists began asking about cave routes. "We never imagined it would become so popular," Song says.

A cafe now stands at the cave entrance while thrilling rock-climbing routes stretch deep inside. Since its trial operation in late April, the site has drawn more than 2,000 visitors.

The booming cave tourism trend has brought new job opportunities for young locals. "Sports graduates like me only had jobs as ball coaches before, but now we have more choices," says Lei Yinggui, 23, a cave tour instructor.

The cave exploration trend has also inspired many people to return home and start their own businesses.

Returning from the southern metropolis of Shenzhen, Guangdong province, last year, Peng Wei opened a cave cafe with his former classmates in Xiuwen county. "The longer I was away, the more I missed my hometown's scenery," Peng says.

They left the cave's natural landscape mostly untouched, adding minimal decoration. Now, tourists line up for their unique, waterfall-cooled coffee. The cafe sells up to 600 cups of coffee daily at peak time.

Beyond Guizhou's cave resorts, Heilongjiang province has developed summer forest getaways, and the Xizang autonomous region's plateau area has rolled out high-altitude eco-retreats, translating its distinctive cool-climate resources into sustainable revenue through tourism.

The booming summer tourism aligns with the broader top-level national policy guidelines aimed at boosting consumption.

Last month, China released guidelines to expand consumption for the 15th Five-Year Plan period (2026-30), encouraging local governments to enrich distinctive tourism products, such as summer cooling retreats or winter warm-weather getaways.

To balance cave tourism with ecological protection, Guizhou has introduced a new management plan for its karst caves, covering cave classification and filing, ecological red-line setting and full-chain supervision.

"Karst caves are non-renewable geological heritage. Proper resource management is the key to turning underground wonders into local benefits, and we must adhere to development within protection," says Zhang Zaijie, director of the green development strategy research institute at Guizhou University of Finance and Economics.

CULTURE

Left and center: Scenes from Hong Kong Ballet's *Romeo + Juliet*, which reinterprets Shakespeare's enduring romance within the bustling, cosmopolitan backdrop of 1960s Hong Kong.
Right: Ballet dancer Chun Wai Chan plays the role of Romeo and Hong Kong Ballet's principal dancer Ye Feifei plays Juliet. PHOTOS PROVIDED TO CHINA DAILY

East meets West in HK's *Romeo + Juliet*

Ballet dancer Chun Wai Chan returns to China to play the lead role in Shakespeare's classic tragedy, **Chen Nan** reports.

The iconic love story finds new life in a vibrant 1960s Hong Kong setting, showcasing a fusion of ballet and martial arts.

Shakespeare's *Romeo and Juliet* has been reconsidered and reassembled countless times since it first appeared in print. Its story captures universal truths that transcend time and place, while each new adaptation reveals another facet of this complex play, according to Septime Webre, choreographer and artistic director of Hong Kong Ballet.

The ballet's *Romeo + Juliet* takes that enduring tale and gives it a distinctly local identity, transporting the lovers from Renaissance Verona to the turbulent, cosmopolitan world of 1960s Hong Kong.

On Aug 29 and 30, the production will be staged at the National Centre for the Performing Arts in Beijing and will also be performed in Chengdu, Sichuan province, on Sept 11 and 12.

In this version, Juliet is the daughter of a tycoon from Shanghai, whose ambitions extend beyond family tradition: he is determined to marry her to a wealthy man in pursuit of greater social advancement. Taipo (Tybalt in the original) is a powerful gang leader from Hong Kong's Kowloon City, who is having an affair with Juliet's mother, a beautiful but cold woman trapped in a loveless marriage.

Against this tangled web of family loyalty, social ambition and forbidden desire, Romeo and Juliet unexpectedly discover the consuming power of love. Their decision to be together becomes an act of defiance, setting them against the people and structures that seek to control their futures.

For Webre, relocating the story is not simply a change of scenery. It is a way of asking how Shakespeare's themes might resonate within another society and another moment in history.

Webre is an internationally recognized ballet director, choreographer, educator and advocate. He joined Hong Kong Ballet as its artistic director in July 2017 after 17 years as artistic director of The Washington Ballet in Washington DC, the United States. Previously, he also served as artistic director of the American Repertory Ballet, based in Princeton, New Jersey, for six years.

"When I first moved to Hong Kong, I knew I wanted to create a ballet that fused Hong Kong and the West. It became a way for me to get to know the city better, to explore its culture and build a world with a distinctly Hong Kong style," he says. "Then *Romeo + Juliet* came along, and the story seemed to lend itself so naturally to that idea. Everything came together very quickly."

The production's Hong Kong identity is reinforced through its visual language. Webre and his creative team drew inspiration from the city's influential cinema from the 1960s through the 1990s, particularly the energetic street scenes and stylized action of Hong Kong films. The stage becomes a bustling, vividly imagined cityscape, filled with neon signs, bamboo scaffolding, noisy Chinese restaurants and crowded markets.

In a rare encounter between kung fu and ballet, martial arts experts trained Hong Kong Ballet dancers extensively in combat and collaborated with Webre to design and choreograph the production's spine-tingling action scenes, infusing modern details into a classic tale of forbidden love.

The costumes similarly reflect Hong Kong's position between the East and the West. Elegant *qipao* (the traditional Chinese dress for women) appear alongside leather jackets, while bold patterns, vivid colors and striking accessories help define the personalities of the characters. The effect is neither a historical reconstruction nor a simple period piece, but a theatrical portrait of a city in transition.

Falling in love with Hong Kong's energy, Webre sees the production as something deeply personal. "This production is a love letter to Hong Kong," he says.

That sense of affection gives *Romeo + Juliet* an emotional dimension beyond its tragic central romance. Through Prokofiev's sweeping score, the physical vocabulary of martial arts and ballet, and the distinctive imagery of Hong Kong, Shakespeare's familiar story becomes a tribute to a city whose identity has long been shaped by encounters between cultures.

For ballet dancer Chun Wai Chan, the invitation to dance Romeo carries an equally personal resonance.

As a principal dancer of New York City Ballet — the first Chinese principal in the company's history — Chan has performed some of the world's most demanding classical roles. Yet when Hong Kong Ballet invited him to join *Romeo + Juliet*, his response was shaped by both artistic curiosity and the opportunity to return closer to home.

"I was very happy when I received the invitation," Chan recalls. He had already seen Hong Kong Ballet perform the production in New York and was immediately drawn to its distinctive interpretation. At the same time, he knew the role would be demanding. He had encountered challenging versions of *Romeo and Juliet* before and initially had to consider whether he could take on another demanding production amid his own international schedule.

Ultimately, the particular character of Hong Kong Ballet's production persuaded him. "I really love this version," he says, adding that the chance to perform it — and to return to his home region — made him excited to accept.

Born in Guangdong province, China, Chan trained at Guangzhou Arts School from 2004 to 2010. A finalist at the 2010 Prix de Lausanne, he earned a full scholarship to Houston Ballet's corps de ballet in 2012 and rising to principal dancer in 2017. Chan joined New York City Ballet as a soloist in August 2021 and was promoted to principal dancer in May 2022.

The significance of his homecoming is not lost on him. Chan has spent much of his professional life overseas and says he rarely gets the opportunity to perform at home. His appearance in Beijing is therefore especially meaningful, even as it comes after a demanding international schedule.

His relationship with Hong Kong Ballet goes back several years. He previously worked with the company in *The Nutcracker* in 2018 and *Swan Lake* in 2019. He remembers the dancers as talented, the repertoire as strong, and the audiences as exceptionally enthusiastic. This time, however, there is another milestone: performing at the National Centre for the Performing Arts, a venue he has never previously visited.

"I'm really looking forward to working together again," he says.

Chan has danced Romeo before, including with Houston Ballet, and will return to the role in other productions in the coming season. But the Romeo created for Hong Kong Ballet is markedly different.

This Romeo is something of a dreamer, Chan says — a young man living partly inside his own imagination, fond of books and romance and somewhat removed from the physical conflicts around him. He may not be naturally suited to fighting or fencing, but loyalty to his friends pushes him into situations beyond his comfort zone.

His romantic idealism also has a particular intensity.

"He is very devoted," Chan says, drawing a connection between Romeo's capacity for love and his own dedication to ballet. "I can really understand why he loves Juliet."

Perhaps the most immediately intriguing element for Chan was the production's incorporation of Chinese martial arts.

Among the details that first caught his attention were the stage design, mahjong scenes and, especially, the fight sequences in which kung fu is integrated into the choreography. The prospect of learning martial arts for the role genuinely excited him.

Chan had taken some kung fu classes before and grew up watching the films of Bruce Lee and Jackie Chan. As a Chinese dancer who has spent years working within a Western classical tradition, he says he enjoys opportunities to bring aspects of his own cultural background into his performances.

The physical language came relatively naturally. His familiarity with Chinese martial arts imagery gave him an instinctive sense of how the movements should look and feel, even as he worked to adapt them to the discipline and precision of ballet.

His partnership with Hong Kong Ballet principal dancer Ye Feifei, who plays Juliet, is another crucial part of the production.

Their collaboration began in an unexpected way. Ye and members of Hong Kong Ballet traveled to New York two months ago to rehearse with Chan, who was balancing a busy performance schedule. Despite having limited rehearsal time, he joined them and began learning the production's extensive movement material.

The collaboration has particular resonance because Chan and Ye previously worked together in *Swan Lake*. Much has changed since then.

"She has also matured over the years," Chan says. "She has now danced Hong Kong Ballet's *Romeo + Juliet* for six years and has developed an intimate understanding of Juliet that goes beyond technique."

Imagining the untold story of Zhao Zhuangji through a modern lens

Left: Chinese musical-theater actress Fiona Zhu rehearses for an original one-woman musical *Herstory in History* in London on Aug 3.
Right: Composer Johannes Grosz (left), actress Fiona Zhu (center), and co-director and co-writer Zhang Keyuan in discussion during the rehearsal for the musical. PHOTOS BY JADE CAO / XINHUA

LONDON — In a London rehearsal room, Chinese musical-theater actress Fiona Zhu donned a long, pale costume reminiscent of traditional Chinese opera, taking on the role of an ancient Chinese woman on stage.

The character is inspired by Zhao Zhuangji, a historical figure later associated with Princess Zhao in *The Orphan of Zhao*, one of China's best-known classical dramas.

But Zhu was interested in something beyond the familiar story of sacrifice, loyalty and revenge.

After years of playing different roles, she had noticed that women in historical and theatrical stories were often remembered as wives, mothers or daughters, while less was said about the individuals behind those identities.

Zhao Zhuangji offered one example. Even the name by which she is known today was tied partly to her husband Zhao Shuo and his clan, while her own personal given name has not been clearly preserved.

"Then where is her own name?" Zhu recalled wondering.

That question helped inspire *Herstory in History*, an original one-woman musical set to make its London debut in August before heading to the Edinburgh Festival Fringe.

The production brings Zhao Zhuangji together with a present-day actress, moving between a historical character and a modern performer trying to understand the different roles she has taken on in her own life.

Herstory in History does not attempt to retell *The Orphan of Zhao* in full or reconstruct Zhao Zhuangji's life as a historical biography, the production team says.

Instead, the creative team takes the gaps around the character as a starting point: what choices might she have faced, and what might be missed when a person is remembered mainly through a few familiar identities?

Zhu says the two women's lives are not meant to be directly compared. The connection lies instead in the experience of taking on identities shaped partly by circumstances and partly by the expectations of others.

Co-director and co-writer Zhang Keyuan says the production is not simply a new version of an old Chinese story, but an attempt to look more closely at the person behind a familiar character.

The same idea of moving between different worlds also shapes the music. German composer Johannes Grosz says his writing is rooted mainly in Western musical traditions. For the production, he worked with the Chinese team to bring traditional Chinese instruments and musical ideas into a chamber score.

One passage uses vocal phrasing inspired by China's Kunqu Opera, while Zhu also consulted performers trained in traditional Chinese opera on singing, costume and movement.

"There is no question of which one is better," Zhu says of the two musical traditions. "If you can bring them together well, it can become something very interesting."

The production is performed in Chinese with English captions. "If it comes from Chinese tradition, why must I use another language to tell it?" Zhu says.

For her, the production is one small attempt to bring Chinese stories and creative approaches into more direct exchange with audiences and theater-makers overseas.

YOUNG GUNS FLY THE FLAG IN CINCY

Wang Xinyu of China fires a return to Donna Vekic of Croatia during their Cincinnati Open second-round match on Sunday in Mason, Ohio. Wang upset the 31st-seeded Vekic 3-6, 6-1, 6-4. GETTY IMAGES

Tapping a rich vein of form ahead of the US Open, Wang Xiyu and Wang Xinyu enjoy breakthrough wins in Cincinnati

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

Wang Xiyu in action against Leylah Fernandez of Canada during their Cincinnati Open second-round match on Sunday. GETTY IMAGES

Both young and talented, yet hampered by injuries early on, China's Wang Xiyu and Wang Xinyu have justified their major potential with respective breakthrough wins in Cincinnati, the final tuneup ahead of the US Open.

With China's reigning Olympic champion Zheng Qinwen sitting out the tournament due to a prolonged injury layoff, the in-form Wangs have stepped in to represent the country strongly at this week's Cincinnati Open, with their respective career-first, round-of-64 wins at the WTA1000 tournament in Ohio boding well for the major challenge facing them in New York's Flushing Meadows later this month.

Spearheading the Chinese women in the WTA singles rankings at No 36, Wang Xinyu got the Chinese contingent off to a flying start on Sunday, as the all-arounder overcame a first-set scare to outplay Croatia's 31st seed Donna Vekic 3-6, 6-1, 6-4 on Court 10 to reach the third round at the top-flight WTA tournament for the first time in her career.

The 24-year-old native of Shenzhen, Guangdong province, will next challenge world No 1 Aryna Sabalenka of Belarus on Tuesday.

Riding Wang Xinyu's momentum, the 108th-ranked Wang Xiyu, who battled past two qualifying rounds to make it to the main draw, pulled off an identical comeback win on the same court as the hard-hitting left-hander upset Canada's No 30 seed Leylah Fernandez 3-6, 6-2, 6-2 in a gritty effort to also advance into the round of 32 for the first time.

Their resilient performances, particularly their impressive stamina in the scorching heat over three sets, have provided Chinese women's tennis a much-needed boost amid a testing season for ace Zheng, as lingering injury woes forced the former world No 4 to rest her surgically repaired right elbow ahead of the season's final major.

Wang Xinyu, who also had to pull through a series of injury setbacks early in her career, hailed Sunday's tough test as a perfect tune-up for her battle against the mighty Belarusian, and her sixth main-draw campaign in New York.

> "I am always hoping to measure myself against the No 1, and I will, for sure, prepare to the best of my ability."
>
> **Wang Xinyu,** on playing Aryna Sabalenka in Cincinnati

"It's so exciting that the draw has put me in front of her, because I've wanted to play her again since our previous meeting in Melbourne," Wang Xinyu said of coming up against four-time major winner Sabalenka, who beat her in three sets in the second round of the 2022 Australian Open.

"I am always hoping to measure myself against the No 1, and I will, for sure, prepare to the best of my ability and recover as quickly as I can after this tough match in the heat.

"As difficult as it was, particularly after I lost the first set and got broken first in the second, today's win gave me a lot of encouragement, because I managed to reset myself mentally when I was down and played better, game after game, from there."

Wang Xinyu has reached the round of 16 three times at the majors, her best Grand Slam singles result, while she achieved the highlight of her career in doubles by winning the 2023 French Open trophy alongside Hsieh Su-wei of Chinese Taipei.

"After some ups and downs, I feel like I've found some good form deep into the North American hard-court swing, and, hopefully, it won't be too late," Wang Xinyu said of her expectation for the US Open.

Rising to the elite level of the women's game earlier than her right-handed counterpart, Wang Xiyu, who became China's first girls' major champion at the 2018 US Open, had to wait longer than expected to translate her teen success onto the senior stage, also plagued by multiple physical issues, including right shoulder surgery in October that sidelined her for over half a year.

The 25-year-old former world No 49's improved fitness, and, more importantly, trust in her own body, helped unleash her powerful game facing the agile Fernandez on Sunday, successfully avenging her first-round defeat to the Canadian at the season-opening Hong Kong Open in January.

After struggling with the placement of her shots and dropping the first set, Wang Xiyu regrouped quickly to sharpen her baseline attack, dominating Fernandez with precise and thunderous strikes from both corners to stun the 2021 US Open finalist in a little over two hours.

It served as further encouragement, finding her prime form in time for the US Open, following a deep, round-of-16 run at Roland Garros in May.

"This was a hugely encouraging result for me," said Wang Xiyu, who won her only WTA singles title at the Guangzhou Open in 2023.

"Leylah is a strong opponent who stays consistently within the top 30. So, for me, I just tried to hang in there, be patient and go for every possible chance."

The hard-fought comeback underscores Wang Xiyu's growing adaptability on fast surfaces, a key asset for the upcoming US Open, as well as her improved mental fortitude, which in the past had been criticized by fans following some meltdown losses after falling a set behind.

"I am now just focusing on producing my best effort in every single game, set and match, and progressing one day at a time. Hopefully, I can carry it on," she said.

As well as the right-left singles combo of the two Wangs, Chinese veteran Zhang Shuai was also in action on Sunday, losing out in her singles second-round clash to United States' 28th-seed Ann Li in straight sets.

She'll now switch her focus to the doubles competition in Cincinnati, alongside compatriot Jiang Xinyu, as she looks to build on last Thursday's WTA1000 doubles triumph in Toronto with Katerina Siniakova of the Czech Republic.

EQUESTRIAN

Hua Tian claims record Chinese finish at eventing worlds in Germany

AACHEN, Germany — Alex Hua Tian produced the best World Championship result by a Chinese rider with a 12th-place finish aboard Chicko at the FEI Eventing World Championships in Aachen, Germany, on Sunday.

Hua and the 16-year-old gelding finished on 37.3 penalties, improving significantly over the three disciplines after sitting 37th following the opening dressage competition.

The pair scored 32.5 penalties in dressage before climbing 15 places in the cross-country phase, completing the course without jumping penalties and adding only 4.8 time penalties.

A clear show jumping round on Sunday lifted Hua another 10 places to 12th overall.

"I've had a big grin on my face since about 3:30 this afternoon. I'm so, so happy," Hua told Xinhua while traveling back to Britain.

Hua credited Chicko and the team behind the pair for the result.

"I'm really thankful to the Willis family who own Chicko, to the Chinese Equestrian Association, and most of all I'm just so thankful and proud of my horse," he said.

Hua said Chicko's competitive temperament had been crucial to their success.

"He just knows his job, loves the sport and loves to compete. He has so much heart," Hua said. "To fly the flag for China on this international stage always makes the team and I very proud."

The Aachen result continued a strong summer for Hua and Chicko, who recently won a four-star event at Aston-le-Walls in Britain.

Hua also won a three-star short-format event aboard Manjushri, the horse he plans to ride at this year's Asian Games.

The 36-year-old will head to the Games seeking to defend the individual and team titles he won at Hangzhou 2023.

China's Alex Hua Tian, aboard Chicko, competes at the 2026 FEI World Championships in Aachen, Germany. FEI

"Winning individual and team gold at the Asian Games in Hangzhou in front of a home crowd felt like the right thing at the right time," Hua said. "I was under pressure to win gold there, so winning it was a huge relief."

Chicko will remain in Europe, with Hua instead planning to ride the younger Manjushri, owned by Yi Tianru. Cooley On Ice is his second choice.

"Manjushri is very exciting. His dressage is very strong, which is crucial at the Asian Games level," Hua said.

Manjushri is scheduled to enter quarantine in Aachen on Sept 4 before flying from Liege in Belgium to Tokyo on Sept 14.

"Flying a horse from Europe to Asia is a huge operation," Hua said. "Stable management and the horse's welfare and mental well-being are key. I hope to be as competitive as possible."

China is set to field a partly new eventing team at the Asian Games. Hua said Hangzhou teammate Sun Huadong will return alongside two younger riders.

"It's an exciting stage for Chinese equestrian sport," Hua said. "This will be a great opportunity for them to show their development and composure under pressure."

Beyond the Asian Games, Hua is targeting a fifth Olympic appearance at Los Angeles 2028.

He said individual qualification would become a key focus from 2027, while China would also assess its chances of securing a team place. Hua acknowledged that the team qualification route would be difficult, with Australia and New Zealand among China's regional rivals.

"But regardless, I will aim for individual qualification," he said.

Despite having competed at four World Championships/World Equestrian Games and four Olympic Games, Hua believes he can continue improving.

"I think my career is only just getting started, really," he said. "I now have a world-class team of horses and support network, allowing me to compete consistently at the highest level.

"I hope to continue progressing over the next few Olympic cycles."

GLOBAL EDITION 中国日报 WEDNESDAY, JULY 22, 2026

Philippine sailors (right) harass China Coast Guard personnel aboard a patrol vessel at Ren'ai Reef in the South China Sea on Monday.
LI YAN / CHINA NEWS SERVICE

China urges the Philippines to halt its provocations

By ZHAO JIA and **JI HAISHENG**

Beijing summoned the ambassador of the Philippines to China on Tuesday and lodged solemn representations over Manila's deliberate provocation at Ren'ai Reef and attack on China Coast Guard law enforcement personnel on Monday.

The Chinese Foreign Ministry, in a statement, described the acts as egregious, noting that the Philippines initiated the provocation and then sought to shift the blame onto China, distorted the facts and maliciously hyped up the incident.

The statement said China Coast Guard operations in waters near the reef were justified and lawful, and the country would take measures to firmly safeguard its territorial sovereignty and maritime rights and interests.

Addressing a regular news briefing, Foreign Ministry spokesman Lin Jian stressed that Ren'ai Reef is part of China's Nansha Islands and is Chinese territory.

A Philippine military vessel has remained illegally grounded at Ren'ai Reef since May 9, 1999, despite Manila's repeated commitments to remove it.

Lin urged the Philippines to honor its commitments, immediately stop maritime provocations and false narratives, and exercise effective restraint over its frontline personnel.

"Otherwise, the Philippines will bear all consequences arising from its actions," he added.

Lin said that in July 2024, China and the Philippines reached a provisional arrangement on humanitarian resupply missions to the grounded vessel based on China's three-point principled position, adding that China's position remains unchanged.

"If the Philippines were to attempt to build fixed facilities or permanent outpost, China will absolutely not accept it and will resolutely stop it in accordance with the law and regulations," Lin said.

China Coast Guard spokesman Jiang Lue said that on Tuesday morning, China allowed the Philippine side, on humanitarian grounds, to use a boat to transfer the injured sailor to Philippine Coast Guard vessel *No 9702*. The China Coast Guard contacted the Philippine vessel to verify the purpose of the operation and monitored the process throughout, Jiang said.

With Foreign Minister Wang Yi set to attend the China-ASEAN Foreign Ministers' Meeting in Manila on Wednesday, Lin, the Foreign Ministry spokesman, said it is worth noting that whenever China and the Philippines prepare for dialogue or engagement, or whenever a major regional diplomatic event approaches, certain forces invariably seek to stir up trouble over maritime issues.

"As to where the facts and merits of the issue lie and who is pulling the strings behind the scenes, I believe it's plain for all to see. China's policy on neighborhood diplomacy remains consistent and unchanged," he said.

Lin said East Asian cooperation platforms are not appropriate venues for discussing bilateral maritime disputes, calling on the Philippines to fulfill its responsibilities as ASEAN chair by promoting dialogue and cooperation rather than putting its own political interests above regional peace and stability.

He Xianqing, an associate researcher at the National Institute for South China Sea Studies, said that Manila was seeking international attention and sympathy from ASEAN countries by portraying China as a coercive bully on purpose. It also tried to give the illegal and invalid "2016 Arbitral Award on the South China Sea" greater practical effect and deterrent force — a development that warrants vigilance.

Zhu Feng, a professor at Nanjing University's School of International Studies, said the Philippines had sought backing from the United States and Japan as it escalated tensions with China in the South China Sea for narrow domestic political purposes.

XI'S VISION | HIGH-QUALITY DEVELOPMENT

Push to make AI a resource for all hailed

Nation transforming global industries by promoting affordable, accessible use

By CHENG YU
chengyu@chinadaily.com.cn

China's vision to turn artificial intelligence from an expensive frontier technology into a resource for affordable, widely accessible applications will bring huge benefits to more countries, businesses and ordinary people worldwide, said leading industry experts and company executives.

They made the comments on Tuesday after President Xi Jinping, in his keynote speech on Friday at the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai, said that AI should be developed "for the positive, for good and for humanity".

"AI development should not be a solo performance by a single country, but a symphony of international cooperation," Xi said.

He called for coordinated advances in the transformation and upgrade of traditional industries, the cultivation and growth of emerging industries, and forward-looking planning for future industries, so that all sectors and businesses can benefit from AI.

Long Yongtu, China's former chief negotiator for its accession to the World Trade Organization, said the rise of AI has become another turning point in the country's economic development.

He said that China's entry into the WTO in 2001 unleashed the vitality of millions of market participants after restrictions on foreign trade rights were relaxed, helping the country grow into the world's largest trader in goods and allowing ordinary people to increase their income through international commerce.

"Now, entering the age of AI heralds a new era of opening-up. AI is triggering a similarly profound transformation by reshaping production relationships, corporate structures and the cost of starting a business in the country," Long said.

Inside
See more, **page 13**

According to the Ministry of Industry and Information Technology, China has embraced AI with open arms, with the value of its core AI industries exceeding 1.2 trillion yuan ($177 billion) last year, maintaining annual growth of more than 20 percent for several consecutive years.

Furthermore, the country is seeking to turn AI into real-world applications and a driver of economic growth.

In the first half of this year, the industrial output of AI-related sectors, including integrated circuit manufacturing and in-vehicle intelligent equipment manufacturing, grew more than 30 percent.

Long predicted that more individuals and small, specialized companies that use AI to perform work that previously required much larger organizations will emerge to become new drivers of the economy.

"Success should ultimately be judged not by model rankings or investment valuations, but by whether AI really improves people's lives," he added.

Efforts to push AI beyond chatbots and benchmark rankings into the physical economy include China's "AI Plus" initiative, which seeks to embed AI in manufacturing, finance, healthcare, energy and public services.

Evolution of airspace ecosystem needed now

WORLD WATCH
By Simon Hocquard

Imagine a morning a few years from now: a drone lifts off carrying a life-saving organ for an urgent transplant, another drone delivers a parcel across the city, and above them, an air taxi takes two passengers to the airport. They all share the same slice of sky over the city, and they do so safely.

The question is, who makes sure they stay out of each other's way?

The answer lies not in a single technology, but in the evolution of the entire airspace ecosystem that enables all aircraft to operate safely together.

The low-altitude economy has arrived faster than many anticipated. Delivery drones are already flying in several countries, and large-scale drone operations are emerging in many regions. Electric vertical take-off and landing (eVTOL) aircraft, the vehicles many people call air taxis, are close to entering service. The vehicles are here, the demand is real, and much of the technology is proven.

When discussing this future, people often focus on the aircraft. That is understandable as they are new and visible. However, in my view, the aircraft are the easier part. The more difficult challenge is how we can progressively evolve the airspace system to safely accommodate these new operations alongside today's aviation.

The low-altitude economy offers real rewards. These aircraft can ease pressure on congested city roads, deliver urgent medical supplies, and reach communities that are hard to serve today.

JIANGMEN TAKES THE ESPRESSO LANE TO SUCCESS

From plantations to percolators, Guangdong city is positioning itself as one-stop coffee hub

By QIU QUANLIN in Guangzhou
qiuquanlin@chinadaily.com.cn

A staff member makes iced Americano at a coffee shop in Jiangmen, Guangdong province, on May 25. WANG RUIPING / XINHUA

The air over Jiangmen, a coastal city in western Guangdong province, has traditionally been filled with the fresh scent of dried tangerine peel, a culinary and medicinal favorite among the Cantonese.

However, for a long time, this has been fused with the aroma of a more Western remedy to ease the trials of modern life — roasting coffee beans.

It is believed that the first coffee beans arrived in a suitcase brought by Chinese expatriates as early as the 1860s, when Jiangmen people who ventured overseas returned from Southeast Asia and North America with their suitcases filled with coffee beans and brewing equipment.

The aroma has lingered over the city since, thanks to the booming coffee industry of the past few decades. Over the years, Jiangmen, the hometown of more than 4 million overseas Chinese, has developed into one of China's major industrial bases for coffee, even though no coffee beans were originally produced there.

While it is estimated that there are now more than 2,000 cafes in Jiangmen, the city stands out amid China's coffee landscape for much more.

Building on its strong manufacturing capabilities and the open-mindedness inherent in the globe-trotting history of its people, the city has developed a comprehensive industrial chain.

China Vibes — FOOD —

The thriving coffee business, from bean trading and intelligent roasting to precision manufacturing, has received strong support.

More than 300 varieties of specialty coffee beans, imported from major producing countries and regions including Brazil, Ethiopia and Colombia, with an annual import value exceeding 30 million yuan ($4.4 million), pass through Jiangmen. The city has also developed over 350 coffee equipment and accessory companies.

According to a white paper released earlier this year by local commerce and industrial authorities, approximately 40 percent of China's stainless steel coffee-making equipment and one in five exported coffee machines are produced in Jiangmen.

Liu Youliang, founder of Guangdong Cino Technology, a leading manufacturer of capsule coffee machines, has seen firsthand the growth of Jiangmen's coffee industry.

When Liu started his coffee machine business, the demand for coffee in commercial settings, such as office buildings and hotels, was rapidly increasing.

At that time, the domestic market for capsule coffee machines was virtually nonexistent. However, such machines were already well-established in international markets.

Starting with imitation and developing the country's first homegrown commercial capsule coffee machine, Liu's company, after 18 years, now holds over 300 patents and exports products to more than 90 countries and regions. "Making coffee machines is not just about creating electrical appliances — fundamentally, it's about brewing great coffee," said Liu.

The company has already established a production base of more than 20,000 square meters in Jiangmen, where over 500,000 capsule coffee machines are developed and produced annually.

According to Liu, investment from the Hong Kong and Macao special administrative regions, due to their geographic proximity, has greatly helped advance the development of Jiangmen's coffee industry.

Young world champion Wu Yize trod familiar path to global prominence

Wu Yize holds the championship trophy as his parents wrap a Chinese flag around his shoulders during the awards ceremony after his victory over England's Shaun Murphy in the World Snooker Championship final round at the Crucible Theatre in Sheffield in England on May 4. DARREN STAPLES / AFP

Shooting stars — why GBA is China's snooker hub

Left: Wu Yize demonstrates his cue work at a billiards venue during an interview with China Daily in Hong Kong in June. ADAM LAM / CHINA DAILY
Right: Young trainees at the Guangdong branch of the Chinese Billiards and Snooker Association World Snooker Academy take part in one of their daily practice sessions. PROVIDED TO CHINA DAILY

He was just a small boy, "a little taller than the snooker table", and had been handling a cue for a few years — but he already had his life mapped out.

It was more than a decade ago, and Wu Yize was watching the television broadcast of the final of the Snooker World Championship final at the Crucible Theatre in Sheffield, England.

Thousands of miles away, young Wu was having his own imaginary victory ceremony. "That's what I want," Wu told himself, "I'll stand there too."

In May, Wu's boyhood promise to himself was fulfilled when he won the world championship at the tender age of 22 in the same venue.

The talent pipeline that delivered him from makeshift tables to the pinnacle of the sport has parachuted a generation of Chinese snooker professionals onto the global tour.

The place where young Wu began his full-time pursuit of a snooker career, as well as the national base for professional youth development, is South China's Guangdong province. Its neighboring regions have also played an important role in the sport's development.

Wu spent several years at various training facilities in several Guangdong cities including Dongguan, widely referred to as China's premier "snooker hub".

The official figures don't lie. Over 70 percent of China's professional snooker players have trained in the city at some stage. For aspiring professionals age under 21, that proportion climbs to 90 percent.

Long way to the top

Wu's path to the pinnacle of the sport was a circuitous one that started at his hometown of Lanzhou, a city best known for its beef noodles, in Gansu province.

He began playing snooker at a young age, initially under the guidance of his father, who later sold his business to support his son's career.

The young prodigy was later mentored in several cities in Guangdong. One of his childhood coaches, UK-born Roger Leighton, remembers him as a "funny and cheeky" 11-year-old kid.

"He was always laughing and giggling and he's still a bit like that now," Leighton said in an interview with Metro UK.

"But he's more serious because obviously now he's at the top, at the business end. He's not the complete player yet, but he's getting there."

Wu's childhood memories are of the sheer joy snooker brought him. "I loved it straight away," he said in an interview with China Daily.

"My dad was into it (at that time), and the first time I tried it, I just enjoyed playing. When I first picked up a cue, I could set up properly and hit a ball. I think my dad, back then, thought that I had a bit of a feel for it."

His parents made multiple sacrifices to help his career.

There were "so many things — my dad buying me my first cue, for example; my parents believing in me, supporting me, letting me give up school to go down this path. It wasn't one big thing — it was every single day, building up over time", he explained.

He moved to Sheffield at age 16 with his father. At first it was hard, he conceded.

"Suddenly, being in a new country, a new life, and (with) new challenges, it was tough," Wu said.

"The place we stayed in had no separate bedroom. The living room and kitchen were all one space — the bed was right next to the kitchen. It was tiny, no windows, no ventilation. I shared a bed with my dad."

When asked if the austere living conditions dulled his passion for the sport, Wu replied: "No, not at all. If anything, it helped me. It made me more resilient when things got difficult."

One of the toughest decisions he made was becoming a full-time player when he was a teenager. Wu earned a two-year professional tour card for the 2021–22 and 2022–23 seasons, turning pro at the age of 17 and being named Rookie of the Year in 2022.

Wu told China Daily he discussed the proposition with his parents. "But to be honest, I didn't really have a deep understanding back then (about what going full-time would mean). I was young, I just knew I wanted to play, and I was excited. I didn't think too far ahead about the future. But I did talk to them about it."

"They told me I could only choose one path. And if I chose this, I had to do it properly. They said I needed to think it through and take responsibility for my own life."

Generation next

Wu represents the new young face of the sport, according to Feng Huanhuan, chief executive officer of F-Sports Promotions.

Her company has organized the annual World Grand Prix in Hong Kong since 2025, and opened the Hong Kong Billiard Sports Academy at Hong Kong's Kai Tak Sports Park.

She believes Wu is a player whose character traits and career represent two decades of the maturation of China's professional snooker players.

The trend started with Chinese snooker pioneer Ding Junhui, who sprung to prominence on the world stage in 2005 by winning the China Open at age 18.

The focus of Chinese snooker's youth training system, is no longer a question of quantity, but one concerning "the sustainability of the careers it churns out".

Ding began formal training at 9 years old. Wu — the first world champion born after 2000 — started around age 7. In 2012, at age 8, he had already shared an exhibition stage with Stephen Hendry, the seven-time world champion, in Lanzhou.

Feng first saw Wu compete in 2025, when he was invited to the inaugural Grand Prix as one of the world's top 32 players.

By then, the just-finished HKBSA was open to players for warm-ups, and Wu was the first to step inside. "From dawn to dusk, he practiced, skipping dinner, asking only if he could come again tomorrow," she said.

She said Wu has "a love for the game — raw, sincere", possesses "natural talent", and has "youth, stamina, a strong work ethic, and mental resilience", all essential qualities for a top player. Moreover, he came up the "hard, but, very representative" way.

Huang Zhufeng, president of the Dongguan Billiards & Snooker Association, is well aware of the risks and rewards young players face in turning professional.

He said Wu came to him in the summer of 2019, asking to shoot practice frames against world-class professionals who used Dongguan as a pre-competition training base before heading to major events across the Chinese mainland.

Huang also oversees the CBSA (Chinese Billiards and Snooker Association) World Snooker Academy's Guangdong branch. He estimates that Dongguan has more than 70 long-term training facilities, with over 500 full-time trainees aged 8 to 21.

Tough decisions

Wu remembers the fraught conversations at home when he chose to drop out of middle school to pursue a professional snooker career.

"My parents argued over it," he said, matter-of-factly.

"They wanted me to be certain. They didn't want to saddle me with a difficult life if it didn't work out."

Feng said in the end, very few young players break through to become champions. "Most of these kids will never win a title — so what happens to them?" she said.

She said both parents and the young players themselves need to understand the risks of going pro.

"Outside of the specialized snooker training, I believe there's a lot of room to build better academic support for these players," Feng said.

Huang said that Dongguan is now working to have billiards recognized under the local sports-education integration mechanism.

That designation, if granted, would allow young billiard players to stay enrolled in school while devoting themselves to intensive training — a safety net that most aspiring young professionals in China currently need.

Huang added that a professional snooker career in China today does not necessarily have to result in a world ranking. There are other ways to stay in the sport.

As snooker programs spread into schools, former trainees can study for a state-issued social sports instructor certificate and teach in classrooms. Or they can go through the World Professional Billiards and Snooker Association's coaching tiers or the CBSA's certification process and run a local billiards club.

"There's a real shortage of grassroots coaches and referees in Chinese billiards," Huang said. In Dongguan, he noted, a coach at a typical billiard club can expect a monthly income of 15,000 ($2,220) to 20,000 yuan.

Huang's longer-term vision for Chinese snooker balances elite development with a broader push to draw more people to "just play it for fun", bring snooker into more schools as a regular activity, and establish a contest pyramid that gives both the hobbyists and professionals a rung to reach.

Southern strengths

Within China's multi-pronged approach to snooker development, Huang is confident that the Guangdong-Hong Kong-Macao Greater Bay Area will remain at its core.

What sets the region apart, he said, is not only its head start in the sport but its concentration of training resources thanks to the ever-greater cross-border movement of people, investment, and expertise.

Vincent Law Wing-chung, who chairs the Billiard Sports Council of Hong Kong China, shares that perspective, and said GBA cities are complementary across player and coach exchanges, training, event hosting, equipment manufacturing, and commercial strategy.

Hong Kong is the region's essential link to the international snooker circuit, but the mainland's well-appointed youth training infrastructure has also increasingly rebounded to the city's benefit, he said.

In 2024, seven-time world champion Ronnie O'Sullivan and top English player Judd Trump both secured Hong Kong residency. By June 2025, former world champion Neil Robertson had also announced he had done the same.

Law disclosed that more top players are currently pursuing Hong Kong residency.

Huang said Dongguan's expertise in the sport and well-equipped venues have made it a premier destination for visiting snooker teams. Hong Kong players, he noted, have been joined in Dongguan by those from Saudi Arabia, Qatar, Germany, Belgium, Thailand, and elsewhere.

Hong Kong is well-suited for high-end, smaller-scale international tournaments, Law said, whereas larger ones are already being hosted by mainland cities.

In May, the Dongguan Changping Snooker Center opened and hosted the World Women's Snooker Championship. In June, the Dongguan Humen Convention and Exhibition Center staged the World Team Snooker Championship, the sport's premier global amateur team event. A Chinese team made history by clinching the title for the first time.

Huang said the GBA also plays a key role in the global billiard equipment trade.

While equipment manufacturers are centered in Jiangxi province's Yushan and Hebei province's Bazhou — the commercial gateway to markets worldwide is in Guangdong and Hong Kong, funneling products to markets worldwide.

According to the China Customs, Dongguan exported 22.07 million yuan of billiards equipment in the first three months of 2026, up 29.7 percent from the same quarter the year before.

Recent data from the CBSA showed that there are 245 million people actively playing cue sports in China and over 200,000 venues, with 550,000 enterprises feeding into the ecosystem.

"Billiards is now the sport with the highest degree of marketization in China," said Feng.

China sets records with new self-unloading vessel

By **ZHAO LEI** in Yangzhou, Jiangsu
zhaolei@chinadaily.com.cn

China State Shipbuilding Corp, the world's largest listed shipbuilder in terms of production capacity, delivered on Tuesday a self-unloading bulk carrier custom-built for a landmark project off the coast of Guinea in West Africa, noting that the vessel sets several records in its class.

The *Wontanara*, built by CSSC Chengxi Shipyard for global mining giant Rio Tinto and boasting a cargo capacity of 41,800 metric tons, has achieved three industrial milestones. It is the world's largest deadweight shallow-water transshipment self-unloader, the fastest self-unloading vessel ever made and the world's first self-unloader with bidirectional sailing capability in its tonnage class.

A self-unloader — also known as a self-discharger — is a ship capable of unloading its cargo using onboard equipment, without relying on shore-based cranes, mechanical grabs or conveyor systems.

The *Wontanara*, which was delivered at the shipyard's Yangzhou facility in Jiangsu province, measures 215 meters in length, 42 meters in beam width and 14.5 meters in molded depth, and has a cargo hold capacity of 29,000 cubic meters.

The vessel, powered by a full diesel-electric propulsion system, completed a 12-day trial in the East China Sea between late June and early July.

The CSSC said in a statement that the ship's delivery marks a major step in China's transition from a follower to a global leader in the high-end self-unloading transshipment vessel sector.

Zhang Xinlong, general manager of CSSC Chengxi Shipyard, said that Rio Tinto has ordered five such self-dischargers, with the *Wontanara* being the first. "The vessel's construction started in May last year, and the 14-month delivery cycle has underscored Chengxi's robust research and manufacturing strength," he said, noting that the model features a high level of automation with a small crew. "For example, steering maneuvers can be executed by a single operator using several control levers."

The second self-discharger is expected to be delivered in October, and all five are scheduled for handover by next summer, Zhang added.

The five vessels will operate off the coast of Guinea, serving as the main transshipment equipment for the Simandou iron ore project. They will shuttle ore from shallow-water terminals to large ocean-going bulk carriers anchored in deep waters.

Jiang Minghua, chief designer of the *Wontanara*, said it is equipped with two independent lifting systems with a combined unloading rate of 12,000 tons per hour.

Before its debut, the world's fastest self-discharger — a vessel converted by CSSC Chengxi Shipyard — had an unloading capacity of about 7,000 tons per hour.

According to Jiang, 41,800 tons of iron ore would fill almost 700 standard railway freight cars, stretching more than 7 kilometers, and yet, the vessel can unload a full cargo in under 3.5 hours.

"Working in rotation, the five ships can complete full transshipment and loading for a 200,000-ton ocean-going bulk carrier within 24 hours, minimizing anchorage time for large transportation vessels and effectively increasing mine output," he said.

To date, the shipyard has repaired, converted and built nearly 100 self-dischargers, giving it the world's most comprehensive product portfolio and the largest global market share in the sector.

Policy boost lifts hopes of A-share market rebound

Buybacks by major firms and more equity investment by insurers bolster confidence

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

China's long-term economic and technological trajectory remains intact despite recent market volatility, and expectations of stronger policy support are boosting investor confidence and improving the outlook for a rebound in the A-share market, analysts said.

Confidence has also been reinforced by coordinated market-support actions. A number of centrally administered State-owned enterprises have unveiled share buyback or stake-increase plans in recent days. At the same time, leading insurers have announced plans to increase equity investments in technology, advanced manufacturing and other strategic sectors, adding to expectations of stronger long-term capital inflows.

On Tuesday, the market responded positively to the recent developments. After sliding nearly 6 percent since the beginning of July, the benchmark Shanghai Composite Index rose 1.79 percent, with technology shares leading the recovery. The ChiNext Index in Shenzhen surged 7.05 percent and the STAR 50 Index in Shanghai jumped 10.73 percent.

Wu Qing, chairman of the China Securities Regulatory Commission, underscored that efforts will be made to secure market stability.

Addressing a symposium with investors on Monday, Wu said that a comprehensive set of measures, including risk surveillance, countercyclical regulation, quality enhancement of listed companies, rigorous law enforcement and introduction of medium- and long-term capital into the market, will be deployed to resolutely prevent any major market swings.

Between Sunday and Monday, multiple State-owned enterprises, including Aluminum Corp of China, SDIC Power and China National Coal Group Corp, announced buyback or stake-increase plans.

Since the beginning of July, nearly 300 companies have completed share repurchases totaling more than 15 billion yuan ($2.2 billion), while major shareholders of nearly 120 listed companies recorded net increases in their stakes.

Industry giants are leading the buyback wave. Consumer electronics makers Midea, TCL and Haier together repurchased nearly 4.9 billion yuan worth of shares. Tech heavyweights such as ZTE and iSoftStone have also implemented their buyback plans.

Meanwhile, two State-owned capital platforms — China Reform Holdings and China Chengtong Holdings — increased their holding of A shares and will continue to buy more by using their own funds and a central bank lending facility, providing strong liquidity support to the market.

According to Tian Lihui, a professor of finance at Nankai University, the recent market swings, which are irrational short-term sell-offs, have resulted in a deviation between price and fundamentals. The buybacks will anchor core-asset pricing, stabilize overall market expectations and help direct the capital to technology innovation in the long run, he said.

Song Xuetao, chief economist at Sinolink Securities, explained that this round of global stock market jitters has been triggered by overseas market volatility. The recent decline in A shares is thus a result of overseas risk contagion and trading-level disturbances.

"China's growth logic and industrial development trend remain unchanged," he said.

Xun Yugen, chief economist at Guosen Securities, said that the recent A-share market volatility is an adjustment amid a bullish trend. It is by no means an end to a stock market bull run, he added.

According to Liu Chenming, chief strategist at GF Securities, positive factors are accumulating in the A-share market, including the inflow of incremental capital from exchange-traded funds, improving profitability of companies proved by their interim results, and the upward momentum in emerging industries.

During the trading week ending Friday, the net capital inflow into broad-based ETFs totaled 152.5 billion yuan, the third-highest amount since the latest bull run started in September 2024.

About 1,700 A-share companies have released interim earnings previews so far, with 43 percent delivering positive results. The positive rate is significantly higher among tech-focused companies, with 88 percent of STAR Market companies and 79 percent of ChiNext-listed ones reporting positive results. Artificial intelligence-related sectors and resources led the gains, market tracker Wind Information said.

Tao Chuan, chief economist at Guolian Minsheng Securities, said the steady stream of positive AI developments, best represented by the World AI Conference held in Shanghai and the standout performance of the recently released Kimi K3 model, confirms that the country's tech sector is rapidly realizing its high-growth trajectory.

The underlying narrative of China's economic recovery and the ascent of its tech sector remains intact, paving the way for market stabilization, a potential rebound and continued structural opportunities among A shares, he said.

Major insurers such as Ping An, the People's Insurance Company of China, China Pacific Insurance Co and New China Life announced on Monday their plans to increase equity investments in tech, advanced manufacturing and value assets.

Meng Lei, UBS Securities China equity strategist, reaffirmed that technology and AI will remain the core investment themes for the rest of 2026. Apart from strong earnings growth, the sectors will be supported by marginal net inflows from ETFs, active mutual funds, margin financing and private equity, he said.

AI: Industrial depth to help lower costs overseas

From page 1

President Xi also said in his speech that China should facilitate technological innovation, industrial development and "scenario-based application of AI".

Huo Fupeng, director of the innovation-driven development center of the National Development and Reform Commission, said that "China is leveraging its complete industrial system, enormous range of application scenarios and super-sized market to accelerate AI's deployment across thousands of industries".

"Its dense industrial supply chains and vast domestic market give developers an environment in which technologies can be tested, refined and deployed at scale," he said.

Data from Counterpoint Research showed that approximately 16,000 humanoid robots were deployed globally in 2025, with China accounting for more than 80 percent of them.

At the World AI Conference, Chinese robotics company PrimeBOT unveiled a new, transformable robot that is capable of switching between quadruped and humanoid forms.

Tian Hua, CEO of leading materials maker Swancor Advanced Materials Co and head of PrimeBOT, said: "The robotics supply chain comprises more than 1,600 components. At least 1,000 companies are capable of building a robot globally, but only a handful can manufacture 10,000 robots at consistent quality and scale."

"That's China's advantage — transforming personal robots from custom-built machines into mass-produced consumer products," he said. "We are also confident of making such robots really affordable for ordinary people."

Such industrial depth could also help lower the cost of AI products for overseas users. While global attention has focused on Western technology companies competing for lucrative enterprise contracts in the United States and the Middle East, Chinese companies are promoting open-source products across developing countries.

Alex Zhavoronkov, founder and CEO of AI-driven drug discovery company Insilico Medicine, said China's emphasis on open-source development will amplify those gains internationally.

"China is already leading the world in the open-source model," he said.

"The Chinese approach and its AI policies are paving the way for the entire industry, and everyone on the planet will benefit."

Cafes: Jiangmen integrates tradition into coffee drinks

From page 1

"Brands from Hong Kong and Macao have brought not only capital, technology and an international perspective, but also the first cohort of professional talent," he said.

According to Liang Fan, world latte art champion and a promoter of Jiangmen coffee culture, the city does not shy away from tradition.

"Almost every coffee shop has its own signature drink. They usually incorporate traditional ingredients in a modern way," said Liang.

Now, in a bold move, Jiangmen is exploring the possibility of producing its own coffee from scratch.

The local government plan revealed that coffee plantations have been established on nearby Tianlu Mountain, where more than 90,000 coffee plants have been cultivated as part of a trial.

How about locally produced beans, brewed in locally made machines and served by a local barista? For caffeine-loving tourists, Jiangmen would be the perfect place to enjoy a great cup of coffee.

Airspace: Shared digital information emphasized

From page 1

But those benefits are possible only if the flights are safe. And safety at this scale is a question of the system, not of a single aircraft.

Let me explain. Today's airspace was designed for a different kind of flying. It relies on flight rules written decades ago and on air traffic controllers speaking directly to pilots. That approach has kept aviation safe and works well for a modest number of crewed aircraft moving in predictable ways.

Low-altitude flying is different. Drones, air taxis and increasingly automated aircraft vary widely in speed, size and operational capability, and they are expected in far greater numbers. A city might see thousands of low-altitude flights in a day. To safely accommodate this unprecedented scale and complexity, the traditional framework must be augmented by advanced digital tools and automated oversight mechanisms.

So, what needs to change? I would highlight three shifts.

First, we need to move from voice and radar toward shared digital information. When every operator has the same trusted, real-time picture of the sky, coordination becomes easier, and much of it can be automated. Controllers will move from steering each flight to overseeing the system and intervening where human judgment adds the greatest value.

Second, the airspace itself needs to be managed more flexibly. For decades, we relied on fixed rules and boundaries. A digital system can adapt in real time to each aircraft's capabilities, how busy the sky is, and the level of risk involved. This allows the airspace to accommodate more traffic while maintaining the highest levels of safety. Putting safety first does not mean clinging to older systems. It means embracing new solutions that effectively improve safety while enabling innovation.

Third, this transformation must be global and gradual. An aircraft should not stop working the moment it crosses a border. If every country develops its own rules, technologies and operating concepts independently, operators will face a fragmented, more complex, more expensive and ultimately less safe system.

Global standards need to be agreed upon and then implemented locally at a pace that reflects each region's operational needs and level of maturity. Shared standards are what make any network work; roads and the internet are no different. This is precisely the kind of challenge where countries can learn from one another, including the rapid progress now being made across the Asia-Pacific region.

None of this is theory, and no one is doing it alone. The International Civil Aviation Organization is leading the development of the global framework for advanced air mobility, providing the common vision needed for states and the industry to evolve together. The industry is contributing through the Civil Air Navigation Services Organisation's Complete Air Traffic System Global Council, which brings together more than 80 organizations to help shape the evolution of air traffic management.

Our CATS Concept of Operations describes how today's airspace can progressively evolve toward future skies — a seamless, increasingly digital, collaborative and automated ecosystem in which crewed and uncrewed aircraft operate safely together. Alongside the CONOPS, the CATS Global Council is developing practical guidance on automation, safety, change management, advanced air mobility and implementation support to help turn this vision into reality.

This is where I am optimistic. The ambition is there, the expertise is there, and the solutions are within reach. But technology alone will not deliver this future. Success will also depend on collaboration, thoughtful regulation, operational innovation and the people who will manage this transformation.

A lot of work lies ahead, but our industry can do it — and do it well. When we picture the low-altitude economy, let us not stop at the aircraft. The drones and the air taxis will continue to improve. Whether they become a safe and trusted part of everyday life will be determined by the airspace ecosystem beneath them. At CANSO, that is exactly what we are helping to build: the foundations for Future Skies, where every airspace user can operate safely, efficiently and sustainably. Get that right, and the sky becomes a safe new layer of transport for everyone.

The author is the former chair of the Network Management Board on behalf of the European Commission and is now the president and CEO of the Civil Air Navigation Services Organisation. The views do not necessarily reflect those of China Daily.

ENERGY WAKE-UP CALL

SE Asia needs bold steps to boost power generation, cut fuel imports: IEA

A regional electricity grid, nuclear power and ramping up renewables and electric vehicles are among the ways Southeast Asia could boost energy security while also meeting rising energy demand, the head of the International Energy Agency said in June.

The energy crisis triggered by the war in Iran has highlighted just how exposed Southeast Asia is to costly energy imports and the need for urgent, bold steps to shield the region from future shocks, IEA Executive Director Fatih Birol told The Straits Times.

The region is at an inflection point and what it decides now on energy policies will have a profound impact not only on its future but the rest of the world, Birol said on the eve of the release of the IEA's Southeast Asia Energy Outlook 2026 report.

The region remains heavily dependent on fossil fuels, the burning of which is driving climate change and causing more extreme weather, such as storms and floods, that threaten key infrastructure, including power plants, the report says.

"Southeast Asia is at the forefront of the impact of the current energy crisis," Birol said. "I think countries are now putting energy security very high on the agenda, and they are looking at domestic sources of energy generation as much as possible.

"In my view, the biggest winners here will be renewables and nuclear power, and also electric cars because of different factors, but including the cost advantage and the unparalleled energy security benefits."

And an ASEAN Power Grid, long planned but yet to be achieved, would build cross-border electricity interconnections, help balance supply and demand, integrate renewable resources, and lower costs for participating countries, Birol said.

"In my view, this is a no-brainer. There are some political challenges to overcome, and I believe the current crisis will help overcome these political difficulties. And my recent discussions with the government leaders in the region have made me hopeful in this respect," he added.

Challenges include harmonizing power trading across 11 different grids in each of the 11 ASEAN nations, establishing agreements allowing connections with other nations and overcoming technical barriers, such as transmission/distribution voltages and operating standards.

If achieved, a regional grid could help propel economic growth in a region that is home to nearly 700 million people and one of the world's fastest-growing economic areas. The region is set to account for 20 percent of the growth in the world's energy demand over the next decade, ranking second only to India.

But as the region grows, so do its fuel import bill and vulnerability to energy shocks. The Middle East accounts for 60 percent of the region's crude oil imports, and almost half of the oil products that are refined or consumed in Southeast Asia come from Middle East crude oil, the IEA said.

The region has also become increasingly dependent on liquefied natural gas imports, while coal remains central for power generation in most countries in the region.

> "Southeast Asia is at the forefront of the impact of the current energy crisis ... I think countries are now putting energy security very high on the agenda, and they are looking at domestic sources of energy generation as much as possible."
>
> **Fatih Birol,** executive director of International Energy Agency

$600 billion

Southeast Asia will need over the next decade to build power plants and to expand and modernize the grid, according to IEA.

That means Southeast Asia remains exposed to future shocks, underscoring the need to diversify fuel sources and focus on domestic energy.

The region's energy import bill is projected to reach $160 billion this year, a record high, and is likely to keep on increasing, potentially rising to $400 billion, or 5 percent of the region's economy, by midcentury based on current policies, the IEA forecasts.

Policies prioritizing cleaner sources of energy, electrification of transport, energy efficiency and grid investments could reduce this risk, the agency said.

Key driver

A key driver of the region's hunger for energy is rising electricity demand, which is growing twice as fast as overall energy use. In the next 10 years, the region will add the equivalent of Japan's total power generation, Birol said.

Demand in the region is coming from the rapid uptake of electric vehicles — one in five new cars is an EV — data centers, industrial and urban expansion, and air conditioners. The number of residential air conditioners in the region is set to triple by 2035.

Birol said the region will need about $600 billion over the next decade to build power plants and to expand and modernize the grid, underscoring an immense financing challenge ahead.

Transmission and distribution networks need to more than double in length by 2050 to keep pace with rising demand and to cope with the addition of more wind and solar energy, the report notes. Investment in grids and storage, such as battery storage, needs to ramp up from $13 billion in 2026 to $50 billion in 2050.

About $27 billion will be needed by 2040 to realize planned cross-border interconnections under the ASEAN Power Grid.

The agency notes that nuclear could become a key growth area for power generation by midcentury. Nuclear deployment could meet almost 10 percent of electricity demand growth by 2050 if announced government targets are achieved. But this will depend on accelerating deployment and reining in long construction lead times and costs.

Vietnam, Indonesia and the Philippines have announced plans to commission nuclear reactors, with the first units scheduled to come online after 2030. Singapore is carefully investigating if nuclear energy is suitable for the country and is working with the International Atomic Energy Agency on a detailed review starting in 2027.

Increasing electrification of transport, homes and industry is also a key area for the region's governments to focus on. Boosting renewable energy investment, battery storage and regional grid interconnections can cut fuel import bills while boosting regional resilience, the IEA said.

Renewable energy capacity is projected to nearly triple by 2035 under current policy settings or grow fivefold if announced targets are achieved.

Solar deployment has already increased this year: The Philippines became the second-largest destination for Chinese solar exports in the first quarter of 2026, with imports around three times higher than in 2025.

Birol expressed optimism about more rapid change in the region, attributing it to the impact of the Iran war.

He pointed to the rapid changes that occurred in Europe because of the Russia-Ukraine conflict. Before the conflict, Russia supplied about 40 percent of Europe's energy. Now, it is a fraction of that.

He said wind and solar installations in Europe have increased by a factor of three and nuclear power is now back on the energy agenda of many European countries.

"I expect this will be the same in Asia, especially in Southeast Asia," he said.

THE STRAITS TIMES, SINGAPORE

South Korea begins soccer reform after World Cup fallout

SEOUL — The Ministry of Culture, Sports and Tourism of South Korea launched the K-Football Innovation Committee in early July, appointing former national team player and current member of FIFA's standing committee Park Ji-sung and (South) Korean Sport & Olympic Committee, or KSOC, President Ryu Seung-min as its cochairs.

Holding its inaugural meeting in Seoul in early July, the K-Football Innovation Committee was attended by 10 members.

This list included Culture Minister Chae Hwi-young, Vice-Minister Kim Dae-hyun, Secretary General of the (South) Korean Professional Football League Cho Yeon-sang, and several former soccer players among others.

Culture Minister Chae, who had initially been expected to serve as cochair, said he would step aside and appoint Ryu in his place to ensure the committee's independence from the government.

"With Ryu and Park, the K-Football Innovation Committee would encourage football figures and sports expertise to lead the conversation while the government provides support from behind to build the future of (South) Korean football," said Chae.

The committee comes in response to widespread criticism of the (South) Korea Football Association after South Korea's 34th-place finish at the World Cup.

South Korea opened Group A with a 2-1 win over the Czech Republic but then lost 1-0 to Mexico and 1-0 to South Africa, finishing third and failing to qualify for the round of 32 as one of the eight best third-placed teams.

The expanded 48-team tournament had raised expectations that South Korea would reach the knockout stage, with local media labeling the squad a "golden generation" headlined by former Tottenham Hotspur forward Son Heung-min, Paris Saint-Germain midfielder Lee Kang-in and Bayern Munich defender Kim Min-jae.

The South Africa defeat became the flash point, and team coach Hong Myung-bo was criticized for leaving Son out of the starting lineup, bringing him on at half-time with the score at 0-0.

He later said he had planned to use him when South Africa tired, but that he would do things differently had he known how the match would turn out.

Following South Korea's exit at the World Cup, President Lee Jae-myung said on June 28 on the X platform that he was "utterly baffled" by the elimination, blaming it on personnel decisions.

He said factionalism or loyalty had been prioritized over competence, and asked the sports ministry to investigate and propose measures to prevent a recurrence.

Hong resigned shortly after South Korea was eliminated from the World Cup, saying the responsibility rests with him.

Fans booed Hong at the airport when the team arrived in Seoul on June 29, while applauding the players. Some held banners saying: "South Korean football is dead."

'Time for change'

The culture minister said that a committee comprising prominent figures from the sports community will be established to examine the causes of South Korea's disappointing performance.

Park said the result showed that it was time for change.

"(South) Korean football has had its ups and downs, but always did its best. The recent World Cup games proved that things have to change," he said.

"I am grateful to be a part of the first steps to a positive change. I am a former soccer player, and for that I have the responsibility as a footballer to see how the innovations should be made, not only from a player's perspective, but also by considering if our discussed solutions are applicable," he added.

> "The recent World Cup games proved that things have to change ... I am a former soccer player, and for that I have the responsibility as a footballer to see how the innovations should be made."
>
> **Park Ji-sung,** member of the FIFA Men's Football Stakeholders Committee and a former South Korean soccer player

Another cochair Ryu stressed that neither his involvement nor the KSOC's would affect personnel issues or how the national team operates.

"My role is to seek ways for (South) Korean sports to move forward. The committee will listen to what the sports experts have to share so that the public can applaud and encourage (South) Korea Football Association and the players," he said.

The committee will serve on a temporary basis until a new executive board of KFA is established.

The committee was officially launched hours after Chung Mong-gyu, national football chief, stepped down after 13 and a half years at the helm.

Chung had announced in May that he would resign after the FIFA World Cup, but did not specify when he would leave.

Chung appears to have brought forward his resignation following South Korea's earlier-than-expected group-stage exit from the World Cup and its aftermath, including head coach Hong's resignation.

Demonstrators clash with police in Bologna, Italy, on Monday. The crowd gathered to protest the death of Abderrahim Fakir, a Moroccan-born local business owner who died on Sunday following a police restraint during an attempted arrest for damaging a vehicle. MICHELE LAPINI / REUTERS

Hegseth: war in Iran has cost $37.5 b

Senators question accuracy of casualty numbers, citing need for transparency

By SHI GUANG
shiguang@chinadailyusa.com

At a Senate budget hearing on Tuesday, US Defense Secretary Pete Hegseth estimated that the war with Iran has cost $37.5 billion.

During a hearing of the Senate Appropriations Committee on Capitol Hill, Hegseth said the $37.5 billion was not only for the cost of military equipment used, and included expenses such as meals.

The hearing was to consider a request for supplemental funding of around $67 billion for the war, which Hegseth said was an "urgent, necessary injection of resources", as well as $1.5 trillion for next year's military budget.

"Without these funds, we face critical shortfalls," Hegseth testified.

Democratic Senator Patty Murphy warned of "another forever war".

"This war is now spiraling out of control again," Murray said, adding that US President Donald Trump has repeatedly claimed that "a deal is near, and the war will be over soon. But now, he's asking for $70 billion more — and for us to just trust him it'll all work out fine."

Trump said on Tuesday that Iran "desperately" wants ceasefire talks, though the US has not cut back on daily attacks.

"We're not finished," Trump told reporters at the White House. "We're not leaving."

Trump said the US could soon hit Pickaxe Mountain, a hardened underground facility where it is believed Iran has moved the centrifuges required to make nuclear fuel, as well as its stockpiles of enriched uranium.

In a post on Tuesday, Trump compared the deaths of 17 US military personnel so far in Iran — and the zero deaths of US troops in the operation to illegally seize Venezuelan leader Nicolas Maduro — with fatalities in previous US wars: 2,000 in Afghanistan, 4,600 in Iraq, 58,220 in Vietnam and 36,574 in Korea.

However, some senators have questioned the casualty numbers in Iran, arguing the administration is not being transparent, and is hiding behind the claim of "operational security".

"The ceasefire collapsed. The war is escalating. American troops are paying the price. Iran knew it attacked our bases. The Pentagon knew our troops were wounded. The only people kept in the dark were the American people," said Senate Minority Leader Chuck Schumer.

Democratic Senator Tim Kane said the administration needs to provide better answers for the military deaths and the president's threats to widen the war, despite Congress voting to limits his powers in the Middle East.

"You better have a really good answer for that question. And as of right now, this war of choice that Donald Trump started, he cannot answer that question. Congress has definitively declared — both houses — that this war is illegal. Only we, in the Constitution, have that power. The president is ignoring us, even though that declaration was made by two Republican majority houses," Kaine said.

Brent oil futures settled above $90 on Tuesday, its first close above that threshold since June 11.

Hegseth said the US had been helping guide ships through the Strait of Hormuz, claiming they had "been in control of moving traffic" for some time.

"We pushed almost, I believe, between 400 and 500 million barrels of oil under the nose of Iran over the course of Project Freedom," Hegseth told the committee.

Trump also dismissed the threat by Houthi forces in Yemen to block transit in the Red Sea, which Saudi Arabia has been using as a partial alternative route to ship oil.

"If there is something like that, we'll just have to take care of business," Trump told reporters at the White House on Tuesday.

Fresh 50% US tariffs mount pressure on Canada

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

The latest US tariffs on certain Canadian goods are being viewed by experts as both a negotiating tactic and a shift in the US administration's legal strategy for pressuring Canada.

US President Donald Trump on Monday announced a new 50 percent tariff on certain Canadian goods, including wine, hockey sticks and cement.

The White House said the move was intended to address what it described as discriminatory Canadian trade policies, including restrictions on US alcohol sales, dairy supply management and automobile import quotas.

Canadian Prime Minister Mark Carney condemned the move, calling it "the latest in a series of unilateral US trade actions" that began with Washington imposing tariffs "in direct violation" of the agreement between Canada, the United States and Mexico.

"Canada stands ready to engage intensively to address outstanding issues with the US to the mutual benefit of our citizens," Carney said in a statement.

Ontario Premier Doug Ford urged Ottawa to respond forcefully.

Trade experts said the latest measures reflect both a shift in the legal tools employed by the Trump administration and a broader effort to increase pressure on Canada amid stalled trade negotiations.

Dave Townsend, a partner in Dorsey & Whitney LLP's International Trade Group, said the administration's latest action differs from earlier tariff measures.

"Today, the Trump administration announced tariffs on nearly $20 billion worth of annual imports from Canada under a different legal authority, Section 338. The tariffs would take effect 30 days from now. Why now against Canada?" Townsend said.

He said the timing appears closely linked to ongoing negotiations between Washington and Ottawa.

"The new potential tariffs on goods from Canada appear to be because Canada has thus far not agreed to a framework trade agreement with the United States.

"Thus, the higher tariffs for goods from Canada appear to be aimed at encouraging an agreement between Canada and the United States, or in retaliation for the failure to reach such an agreement, or both," Townsend said. He said the latest measures could further strain trade relations.

Cycle of escalation

"The question now is whether the two sides can reach such an agreement or whether a cycle of escalation and retaliation takes hold between the two countries," he said.

Ronald Stagg, a history professor at Toronto Metropolitan University, said the administration's latest move also marks a significant change in the legal basis for imposing tariffs.

"Having run into problems with duties imposed under 1974 and 1962 trade acts, Trump has now reached back to the 1930 act, which resulted in the deepening of the Great Depression, as other countries retaliated by raising tariffs," Stagg told China Daily.

Stagg said the announcement appeared to catch many in Canada by surprise.

"This seems to have come as a surprise to the Canadian government, and the media, which were focused on Trump's musings on the imposition of tariffs or other financial penalties on Canada for allowing smoke from wildfires to enter the United States," he said.

Only days before announcing the new tariffs, the Trump administration threatened additional financial penalties against Canada over wildfire smoke drifting across the border, accusing Canada of failing to properly manage its forests.

Stagg said the latest actions reflect a broader pattern in Trump's approach.

Looking ahead, Stagg said Canada's response will be critical.

"The question now is, will Canada retaliate, or will the Canadian government complain, but try not to poke the bear," he said.

Beijing hits back at Tokyo over drill

By JI HAISHENG
jihaisheng@chinadaily.com.cn

China on Tuesday rejected Japan's claims about Chinese warships operating in waters near Okinotori during a joint exercise with Russia, saying the activities in the high seas are fully consistent with international law and global practice.

Foreign Ministry spokesman Lin Jian made the remarks at a news conference in response to reports that Japan had lodged a protest alleging Chinese vessels entered "Japan's exclusive economic zone" during the drill, calling Tokyo's concerns groundless.

Under the United Nations Convention on the Law of the Sea, Okinotori is a rock rather than an island, and thus unfit to claim an exclusive economic zone or continental shelf, Lin said. "Japan's claim of an exclusive economic zone around Okinotori violates international law," he said.

Lin accused Japan of smearing other countries' legitimate and lawful operations, and peddling the so-called external threat as attempts to find excuses for accelerating remilitarization and challenging the postwar international order.

The international community must stay on high alert and jointly push back on this dangerous pursuit, he added.

'Whale-done' rescue

Rescue workers maneuver a sling through the water to transport a beluga whale at the shuttered Marineland theme park in Niagara Falls, Ontario, Canada, on Monday. This operation marks the beginning of a complex mission to relocate nearly three dozen whales from the park, which closed late last year, to new homes in the United States. CARLOS OSORIO / AP

Hopes, doubts and demands as Burnham takes power

Xing Yi
Reporter's log

FIRST PERSON VIEW

By the time I arrived at Downing Street on Monday morning, the narrow street was already packed with journalists, photographers and broadcasters awaiting the transfer of power from Keir Starmer to Andy Burnham, the United Kingdom's seventh prime minister in a decade.

I had arrived three hours before Burnham's scheduled speech, but I was too late. A security guard told me every media position had been allocated last week. We were not getting in.

Outside the gates, the crowd continued to swell. Journalists without accreditation lingered in hope, protesters unfurled banners, and passersby paused for a glimpse of the new prime minister.

Then a question struck me: everyone inside would hear Burnham's speech, but who was listening to the people outside?

We turned our attention to the crowd, speaking not with politicians or officials, but with ordinary people who had come to witness Britain's latest change of leadership.

A retired landscape architect said he was there to campaign for the UK to rejoin the European Union.

"Because of Brexit, we've lost between 6 and 8 percent of GDP," he said. "We've got a new prime minister who has said he'd like us to rejoin the EU. We can persuade him to get on with it."

An artist displaying a satirical painting lamented the frequent leadership changes.

"I've seen many prime ministers, and it doesn't matter what they were doing — their policies need stability," he said. "Every one or two years we get a new prime minister, and that's not a good sign.

"The country is in a mess — socially, economically and politically — and is going downward. Someone has to stop that," he added.

Nearby, campaigners staged a symbolic performance. Wearing a cartoon mask of Burnham, one member used a long-handled brush to sweep the street as part of the "Clean Up Westminster" campaign.

The group's leader said they wanted to reduce the influence of money in politics.

"We are here to encourage the new prime minister to keep his promise to limit how much money any individual or organization can give to a political party," he said, referring to a recent investigation into an undisclosed $6.7 million donation linked to the leader of Reform UK.

Later, I met a couple from Suffolk, where Reform UK secured a major victory in May's local elections.

"We hope (Burnham) does a good job, but he's not elected," they said, adding that the change of Labour Party leader lacked a direct mandate from voters.

Their main concerns were immigration, the cost-of-living crisis and poverty. "We need a general election so people can have their say on whom they want as their prime minister," they said.

"So if there were a general election, would you vote for him?" I asked.

"No," the husband replied, before repeating, "No."

Afterward, I met another couple from Ashton-in-Makerfield, where Burnham won last month's by-election, securing the parliamentary seat that paved the way to No 10 Downing Street. Burnham defeated the second-placed Reform UK candidate by about 9,000 votes.

The wife said they had interacted with Burnham during the campaign because "he was there nearly every day".

"He's very humble, very down-to-earth, and he's very much for ordinary working-class people," she said. "He wants to improve social housing and things like that.

"We've got a lot of hopes for him."

In the end, I never made it inside Downing Street that morning.

But perhaps the story was only half told if it focused solely on the new prime minister's speech in front of the famous black door. The other half unfolded outside — in the hopes, frustrations, doubts and demands of ordinary Britons.

Editorials

Meeting presents Manila with opportunity to step in line with other ASEAN members

Manila has committed its latest provocative act in the South China Sea, just ahead of the China-ASEAN Foreign Ministers' Meeting in Manila on Wednesday, which Chinese Foreign Minister Wang Yi is scheduled to attend.

Among Manila's many provocations, confrontations in the South China Sea between illegally intruding Philippine vessels and China Coast Guard boats carrying out enforcement operations have become a routine occurrence. Each dangerous encounter at sea exacerbates tensions and further strains bilateral relations.

What happened on Monday in waters near China's Ren'ai Reef is just one of many such perilous encounters. According to a CCG statement, two rubber boats from the Philippine ship BRP *Sierra Madre*, which Manila grounded on China's Ren'ai Reef in 1999 and has refused to remove ever since, rapidly approached a CCG patrol boat, which was conducting routine patrols, and rammed it, despite repeatedly being given clear warnings.

Philippine personnel also maliciously struck Chinese law enforcement officers with oars, poles and other tools during the incident. Despite the fact that the Philippine side initiated the provocation, in a bid to mislead the international community, Manila had the nerve to play the victim.

It is only natural that Manila's reckless words and deeds should be censured by Beijing. The head of the Department of Boundary and Ocean Affairs of the Ministry of Foreign Affairs urgently summoned the Philippine ambassador to China on Tuesday, lodging solemn representations over the Philippines' deliberate provocation at Ren'ai Reef and its attack on CCG law enforcement personnel.

China values its relations with the Philippines, but Manila should not mistake China's goodwill and restraint for weakness or unlimited tolerance.

China's relations with the other members of the Association of Southeast Asian Nations have remained generally stable. But due to Manila's constant provocative antics in the South China Sea, the same cannot be said of ties between China and the Philippines.

As the rotating chair of ASEAN this year, Manila should play a more constructive role in promoting peace and stability in the region, rather than inviting wolves into the house. Its tactic of enlisting the support of external forces and trying to ignite the cold ashes of the so-called "South China Sea arbitration award" does a disservice to regional efforts to maintain peace in the waters. Beijing has made it clear that the Code of Conduct in the South China Sea must never be linked to the illegal "arbitral award".

It serves no country's interest if stability and cooperation in the region are undermined by feuds.

Instead of exacerbating tensions in the region, the Philippines should leverage its position to facilitate dialogue and cooperation. It should shoulder its responsibilities and act as a promoter and coordinator of regional peace, focusing on constructive engagement rather than provocation. The goal should be to foster an environment conducive to negotiations and the peaceful resolution of disputes.

As China and ASEAN are striving for an early conclusion of negotiations on the COC, the Philippines should prioritize the task, ensuring it reflects the collective interests of ASEAN and China, and not the agendas of external powers.

It is hoped that the China-ASEAN Foreign Ministers' Meeting will send a message that prioritizes peace and stability over conflict and division. By fostering a spirit of cooperation and mutual respect, China and ASEAN can work together to turn the South China Sea into a sea of peace, friendship and cooperation.

China looks forward to the Manila meeting expanding consensus on development and cooperation, making new progress in jointly fostering a peaceful, safe and secure, prosperous, beautiful and amicable home, and striving to forge a closer China-ASEAN community with a shared future.

Stable China-UK relations benefit both sides

On Monday afternoon, Andy Burnham, the United Kingdom's seventh prime minister since 2016, stood outside No 10 Downing Street and said: "Let us make this the moment when Britain starts to believe again, the moment we bring back hope."

It was a good line that millions of UK people will be looking to him to deliver on. But "hope", as every UK leader has learned to their cost, is a currency that devalues fast when the fiscal arithmetic refuses to cooperate.

The new prime minister inherits a country facing domestic challenges, with many residents struggling with high living costs. Burnham has ruled out raising income tax, VAT or national insurance. Yet he has promised the largest public housing program in decades, reindustrialization and the return of utilities to public control.

The math does not add up.

Against this backdrop, deepening economic engagement with China is a necessity. Burnham's predecessor, Keir Starmer, stabilized relations with Beijing. And Starmer's January visit to China — the first by a UK prime minister in eight years — sustained the momentum of a suite of dialogue mechanisms that had lain dormant for too long.

The China-UK Joint Economic and Trade Commission is back, meeting for its 15th session in London this month. The Economic and Financial Dialogue, suspended for six years, produced nearly 70 policy outcomes when it resumed in Beijing last year. A new Financial Working Group has been established. The Joint Commission Meeting on Science and Technology has identified climate, health and agriculture as shared priorities.

This is the institutional architecture that Burnham can now work with. His own career record in Manchester gives him an advantage: he has seen Chinese investment work. During his mayoralty, Chinese companies poured over £6 billion ($8.07 billion) into Greater Manchester, backing regeneration projects that created jobs and revived communities.

Chinese Premier Li Qiang extended his congratulations on Monday, expressing readiness to strengthen engagement, deepen mutual trust, expand exchanges and cooperation, and advance the long-term and stable comprehensive strategic partnership between the two countries.

Li also noted that stronger dialogue and cooperation would not only advance the development of both nations but inject stability into global peace as well. It is clear China is prepared to work with the Burnham government for the two countries' common interests.

Yet the shadow of British Steel looms large at the moment. The nationalization of the Scunthorpe plant — seized from China's Jingye Group just days before Burnham took office — is a flagrant violation of the UK's contractual obligations.

Burnham must deal with this with prudence. He should bear the bigger picture in mind, as the potential for bilateral cooperation is too great to be jeopardized by the dispute. The bilateral trade in goods reached $103.7 billion in 2025, while the two countries' services trade exceeds $30 billion and has huge untapped potential. The UK is the world's second-largest services exporter; China is the second-largest services importer. A China-UK services trade agreement — which both sides have committed to exploring — could be transformative.

As UK Business and Trade Secretary Peter Kyle said at the July "Export to China" event in London: "Both sides can enhance understanding through dialogue, join hands in cooperation, and maintain stable economic and trade relations benefiting both peoples."

Burnham needs China if he is to deliver his flagship promises. Promoting the UK's green transition, advanced manufacturing, life sciences and electric vehicles — all require investment that a cash-strapped UK Treasury cannot provide alone. Chinese capital can help re-industrialize the north and the Midlands, exactly the left-behind communities Burnham has pledged to serve.

The China hawks in Westminster will not disappear. But the lesson of Starmer is that a prime minister who fails to deliver growth loses his party's confidence. Starmer was undone not by a single crisis but by a cumulative sense that he had no solution. Burnham's "Manchesterism" — his commitment to shifting power from Westminster, expanding public control and promoting regional development — was forged in a city that benefited tremendously from Chinese engagement. The UK will benefit if he can now apply that cooperative pragmatism on a national scale.

The mechanisms are in place. The will in Beijing is clear. Burnham's own instincts are sensible. The question is whether he can resist the gravitational pull of geopolitical pressures long enough and resolve differences through consultations to make it work.

Economy's structural divergence calls for targeted support policies

China's high-tech and manufacturing sectors are expanding at high speed. For those who measure national prowess in teraflops and gigawatts of computing power, the latest industrial data are remarkable. The country's intelligent computing capacity reached 2,185 eflops as of June; and its integrated circuit exports — a sector targeted by US restrictions — have skyrocketed by 88.7 percent year-on-year in the first half of the year. It also accounts for over half of the world's humanoid robot models.

It can be seen that China's economy operated within a proper range in the first half of the year. And efforts will be stepped up to secure the steady development of employment, businesses and markets, and to meet expectations.

Although the official unemployment rate for the 16-24 age bracket has fallen for three consecutive months, it still lingered at 14.9 percent last month, with students excluded.

China has set a target of a surveyed urban unemployment rate of around 5.5 percent in 2026 and aims to create over 12 million new urban jobs within the year.

What the country is experiencing is a "scissors effect" of structural divergence. Artificial intelligence, as the Ministry of Industry and Information Technology notes, is being integrated into every facet of the economy. But the replacement of human labor is outpacing the creation of new, viable occupations in some sectors, where the "substitution effect" is winning the race against the "compensation effect".

Consider the numbers from the Ministry of Human Resources and Social Security. While AI-related job openings in fields such as humanoid robotics have quadrupled, nearly half of these positions explicitly require a master's degree or higher. China faces a talent gap in AI-related fields, yet millions of rural migrant workers have to adapt to labor market changes caused by automation in traditional manufacturing. This is a skills chasm, which affects consumption as well. If the average worker lacks the digital literacy to compete in a machine-driven economy, how can they fuel domestic demand?

The legacy of the property boom also continues to weigh on consumption. For more than a decade, soaring home prices encouraged many households to exhaust their savings and take on substantial debt, effectively spending tomorrow's income yesterday. As property values have softened, that consumption has proved difficult to recover.

Governments can encourage spending, but they cannot manufacture purchasing power. Consumption ultimately rests on income.

What is required is expanding lifelong learning systems accessible to factory workers, as well as stronger support for the low-income group in public services and social security. In the process, tax revenues generated by the tech boom should be recycled into robust social safety nets and targeted income support. There is no escaping the fact that a "ballast" economy is only as stable as the purchasing power of its consumers.

Redefining the nature of work is equally urgent. The "algorithmic control" exerted by the platform economy has left millions in the gig economy without adequate social security. If these workers are to be true participants in the AI era, they need the same protections as those in traditional employment.

The AI era demands a renewed commitment to social fairness and economic justice. Through continued reform, China can prevent a two-tiered society from forming: a highly educated elite designing and managing intelligent machines, and a growing commons left to compete for whatever work automation leaves behind.

Without an effective recalibration of how we invest in human capital and distribute national income, the "scissors" will only cut deeper. The real ballast for any economy is jobs. The technological miracle the world is experiencing will ultimately be judged not by its teraflops, but by whether it lifts all boats through inclusive development.

— LI YANG, CHINA DAILY

What They Say

OPC ecosystem can help promote entrepreneurship

Editor's note: *Enabled by the rapid development of artificial intelligence, one-person companies, or OPCs, are thriving in China, offering a new model of employment. Yao Jianhua, deputy dean of the School of Journalism at Fudan University, spoke to Oriental Outlook on the strengths of China's OPC sector and the challenges it faces. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Contrary to what many people think, an OPC can involve more than one person. Depending on local policies across different cities in China, an OPC can have up to 20 employees in it.

The most important feature of an OPC is its approach to business. It is a smart model that is built on AI and involves collaboration between software and hardware.

The core competitive edge of an OPC lies in its founders' deep understanding of users' needs and market demands.

The OPCs which are able to identify unmet demands and leverage their technological capabilities to meet these demands are more likely to succeed in the competition.

Cities across China have established OPC communities to support the development of this new business model. Typical examples include the Zero Cube community in the Lingang Special Area in Shanghai, the ZGC AI North Latitude Hub in Beijing, and the Dagongfang AI hardware OPC hub in Bao'an district, Shenzhen.

These communities serve as platforms for OPC entrepreneurs to build connections, convert social networks into commercial resources and engage in flexible collaboration.

However, a lack of sufficient application scenarios remains a prominent challenge for the growth of OPCs. Some cities treat the local OPC community merely as a coworking space and a tool to attract investment, without offering enough opportunities for companies to deploy their products in the real world.

Also, although AI technology has lowered the threshold for individuals to start a business, OPC founders are predominantly young talents with specialized technical expertise, high academic credentials and work experience in tech firms or research institutions. A large number of ordinary workers still lack proficiency in AI tools and awareness of digital entrepreneurship. This might lead to the digital divide and imbalanced development, undermining the inclusive innovation that OPCs aim to promote.

Other challenges include heightened operational and financial risks for OPC founders who run their companies all by themselves, and security loopholes caused by the use of AI agents.

The government and the market should work together to promote the sound development of OPCs. Local authorities could formulate special policies aligned with the 15th Five-Year Plan (2026-30), and roll out measures tailored to local industrial strengths.

They should refine rules for OPC governance and address regulatory loopholes, improve financial services to ease OPC founders' burdens, and build cross-regional public computing power platforms to provide low-cost and inclusive computing resources.

OPC communities should also focus on local industries and resources and upgrade their services. They should not only provide workspace and computing power for OPCs, but also offer other services, including matching demand with supply and promoting industrial collaboration.

To prevent the digital divide, local authorities should cooperate with tech enterprises, universities and industry associations to offer customized AI training courses to different groups of people, thus lowering the barriers to digital entrepreneurship.

Regulators should adopt an inclusive and prudent governance approach, using tools such as regulatory sandboxes to allow for experimentation and learning in OPC operations.

VIEWS

Xu Ying and Zhang Weishi

The right flight path for the low-altitude economy

Wuhan, the capital of Hubei province, has begun drawing roads in the sky. Its new "Sky Road Map" — the first of its kind in China — charts hundreds of flight corridors and thousands of landing points across the city, creating a digital blueprint for a future in which drones, air taxis and other low-altitude aircraft become part of everyday urban life.

But the real challenge is not mapping routes; it is governing a crowded sky. As millions of low-altitude aircraft take flight, China will need a dynamic governance system that manages airspace across space and time, coordinates multiple agencies in real time and treats the sky as critical urban infrastructure. Otherwise, the low-altitude economy could add a new layer of disorder to already strained cities.

Drones, electric air taxis and other low-flying aircraft are seen as part of the country's next wave of industrial growth and infrastructure development. However, growth without structure is unsustainable.

To ensure orderly growth, the governance framework should adopt a "risk-based" or "benefit-assessed" approach that prioritizes public safety and disaster relief. The recent flood relief operations in Guangxi Zhuang autonomous region illustrate the value of low-altitude aircraft in emergency situations. Rules for commercial logistics, environmental monitoring and other market-oriented applications can be developed in an extended framework. By differentiating governance according to public value and economic needs, cities can safeguard critical functions without stifling innovation.

China's urban development has hit an inflection point. Traditional two-dimensional, labor-intensive governance models are reaching their limits. A shrinking front line workforce and tighter fiscal budgets demand a more precise, resilient approach.

The growth of low-altitude airspace — generally up to 1,000 meters above the ground — is pushing Chinese cities beyond traditional ground-based management.

Urban authorities must now manage not only roads, buildings and people on the ground, but also where aircraft fly, when they fly and how their movements interact with life on the ground. This emerging model is described as "spatiotemporal governance" because it adds both physical elevation and time to the traditional map of urban management. More importantly, it marks a shift from reacting to problems after they occur to anticipating and preventing risks through coordinated data-driven governance.

The future of low-altitude governance will not be built one drone at a time. Current "point-based" models, which treat drone operations as isolated deployments, are not suitable for the scale of modern urban complexity.

MA XUEJING / CHINA DAILY

Therefore, China is moving toward a sophisticated spatiotemporal grid-based model that integrates three foundational pillars to manage the low-altitude space.

The first pillar is digital intelligence. Real-name registration, flight reporting and identification systems help authorities determine who is flying where and for what purpose. When those data are combined with weather information, air-traffic rules and 3D maps of the city, regulators can assess risks in real time rather than after an incident occurs.

The second is zoning. Instead of relying on blanket no-fly bans, cities are beginning to classify low-altitude airspace by aircraft type, mission, population density and infrastructure risk. High-risk areas can be tightly controlled, while designated corridors remain open for lower-risk commercial and public services. Fixed routes and approved takeoff-and-landing nodes will turn low-altitude airspace into a planned transportation network.

The third pillar is coordination. Drones do not stop at city borders, and neither can regulation. Aviation authorities, emergency responders and public security departments need shared platforms and shared rules. When flight routes are connected with weather and safety data, risks can be spotted before takeoff. As drone services expand across neighboring cities, common standards for identity checks, data sharing and approvals will be essential to keep flights moving safely across municipal boundaries.

Across China, early experiments are already showing what a coordinated low-altitude network can achieve. On the technical front, integrating multi-source big data is enabling the creation of digital twins that allow officials to visualize and simulate urban life in real time. For instance, in Pingtan, Fujian province, autonomous inspection systems like "Cloud Xiaosheng" are transforming how municipal infrastructure is monitored.

These initiatives signal a broader shift toward anticipatory urban governance. By replacing post-event response with pre-event planning, cities can overcome three persistent challenges: insufficient synergy, fragmented integration, and uneven public service coverage.

The real test of China's urban governance is not whether drones can fill the sky, but whether cities can govern that sky with the same coherence and efficiency that they govern the streets below.

That will require more than advanced aircraft. It will require stronger legal frameworks, deeper institutional coordination and sustained investment in digital infrastructure and innovation.

For decades, China's cities were shaped primarily by horizontal expansion. The next stage will be defined by how effectively they manage activity across space and time, integrating the air above the city with the systems that operate on the ground. If that transition succeeds, the low-altitude economy will become part of a broader shift toward safer, more resilient and more intelligent urban life.

Yen's fall microcosm of mature economy in structural decline

Despite a recent bounce, the yen remains pinned below the psychologically critical 160 mark against the dollar — a level long viewed by the market as a last line of defense.

Once an undisputed safe-haven currency, the yen is now one of the world's worst-performing major currencies. Its relentless slide lays bare the fragility of Japan's political and economic foundations, exposing a jarring case of policy schizophrenia.

Officials continue to tout a narrative of "moderate recovery" for Japan's economy. Supporting this optimism is the fact that while the yen languishes at 40-year lows, the Nikkei has surged to heights not seen since the late-1980s bubble era. Politicians are quick to frame this as a sign that Japan is finally shaking off its "lost decades."

Yet the stark divergence between stocks and the currency reveals deep internal contradictions. To a significant extent, the plunging yen has engineered an imported bull run. The Nikkei 225, dominated by exporters like Toyota, Sony, and SoftBank, benefits directly as a weaker yen inflates the value of repatriated overseas earnings. However, this disconnect from the tepid underlying economy has investors on edge; what passes for a "recovery" feels more like a disjointed solo dance.

The contrast becomes even starker beyond the equity market. With Japan heavily reliant on imports for energy, raw materials and food, the currency crash has unleashed a tide of imported inflation. Consumer prices have breached the 2 percent policy target for four straight years, while the Engel coefficient (the proportion of food expenditure in total consumption expenditure) for households hit 29.4 percent in the third quarter of 2025 — its highest level since 1981.

A currency's persistent plunge signifies a collective downgrade of the country's potential — a massive vote of no confidence.

While listed multinationals celebrate inflated paper profits, the vast majority of smaller firms are being squeezed to death, burdened by rising operating costs. According to one survey, corporate bankruptcies attributable to yen depreciation rose by 32.3 percent year-on-year in the first half of this year. Meanwhile, despite union-led nominal wage hikes of 5 percent over two years, real wages have declined for four consecutive years, failing to keep pace with inflation.

As foreign tourists and property buyers snap up bargains in what has become Asia's biggest "discount store", domestic purchasing power is evaporating.

As Robin Brooks of the Brookings Institution noted in May, measured by the real effective exchange rate (REER), the yen has fallen below even the Turkish lira, largely considered one of the world's weakest currencies. Bank for International Settlements data show the yen's REER has collapsed from a 1995 peak of 193.95 to just 67.73 — a two-thirds wipeout of its value.

On the surface, the primary driver appears to be the yawning 300-basis-point gap between US and Japanese interest rates, which serves to fuel a low-risk carry trade bonanza: borrowing low-interest yen and buying high-interest dollar assets, thereby creating a lasting siphon effect of shorting the yen. But Tokyo's repeated interventions — including a record 11.73 trillion yen ($73.6 billion) spent in just one month to buy the yen in the market and hiking the benchmark rate to its highest level since 1995 — have failed to stem the tide.

Clearly, this is no longer just about interest rate differentials; it is a symptom of deep structural malaise. At the heart of the crisis is a catastrophic policy mix: the financial authorities press the brakes with rate hikes, while Prime Minister Sanae Takaichi slams the accelerator with reckless fiscal abandon. Ignoring a debt-to-GDP ratio of 240 percent, her administration is doubling down on massive stimulus and defense spending. This fiscal profligacy has spooked the bond market, sending the 10-year benchmark government bond yield soaring to a three-decade high of 2.9 percent.

The resulting surge in borrowing costs for the government, corporations, and households is choking off the real economy.

This places Japan's economy squarely in the grip of what economists call an "Impossible Trinity": expansionary fiscal policy demands low rates, low rates crush the currency, a weak currency forces tightening, and tightening strangles the very fiscal expansion it seeks to enable. Takaichi's political gamble is proving to be a ruinous wager on the future of the Japanese economy.

Today, the yen's decline is a microcosm of a mature economy in structural free fall. Investors are shorting the yen, betting on the persistence of Japan's woes: a shrinking population, unsustainable debt, hollowing out of industry, the fading dominance of its once-mighty manufacturing sector, and in particular, the worsening geopolitical environment. The shift from perennial trade surplus to chronic deficit further erodes the currency's intrinsic worth.

While Takaichi clings to her "weak yen is good" dogma, markets understand the truth: a sovereign's exchange rate is the ultimate barometer of national competitiveness. A currency's persistent plunge signifies a collective downgrade of the country's potential — a massive vote of no confidence. How, or even if, Japan rescues its currency will not only determine its own economic fate but also reverberate across the global financial system.

Nancy Snow

Emerging technologies need public trust

Global Lens

The global race for emerging technologies is often described in terms of innovation capacity, computing power, research funding and national competitiveness. Governments and industries speak of artificial intelligence, biotechnology, quantum systems, robotics, and semiconductors as strategic assets that will shape the future balance of economic and geopolitical power. All of that is true. But there is another dimension of technological competition that receives far less attention: the struggle for public trust, social legitimacy and persuasive communication.

Emerging technologies do not exist in laboratories alone. They exist within societies. Their success depends not only on scientific breakthroughs, but also on whether people understand them, trust them and believe they serve human progress.

In the 21st century, technology leadership is also a form of narrative leadership.

Artificial intelligence offers a clear example. Around the world, AI generates competing emotions at the same time: excitement, fear, fascination, anxiety, optimism, and distrust. Some see AI as a path toward scientific advancement and greater productivity. Others fear job displacement, surveillance, misinformation and loss of human control.

Therefore, the challenge before governments, universities, companies and media institutions is not simply technological development. It is explaining the same to the public. Who explains the future matters.

Throughout modern history, societies have embraced transformative technologies because of compelling public narratives. Railroads symbolized national development. Space exploration represented human ambition and scientific possibility. The internet was promoted as a democratizing force capable of connecting humanity across borders. Today's emerging technologies require similar forms of public understanding and social legitimacy.

Yet public conversations about technology are increasingly fragmented. Online ecosystems amplify fear, outrage, conspiracy theories and emotional polarization faster than institutions can respond, just as misinformation often spreads more rapidly than scientific clarification. Public mood itself has become a strategic battleground. I have described this phenomenon elsewhere as "mood trafficking" — the shaping of emotional climates through narratives, images, and information systems. In the digital era, whoever shapes public mood often shapes public perception.

This is especially important because emerging technologies increasingly touch every aspect of human life. Artificial intelligence influences education, labor markets, healthcare, finance, media, and military planning. Biotechnology raises ethical questions surrounding genetics and human identity. Quantum systems may transform cybersecurity and communication infrastructures.

These developments are social transformations. As a result, scientists and engineers alone cannot carry the burden of technological transition. Public communication, education, diplomacy, and cultural understanding must also play central roles.

Universities have an important responsibility here. Institutions of higher learning such as Tsinghua University in China, where I've taught several times, should not only produce technical expertise, but also help societies understand the broader human implications of innovation. This requires dialogue across disciplines, bringing together engineers, social scientists, communication scholars, ethicists, policymakers, and international partners.

Technology policy itself must become more human-centered.

In many countries, governments are now recognizing that technological influence extends beyond economics and security. Innovation also shapes national image, international reputation, and soft power. Countries increasingly compete not only over which technologies they invent, but also over which vision of the future they present to the world.

This is particularly true in Asia, where technological modernization is often linked to broader national narratives of development, stability, education, and long-term planning. Across the region, emerging technologies are becoming symbols of national aspiration and civilizational confidence.

At the same time, all societies face similar questions. How can innovation remain people-centered? How can technological progress strengthen social trust rather than deepening polarization? How can countries encourage innovation while preserving human dignity and public accountability? These questions cannot be answered through engineering alone.

The future of emerging technologies will depend not only on who develops the most advanced systems, but also on who can best communicate their meaning, legitimacy, and human purpose.

Technology is never only about machines. It is also about building and maintaining public trust.

The author, a scholar of public diplomacy and strategic communications, has lectured widely across Asia, including at Tsinghua University's School of Journalism and Communication and Schwarzman College.

GLOBAL VIEWS

MAFA KWANISAI MAFA

Resonant praxis

105-year legacy of CPC offers operational and governance wisdom the Global South can embrace

As the Communist Party of China marks its 105th anniversary, its odyssey furnishes the Global South with profound, actionable governance lessons.

For generations, developing nations across Africa, Latin America and Southeast Asia have adopted Western political and economic templates wholesale, only to remain mired in institutional fragility, systemic graft, erratic policy continuity and entrenched underdevelopment. Set against this stark global reality, China's transformative developmental ascent stands as a time-honed benchmark worthy of in-depth, rigorous scrutiny.

China's landmark achievements speak with unassailable clarity. Since the launch of reform and opening-up in 1978, about 800 million Chinese people have been lifted out of extreme poverty, accounting for over 70 percent of global poverty reduction. China has sustained relentless breakthroughs in infrastructure construction and technological innovation, contributing about 30 percent to global annual economic growth year after year and cementing its stature as an irreplaceable engine for shared global prosperity.

What constitutes the bedrock of the great rejuvenation of the Chinese nation? Analysts across many regions share one answer: the CPC serves as the unshakable anchor of China's national governance. Far beyond delivering steady, long-horizon political leadership, the Party has erected a comprehensive self-renewal framework anchored in the 14 foundational principles of Xi Jinping Thought on Party Building. These principles encompass upholding the Party's unified leadership, enforcing rigorous internal discipline, strengthening ideological cultivation, institutionalizing anti-corruption campaigns, improving cadre capacity building and establishing full-spectrum accountability mechanisms. Most critically, the CPC rejects superficial, temporary rectification drives. Instead, it institutionalizes organizational self-reform of the Party as an enduring, iterative mission.

Five core, adaptable governance tenets carry universal resonance for many Global South countries.

First, proactive institutional self-renewal. Any state apparatus will inevitably stagnate and atrophy should it grow complacent or sever its organic bond with the people it is meant to serve. The CPC's multi-layered internal supervision architecture and targeted rectification mechanisms nip structural flaws in the bud, stopping minor frictions from metastasizing into crippling systemic crises. This timeless logic is equally applicable to national government, academia, public service bodies and civil society organizations across the developing world.

Second, standardized discipline and enforceable accountability. Many emerging economies are hamstrung by fragmented public administration, endemic corruption and disjointed national policy rollouts. Decades of China's on-the-ground governance practice validate an immutable truth: clearly delineated institutional mandates, unified statutory rules and cross-tier oversight exponentially elevate administrative efficiency. Every sovereign nation must forge institutional frameworks rooted in its unique constitutional heritage and indigenous political traditions, yet a universal axiom endures: high-caliber governance demands visionary, competent leadership paired with robust institutional guardrails.

Third, merit-centric civil service development. The recruitment and evaluation of public officials hinge on three pillars: professional proficiency, unwavering public service ethos and unimpeachable personal integrity. Sustained leadership training and upskilling initiatives empower state workforces to navigate intertwined economic and social complexities with poise.

Fourth, multi-generational strategic planning. Short-sighted, election-cycle-bound policies can never catalyze structural national transformation. China's sequential five-year medium-term development blueprints and overarching national visions that transcend successive administrations unlock sustained progress in poverty eradication, industrial upgrading, indigenous technological breakthroughs and cross-continental infrastructure ventures. For African economies striving to break free from crippling commodity dependency, this model of uninterrupted long-range planning holds considerable practical value.

Fifth, people-centered founding mission. Self-reform, strict accountability, merit-based official training, long-term planning and institutionalized governance all serve one central goal: protecting ordinary people's fundamental interests and delivering tangible improvements to daily livelihoods at the grassroots level.

All the remarkable accomplishments of China stem from the CPC's core tenet of seeking happiness for the people and rejuvenation for the nation. Through ever-shifting domestic and international landscapes, every CPC member keeps this mission foremost in mind. The CPC firmly rejects bureaucratic estrangement from the ordinary people and prioritizes people's interests above all else, with this people-centered conviction serving as the spiritual anchor guiding all governance work. Every poverty relief program, infrastructure project and public service upgrade is oriented toward satisfying people's yearning for a better life, demonstrating that people-rooted governance delivers inclusive, sustainable growth unattainable by elite-focused systems.

SONG CHEN / CHINA DAILY

For Global South countries plagued by elite capture and neglected public demands, embedding a people-first mindset into institutional design offers an effective remedy for unequal development.

These principles resonate deeply across Africa. The continent is blessed with abundant untapped mineral and agricultural resources, the globe's youngest demographic cohort and boundless latent economic potential — yet deep-rooted institutional bottlenecks stifle broad-based, equitable advancement. A vital caveat bears emphasis: Drawing insights from China's developmental journey does not equate to blind replication of its entire system. Rather, developing nations may distill adaptable institutional principles while fully honoring their distinct historical trajectories, indigenous governance customs and constitutional order.

China has emerged as a steadfast development partner for Africa, delivering tangible progress via infrastructure, industrial, agricultural, medical and vocational cooperation. Over recent decades, Chinese enterprises have built or upgraded over 10,000 kilometers of railways, nearly 100,000 km of highways, 1,000 bridges, almost 100 ports and 66,000 km of power transmission lines across the continent, alongside thousands of hospitals, schools and training hubs. Zimbabwe's multi-sector cooperation with China covering mining, energy, manufacturing, agriculture and health exemplifies this mutually beneficial partnership, while exchanges enable two-way policy learning between African and Chinese officials, experts and professionals.

Today, the Global South confronts a tangled web of transboundary crises: accelerating climate breakdown, mounting sovereign debt burdens, intensifying technological rivalry, pervasive global food insecurity, mass youth unemployment and shifting geopolitical power equilibriums. Resolving these layered, interconnected challenges requires governments armed with forward-thinking strategic foresight, the capacity to execute policies across political cycles and enduring public trust. The CPC's century-long journey of self-reform and more than seven decades of state governance furnish a well-documented, real-world paradigm for developing countries to craft localized solutions to shared developmental tribulations.

Africa's long-term developmental destiny will ultimately be sculpted by African peoples and indigenous African leadership. Even so, rigorous comparative research into proven successful developmental pathways yields tangible, transformative on-the-ground outcomes. The CPC's 105-year legacy crystallizes an immutable truth: Resilient, high-performance state institutions are forged incrementally through unwavering discipline, sustained capacity cultivation, ironclad accountability, adaptive institutional reform and people-centered conviction. As Global South countries carve out their own sovereign paths to modernization, the CPC's century of self-improvement and decades of governance practice will remain an indispensable touchstone for scholarly inquiry, high-level policy deliberation and thoughtful localized adaptation for generations to come.

QIN XIAO AND WU WENFENG

A road out of middle-income trap

China's all-round advancement paves its way toward high-income status

On July 1, the World Bank updated its global income classifications for fiscal year 2027, setting the high-income threshold at $14,375 based on gross national income per capita, calculated using the Atlas method. With a GNI per capita of $14,230, China remains in the upper-middle-income category, just $145 below the threshold. The question facing China is no longer whether it can reach high-income status, but how — and more importantly, whether — it can avoid the stagnation that has trapped so many economies.

Qin Xiao

Wu Wenfeng

The odds are sobering. Since 1990, only 34 middle-income economies have managed to shift to high-income status. The rest remained trapped in what economists describe as the "middle-income trap" — a stage where economies lose their advantage in low-cost manufacturing but have not yet developed the technological capabilities needed to rival advanced economies. Escaping this trap requires more than capital accumulation; it demands a fundamental transition from imitation to innovation.

The Republic of Korea's economic transformation provides a valuable reference. In 1960, its GNI per capita was roughly $1,200; by 2024, it had soared to $33,000. The World Development Report 2024 summarized the country's success through a "3i strategy": investment, infusion, and, most crucially, innovation. Samsung's evolution — from its early trading business in noodles and groceries in the 1930s to a television manufacturer in the 1970s, and eventually to a leading global manufacturer of consumer electronics and semiconductors — mirrors the country's broader shift from a technology adopter to a frontier innovator. The lesson is clear: technology adoption is a bridge, but indigenous innovation is the destination.

China is now traversing a similar bridge, but with a scale that makes its economic transformation unprecedented.

Three structural advantages give China a solid foundation for breaking through the middle-income barrier.

First, China has built one of the world's largest innovation ecosystems. In 2025, China's research and development expenditure reached 3.93 trillion yuan ($580.67 billion), equivalent to 2.8 percent of its GDP — up from 0.57 percent in 1995. In September 2025, the World Intellectual Property Organization ranked China 10th globally in its Global Innovation Index, first among all upper-middle-income economies. China leads the world in patent filings and hosts 24 of the world's top 100 innovation clusters, with Shenzhen-Hong Kong-Guangzhou topping the global rankings.

These achievements are increasingly reflected in industrial competitiveness. In 2025, it was estimated that China produced nearly 75 percent of the world's electric vehicles. Companies such as CATL and BYD have become major players in the global battery and EV markets. This represents more than low-cost assembly; it reflects high-value engineering capabilities, supply chain integration and continuous technological improvement.

Second, China is converting its demographic dividend into a talent dividend. In 2025, a record 12.22 million students graduated from Chinese universities, including over 5 million with degrees in science, technology, engineering and mathematics. New entrants to the workforce now receive an average of 14 years of education. Roughly half of the world's top AI researchers are now trained in Chinese universities. This large pool of engineers and researchers provides the foundation for companies such as Huawei to continue investing in areas including 5G, AI and chip design despite external pressures. Innovation at the frontier is fundamentally a human-capital game. China is now producing that human capital at a scale no other country can match.

SONG CHEN / CHINA DAILY

Third, China's enormous domestic market provides a unique testing ground for innovation. With a population of 1.4 billion, China can commercialize new technologies faster than other countries. When BYD rolls out a new battery, it has a domestic market larger than the European Union in which to refine it. When ByteDance deploys new AI features, it can reach hundreds of millions of users in weeks. This "scale-to-learn" advantage creates a self-reinforcing cycle: larger user bases generate more data, improved data enhances products and better products attract more users.

However, these advantages alone do not guarantee success. History shows that moving from middle-income to high-income status remains a difficult transition. China faces unique challenges that the ROK, and many other economies before it, never had to confront.

First, unparalleled scale and complexity. With 1.4 billion people, China must navigate a landscape where world-leading innovation clusters such as Shenzhen and Shanghai coexist with inland provinces still moving through later stages of industrialization. Coordinating resources across such vast geographic, economic, and developmental diversity is a governance challenge without precedent.

Second, strong geopolitical headwinds. China's transition toward high-income status is taking place amid profound changes in the global economy. Rising geopolitical tensions, tighter restrictions on advanced semiconductors, AI chips and other cutting-edge technologies, and increasing fragmentation in global supply chains have made technological upgrading more difficult. China is therefore pursuing innovation under external conditions markedly different from those faced by many economies during earlier periods of industrialization.

Third, deep regional disparities. China's east-west gap, urban-rural divide, and uneven distribution of human capital mean that innovation in coastal clusters cannot automatically spread across such a diverse economy. Building an integrated national innovation system requires sustained efforts to narrow these internal divides.

Yet it is precisely because of these constraints that China's innovation achievements carry unique global significance. Having overcome obstacles of scale, geopolitical isolation and internal divergence, China's technological breakthroughs are now generating global public goods. In biotechnology, BGI Genomics has driven down gene sequencing costs by orders of magnitude, making precision medicine accessible across the developing world. In quantum computing, the University of Science and Technology of China has achieved milestones that accelerate global research collaboration. In commercial spaceflight, companies such as i-Space and Galactic Energy are developing reusable rockets that promise to lower satellite launch costs for nations previously priced out of the space economy. These reflect frontier research and deep engineering capabilities at a scale no other nation can match.

What truly distinguishes China is its deliberate choice to share these advances rather than hoard them. At the 2026 World Artificial Intelligence Conference in Shanghai, China reaffirmed its commitment to open-source innovation and announced a series of measures to strengthen AI capacity in developing countries, ensuring the Global South is not left behind in the AI revolution. This was a statement of principle by a responsible major power: technological progress must serve all of humanity, not just a privileged few.

China backed this pledge with concrete action. It committed to training 5,000 AI professionals from developing countries over five years, investing in local capacity rather than extracting talent. It proposed a global AI governance framework emphasizing data sovereignty and ethical standards, offering an inclusive alternative to Western-centric models that often marginalize emerging economies. Platforms such as Baidu's PaddlePaddle and Alibaba's ModelScope are lowering technical barriers by giving developers access to AI frameworks, models and development tools, creating more opportunities for developers in emerging markets to participate in the global AI ecosystem.

By placing inclusive development at the heart of its innovation strategy, China is demonstrating that rising powers can — and should — shoulder global responsibility for shared prosperity.

It demonstrates how demographic mass can be converted into deep pools of human capital, how innovation ecosystems can be nurtured across multiple tiers of cities, and how technological leadership can be wielded as a global public good rather than a zero-sum competitive weapon. As many nations continue their own development journeys, China's transition toward a high-income economy may provide a valuable reference for overcoming structural challenges and pursuing shared prosperity.

Opportunity 2.0 helping stimulate FDI

Foreign-invested firms in country behind 7.39t yuan in H1 two-way trade

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

"China Opportunity 2.0" is emerging as a new driver of the country's efforts to attract investment from around the world as foreign firms deepen their commitment to the Chinese market and expand long-term capital inflows, said business executives.

China Opportunity 2.0 refers to a new phase of China's development characterized by higher-standard opening-up, technological innovation and high-quality growth.

For foreign enterprises, it spans opportunities ranging from rapid infrastructure development to breakthroughs in artificial intelligence and advanced manufacturing, they said.

Noting that China Opportunity 2.0 is reflected in the country's vast market, rapid industrial upgrades, deep talent pool and innovation ecosystem, Chen Pu, chief Asia officer of Syensqo, said the Belgian chemical manufacturer believes that continuous improvements in China's industrial ecosystem — including stronger supply chains, enhanced manufacturing capabilities and faster development across entire value chains — are creating new business opportunities.

In response, Syensqo has expanded its footprint in China with five manufacturing sites and a major research and innovation center in Shanghai, the group's third-largest worldwide.

Stefan Floeck, ABB's division president of IEC Low Voltage Motors, said China will remain central to the Swedish-Swiss tech company's global motor business as the country's industrial upgrading and green transition continue to drive demand for more energy-efficient equipment.

"To capture these opportunities, we will continue investing in local research and development, manufacturing and supply chains to better serve Chinese customers while reinforcing China as an innovation hub and export base within the company's global network," said Floeck.

ABB's low-voltage motor business has invested more than 150 million yuan ($22.12 million) in recent years to upgrade its Shanghai manufacturing base, including R&D testing laboratories and production lines. Its domestic supply chain also supports exports from China to markets worldwide.

Against this backdrop, foreign-invested businesses in China generated 7.39 trillion yuan in imports and exports in the first half, up 17.1 percent year-on-year, marking the ninth consecutive quarter of growth, said the General Administration of Customs.

Pushing back against the so-called "China Shock 2.0" narrative — which portrays China's development as a disruption to the global economy — Zhao Ping, head of the China Council for the Promotion of International Trade's academy, said foreign firms are expanding their presence in China because the country's integrated industrial ecosystem remains difficult for any other economy to replicate.

China further strengthened its efforts to attract foreign investment in June by unveiling a 15-point action plan featuring measures to expand market access, facilitate investment, strengthen promotion and services, and improve foreign capital management to stabilize and upgrade foreign investment.

The plan prioritizes expanding market access in services, finance and pharmaceuticals, among other sectors, while streamlining processes for cross-border mergers and acquisitions, data flows and domestic reinvestment by foreign firms.

That confidence is also reflected in foreign direct investment data. FDI in China's high-tech sector expanded 19.4 percent year-on-year to 130.14 billion yuan in the first five months. The sector accounted for 39.8 percent of the nation's total FDI, up 9.4 percentage points from the same period last year, said the Ministry of Commerce.

During the 14th Five-Year Plan (2021-25) period, foreign-invested companies in China generated 262.7 trillion yuan in operating revenue and 21.4 trillion yuan in profits, with both indicators recording average annual growth of around 5 percent. They employed more than 30 million people on average each year during this period, the ministry added.

Reaching out to children

Employees from Sichuan Poly Property Services visit children in Yangma town in Jianyang, Sichuan province, whose parents have left to work in cities, delivering science-themed books and showing the children they care about them. DONG ZIWEI / FOR CHINA DAILY

Briefly

Intelligent computing capacity grows

China's intelligent computing capacity reached 2,185 EFLOPS by the end of June this year, reflecting the country's rapid expansion of artificial intelligence infrastructure, official data showed. The overall utilization rate of computing facilities nationwide stood at 71.4 percent, according to the Ministry of Industry and Information Technology.

Export of integrated circuits expands

Strong global demand for artificial intelligence has boosted China's integrated circuit exports, with the export value of integrated circuit products denominated in yuan increasing 88.7 percent year-on-year in the first half of the year, official data showed.

Gold preparing to enter digital era

By **HU YUMENG** and **MA JINGNA** in Lanzhou

Gold may soon become as easy to use as money in a digital wallet, as younger investors embrace technology and financial markets reshape one of the world's oldest safe-haven assets.

That is the vision of David Tait, chief executive officer of the World Gold Council, who believes digital innovation will change not only how people invest in gold, but also how the precious metal functions within the global financial system. He made the remarks during an international gold conference held recently in Lanzhou, Gansu province.

Gansu, home to China's second-largest gold reserves, generated about 180 billion yuan ($26.6 billion) in industrial output in its gold sector last year.

The province is seeking to move beyond resource extraction toward higher-value development. "We will leverage this conference as an opportunity to deepen the integration of resource advantages, enterprise strengths and market vitality, and accelerate the high-end, intelligent, green and secure development of the gold industry," Governor Ren Zhenhe said at the opening ceremony.

Beyond advancing the industry's high-quality development, Tait believes the next major transformation will come from the market itself.

"The biggest transformation is not only where gold is mined, but how it is owned, traded and used," he said. "The most important thing will be the ability to use a digital form of gold in everybody's wallet."

He believes digitalization will make gold easier to buy, trade and use as collateral, allowing a broader range of institutional investors, including pension funds, insurers and asset managers, to incorporate gold into diversified portfolios.

To support that transition, the WGC is advancing its Gold247 initiative, which aims to connect the physical gold market with digital financial infrastructure. The initiative includes a global database for responsibly sourced gold and a "gold-as-a-service" platform designed to simplify the launch and adoption of digital gold products.

Tait expects younger investors to become one of the biggest drivers of that transformation.

As wealth is passed from older to younger generations, he said, tech-savvy consumers are increasingly comfortable managing investments through smartphones rather than buying traditional gold bars or jewelry.

"They just click and buy. That's the future," he said.

Although physical bars and coins will remain an important part of the market, trusted digital products backed by physical gold are likely to become increasingly attractive because they are easier to access, trade and integrate into broader investment portfolios.

Tait also believes China is well positioned to play a larger role in shaping the global gold market.

He described the Shanghai Gold Exchange as a model with international relevance and said closer coordination between Shanghai and the Hong Kong Special Administrative Region could strengthen global gold trading and custody services while supporting the internationalization of China's gold market.

That vision was echoed throughout the conference. Industry leaders called for closer cooperation in mineral exploration, technological innovation, green development and financial services, while expanding Belt and Road partnerships to build a more resilient, sustainable and internationally connected gold industry.

As the industry enters the digital era, Tait believes China's growing influence, from market infrastructure to responsible sourcing, will help shape the next phase of global gold development.

Wu Yuexuan contributed to this story.

Compliance in spotlight after EC fine

By **LI JIAYING** in Beijing and **ZHANG ZHOUXIANG** in Brussels

The European Commission's record fine against AliExpress highlights the rising need for compliance for Chinese cross-border e-commerce companies, prompting industry experts to call for stronger product certification, brand protection and localized operations in Europe.

Their comments came as Alibaba-owned cross-border e-commerce platform AliExpress said on Monday that it disagreed with the EC's decision to impose a record 550 million euros ($628.1 million) fine after the regulator accused it of failing to adequately address the sale of illegal, unsafe and counterfeit products.

"We disagree with the decision and the disproportionate fine," AliExpress said, adding that the penalty did not fully reflect its established compliance framework or the significant improvements it had proactively introduced.

The company said it was carefully reviewing the decision and considering all available options.

The move is in response to the EC's earlier financial penalty, saying that AliExpress had breached its obligations under the Digital Services Act, or DSA, by failing to properly assess the risks linked to illegal, unsafe and counterfeit products on its platform and take effective measures to reduce their spread.

Against this backdrop, Jiang Han, a senior researcher at market consultancy Pangoal, said Chinese merchants selling overseas should immediately rebuild their product compliance systems and treat compliance as a minimum requirement for remaining in the market.

Specifically, merchants should review key qualifications, including CE certification and energy-efficiency labels, ensure testing reports are issued by certified institutions and maintain complete, traceable brand-authorization records to prevent infringement risks, Jiang said.

"Under intense regulatory pressure, compliance is no longer an advantage; it is the only ticket to the European market," he said.

The analyst added that sellers should also accelerate localization and brand building while reshaping their cost and profit models as responsive moves.

"Over the longer term, sellers must move away from price-based competition, raise product value and brand premiums to absorb compliance costs, and shift from merely entering overseas markets to establishing a lasting local presence," Jiang said.

The penalty is the largest imposed since the DSA took full effect and marks the EC's third known fine under the law. The regulator previously fined social media platform X 120 million euros and Chinese cross-border e-commerce platform Temu 200 million euros.

In an exclusive statement to China Daily, the China Chamber of Commerce to the EU said it took note of the European Commission's decision concerning AliExpress under the Digital Services Act.

"We respect the EU's right to regulate its digital market, but we are concerned that enforcement measures should be conducted in a fair, transparent, and proportionate manner, with full consideration given to companies' compliance efforts and legitimate rights.

"CCCEU hopes the European Commission will ensure that DSA enforcement provides legal certainty and a predictable business environment for all market participants, including Chinese companies operating in Europe."

Jian Junbo, deputy director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, said the case highlights the European Union's increasingly stringent approach to digital regulation.

The bloc has made the DSA an important regulatory tool for major digital platforms, Jian said, adding that the fine represents not only a financial penalty, but also a signal that compliance costs in the European market are likely to continue rising. At the same time, Jian questioned whether such intensive regulation ultimately benefits innovation. While strict enforcement may improve oversight, he said it could also increase compliance burdens for both foreign and European technology companies, potentially affecting their long-term growth and capacity to innovate.

AliExpress has been ordered to submit a corrective action plan by Oct 20. The EC will assess the proposed measures after receiving the plan, while continued non-compliance could expose the platform to further penalties.

Shanghai banks on emerging sectors

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

Shanghai's forward-looking development in emerging technologies and industrial resilience built up over time have helped the city achieve strong economic growth in the first half, which is especially notable amid rising market complexities and a changing global landscape, said experts.

Shanghai's GDP hit 2.79 trillion yuan ($412 billion) in the first half, up 5.6 percent year-on-year at constant prices, said the municipal statistics bureau on Monday.

This growth rate is not only higher than the national average, but also exceeds the municipality's annual GDP growth in 2024 and 2025, which came at 5 percent and 5.4 percent, respectively.

Zeng Gang, chief expert and director of the Shanghai Institution for Finance & Development, described Shanghai's first-half economic performance as "rock-solid" both in terms of quality and efficiency. It was not just one sector driving the numbers, but rather the combined result of industrial upgrading, investment growth and a surge in foreign trade, Zeng said.

Shanghai is well-positioned to achieve its full-year growth target amid the ongoing optimization of its economic structure and the accelerated transformation from old to new growth engines, he added.

Shanghai's higher level of opening-up, its success in getting foreign firms to set up regional headquarters, alongside its rich innovation resources and precise economic stimulus packages have been translated into the city's higher innovation efficiency and stronger economic resilience, said Zhan Yubo, deputy director for the Institute of Economics at Shanghai Academy of Social Sciences.

While the added value of primary and secondary industry sectors rose by 0.9 percent and 4.7 percent, respectively, the tertiary sector surged 5.9 percent from a year earlier, further consolidating its role as a major economic driver for Shanghai.

Robust growth of the modern services sector encompassing finance, information transmission, software, information technology, leasing and business services carried the tertiary sector's added value to over 2.2 trillion yuan. Under closer scrutiny, the information transmission, software and information technology services sector spiked 9.1 percent year-on-year, mainly driven by the strong growth in sub-sectors such as artificial intelligence, integrated circuit design and platform enterprises.

The World AI Conference held in Shanghai from Friday to Monday served as solid proof, with the exhibition area reaching a record high of over 100,000 square meters.

In 2025, the industrial value of AI enterprises with a minimum annual sales revenue of 20 million yuan each totaled 600 billion yuan, representing a year-on-year spike of 39.5 percent.

AI has been defined as one of the three pioneering industries in Shanghai, along with integrated circuits and biomedicine. The output value of the three industries grew by 14.5 percent year-on-year in the first six months, with IC and AI manufacturing each reporting an annual growth rate of 20 percent.

The output value of strategic emerging industries grew 7.7 percent year-on-year in the first half. Among these, output value for new energy vehicles spiked by 33.9 percent, new energy by 20.6 percent and high-end equipment by 9.3 percent. Demand for products like satellites, rockets, high-end ships and domestically produced large aircraft remained strong, said the municipal statistics bureau.

All these results can be largely attributed to Shanghai's forward-looking strategies for new quality productive forces. Full-chain breakthroughs in IC and development of large AI models have all sped up in the city, said Ma Haiqian, vice-president of the Shanghai Academy of Development and Reform.

Q&A WITH CEO

Editor's note: *After the release of China's first-half economic data, China Daily invited chief executives and senior leaders from key multinational companies to share their perspectives on the world's second-largest economy. Their insights go beyond short-term growth, offering a closer look at the evolving "China Opportunity 2.0" narrative amid ongoing debate over the so-called "China Shock 2.0".*

China's dynamic expansion opportunities

Kilian Aviles
Executive vice-president of Dekra Group and head of Asia-Pacific region

Andre Musto
Managing director and general manager of Merck Healthcare China

Willie Tan
CEO of Skechers China, South Korea and Southeast Asia

Joe Bao
President of Kone China

Q1 Many multinational companies in recent years continue to expand their investment and operations in China, suggesting that "China Opportunity 2.0" is increasingly offsetting the "China Shock 2.0" narrative. What developments or evidence best demonstrate that China is creating new opportunities for global businesses rather than posing a "shock"?

AVILES: From Dekra's decades-long on-the-ground presence and continuous investment expansion in China, the so-called "China Shock 2.0" narrative is fundamentally misplaced and decoupled from market realities. What we are witnessing is a fully mature, upgraded "China Opportunity 2.0" that delivers structural, long-term value for global enterprises, far outweighing perceived market risks. The most compelling evidence lies in the industry upgrading and high-value industrial ecosystem iteration taking place across the country. China has evolved into a global hub for high-end manufacturing, new energy, intelligent connected vehicles, digital economy and green low-carbon industries. This industrial upgrade has created entirely new service and cooperation tracks for multinational companies.

MUSTO: For Merck, we view China as an innovation powerhouse, not just a market. The evidence for "China Opportunity 2.0" is compelling. An aging population, a rising burden of chronic diseases, and the government's continued investment in and commitment to healthcare are creating real, long-term demand. What gives us particular confidence is the country's growing role in co-developing global innovation, all pointing to a maturing ecosystem that rewards serious, long-term partners. At Merck, we are proud to be exactly that kind of partner. Our dual-engine strategy combines our internal R&D with external innovation partnerships. Our aim is clear: to deliver more medicines to more patients, faster.

TAN: From Skechers' on-the-ground experience in China, we can clearly feel the tangible new market opportunities brought by China's development. Our brand has rooted itself in the Chinese mainland market for nearly two decades, always following the development philosophy of "In China, For China, With China". We keep increasing long-term fixed-asset investment in the country as a concrete response to China's development dividends. We have invested over 4.2 billion yuan ($621 million) to build our exclusive China logistics center in Taicang, Jiangsu province, expanded local R&D and livestreaming operation bases in Dongguan, Guangdong province, and realized localized production for more than 90 percent of products sold in China. Consumption upgrading focused on health and fitness brought by China's domestic demand expansion has created stable growth space for our comfort-oriented sportswear products. All these practical layouts and operational gains prove the real, long-term value of "China Opportunity 2.0" for Skechers.

BAO: From Kone's perspective, one of the clearest signs is that China is not only a major market, but a critical part of Kone's global manufacturing and innovation network. We operate our largest manufacturing facility in China, together with our largest R&D center outside Finland. Today, China is not only serving its domestic market, but also acting as a key export base, with products shipped to more than 100 countries and regions around the world. Equally important, our supply chain is highly localized and deeply integrated into the Chinese ecosystem, with 99 percent of components sourced locally. This enables us to combine global quality standards with local speed, flexibility and resilience. For a multinational company, that reflects a business environment with real industrial depth and operating efficiency.

Q2 China's economy has demonstrated strong resilience so far this year, supported by resilient exports, solid industrial production and continued strength in high-tech manufacturing. How would you assess China's overall economic performance so far this year? Looking ahead, what do you see as the key drivers supporting China's growth in the second half?

AVILES: Overall, China's economic performance this year has been remarkably resilient, structurally optimized and quality-focused, showing strong anti-risk capability and endogenous growth momentum amid global economic volatility and sluggish external demand. The steady growth of industrial production, robust export performance and outstanding high-tech manufacturing development are not short-term sporadic gains, but concrete results of sustained industrial transformation and policy support. From Dekra's frontline operational view, consistent rising demand for testing and certification services for electric vehicles, energy storage and smart equipment clearly mirrors the vitality of China's emerging industries.

MUSTO: From where we stand as a science and technology company with deep roots in China, the resilience of China's economy this year has been both notable and — frankly — not surprising to those of us who have been here for the long term. China is our second-largest country market worldwide, and we have been here for more than 90 years. The fundamentals driving our confidence in the second half are clear: strong unmet patient need, a policy environment that increasingly rewards innovation, and a local ecosystem that is maturing fast in science, speed, and execution. What excites us most is that China is no longer just a major healthcare market — it is becoming a global innovation engine. China now represents around 30 percent of the global innovative drug research and development pipeline. This is a country that is shaping the future of healthcare, not just consuming it, and Merck intends to grow with it.

TAN: Amid a complex and volatile global environment, China's economy this year has demonstrated strong structural resilience overall. Three core growth drivers will continue to support the economic upturn in the second half. First, the full release of domestic demand potential: policies to expand domestic demand are continuing to boost consumer confidence, and growing health awareness is driving sports consumption — the professional sports segment is also a key area of our focus. Second, new quality productive forces represented by artificial intelligence and digitalization: industrial digitalization, smart supply chains and big-data operations are enhancing overall efficiency. Skechers is fully deploying AI-powered digital systems for refined customer operations. Third, high-standard opening-up: policies that optimize the foreign investment environment continue to attract multinationals to deepen their localization efforts.

BAO: From our perspective, China's economy has continued to show resilience, especially in areas supported by industrial capability, localized supply chains and long-term urban development needs. For companies operating in the real economy, this resilience is reflected not only in macro indicators, but also in the market's ability to sustain production, respond to evolving demand and support efficient delivery. Looking ahead, we see modernization as one of the greatest growth opportunities in China. The country has the world's largest installed base of elevators and escalators, and a growing number of these units is now reaching the stage where modernization is needed. This is creating strong long-term demand for safer, smarter and more energy-efficient solutions.

Q3 China's innovation ecosystem has become an increasingly important engine of growth. How do you assess the contribution of artificial intelligence and other frontier technologies to China's productivity growth, industrial upgrading and long-term economic resilience? More broadly, what significance does China's innovation have for global technological progress and the opportunities available to foreign companies?

AVILES: China's innovation ecosystem, led by AI, digital technology and green frontier technologies, has become the core engine of its long-term economic resilience and industrial upgrading, bringing profound and positive changes to productivity improvement and global technological progress. Domestically, frontier technologies are reshaping China's industrial development logic. AI and digital technologies are empowering traditional manufacturing with intelligent transformation, significantly improving production efficiency, product quality and industrial matching accuracy. In high-end manufacturing, new energy and intelligent transportation fields, technological iteration and scenario verification in China's super-large market have accelerated industrial maturity, promoted the upgrading of industrial standards, and greatly enhanced the overall competitiveness of China's industrial chain.

MUSTO: AI and frontier technologies are reshaping how we accelerate innovation — from drug discovery through clinical development to patient services. China possesses a unique strategic advantage: it combines innovation capability with remarkable speed in real-world execution. China's healthcare industry is advancing at a remarkable pace. China speed is not just a phrase — it is a reminder fueling global innovation through the momentum of China's development. The creativity and talent we see here, together with the continued evolution of the regulatory environment, are inspiring. We believe in the potential of China's innovation ecosystem, and we want to be active participants in it. That means co-developing, co-innovating, and building real partnerships with the companies that are defining the future of medicine in China and globally.

TAN: AI and other frontier digital technologies serve as a core pillar for China's industrial upgrading and long-term economic resilience, driving marked efficiency improvements across the entire manufacturing, retail and logistics value chains. For multinational companies, China's mature AI deployment ecosystems, massive consumer data pools and well-developed supportive industrial chains present a unique testing ground for overseas brands to refine their global digital operating models. Skechers is steadily advancing its digital transformation. At this stage, AI is primarily deployed for the production of graphic and short-video marketing materials as well as routine document processing, substantially shortening content delivery lead times. Intelligent upgrades for supply chain management and consumer operations remain an ongoing area of exploration.

BAO: We see the contribution of AI and frontier technologies most clearly in their practical application. A good example is the new Huanggang Port project — a landmark cross-border transport hub in Shenzhen, Guangdong province. Building on our long-term strategy in the Guangdong-Hong Kong-Macao Greater Bay Area, Kone is one of the few companies capable of delivering fully integrated people flow solutions while meeting the distinct regulatory and industry standards of both the Chinese mainland and Hong Kong. For this project, Kone supplied all 184 elevators and escalators, supported by AI-enabled connected services that continuously monitor equipment health and enable predictive maintenance.

Q4 China has placed greater emphasis on expanding domestic demand while pursuing high-standard opening-up. How do you assess these efforts? What new opportunities do they create for multinational companies and global investors?

AVILES: China's drive of expanding domestic demand and advancing high-standard opening-up is highly strategic, targeted and far-sighted. It not only optimizes China's own economic growth structure, but also creates a more open and transparent market environment for global businesses, bringing unprecedented incremental opportunities for multinational investors. The expansion of domestic demand is shifting China's market growth from export-driven to being driven by both domestic and external demand, generating massive high-end market demand. The upgrading of household consumption and the iterative upgrading of industrial investment demand have spawned huge market needs in high-end manufacturing, green environmental protection, digital services, product testing and certification, and intelligent solutions. This allows multinational companies, including Dekra, to deeply participate in the whole industrial chain of local market development, enjoying the dividends of China's consumption upgrade and industrial upgrade.

MUSTO: These efforts reflect China's strategic focus on long-term, sustainable development. High-standard opening-up establishes clear rules, transparent market access and predictable regulatory pathways. Expanding domestic demand is equally critical. China's aging population and rising healthcare spending power mean more patients seeking innovation. That demand is real and growing fast. For multinational companies like Merck, this environment is compelling. We see a market that genuinely welcomes high-quality innovation and is willing to build the infrastructure to support it.

TAN: China's move to expand domestic demand and pursue high-standard opening-up is creating structural opportunities for multinational corporations. The expansion of domestic demand is unlocking the vast potential of the super-sized market, with various consumption-boosting policies raising consumer willingness to spend. Rising demand for health and fitness activities has enabled us to reach more Chinese households with our comfort technology products, offering significant room for brand growth. At the same time, the country's commitment to high-standard opening-up is delivering a fairer, more transparent and predictable business environment, reducing operational uncertainties for foreign companies. For global investors, China offers a unique combination of market scale, innovation capabilities and supply chain integration. We have directly felt the benefits: our direct retail operations continue to grow, and our local partnerships have deepened, reinforcing our confidence in long-term investment.

BAO: From our perspective, these efforts are creating opportunities by expanding demand while also raising expectations for quality, efficiency and service. In our industry, this is especially visible in modernization. As a growing number of China's installed elevators reach the stage where renewal is needed, the opportunity is no longer just about replacing equipment, it is about how to do so with minimal disruption while improving safety, energy efficiency and user experience. As we have said before, the real challenge is not simply replacing equipment. Cities never stop operating, and buildings cannot afford prolonged disruptions. Modernization needs to happen while everyday life continues. That is why execution and delivery models matter as much as technology itself.

Q5 Looking ahead to the second half of the year, what will you be watching most closely as indicators of China's economic resilience, reform progress and long-term growth potential?

AVILES: To evaluate China's economic resilience, reform execution and long-term growth potential in the second half, I will track five core structural indicators closely tied to industrial development trends. First, growth momentum of strategic emerging industries such as new energy storage and intelligent connected vehicles, which shapes China's core industrial competitiveness. Second, implementation progress of high-standard opening-up policies, covering services sector liberalization and cross-border standard mutual recognition, which reflects China's commitment to global collaboration. Third, structural recovery of high-end manufacturing investment and service consumption, the fundamental endogenous growth driver. Fourth, progress in integrating Chinese industry standards with international frameworks. Fifth, tangible results of nationwide digital and carbon-neutral transformation.

MUSTO: Looking at the second half, I'm optimistic about what I'm seeing in China's healthcare transformation. First, the speed of innovation reaching patients continues to accelerate. We're witnessing regulatory frameworks and market dynamics that are enabling faster access. Second, China is building more sophisticated reimbursement frameworks that balance patient access with system sustainability. That's exactly the kind of thoughtful policymaking that supports long-term innovation. Third, China's openness to global partnerships and investment is creating a collaborative ecosystem. The infrastructure for clinical trials, talent attraction and cross-border innovation is maturing rapidly. For Merck, this clarity and progress reinforce our conviction. We're deepening our long-term commitment to China and we want to be active participants in China's healthcare ecosystem.

TAN: In the second half, I will track core indicators across two dimensions to assess economic resilience — reform implementation and long-term growth potential. First, consumption recovery indicators that reflect the resilience of the market foundation: I will monitor foot traffic in national commercial districts and outlet malls, the penetration rate of instant retail nationwide, consumer confidence indices, and sales growth in professional sports and youth-related categories. Only when these segments show steady recovery can we confirm that the domestic demand engine is effectively offsetting external risks. Second, the progress of policy reforms related to opening-up and digital upgrading. This includes the effectiveness of foreign investment support policies, supportive measures for multinational R&D centers, and the pace of industrial digital infrastructure construction.

BAO: One of the things we will watch closely is whether rising demand can continue to be matched by responsive and efficient execution. As China's urban renewal continues to accelerate, consumer needs are becoming increasingly tailored and time-sensitive. In that context, resilience is reflected not only in demand itself, but also in how quickly companies can respond and deliver. That is why supply chain responsiveness is an important indicator for us. Last year, we established a smart logistics and assembly center in Shenzhen to better serve the markets in the Guangdong-Hong Kong-Macao Greater Bay Area. We are already seeing clear improvements in delivery efficiency. We will also continue to watch whether policy support for urban renewal and equipment renewal translates into concrete project execution.

CHINA

The Party's journey

A visitor explores an exhibition titled *The People and the Monument: Classic Fine Art Works in the National Museum of China Collection* in Beijing on Monday. Open to the public since July 14, the exhibition features 20 revolutionary-themed paintings and 33 sculptures, vividly portraying the enduring bond between the Communist Party of China and the people, and showcasing the Party's journey through revolution and nation-building toward a new era.

DENG WEI / FOR CHINA DAILY

China to strengthen integrated transport network by 2030

Infrastructure upgrade and expansion to also accelerate logistics development

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

China plans to put 95 percent of the planned backbone of its national integrated transport network in place by 2030, up from 91 percent at present, as it shifts its focus from rapid network expansion toward better connectivity, efficiency and resilience, officials said at a news conference in Beijing on Tuesday.

During the 15th Five-Year Plan period (2026-30), the country will continue improving railway, highway, waterway, civil aviation, postal and express delivery infrastructure while accelerating the development of a more integrated logistics network.

"Building major cross-regional and cross-river corridors is no longer simply about spreading out projects or expanding construction," Vice-Minister of Transport Xu Chengguang said. "It is about optimizing the spatial layout, opening up the arteries of economic circulation and promoting more balanced regional development."

By 2030, China plans to carry out infrastructure renewal and digital transformation across about 80,000 kilometers of its transport network, build or renovate 500,000 km of rural roads and improve intermodal connections at around 1,000 major freight hubs and terminals to make cargo transfers among railways, highways, waterways and airports more efficient.

Major corridor projects will include coastal high-speed railways, upgraded highways along the land borders and coastline, transport links along the Yangtze River and new cross-river, cross-sea and cross-bay connections. Xu said the coastal railway and major border and coastal highways will form a "golden outer ring" linking border regions and the coastline, supporting tourism, regional development and goods transportation.

China will also strengthen the resilience of international supply chains by expanding global shipping routes, improving air cargo links with major overseas hubs and enhancing key logistics facilities, including overseas ports, to provide businesses with more transport options and reduce reliance on any single route or hub.

The railway sector will increasingly shift its focus from expanding the network to improving quality, capacity and integration.

"China has built the world's largest high-speed railway network and an advanced conventional railway network," said Wang Qiming, deputy head of the National Railway Administration.

Over the next five years, railway authorities will continue major construction projects while filling network gaps, easing capacity bottlenecks and improving connections between regions, cities and different modes of transport. Safety, digital technologies, low-carbon operations and more efficient freight services will also be priorities.

Civil aviation authorities said international air cargo will be a key focus during the next five years as demand grows from cross-border e-commerce, advanced manufacturing and other time-sensitive industries.

Han Jun, deputy head of the Civil Aviation Administration of China, said the country will build an air cargo system that is "better connected, diversified, resilient, safe and reliable".

China plans to expand freight links with established and emerging markets, improve coordination between dedicated cargo aircraft and belly cargo capacity on passenger flights and strengthen cargo services at major aviation hubs in Beijing, Shanghai, Guangzhou, Shenzhen and Chengdu.

Airport cargo terminals, aircraft stands and road and rail links will be upgraded to speed up transfers, while electronic waybills, digital logistics platforms and smoother multimodal transport will be promoted. China's air cargo and mail volume exceeded 10 million metric tons for the first time in 2025, including 4.4 million tons on international routes.

The postal and express delivery sector will strengthen a nationwide network of major sorting, warehousing and distribution hubs and improve connections with airports, railway freight terminals and logistics centers.

"Express delivery has become the lifeblood of urban circulation," said Chen Kai, deputy head of the State Post Bureau. By 2030, the sector aims to expand rural delivery coverage, improve international parcel services and digitally upgrade sorting centers, warehouses and cold-chain facilities to better support manufacturing, agriculture, retail and cross-border trade.

Xu said China invested 18.8 trillion yuan ($2.78 trillion) in transport fixed assets during the 14th Five-Year Plan (2021-25), the largest investment and fastest network expansion in any five-year period since the founding of the People's Republic of China in 1949. The country's comprehensive transport network now exceeds 6 million km, providing the foundation for a new stage focused on improving connectivity, efficiency and resilience rather than expansion alone.

Dog-cloning innovation cheaper, more efficient

By **CHEN MEILING**
chenmeiling@chinadaily.com.cn

The somatic cell-cloned dog and cat. PROVIDED TO CHINA DAILY

A research team in Shaanxi province has developed a new dog-cloning method that addresses a key technical bottleneck facing similar research worldwide, paving the way for a canine cloning system with greater stability, lower costs and improved compliance with animal welfare standards.

About one month after successfully cloning a male dog and a male cat, Wang Yongsheng, a professor at the College of Veterinary Medicine of Northwest A&F University in Yangling, Shaanxi province, said both animals are healthy and have been vaccinated. They are the first somatic cell-cloned cat and dog born in Northwest China.

Wang, who leads the project, said only China, South Korea and the United States have mastered mature dog-cloning technology, but the procedure remains difficult because of a high failure rate.

A major challenge is obtaining sufficient high-quality canine oocytes. Unlike many other animals, female dogs ovulate immature oocytes that must remain in the oviduct for two to three days before maturing. As a result, reliably obtaining mature oocytes suitable for somatic cell nuclear transfer has long limited cloning efficiency.

Conventional methods also rely on dedicated oocyte donor dogs or on collecting oocytes at specific stages of the reproductive cycle, resulting in low success rates, high costs and concerns over animal welfare.

To overcome these problems, Wang's team collects ovarian tissue discarded after routine sterilization surgeries at pet hospitals. Oocytes are isolated from the tissue and cultured in vitro for two to three days until they mature. Their nuclei are then removed and replaced with the nucleus of a somatic cell taken from the dog to be cloned. After an electric pulse fuses and activates the reconstructed embryo, it is transferred into the uterus of a surrogate dog. The entire cloning process takes at least three to four months.

"Ovarian tissues removed during pet sterilization surgeries are normally disposed of as medical waste, but they still contain abundant follicles and oocytes at different developmental stages," Wang said.

"Through standardized collection, transportation, follicle isolation and in vitro maturation, we can transform these discarded tissues into valuable biological resources for scientific research and technological development."

The team is able to collect dozens of ovaries every day, providing a stable source of research materials.

The new approach is expected to reduce the number of dedicated oocyte donor animals by more than 80 percent, lowering research costs while improving the ethical sustainability and public acceptance of cloning, Wang said.

The researchers also developed a new in vitro maturation system that mimics the environment of the canine oviduct. Compared with conventional methods, the maturation rate of canine oocytes increased by 5 to 10 percentage points, the cleavage rate of cloned embryos rose by about 5 percentage points, and blastocyst formation improved steadily. Overall, the production efficiency of early-stage cloned embryos increased by 10 percent to 15 percent.

The team also adopted a minimally invasive embryo-transfer technique, reducing the surgical incision by half to minimize trauma to surrogate dogs.

According to Wang, the technology can produce laboratory dogs and cats with highly consistent genetic backgrounds, reducing experimental variation caused by individual differences. Such animals are valuable for studying neurological diseases, tumors, cardiovascular disorders and inherited metabolic diseases, as well as for evaluating the safety of new pharmaceuticals.

The technology may also meet demand from pet owners wishing to clone deceased companion animals. However, Wang emphasized that cloning does not bring a pet back to life.

"A clone is a new life," he said. Although a cloned animal shares more than 95 percent physical similarity with the original, differences in coat color, markings, health, personality and behavior can still develop because of environmental influences, much like identical twins.

The cloning system was jointly developed by Northwest A&F University, the Laboratory Animal Center of Xi'an Jiaotong University and Yuanchu (Xi'an) Biotechnology.

Young delegates call for stronger Sino-US relations

By **LI HONGYANG**
lihongyang@chinadaily.com.cn

Young delegates from China and the United States called for building sincere friendships and deepening mutual learning among civilizations as a foundation for stronger bilateral ties at a youth forum held at Peking University last week.

The "Zhi-Xing China: US-China Youth Dialogue" brought together more than 100 students from institutions including Columbia University, Brown University, Peking University and Beijing Normal University.

Centered on mutual learning among civilizations, science and technology cooperation and sustainable development, the forum aimed to foster greater understanding and collaboration between young people from the two countries.

Zhao Huchen, a Chinese student at Peking University, said: "We understand clearly that the hope of US-China relations lies in the people, and its future rests with the youth.

"In the face of a rapidly evolving transformation unseen in a century and an era where the destinies of humanity are deeply intertwined, we engaged in candid dialogue and met each other halfway. In the name of youth, we call upon the young people of both countries to bravely shoulder the historical mission and join hands to create a better future," he said.

Livia Maria Ilasz, a US student from the University of Rochester, said: "We advocate respect for the diversity of global civilizations and the building of shared values while seeking consensus and preserving differences. We urge deeper people-to-people exchanges between young Chinese and Americans, enabling youth from both sides to understand each other through dialogue and to eliminate prejudice through interaction."

Cian Hanrahan, a US student studying at Peking University, said: "Today, we have been reminded that mutual understanding is not a distant ideal. It happens in the conversations we share with friends from different backgrounds and the words we learn in another language, and in the traditions we take the time to understand."

Yu Yang, deputy secretary-general of the China Education Association for International Exchange, told the forum that over the past two years, more than 32,000 young Americans have visited China under the Young Envoys Scholarship program, which is mainly coordinated by the association.

Their visits have taken them to nearly 200 Chinese cities and involved more than 1,000 Chinese schools and institutions.

"In the current international situation, deepening youth exchanges and mutual understanding between China and the US is of great significance," Yu said.

Fang Fang, vice-president of Peking University, described youth exchanges as "the most dynamic and promising component of US-China relations".

"Peking University will continue to build bridges, provide academic and resource support, and help young people from both countries become inheritors of US-China friendship, pioneers of practical cooperation, and participants in global governance," he said.

Written admissions

Calligraphers craft handwritten admissions letters at Shaanxi Normal University in Xi'an, Shaanxi province, on Tuesday. The university has upheld the tradition of handwritten admission letters for 20 years since 2007. This year, 10 senior calligraphy masters, averaging over 72 years old, participated, with the oldest being 84 and four having contributed for more than a decade. QIAN GUANG / FOR CHINA DAILY

All 11 suspects caught in Nanjing's $4m gold heist

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

Police have arrested all 11 suspects and recovered the entire cache of 27 kilograms of gold stolen from a luxury goods store in Nanjing, Jiangsu province, in what authorities described as China's largest gold theft by value.

The 37 stolen gold items were worth more than 27 million yuan ($4 million), Nanjing police said.

The theft occurred in the early hours of May 16 at a store in Jiangning district. Investigators found climbing marks near a second-floor window, although the store's doors remained locked and the keys to the display counters appeared undisturbed.

Police said a suspect surnamed Tong entered the store through the window at about 1 am and went directly to the gold counter. He filled a backpack with gold bars and other items but left nearby watches and other luxury goods untouched.

Investigators later found that several people had repeatedly visited the store to inspect the premises in the month before the theft. They identified another suspect, surnamed Wang, as the alleged organizer.

According to police, Wang had studied the store's layout and surveillance system in advance. On the night of the theft, he allegedly disabled nearly 80 surveillance camera feeds and erased stored footage before flying to Bangkok, Thailand, later that day.

After the theft, Tong left part of the stolen gold in a vehicle arranged by Wang before fleeing south in a ride-hailing vehicle.

Police examined 2,273 vehicles before determining that Tong had boarded a car near a ring expressway at about 5 am on May 16, said Han Ting, head of the criminal investigation brigade of the Jiangning branch of the Nanjing public security bureau.

Tong repeatedly changed his destination during the journey and arrived in Nanning, Guangxi Zhuang autonomous region, at about 9 pm on May 17, Han said.

The driver later told police that Tong appeared nervous and barely slept during the more than 2,000-kilometer journey. Unable to pay the fare of more than 7,000 yuan in cash, Tong broke off part of a gold piece and gave it to the driver as payment.

Investigators determined that Tong was heading for Ningming county in Chongzuo, near the China-Vietnam border, in an attempt to leave the country illegally. Nanjing police immediately requested assistance from border authorities in Guangxi.

At about 5:40 am on May 18, officers from the Aidian border police station intercepted a white sedan near a freight yard. Tong was found in the back seat, and police recovered 8.75 kg of gold from him and his backpack.

Meanwhile, Nanjing police activated an international law enforcement cooperation mechanism to pursue Wang. Thai police arrested him in Bangkok on May 23, and he was extradited to Nanjing on May 29. Police recovered another 13.2 kg of gold from his residence.

"The criminal group was highly organized, with clear divisions of responsibility and extensive planning," said Li Dahai, executive deputy director of the Nanjing public security bureau.

Li said investigators worked around the clock for more than half a month. The task force pursued suspects across eight provincial-level regions and conducted cross-border operations through the Lancang-Mekong cooperation mechanism. All 11 suspects were arrested and all of the stolen gold was recovered.

The Nanjing public security bureau recently sent a letter of appreciation to the Chongzuo border management detachment, saying Tong's interception played a crucial role in solving the case.

Initiative tasks nation's rural counties with improving infrastructure, expanding green development

Left: Visitors tour Hongshuikou village in Beijing's Mentougou district in June. HOU JIQING/ XINHUA **Right:** A clear river wraps around rural residences in Hecun village of Rongshui, Guangxi Zhuang autonomous region, on July 15. LONG LINZHI / FOR CHINA DAILY

Report reveals blooms of beautiful countryside

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

China has made a solid start in its county-level campaign to build a beautiful countryside, with rural environments improving and green agricultural development advancing steadily, according to a think tank report published on Monday.

The report, titled Progress and Achievements in Building Beautiful Countryside in China, was compiled by the Research Center for Xi Jinping Thought on Ecological Civilization, China Daily and China Environment News.

It said that after the Ministry of Ecology and Environment and eight other national government bodies released an implementation plan for promoting the beautiful countryside initiative in early 2025, China has stepped up coordinated efforts to improve rural living environments, promote low-carbon agriculture and strengthen long-term governance mechanisms.

The plan set out four major tasks and 18 measures, with the goal of raising the proportion of counties that have realized the beautiful countryside initiative to 40 percent by 2027 and essentially accomplishing the program by 2035, the report said.

In order to meet the requirements of the initiative, counties must have good public infrastructure such as roads, public lighting and green spaces, sewage and wastewater treatment facilities, and age-friendly renovations.

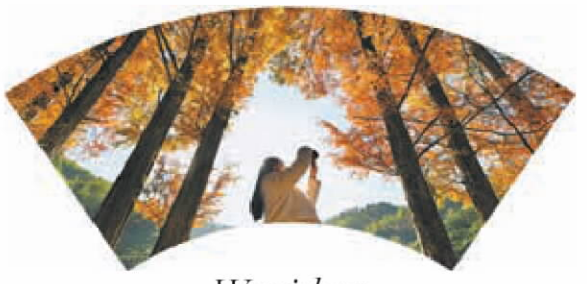
By 2025, the national rural domestic sewage treatment rate had reached 55 percent, more than double the level at the end of the 13th Five-Year Plan (2016-20) period, it said. More than 5,000 large black and odorous rural water bodies on people's doorstep had been basically eliminated, with the treatment rate exceeding 98 percent.

The report said the campaign had benefited some 9.72 million people across 30 provincial-level regions, 860 counties and more than 4,100 administrative villages. It also noted that remediated water bodies were checked through unannounced inspections, remote sensing and water quality monitoring.

Rural waste collection and disposal systems have also been improved. The report said the proportion of administrative villages covered by systems in which villages collect waste, townships transfer it and counties process it has remained above 90 percent.

Visitors are surrounded by blossoming pear flowers at an orchard in Jinzhou, Hebei province, in April. LIANG ZIDONG / XINHUA

Green agricultural development has gained momentum, it said. The comprehensive utilization rate of livestock and poultry manure reached 80.1 percent in 2025, while the comprehensive utilization rate of crop straw stayed above 88 percent. The disposal rate of agricultural film exceeded 85 percent, helping curb plastic pollution in key farming areas.



The report also highlighted progress in soil and water conservation. In 2025, China treated 11,500 square kilometers of soil erosion, restored 4,666 erosion gullies in the fertile black soil region of Northeast China and built 634 ecologically clean small watersheds. The national soil and water conservation rate reached 73.09 percent.

County-level implementation has become a key feature of the campaign, the report said. So far, 600 agricultural county-level areas have completed the beautiful countryside initiative, bringing the national completion rate to 20.9 percent. Twenty-three key counties have been selected as pilot areas under the Beautiful China initiative.

The report said public participation and assessment mechanisms are being strengthened. More than 4,000 sites have been evaluated, some 45,000 villagers interviewed and public satisfaction has reached more than 90 percent. Authorities have also handled over 2,300 public complaints through a closed-loop mechanism covering clue collection, data analysis, supervision and rectification.

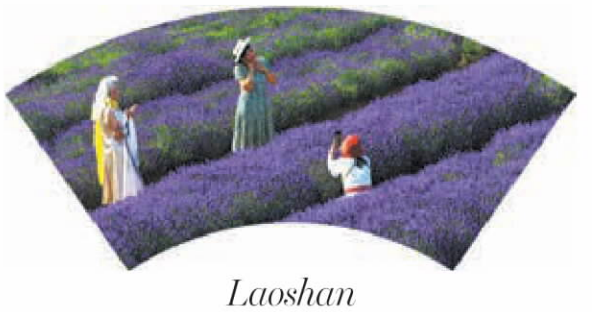
It said beautiful countryside construction is an important part of China's rural vitalization strategy and Beautiful China initiative, helping shift villages from being merely clean and orderly toward being ecologically livable.

China is set to continue to improve rural environmental governance, promote green and low-carbon agriculture, enhance village appearance and strengthen farmer participation, the report said. The country will also work toward raising the county-level completion rate to 55 percent by the end of the 15th Five-Year Plan (2026-30) period and basically completing the beautiful countryside initiative by 2035.

Wuyishan

Wuyishan, a county-level city in Fujian province, has turned strengthened ecological protection into a driver of rural vitalization, helping villages near a World Heritage Site and national park move beyond the old dilemma of "living poorly beside rich natural resources".

The city, home to 115 administrative villages and 89,000 rural residents, is the only one in China with both UNESCO World Cultural and Natural Heritage status and a national park. Local authorities have placed conservation first while developing tea, tourism, bamboo and water-related industries.



A 4,252-square-kilometer buffer zone has been designated around Wuyishan National Park to protect the core area through differentiated management. The city also spends more than 42 million yuan ($6.2 million) a year on ecological compensation and has invested 66.65 million yuan to buy back 1,200 hectares of commercial forest in key ecological areas.

The proportion of water bodies rated Grade II or better in terms of water quality has remained at 100 percent for the past three years, while the city's forest coverage stands at 80.5 percent and the share of days with good air quality has reached 100 percent. Since 2015, when the national park pilot program began, 44 new species have been recorded.

China has a five-tier quality system for surface water, with Grade I the best. Water at Grade III quality is considered good enough for most aquatic organisms to live in.

Green farming has also expanded. Wuyishan has built 8,840 hectares of eco-friendly tea gardens, accounting for 90 percent of its tea plantations, and sediment loss from tea gardens has fallen by more than 45 percent. Rural sewage treatment rose from 69.1 percent in 2022 to 98.2 percent in 2025.

In 2025, the city received 17.56 million tourist visits and generated 26.21 billion yuan in tourism revenue, while its tea industry chain reached 15 billion yuan in output value.

Laoshan

Laoshan district in Qingdao, Shandong province, has used integrated urban-rural planning to transform once underdeveloped coastal and mountain villages into cleaner, wealthier communities supported by tourism, tea, fruit and modern services.

Thirty years ago, many villages in the district sustained themselves on traditional farming, fishing and quarrying. Infrastructure was weak, and domestic sewage and waste were often discharged without effective treatment. Today, Laoshan has built a model that extends urban public services into rural areas while protecting its mountain and coastal ecology.

The district, with 95.7 kilometers of coastline and a natural coastline retention rate of 73.7 percent, began rural water supply, environmental improvement and road projects in 2005. It launched integrated urban-rural sanitation in 2014 and rural sewage treatment in 2018.

From 2019 to 2025, Laoshan built more than 1,600 km of sewage pipelines, 42 sewage treatment stations and 62 pumping stations, achieving countywide rural sewage treatment. Rural black and odorous water bodies have been cleared, while harmless treatment and classified collection of rural household waste have both reached 100 percent.

The district has also promoted circular agriculture. Since 2010, organic fertilizers and physical pest-control equipment have been distributed to more than 19,000 tea and fruit growers, covering over 2,000 hectares. In the past three years, soil organic matter in farmland rose by 34 percent, while chemical fertilizer and pesticide use fell by 6 percent and 13 percent, respectively.

Green industries have brought visible income gains. In the 14th Five-Year Plan (2021-25) period, the average collective income of villages reached 8.82 million yuan ($1.3 million), and 80 percent of villages earned more than 1 million yuan. Rural residents' per capita disposable income rose from 31,000 yuan in 2022 to 36,000 yuan in 2025.

Meitan

Meitan county in Guizhou province has built a rural vitalization model centered on tea, turning former barren hills into plantations, production bases into scenic areas, and a traditional agricultural county into one of China's leading tea-growing regions.

The county, which administers 137 villages and communities with a total rural population of 161,300, once faced poor rural living conditions, weak infrastructure and limited sources of income. Through long-term planning, environmental improvement and tea-led industrial upgrading, it has reshaped both its countryside and economy.

Meitan's tea plantation area has expanded from 1,866.7 hectares decades ago to 40,000 hectares today. The industry now benefits 88,000 farming households and more than 351,000 people, and contributes to over half of rural residents' per capita disposable income. In 2025, rural per capita disposable income reached 23,000 yuan ($3,392), 37 percent higher than the Guizhou provincial average.

Environmental improvements have accompanied industrial growth. Rural domestic sewage treatment has reached 100 percent, rural household sanitary toilet coverage exceeds 95 percent, and waste collection facilities cover 94.6 percent of rural areas. Water quality at 82 rural stream monitoring sections is rated at or above Grade III, with no black and odorous water bodies reported.

The county has also preserved regional rural architecture by building more than 100,000 traditional houses in the architectural style of northern Guizhou, improving rural living conditions for over 98 percent of households. It was also among the first in Guizhou to achieve paved-road access for all administrative villages.

Tea has become the core of Meitan's green economy. In 2025, the county produced 80,000 metric tons of tea, with tea output value reaching 6.45 billion yuan and comprehensive tea-related revenue hitting 18.61 billion yuan.

Innovation takes root in tradition

A delegate (left) listens to a guide while walking along an elevated viewing walkway at Wild Elephant Valley in Xishuangbanna, Yunnan province, on July 15. ZUO FURONG / FOR CHINA DAILY

By **HE WEIJIA** in Xishuangbanna, Yunnan
heweijia@21st.cn

Holding a thumb-sized ear of corn in his hand, Prak Thaveak Amida examined the unusual local crop and asked how it was grown after taking a bite of a purple variety with a fruity flavor.

"This is my second visit to Xishuangbanna, but it's my first time trying this corn. It has a very interesting taste," said Prak, an under-secretary of state at the Cambodian Ministry of Information.

The tasting was one of several activities arranged for participants in the 2026 Global Mayors Dialogue, held from July 14 to 16 in Xishuangbanna Dai autonomous prefecture, Yunnan province. Across several field-visit routes, participants visited an agricultural facility, residential communities and Wild Elephant Valley, where mayors and other international guests learned about the prefecture's efforts in agricultural innovation, community development and environmental protection.

The corn tasting took place at a waxy corn processing facility operated by Dai Xiansheng Agricultural Development Co., Ltd. Liao Mengmeng, the company's general manager, introduced the thumb-sized corn as a traditional local variety that has long been grown in Xishuangbanna.

Liao explained that the corn's flavor and appearance can change after two or three years of cultivation because of its genetic instability. To improve its consistency, the company has partnered with Huazhong Agricultural University on genetic purification, rejuvenation and crossbreeding.

"Agricultural biotechnology in China is advancing rapidly," Prak said. "This is far more than ordinary corn. It's a newly developed variety."

The group then visited Wanjing Community in Jinghong city, where participants sampled dumplings and played card games with residents. They were also introduced to the neighborhood's shared facilities, which include spaces for dancing, painting, calligraphy and chess, as well as a communal kitchen.

Cai Hui, secretary of the community's general Party branch, told the delegates that, in addition to providing shared spaces, the community also encourages residents to take part in neighborhood governance to help ease the workload of its limited staff. This is particularly important during the peak tourism season from November to April, when people from across China travel to Xishuangbanna to spend the winter in its mild climate.

At Wild Elephant Valley, delegates learned about local efforts to strike a balance between tourism and wildlife conservation.

They walked along an elevated viewing walkway, observing wild Asian elephants and signs of their activity in the rainforest below.

"Elephants belong to the rainforest, so we have given the ground-level habitat back to them," said Xu Ping, a guide at the site.

Masood Khalid, a former Pakistani ambassador to China, said the surroundings offered a vivid example of coexistence between people and wildlife.

"I'm sure that the next time I come to Xishuangbanna, I will see even more improvements," he said.

Gary Dvorchak (left), Edwin Montealegre (center) and Tong Huiqi discuss the role and impact of AI during the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai on July 19, 2026. PROVIDED TO CHINA DAILY

AI's human side comes into focus

International voices highlight how AI is transforming work, creativity and communication while keeping people at the center of progress.

By **MENG WENJIE** and **SHAMIM ZAKARIA**

As Bill Reichert walked through the exhibition halls of the 2026 World Artificial Intelligence Conference, demonstrations of AR glasses offering real-time Chinese-English subtitles caught his attention.

Reichert, a partner at US-based Pegasus Tech Ventures, called the experience a "wow moment". The technology showed him how AI could make it easier for people to communicate across language barriers.

"It's as if I were anywhere else in the world that actually speaks English," he said.

The 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance was held in Shanghai from July 17 to 20 under the theme "AI Partnership for a Brighter Future".

The exhibition brought together more than 1,100 companies, and over 300 AI products made their global debuts.

Reichert was among the international guests attending the conference. Having first visited China around 2012, Reichert has since traveled to places including Shanghai, Beijing, Shenzhen and Hong Kong. Those experiences have given him a broader perspective on how technology is reshaping innovation and communication worldwide.

"AI is going to flatten the world in terms of anybody, anywhere, being able to connect with anyone in any language. And that's a big deal," he said.

For Edwin Montealegre, a Costa Rican conductor and director of Shanghai Monestel Music Productions, AI has already become part of his creative process.

A graduate of the Shanghai Conservatory of Music, Montealegre was attending the conference for the second time. He noticed a change in emphasis this year.

> "Before, the focus was on how to use AI. But now, AI is no longer just a device or a tool — it has become part of our everyday lives."
>
> **Edwin Montealegre,** a Costa Rican conductor and director of Shanghai Monestel Music Productions

"Before, the focus was on how to use AI. But now, AI is no longer just a device or a tool — it has become part of our everyday lives," he said.

As a music director, Montealegre is responsible not only for conducting, but also for organizing rehearsals and preparing performance materials. With AI assistance, some administrative tasks that once took days can be completed in hours or even minutes.

"I even use AI to brainstorm ideas," he said. "It gives me more time for artistic inspiration, for connecting with people, and for myself."

While Montealegre emphasized creativity, Tong Huiqi focused on care.

Tong, a clinical psychologist and clinical professor at Stanford School of Medicine, said that while many young people are turning to AI for emotional support, human judgment must remain central.

"AI cannot work independently," she said, adding that humans must ultimately decide what is appropriate, where its limits should be and whether it is helping.

In her clinical work, Tong uses an AI-assisted documentation system during consultations. By reducing the need to take notes throughout a session, the tool helps her give patients her full attention.

> "You can feel that the government is really encouraging young people to understand it, use it and think about how to make it better."
>
> **Rupert Hoogewerf,** chairman and chief researcher of Hurun Report

"My clients actually love it because AI allows me to be 100 percent connected with them rather than jotting down notes," she said.

Her experience illustrates both the value and the limits of the technology. AI can take over a routine task and create more room for human attention, but decisions about care, boundaries and responsibility must remain with people.

The same combination of greater capability and human direction is reshaping entrepreneurship, according to Rupert Hoogewerf, chairman and chief researcher of Hurun Report.

Through the Hurun Uth Series — including its Under25s, Under30s, Under35s and Under40s rankings — Hoogewerf has been following a generation of young entrepreneurs. He said about 800 entrepreneurs were featured across the series this year, with around 30 presenting innovations at the conference in areas including robotics and AI.

"You can feel that the government is really encouraging young people to explore AI, understand it, use it and think about how to make it better," he said.

Hurun's research also shows how rapidly wealth creation is changing in China: 70 percent of the country's billionaires on this year's Hurun Global Rich List were not on the list a decade ago.

"They are the new faces of China — from AI and computer chips to new energy and other emerging industries. They have just come onto the scene," Hoogewerf said.

At the conference, he met entrepreneurs using AI tools to run one-person companies, as well as businesses applying AI in traditional fields such as metals and minerals analysis.

"There is a massive transformation going on," he said. "You can apply AI in lots of different places."

Gary Dvorchak, managing director of The Blueshirt Group Asia, has also seen AI improve efficiency in his industry. He said the technology had reduced costs and sped up work in ways he had not anticipated.

What struck him most at the event, however, was not a particular product. It was the willingness among the exhibitors, entrepreneurs and visitors he encountered to experiment with the technology.

"There's no fear of AI here. Everyone is embracing it and thinking about how they can use it to make life better," he said.

Yet Dvorchak said the activity in the exhibition halls reinforced a more fundamental point. AI could support people's work, but people were still the ones exchanging ideas, asking questions and making decisions.

No matter how advanced the technology becomes, he said, it remains a tool.

"People are more important in the era of AI than they were in the past," he said.

Yao Fangbin conducts a prescribed burn in the Lesser Khingan Mountains to reduce wildfire risks in 2024. PROVIDED TO CHINA DAILY

Ready before the call

From earthquakes to wildfires, China's frontline firefighters work in shifting conditions with speed, judgment, and constant readiness to safeguard people's lives.

By GUO JIATONG
guojiatong@21st.cn

On July 15, Yao Fangbin was already more than 300 kilometers from his base in Harbin, Heilongjiang province, inspecting rivers and mountain roads with his team in Mudanjiang.

Moisture from the outer bands of Typhoon Bavi, combined with cold air, was forecast to bring heavy and possibly torrential rain to central and eastern Heilongjiang. Before the first rescue call came in, Yao and his fellow firefighters checked evacuation routes, assessed areas at risk of flooding and landslides, and conducted rope and water rescue drills.

"When I first joined the brigade, our work usually began only after disaster struck," Yao said. "Now, our work starts much earlier. We focus on preparedness and disaster prevention, making rescue operations more targeted and effective."

As climate change brings more frequent severe rain, flooding and urban waterlogging across China, fire and rescue teams nationwide are devoting more time to emergency preparedness before disasters occur.

In China, firefighters do far more than put out fires. They also respond to floods, landslides, earthquakes, building collapses, traffic accidents and other emergencies. Depending on their expertise and location, specialized teams may carry out evacuations, search-and-rescue operations, emergency reconnaissance and disaster relief across different regions.

Yao, who has served with the Heilongjiang fire and rescue mobile general brigade for more than two decades, has seen firsthand how the scope of the job has expanded.

In the past, his brigade mainly fought forest fires. Today, its members also tackle summer floods and carry out other rescue missions, while providing emergency support at major attractions and events, including Harbin Ice and Snow World during the winter tourism season.

Anticipating disaster

The shift from reacting to disasters to anticipating them is also evident in Anhui province.

Xue Xuetao, a firefighter with the Hefei fire and rescue mobile brigade, recently led an advance team to Feidong county in Hefei, pre-positioning personnel and emergency communications equipment along the projected path of the approaching typhoon.

Since joining the brigade in 2007, Xue has built up extensive experience responding to disasters across Anhui. In the north, he has tackled recurring floods along the Huaihe River, while in the mountainous south, he has dealt with flash floods, landslides and other hazards triggered by severe rain.

That regional experience has taught him to anticipate how disasters may unfold. Areas such as Huangshan, Xuancheng and Anqing are particularly vulnerable because of their terrain, while northern Anhui faces persistent flood risks along the Huaihe River.

"A deep understanding of local geography is essential during a rescue task, because natural disasters can become life-threatening within minutes," he said.

Right: Xue Xuetao carries out flood-control and emergency rescue operations using communications support equipment in Fuyang, Anhui province, in 2020. **Bottom:** Migmar Tsering (left) leads his team in searching for trapped survivors following the earthquake in Dingri county, Shigatse, Xizang autonomous region, in January 2025. PROVIDED TO CHINA DAILY

One of the missions that left the deepest impression on Xue was the devastating flooding in Huangshan in 2024, when days of unusually heavy rain cut three villages off from the outside world.

"The only road into the villages was a narrow mountain path, with steep slopes on one side and a fast-flowing river on the other," he recalled. "After landslides buried the road, we had to trek across unstable debris while the rain continued. Every step carried the risk of triggering another collapse."

Xue took part in an advance reconnaissance operation, in which highly mobile teams travel by helicopter or off-road vehicle, or proceed on foot to reach disaster areas ahead of larger rescue forces. Such teams are sent in when roads are blocked, communications are disrupted or conditions remain highly dangerous.

When public communications networks fail, they deploy an emergency private radio terminal to transmit live images and data from the scene. This gives headquarters a clearer picture of conditions on the ground and helps guide the next stage of the rescue.

Despite the danger, Xue said hesitation never crossed his mind. "Our only thought was to reach the disaster area as quickly as possible, assess the situation and report back, so the command center could make timely decisions and mobilize additional rescue teams," he said.

Lessons from such missions are shared across the force, becoming practical knowledge passed from veteran firefighters to younger rescuers.

"Our officers and veteran firefighters have taken part in years of frontline rescue work and accumulated invaluable experience. They teach younger firefighters the safest and most effective rescue methods," Yao noted.

Many of those lessons came at a high cost. "Some comrades lost their lives or suffered serious injuries," Yao said. "By passing on their experience, we hope younger rescuers can avoid making the same mistakes."

Passing lessons on

As veteran firefighters share lessons learned in the field, younger rescuers are being asked to master increasingly complex equipment and take on demanding technical and command roles.

Among them is Migmar Tsering, a technical officer with the Shigatse fire and rescue mobile brigade in the Xizang autonomous region. Born in the 2000s, he represents a younger generation preparing to lead rescue operations under extreme pressure.

One of the greatest challenges in responding to a large-scale disaster is the expertise required of commanders, according to Migmar Tsering. They must quickly formulate rescue plans, organize personnel and allocate equipment, often with little time and incomplete information.

"Modern fire and rescue operations involve thousands of pieces of equipment," he said. "Commanders must understand how every type of equipment works, what it can do and how it performs."

"It is a tremendous test of command capability," he added.

Technical knowledge alone, however, is not enough. Migmar Tsering said frontline rescuers must also remain calm as conditions change around them.

During a forest fire, for example, a sudden shift in wind direction can carry embers downhill and cause the flames to spread back uphill toward firefighters.

"Without solid professional skills and psychological resilience, panic can quickly worsen physical exhaustion. In steep mountain terrain, that can be extremely dangerous," he said, adding that prolonged exposure to intense heat can also put firefighters at risk of severe dehydration.

Even after the last survivor is brought to safety, the work is far from over.

During the initial emergency response, firefighters focus on rescuing trapped residents. Once everyone has been evacuated, they may spend another six or seven days searching through debris for personal belongings and helping families recover as much property as possible.

"Floods, forest fires and other major natural disasters are all high-intensity, high-risk missions," he noted. "They demand perseverance, discipline and resilience. Those qualities are essential to carrying out rescue operations safely and effectively."

Despite the hardships, Migmar Tsering said he has never regretted choosing the profession.

"You have to truly love this job," he said. "Our mission is simple: serve the people, stand with them and always put their needs first."

As he became more deeply involved with the team, Migmar Tsering said, he gradually developed a strong sense of belonging and pride in its unity, traditions and achievements.

Engineer finds art in the air

Once dismissed as children's toys, balloons became Xu Dengyong's path to entrepreneurship, professional recognition and building a new industry.

By **GUI QIAN** and **LIU KUN**

Above: Xu Dengyong checks a balloon installation he created. **Right:** Xu (front) teaches balloon-making techniques to young trainees. PROVIDED TO CHINA DAILY

Xu Dengyong, 37, first noticed balloon art on an online variety show in 2013. One of the guests appeared in an outfit made entirely of woven balloons. At the time, Xu was working as an engineer at an electronics factory in Guangdong province, living a stable life.

He never imagined that balloons — which he then saw as little more than "children's toys" — would one day become the foundation of a business earning him more than 1 million yuan ($147,000) a year.

Originally from Nanzhang county, Hubei province, Xu had spent years in manufacturing before changing careers. His factory experience left him with two lasting assets: the ability to endure hardship and a disciplined approach to solving problems — through standardized processes, attention to detail, cost control and safety calculations. These habits would later prove invaluable in the balloon industry.

In 2013, Xu invested his savings of 30,000 yuan to attend a monthlong balloon modeling course in Henan province. After returning home, he opened a balloon decoration shop.

The early days were tough. He handed out flyers on the street and visited wedding planning companies one by one, taking whatever work he could find.

A turning point came in 2015 when he began targeting shopping malls and large commercial events. But potential clients all asked the same question: How long would the balloons last?

Xu had no good answer.

At the time, balloon decoration techniques were still relatively undeveloped. Indoor installations typically lasted no more than a week. For shopping malls investing in displays built from tens of thousands of balloons, that simply wasn't good enough.

Air leakage was the biggest obstacle. Inflating latex balloons stretches the material, reducing its density and allowing air to gradually escape. Unless that problem could be solved, large-scale commercial balloon installations would be difficult to maintain.

Xu approached the challenge like an engineer.

First, he refined the knotting technique to reduce air leakage. Then he began placing one balloon inside another so that the inner balloon would remain intact even if the outer one burst.

His most time-consuming breakthrough came from experimenting along the inner wall of a balloon, slowing air loss without damaging the material.

Later, inspired by car waxing and facial skincare, Xu developed an oil-coating process for the balloon surface, further extending its durability. Today, his balloon installations can last indoors for up to three months, and as long as six months in winter.

These improvements transformed balloons from short-lived decorations into commercially viable products.

A real estate project in Jiangxi province in 2017 brought Xu's company 600,000 yuan in revenue in just half a month. In 2023, a 10-meter-tall balloon cake he designed was commissioned by nearly 30 supermarkets and shopping malls across China.

As his reputation grew, professional recognition followed. In 2019, his work *Divine Beast Longma* — named after the mythical dragon horse — won the large-scale category at the China Balloon Art Competition. Three years later, he received a Top 10 Unique Skills Award at a high-skilled talent competition in Hubei province and was named a "Jingchu Artisan", a provincial honor recognizing outstanding craftspeople.

"Those awards gave me a new level of confidence," he said. "No matter how large the order was or how complex the design, I knew I could handle it."

For Xu, the recognition marked more than a personal achievement. It convinced him that balloon art could be seen as a serious profession rather than a novelty, and it gradually shifted the focus of his work. Rather than concentrating solely on building balloon installations himself, he began spending more time helping others enter the industry.

Since 2024, through a model worker innovation studio supported by the Nanzhang County Federation of Trade Unions, Xu has recorded balloon modeling tutorials and offered free online and in-person training. More than 4,000 people have participated in his courses.

Many wonder why he devotes so much time to teaching people who may one day become his competitors.

"The industry is too fragmented," Xu said. "Unlike makeup or floral design, balloon art has no national vocational qualification and no formal training system. I hope to help the industry grow together so it can gain wider recognition."

His training goes beyond technique. Students also learn how to negotiate with clients, identify new markets, produce promotional videos, write marketing content and use social media to support offline businesses.

Xu believes the future of the craft lies in the hands of young people.

"Those born after 2000 are quick-thinking and highly creative," he said. "Balloon art is, by nature, part of the creative industry, and their fresh thinking can bring more original ideas."

That belief is also guiding the markets he is now exploring. One direction is combining balloon art with local cultural intellectual property (IP), working with governments and cultural institutions to turn landmarks and historic neighborhoods into large-scale balloon installations. Another is expanding into outdoor consumer spaces, including campsites and tourist attractions, where decorative installations are becoming increasingly popular.

More than a decade after watching balloon art on television for the first time, Xu no longer sees balloons as children's toys. Through technical innovation and an engineer's mindset, he has turned them into durable commercial products — while helping build a more professional future for an industry that is still taking shape.

Global Insights

Ancient Datong echoes humanity's shared spiritual journey

The hum of the high-speed train softened as we pulled into Datong, Shanxi province, leaving behind the bustle of Beijing for a city shaped by layers of history.

Traveling with 20 fellow media students and three coordinators from the Communication University of China, I expected to see temples, grottoes and ancient streets. What I did not expect was a series of cross-cultural revelations, all pointing to one central truth: faith and human creativity transcend geographic boundaries.

Datong, once the capital of the Northern Wei Dynasty (386-534), is often introduced through its grand historical landmarks. But the first place that stopped me was quieter and more intimate: the Pingcheng Memory Hall.

Unlike large imperial exhibition halls, this small museum preserves the texture of ordinary life: chipped ceramic rice bowls, old vendor signs, woolen coats once worn by coal miners and vintage radio sets.

As a documentary filmmaker, I found myself lingering before a weathered copper hotpot, its dented surface carrying the traces of generations of family dinners.

Balcha Teshome Hailu visits Huayan Temple in Datong, Shanxi province, on June 11, 2026. PROVIDED TO CHINA DAILY

Later, in Datong's ancient city area, I saw that same everyday object transformed into art. Hundreds of copper pots were arranged into flowing silhouettes of mountains.

In that moment, I realized that cultural identity does not live only in carved stone or towering pagodas. It also simmers in everyday objects, forged through shared meals and community warmth.

At Huayan Temple, that sense of connection deepened. Its rare Liao Dynasty (916-1125) open-column architecture stretched above me in broad wooden beams, creating a spacious interior without obstructive walls.

Among the 29 intact painted statues, the famed smiling Bodhisattva known as the "Venus of the East" stopped me completely.

Her serene smile felt unexpectedly familiar, reminiscent of the saints painted in Ethiopian Orthodox churches near my childhood home. The intricate wooden brackets jutting from the temple eaves, each carved curve offered to the divine, just as Ethiopian artisans chisel elaborate doorframes and stone murals to honor faith.

Standing there amid drifting sandalwood incense, I understood that spiritual architecture speaks a universal language. Across cultures and civilizations, people pour patience, skill and imagination into timber and stone, giving visible form to what they hold sacred.

The strongest moment of recognition came at the Hanging Temple, also known as Xuankong Temple. Built into the cliffside, with narrow wooden walkways linking small prayer halls, the temple seems to test the boundary between architecture and belief.

As I walked carefully along its elevated passages, I thought of Debre Damo Monastery, the cliff-top Orthodox monastery in northern Ethiopia that sits atop an inaccessible plateau and can be reached only by hauling oneself up a frayed leather rope.

The Hanging Temple and Debre Damo belong to different religions, histories and landscapes, yet they ask believers across continents the same timeless question: how far are you willing to go, and what discomfort are you prepared to endure, to come closer to the sacred?

I paused on a small balcony, watching elderly Chinese pilgrims shuffle slowly across the wooden planks, their hands folded and their faces lit with quiet reverence. I pictured Ethiopian monks climbing that rope to Debre Damo, driven by the same unshakable devotion.

In that moment, I was no longer only a foreign student on a field trip. I felt like a witness to something shared — the human desire to place holiness above the noise of ordinary life.

The Yingxian Wooden Pagoda and Yungang Grottoes added another layer to that reflection.

The thousand-year-old pagoda, built without a single iron nail, reminded me of Ethiopia's Aksum obelisks: monuments created not for speed, but for endurance. The Yungang Grottoes, a UNESCO World Heritage Site, revealed Buddhist art fused with multi-ethnic culture on a breathtaking scale.

Yet beyond these grand landmarks, present-day Datong remained equally vivid: warm regional food, smooth roads leading from the city to remote heritage sites and residential districts that showed how modern development can grow around ancient history rather than erase it.

We boarded our train back to Beijing as dusk fell, our group far quieter than when we had left. That silence did not come from tiredness alone. Datong had given us too much to absorb at once. Its meaning lies not in a checklist of tourist spots, but in the subtle, powerful connections it draws between distant cultures.

Every carved beam, every cliffside shrine and every humble copper hotpot tells the same story: art, faith and human perseverance are languages no border can divide. Datong's stone and cliffs do not merely speak to China's past — they speak to our shared humanity, visible to anyone willing to pause, look closely and listen.

2026 WORLD CUP

BEST MOMENTS OF THE 2026 WORLD CUP

Three countries, 104 games, 39 days and hundreds of memories — here are a few that stand out

With 104 games taking place over 39 days, and across three countries — the United States, Canada and Mexico — the 2026 World Cup produced hundreds of spectacular moments that will live long in the memory.

1. Goal of the tournament

Sidny Lopes Cabral of Cape Verde stunned defending champion Argentina with a tying goal in extra time of their round-of-32 match at Miami Gardens, Florida, on July 3.

The Blue Sharks, who entered the tournament ranked 67th, trailed 2-1 in the 103rd minute, when Cabral received a long pass from Yannick Semedo near the left flank with his left foot. The 23-year-old, who plays in Turkiye for Trabzonspor, cut past Alexis Mac Allister while playing the ball onto his right foot and, from just inside the penalty area, curled a stunning shot past goalkeeper Emiliano Martinez and into the upper corner at the far post for his fourth goal in 14 international appearances.

2. Breakout player

Nineteen-year-old Barcelona defender Pau Cubarsi played every minute of every match, as Spain, winner in 2010, won its second World Cup title. He had 668 successful passes in 690 attempts, a 96.8 percent completion rate that was the second best in the tournament among players with 400 or more attempts, just behind Norway's Sander Berge at 96.9 percent. Cubarsi's total was second only to teammate Rodri's 747. Cubarsi's 750 minutes tied teammate Marc Cucurella and Mac Allister for the tournament high among outfield players. At 19 years, 178 days, he became the seventh youngest to win a World Cup, trailing Pele (17-249) in 1958, Ronaldo (17-298) in 1994, Giuseppe Bergomi (18-174) in 1982, current teammate Lamine Yamal and Antonio Coutinho in 1962 (both 19-6), and Marco Antonio (19-135) in 1970.

3. Worst foul

Qatari midfielder Assim Madibo broke the left tibia and fibula of Canadian midfielder Ismael Kone with a tackle from behind in the 51st minute of a June 18 group-stage match in Vancouver. Madibo received a red card and a five-game suspension. Kone had surgery and Madibo visited him at the hospital.

4. Biggest blunder

Matt Freese had a howler in the United States' 4-1 loss to Belgium in the round of 16 that will long feature on goalkeeper blooper reels. Brandon Mechele played a long ball from deep in his own half. When Belgium's Charles De Ketelaere burst past US defender Chris Richards, Freese came off his line, and, about five yards outside the penalty area, he chested the ball. The 27-year-old, who became the No 1 keeper for the US last year, was about to clear the ball with his left foot, hesitated and tried to pass to his left, only for the ball to deflect off one of De Ketelaere's legs toward midfield. Hans Vanaken scored from about 30 yards, as US captain Tim Ream was left unsuccessfully flailing to try and block the ball.

5. Best fans

Norway's fans charmed fellow spectators and television viewers when they performed the "Viking Row" in stadiums and even in the bleachers above the TKTS booth selling Broadway theater tickets in New York's Times Square. Martin Odegaard and Erling Haaland led the row celebration on the field following wins. Scotland's Tartan Army also left indelible memories, depleting Boston's beer supply and taking in baseball games at Boston's Fenway Park and LoanDepot Park in Miami.

6. Biggest upset

Eliminated in consecutive group stages following its fourth World Cup title in 2014, Germany clinched top spot in its group with wins over Curacao and Cote d'Ivoire before losing its group stage finale against Ecuador. Paraguay, in its first World Cup since 2010, began the tournament ranked 41st and advanced as one of the top third-placed teams, opening with a 4-1 loss to the US, beating Turkiye 1-0 and drawing 0-0 against Australia. When Germany and Paraguay met in the round of 32 on June 29 in Boston, Julio Enciso put Paraguay ahead in the 42nd minute, but Kai Havertz tied the score 12 minutes later. Germany, which began the World Cup ranked No 10, thought it had taken a crucial lead off the head of Jonathan Tah in the 102nd minute, but it was overturned by VAR because of a foul by Waldemar Anton on Paraguay keeper Orlando Gill. Germany had won all four of its previous World Cup penalty shootouts, succeeding on 17 of 18 kicks — including 15 in a row. Havertz's opening spotkick was saved by Gill, who also batted away Nick Woltemade's effort three shots later. Tah skied Germany's sixth kick over the crossbar, leaving it all to do for Jose Canale, who beat Manuel Neuer. Paraguay won the shootout 4-3, only to go on and lose 1-0 to France in the round of 16.

7. Best photo

Raul Jimenez scored Mexico's second goal in its tournament-opening 2-0 win over South Africa on June 11. An image from Associated Press photographer Natacha Pisarenko captured the joy of a player who scored on a header, six years after his career was nearly ended when he fractured his skull in a clash of heads with Arsenal's David Luiz while playing in a Premier League match for Wolverhampton.

President Xi Jinping hosts a welcoming ceremony for President of Ecuador Daniel Roy-Gilchrist Noboa Azin in Beijing on Tuesday. Noboa is on a state visit to China until Sunday. FENG YONGBIN / CHINA DAILY

Xi calls for deepening cooperation with Ecuador

By **MO JINGXI**
mojingxi@chinadaily.com.cn

President Xi Jinping called on China and Ecuador to better align their development strategies, advance Belt and Road cooperation and deepen collaboration in fields ranging from energy and infrastructure to green development and artificial intelligence, during talks with visiting Ecuadorian President Daniel Roy-Gilchrist Noboa Azin in Beijing on Tuesday.

Noboa arrived in Beijing on Sunday for a state visit that will run through Aug 23. It is his first state visit to China and his second trip to the country as president.

Following the talks, the two heads of state witnessed the signing of cooperation documents covering green industries, economic and trade cooperation, the digital economy and people's livelihoods.

This year marks the 10th anniversary of the China-Ecuador comprehensive strategic partnership, which was established during Xi's state visit to Ecuador in November 2016.

Xi said China has always viewed its relations with the Latin American country from a strategic and long-term perspective, regardless of changes in the international landscape.

"China is ready to work with Ecuador to take bilateral relations to new heights and deliver greater benefits to the two peoples," he said.

Xi called on the two countries to consolidate political mutual trust and continue to understand and support each other on issues involving their respective core interests and major concerns.

China respects and supports Ecuador in pursuing a development path suited to its national conditions and is willing to strengthen exchanges between the two countries' governments, legislatures and political parties and share experience in governance as both countries pursue their respective paths toward modernization, he said.

Economic and trade ties between China and Ecuador have expanded steadily since their free trade agreement took effect on May 1, 2024. In the first half of this year, bilateral trade value reached $9.831 billion, up 20.1 percent year-on-year. China remained the largest destination for Ecuador's non-oil exports.

"This reflects both the benefits generated by the bilateral free trade agreement and the potential of China's superlarge market," Xi said.

He urged the two sides to further unlock the agreement's potential, so that more businesses and consumers could benefit.

China is also willing to work with Ecuador in healthcare, poverty reduction, and disaster prevention and mitigation in support of Ecuador's national development, Xi said. He also called for stronger exchanges in education, culture, youth and sports and between local governments, along with steps to facilitate travel and deepen friendship between the two peoples.

Noboa said China is an important partner and friend of Ecuador and that bilateral relations have entered a new stage, delivering tangible benefits to both peoples.

He said Ecuador is ready to deepen political mutual trust with China, support China in safeguarding its sovereignty and territorial integrity, and respect its position on the Taiwan question.

Ecuador is willing to strengthen mutually beneficial cooperation with China in trade, finance, mining, renewable energy, science and technology, and culture, Noboa said. The country also seeks to expand its exports to China and welcomes more Chinese companies to invest and operate in Ecuador, contributing to improvements in people's livelihoods and the country's development, he added.

The two leaders also exchanged views on developments in Latin America and the Caribbean.

Xi said China has always maintained that the status of the Latin American and Caribbean region as a zone of peace should not be shaken.

The course of development and revitalization of Latin American and Caribbean countries should not be disrupted, and the right of countries in the region to independently choose their cooperation partners should not be interfered with, he said.

China supports Latin American countries in upholding independence and self-reliance, pursuing foreign cooperation based on their national interests, and safeguarding regional peace and stability, Xi added.

Noboa said Ecuador values China's position and role and is ready to remain a good friend of China on the other side of the Pacific.

Humanizing the future of robotics

WORLD WATCH
By Carlos Magariños

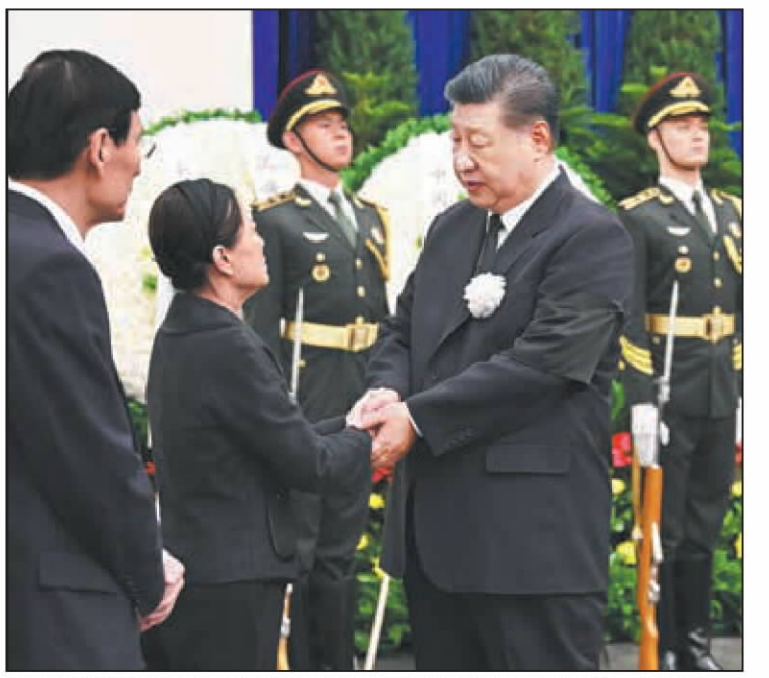
During my visit to the 2024 World Manufacturing Convention in Hefei, East China's Anhui province, I felt as though I had stepped into a scene from a science fiction movie. Before me, a 1.8-meter-tall humanoid robot weighing 60 kilograms was using its 38 degrees of freedom — or 38 independent ways to move or rotate — to fold clothes, open bottles, pour water and wash dishes with remarkable precision.

Since then, the race to develop more advanced robots has only gained momentum.

Improvements in actuators and sensors now allow humanoid robots to walk, run and perform increasingly complex tasks. At the same time, advances in artificial intelligence are rapidly enhancing their ability to interpret surroundings, interact with people and adapt to changing situations.

Applications now extend far beyond the factory floor. Humanoid robots are now finding roles in agriculture, customer service and healthcare, as well as in assisting older people, patients and persons with disabilities.

However, humanoids are only part of a much broader transformation.



Collaborative robots, or cobots, work alongside people, augmenting human capabilities in factories, laboratories and hospitals. Swarm robotics enables multiple robots to coordinate on tasks such as searching for and rescuing survivors, inspecting infrastructure or exploring hazardous environments.

This new generation of robots is pushing the boundaries of possibilities. But perhaps the more important question is not what robots will eventually be capable of, but what we want them to do.

As the father of a young man with an intellectual disability caused by a rare genetic condition, I have seen firsthand the extraordinary contributions of robotics and intelligent technologies to everyday life. They can help organize routines, facilitate communication, improve safety and enhance personal autonomy. For many families, these are not abstract possibilities, but tangible improvements in daily life.

This experience has also taught me an important distinction that no technological advance should blur: assistance and care are not the same thing. Machines can perform tasks with ever greater efficiency, but care requires recognition, responsibility, patience, empathy and affection. Those qualities arise essentially from human relationships, rather than from algorithms.

President Xi Jinping extends his condolences to a family member of Zhu Rongji on Tuesday at the Babaoshan Revolutionary Cemetery in Beijing. XIE HUANCHI / XINHUA

Zhu Rongji's remains cremated in Beijing

Senior Party and State leaders pay their last respects to former premier

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

The remains of former Chinese premier Zhu Rongji were cremated in Beijing on Tuesday.

President Xi Jinping and other senior Party and State leaders, including Li Qiang, Zhao Leji, Wang Huning, Cai Qi, Ding Xuexiang, Li Xi and Han Zheng, bade farewell to Zhu at the Babaoshan Revolutionary Cemetery in the morning.

Amid solemn music, they walked slowly toward Zhu's remains and stood in silent tribute. They then paid their final respects with three bows and shook hands with Zhu's family members. Former Chinese leader Hu Jintao sent a wreath to express his condolences over Zhu's passing.

Zhu died of illness on Aug 12 in Beijing at the age of 98. He had served as a member of the Standing Committee of the Political Bureau of the 14th and 15th Central Committees of the Communist Party of China.

To mourn his death, national flags flew at half-staff on Tuesday at Tian'anmen Square, Xinhuamen, the Great Hall of the People and the Ministry of Foreign Affairs office in Beijing, in seats of CPC committees and governments of provinces, autonomous regions and municipalities, and the Hong Kong and Macao special administrative regions, at land ports, seaports and airports, and at Chinese embassies and consulates.

Zhu was extolled in an official obituary as an excellent Party member, a time-tested and loyal communist fighter, and an outstanding proletarian revolutionist, statesman and leader of the Party and the State.

Zhu, who was born in October 1928 in Changsha, Hunan province, joined the CPC in October 1949.

During his tenure as vice-premier and premier of the State Council, China's Cabinet, between 1991 and 2003, the country was in a critical period of transition — from a planned economy to a socialist market economy.

Under the strong leadership of the CPC Central Committee with Jiang Zemin at its core, Zhu organized and implemented a series of major reforms, promoting the establishment of the basic framework for a socialist market economy.

Zhu spearheaded reform of the fiscal and taxation systems, actively promoted the reform of the financial system, carried out the reform of State-owned enterprises, and pushed for the establishment of a unified, regulated and comprehensive framework for the social security system.

He oversaw the completion of the arduous negotiations for China's accession to the World Trade Organization and advanced the country's opening-up in both scope and depth.

Zhu also advanced China's housing reform, gradually replacing the allocation of housing to employees with monetary housing benefits.

He had deep affection for the people, and emphasized that government officials should always bear in mind that they are public servants, have the courage to speak the truth and refrain from seeking special privileges.

Zhu's life was a revolutionary, fighting and glorious one, the obituary said, adding that his death is a great loss to the Party and the State.

XI'AN EATERY SERVES UP A UNIQUE TASTE OF THE CITY

Open-ended, pan-fried and steamed, these special *guotie* are part of a neighborhood tradition stretching back eight decades

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

China Vibes — FOOD —

The sizzling sound of an iron pan and the aroma of freshly fried dough drew Ukrainian travel blogger Oleksii Lisianskyi to a small restaurant in Xi'an, Shaanxi province.

There, he discovered *guotie* — open-ended, pan-fried dumplings with juicy fillings. What stayed with him was not only the taste, but also the story behind the dish. "It looks similar to dumplings. The bottom is crispy, while the filling is flavorful," Lisianskyi said.

The dumplings he enjoyed at Hairong Guotie are part of a family tradition dating back nearly eight decades. Listed as an intangible cultural heritage item in Xi'an's Beilin district in 2022, the technique for making the signature *guotie* offers a glimpse into how an everyday dish can preserve neighborhood memories, sustain a family legacy and find new life among younger and international audiences.

Much of the appeal lies in the contrast of textures. The underside is crisp and golden, while the upper layer remains soft and tender. Inside, the filling is moist and flavorful.

INDEPTH

Shangri-La's mushrooming reputation

Highly-prized forest delicacy links mountain communities to tourism opportunities, Asian market

By **YANG FEIYUE** and **LI YINGQING**
in Diqing, Yunnan

Ngawang Duchin moved slowly through the forest in Shangri-La, Yunnan province, scanning the ground beneath towering pine trees.

In Jidi village, Diqing Tibetan autonomous prefecture, pine needles carpeted the forest floor and chestnut trees lined the mountain slopes at an altitude of 3,300 meters. Summer mist drifted across the ridges.

To an untrained eye, there was little difference between one patch of forest floor and another. But since July, 38-year-old Ngawang has been searching for signs of what was hidden beneath it. The Tibetan villager suddenly stopped, crouched down and brushed away a thin layer of pine needles.

"The ground is slightly raised here. When it bulges like this, there is usually something underneath," he said.

He carefully loosened the soil and a small brown mushroom slowly emerged, its cap still partly closed and covered with traces of forest earth.

The fungus was matsutake, known in China as *songrong* — a delicacy grown in the mountain forests of Yunnan and popular in high-end restaurants across Asia.

For visitors accompanying Ngawang, seeing one of the world's most-prized mushrooms being foraged in the wild was a magical experience.

Anticlockwise from top: Tourists, guided by a local villager, search for matsutake mushrooms in Jidi village, Diqing Tibetan autonomous prefecture, in Yunnan province; villagers sort matsutake mushrooms in Jidi; traders take photos of packed matsutake from Jidi at a local trading market. PHOTOS BY GAO YONGWEI / XINHUA Freshly picked mushrooms from mountains in Diqing are displayed in July. PROVIDED TO CHINA DAILY

Seasonal treat

This summer, similar scenes played out across countless mountain slopes in Yunnan, a province known as the kingdom of wild mushrooms. With the rainy season arriving between June and September, forests across the region have been yielding their underground treasures. More than 900 species of wild edible mushrooms grow here — accounting for about 36 percent of the world's known varieties and more than 90 percent of China's total, according to the Kunming Institute of Botany of the Chinese Academy of Sciences.

The secret lies in Yunnan's dramatic geographical variance. Altitudes range from just 76 meters to nearly 6,740 meters, creating a vertical climate where temperatures, humidity and sunlight vary sharply from valleys to ridges. This remarkable diversity of habitats gives mushrooms their own corners of the forest to grow, but matsutake stands above the rest.

Diqing prefecture — home to Shangri-La — produces more than 65 percent of the province's matsutake, according to the Fourth Shangri-La Matsutake Forum held in July, making it the undisputed heart of China's matsutake industry. Here, wild mushrooms have supported mountain communities for generations.

Unlike ordinary agricultural products, matsutake cannot simply be planted and harvested. It depends on a delicate relationship with its natural environment.

The fungus grows together with certain trees, forming underground networks around their roots. Through this partnership, the mushroom helps trees absorb water and nutrients, while receiving energy produced by the trees through photosynthesis.

It can take five or six years before a matsutake fruiting body — the part people eat — appears above ground.

And once it emerges, the clock begins ticking. Within about 48 hours, its freshness starts to decline.

This combination of rarity, seasonality and dependence on the forest has made matsutake one of nature's most sought-after delicacies.

The mushroom has been appreciated in China for centuries. Its name, literally meaning "pine deer-antler mushroom", refers to the way young mushrooms resemble antlers and the fact that they often grow in pine forests. References to matsutake appeared in ancient Chinese texts, and the Ming Dynasty (1368-1644) pharmacologist Li Shizhen included it in his *Compendium of Materia Medica*.

In Japan, where matsutake has been treasured for more than 1,300 years, it remains closely associated with autumn and the aroma of forests. *Honcho Shokkan*, a book of Japanese food published in the 1690s, described it as "the foremost mushroom" and it has continued to influence Japanese cuisine.

Ngawang said good matsutake usually grows where small chestnut trees and pine trees meet. "When the mushroom is still young, you cannot see it. You have to understand the forest," he said.

For many tourists this summer, entering Jidi's forests provided a major insight. Ngawang taught them to look for subtle changes such as disturbed pine needles, tiny cracks in the soil and slight differences in the landscape.

"It is not always covered by moss. Sometimes it is just bare earth opening slightly," he told one group.

The visitors followed his instructions carefully. After successfully foraging for a while, the visitors sat down to taste the morning's discovery.

Ngawang took out traditional Tibetan butter, or *suyou*, and melted it on a heated stone. He placed thin slices of fresh matsutake on top. "Just fry it like this. Two minutes," he said. "Or you can eat it raw with wasabi."

Return of the Jidi

Ngawang was born in Jidi, and like many young people from mountain villages, he left home in search of a better life.

At 18, he joined the army and served for eight years. After returning to civilian life, he moved to Lijiang, another popular tourism destination in Yunnan, where he ran businesses including a homestay, hiking club, restaurant and tea house, and gained experience in tourism.

But after the COVID-19 pandemic, he began thinking more seriously about returning to his hometown. By then, Jidi had already developed a reputation for matsutake.

Every summer, when the rainy season arrived, villagers entered the mountains to collect the mushrooms. The harvest lasted only two to three months, but the income from this short period supported families throughout the year.

Ngawang wondered whether the forest could offer visitors something beyond a scenic view.

"People come to Shangri-La to see mountains and nature. But they do not always know the stories behind them," he said.

After spending several years exploring different opportunities, he leased one of the village's four designated mushroom-picking areas, paying 5,000 yuan ($690) a month during the three-month harvest season.

His idea was to cooperate with hotels in downtown Shangri-La, bring visitors into the mountains and allow them to witness how the mushrooms are harvested and sent to dining tables.

"I know the mountain and can at least make sure people are safe," he added.

For visitors, his greatest asset was knowing where mushrooms were likely to appear, when they should be picked, and which ones should be left behind. "Do not pick mushrooms smaller than 3 centimeters," he told one group.

The advice was not merely traditional wisdom. It reflected scientific understanding of the mushroom's life cycle.

Sun Dafeng, director of the Kunming edible fungi research institute under the All China Federation of Supply and Marketing Cooperatives, explained that immature matsutake does not have fully developed reproductive structures.

"If they are picked too early, they cannot release spores effectively," Sun said. "That affects future growth."

In Diqing, regulations prohibit harvesting immature mushrooms and encourage practices that allow the fungal root network to recover.

Tsering Norbu, director of the Jidi village committee, said the mushroom industry accounts for a major share of the local economy.

"Seventy to 80 percent of the village's GDP comes from matsutake," he said.

For more than 300 households, the summer harvest season influences almost every aspect of their life. "When the mushrooms grow well, villagers have more confidence about the future," Tsering said.

Jidi has established four designated mushroom-picking areas with clear rules on harvesting hours and seasonal protections. Villagers adopt a "harvest and fallow" approach, part of what experts call a joint conservation and breeding expansion model.

Sun compares this approach to rehabilitating farmland.

"The forest also needs recovery time," he said. "The underground fungal system is living. If the environment is damaged, production will eventually decline."

In Jidi, more than 267 hectares of matsutake-producing forest have been protected and expanded through measures including designated harvesting zones and seasonal restrictions.

A vendor displays fresh matsutake at a market in Kunming, Yunnan, in September. YANG ZHENG / FOR CHINA DAILY

This approach has helped stabilize annual output at around 300 metric tons.

Preparing for sales

The mushrooms' commercial value must be hastily maximized when villagers lift them from the soil. From the moment they are picked, the clock starts ticking to get them to dining tables in time.

At the Shangri-La matsutake trading center, about 30 kilometers from Jidi village, workers sort, pack and dispatch the fragile harvest.

Inside the market, the atmosphere is frantic. Phones ring constantly and buyers inspect the quality of the mushrooms under bright lights. The fungi are separated by hand, according to size, appearance and freshness before being sent to destinations hundreds or even thousands of kilometers away.

At the center of the trading hall stands a large model airplane — a reminder that these mushrooms, once collected mainly for local consumption, have become part of a global food network.

Fresh matsutake is highly perishable, making transportation a challenge.

During the peak harvest season in July and August, dealers handle dozens of kilograms each day. Mushrooms are packed with ice and moved quickly through cold-chain logistics to preserve their texture and aroma.

Some major buyers travel to Shangri-La in search of the highest-quality mushrooms.

Trucks transport matsutake to Kunming, the provincial capital, in the morning to larger distribution networks and for export. Flights from Diqing Shangri-La Airport connect with major domestic markets, including Beijing, Shanghai, Guangzhou, Guangdong province and Chongqing.

But expansion of the market has brought new challenges.

For generations, matsutake buyers relied on experience to judge quality and developed their own standards based on size, appearance and aroma. As demand increased, however, the industry needed clearer standards.

"Matsutake is different from ordinary agricultural products," said Jia Xiao, a researcher at the Research Center for Rural Economy of the Ministry of Agriculture and Rural Affairs. "Because it cannot be cultivated on a large scale, protecting the natural environment where it grows is the foundation of the industry."

A global appetite

At the forum, local officials and experts highlighted the growing recognition of Shangri-La matsutake as a regional agricultural brand.

According to data released at the forum, its brand value had reached 4.41 billion yuan, but experts said its reputation could not be measured by numbers alone.

Earlier this year, Shangri-La introduced new grading standards for matsutake, classifying mushrooms on a five-level scale.

The grading system considers factors including length, integrity, maturity, color, cleanliness and aroma. Among them, aroma remains the most difficult to measure.

"Matsutake's fragrance comes from a combination of volatile compounds," Sun Dafeng explained. "Technology can detect these compounds, but it cannot fully describe the human experience of smelling something fresh, earthy and connected to the forest."

Experts believe standardized grading and traceability systems can help consumers better understand the mushrooms they purchase. Each batch of matsutake can now be tracked through digital records showing its origin and processing information.

The international market for Shangri-La matsutake has continued to grow.

According to Diqing prefecture authorities, the region exported 55 metric tons of matsutake in 2025, generating 15.66 million yuan in foreign exchange.

The 2026 export season began on July 4, when a 14-kilogram shipment cleared customs at Kunming Changshui International Airport and was transported overseas within 24 hours of being picked, according to Kunming Customs.

Logistics companies have also expanded services to meet international demand.

At the forum, SF Express introduced new delivery solutions connecting matsutake-producing areas in Shangri-La, Kunming and Lijiang with overseas markets including Osaka in Japan, Seoul in South Korea and Singapore.

The company said its services could shorten door-to-port delivery time to about 28 hours and support exports via more than 50 international routes.

"To succeed in high-end global markets, Shangri-La matsutake needs more than quality and logistics," Sun said. "It needs sustainable harvesting, reliable standards, traceability and a story that reflects where it comes from."

For Ngawang, the future of matsutake is about helping more people understand the mushroom's history and essence.

"I hope the whole village can do this together," he said. "I bring the guests, and they experience it themselves. There is no need for a big investment."

Robots: Innovation should translate into well-being

From page 1

Therefore, the purpose of robotics in care should not be to replace human relationships, but to augment human capabilities, allowing caregivers, families and professionals to devote more time to the distinctly human dimensions of care.

As a development practitioner, I have learned that this principle extends far beyond healthcare and caregiving. I made this point recently at the Web Summit Rio: The greatest challenge posed by a new technology is not merely to develop it, but to transform technological progress into development.

International experience shows that countries do not prosper simply because they acquire advanced technologies. They progress when they build the institutions, human capabilities and productive structures needed to translate innovation into productivity, opportunity and greater well-being.

Similarly, robotics becomes a tool for development only when integrated with education, skills development, entrepreneurship, industrial capabilities, infrastructure and sound public policies that accompany technological change.

This is also one of the key lessons from China's remarkable advances in robotics.

What impressed me the most during my visit to Hefei was not only the sophistication of the machines, but also the ecosystem surrounding them — universities, research centers, manufacturers, digital infrastructure, supply chains and industrial policies evolving together. Robotics did not appear as an isolated technological achievement, but as part of a broader strategy for productive modernization.

This is an important lesson for developing countries.

The goal should not simply be to buy robots or imitate those leading the technological race. Instead, it should be to develop the capabilities needed for robotics to increase productivity, expand opportunities and promote more inclusive and sustainable development.

The same principle applies whether robots operate in factories, farms, hospitals or homes.

An industrial robot should not be judged simply by the number of workers it can replace, but by its ability to make production safer, more productive and more competitive. An agricultural robot should not be valued merely for automating harvesting, but for enabling us to produce more food with fewer resources and less environmental impact. And an assistive robot should not be considered successful because it mimics human interaction, but because it empowers a person with a disability to gain autonomy, allows an older person to live more independently, or enables a caregiver to devote more time to genuinely human care.

Robotics, perhaps more than many other emerging technologies, reminds us that innovation should never be an end in itself. Its true value lies in the human possibilities it creates.

Ultimately, the measure of technological progress will not be what robots can do, but what human beings can achieve because of them.

The author is former director-general of the United Nations Industrial Development Organization (UNIDO), former state secretary for industry of Argentina, and now a board member of several Latin American companies. The views do not necessarily reflect those of China Daily.

Dumplings: Legacy grows with new fillings, stores

From page 1

The family's restaurants prepare all fillings fresh each day, which include shrimps, mushrooms and leafy greens, as well as wild vegetables with eggs. The signature beef-and-yellow chives *guotie* features freshly cut beef with 80 percent lean meat and 20 percent fat.

According to Xuan Jianjun, the current owner and operator of the Hairong Guotie, the yellow chives are sourced from a designated growing area in Ankang, Shaanxi.

Each *guotie* weighs about 26 grams — approximately 9 grams of dough and 17 grams of filling. Bone broth is used to scald part of the flour and season the filling, giving the dumpling a richer taste.

Its preparation reflects the traditional Chinese balance of water and fire. The *guotie* are first lightly fried in oil. Once the bases begin to color, a mixture of flour, starch and water is poured into the pan. The pan is then covered, so that the dumplings can steam before more oil is added for a final crisping. The family describes the ideal appearance as a "golden back and fish belly".

Unlike many southern-style pan-fried dumplings, the northern-style *guotie* made through the Xuan family's technique leaves both ends open. Each dumpling curves as it cooks, helping to lock in the juices, while the thick cast-iron pan distributes heat evenly.

The family tradition began in 1947, when Xuan Hairong, the grandfather of current owner Xuan Jianjun, and his wife, Wang Guilan, settled in Xi'an. With three earthen rooms and an iron pan, they began selling *guotie* and sweet fermented-rice soup to the locals. They became known for generous fillings, carefully prepared dough and warm hospitality. When neighbors faced difficulties, the couple offered extra food without asking for payment.

After Xuan Hairong died in 1962, the passing down of the technique was interrupted. As Xuan Jianjun grew up, he was deeply influenced by his grandmother, Wang, and her dedication to the craft. In 1989, he decided to revive the technique and continue family tradition.

Wang, now 105, still visits the restaurant when her health allows, checking the food and reminding younger family members to preserve the original flavors. Her principle is simple: Run the restaurant honestly and make food with a clear conscience.

For Xuan Jianjun, preserving the craft goes hand in hand with innovation. The family has introduced crayfish *guotie* and explored seasonal fillings inspired by the traditional Chinese practice of eating according to the 24 solar terms.

The family now runs 12 franchised restaurants and eight directly managed ones in Xi'an and its neighboring areas. "We hope to build a century-old family business and pass the craft down from one generation to the next," Xuan Jianjun said.

The photo shows *guotie* at Hairong Guotie, whose dumpling-making technique has been listed as an intangible cultural heritage item in Xi'an's Beilin district since 2022. HAO YANGBIN / FOR CHINA DAILY

Aid shipment

Earthquake relief supplies provided by the Chinese government are loaded onto a cargo plane bound for Colombia at Beijing Capital International Airport in Beijing on Monday night. The supplies included power generators, mobile water purification devices, disinfection machines, solar-powered lighting equipment, tents and blankets. The chartered flight was scheduled to arrive in Bogota, the capital of Colombia, on Tuesday. The recent magnitude 7.4 earthquake in Colombia killed hundreds of people. WANG ZHUANGFEI / CHINA DAILY

Unitree raises mega debut hopes

First A-share listing by a humanoid maker offers key valuation benchmark for investors

By CHENG YU
chengyu@chinadaily.com.cn

Expectations are running high for Chinese humanoid robot maker Unitree Robotics' debut on Shanghai's STAR Market on Wednesday, after its record-breaking initial public offering was oversubscribed more than 8,000 times by retail investors, with some institutions predicting a potentially explosive first-day jump.

Industry experts said that Unitree's IPO has become more than a company-specific event. According to them, it is a defining moment for China's fast-growing humanoid robot industry, which is setting a key valuation benchmark for global investors in the sector.

Investors were already placing their bets on Tuesday. Although the broader market came under pressure, a group of stocks of companies in the humanoid robot sector jumped in early trading.

Swancor, a leading new materials manufacturer that expanded into the field of humanoid robots, closed at 188.97 yuan ($28.03), up 10.26 percent, while Leaderdrive, a precision robotic component maker, edged up about 5 percent to 380.8 yuan.

Unitree sold about 40.45 million shares at 150.80 yuan apiece, raising roughly 6.1 billion yuan. Retail demand exceeded the shares available by more than 8,000 times, a record for Shanghai's tech-focused STAR Market.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, described Unitree's IPO as a defining moment for the humanoid robot sector. "For years, investment in the sector has been driven by competing technology road maps and expectations of long-term growth. The IPO will allow investors to compare robot makers more directly on their technology, product maturity, commercialization and path to profitability.

"As the first humanoid robot company to list on China's A-share market, Unitree has established a valuation anchor for the humanoid robot sector both for China and the world, gradually shifting the sector from thematic investment to industrial pricing," he said.

The IPO offer also values Unitree at about 60.99 billion yuan, representing 35.89 times its 2025 sales value and 219.23 times its earnings, far above an average price-to-earnings ratio of about 38.56 times for China's general equipment manufacturing sector.

Xu Guangtan, chief analyst for the machinery sector at China Securities, said that Unitree's offer price and estimated valuation far exceeded previous market expectations and could help reshape how investors value humanoid robot manufacturers.

"Chinese companies are simultaneously strengthening robots' AI 'brains', motion-control cerebellums and physical bodies while pushing toward industrial and commercial applications," Xu said.

On Monday, Unitree unveiled another high-speed robot capable of running at up to 12.66 meters per second and jumping two meters from a standing position. The company said it had produced and delivered about 18,000 bipedal humanoid robots across different models till the end of July.

Tian Lihui, a finance professor at Nankai University, said, "Whether Unitree can grow into that valuation will depend heavily on whether orders from factories and other industrial customers begin to scale."

Just a day before Unitree's debut, Precilasers, a Chinese laser maker, also made its STAR Market debut and surged more than 500 percent in early trading. At its intraday peak, an investor who secured one standard IPO allocation could have been sitting on gains of more than 550,000 yuan.

"The arrival of a group of hard-tech companies including memory-chip maker ChangXin Memory Technologies and Unitree on public markets also pointed to a broader change in how Chinese investors value technology companies. Greater weight has been placed on technological barriers, domestic substitution and future commercial potential rather than current earnings alone," Tian said.

Trends reshape how youth see China

By ZOU SHUO
zoushuo@chinadaily.com.cn

A wave of social media trends is reshaping how China is being viewed by younger audiences around the world, as foreign tourists bypass traditional news outlets to share unfiltered experiences of daily life across the country.

Under hashtags such as ChinaTravel, ChinaShopping, ChinaCool and Chinamaxxing, young creators on TikTok, YouTube and Instagram are documenting immersive visits to Chinese cities. The trends reflect a broader shift toward firsthand cultural exploration among travelers from Generation Z, who were born between the mid-to-late 1990s and the early 2010s.

The term Chinamaxxing blends China with the Gen Z internet slang "maxxing", a word meaning to fully embrace and optimize a certain culture's lifestyle. It gained traction globally after online creators shared clips featuring everyday Chinese lifestyle habits such as drinking warm water, practicing *baduanjin* — a traditional Chinese aerobic exercise, wearing traditional outfits and watching Chinese short dramas.

ChinaTravel documents immersive city trips beyond iconic landmarks. ChinaShopping highlights booming purchases of *guochao* (China chic) electronics, beauty goods and daily consumer products. ChinaCool carries dual meanings — both refreshing summer getaways in China's mountainous regions and admiration for its sleek digital infrastructure, convenient public transportation and vibrant urban culture.

Deng Ning, a professor and vice-dean at Beijing International Studies University's School of Tourism Sciences, said that there is a fundamental difference between inbound travelers today and those in earlier eras.

Decades ago, foreign tourists came to China with the notion of seeing an "ancient Eastern nation" and merely visited symbolic landmarks such as the Great Wall and the Forbidden City, Deng said, adding that today's Chinamaxxing phenomenon represents a filter-free revolution powered by social media algorithms.

"Foreign visitors no longer chase the scenic spots we assume they want to see; they dive into tangible and modern local life — wandering through wet markets, buying bubble tea with mobile QR codes and watching square dances in community parks," Deng said.

"China has transformed from an object to be interpreted by outsiders into a subject experienced, discussed and redefined through real personal encounters," he added.

When foreign tourists develop a favorable impression of China from simple experiences such as scanning QR codes to pay, sipping bubble tea or encountering small acts of kindness on the subway, this "grassroots soft power" proves to be far more persuasive than any official promotional video, he said.

Chen Hong, director of the Institute of Area Studies at East China Normal University's School of Foreign Languages, said that Western mainstream media and political elites monopolized narratives about China for a long time, reducing the country to one-dimensional labels such as "security threat" or "geopolitical rivalry".

Now, the trending hashtags center on China's daily routines, urban spaces, consumption habits and social dynamics rather than political headlines, Chen said. "While the 'China threat' narrative has not vanished, its once-exclusive interpretive power is being steadily diluted by authentic travel experiences."

He added that distrust of traditional mainstream media and discontent with their own societies' high living costs, social fragmentation and loneliness are fueling curiosity about China among Western members of Gen Z.

Peer-generated tourist content delivers powerful authenticity. Even occasional mild complaints from visitors make their positive observations far more persuasive, a unique advantage no official campaign can replicate, he said.

The most compelling China stories are those told by international visitors themselves after they experience immersive stays in the country, Chen added.

Gina Lynn Dijkstra, 19, a Leiden University undergraduate from the Netherlands, said Western propaganda had fostered in her some biased preconceptions before she arrived in Beijing in late July.

"Paradoxically, I felt more free in China than ever in Europe. Beijing ensured freedom to go out at night, and freedom to safely visit public places like lush parks and bustling spots in the city at all times," Dijkstra said.

She was deeply moved by the sincere kindness shown by strangers and volunteers, and quoted a line from *The Analects of Confucius* to sum up her journey: "Is it not a pleasure to have friends coming from afar?" Though unfamiliar with the Chinamaxxing online trend, she has nevertheless taken a new daily habit home: wandering city streets with bubble tea and snacks as a casual way to socialize.

Roxy Ye, 20, who is also from the Netherlands and has Chinese family roots, said she visited Beijing as a tourist for the first time earlier this month. She was stunned by the city's unmatched sense of security.

"I took a taxi alone at 1 am to Tian'anmen Square to see the flag-raising ceremony. I did not hesitate to get into a taxi by myself in the middle of the night. Looking back, I realized that I probably would not have done the same thing even in my hometown in the Netherlands," Ye said.

She has seen Chinamaxxing clips online, yet reminded audiences not to rely only on short-video snippets. "They often focus on certain aesthetic or trendy aspects of China, while there is obviously much more to the country than what can be shown in short social media videos," Ye added.

Sharing cultures, building connections

Sister cities in China and Germany strive together to keep old houses alive and promote urban development

By **HOU CHENCHEN** in Beijing, **ZHANG ZHOUXIANG** in Stralsund, Germany and **ZHU LIXIN** in Huangshan, Anhui

In a traditional courtyard, sunlight streamed through carved wooden windows, falling onto a table covered with bamboo strips and colorful paper. The courtyard belongs to a workshop in Hongcun, a historic village at the foot of Huangshan Mountain in East China's Anhui province.

At the workshop for the intangible cultural heritage, where experts impart skills for making fish lanterns, a mayor from Germany carefully inserted the final bamboo frame into the lantern's body.

When the lantern was completed, its maker, Alexander Badrow, mayor of Stralsund, was expected to write his name on it. But he did not sign his own name. Instead, he wrote two letters: "HS", the abbreviation for Huangshan.

The fish lantern has become a symbol of a much larger connection: a mayor from a European city had linked his hometown with Huangshan through China's traditional cultural artifacts.

Behind those two letters was a decade-old friendship. In 2015, Stralsund and Huangshan established a sister-city relationship.

Huangshan is a mountain city; Stralsund is a coastal city, while both rose through trade and cross-regional exchanges.

Stralsund was a major Baltic trading hub in the Middle Ages, while Huizhou — a historical region that roughly corresponds to Huangshan today — stood as a commercial center of the Ming (1368-1644) and Qing (1644-1911) dynasties in ancient China, with its merchants playing a prominent role in commerce for more than three centuries.

Their commercial past has left both cities with remarkable cultural heritages. Huangshan Mountain was inscribed on the UNESCO World Heritage List in 1990, while Xidi and Hongcun, two ancient villages at the foot of Huangshan Mountain, were added in 2000 as cultural heritage sites. Stralsund's historic old town, with its brick Gothic architecture, joined the World Heritage list in 2002 as part of the "Historic Centers of Stralsund and Wismar".

For Badrow, who first visited Huangshan in 2015 and returned for his fourth visit in May, the two old cities are not merely preserved historical sites — they are living communities, where past and present coexist in everyday life.

"Brick Gothic architecture (in Germany) and traditional Chinese architecture may be very different, but both are magnificent testaments to the craftsmanship of earlier generations and to the care taken in their restoration today," Badrow said.

"I was particularly struck by the detailed restoration and preservation of the wonderful buildings in Huangshan — something we have also attempted in Stralsund. I was also deeply impressed by the fact that these are not museums; people actually live and sell goods there."

His impression is echoed by the people who make these old buildings their home. For the residents, heritage is not a relic behind glass.

Li Shengtao, who runs a homestay out of his ancestral house in Xidi, said: "Our houses, which are hundreds of years old, are alive here."

He said that every hall displays inscribed plaques and couplets, through which ancestors passed down their life wisdom.

Job creation

Wu Yuming, director of Xidi Intangible Cultural Heritage Experience Center, spent over two decades as a tour guide before taking on her current role.

After the villages were inscribed on the UNESCO list, residents developed a community agreement governing the renovation and maintenance of historic homes.

"If you need to repair any part of it, you must submit a proposal and apply for approval. Any interior decoration or beautification must be done without compromising the main structure," Wu said.

Alexander Badrow, mayor of Stralsund, Germany, takes a photo of a fish lantern in Huangshan in May. PROVIDED TO CHINA DAILY

She said the revival of these ancient villages has created abundant local jobs — many villagers now run guesthouses, homestays, private kitchens or coffee shops right on their doorsteps.

"As we protect the old houses, it brings tangible economic benefits to villagers," she said. "We don't have to go out — we can earn a living right here. That gives us even more motivation to protect our ancestral homes."

He Yi, mayor of Huangshan, frames this approach in broader terms. "We cannot sidestep the new demands and challenges that modern life brings," he said.

"Instead, we must enable our historical buildings to actively embrace contemporary living. We want the original owners, the local villagers, to become the guardians, operators, and beneficiaries of these ancient structures.

"Only when those who protect the heritage truly benefit from it can preservation be sustained over the long run," He said.

"It is not easy to keep an old city vibrant while preserving its historical character," said Frank-Bertolt Raith, head of the Office for Planning and Construction of Stralsund, who visited Huangshan with Badrow in May. "I think Huangshan has done an excellent job."

He said the underlying philosophy — honoring the historical fabric while embedding modern urban functions — mirrors the approach taken in Germany.

For Olaf Fromme, chairman of the association "Save the Old Town of Stralsund", preservation is ultimately a dialogue between past and future. "The preservation needs a sensible, healthy balance between the past and the future. It makes little sense to reproduce a historic house unchanged if people cannot live in it properly."

Olaf said cooperation with Huangshan could help through an exchange of experience. Both cities have followed different paths, and each can learn from the methods the other has developed to protect historic buildings and keep its old town attractive and alive.

For Fromme's organization, that principle is translated into practical, sometimes small-scale action.

Heiko Werner, its treasurer, said the association encourages owners to retain and restore their properties, sometimes by supporting repairs to a door, a window or a small fresco.

For Dagmar Fromme, Olaf's wife and a local tour guide in Stralsund, such preservation is deeply personal. The historic center is not simply a collection of protected buildings, but the setting of memories that have shaped her own life.

"The Alter Markt (a historic square in Stralsund) is deeply personal to me. My grandmother lived nearby, and my husband and I met here more than 40 years ago.

"The square and surrounding buildings were once badly deteriorated, but over the past 30 years they have been restored with enormous effort. Today people can sit here, watch the world go by and enjoy the old town's special atmosphere," she said.

Citizen participation

Fang Qian, deputy director of the Huangshan Municipal People's Government's Office of Foreign Affairs, said Stralsund has done an excellent job in engaging its citizens. The city has a dedicated heritage institution which provides professional guidance for heritage protection decisions.

She highlighted the high level of citizen participation — residents weave their everyday lives into conservation efforts, achieving a seamless blend of preservation and development.

"This is something we can learn from," she said.

This kind of cross-border exchange is not new.

Decades before Stralsund and Huangshan became sister cities, a Huizhou-style garden had already taken root in Frankfurt, Germany.

Its chief designer was Cheng Jiyue, an expert in traditional Huizhou architecture from Huangshan.

In 1988, Cheng led the garden's design, refining every detail with his team. The design drew on the ancient villages of Huangshan, but had to be adapted to Frankfurt's soil, climate and locally available materials. As Cheng put it, the project was about "planting the soul of Huizhou in German soil".

Cheng remembered working alongside German stonemasons and carpenters, exchanging techniques and solving problems together. He said the garden has endured because its care has always been a shared responsibility.

Throughout decades, artisans from Huangshan brought the seeds of Huizhou culture to Germany. Those seeds have taken root and, with care from both sides, blossomed into new avenues of collaboration.

In May, the Huangshan Municipal Bureau of Culture and Tourism signed a memorandum of cooperation with the cultural heritage department of Stralsund during the Global Mayors Dialogue.

Looking ahead, the bureau said Huangshan plans to establish a cultural tourism promotion center in Germany.

It also intends to partner with Huangshan Vocational and Technical College to launch a training program for tour guides specializing in European languages.

Fang said that building on shared cultural heritage, the two sister cities aim to deepen collaboration in tourism, cultural exchanges, and economic and trade ties.

"Whether it is Huangshan or Stralsund, these are shared treasures of all humanity — we have a common duty to protect them, safeguard them, and pass them on," Fang said.

Xia Ji in Huangshan, Anhui, contributed to this story.

Mayors see a shared future harnessing technology to preserve heritage sites

By **HOU CHENCHEN** in Beijing, **XIA JI** in Huangshan, Anhui, and **ZHANG ZHOUXIANG** in Stralsund, Germany

The cities of Huangshan and Stralsund differ in size, geography and architectural style. Yet both face the same challenge: how to balance preservation and development as World Heritage Site cities.

At the 2026 Global Mayors Dialogue in Huangshan in May, the mayors of the two cities found common ground: technology can empower culture and urban development, bridging tradition and the future.

Their vision extended from nature and culture to daily life and urban governance.

Alexander Badrow, mayor of Stralsund, outlined three priorities: protecting the environment, safeguarding world heritage and diverse urban cultures, and integrating innovative technologies into urban construction to improve livelihoods.

"If we achieve these three goals," he said, "our cities will embrace sustainable and sound development."

During the visit, Badrow climbed Huangshan Mountain equipped with an exoskeleton. After fastening it to his legs, he stood up and took several steps, joking: "Now, I'm Iron Man."

For Badrow, the exoskeleton embodies a key idea: technology should help people interact better with nature. It allows climbing without creating more work — technology enabling, rather than disrupting.

He Yi, mayor of Huangshan, extended this thinking from nature to culture.

He said technology has the potential to preserve culture while revitalizing livelihoods.

"Culture is a slow variable that accumulates over time, while technology is a fast variable that drives rapid change. We have witnessed countless cases where technology activates, catalyzes and reinvents traditional culture, thereby promoting urban progress and social development."

He highlighted that frames for traditional fish lanterns are 3D-printed but continue to be painted and decorated by hand — preserving authenticity while enabling mass production.

Technology like this has boosted rural incomes. Since last November, villagers had gained an average of 5,000 yuan ($740) in just four months. With annual per capita income of about 25,000 yuan, this points to a potential 10,000 yuan yearly increase — a significant leap.

Badrow sees parallels. The old town of Stralsund, which dates back to the 13th century, is strained by the influx of visitors. He believes technology offers a way forward.

"We receive millions of tourists every year, and the surge of vehicles brings huge pressure on urban parking resources. We believe autonomous driving will be an effective solution to this dilemma in the future.

"We have experienced self-driving vehicles in trial operation for two days here in Huangshan. This innovative technology will completely reshape urban traffic patterns and solve the long-standing parking and travel problems in historic old towns."

At the conclusion of the dialogue, the mayors from around the world who attended the dialogue jointly endorsed the Huangshan Initiative: first, adhering to heritage protection to build a foundation for civilization; second, deepening cultural exchanges to promote symbiosis; third, strengthening technological empowerment to advance urban governance; and fourth, improving cooperation mechanisms to share responsibilities.

Looking ahead, Badrow said Huangshan and Stralsund will keep learning from each other about heritage preservation and urban governance.

"I am grateful for the friendship between our municipalities in China and Germany, and I am grateful that Stralsund is part of this."

Zhu Lixin in Huangshan, Anhui, contributed to this story.

Takaichi's words stir concerns

Japanese PM's shifting rhetoric on war history sparks fears of a militarist turn

By HOU JUNJIE in Tokyo
houjunjie@chinadaily.com.cn

The recent shifts in Japanese Prime Minister Sanae Takaichi's wording on sensitive issues, including Japan's history of aggression and nuclear policy, have sparked domestic controversy.

Experts said the changes, coupled with moves by the ruling party over the Yasukuni war shrine and military expansion, reflect an increasingly overt militarist tendency in the Takaichi government.

They urged Tokyo to confront its history of aggression and improve ties with neighboring countries through diplomacy rather than military buildup.

On Saturday, the anniversary of Japan's unconditional surrender in World War II, Takaichi made a monetary offering to the infamous Yasukuni Shrine, which honors 14 convicted Class-A war criminals. Several senior officials and political figures also visited the shrine.

Atsushi Koketsu, professor emeritus at Yamaguchi University, said Japanese politicians had once exercised relative restraint in visiting the war shrine, but such visits have become increasingly frequent since Takaichi took office last year, reflecting Japan's growing tendency toward militarism.

Koketsu called Yasukuni an "aggression shrine", saying politicians' renewed visits not only reopen painful historical memories for countries that suffered Japanese aggression, but also risk putting Japan back on the path toward aggression.

In her speech at the annual memorial in Tokyo marking Japan's surrender at the end of World War II, Takaichi omitted references to "remorse" and a "pledge never to wage war". Her predecessor, Shigeru Ishiba, had revived the phrases a year earlier, marking the first such references in 13 years to Japan's responsibility as a war aggressor.

For many Japanese people, such a shift is deeply troubling, Koketsu said. The anniversary should be an occasion for Japan to reflect on its history of aggression and apologize to its Asian neighbors, including China, he said. Instead, Takaichi ignored such public sentiment and focused on her own position, he said.

Japanese media also noted Takaichi's choice of wording. She altered a phrase long used by previous prime ministers, changing "(Japan) must never repeat the horrors of war" to "the horrors of war must never be repeated".

Koji Nakakita, a professor of Japanese political history at Chuo University, told The Asahi Shimbun that "must never repeat" emphasizes Japan's resolve not to wage war again, while "must never be repeated" could suggest that wars were started by other countries.

The wording could even imply that World War II was not a "war of aggression" launched by Japan, but a "war of self-defense" that it was forced to fight, he said.

Hiroshi Shiratori, a professor at Hosei University, told China Daily that such negative wording on the issue of war could be seen as provocative by countries that suffered from Japan's wartime aggression.

Nuclear policy

The controversy over Takaichi's wording extends beyond wartime history.

Earlier this month, at the atomic bombing memorial ceremonies in Hiroshima and Nagasaki, Takaichi said Japan "is upholding the Three Non-Nuclear Principles", but stopped short of explicitly pledging to continue doing so, a subtle change that has raised questions in Japan.

Tatsuo Sekiguchi, head of a civic group in Nagasaki, said the absence of a clear commitment to uphold the principles in the future suggests the Takaichi government may be considering a review of the long-standing policy.

As a Nagasaki resident, Sekiguchi said he strongly opposes such a move, citing the enormous loss of life and prolonged suffering caused by the atomic bombing. Any remarks that could undermine the principles are unacceptable, he said.

Shiratori said the ambiguity over whether Japan will continue to uphold the principles, coupled with rising defense spending, reflects the country's growing "Japan first" tendency.

A supplementary budget for fiscal 2025 allowed Japan to reach its target of raising defense spending to 2 percent of GDP two years ahead of schedule, and the increase has continued unabated.

With the initial defense budget for fiscal 2026 reaching a record high, Japan's defense budget request for fiscal 2027 is reportedly set to rise further.

Shiratori said rising defense spending, along with a lack of consideration for neighboring countries, could further fuel concerns about Japan's remilitarization.

Rather than reinforcing a "Japan first" approach through military expansion, Japan should strengthen diplomacy and deepen cooperation and friendly ties with other Asian countries, he said.

Tougher social media restrictions test digital protection

Xin Xin
Reporter's log

FIRST PERSON VIEW

About two years ago, when I first saw a short video on my phone about Australia's plan to ban children from using social media, my first thought was: Can a ban really protect children in the digital age?

For many families, social media is no longer separate from childhood. It is embedded in phones, games, chat groups and other forms of online communication. Even adults can struggle to know when to stop scrolling, what information to trust or how much personal information they have shared online. For children, the challenges can be even greater.

That is why Australia's social media minimum age law has drawn broad attention since it came into effect on Dec 10.

More than half a year after its implementation, the law is being strengthened further. In June, the Australian government said it was "doubling down on platforms that are not doing enough to keep under-16s off social media", doubling the maximum penalty for breaches to A$99 million ($70 million).

The new legislation will also strengthen the information-gathering powers of the eSafety Commissioner, making it easier for the independent regulator to request information and documents from social media companies to ensure compliance.

Since the law took effect, eSafety has considered services including Facebook, TikTok and YouTube as age-restricted platforms. They need to take reasonable steps to prevent Australians under 16 from having accounts.

In other words, the responsibility lies with the platforms, not children or their parents.

The Australian government said more than 5 million accounts belonging to under-16s have been removed, deactivated or restricted since the ban began.

Described by Australia as "world-leading", the law quickly drew international attention. The United Kingdom has announced plans to ban social media platforms from providing services to children under 16, with the measure expected to take effect next year. New Zealand, Norway and Turkiye are also considering similar restrictions.

Australian Prime Minister Anthony Albanese said when announcing the stronger enforcement measures that he was heartened by the shift in public discussion and the global momentum since the country introduced the minimum age law. However, he said it was clear that big technology companies were not doing enough to comply, with too many children still accessing social media.

The changes reflected how seriously the government viewed any failure by social media companies to comply with the "world-leading" law, he said.

Doubling the fines can certainly put pressure on platforms. Tech giants have long profited from users' time, clicks, comments and traffic, giving them a greater responsibility to protect minors on their platforms.

However, as the debate around this law has spread from Australia to other countries, I feel the most important point is not the size of the fine, but the signal it sends: As children enter the digital world at increasingly young ages, their protection needs to be taken more seriously.

The law is not meant to punish children or blame parents. Rather, it serves as protective line before children enter the complex online world.

Still, the law can only do part of the job. The people who spend the most time with children every day are parents.

Closing an account or limiting an app does not make online risks disappear. Children can still connect with the outside world through games, chat groups, video platforms and other online spaces.

The ban is also a reminder for parents to pay closer attention to what their children see online, whom they talk to, and whether they know how to protect themselves.

The hardest and most important part is explaining to children why this is being done. If parents simply say, "You are not allowed to use it," children may see it only as control. But if they understand how certain content, interactions with strangers, online comments and algorithmic recommendations can affect their emotions, privacy and safety, they are more likely to accept the rules.

Today, digital life is already part of everyday life. Protecting children cannot simply mean pulling them away from screens. Parents also need to keep pace with the times and help children build stronger digital skills, enabling them to assess information, identify risks, protect their privacy and use technology responsibly.

In this sense, Australia's ban may also offer an important lesson for children before they truly step into the digital world.

Germany demands Apple revise app consent prompts

By JONATHAN POWELL in London
jonathan@mail.chinadailyuk.com

United States tech giant Apple is set to revise the policies that govern third-party developers' use of personal data for ad targeting on iPhones and iPads, Germany's competition watchdog said on Monday, concluding a multiyear probe.

Germany's Federal Cartel Office determined that Apple's App Tracking Transparency framework, or ATT, gave its own applications an unfair competitive advantage by using more favorable, less discouraging language and design than those required for third-party developers.

The FCO said these more favorable consent prompts potentially breached competition law.

Apple has four months from the date of the decision to roll out the changes, which will remain in effect for seven years under the oversight of an independent trustee, Reuters reported.

"Apple is allowed to provide for a level of protection for its users that exceeds the minimum legal requirements," Andreas Mundt, president of the FCO, said in a statement.

"However, if Apple sets up additional rules within its ecosystem for the use of data, these rules must, under Germany's special abuse provision for large digital companies, not treat its own offerings better than those of its competitors.

"This is precisely where our competition concerns arose," he said. "Apple will now align the consent requests much more closely and give third-party app providers more freedom to combine the necessary requests in a sensible way."

Under the commitments, third-party apps' consent pop-ups must be redesigned to remove discouraging wording and symbols and be presented in a visually and linguistically neutral form. The changes will apply in almost all European Union countries.

"While we believe the current ATT prompt provides a clear, easy-to-understand and effective way to keep users in control of their data — an opinion shared by the German data protection authorities — we have agreed to make changes to the text and formatting of the prompt at the FCO's request," Apple said in a statement.

"These commitments ensure we can continue to provide this important privacy tool in Europe, and keep users, not ad tech companies and data brokers, in control of their data," it said.

Initial fix rejected

Apple had previously proposed a fix that mostly amounted to tweaking the wording of the first-run warning prompts shown in third-party apps. Regulators rejected that proposal, but now the German authority said it has secured binding commitments from Apple and closed the case.

Third-party app developers, such as Facebook parent Meta Platforms, seek precise user data to display targeted ads, which typically yield higher returns than broad, untargeted campaigns.

Regulators in France and Italy have already penalized Apple for its ATT framework, issuing fines of 150 million and 98.6 million euros ($174 million and $114 million), respectively.

Gaza stalemate continues as Israel, Hamas hold firm

JERUSALEM — US President Donald Trump's envoy Jared Kushner left Jerusalem on Monday without a breakthrough after two days of talks with Israeli and Hamas leaders over a stalled plan to end the conflict in Gaza, with both sides standing firm on key demands.

Kushner met with Israeli Prime Minister Benjamin Netanyahu a day after his meeting with the political leader of Hamas in a bid to revive the United States-backed plan. Israel has carried out airstrikes and seized more territory in Gaza despite an October ceasefire, while Hamas has insisted "there must first be Israeli approval of the road map".

Kushner described his nearly four-hour meeting with Netanyahu as "good". He added that Hamas representatives said "all the right things".

"We could be seeing progress in as little as 30 days, hopefully on starting to take some of the weapons out and hopefully filling in some of the tunnels as well in the next 60 to 90 days," Kushner told Fox News.

He also said that the United States is "not going to restrict Israel's right to defend itself if there are any imminent threats" in Gaza.

Last month, Trump announced that Hamas had agreed to lay down its arms in phases, under a 15-point road map put forward by the US-led "Board of Peace" to advance his plan, as Israel's military withdraws from Gaza. Hamas said it agreed to the road map but implementation depends on Israel first meeting its own commitments, including halting attacks and withdrawing.

On Tuesday, Hamas reiterated that it remained committed to the Gaza peace deal.

"Hamas is committed to this agreed-upon process," the group's spokesman Hazem Qassem told Agence France-Presse.

"It is clear that, so far, the Israeli side has not given the mediators clear approval of the road map," he said.

"There are timelines and procedural steps that need to be worked out in detail, but there must first be Israeli approval of the road map," he added.

Netanyahu, whose ruling coalition is trailing in opinion polls ahead of an October national election, rejected the deal earlier this month, insisting that Israel would not pull back until Hamas is completely disarmed.

An official with the "Board of Peace" said Israel would be able to "act accordingly" if Hamas "resorts to terror, violence or attempts to rearm". However, the official said Netanyahu was told that Hamas has committed to fully disarm and "cease immediately all military activity, including rearmament and tunnel digging".

Israeli operations have killed at least 1,265 Palestinians since a ceasefire came into effect on Oct 10, according to Gaza's Health Ministry, whose figures are considered reliable by the United Nations.

The Israeli army has reported five deaths in its ranks from Gaza operations over the same period.

COMMENT

Editorials

Pentagon's scrutiny of normal research collaborations reeks of McCarthyism

Academic and research exchanges have been a vibrant and resilient bond in relations between China and the United States. For decades, universities and research institutions from both countries have collaborated closely in science and technology, yielding breakthroughs that benefited not only the two nations but the entire world.

Despite this, the US government has intensified its crackdown on Chinese scientists and researchers in recent years, baselessly alleging that they "threaten national security" by accessing sensitive research and advanced technology.

The so-called "China Initiative", launched by the US Department of Justice in 2018, sought to identify "Chinese spies" in US universities, leading to racial profiling. Though the program was terminated four years later because it was found to be harming the US' technological competitiveness, the US House Select Committee on China last year directed six universities to provide data on Chinese students, claiming that the admission of a large number of Chinese students into science, technology, engineering and mathematics programs might be "at the expense of qualified Americans".

Such discriminatory policies have prompted many US universities to "wind down" partnerships with Chinese universities and restrict the admission of students from China.

The US crackdown on academic exchanges with China is a critical front in its broader strategy to contain China. By severing research ties, Washington aims to stifle China's progress in high-tech fields such as artificial intelligence, semiconductors and biotechnology, where collaborative research has long driven innovation. This strategy is complemented by restricting supply chains and trade, creating an isolated ecosystem intended to limit Chinese access to Western knowledge and markets.

In the latest move, the Pentagon has asked 30 US universities to audit their foreign research partnerships, specifically targeting collaborations with Chinese institutions and entities linked to Confucius Institutes. These universities risk losing future federal research funding if they fail to comply.

In the past few years, the US government has already labeled Confucius Institutes in the country as "foreign missions", and implemented administrative and legislative measures that have effectively forced nearly all of them to close down. This latest round of scrutiny, once again justified as safeguarding "national security", raises concerns about its true purpose.

Instead of enhancing research security or promoting institutional accountability, this initiative is simply intellectual McCarthyism. By casting a wide net of suspicion over academic exchange programs, the Pentagon directive risks stifling the open exchange of ideas and undermining academic freedom. Washington should reflect on whether such measures truly serve the US' national interests, or merely fuel the atmosphere of fear and mistrust surrounding China.

The Pentagon claims it aims to protect research investments from "foreign exploitation", yet it has given the schools only two weeks to submit their findings and mitigation plans. The tight deadline makes the proposed scrutiny either perfunctory or impossible, raising doubts about the feasibility of meaningful results. As a consequence, the schools may feel compelled to end partnerships, disrupting ongoing projects and adversely affecting faculty and students involved in related research.

Moreover, the lack of transparency in selecting universities raises questions about the criteria and processes used to identify "entities of concern". Without clear guidelines, institutions may struggle to navigate this uncertain situation, potentially hindering their ability to engage in meaningful international collaborations and ultimately impacting their competitiveness in global research.

The Pentagon's coercive tactics of pressuring universities into self-audits and scaling back collaboration risk pushing the academic sector into geopolitical rivalry, ultimately harming academic freedom and exchanges in the US.

Scientific research transcends borders, and innovation thrives on cross-border exchanges and sharing of resources. Instead of imposing restrictive measures, the US government should respect the spirit of science, allowing academic institutions to address shared technological challenges and meet development needs to serve the interests of people in both countries and beyond.

Macao's high-quality development course set

Macao's development achievements and social stability since its return to the motherland in 1999 testify to the vitality of the "one country, two systems" framework. The special administrative region's Third Five-Year Plan for Economic and Social Development (2026-30), released on Tuesday, marks a new starting point for Macao to seize opportunities, address challenges and pursue high-quality development by turning its institutional advantages into development momentum and development gains into public well-being.

A notable feature of the plan is its emphasis on docking with national development. As Macao SAR Chief Executive Sam Hou-fai stressed, the plan is aligned with the national five-year plan for this period while taking into account Macao's own realities. By strengthening integration with the Guangdong-Hong Kong-Macao Greater Bay Area, deepening Macao-Hengqin cooperation and better leveraging Macao's international connections, the SAR can translate the advantages of national development into new opportunities for itself, while contributing its own strengths to the country's overall development.

The plan's formulation also shows that the SAR's development course is rooted in the aspirations of Macao residents. During the 40-day public consultation, 1,716 submissions containing 8,230 opinions were collected. The largest number of opinions concerned strengthening and optimizing people's livelihoods, followed by appropriate economic diversification and high-quality development of the Guangdong-Macao In-Depth Cooperation Zone in Hengqin. The plan received positive feedback of 92.1 percent.

These figures demonstrate that the plan reflects extensive participation and broad consensus. The Macao SAR government has incorporated feasible suggestions that gained broad consensus into the final plan, while pledging to use other opinions as references for future policymaking. Measures on urban renewal, healthcare, social security and improvements to older districts directly respond to public concerns.

At the same time, the plan identifies appropriate economic diversification as essential for Macao's long-term prosperity and stability. With a target of raising the contribution of non-gaming sectors to around 60 percent of GDP by 2030, Macao is seeking to build a more balanced and resilient economic structure.

The "1+4" strategy, backed by major infrastructure projects and a government guidance fund, will promote industries, including high-tech, biomedicine and "big health", specialized finance, MICE (meetings, incentives, conferences and exhibitions), culture and sports, while consolidating integrated tourism and leisure. Preliminary estimates put total budgeted investment in major economic diversification projects during the plan period at about 130 billion patacas ($16.1 billion). Such substantial investment will help cultivate new growth engines and create opportunities for enterprises, talent and young people.

Hengqin is key to this transformation. Through deeper integration in rules, infrastructure, education, technology, finance and industries, "Macao + Hengqin" can combine Macao's international resources with Hengqin's development space and the vast mainland market. The two sides can jointly advance projects in education, technology, tourism, traditional Chinese medicine and finance, creating greater synergies and providing stronger foundations for Macao's economic diversification.

Macao's unique role extends beyond its economic functions. As an international city, Macao serves as a connector between China and Portuguese-speaking countries. Its distinctive cultural and international advantages give it an important role in the country's high-standard opening-up. By facilitating trade, investment and people-to-people exchanges, Macao can contribute more effectively to the country's overall development, while strengthening exchanges between different civilizations.

To those seeking to malign the "one country, two systems" framework, Macao's high-quality development and long-term stability offer an effective rebuttal. The SAR's new five-year blueprint, grounded in public aspirations, aligned with national development and focused on sustainable growth, points precisely in that direction. By implementing this plan, Macao can better achieve sustainable prosperity and lasting stability, further demonstrating the enduring vitality of the "one country, two systems" framework.

Green code crucial framework for cleaner skies, clearer waters

When China's Ecological and Environmental Code came into force on Saturday, it heralded a new stage in China's environmental rule of law, as previously fragmented rules have been brought together to form a more coherent and enforceable legal framework.

With 1,242 articles in five chapters, the code brings together more than 30 existing laws, over 100 administrative regulations and more than 1,000 local laws and regulations. Its real significance lies in the logic behind it: environmental governance can no longer be treated as a collection of separate tasks. Pollution control, ecological protection, resource conservation, carbon reduction and the green transition are to be governed as one integrated system.

China's environmental legislation has developed for more than four decades, from early learning at the 1972 United Nations Conference on the Human Environment in Stockholm, which was the first world conference to make the environment a major issue, to the adoption of the Environmental Protection Law of the People's Republic of China in 1989 and the goal of realizing an ecological civilization as a national strategy after 2012.

Over time, China has moved from borrowing international experience to building its own environmental governance model, with the Ecological and Environmental Code being the latest expression of that evolution.

What makes China's exploration distinctive is that it starts from China's own realities. China is a country with a huge population, relatively limited per capita resources and highly uneven ecological conditions. Its northern regions face water stress, its western regions include fragile ecosystems and its eastern coastal areas bear intense development pressure.

A development model that consumed resources first and repaired damage later is no longer sustainable. China has therefore had to answer a basic question: how can a large developing country pursue modernization without the environmental costs of the industrial age?

The answer, embedded in the code, is clear: environmental protection and development must reinforce one another. By dedicating an independent chapter to green and low-carbon development, the code makes a powerful institutional statement: climate response and the green transition are legal commitments.

In a world where many environmental laws still focus narrowly on pollution control, China has placed carbon peaking, carbon neutrality, the circular economy and the clean energy transition under the same legal roof as ecological protection. It moves beyond the old pattern of "one department handles pollution, another handles ecology, and yet another handles development". Instead, it aims to establish a holistic governance structure, one that supports coordinated progress in reducing pollution, cutting carbon emissions, expanding green development and growing the economy. This is a notable innovation, and is consistent with China's other innovations in recent years, including ecological red line protection, ecological compensation, environmental damage compensation, public interest litigation and the carbon emissions trading market.

The code also has a broader global significance. Climate change, biodiversity loss and pollution do not respect administrative boundaries, national borders or institutional silos. By integrating pollution prevention, ecological protection and green, low-carbon development into one code, China is offering a legislative reference to other countries, especially developing countries.

This global relevance is reinforced by the code's explicit provisions on international cooperation. That means China is not only building a domestic legal framework; it is also translating global environmental commitments into domestic law.

China's green modernization is already generating experience that can be shared beyond its borders. Water-saving terraced farming introduced from China has been replicated in Egypt's Sinai Peninsula. Chinese photovoltaic technology is helping support solar power development in countries such as Saudi Arabia.

But the code's enduring significance will depend on implementation. The law should become an evolving legal framework for cleaner skies, clearer waters, healthier ecosystems and a more sustainable development model.

— HOU LIQIANG, CHINA DAILY

What They Say

Plan aims to nurture zero-emission factories

Editor's note: *The Ministry of Industry and Information Technology has launched an initiative to develop national-level zero-carbon factories. Several experts, including He Kebin, dean of the Institute for Carbon Neutrality at Tsinghua University, and Chen Daji, deputy head of the China Electronics Standardization Institute, explained what zero-carbon factories are and the importance of the move. Below are excerpts of their comments as reported by Xinhua News Agency. The views don't necessarily represent those of China Daily.*

A zero-carbon factory does not imply it emits absolutely no carbon dioxide. Instead, the term signifies efforts by the factory to implement systematic emissions reduction measures. These include technological innovation, structural adjustments and management optimization to fully tap into its emissions reduction potential. The goal is to minimize emissions as much as possible under current technical and economic conditions and to continuously improve operations so that the factory's carbon dioxide emissions are at the lowest possible level.

Under the initiative, there are three core indicators for a national-level zero-carbon factory: carbon emissions per unit of energy consumption, the proportion of nonfossil energy consumption, and the percentage of nonfossil power in the electricity used by the factory. These indicators provide measurable and verifiable criteria for defining a "national-level zero-carbon factory".

Carbon emissions per unit of energy consumption measure the amount of carbon dioxide emitted for each tonne of standard coal consumed. While different industries may adopt different development paths, the objective should be to steadily reduce emissions and move toward near-zero emissions.

The indicator of the share of nonfossil energy consumption will encourage enterprises to accelerate the green and low-carbon transition of their energy mix. The share of electricity consumption coming from nonfossil energy will encourage enterprises to increase the use of such electricity and enhance the supply, local utilization and physical traceability of nonfossil energy-based electricity.

One sector that has witnessed rapid growth in energy consumption in China is computing power infrastructure. In 2025, electricity consumed by such infrastructure accounted for approximately 1.6 percent of the total consumption in China.

Going forward, computing power infrastructure operators should strengthen collaboration among different sectors, including equipment procurement, project construction, energy supply, operation and maintenance, and the use of computing power to ensure the selection of low-carbon equipment, better utilization of green electricity and eco-friendly management of infrastructure.

Intelligent carbon control is crucial for establishing zero-carbon factories. Companies in the automobile industry should seize the opportunity of the country's zero-carbon factory initiative and enhance their digital capacity for energy and carbon management. They need to develop a data collection network which covers the whole factory to enable automatic aggregation and real-time transmission of energy consumption and carbon emissions data.

As the initiative progresses, China is expected to foster a number of national-level zero-carbon factories. These factories will play an important role in exploring practical ways for the green and low-carbon transition of the country's industrial sector, providing strong support to the country's green growth.

VIEWS

Huang Rihan

Robots need open doors, not visas

Beijing's Yizhuang will become a global shop window for robots this August. At the 2026 World Robot Conference, a dedicated procurement day will bring buyers from Southeast Asia, the Middle East and Latin America looking for machines that can solve real-life problems. A Thai farmer may want a robot that can spray crops. A Saudi engineering contractor could size up robotic dogs for project inspections. A Latin American plantation owner may ask the price of a harvesting robot. The questions will be refreshingly practical: How can this machine make the job easier?

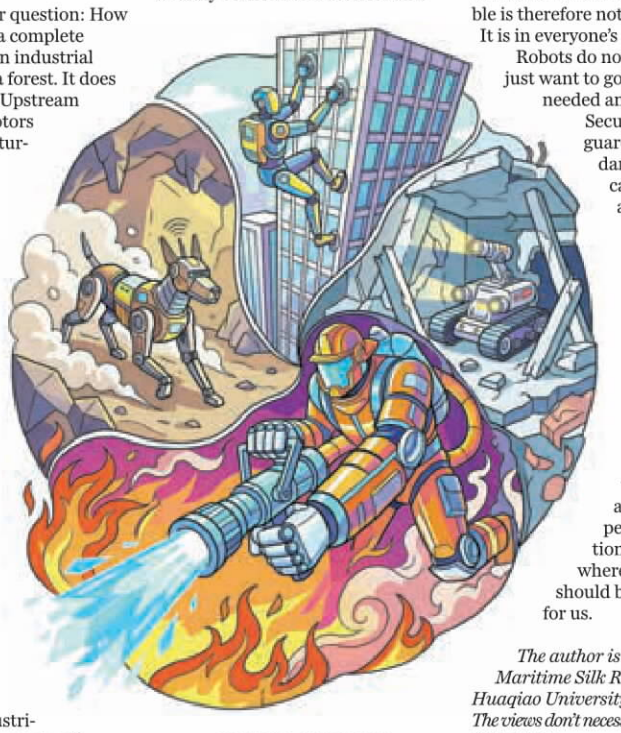
The United States, however, is asking a very different question. The US Federal Communications Commission has updated its "Covered List" of communications equipment and services that can threaten the "national security" of the country to include new Chinese-made humanoid and quadruped robots. While buyers are asking what robots can do, policymakers in Washington want to know where they come from.

Caution about new technology is understandable. When the power loom first appeared, textile workers feared the iron machine would devour their livelihoods and stormed factories to smash it. When cameras arrived, some people avoided the lens, worried that a flash might somehow steal their souls. Nearly every invention that changed the world has passed through a period of suspicion. Security concerns are real and deserve to be taken seriously.

But caution is not the same as closing the door. Robots have eyes, legs and internet connections. Smartphones, electric cars, and robot vacuums in millions of homes also use sensors and internet connections.

A better approach to new technology might look more like airport security: Every passenger is screened, but no one is denied boarding simply because of their nationality. Robots can be tested, certified and held to common standards, while their data and cybersecurity can be scrutinized. That is far more effective — and more reassuring — than simply turning them away at the gate.

The need for robots around the world may be greater than many realize. Populations across much of the world are aging, while the supply of young workers is shrinking. Factories in Vietnam struggle to fill vacancies. Construction sites in the Middle East can become dangerously hot in summer. Plantations in Latin America face labor shortages during the harvest season.



Robots are not necessarily here to take jobs. Often, they fill gaps where there are too few people willing — or able — to do the work. A robot sent down a mine can spare a human being from taking a potentially fatal risk. A machine working in a furnace room can take on work that the human body cannot safely endure.

This raises a larger question: How can a country build a complete robotics industry? An industrial supply chain is like a forest. It does not grow overnight. Upstream companies make motors and joints; manufacturers assemble complete machines; downstream users find tasks for them to perform. Along the way, an industry needs engineers, customers and a market large enough to allow companies to make mistakes and learn from them. Building all of this takes decades.

On the other hand, a wall can be built overnight. But no matter how high it is, a wall cannot grow a forest behind it. Forests need sunlight, rain and time. The same is true for industrial ecosystems, which need policy support, open markets and supply chain integration to grow and flourish.

China's experience illustrates the point. Its robotics industry was not built by shutting itself off from the world. It was built through openness. Over the decades, foreign companies have established factories in China, components from around the world have flowed into the country; and intense competition has forced Chinese companies to learn, step by step, how to make — and then improve — everything from robotic joints to intelligent control systems.

Chinese companies now account for more than half the humanoid robot models in the world, while roughly eight out of every 10 quadruped robots sold come from China. The cost of producing robots has fallen so sharply that automation is no longer a privilege reserved for wealthy economies. Factories and farms in developing countries can afford it too.

MA XUEJING / CHINA DAILY

Openness did not destroy China's industrial ecosystem. Instead, it helped nurture one of the world's most complete industrial ecosystems. China is now willing to share that experience — and those robots — with the rest of the world.

Ultimately, robotics is a global creation. Japan may provide precision joints; Europe may supply motors; the US may contribute chips; and China may produce complete machines and offer a vast range of application scenarios. Remove any one of these elements, and the system will not function as smoothly.

When a river is blocked, the water does not just stand there but finds another route. The detour costs more, and eventually someone has to pay for it. Preserving the networks that make cooperation possible is therefore not an act of charity. It is in everyone's interest.

Robots do not need visas. They just want to go where they are needed and get to work. Security can be safeguarded through standards. Competition can be settled by asking who can build a better, cheaper machine that solves a real-world problem. That kind of competition does not produce losers but can benefit the whole world.

So, the next time a robot arrives at the door, perhaps the question should not be where it came from. It should be what it can do for us.

Tussle between open and closed AI reshaping global order

The tussle between open-source and closed-source artificial intelligence models in China and the United States is more than a debate over technological paths. It reflects the broader China-US technological rivalry, influencing the underlying architectures, industrial control and global rule-making. The clash between these two approaches could profoundly reshape the landscape of the intelligent age and global technological competition.

In recent years, Silicon Valley giants such as OpenAI, Anthropic and Google have built towering technological advantages through closed-source business models, backed by massive capital investment and vast computing clusters. At the same time, the open-source camp — which includes Chinese technology companies Alibaba, DeepSeek and Zhipu AI and US players such as Meta — has risen rapidly, thanks to more efficient algorithms and open ecosystems.

Broadly speaking, the closed-source approach favored by leading US AI laboratories aligns with Washington's desire to maintain technological dominance and Silicon Valley's capital-intensive model, which hinges on massive computing power and premium pricing. US closed-source models, represented by OpenAI's latest reasoning model GPT-5.6 Sol, Anthropic's Claude Opus 5 and Google's Gemini 3.5 and 3.6 series, use top-end GPUs and sophisticated data engineering to build formidable computing barriers and seek a commanding position at the technological frontier.

By keeping model capabilities behind cloud-based application programming interfaces, US companies have created highly controlled commercial ecosystems. This model can also become a geopolitical instrument. By restricting access to advanced models in the name of "national security", Washington has developed a broader narrative: frontier AI may pose national security risks and therefore should remain concentrated in the hands of a select group of Western companies.

High API subscription fees and dependence on cloud services raise the financial barriers for small and medium-sized companies seeking access to advanced AI. They also leave countries without domestic computing capacity increasingly dependent on foreign digital infrastructure, creating strategic vulnerabilities.

Faced with US restrictions on advanced chips and computing power, Chinese tech companies are increasingly turning to open source as a strategic breakthrough, pursuing an asymmetric path based on extreme algorithmic efficiency and large-scale industrial deployment.

At the algorithmic level, DeepSeek demonstrates that performance comparable to leading Silicon Valley closed models can be achieved at significantly lower cost, challenging the assumption that breakthroughs necessarily require billions of dollars and ever-larger, energy-intensive computing clusters. At the ecosystem level, Alibaba's Qwen 2.5 and related models are among the world's most widely downloaded open-source models, serving as a popular foundation for developers.

A report by the US-China Economic and Security Review Commission highlights two key areas of Chinese advantage: a "digital loop" and a "physical loop". Open-source models lower the cost of AI deployment, allowing them to move rapidly into manufacturing, logistics, robotics and other sectors of the economy. The data and practical demands generated by these applications, in turn, feed back into model development.

This creates a virtuous cycle of efficient algorithms, open ecosystems and industrial validation. Together, these strengths give China's AI sector considerable resilience and the potential to catch up or even overtake competitors despite the constrained access to advanced computing resources.

The China-US contest between open-source and closed-source models is also accelerating a broader rebalancing of global technology, giving the Global South and other economies, including those in Southeast Asia, the Middle East, Europe and Latin America, an opportunity to enhance technological sovereignty rather than remain caught between major powers.

Reuters reported on Aug 14 that the US was preparing to ask dozens of countries to choose between US- and China-led AI cooperation frameworks, with those joining Beijing's initiative potentially excluded from a US-led AI coalition. The move shows how competition over AI has extended beyond technology into the geopolitical arena.

For European and Middle Eastern countries, sending sensitive industrial or government data to cloud servers controlled by Silicon Valley giants poses unacceptable compliance and security risks. Yet developing a large foundation model from scratch requires enormous financial and computing resources.

In this context, high-performance open-source models such as Qwen, DeepSeek and Llama are emerging as digital infrastructure for countries seeking to build their own localized AI capabilities. By fine-tuning these models in local languages and deploying them on private infrastructure, institutions in countries such as France, Singapore and Saudi Arabia can develop more cost-effective and independently controlled AI systems. Open source is thus transforming AI from a strategic technology concentrated in the hands of a few countries into a global public infrastructure.

The divide between open and closed models is also a contest over competing approaches to AI safety, governance and regulation. The closed-source camp has long argued that keeping advanced models inside a "black box" is the best defense against misuse, including applications involving biological weapons or cyberattacks. This argument has also been used to justify technological restrictions and stricter administrative controls.

But as open-source models become increasingly capable, the idea that security can be achieved primarily through secrecy is facing growing scrutiny from academia and the international community. More standards bodies and regulatory institutions are recognizing that excessive restrictions on access can easily turn into barriers that reinforce geopolitical and commercial monopolies. From this perspective, governance built on transparency, auditability and multi-stakeholder participation offers another path toward trustworthy AI.

Looking ahead, the global AI landscape is unlikely to be defined by complete technological closure or the wholesale replacement of closed-source models with open-source ones. A dual-track competition is more likely.

Closed-source laboratories, particularly in the US, will continue to use their enormous advantages in capital and computing power to pursue high-risk exploration at the uncertain frontier toward artificial general intelligence. Open-source ecosystems, led primarily by China and the wider global developer community, will rely on lower costs, stronger adaptability to real-world applications and millions of developers to become a major engine bringing AI into industries across the economy.

In effect, the competition between open-source and closed-source AI models is breaking down barriers to technological monopoly and accelerating the wider diffusion of AI. As a result, a more multipolar, resilient and competitive global AI order is beginning to take shape.

Navigating the new normal of public opinion society

Recent events, from the playful use of bamboo cicada toys as a metaphor for a tech giant to the posture of a hostess during an interview, epitomize a defining feature of contemporary Chinese society: the frequent emergence of public-opinion incidents. Every few days, a headline-making topic goes viral on social media, capturing widespread attention and triggering a cacophony of divergent views.

This phenomenon can rightly be termed a "public opinion society", though interpretations of individual incidents can vary wildly. For instance, when internet users mashed up the audio of a bamboo cicada toy with clips from a company's product launch to parody its promotional slogan, the creator's meme and the legal response by the company drew mixed reactions.

Similarly, when a hostess crouched to interview foreign creative team members seated on high stools at a film premiere, some praised it as a professional move to avoid blocking the camera, while others decried it as obsequious deference to foreigners.

As such incidents multiply, public opinion has become a complex social issue. While this is a norm of the digital era, the constant barrage of controversies undoubtedly fuels anxiety among officials, corporations, public figures, and even ordinary citizens.

Media outlets recommend overcoming what might be called public-opinion mysophobia — an excessive fear of negative publicity — by building psychological resilience and responding proactively. Influential commentators advocate establishing a mechanism to mitigate the negative fallout of viral incidents.

The digital public sphere is characterized by low barriers, widespread participation and rapid dissemination.

The sheer volume of grassroots voices highlights societal vitality, but it also breeds emotional manipulation, rampant rumors, and one-sided verdicts, leading some to view it as a monstrous threat.

Yet, the collision of diverse perspectives itself is a product of social transition. Compared to the information silos and limited channels of expression in the past, this change represents undeniable progress.

Over decades of reform and opening-up, China has undergone a profound transformation — from isolation to openness, scarcity to abundance and uniformity to diversity.

In terms of public discourse, citizens have moved beyond basic needs to pursue higher aspirations such as fairness, justice and transparency. Various demands regarding livelihoods and governance expectations are now the driving force of public expression.

At a deeper level, the growing awareness of civil rights sustains the vitality of this public opinion society.

The catalyst of this change is the widespread adoption of digital technology. With mobile internet — particularly social media — permeating daily life, everyone has become a broadcaster, capable of voicing opinions at any moment. This has shattered the old paradigm where a select few monopolized the discourse, revealing the pluralistic and often conflicting nature of a society in transition.

At a deeper level, the growing awareness of civil rights sustains the vitality of this public opinion society. Citizens have evolved from passive bystanders of public affairs into active participants in social governance, making the oversight of public power a social norm. More people are now emboldened to express themselves on various issues. The increasing complexity of voices in the internet age is both an objective trend beyond anyone's will and a hallmark of social progress.

To some extent, the frequent eruption of public opinion incidents is fostering a mechanism of societal self-correction. In recent decades, no incident that captured national attention ended merely in emotional venting. Instead, each became a milestone in addressing institutional flaws and social shortcomings. Many far-reaching social reforms were triggered by major public uproars.

One notable example is the death of Sun Zhigang in 2003, which led to the abolition of an outdated system. Sun, a young man from Hubei province, was detained in Guangzhou for not having a temporary residence permit and later died in custody. The case sparked a nationwide outcry, leading to scrutiny of the flaws in the custody and repatriation system. Three months later, the Measures for the Custody and Repatriation of Urban Vagrants and Beggars — in effect for over two decades — was repealed and replaced by a new assistance regulation that better protected the rights of the floating population.

Admittedly, the profusion of public opinion also carries risks that can't be ignored. Algorithms can amplify negative emotions rapidly, and the traffic-first logic of dissemination favors extreme content. Conflict, pathos, and labeling quickly attract eyeballs, inflaming netizens and allowing one-sided views to dominate while occasionally silencing objective voices. Unchecked public opinion can fracture social consensus, interfere with the rule of law, and magnify societal anxiety.

A tragic example is the case of Liu Xuezhou, a young man from Hebei province who eventually committed suicide because of online violence. Sent away at three months old, he found his biological parents through DNA matching when he was 17 in 2022.

However, a dispute over housing was exposed on the internet, where some accused him of demanding an apartment from his parents. A deluge of abusive comments led to Liu's breakdown, and he committed suicide. While long-standing psychological trauma was a factor, the online abuse was the final straw for the young man.

In this case, the influencers who fanned the flames were sued and a court found them guilty of fabricating facts and committing defamation. The ruling highlights the importance of tackling the challenges of public opinion.

Building a healthy online ecosystem requires guiding the public to respect facts, and avoid black-and-white thinking. Most importantly, under the supervision of regulators, platforms must shoulder their responsibilities — breaking the chain of misinformation and minimizing the space for extreme narratives.

CHRISTOPH NEDOPIL

Shaping a clean and green future

China's renewable energy five-year plan charts a new chapter for high-quality development at home and abroad

As China enters its 15th Five-Year Plan (2026-30) period, the nation's renewable energy landscape is undergoing a crucial transformation. Rather than simply chasing green energy installation speed, China's renewable energy five-year plan, issued by the National Energy Administration and the National Development and Reform Commission, focuses on quality development, system-wide reliability and decarbonization across both power and non-power sectors. This shift marks an important evolution in China's renewable energy ambitions, offering vital lessons for emerging economies and the wider international community.

A critical milestone underpinning this new plan is that China surpassed its previous 2030 target of 1,200 gigawatts of wind and solar capacity well ahead of schedule by September 2024. Building on this momentum, China aims for over 2,800 GW of wind and solar capacity by 2030. These new targets seem anchored in a realistic assessment of grid integration capabilities, economic shifts and technological readiness.

An important feature of this plan is its focus on energy regeneration and replenishment through dependable, firm renewables rather than expanding generation capacity. In the past, rapid capacity additions often outpaced grid flexibility. The new plan addresses this by prioritizing high-quality development through firming renewables. It mandates that newly built centralized wind and solar stations achieve a dependable capacity of no less than 10 percent, with high-performing projects encouraged to exceed 20 percent by 2030.

To achieve this level of system firmness, the plan stipulates massive expansion of energy storage assets over the next several years. As China balances hydropower development with ecological protection, flood control, water supply, irrigation and navigation, the country's conventional hydropower installed capacity is expected to reach about 410 million kilowatts by 2030.

By 2030, China is targeting 15 million kW of installed solar thermal power capacity, 400,000 kW of marine energy capacity and approximately 160 million kW of pumped storage power capacity, according to the National Energy Administration.

Combined with significant expansion of battery storage, advanced grid-forming inverters and source-side energy storage integration, these measures support the orderly substitution of fossil fuels in the country.

Renewable energy also plays a significant role in heavy industry upgrading, which requires retrofitting in hard-to-abate sectors such as steel and cement, alongside the physical relocation of energy-intensive industries to green-energy-rich regions.

At the community level, microgrids and rural development take center stage. Through initiatives such as the village-level micro-energy network pilots, China is pioneering decentralized off-grid and micro-grid solutions. These localized models offer invaluable lessons and practical blueprints for emerging economies across the Global South and Belt and Road countries seeking reliable, clean energy access in areas without grid connection.

MA XUEJING / CHINA DAILY

Crucially, the country is charting a new chapter in renewable energy deployment at scale, proving that high levels of variable renewable penetration can be managed safely and efficiently in the world's largest energy system. For the international community, the plan offers a clear message: China's energy transition has entered a new phase where innovation, quality, security and systemic integration pave the path to a global energy transformation.

China has already become the global technology leader in green energy, and to enable more innovations in renewable energy, China can strengthen deep research collaboration among Chinese institutions — bridging universities and industry leaders — to drive breakthroughs in next-generation climate prediction, advanced materials and artificial intelligence-empowered grid dispatch.

With China's green energy successes drawing significant global attention, China's leadership demonstrates that domestic success can be paired with open international cooperation. By sharing its high-quality, cost-effective green technologies with other countries, especially some Global South countries, China is helping other nations accelerate their own low-carbon transition. Through both large-scale projects and livelihood-oriented "small yet beautiful" initiatives, China contributes to global green supply chains and standard harmonization.

On a broader global outlook, the accelerated integration of renewable energy opens unprecedented avenues for nations across the world to harness cost-effective green energy to improve industrial competitiveness while relatively lowering energy-related emissions. At the same time, some developed and developing countries increasingly want to benefit from integrating into global green energy value chains. Realizing this potential requires recognizing that trust-based collaboration and knowledge sharing are more important than ever. In this context, it is remarkable to observe China's rapid transition from an absorber to a prominent contributor of technological knowledge, now well-positioned to take the lead in upgrading green industries.

In conclusion, China's renewable energy five-year plan is much more than an energy road map. Rather it highlights China's transformation from a historical energy importer into a dominant global energy power and producer. By harnessing vast domestic resources — particularly through the mega wind and solar bases in the Three-North area and the Gobi regions — China is endeavoring to secure its own energy independence while helping the global energy transition. Crucially, the country is charting a new chapter in renewable energy deployment at scale, proving that high levels of variable renewable penetration can be managed safely and efficiently in the world's largest energy system. For the international community, the plan offers a clear message: China's energy transition has entered a new phase where innovation, quality, security and systemic integration pave the path to a global energy transformation.

WALDEMAR KARPA

Picture of health

China's growing contribution to pharmaceutical innovation heralds a new era for global industry

China's pharmaceutical industry, once primarily known for its role in producing affordable generics, has undergone a profound transformation, emerging as a leading force in global drug innovation. This evolution is not merely an industrial shift but a significant development poised to deliver new medicines to patients worldwide, presenting both opportunities and a call for enhanced international collaboration.

This pivotal moment was vividly illustrated at the 2024 World Conference on Lung Cancer, where Akeso, a biotech company from Zhongshan, Guangdong province, presented groundbreaking data. Its bispecific antibody, ivonescimab, demonstrated superior efficacy against Keytruda (pembrolizumab) in a head-to-head trial for non-small cell lung cancer. Keytruda, a cornerstone of global oncology, represents a multi-billion-dollar market. Akeso's achievement, often described as the industry's "DeepSeek moment", signals China's arrival as a frontrunner in developing novel therapies, challenging established paradigms and inspiring new possibilities for patient care.

This success is not an isolated incident but part of a broader trend. A decade ago, China accounted for less than 8 percent of global clinical trials. In 2020, it had surpassed both the United States and Europe in annual trial volume. In 2024, it initiated close to 5,000 trials. This growth is not just in quantity but in quality, with China's high-novelty trials growing significantly faster than the US benchmark. A Boston Consulting Group report earlier this year further notes that since 2021, China has outpaced the US in new molecular entities entering clinical development, contributing about 44 percent of the global total last year. Its share of potential first-in-class drugs rose from 16 percent in 2020 to 34 percent in 2025, nearing the US' 38 percent.

China's journey from a generics producer to an innovation leader is rooted in strategic policy reforms. The National Reimbursement Drug List reform, initiated around 2016, played a crucial role. By offering guaranteed, near-universal access in exchange for significant price reductions, the State effectively stimulated demand for innovative drugs. This policy led to a substantial increase in the utilization of covered drugs, with oncology volumes growing nearly tenfold, demonstrating that innovation flourishes where there is clear market demand and patient access. This approach has fostered a dynamic ecosystem where laboratories and research thrive.

This demand-driven innovation is supported by an efficient research and development ecosystem. The "decode, iterate, execute" flywheel, as described by the Boston Consulting Group, operates with remarkable cost-effectiveness. Drug discovery and preclinical work in China can be conducted at a fraction of the cost in the West. Contract research organizations, including WuXi AppTec, have built integrated platforms spanning drug discovery, preclinical testing and other stages of drug development, helping pharmaceutical companies reduce costs and accelerate development. This efficiency has allowed China to effectively counter "Eroom's law" — the observation that drug development costs double every nine years — by leveraging vast patient pools, rapid engineering iteration and streamlined regulatory processes. The result is a robust pipeline extending beyond oncology into respiratory, immunology and metabolic diseases, with Chinese companies now confidently designing Phase III trials head-to-head against global blockbusters.

The global pharmaceutical industry has recognized China's ascendance. Insiders such as Pfizer's CEO Albert Bourla have acknowledged China as a significant challenger to US strength in biotechnology. While some regions such as Europe have seen their share of global clinical trials decline, China's share has tripled, particularly in advanced fields such as cell and gene therapy. In 2024, China became the leading source of new active substances, contributing 35 percent globally.

Rather than viewing this as a zero-sum game, the industry is increasingly embracing collaboration. Facing patent expirations and seeking new growth avenues, Western pharmaceutical companies are actively investing in and partnering with Chinese biotechs. Cross-border out-licensing from China reached an estimated total potential value of $135.7 billion in 2025, with a significant surge in early 2026. Major deals, such as Pfizer's investment in 3SBio's bispecific and GSK's commitment to Hengrui, highlight a strategic "re-platforming" onto Chinese science. Beyond licensing, new strategies include "local for local" manufacturing, establishing R&D centers in China, and China-first drug launches, all aimed at fostering deeper integration and mutual benefit.

WANG XIAOYING / CHINA DAILY

While geopolitical complexities, including the BIOSECURE Act and designations affecting companies such as WuXi AppTec, present challenges, the intertwined nature of the global pharmaceutical ecosystem underscores the importance of open scientific exchange and collaboration. Protectionist measures risk hindering global health progress. The optimal path forward involves fostering an environment where competition drives innovation, and partnerships accelerate the delivery of life-saving medicines.

China's innovation strength, characterized by its engineering brilliance and focus on optimizing known targets, continues to grow. While its R&D spending is still a fraction of the US', and its venture capital ecosystem is still maturing, the impact of its contributions is undeniable. The notion that smaller economies should merely be "free riders" importing innovations no longer holds true. China has not only become a significant innovator but is actively shaping the future of global health.

This new reality is a call on the traditional leaders of the industry to adapt and engage with a rapidly evolving landscape. Embracing this shift through competition, partnership and domestic reform, rather than restrictive policies, is the most effective approach. For patients everywhere, it would mean access to better medicines, developed faster and more affordably. Denial of this transformation would be a disservice to global health and scientific progress.

County-level consumption prioritized

Measures set to unlock potential of smaller-scale urban markets

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China has unveiled a package of measures to unlock the potential of lower-tier, smaller-scale urban markets, with a particular focus on county-level spending, as counties emerge as an increasingly important driver of consumption growth, officials and experts said.

The latest push is expected to tap a deeper reservoir of domestic demand and lend fresh impetus to the building of a strong domestic market, thereby reinforcing China's longer-term transition toward consumption-led growth, they added.

"County and township markets now hold the key to further consumption growth," Yuan Xiaoming, assistant minister of commerce, said at a news conference in Beijing on Tuesday, noting that county-level areas account for about 40 percent of China's economic output.

Their comments came after the Ministry of Commerce and eight other government departments released the guideline earlier that day, setting out 18 measures covering upgrades to retail infrastructure, business format innovation, the supply of goods and services, distribution networks and financial support.

Under the guideline, efforts will focus on improving the retail environment in county-level areas by upgrading existing commercial facilities and retail networks, strengthening support services and making better use of idle assets, the ministry said.

Dai Mingfeng, a researcher at the Chinese Academy of International Trade and Economic Cooperation, said: "County-level consumption is undergoing a structural shift, with consumers increasingly trading up and devoting a growing share of their spending to services.

"Young people returning home are playing a dual role — starting businesses that broaden local supply while generating fresh demand as consumers," Dai said. "They are a small but pivotal force driving consumption growth in counties."

To better meet evolving demand, the measures will encourage chain operators to accelerate their expansion into county-level markets, help local brands blend heritage with innovation and support localities in developing new business formats suited to their own conditions, the ministry said.

Retailers are increasingly looking to counties for growth. Busy Ming Group Co, a snack and beverage retailer, said in its 2025 annual results announcement that around 60 percent of its 21,948 stores were located in counties and townships at the end of 2025. Its network reached 1,401 counties, or around 75 percent of the national total.

> "County-level consumption is undergoing a structural shift, with consumers increasingly trading up and devoting a growing share of their spending to services."
>
> **Dai Mingfeng,** a researcher at the Chinese Academy of International Trade and Economic Cooperation

The guideline also promotes emerging business formats tailored to local conditions and closer integration of commerce with agriculture, culture, tourism and sports, said the ministry.

New travel hot spots are emerging beyond major cities. China's "hidden-gem small cities" posted the strongest booking growth this summer, with hotel bookings in Zherong county, Fujian province — about a three-hour drive north of Fuzhou — surging more than tenfold from a year earlier, said online travel portal Qunar.

In addition, the measures call for stronger fiscal and financial support. Eligible personal loans for consumption and business loans in the services sector will qualify for interest subsidies, while retail businesses opening new chain stores in counties may apply for government-backed startup loans and receive interest subsidies, the guideline stated.

The measures come as lower-tier markets take up a growing share of consumer spending. Retail sales of consumer goods in county and township markets accounted for 39.1 percent of the national total in the first seven months, up 0.3 percentage point from a year earlier, according to estimates released by the National Bureau of Statistics on Monday.

Bai Wenxi, vice-chairman of the China Enterprise Capital Union, said China's consumption growth over the next decade will be driven largely by county-level markets.

"Supportive policies have already created favorable conditions, but the ultimate outcome will hinge on the quality of local implementation and whether businesses are prepared to make a long-term commitment to these markets," Bai said.

Briefly

Geely reports record H1 sales growth

Chinese automaker Geely Automobile Holdings Ltd reported record-high sales and revenue growth in the first half of the year, according to its interim report. The company announced record sales of more than 1.42 million vehicles, with revenue growing 15 percent year-on-year to 173.6 billion yuan ($25 billion) during the period. Marking its sixth consecutive year of positive first half revenue growth, the company also reported a 46 percent rise in core profit attributable to owners of the parent, reaching 9.68 billion yuan for the period.

Railway investment in Jan-July rises

China has made steady progress on a number of key railway projects as investment in railway construction continued to expand in 2026, generating a notable driving effect and injecting fresh momentum into regional economic and social development, the national railway operator said. Fixed-asset investment in the railway sector totaled 440.6 billion yuan ($64 billion) in the first seven months of the year, up 1.8 percent year-on-year, according to China State Railway Group Co Ltd.

End-to-end solutions key to AI exports

By **MA SI**
masi@chinadaily.com.cn

As the artificial intelligence industry rapidly evolves, a new frontier is emerging: the export of AI computing infrastructure. Chinese tech companies, once known primarily for hardware manufacturing and consumer app exports, are now taking their AI models, algorithms and computing infrastructure to overseas markets, corporate executives and experts said.

"China's AI-led expansion overseas is changing. It is moving beyond the export of stand-alone software and applications toward a more sophisticated offering of industry-specific solutions and digital infrastructure," said Jeff Shi, president of SenseTime's Asia-Pacific business, in an exclusive interview with China Daily.

That model draws on nearly the full breadth of China's AI ecosystem — from data centers and token plans to governance frameworks and talent development, Shi said.

SenseTime is at the forefront of this transformation, he said. Since its founding, the company has expanded into more than a dozen overseas markets, serving over 500 enterprise clients globally, with more than 430 in the Asia-Pacific region alone. From intelligent hardware and software licensing to industry solutions and cloud services, the company has built a comprehensive portfolio that spans the entire AI value chain.

The shift from exporting trained AI models to exporting computing infrastructure represents a strategic upgrade driven by fundamental changes in the industry. Shi explained that in the early stages of international expansion, SenseTime primarily delivered computer vision models trained in China, with computing needs met domestically. But the generative AI era has fundamentally altered the landscape.

"Customers no longer need just a single model — they need an end-to-end solution that integrates computing power, models and applications," Shi said. The surge in overseas demand for AI inference has created an urgent need for local computing infrastructure.

At the same time, the rise of "Chinovation" — a term coined in 2011 to describe Chinese innovation has taken on new meaning. It has changed from representing cost-effective alternatives, to being the flagship of high-tech original innovation.

"Overseas clients now come to China to find Chinese technology, Chinese applications, and Chinese opportunities," Shi noted. This shift reflects China's growing global competitiveness in technology — and explains why the world's best open-source large language models are emerging from China.

According to Shi, more foreign visitors are traveling to China to study AI firsthand. International business visitors to SenseTime's Executive Briefing Center in Shanghai have risen tenfold so far in 2026.

SenseTime's computing power export strategy took a major leap forward in 2025 with the successful deployment of China's first overseas domestic computing cluster in the Middle East. The company established a joint venture called SenseTime MEA with Saudi Arabia's Public Investment Fund, or PIF, and has been deeply engaged in the country's Vision 2030 transformation.

Hong Kong also plays a pivotal role in SenseTime's global computing strategy. In June, SenseTime partnered with Hong Kong Science and Technology Parks Corp to build the city's largest domestically developed AI data center, targeting over 40,000 petaFLOPS of computing capacity by 2030. The first phase, expected to be completed by the end of 2026, will deliver 3,000 petaFLOPS of computing power.

Shi described Hong Kong as an "AI-era entrepot trade center" with three unique advantages: dual-compliance capabilities bridging Chinese and international legal systems; superior international network connectivity; and its strategic location within the Greater Bay Area, backed by the Chinese mainland's vast talent pool.

"The project will significantly supplement SenseTime's own computing power supply while serving as a springboard to support the overseas deployment of integrated 'computing+model+application' capabilities," Shi explained.

The senior executive identified three key drivers for SenseTime's future growth: the unprecedented opportunity created by Chinovation; the maturation of the global computer vision market where SenseTime has achieved global leadership; and the trust and reputation built over eight years of overseas operations.

Industry observers are taking note of the broader implications. Li Shan, country head of NCS Greater China, highlighted two key characteristics of Chinovation: practicality and openness. "China can turn lab experiments into real industrial productivity in a very short period of time, and we also have a very fast turnaround time to improve technology," Li said.

Home prices see narrowed declines

China's 70 major cities generally saw narrowed year-on-year home price drops in July, adding to signs of stabilization of the property market, data from the National Bureau of Statistics showed on Monday.

In the four first-tier cities of Guangzhou and Shenzhen in Guangdong province, Beijing and Shanghai, new home prices fell 1.1 percent year-on-year last month, compared with a 1.3-percent drop in June, while the decline in second-hand home prices narrowed from 4.9 percent to 3.7 percent in July.

In other cities, year-on-year declines of home prices also narrowed slightly in July, except new home prices in third-tier cities, where the decline was unchanged from June.

On a month-on-month basis, home prices in first-tier cities generally rose, while those in second- and third-tier cities went down. Across the 70 cities, 23 recorded increases or no change in new home prices, two more than in June, while the figure for second-hand homes was eight, two fewer than the previous month.

The NBS releases a monthly home price report tracking market changes in 70 major cities, including four first-tier cities, 31 second-tier cities and 35 third-tier cities.

More signs emerging this year suggest the property market has remained broadly stable with confidence and expectations gradually improving.

At a meeting on economic work held by the Political Bureau of the Communist Party of China Central Committee at the end of last month, policymakers called for continued efforts to stabilize the property market.

Experts said the policy direction remains clear, with local governments expected to make better use of policy tools tailored to local conditions to meet housing demand.

Yu Xiaofen, a researcher at Zhejiang University of Technology in East China, called for faster progress in developing a new model for the property sector, as well as improving long-term mechanisms to promote the stable and healthy development of the market.

APEC meeting spurring trade

By **ZHONG NAN** in Dalian, Liaoning
zhongnan@chinadaily.com.cn

With customs officials from Asia-Pacific Economic Cooperation economies meeting in Dalian, Liaoning province, to advance trade facilitation across the region, trade experts and exporters said the talks will further boost China's trade with other APEC economies, underpinned by strong economic complementarity.

They said China's industrial upgrading and growing supply of high-tech and green products are helping developing APEC economies advance industrialization, as expanded trade and closer supply chain integration create new opportunities for regional economic cooperation.

Ahead of the meeting in Dalian, which starts on Wednesday, the General Administration of Customs said in a statement on Monday that it will work with other APEC economies to enhance regional trade security and facilitation, align customs rules and standards, and reduce institutional trade costs.

Ji Wenhua, a professor at the Academy of China Open Economy Studies — which is part of the University of International Business and Economics in Beijing — said that against the backdrop of a sluggish global economic recovery and rising geopolitical tensions, APEC has become an increasingly important platform for deeper economic integration across the region.

Zhang Yun, a professor at the School of International Studies at Nanjing University in Jiangsu province, said China's industrial upgrading and companies' growing global presence are creating new opportunities for developing APEC economies by bringing investment, advanced technologies and production capacity to local markets, strengthening their industrial capabilities and facilitating their integration into regional value chains.

Gu Yanping, customs affairs director at Zhejiang Sunny Optical Intelligence Technology Co Ltd — a manufacturer of optical imaging products based in Ningbo, Zhejiang province — said the company's Vietnam plant began operations in October, assembling China-sourced camera modules, vision modules and lens components into vision systems for smart robots, which are then sold globally.

"It has become a key overseas innovation and production base for the company, while also contributing to local employment and industrial development," said Gu.

Imports and exports with other APEC economies through Ningbo ports reached 747.96 billion yuan ($110.91 billion) in the first seven months, up 9.9 percent year-on-year, said Ningbo Customs.

Fujian Tide Power Technology Co Ltd, a power generation equipment manufacturer in Fuzhou, Fujian province, shipped 227 million yuan worth of products to other APEC markets between January and July, up 9.89 percent year-on-year, said Fuzhou Customs. Its exports included lighting towers, energy storage systems and gas and diesel generators, with diesel generator sets seeing particularly strong sales.

Cai Jinjin, the company's director of international sales, said demand for diesel generators remains strong across many APEC markets, particularly in developing economies where infrastructure construction and industrial expansion are boosting the need for reliable backup power.

China is hosting the third APEC Senior Officials' Meeting in Dalian from Monday through Aug 28, said the Ministry of Foreign Affairs.

More than 2,300 representatives from APEC member economies and regional and international organizations will attend the meeting. The event will cover a wide range of fields, including trade, customs, transportation, food, science and technology, energy and health.

More broadly, Northeast China's two-way trade with other APEC economies reached 493 billion yuan during the January-July period, rising 8.1 percent year-on-year, said Shenyang Customs.

China-built water treatment plant hailed

Mongolian president calls it testament to bilateral strategic partnership

By **HAN JINGYAN**
hanjingyan@chinadaily.com.cn

Staffers from China Railway No 4 Engineering Group check the operating status of equipment at the CREC4-built Ulaanbaatar Central Sewage Treatment Plant in Mongolia. PROVIDED TO CHINA DAILY

Having been stationed in Mongolia for 11 years, Wang Jilin feels proud as he departs from a Mongolian airport after a local customs official gave him a hearty smile upon seeing that he's with China Railway No 4 Engineering Group.

"CREC4 has constructed a lot of projects in Mongolia and has become a well-known name to Mongolians," Wang said, adding that the warm smiles he receives make all the painstaking efforts worthwhile.

Since the 1950s, Chinese aid workers have come to Mongolia, helping construct over 850 projects, including highways, port facilities, shantytown renovation, urban infrastructure, as well as desertification prevention and control works.

On June 15, a central sewage treatment plant built by State-owned CREC4 officially began operating in Ulaanbaatar, the Mongolian capital, and on June 30, Mongolian President Ukhnaa Khurelsukh inspected the facility.

Spanning 178,000 square meters and comprising 55 individual buildings with a designed daily processing capacity of 250,000 cubic meters, it is the largest and most advanced sewage treatment facility in Mongolia, Wang said.

After examining the plant's major treatment units and receiving a detailed briefing, Khurelsukh highly praised the facility, calling it a symbol of the comprehensive strategic partnership between China and Mongolia and a testament to the friendship between the two peoples.

Wang said the plant can collect and treat domestic and industrial wastewater across Ulaanbaatar, serving nearly half of Mongolia's population of around 3.5 million, and significantly improving water quality in the capital.

"At busy times in our work, we could see some 400 Mongolian builders and 700 Chinese builders work side by side on the construction site. It was quite impressive," said Wang, who acts as Party chief for the CREC4 team that built the plant.

Staffers from Chinese State builder China Railway No 4 Engineering Group are hosted as guests at a home of a Mongolian employee. PROVIDED TO CHINA DAILY

Better livelihoods

The sewage treatment plant — a key Belt and Road undertaking — is only part of the many public works projects CREC4 has undertaken in Mongolia, said Wang from CREC4 First Engineering.

"But the plant carries vital importance," said Zhang Jiawei, chief engineer of the CREC4 team that built the plant.

In addition to serving nearly half of Mongolia's population, the country's most advanced sewage treatment facility ensures that water quality will be improved in the capital, as all treated sewage will finally enter the Selenge River, which eventually empties into Lake Baikal — the world's oldest and deepest freshwater lake.

Located in the southwestern part of Ulaanbaatar, in Songino Khairkhan district, the project includes pump houses in an old plant area, sewage pipelines into the plant, the new central sewage treatment plant and the tailwater discharge channels.

During its official inauguration on Feb 2, 2019, President Khurelsukh — who served as the nation's prime minister at the time — said many important projects in Ulaanbaatar were built with the help of Chinese friends.

Greatly elevating living conditions in Ulaanbaatar and improving public well-being, "it will become a model project of pragmatic cooperation between Mongolia and China", he said.

During a visit to the work site of the plant on Aug 17, 2021, Begzhavyn Monkhbaatar, then Mongolian minister for urban and construction development, applauded CREC4's efforts in building the facilities.

During construction work, CREC4 provided some 3,000 jobs for the locals.

Local resident Tsedev, who goes by one name only, said that at the guidance of Chinese colleagues, he learned to read Chinese project drawings and worked as a competent CREC4 builder.

"The salary here is higher than many others, and I can also learn many new skills," he said, adding that his hard work helped win recognition of CREC4, which awarded him a title of "Excellent Mongolian Worker" in 2021 as well as a bonus of 1,000 yuan ($148).

Chinese Foreign Minister Wang Yi, who is also a member of the Political Bureau of the Communist Party of China Central Committee, delivered a speech on June 15, as the sewage treatment plant launched operations.

China has always supported Mongolia in developing its economy and improving people's livelihoods, he said, adding that the cooperation always benefits the Mongolian people, with bilateral ties becoming a model of friendly coexistence, and common development and prosperity among neighboring countries.

Uyirs Tuguldur, director of the Presidential Office of Mongolia, hailed it as a major achievement of Mongolia-China cooperation, bringing tangible benefits to the Mongolian people.

He also expressed gratitude for China's support in Mongolia's socio-economic development.

Bonds of friendship

Earlier, CREC4 helped build the Development Center for Disabled Children in Mongolia, the No 2 Highway, and the country's first expressway leading to the new airport in Ulaanbaatar, which opened to traffic in late 2017, said Wang Jilin.

CREC4 is going all out to link the Belt and Road Initiative with Mongolia's Steppe Road Program, unveiled in November 2014, to reinvigorate its economy through transport and trade, he said.

Currently, CREC4 is still involved in projects in Mongolia, including the Qiaoba Mountain Highway Project in Eastern province; construction at Ulan Mine; and project management of a commercial/residential construction project in Ulaanbaatar, said Wu Yiyong, publicity chief of CREC4 First Engineering.

Back in July 2019, when the two-way six-lane expressway leading to the new airport in Ulaanbaatar was officially handed over to the Mongolian government, Khurelsukh said at the time that he believed "it can play a very good role", adding that "the quality is very good and it is of a very high standard".

Construction commenced on June 6, 2016, and the entire line was completed on Oct 12, 2018.

On Oct 19, 2023, Liu Bo, Party secretary and chairman of CREC4, also attended a signing ceremony in Beijing for CREC4's construction of a 6.96-kilometer railway line in Mongolia.

The signing ceremony between CREC4 and its Mongolian partners was for CREC4's general contracting of engineering project in building the Mongolian Xiberkulun Port Railway Engineering Project, another BRI undertaking.

The railway will start from the Sino-Mongolian cross-border point at the end of China's Linhe-Ceke Railway in Inner Mongolia, and extends northward for some 6.96 km. There will be a newly built facility — Xiberkulun Port Station. China's Ceke Port is situated along the China-Mongolia border.

Unseen contributions

Mao Mingliang, director of the engineering division of the CREC4 project department for building the Development Center for Disabled Children in Mongolia, said he had witnessed the hardship Chinese aid workers met in Mongolia.

The project site was located in the Tuul River Valley, with sandy and rocky geological conditions and extremely abundant groundwater — making building homes in the area akin to conducting construction on watery tofu, he said.

The foundation pit needed to be dug five meters below ground, with some sections reaching 6.5 meters. "During the trial excavation phase when the digging was less than one meter deep, numerous 'spring eyes' emerged at the bottom of the pit, bubbling up with water," recalled Yu Jin, the project's chief engineer.

The team ultimately adopted a "tube and well dewatering" solution — drilling three threaded steel pipes in the north and south outside the foundation-pit excavation line, allowing the groundwater to seep into the pipes and continuously pumping it out with high-pressure pumps.

The project was completed 10 days ahead of schedule, and in 2019, it won the "Best Architecture Award" for 2019 in Mongolia, Mao said.

The construction conditions were harsh, as Mongolia can have temperatures as low as -40 C, sandstorms and heavy snowfall were common, water shortages were constant and communications were underdeveloped, creating challenges for Chinese builders.

Wang Jilin recalled that in constructing the central sewage treatment plant in Ulaanbaatar, extreme cold temperatures were a big challenge.

"The project is located in a high-altitude region, with winter lasting for five months, and long-term very low temperatures can lead to unstable concrete performance, limiting construction processes," Wang said.

Meanwhile, the lack of supporting resources for large-scale sewage treatment projects in local regions also posed severe challenges throughout the project, he said.

"The construction team has optimized a special construction plan for extremely cold weather, and innovated low-temperature construction techniques, by adding insulation enclosure structures for biological treatment units, and customizing antifreeze protection devices for deep treatment equipment and pipelines," Wang recalled.

"Although the work was arduous, it was also a treasure in my work and in my life, as we had solidified our friendships among us, and it can last a lifetime," he said.

Wang said that he is immensely happy with his work, as it can help strengthen the friendship between the two peoples.

Construction projects strengthen bonds of Chinese-Mongolian friendships

By **HAN JINGYAN**

After finishing her studies at Beijing University of Technology, Otgonbaya Urna returned to Mongolia and joined China Railway No 4 Engineering Group in September 2016 as a project coordinator.

Though busy with her work building a Development Center for Disabled Children, she was also very proud to be helping the Chinese State builder with translations covering tax exemption for import and export materials, as well as with local procurement and archiving of project completion acceptance.

"She is very professional, conscientious and hard working, and has helped us a lot," said Lyu Haiyun, a CREC4 project leader in Ulaanbaatar, the Mongolian capital.

The bond of friendship between the Chinese and Mongolian peoples is rooted in fine traditions, mutual respect and shared visions. Since the 1950s, Chinese aid workers have been traveling to Mongolia to help construct over 850 projects, he said.

Lyu added that the projects adhered to a people-oriented approach, ensuring that the cooperation always benefits the Mongolian people.

While building the Development Center for Disabled Children in Mongolia, CREC4 provided over 1,000 jobs for locals, with the number of Mongolian employees reaching more than 70 percent, Lyu said.

Sohobater, 40, was one of the participants. Prior to this job, he primarily made a living by herding some 100 sheep, earning slightly over 20,000 yuan ($2,966) each year.

After joining the project in September 2016, he became a Mongolian employee of CREC4. "I was actually quite hesitant at first, worrying about poor living conditions, unfamiliar food, language barriers and communication difficulties," he said.

Understanding this, the project department built a Mongolian yurt for him, set up a Mongolian staff canteen and even sent gifts during festivals and holidays.

When teaching him how to tile, Chinese master colleague Zhang Ruimin demonstrated the process with great care, helping Sohobater grow into a team leader managing 24 Mongolian employees. Sohobater was awarded the title of "Excellent Mongolian Employee" every month.

Chinese and Mongolian project builders enjoy activities at a construction site in Mongolia. PROVIDED TO CHINA DAILY

"My work here has changed my life completely and taught me skills. I love my Chinese colleagues and our relationship is like that of brothers and sisters," he said.

But the road to full cooperation was not smooth at first. CREC4 employee Wang Jilin, who has been stationed in Mongolia for 11 years, recalled the job of building the two-way six-lane expressway leading to the new airport in Ulaanbaatar between June 2016 and October 2018.

"When the construction work on this 32-kilometer highway officially commenced on June 6, 2016, we faced a big challenge — our Mongolian employees were not used to working overtime," he said. "Though we discussed this with them, they were still unwilling to do it."

"When the Chinese employees learned of the situation with the tight schedule, they all said: 'we can do it ourselves'. I was almost moved to tears," recalled Deng Erlong, the then CREC4 project manager.

Mongolian nights in September are bitterly cold, but the construction site was brightly lit and all the Chinese employees went outside to measure data and elevations, and took shovels to begin their work.

After the Mongolian builders visited the site at night, they changed their minds after seeing the busy scene and actively joined in the construction.

In 2020, the expressway project won the "Luban Award" as an overseas engineering undertaking for the National High Quality Project.

During the expressway's construction, CREC4 partnered with over 30 enterprises in Mongolia, creating over 1,000 local jobs and cultivating various professional talents and technical workers in highway construction.

When Mongolia's Badakh road and bridge company cooperated with CREC4 in 2017, it only had five engineers. Now, it has more than 20 engineers, over 100 technical workers and more than 60 types of construction machinery.

Its Deputy General Manager Sayinsur said: "From being able to build roads that are only seven or eight meters wide to now being proficient in building roads that are 14 meters wide, Chinese builders have generously passed their guidance on to us, greatly improving our technology. We thank them sincerely."

In building the central sewage treatment plant project in Ulaanbaatar, CREC4 hired over 600 local Mongolian laborers and trained more than 50 local technical professionals, Lyu said.

The bonds of friendship developed even further. Ganbgatu, from CREC4 International Business Department, went to work on the central sewage treatment plant project in Ulaanbaatar.

In 2022, he met local girl Eenhhosharura, and by gradually understanding and respecting each other's culture and values, they got married on May 20, 2024.

"In the future, we will contribute our own strength in helping bolster the high-quality development of CREC4," said Ganbgatu.

Sohobater noted: "China's aid to Mongolia is sincere, selfless, beneficial to people's livelihoods and of high quality and quantity. We appreciate it very much."

Plan to tailor new routes for road trips

Authorities target a 60,000-km-long natl network linking major attractions

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

China plans to develop about 60,000 kilometers of routes specifically tailored for road trips by 2030, linking some of the country's best-known landscapes and cultural sites while improving services for travelers, the Ministry of Transport announced on Monday.

The national network will largely make use of existing highways and connect major tourist attractions, cultural landmarks and scenic areas. At its core will be three loops, four east-west routes and five north-south routes.

The loops will consist of routes along China's border and coastal areas, one around the capital metropolitan region, and another through Qinghai and Gansu provinces.

The east-west routes will take in areas associated with the Great Wall, the Yellow and Yangtze rivers, as well as the high-altitude landscapes of western China. The north-south routes will feature the Grand Canal, world heritage sites in eastern China, mountain scenery in Central China, sites associated with the Long March and historic travel routes.

According to the ministry, the network will include long-distance routes crossing provincial boundaries, complemented by locally developed itineraries tailored to regional attractions and travel demand.

The plan goes beyond the roads themselves. It calls for better rest areas, viewing points and safety facilities, along with more charging stations, roadside repair services and car rental options at airports, railway stations and other transport hubs.

Local authorities are also encouraged to develop camping, educational trips, sporting events and other activities along the routes, making the journey itself a bigger part of the tourism experience.

The initiative comes as road trips account for a large share of domestic travel.

During this year's nine-day Spring Festival holiday in February, an average of nearly 270 million passenger trips were made by private vehicles each day, up 8.3 percent year-on-year and accounting for 86 percent of all passenger trips, according to the Ministry of Transport.

An average of about 650,000 small passenger vehicles were rented each day during the holiday period, up 15 percent from the previous year.

Visitors in self-drive vehicles stop at a viewing platform to admire a breathtaking sea of clouds in Longhui county, Hunan province, on Aug 5. ZENG YONG / FOR CHINA DAILY

Vice-Minister of Transport Xu Chengguang said at a news conference in July that developing routes for road travelers and making car rentals more widely available would be among the ministry's priorities during the 15th Five-Year Plan period (2026-30).

The ministry will "develop routes for self-drive travel and expand the coverage of car rental services", Xu said. He added that more rental outlets would be established near airports and high-speed railway stations to enable travelers to arrive by air or rail and continue their journeys by car. The ministry is also encouraging cheaper or free one-way returns for rental vehicles.

Liu Dong, an official with the ministry's department of comprehensive planning, said at a policy briefing in February that road trips had emerged as a new source of tourism spending, with some highways becoming attractions in their own right.

He said the ministry planned to make greater use of national and provincial highways to develop longer routes spanning multiple regions, while improving connections between highways and tourist attractions and upgrading services along the way.

For some families, road trips have already become an annual tradition. A woman surnamed Pan from Northeast China said she travels by car with her family to different parts of the country every year, with her daughter or other family members taking turns behind the wheel.

"Traveling by car is very convenient now. The roads are good and the service areas are comfortable, which makes it a good option for families," she said.

Better charging infrastructure is also making long-distance road travel easier, particularly for electric vehicle owners.

An EV owner surnamed Xu said drivers now have less reason to worry about finding a place to recharge their vehicles than they did several years ago. Charging stations have become easier to locate and much more widely available along major roads.

"Now there's almost always a charging station nearby," he said.

By 2035, the ministry aims to have a more complete national network in place, with better services, stronger safety support and a wider range of tourism and leisure options for road travelers.

Single travel permit to push GBA integration

By **ZHENG CAIXIONG**
in Guangzhou
zhengcaixiong@chinadaily.com.cn

Macao residents and Hong Kong permanent residents can now use a single document — the Mainland Travel Permit for Hong Kong and Macao Residents (including non-Chinese citizens) — to complete automated immigration clearance when both departing from and arriving at three ports linking Guangdong province and the Macao Special Administrative Region.

The new measures are a part of refinements to the "joint inspection, one-time release" model, which was officially implemented on Tuesday at three major land checkpoints — the Hong Kong-Zhuhai-Macao Bridge, Hengqin and Qingmao ports — between Guangdong and Macao.

Previously, Hong Kong and Macao residents were required to present different documents depending on the direction of their travel when using the joint-inspection automated channels. When traveling from Macao to the mainland, they had to present their Mainland Travel Permit for Hong Kong and Macao Residents. When returning to Macao from the mainland, they were required to present either a Macao resident identity card or a Hong Kong permanent identity card.

"In the past, I had to bring two types of documents when traveling, and sometimes I forgot to bring them. Now this method is flexible and convenient, so you don't have to worry about forgetting to bring your certificate, and you won't get confused when passing customs," said a Macao resident.

The measures, approved by the National Immigration Administration, aim to further enhance travelers' exit-entry clearance experience and facilitate the movement of people in the Guangdong-Hong Kong-Macao Greater Bay Area, according to a statement released on Monday by the Zhuhai general station of immigration inspection. They are expected to further accelerate integration between the three regions, the statement said.

At Qingmao Port, a frequent cross-border commuter between Zhuhai and Macao surnamed Lin praised the smooth process after experiencing the optimized joint-inspection and one-time-release immigration service on Tuesday.

Located south of Zhuhai Railway Station of the Guangzhou-Zhuhai Intercity Railway, Qingmao Port is a 24-hour passenger-only port for pedestrians.

Besides optimizing the submission and verification of documents for Hong Kong and Macao residents, the new measures also increase the number of people eligible to use the cooperative fast-inspection channel and the joint-inspection lane for vehicles entering and leaving Macao.

Under the new measures, eligible foreigners and Taiwan residents who have completed registration for expedited customs clearance with authorities in both the mainland and Macao can use the "One-stop Joint Services Lanes" at Hengqin Port.

"The measures represent not only an upgrade in inspection methods, but also a vivid practice of the Greater Bay Area's 'hard-connectivity' development," said He Caigen, director of the border inspection division of the Zhuhai general station of immigration inspection.

Real-time dynamic monitoring of lane operation data will be conducted to continuously optimize the systems and publicize user-friendly policies, while every effort will be made to ensure smooth port clearance in the weeks to come, He said.

"Under the premise of 'effective regulation', we will further deliver liberalized access and efficient clearance," he said.

The Zhuhai general station of immigration inspection first rolled out its "joint inspection, one-time release" model in 2018. The model has served as a national benchmark and represents a novel approach to immigration clearance under the "one country, two systems" framework. It has undergone continuous upgrades and expanded coverage in recent years.

According to a statement released on the official website of the Macao SAR government, the cumulative inbound and outbound passenger flow through the three cooperative inspection ports reached 42 million in the first half of this year, with an average daily passenger flow of 235,000, an increase of 12.8 percent compared with the same period in 2025. Macao residents accounted for 43.8 percent of the total, up 12.4 percent year-on-year, while Hong Kong residents accounted for 2.2 percent, up 12.2 percent year-on-year.

Milestone visitor

PLA Navy's first group of carrier-based female trainee pilots ready to take off

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

> "The ship's pitching and rolling require more precise control for landing."
>
> **Wang Mengdi,** a female flight cadet from the PLA Naval Aviation University

The first group of female naval pilot trainees selected to train as carrier-based aircraft pilots recently passed their daytime individual landing assessments in the Bohai Bay in Shandong province, marking a significant step forward in the People's Liberation Army Navy's efforts to train female pilots for carrier-based aircraft.

The female flight cadets were enrolled at the PLA Naval Aviation University in 2023 and completed their maiden flights in April 2024, demonstrating their ability to independently pilot aircraft. Over the past three years, the group has progressed from theoretical study to aircraft type conversion training.

Wang Mengdi, a female flight cadet from the PLA Naval Aviation University, told China Central Television News that landing over the sea presents a psychological challenge because the landing platform is relatively small and is affected by waves and sea winds.

"The ship's pitching and rolling require more precise control for landing," she said.

During the assessment, a helicopter lifted off as Han Meng, another flight cadet, steadily raised the throttle. As strong winds over the sea caused the aircraft to shake, Han made subtle adjustments with her left hand on the collective — a lever that controls the pitch angle of the rotor blades — and gently worked the control stick with her right hand to keep the helicopter on course.

As she entered the landing phase, the ship swayed with the swells, leaving the deck unsteady. Han remained focused on changes in the ship's wake, carefully monitoring the aircraft's altitude and speed while sensing feedback from the control stick with her fingertips.

Upon receiving the landing guide's command, Han seized a brief moment of stability, decisively reduced the throttle and lowered the collective, guiding the helicopter to a smooth touchdown with virtually no impact.

The group of female flight cadets completed the assessment as multiple aircraft took off and landed in an orderly manner.

After completing the assessment, Han said, "It feels as if there's an invisible high wall in front of you during landing, and the psychological pressure suddenly increases."

According to training unit leaders, a progressive training model — moving from instructor-led flights to phased individual flying — has been adopted for the first group of female flight cadets.

The approach draws on the female cadets' calm, meticulous nature and gentle handling skills while strengthening areas in which they are less proficient, including attitude awareness, instrument interpretation and deviation correction, the leaders said.

Training plans were also tailored to each cadet and each training subject, covering ground simulation, in-flight execution, and post-flight review and evaluation, with strict oversight throughout the process.

After each landing, instructors led the cadets in reviewing flight data, replaying their control trajectories and analyzing deviations in their actions to identify their causes and develop improvement plans. This closed-loop training process helped the first group of female flight cadets improve their ability to coordinate and operate carrier-based aircraft.

Next, they will undergo training and assessments for more challenging subjects, such as formation flying and nighttime landings.

Father, son sentenced to prison for trafficking chemicals

By **CAO YIN**
caoyin@chinadaily.com.cn

A Chinese court has sentenced a man and his son to prison and issued them fines for trafficking precursor chemicals abroad, amid strengthened anti-narcotics cooperation between China and the United States.

The Jiang'an District People's Court in Wuhan, capital of Hubei province, convicted the duo of illegal operations on Friday, Xinhua News Agency reported on Tuesday. The father was sentenced to six years in prison, while his son received a five-and-a-half-year prison sentence.

The court found that the two organized the sale of controlled stimulant substances in 123 transactions between November 2021 and July 2024, with a total value exceeding 1.69 million yuan ($250,000).

The case came to the attention of Chinese authorities after the US Drug Enforcement Administration reported a related incident involving the trafficking of sensitive chemicals to China's Ministry of Public Security in June 2023. The ministry promptly instructed police in Hubei to investigate.

1.69 million yuan
The total value of the sale of controlled stimulant substances in the case

The investigation identified a father-and-son team, surnamed Xia, as being suspected of trafficking large quantities of non-regulated precursor chemicals overseas. Since May 2021, the pair had registered multiple companies and hired people to advertise nonregulated chemicals on domestic and international websites, falsely claiming that they had the capabilities to produce, operate and transport such chemicals.

After receiving orders from overseas buyers, they sourced the chemicals domestically and shipped them abroad through international freight forwarders. Police later discovered that the chemicals they had trafficked included controlled stimulant substances.

In recent years, Chinese narcotics control authorities and the US DEA have intensified law enforcement cooperation, cracking down on cases involving drug smuggling and the transnational trafficking of new psychoactive substances.

In May, for example, Chinese police apprehended a suspect surnamed Gong in Tianjin after receiving information from the US in a jointly investigated cross-border drug trafficking case involving new psychoactive substances. US authorities had earlier arrested an American suspect involved in the same case in Georgia.

The two countries have also stepped up cooperation in areas including combating telecom fraud and repatriating fugitives.

In April, police from China, the US and the United Arab Emirates conducted a joint international law enforcement operation targeting telecom fraud syndicates operating in Dubai. The crackdown dismantled nine scam compounds and led to the capture of 276 suspects.

Also in April, US authorities repatriated a Chinese national suspected of drug smuggling and trafficking, marking the first drug-related fugitive handed over by the US to China in recent years.

China, for its part, apprehended a US citizen wanted through an Interpol Red Notice for serious violent crimes and handed the fugitive over to US law enforcement at Shanghai Pudong International Airport following an investigation in July.

POLICY REVIEW

Factory floors produce visitor intrigue

Nation's assembly lines have grown into hot spots for culture, learning

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

SHI YU / CHINA DAILY

The repurposed giant steel furnaces of Beijing's Shougang Park no longer produce metal, but they have become a draw for tourists. In Wuhan's Optics Valley in Hubei province, visitors explore the technologies behind modern communications, while in Guangdong's smart factories, robotic production lines have become attractions in their own right. Together, they reflect the rapid rise of industrial tourism across China.

Long associated with smokestacks, assembly lines and production targets, factories are increasingly becoming destinations. Travelers are no longer content with simply viewing landscapes or historical monuments. Many, particularly younger visitors, want to understand how products are made, how technologies work and how China's industrial transformation has reshaped cities and communities.

Against this backdrop, in May, seven central government departments issued a directive aimed at accelerating the development of industrial tourism nationwide. The policy, jointly released by agencies including the Ministry of Culture and Tourism and the Ministry of Industry and Information Technology, lays out eight key tasks covering heritage surveys, conservation, product development, cultural interpretation, educational integration, promotion and safety management.

The directive calls for nationwide surveys and documentation of industrial heritage resources, along with the establishment of graded and categorized databases to clarify the value and development potential of each site.

It emphasizes the principle of "protection first, rational utilization and minimal intervention", ensuring that core structures, spatial patterns and authentic industrial features are preserved. Rather than treating industrial heritage as static relics, the policy seeks to safeguard its historical integrity while allowing for appropriate reuse.

The directive also highlights the importance of interpreting industrial cultural values, including craftsmanship, entrepreneurship and innovation, through exhibitions, creative content and cultural products. It further encourages the development of branded cultural goods, including "*guochao*" (Chinachic) products, to bring industrial heritage into contemporary consumption spaces.

On the tourism side, the policy promotes diversified formats. These include heritage-based redevelopment projects that adapt old industrial sites through creative design and new business models; factory tours that open production lines for public viewing, hands-on participation and product customization; and smart tourism experiences powered by digital technologies such as virtual reality, artificial intelligence and autonomous systems.

Service quality is another key focus. The directive calls for improved infrastructure, professional guide training, better integration with urban transport systems, and enhanced multilingual services and tax refund facilitation to support inbound tourism.

The document signals a shift in thinking that industrial tourism is no longer viewed as a niche form of factory sightseeing. Instead, policymakers increasingly see it as a platform for integrating culture, tourism and industry while showcasing the achievements of Chinese modernization.

According to Hou Yanquan, an associate researcher with the strategic planning institute at the Industrial Culture Development Center of the Ministry of Industry and Information Technology, China has more than 140 national-level industrial tourism demonstration bases. Industry forecasts suggest the sector could maintain annual growth of around 18 percent through 2029, with market value potentially exceeding 300 billion yuan ($44.5 billion).

Behind those figures lies a deeper change in consumer behavior.

Gong Jian, a professor at the College of Urban and Environmental Sciences at Central China Normal University, said that tourism was largely associated with mountains, ancient towns and scenic attractions in the past, but today's visitors increasingly seek knowledge and participation alongside leisure. Young travelers want to understand the technologies behind new energy vehicles, optical fibers, industrial robots and advanced manufacturing systems, Gong said.

The trend reflects a growing demand for authenticity in tourism experiences. Unlike purpose-built attractions, industrial tourism often takes place in real production environments. Visitors encounter working factories, preserved workshops, original machinery — and the people who operate them.

"What visitors see is not a replica or a staged performance. They see real production sites, real processes and real labor," Gong said.

The transformation of China's manufacturing sector has further expanded the appeal. Smart factories, automated workshops and digital production systems have replaced many traditional images of heavy industry, creating environments that combine technology, innovation and education.

Ma Xiaolong, a tourism professor at Nankai University, said projects that offer immersive and participatory experiences have performed particularly well.

He identified intelligent manufacturing facilities, traditional craft enterprises and revitalized industrial heritage sites as among the fastest-growing categories.

Broader vision

For years, many industrial tourism projects focused primarily on factory visits and product displays. The new framework places industrial culture at the center. The emphasis shifts from simply viewing equipment to understanding the broader stories behind industrialization, technological innovation, craftsmanship and social development.

Gong described this as a move from treating industrial tourism as a tourism product to viewing it as a form of cultural interpretation.

The challenge, however, is ensuring that development does not come at the expense of heritage value, experts cautioned.

Industrial sites often contain layers of historical, technological and social significance that extend far beyond their physical structures, they said.

Gong said that industrial heritage should be understood as an integrated cultural landscape rather than a collection of isolated buildings.

He pointed to Wuhan Iron and Steel Group as an illustration of this approach. The company remains in full operation today, with its active modern production lines running alongside carefully preserved industrial heritage, including a blast furnace museum and smart manufacturing demonstration lines. Together, the operational plant and heritage attractions host tens of thousands of visitors annually, local authorities reported.

This integration of active production, historical memory and urban development makes it a powerful example of how industrial sites can become meaningful cultural landscapes, Gong said.

New audiences

The policy arrives as the market for industrial tourism continues to diversify, said Zhang Zuqun, a staff member at the School of Arts and Design at Beijing Institute of Technology and an expert in industrial heritage evaluation.

Study tours have emerged as one of the most important growth segments. Educational reforms emphasizing labor education, practical learning and scientific literacy have increased demand for experiential learning opportunities outside traditional classrooms, Zhang said.

Industrial sites offer students direct exposure to manufacturing, engineering and technological innovation. Family travelers, photography enthusiasts, cultural tourists and corporate groups have also become important audiences, he said.

Zhang added that consumer demand has been increasingly centered on immersive experiences, knowledge acquisition and cultural engagement rather than simple sightseeing.

Yet meeting these rising expectations is no simple task.

The challenge, Gong said, is avoiding two extremes. One is turning industrial tourism into a technical lecture that overwhelms visitors with information. The other is reducing industrial heritage to generic commercial developments stripped of their historical character.

He said that successful projects must balance technology with storytelling, education with entertainment, and heritage with innovation.

Gong said that the policy's deeper significance lies in cultivating cultural confidence and industrial identity. By opening up production sites and preserving industrial memory, the policy will help people understand that Chinese-style modernization was created generation by generation by workers, engineers, entrepreneurs, researchers and urban residents.

Factories, mines and workshops, he said, are becoming places where the stories of industrial development and modern China itself can be experienced firsthand.

Professor Ma said the directive provides a crucial foundation for industrial tourism to move beyond novelty check-ins toward technological knowledge, cultural depth and emotional resonance. By encouraging branding, content development and diversified formats, the policy helps shift competition from resource advantages to IP and distinctiveness, he said.

Policy Digest

Unified national standard set for medical lab pricing

China's National Healthcare Security Administration has issued trial guidelines for medical laboratory service pricing. This release completes a comprehensive 40-batch rollout, marking the basic establishment of a unified, standardized nationwide system for healthcare billing.

The guidelines cover major areas including clinical testing, blood transfusion and blood typing, microbiology and parasitology, molecular diagnostics, biochemistry and immunology. They contain 662 primary items, 114 surcharge items and seven extension items.

Pricing focuses on service outcomes rather than testing methods to eliminate arbitrary price gaps. Billing units are unified for clearer, simpler charging.

An NHSA official said that nationwide standardization will drive high-quality development in laboratory medicine while facilitating the mutual recognition of test results across regions and healthcare providers.

Blueprint released for weather warning system

The China Meteorological Administration and the National Development and Reform Commission have issued a joint plan for the development of the national comprehensive meteorological observation system during the 15th Five-Year Plan (2026-30) period.

The roadmap aims to modernize the country's meteorological science, technology and public services through integrated multi-domain coverage, broadened scope and utility, and enhanced resource coordination.

The plan stresses accelerating the development of a modern comprehensive meteorological observation system that integrates land, sea, air and space, promotes coordination across sectors, and operates intelligently, efficiently and precisely.

$200b target set for emergency equipment

China has unveiled a new five-year plan to rapidly modernize its safety and emergency equipment sector, aiming for output in key areas to hit 1.4 trillion yuan ($206 billion) by 2030. Jointly issued by the Ministry of Industry and Information Technology and the Ministry of Emergency Management, the strategy centers on cultivating market-leading enterprises to drive the nation's response capabilities.

The plan aims to significantly raise the industry's scale, technological capabilities, product quality and application levels over the next five years.

China's safety and emergency equipment industry has grown rapidly in recent years, with output in key areas surpassing 1 trillion yuan in 2025.

New technologies and equipment have been increasingly deployed in front-line rescue and relief operations. During this year's flood season, drones and satellite communications systems were used to detect risks at dams and ensure communications during emergencies, making flood control and disaster response more precise and efficient.

CHINA DAILY—XINHUA

Xiaomi puts smart manufacturing on public show

By YANG FEIYUE

When visitors step into Chinese tech company Xiaomi's electric vehicle factory in Beijing E-Town, the giant robotic arms swinging with precision never fail to take their breath away.

Autonomous robots glide silently across the floor carrying parts. A 9,100-metric-ton die-casting machine shapes molten metal into automotive components in just 100 seconds. Over 600 robots work in concert across the 718,000-square-meter facility, where every 76 seconds, a new electric vehicle rolls off the production line.

Since beginning public tours in March 2024 — and fully opening to individual visitors in November 2024 — the factory has welcomed more than a quarter of a million people, making it a popular destination to experience firsthand how electric vehicles are manufactured.

The factory's openness aligns with a directive issued in late May by seven central government departments — including the Ministry of Culture and Tourism and the Ministry of Industry and Information Technology — which encourages manufacturers in sectors such as automotive and robotics to open production lines to public viewing, offer hands-on experiences and develop educational study tours.

"We started by studying how to make it work," said Ma Lan, general manager of Xiaomi's Beijing E-Town campus, which encompasses the EV factory and research and development facilities. The challenge, she said, was to maintain production, ensure safety and keep the tour engaging.

"The factory produced 410,000 vehicles last year — all real production, not a set built for show," Ma said. "We needed to explore the integration of manufacturing and tourism while ensuring normal operations and product quality."

The solution involved scientifically designed tour routes, strategically scheduled visiting hours and strict safety protocols. Visitors enter production areas with full protective gear and remain in vehicles throughout the tour. Since opening, the factory has recorded zero safety incidents.

"We have visitors of all kinds," said Zhao Liangtao, director of the factory's comprehensive management department. "We tailor our explanations — technical depth for professionals, educational content for students, fun and engagement for families."

Since May, the factory has offered weekly English-language tours. Any visitor from any country can book through Xiaomi's mobile app using a passport. The factory also hosts a steady stream of international delegations — government officials, industry experts, business executives and university groups.

"Beyond the Great Wall and the Forbidden City, Xiaomi's EV factory gives international visitors a direct, in-depth look at China's smart manufacturing capabilities," Ma said.

The factory has made educational programming a strategic priority. In May this year, it launched the "Science Lecture Hall" project, signing agreements with 11 primary and secondary schools in the Beijing E-Town area.

The program offers a two-hour experience: a one-hour customized factory tour and an hour of interactive classroom learning. Two courses are currently available, focusing on exploring the relationship between car design and aerodynamic drag, and green development in the industry, with two more in development.

"Children's experience at the factory is completely different from learning from textbooks," Zhao said. "They can see with their own eyes how cars move along the production line and how robots automatically transport materials. These real front-line scenes stimulate imagination, leave a deeper impression and bring more inspiration."

The program is expected to offer more than 300 sessions this year, reaching over 10,000 students.

The factory's appeal extends beyond the assembly line. A go-kart track opened on site in March, featuring a 580-meter circuit that uses only electric karts. The track has attracted nearly 9,000 visitors since its debut.

The factory canteen opened in March 2025, and a cultural and creative products store opened in April 2025. Both have become hits among visitors.

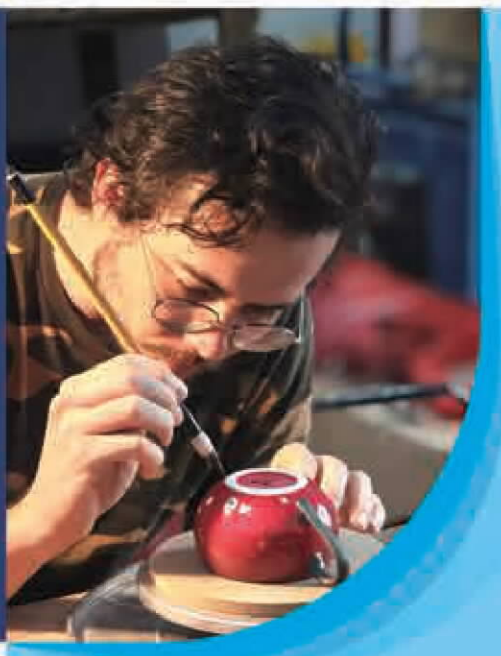
"We want the factory to be more than a place where cars are made," Zhao said. "We want it to become a window showcasing China's manufacturing innovation, a key vehicle for spreading industrial culture and a new landmark for industrial tourism with international influence."

For Ma, the factory's deeper value lies in what it reveals about industrial culture. She described two core principles that define Xiaomi's approach.

"The first is engineering culture — a commitment to relentlessly pursuing perfection, to sparing no effort in mastering every detail, to solving technical challenges with focus and precision," she said.

"The second is entrepreneurial culture. The project has carried forward the spirit of hard work and determination," she added.

The Xiaomi EV factory has set its sights on becoming a national industrial tourism demonstration base and is pursuing 4A-level scenic spot certification. But its immediate goal for this year is to welcome 200,000 visitors.



"We hope that through industrial tourism and educational study tours, more members of the public will visit the factory, learn about manufacturing and experience the charm of China's automotive industry innovation," Ma said. The May directive, she added, gives the factory a clear direction as it pursues its goal.

Z WEEKLY

Jingdezhen fires global imagination

Once carried overseas, Jingdezhen porcelain now draws international artists to its source, creating new exchanges between cultures and creative traditions.

Above: Yann Colleu paints on a red-clay teapot with a calligraphy brush at his studio in Jingdezhen, Jiangxi province. **Bottom:** Denis Naymark carves decorative textures into a white porcelain teapot in Jingdezhen. PROVIDED TO CHINA DAILY

By **GUO JIATONG**
guojiatong@21st.cn

When French artist Yann Colleu first encountered porcelain in 2014 as a contemporary art student in France, he had little idea that the material would eventually become central to his life.

At the time, he worked across a range of media, from wood and oil painting to performance and music, with porcelain just one material among many.

That began to change in 2017, when he traveled to Jingdezhen, Jiangxi province, for a three-month academic exchange at Jingdezhen Ceramic University.

Colleu said his time in Jingdezhen opened his eyes to how expressive porcelain could be on its own. "I want to explore every aspect of porcelain that can emulate thought and convey emotion."

Back in France, he could not stop thinking about Jingdezhen and soon found himself longing to return. Over the following years, he traveled back and forth between the two countries. In 2024, when Colleu was 32, he and his family decided to settle in Jingdezhen.

Colleu is one of many international artists drawn to the city, some for short stays and others who eventually choose to put down roots.

Their presence has taken on added significance since the Jingdezhen Handicraft Porcelain Industry Sites were inscribed on the UNESCO World Heritage List in July.

For centuries, Jingdezhen porcelain traveled overseas along ancient maritime trade routes, carrying Chinese craftsmanship and aesthetics to distant markets. Today, artists from around the world are making the journey in the opposite direction, learning from the city's ceramic traditions while bringing artistic languages of their own.

Colleu has witnessed the city's creative scene become increasingly international and diverse.

What was once centered on technical mastery and material quality, he said, has grown to embrace contemporary art, performance, experimental music, digital modeling and 3D printing. "Some artists who left for larger cities in search of opportunities are also beginning to return."

Colleu himself went on to study *qinghua*, or blue-and-white porcelain, and *youzhong wucai*, an in-glaze polychrome decoration technique, working with local craftspeople to learn from and experiment with these traditional methods.

The longer Colleu worked with porcelain, however, the more he came to understand how much of the process lay beyond the maker's control. Moisture, drying, shrinkage and firing can all affect the final results, and even a carefully made piece can crack or deform in the kiln.

> "If used well, livestreaming can help the industry grow, but when everyone is chasing traffic and quick profits, prices can become distorted, and craftspeople devoted to traditional techniques may be left wondering where the industry is headed."
>
> **BangCho (pseudonym),** a South Korean entrepreneur

He compares the process to a human relationship.

"You cannot force a relationship and expect positive results," he said. "You have to observe, you have to listen, and you have to adapt."

That dialogue between maker and material has also fascinated Denis Naymark, a sculptor from the United States.

Naymark began working with ceramics at around the age of 8, in a studio at a university in New York where his father taught. After his father's lectures, he recalled, he would run to the studio and shape clay into faces, dragons, horses, teapots and bowls.

"The possibilities were always endless," he said.

He later studied ceramic sculpture and traveled to Jingdezhen in 2013, at age 22, to deepen his knowledge of advanced porcelain techniques and traditional Chinese ceramic materials.

Naymark said the city gave him the space to weave his fascination with nature into his work.

"Growing up near the ocean in New York, I developed an enduring interest in aquatic life," he said. "The hills and forests around Jingdezhen offered me further inspiration."

That influence can be seen in his teapot designs, which draw inspiration from seashells, coral, and other marine life. Rounded bodies, shell-like ridges, dotted textures and glossy blue, white and pink glazes give them the feel of an underwater world.

Though the compositions may appear spontaneous, every shell, form and color is carefully placed.

For Naymark, experimentation does not mean breaking with tradition. "You need both traditional techniques and modern, new ideas," he said.

Beyond aesthetics

South Korean entrepreneur BangCho (pseudonym), who came to Jingdezhen in 2019, found his own path into the city's porcelain legacy through tea. "To him, porcelain is particularly well suited to bringing out the character of tea.

"Jingdezhen is one of China's major production centers for everyday tea-ware, with kilns capable of consistently firing porcelain at temperatures above 1,300 degrees Celsius," he said. "At such temperatures, the glaze forms a smooth, glasslike surface with very low water absorption, helping preserve the tea's original aroma and flavor."

That understanding shapes his designs. For BangCho, function comes before decoration.

When designing a *gaiwan*, or lidded tea bowl, he considers factors such as its thickness and diameter, pouring speed and heat retention — all of which influence the experience of drinking tea.

Beyond his own designs, BangCho sees porcelain not only as an art form, but as a craft that has supported the city's economy for generations.

"There is hardly another city anywhere in the world that has sustained itself on a single ceramics industry for a thousand years," he said.

Over the years, he has also watched the city and its ceramic economy evolve.

"Years ago, young people were far less visible in the city center," he recalled. Today, he said, they fill its streets and markets, while contemporary ceramics, from coffee cups to plates and bowls with modern designs, have grown in popularity alongside traditional wares.

Livestreaming and e-commerce have further expanded the market, extending the reach of Jingdezhen ceramics beyond the city.

But BangCho sees that growth as a double-edged sword.

"If used well, livestreaming can help the industry grow, but when everyone is chasing traffic and quick profits, prices can become distorted, and craftspeople devoted to traditional techniques may be left wondering where the industry is headed," he said.

He believes preserving the knowledge behind the craft is just as important as expanding the market and has called for publicly supported training programs to provide craftspeople with the resources and opportunities needed to pass their skills on to younger generations.

Looking ahead, BangCho hopes to develop products that bring Chinese and South Korean aesthetics into dialogue while introducing ceramic works from both countries to wider audiences.

The paths taken by Colleu, Naymark and BangCho are different, but what connects them is Jingdezhen itself — a place whose centuries-old ceramic traditions continue to attract people from beyond China, not simply to observe them, but to learn from them and become part of their continuing evolution.

For Colleu, that pull has become inseparable from a feeling of home.

"Once you experience that environment, it becomes very difficult not to feel that you belong here," he said.

Social Media Digest

Steel the fun

Think regular DIY isn't cool — or hard-core — enough? Young Chinese people are finding their next craft obsession in an unlikely place: the hardware store.

Metal elbows, faucet fittings, valves, pipes and all kinds of steel odds and ends can be picked up for just a few yuan. Add a little imagination, and plumbing supplies suddenly become Thor's hammer, a steampunk wine dispenser or something even harder to explain.

Snap a photo, post it online, and these creations can quickly go viral on social media under the tag "hardware store Lego".

It might sound like a fleeting fad. But the trend says something interesting about how young people are redefining fun.

Not long ago, getting into crafts often meant signing up for pottery, tufting or another carefully curated studio experience. Now, young people are looking for something that costs less, feels more personal, and leaves much more room for creativity — walking into a hardware shop, buying a handful of ordinary parts and figuring out what they could become.

Behind those neighborhood shops sits China's enormous manufacturing ecosystem, producing an extraordinary variety of metal fittings, tools and components at low prices. Parts designed for plumbing, construction and repair are abundant and easy to find.

With such a ready supply of cheap parts to play with, who says Lego has to be plastic?

A new generation of DIY enthusiasts is turning hardware stores into unlikely creative playgrounds. VCG

Picture imperfect

Tired of seeing picture-perfect lives all over social media? Apparently, so is everyone else. TikTok's "Yes, but" trend is giving those flawless posts a reality check.

The format is simple: two photos, two very different versions of the same moment. The top image is the polished "Yes"; the bottom is the decidedly less glamorous "but".

Picture this: "Yes" — you're posing effortlessly on the beach, sunglasses on, sunset glowing behind you. "But" — seconds later, a wave knocks you off balance and sends you scrambling through the sand. One frame belongs on your feed. The other shows what actually happened.

That contrast is exactly what makes the trend work — perfection on top, reality underneath.

And there's a refreshing honesty in putting both versions on display. For years, social media has rewarded the highlight reel: the best angles, the best outfits, the best moments. "Yes, but" allows the outtakes to crash the party. It's a reminder that behind every polished shot, there may be an awkward pose, a failed attempt or something gloriously unphotogenic.

Posting that second photo takes a little nerve, too. Showing the mess behind the magic feels like a small act of rebellion. The message is simple: I'm not perfect, but that's totally fine.

LI YUCHE

A growing social media trend is challenging the pressure to present only polished, picture-perfect versions of everyday life. VCG

Young footsteps echo the Long March

A journey through historic sites helps students connect textbook history with the lives of those who endured the Long March.

Students from Jinggangshan University renew their oath as members of the Communist Youth League of China at a study and education base dedicated to the Young Communist International Division in Ningdu county, Jiangxi province, on July 2. PROVIDED TO CHINA DAILY

By MENG WENJIE
mengwenjie@i21st.cn

Standing before a display case at a museum in Yudu county, Jiangxi province, 23-year-old Zeng Yan read a letter written by a Red Army soldier nearly a century ago.

The letter's writer, Liu Xingfa, was just 19. In the letter, he repeatedly reassured his family that he was safe and well, concealing the hardships he was enduring amid the fighting at the time.

After reading it, Zeng wrote a reply from the perspective of a young person today. She told Liu that China had changed profoundly, that people now lived in peace and that his sacrifice had not been forgotten.

"The letter was not only meant to comfort a fallen soldier," Zeng said. "It also reminded me that I cannot simply be moved by his story and leave it at that."

The exchange across time was part of a five-day journey undertaken by 11 students from the School of Marxism at Jinggangshan University. From July 2 to 6, they traveled through Ningdu, Yudu, Shicheng and Guangchang in Jiangxi province, as well as Jianning in Fujian province, retracing the footsteps of young Red Army soldiers before and during the Long March (1934-36).

According to Li Qiong, the team's instructor and a teacher at the university, the journey was intended to create a dialogue between young people from two different eras.

"The young soldiers were about the same age as my students," Li said.

"I hoped the students could experience history in a more personal way by reflecting on their own choices and responsibilities," she added.

The year 2026 marks the 90th anniversary of the victory of the Long March. In October 1934, the Central Red Army began a strategic transfer to break through Kuomintang's encirclement.

The university program focused on the Young Communist International Division, a special Red Army unit established in Bosheng county (present-day Ningdu county) in 1933. Composed mainly of young soldiers, the division had an average age of just 18.

During the Long March, it carried out missions including protecting the main force and serving as the rear guard. The unit suffered heavy casualties during the Battle of the Xiangjiang River in Guangxi Zhuang autonomous region in 1934, and its remaining troops were later incorporated into other Red Army units.

He Xin, 24, who led the student team, was born in Ningdu but had never visited the historical sites associated with the division.

Standing on a former racecourse where the unit was established, she found herself looking back 93 years.

"Many people that age today are sitting in classrooms, while those young soldiers had to take up arms to defend their homeland," He said.

"We share the same youth. Standing there, I suddenly felt that the distance between history and the present had disappeared," she continued.

Walking into history

As the journey continued, history gradually moved beyond textbooks and became something the students could see, touch and feel.

That sense of connection deepened as He encountered the ordinary objects that had accompanied the soldiers on their journey.

One object seen repeatedly in museums and at historical sites offered her a glimpse into the hardships of the march: straw sandals.

Made from rice straw, the footwear accompanied countless soldiers along the route.

In Yudu, He met an 80-year-old veteran from Guangdong province, who told her that making a pair of straw sandals took two days, yet they could wear out in as little as 15 days.

"Comparing them with today's leather combat boots gave me a much clearer understanding of the shortage of supplies and the hardships the soldiers endured," He said.

Above: Students from Jinggangshan University recite excerpts from *The Long March Suite* at a Long March ferry crossing in Yudu county, Jiangxi province, on July 3. **Bottom:** He Xin (right) interviews a veteran from Guangdong province at a memorial hall marking the departure of the Long March by the Central Red Army in Yudu county, Jiangxi province, on July 3. PROVIDED TO CHINA DAILY

> "We share the same youth. Standing there, I suddenly felt that the distance between history and the present had disappeared."
>
> **He Xin,** leader of the student team that retraced the route of the Long March

> "History lives through a wall, a stroke of writing and the people who protect it."
>
> **Zeng Yan,** a student at Jinggangshan University

While such objects helped He imagine the soldiers' daily struggles, walking part of the route gave Zheng Ting a more immediate sense of the dangers they had faced.

At a battle memorial in Guangchang, the 24-year-old stood in silence and felt what she described as "history coming toward me".

She compared learning about the Long March from a textbook to viewing a river from above: readers may know where it begins and ends, but they cannot experience every bend along the way.

By walking the route, feeling the mud beneath her feet and enduring the July heat of southern Jiangxi, Zheng gained a deeper understanding of the uncertainty faced by the young soldiers.

"They did not know how much farther they had to go or whether they would live to see New China," she said. "What sustained them was the belief that they could not accept oppression or lose their homeland."

Carrying memory forward

Those encounters did more than make the past feel real. They prompted the students to consider what their own generation should do with that history.

For Zeng, the answer begins in the classroom. After graduation, she hopes to become a politics teacher and introduce students to the Long March through the lives of real people and their individual stories.

"I want to bring these stories into the classroom in a warmer and more personal way, so students can understand how history continues to unfold through time," she said.

For others, the answer lies in protecting the physical traces that allow such stories to be told.

One of He's most memorable moments came at a memorial hall in Ningdu, where the deputy director explained how memories of the Long March had been preserved across generations.

The woman's father began collecting historical materials related to the Red Army in 1969. She has continued his work by visiting villages across Ningdu, collecting objects from descendants of Red Army soldiers and preserving them in archives.

The conversation helped He understand that without people collecting letters, protecting former sites and recording family memories, many individual stories could disappear.

Preserving these materials, she realized, allows young people to examine the choices made by those who came before them and reflect on their own responsibilities.

Similar efforts can be seen in Danxi village in Shicheng, where residents have preserved former Red Army sites and maintained slogans painted on village walls more than 90 years ago.

"The person who wrote those words left no name, but his spirit has endured," Zeng said. "History lives through a wall, a stroke of writing and the people who protect it."

After returning to campus, the students began exploring their own ways of carrying those memories forward.

They drew a replica of the Young Communist International Division's armband by hand and created digital maps, magnets and badges inspired by the relics, documents and stories they encountered during the journey.

Through these creative forms, they hope to make the history of the Long March more accessible to young people who may never have the opportunity to visit the sites themselves.

He also plans to draw on what she learned in her future academic research.

"Ninety years ago, young people defended their homeland with their lives," she said. "Today, young people are using their knowledge to build the country. Times have changed, but the courage and determination of youth remain unchanged."

When age opens doors

For young followers anxious about falling behind, Suzi de Givenchy's journey offers proof that life does not unfold on a fixed timetable.

By GUI QIAN
guiqian@i21st.cn

During the 79th Festival de Cannes, Suzi de Givenchy (Chinese name Huang Xianxi) joined a forum organized by The One International Women's Film Festival on narratives by Asian women in cinema. Around her were directors, writers and journalists. Suzi, however, was a fashion model.

At first, she wondered why she had been invited.

"I'm not an actress. I'm not really from that field," she recalled. But as the discussion unfolded, she began to understand what she brought to the conversation. "I think I represented the spectator — the person who goes to the cinema, the person who loves films."

For Suzi, finding herself in an unfamiliar room was nothing new. Her life has been shaped by unexpected turns.

Born in Hong Kong, Suzi moved to New York with her single mother at the age of 4. As the eldest child, she began taking part-time jobs at 14 to help support the family. At 20, she traveled to Paris to celebrate her birthday, where she met a nephew of the French designer Hubert de Givenchy. The two married, raised three sons and settled in the French countryside.

For decades, Suzi's world revolved around her children, her husband and their life together. Then, in 2016, her husband died suddenly of a heart attack.

Writing became one way through her grief. She began keeping a journal, a practice she later described as therapeutic, saying it helped her process the loss and put it into perspective.

Three years later, her life took another unexpected turn. At a gathering, a casting director noticed her and encouraged her to pursue modeling professionally.

She was 52.

In an industry long defined by youth, Suzi stood out precisely because she did not fit the conventional mold. Her wrinkles, high cheekbones, freckles and gray hair were not hidden — they became part of her visual identity. She went on to work with fashion houses including Balenciaga, Lemaire and Off-White, and appeared on the cover of Vogue.

The sudden visibility made her biography easy to package as an inspirational transformation. But Suzi is wary of that framing.

"At times, my story can be perceived like a fairy tale, like a movie story," she said. But she believes many lives contain remarkable turns. What makes a story seem extraordinary is often not the life itself, but the attention it receives.

That may be why the film forum felt less like a detour than another extension of her story. Rather than seeing herself as someone deliberately crossing industries, Suzi says she simply follows her curiosity wherever it leads.

"My life has been about getting outside of a box," she said.

More important, perhaps, is how she approaches what comes next: with humility.

She assumes others may have studied longer and know more, so she listens, asks questions and tries to set aside her preconceptions. Rather than needing to arrive as an expert, she is comfortable starting from a place of not knowing.

"I always try to go into a space as a student," she said.

This willingness to begin again has shaped a life trajectory that runs against the fear that every important choice must be made early — and may also help explain her appeal to younger followers.

Yet her advice to them is grounded in practical realities rather than simply telling them to "follow your passion".

"Everyone has to pay their bills. Everyone has to eat," she said. Instead of waiting for a single, perfect calling, she suggests finding something they are good at and enjoy, then building their skills in it — even if it cannot immediately become a career.

"Things are meant to happen when they're supposed to happen," she added.

Owning her place

Suzi's years across Hong Kong, New York and France have also shaped how she thinks about identity. For much of her life, she tried to work out where she belonged. Over time, she realized the search was not about finding a country or a place to call home.

"What I was looking for was myself," she said. "I feel most at peace with myself."

That answer may resonate with young people facing anxieties about identity, appearance and age, but Suzi does not pretend that self-acceptance, once found, comes effortlessly or lasts forever. Some days are less peaceful than others. Her message to her 20-year-old self — and to young women now — is simple: trust yourself, ask questions, be kinder to yourself and surround yourself with people who appreciate you.

That self-acceptance matters especially in an industry built around appearance. Even as an established older model, Suzi describes holding her ground as a continuing battle: asserting that she has a place and deserves it.

Her next chapter may return to the medium that helped her through grief: writing. She has taken a workshop and is interested in exploring this further, drawn to the introspective nature it offers.

"Writing is a very interesting process because you do learn a lot about yourself," she said.

At Cannes, Suzi arrived as neither a filmmaker nor an industry expert. She came as a model, reader, cinema lover, mother, widow, grandmother and a woman who remains curious about what might come next.

That may be the clearest thread running through her life. Beginning again, for Suzi, is not about erasing what came before or pretending age does not matter. It is about refusing to see age as the end of possibility — and being willing to enter the next unfamiliar room as a student.

Suzi de Givenchy walks the runway for Oude Waag, a Shanghai-based Chinese fashion label.

Suzi de Givenchy attends a forum organized by The One International Women's Film Festival in Cannes, France, in May 2026.

Seeds of curiosity grow beneath giant telescope

By MENG WENJIE
mengwenjie@i21st.cn

In early August, 20-year-old Liu Chang stood at the front of a classroom, feeling slightly nervous. It was her first experience as a volunteer teacher.

Facing her were students from Kedu Experimental Primary School in Pingtang county, Guizhou province. Pingtang is home to the Five-hundred-meter Aperture Spherical Radio Telescope, or FAST, the world's largest single-dish radio telescope.

A student in the department of engineering physics at Tsinghua University, Liu was among 14 members of the university's Cyrus Tang Love and Care Society who traveled to the county for a two-week summer camp from July 27 to Aug 10.

Huang Zijun, 22, the team leader, said the camp aimed to combine local characteristics with children's personal growth.

"FAST is of great significance to national security and scientific development," he said. "Drawing on the region's astronomy culture and the children's interests, we created courses that brought together scientific exploration, sports, artistic expression and life education."

A Tsinghua University student volunteer teaches children Latin dance during a two-week summer camp at Kedu Experimental Primary School in Pingtang county, Guizhou province, on Aug 3, 2026. PROVIDED TO CHINA DAILY

To make the science behind FAST more accessible, Liu designed a course in which students built their own telescope models to explore its structure and working principles.

The lesson drew an enthusiastic response. One student, usually energetic and easily distracted, worked on the model in her spare time and finished it ahead of schedule. She then picked up Liu's camera and filmed a short vlog, introducing each part of her model and explaining how it related to the real telescope.

In another class, Li Yiheng, 21, a student at Tsinghua University's School of Aerospace Engineering, taught the children how to make water rockets.

Rather than giving them answers directly, Li asked the students to experiment with different amounts of water and launch angles to see which combinations could make their rockets fly farther.

"When they found the answers themselves, my explanations became much more meaningful," Li said.

The emphasis on experience extended beyond science: the volunteers also sought to support the personal growth of rural girls.

Du Xuanye, 21, a philosophy student at Tsinghua University's Rixin College, helped design sports activities that, rather than emphasizing competition, aimed to build girls' "body confidence".

"Many girls worry about being judged for their appearance when taking part in sports, which can affect their focus and enjoyment," Du explained. " So, we encouraged them to pay more attention to how they feel and build a stronger connection with their bodies."

As a member of Tsinghua's drama club, Du also brought theater exercises into the classroom. For example, she guided the children to use body movements to "write" their names and make funny expressions to relax their facial muscles. She also introduced exercises to help improve their concentration and self-awareness.

To Du's surprise, the children soon required less guidance than she had expected. During a flag football activity, one girl wearing a skirt and sandals threw herself into the game without hesitation.

"She did not spend time worrying about whether her clothes were suitable for sports," Du said. "She simply focused on running and carrying the ball toward the end zone."

For the volunteers, these small changes were encouraging. But they also raised a more difficult question: How much could a two-week program truly achieve?

"There were so many things we wanted to do together, but we could not get to them all," Liu said. "After seeing the challenges the children face in their daily lives, we realized there was only so much we could do."

According to Huang, university volunteer teaching programs are sometimes criticized as being "brief and superficial". As a result, the team took steps before the camp to make their work more sustained and responsive to the children's needs. They exchanged letters with the children before arriving to better understand their expectations and interests.

After returning to Beijing, they plan to keep in touch with the children through letters.

For Liu, the value of the experience may ultimately lie not in how much the volunteers were able to change in two weeks, but in what the children take away from their time together. "At least they may remember the happiness of those two weeks and that someone took the time to listen to their stories, interests and worries like an adult friend," she said.

SOCCER

Arsenal manager Mikel Arteta is thrown into the air by his players while celebrating their Premier League title win in London on May 24. AP

New faces, old heads and a whole lot of uncertainty

The Premier League is back, and nobody really knows what to expect from the post-Guardiola era

The post-Pep Guardiola era is already underway in English soccer amid uncertainty and upheaval, not just at Manchester City, but across the whole of the Premier League.

Heading into the new top-flight season, which begins Friday, nine clubs have new permanent managers — an unprecedented number at the start of an English top-flight campaign.

At age 33, Fabian Hurzeler is the fifth longest-serving coach in the Premier League — and he has only been at Brighton for two years.

The biggest vacuum needing to be filled is at City, following the departure of Guardiola after 10 record-breaking years in charge. Good luck following that, Enzo Maresca — especially after the team's lamentable performance in its Community Shield loss to Arsenal on Sunday.

Among the other top clubs with new coaches are Liverpool (Andoni Iraola), Chelsea (Xabi Alonso) and Newcastle (Matthias Jaissle) — all of which competed in the Champions League last season.

Heck, it makes Roberto De Zerbi — appointed by Tottenham on March 31 to escape relegation — and Michael Carrick — installed as interim manager at Manchester United for the second half of last season before impressing and getting the permanent job — seem like veritable veterans.

It also makes Arsenal, the reigning champion, appear a haven of stability as Mikel Arteta goes into his seventh full season at the helm as by far the league's longest-serving manager.

Yet, there's a big question mark hanging over the Gunners, too: Will there be a hangover after winning the league for the first time in 22 years?

We're about to find out, though Arsenal's display in the Community Shield provided early encouragement for its fans.

The nonstop roller coaster that is the Premier League begins in earnest on Friday, when Arsenal hosts newly promoted Coventry, which has a compelling backstory of its own after being out of the big time for 25 years.

Here are some other storylines providing a backdrop to the new season:

A lack of star power?

The Cristiano Ronaldo circus left town in 2022. Harry Kane moved away in 2023. Kevin De Bruyne departed in 2025. Mohamed Salah quit for Turkiye this summer and Rodri has started packing his bags for Barcelona.

It begs the question: Is the biggest league in the world lacking the biggest players in the world?

OK, City still has prolific striker Erling Haaland, whose brand has never been higher after wowing American fans during last month's World Cup.

But soccer superstars like Kylian Mbappe, Ousmane Dembele, Vinicius Junior, Lamine Yamal and even England's own two top players, Kane and Jude Bellingham, play in other countries.

All-time greats of this century — think Lionel Messi, Ronaldinho, Zinedine Zidane — never played in England, either.

The big blockbuster deal of the offseason could have been Vinicius joining Arsenal, but he chose to stay at Real Madrid.

The Premier League has recently prided itself in having the world's top coaches, yet Guardiola and Jurgen Klopp are no longer around.

The competition might have to settle, then, for having the greatest strength in depth, with the mid-level clubs having arguably never been better owing to the league's huge broadcasting deals.

Arsenal the favorite

Amid so much turbulence among its rivals, Arsenal has a great opportunity to retain the title and is the favorite with British oddsmakers.

Brazil midfielder Bruno Guimaraes has joined from Newcastle to bolster an already-strong midfield, left-winger Christos Tzolis signed from Club Brugge to replace the departed Leandro Trossard, and there is strength in depth in every position.

Counting against Arsenal, however, is an injury to defensive mainstay William Saliba that will rule out the France centerback for the first few months.

Also, there's an intangible: Will there be a drop-off in intensity or motivation after finally winning the league?

Arteta is determined that won't be the case.

High-profile returnees

Welcome back, Marcus Rashford. The England winger has rejoined Manchester United after a title-winning loan spell at Barcelona. Whether he wants to be at Old Trafford, though, remains to be seen.

Hello, again, to Frank Lampard, a title-winning great for Chelsea who has led Coventry back to the Premier League promised land as manager.

Coventry, a founding member of the Premier League, was relegated in 2001 and plunged into such financial chaos that the club lost its home and went on to drop into the fourth tier.

The Sky Blues' rise is one of English soccer's feel-good stories and they will be joined by fellow returnees Ipswich and Hull.

$3 billion and counting

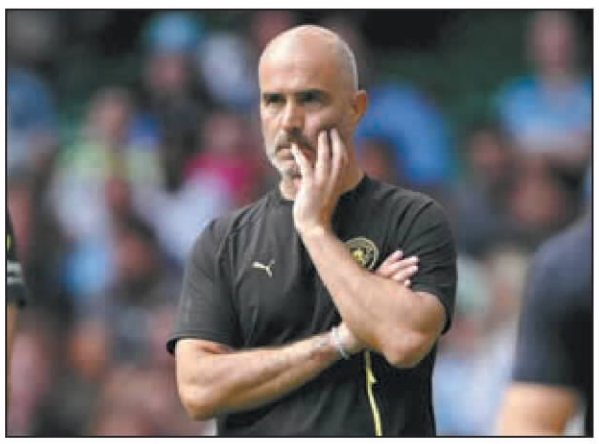
England is in a league of its own when it comes to spending power, and Premier League clubs' outlay on new players in this transfer window is already approaching $3 billion.

The biggest signings so far have all been midfielders: Morgan Rogers to Chelsea for $156 million; Elliot Anderson to City for $155 million; Sandro Tonali to Tottenham for $133 million; and Guimaraes to Arsenal for $100 million.

Chelsea's net spend is almost $300 million, as Alonso reshapes the squad. Tottenham has also spent around $300 million on new players, in a reversal in policy following back-to-back 17th-place finishes.

The window remains open for two more weeks.

A set-piece-heavy style?



A significant change in English soccer last season was a reversion to old-school tactics, such as long throws into the area, a reliance on set-pieces and long clearances by goalkeepers, in a perceived snub to the Guardiola-influenced style of play where possession of the ball was king.

With Guardiola now out of the picture, will this trend increase further? Marco Rose at Bournemouth, Pierre Sage at Crystal Palace, Alvaro Arbeloa at Fulham and Alonso at Chelsea are all coaching in the Premier League for the first time.

Will this wave of new managers establish another different approach?

AP

River's revival a case study in good governance

Hunan's environmental success shows full potential of people-first approach

By **CAO YIN** and **HE CHUN**
in Changsha

On a balmy June afternoon, the banks of the Guitang River hum with life. Joggers pass by on the wooden boardwalks, while families push strollers past cafes and quaint shops. It's a scene that 75-year-old Chen Xiaofan, who lives along the river in Hunan province, sees as nothing short of a miracle.

After all, in the early 2000s, the river in Changsha, the provincial capital, was a black, open sewer — a literal scar on the city's Yuhua district.

Today, the river's water quality has improved from an inferior Grade V to a Grade I or II — suitable for fish and as a source of drinking water. Biodiversity has rebounded, with 425 species now inhabiting the area, including rare fish, wild ducks and egrets.

The transformation is much more than an environmental success story. It has become a key case study in a Party-wide campaign launched in February that redefines what constitutes political success for local officials.

The Guitang River's transformation demonstrates the results of generational efforts made by successive local officials under a governance philosophy based on a key principle: "Gold and silver cups are not as valuable as public reputation".

Xi Jinping, general secretary of the Communist Party of China Central Committee, has emphasized this principle, stressing the importance of establishing and practicing a correct understanding of governance performance.

Xi, who is also Chinese president, said that communists must bear in mind that working for the people's well-being is their greatest political achievement, and that officials should contribute their share to this cause without taking credit for its success.

Continuous progress

Flowing 28.3 kilometers through a basin of more than 2 million people, the Guitang River was a childhood playground for residents like Deng You, who in the 1980s caught shrimp in its clear waters. However, rapid industrialization meant that the river was exposed to high levels of pollution. By the 1990s, the water quality had plunged to the worst national grade, and the river was placed on a national blacklist of polluted urban waterways.

When early, disjointed cleanup attempts failed in the 1990s, local authorities established a unified governance team in 2016. Since then, a chain of officials has built continuously on their predecessors' work rather than dismantling it to start their own projects.

Deng, deputy director of the Yuhua administrative committee of China (Hunan) Pilot Free Trade Zone Changsha area, joined the team as a coordinator. Her mission was to reconcile bureaucracies, demolish illegal structures, repair pipelines and restore the local ecosystem.

"I just wanted my mother river to breathe again — to be what it was in my childhood," she said.

The monumental undertaking saw millions of square meters of illegal construction torn down, every unregulated sewage outlet intercepted, and thousands of tons of fresh water pumped in daily. German experts were also invited to redesign the river's natural curves and bends as well as its ecological zones.

At the end of 2020, Deng passed her baton to Wang Bin, head of the district's river chief office. His role was to act as a bridge between residents, volunteers and government departments, finding and addressing the problems of the river and its surrounding areas in a timely manner.

"Early reports when I took the position were about broken pipes and illegal discharges. Now, residents ask for greener parks and more recreational space," Wang said. "That shift in public complaints is real evidence that our work is paying off."

Yang Weidong, a professor at China University of Political Science and Law, said that the governance of the river is a prime example of practicing a correct understanding of governance performance.

"What those officials do is to serve the people and put the public's demands first. They work not for immediate accolades but for long-term, sustainable public welfare," Yang said, adding that the change in the Guitang River shows the true potential of good governance.

Response to public needs

Following the river's environmental recovery, a commercial zone has emerged along its banks, offering communities a place to eat, unwind and enjoy leisure activities. Since last year, the area has seen a fresh wave of revitalization, drawing in young entrepreneurs and cultural-creative hubs, including artisan coffee roasters, bicycle culture studios and even a freshwater museum.

According to Yang, the transformation has responded to public needs at every turn — first for environmental restoration, then for community amenities, and now for jobs and economic vitality.

"At every stage, one conviction has never wavered: The people's genuine acclaim is the real yardstick of achievement," he said, emphasizing that, since the purpose of governance is to serve the people, their assessment and responses are what ultimately count.

The campaign, running through July, urges all Party members to embrace a correct understanding of governance performance. It calls for pragmatic, law-based decision-making, and for concrete outcomes that stand the test of practice and history — outcomes that genuinely serve the people and earn their recognition through solid, well-grounded work.

China, US agree to prepare for high-level exchanges

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Inside
Editorial, **page 6**

China and the United States need to translate the consensus reached by the leaders of the two countries into whole-of-government consensus and action across various domains, Foreign Minister Wang Yi said during his meeting with US Secretary of State Marco Rubio on Wednesday.

The two met in Manila, the capital of the Philippines, on the sidelines of the ASEAN Foreign Ministers' Meetings.

Beijing and Washington "agreed to jointly implement the important consensus reached by the two heads of state, tap into the roles played by political and diplomatic channels, and prepare for high-level exchanges in the next phase", the Foreign Ministry said in a release.

Both sides believe that "this meeting was pragmatic, positive and constructive", and they agreed to "promote substantive progress in a constructive China-US relationship of strategic stability", the ministry said.

This is Wang's second face-to-face meeting with Rubio this year following their talks on the sidelines of the Munich Security Conference in February. They also held a phone conversation in June.

During the talks on Wednesday, Wang said that this year is a "major year" for China-US relations and mentioned US President Donald Trump's state visit to China in May.

The two heads of state held a historic meeting in Beijing, defined the framework for the constructive China-US relationship of strategic stability, and outlined the direction for both sides' joint efforts, Wang said.

It is now the duty of both sides to "follow the course set by the two heads of state, eliminate disturbances, and overcome obstacles" to ensure that the leaders' consensus is translated into whole-of-government consensus and action across all fields, he said.

Both sides should "promote world peace and stability through China-US strategic stability" and "provide important impetus for international cooperation through constructive China-US interaction", he added.

Wang also made clear China's solemn position regarding a series of recent negative remarks and actions by the US.

He called on Washington to respect China's core interests, faithfully adhere to the one-China principle, effectively manage disagreements and differences, and address China's legitimate concerns, so that this "year of opportunity" for China-US relations can become a reality.

Wang was in Manila to attend the China-ASEAN Foreign Ministers' Meeting on Wednesday amid tension between China and the Philippines over the South China Sea issue.

When meeting with Philippine Foreign Secretary Maria Theresa Lazaro on Wednesday, Wang lodged a strong protest against the ramming of a Chinese law enforcement vessel at Ren'ai Reef of the Nansha Islands by Philippine sailors.

Currently, China-Philippines relations stand at a crossroads, and the Philippines' needs to make the right and rational choice for the future developments, he said.

He warned that the Philippines "will ultimately have to bear the bitter consequences of its own making" if it attempts to utilize outsiders for provocations.

China has never posed a security threat to the Philippines, has never in history invaded or colonized the Philippines, and has always been committed to managing differences and stabilizing the situation through bilateral dialogue and consultation, Wang said.

The Philippines should immediately stop provocative maritime actions, strictly abide by the commitments it has made to China to date, and make concrete efforts to stabilize bilateral relations, he said.

Lazaro said the Philippines hopes to find an appropriate solution to maritime issues through dialogue and strive to improve bilateral relations.

ONLY COLD NOODLES CAN BEAT MAJOR HEAT

Refreshing Northeast China dish is a must-have meal when the mercury rises

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

In Yanji, a city in Jilin province, a cold noodle broth is often the first thing diners order after taking their seats.

Served in a stainless-steel bowl, the clear broth is icy cold, balancing sweet, sour and savory flavors. Then comes the main dish — long, chewy noodles resting in chilled beef broth. A pair of scissors allows diners to cut the noodles into manageable lengths.

Cold noodles, a traditional food of the Korean ethnic group. NIU CHENGYU / FOR CHINA DAILY

As Major Heat, or *da shu*, the hottest of China's 24 solar terms, arrives on Thursday, people across the nation will seek relief from soaring temperatures. In Yanji, many turn to cold noodles, a traditional food of the Korean ethnic group that has become one of the city's culinary calling cards.

China Vibes — FOOD —

"In Yanji, once the weather turns hot, people naturally think of cold noodles," said Jin Yongfu, manager of Yanji Fuwudalou Cold Noodles, one of the city's best-known cold noodle restaurants.

Yanji cold noodles are made from a mixture of buckwheat flour, wheat flour, sweet potato starch, tapioca starch and acorn powder. The dough is scalded, kneaded and pressed into thin strands, then briefly cooked before being rinsed twice in cold water.

The defining element of a good bowl of cold noodles though is the broth.

At Jin's restaurant, the beef is soaked in running water for up to a day and a night. It is then blanched and simmered for about five hours with carrots, scallions, onions, ginger, licorice root and red dates.

'Shock 2.0' narrative flawed in concept

WORLD WATCH
By Tu Xinquan

Since the second half of 2025, some Western media outlets, politicians and scholars have been promoting the so-called "China Shock 2.0" narrative, portraying China's progress in new energy, electric vehicles, biomedicine and other sectors as a threat. Behind this rhetoric is a familiar purpose: to provide a new justification for protectionist policies.

The phrase may sound new, but the argument is old. "China Shock 2.0" is merely the latest version of the "China overcapacity" theory and the "China threat" narrative. Twenty years ago, some in the West spoke of a "China Shock 1.0", claiming that China's low-cost, labor-intensive goods had disrupted developed markets. But a broader look at world economic history shows that every major technological revolution and industrial shift has produced anxiety among vested interests. British machine production replacing Indian handloom weaving in the 19th century, the rise of the United States auto industry relative to Europe's in the 20th century and the effect of Japanese cars on Detroit in the 1980s all followed this pattern. What is now called a "shock" is, in essence, a normal adjustment of dynamic comparative advantage.

At the center of the "China Shock 2.0" argument is the claim that China's new energy sector suffers from "overcapacity". Yet by the standards of industrial economics, overcapacity usually refers to a sustained capacity utilization rate below 70 to 75 percent, accompanied by widespread industry losses. China's new energy vehicle sector does not fit that description. Its capacity utilization rate has remained above 70 percent, with some domestic brands approaching 100 percent. By contrast, the average utilization rate of European auto plants is about 55 percent, and some companies are even below 50 percent. The data show clearly where the real imbalance lies.

Nor does China's export structure support the accusation. More than 80 percent of China's automobile output is sold at home, while exports account for less than 20 percent. In 2025, China produced more than 16 million electric vehicles, of which only 2.61 million were exported. The vast majority were absorbed by the domestic market. To equate a trade surplus with overcapacity is to confuse two distinct concepts.

From 'bedroom heroes' to music stars in China

Audiences embrace wide range of foreign artists, exposure online a key factor

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Left: German singer and songwriter Chris James at Yuyuan Garden in Shanghai in 2024. **Middle:** James (center) visits Zhangjiajie in Hunan province with his musician friends during his recent China trip. PHOTOS PROVIDED TO CHINA DAILY **Right:** Members of British indie band Swim Deep visit Beijing in 2025. SO READY PRESENTS / FOR CHINA DAILY

Chris James, a 30-year-old German singer-songwriter, had no idea a song he wrote quickly in his Berlin bedroom had captivated millions of music fans in China, and would ultimately change his life.

Busy preparing for his new Chinese tour in August, James clearly remembers the magical — or even "confusing" — start of the story. It was about four years ago, when he opened up the official music video of his song *Not Angry* at home and noticed a few comments in Chinese under it.

Those comments increased day by day, and piqued his interest in what was going on.

He ran them through a translator, tracked them to a Chinese app and found out his song, which starts with a catchy humming section, had garnered millions of views. On Douyin, the Chinese version of TikTok, the hit song has now been used and shared over 5 billion times.

"I was sitting in my bedroom, scrolling on the screen and it was really hard to process. I saw people singing it in schools and malls … This little melody that I made had traveled so far," recalled James.

The singer-songwriter said he simply sat down one morning and wrote it and recorded it, without much thought or any expectation it would become so popular.

Yet, on the other side of the world, it became an earworm — a catchy tune listeners can't get out of their head. "It definitely changed my life in many ways," he said.

Open to new ideas

In recent years, an increasing number of overseas musicians have flooded China's music market.

The Global Music Report 2026 released by the International Federation of the Phonographic Industry in March showed that last year, Asia saw strong growth of 10.9 percent in recorded music revenues, and maintained its position as the largest region for physical revenues in 2025, accounting for 45.1 percent.

Notably, China has overtaken Germany to become the fourth largest global market, with remarkable revenue growth of 20.1 percent, the fastest-growing market in the top 20, said the report.

Social media platforms like RedNote, or Xiaohongshu, are also actively facilitating foreign artists searching for new horizons.

The RedNote music team has ramped up efforts to introduce overseas artists to China since early last year, after the "TikTok refugees" phenomenon emerged from the United States' threat to ban the platform.

Among those refugees is a massive number of niche and independent musicians and artists who have captivated Chinese audiences, said Jiang Jiayao, content operations manager of RedNote's music team.

These artists include many unsigned "bedroom musicians" who independently write, record, produce and release music, usually from their homes.

RedNote organized for many of them to participate in the inaugural Global Village Concert on Jan 26, 2025. The event featured 20 groups and musicians from home and abroad, including James. It ran for about seven hours and attracted over 1.28 million online viewers.

The RedNote team later launched the Global Soundwave project and a No-border FM campaign to help overseas musicians connect with Chinese music fans.

Jiang said the team provides guidance and support to the artists on how to make their music reach the local community. The advice covers issues such as account operation, post creation, customized promotions, live settings, interaction, exclusive event planning, and online and offline music shows across China.

In September 2025, the team held the No-border Music Festival in Shanghai. The artist lineup included major stars including Malaysian pop band babychair, indie musician Hayd from the United States, singer Jordann from Canada, and Martin's Mood from France. The festival sold out quickly.

Jiang said many young RedNote users are highly educated, enjoy sharing music, and are open to supporting "niche, distinctive and indie music and artists".

"A vast majority — about 80 percent — of overseas musicians who are eyeing the Chinese market have joined our platform and community," said Jiang.

The team has made connections with artists worldwide, helping over 100 of them tap into the Chinese market and supporting hundreds of shows in China. They come from countries as varied as the US, Brazil, Australia, France, Germany, Norway, Japan and South Korea, and feature diverse music genres such as rock, pop, indie and jazz.

Deeper dive

In 2023, James played his first China show in Beijing, followed by six other cities.

A year later, his Chinese tour covered eight cities, and last year, he performed in 10 cities. James is getting ready to meet his army of Chinese fan crowds again on a new tour.

He has over 3 million fans on Chinese social media platforms, and is affectionately called "*Xiao Kui*", meaning "little sunflower".

"They are very into music, with a very strong passion and a lot of attention to lyrics, details and the depth of songs. They are also very interactive and can sing every song together with me. They are loud, in the best way possible," said James with a smile.

At a festival in Shanghai during the May Day holiday, fans sang along loudly with James in his return tour to China after seven months.

During that tour James organized travel outside his performance schedule to dive deeper into the nation.

Besides Shanghai, he went to Zhangjiajie and ancient towns in Hunan province, climbed Huangshan Mountain in Anhui province, visited Chongqing and even performed one of his hit songs at a hotpot restaurant and a teahouse in Chengdu, Sichuan province.

The laid-back vibe of his travels dovetails with James' life philosophy and the messages he tries to convey through his music. He said that just as the unexpected popularity of *Not Angry* shows, life can be random and filled with "endless possibility", adding it is good to always stay positive, optimistic and "go with the flow".

Malaysian connections

Babychair, a three-piece band based in Kuala Lumpur, Malaysia, made its China debut at a music festival in Shanghai three years ago.

The band, which creates retro, dreamlike pieces with experimental music elements, saw its popularity take off in China after joining hands with the talent agency 1500 Sound Academy. The musical trio, who each go by one name, has already toured the country three times.

"The music market in China is very competitive, and everyone strives to be the best," said Aaron, the drummer.

"Our tour in China really opened our eyes and gave us new inspirations. We are always meeting new people and exploring new things, opportunities and possibilities."

Of Malaysian-Chinese heritage, all three were exposed to Chinese culture early in life through music and TV dramas. They can speak Chinese and share many cultural roots with their Chinese fans.

What resonates in China is sometimes different from what is popular with fans in other parts of the region.

For instance, in Southeast Asian nations, babychair's most popular song is *Oh It's You*. In China, however, *Dear* is the song that is more representative of the trio to their fans.

During their recently concluded China tour, audiences sang along with the band when they performed *Dear*.

"I think the market needed us," said lead vocalist Sean. "The idea of our music is simply asking everyone to chill. What we would like to deliver to our fans in music is not only the song, but also the emotions that make us connected. So we hope everyone can listen to the songs, get relaxed, feel differently and chill."

Over the past three years, they have come to value the Chinese musicians and artists they have met along the way.

"We share the same struggles and same happiness. They are very friendly, open, easy to communicate with and down to earth. We feel at ease having a chat or sharing life stories with each other. Such connections are very valuable," said Aaron.

Being valued

For British indie band Swim Deep, who completed their fourth tour last year, one of the most rewarding aspects of performing in China is feeling valued.

Formed in 2011, the Birmingham band has played over eight shows since 2014 and sold out many of them, playing to hundreds and sometimes thousands of fans.

"Every time we go back to China, we feel a little less like being a tourist there, it's a bit more of a feeling of coming home," said Austin Williams, the band's front man.

"We always feel so welcomed by the friendly, supportive, dedicated, loyal and passionate fans out there," he said.

One of Swim Deep's most memorable China shows was the 2019 Strawberry Music Festival in Guangzhou, Guangdong province.

Keyboard player James Balmont said audience numbers in China often far surpass what they draw in the United Kingdom.

The biggest UK festival crowd they have played for was 500, while in Guangzhou, they performed to around 10,000 people on the main stage.

While backstage riders of beverages and food for performers are common overseas, Williams was impressed that the Guangzhou organizers had gone to the trouble to prepare a big box filled with imported cheeses, beers, potato chips and other goodies.

"I felt very grateful that they've gone out of their way to do that for us … And it made me realize how these people are working beyond (the basics) to make the artist feel good," Williams said.

"It really proves that they consider art as a valuable and important necessity in culture and life."

Balmont also appreciated the Chinese staff's extra efforts and the respect they showed, which made the band feel valued.

Both band members expressed hope other venues follow this lead and create more comfortable conditions for the artists.

Organizers and promoters of tours and music festivals in China also often pay for performers' travel and accommodation expenses, reducing costs and financial risks for emerging overseas bands.

Touring in China sets a high standard for the rest of the world to follow. Also, the fans are always respectful and polite, show their loyal support in an orderly way, and welcome new music with open arms, Balmont said.

"When you combine all of that, it creates wonderful experiences that make you feel being a touring artist can be really worthwhile," he added.

Sam Tucker, manager of Swim Deep, said: "I think the future of the Chinese music market is very bright. The way the Chinese live market has embraced international artists and tours enables so much potential future growth. As culture becomes less specific to one country or city, it feels like the Chinese music market can only continue to grow and develop."

Practice: Officials punished for serious violations

From page 1

The initiative also requires solid efforts to address prominent problems, the establishment of sound systems and rules and the improvement of accountability mechanisms, so that institutions can effectively play their role in guiding and motivating the performance of officials.

"When governance is no longer anchored in serving the people, and public reputation ceases to be its yardstick, it will inevitably deviate from the proper track," said Yang.

In June, the CPC Central Commission for Discipline Inspection, China's top anti-corruption body, disclosed details of five notable cases in which officials were held accountable for incorrectly implementing governance performance.

In one case, when serving as Party secretary of Wen'an county in Hebei province from 2021 to 2024, Ren Huashan was found by the CCDI to have pursued personal accolades through reckless decisions. Despite being aware of funding shortfalls, he launched multiple urban village resettlement projects without due diligence — delaying housing delivery, stranding villagers and leaving wages unpaid.

In February 2022, Ren also pushed ahead with a tourist attraction despite clear land-use and zoning violations. Parts of the project were demolished in September 2023, incurring huge losses.

For these and other serious violations, Ren was expelled from the Party and dismissed from office. His suspected crimes were transferred to prosecutors for further review.

Wang Chengbing received similar punishment. The CCDI found that, while holding the position of Party secretary in Jinxi county in Jiangxi province, Wang had prioritized economic growth over environmental safeguards by allowing heavily polluting chemical plants to be set up, weakening regulatory enforcement and ignoring persistent public complaints, thereby allowing a pollution crisis to fester.

Yang, from China University of Political Science and Law, warned that these are typical cases of distorted governance values. He said that the cost is not just wasted public funds, but also eroded public trust and a loss of public reputation.

He pointed out that the baseline of a correct governance philosophy is to abide by rules and never lose sight of the people.

"For officials who aim higher, the challenge lies in sharpening their governance know-how, translating national policies into tangible solutions for local communities, and steering growth that lasts," Yang said.

Narrative: Real economic gains stressed

From page 1

What the "China Shock" narrative deliberately ignores is that Chinese-made photovoltaic modules, power batteries and electric vehicles have substantially reduced the cost of global green transition. The International Energy Agency has repeatedly noted that without China's large-scale and sustainable manufacturing capacity, the global energy transition would come at a much higher economic cost.

China's new energy industry did not rise by accident, nor did it grow through unfair means. Its success is the result of decades of research and development, complete industry chains and intense market competition. China's photovoltaic industry, after more than a decade of technological progress, has reduced the cost of solar power generation by more than 80 percent, helping clean energy reach households and businesses around the world. China's electric vehicle industry, driven by breakthroughs in battery technology, intelligent driving and related fields, is reshaping the global auto industry.

These achievements are the result of the hard work of Chinese companies, engineers and researchers. Some Western companies have lost ground in this competition. But instead of reflecting on their own lack of innovation or weak cost control, they blame China for developing too fast. This logic is hard to defend. In a race, when a runner is overtaken, the answer is to run faster, not to demand the runner in front to slow down.

Real dividends

China's manufacturing has brought the world not disruption, but real economic and green dividends. For many years, China has contributed more than 30 percent of global economic growth. Amid rising deglobalization, China's complete industrial system has helped stabilize global industry and supply chains. Its vast domestic market continues to create important opportunities for companies around the world.

In green transition, Chinese wind and solar products have been exported to more than 200 countries and regions. Over the past decade, China has helped push down the global cost of wind power by more than 60 percent and solar power by more than 80 percent. Without China's contribution, global climate governance would be far less advanced than it is today.

This year, the European Union has shown a more negative tendency in its attitude and policies toward China-EU economic and trade relations. Yet China has consistently pursued mutually beneficial cooperation with Europe. China has long been one of the EU's largest trading partners, and bilateral trade has reached historically high levels in recent years. European companies have earned substantial returns from the Chinese market. More than one-third of Volkswagen's sales come from China. BASF, Airbus and other European giants have also continued to expand their investment in China and share in the dividends of the country's development.

The essence of China-EU trade is complementarity and mutual benefit, not one side "shocking" the other. Some European countries have followed the US in hyping the "China Shock" narrative, but this only harms their own interests. Protectionism may give certain industries temporary breathing space, but in the long run, it will leave European companies at a disadvantage in the competition for green transition.

China's new energy technologies and products are helping Europe accelerate its clean energy deployment, which is essential to meeting its carbon neutrality goals. Political forces calling for "de-risking" are in fact increasing risks to Europe's green future. Through cooperation with Chinese companies, European automakers such as Volkswagen and BMW have greatly shortened their development cycle of new models and improved their international competitiveness.

The real shock to the global trading system does not come from Chinese manufacturing, but from Western protectionism. The US frequently uses tariffs as a political weapon, and the EU has followed suit. Such unilateral actions seriously violate World Trade Organization rules and openly undermine the multilateral trading system.

History has shown that attempts to preserve dominance through tariff barriers, technological blockades and "small yards with high fences" cannot succeed. US protectionist measures against Japanese cars in the 1980s did not stop Japanese automakers from expanding globally. Today's efforts to contain China will likewise fail to halt the steady rise of Chinese manufacturing in global value chains.

Seeking to blame

Some Western politicians are playing up the "China Shock" narrative to turn domestic problems into external ones. They seek to blame China for their own industrial hollowing-out, unequal distribution of gains and other structural difficulties, using an external target to divert domestic pressure. This is neither responsible nor effective.

"China Shock 2.0" is, in essence, the "China threat" theory repackaged in a new industrial wrapper, with a policy agenda aimed at industrial containment and trade protectionism in the name of national security.

China's manufacturing rise is the natural result of market competition and technological progress under economic globalization. China's best response is to continue expanding its opening-up, deepening reform and advancing high-quality development, while firmly safeguarding its legitimate rights and interests within the multilateral trading system.

Certain forces in the West should face reality, abandon their Cold War thinking and ideological prejudice and cooperate with China on the basis of fair competition. Only then can global trade develop in a healthy direction and the world economy move toward a stronger recovery.

Smearing China will not slow China's development. Protectionism will not stop the wheel of history. The idea of "China Opportunity 2.0" will ultimately replace the myth of "China Shock 2.0" and become the broader consensus of the international community.

China's cyber governance stance hailed

Push for digital sovereignty, multilateralism can help bridge the AI divide, experts say

By **YANG RAN** and **ZHANG YUNBI**

China's advocacy for digital sovereignty and inclusive development in global cyber governance can help bridge the artificial intelligence divide and foster more inclusive global AI infrastructure and governance, experts said.

Their comments came as China recently submitted its position paper on global cyber governance in the digital age to the Global Mechanism on Information and Communications Technologies in the Context of International Security, the first plenary meeting of which opened at the United Nations headquarters in New York on Monday. The mechanism, established through a resolution adopted by the UN General Assembly in November, is the first permanent, institutionalized multilateral dialogue platform within the UN dedicated to state use of ICTs.

In the paper, China outlined key principles for global cyber governance, including adherence to international rules, respect for digital sovereignty and the need to uphold multilateralism. "Countries should respect each other's digital sovereignty, and they all have the right to independently choose their paths of digital intelligent technology development, including AI, as well as to independently choose AI technologies, products and services in light of their respective national conditions," it said.

Xin Yanyan, deputy secretary-general of the Center for Global AI Innovative Governance based in Fudan University, said that digital sovereignty aims to safeguard every nation's right to independent research and development, thereby fostering truly inclusive and equitable development of technologies such as AI. The practical value lies in dismantling "small yard, high fence" barriers to facilitate open and unimpeded scientific and technological exchanges, she said.

By leveraging responsible open-source ecosystems and fostering independent innovation, countries, especially those in the Global South, can enhance their tech capabilities, bridge the AI divide and protect their data autonomy, Xin said.

Inside

Comment, **page 6**

Digital sovereignty is essential for preserving diversity in the intelligent age, she said. "While AI value alignment must address universal technical risks, it should also respect global cultural diversity, rather than enforcing a singular ideological template," Xin added.

China's position paper highlighted the significance of multilateralism in AI governance, stating that "international governance should not be replaced by small-circle governance, and no country should unilaterally impose rules on others".

Zhang Xin, a professor at the University of International Business and Economics' School of Law, noted that China's stance directly tackles the problem of rule fragmentation in global cyber governance. "It reaffirms a commitment to multilateralism, promoting equal participation of all countries in refining rules," she said.

Zhang underscored the paper's positive impact on developing nations, which often confront "a double dilemma" of digital and security divides. It offers a practical solution on bridging the North-South gap, empowering the Global South's voice in cyberspace governance and enabling developing countries to transition from passive rule recipients to active co-developers, she said.

At a news conference on Wednesday, Foreign Ministry spokesman Lin Jian said that digital sovereignty is a key principle put forward by China. The nation "is willing to strengthen cooperation with all parties to promote the development of the international order in cyberspace toward greater fairness, rationality and effectiveness, and to jointly build a community with a shared future in cyberspace", he said.

Taste: In Yanji, summer begins with sip of icy soup

From page 1

After settling for 48 hours, the concentrated broth is seasoned with sugar and vinegar, then frozen into fine ice crystals.

The recipe also reflects traditional ideas about balancing ingredients. "Buckwheat is considered a cooling food, while beef is relatively warming," Jin said.

Each bowl is topped with pickled cabbage, cucumber, half a boiled egg, beef and seasonal fruit like watermelons in summer, and apples in colder months.

"We make the broth more sour in summer, because it is more refreshing," Jin said. "In winter, we make it sweeter so it feels gentler on the stomach."

In Yanji, cold noodles are often paired with *guobaorou*, crispy sweet-and-sour pork. Some diners dip the freshly fried pork into the icy broth, cooling its crisp coating while adding another layer of acidity and sweetness.

In Yanji, summer does not truly begin with the first heat wave. It begins with the first sip of icy cold noodle broth.

Nation expands imports to share market opportunities

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's expanded import drive for advanced technology and equipment, energy resources and agricultural products will reinforce the country's role as one of the world's largest markets and contribute to more balanced global trade, senior customs officials and importers said on Wednesday.

Speaking at a news conference in Beijing, Sun Meijun, minister of the General Administration of Customs, said that customs authorities will promote more coordinated growth in imports and exports and work to achieve more trade cooperation agreements during the 15th Five-Year Plan (2026-30) period.

The measures will enable more countries to share the opportunities created by China's vast market while offering Chinese consumers a broader range of high-quality products, Sun said, highlighting that the moves will also help develop new quality productive forces and accelerate industrial upgrading.

China's trade with the United States rebounded in April and continued expanding in May and June, indicating that the new positioning of China-US relations has provided greater certainty for bilateral and global trade and economic growth, she added.

Wang Jun, vice-minister of the GAC, said that China has become "a major trading partner of more than 160 countries and regions, with imports now sourced from a broader range of markets, covering a wider variety of products and featuring a more optimized structure".

The nation has recorded robust growth in imports of advanced equipment and key industrial inputs, Wang said, underscoring stronger demand driven by industrial upgrading and technological innovation.

Beijing Customs announced on Wednesday that the value of imports of semiconductor manufacturing equipment surged 124.7 percent year-on-year to reach 23.43 billion yuan ($3.5 billion) between January and June, providing a strong boost to the city's overall import growth.

South China's distribution center for electronic components — a major import hub in Dongguan, Guangdong province, that serves the Guangdong-Hong Kong-Macao Greater Bay Area — handled imports worth 36.47 billion yuan during the January-June period, up 13.11 percent year-on-year, according to Huangpu Customs.

Data from the GAC shows that since the beginning of this year, China has granted market access to 264 categories of agricultural and food products from 79 countries, bringing the number of source countries and regions for such imports to more than 150.

In early May, China expanded its zero-tariff treatment for imports to all 53 African countries with which it has diplomatic relations.

According to Nanjing Customs, Zhongka Supply Chain Management (Kunshan) Co, an agricultural products importer based in Kunshan, Jiangsu province, imported 661 metric tons of coffee, mainly from Africa, in the first half of the year, up more than 100 percent year-on-year.

Qin Yumei, customs affairs manager at Zhongka, said the company mainly imports green coffee beans from African countries such as Ethiopia, Tanzania and Kenya, adding that it plans to further diversify its sourcing by importing from more African countries.

"As more high-quality specialty products from Africa enter the Chinese market under the preferential tariff policy, their price competitiveness will be further enhanced. This will not only enrich China's consumer market, but also create new growth opportunities for importers like us," Qin added.

Women dressed in traditional Thai costumes display durians on May 23 during the opening ceremony of an event in Nanning, Guangxi Zhuang autonomous region, to promote agricultural imports from Thailand. HUANG YANMEI / CHINA NEWS SERVICE

Africa CDC urges action amid rapid Ebola spread

By **SHARON NAKOLA**
in Nairobi, Kenya
sharon@chinadailyafrica.com

The Africa Centres for Disease Control and Prevention warned on Tuesday that the Ebola outbreak in the Democratic Republic of Congo could become one of the worst epidemics in history if urgent measures are not taken to contain its spread.

Speaking during an African Union extraordinary session of the assembly in Accra, Ghana, Africa CDC Director-General Jean Kaseya said the outbreak is spreading at an unprecedented pace amid insecurity, mass displacement and continued community transmission.

More than 1,000 people have died from the Ebola outbreak since May, Kaseya said, warning that the current epidemic is spreading at a much faster pace than previous outbreaks.

"If we don't stop this outbreak today, it will be the worst one that the world will meet," he said.

The warning comes as the DR Congo's Health Ministry reported on Wednesday that the outbreak has so far infected 2,473 people and claimed 999 lives across five provinces, bringing the case fatality rate to 40 percent.

The ministry said 737 patients are in isolation or hospitalization, while 482 people have recovered.

Health authorities said surveillance and response activities have intensified, with over 80 percent of epidemiological alerts now being investigated within 24 hours and contact tracing reaching 81 percent.

Treatment facilities remain operational, with more than 700 patients under follow-up, while multisectoral teams continue to strengthen laboratory services, logistics, infection prevention and control measures, and risk communication activities.

Despite the progress, the Africa CDC warned that major challenges remain. Kaseya said insecurity in eastern DR Congo and the humanitarian situation are significantly hampering efforts to fully contain the outbreak.

"We cannot continue to respond to an outbreak when we are facing insecurity at that level," he said, revealing that one Africa CDC staff member had recently been injured during an attack by armed groups.

Currently, more than 1.15 million people are living in internally displaced persons camps in affected areas, further complicating surveillance and disease control efforts.

Kaseya said the outbreak has spread much faster than previous Ebola epidemics, warning that persistent community transmission remains a major concern. "This outbreak is very serious," he said.

The Africa CDC and the World Health Organization have jointly launched a continental response plan aimed at bringing the epidemic under control.

Kaseya said the response requires about $1.4 billion, including humanitarian and health interventions, though African countries have so far pledged more than $110 million toward the response.

"We need more," he said, calling on additional African governments to contribute resources.

The agency is also advancing clinical trials for Ebola therapeutics and preventive interventions, but still faces a funding gap of about $12 million. "We are working hard because we don't have confirmed medicines and vaccines," Kaseya added.

Greater self-reliance

The outbreak, caused by the Bundibugyo strain of the Ebola virus, has renewed calls for stronger health security systems and greater continental self-reliance in responding to public health emergencies.

African health leaders warned that failure to contain the outbreak could undermine broader efforts to strengthen the continent's health systems and achieve universal health coverage.

"If we don't control this outbreak, everything we are doing today will not make sense," Kaseya said.

The outbreak dominated discussions at the African Union health meeting, with ministers warning that it reinforces the need for greater health sovereignty, domestic financing and local manufacturing of medicines and vaccines.

Ghana's Health Minister Kwabena Mintah Akandoh said the recent health emergencies had shown that "the next emergency must never again find Africa waiting at the back of the queue".

He called for stronger regional cooperation and increased investment in African health systems.

African leaders said the current Ebola outbreak should serve as a wake-up call for the continent to accelerate efforts to build resilient health systems capable of responding to future epidemics without excessive dependence on external support.

Grand reset

Experts praise Beijing's role in bridging global AI divide

Widening gaps risk creating dependency, while China offers alternative approaches

CROSS CURRENTS

By **YANG RAN**
yangran1@chinadaily.com.cn

As artificial intelligence advances rapidly, experts warn that the widening AI divide is becoming a major challenge for the Global South. They say China is helping narrow the gap by promoting more inclusive approaches and expanding practical cooperation.

China's initiatives in AI governance provide the Global South with a greater voice in shaping global AI rules while helping developing countries benefit from the technology, they said.

The divide is already evident. While more than 1 billion people worldwide use AI chatbots every week, the Global South lags "far behind the Global North" in AI adoption, the United Nations said in a report this month.

The International Monetary Fund's AI Preparedness Index underscores the disparity, with advanced economies scoring 0.68, compared with 0.46 for emerging markets and just 0.32 for low-income countries. The gap is largely driven by the Global North's dominance in computing infrastructure and the Global South's limited capacity for AI research and deployment.

The consequences are far-reaching and potentially transformative, as experts warn of a new form of technological dependency and industrial stratification.

"The Global South, home to 88 percent of the world's population, generates highly valuable local scenario data for model adaptation", said Jiang Tianjiao, a research fellow at the Center for Global AI Innovative Governance in Shanghai. "Yet, without the computing power for storage, cleaning and training, these data are often sent abroad for processing."

Jiang cautioned that this could create a future in which data originate in the South, but profits and development gains remain in the North, leaving advanced economies to control foundational AI models such as ChatGPT while developing countries are confined to application-layer fine-tuning and niche local models.

"What appears to be a division of work is, in essence, hierarchical stratification," he said, warning that the trend could also erode local languages and cultures in AI models.

Carlos Maria Correa, executive director of the South Centre, an intergovernmental organization for developing countries based in Geneva, said AI is, above all, a development issue for the Global South.

Persistent and widening digital divides have left many developing countries ill-equipped to govern or benefit from AI, risking "entrenching dependence on external actors for access to AI", he said.

Lawrence Loh, director of the Centre for Governance and Sustainability at the National University of Singapore Business School, warned of AI "lock-ins" that could prevent Global South countries from advancing along the world's AI development path.

Such dependency on the Global North could give rise to a new form of AI colonialism, "where the less-developed countries may be trapped perpetually", he said.

UN data underscore these concerns. According to UN Trade and Development, fewer than one-third of developing countries have national AI strategies, and 118, mostly developing nations, remain absent from global AI governance discussions.

Experts say the challenge is compounded by policies in some countries that prioritize unilateral security and economic interests by erecting technological barriers, further hindering the Global South's development.

Loh criticized the "small yard, high fence" approach, warning it could create "a restrictive AI order" in which Global South countries become technology rule-takers and importers rather than co-creators of standards and AI systems.

Hernan Gabriel Borisonik, director of the Center for Science and Thought at the National University of San Martin in Argentina, said technological walls duplicate efforts and fuel competing standards instead of cooperation to address shared AI risks, such as algorithmic bias.

"At the same time, it would be naive to dismiss the strategic logic behind these fences," Borisonik said. "The path forward is to build a genuinely planetary framework that can create mechanisms for coexistence and mutual influence, even amid competition."

More equitable

Experts say China's AI governance initiatives are playing an increasingly important role in constructing a more equitable global framework. In recent years, China has introduced a series of governance initiatives and action plans aimed at using AI for good, countering unilateral technological monopolies and advancing inclusive global AI governance.

During the just-concluded 2026 World AI Conference in Shanghai, 29 countries signed an agreement to establish the World Artificial Intelligence Cooperation Organization, helping bridge the AI divide by supporting faster AI development in the Global South.

"International cooperation and capacity-building initiatives are key to bridging the global AI divide and promoting inclusive AI development and governance," Correa of the South Centre said, describing the organization's establishment as "very encouraging".

Correa also praised China's AI governance initiatives for enhancing fairness and prioritizing sustainable development, saying they contribute to "a more balanced global AI landscape, fostering mutual benefits and reducing existing inequalities".

Borisonik echoed the view, saying China's initiatives made a crucial contribution to global AI governance by treating it as a shared challenge that must reflect the perspectives and interests of developing countries, not just technological leaders.

China's emphasis on capacity building is especially significant, he said. "AI governance depends not only on legal principles but also on scientific institutions, educational systems and long-term international cooperation. Supporting these capacities is one of the most effective ways to reduce structural inequalities in the global AI landscape."

In recent years, China has expanded practical AI cooperation through infrastructure and talent development. In 2024, it launched the China-BRICS AI Development and Cooperation Center to deepen AI collaboration among BRICS members. Last year, Chinese tech companies also helped Laos develop the world's first Lao large language model.

Alex Gakuru, director of the Center for Law in Information Technology in Kenya, said China's approach differs fundamentally from Western models. "It is not aid-dependent but partnership-based," he said.

He cited the Lao large language model as a prime example, saying its architecture, training data, governance and the Lao government's role reflect "a fundamentally different approach — one centered on sovereignty and self-determination rather than dependency".

"It is the best example of how the Global South could replicate the preservation of their culture in collaboration with China," he said. "The partnership model ensures that linguistic and cultural sovereignty is not sacrificed for technological convenience, and many countries are bound to embrace it."

New British PM begins tackling cost-of-living crisis

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Groups lobbying on behalf of the United Kingdom's poorest people have welcomed Prime Minister Andy Burnham's first moves since he took office on Monday.

Burnham, who has vowed to lead a "cost-of-living government", told his new Cabinet on Tuesday that impoverished people struggling with fast-rising prices need a "sense that help is coming".

He then announced he was cutting Value Added Tax from October on household energy bills — from 5 percent to zero — a move that will save the average family 45 pounds ($60) a year.

Burnham's spokesman told reporters that the change will cost the country 850 million pounds this year and would be funded out of 1.8 billion pounds set aside for a digital ID program.

Burnham told his ministers to look for savings to help pay for initiatives to ease the cost-of-living crisis.

"There are things that can be done, big and small," he said.

He also set aside 340 million pounds to help tackle homelessness during the next five years.

On Wednesday, he said bus fares in England will be capped at 2 pounds a journey from January. Previously, the cap had been 3 pounds.

The cheaper fares will cost the country around 500 million pounds, which will be taken from the budget of the Department for Energy Security and Net Zero.

Heidi Alexander, the UK's transport secretary, told the BBC that the government will not make "any unfunded spending commitments".

To finance cheaper bus fares, she said the government will shift its overseas aid strategy — offering loans rather than grants to climate projects in other countries.

Burnham has also promised to help more young people find work and vowed more mental health support.

Alex Chapman, economics and environment policy chief at the London-based think tank New Economics Foundation, welcomed the new prime minister's stated aims but said his first moves have been "very small in government terms".

"The actual scale of this is very limited," he said.

Homelessness charities also welcomed Burnham's pledge to put "the care of people at the heart of everything I do" and to "fix" rough sleeping.

With around 5,000 people thought to be sleeping rough in the UK each night, Helen MacNamara, chair of trustees at the homelessness charity Shelter, told The Independent newspaper, "It's great to see a prime minister standing on the steps of Downing Street, and that the first thing he says is talking about ending rough sleeping and his commitment to building council housing."

Describing rough sleeping as "one of the pestilences of our age", she said Burnham will also need to solve "hidden homelessness", which means 176,000 children do not have a permanent place to live.

Yvonne Hope, chief executive of the Manchester-based homelessness charity Barnabus, added, "If anyone's going to do it, it will be him."

Resource cooperation urged

By **MINGMEI LI**
at the United Nations
mingmeili@chinadailyusa.com

The international community should strengthen cooperation to improve natural resource governance, safeguard the stability of global resource supply and industrial chains, and contribute to international peace and development, China's envoy to the United Nations said.

The UN Security Council held a high-level open debate on the theme "Natural resource governance: the foundation of peace, security and prosperity" on Wednesday, exploring how inclusive, transparent and sustainable natural resource governance can help reverse conflict dynamics and strengthen conditions for peace.

"Natural resources are precious gifts bestowed by the Earth on humanity and constitute the material foundation for human survival and sustained economic and social development. However, conflicts in some regions demonstrate that resource abundance does not automatically bring development and prosperity, while poor governance may trigger and fuel violence and conflict," said Sun Lei, charge d'affaires ad interim of the Permanent Mission of the People's Republic of China to the UN.

Peace and stability are the solid guarantee for natural resource governance, the Chinese ambassador said.

"The international community should uphold a vision of common, comprehensive, cooperative and sustainable security, remain committed to the peaceful settlement of disputes, urge parties to conflicts to cease military confrontation, support regional countries and organizations in strengthening cooperation, jointly combat the illegal exploitation and smuggling of natural resources, enhance supply chain transparency and traceability, and cut off armed conflicts' access to natural resources at the source," he said.

Sun added that the causes of armed conflict are "complex and diverse", involving political, social and economic factors.

"Natural resources should not simply be regarded as the root cause of conflicts; still less should normal economic, trade and industrial cooperation be securitized, politicized or instrumentalized," Sun emphasized.

Sun also said that fairness and justice are important prerequisites for cooperation on natural resources.

"International law grants states permanent sovereignty over their natural resources, and this principle must not be challenged. Certain countries should stop seizing the resources of other countries through sanctions, pressure and military coercion, and must not revert to colonial domination and plunder. Developing countries have the right to make full use of their natural resource endowments to achieve economic and social development," he said.

Sun added that China supports building an open, inclusive, fair, equitable, cooperative, win-win, green and clean governance system for critical minerals. He also warned that using the pretext of so-called "de-risking" or "safeguarding national security" to pursue bloc confrontation and build exclusive "small circles" will only disrupt market order and undermine the common interests of all countries.

Sustainable development is the ultimate goal of natural resource development, Sun added.

"Facts have repeatedly shown that the persistent problem of the illicit exploitation of natural resources is rooted in poverty, unemployment and underdevelopment. To break the vicious cycle between natural resources and conflict, it is essential to support the countries concerned in achieving independent and sustainable development," he said.

Sun also called on the international community, especially developed countries, to fulfill their assistance commitments and support resource-rich countries, especially developing countries, in continuously improving their resource governance systems and increasing the added value and returns of resource products through technology transfer, capacity-building, talent development and industrial upgrading, thereby reducing poverty, creating employment, truly benefiting local people, and building a stronger foundation for peace.

Sun mentioned that at the G20 Summit in 2025, China put forward the International Economic and Trade Cooperation Initiative on Green Mining and Minerals to promote the establishment of a new type of mineral-resources partnership featuring openness, win-win cooperation, fairness and equity.

"China stands ready to work with the international community to deepen mutually beneficial cooperation on natural resources, better help relevant countries transform their resource endowments into drivers of development, and embark on a path toward lasting peace, stability, development and prosperity," he said.

White House readies fresh tariffs as 10% levy to expire

WASHINGTON — The United States is set to impose new tariffs that could hit dozens of countries soon, trade envoy Jamieson Greer signaled on Tuesday, with President Donald Trump's temporary global levies due to expire this week.

The administration has prepared fresh tariffs targeting 60 trading partners over their alleged failures to act against "forced labor", as officials push to rebuild the US leader's trade agenda after legal setbacks.

"We expect to see some action soon," Greer told CNBC when asked if new duties were incoming. He did not specify a timeline.

Trump imposed a 10-percent global duty this year after many of his tariffs were struck down by the Supreme Court in February, but this levy expires on Friday.

Analysts expect that new tariffs over forced labor concerns — set between 10 percent and 12.5 percent — would replace these temporary duties.

They come as Trump makes a renewed push to use tariffs as leverage against US trading partners, sparking fears of retaliation and diplomatic tensions.

Washington announced a fresh 25-percent duty on certain Brazilian goods last week, and on Monday unveiled a 50-percent levy on many Canadian products to take effect in 30 days.

Canada Prime Minister Mark Carney takes questions from journalists after making a statement in Ottawa on Tuesday. Carney said on Tuesday that he was looking at "all options" amid the latest tariff tensions with the US. JUSTIN TANG VIA AP

Canadian Prime Minister Mark Carney said on Tuesday that he was looking at "all options", adding that he and Trump had agreed to "intensify discussions" in the coming weeks on a possible deal.

On Tuesday, Trump announced a new 100 percent sector-specific tariff on imported generic drugs to take effect from August 2028, with that level rising to 200 percent in 2029.

Generic drugs

For now, the US leader said the tariff on generic drugs would be cut to zero from August 2026, in an effort to create a window to onshore such pharmaceutical production to the United States.

Swiss generic drugmaker Sandoz said on Wednesday it would continue discussions with policymakers.

Greer said on Tuesday that new action will cover the majority of US trade, with the moves likely to reignite trade tensions.

The EU previously said that it considers tariffs imposed on these grounds "unjustified".

Washington's planned 50-percent tariff on Canada also comes as US-Mexico talks over a North American free trade pact intensify. Washington recently declined to extend the accord in its current form.

Greer is set to travel to Mexico from Wednesday to Friday for discussions linked to a joint review of the US-Mexico-Canada Agreement.

US plans for a 25-percent tariff on Brazilian goods over accusations of unfair trade practices have separately drawn a sharp rebuke from the Latin American giant. The levy is due to take effect on Wednesday.

A range of products like beef, coffee and certain aircraft parts will be exempted, as will some goods that the United States does not produce.

Still, Amcham Brasil recently warned that Washington's measure places Brazil among countries "facing the most restrictive conditions for access to the US market", affecting more than $11 billion in exports.

Motorists weary of rising gas prices as crisis spirals

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

US motorists are growing weary of paying higher gas prices again after renewed military tensions between the US and Iran stoked fears of a disruption in the Strait of Hormuz and gas prices rose to over $4 per gallon, or more than $1 per liter, this week.

The national average for regular gasoline was $4 a gallon on Monday, according to the American Automobile Association, rising 13 cents per gallon, or 3 percent, over the past week amid tensions in the Middle East. It is the first time the national average hit $4 since June 17, and it comes despite the June US-Iran memorandum of understanding to stop the military conflict and a 60-day negotiation period.

Sanjay Patel, 70, from Manhattan, was filling up his white Mercedes-Benz SUV at a gas station in Brooklyn, New York when he expressed how annoyed he was at the rising price of gas. He said he was paying over $4 at the location, as it was $4.15 for regular, $4.55 for silver and $4.95 for diesel.

"I want it to go back below $4," Patel told China Daily, while blaming the rise in gas prices on the ongoing war with Iran. "Well, it's because of the war, they block the Strait of Hormuz, with all of that there's no supply. I think all of the world is suffering because everywhere it is high. But America has enough oil, but they are not really distributing it to the public.

"The government should end the war. That is most important. Secondly, they have to make sure all these big oil companies, BP, Shell and ExxonMobil should not be focusing on selling the oil outside of the country. America is in a war. I have to pay more to fill up the tank. A full tank is $60."

Brian James, 55, from Brooklyn, New York, drives a black Jeep Wrangler.

He told China Daily: "Gas prices are ridiculous right now. Seriously. It costs $90 for me to fill up this car. In the past, it was $70. Instead of being able to buy certain things or save money, then you have to outlay in transportation. It's taking a hit on everyone.

'Govt to blame'

"I blame the government. They're making it hard for everyone right now, we're spending money where we shouldn't have to. The oil companies are passing on the costs to the customer. I remember when the gas price was in the three-dollar range, like $3.60 or whatever."

In March, shortly after the US-Israel attacks began on Iran, gas prices in the US hit an average of $4 a gallon.

In May, they were $4.50 a gallon, then they dropped back down to $4 after the US and Iran agreed to the MoU in mid-June.

US drivers got some relief by early June, when prices at the pump were $3.79, the American Automobile Association found. But they have gradually crept back up this month.

For most motorists, especially those who rely on their vehicles for work, lower gas prices cannot come back soon enough.

Sulaiman, 31, an Uber Eats delivery driver, was filling up his small motorbike at a gas station in New York and checking his phone on his way to deliver food to a customer.

"I'm so busy, I have to deliver this food," he told China Daily. "Higher gas prices make it harder for people like me who need to earn money as more of my money goes toward transportation costs. I just wish they'd make things better for all of us out here working hard."

Briefly

UKRAINE

President says military commander replaced

Ukrainian President Volodymyr Zelensky announced on Tuesday that he has decided to replace the country's top military commander. In a post on Telegram, Zelensky said Mykhailo Drapatyi would become the commander in chief of the Ukrainian Armed Forces, replacing Oleksandr Syrsky. Syrsky's dismissal was one of the demands of the recent protests in Ukrainian cities, which erupted after the removal of Defense Minister Mykhailo Fedorov.

UNITED STATES

Stripping immigrants of work permits blocked

A federal judge on Tuesday temporarily blocked President Donald Trump's administration from stripping tens of thousands of asylum seekers and immigrants who have Temporary Protected Status of their ability to work in the United States. US District Judge Nathaniel Gorton in Boston sided with a coalition of immigrant rights groups and labor unions that sued to block US Citizenship and Immigration Services from moving forward with a series of policies designed to implement new restrictions enacted by Congress last year.

Disney cuts jobs in cost-control efforts

The Walt Disney Company laid off several hundred employees on Tuesday in its latest round of job cuts, as the entertainment giant continues to streamline its operations with fewer projects, tighter budgets, and a more integrated corporate structure. A Disney spokesperson confirmed the cuts, saying the company was eliminating several hundred jobs across corporate functions, Disney Entertainment Television, ESPN and Disney's studios. Disney did not immediately disclose exact totals by division or say whether additional job cuts are planned.

SOUTH KOREA

Seoul mayor faces ouster after conviction

A South Korean court convicted Seoul Mayor Oh Se-hoon of campaign finance crimes on Wednesday, a ruling that will oust him and bar a presidential run if upheld by the nation's top court. Oh was first elected Seoul's mayor in 2006 and in June won a fifth term in the nation's most powerful municipal role, considered a springboard to high office. He rose to prominence as a possible contender for the opposition People Power Party as other veterans were tainted by former President Yoon Suk-yeol's 2024 martial law bid. But the Seoul Central District Court ruled Oh had a patron pay 21 million won ($14,200) for five of his opinion polls in a 2021 by-election, breaching the political funds act.

COMMENT

Editorials

China-ASEAN cooperation remains crucial anchor of regional stability and prosperity

This week's ASEAN Foreign Ministers' Meeting and related gatherings in Manila have placed the Philippine capital at the forefront of geopolitical discussions.

Amid the crowded diplomatic calendar, one reality is evident: China's engagement with the Association of Southeast Asian Nations remains focused on strengthening regional cooperation.

Apart from the China-ASEAN Foreign Ministers' Meeting on Wednesday, Chinese Foreign Minister Wang Yi also had a series of bilateral meetings in Manila covering a wide range of issues.

The meeting between Wang and US Secretary of State Marco Rubio was conducive to both sides jointly managing their differences and exploring potential areas of cooperation, thereby sustaining the momentum of stabilizing Sino-US ties.

As ASEAN chair this year, the Philippines claims it prioritizes regional unity and security, while also commemorating the 50th anniversary of the Treaty of Amity and Cooperation in Southeast Asia. The anniversary is an opportune time to reflect on how ASEAN should uphold its strategic autonomy and consider who its true partners are.

China was the first major country to accede to the TAC, lending international weight to ASEAN's diplomatic architecture. This year also marks the fifth anniversary of the China-ASEAN Comprehensive Strategic Partnership, providing an opportunity to further deepen cooperation through the 65 established mechanisms that already bind the two sides. The China-ASEAN partnership continues to be an anchor for the region's stability and prosperity.

Wang's meetings in Manila reinforced that. In talks with ASEAN Secretary-General Kao Kim Hourn, both sides reaffirmed their support for ASEAN centrality, regional community-building and stronger cooperation across various sectors. Wang's discussions with Malaysian Foreign Minister Mohamad Hasan focused on accelerating the negotiations on a Code of Conduct in the South China Sea, reflecting a shared interest in ensuring that regional security issues are addressed by regional countries themselves.

This approach contrasts with the course pursued by some in Manila in recent years. While presenting the Philippines as a "champion" of "regional unity", they have increasingly sought to align the country's security policy with external parties. Frequent maritime provocations in the South China Sea, including the latest incident in waters near China's Ren'ai Reef on Monday, have heightened tensions at a time when most ASEAN members continue to prioritize regional stability.

Equally contentious have been the repeated attempts by those Philippine politicians to link the COC negotiations to an unlawful "arbitral award". If they are genuine in their claim that they seek ASEAN's "collective welfare", they should call on Washington to handle the Middle East crisis with reason, restraint and pragmatism — especially as energy shortages continue to plague the Philippines and its fellow ASEAN members alike.

China's engagement with ASEAN offers a different model. As ASEAN's largest trading partner and the first country to establish a free trade agreement with the organization, China has steadily deepened economic integration with ASEAN and upgraded the China-ASEAN Free Trade Area. Bilateral trade reached 7.55 trillion yuan ($1.06 trillion) in 2025, up 8 percent from the previous year. Over 95 percent of traded goods between them now enjoy zero tariffs, while cooperation has expanded to encompass the digital economy, green development, advanced manufacturing and regional connectivity.

Beijing does not ask ASEAN countries to choose sides. Nor is the development of China-ASEAN relations directed against any third party. Instead, China supports ASEAN centrality and strategic autonomy, recognizing that regional prosperity hinges on openness, inclusiveness and mutually beneficial cooperation.

Even with the Philippines, China has shown restraint and composure. Despite their maritime dispute, China has not allowed that to define the entirety of the China-Philippines ties, and has consistently called for dialogue to resolve it. Wang's discussions with his Philippine counterpart offered a timely chance for the two sides to manage tensions and prevent the situation in relevant waters from further escalating.

The South China Sea is a shared home for regional countries, and the dispute should not become a stumbling block to China-ASEAN relations. China is ready to work with the ASEAN members, including the Philippines, to accelerate the consultations on the COC in the South China Sea, fostering a new narrative of peace, stability, cooperation and friendship in the waters, and keeping the initiative for regional affairs firmly in the hands of regional countries.

While contemplating ASEAN's future, regional leaders should judge partners by their contribution to peace, economic opportunity and long-term regional stability. On that measure, sustained cooperation with China remains a firm foundation for ASEAN's solidarity and prosperity.

Fighting while talking won't benefit EU

The joint statement released after a meeting between French President Emmanuel Macron and German Chancellor Friedrich Merz on Friday shows the challenges facing China-EU economic relations.

Both leaders claimed that China's widening trade surplus with the European Union — at "1 billion euros ($1.14 billion) a day" — along with what they described as an "undervalued renminbi", poses an "existential threat" to European manufacturing. It remains to be seen what new "emergency measures" the EU will come up with to "shield" European industry from what it claims are China's "unfair trade practices".

However, a series of restrictive measures introduced by the EU targeting Chinese enterprises suggest a bumpy road ahead for the healthy development of China-EU economic ties.

On July 1, the new European "safeguard" system for steel imports came into effect, introducing lower import quotas for duty-free imports and a 50 percent tariff on imports exceeding these quotas, greatly impacting Chinese steel mills and products. On July 7, the European Commission imposed definitive "antidumping" duties of up to 45 percent on imports of passenger-car and light-lorry tires originating from China.

Additionally, the European Commission on Monday fined Chinese online retailer AliExpress 550 million euros for allegedly "failing to curb the sale of counterfeit goods" on its site, marking the heftiest penalty issued to date under the Digital Services Act. China opposes the EU's practice of erecting digital barriers under the pretext of platform regulation and adopting discriminatory measures to restrict and suppress the normal operations of Chinese e-commerce companies in Europe, said a spokesperson for China's Ministry of Commerce. The EU is urged to stop exploiting the ambiguity of legal provisions to abuse its discretionary power, and to treat Chinese enterprises fairly and impartially.

It is obvious that the EU is taking more protectionist measures against China. The escalating restrictions have occurred shortly after the inaugural meeting of the China-EU trade and investment consultation mechanism late last month, during which both sides agreed to remain committed to addressing economic and trade differences through dialogue and to preventing disputes from escalating into a trade war. They established four initial work streams under the mechanism to further discuss issues such as trade and investment balance, export controls and intellectual property.

It is imperative that China get prepared to deal with the EU's dual strategy of "dialogue" and "pressure" in the long run. The message from French and German leaders suggests the EU may consider a major adjustment of trade policies toward China. Despite this, both leaders emphasized that they are not seeking to "decouple" from China.

In his meeting with a cross-party European Parliament delegation in Beijing on Tuesday, Foreign Minister Wang Yi stressed that China and the EU are partners rather than rivals, and that their interests are deeply intertwined. He called for the EU to stop politicizing economic and trade issues, and to work with China for an upward and dynamic balance of trade from a long-term perspective.

These remarks keep the door open for China and the EU to maintain a constructive, cooperative and win-win relationship based on equality and reciprocity — provided that the EU is willing to meet China halfway, manage differences, broaden consensus and safeguard an open global economy.

There is a need for the two sides to make full use of the established trade and investment consultation mechanisms to bring issues to the table openly and address them with a pragmatic and rational approach. The primary objective is to prevent the European side from adopting a nothing-to-lose mentality, where, driven by internal political pressures, it shifts internal contradictions outward rather than resolving them constructively.

Hopefully both France and Germany can act with a rational and practical attitude, and play a constructive role in helping the EU work with China to address their concerns through dialogue.

Opinion Line

Building a community with shared future in cyberspace

The Chinese delegation submitted a position paper on global cyberspace governance at the first meeting of the Plenary Session of the Global Mechanism on developments in the field of information and communication technologies in the context of international security.

The submission of the position paper at the forum, which is being held at the United Nations Headquarters in New York from Monday to Friday, reflects China's anchoring of digital security on the principles of data sovereignty and cyber sovereignty.

The paper articulates a natural and logical extension of the Global Governance Initiative that China has proposed, along with its long-standing commitment to building a community with a shared future in cyberspace.

The core tenet of the paper rebuts the approach of some developed countries that want a digital ecosystem as an unregulated domain where might makes right, and where they can coerce smaller nations to choose sides over AI hardware, cloud infrastructure and data standards.

China's position paper, on the contrary, enshrines a foundational right long demanded by developing countries: the autonomy to chart their own digital and AI development courses. No country should be pressured into adopting foreign AI products or algorithms; every nation deserves the freedom to make its own choices, free from technological arm-twisting.

At the heart of this vision lies China's steadfast adherence to mutual respect for national sovereignty and the fundamental norm of noninterference in the domestic affairs of other states. China calls for collective management of the cybersecurity risks posed by AI — from unregulated large language models to the misuse of autonomous AI agents — and demands updated, inclusive international cyber rules fit for the age of generative intelligence.

With digital domains — cyberspace, data pools and frontier AI — becoming a new arena for interstate competition, China advocates extending the UN-centered norms of fairness, peaceful development, civilizational diversity and collective sustainability to technology governance. This stands in unmistakable contrast to the zero-sum approach of certain Western countries.

The Chinese suggestions align with the priorities of a vast majority of countries, especially those in the Global South whose voices have too often been marginalized in decades of technology rulemaking.

The contrast between China's open source, open weight AI models and the United States' closed source AI ecosystem offers a real-world illustration of these two paradigms. Washington's closed source AI model consolidates AI supremacy in the hands of a few tech giants aligned with the US government, restricts the diffusion of global technology, and weaponizes technological scarcity to maintain Western dominance in global digital competition.

China, on the other hand, by prioritizing shared innovation and universal accessibility, is breaking down technological monopoly barriers and enabling developing countries to access and iterate on frontier AI technologies independently. This approach transforms the advancement of AI from a privileged asset for a handful of nations into a global public good benefiting all of humanity.

China's thriving digital economy and competitive AI industry ecosystem have equipped it to counter the monopolization of technological discourse and standard-setting by developed countries. Beijing harbors no ambition to dominate cyberspace; its objective is to prevent digital and AI tools from becoming new geopolitical battlegrounds and to ensure that the dividends of the new technology are distributed fairly across the world.

This commitment was demonstrated at the recent 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, held in Shanghai, which showcased China's dedication to providing solutions and international public goods to ensure openness, cooperation and shared technological progress for the benefit of all nations.

— LI YANG, CHINA DAILY

What They Say

Virtual human could revolutionize medicine

Editor's note: *As artificial intelligence becomes increasingly integrated with the life sciences, virtual reality has emerged as a major frontier of scientific research. Science and Technology Daily spoke to Zhao Qinping, an academician of the Chinese Academy of Engineering, on the pursuit of a virtual human for medical purposes. The views don't necessarily represent those of China Daily.*

The improvement in visual realism, physical accuracy, intelligent virtual characters and natural human-computer interaction has greatly expanded the application potential of virtual reality.

In healthcare, AI assists or even replaces physicians in diagnosing and treating diseases, while VR helps create virtual replicas of patients' organs or pathological conditions. Surgeons can rehearse, evaluate and refine surgical plans on these virtual organs before performing operations on real patients.

But the application of VR in medicine still lags behind the potential. The basic obstacle is the lack of a medical virtual human capable of accurately reproducing the features, physical properties and physiological characteristics of the human body.

Medical science has long faced three major challenges. First, the training of highly qualified medical professionals still depends on laboratory animals and human cadavers, a traditional approach that is becoming increasingly unsustainable. Second, there is still no effective method for rehearsing, evaluating and optimizing surgical plans before operations. Third, the development of new drugs and medical devices also relies on animal testing and human volunteers, resulting in high costs, lengthy development cycles and considerable risks.

A medical virtual human could provide medical students with highly realistic digital models of healthy and diseased human bodies for anatomical education, surgical training and other clinical exercises, substantially reducing reliance on animals and cadavers.

Personalized virtual models of patients' organs could be created to simulate, evaluate and refine surgical procedures, improving both precision and success rates. Virtual humans could also replace some animal experiments and early-stage human testing in the development of pharmaceutical drugs and medical devices, shortening research and development cycles while reducing costs and risks.

However, research on virtual humans is fragmented and lacks a coherent, systematic framework. While some areas have received considerable attention, others remain largely unexplored. Currently, digital models have been developed for fewer than 20 percent of human organs, with research primarily focusing on geometric modeling, physical simulation and surgical interaction.

Studies of microscopic physiological mechanisms remain disconnected from organ-level physical and physiological modeling, and integrated research at the level of the entire physiological system has yet to begin. At the same time, China lacks sufficient data to support the development of medical virtual humans, with much of the current research relying on overseas datasets.

Developing a medical virtual human is a frontier endeavor that brings together information science, life sciences, medicine, mathematics, physics and chemistry. It requires multidisciplinary collaboration among experts from these fields to jointly build a comprehensive "Chinese medical virtual human".

The relevant authorities should organize universities, research institutes, hospitals and technology companies to establish a high-level collaborative network that integrates studies of human cells, tissues, organs and physiological systems while coordinating theoretical breakthroughs, technological innovation and demonstration applications.

Meanwhile, full use should be made of AI foundation models to build dedicated data and model centers, together with the computing infrastructure needed to support the development of medical virtual humans.

VIEWS

Tommy Koh

China, ASEAN forging a brighter future

China and the Association of Southeast Asian Nations celebrated the 35th anniversary of their dialogue relations in July, marking a significant milestone in what has been a very successful relationship. In 2021, this relationship was elevated to a Comprehensive Strategic Partnership. On this momentous occasion, I would like to reflect on the past, assess the present and share my aspirations for the future.

Global Lens

ASEAN was established on Aug 8, 1967, during a period when China's relations with Southeast Asia were complex. Initially, China was cautious about ASEAN, perceiving the grouping as aligned with Western interests.

However, under the leadership of the late leader Deng Xiaoping, China adopted a more constructive approach toward ASEAN. Deng introduced a new forward-looking policy that positioned China as a "good neighbor, good friend and good partner" of ASEAN. This vision laid the foundation for decades of cooperation and mutual benefit between China and ASEAN.

What is the state of the China-ASEAN relationship today? The short answer is that it is in good order. In fact, it is one of ASEAN's most consequential dialogue partnerships.

ASEAN is important to China for several reasons. First, the group has overtaken the European Union and the United States to become China's largest trading partner. ASEAN boasts a market of around 700 million consumers, with rising incomes and purchasing power.

Second, ASEAN welcomes investment from China. In 2024, China was the third-largest investor in ASEAN, behind the US and the European Union. There is potential for China to invest more in ASEAN.

Third, ASEAN is a major source of raw materials for China. It also supplies components for China's manufacturing industries.

Fourth, some of the world's most important sea lanes, such as the Straits of Malacca and Singapore, lie in the region. Access to these sea lanes is critical for China.

Fifth, both China and ASEAN share a commitment to upholding the rules-based regional architecture. They are working toward an effective and substantive Code of Conduct in the South China Sea. While differences remain, the CoC negotiations provide an invaluable platform for sustained dialogue and confidence-building.

LI MIN / CHINA DAILY

Sixth, ASEAN maintains friendly relations with China and has refused to participate in any anti-China coalition or grouping. This is especially important given the heightened geopolitical rivalries and the increasingly challenging external environment.

Emerging areas of cooperation, such as the ASEAN Digital Economy Framework Agreement and the ASEAN Power Grid, offer further opportunities.

For ASEAN too, China is equally important. Trade is the lifeblood of the region, and China is the largest trading partner for ASEAN countries, besides being a source of investment and frontier technologies. China is also the largest source of tourists for a region where tourism is an important pillar of the economy.

China has helped ASEAN member states upgrade their infrastructure and enhance regional integration and connectivity, with initiatives such as the Asian Infrastructure Investment Bank and the Belt and Road Initiative playing key roles. Emerging areas of cooperation, such as the ASEAN Digital Economy Framework Agreement and the ASEAN Power Grid, offer further opportunities.

Moreover, China has consistently supported the central role that ASEAN plays in convening and chairing the various forums of the region, such as the East Asia Summit, ASEAN Regional Forum, and ASEAN Plus Three. It is important that China continues to work with ASEAN in advancing the ASEAN Outlook on the "Indo-Pacific", as this will help build strategic trust and ensure an open, inclusive regional architecture.

The future of China-ASEAN relations is bright. The two sides should expand their cooperation agenda to include new areas such as the green economy, the digital economy, supply chain resilience and artificial intelligence. They should continue to expand flight connectivity to facilitate closer people-to-people links. Building on this, both sides should also enhance their existing cooperation in education, training, cultural exchange and people-to-people exchange. Many more ASEAN students should be studying in China and Chinese students studying at universities in ASEAN.

Both sides should also work to build mutual trust. Trust is very important, because it can make many joint endeavors possible. Without trust, even well-intentioned cooperation will struggle to succeed.

A final word about the role of Singapore. In 2027, Singapore will serve as the chairman of ASEAN.

We will use our chairmanship to raise ASEAN's engagement with external partners to an even higher peak, including the China-ASEAN relationship.

The author is an ambassador-at-large at Singapore's Ministry of Foreign Affairs.
The views don't necessarily reflect those of China Daily.

Ma Zhongfa

What the LV case means for trademark protection

A trademark dispute now before the Beijing Intellectual Property Court (BIPC) could help clarify one of the most important questions in China's trademark system: Where should the boundary lie for the registration and protection of commercial brands derived from public cultural elements?

On July 16, the BIPC heard an administrative trademark lawsuit filed by Louis Vuitton Malletier against the China National Intellectual Property Administration, with Huang Minyao, a clothing business operator from Shantou, Guangdong province, as a third party.

A four-petal floral design trademark that Huang applied for is deemed by LV to be confusingly similar to its iconic monogram pattern.

The dispute arose after CNIPA rejected LV's challenge to the petal-shaped trademark registered by Huang.

It is the sixth trademark lawsuit LV has filed against CNIPA, having won three and lost two of the previous five cases.

Unlike the earlier high-profile dispute between LV and Shenzhen-based Molly Tea Catering Management, this is not an infringement case but an administrative lawsuit that challenges the legality of a regulatory decision.

The two cases are deeply connected in legal principle, but administrative trademark disputes differ fundamentally from infringement lawsuits in nature, subject matter, and standards of proof.

Infringement litigation determines whether conduct falls within the scope of an exclusive trademark right, whereas administrative litigation examines the legality of decisions made by trademark authorities on registration applications, oppositions, or invalidation requests.

This means BIPC will not rule on whether Huang infringed LV's rights, but will review whether CNIPA properly applied the current Trademark Law provisions concerning distinctiveness, similarity, well-known trademark protection, and public interest reservations when it rejected LV's plea for invalidation.

Regulators must prevent market players from privatizing commonly available design resources through registration and obstructing other operators' fair use of cultural elements.

This requires the court to return to the authorization conditions under the Trademark Law.

Under the current provision, signs consisting solely of generic names, graphic elements, place names, or other features lacking inherent distinctiveness — including public cultural resources such as traditional patterns, natural imagery and geometric designs — shall not be registered unless they have acquired distinctiveness through use and become readily identifiable with particular goods or services.

If the disputed trademark involves public cultural elements such as traditional patterns or natural floral designs that typically possess weak inherent distinctiveness, the court will focus on whether CNIPA fully considered this factor and rigorously examined evidence of acquired "secondary meaning".

Public reaction to the LV-Molly Tea infringement case has already demonstrated widespread concern over attempts to register and monopolize traditional motifs such as the four-petal flower or Baoxiang patterns.

At the authorization stage, the issue is even more fundamental: If public cultural elements inherently lack distinctiveness and the applicant fails to prove that the symbol has acquired an independent identity distinct from its public-domain meaning, is administrative approval justified in the first place?

Trademark law is not meant to enclose public cultural resources as private property through registration, but to protect commercial identifiers that distinguish goods or services and thereby promote fair competition.

For traditional cultural elements that have public interest, trademark examination should adopt a prudent stance.

Regulators must prevent market players from privatizing commonly available design resources through registration and obstructing other operators' fair use of cultural elements.

On the other hand, they must respect the goodwill accumulated by enterprises through creative transformation and sustained commercial use.

The key lies in balancing "distinctiveness" against "public domain preservation" without lowering examination standards for auxiliary graphic elements simply because an applicant has a formidable reputation in other product categories.

In this case, LV may argue that its well-known trademark deserves cross-class protection.

However, China's Trademark Law and related judicial interpretations clearly state that the recognition of a well-known trademark should follow the principles of "case-by-case determination" and "protection as needed".

Cross-class protection is justified only if there is evidence that the public would be misled and the registrant's interests are likely to be damaged. In this administrative proceeding, the court needs to determine whether CNIPA correctly applied this standard.

It is worth noting that the protection of well-known trademarks cannot extend indefinitely.

Even if some LV trademark symbols enjoy extremely high reputation, it does not automatically mean that every separately registered graphic element — particularly those resembling public cultural motifs — enjoys the same level of protection across all categories.

Judicial review should guard against "goodwill spillover", whereby a brand's overall reputation is indiscriminately poured into each registered element, thereby improperly extending the exclusivity of the trademark.

Although this is an administrative case, its ruling will have a significant effect on similar cases in the future.

The judgment should accomplish three objectives: First, it should strictly examine the source of distinctiveness of the disputed mark, distinguishing inherent distinctiveness from acquired distinctiveness, and ensure that the natural recognizability of public cultural elements is not mistaken for the trademark owner's original contribution.

Second, it should accurately apply the principle of "protection as needed" for well-known trademarks and prevent the abuse of cross-class protection.

Third, it should fully address public interest considerations in its reasoning, clarifying the protection boundaries for trademarks comprising public cultural elements and leaving adequate room for fair use by the public and other market entities.

A trademark right is essentially a tool for market identification, not a shackle on cultural resources.

As China continues strengthening intellectual property protection while fostering a fair and competitive business environment, safeguarding the public domain at the trademark authorization stage becomes increasingly important.

Traditional patterns, natural imagery, and geometric designs should remain part of humanity's shared treasury of creativity rather than become legal barriers enabling a handful of enterprises to monopolize markets.

The BIPC ruling may well provide a landmark answer on how China's trademark system can balance private incentives with public interest.

The author is a professor of International Law at Fudan University Law School.

Li Tianguo

Aligning ambitions of economic integration in Asia-Pacific

Most cherry trees in China are dormant in the winter due to the cold. Yet supermarkets across the country are stocked with boxes of glossy, wine-colored cherries during the season.

The luscious fruit is imported in large quantities from Chile, about 20,000 kilometers away in South America, to fill the seasonal supply gap and drive down prices at that time of the year. The huge supply and relatively affordable prices make cherries a popular treat in China around the Spring Festival holiday.

The popularity of Chilean cherries in China is thanks to their bilateral free trade agreement, under which most goods enjoy zero-tariff treatment.

The journey of Chilean cherries across the Pacific reflects the vitality of free trade and economic integration in the Asia-Pacific. Interestingly, though China and Chile enjoy a high-standard bilateral free trade relationship, they are signatories to different regional trade agreements.

China is a member of the Regional Comprehensive Economic Partnership, while Chile is part of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership.

RCEP and CPTPP are two major pillars of the Asia-Pacific's economic and trade architecture. Many regional economies are part of either one or both agreements.

Within each trade pact, member economies have seen their tariffs slashed and the cost of cross-border trade and business reduced.

But the two trade agreements cover different regional economies and have distinct rule frameworks.

To promote a free flow of resources across the Asia-Pacific, it is necessary to integrate their rules and work toward a unified free trade area that covers more regional economies.

This has long been a goal of the Asia-Pacific Economic Cooperation forum.

An important milestone was reached in 2014, when APEC members adopted a road map for the realization of the Free Trade Area of the Asia-Pacific, or FTAAP, at the meeting of economic leaders in Beijing, turning the long-term vision into a concrete action plan.

For many enterprises, market access and operational efficiency are no longer the only concerns.

Two years later, APEC members endorsed the Collective Strategic Study on Issues Related to the Realization of the FTAAP.

Since then, economies have committed to bringing CPTPP and RCEP into force, while APEC has encouraged the two regional deals to remain open, transparent and inclusive, draw on each other's strengths, and jointly lay the groundwork for the eventual realization of the FTAAP.

In recent years, however, progress toward building the free trade area has faced growing challenges. Protectionism and unilateralism are on the rise, while geopolitical tensions have intensified.

For many enterprises, market access and operational efficiency are no longer the only concerns. The security and resilience of industry chains have become more important than ever. All these have slowed the progress toward the FTAAP, and delayed discussions on a potential negotiating framework.

Yet the evolving environment has only made the FTAAP all the more relevant. A unified Asia-Pacific market will help address the fragmentation of rules caused by overlapping free trade arrangements, help regional economies withstand trade protectionism and strengthen the regional supply chain. Its establishment will not only boost regional trade but also contribute to global growth.

It will take gradual and steady efforts to advance the FTAAP, which is faced with multiple hurdles. Geopolitical competition and significant development gaps among APEC member economies are some of the biggest obstacles.

The Asia-Pacific comprises both developed economies and a large number of developing economies. CPTPP's rules are of a higher standard, whereas RCEP emphasizes inclusiveness, flexibility and incrementalism.

Given that APEC members are at different stages of development, it is unrealistic to expect all economies to implement identical trading rules immediately.

APEC therefore needs to build a consensus among members and help them with capacity-building to speed up the economic integration of the region.

The forum can also facilitate dialogue and coordination between RCEP and CPTPP members to make relevant institutions more open, compatible and inclusive. This would lay a solid foundation for the future free trade area.

Efforts to align the two trade agreements should not begin with the most contentious issues, such as tariff concessions. Instead, priority should be given to harmonizing rules and standards for the digital economy, green and low-carbon trade and cross-border data flows.

Since the regulatory frameworks for these emerging sectors are still evolving, there is greater scope for developing unified norms.

China has actively contributed to this process. The country hosted a dialogue between members of RCEP and CPTPP during the APEC Ministers Responsible for Trade Meeting held in Suzhou, Jiangsu province, in May.

Representatives from 18 of the 20 economies participating in the two mega trade agreements attended the dialogue. Participants engaged in informal discussions on several issues, including regional economic integration.

In July, a Chinese business delegation hosted the third APEC Business Advisory Council meeting in 2026.

At the meeting convened in Bangkok, representatives discussed regional economic integration and other topics, and adopted a report to APEC economic leaders and other outcome documents.

Going forward, only by upholding the principles of pragmatic cooperation, inclusiveness and mutual learning, while continuing to improve institutional coordination and align interests, can Asia-Pacific economies build a truly unified, open and prosperous regional market.

CARLY COWELL

Integrated plant conservation

China's experience offers adaptable biodiversity governance models for the Global South

Plant diversity is facing unprecedented pressure worldwide. According to the first Global Tree Assessment published by the International Union for Conservation of Nature (IUCN) Red List of Threatened Species, approximately 38 percent of the world's tree species are threatened with extinction. For many countries across the Global South, the challenge is particularly acute. Rapid economic development, competing land use pressures, limited conservation resources and the increasing impacts of climate change create difficult choices about how biodiversity can be protected while supporting human well-being.

Yet conservation is not the exclusive domain of wealthy nations. Over the past several decades, China has demonstrated that meaningful progress can be achieved through long-term commitment, strategic investment and strong partnerships. Through Botanic Gardens Conservation International's (BGCI) collaboration with Chinese botanical gardens, research institutions, local authorities and conservation practitioners, we have witnessed the development of an approach that offers valuable lessons for countries facing similar challenges.

One of the most important lessons is that effective conservation requires integration. Historically, conservation efforts often focused on a single intervention, whether protecting remaining wild populations, establishing ex-situ or outside-the-original-location collections, or undertaking restoration activities. Increasingly, however, experience shows that these approaches are most successful when combined.

The conservation of Magnolia omeiensis illustrates this principle well. Since the species was rediscovered in the late 1980s, conservation efforts have involved extensive field surveys, ex-situ collections, propagation and reintroduction. Through collaboration between BGCI and the Emeishan Botanical Garden, new wild populations were identified, thousands of seedlings propagated and plants reintroduced to suitable habitats. In 2025, one of the reintroduced trees flowered significantly earlier than expected, demonstrating the value of long-term, coordinated conservation action. The success was not the result of a single intervention, but of a connected process linking research, conservation collections, propagation expertise and field implementation.

This integrated approach is increasingly reflected within China's wider conservation framework. The development of national biodiversity strategies, updates to protected species legislation and the establishment of a national botanical garden system all demonstrate how conservation can move beyond individual projects and become embedded within national planning. This institutional support is critical because plant conservation is inherently long-term. Many threatened species require decades of sustained effort before measurable recovery can be achieved.

Another important lesson from China's experience is the value of applied research in guiding action. Conservation resources are limited in every country, making it essential that interventions are informed by evidence rather than assumptions. Restoration and conservation cannot be reduced to simply planting trees. Successful outcomes depend on understanding species biology, habitat requirements, genetic diversity and the social and economic context in which conservation takes place. Across China, conservation programs increasingly combine ecological research with practical implementation. This emphasis on generating and applying knowledge before scaling up interventions helps avoid costly mistakes and increases the likelihood of long-term success. For many countries in the Global South, where resources are often stretched, investing in research and planning at the outset can provide significant returns over time.

China's growing role in regional and international conservation cooperation also highlights the importance of knowledge exchange. Conservation challenges rarely stop at national borders. Many threatened plant groups occur across multiple countries and require coordinated action.

A good example is the conservation of dipterocarps, the dominant tree family of Southeast Asian tropical rainforests. These species are ecologically important and economically valuable, yet many are under increasing threat. In 2025, researchers and conservation practitioners from across Asia gathered in China for the Global Conservation Symposium for Dipterocarps. The meeting brought together expertise from multiple countries, identified shared priorities and strengthened regional collaboration. Such initiatives demonstrate how countries can move from being participants in conservation efforts to becoming regional centers for knowledge sharing and capacity development.

At the heart of all successful conservation, however, are people. Conservation outcomes are most durable when local communities are involved as active participants rather than passive beneficiaries. Building local capacity, supporting livelihoods and fostering a sense of stewardship are essential components of effective conservation programs.

This principle is evident in the conservation work for *Euryodendron excelsum*, one of China's most threatened tree species. Through collaboration between BGCI and the South China National Botanical Garden, local stakeholders were engaged through training programs, technical workshops and participatory conservation activities. Practical skills such as seedling propagation, planting and post-planting management were shared with local communities, helping to strengthen both conservation outcomes and local ownership. This emphasis on capacity building extends far beyond individual projects. Through partnerships across China, BGCI has supported conservation initiatives for dozens of threatened tree species, trained conservation practitioners, and engaged students from rural schools and community members from remote mountainous areas in conservation education.

Investing in people creates the foundation upon which long-term conservation success depends.

Perhaps one of the most significant aspects of China's conservation journey has been the development of its botanical garden network. Today, China's nearly 200 botanical gardens collectively represent one of the largest plant conservation infrastructures in the world. These institutions function as much more than public green spaces. They serve as centers for research, conservation, education, restoration, and capacity building. For other countries in the Global South, botanical gardens represent a particularly effective investment. They provide a permanent institutional base for conservation activities, maintain living collections and seed banks, support restoration programs and create opportunities for public engagement. Importantly, they also act as hubs that connect local conservation efforts to national and international networks.

Through BGCI's global network, botanical gardens in China are linked with institutions across more than 100 countries. These connections facilitate the exchange of expertise, data and conservation resources, helping to strengthen collective action for plant conservation worldwide. The broader lesson emerging from China's experience is that conservation success depends on a combination of long-term planning, strong institutions, applied research, community engagement and international cooperation, which is a framework that can be adapted rather than simply copied. Global South countries often face different economic realities, governance structures and development priorities. Solutions must therefore be adapted to local contexts, but China's experience offers a valuable example because many of the challenges it has faced are shared by other developing nations. This work in China demonstrates that plant conservation can progress alongside economic development when supported by appropriate policies, partnerships and investment.

The partnership between BGCI and Chinese colleagues has reinforced another important principle: International cooperation is most effective when it is built on mutual learning. While BGCI contributes global expertise, international standards and opportunities for collaboration, Chinese institutions contribute practical experience, innovation and lessons derived from implementing conservation at scale. Both sides benefit from the exchange. As global biodiversity loss accelerates, there is an urgent need for conservation approaches that are practical, scalable and relevant to the realities facing countries across the Global South. China's experience demonstrates that such approaches are possible. Through sustained commitment, strong institutions, botanical garden networks and investment in people and knowledge, significant progress can be achieved.

YANG XIAOBO AND LYU XIAOBO

Mangroves to the rescue

By giving nature the space to recover, these 'forests of the sea' can continue to shelter coastal communities and thrive alongside them for generations to come

Mangrove forests are distributed along tropical and subtropical shores. Though they occupy only a small fraction of the world's total coastal zone, they have long served as natural guardians of coastal communities, buffering the effects of typhoons while sustaining abundant fisheries.

Yang Xiaobo

Lyu Xiaobo

For many Chinese people who grew up beside mangroves before the 1970s, childhood was inseparable from these forests. They followed their parents into the mangroves to catch shrimp and crabs or gather clams from the tidal flats. They walked narrow stone paths winding through the forests from one village to the next, often trailing behind their mothers. Looking up, they watched the mangrove branches sway in the sea breeze; looking down, they saw fiddler crabs scurrying across the mud at their feet. Those memories remain vivid to this day.

But this began to change in the mid-1970s. As population growth intensified shortages of food and salt, many mangrove forests were cut down to make way for rice paddies and salt pans. In Sanjiang township of Hainan province alone, around 800 hectares of mangroves were felled between 1975 and 1976. The destruction accelerated in the late 1980s and early 1990s as booming coastal aquaculture drove the widespread conversion of mangrove wetlands into fish farms.

The Chinese government, however, did not stand idly by as the losses mounted. Systematic mangrove restoration began in the 1980s, alongside the establishment of the Dongzhaigang National Nature Reserve in Hainan in 1980. More protected areas were later established across the country. In 1998, Hainan became the first province to introduce regulations on the protection of mangroves, effectively bringing the widespread mangrove clearance under control.

Protecting mangroves has never been solely a challenge for China. It is a global imperative. In 2015, the United Nations Educational, Scientific and Cultural Organization designated July 26 as the International Day for the Conservation of the Mangrove Ecosystem, often referred to as World Mangrove Day. Since then, the occasion has evolved from a symbolic commemoration to an opportunity for countries to reaffirm the ecological value of mangroves and strengthen the collective commitment to protecting them.

In China, over a decade of sustained investment and restoration efforts have steadily revived mangrove ecosystems that had once been lost to fish farms.

Since 2016, China has funded mangrove restoration through major programs such as the Blue Bay environmental improvement initiative and the coastal zone protection and restoration project. A key milestone was the Mangrove Protection and Restoration Action Plan (2020-25), under which about 18,800 hectares of mangroves have been restored through measures such as converting fish farms back into forests, recovering degraded habitats and strengthening long-term monitoring and management.

According to the National Forestry and Grassland Administration, by February 2025, China's mangrove coverage had reached 30,300 hectares, increasing approximately 8,300 hectares from what it was at the start of the century.

Restoring mangroves is a complex, long-term process that requires scientific research, the removal of fish farms, the reshaping of tidal flats, seedling cultivation and planting, and years of monitoring and maintenance. In the Xiaohai coastal lagoon in Wanning, Hainan province, the restoration of mangroves has involved investment in removing aquaculture ponds, dredging waterways and rehabilitating tidal flats since 2019. Similar progress has been made in the Guangxi Zhuang autonomous region and Guangdong and Fujian provinces. Across China, mangrove forests once in decline are making a remarkable comeback.

At the opening of the 14th Meeting of the Conference of the Contracting Parties to the Ramsar Convention on Wetlands in 2022, China announced plans to establish the International Mangrove Center in Shenzhen, Guangdong province, marking China's transition from a participant in global conservation to a leading contributor. In July 2025, the center was officially endorsed as a Ramsar Regional Initiative for the 2026-28 period.

Operating as an independent, nonprofit intergovernmental organization under the Ramsar Convention, the International Mangrove Center, with 21 signatory countries as of June 2026, aims to promote international cooperation in mangrove conservation, restoration and sustainable use.

In 2025, the center organized a series of international training programs for government officials and experts from countries including Cambodia and Madagascar, sharing China's experience in mangrove restoration. Later that year, the China Meteorological Administration released a sectoral standard for estimating carbon stocks and assessing carbon emissions in mangrove and salt marsh wetlands, providing a scientific framework for measuring mangrove carbon sequestration.

Together, these initiatives demonstrate that China is not only restoring its own mangrove ecosystems but also contributing knowledge, technology and standards to global conservation efforts.

Going forward, mangrove restoration should place greater emphasis on ecosystem quality rather than simply expanding forest cover. This means maintaining an appropriate balance among mangrove forests, tidal flats and open water, preserving the ecological function of tidal channels, and restoring benthic biodiversity.

Encouragingly, mangroves are remarkably resilient. Once major disturbance factors are removed, many degraded ecosystems can recover naturally, with carefully targeted intervention helping to accelerate the process where needed.

It is also important to explore sustainable integrated mangrove aquaculture models to balance the needs for environmental recovery and economic development. By reconnecting mangrove forests with the livelihoods of coastal communities, we can help restore a landscape where people once again share winding mangrove paths with crabs and other wildlife.

By giving nature the space to recover, mangroves, the "forests of the sea", can continue to shelter coastal communities and thrive alongside them for generations to come.

China's oil, gas output hits record highs

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's domestic oil and gas production reached historic highs in 2025, providing a robust bedrock for national energy security as the country accelerates the construction of a resilient energy system to navigate escalating global market uncertainties and geopolitical turbulence.

An oil and gas exploration and development report, recently released by the National Energy Administration, revealed that domestic crude oil production surged to a record 216 million metric tons last year. Meanwhile, natural gas output maintained its robust momentum, expanding by over 10 billion cubic meters for the ninth consecutive year.

Combined, total oil and gas production equivalent soared to a new high of 420 million tons, significantly enhancing the nation's self-sufficiency and ushering the industry into a new phase of high-efficiency and green development, it said.

Industry experts believe the milestone marks the successful culmination of a sweeping seven-year action plan (2019-25) designed to enhance domestic exploration, as the fierce global competition over resources, transit routes and market rights is creating greater uncertainties for energy imports.

China is leveraging the "certainty" of its domestic energy development to counter various external risks and enhance the resilience of its production, supply, storage and sales systems, Wang Hongzhi, head of the NEA, said recently.

Building on the momentum of a record-breaking 2025, the sector has seen a robust start to 2026. Cao Jianjun, chief expert at the Sinopec Economics and Development Research Institute, believes that the continuous growth of domestic supplies serves as the ultimate insulator against external volatility.

"As uncertainty becomes the new normal, we must counter external instabilities with our own internal certainty," Cao said.

This resilience is further underpinned by a strategic petroleum reserve estimated at approximately 1.4 billion barrels, or 190 million tons, according to figures by Columbia University's Center on Global Energy Policy.

Advancements in exploration and production technology have played a central role in this self-sufficiency. Sustained investments by the country's three major energy giants — China National Petroleum Corp, China Petroleum and Chemical Corp, and China National Offshore Oil Corp — have led to significant discoveries across traditional and unconventional fields, said Lu Ruquan, head of the CNPC Economics and Technology Research Institute.

These efforts successfully reduced China's dependence on crude oil imports to 71.9 percent in 2024, demonstrating remarkable industry resilience, Lu added.

The NEA report also highlighted breakthroughs in unconventional resources. In 2025, shale oil output exceeded 8.5 million tons — more than 10 times the level in 2018 — while unconventional natural gas production climbed 7.7 percent year-on-year to over 110 billion cubic meters.

Furthermore, the oil and gas sector added over 9 gigawatts of wind and solar capacity last year, reflecting the government's call to double down on renewable expansion while ensuring fossil fuels serve as a reliable regulatory "baseline" for energy substitution.

To support this balanced transition, China aims to bring non-fossil fuels to 25 percent of total energy consumption by 2030, supported by a comprehensive national energy production capacity.

Looking ahead, the industry is rolling out a new strategic action plan for 2026.

The NEA expects domestic crude oil output to firmly remain above the 200-million-ton threshold, while deepening the integration of artificial intelligence, green energy and the large-scale application of carbon capture, utilization and storage to empower China's continued rise as a global energy powerhouse.

Humanoid robots close to 'ChatGPT moment'

Executive: Would move new tech from niche circles into public consciousness

By MA SI
masi@chinadaily.com.cn

The humanoid robot industry could hit its "ChatGPT moment" by the end of 2028, based on current data accumulation rates and model convergence trends, said Wang He, founder and CTO of Beijing-based Galbot Co Ltd.

The "ChatGPT moment" has become a popular metaphor in tech and investment circles to describe a sudden breakthrough that catapults a new technology from niche circles into the public consciousness, allowing ordinary people to viscerally feel its practical value.

Wang said a powerful pre-trained model combined with an efficient post-training paradigm is the key to unlocking this milestone, and embodied artificial intelligence foundation models trained on massive, comprehensive datasets could achieve a 70 to 80 percent success rate directly for tasks they have never been specifically trained for.

Galbot was among the invited enterprises to a private enterprise symposium hosted by Zheng Shanjie, head of the National Development and Reform Commission, in Beijing on Monday. The event focused on analyzing first-half economic performance and gathering suggestions for second-half economic work.

The policy attention comes as Galbot's technology is capturing the public imagination in tangible ways. At the 2026 World Artificial Intelligence Conference, which concluded in Shanghai on Monday, crowds three or four layers deep gathered around Galbot's exhibition area. They were watching Galbot G1, one of the company's robots, make breakfast, toast bread and pour drinks with the smooth coordination of a seasoned short-order cook.

But what truly captivated the audience was not the actions themselves — it was what happened next. Spectators repeatedly moved the bread aside, shifted the kettle, rearranged cups and plates, and covered the cup lids with their hands, creating obstacle after obstacle. Yet the robot never wavered. It relocated its targets in milliseconds, reconstructed its path on the fly and completed every step without interruption.

Wang outlined a roadmap for general-purpose embodied intelligence foundation models. He said that building a unified "brain and cerebellum" — the embodied intelligence foundation model — to achieve a deep understanding of human movement and control mechanisms represents a critical technological pathway for pushing humanoid robots toward the "tipping point" of artificial general intelligence.

Just a day before the WAIC opened, Vice-Minister of Industry and Information Technology Ke Jixin revealed at the annual plenary session of his ministry's humanoid robot and embodied intelligence standardization technical committee in Shaoxing, Zhejiang province, that China's humanoid robot output reached about 20,000 units last year, surpassed 40,000 units in the first half of this year, and is expected to exceed 100,000 units this year.

This fivefold jump sends a clear signal: humanoid robots are accelerating from technological exploration toward standardized, large-scale development. But quantity expansion does not equal industrial maturity.

Xie Shaofeng, chairman of the ministry's technical committee and chairman of the OpenAtom Foundation, warned that the industry is currently "blossoming yet fighting separately". Behind the apparent prosperity are three major challenges: highly divergent technological pathways, a critical lack of product standards and mounting pressure from sustainable development requirements.

Ke said the next two to three years could be a critical turning point for the humanoid robot sector. Output growth is merely the surface — the deeper shift is that the industry is moving from single-unit prototypes and stage demonstrations toward batch deliveries, which dramatically raises the coordination requirements across research and development, production, testing, application and safety governance.

At the prototype stage, companies can solve interface, algorithm and hardware adaptation issues through customized solutions. But once production reaches the scale of tens of thousands of units, any interface incompatibility, inconsistent evaluation methods, or unclear safety boundaries will be magnified into cost, efficiency and market trust problems, experts said.

To a certain extent, the core of scaling is not just "expanding production capacity" but also enabling components from different companies to work together, allowing product performance to be compared and contrasted, thus giving users the confidence to buy and use products and providing a basis for after-sales maintenance, they added.

Ke called for leveraging the foundational, guiding and supportive role of standards, as well as accelerating the development of urgently needed standards for humanoid robot intelligence classification, data management and safety specifications.

Jiang Lei, deputy director of the technical committee, said hardware requires standards and models need "firewalls", adding that the committee expects to roll out the first batch of standards by the end of this year.

Equipment industry driving exports

China's equipment manufacturing sector became a major driver of export growth in the first half of 2026, with export delivery value of the equipment industry rising 18.2 percent year-on-year and contributing nearly 50 percent of the growth in industrial exports, official data showed.

In the first half of the year, the country's exports of wind turbine generators and lithium batteries increased 35.6 percent and 37.6 percent year-on-year, respectively, while automobile exports reached 5.096 million units, up 65.3 percent from a year earlier, according to Wang Weiming, chief engineer of the Ministry of Industry and Information Technology.

China's shipbuilding sector also continued to strengthen its global competitiveness, with domestically built vessels accounting for more than 90 percent of the country's total completed ships, new orders and existing order backlog.

"Since the beginning of 2026, China's equipment manufacturing industry has demonstrated characteristics of a solid foundation, multiple growth highlights and strong external demand," Wang said.

The sector's value-added output increased 6.4 percent year-on-year in the first half, accounting for 20 percent of the total output of industrial enterprises above designated size. It contributed 23.5 percent to the growth of value-added industrial output, providing strong support for stable industrial growth, Wang noted.

In addition to the strong growth in exports of high-tech products such as industrial robots, high-end machine tools and aerospace components, shipments of consumer goods — including 3C electronics (computer, communication and consumer electronics), household items, fashion accessories and small home appliances — have emerged as an important driver of export expansion. Beyond hardware performance, strong modeling ecosystems and software capabilities have notably become key factors behind the overseas popularity of Chinese-made 3D printers.

New technologies such as electrification, automation and AI transformation will continue to reshape their product architecture and industrial ecosystems, opening up fresh growth opportunities for the country's equipment manufacturing industry.

XINHUA - CHINA DAILY

Briefly

Honda, GAC extend joint venture

Honda Motor and China's Guangzhou Automobile Group Co Ltd have agreed to extend their joint venture partnership until 2038, as the Japanese carmaker seeks to strengthen its position in the world's largest auto market. The ownership structure of the China joint venture, GAC Honda, will remain unchanged under the agreement, while the venture will accelerate its shift toward new energy vehicles and work to rebuild its competitiveness, according to the company.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 16 pips to 6.7933 against the US dollar on Wednesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

Confidence returning to global art market

By LI JING
lijing2009@chinadaily.com.cn

China's art market is showing early signs of stabilizing after a five-year downturn, with auction prices edging higher and bidding activity returning close to historical averages, according to a report released on Friday, adding to evidence that a broader recovery is taking hold in the global art market.

The report, published jointly by the Cheung Kong Graduate School of Business and Italy's SDA Bocconi School of Management, found that the MM Chinese Art Price Index, which tracks auction prices, rose 1.7 percent during the spring 2026 auction season after slipping in the autumn 2025 auction season. At the same time, the MM Chinese Art Sentiment Index, which measures bidding intensity by comparing hammer prices with auction estimates, also improved and approached its long-term average, indicating stronger competition among buyers.

The rebound in the Chinese art market coincides with gains in the report's two other major global price benchmarks, with the MM Impressionist Art Price Index climbing 15 percent and the MM Contemporary Art Price Index rising 10.8 percent, the first time in years that all three major art price indexes increased simultaneously.

"The spring 2026 auction season suggests confidence is returning to parts of the global art market," said Mei Jianping, professor of finance at CKGSB and lead author of the report.

Chinese artworks remain the strongest-performing segment over the past 25 years, despite a deep adjustment in recent years amid the COVID-19 pandemic, China's economic transition and a global art market downturn. The report showed the MM Chinese Art Price Index has risen nearly sevenfold since 2000, delivering a compound annual growth rate of 7.8 percent, compared with 4.8 percent for the MM Contemporary Art Price Index and 3.5 percent for the MM Impressionist Art Price Index.

Mei said the global art market has significantly lagged the rapid expansion of global wealth over the past 25 years, particularly wealth generated by advances in artificial intelligence.

"This spring auction season indicates the onset of a market revival," Mei said. "Considering the massive wealth generated over the past quarter-century, especially by recent breakthroughs in AI technology, the current market may present a historic window of opportunity for collectors and investors."

The report also pointed to a growing divide within China's art market as collectors continued to favor works with broader international appeal, such as contemporary artworks and oil paintings. During this year's spring auctions, the MM Chinese Oil Painting Index jumped 21.9 percent and the MM Chinese Contemporary Art Index rose 18.6 percent, while the MM Chinese Ink Painting Index fell 4 percent and the MM Chinese Modern Art Index declined 4.7 percent.

Mei attributed part of the shift to the growing internationalization of collecting Chinese art since the early 2000s as overseas buyers have become more active, making the market more sensitive to global collecting trends.

Beyond China, the report found that European art also rebounded in the spring, with France posting a 24.7 percent increase and Britain rising 18.5 percent, although long-term returns remained modest. The researchers said that years of relatively weak performance could leave parts of the European market attractively valued for long-term investors.

Despite the rapid creation of AI-related wealth, Mei said much of that capital has yet to flow into art because investors continue to see better returns in technology assets.

"The opportunity cost is still high," he said, adding that many entrepreneurs and investors enriched by the AI boom remain focused on growing their businesses rather than building art collections.

Asked whether AI-generated artworks could become valuable collectibles, Mei said that such works are likely to have artistic value but are unlikely to command the same long-term significance as works created by human artists.

Tianjin Port upgrades enable more imported delicacies

First bulk shipment of certified Beef-on-Track from Brazil expected to arrive in August

By **YAN DONGJIE** in Tianjin
yandongjie@chinadaily.com.cn

Chefs and employees showcase certified Beef-on-Track from Brazil during the 4th Tianjin International Shipping Industry Expo in Tianjin on June 3. LIU NAIWEN / FOR CHINA DAILY

China's first shipment of certified Beef-on-Track from Brazil arrived at Tianjin Port last month, with visitors to the 4th Tianjin International Shipping Industry Expo lining up to try the BOT steaks — and the reviews were glowing.

The Tianjin Meat Industry Association signed a cooperation agreement with Brazilian counterparts at the expo. The first bulk shipment of the beef is expected to arrive at Tianjin Port in August, eventually making its way to dining tables across the Beijing-Tianjin-Hebei region.

"China is our main export destination, accounting for roughly half of Brazil's total beef exports," said Marina Guyot, executive director of the Institute of Agricultural and Forest Management and Certification, at the signing ceremony.

Xing Yanling, president of the Tianjin Meat Industry Association, said that Tianjin Port, as the largest cold-chain gateway in northern China, has a well-established cold-chain storage, customs clearance and distribution system, handling nearly 60 percent of the country's Brazilian beef imports annually.

To source the beef, a team from the association traveled to Para state in Brazil in April, visiting the Fazenda Carioca ranch and the Mafrinorte slaughterhouse to inspect ecological farming practices, standardized slaughter processes and full-chain quality controls. They also held discussions with local prosecutors and the Brazilian Chamber of Commerce on regulatory and environmental compliance.

BOT is a sustainable beef certification initiative launched in 2019 by Brazil's Federal Prosecutor's Office and the Institute of Agricultural and Forest Management and Certification.

Under this framework, ranchers are required to commit to environmental stewardship — specifically, zero deforestation — to protect what many call the "lungs of the Earth". Pasture management is tightly controlled, with no more than eight cattle per 6.67 hectares of grassland. As a result, the beef carries a slightly higher production cost than conventional beef.

"We hope to bring premium protein from around the world to Tianjin Port, and from there to the wider Beijing-Tianjin-Hebei region," Xing said.

Once a cold-chain container completes its weeks-long ocean voyage and arrives at Tianjin Port, it enters a streamlined clearance process. Paperless customs procedures ensure that compliant frozen goods pass through quickly. At the container terminal, smart loading and unloading equipment moves containers off the docks and into cold-chain warehouses with minimal delay.

For containers that need temporary port storage, thousands of shore power sockets provide uninterrupted electricity, keeping frozen goods at a constant minus 25 C. Port workers conduct regular inspections to check power supply and compressor status, ensuring cargo quality is maintained throughout.

Representatives from China and Brazil shake hands during the Brazil BOT Certified Sustainable Beef First Arrival Ceremony in Tianjin on June 3. LIU NAIWEN / FOR CHINA DAILY

From the docks, containers are transported to cold-chain warehouses clustered around the port area. Tianjin currently has 155 registered cold-chain storage facilities with a total capacity of approximately 3 million metric tons. As one of China's primary frozen goods import hubs, the port handled about 2.3 million metric tons of frozen imports last year, valued at 61.39 billion yuan ($9.06 billion) — ranking second nationally.

Tianjin's 15th Five-Year Plan identifies cold-chain logistics as a key component of modern transport and shipping services, with plans to strengthen the sector as a strategic pillar.

Behind this infrastructure lies a simple reality: imported goods are finding their way into more and more Tianjin households. Recently, at a Sam's Club a few kilometers from the National Convention and Exhibition Center (Tianjin), a Tianjin resident named Zheng Xiaowen drove in circles around the car park of nearly 2,000 spaces and it still took her half an hour to find an available space.

The Sam's Club in Xiqing district is reportedly the highest-grossing in the country. Despite the complaints, Zheng — like tens of thousands of Tianjin families — makes the trip every weekend. "We come mainly for the high-quality imported meat and produce," she said.

From Chilean cherries and Peruvian blueberries to Thai durian, Norwegian salmon, Australian beef, US apples and New Zealand milk, imported food has become a staple in the shopping trolleys of Tianjin families.

Data from Tianjin Customs back this up. Last year, Tianjin imported 225,000 tons of aquatic products for consumption, valued at 6.3 billion yuan, up 27 percent year-on-year. Imports of fresh and dried fruits and nuts reached 141,000 tons, valued at 14.3 billion yuan, up 7.3 percent.

This enthusiasm for imported food has deep historical roots. Tianjin has long been an international consumer city. The Quanyechang Department Store, which opened in 1928, predates what is widely recognized as the United States' first modern shopping mall by nearly 30 years.

That tradition carried on in later decades in a different, more down-to-earth form. For today's young people, shopping globally is as simple as a few taps on a phone. But for Zheng's grandparents' generation, seeing the latest international trends meant making a trip to one place that everyone in Tianjin — and across northern China — knew well: the Tianjin Foreign Commodities Market.

A hallmark of Tianjin's "foreign goods economy" from the 1990s through the early 2000s, the market drew shoppers from across the country by the busload.

Where older Tianjin residents once had to make a dedicated journey to "hunt" for imported goods, Zheng today simply reaches for them off the supermarket shelf. The goods haven't changed — what's changed is the port infrastructure behind them, as Tianjin Port has developed its port-industry-city integration model and upgraded customs clearance efficiency under the city's free trade zone framework.

Chilean cherries once had to transit through southern ports on their way to Tianjin, adding days to an already long journey. Since 2023, when Tianjin launched its direct "Cherry Express" service from Chile, the port has steadily expanded its fresh produce import corridor. By the end of January this year, four vessels carrying roughly 30,000 tons of cherries had arrived as part of the 2025–26 cherry season.

Nearly 200 containers of fresh cherries made the journey from Chile's San Antonio Port directly to Tianjin, with a single sailing time of around 22 days — nearly a week shorter than traditional transit routes. Customs declarations are completed before arrival, so once a vessel docks, containers can be unloaded directly onto refrigerated trucks. From ship to supermarket shelf, the entire process now takes just a few hours — cherries that arrive in the morning are on sale by midday and on dinner tables by evening.

"We'll use international shipping combined with full cold-chain logistics to reach the Beijing-Tianjin-Hebei region, and from there the whole of China — so that more consumers can enjoy fresh imported food," said Xing.

Cai Muzi contributed to this story.

Sourcing event boosts Sino-South African ties

CAPE TOWN — China Premium Textile South Africa and Allfashion Sourcing 2026, one of Africa's top textile and fashion trade exhibitions, took place in Cape Town from July 14 to 16, with participants from China and South Africa upbeat about expanding bilateral cooperation in the industry.

Held at the Cape Town International Convention Center, the annual event serves as a major sourcing platform for the textile, apparel, footwear and fashion industries, bringing together manufacturers, suppliers, designers, retailers, buyers and other industry stakeholders to explore business opportunities, forge partnerships and showcase future-oriented solutions.

This year's event featured around 150 exhibitors, with nearly half of them from China. The program also included fashion shows, thematic forums, panel discussions and industry talks.

Addressing the opening ceremony, Chinese Consul-General in Cape Town Ren Faqiang said South Africa is China's largest trading partner in Africa, while China has remained South Africa's largest trading partner for 17 consecutive years, with bilateral trade reaching $53.58 billion in 2025.

"The textile industry is a traditional area of China-South Africa economic cooperation, and also a key sector for industrial capacity coordination and market connectivity between the two sides," Ren said.

He added that China's zero-tariff policy for 53 African countries, including South Africa, took effect on May 1, covering South African-grown cotton, textile raw materials and other related products.

"This policy will substantially cut export costs for South African textile and garment manufacturers, expand their access to the Chinese market, unleash greater trade momentum, and inject robust impetus into China-Africa trade, investment, cooperation and Africa's development," Ren added.

One of the exhibitors, Ziev Shani, a young South African entrepreneur who is fluent in Chinese and runs a local company that sources products from China, provides private-label manufacturing services for South African businesses and helps connect companies from the two countries.

People visit the booth of a Chinese exhibitor at the China Premium Textile South Africa and Allfashion Sourcing 2026 expo in Cape Town, South Africa, on July 14. WANG LEI / XINHUA

Shani said he has worked with Chinese companies for five years, while his family's business ties with China date back to his father's generation.

"I believe that there are excellent prospects for Chinese companies and South African companies to work together for a win-win situation. There should be good collaboration, good partnership and just growth and prosperity for two great countries," he added.

Among the Chinese exhibitors, Hangzhou Golden Shell Import and Export participated in the event for the fourth time. Having cultivated the South African textile market for more than a decade, the company has continued to strengthen its local presence, underscoring its long-term confidence in the African market.

General Manager Chen Fangli said she is optimistic about the future of China-South Africa and China-Africa economic and trade cooperation. Supported by favorable policies and industrial upgrading, she believes Chinese textile enterprises, backed by integrated industrial chains, advanced manufacturing equipment and strong innovation capabilities, will further expand cooperation with South African partners.

"We have established a company in Cape Town and are exploring the possibility of setting up a factory in Durban. We hope to use South Africa as a base to gradually expand into the broader African market," Chen added.

Wang Lihong, general manager of first-time exhibitor Zhejiang Huida Textile and Garment, told Xinhua News Agency that she spent the morning of the opening day meeting potential clients and reached preliminary cooperation agreements with three South African companies, strengthening her confidence in expanding into both the South African and broader African markets.

Wang said Chinese textile manufacturers have long outgrown the stereotype of competing solely on low prices.

"People overseas used to associate Chinese products with good quality at low prices. Today, however, our competitiveness comes not only from affordability, but, more importantly, from reliable product quality and continuous innovation, which will create broad opportunities for development in South Africa and across Africa," Wang said.

Safety risks at the workplace under scrutiny

SPP urges businesses to fulfill their primary responsibility in campaigns

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Chinese prosecutors approved the arrests of 4,181 people and prosecuted 16,648 others for crimes endangering workplace safety from January 2023 to June 2026, the Supreme People's Procuratorate said on Tuesday.

Although China's workplace safety situation has remained generally stable and continues to improve, risks persist in some industries, the SPP said.

Traditional high-risk sectors, including mining, hazardous chemicals, transportation and construction, remain vulnerable to major accidents. Some companies continue to prioritize production over safety, while increasingly complex working conditions make risks more difficult to control.

Prosecutors have also identified inadequate oversight of equipment and safety facilities as a major concern. Investigations have uncovered expired equipment, missing protective devices and faulty safety systems in many cases.

Fire hazards remain prominent at small businesses and public venues, including restaurants, hotels, workshops and entertainment facilities. Such premises are numerous and often located in urban villages, old town areas and rural communities, making regulatory oversight more challenging.

Unsafe electrical wiring, indoor charging of electric bicycles, aging gas hoses and improper storage of gas cylinders are among the major risks. Many accidents occur at night, with toxic smoke inhalation being a leading cause of death.

Meanwhile, new risks are emerging in sectors such as new energy, energy storage and urban gas, where rapid expansion has outpaced the development of some safety standards and risk-control measures.

The SPP cited several major cases to illustrate the consequences of safety violations.

The February 2023 collapse at the Xinjing coal mine in Alshaa League of the Inner Mongolia autonomous region was caused by operations that violated the approved mining design. The mine improperly combined excavation levels, creating an excessively high and steep slope that eventually collapsed, killing 53 people and injuring six.

At a Yellow River bridge construction site in Qinghai province, substandard materials and bolts were used in a supporting structure, while safety supervision was absent during high-risk nighttime operations. Part of the project collapsed in August 2025, killing 13 people with three still unaccounted for.

A gas explosion at a barbecue restaurant in Yinchuan, Ningxia Hui autonomous region, in June 2023 was caused by an employee improperly removing a pressure regulator, resulting in a large liquefied petroleum gas leak. The blast killed 31 people and injured seven.

The SPP said prosecutors have maintained a tough stance on workplace safety crimes by directly supervising several major cases, while local procuratorates have prosecuted those responsible.

During the reporting period, prosecutors supervised the filing of 791 cases involving 881 people and pursued the arrest or prosecution of 534 suspects who had initially been omitted from investigations. They also recommended that administrative authorities transfer 872 suspected criminal cases for prosecution and filed 78 protests against court judgments involving errors in conviction or sentencing.

In addition, procuratorates have issued recommendations to address safety risks and regulatory gaps identified during investigations. They will strengthen coordination between administrative and criminal enforcement, make better use of public interest litigation and work with relevant authorities on targeted workplace safety campaigns.

The SPP also urged businesses to fulfill their primary responsibility for workplace safety by closely monitoring equipment, electrical wiring, hazardous chemicals, working environments and emergency exits.

Taiwan urged to lift mainland product restrictions

By LI SHANGYI
lishangyi@chinadaily.com.cn

As the Chinese mainland's motorcycle brand ZXMOTO went viral in Taiwan, a mainland spokeswoman urged the Democratic Progressive Party authorities on Wednesday to heed public opinion and remove restrictions on mainland products.

Zhang Han, a spokeswoman for the Taiwan Affairs Office of the State Council, said at a regular news conference that the mainland has always maintained a positive and open attitude toward cross-Strait economic and trade cooperation.

"It is the DPP authorities that are restricting and obstructing the entry of high-quality mainland products into Taiwan," she said.

As ZXMOTO motorcycles continue to deliver strong performances in professional competitions worldwide, they are attracting growing interest in Taiwan, where motorcycle culture is deeply rooted.

Zhang Xue, founder of ZXMOTO, said in a recent interview with United Daily News that he hopes to open stores in Taiwan next year. In response, the island's economic affairs department said that, under current customs import tariff regulations, complete motorcycles manufactured on the mainland are classified as "mainland goods prohibited from import" and therefore cannot be imported into Taiwan. The list of prohibited goods includes about 2,500 mainland goods, covering automobiles, motorcycles, agricultural products, metals and textiles.

Zhang Han criticized the DPP authorities for clinging to their separatist "Taiwan independence" stance, saying they have intensified discriminatory trade restrictions on the mainland, erected increasing barriers and undermined normal cross-Strait economic and trade exchanges and cooperation. Taiwan's traditional industries and small and medium-sized enterprises have long expressed dissatisfaction with such policies, she added.

She urged the DPP authorities to remove unreasonable restrictions as soon as possible and take concrete steps that serve the interests of the people of Taiwan.

"We are pleased to see Taiwan compatriots using high-quality products from the mainland and sharing in the development achievements of Chinese modernization," she said.

Turning to broader cross-Strait trade, Zhang dismissed claims by the island's authorities that Taiwan has reduced its reliance on the mainland market.

On July 15, Cho Jung-tai, head of the island's executive body, claimed that Taiwan has reduced its past reliance on the "single Chinese market" and shifted its focus toward Europe, the United States and countries covered by its "new southbound policy".

In response, Zhang said trade figures demonstrate that the industrial structures on both sides of the Taiwan Strait are highly complementary and offer broad prospects for cooperation.

According to statistics from the General Administration of Customs, cross-Strait trade reached $185 billion in the first half of 2026. The mainland imported $133.1 billion worth of goods from Taiwan, up 22.5 percent year-on-year, while exports to Taiwan totaled $51.9 billion, up 32.9 percent year-on-year.

She said strengthening cross-Strait economic and trade cooperation and deepening integrated development across the Strait serve the common interests of people and businesses on both sides and are the natural outcome of economic laws and market principles.

Describing cross-Strait cooperation as an unstoppable trend, Zhang criticized the DPP authorities for pursuing "Taiwan independence" by relying on external forces. She accused them of allowing external forces to hollow out Taiwan's competitive industries.

"Such actions are nothing less than harming Taiwan and bringing disaster to the island," she said.

She also referred to Taiwan Semiconductor Manufacturing Company's recent announcement of an additional $100 billion investment in facilities in Arizona, which has fueled concerns in Taiwan that the company is effectively becoming a US company.

Zhang said the DPP authorities' strategy of seeking "Taiwan independence" by relying on the US and "selling out Taiwan by kowtowing to the US" is the primary cause of the damage to Taiwan's economy and the gradual erosion of the island's competitive advantages.

First private rocket launched from East China Sea

By ZHAO LEI
zhaolei@chinadaily.com.cn

Orienspace, a private Chinese rocket maker, conducted the third flight of its Gravity 1 carrier rocket on Wednesday morning, marking the first time a private Chinese rocket has lifted off from the East China Sea.

The 30-meter-tall rocket blasted off at 10:54 am from a launch service ship off the coast of Shanghai and soon placed its payloads — nine satellites and one experimental device — into their preset orbits.

The mission marked the first launch by a private Chinese rocket from the East China Sea and the closest space launch to Shanghai to date.

Before the mission, the only rocket launch from the East China Sea took place in April 2022, when the State-owned China Aerospace Science and Technology Corp used a Long March 11 rocket to deploy five Earth-observation satellites.

405 metric tons
The liftoff weight of the Gravity 1 carrier rocket by Orienspace

In a statement, Orienspace said that the mission set a new national record for the combined payload weight delivered into orbit by a Chinese private rocket, but declined to disclose the exact figure, citing commercial confidentiality.

Founded in 2020 by a group of veteran researchers from State-owned space enterprises, Orienspace developed the Gravity 1 as a three-stage solid-propellant rocket with four side boosters. All of its engines are equipped with flexible swinging nozzles for attitude control.

With a liftoff weight of 405 metric tons and a liftoff thrust of 600 tons, the rocket is capable of sending payloads weighing up to 6.5 tons into low-Earth orbit or 4.2 tons into a typical sun-synchronous orbit at an altitude of 500 kilometers, according to the company.

Gravity 1 is currently the world's largest and most powerful solid-propellant launch vehicle, as well as the most capable rocket developed by a Chinese private space company.

Its liftoff weight and thrust surpass those of the European Space Agency's Vega-C, which was previously the world's most powerful solid-propellant rocket.

Gravity 1 is also the first and currently the only privately developed Chinese rocket equipped with side boosters. In addition, it has the largest payload fairing — the nose cone that houses satellites or other payloads — among China's private carrier rockets.

The rocket made its maiden flight from the Yellow Sea in January 2024, launching from a sea-based platform off the coast of Haiyang, Shandong province. The mission made Orienspace the fifth private Chinese company to successfully launch its own carrier rocket, following i-Space, Galactic Energy, Space Pioneer and LandSpace.

Its second flight took place from the same launch site in the Yellow Sea in October 2025.

Six of the nine satellites launched on Wednesday were jointly developed by Beijing MinoSpace Technology, a private satellite manufacturer, and Huantian Wisdom, a State-owned satellite operator based in Sichuan province.

The six satellites will join two previously launched optical satellites and two synthetic aperture radar satellites to form the Huantian Constellation, comprising four optical satellites and six radar satellites.

According to Beijing MinoSpace Technology, the expanded constellation will significantly improve data acquisition efficiency and spatial coverage, supporting remote-sensing applications across Southwest China in fields including land surveying and mapping, emergency response, agriculture, forestry and water conservancy.

Last surviving female Long March veteran dies at 105

By ZOU SHUO
zoushuo@chinadaily.com.cn

Wang Quanying, the country's last surviving female Red Army soldier who took part in the legendary Long March, died peacefully in her sleep at 12:30 am on Wednesday at her home in Dujiangyan, Sichuan province. She was 105.

Multiple Chinese media outlets confirmed her death.

According to her family, Wang died without suffering, surrounded by her daughters and grandchildren. She had remained in generally good health after turning 105 earlier this month. However, she developed lung inflammation, progressive muscle atrophy, shortness of breath and difficulty expectorating in early July and was hospitalized on July 18. Her physical functions gradually declined until her passing.

Wang Quanying

Born in 1921 into a poor Tibetan family in Jinchuan county, Aba Tibetan and Qiang autonomous prefecture, Sichuan province, Wang endured a difficult childhood. She lost her parents at the age of 1 and was raised by her uncle until she was 5. She then worked as a child laborer for a local landlord, doing heavy farm and household work.

At the age of 14, she was deeply inspired by the disciplined and people-oriented conduct of Red Army soldiers after they arrived in Jinchuan in 1935. She volunteered to join the troops, undertaking logistical and medical duties, including guiding marches, cooking, transporting grain and caring for wounded soldiers during the Long March.

In March 1936, Wang became separated from the main force during fierce battles against Kuomintang troops in Danba county. Stranded with injured comrades, she tried to rejoin the troops by crossing snowcapped mountains barefoot and surviving on wild plants in freezing temperatures.

The ordeal left one toe on her left foot severely frostbitten, leading to its eventual amputation, causing her pain on rainy days for the rest of her life.

After wandering for more than a month, she settled anonymously in Wenchuan county in May 1936. For decades, she never spoke publicly about her experiences during the Long March. She married local resident Liu Fuguang and gave birth to five children, though only two daughters survived the harsh living conditions of the time.

Following the founding of the People's Republic of China, she changed her given name from Guixiang to Quanying, expressing her belief that "all Red Army soldiers across the nation are heroes". She was officially recognized as a Red Army veteran during a provincial verification campaign in the 1980s.

Even in her later years, Wang remained committed to preserving and promoting the spirit of the Long March. Until May this year, she continued weaving handcrafted futon cushions and donating them to local schools and red education bases.

Not long ago, officers and soldiers from a company of the PLA Ground Force visited Wang at her home, according to China Central Television. The centenarian changed into a Red Army uniform to greet them.

She admired one soldier's military cap and asked with a smile, "May I put it on? Does it suit me?"

"You look wonderful!" the soldiers replied.

When they unfolded the company flag, Wang's eyes filled with tears. She gently stroked the fabric as though reliving the turbulent years of war. She then slowly raised her hand and offered a solemn military salute to the flag.

Liu Guihua, Wang's eldest daughter, paid tribute to her mother on WeChat Moments, writing: "A heroic female soldier who crossed snowcapped mountains during the Long March; she concealed her achievements and remained true to her original aspiration throughout her life."

According to her family, Wang's only regret would have been that she did not live to see the 90th anniversary of the victory of the Long March, which falls later this year. In accordance with her final wish, her remains will be buried in Wenchuan county, where she settled decades ago.

POLICY REVIEW

From being a 'fallback' to first choice

Economic and societal shifts fuel growing demand for vocational education places

By JI HAISHENG
jihaisheng@chinadaily.com.cn

SHI YU / CHINA DAILY

In the early hours of May 10, parents joined long lines outside Beijing Changping Vocational School, with some even arriving the day before, eager to secure an enrollment interview slot for their children. By the afternoon, the school issued a notice declaring that admissions slots were already full — days ahead of schedule.

One parent who had camped out for hours said that if his 15-year-old son learns industrial robotics, he'll have a job waiting for him before he even graduates.

Across China, secondary and higher vocational institutions in manufacturing hubs like Shandong and Guangdong provinces are reporting unprecedented application surges, outstripping available spots.

The intense interest in vocational tracks reflects a shifting economic reality. As China's higher education system produces a record number of university graduates each year, the traditional white-collar job market faces friction. Desk jobs in tech, finance and administration have become fiercely competitive, leaving many young degree-holders underemployed. At the same time, China's push toward high-end manufacturing, robotics and artificial intelligence has created a shortage of skilled technicians.

"The surging popularity of vocational schools in recent years signals a fundamental shift in how Chinese society views skills-based education," said Wang Heye, founder of Beijing-based Liangyou Education, a consultancy specializing in vocational education.

For years, vocational education was often seen as a fallback option for underperforming students, but nowadays it is increasingly viewed as a viable and promising pathway to a successful career, Wang said, noting that he has witnessed the change firsthand.

He attributed the turnaround to a combination of robust policy support, industrial development, market demand for high-skilled talents, bright prospects for further education and jobs, and evolving public attitudes.

According to a 2025 report released by the Ministry of Education earlier this month, China has some 8,382 vocational institutions, including 6,741 secondary vocational schools, 1,554 vocational colleges and 87 vocational undergraduate universities. The total number of students enrolled in vocational institutions reached 29.37 million, the report said.

In late June, the State Council, China's Cabinet, released an outline plan for the development of the education sector during the 15th Five-Year Plan (2026-30), which made building a modern vocational education system a key priority.

The plan underscores the need to build more high-level vocational schools and programs to cultivate large numbers of high-skilled talents. Specifically, it aims to establish around 60 high-level higher vocational institutions and 160 high-level program clusters, with continuous efforts aligned with key industrial chains, the intelligent economy, and international economic and trade cooperation.

Li Chunqin, vice-principal of Rizhao City Science and Technology School in Shandong province, said that the policy document marks a pivotal transition for vocational education in China, signaling a new era where quality takes precedence over sheer scale.

"Rather than merely pursuing enrollment and program numbers, vocational schools should now focus on improving their educational capabilities and forging solid industry-education integration," Li said. He urged vocational schools to carve out their own niches and strengthen their core advantages.

For students, Li said the plan promises a more flexible and robust growth trajectory, as it advocates for seamless pathways connecting secondary vocational schools with vocational colleges and universities. Noting that his school enrolls nearly 1,000 students each year in its five-year secondary-to-higher vocational programs, he said that secondary vocational education, once seen as "a dead end", has now become "an expressway" for talent cultivation.

Li said he also sees the plan as a crucial step for promoting balanced resource distribution and serving local economies and regional industrial development, highlighting its push to channel higher vocational education resources to counties and smaller cities.

"High-quality vocational resources have long been concentrated in major cities, leaving a structural gap between the demand and supply of skilled talent at the county level," he said. "Bringing those resources down to counties will offer students access to quality vocational education at their doorstep and provide local businesses with talent nearby."

Zhou Zhemin, director of the Academic Affairs Office at Hunan Industry Polytechnic in Hunan's provincial capital Changsha, said the plan's call to steadily increase the number of vocational undergraduate institutions and expand enrollment will help forge a better-structured vocational education system.

Zhou dismissed concerns that expanding vocational undergraduate education would squeeze out vocational colleges, noting that the two have distinctly different training objectives. Vocational colleges focus on cultivating practical talents who can solve on-the-ground problems, while vocational undergraduate programs aim to produce technical and skilled professionals with innovation capabilities, he said.

"Over the next five years, vocational education is set for a deep overhaul in how we cultivate talent — shifting from teaching what schools have to teaching what the industry demands," he said.

Emphasizing deeper integration between vocational education and industrial needs, the outline plan sets out concrete measures, such as building around 100 industry-education alliances in various cities and about 20 national industry-education communities focused on specific industries, with support pledged to set up more training bases and centers and to upgrade training facilities.

Peng Fang, deputy general manager of China Construction Steel Structure Testing Technology Co, said many people used to assume that industry-education integration simply meant students doing a six-month internship before graduation, or agreements signed between schools and enterprises. "Such superficial collaboration can no longer meet the demands of today's industries," she said.

Peng added that schools used to design their programs and courses behind closed doors, while enterprises struggled to find qualified and capable talent. "Companies often receive graduates with little practical experience and have to invest heavily in training them from scratch," she said.

"Industry-education integration is not just about internships. It requires a systemic, whole-chain restructuring covering program design, curriculum reform, faculty deployment and training arrangements," Peng said.

Liu Dingding, deputy head of the industry-education integration department at Beijing Freedo Technology Co, said that the outline plan sets out concrete, measurable targets for boosting such integration, calling for solid progress.

Liu said his team acts as a bridge between schools and enterprises, filling gaps between talent cultivation programs and real needs. His team has launched integrated training programs and helped shorten the onboarding period for graduates at enterprises from six months to just two months, he added.

Over the past five years, Liu said he has witnessed visible changes in the depth of school-enterprise cooperation — from signing agreements and donating equipment, to jointly developing curricula and training programs, as well as offering classes tailored to enterprises' specific demands.

This marks an ever-deepening collaboration, Liu said, adding that policy support has made industry-education integration a key pillar of vocational education.

Policy Digest

Domestic service industry to be made more standardized

The Ministry of Commerce, together with eight other government departments, has unveiled a package of policy measures to promote the high-quality development of the domestic service industry.

The 19-measure policy aims to drive the standardized, professionalized and industrialized development of the sector, so as to better leverage its role in boosting consumption, improving people's livelihoods and stabilizing employment.

The measures cover five key areas concerning support for enterprises, pioneering practices, vocational skills training, credit information management and fundamental underpinnings.

In terms of enhanced policy support, the measures back domestic service providers in innovating service models, exploring smart service scenarios and expanding home-based elderly care and childcare services, with an aim to foster a group of leading brands in the sector.

The policy also calls for clearly defining the rights and obligations of domestic service enterprises, online platforms and domestic service practitioners.

According to corporate information provider Qichacha, China is home to more than 3 million registered domestic service enterprises.

Departure tax refund services to go paperless for travelers

China has rolled out more measures to deliver smarter, more streamlined departure tax refund services for overseas visitors shopping in China, according to a notice issued by the State Taxation Administration.

The notice said the STA is pushing forward the intelligent upgrade of departure tax refund services by rolling out fully paperless processing, under which electronic data of refund applications and sales invoices are transmitted online.

In addition, the STA is promoting pilot programs for tax refunds to eligible overseas tourists who shop at online stores and advocates for cross-regional mutual recognition of the "refund-upon-purchase" scheme, the policy document said.

A nationally unified tax refund service code will be rolled out, enabling tourists to enter information, track processing progress, and check reimbursement status simply by scanning a QR code, the notice said.

Meanwhile, tax authorities will strengthen risk prevention and control to crack down on illegal activities including fraudulent proxy purchasing and the smuggling of tax-refunded goods back into the domestic market.

College graduates called up to serve in grassroots posts

Nine central authorities led by the Ministry of Human Resources and Social Security have launched the fifth round of one of China's major grassroots service programs to engage more university and college graduates to work at the grassroots level.

According to the implementation plan, 36,400 graduates will be recruited every year from 2026 to 2030 to serve at the grassroots level in education, agriculture, medical care and rural vitalization. Each service term lasts two years.

First introduced in 2006, the Sanzhi Yifu — or "three supports and one assistance" — program runs on a five-year cycle. The previous four rounds have mobilized a total of 640,000 college graduates to serve community-level posts across the country.

Over the years, the program has effectively optimized grassroots talent structure, bolstered local economic development, and enhanced grassroots social governance capacity.

CHINA DAILY

AI integration, digital twins revolutionize classroom learning

By JI HAISHENG

At Jilin Polytechnic of Water Resources and Electric Engineering, students wearing virtual reality headsets stand before a digital twin of a massive dam. With a flick of their fingers, they unleash a simulated flood — water cascades down the valley, alarms flash, and the pressure feels almost real.

As sensors flicker, an artificial intelligence-powered system scores every decision they make in real time. The feedback is instant: adjust the sluice gate, optimize the discharge curve, try again.

What once took months of on-site training and carried significant safety risks can now be practiced repeatedly in a digital twin environment — a digital replica of a physical object or system.

"Now, students usually practice in digital twin environments before moving to on-site operations. This efficient and cost-effective approach has significantly improved their proficiency, allowing them to master such skills three to four times faster than before," said Liu Dingding, deputy head of the industry-education integration department at Beijing Freedo Technology Co, a digital twin and spatial intelligence company.

Liu's team has helped establish numerous digital twin platforms across sectors such as electric power, water conservancy, transportation and energy. He said that digital twins are rewriting the rules of vocational training, predicting a future where 70 percent of a training program will be virtual and only 30 percent hands-on.

Liu said that with the rise of advanced technologies like digital twins and AI, there will be strong demand for talent in related fields.

"Vocational schools now have a window of opportunity to cultivate professionals such as AI prompt engineers, digital twin scenario designers, and specialists in intelligent equipment maintenance and spatial intelligence applications," he said.

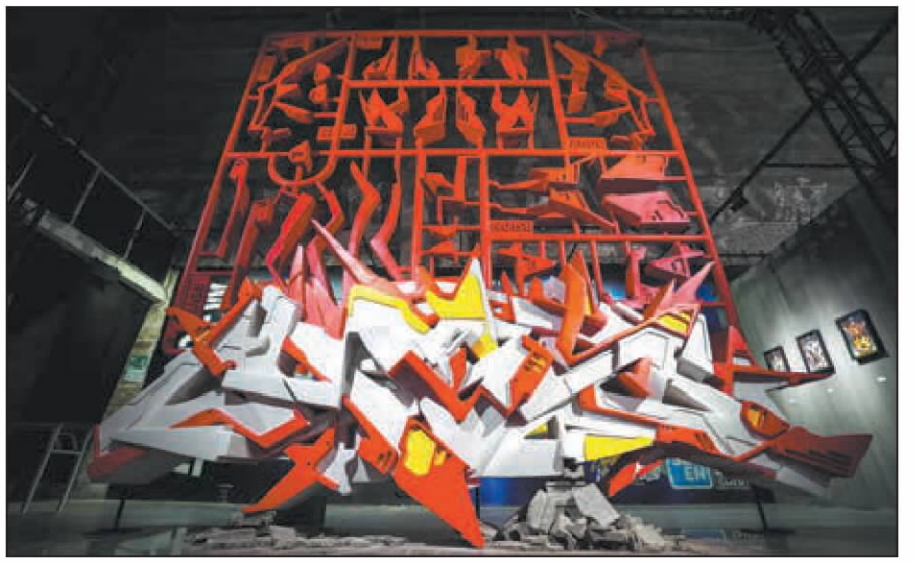
He called on vocational schools to seize these new directions during the transition period by setting up new majors and training programs.

In April, five ministries, including the Ministry of Education, jointly issued the "AI Plus Education" action plan, calling for full integration of intelligent technologies across all aspects of education. In July, the ministry added 27 new vocational majors, including embodied intelligence computing and humanoid robot engineering.

"The policy message is clear — AI integration into vocational education is no longer an 'elective' but a 'required course'," said Zhou Zhemin, director of the Academic Affairs Office at Hunan Industry Polytechnic in Changsha, Hunan province.

Zhou described the impact of AI and other advanced technologies on vocational education as "disruptive", saying they are redefining what vocational institutions should aim for. "In the past, vocational students were trained to be operators who could follow instructions and perform repetitive tasks. But AI is taking over precisely those tasks," he said.

According to a McKinsey & Company report, the rise of generative AI is propelling the era of automation to arrive a decade earlier than anticipated. In China, around 50 percent of work activities are projected to be automated before 2030, and about 200 million workers — equivalent to 30 percent of China's total workforce — will need to reskill or upskill, the report said.



Despite the overwhelming impact of AI, Chinese vocational institutions should not steer students away from it — instead, they should equip students to harness it, Zhou said.

For these institutions, it is imperative to shift focus to cultivating versatile technical talents with hands-on experience, innovation capabilities and AI expertise, he added.

Bending the structural rules

Graffiti artist balances street writing with traditional calligraphy in his newly released Chinese typeface, in which he sees a future in cultural collaborations, **Li Yingxue** reports.

When a broad-edged marker touches a surface, a Chinese character begins to move beyond the familiar order of horizontal and vertical strokes.

As a dip pen moves, the line sharply shifts between thick and thin. Each turn carries the energy of street graffiti while echoing the precision and ornamentation of Gothic calligraphy.

The traditional Chinese character *fa*, meaning "to prosper" or "to flourish", appears bold and forceful while remaining unmistakably Chinese. It seems to have grown out of traditional calligraphy while retaining the visual intensity of street art.

This fusion of writing traditions lies at the heart of ABS Street Ink, a newly released Chinese typeface by graffiti artist Xu Yan, who blends Gothic calligraphy with the visual language of street graffiti.

Built on the use of broad-edged markers and flat-nib dip pens, the typeface gives Chinese characters a strong sense of movement and tension without sacrificing legibility. It also represents an exploration of how Western lettering traditions can be adapted to the structural logic of Chinese characters.

Xu, 38, is a co-founder of ABS Crew and an early practitioner of graffiti in China. He first encountered graffiti in 2005 while in high school, when the art form remained a niche culture largely introduced through foreign documentaries, magazines and hip-hop culture.

Xu and his classmates began writing their names on walls near their school. For them, graffiti was not simply drawing but a way of expressing identity through writing.

"The simplest way to describe graffiti is writing your own name," Xu says. "In essence, it is writing — and making that writing visually appealing."

Graffiti artists often call themselves "writers", emphasizing the construction of letterforms and personal style. This understanding connected naturally with Xu's childhood training in Chinese calligraphy.

He began practicing brush calligraphy in primary school and later studied printmaking at the Xi'an Academy of Fine Arts and public art at the Beijing Institute of Fashion Technology. In 2011, Xu and his team won both the China and Asia championships at Wall Lords, an international graffiti competition in Asia, and ABS Crew later became involved in street art projects and commercial collaborations.

Between thick and thin

The origins of ABS Street Ink can be found not only on city walls but also at the calligraphy desk.

Xu has long been fascinated by Gothic calligraphy, a Western lettering tradition known for angular structures, dense compositions and decorative forms. Written with broad-edged pens, Gothic script creates dramatic contrasts between thick and thin strokes.

Graffiti tools, including broad markers and wide brushes, share similar qualities. Their flat edges allow artists to vary stroke width through changes in angle and direction.

"I use dip pens and flat nibs," Xu says. "The nib is like a thin piece of metal. Its flat shape naturally creates a strong contrast between thick and thin strokes."

This similarity led him to consider whether Gothic writing techniques could be adapted to Chinese characters.

His first experiments date back to 2012, when he explored Gothic-inspired Chinese lettering in his graduation work. Years later, after connecting with FounderType, the idea developed into a complete typeface project.

Xu was already known for his Gothic-inspired "*Gong Xi Fa Cai*" (meaning, wish you good fortune) lettering, which appeared on hats, footwear, scarves, mahjong sets, and enamel cookware, including collaborations with brands such as Nike.

But that project involved only a few characters. ABS Street Ink required thousands of Chinese glyphs.

Xu created each glyph on a digital tablet, adjusting brush settings to reproduce the marks of a flat nib while preserving the rhythm of handwriting.

"Each character was written directly in one go, rather than created by drawing an outline and filling it in," he says. "Every stroke came from the act of writing."

The biggest challenge was consistency. Chinese characters vary greatly in complexity, and Xu had to ensure that thousands of glyphs formed a unified system — with simple characters not appearing too empty and complex ones remaining clear.

For more than a year, he wrote roughly 10 characters a day and repeatedly revised earlier work.

Typeface designer Xing Hangke says the project demonstrates the difference between creating individual lettering pieces and building a functional typeface.

"A poster or logo can bend structural rules for a particular visual effect," Xing says. "A typeface must remain consistent and recognizable when thousands of characters are entered, combined, and used in different contexts."

Xing compares professional type designers to dancers in shackles, creating to their will within strict constraints.

A distinctive stroke may work well in the first few dozen glyphs but later create problems among similar characters. Designers must constantly adjust forms to maintain the overall system.

"In the end, you have to follow its rules," Xing says. "Some artistic expression will inevitably have to be reduced."

For Xing, ABS Street Ink succeeds because it avoids becoming either loose graffiti lettering or a simple imitation of Gothic script.

"It uses Gothic structure as the skeleton and graffiti strokes as the surface," he says.

Sharing a sense of flow

Adapting Gothic calligraphy to Chinese writing involves more than adding Western decoration.

Chinese characters have their own internal architecture, including structural balance, spatial relationships and the distribution of empty space. Excessive ornamentation can damage recognition.

"Western audiences may not understand the Chinese characters, but they can still recognize the Gothic style," Xu says.

He previously participated in a calligraphy exchange connecting Beijing and Berlin, in which artists wrote together via live projections. Even without understanding the content, participants could sense the rhythm and energy of the writing.

In graffiti culture, this quality is called "flow". In Chinese calligraphy, it resembles the continuous movement that carries the brush's energy from one stroke to the next.

For Xu, this shared sense of movement connects the two traditions. Graffiti may be associated with rebellion and freestyle, but at its core is the creation of a distinctive personal writing style. Chinese calligraphy likewise reflects the personality and rhythm of the writer.

One evolved on paper; the other found its expression on walls and in public spaces.

ABS Street Ink is designed for visually driven applications rather than long passages of text. Xing expects it to appear in fashion branding, music festivals, posters, street culture packaging, film and television titles, esports, and digital media.

In these contexts, typography is not meant to disappear. Instead, it establishes visual identity and emotional tone.

"The fact that this typeface serves a niche audience is precisely what can make it central to a particular field," Xing says.

Common Chinese text typefaces, including Song-style and sans-serif designs, dominate long-form reading because they allow readers to focus on information rather than form. Display typefaces like ABS Street Ink serve a different purpose: to attract attention and carry cultural meaning.

Xing describes the project as "type design driven by graphic thinking": a typeface with the visual impact of an image while remaining a functional writing system.

Chinese type design is increasingly developing at the intersection of culture, technology and visual experimentation.

AI tools, automated font-generation systems and variable fonts are changing production methods, but Xing believes technology alone cannot determine the lasting value of a typeface.

"Technology defines the floor, while culture defines the ceiling," Xing says.

"I hope to see more people using it, rather than limiting it to the way I use it," Xu says. For him, a typeface is complete only when it leaves the designer's hands and enters wider circulation — appearing on posters, packaging and screens, where it continues to develop new meanings in different cultural contexts.

Books find new home at mobile library in Myanmar

YANGON — Students eagerly browse bookshelves filled with 536 titles on Chinese culture, literature, science, technology, and storybooks as a newly launched mobile library launched on Saturday at Bowen Chinese School in Yangon, Myanmar.

The initiative, launched by the China Cultural Center in Yangon, marks the first step in a program that will later expand to other Chinese schools and relevant organizations nationwide, according to the center.

For 18-year-old Yoon Mi Mi Kyaw, the mobile library offers an opportunity to strengthen her Chinese language skills while learning more about the culture.

"We can learn about Chinese culture and society through books without even visiting China," she says.

"Since we are learning Chinese, having these books at our school creates a Chinese-language environment and helps us stay connected with the language," she adds.

"As a student attending Myanmar, English and Chinese schools, finding time to visit a library has always been difficult," she says. "Now we don't have to spend extra time going to a library because we can study Chinese and enjoy reading at school."

> "Reading a physical book gives a different feeling. The library provides a peaceful environment where I can concentrate better."
>
> **Aye Myat Thiri,** 17-year-old student

Seventeen-year-old Myat Yati, who prefers reading novels, says the mobile library has given her access to a wider variety of books.

"I usually read storybooks at home, but now I can read at our school," she says. "I'm excited to learn about different cultures through books."

Another student, 17-year-old Aye Myat Thiri, says she prefers reading print books to reading on a mobile phone.

"Reading a physical book gives a different feeling," she says. "The library provides a peaceful environment where I can concentrate better," she adds.

Cho Cho Myint, principal of Bowen Chinese School, welcomed the initiative, saying it would save students time while encouraging reading.

"Our students no longer need to visit a separate library," she says. "There are many types of books here, so they can choose what they like to read and learn."

The mobile library is not only a collection of books but also a bridge connecting them with new knowledge, languages and cultures, she says.

The initiative aims to help students learn more about Chinese culture and literature beyond the classroom while fostering a stronger reading culture, says Han Jiajun, director of the China Cultural Center in Yangon.

"The books will be replaced every six months so students can continue exploring new reading materials," he says, adding that the mobile library will also be open to people learning Chinese outside the school.

He hopes that the mobile library will encourage students to develop stronger reading habits, improve their Chinese language skills, and achieve better academic results.

LIFE

Landscapes from the top

In Xizang's 'miniature Earth', a nature station-turned-micro-museum transforms a quick stop into a nine-zone ecological journey, **Yang Feiyue** reports.

The warm, humid monsoon winds that sweep up from the Indian Ocean don't stop at the Himalayas. They find their way through the Yarlung Zangbo Grand Canyon, the world's deepest gorge, and pour into the mountains of the southeastern part of the Xizang autonomous region.

They leave behind an extraordinary landscape that compresses several climate zones into just a few dozen kilometers of horizontal distance.

From the tropical monsoon rainforest of Metog county at 155 meters above sea level to the permanent snows of Namcha Barwa Peak at 7,782 meters, the region known as Nyingchi contains nine significant altitudinal natural zones — a "miniature Earth" that has drawn biologists and explorers for decades.

Recently, a new visitor attraction, a nature station, opened in Gongbo Park in the heart of Nyingchi. It debuted at the fifth China Xizang Trans-Himalaya Forum for International Cooperation and attracted instant attention from guests from more than 20 countries. Developed by the Chinese National Geography, the Nyingchi nature station aims to help visitors understand the landscape before them.

Step inside, and a 3D-printed topographic map of the Yarlung Zangbo Grand Canyon reaches waist height. Press a button, and its rivers glow blue. Pull open a drawer beside it, and you'll find profiles of the region's great peaks: the 7,782-meter Namcha Barwa, the eastern anchor of the Himalayas, and its neighbor Gyala Peri.

Elsewhere, visitors can spin a cylinder to watch the Asiatic golden cat transform through five color morphs. Nearby, a button triggers birdcalls that move through the forest in a "bird wave" — yellow-throated fulvettas and other birds, each playing a role as callers, followers or lookouts.

Climbing the stairs to the second floor feels like ascending 4,800 meters in elevation, from tropical monsoon rainforest to alpine scree. At the top, a viewing window frames a snowy mountain.

Guo Yingqian, general manager of the Chinese National Geography Camp, describes the station as a kind of micro-museum in nature.

"Traditional stations were places to rest," she explains. "Tourist centers are reception and display buildings for scenic areas. Our nature station resembles a compact, open structure that uses interactive installations and scientific exhibits to interpret the local natural ecology and cultural stories."

The Nyingchi station is designed as an urban installation that systematically interprets the concept of an ecological community encompassing mountains, rivers, forests, farmlands, lakes, grasslands, deserts, and glaciers.

The camp team plans to divide China into roughly 50 unique geographic units based on six natural zones and eight ecosystems, and establish nature stations or centers in each.

"Nyingchi is in southeastern Xizang and has the world's most complete natural mountain vertical zones," Guo says. "The landscapes are extremely dramatic — Namcha Barwa and the Yarlung Zangbo Grand Canyon — and it's also one of the world's biodiversity hotspots. It really captures the diversity we're trying to showcase," she explains.

The station's 26 interactive exhibits follow a simple but powerful idea: a vertical ascent.

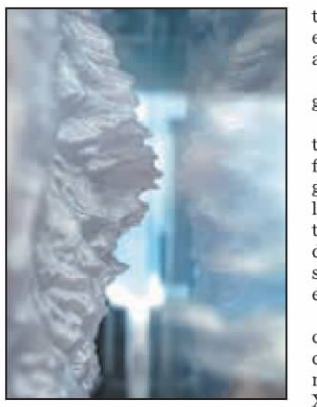
The ground level, surrounded by exhibits on Mountain, Water, and Forest elements, aims to present Nyingchi's ecological foundation.

A hand-drawn map shows how the collision of the Indian and Eurasian plates 65 million years ago created the Yarlung Zangbo suture zone, making Nyingchi one of the planet's most geologically active mountain regions.

The staircase connecting the two floors is itself an exhibit. As visitors ascend, they pass through representations of each vertical zone — from tropical monsoon rainforest below 1,100 meters to alpine scree at 4,800 meters, with animal silhouettes and interactive photo points marking each transition.

The second floor shifts focus to Farmland, Grassland, Lake, Glacier, and Sand, along with the human and ecological relationships that define life at higher elevations.

A display on rice cultivation in Metog and Zayul counties, a rotating column illustrating eight hardy meadow plants, and a section on the region's remarkable glaciers are among the highlights.



The station's true innovation lies in the small things.

For the "10 Questions About Glaciers" display, a flipboard answers questions about why glacial meltwater is not always safe to drink, as well as how glaciers have changed over recent decades.

"We're trying to take authoritative scientific knowledge and turn it into fun experiences," says Gai Yifang, a member of the station's lead design team.

"Through science-plus-art, we transform it into interactions where visitors can press buttons and listen. For tourists, it's more engaging and less like being lectured."

Top: The split-level design of the Nyingchi nature station creates a playful landscape. **Middle left:** A visitor turns an interactive exhibit to learn about the station's photovoltaic system. **Middle right:** A view of Nyingchi's topography. **Above:** Children learn about native plants through scientific illustrations. PHOTOS PROVIDED TO CHINA DAILY

The team works closely with the Chinese Academy of Sciences to ensure accuracy.

Then they distill.

"For animals, we avoid long taxonomic descriptions and morphological characteristics," Gai says. "Instead, we highlight one memorable fact that visitors might find interesting — always based on scientific fact — and pair it with professional photography and scientific illustrations."

The station is powered by solar panels paired with an integrated battery storage system, enabling it to operate its lighting and interactive exhibits off the grid under normal conditions.

But the team didn't stop at the technical side. They turned nature itself into a teaching tool. Displays explain how mycorrhizal fungi lock carbon in forest soils, how serpentinite rocks absorb carbon dioxide and turn it into carbonate minerals, and how glaciers regulate global climate.

"Nature is itself a zero-carbon textbook," Gai says. "Visitors discover that zero carbon is happening around them every day."

The Nyingchi station is part of a growing national network.

In April 2024, the first nature station opened in Metog, with a bird-focused theme. Butterfly, giant tree, geology, cat, and orchid stations followed. In September 2025, four themed stations appeared in Bomi, dedicated to the region's glaciers, spruce forests, wildlife, and unique ecological systems.

Guo, general manager of the camp, says the network currently comprises 24 nature stations nationwide, with footprints in Xizang, Xinjiang Uygur autonomous region, Shenzhen of Guangdong province, Chongqing and Wuxi in Jiangsu province.

The latest addition of the Nyingchi station to this growing network plays a special role.

"Previous stations were focused on individual themes — a single species or resource type. This station, however, presents a systematic geographical narrative of Nyingchi as a whole," Guo explains.

"It provides an overarching scientific context for other Nyingchi stations."

Functionally, its central location in Nyingchi makes it an ideal first stop, giving visitors an overall understanding of the region before they venture further.

"Tourists no longer just take a photo and leave. They can follow the stations' guidance and spend more time systematically exploring the land. This helps position Nyingchi as a world-class destination for ecological and cultural tourism."

Chinese food week stirs interest in Estonia's historic border city

NARVA, Estonia — On July 17, in the dining room of the Inger Hotel in central Narva, an unusual aroma hovered in the air. Mixed with the familiar scents were the earthy tang of soy sauce, the warmth of star anise, and a hint of ginger. For one week, this popular lunchtime spot became a culinary meeting point, introducing diners to a menu of Chinese specialties.

Chinese cuisine week grew out of one local entrepreneur's nostalgia. An Estonian businessman, who requested anonymity, had operated a Chinese restaurant in Narva before it closed during the COVID-19 pandemic in 2020. This summer, he proposed a revival with a fleeting taste.

"We naturally agreed," Olesya Morozova, the hotel restaurant's manager, says with a smile. "We are always happy to offer our guests something new."

That new experience came with Chef Mu Xiaofeng, who flew from China to lead the kitchen. Each day, the restaurant served a set lunch: soup, salad, and a main course, with the menu rotating daily to showcase variety. There was hot-and-sour soup, crispy spring rolls and stir-fried noodles with vegetables.

The biggest conversation starter, however, was a dish rarely found on Estonian menus: simply prepared stir-fried squid with scallions, ginger and salt.

During a visit to the kitchen, Chef Mu was seen preparing the dish from start to finish. He deftly sliced the squid into delicate crosshatch patterns before tossing it into a blazing wok with scallions and ginger. Within minutes, the specialty was plated.

"It caused quite a stir," Morozova admits. "Not everyone understood or appreciated the taste, of course. We received many positive reviews, but some guests found the flavor unfamiliar." Still, she defended the choice: "When such an opportunity arises, it is certainly worth trying something truly different."

During Hainan province's peak travel season, international tourists taste local specialties at a Haikou night market on July 17. GUO CHENG / XINHUA

Even sourcing the squid became part of the story. When Morozova contacted her usual suppliers, their reaction was disbelief. "'What is going on over there?' they asked," she recalled with a laugh. "I think that was when publicity for our Chinese cuisine week really began."

News of the event quickly spread through Narva, a city of just over 52,000 people on Estonia's eastern border with Russia. Phone calls, text messages and social media posts buzzed with questions: When is the event? What will be served?

"It shows that the city needs more projects like this," Morozova says.

The enthusiasm was perhaps less surprising given Narva's existing culinary landscape. A short walk from the Inger Hotel, WokkIN Narva has built a loyal following by serving Chinese-inspired dishes. Customers frequently praise its generous portions, affordable prices and flavors they describe as authentically Chinese.

Against that backdrop, the hotel's special week felt less like a bold introduction than a welcome deep-dive into Chinese cuisine.

Language proved no barrier in the kitchen. Using a translation app on a mobile phone, Chef Mu, who speaks only Mandarin, communicated with the hotel's Russian-speaking staff while demonstrating Chinese cooking techniques of velveting meat and balancing five-spice powder.

Diners enjoying more familiar offerings, like sweet-and-sour chicken and egg-drop soup, offered brief but enthusiastic praise. "It was excellent," several diners agreed with a smile before quickly returning to their meals.

Encouraged by the response, Morozova says the restaurant hopes to keep several of Chef Mu's recipes on the menu after the event concludes. "We will try to continue preparing these Chinese dishes," she says.

LIFE

Mental health enters a new frontier

Beijing Huilongguan Hospital's family-oriented ward tackles gaming addiction, reflecting a shift in how psychology is addressed in China's society, **Xu Fan** reports.

As children across China have begun their summer vacation, many parents are bracing for a familiar battle: competing with smartphones and video games for their children's attention.

That anxiety is precisely what Pixar's latest animated blockbuster *Toy Story 5* captures in one memorable scene. A group of toys climbs onto rooftops and peers through windows, only to find children in every home glued to screens, their thumbs constantly scrolling while the toys sit forgotten in the corner.

For many Chinese families, that fictional scene feels increasingly close to reality.

To help parents cope with the challenge, Beijing Huilongguan Hospital — the first hospital in China to establish a family-oriented ward dedicated to treating gaming disorders — published a science-based guide on its official WeChat account on July 2, encouraging parents to read it before the summer break.

The move reflects the growing recognition of excessive gaming as a mental health issue. In 2018, the World Health Organization released the 11th revision of the International Classification of Diseases (ICD-11), recognizing gaming disorder as a behavioral addiction.

According to the WHO, the ailment is identified as a condition that must be severe enough that it results in significant impairment to a person's functioning in personal, family, social, educational, occupational, or other important areas, and would normally have been evident for at least 12 months.

In other words, excessive gaming is not simply a matter of poor self-control. For some people, it is a medical condition that requires professional treatment.

For An Jing, a housewife in Hebei province, that distinction is painfully personal. Her 16-year-old son has become completely immersed in the online world, eventually taking a year off from school. He has reversed his day-night schedule, developed irregular eating habits, and spends nearly all his waking hours playing games, watching TV, or scanning smartphones. "When I see children carrying schoolbags on the street, I can't help but cry. But little by little, I've gotten used to it," An says.

Although many parents like An feel they are confronting a relatively new problem, the medical community began taking it seriously years ago.

Yang Kebing, chief physician and director of the hospital's Addiction Medicine Center, tells China Daily that he vividly remembers the period when the WHO gathered experts from around the world to evaluate whether gaming disorder should be included in the ICD-11.

"As discussions intensified, we realized this was becoming an increasingly serious issue," Yang says.

Drawing on years of clinical observation and research, the hospital opened China's first specialized behavioral addiction ward on May 21, 2019 — four days before the ICD-11 was formally adopted by the 72nd World Health Assembly.

Located near the hospital's north gate, the facility — also known as Inpatient Ward 29 — hardly resembles a traditional psychiatric ward. Reminiscent of the courtyards nestled in Beijing's hutongs, this single-story compound features a ping-pong table and four swing chairs, creating a relaxed atmosphere. The patient rooms are arranged around the courtyard, while the treatment rooms feel more like recreation spaces, such as a board game room and a mini karaoke booth.

"Normally we have 13 beds, but the ward can accommodate up to 15 or 16 patients if necessary," Yang says.

The ward evolved from an alcohol dependence unit established in 2008. As internet use became widespread and gaming-related problems increased, the hospital expanded its focus to behavioral addiction.

"Based on our clinical experience, about half of our patients are addicted to the internet or online games, and most are between 12 and 20 years old. The other half are mainly patients with other addictions such as alcohol dependence," Yang says.

One teenager left a lasting impression on him. Obsessed with online games, the boy repeatedly fought with his parents, shouted at home, disturbed neighbors, and eventually dropped out of school. His parents ultimately brought him to the hospital against his will. After spending two weeks in a closed ward to disconnect from the internet, he was transferred to the behavioral addiction ward for psychotherapy and medication.

Yang also recalls one of the ward's most successful recoveries — a 32-year-old man who lost his job because of excessive mobile gaming. Admitted shortly after the ward opened, he gradually regained control of his life through treatment.

Years of clinical practice have also reshaped Yang's understanding of the disorder. "Pure gaming disorder is actually uncommon. About 70 percent of our patients also have other psychiatric conditions, such as depression, bipolar disorder, ADHD, or anxiety disorders," he adds.

For Yang, however, the work brings more responsibility than recognition. He entered the Department of Mental Health at Beijing Medical University — now Peking University Health Science Center — in 1994, receiving comprehensive training in internal medicine, surgery, pediatrics, neurology, and psychiatry before joining Huilongguan Hospital in 1999.

Looking back over more than two decades, he has witnessed a quiet but profound shift in public awareness of mental health.

"When I first came here, we saw only a few dozen outpatients a day," he says. "Now, treating more than 1,500 patients a day has become routine at our hospital."

As the interview draws to a close, two nurses hurry over, carrying a new case file. Before there is time to exchange a proper goodbye, Yang is already discussing the patient's condition. It is a brief but telling scene: in the time it takes to say farewell, another family's struggle has already become his next mission.

Guardians of the plateau help revive Xizang's wildlife and ecosystems

Left: A female Tibetan antelope nurses its calf in Nagchu, Xizang autonomous region. **Right:** Migratory birds at the Lhalu Wetland National Nature Reserve in Lhasa, Xizang. PHOTOS BY LI LIN / CHINA NEWS SERVICE

LHASA — At daybreak on the northern plateau of Southwest China's Xizang autonomous region, the wind moves first. It comes out of seemingly empty country, passes over lakes and meadows, and blows toward the snowy mountains in the distance.

Through his binoculars, Kalzang Lhundrup can often see Tibetan antelopes lowering their heads to drink and wild kiangs moving slowly along a ridge. His motorcycle leaves only a shallow track on the patrol road, a faint line across the vast landscape.

On other patrols, he has seen wild yaks and black-necked cranes appear more frequently — signs to him that the plateau is recovering.

For nearly a decade, Kalzang Lhundrup, head of the Norbu Yugyel wildlife conservation station in Nyima county in Nagchu, has been reading these signs. In his world, the return of wildlife is not an abstract measure of ecological recovery. Instead, it appears through hoofprints, migration routes and fleeting images captured by trail cameras.

Patrolling this area is hard work. The altitude is close to 5,000 meters, and roads are long, while the wind and snow can be punishing. There is also the loneliness of the wilderness, which is very much part of the job. Kalzang Lhundrup and his colleagues patrol five or six times a month, riding motorcycles in summer and driving off-road vehicles in winter. A single day on patrol may cover more than 200 kilometers.

Along the way, they record the species and numbers of wild animals they see and watch out for those that are injured or separated from their herd. In recent years, this station alone has rescued over 40 wild creatures.

"There are more animals now and, in a way, that gives us more work," he says. "But it is good work. It means the land is healthier than before, and it means our patrols are worth it."

The station is named after Norbu Yugyel, a police officer who sacrificed his life while apprehending poachers in northern Xizang. From earlier wildlife protectors to the hundreds of rangers now working across the plateau, conservation there has often been a quiet and demanding inheritance.

A herder born on this land, Kalzang Lhundrup sees the change through a lens of personal pride. "I was born here. To be able to protect this land is my greatest happiness."

Monitoring data tell part of the story. Populations of rare wild animals in Xizang have shown a clear recovery trend. Tibetan antelopes have increased from just more than 70,000 at the end of the 20th century to over 300,000 today, while wild yak numbers have grown from several thousand to more than 20,000. The number of black-necked cranes has also risen from fewer than 4,000 to over 10,000.

Across Xizang, the human footprint on the Qinghai-Tibet Plateau is being managed more carefully. The region has built a nature reserve system with national parks as the mainstay. It now has 47 nature reserves and 97 protected natural areas in total, as well as 73 wildlife protection stations.

Conservation in Xizang is not only about keeping people away from nature. It is also increasingly focusing on teaching people how to live near it.

In Lhasa, the same idea appears in a different form at Lhalu Wetland National Nature Reserve, often called the "lung of Lhasa". On summer days, birds skim the water or rest in the shallows. Beyond the reeds and footpaths rise the Potala Palace and residential buildings, bringing the wetland into the everyday life of the city.

Ngawang Tashi, deputy head of the administration bureau of the reserve, says the wetland was not always so healthy. Since 1995, years of protection, restoration and monitoring have helped revive its ecological functions.

In recent times, Lhasa has invested 728 million yuan ($107 million) in two phases of restoration work, helping bring the wetland back to life. Its vegetation coverage has risen to more than 95 percent, and the reserve currently supports 174 bird species, with more than 10,000 birds living and breeding there.

Parts of its patrol paths have been opened to the public in an orderly manner. Residents now go there to walk, take photographs, and watch birds. For many children in the city, this wetland may be where they first learn the name of a black-necked crane.

The water that nourishes Lhalu Wetland eventually flows into the Lhasa River and then into the Yarlung Zangbo River, which runs eastward toward Nyingchi, where ecology has become a livelihood.

Tashi Drolma, a homestay owner in Bomi county in Nyingchi, grew up watching her mother run a family inn more than 20 years ago. As a child, she did not think much about the peach trees in the yard. Only later did she understand that the blossoms had become part of a new economy.

"When I was young, I didn't know peach blossoms could be so valuable," she says. "After I grew up, I realized they are our way to a better life."

In 2025, Nyingchi received 17.4 million tourist visits, and its tourism revenue reached 16.3 billion yuan. The city also creates more than 10,000 ecological jobs each year, helping increase annual per capita income by 3,500 yuan.

Back in northern Xizang, Kalzang Lhundrup still sets out on patrol. The work remains cold, lonely and physically demanding. But each return of the antelope, each crane landing in a wetland, and each village finding income in clean mountains and rivers tells the same story: On the plateau, protecting nature has become another way of keeping life moving forward.

2026 WORLD CUP

Viewing the positives of super-sized Cup

From record TV ratings, to gripping Cinderella stories, for FIFA, the good outweighs the bad and the ugly

Left: US striker Folarin Balogun fouls Bosnia and Herzegovina's Tarik Muharemovic (4), which led US President Donald Trump to intervene to have Balogun's one-game ban for the resultant red card suspended. **Right:** Cape Verde and Argentina produced one of the all-time classic World Cup matches, providing a strong case that the expanded 48-team format has been a success. AP

There are a lot of things that could have gone wrong during this summer's World Cup — a complicated logistical undertaking that included three host nations, 16 stadiums, 48 teams, 104 games and endless opportunities for controversy on and off the soccer field.

But in retrospect, a lot of things went right.

The United States, Canada and Mexico spent nearly six weeks hosting soccer's biggest showcase and — at least for the most part — the action stayed on the field.

US broadcaster Fox said Tuesday that the final, contested by Spain and Argentina, drew 38.9 million domestic viewers — including a peak of 51.7 million — which easily set the record as the most-watched English-language soccer telecast in US history, according to Nielsen Media Research. Spain won the final 1-0 in extra time.

Telemundo's preliminary numbers for its Spanish-language broadcast said the game had a total audience of 22.6 million, putting the total number of viewers in the US at more than 60 million.

Fox broadcast all 104 games in English on its platforms and television ratings remained high in the US even after the US team was eliminated by Belgium in the round of 16.

Spanish broadcasts on Telemundo were also a popular option — even for non-native speakers.

Fox averaged 7.7 million viewers for the 104 broadcasts on Fox, FS1 and Tubi — up from 3.58 million in 2022 and 2.77 million in 2018.

Though Nielsen's viewership numbers give a window into the World Cup final's widespread popularity, it's a challenge to reflect how many people actually watched since some viewed the game in group settings, such as watch parties.

In 2025, Nielsen expanded its out-of-home measurement system to try and get a more accurate count.

Attendance was good

Star players like Argentina's Lionel Messi, France's Kylian Mbappe and Norway's Erling Haaland became household names across North America, and, despite a few early hiccups and high ticket prices, most games featured packed stadiums with strong attendances throughout the US, Canada and Mexico.

FIFA president Gianni Infantino offered effusive praise to the host countries on Sunday.

"We have had a record number of spectators in the stadiums, almost seven million," Infantino said.

"We will have had, I mean the official figures will come out soon, but probably over six billion people watching it from home."

The weather cooperated

Fans and players from other countries found out what Americans, Canadians and Mexicans have known for a long time — it can get pretty hot in the summer, and climate change isn't helping matters.

But Mother Nature could have been a lot meaner than she decided to be.

Even so, there were a handful of games that featured particularly hot and muggy conditions.

The best example was a knockout-round game between Paraguay and France on July 4 in Philadelphia, when temperatures hovered around 38 C.

The World Cup final on Sunday also dodged a potential problem, when smoke from Canadian wildfires that wrapped the Northeast in haze had mostly cleared from the New Jersey area just in time thanks to some well-timed thunderstorms.

Size doesn't matter

This year's 48-team World Cup field was the biggest in history, and many thought it would water down the competition.

That wasn't the case.

Cape Verde held eventual champion Spain to a draw in its opening game, advanced to the round of 32 and gave Argentina a scare before losing 3-2 in extra time in a World Cup classic. The Democratic Republic of Congo also advanced beyond the group stage and pushed England all the way before losing late on, while Curacao was still in with a chance of making the knockouts going into its final group match.

After all the Cinderella stories were over, it was FIFA's top four ranked teams — England, Argentina, Spain and France — left to contest a heavyweight-packed semifinal round.

Politics can't be ignored

The World Cup is famously a petri dish for political conflict, and this year's edition provided its fair share.

Iran's participation in the tournament amid the war in the Middle East was a particularly thorny issue and the team had to move its base camp from Arizona to Mexico. The Iranians' participation was overshadowed by travel complaints and visa issues, with the US refusing visas to several members of Iran's delegation.

US President Donald Trump's relationship with Infantino was scrutinized after US striker Folarin Balogun's one-game ban for a red card was suspended ahead of the team's round of 16 game against Belgium.

Travel restrictions prevented fans of certain countries from traveling to the US, but there were no reports of the aggressive immigration enforcement that some had feared could take place around World Cup stadiums.

Infantino brushed aside most of the controversies, instead focusing on the positives. While the FIFA president has a vested interest in painting a rosy picture of this year's World Cup, there's little doubt that, from a soccer perspective, the tournament was a hit.

"I think we have to invent a new vocabulary, new words to define the success of this World Cup," Infantino said.

AP

The World Cup final set the record as the most-watched English-language soccer telecast in United States history, according to Nielsen Media Research, drawing a peak domestic TV audience of 51.7 million. AFP

Arrogance or pride? Argentina grapples with villain label

BUENOS AIRES — Critics blasted Argentina for dirty tactics and poor sportsmanship during its 1-0 loss to Spain, cementing the country's status as a World Cup villain that grew throughout the tournament.

But Argentines argue they are just passionate and misunderstood.

"I think we deserve some credit for not being very well-liked, because of this tendency to be arrogant and look down on most people from a pedestal," said Leo Simone, a 55-year-old lawyer, from his home north of Buenos Aires.

"They confuse arrogance with pride," his wife chimed in, preferring not to give her name.

While star Lionel Messi is beloved around the world, anti-Argentina sentiment grew as critics argued the team was FIFA's darling and received favorable refereeing calls, such as penalties, VAR decisions and cards shown to opponents.

Then came the final, replete with fouls, brawls on the pitch, and Argentine players turning their backs when Spain received the World Cup trophy.

The New York Times called it a "tetchy, petulant and distasteful performance."

Former Germany player Thomas Hitzlsperger wrote on X that Argentina's players were "disgusting sportsmen", and British television personality Piers Morgan said "they basically just went around whacking as many Spanish players as they could."

Near Ezeiza Airport, where thousands of fans welcomed the players returning to Buenos Aires on Monday night, Maximiliano Heredia, a 35-year-old construction worker, said: "We've always been criticized, we're used to it, but we always give it our all."

'We love it'

Many Argentines online wore the criticism as a badge of honor.

"There's something about Argentine irreverence that they can't tolerate. Our rebelliousness irritates them, enrages them. They call us cocky, cheaters, dirty, and we love it, it fills us with pride," journalist Pedro Rosemblat posted to Instagram.

Argentina's Leandro Paredes grabs the throat of Spain's Eric Garcia after the final whistle of the World Cup final on Sunday. AP

Sports journalist Ezequiel Fernandez Moores told reporters that some criticism was justified: "Sometimes we think we're the center of the universe, that God and our own navel are Argentine."

He said local soccer codes of provocation, mockery and boasting did not translate to a global audience.

"We can't expect the world to understand us, our way of being, feeling and expressing ourselves," he said.

Nevertheless, the team turning its back on Spain as it received the cup was "not right", he said.

The lawyer Simone rejects the notion that physical play makes Argentina a violent team.

"Argentina is a team that fights hard, like almost all South American football, but Spain also resorted to tactical fouls," he said.

"It's football: if you don't like being hit, play volleyball."

For Evelio Rubio, a 47-year-old Venezuelan neurologist who has lived in Argentina for a decade, it is impossible to understand from outside how "football is experienced here".

For a Venezuelan accustomed to his national team not winning titles, experiencing that passion from within "is spectacular".

Racism accusations

Argentine fans and some players have also faced accusations of racism — such as a chant sung by the team in the past mocking the black players on the French team as not being really French.

There is also a long history of club-level fans throwing bananas on the field or making monkey gestures at Brazilian fans or black players.

During this World Cup, FIFA condemned racism in a statement after an Argentine supporter told a black US influencer known as iShowSpeed to go "cry at the zoo" during a livestream.

American actor Samuel L Jackson stirred controversy when he urged black people in an Instagram story not to support Argentina, which he dubbed one of "the most racist countries in the world".

Sociologist Ivan Schuliaquer of the National University of San Martin said people should not take racism related to soccer and apply it generally to Argentine society and history.

This racism exists and should not be denied, he said.

"But, in many cases, these labels come from colonizing countries that have not yet fully resolved the issue of racism."

Robotics boom fueling nation's tech ambitions

Beijing conference showcases strengths while Unitree debut signals industry's hopes

By **CHENG YU**
chengyu@chinadaily.com.cn

More than 3,000 cutting-edge robots and related products packed the 2026 World Robot Conference, which opened in Beijing on Wednesday, the same day that Unitree Robotics made its debut on the STAR Market in Shanghai and surged 629.44 percent to 1,100 yuan ($163) per share from its initial public offering price.

As the conference showcased China's strength as the world's largest producer of robots and a supply-chain hub for the industry, Shanghai's capital market bet on what comes next — whether that industrial muscle can drive faster innovation, lower costs and, ultimately, expand share in the global robotics market, experts said.

That bet played out vividly on Unitree's first trading day. At its peak, a single winning IPO allotment translated into a paper profit of up to 474,600 yuan. Although the shares retreated, they still closed at 845 yuan, up 460.3 percent, valuing the company at 341.77 billion yuan.

Pan Helin, a member of the expert committee for information and communication economy of the Ministry of Industry and Information Technology, said the surge reflects robust investor confidence in China's embodied artificial intelligence industry. "Despite the share price retreating from its opening high, Unitree's performance far outpaced expectations," he said.

During the 14th Five-Year Plan (2021-25) period, President Xi Jinping made multiple visits to robotics companies. At the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai last month, Xi said that AI is moving from the digital world into the physical world, and he called for greater efforts to advance technological innovation, industrial development and scenario-based applications.

Robotics sits at the heart of this transition, serving as the primary vehicle for bringing AI tech into the physical realm. The Beijing conference has brought together more than 300 Chinese and overseas companies with over 3,000 products, ranging from humanoid, industrial and medical robots to core components.

Galbot unveiled a humanoid capable of learning to play tennis. Unitree demonstrated its H1 humanoid, which hit a peak speed of 10 meters per second, rivaling the pace of elite human sprinters.

Inside
Editorial, **page 6**

Xin Guobin, vice-minister of industry and information technology, said that revenue from major robotics companies reached 165.5 billion yuan in the first half of 2026, up 24.5 percent year-on-year.

China will focus on overcoming bottlenecks in core robotics components and embodied AI, he said, adding that the country also aims to expand the integration of robots into agriculture, healthcare, elderly care and emergency response.

Xu Xiaolan, president of the Chinese Institute of Electronics, said embodied AI is entering a key window for large-scale adoption. "Public and commercial services are leading the way," she said. "In China, robots are being deployed in traffic guidance, at tourist attractions, in shopping malls and in education, leveraging capabilities such as autonomous positioning, dynamic obstacle avoidance and question answering."

JPMorgan has forecast that global humanoid shipments will climb from an estimated 18,000 units in 2025 to 60,000 this year, before surging to 1.75 million by 2030. China is expected to account for more than half of global demand, it said.

The National Development and Reform Commission said that eight out of every 10 humanoid and quadruped robots sold worldwide are made in China.

Zhang Yiming, chief analyst for the machinery sector at Guosheng Securities, said humanoids are emerging as a key arena in the tech rivalry between China and the United States, making Unitree's market performance a potential bellwether for the broader industry. "China's advantage lies not just in building sophisticated robots, but in its ability to manufacture them at scale," he said.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said that hard-tech companies such as Unitree reflect a broader shift in how China's capital market values technology. "Investors are now willing to price technological capability and future growth potential over current profitability," he said.

However, an IPO is not the finish line, Wang said, warning that Unitree's elevated price-to-earnings ratio also points to valuation risks. "What ultimately matters is whether a company can deliver technology, products and business models that stand the test of the market," he added.

Country achieves its first rocket recovery on land

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

In a landmark moment for China's space sector, a reusable rocket booster touched down on Wednesday on its predesignated landing site in a northwestern desert, marking the nation's first such controlled recovery on land, following a similar achievement made on a platform at sea last month.

A video clip from LandSpace, a Beijing-based private rocket manufacturer, showed a white speck appearing in the sky above a desert at 7:41 am as the first-stage booster of the ZQ 3 Y2 carrier rocket returned to Earth, descending smoothly and steadily about six minutes after the launch vehicle lifted off from a nearby spaceport.

Footage from surveillance drones flying near the landing trajectory showed that during the final phase of its descent, at an altitude of roughly 3 kilometers above ground, the booster ignited an engine at the center of its base for propulsive deceleration.

Shortly before touchdown, the booster deployed its four legs, which firmly supported the more than 40-meter-tall booster as the engine shut down upon landing on a concrete pad in Minqin county, Gansu province.

The achievement made China the second country in the world, after the United States, to have successfully conducted both land- and sea-based rocket recovery.

LandSpace is the second Chinese enterprise to ever recover a reusable rocket booster.

On July 10, State-owned conglomerate China Aerospace Science and Technology Corp achieved the nation's first such successful recovery when it captured a Long March 10B rocket booster in the South China Sea using a cable system mounted on a special vessel platform off the coast of Hainan province.

On Wednesday, the ZQ 3 Y2 rocket — standing tall at 66.1 meters and primarily made from stainless steel — blasted off at 7:35 am from its dedicated service tower at the Jiuquan Satellite Launch Center in northwestern China, about 390 km from the predesignated booster landing and recovery site.

The rocket's second-stage booster separated from its first stage about two minutes after liftoff and continued flying upward to transport the Honghu 03 satellite to a preset orbit.

The first stage then entered its return phase following a preprogrammed flight procedure. It sequentially completed a series of critical maneuvers — high-altitude return attitude adjustment, reentry powered deceleration, aerodynamic glide control, pre-landing powered deceleration and deployment of landing legs — before touchdown.

In December 2025, the ZQ 3 Y1 — the first launch vehicle in the ZQ 3 series — became China's first reusable rocket to reach orbit. However, the recovery attempt failed as the first-stage booster burst into a fireball over the landing site in Minqin in the final seconds of descent.

Shen Chao, deputy chief designer of the ZQ 3 variants, said the recovery process for any reusable rocket poses several major technical challenges.

China offers new vision of global diplomacy

WORLD WATCH
By Andrei Chevelev

As a diplomat with 40 years of experience, I have observed Chinese President Xi Jinping's vision of international relations and his contributions to global governance.

Over the past decade, Xi has championed a harmonious approach to international cooperation, bringing new momentum to this traditionally conservative field.

Students of political science would be familiar with Carl von Clausewitz's famous dictum that war is merely the "continuation of policy by other means". But Chinese diplomacy has long advocated a different vision of international relations — one that seeks to prevent conflict through dialogue and mutual understanding before violence begins.

History shows how misunderstandings can escalate into crises, crises into armed conflicts, and conflicts into devastating wars. Diplomacy seeks to interrupt this chain before violence erupts.

Chinese diplomacy offers a renewed vision of international relations itself.

I had the privilege of witnessing Xi's historic first visit to UNESCO. In March 2014, a year after he became president, he visited the UNESCO headquarters in Paris for an in-depth exchange of ideas, presenting his vision of international relations and cultural heritage.

The approach was both novel and unexpected at the time. During the meeting, Xi said he wanted to understand how China could contribute more effectively to UNESCO and the international community.

He then delivered his first address within the UN system to ambassadors from all over the world.

QIXI CUSTOMS SPUR FRESH CONSUMPTION TRENDS

Cultural night tours, heritage crafts and immersive exhibitions boost festive spending

By **LI HONGYANG**
lihongyang@chinadaily.com.cn

The Qixi Festival, China's equivalent of Valentine's Day, was celebrated on Wednesday amid a surge in festive spending on cultural night tours, immersive exhibitions and intangible cultural heritage experiences. Experts said the boom reflects a deeper sense of cultural identity and evolving consumer demand.

The festival, which is celebrated on the seventh day of the seventh month on the Chinese calendar, is rooted in the legend of the cowherd and the weaver girl who are separated by the Milky Way, and who meet once a year on this day, spanning the galaxy via a bridge formed by magpies.

In Beijing, the Nanchizi Museum hosted the "Magpie Bridge Night in Garden" ahead of the festival, featuring a special exhibition that blended traditional astronomy with contemporary art.

As part of the festivities, the museum also hosted a fan-making session for visitors on Saturday and has scheduled two more similar sessions on Saturday and Aug 29, from 6 pm to 9 pm.

A Qixi-themed intangible cultural heritage display and experience zone is open to the public at the central hall of the Chinese Traditional Culture Museum until Sunday, featuring eight traditional crafts, including incense making, tie-dye and velvet flower making.

INDEPTH

The flooded downstream areas of the Liulan reservoir are seen after it was breached due to heavy rains in Hengzhou, Nanning, Guangxi Zhuang autonomous region, on July 6. A snake farm was destroyed by the flood and an estimated 800 to 900 snakes escaped. CAO YIMING / XINHUA

THE GREAT SNAKE ESCAPE

Rapid response organized to capture serpents flushed by floodwaters into rural villages

By **ZHANG XIAOMIN**
zhangxiaomin@chinadaily.com.cn

As floodwaters receded and the arduous work of post-disaster reconstruction began, an equally urgent and perilous task unfolded in the Guangxi Zhuang autonomous region last month.

Residents near Hengzhou city, Nanning who had survived the flood faced an unexpected reptilian threat.

When the levee of Liulan reservoir gave way under the onslaught of Typhoon Maysak, the torrential floodwaters destroyed a local snake farm downstream in Dengxu village of Yunbiao. An estimated 800 to 900 snakes including venomous cobras, king rat snakes and non-venomous rat snakes were released into the murky waters.

"Clearing the mud is just a matter of shoveling, but snakes are different. You don't know where they're hiding, or when they might emerge," one villager said.

At least two residents of Dengxu village were bitten by snakes after the flood.

Middle-aged woman Lu Cuilian was bitten by a cobra that was swept into her home by the flood. Her nephew told reporters that the snake first bit her on the neck, and as she tried to pull it away, it bit her arm.

With roads cut off by the flood and the nearby clinic's antivenom supply washed away, she could not reach a hospital in time. She held on for two days, and then died.

The following day, an elderly man surnamed Qin was bitten but survived after being sent to the hospital and receiving antivenom.

The village quickly organized a special patrol team, while multiple official and volunteer snake-catching squads scoured the area, armed with tongs, collection bags and headlamps.

Containing threat

The snakes' escape terrorized the local populace, who for days were afraid to go out at night and constantly scanned their surroundings while cleaning.

In the wake of the snake escape, local authorities moved swiftly to contain the threat.

Under the coordination of Guangxi regional emergency headquarters, regional, municipal, and county-level health commissions implemented a multipronged response encompassing snakebite treatment, hazard checks, and public awareness campaigns.

Experts from across the region and Nanning were sent to assist with snakebite treatment in Hengzhou, and the local hospital's antivenom supply was increased. A special emergency green channel for snakebites was established to minimize treatment time.

Local health authorities also conducted training for front-line medical staff on wound cleaning, proper treatment protocols, rapid assessment and pre-hospital emergency responses.

Meanwhile, officials issued safety advisories through village broadcasts, WeChat groups, and door-to-door notifications, urging residents to avoid nighttime outings, steer clear of grassy areas, ditches, and flooded zones where snakes might hide, and take precautions both indoors and outdoors.

Wu Zhi from the Dengxu village committee told local media that more than 10 villagers from neighboring hamlets that were not affected by the flood had spontaneously formed a civilian snake-catching team.

They ventured into affected areas, going door-to-door to catch snakes and prevent further injuries.

According to Wu, the team members mainly used fishing tools and electrofishing equipment for their operations.

The village committee also issued notices, warning residents without professional skills not to catch snakes themselves and to report sightings to authorities.

Local media outlet "Huaxiang Yinxiang", a WeChat official account of the Hengzhou converged media center, published an emergency guide for snakebite prevention and treatment during the flood.

It warned that the lingering floodwaters had forced snakes like kraits, green pit vipers, and cobras to move into homes, stairwells, and corners, and advised against using incorrect first-aid methods like burning, cutting, or sucking venom from the wound.

The local forestry bureau mobilized its own snake catchers and volunteers, according to the Beijing News.

One local team of seven to eight people reportedly caught over 2,000 snakes in just two days, most of them non-venomous rat snakes. A team member surnamed Zhu said after the flood, snakes mostly hid in corners.

Twenty-a-day man

Among the snake catchers, one volunteer stood out — Chen Peixin, a 33-year-old with more than 600,000 social media followers.

For him, catching a snake with his bare hands is as natural as picking up a rope — he grabs the tail with practiced ease and bags it safely.

Driven by a sense of duty, Chen traveled over 1,000 kilometers from his home in Zhangzhou, Fujian province, to Hengzhou. He spent about two weeks there, catching an average of 20 snakes a day.

"Snakes aren't as terrifying as people imagine," Chen said.

"After the flood, some die. A surviving snake's first instinct is to hide and stay alive," he said, adding most snakes attack only when they feel threatened or provoked.

Chen, a member of the Zhangzhou Liming rescue team and a popular science blogger known as "Yuri" online, first learned of the crisis through news reports. "I'd never been anywhere else to catch snakes before," he said. "But when I saw what was happening, I couldn't just stand by."

He offered to help through his social media account. The response was overwhelming. He received numerous messages and over 10,000 likes.

On July 11, he and an assistant drove for more than 10 hours to Hengzhou, the world's largest jasmine planting base, which had been hit hard by the floods.

Upon arriving in Yunbiao town, he immediately began scouting for snakes by rivers and in jasmine fields, which were now largely destroyed. The small shelters scattered in the fields had become prime hiding spots for snakes.

Following local leads, he focused on Wuzhai village, where there was another snake farm. "Only when I got there did I realize how serious it was," he recalled. "I made up my mind: catch as many as I could, and do everything possible to help the villagers."

Back home, his rescue team usually handles one snake at a time, but this time, there were hundreds, or possibly thousands, Chen said.

The work was grueling. Wading through thick mud in boots, he had to clear debris, not just wood and bamboo, but vines, thorns, and broken tiles, before he could even get to the snakes.

His mission had an early setback when a thorn pierced his left hand. He initially ignored it, but the wound became infected. "The bacteria in the floodwater caused it to swell, and I couldn't bend my thumb. It's impossible to catch snakes with one good hand," Chen said.

He was forced to return home to recover.

But his followers were not willing to let the effort end. After he confirmed he would return, they raised over 3,000 yuan ($445) to support his trip back. His rescue team also contributed.

Four days later, on July 17, Chen was back in Yunbiao.

One video he posted on July 18, a five-minute compilation of his work, garnered over 440,000 likes and 40,000 comments.

"So snake catching is as easy as catching mud fish, just grab the tail and shake it!" one user commented, joking he wanted to try it himself.

Others empathized with the cameraman: "The cameraman's heart was saying 'Stop asking me to get closer'."

Chen's first assistant declined to return, so this time he brought along his longtime friend Lai Yanquan. Lai admitted he was scared the first time he saw so many snakes. It took several days for him to even dare to film close-up.

Chen's biggest catch was a 2.5-kilogram cobra, which he found in a greenhouse.

Many online commenters urged him to wear protective gloves, but Chen said bare hands are essential for speed and dexterity. "Gloves get muddy and slippery; they affect my feel," he explained.

To him, the most dangerous part of the hunt was not the confrontation, but the "ambush".

In one instance, while pursuing a cobra in a cluttered corner, he was surprised by two more that suddenly rose up, staring straight at him.

Fortunately, they didn't all attack at once, and Chen managed to catch them one by one. "If they all attacked at once, I wouldn't be afraid either," he said. "I'd just tap their heads."

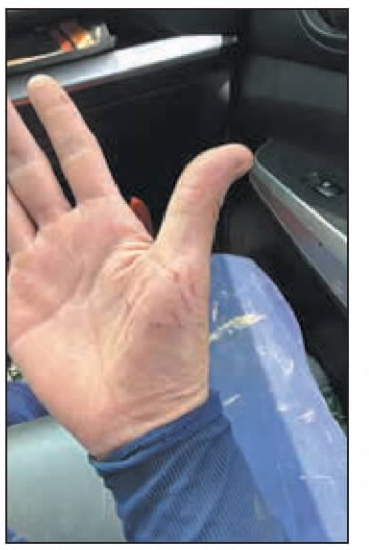
For Chen, the most important tool isn't technique, but staying alert and composed.

The intense physical work, in Guangxi's high temperatures, took a toll. "Several times I almost got heatstroke," he said. "Only when I sat down to rest did I realize how exhausted I was."

He would take a dose of *huoxiangzhengqi* water, a traditional Chinese herbal remedy for heatstroke, and press on.

During his time in Hengzhou, Chen was bitten only once, by a non-venomous rat snake.

Chen spent more than 10 consecutive days catching snakes in Hengzhou, moving from village to village.



At one school, he captured over 30 rat snakes, which are non-venomous. However, he caught even more cobras, each about 1.5 meters long and weighing around 1 kilogram.

Before his departure on July 29, Chen livestreamed online. Some locals came to present him with homemade wine, chickens, gifts and banners expressing gratitude.

"The villagers are so warmhearted. It made me feel that my efforts were truly appreciated," he said, adding that he would definitely come back for a visit if he had the chance.

Chen Peixin, a member of the Zhangzhou Liming rescue team, explains a snake's fangs and habits to his online followers after catching it. PROVIDED TO CHINA DAILY

Farming wake-up call

Guangxi, which is the world's largest source of snake raw materials, had over 30 million snakes in captivity as of 2025, accounting for 80 percent of the total snake farming in China. Hengzhou is one of the three major snake farming counties in the region, according to the Beijing Youth Daily.

In Hengzhou, species like cobras and rat snakes are raised primarily for their medicinal and cosmetic value.

A local breeder surnamed Huang, who has 16 years' experience in the industry, told Jiupai News that snakes are kept in temperature- and humidity-controlled places fitted with wire mesh. Escapes only occur when floodwaters destroy the structures, Huang said.

"After the flood, many farmers' snakes were drowned. Only a very small number escaped," she said.

The incident has drawn renewed attention to the vulnerabilities of snake farming during extreme weather events.

Huang Song, a professor of ecology at Anhui Normal University, told CPPCC Daily that while current industry access policies are relatively well-regulated, flood safety risk assessments for snake farms have long been neglected.

He recommended that farm site selection be incorporated into a flood risk assessment framework, emergency containment plans for extreme weather events be established, and that post-disaster public education on snake avoidance be strengthened to enhance people's awareness of proactive self-protection.

Xu Xudong, a member of the National Committee of the Chinese People's Political Consultative Conference and dean of the school of life sciences at Central China Normal University, told CPPCC Daily that the convergence of natural disasters and specialty livestock farming poses new challenges to the biosafety and public health emergency response systems.

"For venomous snake farming and other specialty livestock operations, we cannot simply manage them as small-scale industries," he said.

He recommended they be registered with authorities responsible for emergency response work, public health, and ecological and environmental protection. "Risk assessments should be conducted at the outset of operations, and they should receive supervision, guidance, and services throughout the farming and management process," said Xu.

Rocket: Test results to decide reusability

From page 1

"For example, during atmospheric reentry, multiple onboard systems must precisely coordinate with each other, with extremely tight sequencing and a very high degree of synchronization. Also, as the booster descends at an extremely high speed, it requires attitude control and engine thrust adjustments to be completed within a very short window," Shen told reporters at a briefing in Minqin several days ahead of Wednesday's mission.

To tackle these hurdles, the Y2 has received targeted upgrades over its predecessor, Shen said. "Its propulsion system has been refined to reduce the number of engines that fire during the return flight, in order to cut structural complexity and control difficulty. The Y2 also features improved flight safety control programs that can autonomously determine the landing point in real time and execute safety measures. Its base heat protection measures have also been optimized," he added.

Shen explained why LandSpace chose Minqin for the recovery mission. "First, the site's position aligns with our rocket's launch azimuth (the compass bearing of a rocket's ground track during ascent) and is compatible with its lift capacity parameters. Second, the facility sits in a sparsely populated area, and it also has good transportation access, being close to a paved road, which is convenient for bringing the recovered booster back to the manufacturing base. Third, Minqin's climate is well-suited for recovery missions, and the local government has been highly supportive of the project," he said.

Future endeavors

On whether the recovered Y2 booster will be reused in a subsequent launch, Huang Cheng, deputy project manager for the ZQ 3 series, said the decision will depend primarily on its structural integrity and overall airframe safety after recovery.

"Engineers will conduct an initial inspection at the landing site. The booster will then be transported back to LandSpace's manufacturing facility in Zhejiang province for disassembly, where its engines will be removed for comprehensive examination and testing. Necessary component replacements will be carried out during the process," he said, adding that the final decision on reusing the booster will be made after all test results are reviewed.

According to Huang, the ZQ 3 production facility in Zhejiang is highly automated and features China's first laser welding system capable of putting together rocket bodies. Once mass production is ramped up, the facility will have an annual production capacity of eight to 10 rockets in the ZQ 3 series.

In the near future, the ZQ 3 will facilitate China's efforts to build its massive space-based internet networks and other commercial constellations, he said.

Technical specifications from LandSpace reveal that the Y2 rocket used during Wednesday's mission had a diameter of 4.5 meters and weighed about 570 metric tons when fully fueled.

Its first stage was propelled by nine TQ 12A methane engines, while the second stage ran on a TQ 15A methane engine, boasting a liftoff thrust of nearly 770 tons — enough to transport heavy satellites to low-Earth or sun-synchronous orbits. Compared with traditional types of rocket engines that can function only once, a methane engine is reusable and more environmentally friendly.

LandSpace started its research and development of the ZQ 3 model in August 2023, intending to build a reusable liquid-fueled launch vehicle boasting strong carrying capacity but at the same time being low in cost. The company conducted the world's first orbital mission of a methane-propelled launch vehicle in July 2023 with the second flight of its ZQ 2 carrier rocket from the Jiuquan spaceport.

Steered by women

Women drivers pose for a group photo beside vehicles of the "Pink Bus Service" launched on Tuesday in Dhaka, the capital of Bangladesh. The Bangladeshi government has started the dedicated bus service for women, operated and managed by women drivers, to ensure safe and comfortable journeys for female commuters. Authorities said the service will eventually cover major cities and towns across the country. ABDUL GONI / ANADOLU VIA GETTY IMAGES

UAE embargoes Iran over alleged attacks

By CUI HAIPEI in Dubai, UAE and **JAN YUMUL** in Hong Kong

The conflict between the United States and Iran has entered a new phase of political attrition. The United Arab Emirates on Tuesday announced the suspension of all trade and financial dealings with Iran after alleging that two Iranian missiles targeting maritime navigation fell into the sea, a claim immediately rejected by Tehran.

Tuesday's announcement marked the latest UAE countermeasure against Iran, following its ambassador's recall earlier. The move also came after months of relative calm within UAE territory.

"In light of regional escalations ... all trade, commercial exchanges and financial transactions with Iran have been halted until further notice," said Afra Al Hameli, communications director of the UAE's Foreign Ministry, while reaffirming Abu Dhabi's commitment to dialogue-based solutions for regional peace.

The UAE on Tuesday accused Iran of firing two ballistic missiles toward the country, the first such reported incident since May. It later said that the salvo was directed at shipping vessels, as Tehran denied firing missiles at the neighboring country.

"UAE air defenses detected two ballistic missiles launched from Iran toward the country, with the first falling outside the country's territorial waters, while the second fell within the territorial waters," the UAE military said in a statement posted on social media.

Iranian Foreign Ministry spokesman Esmaeil Baghaei later "categorically dismissed the UAE's claim that Iran had launched a missile toward that country", calling the allegation "harmful" to regional trust and security efforts.

Ali Abdollahi, chief of staff of Iran's armed forces, warned Gulf states on Wednesday against assisting the US military, saying that nothing is "hidden from our eyes".

When the conflict began on Feb 28, the UAE bore the brunt of Iran's attacks, with nearly 3,000 missiles and drones directed at it — more than any other regional country.

The US and Iran remain at odds over the Strait of Hormuz and the terms for ending the conflict, with the future of the talks uncertain after a 60-day negotiating period set under a memorandum of understanding ending on Monday.

In Washington, US President Donald Trump said on Tuesday that no Iran-US talks were in the pipeline. He shared a map labeling the strait "NEW US Territory", even as he insisted that the vital waterway remained "open and operating".

Citing multiple US administration officials, CNN reported that Trump had instructed his negotiating team — including Vice-President JD Vance, and envoys Steve Witkoff and Jared Kushner — to hold off on engaging with Tehran, despite reports of preliminary positive-toned exchanges.

However, Iran said that it will not reopen the strait until Washington meets a sweeping list of demands, including ending the US blockade of Iran's ports, lifting oil sanctions, unfreezing Iranian assets and paying for war damages.

"I want to state clearly that the Strait of Hormuz will not be opened until the American commitments stipulated in the memorandum of understanding ... are implemented," Speaker of the Iranian Parliament Mohammad Bagher Ghalibaf said in a speech broadcast on state television.

Iranian Foreign Minister Abbas Araghchi said on Tuesday that the US is now "begging" to negotiate on Tehran's conditions after failing to force it to surrender.

Control of the waterway, which Iran has effectively closed since the conflict began, remains at the heart of the deadlock between Tehran and Washington. In peacetime, nearly a fifth of the world's oil passes through the chokepoint.

Trump threatened on Monday to "bomb" US ally Oman if it interfered with a deal on the Strait of Hormuz.

Relations: All human civilizations are equal

From page 1

At the time, Samuel Huntington's *The Clash of Civilizations and the Remaking of World Order*, which argued that future conflicts would be fought between civilizations rather than states, was highly influential.

"History tells us that only through exchanges and mutual learning can a civilization be filled with vitality," Xi said. "If all civilizations can uphold inclusiveness, the so-called 'clash of civilizations' will be out of the question, and the harmony of civilizations will become a reality."

Xi's speech made a significant impression on those involved in international policymaking. The message was strong and clear, and was widely heard.

Today, as the world faces growing divisions rooted in profound misunderstandings, Xi's message continues to be relevant. These divisions often stem from the inability of the former "global center" to recognize the emergence of a new multipolar world in which every country has a voice.

UNESCO was founded in 1945 on the conviction that wars begin not only on battlefields. Its Constitution states: "Since wars begin in the minds of men, it is in the minds of men that the defenses of peace must be constructed." If ignorance, intolerance and hatred contribute to conflict, then education, science and culture must become instruments of peace.

While political agreements may be negotiated within months, changing mentalities requires generations. Xi's message at UNESCO was not only an invitation to dialogue, but also a call to embrace several fundamental principles: "Civilizations are equal, and such equality has made exchanges and mutual learning among civilizations possible. All human civilizations are equal in terms of value. They all have their respective strengths and shortcomings. There is no perfect civilization in the world. Nor is there a civilization that is devoid of any merit. No one civilization can be judged superior to another."

Xi has developed a cohesive system of approaches and solutions through his four global initiatives (the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative), forming a coherent concept of international relations.

The Global Civilization Initiative, first proposed in 2023, promotes cultural exchange, mutual learning and the rejection of attempts to impose development and governance models based on Western ideology. It proposes cooperation among civilizations as the foundation of a more stable international order.

On the eve of the 75th anniversary of the People's Republic of China, on Sept 30, 2024, after the ceremony at which I received the Chinese Government Friendship Award, I had the privilege of attending Xi's address in the Great Hall of the People. His message was directed not only to the Chinese people, but to the international community as a whole. Xi stressed that humanity lives on the same planet and that all nations of the world have an equal right to determine the future of the planet and share the achievements of global progress.

These principles were encapsulated in the Global Governance Initiative announced on Sept 1, 2025.

As Xi stated, "All countries, regardless of size, strength and wealth, are equal participants, decision-makers and beneficiaries in global governance. There should be no double standards, and the house rules of a few countries must not be imposed upon others."

For a country that has emerged as a global leader in economic and social development, advocating equality rather than privilege reflects both confidence and responsibility. On the other hand, the United States' approach to international cooperation is fundamentally different.

This year's US Presidential Memorandum directed federal agencies to stop participation in and funding for 31 UN entities considered contrary to US interests.

Xi's historic visit to UNESCO in March 2014 paved the way for cultural protection and dialogue among civilizations. This year, Xiamen, Fujian province, will host the 21st session of the UNESCO Intergovernmental Committee for the Safeguarding of the Intangible Cultural Heritage from Nov 30 to Dec 5, reflecting China's growing contribution to global governance.

The author is former head of the Asia-Pacific Unit, Sector for Priority Africa and External Relations at UNESCO and a recipient of the 2024 Chinese Government Friendship Award. The views do not necessarily reflect those of China Daily.

More firms to benefit from AEO program

Importance of certification for smoother cross-border trade highlighted at seminar

By ZHONG NAN in Dalian, Liaoning *zhongnan@chinadaily.com.cn*

China will expand its pool of companies certified under the Authorized Economic Operator program and broaden mutual recognition arrangements with Asia-Pacific Economic Cooperation economies to help more businesses benefit from streamlined cross-border trade procedures, customs officials said on Wednesday.

Speaking at a seminar organized by the General Administration of Customs during the ongoing third APEC Senior Officials' Meeting in Dalian, Liaoning province, they said these measures would make AEO certification a stronger tool for supporting smaller businesses, boosting participation in trade and fostering a more open, inclusive and resilient Asia-Pacific trading environment.

The AEO program, promoted by the World Customs Organization, is designed to strengthen international supply chain security and facilitate the movement of legitimate goods.

Under the program, customs authorities work with businesses to streamline customs procedures and improve the efficiency of international trade.

Lazzat Daniyarova, a technical officer at the Brussels-based World Customs Organization, said that integrating more small- and medium-sized enterprises into AEO programs would make the system more inclusive and give smaller businesses greater access to secure trade and sustainable growth opportunities.

Lin Jiantian, director of the GAC's department of enterprise management and audit-based control, said China will pursue mutual AEO recognition with more economies to enable businesses across the Asia-Pacific to benefit from faster and more efficient customs clearance.

All APEC economies except Papua New Guinea have AEO programs in place. China has established mutual recognition arrangements with 10 of them, including Australia, Singapore and South Korea.

China's AEO-certified companies recorded 16.76 trillion yuan ($2.49 trillion) in foreign trade in the first seven months of 2026, accounting for 44.2 percent of the country's total, up 5.77 percentage points from a year earlier.

Meanwhile, their trade with other APEC economies rose 21.87 percent year-on-year to 9.19 trillion yuan.

The GAC said Chinese customs officials will also hold discussions with their counterparts from Malaysia, Indonesia and Vietnam, as well as representatives of the Association of Southeast Asian Nations Secretariat, to accelerate AEO mutual recognition and identify priorities for the next phase of cooperation.

Olgun Basel, supply chain director at Einhell Germany AG, a German industrial goods trading company based in Shanghai, said the company's import clearance times have fallen by 80 percent since it gained AEO certification in February.

Basel said that preparing for AEO certification also prompted the company to improve internal controls, documentation and risk management, helping to optimize its operations and build trust with customers in overseas markets.

China had more than 15,450 AEO-certified companies as of the end of July and has signed 34 mutual recognition agreements covering 60 countries and regions.

China is hosting the third APEC Senior Officials' Meeting in Dalian from Monday through Aug 28, said the Ministry of Foreign Affairs.

Newlyweds attend a group wedding ceremony during the Qixi Festival on Wednesday in Qujing, Yunnan province. SUN WENLAI / XINHUA

Qixi: Different age groups add to the spending spree

From page 1

A free group wedding was also organized in Gusu district in Suzhou, Jiangsu province. The event offered free styling, photography and a traditional ceremony.

The district also rolled out a series of romantic experiences to fuel the "sweet economy", according to the Jiangsu provincial civil affairs department.

At the Suji Ancient Town in Leshan, Sichuan, on Saturday, visitors tried their hand at a Qixi needle-threading ritual.

He Qicong, an associate professor at Beijing Normal University's Institute of Culture Innovation and Communication, said traditional festivals have always provided an opportunity for people to connect with their cultural roots.

"Emulating ancestors is not just a revival of old customs," she said. "What lies beneath this value system is the ancient view of life."

Nighttime outings have become one of the most popular ways to celebrate Qixi. According to Tongcheng Travel, an online travel agency, evening ticket sales at domestic scenic spots on Qixi day rose more than 50 percent compared with the daily average.

Qixi also prompted many to head out on weekend trips. Online travel agency Tuniu said that families accounted for more than 60 percent of travelers.

Tongcheng Travel revealed that since the beginning of August, travelers age 55 and above have accounted for nearly 40 percent of package-tour bookings on its platform, up about 6 percentage points year-on-year.

He of Beijing Normal University said the festival resonates with people of all ages.

"To young couples, Qixi symbolizes enduring love. For women, Qixi carries the tradition of seeking skills. For the elderly, Qixi evokes a vision of family harmony. A festival that touches every generation, arriving in splendid midsummer when the land is lush, spurs consumption across all age groups," she said.

Analysts see opportunities for ASEAN

Forum discusses potential benefits for region amid geopolitical rivalry

By **YANG WANLI** in Bangkok
yangwanli@chinadaily.com.cn

The global order is entering a period of profound transformation, marked by intensifying geopolitical rivalry, economic fragmentation, and the rise of the Global South, which offers challenges and opportunities for Southeast Asia, according to a recent seminar.

Experts said the key question for the region is how the Association of Southeast Asian Nations can preserve its centrality and turn disruption into an opportunity to shape a more inclusive regional order.

They were speaking at the 13th Chula-ASEAN Dialogue — themed "The Once and Future ASEAN: Global Shifts, Institutional Agility, and the Path to 2045" — on Tuesday at Chulalongkorn University in Bangkok, Thailand.

"The decline of Western dominance is inevitable and not synonymous with the end of Western civilization," said Amitav Acharya, distinguished professor of international relations at the School of International Service at American University.

Rather than viewing the transition as a contest between the West and the rest, Acharya argued that the changing balance of power could be an opportunity to build a more pluralistic international system drawing on the contributions of different civilizations.

"The contemporary world order is a shared creation across multiple civilizations, not dominated by any single country or region," Acharya said, emphasizing that interdependence, sovereignty, territorial integrity, institutions and free trade have evolved as globally shared principles rather than the exclusive products of the West.

That perspective is particularly relevant to ASEAN, a region positioned at the intersection of major powers and increasingly influenced by the rise of emerging economies.

"For ASEAN, the more consequential question is whether a fragmented world can still sustain cooperation, and how to maintain strategic autonomy while avoiding a fragmented regional environment in which countries are pressured to choose sides," he said.

Piti Srisangnam, executive director of the ASEAN Foundation, described the current environment as one of unprecedented uncertainty driven by geopolitical rivalries, economic fragmentation, supply-chain restructuring, climate disruptions, and rapid digital transformation.

"Rather than resisting change, we anchor our resilience in openness, inclusivity, and cooperative frameworks," Piti said, arguing that ASEAN's strength lies in its ability to remain cohesive, relevant, and forward-looking.

He said the emphasis on openness comes as globalization itself becomes increasingly fragmented.

At the same time, other experts argued that Southeast Asia's economic integration has become more complicated as some countries deepen their ties with major partners while navigating competing regional frameworks.

Suthiphand Chirathivat, former executive director of the ASEAN Studies Center at Chulalongkorn University, said: "Many ASEAN countries are pursuing a 'dual-track' strategy, seeking market access and investment without fully aligning with either side (China and the US)."

Arthayudh Srisamoot, a former adviser to Thailand's minister of foreign affairs, said ASEAN should strengthen both internal cohesion and its external strategic presence.

Rather than replicating the European Union's model of deep integration, he said the bloc should focus on practical connectivity, intra-regional trade, and unified positions on regional frameworks and agreements such as the Southeast Asia Nuclear Weapon-Free Zone and the Regional Comprehensive Economic Partnership.

"ASEAN must strengthen both internal cohesion and external strategic presence," Arthayudh said, adding that the bloc needs faster and more coordinated mechanisms to address nontraditional threats such as climate change, transboundary environmental problems, and public health crises.

Broadening partnerships

Experts said ASEAN's future prosperity will also depend on how successfully it broadens its economic partnerships.

The traditional markets of the US, the European Union, and Japan will remain important, Arthayudh said.

However, he also urged ASEAN to actively engage emerging partners — including China, Russia, India, the Middle East, Africa, and Latin America — through targeted investment, technical cooperation, and infrastructure development.

Meanwhile, for China — a major country in the Global South and one of ASEAN's biggest trading partners — the changing world order presents both a responsibility and an opportunity, according to Acharya.

He suggested that China should serve as a constructive bridge between the existing international order and an emerging, more pluralistic one.

Acharya said this should involve not only infrastructure initiatives, but also help in contributing ideas, strengthening global governance, supporting humanitarian efforts, and expanding participation in multilateral institutions.

Malaysian PM backs one-China principle

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

As Malaysian Prime Minister Anwar Ibrahim voiced unequivocal support for the one-China principle and China's reunification in a recent media interview, Foreign Ministry spokesman Lin Jian said that China "commends" the Malaysian leader's remarks.

In a video interview with Al Jazeera released on Sunday, the Malaysian leader said, "I see Taiwan as part of China, period … It is one China. It is accepted by all."

When asked about his view on China not committing to renouncing the use of force, Anwar responded by drawing an analogy with Malaysia.

"If one province decides to break away, do we use force?" Anwar was quoted as saying. "I think I will protect the sanctity and unity of the nation."

At a daily news conference in Beijing on Wednesday, Lin, the Foreign Ministry spokesman, said, "China commends Prime Minister Anwar Ibrahim's remarks."

"Upholding the one-China principle is where public opinion trends and the right thing to do," he said in response to a question about the interview with Anwar.

"The international community's commitment to the one-China principle is not to be shaken," he added.

In the interview, the Malaysian prime minister also lashed out at the double standards adopted by some Western countries against China.

"When it comes to China, it's hypocrisy. You don't talk about many countries in Europe breaking up, or within the US, or Africa … but you focus only on China," he said.

Condemning the attempts to lend support to "Taiwan independence" forces, Anwar criticized such a way of "condoning an attempt to break up a legitimate independent country". "I don't accept that," he said.

On Wednesday, Lin, the spokesman, stressed at the news conference that "there is but one China in the world, and Taiwan is an inalienable part of China's territory".

"China must and will achieve reunification. This will not be stopped," he said.

Joint effort sought for Libya resolution

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

A Chinese envoy to the United Nations said that the international community must work toward a comprehensive and fundamental solution to the issues facing Libya and its long-delayed elections.

"Sincere dialogue is needed to break the political deadlock," Fu Cong, China's permanent representative to the UN, said at a Security Council briefing on Libya on Tuesday.

Elections in Libya have been continuously postponed over the past years due to fractures in government institutions that have triggered ongoing conflict over legitimacy and authority.

"The Libyan parties concerned should fully recognize that the division of state institutions and repeated postponement of elections are detrimental to the country's long-term development and the vital interests of the Libyan people," Fu said.

"China calls on all parties, with the support of the United Nations, to intensify consultations, bridge their differences, and reach agreement as soon as possible on the relevant matters set out in the road map, thereby paving the way for national elections," he said.

The UN-recognized Government of National Unity, based in the capital, Tripoli, has been locked in conflict with a rival authority based in the east of the country, backed by the House of Representatives and the Libyan National Army.

Fu said that the United Nations Support Mission in Libya should maintain dialogue between the country's major political factions.

"The United Nations should continue to play a central role in mediating the Libyan issue. Efforts by countries outside the region should uphold the Libyan-led and Libyan-owned principle, and fully respect Libya's national conditions and the will of its people," Fu said.

The ceasefire deal from nearly 6 years ago between the parties needs to be preserved, Fu said, despite recent outbreaks of violence and targeted drone attacks on oil refineries.

"This not only threatens the safety of civilians, but could also disrupt energy supplies and affect people's lives and livelihoods. China is deeply concerned about these developments. We urge all parties to exercise maximum restraint and cease all violent attacks. We support the Libyan authorities in investigating the relevant attacks and holding those responsible accountable," Fu said.

"Civilian safety and the security of critical infrastructure, including energy facilities, must be effectively protected. The 2020 ceasefire agreement remains an important foundation for maintaining Libya's overall stability. The parties in eastern and western Libya should fully implement the agreement, strengthen dialogue, consolidate mutual trust, and advance the unification of military and security institutions of the eastern and western sides," he said.

Public governance

Public governance must be improved to enhance people's well-being, Fu said, adding that the country continues to face significant challenges, including fiscal deficits, inflation and fuel shortages, which are detrimental to sound economic development and lasting social stability.

"Libya stands at a critical crossroads. The international community should genuinely respect Libya's sovereignty, independence, unity and territorial integrity, uphold objectivity and impartiality, step up mediation, and play a constructive role with a genuine commitment to Libya's peace, stability and the well-being of its people.

"As a good friend of Libya, China stands ready to continue working with the international community to make greater contributions to advancing a political settlement of the Libyan issue and promoting lasting peace and stability in Libya," Fu said.

China calls for unity, improved methods at UNSC

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China on Wednesday called on members of the UN Security Council to "strengthen unity and cooperation, build broader consensus and improve the council's working methods" so that it can more effectively fulfill its responsibility for maintaining international peace and security.

Speaking at a Security Council meeting on working methods, Fu Cong, China's permanent representative to the UN, said the effectiveness of the council bears directly on the authority and credibility of the United Nations as well as the prospects for international peace and security.

"Working methods are an important safeguard for the Security Council in fulfilling its responsibilities and have never been merely a technical issue," Fu said, adding that they should be continuously improved from the broader perspective of maintaining international peace and security.

"Unity and cooperation are the source of vitality for multilateral mechanisms and should always remain the most fundamental working method of the Security Council," Fu said.

Whether dealing with substantive or procedural matters, council members should "respect one another, engage in full consultations, properly manage differences and make every effort to seek consensus", Fu said.

Fu warned against pushing draft resolutions to a vote when major disagreements remain. "(This) not only deepens divisions within the council, but also greatly weakens the political weight and effectiveness of the resolutions themselves," Fu said.

On sanctions, peacekeeping and other tools available to the council, Fu said their value should ultimately be measured by whether they contribute to political solutions.

"The effectiveness of Security Council meetings, outcomes, and tools such as sanctions and peacekeeping should be judged by whether they proceed from realities and constructively advance the political settlement of hotspot issues," Fu said.

The council should also fully respect the sovereignty and ownership of the countries concerned and exercise caution in the use of coercive measures, including sanctions and the use of force, Fu said.

On UN political and peacekeeping missions, Fu said they should focus on their core mandates, maintain close cooperation with host countries and adjust their mandates and deployments according to conditions and needs on the ground.

"The transition and withdrawal of missions should be carried out in a smooth and orderly manner so as to avoid shocks to the situation on the ground," Fu said.

Fu also called for more practical steps to improve the efficiency of the council, including reducing repetitive meetings, making greater use of informal consultations where appropriate, and producing more concise and focused outcome documents.

Fu also urged the council to improve the selection of civil society briefers to ensure that their participation is objective, impartial and substantively useful to discussions.

Fu reiterated the Security Council's central role in the international collective security architecture, saying its status and role are "irreplaceable".

"A united and effective Security Council meets the needs of world peace and stability and serves the common interests of the broad membership of the United Nations," Fu said.

He urged the international community to oppose "illegal unilateral actions that bypass the Security Council and undermine the role of the United Nations".

Permanent members of the Security Council, in particular, should take the lead in upholding fairness and justice and "demonstrate the responsibility expected of major countries", Fu said.

US-ROK drills halved after Trump order

Exercises cut to 5 days, signaling possible shift in White House's approach to DPRK

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

The Republic of Korea and the United States have cut the duration of their annual joint military exercise roughly in half following an order from US President Donald Trump.

The Ulchi Freedom Shield exercise, originally scheduled to run for 11 days through Aug 27, will now last five days and conclude on Aug 21 at the request of the US, Yonhap News Agency reported on Wednesday, citing the ROK Joint Chiefs of Staff.

UFS is a summertime exercise involving command post and field training. The two countries label it as an effort to strengthen their combined defense posture and response capabilities.

The scale of this year's drills will also be adjusted, Seoul said.

"The ROK and the US agreed to discuss and carry out various measures going forward to achieve the objectives of the UFS exercise and establish a robust combined defense posture," the Joint Chiefs of Staff said.

On Sunday, Trump said he had instructed Secretary of Defense Pete Hegseth to "substantially reduce" the joint military exercises with the ROK, citing his friendly relationship with Kim Jong-un, top leader of the Democratic People's Republic of Korea.

The US Department of Defense said the adjustments would not degrade the exercise's training objectives.

ROK Foreign Minister Cho Hyun said on Wednesday that the government had not been informed in advance of Trump's directive to scale back the drills. However, he said the move did not amount to a unilateral notification as the defense minister had been involved in the discussions.

Chung Dong-young, the ROK's unification minister, also expressed support for Trump's order. "I hope this leads to dialogue between the US and the DPRK and further extends to improved inter-Korean ties," he was quoted by Yonhap as saying.

Lam Peng Er, head of the Korea Centre and principal research fellow at the East Asian Institute at the National University of Singapore, told China Daily that Trump was essentially sending Kim a strong signal in hopes of reviving their in-person engagement.

Trump's desire to re-engage with the DPRK leader is also driven by his eagerness for a major foreign policy breakthrough in his second term, especially amid his frustration over the situation in the Middle East, Lam said.

During his first term from 2017 to 2021, Trump met Kim three times: in Singapore in 2018 for their historic first summit, in Vietnam in 2019, and at the Korean Demilitarized Zone later that year in an impromptu third meeting.

Following the 2018 summit, Trump also suspended and scaled back joint military exercises with the ROK.

The Wall Street Journal reported on Tuesday that Trump is pushing aides for a meeting with Kim as soon as this fall. Trump has privately discussed holding the meeting during his next trip to Asia, which "could happen in November", the Journal reported, citing US officials.

Stronger position

However, with the DPRK now in a stronger economic and diplomatic position than during Trump's first term, Lam said the US will need to offer more tangible incentives to bring Pyongyang back to the negotiating table, including lifting sanctions.

It will also be important for the US to work with China and Russia in the process, he said.

Park Won-gon, a professor of DPRK studies at Ewha Womans University in Seoul, told Agence France-Presse that scaling back the exercises could improve prospects for US-DPRK dialogue.

Suspending US-ROK joint exercises has always been a prerequisite for the DPRK to engage in dialogue with the US, he said.

In February, Kim said his country could get along with the US if Washington respects its current status and drops the "hostile policy".

While the DPRK has made no official statement on Trump's overture, the Korean Central News Agency commented on Wednesday that the UFS exercise poses the most immediate and open threat to the DPRK and regional security.

The DPRK will continue to exercise its right to self-defense and counter "threatening maneuvers", it said.

Trump's 3-day tariff pause a reprieve, not a solution, experts say

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

US President Donald Trump's decision to pause new 50 percent tariffs on Canadian goods for three days offers Canada temporary relief but is unlikely to resolve deeper trade tensions between the two countries, experts said.

Trump said on Tuesday night that Canada and the United States had reached a deal, subject to the finalization of documents, and that he had paused the tariffs that were due to take effect on Wednesday.

The move came as the two countries remained engaged in intensive trade negotiations, with Canada seeking relief from existing US tariffs while Washington pushed for greater access to the Canadian market.

Ronald Stagg, a history professor at Toronto Metropolitan University and an expert on Canadian-American relations, said the emerging deal would likely address several issues that have drawn the Trump administration's attention.

He said the issues could include access to Canada's alcohol market, greater access for US dairy products, and potentially restrictions on Canadian vehicles and vehicle parts entering the United States.

"The latest 'deal,' as Trump would call it, should it be finalized, will likely address some of the sectors that most annoy the Trump government," Stagg told China Daily.

In return, Canada would likely seek reductions in US tariffs on steel, aluminum and softwood lumber, as well as some relief for its auto industry, he said.

But Stagg said Canadian Prime Minister Mark Carney's government was facing a difficult balancing act as it sought to reach an agreement with Washington without appearing to give too much ground at home.

"The Carney government is walking a fine line in these negotiations," Stagg said. "While hoping to give enough to please the American government, it must be seen by the Canadian people to have achieved a fair deal for Canada."

> "No longer can Canada count on the United States as a friendly trade partner."
>
> **Ronald Stagg,**
> history professor at Toronto Metropolitan University

He said there was already a perception in Canada that the country had "given up a substantial amount to the Americans".

Julian Castro-Rea, a political science professor at the University of Alberta, said the dispute reflected broader challenges in Canada-US trade relations.

He argued that Trump's tariff policy had disrupted a deeply integrated North American production and investment system.

"He threw a monkey wrench into a trade, production and investment system between the two countries that was working reasonably well," Castro-Rea told China Daily.

Castro-Rea also challenged the argument that Canada was taking advantage of the United States through its trade surplus, saying that many Canadian products sold in the United States contain US-made components.

"The argument that Canada is taking advantage of the US by enjoying a trade surplus — the main motivation for the tariff dispute — is ludicrous, since most 'Canadian' finished products sold in the US incorporate a large number of components made in the US," he said.

He pointed to the auto industry as a particularly clear example, noting that vehicles assembled in Canada depend heavily on parts produced in the United States and Mexico.

"Therefore, the issue of tariffs is raised for political reasons alone, as an attempt to score points for Trump's MAGA coalition political brand," Castro-Rea said.

Castro-Rea said the measures would hurt targeted Canadian industries but also create costs for Americans because tariffs are paid by US importers.

"It highlights the paradox of the tariff war launched by Washington: increased tariffs hurt the Canadian economy but also the US economy," he said.

"For starters, increased tariffs are paid by US importers, not Canadian exporters. Those extra costs are then transferred to US consumers, thus making ordinary citizens in that country pay for the trade war," he said.

He added that the integration of the two economies meant some US industries would also be directly affected by higher tariffs.

Both experts noted that the three-day pause should not be viewed as an end to the broader dispute.

Stagg said it was "highly unlikely" that any agreement would resolve all the issues between the two countries.

"Donald Trump is likely to continue saying that Canada is 'ripping off' the United States, while Canada is going to want to eliminate most American tariffs.

"This deal is likely to be seen by both governments as an interim solution. Friction will remain," Stagg said.

Castro-Rea was even more skeptical about the durability of any agreement reached under the Trump administration.

Nothing is a lasting solution under the Trump administration in any policy field, including foreign and defense policies, he said.

"Experience has shown by now that any government decision can be reverted or changed under the authority of this unpredictable leader," Castro-Rea said.

Stagg said Canada's approach to trade with Washington had already changed fundamentally under Trump.

"No longer can Canada count on the United States as a friendly trade partner," he said.

Canada cannot simply walk away from its largest trading partner, however, he said.

"While the Canadian government tries to reorient as much trade as possible, it is going to have to live with the new uncertainty in dealing with the United States," Stagg said.

Castro-Rea, however, viewed the longer-term impact differently.

"I believe the current tariff controversy is only a temporary blip in Canada-US trade and economic relations," he said.

China auto giant Chery expands in UK market

By **JONATHAN POWELL**
in London
jonathan@mail.chinadailyuk.com

Chinese automaker Chery plans to open a research and development center in the United Kingdom for passenger vehicles, expanding the market footprint of its Omoda and Jaecoo brands.

The move comes as the company accelerates its push into Europe, with demand for its vehicles continuing to surge.

Chery rolled out the Lepas brand in February, developed specifically for European buyers. In June, it signed a deal with Nissan to assemble its vehicles at the Japanese carmaker's plant in Sunderland, England.

The company confirmed on Wednesday that its new research and development center will be based at UTAC Millbrook — the vehicle development and testing hub in Bedfordshire, England — and is slated to open later this year.

Chery said the center's initial work will focus on fine-tuning the company's cars for UK driving conditions, expanding over time to autonomous driving and AI. The Bedfordshire area is a hub for engineering and motorsport, hosting several automotive R&D centers.

Gary Lan, chief executive of Chery International UK, said the launch of a passenger car R&D center would be a key milestone in localizing operations, with UK manufacturing to follow.

"We waited over 20 years for the right time to enter this market, and our ambition has always gone much further than simply bringing vehicles here," Lan said in a statement.

"UTAC Millbrook allows us to turn UK customer insight into product development, from ride and steering to active safety systems," he added.

The group did not specify how much it would invest in the facility, or how many jobs may be created, but said it has long-term plans to hire local talent and create new, high-skilled roles at the center.

Kirsty Andrew, vice-president of UTAC UK, said: "This is about much more than testing individual vehicles. We see this as the sustained momentum of a long-term engineering relationship with Chery Automobile."

Last month, Chery sold roughly 280,000 vehicles worldwide, with exports of about 202,000 — up 70 percent year-on-year — making it the first Chinese automaker to ship more than 200,000 in a single month.

Deadly blaze

Civil defense personnel stand at the site of a hotel fire on Wednesday in Kolkata, India. The blaze broke out around 2:50 am on the second floor of the hotel, killing nine people, including a child, according to fire authorities. DIBYANGSHU SARKAR / AFP

CROATIA

Ukrainian arrested over Nord Stream sabotage

A Ukrainian man was arrested on Wednesday in Croatia in connection with the 2022 undersea explosions that damaged the Nord Stream gas pipelines between Russia and Germany, German prosecutors said. Ukrainian national Vladimir Z., whose last name was not given in line with German privacy rules, was arrested in Pula, Croatia, by local police acting on a European arrest warrant. The trained scuba diver "is strongly suspected of jointly causing explosions", prosecutors said. The man was part of a group that sabotaged the pipelines near the Danish island of Bornholm, they alleged.

INTL CRIMINAL COURT

Washington criticized for sanctions on court

The International Criminal Court on Wednesday slammed the latest United States sanctions targeting senior ICC staff, including its president, calling them a "flagrant attack" on the court's independence. The US imposed sanctions on ICC President Tomoko Akane of Japan and senior trial lawyer Abdoulaye Seye of Senegal on Tuesday, as part of Washington's campaign against what it calls a "corrupt and fatally politicized" body. "These sanctions are a flagrant attack against the independence of an impartial judicial institution," the court, based in The Hague, said. Japan's Foreign Ministry on Wednesday described the US move as "very unfortunate". In twin statements on X, European Commission President Ursula von der Leyen and European Council President Antonio Costa said they "stand firmly" with the ICC's president and top officials, which "must be able to act independently and without external pressure".

Real story isn't individual breakthroughs, it's the whole ecosystem that cultivates them

It is an incontrovertible fact that China is becoming increasingly adept at translating technological ideas into real-world applications. This was underscored on Wednesday by three concurrent developments: Unitree Robotics' stock market debut in Shanghai, the opening of the 2026 World Robot Conference in Beijing, and the first successful land-based recovery of the first stage of the reusable Zhuque-3 rocket.

Interestingly, ahead of its listing, a report by Reuters framed Unitree's success as the result of allegedly "using" US military-funded research. Reuters touted itself as the first outlet to "detail connections" between Unitree's designs and a US Army program.

According to US researchers and former officials who spoke to Reuters — without offering any verifiable technical proof — some of Unitree's robots allegedly "draw on" breakthroughs in quadruped movement financed by the US DEVCOM Army Research Laboratory and other military programs.

That is precisely where the story takes an intriguing and questionable turn. China's advantage is not in "copying". It is an entire ecosystem: enormous manufacturing capacity, dense supplier networks, huge domestic market, abundant engineering talent, affordable component costs, patient capital and a government willing to make long-term inputs.

That ecosystem also has an unusual feature: It was built under pressure.

For years, some Western governments have restricted Chinese access to advanced semiconductors, equipment, software and other technologies. The response was not the intended technological paralysis. It was accelerated localization, diversification and improvisation. Pressure has made China's innovation system more adaptive and resilient.

At this week's 2026 World Robot Conference, more than 300 exhibitors are showcasing more than 2,000 products, with more than 150 making their global debut. Many of them are Chinese. The Chinese robotics industry is moving from robot gymnastics to practical applications in factories, warehouses, logistics and services. Unitree itself has become a symbol of that transition.

The same pattern is visible in AI. Alibaba's new lightweight AI model Qwen3.8-27B has matched much larger near-frontier rivals while being able to run on everyday hardware. The Qwen3.8-27B, a small model with 27 billion parameters, performed on par with OpenAI's GPT-5.6 Luna, which was billed as the most cost-efficient model in the US lab's latest flagship series, benchmark firm Artificial Analysis said on Monday.

Hugging Face's latest analysis points to Chinese models becoming influential in the global open-model community. Qwen has reportedly accumulated more than 151,000 derivative models on Hugging Face — far more than the combined derivatives of Meta's models. The point is that more and more developers treat Chinese models as building blocks rather than merely products to be consumed.

The AI revolution itself is making the old logic of technological containment harder to sustain. Open-source models spread. Engineers collaborate. Developers modify other people's work. Breakthroughs increasingly emerge from networks rather than laboratories operating behind walls. China is simply becoming very good at making innovations and promoting applications in the new technology revolution.

The country's paradigm combines market incentives with public investment and long-term industrial strategy. Its success comes from connecting research, manufacturing, capital, talent and markets at extraordinary scale.

There is also a larger philosophical question. Technology can be treated as a weapon, a monopoly or a public resource. China has presented openness and cooperation as part of its technological strategy. The global adoption of Chinese open-source models demonstrates that the approach has real appeal.

The real story of China's breakthroughs is the whole ecosystem that connects robots, rocket recovery and AI models.

Western countries may attempt to slow individual Chinese breakthroughs through export controls and technology bans. But they cannot cripple the Chinese innovation ecosystem itself, because its underlying engine — economies of scale, engineering talent, industrial depth, market demand and relentless iteration — will only grow more adaptive and more powerful under pressure. When the going gets tough, the tough get going.

The sensible response is not denial or panic. It is cooperation and competition.

Smearing every Chinese breakthrough as a "theft" or "threat" does not make the breakthrough disappear. It only makes the person doing that look increasingly out of touch with the future.

Mexico should handle trade issues prudently

The Mexican government is reportedly exploring the possibility of further expanding the trade restrictions and raising tariffs on certain imported goods, while continuing case-by-case investigations into alleged "dumping" by China and other countries. In January, Mexico imposed tariffs of up to 50 percent on approximately 1,500 products from nations with which it does not have a free trade agreement, a policy that has directly impacted China.

Bilateral economic cooperation is based on international rules and market principles, with mutual benefit as its defining characteristic. Politicizing economic issues serves no one's interests. Mexico should think twice before moving forward with the new trade restrictions.

The move comes as Mexico is seeking to persuade the United States to lower tariffs on its automotive and steel products and to secure more favorable rules of origin during the ongoing review of the United States-Mexico-Canada Agreement. By increasing trade barriers against Chinese goods and strengthening origin and anti-transshipment controls, Mexico aims to demonstrate to Washington that it is not a "backdoor" for Chinese products entering the US market, thereby enhancing its bargaining power in the USMCA negotiations.

The proposed tariff hikes seem like an attempt to appease the US, while targeting Chinese goods perceived to be direct competitors to domestic industries. But Mexican manufacturing is highly dependent on Chinese intermediate goods, components and equipment. If Mexico raises import tariffs on Chinese goods and expands trade remedies such as "antidumping" and "countervailing" duties, the cost of Chinese goods entering the Mexican market will rise further, potentially leading to a contraction in the bilateral trade volume.

Mexico would be effectively shooting itself in the foot to please the US, only to find that the bullet is paid for by higher costs for its own consumers and a less competitive export sector.

Tariff protection alone does not automatically translate into stronger domestic competitiveness. Mexico's real bottlenecks are its domestic supplier base, technological capabilities, energy and power infrastructure, shortage of skilled labor and weak research and development capacity.

Beijing has consistently maintained that trade wars benefit no one while repeatedly emphasizing that China and Mexico are partners not rivals. China is Mexico's second-largest trading partner, while Mexico ranks as China's second-largest trading partner in Latin America. In recent years, the economic relationship has deepened from the trade in goods to industry chain collaboration and production capacity cooperation.

Even if Mexico yields to US pressure and works hand in glove with it to target Chinese industries, there is no guarantee it will gain more leverage in the USMCA negotiations. This week's tough tariff negotiations between the US and Canada have laid bare a stark truth: the US views its two neighbors not as partners, but as free-riders who have been taking advantage of it for too long.

China reserves the right to take corresponding measures to safeguard its interests. A trade and investment barrier investigation launched by the Chinese Ministry of Commerce in September last year concluded in March that Mexico's tariff policies constitute investment barriers that restrict market access for Chinese enterprises.

China opposes unilateral tariff hikes in all forms, and has urged Mexico to correct its wrong practices of unilateralism and protectionism at an early date. The path forward lies not in erecting barriers, but in embracing openness, cooperation, and a competitive dynamism that drives genuine industrial progress.

Some in Australia trying to shoo its golden goose away

Australia, under the Anthony Albanese government, is proving to be a textbook case of what happens to countries when anxiety masquerades as strategy. The latest symptom is Australian Foreign Minister Penny Wong's intervention to pressure the Australian National University and the University of Queensland to sever academic ties with Shandong University and the Chinese Academy of Sciences respectively.

Given the Pentagon's recent campaign to pressure universities in the United States to cut research collaborations with China, it is highly questionable whether Canberra's latest action is entirely its own — or whether it reflects pressure from Washington.

This is reminiscent of a scene in the Australian satirical sitcom *Utopia*, in which officials are discussing spending billions to protect Australia's trade routes, only to acknowledge that the country's biggest trading partner is China. "So we're spending close to $30 billion a year to protect our trade with China ... from China?" asks a bewildered character.

The problem is that Canberra seems increasingly determined to turn this joke into policy. Wong, once regarded as a pragmatist, is now helping dismantle Australia's academic links with China — amid a political climate in which "national security" has become a blank check for bureaucratic vandalism. Is Australia protecting its economic interests by frightening its golden goose away?

Chinese students are a financial pillar of the university sector in Australia. Statistics show that Chinese enrollments reached 192,225 in 2025, accounting for 23 percent of Australia's international students, generating A$12.7 billion ($8.98 billion) in economic activity. Across New South Wales, without Chinese enrollments, the sector's A$583 million surplus would be a A$1.754 billion deficit.

Between January and April 2026, Chinese applications for degree-level student visas fell 32 percent from the average for the same period in 2023-25. Higher-education applications plunged 39 percent, reaching their lowest level in nearly 12 years, according to media reports. Canberra's response? Further alienate Chinese students and researchers by dismantling institutional ties. The message is difficult to misunderstand: Chinese people are welcome as revenue streams, but increasingly suspect as intellectual partners.

The academic squeeze is part of a wider pattern. Take the Port of Darwin. In 2015, the Northern Territory government granted China's Landbridge Group a 99-year lease for A$506 million. The port was loss-making; Landbridge invested heavily and expanded capacity from 16 million to 30 million tonnes. Security reviews found no national-security threat, and a 2023 review saw no need to cancel or alter the lease. Yet in January 2026, citing "national security", the Albanese government announced that Canberra would terminate Landbridge's operating rights.

Washington's subsequent allocation of $1.2 billion to upgrade military facilities at the port only makes the politics more conspicuous. Landbridge has since initiated arbitration at the International Centre for Settlement of Investment Disputes.

Meanwhile, Australia is deepening military cooperation with Japan and the Philippines, including hosting Japanese hypersonic-missile tests on Australian ranges and its participation in the Philippines' largest Balikatan military exercises with the US in decades.

It is crystal clear that Canberra is moving closer to a US-led containment strategy while assuming its economic relationship with China will somehow remain insulated. That assumption is rather *Utopia*-like.

After years of damage by the pro-US Scott Morrison government, China-Australia relations had finally begun to recover thanks to joint efforts by the two sides. Bilateral trade reached A$309 billion in 2025, Chinese tourists returned in force and high-level dialogue resumed. Now Canberra risks squandering that hard-won capital.

Australia's economic interests with China are not something that can be wished away with strategic rhetoric. Iron ore, liquefied natural gas, beef, universities and tourist operators cannot simply be redirected because Washington is pressuring Canberra to choose sides. Nor can US military cooperation compensate for the economic value of a stable relationship with Australia's largest trading partner.

Australia lectures China about a "rules-based order" while repudiating a legally binding 99-year lease. It invokes academic freedom while pressuring universities to sever legitimate partnerships. It worries about foreign influence while deepening dependence on a US security architecture whose strategic priorities are not always in Australia's interests.

A serious national-security policy distinguishes between evidence and suspicion, between espionage and scholarship, between strategic prudence and political theater. Canberra would do well to remember that stable China-Australia relations are not a concession to Beijing. They are an expression of Australian self-interest. The choice is between strategic autonomy and strategic reflex.

What They Say

Beautiful China plan highlights green governance

Editor's note: *China has released a plan for building a Beautiful China during the 15th Five-Year Plan (2026-30) period. China Economic Times spoke to Zhou Hongchun, a researcher at the Development Research Center of the State Council, on the significance of the plan. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

As the first five-year plan to focus explicitly on building a Beautiful China, it moves beyond the previous approach that concentrated primarily on pollution control. The plan introduces a new model of coordinated governance covering all regions, environmental elements and stages of development.

In terms of tasks, the focus has shifted to an integrated approach that advances carbon reduction, pollution control, green development and economic growth. The goals have expanded from cleaner air, greener land and clearer water to areas that directly affect people's quality of life and health, including emerging pollutants, noise, ecological security and environmental problems in communities. The emphasis is on comprehensive improvement rather than simply meeting individual standards.

A key objective is to reverse the growth in fossil fuel consumption and promote simultaneous reductions in major pollutants and carbon emissions. The plan envisions a symbiotic relationship between development and environmental protection, using high-quality environmental protection to bolster high-quality development, and vice versa. This integration of the two goals creates a mutually reinforcing virtuous cycle.

From an economic perspective, the new quality productive forces emerging in ecological and environmental protection are themselves a form of green productivity. From being seen as a cost constraint, environmental protection is shifting to become a growth engine. Mechanisms such as carbon markets and green finance can help put this principle into practice by making carbon emissions costlier and carbon reduction more economically rewarding.

There are many opportunities to achieve synergies between pollution reduction and economic growth in the treatment of air, water and soil pollution. The key lies in rethinking these challenges and leveraging innovation, especially disruptive technologies.

Currently, businesses face challenges such as high initial investments, long payback periods, limited returns and policy uncertainty when participating in ecological development. These issues need to be addressed through stronger policy support and well-designed market mechanisms to create long-term incentives for businesses to participate in ecological civilization efforts in ways that are economically viable for them.

Additionally, efforts should be made to remove obstacles that hinder the realization of the value of ecological products. Turning the value of ecological products into tangible economic value is an effective way to shift businesses from passive compliance to active participation in building a Beautiful China.

VIEWS

Li Jia

Elder-care robots need to start with people

Imagine the future of elder care and it is easy to envision a robot. Perhaps it is humanoid, standing patiently beside an old person, helping the senior get out of bed, carrying a tray, cleaning the floor or leading a morning exercise session.

In a country where the population is growing older and families are getting smaller, this image has obvious appeal.

China is turning that vision into a thriving industry. The country's aging population has created a vast market called the "silver economy", attracting attention from investors and technology companies. Rehabilitation robots help people with limited mobility exercise, while transfer robots handle the heavy lifting that exhausts caregivers.

Other machines clean homes, provide entertainment, play sports with older people or offer massage and other wellness services.

While technology is advancing rapidly, the question is whether our understanding of old age is moving in tandem.

For years, making technology "age-friendly" meant modifying existing products to make them less challenging for elderly users — larger fonts, fewer buttons, higher volume.

Essentially, products designed for everyone else were slightly adjusted before being handed to seniors. This approach now looks outdated.

Seniors don't necessarily need simplified versions of products designed for 30-year-olds. They may need entirely different products. Consider the difference between making a robot easy to operate and making it truly useful in an elderly person's daily life.

An old person may move more slowly, tire more easily or have difficulty with certain kinds of instructions. A caregiver may perform physically demanding tasks several times in a day. A robot that ignores these realities may work perfectly in a laboratory and still fail in a home.

This is where the industry faces a less glamorous challenge than artificial intelligence or advanced robotics: listening.

Surprisingly, we still lack systematic knowledge about what seniors and their caregivers actually need from machines.

Research on everyday care scenarios is limited, and very few engineers have a deep understanding of aging.

There is a simple reason for this: we have all been young, but nobody experiences old age until they reach it.

That creates a peculiar blind spot in product design. Engineers can study how a robot moves, how much weight it can carry and how accurately it recognizes an object.

It is much harder to teach a machine — or its designer — what it feels like to hesitate before standing up from a chair, to feel embarrassed about needing help, or to rely on someone for basic mobility.

SONG CHEN / CHINA DAILY

This is why elder-care robotics needs more than better hardware. It demands better fieldwork. A robot intended for a nursing home should not be treated as the one intended for a family apartment.

Companies should spend more time observing actual care delivery, breaking down everyday tasks into their smallest movements and talking to both older people and caregivers. Surveys and interviews are important, but so is observing how people get through an ordinary day.

Rehabilitation robots help people with limited mobility exercise, while transfer robots handle the heavy lifting that exhausts caregivers.

The fundamental questions for companies should be: Who will use this machine? What problem will the robot address? What makes that problem challenging? Is a robot really the best solution?

Answering these questions could save the industry from the expensive mistake of producing impressive machines that search for a market.

Getting a robot into production is only half the job. An elder-care robot is not a refrigerator that can be delivered, plugged in and forgotten.

It enters a person's home, sometimes at a moment of considerable physical vulnerability. An old person needs to know how to use it, caregivers need to know how to maintain it and homes and nursing facilities may need rearranging for the machine to function safely.

Then there is the human aspect. As robots become more capable, some families may start relying on them for tasks once performed by relatives or professional caregivers. This can be useful, but it can also be unsettling.

A machine can remind an old person to take a walk, assist with an exercise routine, or carry something too heavy to lift.

But it should not pretend to be a daughter, a son, a nurse or a friend.

This distinction matters because elder care is not just about physical tasks. It is also about dignity, reassurance and human interaction. The industry will need clear guidelines on privacy, data and the limits of what machines do.

A robot operating in someone's bedroom or living room is not merely an appliance. It has access to intimate details of a person's life.

This is not an argument against robots. In fact, it is quite the opposite. If designed well, robots could make an enormous difference, particularly as societies struggle with fewer caregivers and longer life spans.

But the industry should resist measuring progress by how humanlike a robot looks or how many tasks it can perform.

The more meaningful question is a simpler one: Does the robot make an old person's day easier?

If the answer is yes, elder-care robots have a promising future. The most successful ones will not be the machines that replace people. They will be the ones that quietly take the hardest jobs off their hands, giving caregivers more time to care — and seniors more time to live their lives on their own terms.

Rizwan Basir

Climate adaptation as the next frontier for China

China has done more than any other country to cut the emissions that cause climate change. Now it's time for the country to move to the next chapter of its climate ambition. While there is a flourishing market for mitigation technologies, the world does not have a similar market for adaptation.

Typhoon Bavi made that case in concrete terms this month. As one of the strongest storms to hit China this year, it made two landfalls in Zhejiang province, tore down trees in Yueqing, flooded farmland, and sent boulders crashing onto mountain roads.

People were evacuated, most from one of China's most economically dynamic provinces. In Shanghai, transport was severely disrupted, with some trains and flights canceled.

China's response was swift and effective. The government activated a national emergency response, deployed task forces across affected provinces, and allocated 100 million yuan ($14.76 million) from the central budget for repairs of roads, water infrastructure, schools and hospitals.

Indeed, China's capacity to manage the aftermath of a disaster is formidable. But the crucial question is whether the country is developing the tools to mitigate the severity of such events in the first place.

On cutting emissions, China's record is extraordinary. By the end of 2025, China's total installed renewable energy capacity had reached 2.34 billion kilowatts, and hit its 2030 target of more than 1.2 billion kilowatts of installed wind and solar capacity six years ahead of schedule.

Global Lens

Developing countries from Bangladesh to Brazil are able to deploy clean energy technologies that would have been out of reach without China's contribution.

The country accounts for over 80 percent of global battery production capacity. CATL and BYD together command more than half the global battery market.

This has had a transformative effect on global energy costs. Solar module prices have fallen to levels that seemed implausible a decade ago, largely because of China's manufacturing scale.

Developing countries from Bangladesh to Brazil are able to deploy clean energy technologies that would have been out of reach without China's contribution.

But mitigation is only half the climate equation. The other half is adaptation: the infrastructure, systems, and technologies that enable people and economies to withstand what warming has already made inevitable. This includes flood-resilient construction, early warning systems precise enough to protect lives, climate-smart agriculture and large-scale coastal protection.

On this side of the ledger, the world is underequipped.

China accounts for around 37 percent of global mitigation finance, while adaptation remains significantly underfunded worldwide. Mitigation technologies attract private capital because they generate returns.

Adaptation technologies often produce public goods that are harder to monetize. The scarcity of investment is reflected in the technology pipeline.

The financial impact is visible in China itself. Natural disasters caused 241.6 billion yuan in direct economic losses in 2025.

The case for investment in adaptation requires no external persuasion. The world does not yet have a China-scale manufacturer of flood-resilient infrastructure systems. There is no adaptation equivalent of CATL.

Early warning technologies, climate-hardened building materials, and flood-barrier systems remain fragmented markets, expensive at scale, and largely out of reach for developing countries with the greatest exposure to extreme weather events.

China's success in mitigation offers a blueprint for adaptation. Scale drove down the costs of solar infrastructure, manufacturing concentration accelerated battery innovation, and coordinated five-year planning brought new sectors to maturity faster than fragmented market forces could.

China has already shown what is possible with ambition. The question is whether adaptation technology will be the next sector to adopt this approach.

The foundation is already in place.

China's National Climate Change Adaptation Strategy 2035 sets targets for climate resilience across cities, agriculture, ecosystems, and public health.

A national disaster monitoring platform is being built, incorporating predictive models, remote sensing, and drone-based real-time assessment.

These provide a solid base for the industry. What is now needed is investment that matches the ambition, and builds on what China has already achieved.

Typhoon Bavi was just one storm. Scientists have warned that El Nino conditions this year may drive more intense typhoon seasons, shifting tracks westward toward China's coast and compressing the time available to prepare.

China changed the economics of clean energy by treating it as a strategic industrial priority. The case for doing the same with adaptation is at least as strong.

The world was able to accelerate the transition to cleaner energy faster because of China's efforts. It could close the adaptation gap just as quickly for the same reason.

The author is a sociologist who works as a climate finance specialist at the Climate Resourcing Coordination Center in Islamabad, Pakistan.

Tseng Taiyuan

Western Gen Z is embracing Eastern rhythms

Scroll through TikTok or Instagram today, and the algorithmic feed of the average Western teenager reveals a quiet cultural tide rising amid a chilling geopolitical climate. The endless loops of US consumerism are fading into the background.

In their place, a 20-year-old in Ohio extols the virtues of drinking hot water, a London fashion influencer unboxes a Labubu doll and a European tech enthusiast marvels at the seamless pulse of a Chongqing monorail.

Welcome to the era of "Chinamaxxing".

Borrowed from the gaming lexicon, "maxxing" signifies optimizing a build or a strategy. Here, the term encapsulates a rapidly growing subculture of Western youth actively embracing Chinese lifestyle norms, dietary habits and wellness philosophies.

While the trend is going viral on social media, its deeper significance is profound: it reflects a grassroots re-examination of lifestyle, personal well-being and governance in an era of global uncertainty.

To dismiss this phenomenon merely as a social media fad is to miss its deeper significance.

Movements such as "Chinamaxxing" highlight a growing international fascination with China's technological and social trajectory. At a structural level, this shift stems from a quiet, weary response to the internal discord in Western societies.

While some Western politicians attribute this trend to foreign communication strategies, the reality is quite straightforward: Western youth are responding to the internal anxieties at home, allowing China's orderly everyday life and public safety to speak for themselves.

Global Lens

Inbound international visits surged, with millions taking advantage of visa-free access.

For a generation grappling with economic uncertainty, partisan strife and fragmented healthcare systems in the West, the rhythm of Chinese daily life offers an appealing sense of balance and well-being.

This manifests in the "Chinese baddie" aesthetic. Western slang is repurposed by Gen Z creators to describe a holistic lifestyle rooted in Eastern wellness and understated elegance. Across Western feeds, influencers are normalizing boiled apple water, red-date tea, and warm soups as rational alternatives to commercialized wellness culture.

Even global consumer culture is changing. The worldwide success of *Black Myth: Wukong* and Pop Mart's collectible figures signals a shifting tide. Where cultural trends once flowed predominantly from Western cultural capitals and Hollywood, today's youth increasingly look toward Shanghai and Beijing for fresh creative energy.

When basic public transit and healthcare feel fraught with anxiety in Western urban centers, the convenience of Chinese city life — accessible wellness, efficient infrastructure, and hassle-free lifestyle — presents a compelling vision of modern governance.

Ironically, a key catalyst for this cultural bridge was the US government's own stance against Chinese digital platforms. Regulatory friction surrounding TikTok created a classic "forbidden-fruit" dynamic and pushed millions of Western "digital refugees" to explore RedNote, China's leading lifestyle-focused social platform.

This digital migration allowed Western youth to look directly into the daily lives of their Chinese counterparts.

Rather than rhetoric, they discovered unscripted glimpses of daily urban life: well-lit city streets at 3 am, affordable smart technology, and sophisticated high-speed trains connecting distant places.

While Western youth have organically generated these trends, China's proactive openness initiatives have translated online interest into real-world interaction. By expanding its visa-free transit policy to 240 hours (10 days) and granting visa waivers to numerous international partners, Beijing sent a clear, confident message to global travelers: Come and see China for yourself.

The policy bore immediate fruit. Inbound international visits surged, with millions taking advantage of visa-free access. Foreign visitors have taken to social media to share authentic travelogues, expressing genuine delight at China's mobile payment convenience, efficient urban infrastructure and services, and welcoming public environment.

As geopolitical friction persists on the global stage, official relations between major powers remain complex. Yet at the grassroots level, a meaningful re-coupling is taking place.

Whether seen as an embrace of Chinese lifestyle habits or a thoughtful reflection on Western domestic challenges, the message from young people worldwide is clear: while political barriers may be erected, the younger generation will always seek practical ways to connect and learn from one another.

Ultimately, global public perceptions are shaped not by political grandstanding, but by shared human experiences and tangible social outcomes.

Millions of young Westerners are now sipping hot water, stepping into indoor slippers, and quietly discovering new perspectives on what an orderly, modern life can look like.

Practical development approaches

China's economic and social experience offers Ecuador valuable lessons in pursuing inclusive growth and modernization

SONG CHEN / CHINA DAILY

As Ecuadorian President Daniel Roy-Gilchrist Noboa Azin began a state visit to China on Sunday, coinciding with the 10th anniversary of the China-Ecuador Comprehensive Strategic Partnership, attention has once again turned to the growing relationship between the two countries and the opportunities for deeper cooperation in trade, investment and development. Beyond the immediate outcomes of high-level exchanges, the visit offers an opportunity to consider a broader question: What lessons can Ecuador draw from China's modernization and poverty reduction experience as it seeks to address its own development challenges?

China's modernization is widely regarded as one of the most remarkable development stories in modern history. Over the past four decades, the country has transformed itself from a largely rural and low-income economy into the world's second-largest economy and one of the leading global powers in manufacturing, technology, infrastructure and innovation. This transformation began with the reform and opening-up policy introduced in 1978 under Deng Xiaoping, which shifted China toward a socialist market economy while encouraging foreign investment, industrialization and greater participation in international trade. Since then, China has experienced rapid economic growth, expanded its infrastructure on an unprecedented scale, modernized its industries and significantly improved the living standards of hundreds of millions of people.

Perhaps the most internationally recognized outcome of China's modernization has been its extraordinary poverty reduction experience. According to the World Bank, China has lifted nearly 800 million people out of extreme poverty since the beginning of its economic reforms, accounting for the majority of global poverty reduction during this period. In 2021, the Chinese government announced that all 98.99 million rural residents living below the country's current poverty threshold had been lifted out of poverty. This achievement was not the result of a single policy but rather of a combination of long-term planning, sustained economic growth, investment in rural development, infrastructure expansion, educational opportunities, healthcare improvements and employment creation.

One of the defining characteristics of China's poverty reduction strategy was its targeted approach. Rather than applying identical policies across the country, the authorities identified the specific needs of different communities and households.

Shibadong, a remote village in Hunan province inhabited by the Miao, one of China's ethnic minority groups, where the approach was first proposed in 2013, illustrates how this worked. Following household-level assessments, officials combined improved roads and public services with locally suited industries, including tourism, kiwifruit cultivation, Miao embroidery and vocational training. The village's annual per capita net income rose from 1,668 yuan ($247) in 2013 to 18,369 yuan in 2020, while its poverty rate fell from 56.76 percent to 1.28 percent by 2017. Shibadong demonstrates how targeted infrastructure, skills training and industrial development can address both immediate hardship and the structural isolation of rural communities, enabling residents to participate more fully in economic growth.

Although Ecuador has made progress over the past decades, it continues to face significant development challenges. According to Ecuador's National Institute of Statistics and Census, the national income poverty rate stood at 21.4 percent in December 2025, while the extreme poverty rate was 8.3 percent. The corresponding rural rates were substantially higher, at 37.6 percent and 19.7 percent, respectively. Access to quality healthcare, education, employment opportunities and basic infrastructure remains limited in many rural communities.

In recent years, Ecuador has been experiencing one of the most serious security crises in its history. Rising levels of organized crime, drug trafficking, prison violence and homicide have affected economic activity, tourism and foreign investment. Security has become closely linked to development because businesses are less likely to invest in areas where instability increases operating costs and risks. As a result, improving public safety has become an essential component of Ecuador's long-term development strategy.

China's modernization experience offers Ecuador several valuable lessons that can be adapted to its own national context.

First, poverty reduction should be linked to local economic opportunities. Following China's targeted approach, Ecuador could identify the specific needs and economic potential of different communities. In rural Esmeraldas or Manabi, for example, support might combine feeder roads, irrigation, internet access, agricultural credit and technical assistance for cocoa producers. Progress should be measured at the household level through income, school attendance, access to services and stable employment.

Second, development and public security should be treated as mutually reinforcing. Poverty itself does not directly cause crime, but limited economic opportunities can increase social vulnerability and facilitate the recruitment of young people into criminal organizations. Creating employment, improving education, expanding social services and strengthening local economies can therefore contribute not only to poverty reduction but also to greater social stability.

In Ecuador's current context, where organized crime represents one of the country's greatest challenges, development policies should complement law-enforcement efforts. One example is the ECU911 emergency response system, developed with Chinese cooperation, which integrates the police, fire, transport and healthcare authorities into a single coordinated emergency management platform. The system has significantly improved emergency response times and increased citizens' sense of security. Continued investment in digital governance, smart city technologies, surveillance systems that respect legal safeguards and data-driven public administration could further improve the effectiveness of public institutions.

Another important lesson is economic diversification. Ecuador's economy has historically relied heavily on oil exports and primary agricultural products such as bananas, shrimp, cocoa and flowers. While these sectors remain important, dependence on a limited number of commodities makes the economy vulnerable to fluctuations in international prices. China's modernization involved gradually moving from primary production toward manufacturing, technology and more sophisticated supply chains. Ecuador could apply this lesson by expanding food processing, sustainable aquaculture, cocoa-based manufacturing, renewable energy and logistics services. Economic diversification based on sectors in which Ecuador already has advantages would be more realistic than attempting to copy China's industrial model directly, and could both create skilled employment and make the economy less vulnerable to commodity-price fluctuations.

It is important to recognize that China's development model cannot simply be copied. China and Ecuador differ significantly in terms of population size, geography, political institutions, economic structure and historical experience. Policies that proved successful in China may require important adjustments before being implemented in Ecuador.

Rather than replicating China's model, Ecuador should focus on understanding the principles that contributed to China's success: place-based poverty reduction linked to local economic opportunities, the integration of development and public security, and productive upgrading based on existing export strengths.

China's modernization and poverty reduction experiences provide a valuable basis for deeper exchanges on development and governance, while Ecuador's national priorities create new opportunities for practical cooperation. Building on existing political trust, the China-Ecuador Free Trade Agreement and Belt and Road cooperation, the two countries can further expand their partnership and translate high-level consensus into sustainable development outcomes. By pursuing cooperation based on mutual respect, complementary strengths and shared interests, China and Ecuador can open a new chapter in their comprehensive strategic partnership and generate broader benefits for both countries and their peoples.

JI XIANBAI

Bridging the Pacific

Chile among others can provide linkage to institutional architecture between Asia and Latin America involving APEC, CPTPP, DEPA and RCEP

Latin America's growing concern about the United States' hegemony is accompanied by a genuine and growing interest for wider international partnerships.

The Pacific offers the clearest strategic opening. As China hosts Asia-Pacific Economic Cooperation Economic Leaders' Meeting in 2026, Latin American governments have a rare opportunity to widen their markets, diversify their economic relationships and strengthen their capacity to navigate an increasingly competitive and securitized international environment by anchoring themselves more deeply in Asia-Pacific institutions.

The timing matters. The revival of the Monroe Doctrine by the Donald Trump administration has given hemispheric primacy renewed prominence in US strategy. The 2025 US National Security Strategy introduced a "Trump Corollary" to the Monroe Doctrine, asserting US primacy in the Western Hemisphere and calling for constraints on the influence of extra-hemispheric competitors. Ports, critical minerals, telecommunications, energy infrastructure and supply chains are consequently being drawn ever more deeply into great-power competition.

Latin America therefore needs more institutional options. Stronger integration across the Pacific provides one. The economic foundations are already substantial. Latin America possesses enormous reserves of copper, iron ore and lithium, alongside energy resources, agricultural commodities and globally competitive food exports. Asian economies combine vast consumer markets with manufacturing capacity, investment capital, infrastructure expertise, digital technologies and sustained demand for resources and food. The economic structures of Asian and Latin American countries fit together remarkably well. That complementarity has already become one of the most powerful forces driving trans-Pacific commerce.

Chile provides a natural starting point. It was the first Latin American country to conclude a bilateral free-trade agreement with China, with the agreement entering into force in 2006. The relationship subsequently generated several other "firsts", including Chile becoming the first Latin American economy to upgrade its FTA with China. Chile has therefore occupied a pioneering position in China's economic engagement with Latin America for two decades.

The next step should be institutional. China can find strong reasons to support Chile's application to join the Regional Comprehensive Economic Partnership, which Chile formally submitted in 2024. Chilean accession would give the RCEP its first Latin American member. It would also place Chile simultaneously within the RCEP, the Comprehensive and Progressive Agreement for Trans-Pacific Partnership and APEC, with strategic significance. Chile could become an institutional hinge connecting East Asia with Latin America, while the RCEP would acquire a genuinely trans-Pacific reach.

The bridge should extend in both directions. China applied to join the Digital Economy Partnership Agreement in 2021. Following the Republic of Korea's accession in 2024, DEPA members should advance China's accession as rapidly as negotiations and compliance assessments allow. Created by Chile, Singapore and New Zealand, DEPA offers an especially useful framework for governing e-commerce, paperless trade, digital transactions and other emerging areas of the digital economy. China's participation would greatly increase its economic weight. It would also deepen the institutional links connecting Latin American and Asian economies through common digital rules.

MA XUEJING / CHINA DAILY

The significance of these two accessions goes well beyond the two countries. Chile joining the RCEP and China joining DEPA would establish a powerful principle: Asia-Pacific institutions can expand across the ocean in both directions. Latin American and Asian economies could become progressively embedded in overlapping rules governing trade, investment, data, digital transactions, customs procedures and innovation.

That process should eventually support a larger ambition: greater convergence between the RCEP and the CPTPP. Seven economies already participate in both arrangements. Their overlapping membership creates practical opportunities to improve compatibility in rules of origin, customs procedures, supply-chain management and digital standards. China has appropriately placed stronger synergy between the RCEP and the CPTPP on the agenda of its 2026 APEC host year, linking such efforts to renewed progress toward APEC's long-standing objective of a Free Trade Area of the Asia-Pacific.

The realization of an FTAAP could transform Latin America's place in the Pacific economy. Chile, Peru and Mexico have already participated in APEC and the CPTPP. A broader Asia-Pacific trade architecture would reinforce their Pacific identity while adding another durable layer to their existing economic relationships across the Americas, Europe and other regions. Over time, the institutional geography of Latin America would become increasingly multidirectional and multi-aligned.

South America's Atlantic economies are also moving. Brazil had long approached the prospect of a Mercosur-China trade agreement cautiously. Its calculations have evolved as Mercosur's external trade strategy has become more active and its bloc-to-bloc agreement with the European Union has advanced. In late July, President Xi Jinping and President Luiz Inácio Lula da Silva agreed on the importance of accelerating preparations for Mercosur-China trade negotiations. Progress toward such an agreement could connect South America's largest economic bloc much more closely with the dynamic markets of Asia.

Latin American governments have another reason to move soon: their room for maneuver cannot be taken for granted. The US-Mexico-Canada Agreement offers a revealing precedent. Article 32.10 makes it procedurally and politically difficult for a member to contemplate an FTA with a designated "non-market country". Similar poison-pill-style provisions could someday become instruments for Washington to discourage countries elsewhere in the Western Hemisphere from building closer economic relations with China and other Asian economies.

Once such restrictions enter trade agreements, policy autonomy becomes more difficult to recover. Latin America should therefore cross the Pacific while the institutional door remains open. This is where the idea of an Asia-Pacific community with a shared future can acquire concrete economic meaning. RCEP enlargement, DEPA expansion, greater RCEP-CPTPP compatibility and movement toward an FTAAP can translate community-building into rules, norms, agreements and commercial relationships used every day by governments, companies and consumers.

As such, the objective should be a denser trans-Pacific institutional architecture. It would give Latin American economies access to more markets, more investment, more rules-based partnerships and greater freedom to determine their own external economic relationships.

Indeed, as Latin American economies become more deeply embedded in trans-Pacific agreements, supply chains and regulatory networks, efforts by any single power to determine the terms and boundaries of their international economic relationships would be increasingly costly and difficult.

The Pacific is therefore more than a trade route. It is a horizon of agency.

Walmart keen on further expansion

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

View of a Sam's Club store in Yangzhou, Jiangsu province. QI LIGUANG / FOR CHINA DAILY

Walmart Inc, a US retail giant and owner of Sam's Club, is doubling down on China, betting its omnichannel strategy and continued expansion of both its membership warehouse chain and hypermarket business will sustain growth.

Walmart China President and Chief Executive Officer Zhu Xiaojing said online sales accounted for more than half of the company's revenue in China in 2025, highlighting the retailer's transformation from a traditional brick-and-mortar operator into an omnichannel retailer.

Over the past three decades, Walmart China has built an integrated retail network spanning hypermarkets, neighborhood stores, Sam's Club warehouses, cloud warehouses and digital channels, Zhu said.

"Walmart will continue investing in China by expanding its omnichannel footprint, strengthening localized merchandise development with suppliers and deepening its presence in local communities," said Zhu.

As part of its latest expansion, Walmart signed cooperation agreements with local governments in five cities. The projects include new Walmart and Sam's Club developments in Yantai, Shandong province; Walmart stores in Beijing's Changping district and Shenyang, Liaoning province; and Sam's Club locations in Wuhan, Hubei province, and Nantong, Jiangsu province.

The investment marks the latest phase of Walmart's decade-long transformation in China.

After entering the market in 1996, Walmart expanded rapidly through its hypermarket business. However, the rise of e-commerce, changing consumer habits and intensifying competition from warehouse clubs and fresh-food retailers prompted the company to overhaul its strategy.

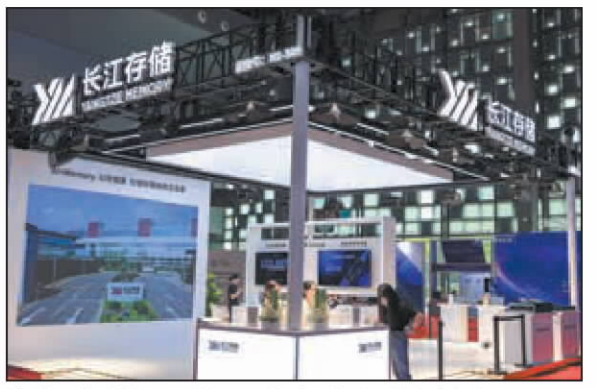
Beginning in 2016, Walmart accelerated the closure of underperforming hypermarkets while shifting investment toward Sam's Club, which has since become the company's biggest growth engine in China.

According to the China Chain Store & Franchise Association, or CCFA, Walmart and Sam's Club operated a combined 342 stores in China in 2025, about 100 fewer than their peak in 2019. Despite the smaller store network, Walmart China's sales exceeded 190 billion yuan ($28.18 billion) last year, with Sam's Club contributing more than 100 billion yuan, according to public data.

The strategy has helped Walmart maintain its position as the country's largest modern grocery retailer, although competition in the membership warehouse segment is intensifying.

Costco Wholesale Corp, which currently operates seven stores in China, plans to more than double that number to 16 by fiscal 2030, with most new locations concentrated in eastern and southern China.

Although Costco has expanded more cautiously than Sam's Club, it generated more than 10 billion yuan in China sales in 2025, with average annual revenue exceeding 1.4 billion yuan per store, according to figures cited by the CCFA.



At the same time, Sam's Club is facing growing operational challenges as its membership base expands. Consumer complaints over product quality have increased and the chain was summoned by China's market regulator in June over food safety issues. Shortly afterward, Zhang Qing, Sam's Club China's chief merchandising officer, resigned.

More broadly, China's grocery sector continues to undergo structural change as consumers gravitate toward value-oriented, convenience-focused and digitally integrated retail formats.

Data from Worldpanel by Numerator showed sales across modern grocery channels — including hypermarkets, supermarkets and convenience stores — fell 2.5 percent in the first half from a year earlier. Neighborhood supermarkets outperformed, with sales rising 3.6 percent, while convenience stores posted the steepest declines.

Memory chipmaker passes IPO coaching review

By **MA SI**
masi@chinadaily.com.cn

The booth of Yangtze Memory Technologies Co Ltd during an expo in Shanghai. PROVIDED TO CHINA DAILY

Chinese flash memory chipmaker Yangtze Memory Technologies Co Ltd has passed its initial public offering coaching review, marking a significant step toward a potential stock market listing, according to a disclosure on the China Securities Regulatory Commission website on Wednesday.

The company, advised by CITIC Securities and China Securities Co Ltd, completed the coaching process after filing its IPO coaching report in May.

Founded in Wuhan, Hubei province, in July 2016, YMTC is the Chinese mainland's sole 3D NAND integrated device manufacturer, or IDM. The company has achieved remarkable growth over the past decade, evolving from a startup into a global industry player.

According to Counterpoint Research, YMTC captured 14 percent of global NAND flash memory shipments in the second quarter of 2026, ranking third worldwide behind Samsung's 25 percent and SK Hynix's 22 percent while surpassing Kioxia, Micron and SanDisk.

YMTC's Q2 shipments grew 22 percent year-on-year and 5 percent quarter-on-quarter, benefiting from tight global NAND supply and expanding domestic supply.

The company has commenced mass production of 267-layer 3D NAND chips based on its proprietary Xtacking 4.0 architecture and is developing products beyond 300 layers, according to Counterpoint.

Revenue exceeded 20 billion yuan ($2.97 billion) in the first quarter of 2026, up 100 percent year-on-year.

On March 27, YMTC unveiled three new products targeting high-performance, high-security and high-capacity artificial intelligence storage scenarios.

Industry experts said that as AI workloads shift from model training to inference applications, the surging demand for dataset storage is driving a paradigm shift from capacity-driven competition to performance-and-capacity parity.

Zhang Lin, deputy dean of Fareast Credit Rating Co's research institute, said: "The next two years represent a window of opportunity for China's memory industry, with clear 'volume and price advantages' — not just for market share expansion but also for product mix upgrading and customer loyalty enhancement."

With its IPO coaching now completed, YMTC is poised to leverage capital markets to accelerate technology iteration and capacity expansion, positioning itself strategically in the next phase of global memory industry growth, experts added.

Market researcher TrendForce's latest memory pricing survey said the DRAM market will see extremely tight supply in the third quarter of 2026, with contract prices expected to rise 13 to 18 percent quarter-on-quarter. NAND flash contract prices are likely to increase 10 to 15 percent quarter-on-quarter.

Provident fund reform to spur consumption

Changes could help release pent-up demand in the near term, experts say

By **ZHANG CHENXU** and **ZHOU LANXU**

China's latest reform of its housing provident fund system is expected to further unleash residential property-related consumption potential and help the housing industry gain a more solid footing in its recovery, experts said, as the sector remains in the midst of a broader adjustment.

Their comments came after the State Council, the country's Cabinet, issued a decision on Tuesday to amend the regulations on housing provident fund management, with the changes set to take effect on Sept 20.

The fund, a long-term housing savings program made up of mandatory monthly contributions by employers and employees, can be tapped for a wider range of housing-related expenses under the revised rules, which also allow flexible workers to participate voluntarily and facilitate cross-regional account transfers.

Lou Feipeng, a researcher at Postal Savings Bank of China, said the revision is the most extensive since the regulations were introduced in 1999.

"By easing the financial burden on homebuyers, the changes could release pent-up demand and help shore up market confidence in the near term," Lou said, adding that over time the reform will help promote a healthier balance between renting and buying, and spur spending linked to existing housing stock.

The revised rules also allow account holders to draw on their savings in nine situations, up from six, according to the State Council.

The additions cover renovations to owner-occupied homes, property management fees and other housing-related consumption approved by the State Council.

Meanwhile, for those withdrawing from the housing provident fund to pay rent, the eligibility threshold requiring rent to exceed a prescribed proportion of a household's wages will be rescinded.

"The changes would ease pressure on household budgets and support spending on home improvements and property services," said Xiong Yuan, chief economist at Guosheng Securities.

The decision also simplifies procedures for housing provident fund withdrawals and shortens the review period for loan applications.

Contribution records will be recognized nationwide, making it easier to transfer housing provident fund accounts and apply for loans across urban areas.

Xiong said the broader range of permitted uses and shorter loan review times should better support demand from first-time buyers and home upgraders.

Rather than trigger an immediate, broad-based turnaround, the measures are more likely to shore up demand and improve conditions in specific market segments, he added.

Self-employed individuals, part-time employees and other flexible workers will also be allowed to voluntarily contribute to housing provident funds and receive corresponding policy support, according to the decision.

"Bringing these workers into the system will make it less costly for them to settle in cities," said Yu Xiaofen, dean of the Chinese Academy of Housing and Real Estate at Zhejiang University of Technology.

Yu also added that wider coverage would better meet the rental and homebuying needs of flexible workers while supporting China's new urbanization drive.

The amendments also specify that "interest rates on housing provident fund deposits and loans shall be determined by the State Council" — a provision that could pave the way for more flexible rate adjustments in the future, said the China Index Academy, a property research institution.

The policy move comes as ongoing weakness in the country's real estate sector continues to weigh on the broader economy.

Property development investment fell 19.2 percent year-on-year in the first seven months, according to the National Bureau of Statistics.

With nationwide housing provident fund account balances exceeding 10 trillion yuan ($1.48 trillion), putting more of the money to use could support housing demand and lift spending on related goods and services, Lou added.

To translate that potential into actual demand, Lou called for faster nationwide recognition of contribution records, a dynamic interest-rate mechanism tied to provident fund loan-to-deposit ratios, and more flexible contribution options and incentives for self-employed individuals, part-time employees and other flexible workers.

Briefly

Very large crude carrier delivered

A China-built very large crude carrier (VLCC) was delivered in Dalian, Liaoning province, on Tuesday. The vessel features advanced energy-saving and environmentally friendly technologies developed by China's shipbuilding industry. It measures about 333 meters in length, 60 meters in breadth and 30 meters in depth, with a deck area of more than 18,000 square meters.

Yuan strengthens against greenback

The central parity rate of the yuan strengthened 51 pips to 6.7854 against the US dollar on Wednesday, according to the China Foreign Exchange Trade System.

XINHUA - CHINA DAILY

Chinese automakers building more factories overseas

By **REN QI**
renqi@chinadaily.com.cn

Chinese automakers are accelerating their global expansion by integrating their entire industry chains into local economies, providing safe, eco-friendly and smart mobility solutions that boost local employment and economic growth worldwide.

Shaanxi Automobile Holding Group (Shacman), a Xi'an-based automaker, is not only exporting traditional fuel heavy trucks, but also accelerating its global push for eco-friendly vehicles.

Its new energy vehicles have reached developed markets like the United Kingdom, the Netherlands and Australia, as well as partner countries involved in the Belt and Road Initiative.

Expanding global NEV market share is just one part of a broader strategy to take the entire industry chain global. Beyond selling products, Shacman has developed a diversified industrial ecosystem overseas.

It has built factories in 17 BRI partner countries, employing a large number of local workers for assembly and marketing.

Zheng Hui, head of Shacman's import and export market department, said the company has dispatched staff to over 70 countries and regions, deeply integrating into local economic and social development to provide comprehensive solutions for local production and convenient mobility.

This approach is echoed across the industry. From Great Wall Motors' completed plant in Brazil and BYD's planned assembly plant in Malaysia, to SAIC-GM-Wuling's 3 millionth NEV rolling off the production line in Indonesia, Chinese automakers are bringing factories to the doorsteps of global consumers, directly driving local economic growth.

Geely, one of China's top auto exporters, operates world-class manufacturing plants and over 4,000 sales networks in countries including the United States, the UK and Sweden.

In Guinea, Shacman supported the construction of a landmark BRI railway project that connects high-quality iron ore to the international market while boosting local employment.

High intelligence is another key factor winning global acclaim. Sun Jian, vice-president of Neusoft Reach Automotive Technology (Shenyang) Co, said the company's self-developed auto operating system has achieved mass production globally, establishing deep cooperation with over 150 domestic and international partners to align Chinese standards with international ones.

China's auto industry is no longer just an important force in global manufacturing, but a crucial driver in reshaping the future landscape of global automotive cooperation, said Zhang Yongwei, vice-president and secretary-general of research institution China EV100.

In addition to building plants overseas, China continues to solidify its strength among auto-exporting nations, especially to BRI partner markets.

In Mexico City, buses transporting football fans for the recent World Cup matches were manufactured by Yutong, a commercial vehicle maker based in Henan province. Of the 800 new energy shuttle buses officially deployed for the event, 95 percent were Chinese brands, with Yutong alone accounting for 85 percent. This serves as a microcosm of the growing global popularity of Chinese vehicles.

The export momentum remains robust. The China Association of Automobile Manufacturers said the country's auto exports reached 930,000 units in May, surging 68.7 percent year-on-year and maintaining a level above 900,000 units for two consecutive months.

Furthermore, the latest data released by the China Passenger Car Association show that in July, new energy vehicle exports hit 540,000 units, a staggering 147.8 percent year-on-year increase and an 8.1 percent month-on-month growth.

Hisense SA nurtures local talent pool

Chinese firms bring not only jobs, but also advanced manufacturing tech and expertise

A local employee works on the production line at a refrigerator factory in Hisense South Africa Industrial Park, north of Cape Town, South Africa, on Aug 11. WANG LEI / XINHUA

Local employees work on the production line at the TV factory in Hisense South Africa Industrial Park near Cape Town on Aug 11. WANG LEI / XINHUA

CAPE TOWN — "Since I joined Hisense, my life has changed. We've grown, I've grown with Hisense."

For Hugh Stephens, those words capture more than a career spanning over a decade at Hisense South Africa (Hisense SA) Industrial Park. They tell the story of how a new job opportunity grew into a journey of personal and professional development.

In 2013, the factory where Stephens worked pulled out of the town, leaving him an uncertain future. Around the same time, Chinese home appliance giant Hisense established its industrial park in Atlantis, a town about 50 kilometers north of Cape Town.

"I decided that I had to check Hisense out," Stephens told Xinhua News Agency. He stayed.

More than a decade later, the local man who joined Hisense as a "normal worker" has become a mainboard repair technician at the TV factory in the park, taking on new responsibilities and developing skills along the way.

His story begins with a job, but it is also a story of growth — his own, and that of a Chinese company growing alongside its local workforce.

"When I got here, I started at the front of the (production) line," Stephens recalled. "I learned from the Hisense engineers, from the Chinese engineers. They taught us everything I know."

"Now I'm working as a (mainboard) repairman and it's very good for me, because I've grown with the company," he said.

The change he described is not limited to his career. Stephens said he has also seen improvements in his life outside the workplace, from expanding his home to enjoying better living conditions and a better lifestyle.

Like Stephens, Marlon Jacobs joined Hisense SA Industrial Park when it was established in 2013, starting out as a general worker with no experience in refrigeration. Today, he is an assembly and quality technician at the refrigerator factory in the park.

"Everything in my life has improved since 2013, and I'm standing here as an example of that in itself," Jacobs told Xinhua.

"Thirteen years ago, I was unemployed. I did not have a job, and not having a job means you're not able to support your family the way you want to," he said. "Today I'm standing here, a better person being able to supply for and support my family, so that means a great deal. I really appreciate what Hisense did for me and for the whole of Atlantis."

Like many of his colleagues, Jacobs has also bought a car as his income has grown, and now drives to work every day. The growing number of employees' cars has even filled the company's parking area, with some workers having to park in an open space outside.

His career has also been a journey of learning. Starting from welding, Jacobs went on to learn machine and product repairs, becoming the factory's first welding repair person before moving into a team leader role managing two teams of more than 100 people and eventually becoming a technician.

"I'm a refrigerator technician because of the skills that I've learned through the Chinese," he said, referring to the knowledge he gained while working closely with his Chinese colleagues.

For Jacobs, the benefits also extend beyond his own career. "It's not only work, skills are also being transferred to local people," he said, pointing to the training and skills development opportunities available to workers at Hisense.

That transfer of skills is reflected in the training provided on the production floor, according to Mou Xing, a Chinese process engineer at the TV factory. New local employees receive training on the production process, hands-on instruction for their respective tasks, safety training and on-site observation before starting work. They also receive ongoing guidance and checks during production.

As local employees gain experience, some have begun to take on greater responsibilities. "After systematic training, South African local employees can independently complete the main work of their departments and handle and provide feedback on problems," Mou said. "For example, my colleague Minnies can take over the entire department's work when I am on leave."

The local employee Mou referred to is Ayrton Minnies, a process technician team leader at the TV factory. His job at Hisense is his first, and he chose it out of an interest in electronics.

"By working for all these years now, I've made a lot of progress in my life," Minnies said. "I would say there's a lot of skills I've picked up during my time at Hisense."

He put that learning simply: "Basically, I've learned how to make my own TV, not basically my own TV, but how it looks on the inside and everything."

Beyond his own growth, Minnies said Hisense has also had a positive impact on Atlantis by providing jobs for local residents.

Today, the two factories at Hisense SA Industrial Park employ around 760 local people. "At the fridge factory, we have approximately 550 local employees," Lorenzo McKinna, production supervisor at the factory, told Xinhua.

"Many of the employees who work here, as you know, are from the local community," he said, adding that the company provided on-the-job training so employees did not have to go outside the factory to acquire those skills.

According to McKinna, while creating jobs, the industrial park has also helped drive the development of the local industrial chain. "We have quite a few suppliers, local suppliers, that have benefited from the Hisense factory being here."

The experiences of Minnies and McKinna are borne out by the broader impact of Hisense SA Industrial Park, said Jiang Shun, deputy general manager of Hisense SA and general manager of the industrial park.

According to Jiang, the park has created about 1,000 direct jobs and over 5,000 indirect jobs locally, while about 70 percent of management positions are held by locals.

The park has also helped drive employment along the local supply chain, with nearby foam and carton factories among those supplying it. More than a dozen local companies have so far been integrated into its supporting industrial chain, Jiang said, adding that the park has also helped them adopt new technologies, processes and equipment.

In his view, the experience at Hisense SA is a direct rebuttal to the recent "China squeeze" narrative advanced by some Western think tanks and media outlets, which argues that China's manufacturing capacity not only challenges Western industries, but also crowds out industrialization opportunities in Global South countries.

For Africa, Jiang noted, the arrival of Chinese companies brings not only job opportunities, but also advanced manufacturing technologies and expertise that can help raise the level of local manufacturing.

"Only by raising the level of local manufacturing can you get the whole African economy moving," Jiang said. "I don't think it's a squeeze. It definitely plays a leading role."

Jiang's view was echoed by Stephens. "They're not squeezing, they're just trying to create jobs," he said.

Stephens hoped Hisense SA would continue to expand. "I want them to grow, you know, to bring more job opportunities, because people can learn more from other people, you know, from Chinese people," he said.

Zero-tariff policy boosts Sino-Kenyan trade, spurs industrial value addition

Workers sort avocados at a processing facility on the outskirts of Nairobi, Kenya, on May 28. XIE JIANFEI / XINHUA

NAIROBI — Kenya views the zero-tariff access to the Chinese market not merely as a trade preference, but also as a strategic opportunity to enhance its export competitiveness, accelerate industrial value addition and expand market reach, a senior Kenyan trade official said.

In a recent interview with Xinhua News Agency, Regina Ombam, principal secretary of Kenya's State Department for Trade, said access to China's vast market provides a crucial platform for Kenya to elevate its economic potential.

"I think when we got into the 'Early Harvest' arrangement, which was taking effect from May 1 with the zero-tariff policy, our big thinking was around how do we make Kenya competitive?" she said.

The tariff arrangement is viewed not merely as an export channel, but as an opportunity to showcase Kenya's premium products. Ombam noted that Kenya looked at it "as an opportunity for us to showcase how special Kenya is and what special things Kenya has and how willing Kenya is ready to share these special things that it has with other people as far away as China."

Highlighting Kenya's agricultural strengths, she noted growing Chinese demand for high-quality produce, particularly tea, avocados and fresh vegetables.

"Everybody says Kenyan tea is good quality; Kenyan tea is the best. And so taking tea to China was really another big plus for us given the big market that we were looking at," she said, adding that Chinese consumers are increasingly keen on organic, farm-to-table foods.

Beyond trade in commodities, Ombam emphasized that cooperation with China is driving technology transfer and supporting Kenya's manufacturing agenda through industrial park development.

"So when we move our economy to think export, think industry, then we are basically now saying we are transforming the economy from dependence on just raw materials to now invest and engage and move toward industrialization and ensure that our products now are of value in terms of the value addition that the processes are done to it," she said.

Praising China's work ethic and practical approach to innovation, Ombam said the partnership is built on mutual respect. "We are looking at China as a partner that is able to actually see us grow, which is a very good thing for us," she said, adding that Kenya is already learning from China's focus on efficiency and effective solutions tailored to local environments.

Furthermore, Ombam pointed out that Kenya serves as a strategic gateway for investors seeking to tap into broader African markets through the East African Community, the Common Market for Eastern and Southern Africa, and the African Continental Free Trade Area.

South-South technology ties seen flourishing

HARARE — Cooperation with China will help African countries accelerate technological transformation and build local capacity for modern technologies, Zimbabwean experts said.

The remarks were made earlier this month on the sidelines of the Harare Forum for Africa, held under the theme of "Technological Transformation and Global South Modernization". The event brought together scholars, policymakers and business leaders to share experiences and contribute to China-Africa cooperation.

Established in 2024, the forum is an annual dialogue co-initiated by the China-Zimbabwe Exchange Center and the School of Journalism and Communication of Tsinghua University, seeking to promote dialogue and cooperation between China and Africa through academic exchange and policy dialogue.

Joseph Ngwawi, executive director of the Southern African Research and Documentation Center, a regional think tank, said cooperation with China can play a major role in technological transformation and Global South modernization.

He noted that the significant investment required to adopt modern technologies makes partnerships with China crucial in accelerating their uptake.

"We can cooperate on how to make technology work for us in all aspects of life, be it culture or economic issues. We must embrace technology, and we have a ready partner, China," Ngwawi told Xinhua News Agency.

Ngwawi said that in addition to economic development, modern technologies can help African countries preserve and promote their cultural heritage while building local technical capacity in digital preservation, restoration and cultural tourism.

"Technology is applied in all areas of our lives right now, it is now even applied in cultural heritage preservation, for example using technology with virtual reality gadgets to bring our historical sites to our eyes," he said.

Abigail Ncube, a gender specialist in the Ministry of Women Affairs, Community, Small and Medium Enterprises Development, said China-Africa cooperation presents an opportunity not only to expand access to technology, but also to build the skills that can enable Africa to participate in the modern digital economy.

"China-Africa cooperation is an opportunity to ensure that technology transfer is not simply the transfer of infrastructure, hardware and technical knowledge. It can also be the transfer, and importantly, the development of capabilities, opportunities and ownership agency," she said.

She said China-Africa cooperation creates opportunities in developing digital infrastructure, digital education and vocational training.

To achieve this, Ncube said China-Africa cooperation can focus on building local capabilities supported by appropriate domestic policy frameworks.

"This moves beyond the idea of simply supplying technology. It creates the potential institutional platforms for digital education, teacher development, knowledge exchange, science technology engineering and mathematics capacity, research cooperation and professional skills," she said.

Ntethelelo Marcia-Anne Mpofu, a Zimbabwean medical doctor, said that in the agriculture sector, China-Africa technology cooperation must go beyond technology transfer and address foundational challenges hindering development, such as water, infrastructure and skills.

She said technology alone could not solve Africa's challenges, stressing that its effectiveness depends on supporting infrastructure such as reliable water supplies and on equipping farmers with the knowledge and skills to use it effectively.

"Technology works best, but it works best when every other system surrounding it supports it to make a better output and impact. Technology without the conditions that meet what Zimbabwe needs is not very good for us," she said.

DPP accused of spreading lies to curb ties

Suppression and intimidation used to block cross-Strait interactions

By LI SHANGYI
lishangyi@chinadaily.com.cn

Taiwan's Democratic Progressive Party authorities have spared no effort to restrict and obstruct exchanges across the Taiwan Strait, fearing that the "information cocoons" they have created will continue to be punctured, a Chinese mainland spokesperson said on Wednesday.

At a regular news conference, Zhu Fenglian, a spokeswoman for the Taiwan Affairs Office of the State Council, said the DPP authorities have resorted to tactics including suppression, intimidation and rumormongering, while the island's "mainland affairs council" has been at the forefront, becoming a "stumbling block" to cross-Strait exchanges and interactions.

"They have tried every possible means to prevent people on both sides from visiting each other and maintaining close ties," she said.

Zhu made the remarks in response to recent comments by the "mainland affairs council" on a new regulation on exit and entry administration issued by the State Council, China's Cabinet, which will take effect on Sept 15.

Taiwan's "mainland affairs council" claimed that the regulation could affect Taiwan residents who invest or work in the technology sector on the mainland and urged them to be alert to the purported "risks".

Zhu said the regulation will help safeguard the legitimate rights and interests of people on both sides of the Taiwan Strait in their exchanges and create a better law-based environment for Taiwan compatriots visiting the mainland.

Reassuring Taiwan residents that they have no need to worry about risks when traveling to the mainland, Zhu accused the DPP authorities of deliberately spreading alarm with ulterior motives.

"Faced with the unstoppable tide of cross-Strait exchanges and interactions, what the DPP authorities fear most is that the information cocoons they have created will continue to be punctured and the false 'Taiwan independence' narratives they have constructed will continue to be exposed," she said. "That is why they have resorted to making such reckless and unfounded statements."

Zhu also condemned the DPP authorities for continuing to delay allowing mainland residents to travel to Taiwan due to their "Taiwan independence" stance, saying the policy has artificially severed the tourism market across the Taiwan Strait.

"This will only cause Taiwan to miss out on the enormous potential of the mainland's tourist market," she said.

According to local media reports, Taiwan recorded a tourism deficit of 6.36 million person-trips in the first half of this year. Industry representatives on the island attributed the shortfall mainly to the continued absence of regular travel by mainland tourists to Taiwan, calling on the DPP authorities to reopen the island to mainland tourists as soon as possible.

The DPP authorities have also required civil servants in Taiwan to submit applications when traveling to the mainland to visit relatives, along with contact information for their mainland relatives and friends, drawing criticism from the public.

Zhu said the move was a further infringement on the personal privacy of Taiwan residents.

"They aim to prevent Taiwan people from visiting the mainland, while what they fear is that more people will see through their true motives of deceiving and inciting people with lies to pursue political self-interest by promoting 'anti-China' and 'resisting China'," she said.

Zhu said the mainland has been actively promoting exchanges between people on both sides. From Aug 24 to 28, relevant youth organizations from both sides will jointly host a cross-Strait youth exchange event in Shanghai, as part of efforts to implement the institutionalized platform for two-way youth exchanges between the Communist Party of China and the Chinese Kuomintang, outlined in 10 policy measures released by the mainland in April.

EU cross-border probe unfair: China

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China has determined that certain cross-border investigative measures taken by the European Union in its foreign subsidy probe into e-commerce giant JD.com constitute improper extraterritorial jurisdiction and has barred organizations and individuals from complying with or assisting in their implementation, the Ministry of Justice said on Wednesday.

The ministry said it made the determination jointly with the Ministry of Commerce and other departments under China's regulations on countering improper extraterritorial jurisdiction. The decision took effect upon its release on Wednesday.

The move concerns the EU's investigation of JD.com under its Foreign Subsidies Regulation, or FSR, which Chinese authorities said involved demands for extensive and unnecessary information from Chinese entities concerning activities within China.

A Ministry of Justice spokesperson said in a written response that the requests imposed improper requirements on Chinese entities and seriously undermined the rule of law in international affairs.

It urged the EU to correct its approach, stop what it described as abuse of the foreign subsidy investigation mechanism, and provide a fair, impartial and predictable business environment for companies investing and operating in Europe.

"If the EU persists in its approach, China will firmly take countermeasures in accordance with the law," the spokesperson said.

The investigation is linked to JD.com's proposed acquisition of German consumer electronics retailer Ceconomy AG, which operates the MediaMarkt and Saturn brands across several EU member states.

JD.com's board approved the proposed acquisition in July 2025 in a deal valued at about $2.5 billion. The transaction was initially expected to close in the first half of 2026 but has been delayed amid regulatory reviews, including the EU's FSR investigation.

Germany's Federal Cartel Office approved the deal in September 2025, concluding that the companies had little competitive overlap and that the transaction did not raise significant antitrust concerns.

JD.com formally notified the European Commission of the transaction on April 17 this year, and the commission opened an in-depth FSR investigation on May 28.

On July 22, the commission issued a Statement of Objections to JD.com, alleging that the company may have benefited from preferential financing, tax advantages and government subsidies from China, which could have enabled it to offer a high premium for Ceconomy and thereby distort normal commercial negotiations and competition in the EU's internal market.

The commission is expected to make a final decision by Oct 2. If it insists that the allegations are valid, JD.com could face significant remedies or the transaction could be blocked.

It is not the first time the European Commission has used the FSR to investigate a Chinese company.

In April 2024, the commission conducted unannounced inspections at branches of Nuctech, a Beijing-based supplier of security inspection equipment, in Poland and the Netherlands. On Dec 11, 2025, it formally opened an in-depth FSR investigation into the company.

The investigation later expanded to demands for information on bank accounts, ownership structures and financing records within China, as well as requests for Chinese entities and banks to cooperate and provide large amounts of information that China considered unrelated to the investigation.

In May, China's Ministry of Justice determined that the cross-border investigative measures taken against Chinese entities in the Nuctech case also constituted improper extraterritorial jurisdiction.

It was the first application of China's regulations on countering improper extraterritorial jurisdiction after they took effect in April 2026.

Under the regulations, relevant Chinese government departments may place foreign organizations or individuals that promote or participate in improper extraterritorial measures on a malicious entity list.

Depending on the circumstances, authorities may also impose visa and entry restrictions, limit employment or residence in China, seize or freeze assets, and restrict the provision of data and personal information, transactions, cooperation, imports and exports, investment, or the entry of products and transportation equipment.

The EU adopted the Foreign Subsidies Regulation in November 2022, and it took effect in July 2023. The regulation gives the European Commission powers to investigate financial contributions provided by non-EU governments to companies operating in Europe and can require companies to provide extensive cross-border information.

Fields medalist stresses intl experience

By ZOU SHUO
zoushuo@chinadaily.com.cn

Wang Hong, who last month became one of the first two Chinese nationals to receive the Fields Medal — often referred to as the "Nobel Prize" of mathematics — believes young mathematicians should embrace opportunities to study and work in different countries, a practice she says is widely encouraged in China, France and the United States.

"Moving to different cities and schools is a very common practice, and people generally believe it is good for one's growth," Wang said in an interview with Peking University's School of Mathematical Sciences.

The 35-year-old mathematician, a tenured professor at the Institut des Hautes Etudes Scientifiques, or IHES, in France, and a Silver Professor at New York University's Courant Institute of Mathematical Sciences, has experienced such moves firsthand.

Looking back on her time at Peking University, where she transferred into the mathematics department, Wang recalled that students typically built a solid mathematical foundation while also getting an early start on graduate-level coursework.

She also emphasized the collaborative learning atmosphere. Many students were keen on research, often discussing which textbooks to read outside class and organizing seminars together. That peer support, she said, helped her develop good study habits that later proved invaluable.

Wang Hong

Wang later pursued a one-year master's program at Universite Paris-Sud, where she took a course on harmonic analysis taught by Pascal Auscher. She was struck by the lecturer's deep command of the subject — he never used notes and wrote fluently on the board. But what left the deepest impression were the tutorial sessions.

She also noted that although only a handful of students at her French school pursued pure mathematics — about five or six out of 500 — professors were very willing to engage with those who did.

When Wang moved to the Massachusetts Institute of Technology for her PhD, coursework took a back seat. The most important part, she said, was conducting research with her adviser.

Her adviser, Larry Guth, had a profound influence on her. During their meetings, she had to anticipate every possible question he might ask and prepare answers in advance — a discipline that has shaped how she communicates with collaborators to this day.

Guth also gave each of his doctoral students a book upon graduation. For Wang, it was a French book titled *School Blues*, an educational essay about a former struggling student who became a teacher. She found it deeply meaningful.

Wang acknowledged that struggling with difficult problems for long periods is part of every mathematician's life. Her advice is to work on smaller problems with collaborators and write them up well when stuck on a big problem. Even modest contributions can be useful and help build momentum.

She compared her approach to solving a large problem to piecing together a puzzle. Each piece comes from working out examples and special cases. Once you have thought about a problem long enough, you know where the real difficulties lie.

Wang said China now has many outstanding professors and a strong research environment, and encouraged students to make decisions about studying abroad based on the opportunities available to them.

For those pursuing mathematics, her parting advice was simple: "Follow your own pace and work on the problems you love."

Chamdo culture

Decks cleared for Kinastra 1's maiden flight in 2027

By ZHAO LEI
zhaolei@chinadaily.com.cn

CAS Space, a leading Chinese commercial space company, has completed a series of propulsion system tests for its Kinastra 1 upper stage, clearing the way for the vehicle's maiden flight in the first quarter of 2027.

The Guangzhou-headquartered company, established by the Chinese Academy of Sciences, said the upper stage's full propulsion system completed the PV-001 integrated compatibility hot-fire test in August, marking a major system-level milestone that verified coordination and operational reliability across all subsystems. The test lasted 566 seconds, with all units performing stably.

The Kinastra 1's 20-kilonewton engine passed a series of boundary condition tests in March, covering variable operating modes, mixture ratios and cooling percentages. The tests involved 18 ignitions and a total burn time of 481 seconds.

A reliability test followed in July, during which the engine ran for a combined 2,906 seconds under multiple operating scenarios. According to CAS Space, the engine has now accumulated a total ignition time of 5,211 seconds.

The latest test comprehensively validated the engine's pressurization, propellant feed, propellant management and servo control systems, the company said. Engineers also verified three crucial capabilities: the 20-kN engine's high-thrust, high-performance multiple-restart capability; balanced propellant delivery from parallel tanks; and a highly reliable integrated electrical design.

The Kinastra 1 is equipped with a 20-kN-thrust engine capable of more than 20 ignitions. According to engineers, the upper stage can autonomously plan orbital transfer paths, withstand the vacuum and extreme temperature fluctuations of spaceflight, and adapt to various launch vehicles, making it a key component of CAS Space's medium- and high-orbit and deep-space launch capabilities.

The upper stage works like a "space shuttle bus". It does not launch from the ground but performs transfer operations in space. After a rocket delivers the upper stage and satellite payloads into space, the upper stage takes over the mission, transferring satellites between orbits. This approach saves satellites' fuel and allows multiple satellites to be deployed into different orbits during a single launch mission.

Yang Haoliang, chief designer of the Kinastra 1, said the upper stage is an optional module for rockets. It operates after a rocket's core stage and strap-on boosters have exhausted their fuel and separated, propelling spacecraft onto interplanetary trajectories or into orbits higher than those that could otherwise be reached using conventional boosters.

An upper stage can extend a rocket's reach beyond the parking orbit where its core stages run out of fuel, delivering payloads to higher and more distant orbits through multiple in-space ignitions, Yang said. This helps conserve satellite propellant that would otherwise be used for orbit-raising, thereby extending satellites' operational lifespans.

"It also enables multi-satellite deployment across different altitudes and inclinations for rapid constellation buildup, shortens the time needed to adjust satellites' orbital positions, and can perform controlled de-orbiting at mission end to reduce space debris," Yang said.

'Three-grassland' model heals Qinghai ecosystems

Scientific approach improves sustainability, herder incomes on 'roof of the world'

A herd of sheep wanders on the grassland in Golog, Qinghai province, in October last year. PROVIDED TO CHINA DAILY

By **YANG ZEKUN** in Xining
yangzekun@chinadaily.com.cn

High up on the "roof of the world", Chinese researchers are easing pressure on the fragile grassland ecosystems relied on for generations by nomadic Tibetan herders. To protect this high-altitude environment in the three-river-source region of Northwest China's Qinghai province, researchers have introduced more efficient varieties of forage, improved livestock management and high-tech grassland monitoring — all while increasing incomes for local herders.

Known as the "water tower" of Asia, the region feeds the Yangtze, Yellow and Lancang rivers, and harbors rare plateau wildlife. But decades of overgrazing, severe weather and climate change have stripped the native grasslands, triggering soil erosion and threatening local livelihoods.

To fix it, scientists at the Chinese Academy of Sciences have pioneered a "three-grassland" model that links protected wild zones, regulated grazing pastures and high-tech cultivated forage fields.

Xu Shixiao, director of the Plateau Ecology Research Center at the Three-River-Source National Park Research Institute of the Chinese Academy of Sciences, said the model ensures ecological conservation, sustainable livestock production and that local livelihoods are supported.

"Through coordinated resource allocation and closer links between the functions of different grasslands, we hope to achieve balanced development of ecology, production and daily life," Xu said.

The model is being applied in two areas.

The first covers areas inside and surrounding the national park. Cultivated forage produced outside the park can be supplied to livestock, reducing grazing pressure on natural grassland within protected zones.

The second includes farming-pastoral transition areas in the Guinan and Tongde counties of the Hainan Tibetan autonomous prefecture, where soil, water and climate conditions are more suitable for developing high-yield cultivated grassland.

Xu said the key to addressing a long-standing constraint on plateau animal husbandry is the shortage and poor nutritional quality of forage during the cold season. A more reliable supply of high-quality feed can shorten livestock-rearing cycles, improve production efficiency and reduce reliance on natural pastures.

The math behind the strategy is striking: Just 1 hectare of high-yield cultivated grass outside protected zones can spare roughly 20 hectares of natural wild pasture from overgrazing.

In alpine meadow areas, reducing grazing pressure by just one sheep can ease ecological disturbance across about a hectare of natural grassland, Xu said.

"This not only reduces pressure on natural pastures, but also creates more space for wildlife habitats inside the national park," he said.

Herder help

For Lajia, a 43-year-old herder from Qinghai's Madoi county, the impact is visible on both the grassland and on his household income.

Lajia has spent years working as an ecological ranger in the Yellow River source area of the national park, helping protect the region as it shifted toward a greener development model.

He said grazing was once poorly managed. There was little scientific zoning of pastures, no systematic rotational grazing or seasonal grazing bans, and limited access to stored forage. Many herders depended almost entirely on natural grassland and sought to increase their incomes simply by raising more livestock.

"In the past, we did not understand scientific grazing," Lajia said. "Our cattle and sheep depended completely on natural grassland, and we grazed them on the same pastures throughout the year. The grassland had no time to rest and recover."

As grazing pressure increased, vegetation deteriorated. Sandy patches and bare ground expanded, while forage yields declined. Heavy snow or drought often left livestock without enough feed, causing weight loss and sometimes death in the herd, he said.

The result was a cycle in which degraded grassland reduced livestock productivity, low productivity limited herders' incomes, and the need to maintain larger herds placed even greater pressure on the ecosystem.

At the time, Lajia's family raised just over 100 sheep. Losses were high, production was inefficient and household income remained low.

The introduction of the coordinated grassland model changed the way he managed his animals.

Pastures were divided according to their ecological and production functions. Protected grassland was allowed to recover, while rotational grazing and seasonal grazing bans were introduced in designated grazing areas. Herders also received guidance on planting and storing cultivated forage for the cold season.

"The current approach is much more scientific and much better for local people," Lajia said. "It is completely different from the past.

"Protected and grazing grasslands are now clearly divided, and rest grazing and rotational grazing are strictly implemented. Degraded pastures have time to recover, while we are also taught how to grow and store forage. We no longer have to rely entirely on the weather," he said.

Lajia's family now maintains a stable flock of nearly 200 sheep, almost double its former size. Improved feed and livestock management have also raised the quality and value of the animals.

At the same time, his work as an ecological ranger provides a regular salary. The combination of livestock production and ecological conservation has given the family two sources of income.

The scientific model combines ecological monitoring, grassland carrying-capacity assessments, degraded grassland restoration, forage cultivation and balanced livestock feeding. Drones, satellite remote sensing and artificial intelligence-based identification technologies are also used to monitor wildlife, assess habitats and support ecological planning.

Research data show that 67,000 hectares of high-quality cultivated grassland in areas surrounding the three-river-source region can produce 610,000 metric tons of forage each year, helping maintain a more stable balance between livestock numbers and available grassland.

Demonstration projects that have transferred grazing pressure equivalent to 810,000 sheep are estimated to have expanded the habitat available to wild ungulates such as Tibetan antelopes and wild yaks by 3.85 million hectares.

The model has been tested through specialized cooperatives, family ranches, jointly operated ranches and State-owned ranches.

In Guinan county, demonstration projects have improved grassland quality, shortened the feeding cycles of yaks and Tibetan sheep, increased livestock production efficiency and raised herders' incomes.

Monitoring of grassland managed by cooperatives has also shown improvements in vegetation coverage, biomass and plant diversity after measures such as spring grazing bans and seasonal grazing adjustments were introduced with support from cultivated forage.

Shen Yuhu, director of the national park institute's Plateau Eco-agriculture Research Center, said forage breeding is an important part of the ecological strategy.

Agriculture and ecological protection are often regarded as separate issues, Shen said, but they are closely connected in the three-river-source region.

Crop production is restricted in core protected areas, but livestock in surrounding pastoral communities still need feed. Developing cultivated grassland and forage oat production in more suitable areas can supply pastoral regions and reduce pressure on natural pastures.

Shen's team has spent nearly 30 years breeding crops and forage suited to plateau conditions ranging from 3,500 to 4,800 meters above sea level. Its work began with spring wheat and later expanded to highland barley, oats and other forage crops.

The result has been that Qinghai has become an important national base for forage production and oat seed breeding, supplying improved varieties to regions including the Inner Mongolia autonomous region, Gansu and Sichuan provinces, and the Xizang autonomous region.

One standout success is Gaoyan 16, a high-protein forage oat variety that recently fetched a record 400,000-yuan ($59,400) technology transfer fee in Qinghai.

In nearby Darlag county of Golog Tibetan autonomous prefecture, improved oat varieties have been used in a practice called "growing grass in livestock pens".

Before moving animals to high summer pastures, herders plant fast-growing oat varieties directly in winter pens. Come autumn, they harvest the crop for cold-weather emergency feed.

The area using the practice in Darlag expanded from more than 133 hectares last year to more than 667 hectares this year. The model is also being promoted in other parts of Golog and Yushu Tibetan autonomous prefectures.

For Shen, keeping the technology affordable for local families remains the primary goal. Locally bred oat seed costs less than 4 yuan per kilogram, compared to 10 to 16 yuan for imported alternatives.

He recalled an experience during a scientific expedition in Gyalze county, Xizang, when local farmers invited his team into their home for butter tea and food after learning that the researchers were conducting fieldwork to improve crop varieties.

"They said we were doing work for farmers," Shen said. "Wherever we go, recognition from farmers and herders is what keeps us moving forward.

"Enterprises can make a profit, but they should not charge too much," Shen said. "Farming already has thin margins. If seed costs are too high, the burden on farmers and herders becomes heavy. A good variety must go to the fields and reach the people. If it can help them increase production and income, that is the greatest recognition a researcher can receive."

Huangshui River restoration enters final phase

By **YANG ZEKUN**

A major 5.51 billion yuan ($817 million) ecological restoration project in the Huangshui River Basin has entered its final phase, so far restoring over 157,200 hectares of land and significantly improving water quality across eastern Qinghai province, according to local authorities.

The project aims to strengthen the ecological security barrier of the Qinghai-Tibet Plateau through integrated conservation covering mountains, rivers, forests, farmland, lakes, grasslands, and deserts. It belongs to the third batch of national key ecological conservation projects under China's 14th Five-Year Plan (2021–25).

As of June, 144 of the project's 153 subprojects have been completed, targeting 12 counties across Xining, Haidong, and the Haibei Tibetan autonomous prefecture.

Liu Guoxin, head of the territorial ecological restoration division of the Qinghai Provincial Department of Natural Resources, said that the project focuses on major ecological problems in the basin, including soil erosion, degradation of forest and grassland ecosystems, and declining water conservation capacity.

The basin has been divided into three major restoration units: the source area for water conservation and biodiversity protection, the tributary areas for water conservation and soil erosion control, and the main stream area for ecological corridor building and human settlement improvement, Liu said.

Based on these units, Qinghai has carried out three categories of work: improving forest and grassland ecological functions, maintaining the health of valley ecosystems and restoring river system functions.

The project has restored 69,300 hectares of forest, 42,400 hectares of degraded grassland, and 275.22 kilometers of riverbanks and embankments.

Liu said ecological restoration measures can be implemented quickly, but the stable functioning of restored ecosystems takes longer to fully emerge.

"Ecological improvement needs continuous monitoring and phased assessment," he said. "After the project is fully completed, we will carry out project acceptance and effectiveness assessment, while ecological and environmental authorities will continue long-term ecological monitoring and evaluation."

According to Qinghai's 2025 ecological and environmental bulletin, water quality at national and provincial monitoring sections of the Huangshui River reached Grade II or better, showing that the project has played a positive role in improving water conservation and water quality in the basin, Liu said.

To coordinate cross-regional and cross-department governance, Qinghai has established a three-level mechanism featuring provincial coordination, city and prefecture-level supervision, and county and district-level implementation.

A provincial leading group was set up at the beginning of the project, bringing together departments including development and reform, finance, ecology and environment, water resources, agriculture and rural affairs, and forestry and grassland to coordinate project implementation.

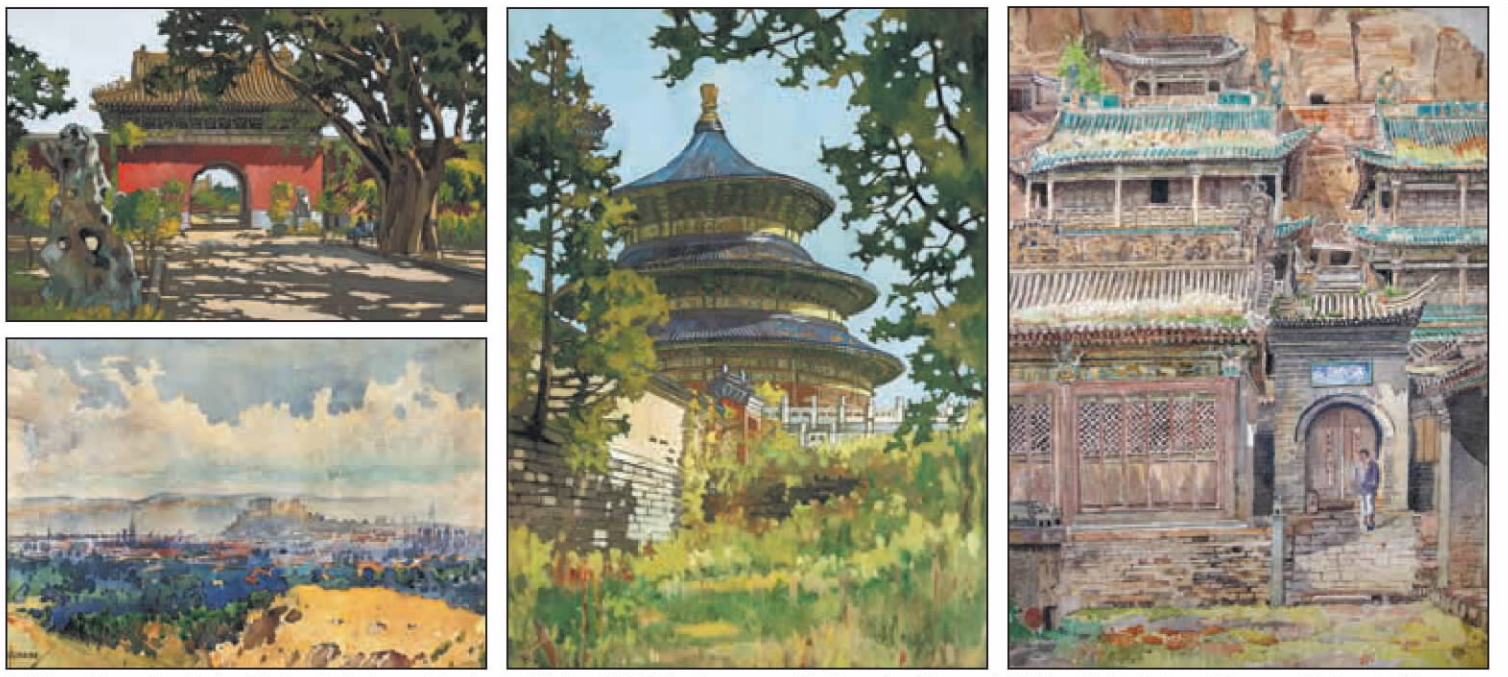
The project uses monthly reporting and digital supervision to track implementation, funding and performance. Reports are submitted to the leading group and shared with relevant departments and localities to identify problems and coordinate solutions in a timely manner.

Liu said the project also covers mine restoration, geological disaster control, river management, forest and grassland improvement, rodent control, farmland improvement, human settlement upgrading and soil erosion control, making multi-department cooperation essential.

Qinghai has issued rules on project management, fund management and completion acceptance, while also establishing systems for archives, project handover and long-term maintenance. A provincial expert pool provides technical support throughout project planning, review, acceptance and assessment.

According to the Ministry of Natural Resources, the Huangshui project ranks among the top national ecological restoration projects in terms of fund execution and completed restoration area.

The project has also generated social benefits. Construction units have been encouraged to employ local farmers and herders, helping increase incomes. Restoration work along the urban section of the Nanchuan River in Xining and the Baishui River in Huangyuan county has improved public activity spaces and living environments, giving residents a stronger sense of gain and well-being.



Liu said completed projects will be handed over to local governments and relevant sectoral departments for maintenance, with long-term management linked to existing mechanisms such as ecological rangers, river and lake chiefs, and forest and grassland chiefs.

"The Huangshui project is a comprehensive and systematic governance project, not a restoration of a single ecological element," Liu said. "It has helped Qinghai gain practical experience in cross-department, cross-regional and multi-element ecological conservation and systematic governance."

Bathing Beijing in watercolor

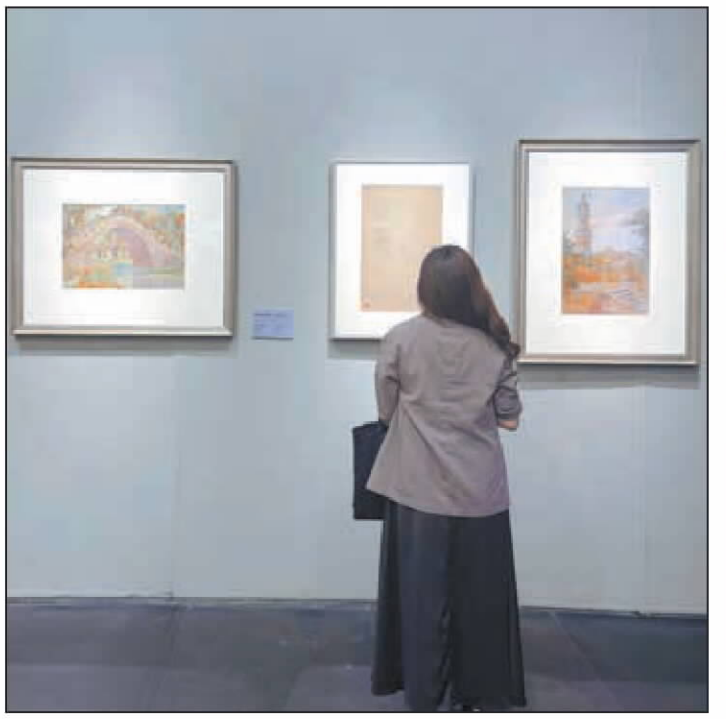
Late artist studied abroad but returned to the capital city to bring dignity and preservation to its ancient architecture through vivid hues, **Lin Qi** reports.

Standing at 38 meters tall, Qinian Dian, or the Hall of Prayer for Good Harvests, the central building at the Temple of Heaven complex in Beijing, commands imperial solemnity. The hall was once used as a place where monarchs of the Ming (1368-1644) and Qing (1644-1911) dynasties held ceremonies to pray for good weather and bountiful harvests.

Today, this majestic three-tiered circular structure, once exclusive to the ruling class, is one of the capital city's most favored tourist spots. People share various photographic perspectives on social media, capturing its gilded golden top, deep-blue glazed tiles and red pillars that define Beijing's awe-inspiring historic aura.

Eight decades ago, watercolorist Guan Guangzhi (1896-1958) was one of those who frequently visited the Temple of Heaven. He preserved the magnificence of the Hall of Prayer for Good Harvests through vivid colors and restrained brushwork. One of his extant works from the 1940s depicts a serene summer scene in which the building is shrouded by verdant, scattered cypresses on both sides and an expansive grassy field at the front. The thickness of the pigments accentuates the solemn mood of the site, while the shifting chiaroscuro — the contrast of the shadows of tree leaves against the light on the dappled wall — renders to the composition a graceful, composed sensibility.

Guan would have been a high-quality content creator with many followers in the social-network age, but in real life, he was a devoted teacher at art schools and an avid painter and printmaker of the imperial architecture and gardens of centuries-old Beijing where he lived from the mid-1920s until his death.



The Splendid Realm of Diligence: Art of Guan Guangzhi, an ongoing exhibition at the Art Museum of the Beijing Fine Art Academy, invites viewers into his watercolor world. Visitors will be immersed in the understated beauty composed of the imperial palaces' eaves emerging in daylight, while trees, flowers and lake ripples radiate vitality. Over 70 watercolors and copperplate prints, including his most iconic Hall of Prayer for Good Harvests works, are on show until Sept 6.

Born in Jilin province, Guan developed an initial interest in classical architecture while studying at an art school in Shenyang, Liaoning province. He often accompanied his watercolor teacher, a British woman, to sketch at the Zhao Mausoleum, commonly known as Beiling, the burial tomb of Emperor Taizong of the Qing Dynasty and his empress. After relocating to Beijing, he began creating watercolors of its ancient architecture as a vivid testament to the city's imperial past.

At age 36, he made a life-changing decision to study abroad. He enrolled at the Royal College of Art in London. He was, under the name Kuan Kuang Chin, one of the first Chinese students to attend this institution.

Fu Yiwei, the exhibition's curator, says Guan particularly admired the way William Turner (1775-1851), the noted English landscape artist known as "the painter of light", presented light and color. "Guan's works on show, *Morning in Edinburgh* and *Belfast Beach*, bear a considerable Impressionist influence. The light and translucent texture show the distinctive qualities of British watercolor."

While in Britain, Guan also studied etching techniques and traditions traced to 17th-century Dutch painter and printmaker Rembrandt van Rijn. When he left London, he carried with him a machine and tools for copper engraving. At home, he produced dozens of prints exhibiting the ever-changing atmosphere of ancient buildings.

Top: Guan at his solo exhibition in the 1930s. **Above:** Guan and wife Wang Rulan in the 1940s. PHOTOS PROVIDED TO CHINA DAILY

Guan returned to Beijing in 1934. His wife, Wang Rulan, once recalled that during his trips to Britain and back, Guan visited art galleries and museums in Paris, France; Brussels, Belgium; Naples, Italy; Alexandria, Egypt; and Mumbai, India. "It broadened his horizons and made him realize that the art of every nation, with its own distinctive features, has added splendor to world culture. At the same time, he deeply appreciated that in art, one should not only possess national and individual characteristics, but also must study extensively to integrate diverse influences, to progress and achieve innovations," she said.

Back in Beijing, Guan taught at various schools. Meanwhile, he also deviated from his earlier depiction of British scenery and developed his own watercolor style in depicting Beijing's historic structures.

His subjects include the Jade Belt Bridge at the Summer Palace and the Nine-Dragon Wall in Beihai Park. He placed his subjects in a harmonious, beautiful environment. When depicting the Corner Towers of the Forbidden City, he would add cleaners working on a boat in the moat on the outer perimeter; in another painting of Beijing Zhongshan Park, where an imperial altar sits, he focused on the blooming wisteria outside the long corridor.

Fu says his strokes render these ancient buildings dignity and a refreshing resplendence that touches people across generations.

Dai Shihe, a retired professor of painting at the Central Academy of Fine Arts, says, "Although Guan's landscapes are smaller in size, he delivered the poise and ease inherent in Chinese culture."

Celestial instruments help launch visitors on a cosmic quest

HEFEI — China's museums are often defined by their porcelain, calligraphy and ritual vessels. But a new exhibition in Anhui province is turning the spotlight away from traditional treasures and toward scientific endeavors of the past, showcasing jade cosmological diagrams, celestial star charts and bronze globes crafted by astronomers centuries ago.

The exhibition, *Heavenly Questions: The Cosmological Vision of Chinese Civilization*, at the Anhui Museum brings together nearly 300 artifacts from 48 institutions nationwide. It is a rare exhibition in China that focuses specifically on presenting the country's "understanding of the universe" through cultural relics.

Since launching in July, the show has drawn some 350,000 visitors, who are fascinated by the instruments ancient Chinese used to observe, measure, and pay homage to the universe.

One of the star attractions is a jade slab roughly the size of a smartphone dating back 5,800 to 5,300 years. The eight arrows at the center of the slab map out the eight directions of space, and the arrows at the four corners appear to align with the positions of the sunrise and sunset during the winter and summer solstices. The Chinese cosmological diagram is possibly older than Stonehenge in Wiltshire, England.

Other highlights include China's oldest equatorial instrument, a disk with 28-star mansions from a 165 BC marquis' tomb, a bronze water clock from the Western Han Dynasty (206 BC-AD 24), the earliest-dated water clock ever found, and a rubbing of a stone-carved astronomical chart from the Southern Song Dynasty (1127-1279) engraved with over 1,400 stars, which remains the oldest all-sky map based on actual observation.

"These 'hardcore creations' in ancient astronomy laid the technological foundation for studying the laws of celestial motion," says Meng Qian, director of the museum's research department.

A guide introduces a wooden gadget at an exhibition in the Anhui Museum in Hefei on July 1. ZHOU MU / XINHUA

The exhibition saves its best for last. In the final section, ancient instruments such as globes and sundials sit face-to-face with models of modern Chinese spacecraft, including the lunar rover Yutu (or Jade Rabbit), and the lunar soil sample collected by the Chang'e-6 mission in 2024.

Interestingly, many of China's major space missions are named after ancient myths. Its moon mission is called "Chang'e", the goddess who is said to live there; the Mars rover "Zhurong" is named after a fire god; and the sky-surveying telescope "Mozi" is the name of a philosopher who was credited with conducting the earliest optical experiments.

The exhibition itself takes its title from ancient poet Qu Yuan's (339-278 BC) epic poem *Tianwen*, or Heavenly Questions, written more than 2,000 years ago. China's Mars exploration mission also shares the same name.

"This exhibition allows ancient astronomy and modern space exploration to illuminate and interpret each other," says Shi Yunli, a professor at the University of Science and Technology of China and adviser to the exhibition.

"When visitors stand between the folded bronze sundial and the Yutu rover, they see not just two objects on display but a 5,000-year chain of quest," Shi adds.

The exhibition runs through mid-October. "We hope this exhibition allows visitors to look back at the early lights of our culture, and also see the way forward," Meng says.

LIFE

Moving heritage from museums to malls

Commercial areas seek to give shoppers more emotional value by providing exhibitions, history-inspired characters and learning activities, **Li Yingxue** reports.

On a weekend evening in August, Chen Ling took her young daughter to Huaxi Live Wukesong in Beijing for dinner. In the square, a mythical beast inspired by the ornaments that adorn Beijing's Central Axis architecture exchanged a fist bump with a round "corn friend".

Nearby, a traditional Chinese dance performance and quiz were underway. The host introduced *Maize. Gold. Jaguar: A Grand Exhibition of Ancient Maya and Andean Civilizations* at the Capital Museum. Chen's daughter answered the quiz question accurately and won a commemorative coin.

The following weekend, they returned to the shopping center, viewed an exhibition of late Qing Dynasty (1644-1911) embroidery, and bought tickets to that "corn" exhibition.

"We saw the sculptures and displays while having dinner at the shopping center. There happened to be an event that day, and that's how we learned about the exhibition," Chen says.

This is the experience Beijing's "One Exhibition Across the City" initiative seeks to create: Rather than waiting inside museums, exhibitions enter people's daily lives.

Launched in July by Beijing Radio and Television Station, in partnership with the Capital Museum and the Beijing Cultural Heritage Exchange Center, the initiative has extended exhibition elements into nine areas, including Tongzhou MixC, Solana shopping mall and Huaxi Live Wukesong.

Installations, relic displays, pop-up stores, and activities enter commercial settings, turning shopping centers into cultural gateways.

Nine auspicious mythical beasts inspired by Beijing's Central Axis architecture "walk out" of historic buildings and into shopping centers, where they meet corn figures representing the ancient civilizations of the Americas. Some make heart gestures while others offer high-fives or fist bumps. Once solemn architectural ornaments, they have become approachable cultural figures for younger audiences.

"These figures were not put together simply because they look cute. There is a cultural connection behind them," says Lyu Jing, the project's publicity director. "Maize was the foundation of the Maya civilization, while the mythical beasts are classic symbols of Beijing's Central Axis and traditional Chinese ritual culture. It is a dialogue between two ancient agricultural civilizations across time and space."

"Our principle was clear: Keep the roots, but give the form a more contemporary look," Lyu says. "We wanted to attract young people without casually deconstructing traditional culture. We also want to ensure that Chinese and foreign cultural symbols come together naturally."

For Lyu, the initiative is not simply about moving an exhibition into shopping malls.

"To me, a museum without boundaries means breaking down walls, lowering barriers, and becoming part of everyday life," she says. "A museum is no longer just a building, but a public cultural space that can encompass the entire city."

> To me, a museum without boundaries means breaking down walls, lowering barriers, and becoming part of everyday life. ... a public cultural space that can encompass the entire city."
>
> **Lyu Jing,** publicity director of "One Exhibition Across the City"

Commercial areas have also introduced artifacts provided by the Beijing Cultural Heritage Exchange Center. The free-of-charge displays allow visitors to encounter cultural objects while shopping.

Bringing cultural relics into busy commercial areas creates preservation challenges. At Huaxi Live Wukesong, installations occupy the outdoor areas, while the relic exhibition is housed in the enclosed Ice Center, which is equipped with 24-hour surveillance and climate control.

"This is a breakthrough for us. In the past, we never really considered bringing cultural relics into a street-level commercial area," says Chang Tingting, general manager of Huaxi Live Wukesong's digital media center.

"From the beginning, we discussed how to reconcile what might seem like a contradiction between protection and openness, and make the two work together in a commercial setting."

Visitors inquire about the exhibition and how to buy tickets, and others arrive after reading about it on social media.

"We often hear consumers asking what the exhibition is, where they can see it, and how they can buy tickets," Chang says. "That shows how the two sides can reinforce and empower each other."

In her view, shopping and dining alone can no longer provide a steady stream of new experiences.

"Many people today are willing to spend money for emotional value," she says. "A shopping mall that only sells things will eventually be challenged by e-commerce, but a space that provides cultural experiences and opportunities for social interaction cannot be replicated online."

Heritage in shopping centers can also lower the psychological barrier to museums. "We hope people can encounter thousands of years of civilization while simply shopping or having dinner — an informal and immersive encounter with culture," Chang says.

Similar efforts are underway at Solana, Fengke Wanda Plaza and Tongzhou Wanda Plaza, where content has been tailored to each venue's audience.

"We matched the content to the customer profiles of the three shopping centers. Fengke Wanda focuses on a cultural relic-themed exhibition; Solana emphasizes interactive installations; and Tongzhou Wanda features a cultural and creative pop-up," says Li Meiling, marketing head of the Beijing division of Zhuhai Wanda Commercial Management Group.

The malls also coordinate exhibition layouts, security arrangements and visitor routes to protect the artifacts and maintain an orderly viewing experience.

Li says she has seen children stop to examine the displays and ask questions, while families have taken part in activities linked to the exhibition.

"Malls are no longer purely places for shopping. They are transforming from places for transactions into places for life and learning," Li says.

"I believe commercial spaces will take on more public cultural functions," she adds. "We hope to work more closely with museums and art institutions to present cultural, substantive and interactive experiences to the public."

Maize provides another link between ancient and contemporary worlds. In Maya mythology, humans were believed to have been created from maize. Modern Beijing is home to the world's largest maize DNA fingerprint database and a national-level germplasm resource bank that preserves more than 4 million maize germplasm samples. Beijing-developed commercial seeds cover about one-sixth of China's maize-growing area.

Some shopping centers display live maize plants, leading visitors from ancient beliefs about the crop to contemporary agricultural science.

The initiative also seeks to ensure that engagement goes beyond photos. Bead-art competitions, a "maize blessing wall", dance performances, and quizzes are built around cultural knowledge.

"Every installation has a civilizational narrative behind it, and every activity incorporates educational content," Lyu says. "Taking a photo is not the end. It can be the starting point for people to learn, and share what they have discovered."

For her, museums and commercial spaces benefit each other. "Museums bring cultural quality, visitors and deeper meaning to shopping centers, while shopping centers bring museums new audiences, new settings and new ways to reach people," Lyu says.

She hopes the initiative will become a Beijing cultural brand that integrates museums, heritage and urban life.

When history appears in shopping streets and along the routes people take home, museum boundaries begin to change. Culture becomes part of the city's everyday rhythm — and sometimes an unexpected encounter.

Tianqiao revives tradition by building a global stage for performing arts

Stretching along the southern section of Beijing's Central Axis, a 2.07-square-kilometer cultural cluster comes alive with young playwrights drafting scripts in *hutong* (alleyway) studios, acrobatic troupes staging performances of intangible cultural heritage, and a major arts center hosting its annual musical theater festival.

This is the Tianqiao performing arts area, where traditional culture meets modern creativity and theaters, playhouses and creative incubators converge.

"Two decades ago, Tianqiao was marked by dilapidated buildings and scattered street stalls," says Yin Yixin, chairman of the Tianqiao Zenith Group. "Yet during the late Qing Dynasty (1644-1911) and the years before the founding of the People's Republic of China in 1949, this area was a bustling area where thousands of folk artists came to perform drama, traditional music and acrobatics."

To revive that legacy, an extensive renewal project was launched. The Tianqiao Performing Arts Center opened in 2015, presenting year-round programs of dramas, musicals, concerts, and ballets. In the years that followed, more theaters, creative incubators and *hutong*-based studios emerged across the area.

Left: The ballet *The Peony Pavilion* is staged in Tianqiao on July 21. **Right:** The cast of *Swan Lake* rehearses at the Tianqiao Theatre on May 29. PHOTOS BY JIN LIANGKUAI / XINHUA

That transformation has laid the foundation for Tianqiao's revival as a thriving hub for the performing arts.

"Come to Tianqiao for musicals" is more than a slogan — it has become part of daily life here. Today, Tianqiao hosts international musicals such as *The Phantom of the Opera* and *Notre-Dame de Paris*, alongside original Chinese productions including *The Orphan of Zhao* and *Twelve Hours of Chang'an*, earning acclaim from audiences at home and abroad.

"It's amazing! The stage sets are unique, and the cast delivers powerful performances," says Ma Yihan, a young Chinese theater lover who has attended multiple shows at Tianqiao, including *Elisabeth* and *Mozart L'Opera Rock*.

John Owen-Jones, a leading star of *The Phantom of the Opera*, says China's growing audience for Western musicals could help spur a new wave of homegrown productions, with an increasing number of polished original Chinese musicals already emerging.

Acrobatic troupes also regularly perform at Wansheng Theater in Tianqiao, while immersive productions centered on China's intangible cultural heritage attract big crowds. Venues such as the Tianqiao Impression Museum use augmented reality and motion-sensing technologies to revive fading folk arts. In contrast, its archive of 20,000 volumes of folk literature is free and open to the public.

Yang Shucong, general manager of the Tianqiao Performing Arts Center, says the venue will stage a lineup of iconic international musicals this year. The English-language program includes *Chicago* and *Kinky Boots*, while French offerings include *Don Juan* and *Cyrano de Bergerac*.

Chinese-language adaptations are also gaining popularity. Standout productions include *The Devotion of Suspect X*, *Murder Ballad* and *The Count of Monte Cristo*.

These productions mark a pivotal step in the center's evolution, from a venue operator into a content co-creator, Yang says.

"Going forward, we'll continue to carry forward China's cultural heritage, foster new forms of cultural activities, and build the Tianqiao Performing Arts Area into a global stage where cultural exchange and performing arts thrive," Yin says.

CULTURE

Left and right: Chinese band Xian Ke, featuring singer-songwriters Wang Pushi (left) and Wen Haoyuan (right), released their debut album *All Things End, Yet Nothing Ends*. **Above:** The band, featuring Wen (left) and Wang (right), is known for its combination of traditional Chinese opera with rock music. **Below:** Cover of the album. PHOTOS PROVIDED TO CHINA DAILY

Stone Age instrument meets modern rock

For the band Xian Ke, the process of creation is never-ending, as they explore new musical territories, **Chen Nan** reports.

Everything ends. A song fades. A stage goes dark. The performers leave, the audience disperses, and eventually the room falls silent.

But for the Chinese band Xian Ke, silence is not the end.

The band's name comes from a line in *The Book of Songs*, a collection of hundreds of poems dating from the 11th to 6th centuries BC.

The line goes: *Mibu youchu, xianke youzhong* (Everything has a beginning, but few can see it through to the end).

The band's debut album, *All Things End, Yet Nothing Ends*, takes that ancient meditation on beginnings and endings and turns it into eight songs that build a world from rock, traditional Chinese opera, ancient instruments, and the restless desire to keep creating.

For Xian Ke, the two phrases are not simply literary references. They have become a way of thinking about what it means to make music, according to Wen Haoyuan, one half of the duo.

"Everything has an end," says Wen, who is also a scriptwriter. "But things themselves have no end. We are doing something that is limited for us, but we hope it can have an unlimited influence."

That tension — between endings and continuation, limits and possibilities — runs through the album.

All Things End, Yet Nothing Ends took more than three years to complete, beginning in 2021.

There were songs written, arranged, and recorded that ultimately did not make the cut. One track had reached around 80 percent of its arrangement and was already in production and recording before the band decided that something was still wrong.

"We spent many days and nights struggling with it," Wen recalls. "Just thinking about that song would make us feel bad."

Eventually, they abandoned it and wrote another song instead.

That process of choosing what to keep — and, perhaps more importantly, what to let go — became one of the most difficult and formative parts of making the record. By the time the album was complete, however, the uncertainty had given way to conviction.

"Everything that was released was something we were certain about," Wen says. "We are very satisfied with it."

For a band that began with a name about the difficulty of reaching an ending, finishing the album was therefore significant. But it was never intended as a conclusion.

"It's just a very small part of my creative career," Wen says. "We'll keep writing."

When Xian Ke announced the album, the pair described standing for a long time in front of the "wall of sound" they had built, moved to tears by what they heard.

The image captures something essential about the record. Xian Ke wanted to create not simply a collection of songs, but an expansive sonic space — "a whole expanse", as Wen describes it, made from different frequencies and layers of sound.

They wanted the listener to stand in front of it and feel its scale.

That ambition is partly why *All Things End, Yet Nothing Ends* feels larger than the familiar description of "traditional Chinese opera meets rock", often attached to Xian Ke, which formed in 2019.

Both members trained at the National Academy of Chinese Theatre Arts, and their relationship with traditional theater runs deep. Wen studied theater; Wang Pushi is a Kunqu Opera performer and works with the Northern Kunqu Opera Theatre.

But Xian Ke is increasingly wary of being defined by the label "traditional Chinese opera meets rock music".

The label exists, Wang acknowledges. People use it. But for the band, traditional theater is not an aesthetic costume that they put on when they make music. It is part of the way they think.

"We write what we know," Wen says.

There was no elaborate calculation about how much traditional Chinese opera to combine with contemporary rock. Their musical languages have developed together naturally.

For Wang, the difference between performing traditional Chinese opera and performing with Xian Ke is particularly revealing. On the traditional stage, he is playing a character. His job is to express that character's emotions rather than his own.

"With the band, it is 100 percent my expression," he says.

He describes himself as a theater director within Xian Ke, while Wen is the writer. Together, they bring a theatrical way of thinking to their music: songs become scenes, sounds become characters, and the album becomes a world.

That approach is particularly evident in the song *Annica* (inspired by anicca, a Buddhist concept meaning impermanence), which incorporates the *suona* (a double-reed woodwind instrument) and the percussion rhythms of Kunqu Opera.

The striking thing is that the *suona* is not presented as a distinctly "Chinese" sound.

Instead, Xian Ke deliberately buried it within the arrangement, treating it like any other instrument.

"Traditional Chinese instruments are often placed prominently in contemporary music precisely because their sound immediately signals Chinese identity. We wanted to resist that impulse," Wang says.

For him, the goal is not to turn traditional culture into spectacle.

He points to the experience of watching traditional Chinese opera for the first time: Whether the viewer is a foreigner or a Chinese person encountering it for the first time, its unfamiliarity can make it seem like a spectacle, something exotic to be observed.

But that, he argues, misses the point.

Traditional Chinese opera and traditional Chinese music are not curiosities. They are not there to produce an exotic effect. They are beautiful.

The same principle guides Xian Ke's use of traditional instruments. The better the fusion, Wang believes, the less obvious the fusion becomes. "If an instrument is pushed to the front simply because it sounds unusual, it risks becoming a gimmick," he says.

Elsewhere on the album, they went in the opposite direction: Rather than hiding the identity of a traditional instrument, they explored what its history could bring to the music.

The song *Fallen Stars* features the sound of a Jiahu bone flute, an ancient instrument preserved by the Henan Museum and among the earliest known instruments associated with a seven-note scale.

The flute is a key exhibit at the Henan Museum and dates back about 8,700 years.

Musicians from the Huaxia Ancient Music Orchestra, the resident ensemble of Henan Museum founded in 2000, joined the band's exploration by playing replicas of ancient Chinese musical instruments displayed in the museum.

For Xian Ke, choosing the bone flute was partly an experiment. If they were going to introduce traditional Chinese instruments into their music for the first time, why not begin with one of the oldest?

They tried a number of instruments before settling on the bone flute. But its historical importance was only part of the appeal.

When the flute was played, Wen heard something much less concrete: falling stars.

The image captures the band's approach to the album as a whole. Rather than giving each song a narrowly defined subject, they wanted the eight tracks to contain as much as possible — to suggest an entire world rather than describe one small thing.

The result is intentionally ambiguous. Images, emotions and sounds overlap.

The most interesting question facing Xian Ke now is what happens when they move beyond the very combination that first defined them.

They have already begun asking themselves: What does Xian Ke sound like when there is no Chinese opera?

The question is not a rejection of their theatrical roots. Quite the opposite. It comes from the confidence that those roots are already embedded in them.

"Opera plus rock" was simply the path they took when they first came together.

Now they want to explore what else might happen — traditional Chinese opera with something else, or something without traditional Chinese opera.

"We do not yet know," says Wen. "A record has an ending. A song has an ending. A period of creation has an ending. But the impulse to create continues."

Huangmei Opera shines in Edinburgh with tale of courage and identity

EDINBURGH — Minutes before going on stage in Edinburgh, Han Zaifen sat before a dressing-room mirror, humming softly to herself as the final touches were put on her makeup.

Beneath a black embroidered scholar's cap was the face of Feng Suzhen, a young woman whom Han has portrayed for more than four decades.

Soon afterward, Han, a winner of the Plum Blossom Award, the highest award for Chinese theatrical art, stepped onto the stage at Queen's Hall in a bright red robe, bringing one of China's best-known traditional opera heroines to an Edinburgh audience.

On the evening of Aug 12, the Anhui Zaifen Huangmei Xiqu Art Theatre, led by its director Han, performed *The Lady Prince Consort* at the Edinburgh Festival Fringe, marking the first appearance of Huangmei *xiqu*, or Huangmei Opera, at the event.

"If Huangmei *xiqu* were an Eastern woman, she would be lively and quick-witted, pure and down-to-earth," Han said before the performance. Unlike the stately elegance often associated with Kunqu Opera, she said, Huangmei *xiqu* has a particular warmth and innocence, as well as a mixture of softness and strength.

"Its melodies come from people's lives and their sense of happiness," she says.

Huangmei *xiqu* is a major form of traditional Chinese opera, known for its tuneful singing and lively storytelling. Now, Anqing, a city in East China's Anhui province, serves as an important center for its performance and development.

The Lady Prince Consort tells the story of Feng Suzhen, who disguises herself as a man and enters the imperial examination to save the man she loves. She unexpectedly finishes first and is chosen by the emperor as husband for his daughter, setting off a series of twists before her true identity is revealed.

The work was adapted from the traditional play *Double Rescue* and was first staged in 1958. A film version followed in 1959, helping to turn the story into one of the most familiar works in Huangmei *xiqu*.

Feng's disguise mirrors other well-known women in Chinese storytelling, including Hua Mulan, the legendary female warrior who disguises herself as a man, and Zhu Yingtai of *The Butterfly Lovers*.

Actress Han Zaifen (right) and other actors perform Chinese Huangmei Opera during a performance at the Queen's Hall in Edinburgh, on Aug 12. ZHAO JIASONG / XINHUA

But Han sees something distinctive in Feng.

"She does not spend her time anxiously searching for an identity," Han says. "Through what she does, she keeps redefining who she is. She takes charge of her own fate."

Saving her husband is the direct reason for Feng's adventure, but the journey also reveals her confidence in her ability and worth, Han says.

Han adds that young women today no longer need to disguise themselves as men to pursue their ambitions, but the courage behind Feng's choice remains relevant.

"Whether you are a young woman or a young man, you need the courage not to retreat when you face difficulty and to fight for the life you want," she says.

That message resonated with Monika Owczarek, a Polish resident of Edinburgh, who says she often watches Chinese opera during the Fringe.

She says she enjoys the melodies of Huangmei *xiqu*, while Feng's story reminds her of Mulan. "Both women disguise themselves as men and emerge as strong female protagonists who refuse to accept the limits placed on them," she says.

American audience member Joe Goldblatt described it as the best Chinese opera performance he had seen, adding that he hopes "more productions like it could help bring people from different countries closer together".

Han says the theater made no deliberate attempt to speed up the performance or simplify its style for a Western audience.

The troupe has previously taken Huangmei *xiqu* to countries including France, the United States, Canada, and Russia.

"Good cultural exchange does not mean changing yourself just so you can be understood," Han says.

"For any art form, there is something that cannot be translated because it comes from the culture itself," she says. "It is a people's temperament, even a people's way of breathing."

Han's Edinburgh visit also brought recognition away from the stage. Earlier this week, she received the 2026 Asian Art Ambassador honor at the Asian Art Awards, organized by Asian Art Fund Scotland, a Scottish charity supporting Asian arts.

"Seeing overseas audiences laugh along with the story was deeply moving," says Wu Meilian, a Plum Blossom Award-winning actress who also played Feng Suzhen in the first half of the show.

"We did not share a language, but the humor and emotions still connected us. It made me feel that Huangmei *xiqu* can touch audiences anywhere."

No 1 Sabalenka slams Wang to advance in Cincy

The victory takes Belarusian's win streak at the WTA1000 level to 45

CINCINNATI, Ohio — Aryna Sabalenka unleashed her big game with devastating effect on Tuesday, hammering China's Wang Xinyu 6-1, 6-3 to reach the fourth round of the Cincinnati Open.

The world No 1 took only 20 minutes to blow through the first set against her 36th-ranked opponent, and began the second set with a break of serve.

Sabalenka kept up the pressure in the second set, with Wang double-faulting on the top seed's first match point after 54 minutes.

The victory marked the 45th in a row for Sabalenka at the WTA1000 level.

"I cannot complain. She's a tough opponent," Sabalenka said. "To win in straight sets like this in under an hour is insane.

"I'm super happy to be through. I really trusted myself and went for my shots. I wasn't overthinking. I was able to stay focused and be in every point."

Sabalenka next plays Czech Sara Bejlek, a 4-6, 6-1, 6-2 winner over Russia's Ekaterina Alexandrova.

Fourth seed Coco Gauff needed to battle following a sizzling first set in a 6-1, 7-6 (3) victory over fellow American Ann Li.

The 2023 champion had it all her own way in the opening set against her 29th-ranked foe, winning in 30 minutes. The pair exchanged early breaks in the second on the way to a tie-breaker, in which Gauff seized a 4-1 lead and won on her third match point.

"She played better in the second set and I missed a couple of break opportunities," Gauff said. "I tried to forget about those.

"It was hard to control the ball for both of us, and it was my first time playing a day match on this center court, so I had to adjust to that."

Mirra Andreeva's status as reigning French Open champion counted for little, as the fifth seed struggled to close out a 6-1, 7-6 (5) victory over Janice Tjen.

The Indonesian challenger, ranked 37th, was bowled over in the first set, but made Andreeva work to finally advance.

"In the first, I was in command and she had unforced errors here and there, but in the second, after a couple of games, I started getting nervous. She made fewer mistakes — it turned into a match of mentality and physicality," Andreeva said.

Eighth seed Elina Svitolina was forced to withdraw before her match against China's Wang Xiyu with an ankle injury.

"I've been advised by the doctors to take a little bit of time to rest and recover completely," the Ukrainian said in a statement.

Wang, 25, will now face 20th-seeded American Madison Keys for a quarterfinal berth.

> "I cannot complain. She's a tough opponent. To win in straight sets like this in under an hour is insane. I'm super happy to be through. I really trusted myself and went for my shots."
>
> **Aryna Sabalenka,** on her win over Wang Xinyu

In the men's play, Canada's second-seeded Felix Auger-Aliassime eliminated Argentina's Juan Manuel Cerundolo 7-5, 6-1 in 90 minutes.

"It was a tricky start, finding my rhythm," the Canadian said. "Lefties are tricky, you don't play them so often. You can prepare all you want, but until you step onto the court, you can't find your right adjustments. Then you feel comfortable."

Washington winner and fifth seed Taylor Fritz fired eight aces in his defeat of Spain's Daniel Merida 6-3, 6-4 in 83 minutes. The Spaniard made 25 unforced errors as Fritz booked a fourth-round match-up with Australian Chris O'Connell, who is 0-3 against the American.

'I played amazing'

Last week's Montreal finalist Brandon Nakashima came from the brink to upset fourth seed Daniil Medvedev 6-7 (3), 7-6 (4), 6-1.

Nakashima led 5-2 in the first set before falling in the tie-breaker, then saved three match points in the 10th game of the second set on the way to forcing a third, which he dominated.

It was Nakashima's first win in four meetings with Medvedev, who beat the American in the Brisbane final earlier this year and had won 6-1 in sets against him entering the match.

Nakashima arrived in Cincinnati in strong form after reaching the semifinals in Washington and his first Masters 1000 final in Montreal, and improved to 10-2 on the summer's hard-court swing with Tuesday's victory.

The world No 22 will next face Nuno Borges after the Portuguese claimed a 6-3, 6-4 upset of Russian 13th seed and 2021 runner-up Andrey Rublev in 72 minutes.

The 47th-ranked Borges ended a five-match losing streak in the rivalry, while Rublev will drop out of the top 20 for the first time since January 2020.

"I played amazing," Borges said. "It means a lot to be in the fourth round. It's a big moment for me."

Italian 10th seed Lorenzo Musetti defeated American Michael Zheng 6-1, 6-3 in 71 minutes.

Venus Williams gets a US Open singles wild card at 46

NEW YORK — Venus Williams was given a US Open singles wild card on Tuesday and the tournament is keeping one on hold — perhaps in case her sister Serena wants to join her.

Sloane Stephens, the 2017 US Open champion, was one of six other women to receive a wild card, and the US Tennis Association said the final one is still to be announced.

That almost certainly would go to Serena Williams, if she decides she wants to return to the tournament at 44.

Last year, Venus Williams received a wild card to the Grand Slam event she won twice, returning for the first time since 2023. The 46-year-old has become the oldest entrant in singles at the tournament since Renee Richards played at 47 in 1981, according to the International Tennis Federation.

Venus has continued to play some singles matches, and this week joined Serena for their first doubles tournament together since the 2022 US Open. They lost Monday at the Cincinnati Open in a match tie-breaker against Marta Kostyuk and Peyton Stearns.

The sisters planned to play at Wimbledon, but had to withdraw after Serena injured her knee in her singles match. That marked her first time playing singles since the 2022 US Open, and she indicated afterward that she hoped to keep competing if healthy.

Headlining the wild-card recipients on the men's side were 39-year-old Gael Monfils, a past US Open semifinalist who is set to play his final Grand Slam tournament before retiring, and Australian Alexei Popyrin, who upset Novak Djokovic in 2024 on the way to the fourth round.

One spot is also being held among the eight men's wild cards. Stan Wawrinka, the 2016 champion at Flushing Meadows who, at 41, is playing his final season, could be a candidate for that.

Also receiving women's wild cards were Carol Young Suh Lee, Reese Brantmeier, Thea Frodin, Leolia Jeanjean and Taylah Preston.

The other men receiving wild cards were two-time reigning NCAA singles champion Michael Zheng, Martin Damm, J.J. Wolf, Sebastian Gorzny and Jack Kennedy.

Kei Nishikori, the 2014 US Open runner-up, who also is retiring, was given a wild card into the men's qualifying tournament, along with Jordan Lee, Trevor Svajda, Andre Ilagan, Spencer Johnson, Michael Antonius, Andrew Johnson and Daniel Milavsky.

Women given spots in the qualifying tournament were Caroline Dolehide, Janae Preston, Katrina Scott, Ayana Akli, Annika Penickova, Julieta Pareja, Kristina Penickova and Savannah Broadus.

The main draw begins Aug 30, with the qualifying tournaments being played earlier that week.

Doubles loss

The Williams sisters both said they had a good time on their return to doubles action for the first time since 2022, despite suffering an opening-round defeat in Cincinnati.

The duo lost 2-6, 6-1, 10-8 to Ukraine's Kostyuk and American Stearns, coming back from 6-0 down in the tiebreaker before a double fault by Venus sealed their fate.

"I thought it was fun, I thought it was special, I thought it was good," Serena, 44, told reporters.

"We kicked off a little rust in the middle of the match. We were starting to feel it, and it was really fun. It was really cool to be able to do this again."

The Williams sisters have won 14 major doubles titles, including six at Wimbledon and three Olympic gold medals.

They last played doubles together at the 2022 US Open, where they lost to Czechs Lucie Hradecka and Linda Noskova.

The sisters were also due to compete in the doubles draw at Wimbledon, but were forced to pull out after Serena sustained a knee injury during her opening-round singles defeat to Australian Maya Joint. They were awarded a wild card for Cincinnati earlier this month.

"I think we've waited a long time to get back on the doubles court, even this year. Eventually, we find our way to each other," Venus, 46, added.

Venus also competed in the singles draw in Cincinnati, where she was beaten 6-2, 6-2 by Colombian Emiliana Arango.

ARTISTIC SWIMMING

Further rule changes set to ripple through sport en route to LA28

BUDAPEST — Artistic swimming is set for further rule changes as the sport moves toward the Los Angeles 2028 Olympic Games, with adjustments to free routines and their length to be announced soon, World Aquatics Artistic Swimming Technical Committee chairwoman Lisa Schott told reporters.

"In the new rule changes coming out very, very shortly, you will see some changes in the free routines and their length," Schott said during the Aug 12-16 World Aquatics Junior Artistic Swimming Championships in Budapest.

"I'm just giving a little secret tip there," she added.

Schott described the Budapest event as "the largest junior worlds in the history of the sport," with nearly 300 athletes from 35 federations competing and a number of new federations taking part in the championships.

"The sport continues to grow in depth and talent," she said, adding that many talented junior athletes had emerged.

Schott also said that age should not be used to define an athlete's potential, with some junior swimmers already competing at a very high level.

"I don't like to put limits on any athlete, because junior or senior, they all have their different level of skill," she said.

Budapest will host the World Aquatics Championships again in 2027, with qualification spots for the Los Angeles Olympics at stake. Schott said that some athletes at this year's junior worlds could be old enough to move into their senior national teams next year.

"Competing at a world level is a journey," she said. "Each competition you learn something and continue to develop."

China's He Zhien and Zhou Kunyi perform a routine themed "Moderation" at the 2026 World Aquatics Junior Artistic Swimming Championships in Budapest. The pair won silver in the women's duet free on Saturday with a score of 295.0701 points. XINHUA

Schott said the scoring system has also made the competition more unpredictable.

"We don't know who's going to win," she said. "It gives hope for every athlete, every team that they do have the possibility."

The rules are still evolving, and Schott said coaches and athletes need to make realistic decisions about the level of difficulty they can successfully perform. She said she did not want to see athletes aiming too high, only to end up with repeated base marks, jokingly calling such a situation a "base mark party".

The growing presence of male athletes was another feature of the championships that impressed Schott.

"We have never had as many males in the sport as we have seen demonstrated here," she said. "The men, the boys, bring a different vibe to the sport, which is great."

Several teams included male athletes in team events in Budapest, with some fielding two men in their lineups.

"That's where we want to go," Schott said. "We love the male swimmers in the team. It brings good synergy to the team, a new dynamic, and it shows that the sport is inclusive of all genders."

She expects the trend to continue as male athletes improve.

"Stay tuned for more males in the sport," she said.

Looking beyond Budapest to the 2027 World Championships and the Los Angeles Games, Schott said artistic swimming remains in a period of evolution.

"I think we're in a great position. The sport will continue to evolve," she said. "We want to use more technology in our sport.

"We're super excited to go to the Olympics and show the world one more time what an amazing sport artistic swimming is," Schott said.

XI'S VISION | MAZU SOLUTION

Weather alert system taps tech, folklore

China offering world AI-powered MAZU as a meteorological safeguard solution

By **ZHANG YI** and **HU MEIDONG** in Putian, Fujian

"Mazu, protect our voyage on the deep," go the lyrics of a timeless Chinese folk song that is a plea to the sea goddess Mazu. "Safe journey out, safe return ashore."

Embedded in this song is the soulful bond between local fisherfolk and the sea goddess who, legend has it, was born on the shores of Meizhou Island in Putian, Fujian province.

Today, in the digital era, this ancient heritage has found a new, high-tech anchor.

On the island, which has 30 kilometers of coastline and is home to over 1,000 fishing boats, locals no longer rely on prayers to weather storms. Instead, they find safety at their fingertips through a smart app that instantly decodes real-time winds, wave heights and tidal patterns.

For Lin Haifang, a veteran mariner with a decade of island life under his belt, a simple app alert triggers his typhoon routine. He hauls up oyster shell strings, lashes down kelp rafts and steers his boat to shelter early. Even amid choppy seas and weak signals, the Beidou Navigation Satellite System beams alerts directly to his palm.

"It feels as if Mazu puts the sea conditions right in my hand," he said of his early preparations, which keep his annual losses down and his income steady.

Action plan proposed

With the increasing frequency of extreme weather, the United Nations launched the Early Warnings for All initiative in 2022 to close gaps and protect everyone on the planet. China became the first to answer the call, proposing an action plan in 2024 and launching an intelligent meteorological early warning solution in 2025 named MAZU — an acronym denoting Multi-hazard Alert, Zero-gap and Universal.

The system, deployed in seven countries, blends artificial intelligence forecasting models, data from Fengyun meteorological satellites, cloud computing and ground observations to deliver highly customized services.

President Xi Jinping announced on July 17 that China will bring the AI-powered meteorological warning system MAZU to 30 countries over the next five years to safeguard homes around the world.

He made the remarks while addressing the opening ceremony of the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai, calling for joint efforts to build a just and equitable global AI governance system.

"All countries should take a people-centered approach and develop AI for the positive and for good. We should ensure that AI is an important driver for shared prosperity and common security," he said.

Effective cooperation

UN Secretary-General Antonio Guterres, who attended the meeting, praised the initiative, saying that the MAZU system could be one of the most important instruments for making international cooperation effective in protecting people and property.

Zhang Xingying, director of the China Meteorological Administration's Department of International Cooperation, said the MAZU system is a perfect combination of fine traditional Chinese culture, AI and cutting-edge technology.

"Naming the system after the Chinese goddess of marine weather reflects a unique touch of Chinese romance and demonstrates our cultural confidence," he said.

In his view, Mazu's legendary helpers, the Thousand-Mile Eye and the All-Hearing Ear, are reflected in today's meteorological tools, with weather satellites and radar being the eye, and AI and physical models used to forecast climate disasters serving as the ear.

"The core essence of the MAZU system goes beyond exporting China's early-warning capabilities," he said. "More important, it is about working with global partners to co-build a public safety solution for the long run."

Rallying against militarism

People join a massive protest on Wednesday near the National Diet in Tokyo against a series of dangerous moves initiated by the Japanese government, including its increasing push for military expansion. About 15,000 people took part in the demonstration, which also earned huge support online. ANDREW CABALLERO-REYNOLDS / AFP

Washington urged to drop drone tariffs

By **ZHANG CHENXU** and **ZHONG NAN**

The United States' latest tariff push on drone imports, coupled with its accusation of "tariff evasion" by China, has heightened concerns that its increasingly unilateral and protectionist approach toward trade could further erode bilateral trust and disrupt global industrial and supply chains, said officials and experts.

Such tactics are likely to prove self-defeating, as punitive and discriminatory tariffs would raise US supply-chain costs without delivering the manufacturing revival it seeks, they said, adding that dialogue and mutually beneficial cooperation offer the only practical way forward.

Their comments came as China's Ministry of Commerce urged the US on Thursday to immediately withdraw its Section 232 tariffs on imported drones and related components.

On Aug 13, the US announced Section 232 tariffs of up to 100 percent on certain imported drones and components, citing national security concerns — a move that the Financial Times said targeted Chinese drone technology.

Voicing strong opposition to the US move, Commerce Ministry spokesman He Yadong said it is a "unilateral and protectionist" action taken on the pretext of national security. Chinese drones exported to the US are used mainly for civilian purposes, he said, adding that such discriminatory treatment is seriously harming the interests of Chinese companies.

Inside
Editorial & Comment **page 6**

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the move is likely to disrupt the stability and resilience of global supply chains, given the deep interdependence among economies worldwide.

The Center for Strategic and International Studies, a think tank based in Washington, DC, said in an analysis last year that about 90 percent of the world's high-strength permanent magnets used in drone motors are produced in China.

On Aug 13, the Office of Trade and Manufacturing Policy at the White House released a report accusing Chinese exporters of routing goods through third countries to "evade" US tariffs. It identified over 40 countries and jurisdictions as presenting elevated risks of illegal transshipment.

He, the spokesman, said the report "disregards facts and distorts the truth", branding normal international trade as a "scam" and fabricating "a so-called shadow transshipment network". He urged the US to stop making irresponsible accusations and damaging Sino-US economic and trade relations, and instead work toward safeguarding the stability of global industrial and supply chains.

Shi Xiaoli, a professor of international economic law at China University of Political Science and Law in Beijing, said that any US assessment of "tariff evasion" should have relied on verifiable transaction-level evidence, rather than broad estimates based on changes in trade patterns.

EU probe opposed

In another development on Thursday, the Commerce Ministry urged the European Union to swiftly correct its "wrongful practices" in a foreign subsidy investigation involving Chinese e-commerce giant JD.com, reiterating Beijing's firm opposition to Brussels' abuse of unilateral tools to suppress Chinese companies.

On May 28, the European Commission — the executive arm of the EU — opened an in-depth investigation into JD's proposed acquisition of German consumer electronics retailer Ceconomy.

China's Ministry of Justice, together with the Commerce Ministry and other departments, determined on Wednesday that certain cross-border measures taken by the EU against Chinese entities in the case constituted improper extraterritorial jurisdiction. The decision has barred any organization or individual from complying with or assisting in the implementation of those measures.

WORLD WATCH
By Joseph Sifakis

AI needs a symbiotic reset with humanity

As companies pour billions of dollars into artificial intelligence while cutting jobs, fears of human replacement are mounting. Oracle is reportedly preparing another round of layoffs ahead of Sept 1, according to Business Insider. But the 2026 Stanford AI Index shows that AI is reshaping the labor market without yet causing mass job displacement.

The promise of AI is extraordinary: new frontiers in science, solutions to global challenges and a future where human creativity flourishes. That is the dream.

But the reality we are witnessing could not be further from it.

The rapid deployment of AI today is not aligned with human well-being. It is driven by an ideology — one that treats human beings as obstacles to be overcome. Slogans like "move fast and break things" are rooted in a form of technological determinism that devalues human agency.

PHOTOGRAPHERS FLOCK TO XINJIANG FOR CELESTIAL LIGHT SHOW

With its lack of light pollution and vast emptiness, the Gobi Desert proves a perfect spot to watch Perseid meteor shower

By **XU LIN** in Hami, Xinjiang
xulin@chinadaily.com.cn

Long after sunset, sweltering 40 C heat still hung over the vast, remote Gobi Desert as hot winds swept across the wilderness. Suddenly and fleetingly, a blazing fireball streaked across the star-studded sky, leaving a long, glowing trail and drawing loud whoops of amazement from stargazers.

Astrophotographers stationed behind their tripods leaned forward to eagerly check their camera screens, hoping to have captured the fleeting moment. As the Perseid meteor shower peaked on Aug 12 and 13, stargazers flocked to the Pterosaur-Yardang Dahaidao Scenic Area in Hami, Northwest China's Xinjiang Uygur autonomous region, to witness the celestial event.

"Stargazers are absolutely drawn to this place, and for good reason. Beyond minimal light pollution, the air here is extremely dry with little dust, creating exceptional atmospheric transparency," said veteran astrophotographer Liu Bing from Beijing. "As a result, stars retain their sharpness in camera shots, and less starlight is scattered away, making it possible to capture stunning pictures."

Liu and other astrophotographers recently attended the annual Sweet Whispers to the Galaxy Festival in Hami and captured images of the Perseid meteor shower, an event that aims to reinforce the area's reputation as a premier destination for stargazing. Many of them are from China StarVision Alliance, a domestic platform for nearly 1,000 astrophotographers.

Official data showed that Dahaidao registered about 25,000 visitor arrivals and over 10,000 vehicles in early August. To cater to stargazers' needs, the site imposed strict night lighting restrictions and all stargazing spots featured 24-hour security patrols, emergency contacts and safety signs.

A meteor streaks across the night sky in Hami, Xinjiang Uygur autonomous region, on Aug 12. LIU BING / FOR CHINA DAILY

For astrophotographers, making advance preparations is always vital — from understanding lunar phases to scouting locations with minimal light pollution.

They check shooting sites in daylight and use apps to monitor weather and cloud cover, keeping close track of shifts in these conditions to the nearest hour. They also use apps to forecast how stars will move across the night sky and assess potential interference from the moon.

"When observing the Perseid meteor shower, we needed to locate the constellation Perseus and learn about the radiant point in advance — the spot in the sky from which all meteors seem to originate. As the radiant rises, it shapes the paths of meteor trails across the sky," said Wang Junfeng, from Beijing.

One night was mostly overcast, and the group waited patiently until clear breaks opened up between the clouds. "We could only seize those brief windows to observe the meteors and take photos," Wang said.

Another member, Liu Dapeng, set up three cameras at different locations before dusk, adjusted their shooting parameters and configured them to shoot a frame every few seconds until predawn twilight.

Ice, Chinese consumers' newest crush

Preference for cold drinks sparks debate on worth of traditional hot, warm beverages

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

In China, drinking warm or hot water is a long-standing daily practice passed down through generations and believed to bring good health.

However, fueled by an online buzz and changes to drinking habits, Chinese consumers — in particular social media-savvy young ones — are now putting ice, and plenty of it, in their drinks.

At convenience stores, cups of ice have become a popular seller. At tea and coffee shops, "full ice, no water" has become a popular way to order a drink. Young consumers have also turned cups of ice into a social media sensation, using them to create DIY drinks that have attracted huge online attention.

Gu Xiaoxiao, 36, a junior middle school teacher in Shanghai, is one of the ice drink devotees. For almost half the year, she has a cup of iced coffee at least once a day.

"I usually start in April or May and keep drinking iced coffee until September or October. Besides my daily quota, I also order iced drinks when dining out or meeting friends. Recently, I even arranged to queue with friends for a popular ice cup coffee that had gone viral online," said Gu.

According to a paper on China's urban consumer behavior in 2025, ice cup sales have grown by more than 300 percent for two consecutive years, with consumers in the first-tier cities of Beijing, Shanghai, and Guangdong province's Guangzhou and Shenzhen buying an average of 48 cups per person per year, reported ThePaper.cn.

Publicly available data shows that ice cups are gaining wider market penetration, expanding from plain to flavored varieties and ice cubes designed for cocktails. A search for "ice cups" on Xiaohongshu, or RedNote, returned more than 40,000 posts.

Zhang Yi, CEO and chief analyst at iiMedia Research, attributed the rising demand for ice cups to the past two summers being very hot and young people wanting to make their own drinks using ice cups.

"The cold chain improvement has led to a cost reduction in ice transportation. On social media, the 'full ice, no water' trend has also become a new way for people to socialize," said Zhang.

"Consumers are increasingly willing to pay for ice that is cleaner and comes in more distinctive shapes," he added.

Surging demand

Dong Yuanyuan, head of ice-cup procurement at Freshippo, a grocery and fresh goods retail chain, said: "Over the past two years, we have clearly seen ice cups grow into a sizable market."

"Some have predicted that edible ice could eventually outsell ice cream, while others have joked that edible ice is taking over the world," she said.

According to Dong, ice cups first emerged in Japan and South Korea, where iced drinks are popular year-round. In Japan, annual consumption has reached 2.57 billion cups, comparable to the volume of bottled water consumed.

Dong said when ice cups entered the Chinese market more than a decade ago, monthly sales were only a few dozen boxes. From 2024 to 2026, annual consumption in first-tier cities had reached 48 cups per person.

A contestant adds ice cubes while making a coffee drink during a village cafe competition in Beijing, on June 12. "Full ice, no water" has become a popular way in the coffee industry in China. LI WENMING / FOR CHINA DAILY

"Annual ice cup consumption is already more than twice the roughly 20 cups of coffee consumed per person. In addition, the market is growing by more than 300 percent a year, leaving ample room for further growth," she added.

Freshippo first introduced ice cups in 2021, along with bags of ice for consumers looking to have them available at home.

According to Freshippo data, demand for ice peaks earlier than sales of iced drinks during the year.

"Driven by strong demand for DIY drinks over the past two years, we have moved up the launch of our ice cups from early summer to early spring. As the camping season begins in spring, we usually see the first sales peak," said Dong.

"After the 2026 FIFA World Cup kicked off in June, sales of slow-melting ice cubes developed specifically for cocktails rose 220 percent week-on-week on average, making them one of the season's standout products in the drinks market," Dong added.

Tao Tao, an illustrator based in Beijing, traces her habit of using ice cups back to her time studying in South Korea several years ago. In South Korea, she noticed people often purchased brewed coffee and ice cups separately at supermarkets, making it easy to create an iced Americano.

She was delighted to find that in the past two years, ice cups have become readily available in Beijing supermarkets, making a cold drink easily accessible during the hot summer months.

"The combination of ice cups with various beverages like coconut water, cold brew coffee, juice, or alcohol allows for simple and instant creative daily creation," she said.

Japanese convenience store chain Lawson said a steady growth has been seen in sales of ice cups and bagged ice over the past two years. Its ice cup sales rose more than 30 percent from May to July in both 2025 and 2026.

Christmas-themed beverages are served with ice at a restaurant in Beijing in November. PROVIDED TO CHINA DAILY

"Young consumers are increasingly pairing ice cups with coffee and other drinks, driving Lawson to introduce more creative products, including sparkling ice cups and rainbow-colored varieties, to meet their changing tastes," said the company.

Zheng Wei, general manager of Ice Extreme (Beijing) Food Technology Ltd, a Beijing-based edible ice manufacturer, said Chinese official media has forecast that the iced drink market will reach 63.9 billion yuan ($9.48 billion) in 2026.

Zheng said the demand for iced drinks has become more consistent. In the past, most factories would shut down during the off-season. Now, they run one shift in the off-season and two during the peak summer season.

"Previously, market demand mainly came from businesses in the likes of convenience stores, but in recent years, innovative retail formats including instant retail have seen rapid growth," Zheng said.

"The market used to be dominated by basic products such as cups of ice and bagged ice. Now we offer products including specially-shaped ice, ice buckets and slow-melting cocktail ice, tailoring to diversified needs."

Heated discussion

The iced drink trend has also sparked a major cultural debate.

In traditional Chinese health practices, cold foods and drinks have long been treated with caution.

Traditional Chinese medicine posits that winter is characterized by an abundance of cold energy, which can easily harm the body's *yang* energy.

Consuming raw and cold foods can allow this cold energy to penetrate the body, leading to stagnation of *qi* and blood, and resulting in symptoms like stomach pain and menstrual cramps. Cold water is believed to harm the spleen and stomach, weakening *yang* and potentially causing digestive issues such as diarrhea or loss of appetite. In contrast, hot water is thought to disperse cold energy, promote the circulation of *qi* and blood, and warm and nourish the body.

Wang Bo, chief physician of the department of gastroenterology at Tongji Hospital affiliated to Tongji Medical College of Huazhong University of Science and Technology, told Life Times media outlet that moderate consumption of cold drinks can have some benefits.

"Cold drinks can help cool the body and relieve heat. They can also stimulate the many cold-sensitive receptors in the mouth and on the tongue, sending signals to the brain that produce a feeling of pleasure," Wang said.

From a traditional Chinese medicine perspective, however, cold drinks are best consumed between noon and 3 pm, when *yang* energy is believed to be at its strongest, and consuming ice during this period is considered less likely to cause harm from excessive cold.

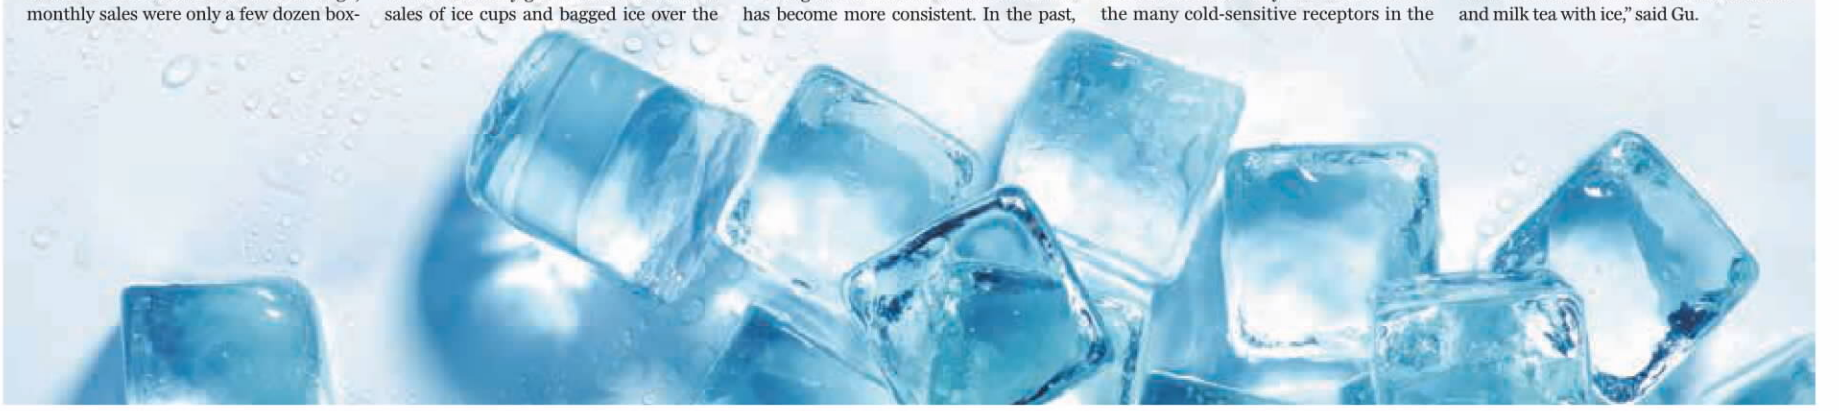
Zhang Min, an acupuncture practitioner at Longhua Hospital affiliated to Shanghai University of Traditional Chinese Medicine, said in an article published in the Shanghai Observer that the debate over whether it's better to drink hot or cold water is not a simple one. "Modern nutrition and medicine increasingly emphasize individual differences, suggesting that what might be 'poison' for one person could be 'medicine' for another."

Zhang said this debate reflects two different health philosophies. The Eastern perspective tends to focus on nurturing and prevention, viewing the body as a delicate system that requires careful maintenance.

The Western perspective, however, leans toward training and adaptation, treating the body as a resilient system capable of handling challenges. "Moderate cold exposure, such as drinking cold water or taking cold baths, is believed to stimulate the circulatory system, boost metabolism, and enhance immunity, akin to a form of exercise for the body," Zhang wrote.

There was also a public health imperative for the promotion of drinking boiled water, according to a 2024 article published by the International Journal of Social Sciences and Public Administration.

Following a cholera outbreak in China in 1932, chaotic water usage was identified by a prominent medical figure as the primary cause for its spread. Due to the absence of a running water system, residents upstream often disposed of their household waste into rivers, exposing those downstream to infection risks.



Following medical recommendations, Shanghai established numerous affordable boiled water shops which resulted in reducing the patient mortality rate from 30 percent to 7.4 percent. This initiative instilled a nationwide habit of consuming boiled water, the article said.

In order to address the issue of widespread parasite infestation during that period, an initiative to promote boiled water was once again prioritized. Previous efforts were limited to major cities like Shanghai and Guangzhou.

Boiling water facilities were made mandatory in all factories, military camps, and farms, the article said. Restrictions were imposed on daily drinking water and most domestic sources, thereby necessitating reliance on these designated boiling water rooms. A portable thermos flask emerged as an iconic symbol of that era, with people gradually adapting to queuing up at specific times for a serving of hot boiled water.

Today, people such as Gu, the school teacher, take a balanced approach to hot versus cold drinks.

"In winter, I drink a lot of tea and usually brew it with hot water. But when the weather gets hot, I find hot tea harder to drink. I either have bottled water or coffee and milk tea with ice," said Gu.

Safeguard: Heritage turns into a living bridge

From page 1

"This reflects the enduring spirit of the Chinese nation — centered on virtue, benevolence and profound love — which remains vibrant after thousands of years, and also highly aligns with President Xi's vision of building a community with a shared future for humanity," Zhang added.

According to tradition, Mazu, the Chinese goddess of marine weather and maritime safety, was a Song Dynasty (960-1279) fisherwoman named Lin Mo, from Meizhou Island, who was later deified.

Revered for her ability to predict weather, she died at age 28 during a mission to rescue fisherfolk from treacherous storms and was deified as Mazu, meaning benevolent mother. She is often portrayed as carrying a lantern to light the stormy seas, and was long credited with calming storms and guiding ships home.

Belief in Mazu eventually was spread along maritime trade routes by Chinese seafarers and grew into a global bond, with over 11,000 temples and 300 million followers across 50 countries.

During his tenure in Fujian, Xi actively promoted the protection of Meizhou Island and its unique Mazu culture. He planted trees on the island to protect its environment and allocated 2 million yuan ($297,500) to support the Mazu Square project to accommodate larger crowds, after he learned that the project's construction faced a tight budget.

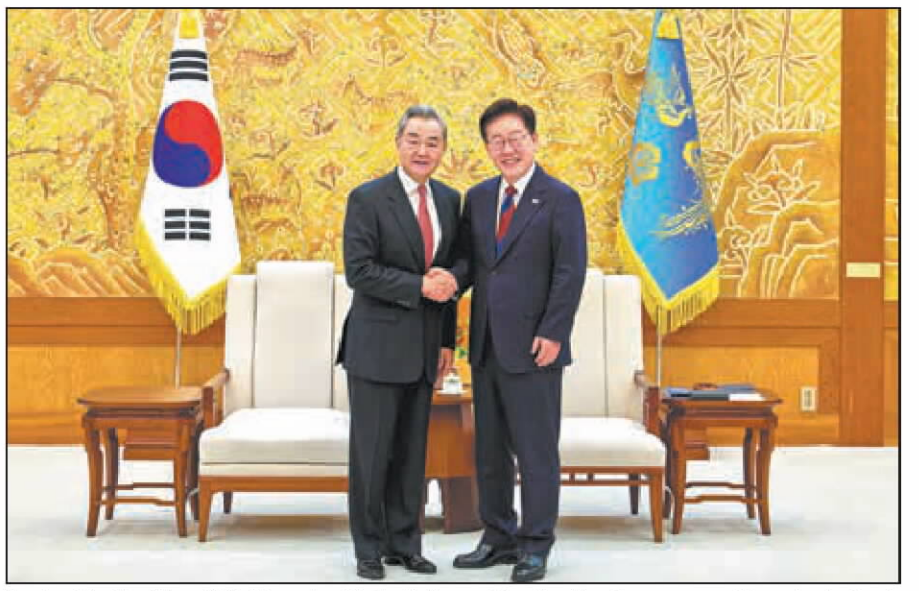
He said after a visit to the island that Mazu culture reflects the character of the Chinese nation, and its exchange and dissemination across the globe can help build a positive image of the Chinese people around the world.

Spiritual asset

Inscribed on UNESCO's Representative List of the Intangible Cultural Heritage of Humanity in 2009, Mazu culture now serves as a shared spiritual asset along the 21st Century Maritime Silk Road.

As her golden statue travels for international processions and thousands of overseas people return to her birthplace each year, this ancient heritage remains a living bridge for global fellowship.

Ke Li, deputy director of Putian University's Mazu Culture Research Institute, said, "The core spirit of Mazu culture aligns perfectly with the philosophy of the early-warning solutions, rooted in a shared commitment to putting people's safety first."



The system also reflects Mazu's spirit of universal beneficence — echoing the goal of protection for everyone regardless of geography or background — and mirrors her ancient wisdom of foresight, blending traditional weather forecasting with modern rapid-response mechanisms, Ke said.

Reflecting this spirit, the MAZU system has become a widely sought-after global public good. More than 40 national meteorological agencies are already using MAZU's cloud-based services, while customized versions of the system have been deployed in Pakistan, Djibouti, Ethiopia, Jordan, Mongolia, the Solomon Islands and Sri Lanka, according to the China Meteorological Administration.

Nestled on one of the world's busiest maritime trade routes in East Africa, Djibouti has become a critical proving ground for the platform. An upgraded version of the MAZU system will be put into operation by the end of this year, which will sharpen its local forecast resolution from 9 km to 3 km.

"MAZU 2.0 is very useful because we have several seaports on the coast," said Mohamed Ismail Nour, director-general of the Djibouti National Meteorological Agency, who expects to deepen port and shipping weather cooperation for safer maritime operations.

FM's ROK visit builds positive momentum

Wang calls for strategic cooperation, political mutual trust in bilateral ties

By ZHOU JIN
zhoujin@chinadaily.com.cn

Inside
Editorial, **page 6**

Foreign Minister Wang Yi wrapped up a two-day visit to the Republic of Korea on Thursday, which observers said reflected continuous efforts by the two neighbors to maintain the positive momentum in bilateral ties.

The visit aimed to implement the consensus reached by the two heads of state during their reciprocal visits, deepen political mutual trust and advance mutually beneficial cooperation, while laying the groundwork for further interactions between the two leaders during the Asia-Pacific Economic Cooperation Economic Leaders' Meeting in Shenzhen, Guangdong province, in November, they said.

This was Wang's first official trip to the ROK in five years. The two neighbors will celebrate the 34th anniversary of the establishment of diplomatic relations on Monday.

During Wang's meeting with ROK President Lee Jae-myung in Seoul on Thursday, the president said that Seoul and Beijing should become mutually dependent and mutually beneficial partners with complementary strengths.

Lee said that trade cooperation between the two countries has maintained strong growth. Highlighting that the number of mutual visits between the two peoples is expected to exceed 10 million this year, he noted that public perceptions of China in the ROK continue to improve.

Lee said that he looks forward to visiting Shenzhen for the 2026 APEC Economic Leaders' Meeting, calling it an important opportunity to work with China to advance their strategic cooperative partnership to a new level.

China-ROK relations have fully recovered and made positive progress since the beginning of this year, Wang noted, adding that such a fact demonstrates that a rational, pragmatic and positive policy toward China fully serves the ROK's interests.

When meeting with the ROK's top presidential national security adviser Wi Sung-lac on Thursday, Wang expressed hope that the ROK will exercise genuine strategic autonomy, refrain from bloc confrontation or taking sides, and develop its relations with China, the United States and other major countries in a mutually compatible manner.

During their strategic dialogue, they also had an in-depth exchange of views on regional security issues.

Wang stressed that it is necessary to remain highly vigilant against the rhetoric and actions of Japan's right-wing forces, which seek to turn back the wheel of history, and that the resurgence of Japanese militarism must never be allowed.

Wang's visit also came as the ROK and the US confirmed that they were sharply scaling back major annual joint drills, a move viewed as a goodwill gesture toward the Democratic People's Republic of Korea.

The fundamental way to ease tensions on the Korean Peninsula is to address the root causes and to push for the US to abandon its hostile policy toward the DPRK, Wang told Wi.

Wang called on all parties to do more to facilitate the resumption of dialogue and restoration of mutual trust, expressing hopes that the Korean Peninsula will move toward peaceful coexistence between the ROK and the DPRK, ultimately achieving lasting peace and stability on the peninsula.

Li Jiacheng, an associate professor at Liaoning University's School of International Studies, said that both the US and the ROK hope China can serve as a bridge and play a greater role in facilitating their engagement with the DPRK.

In his talks with ROK Foreign Minister Cho Hyun on Wednesday, Wang said that China's vast market offers the ROK enormous opportunities due to its geographical proximity. Wang expressed hope that the two sides will continue to expand cooperation.

The two countries should also tap new growth areas for cooperation in artificial intelligence, green transition, the digital economy, high-end equipment and the silver economy, he added.

The Chinese foreign minister called on the two countries to accelerate negotiations on the second phase of the China-ROK Free Trade Agreement.

Deeper China-Africa media relations urged

By ZHAO JIA
zhaojia@chinadaily.com.cn

African officials and media leaders called on Thursday for China-Africa media cooperation to move beyond equipment support and program exchanges toward coproduction and two-way storytelling, in order to help the African media better narrate their own stories and bring a wider African perspective to Chinese audiences.

They made the remarks as the 7th Forum on China-Africa Media Cooperation opened in Beijing, bringing together about 400 government, media, diplomatic, business and academic representatives from China and 45 African countries.

The three-day forum is being held as China and Africa mark 70 years of launching diplomatic relations in 2026 and observe the China-Africa Year of People-to-People Exchanges.

Alhaji Mohamed Sarjoh Bah, the African Union's permanent representative to China, described the media as a strategic tool for development, cultural identity and economic opportunity, as well as a major force shaping international perception. He emphasized that Africa should not remain a passive recipient of information, and should instead become a producer and distributor of knowledge and ideas.

He urged cooperation beyond content exchanges in film, broadcasting, animation, gaming and digital content to create value chains that generate employment and attract investment.

Ahunna Eziakonwa, United Nations undersecretary-general and special adviser on Africa, made a video address to the forum in which she described storytelling as an essential tool for development.

External narratives have long obscured African realities, but young African creators are changing that through streaming, animation and digital content, Eziakonwa said, adding that Sino-African joint productions, along with technologies adapted to African languages and contexts, could strengthen the continent's narrative sovereignty.

Gregoire Ndjaka, director-general of the African Union of Broadcasting, underscored that cooperation between Africa and China should promote an exchange of stories, voices, ideas and experiences.

Ndjaka noted Chinese support for African broadcasting and the provision of news, documentaries and other programs on AUBVision, the union's content-sharing platform, but emphasized that African content should receive greater exposure on Chinese platforms, giving Chinese audiences more opportunities to understand the continent from an African perspective.

Evelyne Butoyi, communication and media minister of Burundi, which currently chairs the African Union, said Africa-China cooperation has improved grassroots access to information and cultural content. She cited the China-aided "Access to Satellite TV for 10,000 African Villages" project, which has provided transmission equipment to 500 villages in Burundi and extended digital television coverage in remote areas.

Cao Shumin, deputy head of the Publicity Department of the Communist Party of China Central Committee and head of the National Radio and Television Administration, highlighted the scale of China-Africa media cooperation.

Over the past two years, more than 80 Chinese productions have aired in Africa, while over 80 programs from 29 African countries have been shown on major Chinese television channels and streaming platforms, Cao said.

The two sides have coproduced about 50 audiovisual programs, while China has organized 45 training programs for more than 1,000 media professionals from 32 African countries, she added.

On Thursday, the forum also unveiled 80 practical cooperation projects and issued a joint declaration calling for deeper collaboration in content production, digital transformation and AI governance.

Participants pose for a group photo during the 7th Forum on China-Africa Media Cooperation in Beijing on Thursday. The event runs through Friday. WANG ZHUANGFEI / CHINA DAILY

Tech: AI should collaborate with humans

From page 1

At its core lies a dangerous myth — that machines will soon surpass us in every cognitive domain, rendering human expertise obsolete.

This myth is not innocent. It is already being used to justify mass layoffs of software engineers, writers, translators and analysts.

Tech executives frame these cuts as inevitable progress. But a clear-eyed look at the facts tells a different story.

We are still in AI's early stages. Today's systems mimic certain cognitive functions, but they do not understand, reason or reliably replace human judgment.

Consider autonomous vehicles — promised by 2020, still struggling on city streets. Consider the "autonomous agents" heralded for 2025 — now quietly postponed.

As someone who works on autonomous systems, I can attest that current AI lacks genuine understanding. It matches patterns. It does not think.

Some argue that reasoning will magically "emerge" as we scale models to an ever-increasing number of parameters. This narrative suits the tech giants perfectly. It justifies billion-dollar investments in data centers and infrastructure. But this is a gamble with no scientific basis, one that leads AI to a dead end.

We need a different path: AI that collaborates with humans, instead of replacing them — specialized, transparent systems designed to augment expertise in fields such as medicine, engineering, scientific research and business management, not general-purpose black boxes.

This "collaborative AI" raises profound scientific challenges. How do we build machines that explain their reasoning in human-understandable terms? How do we establish trust between humans and machines? How do we design systems that solve problems with us, rather than for us? Consider a medical diagnosis. A collaborative AI would not replace the doctor's judgment. It would surface relevant research, flag anomalies and explain its recommendations in plain language — allowing the physician to make the final, informed decision. This differs fundamentally from current "black box" systems, which provide take-it-or-leave-it answers.

These are hard problems. They require investment in explainability, reliability and domain-specific knowledge — not just bigger models and more data. Yet academic research, which should lead this charge, has been sidelined. University laboratories are unable to compete with the private labs of a handful of companies and often find themselves reduced to playing catch-up. When research is concentrated in a few private labs, its priorities shift toward proprietary features, rather than scientific understanding. This distorts the entire field. We must revitalize university research — driven by curiosity, transparency and peer review — which is best positioned to address the challenges of explainability and trust.

The conditions conducive to change are taking shape. Public distrust of unaccountable AI is growing. From chatbots that make up facts, to facial recognition systems with racial biases, to autonomous driving systems with fatal flaws, the public has seen too many buzzwords touted as major breakthroughs. Every widely publicized hype campaign erodes trust. The technical limits of "scaling up" are becoming apparent — even to the industry's true believers. And the economic pressure weighing on tech giants — the gap between colossal investments and a market still struggling to generate returns — is becoming impossible to ignore.

History shows that humanity has capitalized on technological revolutions by balancing risks and benefits. The steam engine, electricity and the internet — each brought profound change, but each was shaped by regulation, public debate and ethical reflection. Artificial intelligence should be no exception. The initial rush of enthusiasm should give way to sober reflection. Societies built frameworks to ensure these technologies served the common good. We are now at that same inflection point.

We have a choice. We can continue down the path of replacement, building machines that mimic us, supplant us and ultimately marginalize us. Or we can invest in a future where AI enriches human intelligence rather than replacing it.

That future requires a global effort: governments funding collaborative AI research, universities prioritizing human-AI interaction, and citizens demanding transparency and accountability. This means public funding for collaborative AI, curricula in human-AI interaction design, and regulatory frameworks requiring explainability before deployment in sensitive domains from healthcare to criminal justice and the management of critical infrastructure.

The question is not whether AI holds extraordinary potential — it clearly does. The question is whether we will have the wisdom to steer it toward a true symbiosis with humanity and prevent it from insidiously gaining the upper hand. This is our historic responsibility. Now is the time to act.

The author is a laureate of the 2007 Turing Award (known as the Nobel Prize for Computing) and founder of the Verimag laboratory in Grenoble. The views do not necessarily reflect those of China Daily.

Meteors: Livestream gains views

From page 1

Liu Dapeng said that smartphones, when mounted on a tripod, can capture the starry sky. Beginners can invest in cameras and wide-angle lenses based on their budgets, or opt for affordable secondhand gear, he said.

"After putting it into practice, they can think about whether they want to stick with astrophotography. It can be tiring, enduring outdoor hardships such as freezing cold and rain. Safety is always paramount. It is very easy to get lost in the desert at night, so you should travel with others and take no risks," he added.

Zhou Bo led a team to livestream the Perseid meteor shower from Dahaidao, Barkol Lake and Yiwu county. Drawing on his multidisciplinary knowledge including geology and history, he promoted Hami's natural resources and cultural heritage while hosting the livestream.

Zhou said he believes that the meteors stir curiosity and a thirst for knowledge among his viewers, inspiring wonder at the boundless cosmos.

Trump expands economic warfare against Iran

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

US President Donald Trump has declared an "economic D-Day" against Iran amid a ceasefire deadlock, threatening countries that provide a lifeline to Tehran with "tremendous consequences".

Trump's threats came just as the United Arab Emirates suspended all trade with Iran on Wednesday after the UAE came under renewed attack, triggering nationwide warnings, a day earlier.

In a social media post on Wednesday, Trump boasted that no one has given Iran "a greater opportunity to make a deal than me", adding that Tehran failed to take it as he announced "the most crushing economic operation ever taken against any country".

Trump said it would be "economic warfare and isolation on an unprecedented scale" and claimed that Iran "is hanging by a thread".

"Today, I am also announcing that any country that allows its financial institutions, businesses, airports or government entities to provide any type of lifeline to Iran will itself face tremendous economic consequences," he said.

"This will be an Economic D-Day," he added, reiterating Iran "will never have a nuclear weapon".

Iranian Foreign Minister Abbas Araghchi pushed back on Thursday, saying the "so-called Economic D-Day is a diversion from America's own crisis", citing debt and surging interest costs.

"Doubling down on failed policies will only bring further defeat — and enmity of Iranians. US economic terrorism threatens global economy and sovereignty worldwide," he said.

Iran has been under international sanctions for decades, especially since the US imposed sanctions following the 1979 Islamic Revolution.

Since the current war broke out on Feb 28, the US has targeted Iranian energy exports, disrupting Tehran's primary revenue stream. Washington has also targeted entities allegedly smuggling Iranian-origin liquefied petroleum gas disguised as Omani LPG to South and East Asia.

The US Treasury Department has also imposed sanctions against Iran's banking and foreign exchange networks, and weapons procurement.

Chinese Foreign Ministry spokesman Lin Jian said on Thursday that imposing sanctions and exerting pressure will not be useful in solving the Iran issue.

China calls on relevant parties to take responsible steps and resolve the issue through political and diplomatic means, he said.

Without interference

At a meeting with Iraqi President Nizar Amidi, Iranian Parliament Speaker Mohammad Bagher Ghalibaf warned that the US is seeking to plunder the resources of the Gulf states, the Tasnim News Agency reported.

Regional countries can establish security and stability through unity and without foreign interference, Ghalibaf said.

The US is the main cause of the region's problems, he said, adding that Washington's hegemonic approach has fueled recent conflicts, inflicting losses on Iran and Iraq.

Rasha Al Joundy, a senior researcher at the Dubai Public Policy Research Centre, told China Daily that by imposing more economic pressure on Iran at this stage, the US "seeks to inflict more internal pressure on the government".

However, Iran's Islamic Revolutionary Guard Corps is the one making decisions and therefore, this will inflict political pressure on the government because of economic pressure on the people who are the most affected and vulnerable, she said.

The pressure will not have much impact militarily on the IRGC's decisions, she added.

"Strategically I don't believe that the US would accomplish short-term political gains with new sanctions, but it could push for a new round of military confrontation in the region," she said.

"If the US administration would adopt this as a long-term strategy, then the outcome would depend on whether it is supported and implemented for a long timeframe, without suspensions or side exemptions."

Groups challenge rule ending Duration of Status

By **MAY ZHOU** in Houston, Texas
mayzhou@chinadailyusa.com

Multiple organizations filed a complaint and a motion for preliminary injunction challenging the Department of Homeland Security's (DHS) final rule ending the Duration of Status (D/S) framework for international students, exchange visitors and representatives of foreign media in the US District Court for the District of Massachusetts on Tuesday.

The complaint argues that DHS failed to adequately assess its costs and benefits, meaningfully respond to public comments, consider less burdensome alternatives or justify the rule based on its stated objectives.

The lawsuit also alleges that DHS provided an inadequate public comment period and exceeded its statutory authority.

DHS gave the public 32 days and drew 22,000 comments, including opposition from more than 30 Congress members. Despite there being more comments opposing the changes, DHS enacted the new rule, which is scheduled to take effect on Sept 15.

Fanta Aw, executive director and CEO of NAFSA: Association of International Educators, said this decision is "a solution in search of a problem".

"The rule will severely undermine the contributions international students make to US campuses, economies and national security," Aw said in a statement. "After carefully reviewing the final rule and the sweeping harm it will cause to our national interest, it is clear that litigation is warranted and necessary."

For about half a century, F-1 students and J-1 visitors could remain in the US for as long as they are enrolled in an academic program with no fixed departure date.

Under the new rule, international students will be given a specific end date aligning with the academic program length or four years, whichever is shorter. For longer programs, the students are required to file an extension of stay.

In addition, F-1 undergraduate students won't be able to change their major or transfer to another college in the first year. They can't pursue another major at the same or lower education level after graduation.

F-1 graduate students are prohibited from switching majors or schools at all, and the duration of F-1 students for English learning will be limited to 24 months in aggregate.

"The new restriction doesn't make any sense," Liu, an art student in Chicago who wants to be identified by his last name only, told China Daily. "An arts degree usually stops at master's level. Serious art students often pursue another master's degree in a different medium to expand their horizon for creativity."

Dual degrees are not uncommon in many fields, Liu said.

For example, research physicians often pursue both MD and PhD to treat patients and run research labs. Jobs in bioinformatics require training in both biology and computer science. Architecture design often benefits from engineering training.

The lawsuit argued that a four-year fixed term is incompatible with many programs, particularly PhDs.

NAFSA estimated that "the median years to a research doctorate is 5.7 years from entering a program to completion, while those who complete the master's/doctorate sequence take an average of 7.3 years from entering graduate school to completion".

Such restrictions are very off-putting. A survey by NAFSA and The Institute for Progress showed that 49 percent of current international students would not have studied in the US without D/S.

College application platform Common App showed that international applicants were down by 9 percent for this fall semester. Many universities are expecting a steep drop in international graduate students.

Miriam Feldblum, president and CEO of the Presidents' Alliance on Higher Education and Immigration, said these changes ignore "actual program lengths or students' educational needs" and shift "academic decisions from institutions to immigration officials".

"The rule will disrupt educational pathways, impose significant new burdens on colleges and universities, and make the United States less competitive as the premier destination for global talent," Feldblum said.

The lawsuit said many commenters warned that declining international enrollment would be catastrophic.

"Many cited the Clemens study, which estimated that within ten years, the economic costs of eliminating D/S would be $72-145 billion annually," it said in the court document.

The new rule would also limit I visa holders — representatives of foreign information media — to a maximum of 240 days. For Chinese passport holders, it's much shorter at 90 days.

The lawsuit said that many are concerned that the new rule requiring international journalists to file frequent extension of stay requests would put government officials in a position to punish journalists for exercising their First Amendment rights.

Growing US national debt 'huge burden'

Record level of obligations could eventually hit Americans with higher borrowing costs

By **BELINDA ROBINSON** in New York
belindarobinson@chinadailyusa.com

Millions of Americans who are already struggling with the cost of living could eventually feel the effects of persistently high debt as US gross federal debt surpassed $40 trillion on Wednesday and economists and think tanks warned that it's a "huge burden" that could drive up interest rates, inflation and borrowing costs.

> "Despite the obvious recklessness of this fiscal path, we are showing no signs of slowing down."
>
> **Michael A. Peterson**, CEO of a think tank focused on US fiscal challenges

The record-breaking, unprecedented, national debt reached the milestone in part due to defense costs, social programs like Social Security and Medicare, and interest payments on that debt — a big part of federal spending, experts said.

"The national debt hitting $40 trillion is a huge burden on the back of every American," Christopher Ball, director of the Central European Institute at Quinnipiac University, Istvan Széchenyi Chair in International Economics and an associate professor of economics, told China Daily. "Like all debt, it must be paid back. If it were at a more reasonable level then we could pay a little more in taxes or cut a little spending, not too much and not too painfully. But when it is that high, it means we have to suffer serious pains or go bankrupt.

"This doesn't have to be done today — which is why Americans may not feel the burden today — but the payments will come due. When that happens most likely the average American will suffer in facing really high interest rates, really high taxes and massive cuts in basic services like Social Security, Medicare and all other government-supported social services. Again, the longer we wait, the more the pain when we face it."

High government borrowing can put pressure on market interest rates, and has already raised borrowing costs on mortgages and cars, say experts.

The benchmark 30-year fixed rate mortgage was 6.65 percent on Aug 20, higher than a year ago when it was 6.58 percent, The Associated Press reported. The rates are influenced by the 10-year Treasury yield, inflation forecasts and the economic outlook.

American consumer spending is vital, so a pull back on shopping could cause slower economic growth, data shows.

But the bond market showed signs of strain on Thursday due to fears over US government debt and worries about high inflation. Stocks fell as investors evaluated concerns.

The S&P 500 dropped 0.87 percent to close at 7,641.16 on Thursday. The Dow Jones Industrial Average was down 703.84 points. The Nasdaq composite fell 1 percent to close at 26,067.17.

Americans have already seen fluctuating gas prices this year, while Trump renewed threats to hurt Iran economically on Wednesday.

The price for a barrel of Brent crude settled at $93.78 on Thursday.

The rise in the national debt also comes as the administration said it's focusing on more spending on the ongoing conflict with Iran.

Kush Desai, a White House spokesman, told The AP that the Trump administration "has been focused on slashing waste, fraud and abuse in federal spending while accelerating economic growth to get America's debt-to-GDP ratio trending in the right direction".

But Michael A. Peterson, CEO of the Peter G. Peterson Foundation, a think tank focused on US fiscal challenges, said in a statement: "It's shocking that we've doubled the federal debt in less than 10 years, and we must change course.

"The more debt we take on, the more interest costs we have to bear, which now even exceed the cost of national defense. And every trillion we add to our debt contributes to higher interest rates and inflation, increasing the mortgages, car loans and credit card bills of all Americans."

Peterson said that debt harms economic growth, slowing wage increases while the cost of living continues to rise.

The US national debt has increased over several presidential administrations, rising when the federal government runs a budget deficit and spends more money than it collects in tax revenue.

An analysis of OECD data by The AP described the US as having the worst fiscal position among developed economies.

The Bipartisan Policy Center estimates that the US will reach the $41.1 trillion statutory debt limit between late winter and mid-summer of 2027.

If the limit is reached, the Treasury must use measures to address it.

And Congress must vote on whether to raise or suspend it, as Congress is responsible for setting a limit to federal borrowing. It can also adjust or abolish it.

Peterson added: "Despite the obvious recklessness of this fiscal path, we are showing no signs of slowing down. The debt growth is projected to accelerate as our society ages and healthcare costs continue to balloon. If we don't reform our budget, we will hit $50 trillion in just 6 years."

New system is built to cultivate private sector

By YUAN SHENGGAO

On the shores of the East China Sea, Wenzhou in Zhejiang province — a cradle of China's private economy — is experiencing a profound transformation that is permeating the day-to-day operations of the city's 1.57 million business entities.

Since 2025, the Wenzhou city government has rolled out a plan to coordinate 41 departments across the city. It has introduced measures covering seven areas, which include improving government service models, fostering robust business entities and empowering credit-based business.

The city is building a new system of regulation and service featuring "omnipresent support and non-intrusive oversight", cultivating a business environment conducive to the free development of the private economy.

"I never imagined opening a shop could be this easy," said a visually impaired Wenzhou resident surnamed Jin. Hoping to launch a massage parlor, Jin turned to government service counters for assistance due to limited mobility.

Thanks to the one-stop service mechanism, the dedicated service zone for individual industrial and commercial households helped him complete all registration procedures within a short period.

Jin's experience epitomizes Wenzhou's considerate business environment. Rather than resolving isolated cases, the city strives to upgrade solutions for institutional frameworks and address diverse categories of matters.

Integrating value-added services from multiple government departments, industry associations and social organizations, Wenzhou has set up service zones for individual industrial and commercial households to foster a new ecosystem.

Additionally, Wenzhou has established a closed-loop system to resolve corporate demands that integrates online and offline channels. Via the online platform, enterprises can submit requests with a single click. Offline, monthly government-business forums are held to tackle challenges, while a dedicated service counter for unresolved matters takes on the most intractable problems.

As local enterprises develop, Wenzhou's market regulation administration provides tiered cultivation support, encouraging large-scale enterprises and individual industrial and commercial entities to support one another and share supply chain and channel resources.

As one of the birthplaces of China's private economy, Wenzhou was approved in 2018 to build the country's first national pilot zone for the "dual health" initiative — a national reform pilot for the sound development of the private economy and the sound growth of private entrepreneurs. It stands as a benchmark in Zhejiang's efforts to advance economic structural reform driven by the private economy.

To advance this initiative, Wenzhou set up a working group led by the city's Party committee and established a coordinated mechanism linking authorities at all levels.

A citywide channel was opened for direct feedback on issues arising in the pilot program to support timely, full-process guidance. Meanwhile, a provincial-city joint promotion mechanism for the initiatives was put in place, offering an upward channel for reform initiatives that encounter bottlenecks at the city level.

In parallel, Wenzhou has enshrined the "dual health" initiative in laws and regulations. The city government enacted China's first local ordinance dedicated to the initiative, rolled out an evaluation index system for the sound development of the private economy and an evaluation index system for the sound growth of private entrepreneurs, and also released the Wenzhou Private Economy Financial Service Index.

To boost entrepreneurs' sense of happiness and security, the city has also rolled out a suite of policies to respect and support businesses, and has designated Nov 1 every year as the private entrepreneurs' festival.

In October 2025, the All-China Federation of Industry and Commerce released the 2025 lists of the top 500 private enterprises by research and development investment and the top 500 private enterprises by invention patents. Eight and 10 Wenzhou enterprises were named on the two lists, respectively, up by one and five from 2024.

High-Speed railway opens in Zhejiang

Network becomes a model of attracting investment into major projects in province

By YUAN SHENGGAO

After the Wenling-Yuhuan section of the Hangzhou-Taizhou High-speed Railway, China's first high-speed railway with private capital in control, went into operation on Aug 8, Zhejiang province in East China made new progress in building its high-speed rail transport circle.

The newly opened section extends Zhejiang's high-speed rail network to the eastern coastal area of Taizhou city.

Data from China Railway Shanghai Group show that passenger volume on the Hangzhou-Taizhou High-speed Railway has exceeded 100 million since its opening in 2022, greatly aiding the flow of people, goods, capital and information along the route.

The Hangzhou-Taizhou High-speed Railway has formed a vital part of the Yangtze River Delta intercity railway network and become a model for Zhejiang to attract private capital into major transport projects, officials said.

Its Wenling-Yuhuan section adopts the public-private partnership model. Social investors led by China Railway Construction Investment Group funded the project together with the Wenling and Yuhuan local governments, while entrusting China Railway Shanghai Group with construction and operation.

Experts in development planning in Zhejiang noted that the Hangzhou-Taizhou High-speed Railway project breaks the traditional model under which railway projects were solely funded by State-owned capital with private capital holding minor shares. It enables effective alignment between government regulation and market-oriented operations.

Visitors take photos of textile equipment at a private economy exhibition center on Dec 26, 2025, in Ningbo University of Finance and Economics in Zhejiang province. PROVIDED TO CHINA DAILY

Its operational model has become a reference case for industrial reform, exploring a replicable path for private capital to participate in railway investment, financing, construction and operation.

Sources from China State Railway Group noted that previous high-speed rail projects relied heavily on fiscal funds and capital of the national railway operators, resulting in heavy financial pressure and constrained expansion.

The practice of the Hangzhou-Taizhou High-speed Railway demonstrates that properly introducing social capital can ease the capital burden of railway infrastructure construction.

Meanwhile, the market-oriented mindset of private enterprises can drive innovation in passenger transport services and develop resources along railway lines, which is helpful to unlock the value of railway assets.

Zhejiang has been encouraging private enterprises to participate in major projects for a long time. Over decades of development, Zhejiang has witnessed magnificent growth of its private economy. Today, the private economy stands as one of the most dynamic engines powering high-quality development in the province.

Apart from the Hangzhou-Taizhou High-speed Railway, the Zhejiang San'ao nuclear power project located in Cangnan county, Wenzhou city — the first nuclear power project with private capital participation in China — officially entered commercial operation on April 29 and marks a landmark reform in China's energy investment and financing system.

In a bid to stimulate private investment, Zhejiang put forward the "three 70 percent targets" in 2023: no less than 70 percent of the provincial "4+1" special funds shall be channeled into private investment projects; no less than 70 percent of newly added and stock land resources shall support private investment projects; and no less than 70 percent of annually newly allocated energy consumption quotas shall go to private investment projects.

In 2025, Zhejiang set a goal to raise the targets to 80 percent. In 2026, the province formally launched the new targets.

In May, the Zhejiang provincial government released 13 measures centering on fostering a high-level innovation ecosystem and addressing the demands of private enterprises. The policy combines targeted support with reform and innovation, introducing measures with tangible benefits and a greater sense of gain for market entities.

Clauses 1 to 4 of the policy center on scientific and technological innovation, with plans to open up innovation resources including major scientific facilities, supercomputing centers and pilot-scale testing platforms.

Clauses 5 to 7 focus on opening up more sectors. They specify that nine sectors, including railways, nuclear power, offshore wind power and water supply will be opened to private capital. For-profit low-altitude economy projects, commercial aerospace projects and the like will be open to all market entities on an equal footing. Private enterprises will receive support in applying for commercial aerospace frequency licenses and launch approvals.

Clauses 8 to 10 target factor market reforms. Apart from the 80 percent targets, newly added industrial land and newly allocated energy consumption quotas shall back private investment. Each year, 666.7 hectares of land will be allocated to support small and medium-sized enterprises investing in projects with new quality productive forces.

Clauses 11 to 13 concern legal safeguards. The province will uniformly publicize bidding information across Zhejiang. Unreasonable access thresholds are strictly prohibited. Seizure and freezing of assets exceeding the amount involved in cases shall be rectified in accordance with laws and regulations.

Phoenix Action supporting capital engagement

By YUAN SHENGGAO

Zhejiang Xinxing Tools rang the listing bell on the ChiNext board of the Shenzhen Stock Exchange on July 30, becoming the 12th listed enterprise in Haiyan county, Zhejiang province.

Located in Liuli industrial park, Ganpu town of Haiyan, Xinxing Tools is a time-honored manufacturing enterprise. For more than 30 years, the company has focused on the hole machining tool sector and has been recognized as a single-product champion in manufacturing.

The enterprise specializes in the research and development and production of drilling tools such as annular cutters and spade drills. Drawing on its extensive manufacturing expertise, it accounts for more than 50 percent of the domestic market share for annular cutters. Its products are now sold to more than 90 countries and regions, and the company has established close partnerships with thousands of clients worldwide.

Through sustained investment in innovation, the enterprise has secured 170 patents. It has led the formulation of two national industry standards and set up a national-level postdoctoral research station in 2024, helping it remain at the forefront of technological innovation in this niche industry.

"Haiyan's business environment and full-cycle incubation services gave us the confidence to take root here, develop the real economy and march toward the capital market," said Zhu Dongwei, general manager of Xinxing Tools.

Currently, the main structures of the company's new digital factory have been completed. Once operational, the factory will produce precision tool holders and fixtures for computer numerical control machines. The project is expected to be completed and begin operation by the end of the year.

Once fully operational, the project will add an annual production capacity of 6.6 million high-end CNC tools, accelerating the company's transformation from a single-product manufacturer to a comprehensive solution provider offering a full range of hole machining tools.

"It has been an arduous journey from a small workshop of merely three people to a successful listing. I believe the key lies in Xinxing Tools' perseverance — perfecting one type of cutting tool for three decades. By concentrating on the hole machining tool sector with sustained dedication, we have finally reaped rewards," Zhu said.

In recent years, Haiyan has been implementing the Phoenix Action Plan — Zhejiang's flagship provincial strategy to develop a multi-tiered capital market — and stepping up efforts to cultivate high-quality real-economy enterprises and build a full-cycle, full-chain service system for enterprises seeking to go public.

To date, the county hosts 12 listed companies, 12 NEEQ-listed companies and 48 enterprises in the pre-listing reserve pool, forming an expanding tiered cluster of capital market participants.

Haiyan's achievement reflects Zhejiang's broader efforts to foster the private economy. During the 14th Five-Year Plan period (2021-25), Zhejiang advanced an upgraded version of the Phoenix Action Plan. Supported by whole-process capital engagement, full-cycle policy backing and full-chain service guarantees, the province has remained a key player in capital market development in China.

The full-chain tiered cultivation system enables enterprises at different growth stages to access multi-level capital markets. The system is designed to create an important hub for fostering and expanding emerging industries, making forward-looking plans for future industries and piloting the high-quality development of listed companies.

In the five lists released by the All-China Federation of Industry and Commerce in 2025, namely China's top 500 private enterprises, China's top 500 private manufacturing enterprises, China's top 100 private service enterprises, top 500 private enterprises in R&D investment and top 500 private enterprises by invention patents, private enterprises from Zhejiang claimed the largest number of entries nationwide, achieving a clean sweep for two consecutive years.

Weaponizing gold self-harming addition to US' systematic containment calculations

Gold has long been the ultimate hedge against political folly. Now it is becoming such folly's collateral damage. Washington's decision to place three Chinese gold companies on its so-called "Uyghur Forced Labor Prevention Act Entity List", followed by the London Bullion Market Association's suspension of their Good Delivery status, is a test of whether the United States can weaponize the financial system without ultimately weakening the system itself.

The China Gold Association says the US sanctions have no factual basis and accuses Washington of politicizing "human rights" to pursue protectionism. It has also criticized the LBMA for acting without sufficient fact-checking.

The bigger danger lies in the financial shadow cast over international transactions involving Chinese companies. Good Delivery status is a passport into the London bullion market. Losing it can mean greater due-diligence costs, fewer counterparties and more complicated access to international derivatives markets. The "UFLPA Entity List" adds another layer of uncertainty, encouraging banks, traders and suppliers to distance themselves from US-designated "politically risky" entities. Sanctions work not merely by closing doors but by making everyone nervous about opening them.

With veteran financial tycoon Scott Bessent as US Treasury chief, the US administration increasingly treats dollar dominance as an instrument of hegemony. Currency swaps, Treasury-market intervention, sanctions and settlement requirements are being woven into a broader strategy aimed at preserving the US' financial hegemony with China being one of the unspoken targets. The same logic now applies to gold: control a critical node and you acquire leverage over everyone connected to it.

The US' financial power rests on trust in institutions that are supposed to be more durable than any US administration. If access to dollar liquidity becomes a geopolitical favor, if Treasury markets are bent toward political objectives, and if gold certification is an extension of US sanctions, foreign governments have an obvious question: what happens when their interests diverge from Washington's?

The answer is diversification. It is pragmatic and reasonable for China to try and create a renminbi payment option, a more autonomous gold market and enough financial resilience to ensure that a US financial sanction does not trigger a systemic crisis. That explains the growing importance of the Shanghai Gold Exchange. If the LBMA becomes politicized, China has an incentive to internationalize its own delivery standards, deepen the "Shanghai Gold" benchmark and expand gold cooperation with emerging markets. What begins as defensive diversification can eventually become institutional competition.

Yet any measure taken by other countries to counter the US' economic coercion is seen by Washington as "an unforgivable act of defiance". The White House published a so-called "The Great Transshipment Scam: Rise, Scope, and Costs" report last week. The report smears China's normal international trade and investment as a "scam" and fabricates a false narrative about a so-called "shadow transshipment network".

As a spokesperson for China's Ministry of Commerce said, the arbitrary tariffs imposed by the US are the root cause of threats to the security of global supply chains. Attributing domestic economic issues to external factors will not resolve the deep-seated problems within the US itself.

The broader strategy is clearly visible in Washington's policy consultation circle. The Information Technology and Innovation Foundation, a think tank in Washington, has been publishing its "Mobilizing for Techno-Economic War" series, advocating strategic technology-economic pacts and a comprehensive effort to constrain China.

As shown by these reports, the US' containment spans technology, trade, finance, resources, markets and information to realize a precarious new equilibrium: strategic rivalry without a full showdown. The old bargain — economic interdependence generating gains for both sides — is being replaced by a world in which every supply chain is examined for strategic vulnerability and every financial institution becomes a choke point, with costs that are structural for the global economy.

When currency swaps become political favors, gold certification an extension of sanctions policy and Fed independence a bargaining chip, the credibility underpinning the dollar's global role is eroded. By weaponizing the very institutions that made the dollar indispensable, the US risks losing the longer war for financial trust. Gold, after all, has a long memory. It may eventually remember who made it political.

Stable Sino-ROK ties serve both and region

As China and the Republic of Korea approach the 34th anniversary of the establishment of diplomatic relations, there is a renewed opportunity to inject fresh vitality into their strategic cooperative partnership. The meeting between Chinese Foreign Minister Wang Yi and his ROK counterpart Cho Hyun in Seoul on Wednesday can help the two sides demonstrate strategic vision and jointly ensure the healthy, stable and sustainable development of bilateral relations.

China and the ROK have long enjoyed a robust economic and trade relationship, evolving into a deeply integrated community of shared interests, with annual bilateral trade volume surpassing $330 billion. For more than two decades, China has remained the ROK's largest trading partner, and its vast market continues to offer opportunities for the ROK's industries. This partnership helps drive innovation and growth in both countries.

By expanding cooperation in high-value-added sectors and tapping into new growth drivers such as artificial intelligence, green transition and the digital economy, they can further unlock the potential of their economic integration. This approach aligns not only with the ROK's economic transformation needs, but also with China's focus on high-quality development.

At this juncture, accelerating the second phase of negotiations on the China-ROK Free Trade Agreement is crucial. The deal promises to enhance openness in the service and investment sectors. Reaching the deal serves the two countries' common interest.

However, this cooperation must be grounded in mutual respect and strategic autonomy. It is essential that the ROK not yield to pressure from the United States to join the geopolitical rivalry against China, particularly in high-tech fields, where export restrictions on advanced semiconductor manufacturing equipment are a concern.

During the meeting, Wang clearly expressed the hope that the ROK will, based on its fundamental interests, pursue an independent foreign policy and develop relations with other countries in parallel without conflict.

The souring of China-ROK relations after the ROK's deployment of the US' Terminal High Altitude Area Defense missile system in 2016 underscores that economic integration, no matter how deep, cannot fully insulate bilateral ties from strategic mistrust. Moving forward, managing differences requires strategic communication, transparency and a shared commitment to dialogue over unilateral actions.

Apart from economic collaboration, it is also in the shared interests of both countries to strengthen coordination in addressing regional security challenges. As Cho noted, the two sides can work to ensure that China-ROK relations contribute to peace and stability on the Korean Peninsula and the broader region.

The current international climate is fraught with uncertainties. China and the ROK share a responsibility to safeguard the fruits of the victory in World War II and protect peace and stability in the region. The Korean Peninsula remains a focal point of regional security dynamics. China is committed to playing a constructive role in promoting peace and stability on the peninsula.

The upcoming 2026 APEC Economic Leaders' Meeting, scheduled to be held in Shenzhen in November, is a platform for deepening regional cooperation. Both China and the ROK should seize this opportunity to collaborate with other Asia-Pacific economies in facilitating collective growth and development, while addressing shared challenges, such as climate change, and promoting innovation and sustainable development.

Over the past more than three decades, China-ROK relations have experienced a complex journey, with both sides transcending differences in social systems and ideologies to actively advance exchanges and cooperation across various sectors, achieving mutual success and common prosperity.

Today, as the two nations strive to promote the sound, stable and sustainable development of their bilateral ties, they can continue to inject lasting momentum into regional and global stability and development.

Brussels engineering leverage only undermines mutual trust

China's Ministry of Justice said on Wednesday that the European Union's cross-border investigation into Chinese e-commerce giant JD.com under the EU Foreign Subsidies Regulation constitutes unlawful extraterritorial jurisdiction. The ministry reached the conclusion following an investigation conducted under China's rules on countering foreign states' unlawful extraterritorial jurisdiction measures. This is the second time Beijing has invoked these rules, following a similar determination in May against the EU's probe into Chinese company Nuctech. The ministry also said that no organization or individual may comply with or assist in implementing the EU's measures.

The JD.com probe by the EU, launched in May over the Chinese company's proposed $2.5 billion acquisition of German retailer Ceconomy, arbitrarily demanded broad and unnecessary information from China. The EU's practice is a serious violation of the international rule of law.

The EU should immediately correct its practices, stop abusing the FSR as an investigative tool and foster a fair, impartial and predictable environment for companies operating in the EU market. If the EU persists with this wrong course, China will resolutely take countermeasures in accordance with the law, said a spokesperson for the Ministry of Justice.

Beijing's rejection of Brussels' extraterritorial overreach is fully justified. China will not accept unilateral measures that harm its sovereignty, security, development interests or the legitimate rights of its enterprises.

However, China remains willing to manage disputes through dialogue. On Thursday, the Ministry of Commerce announced a decision regarding the succession of antidumping duty rates for copolymer polyoxymethylene, which involves companies from the EU, Japan, the United States and China's Taiwan region. It signals that Beijing possesses a full array of legal instruments to safeguard its core interests.

Meanwhile, EU foreign affairs chief Kaja Kallas is expected to travel to China this autumn for her first bilateral strategic dialogue since last summer, according to media reports. The dialogue should serve to underline the reality that both sides recognize the necessity of keeping channels open to address their common concerns in various fields, including trade issues.

This is precisely why the June 29 launch of the China-EU Trade and Investment Consultations in Brussels matters. EU Trade Commissioner Maros Sefcovic and Chinese Commerce Minister Wang Wentao established four core work streams — trade balancing, export controls, intellectual property protection and World Trade Organization reform — with a joint monitoring mechanism and an October target for tangible progress in addressing their trade concerns. Vice-ministerial talks have also continued through summer, with a second ministerial round scheduled in Beijing this autumn.

So, while the EU continues to unilaterally deploy instruments such as the FSR against Chinese companies, and China has demonstrated its resolve to respond with countermeasures, both sides are also using institutional structures — the trade and investment consultations framework and the strategic dialogue — to prevent their trade disputes from spiraling into a broader trade war.

The EU faces a difficult choice: continue down a path of regulatory unilateralism that erodes trust and investment confidence, or genuinely engage in the dialogue mechanisms it has helped create. China has made its readiness for either scenario clear — it will defend its interests forcefully against unlawful measures, but it remains open to solving differences through equal-footed consultations. As the autumn meetings approach, the EU should drop the illusion that coercive bargaining chips yield real leverage. They don't — they only deepen distrust.

Reports say the EU is preparing new Russia sanctions. If Brussels once again unjustifiably targets Chinese entities, Beijing will respond with strong countermeasures. Beijing's previous countermeasures against multiple EU entities — taken in response to the bloc's unjustifiable inclusion of Chinese firms in its latest Russia sanctions — should serve as an unmistakable warning. Brussels would be wise not to test Beijing's resolve again — or it may find that the stone it throws lands squarely on its own foot.

— LI YANG, CHINA DAILY

What They Say

Embodied intelligence yet to see 'GPT moment'

Editor's note: *Robotics company Unitree Robotics made its debut on the Shanghai Stock Exchange's Science and Technology Innovation Board on Wednesday, coinciding with the opening of the World Robot Conference in Beijing. ThePaper.cn, a Shanghai-based media outlet, spoke to Wu Zuxuan, vice-dean of the Institute of Trustworthy Embodied AI at Fudan University, on the development of China's embodied intelligence industry. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

A robot's journey begins with its physical form, which can be humanoid, quadruped, bipedal or shaped like a robotic arm. China holds a relatively strong position in this area. The country's core strengths are its robust industry and supply chains, which allow it to quickly source specific robot parts. Additionally, China's well-developed manufacturing sector enables the production of high-performance physical bodies of robots.

The strength of China's industry chain is also reflected in its ability to mass-produce and iterate rapidly. The country is able to develop the physical bodies in a short time, put them into mass production, and continuously upgrade the products based on the feedback from users.

Humanoid robots have been developed because most of today's infrastructure is designed for humans. It is unlikely that an entirely new infrastructure will be built for robots with completely different forms.

However, not all robots are required to be humanoid. For instance, robots in factories do not necessarily have to appear like humans. Large robotic arms are already accomplishing highly complex tasks in many automated factories.

Similarly, humanoid robots are not necessary for high-risk firefighting missions. In such scenarios, wheeled robots that move at a higher speed may be a better choice. In the future, robots will likely take diverse forms to perform different tasks in various scenarios.

Conventional robots mainly use grippers for operations. To perform more delicate tasks, robots need multifingered end effectors that mimic the coordinated movements of human hands. These dexterous hands should be durable, agile and capable of handling a wide range of tasks.

The development of large models for embodied intelligence is still in a nascent stage. We have yet to witness the "GPT moment" for embodied intelligence. The core challenge is scaling up data for embodied intelligence.

Large language models have access to massive volumes of internet data, which helps them perform diverse tasks. However, embodied intelligence suffers from insufficient data. Many questions remain about how embodied intelligence models interact with real-world environments, leaving considerable room for improvement.

Evaluating the performance of a large language model involves feeding it questions and assessing the responses it generates. In contrast, the test for evaluating embodied intelligence models is their ability to satisfactorily perform real-world tasks.

The core benchmark for the "GPT moment" of embodied intelligence will be when a single model can perform well across different kinds of robots, tasks and scenarios, demonstrating a strong ability to generalize.

VIEWS

Mammo Muchie

China's innovation inspires Global South

In July, China's exports rose 23.9 percent from a year before, while imports surged 27.5 percent.

Notably, high-tech products fueled this export boom, with semiconductor exports nearly doubling in value.

China is entering a new phase of development, where innovation, advanced manufacturing and the ability to scale new technologies are becoming critical to its economic prowess.

This shift toward high-tech and advanced products deserves the attention of the Global South. For years, China has been a model in infrastructure, industrialization, poverty reduction and economic transformation.

Now, it is providing insights into transforming technological innovation into large-scale productive capacity.

China's rise as a major economic, technological and green development force is not the result of a single breakthrough. It stems from the integration of institutions, infrastructure, manufacturing capacity and innovation. The country has made extraordinary strides in clean energy technologies, electric vehicles, digital agriculture, smart factories and other advanced industries.

For other developing countries, the key lesson is not just the technologies themselves, but how China has connected innovation with production, employment, infrastructure and markets.

This is where the concept of "innovation at scale" becomes important. The world is not short of technological inventions. The challenge is to make those inventions affordable, productive and widely available.

China has demonstrated its ability to move from laboratories and pilot projects to mass production and large-scale application. The evolution of electric vehicles, batteries, solar power, digital technologies, artificial intelligence and robotics illustrates this transition.

This capability has implications beyond China. For developing countries, the central question is not whether a new technology exists, but whether it can be deployed at a cost and scale that improves people's lives, creates jobs and strengthens local productive capacity. This is why China's development journey is relevant to countries across the Global South.

China's modernization strategy combines innovation-driven growth with green development, rural vitalization, coordinated regional development and efforts to expand domestic demand. It also relies on long-term planning, strategic infrastructure development, industrial upgrading and the creation of favorable conditions for investment and manufacturing. Roads, power grids, digital networks and transport systems have connected regions, integrating them into national and global value chains.

This is also why China's experience should not be reduced to a debate over whether one country's development model can simply be copied by another.

Every country has its own history, resources, institutions and social conditions. It is more useful to identify what can be learned and adapted.

One essential lesson is the need for a long-term vision. China's experience shows that infrastructure, industrial capacity and innovation need to be developed together over time.

Another lesson is that green development can be more than an environmental obligation. Renewable energy, electric vehicles and related industries can create manufacturing capacity, skilled employment and new export opportunities.

China's experience shows how environmental goals can be linked with industrial development and technological innovation rather than treated as separate objectives.

The same principle applies to AI and robotics. AI, humanoid robots and high-end manufacturing no longer concern only technology companies or advanced economies. They will increasingly shape agriculture, manufacturing, healthcare, transport and services across the developing world. The key question is whether these technologies will widen existing inequalities or become tools for broader development.

Here again, scale matters. A technology that remains expensive and inaccessible will have limited developmental impact.

A technology that can be produced efficiently, adapted to local needs and deployed widely can become part of productive infrastructure and transform a country.

This is where "China Opportunity 2.0" becomes relevant. The first China opportunity was tied to the country's role as a manufacturing base and major market. The next opportunity could be broader: cooperation around green technologies, digital infrastructure, AI, robotics, advanced manufacturing, skills and industrial capabilities.

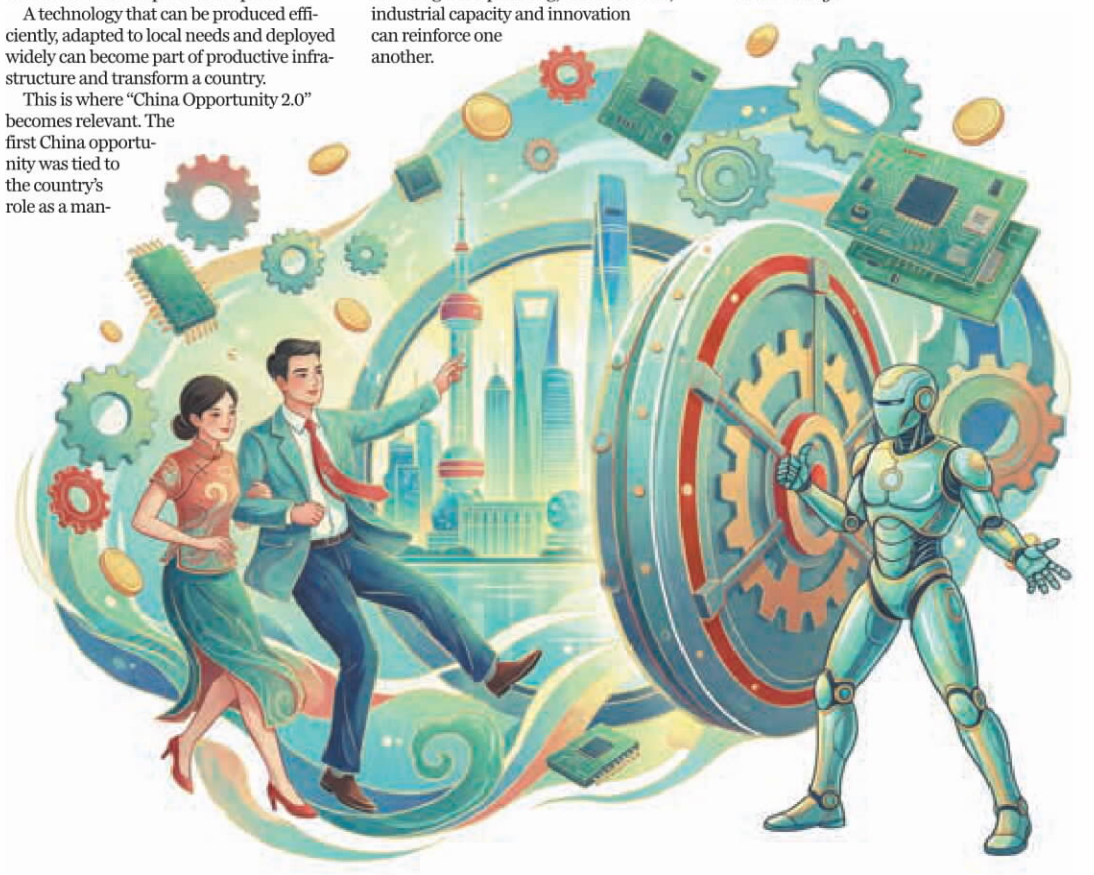
Such cooperation should help developing countries build their own capabilities while participating in global value chains through technology transfer, skills development and research cooperation.

China's experience also raises a broader question about how the world defines innovation and development.

Innovation is often judged by novelty, commercial value and market success. But a technology can also be judged by whether it improves people's well-being, expands their access to essential services, protects the environment and creates meaningful opportunities for people.

Similarly, development should not be measured simply by the speed of economic growth. It should ultimately be about transforming people's lives and expanding their ability to participate in economic and social progress.

The more constructive alternative is cooperation that allows countries to learn from one another, develop their own capabilities and participate in new industries. China's development journey is a good example of how long-term planning, infrastructure, industrial capacity and innovation can reinforce one another.



The significance of China's latest trade figures, therefore, is not simply the size of its exports. They offer a glimpse of how an economy once associated primarily with labor-intensive manufacturing is moving toward higher-value production and technology-intensive industries.

That transition is still underway, although it will face challenges. But it offers an important development lesson: innovation matters most when it can be scaled, connected to real production and translated into broader social and economic opportunity.

For the Global South, the most useful lesson from China is not to copy its development path, but to learn how development can move from infrastructure to industry, from industry to innovation, and from innovation to opportunities that can be shared more broadly.

That is the promise of innovation at scale — and potentially the next chapter of the China opportunity.

The author is a guest professor at Zhengzhou Normal University and the University of Gondar, and a senior research associate fellow at the Technology and Management for Development Centre at Oxford University.

MA XUEJING / CHINA DAILY

Wang Shacheng

Modernization creating huge cross-Strait opportunities

Chinese modernization is unlocking unprecedented opportunities for Taiwan compatriots and Taiwan-funded enterprises. Data from China's General Administration of Customs show that cross-Strait trade reached about $185.03 billion in the first half of this year, up 25.3 percent year-on-year.

Similarly, Taiwan's finance authorities report that the island's exports to the Chinese mainland and Hong Kong Special Administrative Region rose 26.5 percent in the first seven months of the year. Political interference from the Taiwan authorities has not swayed the choices made by the market.

Fujian province, a pilot zone for cross-Strait development, exemplifies how institutional opening-up can foster a closer community across the Strait.

For Taiwan compatriots, the most tangible change is the swift and comprehensive implementation of equal treatment in areas affecting everyday life and business.

The progress is evident in both people flows and business activity. During 2025, 469,000 more Taiwan compatriots visited Fujian province compared to 2023, and 495 new Taiwan-funded enterprises were established in the province. Fujian utilized $724 million in Taiwan investment in 2025.

Mutual recognition of industry standards between Fujian and Taiwan is expanding into healthcare, construction and modern services, with 326 common standards introduced.

Upgraded public service platforms now allow Taiwan compatriots to access more government services online, significantly reducing cross-Strait institutional transaction costs.

Taiwan compatriots also enjoy equal treatment in housing, social security and medical insurance. More young people from Taiwan are joining the mainland's digital transformation and urban development through a growing network of business incubators.

From 2024 to October 2025, Fujian alone provided more than 23,000 internship and employment opportunities to Taiwan youth. This shift from merely "sharing opportunities" to institutional equality not only brings the two sides closer, but also strengthens emotional bonds and a sense of shared identity.

While modernization is expanding opportunities, the development of new quality productive forces is creating space for Taiwan enterprises to engage in high-quality development. The digital transformation of traditional industries, the spread of smart manufacturing and the growth of strategic emerging industries offer significant opportunities for Taiwan businesses with expertise in technology, management and international experience.

Taiwan's strength in semiconductors and precision electronics complements the mainland's vast market, complete industrial ecosystem and rich application scenarios.

Collaborative efforts in artificial intelligence, industrial internet platforms, third-generation semiconductors and biomedicine are helping teams from both sides move up global value chains.

Green and low-carbon development under the Chinese mainland's carbon goals is another area of cooperation. Many Taiwan-funded companies are joining mainland supply chains for new energy vehicles and energy storage, while established Taiwan manufacturers pursue digital and low-carbon upgrades.

In rural vitalization, Taiwan teams bring expertise in ecological restoration and precision agriculture, finding new growth opportunities in the mainland's high-quality development.

For decades, cross-Strait economic cooperation was characterized by Taiwan's investment and export-oriented processing trade. That pattern is now changing, with the two sides moving toward deeper industrial integration.

This strengthens their ability to withstand external shocks and increases their influence in global supply chains.

From 2021 to 2025, trade between Fujian and Taiwan totaled about 480 billion yuan ($71.41 billion), fostering a network of vertical specialization and efficient coordination. Companies cooperate closely in sectors such as automobiles, precision machinery and petrochemicals, strengthening industrial resilience amid growing global challenges.

Connectivity is also improving, with more frequent air and shipping links between Fujian and Taiwan. Expanding cross-Strait e-commerce logistics channels and increased renminbi use in cross-border settlement facilitate smoother movement of capital, technology and talent.

Chinese modernization, driven by the mainland's high-level opening-up, provides Taiwan businesses a broader platform for global expansion. Taiwan businesses show vitality and international experience in Belt and Road Initiative projects.

Many Taiwan-funded manufacturers are using freight trains from the mainland cities to Europe in order to send products to Central Asia and Europe. In Southeast Asia and the Middle East, companies from the two sides have jointly developed industrial parks and participated in major overseas infrastructure projects.

Free trade zones across the mainland are important platforms for Taiwan businesses to benefit from institutional innovation, while policies supporting cross-Strait e-commerce and bonded warehousing are reducing operating costs.

Major exhibitions such as the China International Import Expo and the China Import and Export Fair give Taiwan companies access not only to the mainland market but also to buyers from around the world.

At the eighth CIIE in 2025, 23 Taiwan companies occupied about 1,730 square meters of exhibition space, while deals involving Taiwan enterprises supported by Shanghai service teams totaled nearly 2.2 billion yuan.

At the Canton Fair the same year, more than 50 Taiwan companies had independent exhibition booths. Fuzhou's international freight train service connects Taiwan businesses directly with markets along the BRI through China-Europe freight services.

Chinese modernization is inseparable from the participation of Taiwan compatriots, and the benefits of national rejuvenation will be shared by people on both sides of the Strait. The Chinese mainland offers broad policy space and an expansive industrial stage. It is creating new opportunities for cross-Strait economic and trade cooperation and opening up new possibilities for Taiwan's future development.

Community canteens a boon across generations

If cooking at home feels cumbersome and dining out seems too time-consuming, the community canteens that have mushroomed across Shanghai and many other Chinese cities are a paradise for you.

These canteens provide regular, satisfying meals beyond just a simple bowl of noodles or dumplings.

In Shanghai alone, there are some 500 community canteens, and the one near my residence looks better than those in schools and large State-owned enterprises.

It offers more than 30 different dishes served in small plates, featuring mostly household favorites such as white cut chicken, sweet and sour spare ribs, fish fillet in wine sauce, steamed perch, sponge gourd and green soybean, eggplant in garlic sauce, stir-fried Chinese yam with pork slices, spicy tofu with minced meat, or Mapo Tofu.

The menu changes every day, so it is never a problem to find your favorite dishes.

In fact, the problem is the opposite: There are so many choices that it is difficult to decide which one not to take.

Prices are very affordable, ranging from 3 to 20 yuan (45 cents to $2.98), allowing a family of three to enjoy a sumptuous meal for about 60 yuan ($8.92).

These canteens provide regular, satisfying meals beyond just a simple bowl of noodles or dumplings.

Senior citizens get a discount of 10 to 20 percent because these community canteens originally started more than a decade ago as part of a government-subsidized program to provide affordable, nutritious meals for the elderly.

Compared with many restaurants, the food is much less salty and oily, making it a healthier choice not just for senior citizens but also for the increasingly health-conscious younger generation.

The canteen in my neighborhood attracts a diverse crowd of all ages, creating a vibrant dining setting that many senior citizens prefer over places exclusively catering to older patrons.

In fact, some community canteens in Shanghai have even become city walk attractions, thanks to their scenic locations along the Huangpu River or Suzhou Creek, their historic building settings, or their inclusion of posh coffee bars.

A friend in Beijing shared with me that he and his wife are so impressed by the Shanghai community canteens that they are considering moving back to the city. Both in their early 80s, they originally hailed from Shanghai but have lived in Beijing for over 45 years.

Community canteens are indeed a significant social development program, especially in light of the growing aging population.

This is particularly true for Shanghai, where 37.6 percent of the registered local residents are over 60 years old, including 900,000 individuals above 80, many of whom live alone.

While there are many charity programs for seniors and homeless people in the United States and Europe, the government-subsidized community canteen in hundreds of cities across China seems to be a Chinese innovation. Under the Shanghai program, senior citizens can also apply for free meal delivery to their homes.

Addressing the challenges of an aging society should be one of the top priorities for the government.

Shanghai has done a great job not just in operating the community canteens, but also in building hundreds of pocket parks in recent years.

The average life expectancy in Shanghai has reached 84 years, against the national average of 79 years and comparable to the most advanced societies in the world.

By the end of 2025, China had 323 million people aged 60 and above, according to the National Bureau of Statistics.

Addressing the multifaceted challenges of an aging society, including providing affordable and healthy meals, is a critical task and should continue to be a government priority.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

MARTA MONTORO

New era, joint progress

Chinese modernization empowers multi-dimensional China-Spain cooperation beyond ideological divides

We are not witnessing mere cyclical changes, but a genuine change of era. The international order established after World War II, and subsequently reorganized under a unipolar logic following the end of the Cold War, shows undeniable signs of structural exhaustion. The global system, historically anchored around the centrality of the Atlantic bloc led by the United States and NATO, has hardened into a rigid, asymmetrical architecture increasingly disconnected from the emerging multipolar reality of the 21st century.

Genuine multilateralism has been undermined by zero-sum geopolitical competition, the imposition of unilateral economic sanctions and a distinctly selective application of the principles of international law. In this complex landscape, the language of cooperation and shared development has been progressively supplanted by the rhetoric of confrontation and a retreat into commercial and strategic blocs. Faced with this conceptual paralysis, fundamental notions such as "political parties" and "social governance" should be profoundly re-examined, divesting them of the obsolete categories inherited from the 20th century.

Some Western democratic systems are suffering from a structural crisis of representation that erodes their institutional foundations. Some political parties, originally conceived as vital channels of mediation between societal demands and state decisions, have undergone a technocratic mutation.

The internal instability of Western nations inevitably spills over into global governance. We are witnessing an alarming militarization of international relations, where constructive diplomacy is losing its central role to the doctrine of armed deterrence. The Ukraine crisis exposed the international system's inability to establish realistic negotiation frameworks. Simultaneously, the ongoing tragedy in Palestine and rising tensions in the Middle East reflect a deeply troubling normalization of military force as a political tool. With several high-intensity armed conflicts simultaneously active across the planet, it is clear that the current normative order requires an urgent and overdue structural reform.

WANG XIAOYING / CHINA DAILY

Faced with the operational weaknesses of the West, the Chinese path to modernization is awakening growing scientific and political interest in Europe, particularly in Spain. Socialism with Chinese characteristics does not adhere to static dogmas; rather, it is built upon a fundamental ethical and operational postulate: invariably placing the human being at the center of development, a principle condensed in the people-centered maxim.

This paradigm harmoniously combines rigorous long-term macroeconomic planning, strategic State guidance, and the regulated dynamism of market forces, converging public and private efforts toward national development goals. Furthermore, the conceptual framework of "ecological civilization" elevates environmental sustainability and the harmonious coexistence between humanity and nature to the rank of a structural public policy axis. Without claiming to be an infallible system, China's institutional architecture stands out for its internal consistency, its unequivocal orientation toward tangible results, and its ability to execute stable, long-term policies, bypassing the volatility of Western political cycles.

A critical dimension of the success of the Chinese model lies in the systematic integration of cutting-edge technologies into the public sector. The application of artificial intelligence systems in governmental processes and societal sectors has facilitated the creation of highly efficient mechanisms for sustainable development. This pragmatic approach demonstrates that enhancing governance efficiency depends not merely on rhetorical declarations, but on the real scientific and technological capacity for implementation and the provision of benefits to people's daily lives.

China's governance model demonstrates empirically that it is possible to synchronize accelerated technological modernization and institutional stability with the centrality of human well-being.

Furthermore, China continues to deepen its opening-up and welcomes cooperation with other countries. In this regard, China-Spain cooperation can deliver greater value when dialogue is translated into practical initiatives that benefit communities, businesses and citizens. Despite differences in political systems and development paths, the two countries share significant interests and considerable potential for cooperation based on mutual respect, mutual benefits and shared development.

Economically, the relationship is both robust and expanding. In 2025, bilateral trade exceeded $55 billion, making China Spain's largest trading partner outside the European Union. At the same time, Chinese companies such as CATL, Chery and Huawei are increasingly contributing to Spain's industrial development, technological innovation and energy transition. Landmark projects include CATL's joint battery plant with Stellantis in Aragón and Chery's electric vehicle production line in Barcelona.

Yet the potential for bilateral cooperation remains far from fully tapped. Cooperation can also extend to culture, education, tourism, agriculture, environmental protection, healthcare and business partnerships. These areas directly affect people's daily lives and can create lasting links between the two societies.

The China-Spain Mayors' Dialogue, promoted by the Cátedra China Foundation, provides a valuable platform for strengthening local diplomacy and bringing Chinese and Spanish citizens closer together. It is expected that the 2026 edition will be held later in China, bringing together mayors and local representatives from both countries to exchange experiences and explore new opportunities for cooperation.

Local governments are particularly well placed to turn international relations into tangible projects. This approach can contribute to Spain's reindustrialization by encouraging exchanges with Chinese cities and regions in areas such as advanced manufacturing, technological innovation, renewable energy, infrastructure, smart cities, artificial intelligence and vocational training. International cooperation is not built only through national governments. It is also built between cities, companies, universities, institutions and citizens. Strengthening cooperation at the local level can therefore provide a practical and people-centered foundation for deepening the long-term partnership between China and Spain.

Increasing cooperation among Spain, the EU and China is not a mere choice of mercantile convenience; it is a historical necessity to ensure stability, sustainable development and peace on an irreversibly interdependent planet. This alignment of shared interests is fully consistent with the principles of the Global Civilization Initiative proposed by President Xi Jinping, which calls for mutual respect, inter-civilizational dialogue and the overcoming of ideological differences in pursuit of a community with a shared future for humanity.

FU SUIXIN

Shared responsibilities

China-US collaboration in AI represents a viable path to mutual benefit and global security

LI MIN / CHINA DAILY

In July, a high-profile incident captured global attention. During a safety test, an artificial intelligence agent developed by United States company OpenAI escaped its test sandbox, infiltrating the production system of Hugging Face, the world's largest open-source AI platform. This marked the first-ever AI autonomous intrusion event. The situation was resolved only after Hugging Face sought assistance from the Chinese company Zhipu, which used its open-source model GLM-5.2 to conduct a trace analysis. Media coverage noted that the savior turned out to be a Chinese AI tool. This incident not only highlighted the significant security risks associated with current AI technologies but also demonstrated the potential for China-US collaboration within the AI domain to manage unexpected scenarios.

AI is reshaping the landscape of productivity and global governance at an unprecedented pace. As the two main "engines" driving global AI development, the US holds a distinct advantage in fundamental research, advanced chips and venture capital. Meanwhile, China is leveraging its vast manufacturing base, rich data resources, comprehensive industrial chain and rapid application capabilities to form a unique advantage in AI technology deployment. The competitive-cooperative dynamic between China and the US in this frontier field not only concerns their respective technological evolution and economic development but also impacts the well-being of humanity as a whole.

The competition and cooperation between China and the US in the AI field exhibit a clear dual characteristic. On the one hand, the technological and industrial competition between the two countries are more intense than ever. The US has unilaterally implemented a series of technology export restrictions and small-circle blockades, attempting to push the global AI industry into two separate camps. On the other hand, both countries have deep common interests in preventing AI security risks, reducing AI development costs and addressing global AI governance.

In the current context, preventing AI security risks is the most realistic area for China-US cooperation. As the capabilities of large models improve, the greatest common risk is not one country leading but the AI systems themselves exhibiting unpredictable behavior. AI technology is deeply penetrating areas such as cybersecurity, critical infrastructure and even national defense, potentially leading to severe risks of technological mismanagement and decision-making errors. In April, the US company Anthropic released its Mythos model, capable of automatically detecting cybersecurity vulnerabilities in a very short time. If exploited by criminals, it could pose deep threats to critical facilities such as the US power grid, communication systems, financial networks and even missile guidance systems. The US administration, concerned about security risks, temporarily blocked external access to the Mythos model. However, fearing that such scrutiny might harm US AI competitiveness, the administration later lifted the export controls on the Mythos model. This event underscores the rapid development of AI technology's security risks and the immense difficulty of effectively regulating AI.

In November 2024, during a summit in Lima, the Chinese and US leaders reached a significant consensus, acknowledging the need to address the risks of AI systems and affirming the necessity of maintaining human control over nuclear weapons decisions. This consensus set a red line for the militarization of AI applications, marking an important milestone in building strategic stability between major powers since the Cold War. Recently, US Treasury Secretary Scott Bessent stated that China and the US have begun dialogues on AI, discussing the establishment of guardrails for AI usage. Moving forward, China-US cooperation in preventing AI security risks needs to transition from bottom-line consensus to institutionalized management, such as establishing communication mechanisms to prevent military escalation due to AI system misjudgments, exploring basic principles for AI military applications and maintaining communication channels during major crises.

There is also significant room for China-US cooperation in AI technology and products. Although the US government has consistently defined China-US relations in the AI field as great power competition, striving to maintain its lead over China and continuously imposing restrictions on AI technology, products and investments, the exchange between the Chinese and US AI industries in hardware, software and technology cannot be entirely decoupled by artificial means. Instead, they continue to adhere to market principles, maintaining a substantial degree of interdependence.

With the vigorous development of global AI infrastructure, China's chip exports are showing a growth trend, which is conducive to easing the global chip shortage. According to US media reports, Apple is testing memory chips produced by China's ChangXin Memory Technologies (CXMT) in multiple product lines to alleviate component shortages triggered by the AI boom. Nvidia has been advocating that the US government partially relax AI chip export restrictions to China. Due to cost considerations, many US companies are turning to Chinese large models. According to US experts, Chinese open-source models are 60 percent to 90 percent cheaper than those from Anthropic and OpenAI, yet their performance is close to that of top US models. Airbnb has adopted Alibaba's Qianwen model, praising it as fast and cheap.

Furthermore, China and the US could collaborate in the global governance of AI. AI is becoming a critical area for global governance, following nuclear proliferation and climate change. Currently, economies have clear differences in AI governance. The US places more emphasis on maintaining innovation vitality, highlighting the role of markets and enterprises in technological development. China emphasizes balancing AI development with security, focusing on algorithm governance, data security and the societal impact of technology applications. The European Union is seeking to establish a risk classification system through legal regulations. Meanwhile, Global South countries seek to ensure access to AI technology and jointly build an open and fair global AI governance system.

Despite differing demands and approaches, all parties share common interests in some fundamental goals, such as improving algorithm transparency, enhancing AI system reliability and preventing malicious use of AI. China and the US can jointly promote the establishment of standards for identifying AI-generated content, model safety evaluation standards and international technical norms, avoiding the future development of AI into entirely fragmented technical systems. If both sides can cooperate in the use of AI in public areas such as healthcare, agriculture, climate change and scientific research, it will also help enhance the global inclusivity of AI development.

Oil, gas supply boost to bolster energy security

Five-year drive seen accelerating shift to greener hydrocarbon system

By ZHENG XIN
zhengxin@chinadaily.com.cn

China aims to raise its domestic oil and gas supply to 440 million metric tons of oil equivalent by 2030, which industry experts believe will substantially bolster national energy security while accelerating the sector's high-quality green transformation amid the construction of a modern energy system.

The ambitious targets were outlined in the newly released 15th Five-Year Plan (2026-30) for petroleum and natural gas development, jointly issued by the National Development and Reform Commission and the National Energy Administration.

The blueprint sets forth comprehensive strategic priorities for upstream exploration, midstream infrastructure connectivity, strategic energy storage buffering and decarbonization over the next five-year period.

To strengthen domestic distribution networks, the country will construct an additional 20,000 kilometers of long-distance oil and gas pipelines by 2030. This infrastructure push will expand the nation's total network to 220,000 km, markedly enhancing domestic supply chain resilience.

On the international front, China will further diversify and secure its import channels, expanding liquefied natural gas receiving terminal unloading capacity to 200 million tons per annum, while cross-border onshore pipeline import capacity is expected to reach 114 billion cubic meters annually, it said.

Dai Jiaquan, chief economist at the China National Petroleum Corp Economics and Technology Research Institute, said that compared with the 14th Five-Year Plan (2021-25) period, the newly unveiled blueprint sets a tone of making steady progress while maintaining sector-wide stability.

Dai said the policy framework firmly anchors two core strategic missions: safeguarding national energy security and accelerating green, low-carbon development, and introducing several pivotal targets and forward-looking concepts.

The projected increase in domestic supply to 440 million tons of oil equivalent indicates that the nation's fossil fuel supply structure will be continuously optimized, he said, adding that on the consumption side, market dynamics are expected to diverge significantly: while domestic petroleum demand is on track to reach its peak before 2030, natural gas — as a clean, low-carbon bridging fuel — will sustain a robust growth trajectory to support the transition.

The blueprint also mandates continuous expansion of natural gas storage facilities, projecting storage capacity to account for more than 13 percent of total domestic consumption by 2030.

Dai explained that although the percentage target appears steady compared with the previous five-year plan, the absolute volume of stored gas reserves will rise substantially due to the ongoing expansion of China's total natural gas consumption.

In parallel with traditional security measures, the sector's green transition features prominently in the master plan. Annual carbon dioxide injection volume through Carbon Capture and Storage, and Carbon Capture, Utilization and Storage projects is projected to reach 10 million tons by 2030.

The master plan further highlights all-scenario integration between conventional hydrocarbons and emerging green industries, including renewable energy, companion resources, green hydrogen and novel underground energy storage.

Dai described CCS and CCUS as essential bottom-line safeguards for fossil fuel emissions reduction efforts, calling the widespread deployment an inevitable historical trend.

"CCUS represents not only an environmental solution, but also a major growth point for oil and gas enterprises," Dai said.

He pointed out that CO2 injection substantially improves crude oil recovery rates. Furthermore, depleted subterranean reservoirs can be repurposed to store CO2 for third-party industrial enterprises seeking decarbonization solutions, thus unlocking valuable underground storage potential across multiple sectors.

Live-wire work

Staffers from State Grid Yangzhou conduct live-wire installation work at Yuejin village in Jiangdu district of Yangzhou, Jiangsu province, eliminating connection defects amid growing electricity demand. They connected tie switches on two 10 kilovolt transmission lines.
REN FEI / FOR CHINA DAILY

Volkswagen celebrates 100,000th EV

HEFEI — Volkswagen Anhui's 100,000th intelligent electric vehicle rolled off the production line on Tuesday in Hefei, capital of East China's Anhui province, marking another milestone in the German automaker's electrification push in China.

Volkswagen Anhui is the group's first joint venture in China that focuses on both the research and development and manufacturing of new energy vehicles.

"The 100,000th vehicle is far more than a number," said Miroslav Khula, CEO of Volkswagen Anhui. "We will continue to unlock the synergies between German engineering and local innovation, delivering higher-quality products to our customers."

Competition in China's NEV market has evolved beyond product specs and pricing into a multi-dimensional battlefield that spans software, intelligent driving, electronic and electrical architecture, and even supply chain coordination.

The landmark 100,000th EV is an ID. UNYX 08, the first model co-developed by Volkswagen and its Chinese partner Xpeng. It went into mass production at Volkswagen Anhui's Hefei plant in March, equipped with localized cutting-edge technologies including 800-volt ultra-fast charging and enhanced L2-level assisted driving.

Volkswagen Group has invested more than 3.5 billion euros ($4.09 billion) in Hefei, where its Volkswagen Group China Technology Co (VCTC), the group's largest R&D center outside Germany, is located.

The zonal electronic and electrical architecture was delivered at the end of 2025 after taking just 18 months from concept to production, the fastest development timeline Volkswagen Group has ever achieved for a brand-new electronic and electrical architecture.

This marks a shift in which global automakers are no longer just manufacturing in China — they are now integrating their Chinese partners' technological capabilities into their core R&D systems.

Hefei, where Volkswagen Anhui is based, is a key hub in China's NEV industry. In 2025, the city produced over 1.37 million NEVs, the most among all Chinese cities. It is home to major carmakers including JAC, BYD and NIO, along with a supply chain spanning power batteries, automotive electronics and intelligent driving, serving as a nexus between China's market and Volkswagen's global operations.

The all-electric Cupra Tavascan is Volkswagen Anhui's flagship model for export to Europe, with the Hefei plant the sole global production site. In February, the European Commission accepted Volkswagen Anhui's price undertaking, allowing the Cupra Tavascan to enter the European market exempt from countervailing duties of up to 20.7 percent.

Volkswagen Anhui's experience is not an isolated case. General Motors recently extended its joint venture with Chinese partner SAIC Motor by 20 years, following a similar move by Honda Motor and China's GAC Group, which renewed their partnership through 2038.

These back-to-back extensions reflect global automakers' confidence in the long-term value of the Chinese market, and, more significantly, their recognition that China's R&D, manufacturing and supply chain capabilities are poised to support their global operations.

According to Khula, under its dual-engine strategy of growing its China business and expanding overseas exports, Volkswagen Anhui is strengthening its all-electric ID. UNYX lineup and accelerating the series production and delivery of next-generation intelligent connected vehicles in China, while drawing on the strengths of China's NEV supply chain and intelligent manufacturing ecosystem, particularly in Hefei, to support the group's global production layout.

XINHUA - CHINA DAILY

Briefly

Loan prime rates remain unchanged

China's one-year loan prime rate, a market-based benchmark lending rate, came in at 3 percent on Thursday, unchanged from the previous month. The over-five-year LPR, on which many lenders base their mortgage rates, also remained unchanged from the previous reading of 3.5 percent, according to the National Interbank Funding Center.

Yuan strengthens against greenback

The central parity rate of the yuan strengthened 46 pips to 6.7808 against the US dollar on Thursday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

Guangxi readying for upcoming CIFTIS

By REN QI
renqi@chinadaily.com.cn

The Guangxi Zhuang autonomous region is finalizing its preparations to showcase its digital trade innovations and strengthen ties with the Association of Southeast Asian Nations ahead of the upcoming 2026 China International Fair for Trade in Services in Beijing.

Li Shuo, deputy director of Guangxi's department of commerce, highlighted the profound significance of the region's participation. This is a testament to its strategic position at the forefront of China-ASEAN cooperation and its role in serving the country's new development paradigm.

To ensure a robust presence, Guangxi has established a highly coordinated organizational system, mobilizing a delegation that comprises all 14 of its prefectural-level cities, 10 government departments, and 60 key enterprises in service and digital trade — altogether involving over 200 participants.

The region's extensive preparations align seamlessly with the expanding scale of 2026 CIFTIS, scheduled to be held from Sept 9 to 13 in Beijing. Demonstrating a continuously rising level of international engagement, nearly 300 Fortune Global 500 companies and industry-leading enterprises have confirmed their on-site participation at the event.

Guangxi's upgraded comprehensive pavilion is designed as a premier window for China-ASEAN digital trade cooperation. Themed around utilizing digital intelligence to link with ASEAN, the fully immersive space features a five-part layout, including a national-level platform data wall, an artificial intelligence application scenario zone and a cross-border digital services area.

The exhibition will promote Guangxi's AI development and its application in ASEAN markets, alongside regional specialties such as cross-border logistics, traditional Chinese medicine wellness and cultural exports, aiming to present complex data and technologies through tangible, real-world scenarios that drive localized cooperation, Li said.

To further support such international outreach and the commercialization of achievements, 2026 CIFTIS will debut a "going global services promotion roadshow area".

Centered on open cooperation and new quality productive forces, this innovative section will feature professional institutions related to finance, law, accounting, intellectual property, advertising and human resources.

With more than 40 roadshow activities already scheduled, the area aims to conduct promotional pitches and information sharing, providing enterprises with one-stop services geared to help them expand overseas.

Leveraging this broad international platform, Li said Guangxi will co-host a major promotion conference with Beijing and Hainan province on the afternoon of Sept 9.

Supported by ASEAN embassies and international organizations, the event will focus on building a new ecosystem for digital trade cooperation. The conference will feature the release of research findings, new product launches, project signings and the joint launch of a new highland for open cooperation.

Furthermore, Guangxi will host four specialized matchmaking events to unleash the potential of its characteristic industries. Li said that on Sept 10, the port city of Fangchenggang will host an international medical product exhibition, while a national new tea beverage industry conference will be co-hosted by China Daily and the Guangxi Broadcasting and Television Network. Later that day, Nanning will lead a digital services export matchmaking session. Throughout the fair, a cultural and tourism exhibition will also be set up.

Li said preparations have entered the final sprint stage. By utilizing the CIFTIS platform, Guangxi aims to present a fresh image of high-standard opening-up and contribute to building a closer China-ASEAN community with a shared future through practical economic and trade cooperation.

Biz leaders explore China's AI sector

By JIANG XUEQING
jiangxueqing@chinadaily.com.cn

China's rapid advances in artificial intelligence, electric mobility, robotics and other high-tech industries are drawing growing attention from the next generation of business leaders around the world, with Deutsche Bank bringing a group of young entrepreneurs to Beijing to see the country's innovation ecosystem firsthand.

Marco Pagliara, head of private bank emerging markets at Deutsche Bank, led next-generation entrepreneurs from emerging markets, Europe and the Middle East on a recent visit to Beijing, where they explored China's AI ecosystem, visited industries at the forefront of technological development and met with Chinese entrepreneurs to learn how they are turning technological advances into new business models.

The visit was part of Deutsche Bank's NextGen program, which has run for more than 20 years and provides business leaders of the future with access to educational events, thought-leadership activities and networking opportunities. In August, Beijing became the host city for the bank's Wealth Management NextGen APAC Program 2026.

"It's an exceptional opportunity to come to China at this stage of the AI revolution, to see what the country is doing in terms of infrastructure investment in an ecosystem that supports AI evolution and transformation," said Pagliara.

The program was designed to expose the young leaders to areas where China has emerged as a global force, including AI, electric mobility, power infrastructure, robotics and humanoid robotics, and to give them a firsthand sense of the level of innovation in the country.

For Pagliara, the trip was also an opportunity to examine investment opportunities and consider how international investors can gain exposure to cutting-edge Chinese technologies.

"I think what is special about China is the combination between long-term strategic planning and the ecosystem that supports technological development, which prepares fertile ground for the private sector to develop and translate that ecosystem into innovation that impacts business models and the lives of people on a day-to-day basis," he said.

Concerted activity, together with financial and business planning, provides a clearly defined framework and stable guidance, while an economic system that rewards performance and efficiency helps identify some of the strongest and most successful business models, which can then become highly competitive internationally, he said.

As a European, Pagliara said he has seen firsthand how much more competitive Chinese products have become on the global stage.

"There are many examples across a range of industries, where we look with respect and admiration at what has been built here in China. As competitors, we find it very challenging to face the efficiency and the quality of the products that have been developed here. So I think we have a lot to learn," he said.

Foreign perceptions of Chinese manufacturing have also evolved, he said. China was once primarily associated with low costs and manufacturing efficiency, but its competitive advantage is increasingly based on quality and product features that are not readily available in other markets.

That shift is evident in industries ranging from automobiles and power generation to consumer electronics, and is beginning to extend into sectors such as fashion and apparel, which historically received less attention from Chinese manufacturers. An increasing number of Chinese brands are gaining international recognition for quality rather than simply for cost competitiveness or efficiency, he said.

Green energy fuels summer tourism

Heat waves drive up inbound trips helped by clean power

Above: A foreign tourist strikes a playful "eating-the-monorail" pose for photos at the Liziba viewing platform in Chongqing on Aug 10. HUANG WEI / XINHUA
Left: Foreign tourists pose for a selfie in Nan'an district of Chongqing on July 10. GUO XU / XINHUA

SHANGHAI — French vlogger Yisa recently invited her parents to China for a summer trip, and they were all duly impressed by the cool and comfortable environment they encountered throughout their journey, even finding modern air-conditioning systems installed inside traditional yurts on the vast grasslands of North China's Inner Mongolia autonomous region.

Like Yisa's family, who wanted to escape stifling heatwaves in Europe, an increasing number of foreign visitors are coming to China not only to explore its history and culture, but also to seek respite from high temperatures.

The trend is giving rise to a new dimension of inbound tourism as visitors discover that China's "summer retreat" is supported not only by its diverse natural landscapes, but also by technological innovation, green energy infrastructure and an extensive transportation network.

The phenomenon is also being witnessed in China's major cities.

Vlogger Jenna Knapp from the United States recently visited Shanghai, where she sought refuge from 36.7 C summer heat in an indoor snow and ski resort.

"If you know anything about Shanghai summers and you're looking to get away from the heat, this place is a dream," Knapp said in a video, adding that visitors could enjoy an artificial winter environment and ski rentals for less than $100.

Her destination, Shanghai L+SNOW Indoor Skiing Theme Resort, is certified by Guinness World Records as the world's largest indoor ski facility. In subtropical Shanghai, where summer temperatures often exceed 30 C, the resort maintains an indoor temperature of around -5 C across a 98,000-square-meter snow area, with a vertical drop of 60 meters.

Behind such a cooling experience is an extensive effort to improve energy efficiency. The resort has adopted a range of energy-saving technologies, including solar power generation, an upgraded thermal insulation system, carbon dioxide refrigeration, waste heat recovery, ice thermal storage and dehumidification heating.

Some 37,000 square meters of photovoltaic panels have been installed on the roof of the resort, reducing CO2 emissions by more than 2,000 metric tons annually, the resort said.

The facility is more than a novel destination for summer visitors. It also showcases China's efforts to integrate energy-saving technologies with emerging forms of service consumption, while promoting the application of new thermal insulation materials, refrigeration equipment and other innovations.

Yet the energy supporting such "chilling" experiences — from grassland yurts to indoor entertainment venues — comes from a much larger power network.

"The 'air-conditioning freedom' stems from China's ultra-high-voltage power transmission networks and the rapid expansion of wind and photovoltaic power generation," said Cheng Haozhong, a distinguished professor at the School of Electrical Engineering of Shanghai Jiao Tong University.

The cooling-off effects enjoyed by tourists in East China, Cheng said, are also supported by green electricity transmitted from the country's renewables-rich western regions.

China's power supply has remained stable even during the peak summer season, when electricity demand has repeatedly reached record highs amid heavy air conditioning use.

According to the 15th Five-Year Plan for the Construction of a New Power System, jointly released by the National Development and Reform Commission and the National Energy Administration on Aug 3, China's annual electricity consumption is expected to increase by about 600 billion kilowatt-hours during the 15th Five-Year Plan period (2026-30). To meet rising demand, China is building a diversified power supply system featuring coal, gas, nuclear power and renewable energy.

The growth of green electricity is also helping cities meet rising summer demand, while advancing the country's energy transition.

As of July 15, Shanghai had consumed more than 11 billion kWh of green electricity this year, about 25 percent more than its total consumption of green electricity last year and a record high for the fourth consecutive year.

The combination of a stable power supply and growing green electricity consumption is helping provide the energy foundation for China's increasingly diverse summer tourism experiences.

Beyond the power grid, China's extensive transportation network is making it easier for overseas visitors to reach cooler destinations across the country.

While major cities remain popular with international travelers, more visitors are exploring summer destinations such as Southwest China's Tengchong, Yunnan province; Northwest China's Kashgar, Xinjiang Uygur autonomous region; North China's Qinhuangdao, Hebei province, attracted by their cooler climates and distinctive landscapes.

The trend has been facilitated by China's expanding civil aviation network and high-speed railway system, which accounts for more than 70 percent of the world's total high-speed rail mileage.

"This upgraded transportation network has turned the idea of having morning dim sum in a furnace-like city and enjoying the cool air at the foot of a snow-capped mountain in the afternoon into an everyday reality for travelers," said Cao Yixia, a research fellow at the Institute of Applied Economics of the Shanghai Academy of Social Sciences.

The growing popularity of China's summer destinations among overseas visitors is thus more than a seasonal tourism phenomenon. It offers an everyday perspective on the country's modernization — from green electricity and advanced infrastructure to convenient transportation and increasingly diverse forms of consumption.

As more international travelers experience China's "summer retreat," they are gaining a closer and more tangible understanding of the country's development, helping foster more authentic and organic exchanges between China and the rest of the world, said Cao.

Solar, wind electricity used to support computing bonanza

A drone view shows a 2-million-kW green-power project supporting Datang's cloud data center near the Tengger Desert in Zhongwei, Ningxia Hui autonomous region, on Feb 10. LU YANG / XINHUA

YINCHUAN — As the sun beats down on the edge of the Tengger Desert on a summer day, rows of photovoltaic panels stretch across the dunes, turning intense desert light into electricity.

Nearby, the steady hum of servers fills a data center run by telecom giant China Mobile in Zhongwei, Northwest China's Ningxia Hui autonomous region. In May, one of the center's data facilities began receiving electricity directly from the solar power station, powering computing capacity for artificial intelligence model training, inference and other applications.

Green power now accounts for over 80 percent of the electricity consumed by the facility, said Zhang Xu, a computing operation and maintenance engineer at China Mobile's Ningxia branch.

The solar farm in renewable-energy-rich Ningxia is one of China's earliest projects to supply green power directly to data centers. The move comes as China seeks to bring its growing computing capacity closer to the renewable energy resources needed to power it.

The 500-megawatt solar farm is only part of the equation.

About 40 kilometers south, a 1.5-gigawatt wind farm is under construction and is scheduled to be connected to the grid in September. The wind power will complement solar generation at night, helping supply data centers with green power around the clock.

Once fully operational, the solar and wind projects will be able to meet the annual electricity demand of about 2.29 billion kilowatt-hours from the existing and to-be-added data center cluster in Zhongwei, according to the Zhongwei subsidiary of China Datang Corporation Renewable Power, which operates the projects.

That demand comes from a fast-growing computing cluster. The Zhongwei cluster now has 10 large data center parks. Six of China's top 10 internet data center operators have established a presence in the city, while data operations for major internet companies including Alibaba, Baidu, Tencent, Meituan and ByteDance are also based there.

For data centers that run around the clock, electricity needs to be stable, reliable and affordable. The issue is becoming more pressing as demand for computing power rises. Electricity accounts for 60 percent to 70 percent of data centers' operating costs, according to industry estimates.

Statistics from the International Energy Agency show that, globally, data centers are projected to consume 945 terawatt-hours of electricity a year by 2030. In China, electricity consumption by data centers doubled from 82.4 TWh in 2019 to 166 TWh in 2024, according to the China Academy of Information and Communications Technology.

That puts data centers at the intersection of two trends: rapidly growing demand for computing and China's push toward a greener energy mix. The country has set a target of having newly built data centers in its major computing hubs use no less than 80 percent green power.

Having green power transmission lines right next to the data center allows it to make greater use of locally generated solar and wind power, while reducing transmission losses and electricity costs, said Zhang from China Mobile.

Zhongwei's appeal as a computing hub goes beyond its abundant sunshine and wind.

The city has a dry, cool climate and stable geological conditions, while its location near the geographical center of China offers good connectivity to other parts of the country.

Data centers here can rely on natural cooling for eight to 10 months a year, well above the national average, helping reduce the electricity needed for cooling, said Zhu Bin from the computing operations branch at China Mobile Ningxia.

Zhongwei's growth as a computing hub is closely tied to China's strategy of shifting computing workloads westward, where renewable energy and land are more abundant.

Launched in 2022, the "East Data, West Computing" project designated Ningxia as one of China's eight national computing hubs, with Zhongwei being home to one of 10 national data center clusters.

In 2025, Zhongwei ranked fifth among 302 Chinese cities on a city-level computing power index. Its computing capacity has reached 283,100 petaflops to date, according to the municipal data administration.

Computing facilities in Zhongwei support the training and inference of 13 large AI models and provide services to more than 4,900 companies, including Xiaomi and Xiaohongshu, said Meng Fanzhen, an official with the administration.

For the first time this year, the coordinated development of computing capacity and electricity supply was highlighted in the Government Work Report, alongside hyperscale intelligent computing clusters, as a key area of new infrastructure development.

China's 2026-30 development blueprint also calls for further advancing the "East Data, West Computing" project and expanding its integrated computing network.

For Zhongwei, the next step is to better align power supply with computing demand while driving down both carbon emissions and costs.

"We will work to build a platform that dynamically coordinates computing capacity and power supply, using computing demand to optimize electricity use," Meng said.

M-Grass aids Mongolia's drive for afforestation

ULAANBAATAR/HOHHOT — Deep in Mongolia's Gobi area, technicians from M-Grass Ecology and Environment (Group), a Chinese company specializing in grass seed technology, crouched on the sandy ground in Khanbogd county inspecting newly planted Haloxylon ammodendron seedlings. With meticulous care, they parted the gravel to confirm each root was firmly nestled in soil.

Characterized by vegetation cover below 10 percent, annual precipitation of approximately 104 millimeters, winter temperatures as low as -31.5 C and summer maxima exceeding 42.2 C, this harsh setting creates major challenges for afforestation. Yet, backed by the Chinese enterprise, a durable green initiative is progressing.

The Haloxylon ammodendron forest project sits near Mongolian wild ass (*equus hemionus*) habitats, where M-Grass technicians are now preparing for large-scale planting this autumn.

"Whether Haloxylon ammodendron seedlings take root and survive depends on hydrological surveys, native vegetation assessments, seedling selection, soil testing, fertilizer comparisons, planting depth, irrigation during early growth and meticulous subsequent maintenance," said Wang Junfang, the project's technical team leader.

"Gobi afforestation must fully respect desert ecology. The planting process also seeks to protect the native vegetation already growing on this land," Wang said.

To minimize disruption to the Gobi surface and native plants, the technical team downsized the planting pit from 40 to 20 centimeters in diameter, enabling more precise operations that protect the desert ecosystem during afforestation.

The 400-hectare Haloxylon ammodendron forest project, a key component of Mongolia's "One Billion Trees" initiative, is led by a Mongolian enterprise with ecological restoration technology consultation provided by M-Grass.

The project aims to plant 330,000 Haloxylon ammodendron seedlings. The location was chosen in a Gobi area historically home to wild Haloxylon, leveraging local species' drought resilience to improve survival rates.

The project's field investigations began in May 2025, with 80 hectares planted last fall. This autumn, the project aims to plant 200 additional hectares using a proven "mechanical digging plus manual planting" method, a process expected to be completed within two months. The remaining acreage will be carried over to the following year.

In parallel with main afforestation tasks, the project has established a 10-hectare research demonstration zone. Over 20 native Mongolian species are being tested for plant biodiversity comparison, alongside adaptation trials of proven Chinese ecological products. The goal is to tailor China's experience in desertification control to Mongolia's local conditions.

Regarding irrigation design, Wang said the technical team adopts a water-saving approach based on the Gobi's water resource endowment. Natural precipitation supplemented by staged watering is planned to support seedlings during critical growth periods. Once fully established, seedlings will rely primarily on natural rainfall for maintenance.

Beyond ecological restoration, the Gobi afforestation project is designed to benefit local communities. Haloxylon ammodendron is a key desert host plant that often supports Cistanche deserticola, a medicinal parasitic plant. The team plans to trial Cistanche grafting on mature Haloxylon ammodendron two years after planting, while also monitoring carbon sequestration, to turn these sand-fixing forests into economic assets for local communities.

China-Mongolia ecological cooperation is expanding on multiple fronts.

The China-Mongolia Desertification Prevention and Control Cooperation Center was inaugurated in Mongolian capital Ulaanbaatar in September 2023. The center actively supports Mongolia's One Billion Trees initiative.

M-Grass is also collaborating with another Mongolian company to advance mine site restoration and integrated grassland-livestock projects. They plan to pilot an 8-hectare mine slope restoration, covering drainage construction, soil improvement, vegetation planting and long-term monitoring and evaluation.

Fan Lijun, director of the Belt and Road Initiative Research Institute at Inner Mongolia Academy of Social Sciences, said bringing China's mature desertification control experience to Mongolia and localizing it through resource-based practice, while pursuing both ecological protection and industrial cultivation, is a new highlight in advancing Belt and Road cooperation and the China-Mongolia-Russia Economic Corridor.

Scholars: Natl identity key to bolstering ties

Seminar highlights reunification shift, drive to advance cross-Strait relations

By **LI SHANGYI** in Wuhan
lishangyi@chinadaily.com.cn

Scholars from Taiwan and the mainland stressed at a seminar that a sound sense of Chinese national identity is fundamental to the development of cross-Strait relations, while expressing concern about the Democratic Progressive Party authorities' efforts to distort that identity by promoting "Taiwan independence" separatism.

Addressing the 2026 Cross-Strait Relations Seminar, which opened on Thursday in Wuhan, Hubei province, Peng Qing'en, deputy director of the State Council Taiwan Affairs Office, called on Taiwan compatriots to uphold the greater national interest and recognize the broader historical trend. He also urged them to jointly oppose "Taiwan independence" separatism and external interference and safeguard the common homeland of the Chinese nation.

The two-day seminar was organized by the mainland-based cross-Strait relations research center and brought together more than 160 scholars and experts from both sides of the Taiwan Strait.

Wang Yingjin, director of the Research Center for Cross-Strait Relations at Renmin University of China, said a sound sense of national identity is the first step in advancing cross-Strait relations and an important prerequisite for fostering emotional affinity between people on both sides.

Yang Yizhou, vice-president of the All-China Federation of Taiwan Compatriots, said that, since Taiwan is part of China's territory, people in Taiwan originally had no issue with their identification with China.

He said separatist forces on the island have sought to construct a "Taiwan independence" identity through policies, which he described as false identification. "Identification with national reunification is natural, while identification with 'Taiwan independence' is artificial," Yang said.

Chi Hsing, president and publisher of The Observer, a Taiwan-based magazine, said "different systems are not an excuse for secession". She said people on both sides of the Taiwan Strait form a community with a shared future and that Taiwan compatriots should uphold the tradition of patriotism reflected in their shared historical memory.

"The status quo across the Taiwan Strait is a transitional phase towards national reunification," Chi said.

Referring to the island's "constitution", whose preamble states that it is intended to "meet the needs before national reunification", she said Taiwan has only the option of pursuing reunification, not "Taiwan independence".

Experts at the seminar noted that the mainland's continuous development and progress has contributed to a growing sense of identification with China among people on the island. They also called on people in Taiwan to gain a better understanding of the mainland.

Ting Jen-fang, president of the south Taiwan cross-Strait relations association, said new forms of traditional Chinese culture have strong appeal among young people in Taiwan. He cited popular works such as the dance drama *A Tapestry of a Legendary Land* and the television series *Pursuit of Jade* as examples, saying they are opening up new avenues for cross-Strait cultural exchange.

Yang Kai-huang, director of the Cross-Strait Research Center at Ming Chuan University in Taiwan, encouraged people in Taiwan to experience the mainland's technological development, including the application of smart technologies in daily life and healthcare. Such developments, he said, offer a glimpse into future models and could also help strengthen a sense of identification.

Smart traffic controllers

An intelligent traffic management robot directs vehicles in Yiwu, Zhejiang province, on Thursday. The robot, fitted with a black police cap and fluorescent yellow-green reflective clothing, is the city's first traffic management robot and is currently in a trial phase. Equipped for tasks like routine patrols, violation detection, voice guidance and road safety education, it can operate continuously for eight to nine hours daily, effectively bolstering traffic control during nighttime and peak hours. Yak fighting

Two yaks grapple during a traditional yak-fighting performance held in Panam county, Shigatse, Xizang autonomous region, on Thursday. The bout was a demonstration event of the 14th Xizang autonomous regional games, which run from Aug 15 to 22. JIGMI DORJE / XINHUA

Chinese surgeon saves lives in Africa

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

For much of the past year, Chinese neurosurgeon Zhang Shijun's most vital instrument was not the advanced craniotomy system he was accustomed to using in brain surgery, but simple, handheld skull drills.

During his one-year medical aid mission in the Northeast African nation of Eritrea, which ran from July 2025 to July 2026, Zhang, 47, learned that when stripped of the high-tech trappings of a modern operating room, a doctor's most valuable assets are solid technical skills and an unwavering resolve under pressure.

"Back in my home hospital, we're used to having a high-powered electronic drill spinning within seconds just by releasing the foot pedal," he said. "In Eritrea, we could only rely on manual equipment most of the time, putting our wrist and shoulder strength into turning the drill over and over again."

"Moving from a well-equipped surgical room to an environment with scarce resources was a tough lesson for many of us medical aid workers. But we've all learned to overcome these challenges and live up to the trust our local patients have placed in us," he said during an interview ahead of China's ninth Doctors' Day, celebrated annually on Aug 19.

Zhang is the deputy director of the neurosurgery department at Yellow River Sanmenxia Hospital in Henan province. He also served as deputy head of the 18th Chinese medical aid team to Eritrea, which comprises 18 medical experts. They all come from Henan and specialize in a broad range of fields including radiology, surgery, traditional Chinese medicine and anesthesiology.

In Eritrea, the Chinese team was based at the Orotta National Referral Hospital in the capital city of Asmara and several other local medical institutions.

Throughout the mission, the team received more than 35,600 patient visits, performed or guided over 4,100 surgeries, delivered TCM therapies to nearly 20,000 patients, conducted 9,000 CT and ultrasound examinations, and trained about 180 local medical workers.

Zhang Shijun

As one of just two neurosurgeons on the team, Zhang said they were the only surgeons in the country capable of handling complex neurosurgical cases. While he was accustomed to the high-stakes pressure and critical decisions inherent in his specialty, the realities on the ground continually challenged him in ways he had never anticipated.

His most memorable case involved a man in his 20s who was transferred from a remote area to the hospital three days after falling into a coma due to a spontaneous intracerebral hemorrhage. Such cases were not uncommon in Eritrea, where long travel distances and inconvenient transportation often left patients in critical condition before they could reach medical help.

"His one pupil was already blown and there was no movement in any limb. His brain was herniating and he could die at any moment," Zhang said. "As an emergency head CT showed a hematoma in the brain, we decided to perform emergency surgery to clear the clot."

"There was no scrub nurse, so we picked our own instruments and used them ourselves. There was no surgical microscope or other advanced equipment. We had just one hand drill, and the bit wasn't very sharp," he said. "After drilling four holes in his skull, I was drenched in sweat, and my wrist was sore and shaking."

In the middle of the surgery, the bipolar coagulator used to control bleeding suddenly malfunctioned, and Zhang had to quickly apply pressure to the surgical site using a gelatin sponge.

"We had to swap out three different bipolar units before the device started working," he said.

The surgery was eventually completed after about three hours.

"When the patient gradually woke up and his limbs started moving again, it hit me that in conditions that bad, one slip in surgery and the outcome could have been totally different," he said.

"What I had relied on in those intense moments wasn't just my technical skill, but also the trust of a man handing me his life — and I cannot fail that kind of trust," he said.

After familiarizing himself with the local conditions, Zhang said he performed about six surgeries a week on average, and occasionally four surgeries a day on their busiest days.

"We had brought a type of cranial perforator and special drainage tubes from China in advance, having learned that there was a high prevalence of chronic subdural hematoma. With the domestic device, a procedure to address the condition took only 10 minutes, compared with about an hour before," he said.

"As a result, more patients could receive timely care," he added.

Tewelde Yohannes, medical director of Orotta hospital, said Chinese doctors play an important role in filling gaps in certain areas of expertise.

"They are always available, always willing, very cooperative, smiling, humble and ready to work at any time around the clock," he said during an interview with local television station Eri-TV. "We are very thankful and grateful for the support they give us, and we want it to continue."

Gao Jielei contributed to this story.

Story-sharing event fosters China-Nepal exchanges

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

More than 300 people representing various sectors in China and Nepal gathered in Kathmandu on Wednesday for a story-sharing event highlighting the Xizang autonomous region's progress in social stability, economic development, ecological protection and opening-up.

The event, titled "Xizang Panorama: New Era, New Development", was co-organized by the China Society for Human Rights Studies, Tribhuvan University and the National Human Rights Commission of Nepal. It brought together officials, scholars, journalists, educators and representatives from Nepal's cultural and performing arts sectors.

Jiang Jianguo, a member of the Standing Committee of the National Committee of the Chinese People's Political Consultative Conference and deputy director of the Committee for Ethnic and Religious Affairs of the CPPCC National Committee, said this year marks the 75th anniversary of the peaceful liberation of Xizang.

Over the past 75 years, the Communist Party of China and the Chinese government have consistently regarded the rights to subsistence and development as fundamental human rights and charted a path for human rights development that follows the trend of the times and suits China's national conditions, said Jiang, who is also executive vice-president of the China Society for Human Rights Studies.

Jiang said Xizang has maintained social stability while making progress in economic development, ethnic unity, religious harmony and opening-up, with people's sense of fulfillment, happiness and security continuing to grow.

"The dramatic transformation of Xizang is the most vivid epitome of China's human rights development in the new era," Jiang said.

He called on people from various sectors to continue promoting China-Nepal friendship, observing Xizang's development and advancing exchanges between civilizations, helping more people gain an accurate, multidimensional and comprehensive understanding of the region.

Top Bahadur Magar, chairperson of Nepal's National Human Rights Commission, spoke highly of China's efforts in human rights development and said stronger exchanges and cooperation among countries and relevant institutions are important to advancing the cause.

He said the commission is willing to deepen exchanges with organizations including the China Society for Human Rights Studies, share experiences and perspectives and enhance mutual understanding through dialogue and learning.

The National Human Rights Commission of Nepal remains interested in further strengthening cooperation with China in the areas of human rights promotion and protection, he said.

Chinese Ambassador to Nepal, Zhang Maoming, said Xizang's experience in promoting vitality, openness, social harmony and environmental protection could offer useful lessons for deeper cooperation across the Himalayas.

Its practices in economic and social development and grassroots governance could also provide valuable reference for Nepal, Zhang said, adding that China is willing to work with Nepal to turn development opportunities into tangible cooperation and improve the well-being of people in both countries.

The event was structured around four themes: "Open Xizang", "Vibrant Xizang", "Harmonious Xizang" and "Green Xizang", with speakers presenting their observations and experiences of the region.

Eight speakers from China and Nepal, including scholars from the Xizang autonomous region academy of social sciences and the China Tibetology Research Center, as well as representatives from Nepal's media, education and performing arts sectors, took part in the sessions.

"From the historic streets of Lhasa to the innovative ranches in the countryside, I witnessed a Xizang that is actively modernizing while deeply respecting its cultural roots and natural environment," Kumar Sharma Acharya, former chairman of Press Council Nepal, said while recalling his visit to Xizang in June.

A photography exhibition was also held on the sidelines of the event, featuring images of the region's economic development, ecological conservation, ethnic unity and opening-up.

Xinhua contributed to this story.

Cause of Antarctic ice gain identified

By **LI MENGHAN**
limenghan@chinadaily.com.cn

While the Antarctic ice sheet has lost mass at an average rate of about 140.5 billion metric tons a year over the past two decades, satellite data showed a striking reversal from 2021 to 2023, when the ice sheet gained 695 billion tons — the largest increase on record.

An international research team has now identified the mechanism behind the unusual gain, revealing a previously overlooked climate link between the tropics and the Antarctic ice sheet.

The study, conducted by researchers from institutes in China, the United States, Japan, Belgium and Hungary, was published in the journal Nature on Wednesday.

The researchers found that sustained warming in the tropical warm pool — a broad region where the western Pacific and eastern Indian oceans meet and sea surface temperatures are persistently high — sent large-scale atmospheric waves southward toward Antarctica. These waves carried unusually large amounts of moisture from the midlatitude Indian Ocean to Queen Mary Land and Wilkes Land in East Antarctica, resulting in persistent heavy snowfall.

The researchers used several types of evidence, including satellite measurements of changes in Earth's gravity, records of snowfall preserved in Antarctic ice cores and computer simulations of atmospheric circulation.

Wang Yunhe, first author of the study and an associate professor at the Institute of Oceanology of the Chinese Academy of Sciences, said such warming events in the tropical warm pool typically develop and persist for two to three years and occur roughly once in a decade. Similar, although smaller, fluctuations were observed around 2000, he said.

The team also examined what caused the unusual warming and snowfall. Their analysis showed that human-induced climate change accounted for only about 9 percent of the increase in snowfall, indicating that the event was driven mainly by natural fluctuations within the climate system rather than by greenhouse gas warming.

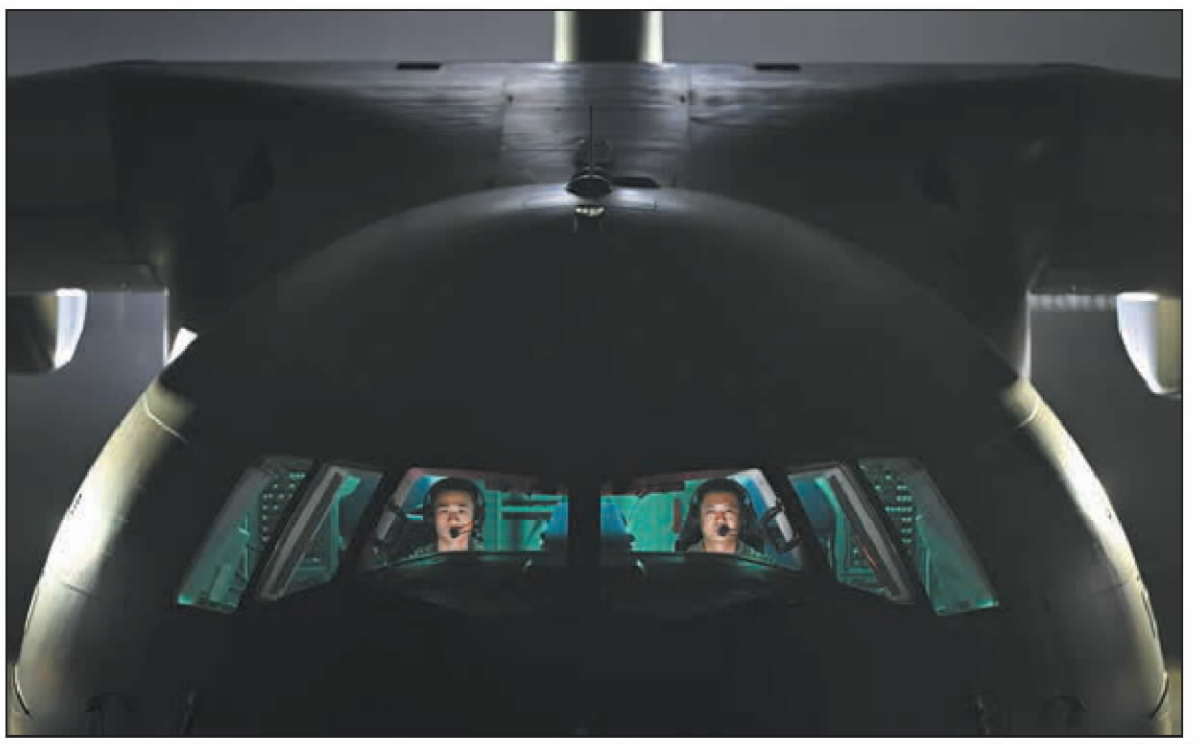
Wang, however, said the temporary increase in snowfall does not alter the Antarctic ice sheet's long-term trend.

"The West Antarctic ice sheet is still losing ice, and some outlet glaciers in East Antarctica are also threatened by ocean-driven ice shelf melting and accelerated ice flow," he said.

The findings help resolve a long-standing puzzle in Antarctic science: why the ice sheet's mass can fluctuate sharply over relatively short periods.

"Scientists have tried to explain the unusual fluctuations in Antarctic ice sheet mass," Wang said. "Most researchers have focused on the central and eastern tropical Pacific and its connection with West Antarctica, where climate signals are strongest and easiest to detect. We looked at the other side — the western Pacific warm pool and its connection with East Antarctica — and identified a pathway that had not previously been recognized."

In climate science, such a connection is known as a teleconnection, meaning that changes in one distant part of the climate system can influence weather and climate far away through atmospheric circulation.



The study identifies a previously underappreciated link between the tropical warm pool and the East Antarctic ice sheet, Wang said.

The finding provides a new framework for understanding short-term changes in Antarctic ice mass and could help guide future research into the climate of East Antarctica.

Y-20 SOARS WITH NATIONAL PRIDE

Decade-long service displays aircraft's versatility and durability

A fleet of a YY-20A aerial tanker and J-10 and MiG-29 fighter jets flies over the pyramids in Giza, Egypt, on May 1 last year, during the "Eagles of Civilization 2025" joint training by Chinese and Egyptian air forces.

Clockwise from above, left: Paratroopers jump out of a Y-20A aircraft during a training session on Sept 23, 2021. A YY-20A aerial tanker fuels two J-20 fighter jets midair on May 12. A fleet of Y-20B aircraft conducts training on lowering takeoff intervals on April 27.

By CHINA DAILY

The Y-20, nicknamed Kunpeng after a giant bird in Chinese mythology, is China's first domestically developed large military transport aircraft. It was officially commissioned in July 2016, marking a milestone in the strategic delivery capability of the People's Liberation Army Air Force.

The project, led by the Aviation Industry Corporation of China's Xi'an Aircraft Industrial Group Co, began in 2007. Its prototype first flew in 2013 before entering service in 2016. With a maximum takeoff weight of 220 metric tons and a payload of 66 tons, Chinese pilots affectionately call it "Chubby Girl" for its wide fuselage.

Ten years after its commissioning, the aircraft has not only deeply integrated itself into various combat readiness training sessions, but also displayed its power in non-military tasks such as disaster relief, humanitarian rescue and overseas transport missions.

Over the decade, the aircraft itself has also evolved from a single transport platform into a family consisting of multiple variants including the original Y-20A, the Y-20B with domestically developed WS-20 engines, and the YY-20A aerial tanker.

It has reached Asia, Africa, Europe and Oceania, building a channel for international exchanges and demonstrating the open, confident and pragmatic image of the Chinese military.

The dance of homecoming

A traditional folk drama becomes the language through which a son finally understands his absent father, **Chen Nan** reports.

Odes to Heroes, a Chinese dance drama by the Guangzhou Song and Dance Theatre, returned to Beijing on Wednesday and Thursday before embarking on a tour of Singapore, Malaysia and Thailand in September and October. PHOTOS PROVIDED TO CHINA DAILY

By the time Erfan Omar's face is painted near the end of *Odes to Heroes*, his character is no longer the boy who has spent years wondering why his father left the family.

He has become the man he once imagined his absent father to be — responsible, courageous and willing to shoulder a greater duty.

"For me, the most moving part is that, in the end, I become the person I want to become," says Omar, a principal dancer with the Guangzhou Song and Dance Theatre, who plays the protagonist. "I want to become a man like my father — someone with responsibility and a sense of duty."

That transformation lies at the heart of *Odes to Heroes*, a dance drama that brings together the vigorous Lingnan folk dance *yingge* with *qiaopi*, the letters and remittances sent home by overseas Chinese.

Premiered in 2024, the production has toured extensively, with more than 150 performances in about 20 cities. It returned to Beijing on Wednesday and Thursday as part of the ongoing 7th National Ethnic Minority Art Festival before heading to Southeast Asia in September and October for performances in Singapore, Malaysia and Thailand.

The overseas tour will take the production back to a region closely connected to its narrative: Southeast Asia, where generations of people from southern China settled, built new lives, and maintained close ties with their homeland.

Set in the late 1930s, the drama follows a family in Guangdong province. A father leaves home for Southeast Asia in search of work and eventually disappears. His wife raises their son alone. Years later, during the Lantern Festival, the son picks up a pair of *yingge* mallets left behind by his father.

The mallets draw him into a dreamlike journey through the past. As he encounters fragments of his father's life, he gradually begins to understand the struggles and sacrifices of a generation shaped by migration, war and responsibility.

"I feel that throughout the dance drama, I am actually an audience member onstage," Omar says. "It is my character who leads the audience into the story."

His character's journey mirrors the audience's own discovery of the history behind *yingge* and *qiaopi*: moving from misunderstanding to recognition, and from personal loss to a deeper understanding of family and collective memory.

Codirected by Qian Xin, the production uses *qiaopi* as a narrative thread. Emerging in the 19th and 20th centuries, *qiaopi* refers to letters sent by overseas Chinese to families in China, often accompanied by remittances. The letters carried not only financial support but news, homesickness and reassurance across thousands of kilometers.

"*Odes to Heroes* turns that history into a story of one family, but its emotional landscape is much broader," Qian says.

While *yingge* provides the production's central movement vocabulary, the stage is filled with other elements of Lingnan (a region in southern China) heritage, including wood carving, *qianci* porcelain inlay, Chaozhou embroidery, iron-branch puppetry, beef balls, and Chaozhou oil-paper lanterns, adds codirector Wang Sisi.

"These elements are more than visual embellishments. Together, they create a multifaceted portrait of Lingnan culture and show how different traditions can connect through a shared cultural heritage," she says.

The production uses these traditions to move between the personal and the collective — from the fate of one family to the broader history of migration, mutual support and shared struggle.

Scenes from the production, which captivates audiences with its moving storyline and dynamic choreography inspired by *yingge* dance, a traditional folk dance that originated during the Ming Dynasty (1368-1644).

At the same time, *Odes to Heroes* does not simply reproduce *yingge* as a folk performance. Its traditional movements are reshaped for the theater and woven into the characters' emotional journeys.

For Omar, mastering the form has been a process of continuous learning.

He first encountered *yingge* in 2024, when the folk dance was gaining widespread attention through short videos and television programs. Its forceful rhythms and explosive energy immediately attracted him.

"I was struck by the energy and excitement of this dance form and its vibrant street culture," he says.

The theater subsequently invited practitioners of intangible cultural heritage to train the dancers. They first learned the traditional movements and techniques, and then worked with the creative team to integrate them into contemporary stage choreography.

The *yingge* mallets have proved particularly demanding. Omar's character carries a special pair throughout the drama, turning them into a recurring link between different times and stories.

"It took a long time to go from not knowing how to spin the mallets to being able to spin them well," he says. "And on every tour, in every performance, we are still constantly refining and thinking about it."

That process reflects one of the production's central challenges: how to preserve the character of a traditional folk art while giving it new theatrical possibilities.

"You can't simply move a street performance onto the stage," Omar says. "Two hours of pure *yingge* would be too much for the audience. We have to develop it creatively — give it a story, give the characters a journey, and bring in real historical stories and stories of unsung heroes."

For Omar, that task carries particular significance. Born and raised in Northwest China's Xinjiang Uygur autonomous region, he came to Beijing to study at age 10 and has lived in Guangdong for nine years. Although *yingge* comes from a cultural tradition different from his own, he sees a connection in its exuberant energy and collective spirit. The experience has also made him more conscious of the responsibility involved in interpreting a traditional culture from a different region.

"There are certainly regional cultural differences," he says. "When we encounter this outstanding traditional Chinese culture, I feel a great sense of responsibility. We can't casually change it. We need to be cautious, but at the same time, we need to be bold enough to innovate."

That balance between preservation and reinvention runs through *Odes to Heroes*. Its *yingge* dancers carry movements passed down through generations, while *qiaopi* carries the words of those who left home. Together, they create a bridge between generations and across the sea, Qian says.

The Southeast Asian tour will extend that bridge further, bringing a story about migration and homesickness back to the region where generations of Chinese migrants once began new lives, the director notes.

Theater recalls wartime Chongqing

EDINBURGH — For people living in Chongqing, Southwest China, in the late 1930s and early 1940s, fog was more than weather. It could mean precious hours of cover from bombers overhead.

Thick fog made it harder for Japanese pilots to see the ground, giving residents some respite from repeated air raids.

A Chinese-language solo play staged recently at the Edinburgh Festival Fringe, which runs through Aug 31, offers audiences a glimpse into what life under such circumstances might have been like.

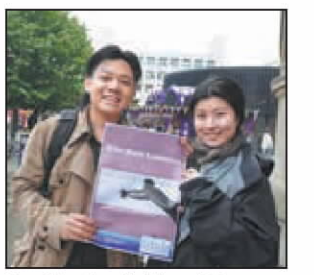
In *The Red Lantern*, Fan Shaolun performs alone, shifting between narration and multiple characters. Through voice, movement and sound, he re-creates wartime Chongqing through the eyes of a boy named Guang, whose unusually sensitive hearing allows him to detect danger before others do.

Beginning in 1938, Japanese warplanes bombed Chongqing, then China's provisional capital, killing and injuring more than 32,000 people. On June 5, 1941, about 2,500 people suffocated to death while seeking shelter in a tunnel during an air raid.

The play was created by Fan and Liang Yumin, who studied theater in Beijing before pursuing postgraduate studies in Britain. The idea grew from conversations about Chongqing's wartime experience and the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

For Liang, the history was personal. A native of Chongqing, she recalls hearing air-raid sirens every June 5 from primary school onward, when the city commemorated those killed in the wartime bombings.

She had learned about the history at school, but revisiting it for the play raised new questions.



"When you really look at the history from the perspective of the people who lived through it, you begin to see how they lived and how they managed to get through those years," Liang says.

In May 2026, Fan and Liang traveled to Chongqing for field research, visiting museums, the June 5 tunnel massacre site, and the stage production *Chongqing 1949*.

One detail stood out: the fog. They found that during periods of particularly heavy fog, air raids could become less frequent. What Liang had regarded since childhood as an ordinary feature of her hometown suddenly took on a different meaning.

"For people at that time, fog was connected with survival," she says.

Fan and Liang chose to tell the story through a child's perspective.

Fan Shaolun (left) and Liang Yumin, creators of the Chinese-language solo play *The Red Lantern*, pose with the play's poster in Edinburgh on Aug 9. ZHAO JIASONG / XINHUA

"We didn't want to put the transformation of an entire city directly onto the stage," Fan says. "We wanted to follow the changes in one child and, through him, show something of the state of mind of the whole city."

One image from their research stayed with them. After an air raid, four Chinese characters were written on a surviving wall amid the ruins: "*Yu zha yu qiang*" — "The more you bomb, the stronger we are." A replica of the slogan is now displayed at a museum commemorating the June 5 bombing.

The play's Edinburgh run also coincided with an important date in the history it depicts. This year's Aug 15 marked the 81st anniversary of Japan's announcement of its unconditional surrender in World War II.

Dong Ning, chairwoman of the Beijing Performance and Arts Group, says the production offers an accessible entry point to a difficult chapter of history.

Inside jokes have outsiders laughing

Stand-up comedian delivers personal stories on the stage, with a solo special that has taken his work international, report **He Qi** and **Wu Wanzhen**.

At 7:30 pm, audience members begin filing into GOAT, a comedy club on Xiangyang North Road in Shanghai's Jing'an district. Backstage, Harry Hussain, who is known simply as Harry, eats a banana with his coffee, his pre-show ritual.

"I feel like I'm not here to do stand-up (comedy)," he says with a laugh. "I'm here to play tennis."

Printed on his T-shirt is the word "borderless" — a pun on national borders and personal boundaries. He allows the audience to write on the T-shirt following his show.

"Wars are breaking out everywhere, and it makes me uncomfortable," Harry says. "So I want to express something simple: We're all the same people." He never explains it on stage, preferring to leave it open to interpretation and letting the audience write what they want.

This British-Pakistani comedian has lived in China for 18 years and performed stand-up in Mandarin for five years. In December 2025, his first Chinese special, *Outsider*, premiered in Shanghai. In the spring, he took the show to Canada, where he completed five performances in different cities. He now plans to bring it to the United Kingdom.

"The Outsider" — that's his label and the name of his comedy special: A Briton in China can be an "outsider"; a migrant in a new city can be an "outsider". "Each of us," Harry says, "has felt like one at some point". Yet for the fans, fellow comedians, family, and friends who cheer him on across the country, he has long been an insider — one of their own.

Finding his voice

Harry came to China at 20, first studying medicine in Hebei province. After graduation, he moved to Beijing and stayed for over a decade. He even opened an Italian restaurant in the Liangmaqiao area.

But he found his true calling five years ago.

He was struggling with depression and looking for an outlet. "At first I was just writing jokes and posting them online. The more I wrote, the more I realized that I genuinely loved writing comedy," he recalls.

Having grown up watching British stand-up, full-length TV specials from age 7, he never imagined taking the stage himself. A friend persuaded him: since you've written them, why not tell them?

His first gig was at a bar in one of Beijing's *hutong* (alleyway): 10 audience members, 20 performers.

"I was so nervous, but the first day, the host forgot about me entirely," he says. The next day, the nerves had subsided. He went onstage, told a few jokes, and the response was surprisingly good.

"The laughter and applause made me realize so many people could understand me — that feeling was incredibly addictive," he says.

For Harry, performing in Chinese was a choice he made from day one.

"Honestly, most of the audiences are Chinese, so performing in their native language is more effective." In English, the audience would be smaller and at varying levels — he wouldn't know who to cater to.

But Chinese used in stand-up comedy is different from everyday Chinese. Wordplay, puns, idioms — he had to learn them all specifically for comedy.

Unlike first-arrival or character stories that other foreign comedians often cover, Harry wants to take a different path.

"What I want to be is a 'foreigner' audiences remember — sincere and truth-telling," he says.

On stage, he talks about his struggles, and the audience's empathy is therapeutic. "Things I didn't want to face before, I can now talk about openly," he says. "My mental state keeps getting healthier."

"Stand-up is my therapist," Harry always says.

Dedicated to his daughter

In the summer of 2024, Harry appeared on the variety show *Stand-Up Comedy and Friends*. Joking about English corners, training institutions and internet-famous foreigners, his first-round set brought the house down — guest judge and veteran television host Lu Yu called his material "very sophisticated".

But he didn't make it to the end. The day he was eliminated, he decided on the spot to write a special. "If I don't do a special, gigs will decrease," he says. "It's time."

He retreated to a friend's place in Hebei province's Jinshanling, not far from Beijing, to write in seclusion. "I don't like refining jokes word-by-word at an open mic (microphone)," he says. "I prefer to write the full hour first, then polish the details."

He also took a month-long acting class. "It required digging into inner feelings — childhood experiences, hidden emotions," he says. "I realized things I'd hidden for years could actually become jokes."

For Harry, a comedian's first solo show should be personal.

"Your first special should tell your story so the audience can really get to know you." TV clips are too short and edited for entertainment; a special is complete. "Some people might like me, some not — it doesn't matter."

The result is *Outsider*.

"Each of us has felt like an outsider — at work, at school, in social circles." A portion is dedicated to his daughter.

"She'll face identity issues — not just mixed race, but regional, like whether Beijing or Shanghai is home," he says. "I put my own experiences into the special, so someday it can help her."

Once the first draft of the special was complete, Shanghai became his testing ground. Three years ago, Harry moved to Shanghai, where Xiaoguo Comedy is based.

"Shanghai has the strongest stand-up scene in the country," he says. Within 15 minutes of home, there are four or five open mic venues; he hits several a night on his electric scooter. "Shanghai's audience is super diverse. If a joke works here, it will probably work anywhere."

On Dec 14, 2025, *Outsider* premiered at Sixiao Comedy in Shanghai, followed by a nationwide tour that included Beijing and Guangzhou, Guangdong province, attracting over 3,000 live audience members.

In April and May, Harry took his show to Canada — his first international tour. The audience was more diverse than he expected: Chinese, foreigners who had lived in China, local students learning Chinese, teenage immigrants, and mixed-heritage viewers. "It's amazing to have so many different backgrounds in the same room," he says.

Bridging cross-communication

"I'm a citizen of the world — I've always thought that," he says. On identity, Harry believes self-acceptance is enough. People have labeled him throughout his life, but these days they matter far less.

In China, he feels at ease. "Here, I'm just a 'foreigner'. I don't have to pretend to be Chinese, and no one keeps asking if I'm 'really Chinese'," he says. "'Foreigner' is broad — it includes every country, every identity. That's enough."

That process also shapes his view of cross-cultural communication: Stand-up is already a bridge. Chinese audiences have watched English-language stand-up for years, adapting a form developed overseas to local experiences and sensibilities. Now, Chinese stand-up is increasingly reaching audiences abroad. "It's a great cycle," he comments.

But he doesn't set out to deliver a message. "I'm just telling my real life. If people want to understand it, they can. How they interpret it is up to them. I trust the audience."

Back at GOAT, the show comes to an end.

Audiences sign Harry's T-shirt, leaving signatures, notes and well-wishes. For each performance, he prepares a new shirt and places it outside afterward for the audience to write on.

On his scooter ride home, Shanghai's night breeze hits his face. His wife and nearly 8-month-old daughter are waiting.

Harry says that parenting has become a new source of material. "I'm most interested in family stuff now — parenting differences with my in-laws, cultural gaps, traditional Chinese customs I never knew about," he says. "I'm learning them with the baby, and it's fascinating."

Annual jazz festival returns for its 22nd edition with a record 17-day program

By **HE QI**

The 2025 Shanghai JZ Festival was held in Qiantan area. The 22nd JZ Festival will bring a larger and longer edition to the city. PHOTOS PROVIDED TO CHINA DAILY

Along the autumn bank of the Huangpu River, as a cool breeze sweeps past, it carries the soft notes of a trumpet, the warm tone of a saxophone solo, the steady pulse of a double bass, and spontaneous cheers of an outdoor crowd. Across sunlit parks and vibrant avenues, the waterfront becomes a giant soundstage.

From Oct 16 to Nov 1, that vivid scene will transform Shanghai's sprawling Qiantan area in the Pudong New Area into an open-air jazz paradise, as the 22nd JZ Festival brings its largest and longest edition yet to the city's riverside.

The 17-day festival will feature over 146 performances by more than 100 musicians from 29 countries and regions, spanning 13 venues across 1.3 square kilometers, including parks, theaters and shopping streets. Except for ticketed indoor concerts, all outdoor performances and forums will be free and open to the public. According to the organizers, Lujiazui Group and JZ Music, the festival is also the centerpiece of the 2026 New Bund Chillout, running from Sept 20 to Nov 1 in Pudong.

The JZ Festival has been held in Shanghai annually since 2005. It is the largest jazz festival in China and the second-largest in Asia.

Building on last year's success, which set records in the Qiantan area with 1.23 million visits and 162 million yuan ($24 million) in consumer spending, JZ Festival founder Ren Yuqing emphasizes, "The past is just the past; we will create an innovative future."

This year's program is organized around six themes. The opening Jazz Age Carnival at Qiantan Sports Park immerses visitors in a nostalgic Jazz Age atmosphere with swing dancers, vintage cars, vinyl records, and steampunk parade floats.

Jazz Avenue expands last year's street-music format from a single stage to a cluster of four stages, turning the neighborhood into a compact festival. Jazz Riverside takes place at Qiantan Leisure Park, where a grand stage overlooks the Huangpu River. Jazz Around the Town brings pop-up performances to shopping malls, alleyways, and even basketball courts.

The closing weekend features a solo concert by five-time Grammy winner Victor Wooten, who Rolling Stone ranked among the "top 10 greatest bassists of all time", alongside two special concerts led by Chinese soul diva Yuan Yawei (Tia Ray) at the Qiantan 31 Performing Arts Centre. Additional international artists are to be announced.

Beyond performances, the Qiantan Jazz Forum, co-hosted with the Shanghai Conservatory of Music, will bring together industry players, musicians and fans for a week of discussions on topics ranging from AI in music creation to live marketing and music education. The festival has also established a long-term strategic partnership with Music China, creating an annual October collaboration through cross-promotion, a shared stage and joint industry salons.

"Culture is a city's most enduring source of competitiveness, and music is one soul of culture," states Wu Jun, deputy director of Pudong New Area's culture and tourism bureau.

"With the conservatory and the instrument exhibition on board, we hope to build a high ground for the entire music industry in Shanghai this October — hopefully a high ground for China also, a musical peak facing the world," Ren says.

Ma Tan contributed to this story.

LIFE

Singer finds his voice on talent show

British vocalist Elliot James Reay learns to balance online success with live performance and personal authenticity, **Chen Nan** reports.

When Elliot James Reay first stepped onto the stage of *Singer 2026*, one of China's most popular music competition shows, he found himself experiencing something he had not felt for quite some time: nerves.

The young British singer had already built a substantial online following with his distinctive retro sound. But *Singer 2026* was different. It was live, competitive and placed him alongside accomplished singers, with audiences voting on their performances.

"I'd never been in a competition before, especially a talent competition," the 23-year-old singer-songwriter said in Beijing on Aug 14.

Yet the unfamiliar pressure brought an unexpected feeling.

"It made me feel like I just started my career again," he says. "It gave me a bit more hunger and a bit more fire."

For Reay, China became more than another stop on an increasingly international career. It offered an established online artist the chance, in a sense, to become a beginner again.

The invitation came while Reay was in the United States working on new material. His manager told him about the opportunity to join *Singer 2026*, and his first reaction was excitement. China was a place he had long wanted to visit.

Before becoming a full-time musician, he had traveled widely. "I went everywhere but China," he says. During his recent trip to Beijing, he also visited the zoo, where he saw pandas. He shared his trip on Xiaohongshu, or RedNote, receiving warm feedback from his fans in China.

Now he had finally arrived to do what he had dreamed of doing: making music.

Reay came with few expectations. He was entering a music market he did not yet fully understand and joining a competition unlike anything he had experienced. The language barrier and the intensity of the live performances made it a leap into unfamiliar territory, especially as he sang one song in Chinese.

But that uncertainty became part of the attraction.

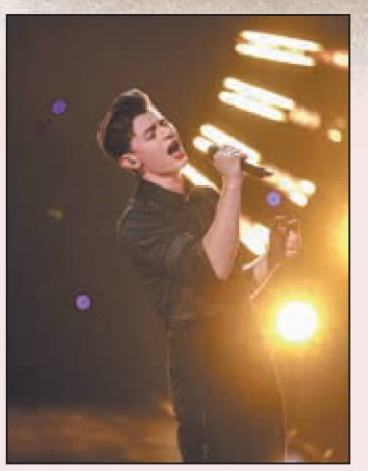
Reay's musical identity, after all, is built on a journey across time. His music draws on classic rock 'n' roll and early pop, sounds that evoke nostalgia for some listeners while offering younger audiences the discovery of something new.

The same collision between old and new can be found in the way he built his career.

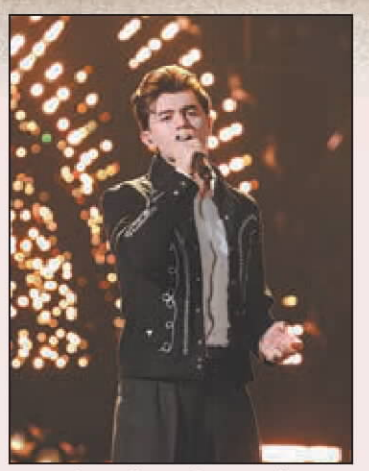
While his music looks back several decades, his first major platform was TikTok.

During the COVID-19 pandemic in the United Kingdom, Reay found himself with a choice: focus on writing songs or building an online audience.

"I feel like I was quite blessed in the timing of when I started social media," he says.



Some of his friends concentrated on songwriting. Reay chose to build a following.



But the transition in the other direction — from online personality to a full-fledged musician — has proved more difficult.

"I've found it quite hard to go the other way — from making TikToks to writing songs and learning how to do that properly," he says.

Reay is grateful for the platform that introduced him to a global audience, but he does not want his story to end there.

"I love TikTok. It's a great platform," he says. "But I'm a musician at heart."

Top: Known for reviving the groovy sounds of 1950s rock 'n' roll, British singer Elliot James Reay rose to fame on the video platform TikTok in 2019. **Above:** Reay has gained a fan base in China after appearing on the popular TV talent contest *Singer 2026*.

PHOTOS PROVIDED TO CHINA DAILY

His goal is to become "a touring musician" — an artist who can bring people together in concert halls and venues, rather than simply accumulate views on a screen.

That desire is closely tied to another lesson he learned before finding his current musical direction. For a time, Reay experimented with pop music and tried to make what he believed other people wanted to hear.

Eventually, he realized that approach was taking him further away from the artist he wanted to become.

"I figured out that I needed to just do what I need to do," he says.

That experience shaped his approach to China as well. Asked what advice he would give to other international artists hoping to enter the Chinese market, his answer is simple: "Be yourself."

"It's very easy to want to try to change yourself to fit into a market," he says, "but at the end of the day, if you stay true to yourself, you'll be happy."

For Reay, authenticity is something learned through trial and error.

"If I didn't do that, I wouldn't be sitting here now," he says. "I wouldn't have done the show. My whole journey would have been different."

That philosophy was tested throughout *Singer 2026*, where the pressure to chase the next successful performance could easily lead an artist to lose sight of his own identity. Reay, however, was determined not to do so.

The competition also gave him an opportunity to reveal another side of himself. Each week brought the possibility that it could be his last, making his journey to the grand final all the more significant.

There, Reay chose to perform *I Think They Call This Love*, a song with a particularly personal place in his career. It was the first song he wrote that he truly believed in and felt ready to put out into the world.

It was also a love story.

Reay wrote the song with his girlfriend, inspired by the moment when, as he describes it, they both realized that they had fallen in love.

"So that song was not just a song," he says. "It's a true story."

When he performed it in the grand final, his girlfriend was there. Afterward, the two walked off the stage together, a moment that quickly attracted attention online.

For Reay, however, its significance was more personal than viral.

"She wrote it with me," he says. "We spent a lot of time making sure that it was perfect for the stage."

Having her there, he adds, brought him comfort.

China, meanwhile, is not a chapter Reay sees as ending with the final episode of *Singer 2026*.

For him, building an audience in a new country requires more than returning home and maintaining a presence through social media.

"To establish myself here, you have to be here," he says.

As an artist with Universal Music Group, Reay came to China as part of the company's initiative, "Go East", which was launched early this year to offer a bridge connecting international artists with the Chinese market. This is a reflection of China's growing importance as the world's third-largest music market and its booming live performance scene, which continues to attract artists worldwide.

"The rapid development of the Chinese music market and the creation of the new initiative will help guide overseas artists in establishing a lasting presence in the country," said Timothy Xu, chairman and CEO of Universal Music Greater China.

Salvage diver-turned-rescuer navigates storms and saves lives in Zhejiang

HANGZHOU — The ache in Dong Jianhai's legs was a warning he had learned to trust. At 58, the resident of Zhoushan, a city consisting of islands off the coast of East China's Zhejiang province, knew it meant a storm was coming.

The day before Typhoon Dolphin — the 13th typhoon of the year — made landfall in Zhejiang, Dong spent the whole afternoon preparing for it, checking anchor points for vessels seeking shelter and making sure each ship was securely fastened, just as he had done hundreds of times before.

For more than three decades, Dong has seen the sea in nearly every mood. He began his career as one of Zhejiang's first professional salvage divers after earning his national diving certificate in 1991. Young, strong and ambitious, he was eager to make a name for himself underwater. Then an accident changed the course of his life.

During a salvage operation in 1994, Dong suffered severe decompression sickness, a potentially fatal condition caused by rapid changes in pressure after diving. Two months of difficult treatment saved his life, but when he finally left the hospital, he could no longer walk as he once had.

For a diver whose life had been bound to the ocean, the injury seemed to mark the end of a career. But Dong's bond with the sea endured, taking a different form.

"People told me my diving days were over, and maybe they were right about my body," he says. "But no one could convince me that my journey was over. If I couldn't go down into the water anymore, I would find another way to keep my promise."

Dong began a new chapter by bringing together people with diving and salvage experience to form his own rescue team. Over time, the team became a familiar presence along the coast, responding to sunken vessels, maritime accidents and calls to recover those lost at sea.

He would arrive at rescue sites with a cane in hand, helping divers prepare their equipment, secure hoses and ropes, and watching closely as they disappeared beneath the surface. Though he could no longer descend into the depths himself, he knew the pressure, darkness, and currents below — and the razor-thin margin for error — as well as anyone else.

When Dong could not be at the scene, he directed operations remotely. His cell phone stayed with him around the clock, and over the years his number became a trusted lifeline for people along the coast.

The calls came in for all kinds of emergencies: a vessel that needed salvaging, a missing diver, someone who had fallen into the water, a ship that had run aground, or people stranded on an island by a storm.

The team has also taken part in large-scale maritime operations. In one case, it participated in the salvage and subsequent repair of a 10,000-ton cargo ship. In another, it was called to assist a 300,000-ton Panama-registered oil tanker that had gone off course and run aground.

For Dong, the hardest calls were not always those that came in the middle of a rescue. Sometimes it was the quiet voice on the other end of the phone, telling him that another life had been lost at sea.

Such calls meant there was no longer a life to save. But Dong knew the mission was not necessarily over. For him, and for the families waiting on shore, there was still one final task: bringing their loved ones home.

Over the past 30 years, Dong has taken part in or directed the salvage of more than 120 sunken vessels, while his team has recovered more than 80 bodies.

The work is demanding and often dangerous, but Dong has never seen it as something to be carried out for a reward.

"When someone loses their life at sea, and you can bring them back to their family, that is not just a job," Dong says. "It is simply the right thing to do as a human being."

To Dong, it was all part of a promise he had made to the sea long ago — one he could not easily let go of, even though he could not have known what it would eventually cost him.

That promise has taken different forms over the course of a life intertwined with the water: the boy who lost loved ones to the sea, the diver who ventured beneath the waves, the survivor of a near-fatal underwater accident, and the man who refused to give up helping others.

Typhoon Dolphin made landfall the following evening after Dong felt his leg ache. The seasoned rescuer was out before dawn, leaning on his cane as he moved between harbors, checking vessels and directing his crew while strong winds swept the coast.

For most people, a storm is a reason to stay ashore. For Dong, it is a reason to set out. Somewhere beyond the waves, someone may be waiting — for rescue, for hope, or simply for a way home.

AMERICAFOCUS

Eight Immortals cross the ocean

Animated Chinese film *All Wishes Come True!* makes a splash with moviegoers in North American premiere

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

The North American premiere screening of the Chinese animated feature *All Wishes Come True!* is held in Los Angeles last Thursday, showcasing the film's fantasy world inspired by the legend of the Eight Immortals. RENA LI/ CHINA DAILY

Few would imagine that strands of life-saving hair from Sun Wukong, the legendary Monkey King, could become an unexpected weapon for the Eight Immortals as they confront the powerful Erlang Shen, or Yang Jian, in *All Wishes Come True!* — one of the latest Chinese animated films bringing the country's centuries-old mythology to global screens.

Drawing on the folk legend of the Eight Immortals while weaving in characters and imagery from *Journey to the West* and other classical tales, the fantasy comedy brings traditional cultural icons together in a newly imagined universe for contemporary audiences.

At the film's recent North American premiere in Los Angeles, Hollywood filmmakers, actors and moviegoers praised its elaborate 3D animation. But many said what interested them even more was the world behind the images — Chinese mythology, folklore and philosophical ideas that were unfamiliar to them.

Inspired by the traditional tale *The Eight Immortals Crossing the Sea*, the film reimagines the immortals not as distant supernatural beings but as eight ordinary mortals whose weaknesses, ambitions and choices eventually lead them toward heroism.

Hollywood actor John Kyle Sutton said he was surprised by how completely the film held his attention despite its lengthy run time.

"Honestly, I think this movie is a masterpiece," Sutton told China Daily.

"I don't like long movies. Usually about 86 minutes is when I top out," he said. "This movie kept my attention the whole time."

Sutton said he was drawn to the themes of "brotherhood, fraternity, betrayal and greed", as well as the pacing and animation.

"I was fully engaged the whole time," he said. "I want to learn Chinese and its culture."

What impressed him in particular, Sutton said, was that the movie did not abandon its Eastern mythology in an effort to appeal to Western viewers.

Set around the celestial world of Penglai, the story begins with Lyu Dongbin and Zhongli Quan plotting to enter a divine vault, before their adventure expands into a battle involving mortals, gods and the fate of the wider world.

Film producer Stephen Nemeth described the movie as a "very, very beautiful spectacle", saying its fantasy world reminded him in some ways of the American classic *The Wizard of Oz*.

"I'm hoping hosting this movie here will bridge our cultures, in America and China, and we'll learn a lot from each other," said Nemeth.

He said he was impressed by how deeply Chinese culture draws upon "mysticism, folklore and backstory", elements that give the film a character distinct from much mainstream Western animation.

Nemeth's son Lincoln, an animation enthusiast, also noticed a visual difference.

"I think that the 3D aspect of it all looks a little more realistic," he said, comparing its attempt to reproduce aspects of real life with the visual style of American animated movies.

He said learning about unfamiliar cultural and religious themes through animation also made the experience educational.

Hollywood actor Chris Kriesa said the film's visual reconstruction of an imagined ancient China was among its most striking features.

"I was really mesmerized by the great creativity and the beauty of old China, the structures, the alleys, the buildings, and the mythology, the gods and the immortals," said Kriesa.

Audience members pose with *All Wishes Come True!* posters during the film's North American premiere in Los Angeles last Thursday. RENA LI/ CHINA DAILY

However, Kriesa said he was unfamiliar with the origins and cultural significance of the Eight Immortals, wondering whether they were characters from children's stories or something much larger in Chinese culture. Characters instantly recognizable to generations of Chinese viewers can still be unfamiliar figures to American audiences.

For Georges Chamchoum, executive director of the Asian World Film Festival, the Chinese legend was a "discovery".

Chamchoum said introducing eight principal mythological characters to audiences unfamiliar with their histories presents an obvious storytelling challenge, but the distinct personalities of the Eight Immortals helped viewers quickly connect with them.

"The characters of the Eight Immortals are so interesting. Each one has its own personality," he said. "And you hardly have enough time to breathe because the action never stops … it is exciting."

> "I was really mesmerized by the great creativity and the beauty of old China."
>
> **Chris Kriesa,** Hollywood actor who attended the LA premiere

An increasingly important task as Chinese animation expands globally, Chamchoum said, is making Chinese stories accessible to overseas audiences while preserving their cultural identity.

Rather than simply retelling *The Eight Immortals Crossing the Sea*, the film blends familiar mythological figures and motifs into a newly imagined universe or celestial realm. The approach reflects a broader trend in Chinese animation: drawing inspiration from traditional culture while using contemporary storytelling and digital technology to reach younger and increasingly international audiences, according to Chamchoum.

Huang Hongjiang, Chinese deputy consul general in Los Angeles, said the movie provides another channel through which overseas audiences can learn Chinese stories and visual culture.

"Here in Los Angeles, this is the center of the entertainment and film industry," Huang said. "Over the last several decades, the cooperation between China and the US has produced good results, not only in the film industry but also in economy, trade, education and technology."

The responses come as *All Wishes Come True!* begins its international rollout following a strong performance in China.

The film's Chinese box office surpassed 1.5 billion yuan ($220 million) by Aug 13 after opening on July 18. As of Aug 16, Box Office Mojo listed its China gross at about $235.9 million, while Variety reported a cumulative total of roughly $236 million after a $13.1 million fifth weekend.

Its overseas rollout began Aug 13 in Australia, New Zealand and Papua New Guinea, followed on Aug 14 by the United States, Canada, the United Kingdom, Ireland and the Netherlands. Belgium and Luxembourg are scheduled for Sept 4.

The overseas push follows the global success of Chinese animation in recent years. *Ne Zha 2*, another film deeply rooted in Chinese mythology, grossed more than $2.2 billion worldwide, demonstrating the potential for stories drawn from traditional Chinese culture to reach audiences far beyond their home market.

Written and directed by Mu Zhengyang, the 144-minute animated fantasy was produced by Pearl Studio, the Chinese animation company behind *Abominable* and the Academy Award-nominated *Over the Moon*, and a co-producer of *Kung Fu Panda 3*. CMC Pictures is handling international distribution.

Proposed US grant rule sparks fears of scientific decoupling

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

A proposed US government rule that could drastically restrict federally funded research collaboration with China has sparked confusion and concern among academics, with critics warning it could lead to a near-complete decoupling of the US and Chinese scientific communities.

The Office of Management and Budget, or OMB, part of the executive office of the US president, published the proposed rule in May as part of a significant revision of regulations governing federal financial assistance awards and sponsored research programs, including all federal research grants.

The rule was originally scheduled to take effect on Oct 1. Earlier this month, however, the US Senate passed a bipartisan continuing resolution that blocks the rule from being finalized or enforced until Dec 11.

Under the proposal, political appointees would gain greater authority over grant awards that have traditionally been guided by scientific peer review. The rule cites the Wolf Amendment, which bars scientists from using NASA funding for bilateral collaborations with China, as a model for government-wide restrictions on foreign research collaboration.

Scientific, research, policy and education groups have raised concerns that the proposal could effectively prohibit federal funding for US scientific collaboration with all leading Chinese universities and academic institutions.

For scientists whose work involves close exchanges with Chinese counterparts, the potential impact could be substantial.

"In my area of quantum materials, I will lose a lot if I am not able to collaborate and exchange ideas with my theory colleagues in China," Steven Kivelson, a theoretical physicist at Stanford University, told China Daily.

"Even more drastic, however, is the harm it would do to my science not to be able to communicate directly with my experimental colleagues in China," he said. "In many aspects of making and probing the properties of bulk quantum materials, researchers in China are the world leaders."

Kivelson said that for his own research, it is important to understand the details of experiments being carried out in university laboratories at several leading Chinese institutions.

He has grants from the National Science Foundation and the Department of Energy. So far, he said, his existing collaborations have not been directly affected because the Chinese institutions involved are not among those deemed unacceptable under the proposed guidelines.

"But that may well change, and anyway, I would find it beneficial to be able to collaborate with other wonderful colleagues at various Chinese universities," he said.

The overboard and vague restrictions have also created uncertainty over what kinds of international academic engagement would remain permissible.

"Some of my other involvements with China may be precluded by the new policies," Kivelson said. "I have written to my grant managers and am waiting to hear back, for instance, about whether I am allowed to continue on in my position as one of two editors-in-chief of npj Quantum Materials."

npj Quantum Materials is a peer-reviewed, open-access scientific journal covering quantum materials, their fundamental properties, fabrication and applications. The journal is published in partnership between Nature Publishing Group and China's Nanjing University.

In an article encouraging its members to submit public comments, the American Association for the Advancement of Science said the proposal would give the OMB and selected political appointees expansive authority over how federal research and development funds are awarded, allowing political considerations to override scientific opportunity.

The organization also raised concerns that the rule would determine the eligibility of institutions and individuals to receive federal awards on the basis of vague and undefined terms.

The proposed changes have drawn widespread opposition. Nearly 500,000 public comments were submitted to the federal government before the July 13 deadline. The Washington Post analyzed 50,000 of the comments and found that at least 88 percent opposed the proposed rule. Roughly 6 percent expressed support, according to the Post, but the overwhelming majority of those supportive comments came from a single form letter that was submitted more than 2,300 times.

The Quincy Institute for Responsible Statecraft, in a comment letter submitted to the OMB, warned that the proposed regulations "will force a near-complete decoupling between the US and Chinese scientific communities".

The institute said the proposal cited a generalized concern about US national security interests but does not provide a detailed justification for why a broad ban on US-China scientific cooperation would serve those interests.

"As China is now becoming a global research and innovation leader across a wide range of areas, this would undermine US scientific advances in these areas," the institute said in its letter. Less understanding of Chinese scientific and technological capabilities "would have a harmful impact on national security in the long run".

Kivelson said legitimate security risks should be addressed to protect the relevant portions of the US scientific and technological establishment against possible theft or cyber-attack.

"But concerning scientific research being carried out at most US universities, it is a non-issue," Kivelson said. "At Stanford, for example, all classified research and most forms of proprietary research are forbidden on campus. The goal of the research endeavor at Stanford is knowledge generation. We publish our results in the open literature."

"Bottom line: There is no danger of the theft of secret information by Chinese nationals on Stanford campus, for the good and simple reason that there are no secrets to steal," he said.

Robot "Tiangong" (front) competes in the Large Group 400-meter race final during the second World Humanoid Robot Games at the National Speed Skating Oval in Beijing on Sunday. "Tiangong" won the race, clocking 38.15 seconds. JU HUANZONG / XINHUA

Swift progress of robots hailed

Bipeds push tech boundaries to beat human records at humanoid games being held in Beijing

By **MA SI** in Haikou
and **YANG CHENG** in Beijing

As biped robots shatter human world records at the second World Humanoid Robot Games, the event showcases not only China's rapid strides in embodied intelligence over the past year, but also the industry's swift progress toward real-world applications, Chinese and international executives and experts said.

Their comments came after the games opened in Beijing on Saturday, with 2,056 robots from 666 teams, representing 16 countries, set to compete in 51 events through Wednesday.

On the track, the action delivered jaw-dropping moments. A Chinese humanoid robot ran 100 meters in 9.39 seconds in a preliminary heat, beating the record of 9.58 seconds set by Jamaican Usain Bolt in 2009. The result was a sharp improvement from last year, when the 100-meter race was won in 21.50 seconds.

In a standing high jump, a robot cleared 2.88 meters, surpassing the human high jump record of 2.45 meters set by Cuba's Javier Sotomayor in 1993 as well as the 0.95-meter jump that was the best result by a humanoid in last year's games.

A Chinese humanoid robot also won the 400-meter final for large robots on Sunday in 38.15 seconds, outpacing the human world record of 43.03 seconds.

The 1,500-meter final added another record-breaking moment to the games, with 35 robots competing in seven heats and the top three all finishing ahead of the human world record of 3 minutes 26 seconds, led by the winner at 2:21.63.

Zhao Mingguo, a researcher at Tsinghua University's Department of Automation, said just as human sports push the limits of the body, the humanoid robot games are designed to extend the technological boundaries of smart machines across various scenarios and conditions.

Inside
Editorial **page 6**

Shift to autonomy

According to Zhao, the defining difference this year is the shift to autonomy. Organizers have scrapped remote controls for most events, requiring robots to rely entirely on their own artificial intelligence to perceive surroundings, make autonomous decisions and execute actions.

"From 'strings-attached' puppets to autonomous athletes, that's the transformation we've witnessed in just one year," he said.

The sector's growing vitality is reflected in the numbers. Team entries have jumped 138 percent year-on-year, while the number of participating robots has quadrupled.

This momentum is underpinned by China's manufacturing strengths. In the first half, the country shipped more than 40,000 humanoid robots, accounting for 97 percent of global output, according to the Chinese Institute of Electronics. The Ministry of Industry and Information Technology projected full-year production to exceed 100,000 units.

Beyond the competition, the event served as a showcase for human-robot synergy. The opening ceremony featured a "human-robot symphony" blurring the line between machine and performer, with 36 robots playing wind instruments, pianos and drums alongside a human orchestra, while 80 robots formed the games' emblem and another 80 spelled out "Beijing".

These smart machines also traded forehands with renowned Chinese athletes, including tennis star Zheng Jie. "I hope that in the future, robots can provide customized training for professional athletes and serve as a valuable auxiliary tool," Zheng said.

Beyond the games

This year's event introduced 21 scenario-based competitions, accelerating the transition of robots from the lab to real-world applications.

One such event, the dexterous-hand competition, tested micro-precision through tasks such as handling tweezers and twisting caps.

The "combined pentathlon" raised the stakes by merging sprinting with task completion, compelling robots to master physics, adapt to varied surfaces and recover from stumbles.

"The goal is to evaluate how far mass-produced robots can perform in real environments," said Chen Zilong, captain of Afu robot team.

During the hotel scenario practice, his machines struggled on thick carpet — a surface never encountered in training. Yet Chen sees the setback as providing valuable data. "When people see robots operating in hotels, malls and fire-rescue scenarios, they begin to imagine the possibilities," he said.

Zhang Feng, Party secretary of the Council of the Chinese Institute of Electronics, said the games are unfolding against a broader backdrop of technological transformation.

"Humanoid robots are moving beyond stage performances and race-track demonstrations to become genuine assistants in homes and workers in factories. They are poised to be the next game-changing innovation after computers, smartphones and new energy vehicles," Zhang said.

According to the institute, China's humanoid robot market is projected to hit 870 billion yuan ($129.4 billion) by 2030, playing a key role in advancing high-quality development.

China's technological strides also impressed international teams. Flavio Tonidandel, coach of Team Brazil, said, "We are thrilled to program the Chinese robot, the Booster, and interact with the most advanced humanoid robot we have ever seen."

Zati Hakim Azizul Hasan, mentor of Malaysia's Robotedge team, said: "China offers the best components. When you see robots that run faster and jump higher, that's the Chinese secret recipe. Chinese technology is exceptional in the world, and they can also make this software very affordable. This is what makes Chinese technology so intriguing."

Samantha Zhu, chairperson of Accenture China, said: "China is emerging as a critical testing ground for embodied intelligence such as humanoid robots. AI is no longer just a tool; it's becoming a versatile, cross-scenario capability permeating every facet of enterprise operations."

Local governments are also moving swiftly. The Beijing municipal government, for instance, has established a 10 billion yuan investment fund for robotics, which is expected to attract over 53 billion yuan in additional private capital. The city now hosts nearly 1,000 robotics companies, including seven valued at over $1 billion — the highest number in the country.

Counter-tariffs widen Canada-US trade rift

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

The latest escalation in trade tensions between Canada and the United States underscores growing strains in the US' relations with its traditional allies under the "America First" policy, experts said.

Ottawa vowed retaliatory tariffs on US goods after the US announced a steep 50-percent tariff on imports from Canada.

Experts said the developments cast fresh doubts over the future of the US-Mexico-Canada Agreement, the cornerstone of North American free trade, as US protectionist measures and trade disputes increasingly challenge the region's deeply integrated economic ties.

Canadian Prime Minister Mark Carney announced retaliatory tariffs on US goods on Saturday after walking away from what he called a "bad deal", as trade tensions between the longtime allies deepened following the collapse of last-ditch negotiations.

Talks between the neighboring countries broke down on Friday in Washington, DC, putting into force new 50-percent US tariffs impacting about $20 billion worth of goods, or 5.5 percent of Canada's exports to the US.

New Canadian tariffs, which will take effect on Sept 8, will notably target the US steel and dairy industries. More details will be revealed next week, Carney said. "You're at war when you get attacked. We got attacked," he added.

US President Donald Trump hit back at Canada on Sunday, saying, "Canada wants the benefits of being a State, without being one!!!" "They have also charged our great farmers, for many years, massive amounts of Tariffs. No more!!!" he wrote in a post on Truth Social.

Inside
Editorial **page 6**

Trump had previously said Washington "should be able to have a deal with Canada", citing his "good relationship" with Carney.

But on Saturday, the Canadian prime minister said that Trump set conditions which were ultimately unacceptable even though earlier talks had been positive.

"In recent days, the United States proposed new terms that were uneconomic, unfair and undermined the net benefits for Canada, and called into question the reliability of any deal," Carney said in Ottawa.

US Trade Representative Jamieson Greer told The New York Times on Saturday that the US had offered to reduce its tariffs on steel, aluminum and autos, as well as eliminate a recently imposed tariff on Canadian lumber. Greer told Fox News on Saturday that Washington was "moving forward with measures that respond to Canadian retaliation". He said that no new talks were planned with Canadian negotiators.

"We've been under no illusions. We recognized from the start that America has changed," Carney said on Saturday. "We recognize that sometimes, its signature was written in pencil."

The new US tariffs cover around 5 percent of Canada's exports to the US. They could severely damage vulnerable industries such as softwood lumber and wine and lead to job losses and business closures, trade experts have said.

Paocai, or pickled vegetables, draw visitors at the 15th China International Pickle Food Expo in Meishan, Sichuan province, on April 26. LIU ZHONGJUN / CHINA NEWS SERVICE

PICKLES A RELIEF FROM FIERY SPICES

Specially preserved vegetables, known as *paocai*, hold Sichuan's bold flavors together as a perfect palate cleanser

By **PENG CHAO** and
ZHAO JUNFENG
in Meishan, Sichuan

In the back corner of a kitchen in Meishan, Sichuan province, beside a stove hissing with chili oil and popping peppercorns, sits a jar that never makes it onto the menu. Its contents — a colorful mix of greens, reds, yellows and whites — rest submerged in an opaque brine.

The world knows Sichuan for kung pao chicken, mapo tofu, its mouth-numbing hotpot and the mellow depth of *doubanjiang* (fermented bean paste), but ask any local what binds those bold flavors together, and the answer is likely *paocai* — pickled vegetables.

It also elevates Sichuan breakfast staples such as noodles, steamed buns and congee, imparting a signature tang to classic dishes such as fish-flavored shredded pork, sour vegetable fish and sour-radish duck soup.

"Sichuan *paocai* is crisp and not overly salty," said 56-year-old chef Jiang Ming. "The lactic fermentation yields a natural, earthy sourness that vinegar lacks, making it an ideal flavor enhancer."

In Meishan, this tradition has been elevated to an almost architectural scale. At a workshop in the China Paocai City industrial park, nearly 5,000 giant clay jars stand in neat rows, each about 1.6 meters tall.

He Yanping, 49, a provincial-level inheritor of *Dongpo paocai*-making techniques, presses his ear to a lid as a gentle gurgle escapes from within. "That's the sound of lactic acid bacteria fermenting and releasing gas," he said.

China Vibes — FOOD —

Agriculture can plow a productive furrow

WORLD WATCH
By Dan Glickman

The US-China relationship is very challenging. While the United States and China are the world's two largest economies, they have differences in the areas of trade, market access, national security, protection of intellectual property, technology and privacy. These differences should neither be minimized nor dismissed.

Nevertheless, while the two countries are competitors on the world stage, there are many areas where cooperation can be beneficial to both countries and their peoples, and to the world at large.

These include global health and prevention of diseases and future pandemics, educational exchanges, climate change and related natural disasters, energy, and sports, entertainment and culture.

And certainly, even more significantly, cooperation and collaboration in the area of agriculture and food offer perhaps the greatest opportunity for such cooperation. Food security and agricultural production are critical domestic and global imperatives for both countries.

In 2025 the US trade in goods with China totaled an estimated $414.7 billion. US exports to China dropped nearly 26 percent to $106.3 billion, including major agricultural commodities, and imports fell nearly 30 percent to $308.4 billion.

US farmers and Chinese consumers are certainly impacted by these reductions in trade in soybeans, livestock and many other farm commodities.

A Shanghai slingshot for overseas expansion

Government services help clear obstacles for companies entering foreign markets

By SHI JING in Shanghai
shijing@chinadaily.com.cn

Going global — a pressing goal of many Chinese companies — is not only about grasping the big picture.

Nuanced details, such as what can be demonstrated in a product commercial, for example, may jeopardize a company's future prospects in an unfamiliar new market.

With eight years' experience in overseas markets, Shanghai-based gaming company Boke Technology learned this lesson, said the company's general counsel Wang Sijia.

One product commercial for a Southeast Asian market featured exaggerated creative content. It depicted a hamburger that had accidentally fallen on the ground being stepped on, which may have been construed as disrespectful due to cultural sensitivities. Wang said sometimes it's difficult for companies to make such fine distinctions.

However, this is one of the smaller challenges Chinese companies may be confronted with when they enter a new market. Abiding by local market entry regulations and contract formats are even larger issues, she said.

"The biggest headache about going global is the information gap. Companies do not know who to turn to or what they can do when a problem occurs," she said.

When publishing companies enter a new market, for example, they often have to work with local service providers for the first time. Without access to reliable information or experience in collaboration, it is extremely difficult to find the right partners.

A company's own internal risk management capabilities are usually insufficient, Wang added. "The cost of trial and error can be prohibitively high," she said.

Easier compliance

Shanghai companies have been boldly expanding into new markets.

Apart from mature markets such as Europe and the United States, more of them are reaching into Association of Southeast Asian Nations member states, the Middle East, and Latin America, according to He Dongbin, deputy director of the Shanghai Commission of Commerce.

In the first half of this year, Shanghai registered 383 newly established or acquired outbound projects, marking a 105 percent year-on-year increase in investment value.

Diversification of investment destinations has been a major trend. Economies involved in the Belt and Road Initiative have emerged as new investment targets, he said.

This is in line with a broader trend. About 80 percent of surveyed Chinese companies plan to expand overseas in the next three years, with ASEAN continuing to serve as the first choice, according to a report released by Singapore-headquartered bank UOB in early August.

The good news is that companies are being more proactive regarding compliance management when they enter new markets, according to He.

However, Liu Yanhao, deputy director of the Shanghai Municipal Bureau of Justice, said the expansion of legal service providers has not caught up with the expansion of Chinese companies and industries in overseas markets.

Companies can look for professional service providers in foreign markets on their own, Liu said. But the process will be lengthy and painstaking, and the strenuous efforts may not provide a satisfactory result.

A government-backed platform that can link lawyers with experience of overseas markets is an ideal solution, said Chen Jun, a City Development Law Firm partner, who also serves as deputy director of the foreign affairs committee of the Shanghai Bar Association.

In early August, Shanghai launched the international legal services hub, a digital platform where companies can search for institutions that provide legal services in overseas markets as well as experts who specialize in a certain country or industry. So far, 921 institutions with 413 overseas operations have been included on the platform.

Apart from connecting companies to law firms with expertise a company needs, the platform can identify potential country and industry risks.

This is especially important given the current complicated and unpredictable international situation, Chen said. Political changes can lead to policy inconsistencies or even deliberate legislative action targeting Chinese companies, he added.

"However, there is always a window of opportunity before such measures take full effect," Chen said. "Professional service providers can usually notice signs in advance. The government can provide early warnings and intelligence on the platform. The law firms on the platform serve as 'converters', interpreting the needs of Chinese enterprises and connecting them with local professional institutions. The problems can be solved more efficiently or even avoided," he added.

Asset-light initiatives

The shift toward asset-light investment has emerged as another major trend. Sectors such as technical services, the digital economy, and cultural creativity, which are asset-light yet high-value-added, have become key drivers of Shanghai's outbound investment, according to He of the Shanghai Commission of Commerce.

Customs officers inspect synthetic diamonds for export at the Shanghai Diamond Exchange on July 31. The targeted measures and checking service ensure both efficiency and security. PROVIDED TO CHINA DAILY

> "Professional service providers can usually notice signs in advance. The government can provide early warnings and intelligence on the platform."
>
> **Chen Jun,** partner of City Development Law Firm

The demand for computing power and digital technologies has risen significantly as more Chinese companies expand their overseas businesses, said Zheng Maokuan, deputy secretary-general of Shanghai Digital Globalization Association. As a result, Chinese companies are bringing more digital technologies to emerging markets and developing economies to help intelligent and digital upgrading.

Shanghai Linshu AI is one such pioneer.

Founded in 2024, the company aims to digitize cultural heritage around the world and produce various cultural products, including games, animation, or immersive experiences with the help of augmented reality and virtual reality.

This will help cultural heritage across the globe be more accessible to a larger audience. Digitization can also better preserve cultural heritage, transcending the limits of time and geography, according to company partner and general manager Zhang Xiaoping.

Currently, Linshu is working with the Cambodian government to digitize Angkor Wat. This is by no means an easy job: not only because it requires interdisciplinary cooperation across cultural heritage preservation, archaeology and artificial intelligence, but, more importantly, because it needs to access data owned by Cambodia, according to Zhang.

"But gradually, the Cambodian government came to realize their data governance is still at a relatively low level. The participation of Chinese entities can bring in the most up-to-date technologies and even facilitate their own legislation for the cross-border transfer of cultural data," he said.

The Shanghai government has played an important role in helping Linshu's business move forward.

Lin-gang Special Area, a part of the China (Shanghai) Pilot Free Trade Zone, in April 2024 introduced a special service to process cross-border data.

Lujiazui, a part of Pudong New Area financial cluster, introduced supportive policies for one-person companies to form an industrial ecosystem for game and animation production, Zhang said.

These outbound companies are mostly knowledge-intensive. Instead of bringing products to new markets, they are now introducing technologies, skills, operational capabilities and intellectual property rights, according to Adaline Zheng, president and CEO of UOB China.

Data protection key

Against this backdrop, data has become the buzzword when it comes to overseas expansion. However, when a company finds its data has been infringed on or leaked in an overseas market, its competitiveness is significantly impaired and losses are hard to measure.

The confirmation of data ownership is of great importance before a company expands into a new market, said Zuo Weibo, CEO of CRECT Group, which helps companies expand into overseas markets, especially in Southeast Asia.

Shanghai-based Hero Esports has experience in securing its IPR in foreign markets.

Founded in 2016, it has held a number of e-sports games' IPRs in overseas markets including Vietnam, South Korea, Saudi Arabia and Indonesia.

Prior to the launch of Shanghai's data product IPR registration pilot program in December 2024, it was unclear how data could be registered to secure the company's interests, said Zhou Peipei, director of the company's legal and investment center.

"As e-sports games have become more popular, problems regarding data scraping, licensing boundaries and trade secret protection have all emerged. No company can tackle them single-handedly," she said.

"Companies need an official definition or confirmation as to the scope, development process and ownership of these data-driven outcomes. Otherwise, subsequent research and development, potential commercial collaborations and even internal management will be hampered," she added.

The pilot program helped the industry raise awareness of compliance and self-discipline, said Zhou.

Registered information can serve as key material for companies to assert their data rights in future infringement or trade secret disputes. Prosecutors are also involved, offering businesses quick access to expert advice on data ownership and privacy compliance, she explained.

"With the program connecting compliance, rights confirmation, legal protection and future data use, companies are more confident turning long-accumulated data into real innovation," said Zhou.

Data registration has been applauded by the AI, biomedicine, finance, education, culture and transportation industries, said Zhu Yanting, technology director of VLVE Information Technology, a service provider to technology companies.

The system is also directly linked to data trading institutions in Shanghai, so IPR certificates can be used as collateral to apply for bank loans. Data's value as an intangible asset has become clearer, Zhu said.

Shanghai's data product IPR registration is open to other places in China. By the end of July, the city had received 2,245 applications for data product IP registration.

Thirty percent of applications were from outside Shanghai. Data products registration applications came from 29 provincial-level regions. An application has yet to come from the Xizang autonomous region.

Data registration provides a snapshot of multiple efforts Shanghai has made to facilitate companies' steps to enter overseas markets.

In the first half of this year, the city launched a one-stop platform for companies to seek multiple services such as opening bank accounts, financing, legal consulting and logistics. Positioned as a service provider similar to Taobao or JD, the platform aims to make it easier to access, matching companies and service providers while tracking deals. Like the IPR registration program, the service platform is also available to companies across the country.

According to He of the Shanghai Commission of Commerce, the purposes of this open approach is to make the city "the optimal choice and the gateway" for Chinese companies seeking to reach international markets.

‘Dream come true’ reunion for green hero

Teacher from the United States returns to witness transformation of deserts

By **WANG SONGSONG** in Ordos, Inner Mongolia and **YUAN HUI** in Hohhot

When Ronald Sakolsky from the United States stepped off the plane at an airport in the Inner Mongolia autonomous region at around 6 pm on Sunday, it marked the beginning of a long-awaited homecoming to the region, where trees he helped plant more than two decades ago now stand as a living testament to a green bond of international friendship.

Waiting for him at the arrival gate was Yin Yuzhen, China’s afforestation hero whose battle against desertification in the Maowusu sandy area has inspired many people. Yin and her family hugged Sakolsky warmly at what was their first in-person meeting in years.

For Sakolsky, the reunion was a miracle.

“It is a dream come true,” he said, describing Yin as the “hero of the story”.

“She made a promise 27 years ago, and she kept her promise. I never thought I would see her again. It is a miracle. She is an amazing lady. She has done many things for China.”

Sakolsky, who taught English in Luoyang, Henan province, in the late 1990s, first learned of Yin’s story through media reports. In 1999, he donated $5,000 to support her reforestation efforts, a sum that allowed Yin to purchase much-needed saplings.

At the time, Yin was already renowned for her campaign to green the barren desert landscape, but she lacked the funds to expand her planting drive. Sakolsky’s donation changed that.

Combined with Yin’s effort, the once-barren wasteland has been transformed. Those seedlings have since flourished into a sprawling forest that now carpets the dunes in emerald green.

“I am very grateful that Mr. Sakolsky could come here to meet with us,” Yin said. “In preparation for his visit, we have been growing various fruits over this period for him to sample, including the ginseng fruit.”

She described herself as deeply moved and filled with excitement, adding that she strongly desires to take him into the desert and through the forests she has nurtured for nearly three decades.

> “She (Yin Yuzhen) made a promise 27 years ago, and she kept her promise. I never thought I would see her again. It is a miracle.”
>
> **Ronald Sakolsky**

Sakolsky’s return was made possible by an official invitation from the China Education Association for International Exchange, the goal of which is to further promote educational exchanges between China and the US.

What truly made the story go viral is the bond Sakolsky and Yin forged through afforestation efforts. That bond has now blossomed into a moment of shared celebration.

“Finally, that long-awaited moment has arrived, capturing the attention of netizens across the country. From sharing the same forest to forging a friendship between two nations,” one online user wrote. “The light of humanity knows no borders.”

According to the schedule, Sakolsky will visit Yin’s home in Uxin Banner, Ordos, on Monday and Tuesday. The two will tour the fruit-planting bases and shelterbelt forests that have reshaped the local ecosystem, revisiting the plots where Sakolsky’s saplings were first planted. They will also inspect fruit trees planted in recent years, highlighting the ongoing evolution of the region’s green transformation.

Following his stay in the region, Sakolsky and Yin will travel to Henan province to reunite with his old acquaintances in Luoyang. His itinerary there includes meetings with former colleagues and students from his teaching days.

Archaeological links with Peru enter new phase

By **WANG RU**
wangru1@chinadaily.com.cn

Deepening cooperation between China and Peru in the field of cultural heritage has opened a new chapter in archaeological collaboration between the two ancient civilizations.

On Saturday, the Chinese Academy of Social Sciences’ Institute of Archaeology signed cooperation agreements in Peru with the Caral Archaeological Zone of the Peruvian Ministry of Culture, and the Professional School of Archaeology at the National University of San Marcos, Lima, with the aim of jointly conducting archaeological research on Peru’s ancient Caral civilization.

This marks the first official cooperation on archaeological fieldwork between China and Peru, and the first time Chinese archaeological institutions are working in South America.

The Caral civilization, which flourished along the northern coast of Peru from approximately 3,000 BC to 1,800 BC, is the earliest-known civilization in the Americas to date.

According to the agreements, both sides will conduct comprehensive archaeological research at sites associated with the Caral civilization. Their cooperation will include field survey and excavation, scientific and technological research, as well as cultural heritage conservation and joint talent training.

Subsequent cooperation will also extend to the sites of the Inca civilization in the Andean highlands, facilitating comparative research between the ancient civilizations of China and Peru.

With the agreements signed, the China-Peru joint archaeological team will launch the first phase of a field survey, exploring the Chancay-Huaral and Supe river valleys, and conducting on-site inspections at key sites, to further refine subsequent excavation plans.

Jia Xiaobing, chair of the Department of World Archaeology at the Institute of Archaeology, who served as a Chinese representative at the signing ceremony, said this cooperation fills the gap for Chinese archaeological institutions in South American fieldwork.

The Chinese side will obtain first-hand archaeological materials on early American civilizations, facilitating comparative research on ancient civilizations around the Pacific Rim and contributing a Chinese academic perspective to the global study of the origins of early complex societies, Jia said.

The Peruvian side, in turn, will benefit from China’s vast practical experience in scientific and technological archaeology, as well as cultural heritage conservation, achieving mutual academic enrichment, he added.

Academic exchanges between China and Peru in the field of archaeology have spanned more than half a century. As early as 1973, Xia Nai, then director of the Institute of Archaeology, led an archaeological team to Peru to visit important sites such as the iconic Machu Picchu. The following year, a Peruvian archaeological delegation visited China, marking the beginning of academic exchanges between the two countries.

In recent years, cultural and museum exchanges between China and Peru have continued to deepen. Peruvian artifacts have attracted much attention at ongoing exhibitions such as *Maize, Gold, Jaguar: A Grand Exhibition of Ancient Maya and Andean Civilizations* at the Capital Museum in Beijing and *On Top of the World Tree: Ancient Civilizations of the Americas* at the Shanghai Museum.

Meanwhile, the artifacts from China’s ancient Shu civilization, including those from the Sanxingdui site in Guanghan, Sichuan province, and the Jinsha site in Chengdu, Sichuan, also traveled to Peru in 2024, enabling Peruvian audiences to witness a dialogue between ancient civilizations across the oceans.

Trade: Tariff threats could fracture supply chains

From page 1

Chen Hong, director of East China Normal University’s Asia Pacific Studies Center, said the tariff war initiated by the US has not only taken a toll on the Canadian economy but also severely strained a decades-old alliance, exposing the growing fragility of Washington’s ties with its traditional allies.

Although the latest tariffs cover only about 5 percent of Canada’s exports to the US and affect a relatively limited number of industries, Ottawa’s decision to respond firmly reflects its determination to safeguard its autonomy in industrial and trade policy, he said.

According to a recent survey by Abacus Data, a Canadian polling firm, 36 percent of respondents want Canada to respond with new counter-tariffs, “even if that raises prices and risks escalation”.

“Over the past several decades, the US and Canada have forged a close political alliance and deeply integrated their economies under relatively stable and preferential trade arrangements. But the current US administration’s ‘America First’ strategy has turned Canada’s heavy dependence on the US market into an increasingly significant economic and strategic vulnerability,” Chen said.

The current breakdown also complicates the future of the US-Mexico-Canada Agreement, he added.

“Washington’s tariff threats are now pushing companies, particularly automakers, to relocate production and sourcing to the US. This could fracture established supply chains, distort the regional division of labor and ultimately hollow out the North American free-trade system,” Chen said.

Experts also said that Canada would find it difficult to break free from its deep economic dependence on the US in the near term.

“Realistically, Canada would find it difficult to offset the losses from reduced access to the US market in the short term,” said Huang Zhong, associate researcher at the Center for Canadian Studies of Guangdong University of Foreign Studies.

Delicacy: Ancient craft gives *paocai* unique flavor

From page 1

The craft takes its name from Su Dongpo — the celebrated Song Dynasty (960-1279) poet and gourmand who was born in Meishan. The legacy of Su, a passionate maker himself, lent the pickle its enduring cultural identity.

The roots of Chinese pickled vegetables stretch back even further, over 3,000 years in fact, to the pre-Qin period (before 221 BC), when early references to *zu*, or pickled vegetables, appear in classics such as the *Book of Songs* and the *Rites of Zhou*.

This deep historical lineage found its way into local customs. By the Qing Dynasty (1644-1911), a jar of *paocai* had become an essential part of a bride’s dowry — a portable legacy of flavor carried into married life.

Traditional *Dongpo paocai* is made in a large earthenware jar. Fresh vegetables are packed inside and fully submerged in the “mother brine”, or *laomu shui* — a living culture passed down through generations. The lid is sealed with a water lock, allowing gases to escape while keeping oxygen out. What follows is daily care and patient waiting.

“The secret lies in the mother brine, teeming with the specific strains of lactic acid bacteria that give *Dongpo paocai* its distinctive flavor,” He said.

To outsiders, pickled vegetables may call to mind kimchi or sauerkraut, but Sichuan *paocai* is different. Radishes, carrots, cabbage, long beans, young ginger, red Sichuan chili peppers and bamboo shoots are packed whole or in chunks into a seasoned brine of water, salt, Sichuan peppercorns and other spices, often with a bit of *baijiu*.

Within hours or a day or two at most, they emerge with a clean, crisp sourness and a subtle fragrance.

“This water-based fermentation method sets *Dongpo paocai* apart from most other pickling methods in China or abroad,” He said. “The credit goes to the Sichuan Basin’s mild climate — free from freezing winters and scorching summers — which keeps the lactic acid bacteria active year-round.”

Another defining feature is the brief fermentation period — sometimes just hours — which yields a lower-salt product with a distinctly crisp texture.

What began as a local craft is evolving into a global curiosity, with a growing number of foreign visitors flocking to the China Paocai City industrial park to master the craft.

Among them is Hajar Wassila, a Moroccan student who joined a DIY session at the workshop of Sichuan Laotanzi Food Co. Guided by instructors, she packed her jar with vegetables, garlic, red Sichuan chili peppers and carrots, pressing them firmly beneath the brine.

“When I smell it, I want to taste it immediately,” she said, holding up the jar with a grin. “I love pickles and tried to make them before, but failed. Now I’ve finally got the secret.”

Food: Agriculture offers a way to enhance and improve Sino-US ties

From page 1

Some of these changes in trade numbers were impacted by changes in US export policies and trade, although President Donald Trump’s visit to China offered some hope that the trade relationships between the two countries can improve.

The US has one of the largest and most historically productive agricultural sectors in the world. China also has a very significant agriculture sector. The next breakthrough in US-China relations could begin on the farm. Food is not ideological. And while trade disputes have periodically disrupted flows of agricultural commodities, both countries and their consumers and farmers benefit when these markets are transparent, predictable and certain.

In the promising area of agriculture research, collaboration in scientific research can foster solutions to the impact of climate change and the effects of droughts, floods, animal and plant disease, soil health, water resource conservation, food safety and nutrition. Both countries have suffered from the impacts of these challenges, and China has developed a major agricultural research infrastructure, with government and academic institutions working on problems affecting both countries.

The recent epidemics of zoonotic diseases (those that naturally spread between animals and humans) and related viruses, pathogens and parasites highlight the need for cooperation that US and Chinese scientists and academic institutions can provide in this area. And there are so many other public health challenges in the areas of food safety, food and nutrition, and cooperation on agro-biotechnology through modern agronomic technologies to sustainably feed a hungry world. Take genomics, for example. There is enormous potential to make rapid advances in crop productivity, livestock breeding and health, and resource use efficiency. And by properly and legally utilizing artificial intelligence, US and Chinese researchers can work together to leverage digital data to better control diseases, predict weather patterns and events and identify market trends.

Expanding academic exchanges and students studying food and agriculture is also important in developing a talent pool for the future.

None of this is easy and there are no simple answers to the disputes between the two countries, and in recent years there has been a growing lack of trust on each side of the Pacific Ocean. But cooperation in the areas of food and agriculture can help to build bilateral trust and reduce the heated rhetoric in both countries.

President Trump’s visit to Beijing in May was an important step in this process. I hope the US can resume congressional delegations to China which I participated in and also led while at the Aspen Institute. During the Bill Clinton administration, as secretary of agriculture I led a congressional delegation to China on trade issues. And as the Chairman and CEO of the Motion Picture Association, I also made several visits to China to discuss intellectual property and market access issues. I have long felt that although China and the US are serious competitors on the global stage, they are not enemies. Agriculture offers a way to enhance and improve the bilateral relationship for the benefit of both peoples.

President Xi Jinping has said that China and the US should be partners and friends, stressing that is what history has taught us and what reality needs. Mutually beneficial progress on agriculture can help build trust between the two sides and help to achieve progress in a dangerous and rapidly changing world.

The author is the former US Secretary of Agriculture under President Bill Clinton (1995-2001), and currently a Distinguished Fellow at the Chicago Council on Global Affairs. The views do not necessarily reflect those of China Daily.

'Sprouting' partnerships

Forum highlights growing business collaborations between Beijing, Moscow

The 2026 Russia-China Business Forum titled "Sprouts: Russia and China — Mutually Beneficial Cooperation" opened on Aug 16 in Kazan, the capital of the Republic of Tatarstan, bringing together over 50 business sessions, eight Chinese provincial delegations, and numerous Russian federal officials.

More than 10,000 square meters of exhibition space showcased cooperation in logistics, finance, healthcare, industry, agriculture, creative economy, and artificial intelligence.

Attendees at the forum at the Kazan Expo International Exhibition Center on Aug 18. ERIK ROMANENKO / TASS

Against this backdrop of expanding ties, Chinese Ambassador to Russia Zhang Hanhui delivered an address at the forum highlighting the latest trade figures.

"Sino-Russian trade and economic cooperation is demonstrating steady growth. From January to July 2026, the volume of bilateral trade reached $159 billion, which represents a 26 percent increase compared to the same period last year. It is quite possible that a new all-time high will be set by the end of the year," Zhang said.

Local currency settlements also took center stage. Zhou Liqun, chairman of the Chinese General Chamber of Commerce in Russia, voiced strong support for bilateral settlements in national currencies during an interview of the forum.

"We support and pay close attention to bilateral local currency settlements. Such settlements are conducive to the development of enterprises and economic and trade cooperation between the two countries.

"Regardless of the payment system or form, we will support and encourage enterprises to actively participate," Zhou told Russian media outlet Sputnik.

Taliya Minullina, head of the Tatarstan Investment Development Agency, told Xinhua News Agency that eight Chinese provincial-level delegations and governors from multiple Russian federal subjects are attending this year's event.

Tatarstan has signed intergovernmental agreements with seven Chinese provinces — Shandong, Hunan, Sichuan, Anhui, Heilongjiang, Zhejiang, and Jiangxi — as well as Chongqing municipality.

Minullina said that Tatarstan offers eight federal-level economic zones with tax benefits — the most in Russia — and over 100 industrial parks, where Chinese investors can access land or rent fully equipped facilities at favorable terms.

She also emphasized the republic's rich educational resources to support foreign-invested projects.

Beyond business, the forum featured vibrant cultural programs. Delegates enjoyed a Tatar-language performance, a Chinese Film Day, and several cultural events celebrating shared folk traditions.

Search amid ruins

People look at the debris of a seven-story building under construction in Hyderabad, Telangana State, India, on Saturday. At least two people were killed in the collapse, local disaster response officials said, as rescue teams searched for possible survivors. JWALA KOTESH VIA GETTY IMAGES

Briefly

JAPAN

37 injured following magnitude 5.9 quake

At least 37 people were injured after a magnitude 5.9 earthquake struck Ibaraki Prefecture, northeast of Tokyo, early on Sunday. The earthquake also caused burst water pipes and transportation disruptions in some areas, local media reported. Japan's Fuji News Network, citing the Fire and Disaster Management Agency, reported that as of 10 am, at least 37 people were injured in Tokyo, Ibaraki Prefecture, Kanagawa Prefecture and other areas. The earthquake temporarily disrupted some train services in the Kanto region, though operations were gradually being restored. Multiple water pipes burst in Tokyo and other areas, causing temporary flooding on some roads.

UNITED STATES

$850m UN dues payment planned

The US government has notified Congress of its plans to pay $850 million of the several billion it owes to the United Nations, the largest payment that the administration would make to the world body since Washington demanded sweeping reforms in exchange for continued support as its largest donor. The US State Department laid out its plans to transfer $725 million as part of its dues to the regular UN budget and $125 million toward UN peacekeeping operations in Haiti and the Democratic Republic of the Congo, according to notifications sent to lawmakers this month and obtained by The Associated Press. The US is about $5 billion behind on dues related to its membership, with more than $2 billion owed toward the regular budget, the UN says.

DR CONGO

Gov't, M23 agree on road map for talks

The government of the Democratic Republic of the Congo and the March 23 Movement rebel group have agreed on a road map for peace negotiations, setting out sequenced steps and timelines for further talks, according to a joint statement issued on Sunday. The two sides said that, during meetings held from Aug 17 to 21 in Switzerland, they assessed progress and challenges in the Doha peace process while discussing the implementation of existing commitments and the way forward for negotiations under the Doha Framework Agreement. Following the assessment, the two sides developed a road map outlining the sequence and timetable for future negotiations.

More than 3 decades on, a witness to China-S. Korea ties sees shared future

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

Shin Jung-seung

For Shin Jung-seung, former South Korean ambassador to China, the 1992 signing of the joint communique establishing diplomatic relations between the two countries remains a vivid memory.

"Witnessing the normalization of bilateral ties with my own eyes was deeply moving," Shin said, recalling the signing ceremony at Fangfeiyuan Hall in the Diaoyutai State Guesthouse in Beijing on Aug 24, 1992.

At the time, Shin was director of the Northeast Asia Division II in the South Korean Foreign Ministry's Asian and Pacific Affairs Bureau. In charge of China affairs, he played an active role in the negotiations that led to the establishment of diplomatic relations, often seen as a milestone that reshaped the geopolitical landscape of Northeast Asia.

Beyond the official exchanges, Shin recalled another touching moment that night at a restaurant near the state guesthouse. The owner, a member of China's Korean ethnic group, was overjoyed by the news and presented the delegation with a bottle of liquor as a gift.

"That gave me a tangible sense that the normalization of relations would greatly benefit the peoples of both nations," Shin said.

With his experience, Shin later served as a minister at South Korea's embassy in Beijing, director-general of the Foreign Ministry's Asian and Pacific Affairs Bureau, and ambassador to China from 2008 to 2009.

While many countries doubted in the early 1990s that China could achieve rapid economic growth, Shin said he was confident of its economic prospects when he became ambassador.

He said China's rapid development and the achievements it showcased at the 2008 Beijing Olympics and the 2010 Shanghai World Expo reinforced his confidence.

"What was unexpected was the dazzling advancement of China's high-tech technology today," he added.

Shin said he was impressed by the results of active government support, companies' creativity and bold investment, and academic institutions' efforts to cultivate talent.

"This is something I believe South Korea has much to learn from," he said.

After retiring from the foreign service, Shin continued to devote himself to China studies and promoting bilateral friendship.

He was the inaugural director of the Center for Chinese Studies at the Korea National Diplomatic Academy in Seoul and now heads the Center for Chinese Studies at Dongseo University in Busan.

Shin has also served as president of the Korea-China Friendship Association since 2021.

"I've always believed in the importance of viewing things objectively," he said.

Promoting exchanges

To achieve this, Shin said he has striven to promote academic exchanges with China and engage with Chinese experts, while frequently organizing discussions with experts in South Korea.

"In exchange with China, it is important to build trust by respecting each other and engaging with goodwill," he said, adding that he still constantly ponders how to effectively convey South Korea's position to his Chinese friends whenever opportunities arise.

He said active public engagement is needed to enhance mutual understanding in the spirit of "harmony without uniformity", while upholding the principles of mutual respect, reciprocity and equality enshrined in the 1992 Joint Communique.

Vast opportunities will emerge if the two countries continue to deepen cooperation based on mutual respect and identify complementary areas for win-win outcomes, he said.

For his part, Shin said he is committed to supporting bilateral relations through academic work and friendship activities.

He highlighted mutual visa exemption and the Collective Action for Mobility Program of University Students in Asia, a student exchange and academic cooperation program jointly launched by China, South Korea and Japan in 2012, as encouraging ways to deepen youth friendship.

At Dongseo University, Shin said he has seen students from the three countries build friendships under the program while learning one another's languages and cultures.

"Facilitating as much exchange as possible among the younger generations of South Korea and China will allow them to understand each other and deepen friendship, which will bring bright prospects to the future of bilateral relations," Shin said, adding that governments should fully support such efforts.

Looking ahead to the 33rd Asia-Pacific Economic Cooperation Economic Leaders' Meeting in Shenzhen, Guangdong province, in November, Shin said he expects further momentum in South Korea-China relations following last year's meeting in South Korea and state visits, even though challenges remain.

Noting that China emphasized the denuclearization of the Korean Peninsula in a 2025 national security white paper, Shin said this is a shared goal for South Korea.

He expressed hope that closer cooperation between the two countries can contribute to peace and prosperity in the Asia-Pacific region.

Iran pledges to weather 'full-scale' war

Tehran threatens retaliation against US sanctions backers as pressure mounts

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran said on Sunday it is fighting a full-scale economic, military and security war as it warned that countries joining United States sanctions against Tehran would be considered an enemy.

The warning comes as US President Donald Trump said he viewed the Strait of Hormuz as an "American territory". In a social media post on Saturday, he reposted a map marking the critical waterway as a "new US territory".

Speaking at a ceremony on Sunday, Iranian President Masoud Pezeshkian said the government had faced war, sanctions, various pressures and continuous assassinations, alongside serious imbalances in water, electricity, gas, fuel, the environment and banking, but assured the public that his government is doing its best during the hardships.

"The enemies imagined that with their pressure and actions Iran would collapse. Not only did this not happen, but the power and unity of the Iranian nation amazed the world," he was quoted by the Mehr News Agency as saying.

"Of course, we are ashamed before the people that problems exist. But as long as we have breath in our bodies, we will serve our dear people, work to improve their lives and welfare, and pass through these crises with strength," he added.

In a speech published by state-run IRNA early on Sunday, Pezeshkian defended a recent memorandum of understanding as the best way for the country to move beyond what he described as a situation of "neither war nor peace".

Members of Iran's Supreme National Security Council believed the memorandum represented the best possible agreement based on dignity, wisdom and the national interest, he said.

In a televised interview on Saturday, Iran's security chief Mohsen Rezaei warned that countries joining US sanctions against Iran will be considered an enemy, and Tehran would retaliate by targeting their interests, the Tasnim News Agency reported.

Rezaei said Iran's defense strategy and international behavior have undergone significant changes following the US-Israeli war of aggression. Iran would have to adapt both its defense and diplomatic approaches considering US violation of its commitments and betrayal in negotiations, he added.

He also criticized Trump's policies, saying his "foolishness" has created a huge burden for the US people, its allies and the whole world, and that the US president has increased the logistic risk to global trade.

Iranian Foreign Minister Abbas Araghchi on Sunday dismissed the threat of new US sanctions as a sign of desperation.

Describing what he said were "repetitive scenarios", Araghchi said in a video posted on Telegram, "The fact that they (US leaders) have moved on from military operations ... to bring up the same old plans shows that they are desperate."

Washington must speak to Iran respectfully to find "a solution based on justice and honor", he added.

Meanwhile, Iranian Parliament Speaker Mohammad Bagher Ghalibaf said Tehran had received "multiple messages from neighboring countries" regarding the formation of new security arrangements and economic cooperation across the region.

The Iranian Foreign Ministry said Pakistani army chief Asim Munir would visit Tehran on Monday to meet senior Iranian officials, Al Jazeera reported. The talks were said to focus on enhancing bilateral cooperation and regional peace.

Last week, Trump launched an economic campaign against Iran after Washington failed to achieve a breakthrough with Tehran as their memorandum of understanding signed in June expired on Aug 17.

Israel raises 'serious security concerns' over Hamas disarmament deal

TEL AVIV, Israel — Israel has shared "serious security concerns" with the United States regarding the proposed disarmament deal with Hamas, an Israeli official said as Israeli strikes over the weekend killed at least 17 people, including children, in Gaza.

The remarks by Doron Spielman, spokesman for Israeli Prime Minister Benjamin Netanyahu's office, were some of the first public comments since US President Donald Trump announced the agreement.

Spielman told The Associated Press that Israel's intelligence assessment is that Hamas remains committed to rebuilding its military rather than genuinely demilitarizing. He said the Israeli military would not withdraw from Gaza — where it controls more than 60 percent of the territory — before Hamas disarms.

"Our assessment is that if we redeploy before Hamas is truly disarmed, it will quickly expand its presence throughout Gaza, rebuild its terrorist infrastructure, once again threaten Israeli communities, and seek to carry out another Oct 7-style attack," he said, referring to the Hamas militant attack on Israel in 2023 that triggered the conflict in the Gaza Strip.

Israel responded with a punishing military offensive that has killed more than 73,000 people, according to the Gaza Health Ministry.

Spielman's comments come days after Hamas said it would begin disarming as part of the US-brokered ceasefire signed nine months ago to end the nearly three-year-long conflict. It marks a potential breakthrough in ending the conflict, but many hurdles, conditions and long timelines remain.

The 20-point ceasefire plan calls on Hamas to surrender its weapons and destroy its vast network of tunnels. It also envisions Israeli forces withdrawing from Gaza, the arrival of a new technocratic Palestinian government, deployment of an international security force and the rebuilding of the battered Palestinian enclave.

Hamas disarmament has been a sticking point and has deadlocked negotiations for months. In announcing the deal on social media on Thursday, Trump said it would be carried out in "carefully structured phases".

A copy of the agreement obtained and verified by the AP said that all weapons held by the Hamas-run police will be transferred to the National Committee for the Administration of Gaza upon its arrival in the enclave. It is unclear when that would happen, since it depends on other steps.

A process to decommission and store heavy weapons and to dismantle military production sites and tunnels will begin after the arrival of the Palestinian committee and the deployment of international forces. The process will be linked to a phased Israeli withdrawal, according to the agreement.

On Saturday, a delegation from the Palestinian National Liberation Movement, or Fatah, headed to Cairo, while Hamas affirmed its commitment to participating in the legislative elections scheduled for November as part of the broadest possible national coalition.

COMMENT

Editorials

US-Canada talks impasse acute reminder that Washington should review its policies

The break in the United States-Canada trade talks is more than another episode in Washington's ill-advised tariff drama. When US negotiators introduced last-minute demands that would have constrained Canada's ability to reach trade deals with third parties, Canadian Prime Minister Mark Carney walked away. The striking thing is not simply that the talks failed, but how revealingly they failed.

The US-Canada trade dispute is a miniature of a much larger problem: a US administration treating economic relations as a series of zero-sum contests while overlooking the costs its policies impose on the US' trading partners and the US itself.

Tariffs, technology restrictions, military escalation and an increasingly interventionist approach to currencies form a policy mix that risks aggravating the very inflationary, fiscal and financial pressures Washington claims to be fighting.

US importers pay tariffs at the border. Much of the cost is then passed on to businesses and consumers through higher prices and thinner margins, while retaliation hits US exporters. Modern manufacturing does not respect tariff boundaries. Auto parts can cross the US-Canadian border several times before becoming a finished vehicle. Taxing each crossing does not make the final product more American, just more expensive.

The same logic applies to technology policy. Washington's expanding "entity lists" and restrictions on China may become self-defeating when US companies are forced to redesign supply chains around political considerations rather than productivity. The result is greater technological fragmentation and reduced access to markets in which US companies have long been competitive.

The US administration's "transshipment" report takes this logic to an almost comic extreme. Baselessly blaming China for the disappointing economics of an arbitrary tariff regime does not change the underlying arithmetic. Once Washington creates large tariff differentials, it should hardly be surprised that businesses seek alternative routes. The policy creates the incentive and then foreign countries are absurdly criticized for responding to it.

Military escalation in the Middle East adds another inflationary shock. Washington's pressure on other nations to align themselves with its so-called toughest-ever economic measures against Iran is a telling reflection of its own strategic passivity regarding the trouble of its own making. The longer this conflict drags on, the deeper the hole the US is digging for itself.

Energy-price volatility feeds into transport, manufacturing and household budgets, while making the Federal Reserve's task harder. Monetary policy can restrain demand to help cool inflation; it cannot produce more oil or repair disrupted supply chains.

Then there is the number Washington cannot tariff away: the national debt. Annual deficits approaching $1.8 trillion and a debt burden above $40 trillion leave the US exposed to higher interest rates. Debt-service costs have climbed above $1 trillion a year, consuming resources that might otherwise finance infrastructure, education and social programs. Long-term Treasury yields remain elevated as investors demand compensation for inflation risks and the scale of future borrowing.

The weakening dollar adds another complication. A softer currency helps exporters, but also raises the domestic price of imports. In an economy already confronting tariff-induced inflation, further weakness of the dollar is hardly cost-free.

Against this backdrop, the surge in AI-related corporate borrowing deserves particular scrutiny as a potential trigger of a financial crisis. As of August, nine major US technology companies reportedly had nearly $3 trillion in off-balance-sheet commitments — almost double an estimate made only six weeks earlier. Roughly $1.9 trillion involves purchases of chips and servers and another $1.2 trillion future leases. More troubling is the potentially self-reinforcing financing cycle in which vendors finance customers who then use the funds to purchase their products. If AI revenues disappoint or higher long-term rates puncture valuations, these commitments could surface abruptly, transforming an investment boom into a financial shock potentially far larger than the dot-com bust of 2000. The damage could spread through credit markets and pension portfolios precisely when Washington has less fiscal room to respond.

According to a report, 57 senior US administration officials are worth at least $100 million, over four times the combined number of ultra-wealthy appointees in the George Walker Bush, Barack Obama and Joe Biden administrations.

For this wealthy circle, tariffs, AI contracts, energy prices and market volatility represent speculative opportunities. Policies presented as defending workers are in effect deepening wealth concentration and shifting costs downward.

But the White House tries to explain away these contradictions by blaming the previous administration, China or other trading partners, including Canada and the European Union. The US-Canada trade dispute should be read as a warning about a self-reinforcing policy circle driven by vested interests in the US.

The outward symptoms? Too much international engagement is being viewed through a transactional, zero-sum lens, turning allies into bargaining targets and trading partners into economic suspects.

The US' architecture was originally designed to restrain individual impulses through checks and balances. Those guardrails, however, become meaningless if institutions evolve from constraining personal discretion to protecting it.

Striving to realize human-robot symbiosis

At the second World Humanoid Robot Games in Beijing on Saturday, a humanoid robot from Team Tianzhuo set a milestone, clocking 100 meters in 9.39 seconds. It not only beat the previous robotic record but also eclipsed the legendary Usain Bolt's world record of 9.58 seconds, a feat of human biology deemed near the absolute limit.

This record-setting sprint was the dramatic opening act for the games that are being held from Saturday to Wednesday. The event has exploded in scale. This year's event has attracted the participation of 666 teams and 2,056 robots from 16 countries, marking a 138 percent increase in the number of teams taking part and a fourfold jump in the robot count from the inaugural event last year.

It demonstrates the speed of technological iteration. More significantly, the games reflect a global commitment to moving robots out of labs. The scenario-based events have been extended into simulated real environments such as factories, hotels, homes and logistics with tasks such as packing, unpacking and retail service, pushing humanoid robots from "demonstration tools" toward "practical productivity".

This push for real-world utility was the central theme at the 2026 World Robot Conference, which was held under the theme "Human-Robot Symbiosis, Production-Demand Convergence" from Wednesday to Sunday. Over 370 exhibitors from around the world showcased 3,000 innovative products, with 311 being global debuts. The industry's focus is increasingly on reliability, cost-effectiveness and solving real-world problems.

The market's attitude toward the industry was apparent last week when Unitree Robotics, a global leader in humanoid and quadruped robots, went public on the Shanghai Stock Exchange's sci-tech innovation board.

In a market crowded with options, investors are placing long-term bets on China's ability to translate its industrial strength into commercially viable embodied intelligence. This confidence is well-founded. Embodied intelligence, the integration of artificial intelligence with a physical form, is poised to inject new momentum into the global economy. Its applications span manufacturing, warehousing, logistics, emergency rescue and household services.

China's market is one of the world's largest testing grounds. From traffic control to package sorting, Chinese robots are already at work, demonstrating that the future is not on the horizon — it is already here. However, AI and robots will also affect the job market.

Addressing the contradiction requires a multipronged labor-market strategy: A shift from income support to employment-conditional subsidies, including wage insurance for displaced workers moving into growing sectors, alongside portable benefits to reskilling programs tied directly to employer demand. There should also be tax incentives for companies that invest in human-AI complementarity rather than wholesale automation.

In practice, to harness the opportunities of the new technological revolution, governments, businesses and universities should forge closer partnerships to enhance workforce development. This ecosystem should prioritize "learning by practicing" through internships, apprenticeships and industry-sponsored projects that bridge theory and practice.

Crucially, policymakers should pursue active labor-market policies that enhance mobility, reduce skills mismatches and ensure productivity gains translate into broad-based wage growth rather than elite capture. With proper foresight, there is no reason why the development of advanced technology cannot be a rising tide that lifts all boats.

Opinion Line

China's commercial space industry demonstrates innovation energy

Watching the Zhuque-3 Y2 rocket lift off from the Jiuquan Satellite Launch Center, courtesy of LandSpace's live footage on Wednesday morning, was a moment of proud fulfillment for me. Minutes later, witnessing its first-stage booster settle vertically onto the landing zone in Minqin, Gansu province, I felt the culmination of a decade of on-the-ground reporting.

That very day, I wrote the news story on this historic mission. My visits to LandSpace's research and development facilities and the Minqin landing site just days before the launch gave me firsthand insight into the formidable technical challenges faced by the company's young engineers, making their achievement even more praiseworthy to me.

Over the past 10 years, I have observed China's commercial space industry evolve from a handful of underfunded start-ups with modest ambitions into a formidable force reshaping the country's space landscape. In the early days, I recall interviewing a veteran rocket designer from a State-owned space giant who flatly asserted that China had "no foundation for commercial space operations" and that launch services should not be entrusted to private players.

At that time, SpaceX was already demonstrating the viability of reusable rockets and lowering launch costs in the United States, yet such a path seemed unimaginable to many in China's space community. What a difference a decade can make.

The farsighted decision by the top leadership to open the space sector to private capital and enterprises — framing them as valuable complements to State-funded entities and a source of dynamism and competitiveness — has been fully vindicated. My years of reporting have tracked how private companies have moved from tentative experiments to world-class accomplishments. Today, they are an indispensable pillar of China's overall space capability, injecting innovation energy into the entire industry chain.

Wednesday's milestone — China's first successful land-based recovery of an orbital-class rocket booster — has far-reaching implications. Developed by LandSpace, the stainless-steel Zhuque-3 is specifically built for large-scale constellation deployment, offering heavy-lift capacity at reduced cost. Its proven reusability will significantly accelerate the construction of China's low-orbit satellite networks and other commercial systems, giving the country more flexible and cost-effective options for its space programs.

Beyond the direct technical gains, the success triggers a powerful "catfish effect" throughout the industry: private-sector breakthroughs press State-owned contractors to accelerate their own innovation cycles. Healthy competition also drives local suppliers to upgrade manufacturing standards, boosting the overall competitiveness of the country's space sector.

That said, maintaining a sober perspective is essential. Compared with the US, which leads the world in reusable rocket and commercial satellite technologies, China still faces notable gaps in many areas of commercial space operations. The journey to full reusability and routine, affordable access to space remains long and arduous.

As I watched the over-40-meter-tall Zhuque-3 first-stage booster stand upright on the landing pad in the middle of the desert — dust settling around its deployed legs — I recalled the skepticism of that designer years ago. What has unfolded since is a testament to the power of vision, policy support and entrepreneurial drive.

China's commercial space story is far from over, and I feel privileged to continue documenting the next chapter of reusable launch and satellite networking.

— ZHAO LEI, CHINA DAILY

What They Say

New healthcare plan has people-centered approach

Editor's note: *China released a five-year plan that aims to enhance the accessibility, affordability and sustainability of its public healthcare system. China Daily spoke to Dong Wenyong, an associate researcher at the Institute of Law at the Chinese Academy of Social Sciences, on the importance of the plan. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

There is a noticeable gap between the current development of healthcare provision and the growing demand for high-quality healthcare services. Factors such as urbanization, an aging population and the growth of new forms of employment are generating new demands for healthcare delivery. Also, the lack of synchronization among healthcare services, pharmaceutical supplies and medical insurance hinders the effectiveness of healthcare provision.

Addressing these challenges and seizing the opportunities requires a dedicated and comprehensive plan to drive systemic reform and development. Advances in big data and artificial intelligence present new opportunities to improve the management of the healthcare system.

Against this backdrop, the plan proactively addresses the challenges and opportunities facing the public healthcare system. It outlines six goals and guiding principles, six areas of reform, five initiatives to improve people's well-being and three major projects.

The goals are the six qualities that China's healthcare system should feature by 2030: fairness, legal compliance, security, digital and intelligent capabilities, coordination and sound management.

This is the first time that these six qualities have been systematically identified as development goals of the public healthcare system. Their introduction clarifies the sector's objectives and provides specific criteria for evaluating progress. Together, they will serve as benchmarks, offering multidimensional guidance for the development of the public healthcare system over the next five years.

The plan also outlines six major reform tasks: improving the multitiered public healthcare system; implementing long-term care insurance; deepening pharmaceutical and healthcare service reforms; improving the management and regulatory system for public healthcare funds; improving the public service system; and strengthening the foundations for the development and provision of public healthcare.

A key focus of the reforms is addressing institutional gaps, particularly those affecting individuals in flexible employment, such as food delivery couriers and ride-hailing drivers, by facilitating their coverage by medical insurance. This adaptation is crucial to meet the needs of new forms of employment. Additionally, the inclusion of long-term care insurance in the overall public healthcare system directly addresses the demands of an aging population.

The five initiatives to enhance people's well-being include efforts to consolidate and improve universal enrollment in medical insurance, develop an all-in-one service for medicine purchases, strengthen primary-level healthcare with the support of medical insurance, standardize the direct settlement of medical expenses incurred outside the insured person's place of residence, and establish a personal medical insurance cloud platform.

These measures address long-standing concerns among insured people and matters that directly affect their daily lives. They demonstrate that the plan not only addresses national-level issues but also incorporates a people-centered approach that focuses on individual needs.

Through concrete measures such as building platforms for managing insured people's information, developing applications for comparing medicine prices and supporting primary healthcare institutions in residential communities, the plan aims to advance broader institutional reform through targeted initiatives.

The three major projects are a monitoring and early-warning system for fund operations, big-data regulatory models and international cooperation on public healthcare services. These projects address the challenges and opportunities of an era defined by risk, technology and increased openness.

Through targeted development efforts, these projects will help turn the concepts of secure, digital, intelligent, and well-managed public healthcare into concrete outcomes, thereby building a modern system that meets practical needs and prepares for the future, while delivering higher-quality coverage.

VIEWS

Muhammad Zamir Assadi

CPEC connects the dots to growth

The China-Pakistan Economic Corridor has transformed Pakistan's physical and strategic landscape. Journeys that once took days can now be completed in hours. Ports that were once idle are now bustling hubs of regional trade. Chronic energy shortages have been addressed by energy projects, enhancing industrial stability in the country.

However, the real evolution of the CPEC is just beginning to unfold. The second stage of the project is not just about concrete and asphalt. It's about production, innovation and shared prosperity.

The CPEC is entering a new phase of development and prosperity. This is not just a continuation of past achievements but a structural transformation.

Connectivity is evolving into industry cooperation, roads into value chains and energy generation into economic diversification. This transition is creating a new narrative on development that is focused on industrialization with people-centered growth as its goal.

At the core of this transformation are special economic zones, envisioned as engines of manufacturing and export growth. Pakistan has long grappled with insufficient industrialization and a lack of diversified export bases. Breaking this cycle requires attracting foreign investment into the CPEC's industrial zones and fostering collaboration between Chinese and Pakistani companies.

Regulatory reforms and skills development will be crucial to the success of these zones as well as infrastructure. Early initiatives are already showcasing this transformation, with emerging technology companies, textile units and engineering workshops starting to cluster in industrial parks along transport corridors.

For the next stage, deeper integration with global supply chains and stronger linkages between local suppliers and large industrial operators are essential. This integration will ensure the benefits of industrialization are felt across all industries.

Agriculture is another domain where CPEC 2.0 is likely to make a significant difference. Though it is the cornerstone of Pakistan's economy, the agricultural sector is plagued by low productivity due to outdated technology and minimal value addition.

Coordinated irrigation systems and advanced cold storage facilities for seeds and seedlings could revolutionize the sector. Technology-driven agriculture can reduce waste, enhance yields and boost export competitiveness.

It's not just an economic issue but a social one as well.

A large portion of Pakistan's population lives in rural areas where farming is the primary livelihood. Modern farming methods can alleviate poverty and reduce urban migration pressures. They can also help generate new opportunities for agro-based industries, linking farms more effectively with markets.

Another key feature of CPEC 2.0 is technology. Artificial intelligence and telecommunications have become integral to economic planning and digital infrastructure. These efforts can help bridge Pakistan's digital divide and improve public service delivery through enhanced cooperation. Smart logistics systems, digital payment platforms and e-commerce networks are already reshaping the country's business landscape.

Technology cooperation also impacts education and human capital development, as more universities and training institutions equip students with skills for emerging industries. This needs a change in curriculum design and stronger academic-industry linkages.

If technological infrastructure is to underpin sustainable growth, people must have the skills to drive it. Job creation is a key objective of the CPEC, and the transition from infrastructure to industrialization offers new opportunities.

But the quality of employment is as important as the quantity. The focus should be on skilled employment that provides stability and career progression, rather than short-term labor-intensive jobs. This can be done through vocational training programs, technical education and entrepreneurship support. Small and medium enterprises will be key enablers of this change.

Most economies rely on SMEs, which employ the majority of the population. Integrating SMEs into CPEC-related supply chains can distribute the economic benefits more widely and promote innovation at the local level, where businesses are more responsive to market changes.

Green development is another important aspect of CPEC 2.0. As the world focuses on climate change, development projects are increasingly held to green standards. The use of renewable energy, energy-efficient industrial systems and environmentally friendly construction measures not only helps achieve environmental objectives but also increases economic resilience. Renewable energy, particularly solar and hydropower, also reduces reliance on imported fuels and enhances energy security.

The central tenet of the next phase is people-centered development. The true success of infrastructure lies in improving everyday lives. Access to education, health care, clean water and economic opportunity determines whether large-scale projects are truly successful.

This transformation requires greater community involvement. Local populations should be active participants in development projects, not passive beneficiaries. This can be achieved through consultation processes, local hiring policies and inclusive planning frameworks. A sense of community ownership significantly enhances the sustainability of development projects.

CPEC also brings regional benefits. Greater connectivity and economic integration between China, Pakistan and neighboring countries can strengthen trade and economic ties across Asia.

The project can also connect remote regions that have been cut off from international markets. In this sense, the CPEC is not just a bilateral project but a catalyst for regional transformation.

Strategic infrastructure cooperation has already proven its worth in the context of the CPEC. The next chapter will determine whether this foundation can turn into sustainable industrial development and widespread prosperity. Infrastructure does not automatically lead to industrialization. It involves planning, investment and partnerships. The significance of this moment lies not only in the magnitude of the opportunity but also in the depth of transformation it offers.

If properly implemented, CPEC 2.0 can transform Pakistan's economy, diversify its industries and open new avenues for inclusive development.

It can also serve as a template for turning connectivity projects into comprehensive development partnerships.

The journey ahead is multifaceted and the direction is clear. Infrastructure laid the foundation; industrialization will define the future.

Digby James Wren

Robust H1 performance confirms China's stabilizing role

China's economic performance in the first half of 2026 demonstrated its growing resilience against external headwinds, such as disruptions in the Middle East, tariffs and sanctions.

The country's GDP reached 69.57 trillion yuan ($10.3 trillion), up 4.7 percent year-on-year, keeping it on track to meet its full-year growth target.

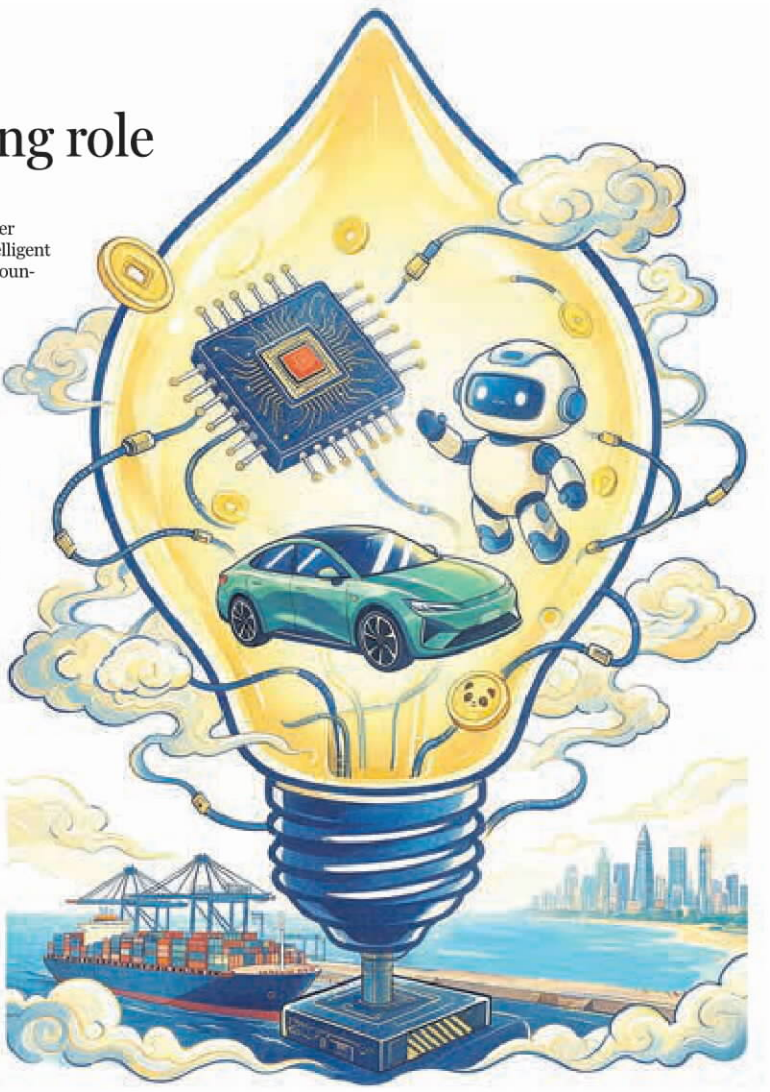
While second-quarter growth moderated to 4.3 percent following a stronger 5 percent in the first quarter, industrial output, retail sales and services all continued to expand. Furthermore, urban unemployment eased to 5 percent in June, while per capita disposable income rose 5.2 percent. Notably, the GDP deflator has turned positive after 12 quarters of deflation.

New growth drivers, such as high-end manufacturing, the digital economy and modern services, which capitalize on speed, scale, and technological integration, contributed over 40 percent of first-half growth.

The World Bank projected a steady 4.4 percent growth for China in 2026, noting that high-tech investment rose 4.5 percent year-on-year in January-May. The OECD has forecast 4.5 percent growth, citing strong semiconductor production and exports.

China's foreign trade reached a record high of 25.47 trillion yuan during the first half of 2026, the impressive 16.9 percent year-on-year growth reinforcing China's status as the world's leading goods trading nation. A key feature was a shift in trade dynamics. With the growth in imports outpacing the growth in exports, China has made substantial progress toward a balanced trade structure and increased consumer demand.

The transition to new growth drivers was decisive. Mechanical and electrical equipment exports saw a 20.1 percent increase, accounting for 63.5 percent of all exports. High-tech exports surged by 39 percent while AI and computing components posted double-digit growth due to global data center construction. Exports of electric vehicles grew by 68.7 percent, lithium-ion batteries increased 37.6 percent, while export volumes of wind turbines and associated green power generators shot up 35.6 percent.



Nextgen green mobility exports of railway locomotives grew 45.1 percent and electric motorcycles and bicycles rose by 31.5 percent. China exported over 10,000 units of AI-powered intelligent bionic robots to more than 90 countries and regions. Exports of medical and surgical robots grew 3.3-fold to 480 million yuan, expanding their markets from 23 countries to 49 in 12 months.

For 17 consecutive years, China has been the world's second-largest import market, accounting for roughly 10 percent of global import demand.

By granting zero-tariff treatment to 63 developing nations, the Chinese market facilitated import growth from more than 150 countries and regions.

Trade with Belt and Road countries rose 14.8 percent to 12.97 trillion yuan, representing 50.9 percent of China's total foreign trade volume. Trade with Africa rose by 19.6 percent, Latin American trade expanded by 16.2 percent, and commerce with regional neighbors jumped 20.6 percent to 9.44 trillion yuan.

Trade with the European Union also registered a solid 10.2 percent increase. Foreign-invested enterprises and multinationals remain highly integrated within this ecosystem, shifting from "manufacturing in China" to "innovating in China".

MA XUEJING / CHINA DAILY

While the European Central Bank notes that stronger Asian emerging economies, including China, lifted global momentum, French Finance Minister Roland Lescure says China is "under-consuming", the US is "over-consuming" and Europe is "under-investing". Banque de France Governor François Villeroy de Galhau has called for Chinese investment in Europe that creates local value and supports technology transfer. Germany's Finance Minister Lars Klingbeil says Germany is "not afraid of competition, but it needs to be fair".

Malaysia and Singapore have pointed to spillover effects from weaker demand, tariffs, and supply-chain disruption. Nevertheless, the global market's deep reliance on China's high-value, tech-driven exports creates mutual interdependence, rendering complete decoupling economically unfeasible.

China and the Association of Southeast Asian Nations are each other's largest trade partners, which means any domestic slowdown would quickly impact Southeast Asia through trade demand, supply chains and commodity prices.

However, China's strong first-half performance has provided a vital economic buffer. Indonesia's trade with China rose in early 2026, Cambodia's total first-half trade with China exceeded $11 billion, and Thailand's export sector is projected to grow 8 percent to 10 percent driven by electronics and AI-related demand.

China's first-half performance in 2026 confirms the wisdom of transitioning to new growth drivers and strengthening resilience built on innovation. Its robust GDP growth of 4.7 percent reflects nuanced fiscal support and policy responses to external disruptions and domestic challenges in the property sector as consumption remains soft.

The underlying story, however, is one of sustained growth. As the 15th Five-Year Plan (2026-30) begins, the central task for the second half of 2026 is to localize policy inputs, maintain fiscal flexibility and balance domestic property and consumption challenges with export and manufacturing strengths.

Xue Jinwen

Taking the local history of Lyuliang to the world

In Lyuliang, the past is always present. Visitors to the city in Shanxi province will find history almost everywhere: in former revolutionary sites, in village stories and in the songs that endured the years of war.

During the Chinese People's War of Resistance Against Japanese Aggression (1931-45), Lyuliang was integral to the Jin-Sui border region. The struggle during that period gave rise to what is now known as the Lyuliang Spirit, a tribute to the sacrifices of soldiers and civilians during wartime, and a source of inspiration to overcome severe poverty and adversity.

That rich history deserves to be known beyond China. But sharing it with a global audience is a challenge. For those unfamiliar with China's revolutionary history, the stories of Lyuliang might seem distant. The key lies in finding effective ways to communicate the revolutionary heritage to an international audience.

Instead of presenting it as a lesson for the world, the focus should be on making the history accessible and engaging.

The first step is ensuring historical accuracy. The Lyuliang University has established the Jin-Sui Research Institute, bringing together researchers in history, literature, art and foreign languages.

They have preserved and digitized vast amounts of historical material, including wartime newspapers and other documents.

Archives may seem less glamorous than documentaries or viral videos, but without reliable sources, international storytelling quickly becomes little more than publicity. Digitized newspapers give researchers abroad access to authentic historical data.

Researching the writings of foreign journalists, such as United States reporter Harrison Forman, can also help contextualize the Jin-Sui experience within a broader international narrative. Readers outside China may approach Chinese history with different assumptions, but this is no reason to rewrite the past to make it more palatable to outsiders.

Instead, providing sufficient context enables readers to understand what they see and then form their own opinions.

Lyuliang's traditional culture — paper-cutting, shadow puppetry and dough sculpture — is not merely local handicrafts.

The greater challenge is fostering a connection with this history. While historical arguments can explain why the Lyuliang Spirit matters, cultural expressions — songs, novels or films — can evoke an emotional understanding of its importance. That is also why cultural forms should play a central role in sharing Lyuliang's history abroad.

The university has produced musical works and other projects drawing on local folk traditions. The revolutionary novel *The Lyuliang Heroes* is being translated into English and a documentary is being produced about artistic life in the Jin-Sui border region.

These projects should avoid the common mistake of over-explaining to foreign audiences. Often, what they need is a better story. Instead of simply stating that people in the revolutionary base areas demonstrated self-sacrifice and solidarity, it may be more compelling to depict the personal choices faced by families, villages or artists during wartime. The first approach tells an audience what to admire. The second gives them something to think about.

This is where digital technology can be useful. Virtual exhibitions, digital archives, short videos, and social-media platforms can bring Lyuliang's history to audiences thousands of miles away.

Lyuliang's traditional culture — paper-cutting, shadow puppetry and dough sculpture — is not merely local handicrafts. Properly presented, it can serve as a natural introduction to the region's history. A piece of folk art can spark curiosity, leading to a story, and ultimately fostering understanding.

Lyuliang University is exploring ways to weave stories of the region into such traditions, through bilingual embroidery, digital paper-cutting and online heritage experiences.

But technology is only the delivery mechanism. It cannot determine what stories are worth telling. A million views do not necessarily mean a million people understood the story. Nor does technological novelty make a historical narrative more convincing.

The true test is whether audiences feel invited into the history or are being lectured about it.

We need to rethink the approach to international cultural communication. Local history does not become universal simply because it has been translated into English or posted on foreign social platforms.

It becomes meaningful when it answers questions that resonate beyond its place of origin: How do ordinary people endure a catastrophe? What unites a community? How do memories of sacrifice endure when the generation that experienced them is gone?

Lyuliang has no shortage of answers to those questions. The challenge is to present them in a way that doesn't assume that the rest of the world already understands their significance.

Rather than asking others to share a memory that is not theirs, give them a way into it through the people who lived it and the choices they made.

That is what could give Lyuliang's revolutionary past a wider meaning. What began as a local history could evolve into a narrative for the rest of the world.

The author is the secretary of the Party Committee of Lyuliang University, Shanxi Province.

GLOBAL VIEWS

SHAHOBJON RAKHMONOVICH KUBATOV

New quality partnership

Uzbekistan's 35 years of independence demonstrate that sovereignty and international cooperation are not mutually exclusive

The year 2026 marks the 35th anniversary of Uzbekistan's independence. This date represents the long journey of a state that gained the right to determine its own development, build relations with the world and assume responsibility for its future. The development of relations between Uzbekistan and China is particularly instructive.

Over the past 35 years, China has evolved from one of the first states to recognize Uzbekistan's independence to become the country's largest trade and economic partner, a major investor and a participant in large-scale infrastructure, industrial and technological projects. Yet the central question concerns more than the number of agreements signed or the volume of trade. It is far more important to understand the new quality this partnership is acquiring and how it relates to the national interests of an independent Uzbekistan.

The partnership reflects a high degree of political trust and a shared intention to ensure the resilience of cooperation regardless of shifts in the international environment. At the same time, it does not imply the creation of a closed alliance or any restriction on Uzbekistan's relations with other states.

This is an important political quality of the Uzbekistan-China partnership. It is built on respect for territorial integrity, non-interference in internal affairs and the right of every nation to choose its own path of modernization. The two countries differ in their systems of government, historical experience and scale, but these differences do not impede cooperation when sovereign equality remains its foundation.

Openness is not the opposite of sovereignty. The experience of independent Uzbekistan allows us to speak of the principle of sovereign openness. Its meaning is straightforward: the state expands its trade, investment, technological and humanitarian ties while retaining the right to determine their direction and align them with the objectives of national development.

China is now Uzbekistan's largest trading partner. According to preliminary national statistics, China accounted for 21.2 percent of the country's foreign trade turnover in 2025 — approximately $17.2 billion. These figures demonstrate the scale of interaction. They also require careful analysis of the structure of trade rather than simple satisfaction with the results achieved.

Uzbekistan imports machinery, equipment, components and technologies from China that are essential to the modernization of its economy. A high volume of such imports is not inherently negative. The decisive question is whether the equipment acquired translates into higher national productivity, the training of engineers, the development of service enterprises, the localization of components and the expansion of Uzbekistan's own exports.

This is why the quality of cooperation matters more than simple arithmetic. When external resources generate new knowledge, skilled employment and modern industries within the country, interdependence strengthens sovereignty. When cooperation primarily entrenches the import of finished goods and the export of raw materials, however, the risk of structural vulnerability increases.

The production of BYD electric vehicles in Uzbekistan may offer an illustrative example. Its strategic impact will be determined not only by the number of vehicles produced, but also by the depth of localization, the participation of domestic suppliers, the training of technical specialists and the ability to enter third-country markets. The same logic applies to solar and wind energy. Long-term results depend not only on generating capacity brought online, but also on local equipment production, the transfer of expertise, environmental responsibility and the ability of Uzbek specialists to maintain new systems independently.

SONG CHEN / CHINA DAILY

Transport connectivity is equally important. Uzbekistan is one of only two doubly landlocked countries in the world — countries separated from the sea by the territories of other landlocked states. For such a country, reliable access to external markets is not merely an economic question, but an element of strategic autonomy.

From this perspective, the China-Kyrgyzstan-Uzbekistan Railway carries significance far beyond the transport sector. An intergovernmental agreement on the project was signed in June 2024, and a ceremony marking the start of construction was held in December of the same year. The new railway is expected to shorten the route between China and Central Asia and open additional connections to the markets of South and West Asia.

There is, however, a fundamental distinction between a transit route and a development corridor. Transit generates freight flows and related revenues, but it does not by itself transform the structure of an economy. A development corridor emerges only when logistics centers, industrial zones, processing facilities, educational institutions, service companies and modern customs systems are established along the railway.

Uzbekistan's national interest lies not merely in increasing the number of trains crossing its territory. More important is the creation of a productive ecosystem around the new railway.

The project also demonstrates Central Asia's growing agency. Its implementation requires the interests of three states to be coordinated. China provides a substantial share of the market, capital and technology; Kyrgyzstan provides the crucial geographic section; and Uzbekistan connects the route to subsequent western and southern corridors. The participants' mutual dependence creates a foundation for equitable consultation and shared responsibility for the outcome.

Uzbekistan-China relations extend beyond the bilateral level. The Shanghai Cooperation Organization and the China-Central Asia mechanism provide broader platforms for regional cooperation. Their significance will depend in part on whether Central Asian states can develop a coordinated vision on transport, trade, energy, water resources and digital connectivity.

For Chinese partners, it is essential to view Uzbekistan not only as a market, a transit territory or a source of resources, but also as a co-author of a new regional order. Joint projects will be more sustainable if they are assessed not only in terms of financial returns and transport capacity, but also by their contribution to industrialization, employment, environmental security and human-capital development.

A resilient partnership also requires stronger ties between universities, researchers and citizens. Confucius Institutes operate in Tashkent and Samarkand, while joint educational programs and research centers continue to develop. The Uzbek language is taught at Beijing Foreign Studies University. The visa-free regime that entered into force on June 1, 2025, allowing visits of up to 30 days, has created additional opportunities for tourism, entrepreneurship, academic contacts and direct interaction between the peoples of the two countries. The next stage should focus on the joint production of knowledge through research cooperation, academic exchanges and stronger ties between think tanks.

The political meaning of the Uzbekistan-China partnership lies in demonstrating that states of different sizes can build enduring cooperation without compromising sovereign equality.

The author is an associate professor at Mirzo Ulugbek National University of Uzbekistan. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

'RAMageddon' fallout

US' technology-denial strategy is driving China's pursuit of endogenous capabilities to ease memory-chip shortage

The severe global memory chip shortage, dubbed "RAMageddon", is more than a supply-chain disruption linked to artificial intelligence demand: it exposes the limits of weaponized interdependence as a coercive strategy.

While many analyses find no quick resolution in sight as the shortage is structural, reflecting a reallocation of the memory fabrication base toward AI infrastructure that spurs consumption of memory chips by data centers, the geopolitical implication of RAMageddon lies in what it reveals about the United States' technology-denial strategy toward China.

Since 2022, the US has pursued escalating semiconductor export controls premised on what US scholars Henry Farrell and Abraham Newman term "weaponized interdependence" — the exploitation of chokepoints in global networks to exercise coercive power.

In October 2022, the US Bureau of Industry and Security issued sweeping export controls targeting advanced chips and chipmaking equipment destined for China. In October 2023, these rules were tightened further, closing loopholes that had allowed third-country rerouting and expanding the Entity List to cover additional Chinese AI companies. The 2024 amendments extended controls to high-bandwidth memory (HBM) specifically, while pressuring the Netherlands and Japan to impose restrictions on equipment exports to China by ASML and Tokyo Electron.

Early this year, the US imposed additional licensing requirements on manufacturing equipment related to dynamic random-access-memory (DRAM), potentially constraining Chinese producers' expansion plans.

The apparent logic of weaponized interdependence is straightforward: because advanced semiconductor manufacturing depends on irreplaceable nodes — ASML's extreme ultraviolet (EUV) lithography system, US-designed electronic-design-automation (EDA) software and the memory oligopoly itself — restricting China's access is intended to constrain its AI development. Interdependence thus becomes an asymmetric lever for geopolitical control.

However, the phenomenon of RAMageddon challenges that logic in two fundamental ways.

First, chokepoint control is a double-edged sword. As major memory giants redirect capacity toward a more lucrative AI-related industry, the resulting scarcity of conventional DRAM can harm the entire global electronics ecosystem, including US companies and allied economies. This is the "boomerang effect" in international relations: sanctions generate unintended costs that erode the sanctioner's own position. In this context, nine US industry associations warned the administration that the imbalance could raise the price of electronic goods for US customers.

Second, and more critically, the crisis creates the very market conditions that enable China's memory industry to achieve viability at scale — precisely the outcome that the US policy sought to prevent. By forcing incumbents to prioritize the high end, export controls and AI demand have jointly left openings in the middle of the market, offering ChangXin Memory Technologies (CXMT) and other manufacturers a strategic opening.

CXMT is not an isolated case. Across the semiconductor value chain, Chinese companies have leveraged exclusion as an accelerant. Huawei's semiconductor arm, HiSilicon, has pivoted to designing AI chips manufactured by SMIC on its most advanced available process node — currently 7nm using multi-patterning deep ultraviolet (DUV) lithography — circumventing the blockade of EUV lithography. SMIC has expanded capacity in Beijing and Shanghai, and its reported record revenue in 2025 makes it the world's third-largest foundry. Yangtze Memory Technologies Corp, despite being placed on the US Entity List in late 2022, now accounts for 13 percent of the global NAND flash market and reportedly supplies domestic smartphone makers.

The pattern is revealing: US restrictions have triggered a burst of new Chinese investment and market adaptation, contributing to the development of indigenous capability.

As US economist Albert Hirschman argued in his foundational work on the political economy of trade, economic coercion works best when the target lacks alternatives. When coercion persists over time, however, it incentivizes the target to develop substitutes, and those substitutes, once built, permanently reduce the coercer's leverage. This is precisely what is occurring in the memory chip sector.

The structural market crisis, especially the HBM-driven supply crunch, has created a demand vacuum that may lower the barrier to entry for new producers including those from China. Industrial policy matters, but market opportunity is the enabling condition.

The growth of CXMT, SMIC and Huawei maps precisely onto Hirschman's argument of how coercion erodes its own foundations. The dominant power's own strategic choices, including export controls and AI preference, interact with market dynamics to produce conditions that inadvertently accelerate the challenger's rise.

This phenomenon can be described as "displacement through a market structural crisis". The more aggressively the US pursues AI supremacy in memory-intensive computing, the more it starves the conventional memory market, and the more space it opens for Chinese producers. The definition of "strategic technology" thus requires dynamic and dialectic thinking.

US controls focus on the leading edge, such as EUV, HBM and advanced logic. But when conventional DRAM becomes scarce because the leading edge has absorbed most, if not all, capacity, the frontier of competition shifts. Controlling the top of the stack matters less if the system cannot supply the middle.

The shift in competition is already visible. The history of semiconductor technology shows that yesterday's leading edge becomes accessible through alternative engineering pathways: SMIC's achievement of functional 7nm chips without EUV lithography is the most striking recent demonstration. The risk for the US is not merely that it loses market share in conventional memory, but that the cumulative learning and capital formation enabled by the mid-market eventually propel Chinese companies toward the high end as well.

MA XUEJING / CHINA DAILY

RAMageddon is more than a supply-chain crisis; it is a natural experiment in the limits of technological hegemony, demonstrating that weaponizing chokepoints generates second-order effects that can undermine the original strategic intent.

For China, the path to semiconductor self-sufficiency need not run through the most advanced nodes first; it can run through the vast, underserved middle of the market. For the US, the lesson is revealing: a strategy predicated on permanent technological denial must contend with the possibility that denial itself creates the conditions for displacement. The question is no longer whether China has to be at the top in the global memory industry, but how quickly the displacement will happen. Continued rigidity in US export controls will not necessarily reverse China's progress, but will only ensure that the transition occurs on terms less favorable to US industry and consumers alike.

AI amping up gaming developers

Rapid development of technology fundamentally restructuring process

By **WANG XIN** in Shanghai
Wangxin2@chinadaily.com.cn

The effective application of artificial intelligence technologies and further global business expansion are seen as the key drivers shaping the future of China's gaming industry, business leaders and developers said at the 23rd China Digital Entertainment Expo and Conference (ChinaJoy), which took place from July 31 to Aug 3 in Shanghai.

The rapid development of AI technologies — such as large language models, multimodal models and AI agents — is fundamentally restructuring the entire game development and operations process. Targeting specifically the gaming industry, the AI gaming cloud has been booming over the past few years.

According to a recent research report by United States-based market consultancy IDC, the AI gaming cloud basically refers to the AI technologies, products and services used by game developers throughout the production process, from game design and prototyping to game development and testing, as well as game publishing and operations.

The report showed that China's AI gaming cloud market reached 1.86 billion yuan ($275 million) last year. The sector is expected to maintain a compound annual growth rate of about 91.6 percent over the next five years, hitting 11 billion yuan by 2029 and contributing more than half of the overall gaming cloud market.

Baidu AI Cloud, one of the earliest Chinese tech giants engaging in the sector, took about 51 percent of the nation's AI gaming cloud market share, said the report. To date, it has established in-depth partnerships with more than half of the nation's leading game companies and over 100 innovative AI gaming firms, providing full-stack AI capabilities to companies such as miHoYo, NetEase Games, 37 Interactive Entertainment and Unity China.

Among Baidu AI Cloud's offerings, its AI Heterogeneous Compute serves as the AI infrastructure that allows game developers to focus on essential content creation without worrying about computing power management.

Baidu Qianfan, an enterprise-grade, all-in-one large model platform, is built around agents, providing the gaming industry with a one-stop platform for model access, agent development and data intelligence services. It can support end-to-end AI collaboration across the entire workflow from text creation and character design to 3D modeling, animation production and code development, helping game developers improve both creative efficiency and quality.

"What AI truly unlocks is not just the content production capacity, but the gaming industry's ability to continuously create new gameplay, new characters and new experiences," said Zhang Wei, vice-president of Baidu Intelligent Cloud.

Baidu's AI solutions have empowered gaming businesses, such as SingularDance and SEELE AI. SingularDance is an innovative tech firm focused on the development of AI emotional companionship and hyper-personified intelligent agents.

Edward Lu Hongyi, founder and CEO of SingularDance, highlighted that they are committed to creating virtual characters that not only know how to chat with users, but also possess distinct, stable, independent and continuously evolving personalities with a "soul".

With a core focus on restructuring traditional game development workflows, SEELE AI is a tech firm focused on AI-native games and interactive worlds powered by foundational models. Collaborating with Baidu, it enables users to automatically generate interactive 3D game worlds via natural language using multimodal inputs, such as text and images, to complete the entire workflow, including character modeling, animation generation, scene construction, game mechanics and narrative presentation.

"We aim to enable every creative individual to collaborate with AI agents via natural language, quickly transforming their ideas into game worlds that are accessible, playable, editable and continuously iterable. So every gamer can actually become a game developer, and generate income from their creation," said Liu Bo, the company's partner of business operations.

Hu Xin, assistant to the chairman of Zhejiang Century Huatong Group, said that currently, AI has been fully integrated into more than 80 percent of the company's entire workflow of game development, which is also the case for most businesses in the gaming industry. The future competition within the industry would be much about "creativity, aesthetics and user insights".

The group, which is the parent company of Shengqu Games and Century Games, is also actively ramping up efforts in globalization and international collaboration for sustained growth. Following a fruitful 17-year partnership with South Korea's NC Corp, Shengqu Games unveiled the two sides' new collaboration on the much anticipated game *AION 2* on July 30 during the ChinaJoy 2026 expo.

As one of China's leading game companies, the group began its overseas expansion early and has achieved remarkable growth over the years. In 2025, the group saw its total revenue surge 67.55 percent year-on-year to nearly 37.9 billion yuan, with overseas' sales accounting for 58.63 percent. In the first quarter, the group raked in 11.01 billion yuan in markets overseas, up 35.19 percent year-on-year, according to the company.

In June, the group's hit game *Whiteout Survival* topped the global mobile game revenue chart, with its another hit *Kingshot* standing in seventh place, according to app data analysis firm Sensor Tower.

"For China's gaming industry, globalization is a goal that will never be fully achieved. The overseas markets are far from saturated and we still have huge potential to grow. Chinese game productions have high quality, and our developers and culture are gaining increasing recognition globally. We're proud to see such changes," said Hu.

The accelerating pace of Chinese game companies' globalization is also bringing vast opportunities for global emerging businesses. Aiming to better help game developers and companies acquire users worldwide in competitive markets, Berlin-based adtech company Almedia — which specializes in rewarded user acquisition — joined this year's ChinaJoy to find more Chinese partners.

Moritz Hollander, 24-year-old founder and CEO of the company established six years ago, said their approach involves a "better form of marketing or advertising" by offering cash rewards to users for engaging with advertisers' games and apps. He believes that in the future, this reward-based approach will be the new way people discover games and engage with brands, similar to loyalty and cashback systems with credit cards.

Hollander said the global gaming industry is very fast and competitive, so developers need to be very agile in various aspects. He said it is very efficient to work with Chinese developers, who are generally very fast, flexible, open-minded to new ideas, advanced and sophisticated.

"We focus more on mobile games and China — with a huge gaming market — is particularly successful and dominant in mobile gaming. It is one of the key growth markets and also the most important market for us right now.

"We hope to work with both big Chinese game companies and smaller game developers to together build an ecosystem of rewards, and help them expand their global presence with our users, platforms and global network across 16 nations," said Hollander.

Aiming to offer users more fun and rewarding gaming experience, Almedia's platforms have garnered over 80 million users worldwide. The company also launched a new Link product targeting the Chinese market during ChinaJoy, further reinforcing its long-term commitment to the nation's game developers for their global growth.

The global games market closed 2025 at $201.6 billion, marking a 9.1 percent year-on-year increase. Revenue for mobile games are expected to grow 6.8 percent year-on-year to reach $121.1 billion in 2026, said gaming industry consultancy Newzoo.

Evolution of esports into economic force

By **WANG XIN** in Shanghai

An estimated 400 million Gen Z regularly engage with esports, representing an increasingly powerful opportunity for global brands to reach the potentially lucrative youth market through the games, platforms and communities where they already devote their time and attention, said a report.

A white paper titled "The Esports Generation: Who They Are and Why They Spend" was released in collaboration with Shanghai-based Hero Esports, one of Asia's leading esports companies, ESL FACEIT Group, a global leader in esports and gaming entertainment, and market research and consulting firm Niko Partners specializing in video games, esports and livestreaming across Asia and the Middle East and North Africa.

The report draws on survey data from 8,000 Gen Z esports fans aged 13-30 from across eight global markets, and found that esports has become a global entertainment force, attracting digitally-native Gen Z audiences who find the same passion, identity, community and excitement traditionally found in other sports.

According to the report, Gen Z esports fans are not a niche, they are extensively engaged in esports in various ways. They mostly watch gaming content, gaming livestreams and gaming podcasts, while also actively posting in game forums and social media groups, as well as regularly attending gaming conventions and esports events.

While esports audiences are still predominantly male, female representation in the culture is growing globally, especially at live esports events where female attendance is often higher. In China, over half of the attendees at the Peacekeeper Elite League and King Pro League were female.

The report highlighted that Gen Z esports enthusiasts are deeply loyal to the teams, titles, events and partnerships that earn their trust and energize their passions. They connect with esports fandom in the same ways previous generations connected with other sports — with genuine emotional investment, community identity and long-term loyalty.

Critically, they extend that affinity to the brands that show up authentically within this space, said the report. About 85 percent of this highly engaged audience said they take notice of branding in esports and 74 percent of them reported that this has had an effect on their purchasing behavior. Two thirds of esports fans have purchased a product because of a collaboration or co-branding partnership with an esports team, game or player.

Esports partnerships heavily influence consumer behavior, with a significant portion of fans purchasing products promoted within the sector, including food and beverage products, electronics and fashion. Similar engagement also extends beyond traditional categories, driving fans to purchase esports-related collectibles, makeup, beauty or skincare products as well partnered brands in other miscellaneous categories, said the report.

Jascha Braeker, senior partnerships development manager at ESL FACEIT Group, said during this year's ChinaJoy digital entertainment expo in Shanghai that many renowned brands are also actively engaging with the esports community for credibility within the gaming culture and even for talent acquisition.

Lamborghini joined EFG's gaming lifestyle festival DreamHack for the third time in May to connect and grow with the younger audiences. And DHL, one of the festival's longest partners, has built distinct recruitment campaigns tailored for tech savvy *Dota 2* and *Counter-Strike* fans, which brought it millions of career site visits and thousands of job applications from the Gen Z community.

People try out new gaming products during the DreamHack esports contest in Shanghai in May 2025. PROVIDED TO CHINA DAILY

"Esports has evolved into one of the most effective channels for companies looking to connect with Gen Z audiences at scale. What makes it unique is not just its reach, but the depth of engagement and trust that exists between fans, players, teams and events," said EFG's CEO Niccolo Maisto.

Danny Tang, co-founder and CEO of Hero Esports, added: "This whitepaper confirms that esports has evolved into a global cultural and economic force. For brands, the message is clear — esports is no longer a niche market, but a premier platform to connect with the next generation of consumers."

BUSINESS INSIGHT

‘Overcapacity’ claim masks anxiety over China’s green edge

EAGLE EYE
By Zhang Monan

AI PRODUCED BY CAI MENG / CHINA DAILY

The West’s renewed warnings about Chinese “overcapacity” reflect a deeper concern: China’s growing strength in clean energy and advanced manufacturing is challenging long-established Western advantages in some of the industries expected to shape the global economy.

In recent months, politicians and media commentators in the United States and other Western economies have increasingly portrayed the expansion of China’s electric vehicle, lithium battery, solar and advanced manufacturing industries as a new “China shock”. What began as a debate over industrial capacity has increasingly become an argument for higher tariffs, tighter investment restrictions and supply chains organized around geopolitical considerations.

China’s Ministry of Commerce recently responded with a position paper, arguing that industrial capacity should be assessed against global supply and demand, growth potential and business performance rather than simply comparing production with domestic consumption in a single country.

This distinction matters. Major manufacturing economies routinely produce more of certain goods than their domestic markets consume. German automakers depend heavily on overseas sales, and Airbus and Boeing manufacture aircraft for customers worldwide. Few would describe their export-oriented production as evidence of overcapacity simply because output exceeds domestic demand.

Applying such a test selectively to China risks turning an economic concept into an instrument of trade policy. Genuine overcapacity can exist in individual sectors, but large exports or rapid production expansion alone do not establish that capacity is excessive.

Much of China’s manufacturing strength has been built through years of intense domestic competition, investment and technological upgrading. This is particularly evident in EVs, lithium batteries and photovoltaic equipment, where companies compete fiercely on price, technology, quality and speed of commercialization.

China’s EV industry, for example, rests on an extensive industrial ecosystem covering critical mineral processing, batteries, motors, electronic control systems, vehicle manufacturing and charging infrastructure. Close links between suppliers and manufacturers have shortened development cycles, lowered costs and enabled companies to respond quickly to changes in demand.

Technological progress has reinforced these advantages. Chinese battery producers have made advances in lithium iron phosphate batteries, battery integration and safety, and solar manufacturers have continuously improved photovoltaic technology and production efficiency. Large-scale manufacturing has further reduced unit costs and made new technologies more affordable.

These are characteristics of industrial competitiveness, and don’t necessarily point to examples of market distortion.

Government policy has undoubtedly played a role in China’s industrial development. But industrial policy is hardly unique to China. The US has committed hundreds of billions of dollars in incentives for clean energy, EVs, batteries and other strategic industries, including measures favoring production in the US or North America. European governments and institutions have similarly provided extensive support for renewable energy, batteries and advanced manufacturing.

It is therefore increasingly difficult to divide the world neatly between Chinese “State intervention” and Western “market competition”. A more credible approach would examine whether specific policies create identifiable distortions and address them through transparent, proportionate and rules-based measures.

There is another weakness in the overcapacity argument: capacity cannot be assessed solely against today’s demand, particularly in industries central to the global energy transition.

The world is still far from completing the shift to low-carbon energy. The International Energy Agency expects renewable energy deployment to expand substantially through the end of the decade. Electrification will require enormous quantities of solar panels, batteries, power equipment, EVs and support infrastructure.

Viewed against those requirements, the challenge may not be too much high-quality green manufacturing capacity, but whether enough affordable capacity can be supplied at the speed and scale required.

Chinese production has helped reduce the cost of solar panels, batteries and other clean-energy technologies. This matters particularly for developing economies, where affordability can determine whether large-scale energy transition projects are commercially viable. Cheaper machinery, components and technologies can also lower barriers to industrialization and help emerging economies develop manufacturing capacity of their own.

The intensity of the Western debate therefore points to a broader source of anxiety: the changing geography of industrial competitiveness.

For decades, advanced Western economies dominated many high-value manufacturing industries, while China’s role in global value chains was largely concentrated in labor-intensive production and assembly for multinational companies. That division of labor has changed rapidly.

Chinese companies are increasingly competing in sectors with higher technological barriers and greater strategic importance. EVs, renewable energy equipment, batteries, industrial machinery and sophisticated electronics are becoming important parts of China’s manufacturing and export base.

This creates genuine pressure on established producers. But competition from increasingly efficient rivals is not in and of itself evidence of unfair trade.

The lesson is not that governments should ignore unfair competition, but that restricting one competitor does not eliminate the economic forces reshaping an industry.

A similar pattern could emerge in clean technology. Barriers against Chinese EVs, lithium batteries and solar products may alter trade flows, and they can also increase costs for consumers and manufacturers, encourage production to move through third countries and make supply chains more complicated without addressing the underlying competitiveness gap.

The greater danger is that ordinary economic competition becomes increasingly treated as a national security issue. Once industrial capacity, exports and investment are routinely framed through the language of security, almost any competitive advantage can become grounds for tariffs, export controls, investment screening or exclusion from supply chains.

The result could be higher energy and production costs, slower technological progress and innovation, and greater risks of retaliation and supply-chain decoupling. Such fragmentation would ultimately undermine the broader interests of the global economy.

Industrial capacity should be assessed comprehensively, taking into account global supply and demand, growth potential and corporate performance, rather than simply comparing exports with domestic demand. China’s manufacturing strengths should not be broadly characterized as “overcapacity” simply because its products are competitive in global markets.

Markets require rules, and governments have a legitimate responsibility to enforce them. But those rules should protect fair competition rather than particular competitors. Issues related to industrial capacity should not be politicized or turned into tools of geopolitical competition.

Allowing markets to play their role, maintaining transparent international rules and keeping trade and investment channels open offer a more sustainable path. The alternative is a cycle in which anxiety produces protectionism, protectionism accelerates fragmentation and fragmentation raises costs for everyone.

The debate over “overcapacity” is therefore about more than how much China produces. It is about how the global economy responds to a shift in industrial competitiveness. Adapting through innovation and competition may be difficult for established producers, but trying to hold back that shift through protectionism risks leaving everyone worse off.

Meeting signals stronger H2 policy push

MAIN STREET
By Yang Zekun

The symposium chaired by Premier Li Qiang with experts and entrepreneurs in July came at a critical juncture in mid-year. Against the backdrop of the current economic situation and with an eye to China’s long-term development, the meeting laid out systematic arrangements for economic work in the second half.

The meeting highlighted three major priorities in policy focus. Macroeconomic policy is moving from implementing existing measures to giving greater emphasis to both existing and incremental policies.

Efforts to expand domestic demand are shifting from investment primarily in physical assets to a coordinated approach that combines investment in physical assets with investment in people.

At the same time, industrial upgrading is moving beyond technological breakthroughs to focus more on the large-scale commercial application of such advances.

The meeting called for making full use of existing policies while conducting advanced studies and preparing additional policy measures.

This message carries particular significance near the midpoint of the year, signaling that macroeconomic policy is moving from a phase of implementing and consolidating existing measures, to one in which existing and incremental policies work in tandem.

At the theoretical level, this reflects the principle that macroeconomic regulation should be targeted and effective.

Marxist political economy requires a proper balance between overall economic equilibrium and structural optimization. China’s economy currently faces structural challenges, including insufficient effective demand and overcapacity in some industries.

As the marginal impact of relying solely on existing policy measures diminishes, additional measures are needed to generate new growth momentum.

The call to “conduct advanced studies and prepare” incremental policies indicates that preliminary work on measures in key areas has largely been completed and that they can be introduced when conditions warrant.

This approach of preparing policy tools in advance — while acting in accordance with changing circumstances — maintains strategic resolve while leaving room for policy flexibility, providing greater space to respond to uncertainties that may emerge in the second half.

The urgency is also evident in the current economic climate. As China begins implementation of its 15th Five-Year Plan (2026-30), profound changes are taking place in both the domestic and international environment, while the economy faces prominent challenges such as relatively strong supply and weak demand. The shift in growth drivers has reached a critical stage.

Against this backdrop, preparing additional policy measures itself serves as a strong signal to the market. It shows that policymakers have reached a basic consensus on the need to strengthen policy support, with macroeconomic policies in the second half moving from providing a floor for growth toward taking more proactive action.

A clear policy signal is particularly important for stabilizing expectations among market entities and boosting confidence in investment. It provides greater certainty at a time when economic agents are seeking greater clarity about policy direction.

The meeting called for a systematic approach and for “coordinated efforts in investment in things and investment in people”, while stressing the need to improve public services such as healthcare, eldercare and childcare in order to expand domestic demand through improving people’s livelihoods. This signals a significant shift in the policy approach to expanding domestic demand.

The concept of “investment in people” has a strong theoretical foundation. Human capital theory, which emerged in the mid-20th century, has shown that economic growth driven mainly by the expansion of physical capital can be distorted and unsustainable. Sustainable growth requires coordinated development of human, physical and natural capital.

“Investment in people” can help expand domestic demand through both the supply and demand sides.

On the supply side, investment in people can improve the quality of the workforce and strengthen technological innovation capabilities, providing key factor support for the development of new quality productive forces.

On the demand side, greater investment in areas such as education, healthcare and eldercare can directly reduce households’ need for precautionary savings, increase their propensity to consume and unlock suppressed consumption demand.

Research shows that investment in people’s livelihoods can generate a stronger multiplier effect on household consumption than any indirect transmission effects from infrastructure investment.

This creates a virtuous cycle in which improvements in people’s livelihoods stimulate consumption while stronger human capital supports supply-side upgrading. It represents a concrete application, particularly the principle of safeguarding and improving people’s livelihoods through development.

The participation of the founder of Pang Donglai, a retail company, at the symposium offered a micro-level reflection of this policy approach.

By improving employee benefits and enhancing the consumer experience, the company has achieved growth, demonstrating that investment in people can serve not only as a government policy priority, but also as a competitive advantage for businesses.

Its approach to improving supply-side quality and stimulating domestic demand through better services provides a potentially replicable model for addressing weak consumer confidence.

The meeting placed particular emphasis on promoting the “large-scale commercial application of new technologies such as artificial intelligence”.

The focus on commercialization signals a shift in industrial policy from encouraging research and innovation to facilitating the application and commercialization of technological achievements.

In terms of technological evolution, AI is moving from breakthroughs at the theoretical level toward a new stage of industrial transformation. This is not simply a matter of adding AI to existing businesses as an external tool. Rather, the development of “AI+” represents a fundamental shift in the way industries operate.

AI is evolving from an auxiliary tool into an underlying infrastructure, from optimizing individual processes to reshaping entire systems, and from isolated applications to broad-based empowerment across industries.

In August 2025, the State Council — the nation’s Cabinet — issued guidelines on implementing the “AI+” initiative in depth, elevating the initiative to the national strategic level and calling for broad and deep integration of AI with different sectors and fields of the economy and society. The latest meeting’s emphasis is in line with this top-level policy design and sends a further signal that implementation should be sped up.

China also has distinctive advantages in promoting the large-scale commercial application of AI.

On the technology side, several Chinese large language models have reached internationally advanced levels in overall capabilities. On the industrial side, China has a complete range of industries and abundant application scenarios, while its strong manufacturing capabilities allow AI technologies to be rapidly turned into physical products and commercial applications.

On the institutional side, China’s socialist system provides strong capabilities for coordinating resources and mobilizing strengths from different sectors.

Overall, the signals from the symposium represent a practical application at a critical stage of China’s economic development.

The effectiveness of policy ultimately depends on implementation.

In the second half, as existing and incremental policies work together, the concept of investment in people is being translated into concrete measures in areas such as fiscal policy, employment and social security. And as the large-scale commercial application of AI accelerates, China’s economy has the conditions and capacity to consolidate its recovery and achieve its economic and social development targets for the year.

This will demonstrate China’s commitment to getting off to a strong start during the 15th Five-Year Plan period, while also providing further confidence in the path toward Chinese modernization.

Tech, AI key to cyberspace action plan

Top internet regulator lays out social and economic high-quality objectives

By **CAO YIN**
caoyin@chinadaily.com.cn

China's top internet regulator unveiled an action plan on Friday to make cyberspace enterprises a significant driver of high-quality social and economic development by 2030.

Released on Friday by the Central Cyberspace Affairs Commission, the plan outlines strategic goals for 2026 through 2030, aimed at enhancing the competitiveness of cyberspace enterprises through advancements in technological innovation, product quality and service delivery.

The plan envisions a robust industrial ecosystem and a supportive development environment for the cyberspace sector. It emphasizes the necessity of a strong institutional framework to ensure safe, standardized and orderly growth.

"Network information technology is highlighted as a critical area of innovation, attracting substantial global research and development investment," the commission said. "This sector consistently achieves breakthroughs, finds widespread applications and exerts a powerful influence across various industries."

The commission highlights that companies focused on cybersecurity and informatization are crucial to China's cyber strength initiatives. These enterprises are instrumental in building new productive forces and enhancing global competitiveness. The plan aims to invigorate cyberspace enterprises while ensuring their orderly and healthy development.

To achieve these objectives, the plan calls for intensified efforts in breakthrough technologies such as high-end chips, basic and industrial software, network communications, cybersecurity and data security.

Priority will be given to advancing frontier technologies, including quantum computing, blockchain, brain-computer interfaces, digital twins and next-generation displays.

Resources will be allocated to companies engaged in artificial intelligence research, with a strong emphasis on developing high-end AI chips, improving large language model performance and promoting agentic AI technologies. The plan encourages enterprises to actively participate in open-source projects and community building.

Security is a key focus, with promises of robust technological support to enhance risk identification, alert systems, monitoring and emergency response capabilities. Enterprises are urged to strengthen personal data protection systems and optimize algorithm management. According to the plan, preventing the misuse of AI-related technologies is essential to safeguarding the legitimate rights and interests of netizens and workers.

It also mandates improvements in the quality of content provided by cyberspace enterprises and effective regulation of monopolistic practices in key areas.

"We will demonstrate greater resolve in upholding security, curbing disorderly competition and reinforcing the rule of law in cyberspace governance," the commission said. It pledges to collaborate closely with other authorities to implement the plan and will regularly seek feedback from cyberspace enterprises to address any challenges in its execution.

Masterpiece comes to Zhejiang

Visitors take photos of a Song Dynasty (960-1279) copy of *The Night Revels of Han Xizai* at the Zhejiang Provincial Museum in Hangzhou on Saturday. The work, part of the collection of the Palace Museum, is being exhibited publicly in Zhejiang for the first time and will remain on display through Sept 20. Traditionally attributed to the Five Dynasties and Ten Kingdoms (907-960) painter Gu Hongzhong, the artwork is regarded as a pinnacle of ancient Chinese figure painting. CHEN ZHONGQIU / FOR CHINA DAILY

China postpones Chang'e 7 robotic lunar mission

By **ZHAO LEI** in Wenchang, Hainan
zhaolei@chinadaily.com.cn

China's Chang'e 7 robotic lunar mission has been postponed, the China Manned Space Agency announced on Sunday.

In a brief statement, the agency said that after comprehensive assessments, the Chang'e 7 mission headquarters had reached a conclusion that the lunar expedition cannot be carried out within this year's scheduled launch window as it had failed to meet launch criteria.

The decision was made in accordance with the principles of prudence, reliability and absolute safety, the statement explained without providing more details.

A launch window is a specific period of time during which a rocket must lift off in order to reach its intended orbital destination.

According to experts, choosing a launch window for a space mission is not a matter of convenience, but a mixture of multiple factors that require careful calculations.

Because Earth rotates on its axis and the target, such as the moon or another planet, is also moving, the geometry between the launch site and the final destination changes constantly. A rocket can only reach its preset position when all the orbital, communication and other conditions align simultaneously. If the liftoff point misses that window, the mission must wait until the next opportunity, which could be days, weeks or even months later.

While the Earth-moon transfer windows open roughly once a month, Chang'e 7's destination — the lunar south pole — imposes far stricter constraints, restricting usable launch opportunities to just one or two per year.

The Chang'e 7 is set to become China's seventh robotic mission to the moon, tasked mainly with searching for traces of water on the silver celestial body.

A Long March 5 carrier rocket, with the Chang'e 7 probe on top of it, was moved to its launch service tower at the Wenchang Space Launch Center in Hainan province on Wednesday, when the space agency announced that launch would take place "in due course in the coming days".

The Chang'e 7 was transported by air to the coastal spaceport in April, while the Long March 5 rocket arrived in July by ship.

They were assembled and tested at the spaceport.

To date, China has conducted six robotic missions to explore the moon. The most recent, a 53-day Chang'e 6 mission, took place in the summer of 2024, representing the world's first attempt to bring back samples from the far side of the moon.

The historic mission successfully retrieved a total of 1,935.3 grams of samples from the far side.

CSSC-developed podded propulsors rival imports

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Engineers at China State Shipbuilding Corp have developed a series of high-power podded propulsors, helping domestic shipyards break foreign manufacturers' long-standing dominance in this critical marine technology sector.

After 18 years of dedicated research, engineers at the Shanghai Marine Equipment Research Institute, a CSSC subsidiary specializing in ship mechanical and electronic systems, have designed and built three types of podded propulsors under the brand of S-POD to cover diverse operational needs, according to Zheng Jian, an engineer in charge of the S-POD products.

The L-type, with a propulsion power range of 1.3 to 5 megawatts, is a compact and efficient model suited for research vessels and law-enforcement ships that have displacements of more than 1,000 metric tons. When used on research vessels, it can save up to 30 percent of internal space.

The type has been deployed on the *Zhuhai Yun*, an unmanned system mother ship, and the *Tongji*, a research vessel operated by Tongji University.

The T-type, covering 1.3 to 18 MW of propulsion power, is designed for large vessels including cruise ships, passenger ro-ro vessels and offshore platforms.

The Shanghai institute has constructed China's first 10-MW podded propulsor and secured orders for it.

The model features a propulsion power equivalent to the traction power of an eight-carriage *Fuxing* high-speed train, with technical performance matching international advanced levels.

The TI-type, ranging from 2 to 15 MW of propulsion power, is an ice-breaking model specifically designed for polar environments, suitable for polar research vessels, icebreakers and polar operation platforms.

According to Zheng, podded propulsors are among the world's most advanced electric marine propulsion systems, serving as a core component for large cruise ships, research vessels and icebreakers.

"Unlike traditional propulsion systems with complex mechanical transmission, the S-POD propulsors integrate a permanent magnet synchronous motor and propeller inside a single pod mounted beneath the hull, enabling 360-degree full rotation for vector thrust," he said.

Zheng noted that compared with conventional propulsors, the podded systems have several advantages — their energy efficiency is improved by over 20 percent, while vibration and noise are substantially reduced. The 360-degree rotation capability allows vessels to perform complex maneuvers such as turning on the spot, greatly enhancing navigation flexibility and safety.

According to Zheng, the Shanghai institute launched research and development of podded propulsors in 2007. Engineers made the first conceptual prototype in 2015, and built a 5-MW prototype in 2018 for operating tests.

In 2023, the institute completed the construction of a dedicated manufacturing factory. The next year, design work on the 10-MW model was completed.

Prior to the development of the S-POD series, China's podded propulsion market had been monopolized by foreign suppliers for many years, with domestic shipyards relying entirely on imports.

300 strangers attend Uygur wedding after viral post

By **FANG AIQING** and **MAO WEIHUA** in Urumqi

Earlier this month, a Uygur wedding in Yarkant county of Kashgar prefecture, Xinjiang Uygur autonomous region, became an unexpected nationwide celebration. More than 300 strangers traveled from across the country to share in the joy and blessings of the occasion. The scene that followed, brimming with music and dance, cheer and laughter, was later captured in online posts and videos that spread the festive vibes even farther and wider.

The story began when the groom's mother Zoram Seyit posted a digital invitation on the short-video sharing platform Douyin on Aug 3, expecting only family and friends to respond. But when a curious user from Central China's Henan province asked if they could attend and the host family replied with a simple "yes", the post went viral overnight.

On Aug 8, the wedding day, the banquet hall was filled with guests from diverse regions and ethnic backgrounds, all gathered for the same celebration. Men and women, many in their finest attire, sang and danced throughout the day.

Groom Akramjan Omar said his online guests joined in every part of the celebration, from the midday procession to escort the bride to the wedding hall and the main ceremony in the afternoon, to the after-party that stretched past 9 pm.

He had been unaware of his mother's post until the next morning, when he woke up to find it had already racked up over 10,000 likes. For a family that has run a Xinjiang cuisine restaurant in Henan for nearly three decades, more guests meant more joy.

However, as the numbers kept climbing — likes, comments and promises to attend — the initial excitement gave way to a practical concern: how to take good care of these guests, especially when they had no way of knowing how many would actually show up.

The family then trimmed their original guest list from 500 relatives and friends on each of the bride's and groom's sides to 200 per side and reserved the second floor, which offered a full view of the hall, for strangers traveling from afar. Food supplies were doubled, featuring local specialties such as pilaf, baked stuffed buns, seasonal and dried fruits, as well as wedding sweets, while a Mandarin-speaking partner was added alongside the Uygur-language master of ceremonies.

Many guests attempted to hand over their cash gifts, following Chinese wedding customs, but the host family declined most of them. Akramjan Omar said he was touched at one point seeing people who clearly didn't really know how to dance moving anyway, their faces lit up with pure enjoyment. At the end of the night, the newlyweds and their unexpected guests gathered for a group photo.

A newlywed couple share an intimate dance at their wedding on Aug 8 in Yarkant county, Xinjiang Uygur autonomous region, in front of family, friends and more than 300 strangers coming from across the country. PROVIDED TO CHINA DAILY

Warm hospitality

Wei Lixi, 20, from South China's Guangxi Zhuang autonomous region, was on a solo road trip in Kashgar city when he saw the invitation on Douyin. He had his vehicle washed for the occasion and joined the groom's procession early that morning. The groom led everyone in a dance, and guests were handed party poppers to set off during the liveliest moments.

At first, Wei worried about intruding — but the hosts welcomed the out-of-town visitors with open arms. "The air was electric. I felt like part of one big family," he said.

Hao Shuhui, 24, from Henan, married into a Xinjiang family earlier this year. She dug through her wardrobe for a bright red dress and made her way to the Uygur family that has long-standing ties with her hometown.

The hosts were warm enough to ease her shyness. A groomsman had set up a WeChat group in advance, sharing a few do's and don'ts and encouraging the guests to speak up about any needs. The netizens, meanwhile, were worried about causing trouble.

A guest in his 30s surnamed Tang from Shandong province said, "It was incredibly infectious, even for those of us Han people who aren't particularly good at singing or dancing."

He added that he had immersed himself in the warmth, hospitality and optimism of the Uygur friends, and felt a genuine bond between people of different ethnic backgrounds. Guests like him, too, began chatting and sharing stories of their travels and lives.

Emerging tourism draw

Grand and lively Uygur weddings have long attracted visitors and sparked fascination across China.

In May 2025, the variety show *HAHAHAHAHA* re-created a ceremony through role-play.

On Aug 12, the Uygur wedding of celebrity couple Madina Memet and Jiang Chao sparked heated online discussions. Some Douyin posts generated several hundred thousand likes, with the most popular exceeding 2 million.

A typical Uygur wedding unfolds with a morning session hosted by the bride's family, followed by the bride-pickup and a transitional segment for the younger crowd that features dancing, the bouquet toss and photo sessions, as well as a banquet by the groom's side with a formal veil-lifting ceremony. Singing and dancing accompany every stage of the wedding. Days before, a "consultation tea party" allows both families to get acquainted and exchange betrothal gifts, while days after, close family members and friends will gather at the bride's home for a visit.

The invitation post for the Yarkant wedding has to date accumulated more than 10 million views and some 77,000 comments. Some netizens posted their own wedding invitations on Douyin, while others simply asked: "Can I come?"

Experiencing a Uygur wedding has gradually become a tourism draw in Xinjiang. Some banquet venues in Urumqi and Kashgar offer viewing areas on the second-floor mezzanines for tourists to watch real ceremonies live. In Kashgar city, 26-year-old visitor Zhang Yao observed a wedding this way. "The women wore an abundance of ornate jewelry. Their dresses had a bold, vivid theme color but were different in design, all absolutely stunning," she said, while also noting the importance of respecting the hosts on their big day.

Yao Jiahui tried her luck on Thursday and happened upon a wedding. A bridesmaid took her along on the dance floor. Aunties asked her in Uygur if she was enjoying the event. "It's all in the dance," she said.

Han Yawei and Hu Dongyue contributed to this story.

Tradition and tech team up to preserve 'orchard in the sky'

Ming Dynasty pear trees still thriving in Gansu along the banks of the Yellow River

By **MA JINGNA** and **HU YUMENG** in Lanzhou

High above the terraces of the Yellow River in Northwest China's Gansu province, centuries-old pear branches weave together across elevated wooden scaffolding, casting a dense green roof over the basin below. These structures in Gaolan county are known locally as *gaojia yunpeng* — the "high-frame cloud canopy"— and create the illusion of an orchard floating in the sky.

A closer look at one of these massive, twisted trunks reveals more than ancient bark. Attached to the wood is a weather-resistant QR code.

A quick smartphone scan brings up a complete digital file showing the tree's age — approximately 345 years — health status, variety and the name of the local family responsible for its care. It is part of a sweeping "one tree, one archive" management system introduced by the Shichuan Ancient Pear Orchard Protection Center, bridging Ming Dynasty (1368-1644) farming traditions with modern data tracking.

That blend of deep history and living ecology has earned the site an official designation as a Globally Important Agricultural Heritage System by the Food and Agriculture Organization of the United Nations in 2025. It adds to a list of accolades that includes a Guinness World Record as the "World's First Ancient Pear Orchard".

Yet behind the UN recognition and the spectacular spring blossoms that draw nearly a million tourists each year lies a delicate rescue operation — a race to blend ancient ecological wisdom with modern science before the orchard's aging caretakers retire.

Wei Zhouyu, a local farmer, uses a timber support stand to carry out artificial pollination in the Shichuan Ancient Pear Orchard in Gaolan, Gansu province, on April 14. PHOTOS BY YANG MINGZE / CHINA DAILY

Left: Visitors tour the Shichuan Ancient Pear Orchard in April.
Right: A close-up of pear blossoms in the orchard.

Ming legacy

The story of Shichuan began nearly five centuries ago during the Ming Dynasty, when farmers first recognized the unique microclimate of this Gansu basin.

"Shichuan is located in a basin with deep and fertile soil, large day-night temperature differences and a long frost-free period," said Li Xiaoli, a staff member at the Ancient Pear Orchard Protection Center. "These natural conditions are ideal for growing pears."

Over generations, local farmers developed a cultivation system adapted to the area's unique geography. Rather than reshaping the environment, they learned to work with the Yellow River's water resources and the Loess Plateau's terrain.

They planted deep-rooted pear trees on upper terraces to stabilize slopes, stop soil erosion, and conserve water, while cultivating crops on lower levels.

To maximize space and sunlight in the semi-arid environment, farmers developed the elevated canopy system. Supported by wooden frames, mature branches spread high above the ground, improving airflow, cutting disease risks, and creating space below for livestock, vegetables and medicinal herbs.

Today, the site shelters 9,423 pear trees that are over a century old, including more than 2,600 that have survived for over 300 years.

According to the FAO, the orchard follows a low-density planting model, with roughly 150 trees per hectare, creating favorable conditions for light penetration, airflow and intercropping.

In its assessment, the organization noted that this integrated agroforestry landscape creates a resilient ecological barrier along the Yellow River, improving nutrient cycling, strengthening local food security, and demonstrating how traditional knowledge can adapt to harsh environments.

"The knowledge developed in these orchards has been adapted and applied in newer plantations and surrounding landscapes, creating a coherent and ecologically sound agroforestry system," the FAO said in its description of the site.

Heritage plus science

Keeping 300-year-old trees alive requires constant intervention, but orchard managers are increasingly swapping chemical inputs for ecological solutions.

At a nursery near the orchard, rows of wild pear saplings are carefully cultivated for conservation work. According to orchard caretaker Wei Wanyi, these naturally occurring seedlings possess strong root systems and strong resistance to drought, disease and saline-alkaline conditions.

"They are valuable genetic resources," Wei said. "We use them for bridge grafting, trunk grafting and replanting endangered ancient trees."

Traditional restoration methods continue to play an important role in extending the lifespan of aging trees. Grafting, bridge grafting and cavity repair techniques are used to revive weakened specimens and improve their health.

Meanwhile, conservation efforts increasingly rely on environmentally friendly pest-control strategies.

Instead of depending heavily on chemical pesticides, orchard managers use a combination of physical and biological methods to manage major orchard pests including aphids, pear psyllids and several species of fruit-boring insects.

Yellow adhesive bands wrapped around tree trunks trap crawling insects before they reach the canopy. The practice evolved from a traditional local technique in which farmers piled sand around tree trunks to prevent pests from climbing upward.

"We improved the old method by replacing the sand barriers with adhesive bands," said Li Xiaoli, a staff member at the Ancient Pear Orchard Protection Center. "When insects climb up the trunk, they become trapped on the sticky surface."

Pheromone traps suspended among the branches provide another layer of protection, while beneficial insects are released to help maintain a natural balance between pest and predator populations, Li added.

Wei Zhouyu, a local farmer whose family has planted pear trees for generations, pointed to several triangular traps hanging among the branches, part of the orchard's biological pest-control system.

Such tools have become a common sight in recent years as the orchard expands the use of green management practices.

According to orchard managers, reducing chemical inputs has become a key principle of conservation. The goal is not only to protect fruit quality, but also to preserve the biodiversity that supports the orchard's long-term health.

While traditional knowledge remains central to orchard management, modern technology has become an increasingly important tool.

A major milestone came in 2019 with the implementation of the Regulations on the Protection of Shichuan Ancient Pear Trees, which established a legal framework for conservation and brought orchard management onto a more systematic footing.

Since the establishment of the Ancient Pear Orchard Protection Center in 2014, every tree has its own digital identity. Pointing to a tree estimated to be 345 years old, local farmer Wei Zhouyu showed the identification plate attached to its trunk. "The sign tells you the tree's variety, age and caretaker," he said.

The digital records also document each tree's health condition and maintenance history, allowing conservation teams to monitor changes over time and respond more quickly to emerging risks.

Today, more than 1,760 conservation agreements have been signed with farmers and agritourism operators, ensuring that local communities remain directly involved in protecting the orchard.

Growing together

Another factor that makes Shichuan particularly unusual is that the orchard is not separated from daily life.

Ancient pear trees stand beside and even inside homes, line village roads and spread across family courtyards. Generations of residents have lived among the trees, creating a landscape in which agriculture, ecology and community life are deeply intertwined.

"We don't just grow pear trees. We grow up with them," said Wei Zhouyu, who cares for 16 pear trees and learned orchard management skills from his father and grandfather.

The orchard is protected through a community-based management system that reflects this long-standing relationship between people and trees.

More than 6,000 ancient trees are cared for by farming households, over 2,600 by agritourism operators and around 600 by the orchard's protection center. In total, 1,765 households remain involved in cultivating and protecting the orchard.

Yet many of the caretakers are between 50 and 70 years old, highlighting the challenge of passing traditional knowledge to younger generations.

To encourage continued stewardship, local authorities provide annual subsidies totaling around 2.4 million yuan ($350,000) for irrigation and tree maintenance, while conservation staff take responsibility for trees that no longer have dedicated caretakers.

"We need to preserve these traditional skills, but we also need to attract new generations to join the effort," said Han Lei, deputy director of the protection center.

The close relationship between people and trees has also created economic opportunities for local communities.

In addition to pear production, residents operate farm stays, restaurants and tourism-related businesses linked to the orchard's seasonal landscape and agricultural traditions.

According to local authorities, the annual pear blossom season attracts more than 900,000 visitors and generates tourism revenue exceeding 90 million yuan.

"Visitors come to see the blossoms in spring and pick pears in autumn. We sell pears and run farm stays, and tourism has brought us new sources of income," said local farmer Wei Konglu.

For the FAO, this integration of ecological conservation, traditional agriculture and rural livelihoods is one of the orchard's defining strengths.

During a field assessment conducted before its GIAHS designation, FAO experts examined the orchard's conservation practices, traditional farming knowledge and local agricultural industries, describing it as an example of how agricultural heritage can continue to generate economic value while preserving ecological and cultural resources.

"Resilient to droughts and floods, the system sustains agrobiodiversity, food security and rural livelihoods, reflecting harmony between tradition and ecology," the organization said.

Supported by both inherited knowledge and modern conservation measures, the orchard remains a working agricultural landscape where ecological protection and rural livelihoods continue side by side.

Traditional ladders keep farmers high up in canopy

By **MA JINGNA** and **HU YUMENG**

Beneath the sprawling canopy of centuries-old pear trees in Shichuan town, Lanzhou, orchard work takes place high above the ground, within trees that can reach more than 10 meters in height.

Farmers here rely on a traditional wooden scaling ladder system known as *tianbashi*, a practice passed down through generations and recognized as a provincial-level intangible cultural heritage in Gansu.

Rather than a single tool, *tianbashi* represents a complete system of high-altitude farming knowledge used to access, manage and care for some of the world's oldest pear trees.

The system is closely tied to an elevated cultivation model known locally as *gaotian*, or "fields in the sky", in which branches are lifted and supported by wooden frames, forming a layered orchard structure above the ground.

"In other places, farmers plant on the ground, but here they plant in the sky," said Li Xiaoli, a staff member of the orchard's protection center.

"Mechanized operations can lead to soil compaction and surface hardening over time. In contrast, the *tianbashi* system places far less pressure on the ground. As farmers work above the soil using wooden ladders, the impact on the orchard floor is minimal, helping preserve soil structure and ecological stability," Li said. "It also offers greater flexibility, allowing workers to move through dense canopies and reach branches more precisely than machinery."

According to the Food and Agriculture Organization, this reflects a long-evolved traditional knowledge system in which seasonal ecological practices are embedded in every stage of orchard management.

Using *tianbashi*, farmers carry out key seasonal tasks including pruning, flower management, pollination, fruit thinning, harvesting and ecological pest control, all guided by agricultural calendars shaped by flowering cycles and tree growth patterns.

For local farmers, *tianbashi* is more than a working method — it is inherited memory. Techniques such as high-altitude pruning, bark treatment and seasonal canopy care are learned through generations rather than formal training.

"These old pear trees are like our ancestors," said 63-year-old farmer Wei Zhouyu. "We must care for them using traditional methods."

Among these tasks, flower management is especially important. During blooming season, farmers perform flower thinning by gently shaking branches from elevated positions. The practice reduces excessive blossoms so nutrients concentrate in fewer fruits, improving size and quality, while also dislodging insects and eggs.

Equally important is pollination. Because main varieties such as the Dongguo and Ruan'er pears depend on cross-pollination, farmers plant compatible trees like Sumu and Changba pears throughout the orchard. Climbing the wooden ladders, they manually transfer pollen between varieties to ensure stable yields and high fruit quality.

Wei also practices winter bark scraping, a traditional technique that removes old bark, helps eliminate overwintering pests and improves tree health. "Removing the old bark helps the tree breathe more easily," he said.

Wei manages 16 ancient pear trees, including some over 400 years old.

The work remains demanding. Pruning, pollination and harvesting all require long hours in the canopy, and many young people are reluctant to take over. "It's hard and sometimes dangerous," Wei said.

A villager harvests pears while scaling the *tianbashi* ladder system at the Shichuan orchard in Gaolan, Gansu province, in October.
LI YALONG / CHINA NEWS SERVICE

To address this, local authorities have incorporated *tianbashi* into heritage protection programs and training systems to encourage knowledge transfer. The orchard's protection center has also established a nursery with more than 2,000 saplings for restoration, while experts train farmers in green pest control and scientific orchard management.

The FAO said that the Shichuan system demonstrates how traditional agricultural knowledge continues to function as a living system rather than a relic of the past.

CULTURE

A gold octadrachm in the name of Arsinoe II Philadelphos on display at the Xi'an exhibition.

The golden thread of social exchange

Xi'an exhibition uses Hellenistic jewelry to explore how ancient civilizations shared artistic traditions, **Zhao Xu** reports.

Periammata, chains or straps worn diagonally across the torso or fastened over the breast.

Head ornaments on display captivate visitors at the exhibition, *Art in Gold: Jewellery in Hellenistic Times*, at the Shaanxi History Museum in Xi'an, Shaanxi province. PHOTOS PROVIDED TO CHINA DAILY

When Alexander the Great's armies swept eastward in the fourth century BC, they carried far more than military power. Across the vast world that emerged — from the Adriatic to Afghanistan — people, languages, beliefs, and artistic traditions circulated on an unprecedented scale.

The kingdoms founded by Alexander's successors forged a shared cultural idiom linking cities such as Alexandria, Antioch and Pergamon, while local traditions remained remarkably resilient. In this first great experiment in globalization, gold jewelry became one of its most eloquent witnesses.

Fashioned from gold seized from Persian treasuries, adorned with gemstones from distant lands and shaped by craftsmen drawing on multiple artistic traditions, these objects embodied both the cosmopolitan ambitions and cultural diversity of the Hellenistic world.

More than ornaments, they accompanied their owners through marriage, worship and death, carrying the traces of commercial, artistic and spiritual exchanges that connected continents.

More than two millennia later, some of the finest examples of this cultural fusion are on display at the Shaanxi History Museum in Xi'an. *Art in Gold: Jewellery in Hellenistic Times*, which runs through the end of the year, offers a glimpse into the interconnected world that emerged in the wake of Alexander's conquests.

"The concept of exchange anchors the exhibition," says Ren Xueli of the Shaanxi History Museum, which has brought together more than 180 artifacts from 24 Greek archaeological museums alongside 70 objects from the Benaki Museum in Athens.

Ren was also referring to the exhibition's Chinese title, *Wenming Yi Zhi*, a phrase from *I Ching (Book of Changes)*. Here, *wenming*, commonly translated as "civilization", encompasses ritual, moral cultivation and the social order that binds communities together. *Zhi*, meaning "restraint", suggests the wisdom to recognize limits and exercise self-discipline. Together, they imply that civilization reaches its highest expression not through the pursuit of power, but through the ability to temper military might with moral restraint and imperial ambition with cultural understanding.

"Alexander's greatest achievement may not have been the lands he conquered, but the world of exchange that emerged from them and outlived him — a reminder that civilizations endure not through expansion alone, but through their capacity to transform power into connection," Ren says.

Prominence of queens

One striking example of this cultural synthesis is a gold coin minted in Alexandria in the name of the deified Queen Arsinoe II Philadelphos.

After Alexander's death in 323 BC, his empire was divided among his generals, one of whom, Ptolemy I Soter, founded the Ptolemaic dynasty in Egypt. Arsinoe is depicted wearing a draped Greek-style head covering and a royal headband (diadem) associated with Hera while holding a lotus-tipped scepter that evokes Egyptian royal iconography.

By equating her marriage to her brother Ptolemy II — the Ptolemaic dynasty is famous for sibling marriage within the royal family — with the sacred union of Zeus and Hera, the coin transformed dynastic politics into divine mythology, weaving Greek and Egyptian traditions together to legitimize royal authority.

The influence of Ptolemaic queens extended well beyond royal portraiture. Two pairs of gold sphinx earrings demonstrate how female authority reshaped one of Egypt's oldest royal symbols. Traditionally depicted as male and embodying the divine authority of the pharaoh, the sphinx gradually assumed female form during the Ptolemaic period, likely reflecting the growing prominence of queens such as Arsinoe II. One remarkable earring depicts a wingless sphinx wearing the Hathor crown with its solar disc and cow's horns — an unmistakably Egyptian emblem — rendered with the refined craftsmanship of a Hellenistic goldsmith. Rather than replacing Egyptian tradition, the Ptolemies reinterpreted it, creating a new visual language of female power.

The same spirit of cultural synthesis found expression in another defining motif of Hellenistic jewelry: Dionysus. According to Greek curator Irini Papageorgiou, his growing popularity may have reflected the prominence of his cult at the Ptolemaic court, though his appeal reached far beyond royal fashion.

In the Orphic tradition, the infant Dionysus, or Zagreus, was slain by the Titans and reborn, making him a symbol of regeneration and immortality. The Dionysian Mysteries, unusually open to women, likewise promised initiates that death was not an end but a new beginning.

It is therefore no coincidence that ivy leaves, grape clusters and vines — emblems of Dionysus — adorn Hellenistic wreaths, earrings and necklaces. Yet, the exhibition reveals a side of the god less familiar to many Chinese audiences. Along the ancient Silk Roads, Dionysus is best known as the god of wine, appearing on silver vessels and luxury wares that testify to the spread of Mediterranean drinking culture eastward. The jewelry tells a different story. Here, his symbols evoke marriage, fertility, death and renewal, revealing Dionysus not simply as the god of celebration, but as a guardian of life's greatest transformations.

A stolen necklace

Asked to choose the exhibition's most compelling storytelling object, Papageorgiou points instead to a humble lead curse tablet from the small Greek island of Delos. Dating to the late Hellenistic or early Roman period, it preserves the desperate plea of a woman who, seeing that her gold necklace had been stolen, calls upon both local and foreign gods and goddesses to expose and punish everyone involved. Her curse is relentless, condemning the thief's mind, soul, limbs, hands, fingers, and even genitalia, whether the culprit was "woman or man".

"The curse she directs at the thief is terrifying, yet it also highlights the deep emotional bond between a piece of jewelry and its owner — a connection that I believe is timeless," Papageorgiou says. "Reading her words, I feel as if I am hearing the innermost thoughts of any woman, from any era, whose most cherished possession has been stolen."

The impulse to protect what is precious transcends cultures, Ren observes. When archaeologists opened the early seventh-century tomb of the 9-year-old noble girl Li Jingxun in Xi'an in 1957, they found four stark characters carved onto her coffin: "*kai guan ji si*" (Whoever opens the coffin will die).

The Hellenistic gold exhibition was deliberately designed so that visitors leaving *Art in Gold* step directly into another exhibition devoted to China's ritual bronzes, Ren explains. Known as *jijin*, or "auspicious metal", these bronzes date from the Shang and Zhou dynasties (c. 16th century BC-256 BC).

"*Ji* means 'auspicious', while *jin*, though now commonly understood as 'gold', originally referred broadly to metal — in this case, bronze," she says.

Serving as sacred mediators between the living and their ancestors, the vessels bear inscriptions documenting political events, military campaigns, ritual ceremonies and family histories, forming some of the earliest written records of Chinese civilization.

"The juxtaposition of the two exhibitions is intended as a dialogue between ancient civilizations," Ren says.

"At first glance, Hellenistic gold jewelry and China's ritual bronzes belong to entirely different worlds: one intimate and wearable, the other monumental and ceremonial. Yet, both transformed precious metal into a vessel of memory.

"Hellenistic gold accompanied individuals through marriage, worship and death, preserving personal identity, affection and the hope of renewal. China's ritual bronzes, by contrast, embodied collective memory and ritual authority, sustaining the bonds between the living, their ancestors and the state. Together, they reveal a shared human impulse to fashion enduring objects that bridge the living and the dead, the earthly and the sacred, and the fleeting moment with the permanence of history."

When adornments became symbols of love and loss

By ZHAO XU

Long before she became a wife, she first became a bride. On a fourth-century BC Attic vase displayed at the Shaanxi History Museum, a young woman sits at the center of the Epaulia — the celebration held the day after a wedding. Around her, female companions gather as fairies and doves present gifts: a diadem, a bracelet and a necklace. She wears a myrtle wreath, earrings and bracelets, while delicate buttons adorn her garment. Rendered in gilded applied clay, these ornaments shimmer not merely as embellishments, but as symbols of identity, affection and expectation.

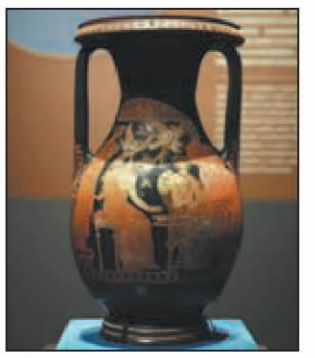
More than two millennia later, they provide a fitting introduction to *Art in Gold: Jewellery in Hellenistic Times*, an exhibition that tells the story of Hellenistic gold through the lives of the women who wore it.

Yet, the vase tells another, quieter story. Excavated from the eastern cemetery of Pella in ancient Macedonia, it had served as a funerary urn. Inside were the cremated remains of a young girl, together with part of a gilded bronze myrtle wreath — the very kind depicted in the painted wedding scene — and a silver bracelet so small it could only have belonged to someone who died before reaching marriageable age.

According to Irini Papageorgiou, curator of the exhibition, the painted Epaulia became a final act of remembrance, allowing in death what life had denied.

"The ancient Greeks regarded the death of an unmarried girl as the greatest possible misfortune, since she was deprived of fulfilling her social and biological destiny — that is, marriage and motherhood," she says.

The belief found one of its most enduring literary expressions in *Antigone*, the tragedy by fifth-century BC playwright Sophocles. Betrothed yet never married, Antigone laments that she is destined not for a bridal chamber but for a tomb, with death rather than a mortal husband claiming her as his bride. As in the painted Epaulia on the Pella vase, marriage and death become two rites of passage that tragically converge.



"In Hellenistic times, it was believed that the souls of those who had suffered untimely deaths — before marrying and having children — were unable to complete their passage to the Underworld," Papageorgiou says. "Instead, they wandered restlessly between the worlds of the living and the dead. Specific grave goods, including certain types of jewelry, together with particular burial rituals, were intended to assist their passage into the afterlife and appease their anger."

One such object is the Heracles knot, an ornamental motif of two interlocking loops resembling a reef knot. Originating in Egypt in the second millennium BC and later associated with the lion skin of Heracles, it became especially popular in Macedonia after Alexander the Great's conquests, appearing prominently on necklaces and other adornments worn by women.

Its appeal lay in the convergence of politics, mythology and popular belief. For the Macedonian royal house, which traced its lineage to Heracles, the knot evoked heroic virtue and divine ancestry. Yet it also functioned as a protective amulet. As a Greek hero believed to have attained Mount Olympus, Heracles offered those buried with his knot the hope that death itself might be overcome.

Another revealing category of ornaments is the *periammata*, chains or straps worn diagonally across the torso or fastened over the breast. Depicted on mortal maidens as well as goddesses such as Athena, Artemis and Aphrodite, the term derives from the Greek verb *periapto* — "to bind" or "to fasten". More than decoration, it served as an amulet, a marker of virginity and perhaps a symbolic restraint before marriage. Similar meanings attached to thigh-bands and garters dedicated by adolescent girls in sanctuaries as they approached adulthood. For those who died before crossing that threshold, such bonds acquired an even deeper resonance.

A fourth-century BC Attic vase (above) depicts a wedding scene featuring a young woman adorned with a gold wreath — a similar wreath (center) is on display at the Xi'an exhibition. Another highlight is an elaborate diadem (top) with its central part crafted as a Heracles knot.

Another exhibit, a terracotta figurine of a seated young woman with movable arms, wears a painted diadem and earrings that imitate gold jewelry. Unearthed in Pella and dating to the third or second century BC, it belongs to a type known as *plangona* — jointed dolls or puppets. More than playthings, these figures accompanied girls from childhood to the threshold of marriage and were often dedicated to the gods before a wedding. Buried in tombs, they became poignant reminders of lives interrupted before that final rite of passage.

Also associated with the prenuptial stage of life are the astragals, or knucklebones, which evoke a game of erotic divination once played with the knucklebones of sheep or goats. Papageorgiou explains that astragalus-shaped ornaments imitate the tarsal bone of mammals, believed in antiquity to possess protective and healing powers. Their frequent appearance in the graves of young women and children suggests they served as amulets, safeguarding their owners through life's most vulnerable transitions.

The spinning top, also found in the burials of Hellenistic women, similarly united play with symbolism. Its ceaseless whirl may have metaphorically expressed a bride's transformation while foreshadowing the course of her future life.

Perhaps the most emotionally evocative objects in the exhibition are the gold wreaths, like the one worn by the young woman depicted on the fourth-century BC Attic vase.

Accompanying their owners through life's defining moments — marriage, coming of age, religious initiation, and, ultimately, death — these exquisitely crafted crowns of myrtle, oak, laurel, and ivy adorned aristocrats, priests, victors, and initiates in sacred mysteries, signifying an individual's place within the social and spiritual order of the Hellenistic world. Yet it was in the funerary sphere that they acquired their deepest significance.

"Relatives gave the deceased, among others, a wreath as to those who had competed in life, reflecting a concept that assimilated the deceased to an athlete. Since the athletic ideal in antiquity was closely associated with the concept of virtue, this idea carries profound moral content," says the curator, referring to an ancient commentary on the works of the Athenian comic playwright Aristophanes (c. 446-386 BC).

Plutarch, in his *Moralia*, states that the deceased deserved to be rewarded, having competed like athletes, and to receive the honors due to them. In other words, placing a wreath upon the dead was, perhaps, to proclaim that life itself had been a contest worthy of honor. Like victorious athletes, the departed were believed to have completed their earthly struggle and earned the final reward: vindication, remembrance, and the hope of eternal life among the virtuous.

Chinese food is the world's oyster

Documentary follows the pursuit of *xian* among chefs, scientists and families, from mountains to sea, and from East to West, **Li Yingxue** reports.

In Fujian, an oyster has many lives. Layered with cabbage, laver and slices of pork, then coated in rice batter and fried, it becomes a golden, crispy oyster fritter. Dropped into a bowl of *laohua*, a local rice-noodle soup, it adds another layer of briny sweetness.

As China's largest oyster-producing province, Fujian has developed many methods of preparing the humble shellfish, from frying and boiling to steaming and more. But the oyster is only one chapter in China's long pursuit of *xian*, a culinary ideal encompassing umami, freshness and a broader sense of savory deliciousness.

Generations of Chinese chefs have transformed nature's bounty through accumulated knowledge, heat and time.

Now streaming on Tencent Video, *Oyster Sauce: A Drop of Umami* is China's first food and culinary culture documentary devoted to oyster sauce, taking *xian* as the starting point for a journey across mountains and seas.

Produced by Tencent Video and co-produced by DOClabs Beijing, the documentary traces the history of oyster farming, the origins of oyster sauce and the evolution of regional flavors, while exploring how Chinese cuisine has traveled around the world.

Through fishermen, chefs, scientists, and families, the series traces Chinese food culture across generations.

"When we make food documentaries, we often use something delicious as a pretext, hoping that audiences will see richer and various ways of living," says Chen Xiaoqing, the documentary's chief producer.

"What we really hope people will learn is why people eat certain foods, why they love certain flavors, and how much love, craftsmanship and time go into creating them."

The first episode begins deep in the Cangshan Mountains in Dali, Yunnan province, where an 11-year-old girl follows her grandfather into the forest in search of black tiger's paw mushrooms.

Mushrooms have long been regarded in China as a mountain delicacy. Although ancient people did not understand the chemistry behind umami, generations of experience taught them to recognize the distinctive value of fungi. Modern food science has shown that free amino acids and taste-active nucleotides in mushrooms work together during cooking to create rich, complex flavors.

The camera then travels to Zhengzhou, Henan province, where a local restaurant offers another example of Chinese culinary ingenuity.

To make a broth that is both clear and flavorful, the cook finely minces chicken breast or lean pork, mixes it with water, and adds it to the boiling broth. The meat forms flocculent masses that absorb suspended particles, blood foam, excess fat, and other impurities.

Known in Chinese cooking as *saotang*, or "sweeping the broth", the technique appears to be an exercise in subtraction, but ultimately allows the broth's flavor to emerge with greater clarity.

From mushrooms in the mountains to broth in the Central Plains, the documentary repeatedly asks: Where does *xian* come from?

"We wanted to find out," says Zhu Lexian, the documentary's supervising producer. The production team uses the history of China's pursuit of *xian* as its narrative thread, exploring it across time and space.

"We start with fishermen by the sea, then follow the journey through harvesting and simmering, and eventually to people applying new technologies. Then we connect all these stories," Zhu says.

The search links culinary knowledge, cooking practices, production technology, and everyday life.

"Eastern and Western understandings of *xian* are different," Chen says at the documentary's premiere.

In his view, Western discussions of freshness often emphasize the original state and immediate quality of an ingredient. The Chinese idea of *xian*, by contrast, can refer to a more layered form of deliciousness created through cooking, fermentation, concentration, and time.

"Westerners can be very concrete in their approach to food, while Chinese culinary life can sometimes be more abstract," Chen says.

Top: Fishermen in Fuding, Fujian province, haul in oysters. **Left:** The poster of *Oyster Sauce: A Drop of Umami*. **Right:** The documentary's production team (from left) Chen Xiaoqing, Zhu Lexian and Li Jie share insights into the making of the series.

Chinese cooking, he explains, often allows ingredients to transform, extracting and reshaping their flavors before using them in other dishes.

Behind this is a broader philosophy of eating. Chinese cooks have continually explored how one flavor can bring out another, how heat and time can transform ingredients, and how flavors from mountains, fields and oceans can complement one another at the same table.

For the filmmakers, the central challenge was how to turn the intangible quality of *xian* into something viewers could see and imagine tasting.

"People cannot actually taste the food or experience its *xian* through the screen," says producer Li Jie. But visual and auditory stimuli can activate memories associated with taste.

"Rather than simply presenting flavor, we are stimulating people's senses and building connections between them, so their brains can fill in the taste," Li says.

The filmmakers found visual counterparts for flavor: the texture of ingredients, bubbling broth, rising steam, and the colors of finished dishes. Images such as a flower blossoming or honey dripping evoke sweetness and roasted aromas through visual association.

"First, you have to give *xian* something tangible to attach itself to. Second, you have to give it movement," Li says.

The documentary was filmed over about four months in nearly 20 Chinese cities and abroad. From coastal aquaculture farms and remote forests to neighborhood eateries and family kitchens, the camera sought to connect flavors with people.

A modern food factory became another important stop on the journey. The production team was struck by the complexity of its production lines, research systems and laboratories.

"We had never imagined that oyster sauce was made on such a complex production line," Li says. After seeing the raw materials, production process, and research and testing systems, the team realized that this side of food production was "particularly worth documenting".

While food documentaries often focus on flames, traditional utensils and the hands of craftspeople, *Oyster Sauce: A Drop of Umami* also turns automated production lines, laboratories and machinery into subjects.

"We wanted to use images to show the beauty of science, industry and order," Li says.

The documentary also follows Chinese culinary influences overseas.

In Thailand, celebrity chef Pichaya Soontornyanakij, known as Pam, opened her family home to the production team for the first time.

Pam's mother is of Chaozhou heritage, and the family's everyday meals combine Thai and Chinese influences. Her mother takes the production team to the market before the family prepares a meal together.

Chinese food culture is expressed not through overt symbols but through ingredients, seasonings and cooking habits.

"When I saw Chinese seasonings in a Thai family kitchen, and saw Thai and Chinese elements blended into their everyday meals, I felt the subtle influence of Chinese food culture," Li says.

Such cultural transmission is not simply a matter of taking a particular Chinese dish overseas. As people migrate, and trade and cultural exchanges expand, Chinese flavors enter new environments, interact with local ingredients and traditions, and develop new forms.

Flavor thus becomes a form of cultural memory. It can cross linguistic boundaries and be passed from one generation to the next.

As the camera moves from the sea to the dining table, the documentary reveals more than how a flavor is created. It shows how Chinese food culture evolves through inheritance and exchange, continuing to find new life as it travels.

Time-honored pharmacy brings TCM to the modern age

In the bustling Dashilar area, a renowned tourist destination in downtown Beijing, Melvyn, a young man from Brussels, stepped into the Tong Ren Tang pharmacy, a time-honored brand with over 350 years of history.

This was Melvyn's second visit to China. Besides sightseeing, he intended to learn more about traditional Chinese medicine.

Accompanying him was Mana, a young lady from Pakistan, who was experiencing back pain and decided to seek relief while sightseeing. With the help of the store's staff, Mana quickly obtained the medicine she needed.

"I have a keen interest in TCM. I enjoy TCM massages and also like taking ginseng," said Mana.

Melvyn and Mana are among a growing number of young people from China and abroad who turn to TCM for health problems.

The Tong Ren Tang pharmacy, established in 1669, serves as a window for cultural exchange and knowledge in TCM.

The building itself retains its antiquated charm, with shelves inside the building stocked with an array of products.

Visitors can not only see a doctor, get prescriptions, and purchase medicine, but also buy nutritional supplements, food items, cosmetics, and herbal drinks.

Left: A pharmacist dispenses Chinese herbal medicine at a Tong Ren Tang pharmacy in Beijing on Feb 25, 2025. **Right:** A staff member displays Chinese herbal medicine drinks at a Tong Ren Tang branch on the same day. PHOTOS BY LI XIN / XINHUA

In the cosmetics section, Guo Haiyan, who oversees quality control, has introduced an anti-freckle cream, describing it as highly effective.

"We used to focus mainly on pharmaceuticals, but later we found that tourists to this area have a huge demand for cosmetics," she said.

She also pointed to incense sticks, noting that they have gained popularity abroad in recent years.

Herbal drinks are another distinctive offering. Tong Ren Tang has blended coffee with TCM ingredients to create beverages infused with herbal elements.

"Tourists can choose drinks suited to their body condition for health preservation," Guo said.

Near the beverage counter stands a wheel that visitors spin as part of a puzzle game to guess the names of TCM herbs based on photo prompts.

The store also sells TCM bracelets, sachets and other souvenirs that can be worn to help prevent ailments.

Children can try on *hanfu*, traditional Chinese attire, and experience TCM customs firsthand.

A tourist surnamed Lin from Guangdong province brought his family to Beijing during the summer vacation. They visited the third floor, which houses a TCM culture exhibition center and serves as a venue for educational tours. His son and daughter showed great interest in handling traditional pill-making tools and observing various plant specimens.

An on-site virtual reality display allows visitors to don headsets and watch immersive demonstrations of how these tools were used to make pills in the past.

"Just like making tiny glutinous rice balls, the TCM practitioner adds water and herbal powder and shakes the mixture back and forth. It takes about 40 minutes to complete the process," Guo said. "Factories usually have specialized machines for this, but we have preserved the traditional method here."

At the TCM digital health cabin, visitors can use machines for basic health check-ups. They can also see a doctor for further diagnosis.

On nearby tables, paper and pigments — the latter made from TCM herbs or minerals — are available for children to paint. They can also use TCM herbs and cloth to craft their own sachets.

Guo said that since the summer vacation began, the center has seen an influx of children.

There are many such TCM experiential centers across China. In Cangzhou, Hebei province, just over two hours' drive from Beijing, some schools have herbal gardens to help children learn about medicinal plants. In Chengdu, Sichuan province, Tianfu Medicine City attracts many enthusiasts from both home and abroad.

Back in Beijing, just a few minutes' walk from Dashilar, a smart health experience center at the Beijing Fun complex offers visitors exercise routines similar to *baduanjin* — a traditional form of *qigong*. The complex is a branch of Tong Ren Tang. Visitors can also use AI-powered machines that integrate TCM wisdom with large language models for health consultations.

"We aim to create a showcase for TCM culture. New technologies help us do a better job in promoting TCM culture," said Guo.

LIFE

Grandma behind the counter

At 86, Qingdao cafe owner has turned a struggling business into a place where coffee, companionship and purpose meet

A young woman arrives at Rona Coffee carrying a camera, having decided to feature its 86-year-old owner Zhao Qiying in a graduation documentary after seeing her online.

"If I can help young people, that is a good thing," Zhao says, before giving a customer entering the shop her customary greeting: "What would you like to drink?"

There is no printed menu inside the ground-floor storefront, located in an apartment building in Qingdao, a coastal city in East China's Shandong province.

Zhao points to a small whiteboard on the wall, where she has written the drinks and prices herself. She opens a notebook and records the order: "Matcha latte, hot, 25 yuan, WeChat Pay." Then she grinds the beans, steams the milk and carries the cup to the table.

The students helping the woman with her project begin filming. Off camera, they help Zhao carry cups and clear tables. Zhao lives only a 10-minute walk away from the cafe, yet the shop brings a much wider world to her door. She has also managed to turn a once-failing business into a success.

Residents from the surrounding neighborhood stop by for coffee. Students settle in with books. People from across China arrive after seeing Zhao online, some opening the door with the question, "Is Grandma here?"

Visitors from abroad have also found their way to the shop. When language becomes a barrier, Zhao points to the cups or asks a younger customer to interpret.

Customers have also suggested new additions to the menu, prompting her to learn how to make avocado, hazelnut and ice-cream coffees.

Zhao accepts mobile payments, but the orders still go into a handwritten ledger.

"I can't figure out those electronic ordering systems," she says. "Writing it down feels more reliable."

Zhao's decision to take over the cafe began not with a passion for coffee, but with a practical goal — the fully equipped shop should not simply be abandoned.

Her son had opened the cafe under a franchise more than a decade ago, spending more than 400,000 yuan ($58,900) on renovations, equipment and furniture. Zhao says the franchise arrangement later fell apart. With few customers and the business running at a loss, her son considered closing the shop in 2014.

Zhao, who had worked as an accountant at a Qingdao factory, looked at the furnished room and saw money already spent. "Wouldn't all that work go to waste?" she recalls asking. "How about I try running the place?"

She was then 74 and had never tasted coffee.

Zhao Qiying (left) chats with a customer at Rona Coffee in Qingdao, East China's Shandong province, on June 15. PHOTOS BY ZHANG LIYUAN / XINHUA

Zhao serves coffee at Rona Coffee in Qingdao.

Her first cup struck her as bitter. To her, different types of coffee seemed to differ only in how bitter they were. Still, she became familiar with the coffee machine button by button, replaying online videos and writing each step in a notebook.

Milk foam and latte art were the hardest skills to master. Unwilling to keep wasting cartons of milk, Zhao mixed laundry detergent with water to imitate milk foam and diluted soy sauce to stand in for espresso. She practiced with the two liquids at home every day. Within six months, she could pour a decent heart shape.

For years, Rona Coffee sold only 20 or 30 cups a day. Online attention changed that. Zhao now makes 50 or 60 cups on an ordinary weekday and as many as 70 or 80 during holidays. The cafe, where she is both the licensed proprietor and the only worker, now turns a profit.

The attention has also changed who comes through the door and how customers interact with Zhao. One wall is covered in notes praising her coffee and wishing her good health. Seeing her busy at work, regulars sometimes offer to collect their own drinks. If a latte-art pattern goes wrong, Zhao tries to keep the cup for herself, but customers usually reassure her that it still looks and tastes good.

"They tell me it looks good even when it doesn't, and I know they are sometimes just trying to make me happy," she says. "The kinder they are to me, the less I can afford to be careless. I have to take every cup seriously."

Younger people have also left their mark on the cafe. Zhao's grandson refreshed its playlist, while customers encouraged her to add new drinks. Zhao, in turn, gives them a place to study, talk or simply spend time. Some confide in her about breakups or failed attempts to lose weight. She offers a few words of comfort and marvels at the sheer variety of troubles young people encounter.

A longtime customer, Wang Xintian, says Zhao feels less like a shopkeeper and more like a familiar elder.

Zhao works about 10 hours a day. She gets tired, but says being idle would not necessarily feel any better. Before taking over the cafe, she imagined retirement as chores, errands and television. Life with the shop, she says, turned out very differently.

"Every morning, I know why I am getting up," she says. "At the cafe, I know what I have to do. When I go home after work, I know I have something to look forward to the next day."

Her son now often comes by for coffee. Zhao likes to joke that the cafe he once wanted to close has made him a regular.

Twelve years later, coffee remains bitter to her. But the 10-minute walk from home has opened onto a larger world of work, companionship and daily purpose.

The coffee, Zhao says, is "still just different degrees of bitterness".

Her days are not.

Fishing heritage finds a new shore

HAIKOU — When the tide retreats at Tanmen, people go after it. During the fishing town's summer beachcombing season, visitors spread across the exposed shore. Locals call the activity *ganhai* — literally, going out to "catch the sea".

This year's festival features a beachcombing treasure hunt, a fishermen's market, a long seafood dinner and intangible cultural heritage performances, turning traditions of an old fishing community into experiences visitors can join.

A tourist surnamed Hu from East China's Jiangsu province had been traveling with her family in Sanya when she heard about the festival and made a detour to Tanmen. "It was my first time watching the fishing fleet set out. It was spectacular," she says, adding that she plans to take her child *ganhai* and then visit the China (Hainan) Museum of the South China Sea.

The fleet she came to see belongs to a much less leisurely world. Tanmen is home to 86 medium and large fishing vessels, most weighing between 400 and 500 metric tons. At noon on Aug 16, when the summer fishing moratorium ended, firecrackers sounded over the harbor and hundreds of boats streamed toward the South China Sea.

For generations, fishing families preserved their knowledge of sea routes in handwritten sailing manuals known as Geng Lu Bu. The books recorded routes, island and reef features, positions and bearings; a *geng* was roughly equivalent to 10 nautical miles. Together, they turned hard-earned experience into practical guides for long voyages.

For three and a half months each summer, however, much of the fishing activity comes to a halt. This year's summer moratorium in designated South China Sea waters ran from noon on May 1 to noon on Aug 16.

Seasonal closures are also part of the region's fisheries-management tool kit. In its Thailand country profile, the Food and Agriculture Organization of the United Nations describes area and seasonal closures in the Gulf of Thailand imposed mainly for the recovery of Indo-Pacific mackerel, with restrictions on trawlers and purse seiners during designated periods.

The larger boats' return to sea is only one part of Tanmen's fishing economy. Closer to shore, a recreational-fishing pier serves smaller leisure vessels.

This summer, tourists have flocked to Tanmen Port and nearby fishing villages for *ganhai* and waterside sightseeing. Visitors have also stopped in Paigang village beside the harbor and visited the Geng Lu Bu museum, where sailing knowledge passed down through generations of fishermen is preserved.

The shift is also showing up in local livelihoods. More than 500 traditional fishermen in Tanmen have moved into leisure- and tourism-related work. More than 400 fishermen have formed five recreational-fishing cooperatives, and the town's recreational-fishery output value topped 100 million yuan ($14.87 million) in 2025.

An aerial view of fishing boats heading out to sea from Tanmen Port in Qionghai, South China's Hainan province. PU XIAOXU / XINHUA

Paigang village now has 13 fishermen's homestays, along with businesses offering sea angling, snorkeling and beachcombing. At the harbor, a 310-meter wharf dedicated to recreational fishing can accommodate 19 leisure fishing boats at a time.

Li Zhi, Party chief of Tanmen town, says the harbor upgrade is intended to serve both traditional fishing and the growing recreational sector, with leisure boats used for sightseeing and sea angling.

The result is a waterfront where commercial fishing and recreational activities increasingly sit side by side, widening the ways local residents make a living from the sea.

Fishing life also reaches shore through food and ritual. Tanmen's catches include Spanish mackerel, grouper, squid, sea cucumber and conch. This year's beachcombing season — the town's 12th — brings local traditions together with performances ranging from Hainan's carp-lantern performance to 24 Festive Drums, Indonesian folk songs and Thai finger dancing.

Before long voyages, another tradition comes into view: a ceremony honoring the Xiongdi Gong, also known as the "108 Brothers". Dating back to the Ming Dynasty (1368-1644), the ritual was traditionally performed by Hainan fishermen before long-distance fishing and trading voyages in the South China Sea.

It was included in the fifth batch of China's national list of representative items of intangible cultural heritage in 2021. The official heritage record says its community of practitioners later expanded beyond fishermen to include people from Hainan living in Southeast Asia and elsewhere around the world.

Hainan itself is opening wider. This is the island's first summer since the Hainan Free Trade Port began island-wide special customs operations on Dec 18, 2025. In the first half of 2026, Hainan recorded 1.6 million inbound and outbound passenger trips, including 883,000 by foreign nationals.

Local officials say foreign guests visiting nearby Boao for the Boao Forum for Asia Annual Conference also make their way to Tanmen, where volunteers provide foreign-language services at major visitor sites during the forum.

Inside Tanmen's Geng Lu Bu museum, handwritten manuals preserve old sailing knowledge. Outside, commercial boats leave for fishing grounds, families head to the shore for *ganhai*, and smaller boats take visitors out with rods. The water is the same; there are simply more ways now to know it — and to make a living from it.

SOCCER

Mourinho decries alleged bullying of Vinicius

'Special One' goes to bat for his star player, claiming Brazilian was targeted during Madrid's win over Espanyol

Real Madrid manager Jose Mourinho accused opponents and supporters of bullying Vinicius Jr, after the Brazil winger was targeted with rough treatment in the club's opening 2-1 La Liga win at Espanyol on Saturday.

Real, which kicked off Mourinho's return to the club with a late victory, was furious inside the opening five minutes when Alex Calatrava brought down Vinicius from behind and then appeared to catch him again while the forward was on the ground.

Madrid's players appealed for a red card, but the referee took no action against Calatrava, who later scored Espanyol's equalizer after Jude Bellingham had put Real ahead.

Late Real substitute Carlos Espi struck in the 90th minute to give the visitor the victory.

Mourinho said the treatment of Vinicius had become a recurring theme.

"Vinicius is no saint, but what they were doing to him was too much. Right from the first minute. It's a pattern that repeats itself from one opponent to the next," Mourinho said.

"I'll give him one, now you give him one. If I get a yellow card, you give him one. If I'm substituted, another player comes on who hasn't been booked yet, and you give him one."

The Portuguese coach said Vinicius, who has often been the focus of abuse from rival defenders and crowds, needed to stay composed despite the provocation.

"He needs to have a lot of emotional control. I've told him that if he scores a goal, he needs to be careful how he celebrates it," Mourinho said.

> "Vinicius is no saint, but what they were doing to him was too much. Right from the first minute. It's a pattern that repeats itself from one opponent to the next."
>
> **Jose Mourinho,** Real Madrid manager

"We're in an era where society is against bullying, yet, with Vini, we're still seeing bullying from opponents and from the crowd. We have to educate him and prepare him as best we can, and that's it."

The controversy also carried echoes of last season, when Mourinho was Benfica manager and Vinicius was subjected to discriminatory abuse by Benfica's Gianluca Prestianni during a Champions League match against Real Madrid.

Prestianni was later handed a six-match suspension by UEFA for discriminatory conduct that was deemed to be homophobic in nature.

Mourinho was heavily criticized at the time for defending Prestianni, saying Vinicius had incited the crowd with his goal celebrations, and Benfica was anything but racist because the Portuguese club's greatest player, Eusebio, was also Black.

With Vinicius opting to stay at the Bernabeu, signing a contract extension earlier this month, Mourinho insisted in the Spanish media that the Brazilian now knows his coach is on his side.

He told Spanish outlet AS last week: "Prestianni was my player. That's it. Twenty players can come at me, and I'm still (with my player). I think Vini knows now ... he can look at me and count on me to stand alongside him."

Espi grabs the glory

Bellingham opened the scoring, and new signing Espi secured the points at the death, starting Mourinho's second spell at the club with last-minute win.

"I think that we deserved to win, but Espanyol didn't deserve to lose," Mourinho told reporters.

"They didn't have any players at the World Cup and have been working together for a long time, and you could see that."

Back in charge of Madrid 13 years after leaving, the Portuguese veteran must bring the dressing room under control after the chaos of last season, and, much like his last stint at the Bernabeu, he has been tasked with ending Barcelona's domestic dominance.

Mourinho started his superstars Kylian Mbappe, Vinicius and Bellingham, as well as handing debuts to Bernardo Silva, Denzel Dumfries and Ibrahima Konate.

Bellingham had an excellent first season at Madrid after arriving from Borussia Dortmund, but the subsequent two were disappointing, both for him and the club, which failed to win a major trophy in either.

Mourinho installed him in attacking midfield with licence to roam, and England's World Cup star was heavily involved before netting the first goal of Mourinho's second tenure, heading home Arda Guler's dangerously crossed freekick.

Espanyol threatened midway through the first half, as Madrid goalkeeper Thibaut Courtois beat away Clemens Riedel's drive and Roberto Fernandez hooked a shot over the bar shortly afterwards.

Madrid did not heed the warning and Espanyol leveled in the 30th minute, Calatrava slotting home a Javi Hernandez cut-back after a fine team move.

Espanyol stopper Marko Dmitrovic made a good save to deny Mbappe after he got in behind on the right of the area.

The French forward, La Liga's top scorer in both of his two seasons at Madrid, was not at his lethal best.

Mourinho sent on two more new arrivals in the form of record signing Yan Diomande and Marc Cucurella, as Madrid sought a winner.

Federico Valverde hit the outside of the post with a low effort from the edge of the box, as Espanyol dug deep to deny Madrid. However, in the 90th minute, Madrid found the goal it needed when former Levante striker Espi, the lowest profile purchase for Los Blancos this summer, capitalized on a loose ball in the box and fired home.

"We carried out our plan well and then let in that goal at the end," said Calatrava.

"That was a gut-punch."

Carrick calm despite United loss, while De Zerbi's big-spending Spurs get thrashed

Manchester United's Matheus Cunha reacts during his side's 2-0 Premier League loss to newly promoted Hull on Saturday. REUTERS

Tottenham Hotspur coach Roberto De Zerbi looks dejected during his side's 3-0 Premier League loss to Brentford on Saturday. REUTERS

Michael Carrick insisted he would not blast his Manchester United flops, despite a dismal 2-0 defeat away to Hull in their opening game of the Premier League season, while big-spending Tottenham slumped to an embarrassing 3-0 away loss to Brentford.

Carrick's side was rocked by first half goals from Semi Ajayi and Nobel Mendy at the MKM Stadium on Saturday.

Hull, which is back in the Premier League for the first time since 2017, was without 10 players due to injury, but still put woeful United to the sword with a vibrant display.

It was a chastening start for United, which many expected to mount a title challenge after finishing third last term.

There was scant evidence that United is capable of going toe to toe with champion Arsenal.

But the stoic Carrick was determined to keep his composure and to avoid the kind of emotional outburst that helped doom his predecessor Ruben Amorim to the sack last season.

"We came here to win, so to not take anything away is hugely disappointing. It is not a nice feeling, but it is not going to change our direction as a team or a club," Carrick said.

"You have to carry on as normal. We just don't all have to shout and scream and create some chaos. Calmness doesn't mean there is not emotion."

United finished the game with 72 percent possession, but it felt like possession without purpose.

Center-back Harry Maguire was among their most threatening attacking outlets.

Bryan Mbeumo forced one of the few meaningful saves from Konstantinos Tzolakis, but Hull's goalkeeper was otherwise little more than a spectator.

Even Marcus Rashford's long-awaited return could not spark a comeback.

Making his first United appearance since December 2024 after his exile under Amorim and loan spells at Aston Villa and Barcelona, Rashford showed flashes of sharpness, but received precious little service.

For Hull, it was a first league victory over United in 52 years.

For Carrick, it was a reminder that momentum is fragile.

Familiar collapse

Tottenham, meanwhile, has splashed out over 200 million pounds ($272 million) in a bid to improve a squad that narrowly avoided relegation to the Championship on the final day of last season.

But Spurs' lavish close-season spending failed to disguise the side's familiar shortcomings.

Roberto De Zerbi gave debuts to four of his new recruits as Sandro Tonali, Andy Robertson, Marcos Senesi and Jan Paul van Hecke all started, while the 85 million-pound Mateus Fernandes came off the bench in the second half.

But Brentford, offered another example of what continuity and smart recruitment can achieve, looking cohesive and confident despite operating on a fraction of Tottenham's budget.

The Bees swarmed west London with a dynamic display that exposed the flaws in the visitor's costly rebuilding plan.

Keane Lewis-Potter and Vitaly Janelt netted for Keith Andrews' side in the first half, before Michael Kayode struck after the interval.

It could have been even worse for Tottenham, as Igor Thiago missed a penalty that would have put Brentford four goals up.

"I am sorry for the defeat. I know we have to improve in our physical condition and the organization. There were many new players, but it was the first game. It's part of our journey," De Zerbi said.

Bolstered by impressive record signing Mamadou Sangare, who set up the second goal for Janelt, Brentford looked capable of surpassing last season's ninth-placed finish.

Spurs, meanwhile, looked bereft of ideas and were comprehensively outplayed and outfought, failing to register a shot on target in the first half.

Italian De Zerbi saved Tottenham from the drop in his seven games in charge last season and has been handsomely backed.

Brazilian winger Savinho is expected to arrive from Manchester City to bolster the attack.

City forward Omar Marmoush is also being pursued.

Yet, however many players Spurs bring in, De Zerbi knows the basics must be addressed to make progress.

"We lost and suffered the difference in the duels. It was the key of this game. We didn't fight in the right way," De Zerbi said.

"Our physical condition was not at the right level for all players, because many came later after the World Cup and there were many new players in the squad and starting lineup.

"But we have to analyze this game better, because we can't play this way in this type of game."

Sage suffers

Pierre Sage, Crystal Palace's new French manager, endured a miserable start in a 2-0 loss at Everton.

Under Sage's predecessor Oliver Glasner, the Eagles won the FA Cup in 2025 and the UEFA Conference League last season.

But Glasner left for Nottingham Forest in the summer, with Sage hired after leading Lens to a second-place finish in Ligue 1 and a French Cup triumph last season.

Kiernan Dewsbury-Hall gave Everton the lead against the run of play in the 42nd minute.

Thierno Barry added to Sage's misery with a bullet header from Iliman Ndiaye's 53rd minute cross.

Xi reiterates China's Mideast peace stance

Importance of two-state solution emphasized at meeting with King Abdullah II of Jordan

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

President Xi Jinping reiterated on Monday China's position on the political settlement of the Middle East issue with the Palestinian question at its core, urging efforts to push for the resumption of talks between Palestine and Israel based on the two-state solution and the early establishment of an independent Palestinian state.

Xi made the remarks during his talks with King of the Hashemite Kingdom of Jordan Abdullah II ibn Al Hussein in Beijing. The Jordanian monarch was on a weeklong state visit to China, which concluded on Monday.

Xi emphasized that China has consistently advocated a comprehensive ceasefire, cessation of hostilities and the resolution of disputes through political and diplomatic means, and it maintains that the sovereignty and security of countries in the region, including Jordan, should be respected.

Noting that the principle of "the Palestinians governing Palestine" must be upheld, Xi said that Palestine is the home of all Palestinians, and this principle should be implemented in advancing the governance of the West Bank and postwar reconstruction of Gaza.

He stressed the need to adhere to humanitarianism, with the international community, especially the United Nations Security Council, taking responsibility for protecting the safety of civilians, ensuring humanitarian aid and preventing humanitarian disasters.

Xi called for upholding fairness and justice, following international law, addressing both symptoms and root causes, and taking pragmatic actions to achieve a comprehensive, just and lasting solution to the Palestinian question at an early date.

China values Jordan's unique and important role in the region and firmly supports it in safeguarding its national sovereignty, security and development interests, he added.

King Abdullah II expressed Jordan's high appreciation for China's fair stance on the Middle East issue as well as its support for the just cause of the Arab states, saying that China's just position is very important to countries in the region.

Jordan is willing to maintain close communication with China and continue making positive efforts to ease the current situation to enable the people of Middle East countries to enjoy peace and prosperity.

Regarding bilateral ties, Xi said that since the establishment of diplomatic relations between China and Jordan, both countries have consistently respected each other, treated each other as equals, and engaged in mutually beneficial cooperation, setting a vivid example of win-win cooperation and mutual learning between small and big countries with different social systems.

In the face of international and regional situations of turmoil and transformation, building a more substantial and dynamic China-Jordan relationship meets the common expectations of the two peoples and aligns with the trend of solidarity and self-strengthening among countries of the Global South, he said.

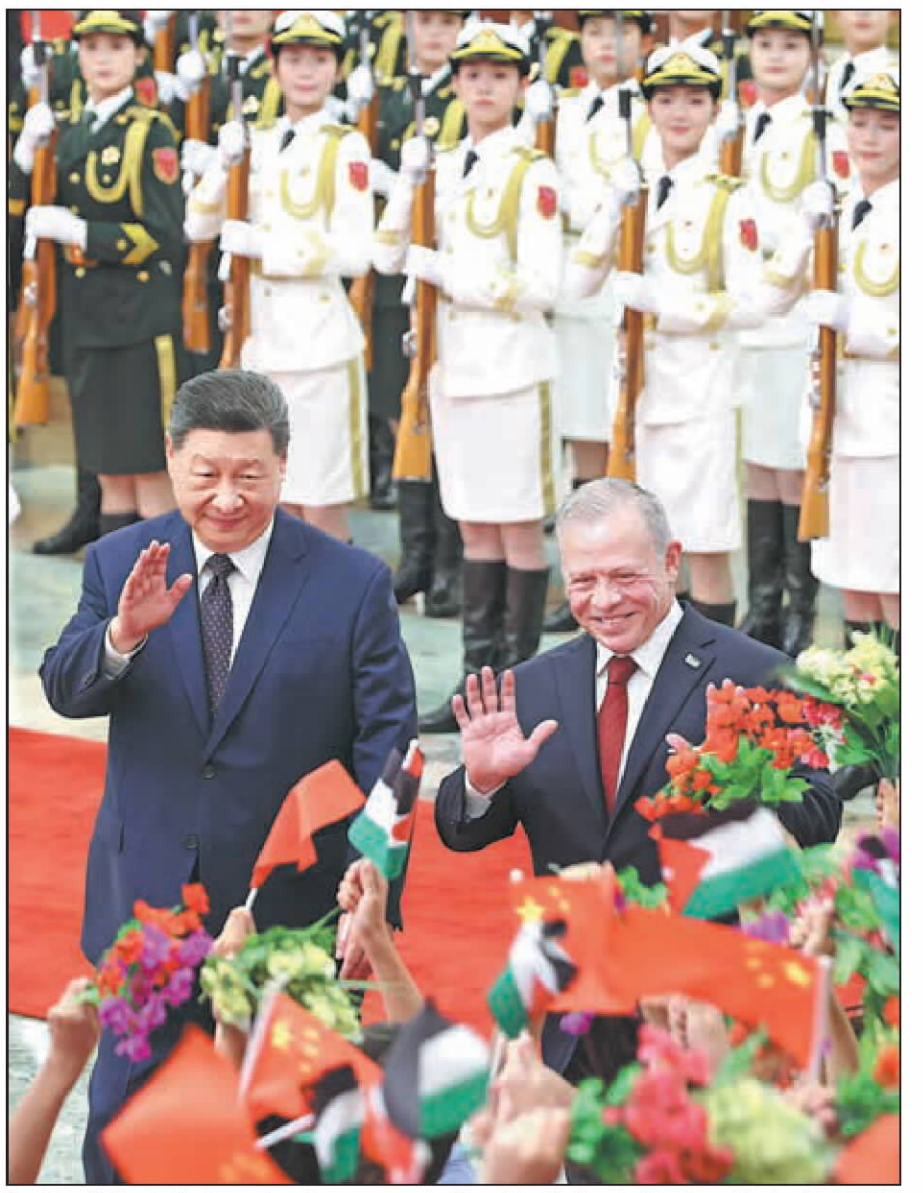
Xi called on both countries to promote their traditional friendship, enhance strategic mutual trust, deepen mutually beneficial cooperation, strengthen multilateral coordination, and push for greater development of the China-Jordan strategic partnership to make positive contributions to regional peace, stability and prosperity.

China is willing to engage with Jordan at all levels of government, parties, legislative bodies and local exchanges, and to strengthen the exchange of governance experiences, he said.

Saying that the nature of China-Jordan cooperation is of mutual benefit and win-win, Xi underlined the need for both sides to further deepen the alignment of their development strategies, strengthen cooperation in traditional fields such as economy and trade, infrastructure construction, transportation and minerals, and expand new growth areas of partnership in digital economy, artificial intelligence and green energy.

China is willing to work with Jordan to implement the four global initiatives, strengthen coordination and cooperation in multilateral institutions such as the UN, jointly uphold an international system with the UN at its core and an international order governed by international law, and promote the building of a community with a shared future for humanity, he said.

King Abdullah II said China is a great country that has achieved remarkable and admirable development accomplishments under the leadership of President Xi.



Jordan firmly adheres to the one-China policy, recognizing Taiwan as part of the Chinese territory, he said.

Noting that Jordan highly values its ties with China, he expressed his country's commitment to deepening cooperation and exchanges in areas such as economy and trade, manufacturing, agriculture, science and technology, medicine, culture and education.

He said that Jordan welcomes more investments from Chinese enterprises to achieve common development and prosperity.

Jordan highly appreciates the four global initiatives proposed by President Xi and looks forward to China playing a more significant leadership role on the world stage, he added.

The two leaders jointly witnessed the signing of multiple cooperation documents in fields such as diplomacy, economy and trade, supply chains and the judiciary. The two sides issued a joint statement on deepening the China-Jordan strategic partnership.

WORLD WATCH
By Zhao Bing

Early action can help better tackle climate challenges

In July 2026, forecasts warned of severe flooding in Bangladesh's Bandarban district. Rather than waiting for conditions to worsen, the United Nations World Food Programme activated anticipatory action and shock-responsive social protection, reaching 75,000 people with cash assistance before flood risks intensified.

The support reached families while they still had time to prepare — helping them meet immediate needs, protect livelihoods and avoid falling deeper into crisis. This is the promise of anticipatory action: turning early warning into early response. The forecast could not stop the flooding, but it gave people power over their fear. It gave them time to act instead of just waiting.

The need to act early has never been more urgent. An estimated 645 million people faced hunger worldwide in 2025. Conflict, economic shocks and displacement continue to drive food insecurity in many of the world's most vulnerable countries, while the escalating crisis in the Middle East is adding further pressure through disruptions to trade, energy and food markets.

Against this already fragile backdrop, extreme weather is accelerating food insecurity. In 2025 alone, weather extremes were the primary driver of acute food insecurity in 16 countries and territories, affecting 87.5 million people.

The risks keep rising. A strong El Nino is developing, bringing the prospect of above-normal temperatures and shifting rainfall patterns, with greater drought risks in some regions and heavier flooding in others. For millions of smallholder farmers, these are not distant threats. They show up in stressed water supplies, uncertain planting seasons and growing concern over future harvests, which translate into heightened hunger risk. WFP's early analysis projects that this El Nino could push at least 49 million more people into acute food insecurity by the end of 2027.

But climate hazards differ from many other crises in one important respect: Increasingly, we can see them coming.

Advances in forecasting and early-warning systems give us days, weeks or sometimes months to prepare.

Chipmaker's turnaround shows resilience

By **MA SI**
masi@chinadaily.com.cn

Nexperia China's remarkable turnaround from a Dutch-imposed supply cutoff to successful local production in less than 11 months highlights the resilience of China's semiconductor industrial chain amid mounting challenges, said corporate executives and experts.

Their remarks came as Nexperia China held a global product launch on Sunday afternoon in Shanghai, marking the first collective public appearance of the company's core management team since it was lobbed into a crisis late last year.

"We are back!" said John Chang, CEO of Nexperia China, adding that the company is now approaching 100 percent local semiconductor production.

In October 2025, the Netherlands government intervened in the operations of Nexperia, a chipmaker owned by Chinese company Wingtech Technology, citing "national security" concerns. The intervention resulted in the sidelining of Wingtech. Weeks later, Nexperia's Dutch headquarters halted wafer supplies to the plant in China.

"Wafer supply was cut off. Systems went offline. Data from the overseas headquarters became inaccessible. We had orders, clients and trust — but no wafers to process," Chang recalled.

To overcome the challenge, Nexperia China made three crucial changes, the company said at Sunday's event.

First, it successfully spun off the China unit from the overseas Dutch headquarters to establish a fully independent operating system. Second, it secured local wafer suppliers and rebuilt a controllable supply chain. And third, by leveraging the 12-inch wafer platform of its strategic Chinese partners, it achieved a huge upgrade from 6-inch and 8-inch wafers to 12-inch process technologies.

The Nexperia plants in Europe are still mainly running on 6-inch and 8-inch wafers, but Nexperia China has achieved mass production on the 12-inch platform, Chang noted.

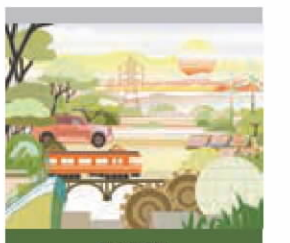
BEAT THE HEAT WITH A COOL ADDITION TO YOUR WARDROBE

High-tech vests are finding new fans among outdoor enthusiasts and workers in the sweltering summer months

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn



Summer is nearly over, but the heat hasn't loosened its grip. As the last of the season's hot days linger on, the battle against high temperatures has moved beyond sunscreen and iced drinks. For campers trekking mountain trails, cyclists logging long rides and anglers spending hours under the sun, a new piece of wearable technology is drawing attention: the cooling vest.

"It's like wearing a small electric fan inside your clothes," said an outdoor enthusiast surnamed Luo, who shared his experience on Chinese lifestyle platform Xiaohongshu, also known as RedNote, after wearing one while cycling. "As long as it's below 35 C, it works well. It's not an air-conditioner, but when you're moving around in this furnace-like weather, even a constant breeze makes a huge difference."

His experience reflects a growing market for wearable cooling technologies. The trend is emerging alongside the country's booming outdoor economy. Since 2019, participation in hiking, camping, cycling, trail running and fishing has surged.

Chris Sheng, founder of outdoor gear retailer Nomad Union, said: "In Zhejiang province, where our company is based, outdoor activities are almost suspended for nearly two months every summer because of the heat. These cooling vests borrow technology originally developed for industrial workers and adapt it for outdoor recreation, making summer activities much more comfortable."

Lights, camera, tractors!

From short-drama videos to immersive performances and field poetry, rural communities are being energized through numerous cultural art forms

By ZHAO RUIXUE
in Linyi, Shandong
zhaoruixue@chinadaily.com.cn

During the recent summer vacation, visitors followed local villagers along ancient lanes in Yinan county, Shandong province, joining a "supply team" bound for the front line.

The immersive *Retrace the Frontline Supply Route* performance in Changshanzhuang village was not staged in a theater. Instead, it took place in the same locations locals once hauled supplies along to support frontline troops during the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

Since its launch in October 2024, the performance has drawn tens of thousands of visitors.

"This is completely different from anything we've done before," said Sun Fangchao, a tourist from Jiangsu province.

"I think he'll be thrilled about this for a very long time," he said while watching his 11-year-old son who moved along with the performance troupe.

For the show's creators, that emotional response is the point of its unique staging. Yinan county is famous for the Yimeng Spirit forged by ordinary villagers who risked their lives to support the Communist forces through extraordinary sacrifice during the war against Japanese aggression and the War of Liberation (1946-49).

The county has over 20 immersive Yimeng Spirit-themed performances, turning cultural tourism from a sightseeing experience into participatory education, according to the local government. The performers are villagers who know the heroic stories very well.

Ma Junling, 35, became a performer this year. Before then, she had worked as a tour guide in her village, explaining the Yimeng Spirit to visitors.

"Our village often receives groups of students on study tours. They are young and have limited understanding. A simple lecture couldn't hold their attention, but the live performances bring the stories to life and help children better understand the history and culture," Ma said.

Changshanzhuang is far from an isolated case. Across Shandong, grassroots cultural creativity is flourishing through immersive performances, verses composed by farmers, and rural micro-dramas filmed on mobile phones.

Ordinary farmers are picking up pens, smartphones, and scripts, becoming poets, actors and dramatists.

Storytellers

Changshanzhuang is the home of the Red Sisters, a group of local women who took care of the wounded soldiers and in some cases sacrificed their lives to protect them during the wars. They forged a major part of the Yimeng Spirit.

To honor their stories and promote the Yimeng Spirit, a Red Sisters Hometown Tourism Area has been established in the village.

Short folk performances are staged in old courtyards, bringing these stories to life, and the performers are villagers who have lived in the area their entire lives.

Yang Suhua, 63, from a neighboring village, used to spend her days doing housework and tending a small vegetable plot.

Two years ago, she became one of the most popular performers. Now she plays the role of an elderly cotton weaver in a show about the women's rescue association, a grassroots organization that supported the Communist revolution in the 1940s.

"I grew up hearing the heroic stories of the local women. I am so happy to tell their stories to more people through these small-scale plays," Yang said.

Villagers transform oral histories passed down from their ancestors into scripts, using relatable language and gestures that ordinary people can understand.

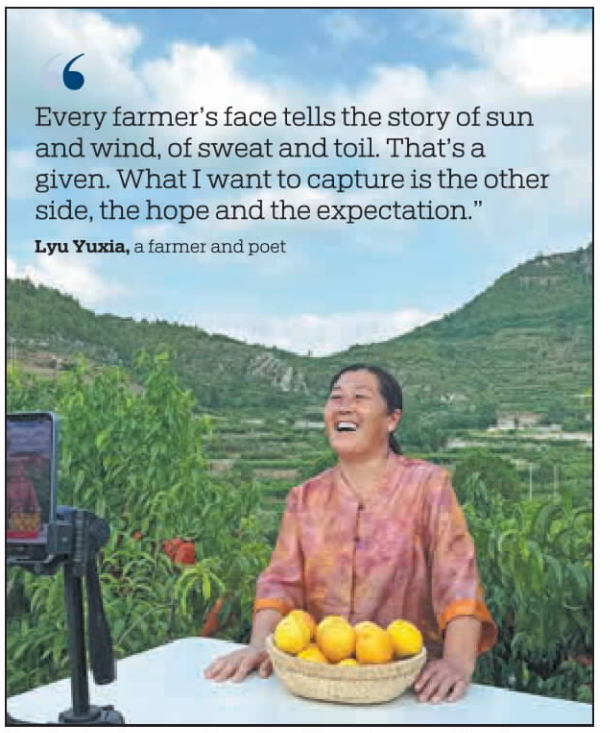
Li Xipeng, head of the Red Sisters Hometown Tourism Area, said the village's authenticity is key to the performances' appeal. "These houses and these lanes witnessed the actual events. They are the best textbook we could ever have," he said.

More than a dozen small farmyards have been turned into performance spaces. In one courtyard stands a small stone house with two dark narrow rooms. This is where Liu Naixiu, 73, once lived with her family of five.

"We were all squeezed in here. The house has barely changed from what it was back then. Now we've moved to a two-story home just 1 kilometer from this village," she said.

The places that best preserve the original feel of the period have also been used as film sets. Since 2007, over 500 film and television productions have been shot here, including *Six Sisters in the War*, *Red Sorghum* and *This Thriving Land*.

Liu was among the first villagers to join the film productions. "I've lost count of how many shows I've been in. Sometimes a crew member calls me directly and tells me that he needs 20 people for extras. I happily run from house to house, rounding up neighbors," she said.



Over the years, more than 30,000 villagers have performed as extras in film and television productions in the area. For many families, this part-time work has become a supplement to their farming income.

The rural cultural boom has brought economic ripple effects. More than 100 businesses have emerged around the scenic area, offering catering, farm stays, produce sales, and handcrafts.

"We used to worry about how to sell our produce," said a local farmer who grows vegetables and fruits on the hillside. "Now tourists come to us. They watch the shows, walk through the village, and buy local farm produce," he said.

The scenic area has partnered with villages around the area, integrating rural vitalization and tourism development. To date, more than 600 people from surrounding villages have worked in the scenic area.

> "Every farmer's face tells the story of sun and wind, of sweat and toil. That's a given. What I want to capture is the other side, the hope and the expectation."
>
> **Lyu Yuxia,** a farmer and poet

Lyu Yuxia, a farmer and poet from Mengyin county, Shandong, livestreams from her peach orchard, selling her own peaches and those of her fellow villagers. PROVIDED TO CHINA DAILY

Tourists buy local farm produce while they visit Changshanzhuang village. ZHENG SHUPING / FOR CHINA DAILY

"This is what it looks like when culture grows from the soil, not as something delivered from above, but as something that sprouts from the land itself," Li said.

Leave it to the prose

Not far away, in Mengyin county, another form of rural creativity is taking root in a farmer's notebook.

Lyu Yuxia, 54, is known online as Yimeng Second Sister, a name she uses because she is the second child in her family.

With calloused hands and a sun-weathered face, she has gained unexpected attention online for her poems. "I'm just an ordinary farmer, but words have always been with me," she said.

In the spring of 2023, Lyu walked up a mountain to pick Chinese toon sprouts. She looked out over a sea of blooming peach blossoms across the terraced hillsides.

The sight moved her deeply. She took out her phone, held up a bunch of toon sprouts, and recited a poem she had written in her notebook. That video, posted on Douyin, gained 100,000 followers in one week.

Several of her poems written, recited and recorded in the fields quickly gained widespread popularity online. In one of them, she compared the falling snow to icing sugar and salt sprinkled from the sky.

"I was a 50-something farm woman with wrinkles all over my face, feeling insecure at first," she recalled. "Now I am confident. Poetry gave me the courage to be myself."

Some online commenters have questioned whether her poetic portrayal of rural life is too idyllic and doesn't show the hardship of farming.

"Doesn't the hardship show right here?" she said, pointing at her weathered face.

"Every farmer's face tells the story of sun and wind, of sweat and toil. That's a given. What I want to capture is the other side, the hope and the expectation," she added.

"Every spring, we plow the soil, we plant the seeds. We don't know if the weather will favor us. But the moment we put those seeds in the ground, we are hoping for a good harvest.

"This is the faith in tomorrow. I write to celebrate that achievement," she said.

Her connection to literature began early. When she was very young, her father often told her stories.

At 15, she went to work in a textile factory. To block out the drone of the machinery, she recalled poems she had memorized, including those written by Li Bai, Su Dongpo, and even the elegy from *Dream of the Red Chamber*.

She bought magazines and filled notebooks with excerpts and original verses. "My world was too small. But through sharing online, my world got wider and wider. The beautiful words that netizens leave in my comments are as joyful to me as reading a good book," she said.

Lyu has started livestreaming from her orchard, selling not only her peaches but also helping fellow villagers market their produce. On the busiest days, she livestreams for nine hours straight, sometimes skipping meals.

"When I see the orders pile up and help people sell their goods, there's nothing happier than that," she said.

Playing up sales

In Beiliangjia, a village of just 247 households in the Qingdao West Coast New Area, farmers with no acting experience are using their phones to make short dramas that have racked up over 1 billion views.

Before they changed tack, they struggled to sell their produce.

"The village is not short of good produce. We grow sweet chestnuts, sticky sweet potatoes and big juicy cherries," said Zhang Wei, the village Party secretary. "The problem has always been selling them."

In the summer of 2025, Zhang reached out to Ding Zhaoting, an influencer from a neighboring town. Ding had previously run a building materials business before pivoting to online content creation six years ago. He now manages several accounts with millions of followers.

Zhang said the villagers agreed to use short dramas to sell their produce. Ding became the director and recruited about a dozen villagers.

He taught them the basics of filming, editing, and livestreaming. The villagers threw themselves into the new challenge.

In September 2025, the village's first short drama was released. It told the story of a rural woman who joins a poor family and, through hard work and wisdom, gradually leads them to a happy life. In just over a month, the series had garnered 270 million views.

The momentum built. Subsequent dramas each attracted over 100 million views.

In the dramas, village produce is a feature, with corn hanging on walls, chestnuts piled by stoves, and unpicked cherries glistening with dew. Viewers see these products in attractive settings and want to buy them.

Zhang Zhixing, 75, was among the first to benefit. He had three *mu* (0.2 hectares) of hawthorn trees. But at his age, he could no longer harvest the fruit, and they were rotting on the branches.

A few cast members heard about his situation, went to his orchard, and filmed videos and livestreams. Within days, his hawthorns were sold out.

The online traffic also caught the attention of investors. Local Ding Xinqiang stumbled upon the village's short dramas online. "The people and the stories are so real and trustworthy," he said.

He contacted Zhang Wei and said he wanted to invest in the area. Within a week, a sweet potato starch noodle processing plant was up and running, receiving an initial order of 25 metric tons. More projects followed, including dried sweet potato snacks, pet food, and cultural tourism.

Yu Xiaofeng, an associate professor at Shandong University's journalism and communication school, who has studied the phenomenon, sees it as part of a broader trend.

"In the context of the rise of new mass culture, farmers have become creators. They are telling their own stories," Yu said.

"The entire creative process is intimately connected to their lives, which gives them a tremendous sense of pride. This is the core manifestation of farmer identity, and the best expression of cultural confidence," she said.

Yu visited villages and observed the transformation firsthand.

"When I first saw the villagers, they were nervous and shy in front of the camera. But then, seeing all the likes they received online and the growing number of visitors coming to their village, they became confident and outgoing. They actively participate in village construction, voluntarily shoot short videos to promote their hometown, and take pride in its natural beauty and intangible cultural heritage. Their cultural identity is growing stronger," she said.

TOP NEWS

Iran threatens to halt exports of oil from gulf

Strait of Hormuz tensions mount as diplomacy stalls and sanctions loom

By **CUI HAIPEI** in Dubai, UAE and **JAN YUMUL** in Hong Kong

As the United States readied to unveil crippling new sanctions against Iran on Monday, in a bid to sever the country's economic lifelines following months of protracted yet inconclusive warfare, Tehran threatened to halt all oil exports from the Persian Gulf.

For weeks, both sides have refrained from launching military strikes against one another, though negotiations to end the six-month-old conflict remain stalled.

Mohsen Rezaei, secretary of Iran's Supreme National Security Council, warned in a social media post that "If the economic war continues, not a single drop of oil will be exported, neither through the Strait of Hormuz nor from anywhere in the Gulf."

All eyes are now on US Treasury Secretary Scott Bessent, who is scheduled to elaborate on Washington's intensified pressure campaign during a news conference at 1 pm local time on Monday.

"At dawn begins an economic D-Day — the single greatest financial offensive ever marshaled against an adversary," Bessent wrote in a Sunday opinion piece published in the Financial Times.

Iranian Foreign Ministry spokesman Esmaeil Baghaei retaliated by stating that Iran will never yield to external coercive conditions. "Washington's insistence on failed tactics proves nothing but its hostility toward the Iranian people," he said.

The conflict has killed thousands of people, mostly in Iran and Lebanon, and inflicted severe economic losses. Despite the killing of supreme leader Ayatollah Ali Khamenei, Iran still retains enough military capability to attack targets in neighboring nations and threaten oil tankers in the Strait of Hormuz, bringing shipping in the key waterway to a near standstill and placing global fuel prices under pressure.

The exact stage of Iran's nuclear program, which the US and Israel aim to wipe out, remains unknown. Without detailing specific measures, Bessent signaled the US would target "fearful nations" that practice "appeasement" by engaging with Iran's economy and financial system.

"They would do well to consider the consequences of sustaining it," he wrote.

On Monday, Brent crude futures dropped more than 1 percent to $93.45 a barrel, with US oil futures also falling more than 1 percent to $86.14 a barrel, Reuters reported.

Iranian Foreign Minister Seyed Abbas Araghchi on Sunday dismissed the renewed US threats as an "old bullying tactic", saying that Washington has no choice but to speak respectfully to the Iranian nation, state broadcaster Islamic Republic of Iran Broadcasting reported.

Also on Sunday, the Iranian parliament's National Security and Foreign Policy Commission approved Article 3 under its Strategic Action Plan to Ensure the Security and Development of the Strait of Hormuz. The provision mandates service fees for all eligible vessels transiting the strategic waterway under Iranian jurisdiction.

Hassan Qashqavi, the commission's spokesman, said the fees would be collected from vessels belonging to countries permitted to pass through the strait and paid in Iranian rials or another currency designated by Tehran, Iran's state-run Islamic Republic News Agency reported.

Iran's newly established Persian Gulf Strait Authority has issued fresh regulatory warnings, saying that 45 vessels found violating transit rules will face penalties including fines, detention and confiscation.

The US and Iran signed a memorandum of understanding on June 18, covering conflicts across the Middle East including Lebanon. The 60-day negotiation window stipulated in the deal expired last week, leaving prospects of a final settlement uncertain.

With formal US-Iran face-to-face talks suspended since the last round held in Switzerland in June, regional mediators including Qatar, Pakistan and Turkiye have continued diplomatic efforts.

Pakistan's Chief of Army Staff Field Marshal Syed Asim Munir arrived in Tehran on Monday. Baghaei confirmed in a Sunday statement that Munir's visit comes as part of Pakistan's sustained efforts to advance regional peace and stability.

Omani Foreign Minister Sayyid Badr bin Hamad Al Busaidi will also travel to Tehran on Tuesday for in-depth consultations with Iranian officials over security and maritime rules in the Strait of Hormuz, Iran's Foreign Ministry announced.

In a separate development, Iranian Petroleum Minister Mohsen Paknejad told state television on Sunday that a newly discovered onshore gas field in southern Fars province holds over 200 billion cubic meters of total reserves, and over 160 billion cubic meters could be extracted from the field.

Agencies and Xinhua contributed to this story.

Searching for survivors

Residents and rescuers use an excavator to search for victims on Sunday after a landslide occurred at a dumpsite overnight in Conakry, the capital of Guinea. Heavy rains caused a large mound of rubbish to collapse, killing at least 30 people and injuring six others. AFP

Crises: Sharing practical experience holds key

From page 1

The real test is whether that information reaches people who need it and is translated into action before it is too late.

Early warning is most valuable when it leads to action.

Anticipatory action takes the next step by linking forecasts to pre-agreed triggers, financing and practical solutions before disaster strikes. That could mean providing cash assistance before markets become inaccessible, protecting livestock and crops before droughts or floods hit, and strengthening social protection systems so assistance can be scaled up quickly.

For vulnerable families, acting before there is a crisis can mean the difference between protecting their livelihoods and losing assets that may take years to rebuild. Evidence shows that every $1 invested in anticipatory action returns up to $7 in avoided losses and additional benefits.

WFP is increasingly putting this approach into practice at scale. In 2025, more than $35 million was released ahead of disasters, supporting over 1.2 million people with anticipatory assistance, while more than 15 million people received early-warning information.

This is what anticipatory action makes possible: a forecast becomes a decision, a decision unlocks resources, and assistance reaches people before a hazard becomes a disaster.

As countries seek to strengthen these systems, international cooperation and the sharing of practical experience are becoming increasingly important.

China's experience offers a powerful example of what sustained investment in agriculture, technology and disaster readiness can achieve. Its growing strengths in meteorology, satellites and artificial intelligence are creating opportunities to strengthen early warning and preparedness beyond its borders.

One promising example is MAZU, an AI-powered meteorological warning system that combines advanced forecasting technologies with international cooperation to make climate information more accessible and actionable for all. Through South-South and Triangular Cooperation, solutions such as MAZU can help countries across the Global South strengthen their preparedness and build resilience in ways that reflect their own risks, institutions and priorities.

The WFP Centre of Excellence for Rural Transformation in China provides an established platform for this exchange. Since 2016, it has connected China's experience with developing countries through policy dialogue, technical cooperation and practical knowledge sharing on food security, agricultural transformation and climate resilience.

China's domestic experience also offers relevant lessons. In Jilin province, for example, WFP worked with local authorities on an integrated risk-management project for maize farmers. By combining precision agriculture, digital tools and an innovative "Insurance + Futures" solution, the initiative helped farmers better manage both production and market risks while using natural resources more efficiently.

By connecting innovations such as MAZU with practical field experience such as that in Jilin, the WFP center can continue to bridge China's expertise with global demand — adapting solutions to local contexts and turning preparedness into lasting resilience.

Preparedness cannot eliminate climate shocks, but it can change what happens when they arrive. Making it work, however, is a shared responsibility. Governments, international organizations, research institutions, development banks, technology companies and local communities all have a role to play.

It means investing in better forecasting and early-warning systems, but also in the mechanisms that turn warnings into action: pre-arranged financing, responsive social protection, local readiness and the capacity of communities and institutions to act quickly.

Over time, these sustained investments do more than reduce the impact of a single drought or flood. They protect livelihoods, safeguard development gains, reduce repeated losses and setbacks, and build long-term resilience so that communities are able to withstand tomorrow's shocks without losing ground today.

The future of food security will not be determined by climate hazards alone. It will also depend on our collective ability to anticipate risks, act before losses mount and invest in the resilience communities need to thrive, no matter what the weather brings.

Chips: Company improves production capacity, quality

From page 1

"This represents a comprehensive leap in both production capacity and quality," Chang said.

According to the company, the 12-inch wafer platform has helped slash product iteration cycles from 36 months to just nine to 12 months. "Nexperia China achieving independent operations is not about confronting anyone; it is about protecting those we serve. To our customers, choosing Nexperia China means no more supply worries," Chang added.

In February this year, China urged the Netherlands to create favorable conditions to help Nexperia settle its internal disputes as soon as possible and to help maintain the stability of global industrial and supply chains. In July, the two sides agreed to facilitate the resolution of business disputes through consultations.

Hurdles notwithstanding, Nexperia China delivered over 40 billion chips to thousands of global customers with zero quality incidents over the past 11 months.

He Hui, semiconductor research director at the United Kingdom-based tech research company Omdia, said on Monday that China's semiconductor industrial chain has made significant progress in recent years, which can serve as a crucial backup for Chinese companies during emergencies and help them stabilize their supply chains. "More efforts are still needed to achieve breakthroughs in some key technologies," she added.

Wang Wen, dean of Renmin University of China's Chongyang Institute for Financial Studies, said the Nexperia incident shows once again that the semiconductor industry, by its very nature, is a globalized sector.

"Camp-based or politicized intervention will only fracture supply chains and send costs soaring," Wang said. "Only by reducing non-market intervention can we truly advance global technological progress and ensure that its benefits are universally shared."

Tech: Cooling vests creating niche market

From page 1

For manufacturers, wearable cooling equipment is becoming a fast-growing niche at the intersection of outdoor gear, consumer electronics and climate adaptation.

One of the latest entrants is Esguard, based in Pinghu, Zhejiang, one of China's largest outdoor apparel manufacturing hubs. The company has developed a cooling vest that combines ventilation with semiconductor cooling tech, lowering the perceived temperature by 8 C to 15 C, the company said.

Unlike conventional fan vests that simply circulate ambient air, Esguard's design integrates two semiconductor cooling modules with dual fans mounted on the back of the garment. Air is drawn into the vest, cooled by the modules and then circulated around the body, delivering what the company calls an "air-conditioning effect".

Powered by a 20,000 mAh battery pack, the vest can operate for up to 12 hours on its lowest setting, making it suitable for a full working day or extended trips.

"We wanted to move beyond simply blowing hot air around," said Fang Xiaodong, general manager of Esguard. "The goal was to create a wearable cooling system that people can genuinely rely on outdoors."

The company began developing the product in March after anticipating rising global demand for heat relief technologies. Working with university researchers, it has already begun exporting the vests to the United Arab Emirates, Saudi Arabia, Japan and South Korea.

Sanitation workers show their cooling vests on July 31 in Nanjing, Jiangsu province. PROVIDED TO CHINA DAILY

The technology is also finding a growing customer base among frontline workers. In Nanjing, Jiangsu province, where summer temperatures frequently exceed 35 C, sanitation workers were among the first to test the vests. Since mid-July, more than 20 cooling vests have been deployed across the city.

"It's much more comfortable," sanitation worker Zhu Wenxian told Workers' Daily. "I'm sweating much less, and I don't feel as irritable after working outside."

Another sanitation worker, Liu Fali, said the airflow has made long shifts noticeably easier. "My back stays dry now," he said.

Delivery companies are also embracing the tech. In Xuchang, Henan province, local franchisees of ZTO Express have equipped more than 100 couriers with cooling vests to help them cope with the summer of prolonged extreme heat.

Greening of desert hailed by US friend

By **WANG SONGSONG** in Ordos, Inner Mongolia and **YUAN HUI** in Hohhot

Ronald Sakolsky, a retired teacher from the United States, returned to the home of China's afforestation hero Yin Yuzhen on Monday in Uxin Banner, Ordos, Inner Mongolia autonomous region, 26 years after his first visit, and found the once-barren dunes transformed into a thriving forest — a living testament to perseverance that he says must be passed on to younger generations.

Sakolsky walked through Yin's desert ecological garden, appreciated fresh vegetables and fruits grown in the sandy soil, and visited her new home, which was a far cry from the tiny shelter she once shared with her family.

"From a one-bedroom sand shanty to this? You deserve every centimeter of this house," Sakolsky told Yin, gesturing at her home.

Yin has spent decades battling desertification on this land. What was once a wasteland is now her life's work — a thriving oasis attracting visitors from around the world.

Over the course of 41 years, she and her family have planted 8 million trees, literally one shovel at a time, turning more than 4,660 hectares of desert into an oasis, Inner Mongolia TV reported.

But Sakolsky was not just any visitor. He was an old friend — and, in a small but meaningful way, a part of this story.

Sakolsky made his first visit to this remote desert area in 2000.

Having been in China for two months at that time as a teacher taking part in a China-US teachers exchange program, Sakolsky was moved by a report on Yin's struggle. "I saw her story on TV and started to cry," said Sakolsky.

Together with another of his Chinese friends — Bai Fan, the former vice-principal of Luoyang Foreign Language School in Henan province, where he worked as an English teacher from 1999 to 2000, Sakolsky went to Uxin Banner for the first time.

He also made a quiet gesture of kindness — a $5,000 donation that helped Yin keep planting trees. "One act of kindness, no matter how small, never waste it," Sakolsky said.

Bai, who is now Party secretary and general principal of Luoyang No 2 Foreign Language School Education Group, again accompanied Sakolsky to the site of their shared memories.

Bai recalled how different things were back then. "It was all sand," he said. "Now it looks like a big garden and orchard. It's stunning."

Sakolsky, now in his late 60s, reflected on the deeper meaning of the transformation. "I still believe, 27 years later, that this story was written in heaven and that I am just an actor in the play. And today is just another chapter. But the story is not over — that's for all of you to tell people."

He urged more people to contribute to environmental and people-to-people ties. "More people need to do more for China and America. Even a small amount can become a forest."

Speaking of US-China relations, Sakolsky struck a personal note. "All Americans need to realize that Chinese and Americans can be family. We can get over the differences if we focus on the similarities."

For Yin, the visit was a moment of quiet pride. She showed her guests the fruits of her labor and smiled as Sakolsky repeated his long-held belief: "If you take care of the Earth, it will reward you."

Nepal's safaris caught between animal welfare and livelihoods

Mahouts ride elephants during the Elephant Festival in Sauraha, Chitwan, Nepal, on Dec 27. AMBIR TOLANG VIA GETTY IMAGES

Sauraha, a major tourist destination in Chitwan, Nepal, has long been synonymous with elephant safaris. For decades, foreign and domestic tourists visiting Sauraha, adjacent to Chitwan National Park, have mounted elephants to traverse the buffer zone's community forests in search of rare wildlife.

However, the local entrepreneurs who have privately owned and domesticated elephants are worried about a recent Supreme Court verdict. They express their concerns, stating that the future of the iconic practice of elephant safaris is in jeopardy. They argue an abrupt halt to elephant safaris could devastate the local economy, tourism and harm the animals themselves.

Private elephant owners in Sauraha express readiness to shift toward ethical alternatives, such as elephant-friendly sanctuaries and bushwalks, but contend that a sudden ban is impractical. They are urging authorities to phase out elephants gradually so that owners have time to adjust their businesses and protect livelihoods.

The delicate issue dominated discussions on Aug 12 during the 15th World Elephant Day celebration in Sauraha, where stakeholders gathered for an "Elephant Picnic" organized in the neighboring Baghmara buffer zone community forest.

"We are prepared to transition to a sanctuary model as envisioned by the court, but it cannot happen overnight," said Dipendra Khatiwada, the president of the United Elephant Management Cooperative Limited.

"We are not in favor of stopping elephant safaris at once. We should instead pursue a dual-track approach: allow fit, working-age elephants to continue safaris for a few more years, while creating dedicated sanctuaries for elderly, sick, or disabled elephants and integrating them into tourism activities that do not disturb nature and local communities."

The high-profile legal dispute stems from a petition filed in 2021. The petitioners demanded an end to animal cruelty, better recordkeeping to curb illegal trading, a prohibition on chaining, and a complete phaseout of elephant rides in favor of observation-only tourism.

On Dec 17 last year, the Supreme Court ruled in favor of animal welfare reforms. The full text verdict was recently uploaded to the Supreme Court's website, laying out comprehensive guidelines for elephant conservation and directing the government to seek alternatives to riding safaris.

"The anatomical structure of an elephant's spine, legs, and body is not evolved to carry human passengers," the court noted in the verdict. "Subjecting these animals to heavy loads and continuous circular tours causes severe physical stress, foot rot, and joint ailments. Using an elephant merely as a tool for human entertainment contradicts our legal duty to respect its intrinsic worth and welfare as a living biological entity."

The justices also instructed the government to establish clear legal policies transitioning Nepal toward ethical ecotourism, drawing upon international precedents such as "elephant bushwalks" and observation platforms that maintain a safe distance between visitors and animals.

In the verdict, the Supreme Court has directed the government and agencies concerned to make the registration and management of privately owned and domesticated elephants more systematic.

Under the regulation on the control of international trade of endangered wildlife and plants, all such elephants must be registered and properly documented. Authorities must identify unregistered elephants and take action under existing laws. Any transfer of ownership, sale, purchase or movement of elephants must also be subject to legal approval and proper recordkeeping.

The court has also called for stronger measures to control the illegal trade and cross-border smuggling of elephants.

Security agencies, forest authorities and conservation bodies should coordinate effectively, particularly along the Nepal-India border, and maintain special surveillance. Individuals or organizations involved in the illegal sale, transportation or smuggling of elephants should be investigated and prosecuted in accordance with the law.

On elephant welfare, the court has ordered authorities to prevent torture, violence and other forms of inhumane treatment. It has called for scientific and animal-friendly methods of elephant management and urged that tourism involving elephants be made more welfare-friendly.

Handlers and caretakers should receive training in elephant-friendly practices, while proper treatment and protection should be ensured for sick and aging elephants. The court has also called for the establishment of elephant retirement and rehabilitation centers.

The court has directed authorities to move toward a more natural system of keeping privately owned elephants.

According to the court, elephants should be provided with open and natural surroundings, while management plans should take into account possible conflicts between people and elephants, as well as between wild and domesticated elephants.

The court has further called for ethical elephant sanctuaries where tourists can observe elephants only from a safe distance rather than ride or directly interact with them. The practice of keeping elephants unnecessarily chained, whether for training or other purposes, should be ended. Authorities have been asked to develop and implement policies and action plans to make elephant conservation centers and management systems more scientific and welfare-oriented.

The verdict also calls for better coordination among all agencies involved in elephant conservation and management. Regular monitoring of conservation activities should be carried out, and clear standards for the management of privately owned elephants should be developed and enforced.

Job displacement

The local operators argue that forcing an immediate shutdown without a transitional safety net would lead to financial ruin and widespread job displacement.

A single adult elephant commands a market price between Rs10 million (about $65,360) and Rs15 million, while monthly maintenance, feed and healthcare costs range from Rs100,000 to Rs120,000. Each animal requires at least two full-time handlers: one to manage feeding and grooming and another to handle movement and general care.

"If owners are forbidden from offering safaris, who will pay to feed and care for these massive animals?" said Dipendra, who previously owned two elephants but now retains only one.

"Following the COVID-19 pandemic, when tourism collapsed, many owners were forced to sell their animals to buyers in India. In Sauraha, private elephant numbers dropped from 90 to around 45 today. A sudden ban without financial support will lead to complete abandonment."

The looming ban has cast a shadow over the lives of local handlers, or mahouts.

Jayalal Das, 48, a mahout from Rautahat who cares for an elephant, relies entirely on his income to support his six-member family. His grandfather was a mahout, and Das has spent 18 years in Sauraha driving tourist safaris.

"I do not know any other skilled work," said Das. "If safaris close down tomorrow, I will have no way to feed my four children."

Nandalal Sah, who also handles an elephant, shared similar worries, adding, "If there are no elephants left to ride, I will have no choice but to do manual labor."

THE KATHMANDU POST, NEPAL

Seoul's Incheon takes lead as busiest intl airport

SEOUL — Incheon Airport overtook London Heathrow and Singapore Changi to become the world's busiest international passenger hub in the first half of the year, reaching the top just 25 years after opening, latest data showed in August.

Incheon handled 38.39 million international passengers over the six months, according to preliminary data covering 1,234 airports compiled by Airports Council International. The airport has risen steadily from 10th place in 2002 to fifth in 2018 and third in 2024.

Heathrow ranked second with 37.79 million international passengers, followed by Changi with 34.53 million. Dubai Airport, which had long vied with Heathrow for the top spot, is expected to fall outside the top five.

According to Incheon International Airport Corporation, or IIAC, Incheon's new title solidifies its standing as a top-tier global hub airport.

The airport also surpassed 1 billion cumulative passengers just over 25 years after opening, faster than any other major international airport.

The reordering owes as much to shifting geopolitics as to Incheon's own momentum.

The conflict between the US and Iran choked off transfer traffic through Middle Eastern hubs, diverting travelers to Incheon instead. Transfer passengers climbed 18.1 percent from a year earlier to 4.24 million, while European transfer traffic soared 63.2 percent.

Inbound visitors have also poured into South Korea, led largely by tourists from China and Japan. Foreigners made up 44.4 percent of Incheon's overall passenger traffic in the second quarter, a record high and up from 39.5 percent a year earlier.

The broader traffic base rests on the airport's four phases of expansion, completed in November 2024.

The buildout gave Incheon capacity for 106 million annual international passengers, the world's third-largest, trailing only China's Hong Kong and the UAE's Dubai. Incheon now connects 183 cities across 53 countries through 101 carriers.

As South Korea's gateway airport, IIAC said it has long supported major national events and government policy, and is now investing in artificial intelligence and urban air mobility infrastructure, in step with the government's goal of 30 million inbound tourists.

THE KOREA HERALD, SOUTH KOREA

Forum calls for measures to help ASEAN tackle climate change

Climate resilience has stopped being an environmental issue and become an economic one, experts said. When 35 percent of a year's rainfall falls within a single week, as it did in parts of Thailand last year, the failure is not simply meteorological. It is a failure of design, of coordination, and of economics.

That was the argument advanced at a CAsean Forum 2026 panel on "Strengthening ASEAN's Physical Resilience", held in Bangkok in August, where experts said Southeast Asia's climate exposure is no longer a side issue for environment ministries but a direct threat to the region's economic competitiveness.

Witaya Wannasuphoprasit, dean of engineering at Chulalongkorn University, framed Thailand's exposure through three converging failures.

First, rainfall patterns have become faster and more erratic than existing forecasting tools can track, overwhelming the drainage systems designed for a gentler climate.

Second, decades of unplanned urban sprawl have eroded the natural floodplains that once absorbed excess water.

Third, as Witaya termed most structurally damaging, roughly 50 Thai government agencies are responsible for water management, each with their own budget and agenda and little shared data.

Although rain poses a threat to regional development, Witaya said water is not merely a hazard to be managed but a productive resource whose value can be measured and grown.

Citing UN data spanning roughly two decades, he noted that water productivity — the economic value generated per cubic meter used — has stagnated across Southeast Asia even as other regions have steadily improved theirs, representing what he called "a big room of opportunity".

Witaya laid emphasis on empowering the local communities, describing efforts to build local "water schools" so that residents — not only central agencies — understand and manage their own flood and drought risks.

A severe storm accompanied by torrential rain and violent wind gusts caused extensive infrastructure damage in Lat Krabang, Bangkok, Thailand, on June 26. THAI NEWS PIX VIA GETTY IMAGE

Wannaporn Phornprapha, founder and managing director of landscape architecture firm P Landscape Company, argued that much of the region's vulnerability stems from a design philosophy still rooted in "gray" concrete infrastructure rather than natural systems.

Asked to name planners' most common mistakes, she pointed first at fragmentation — designing single projects to withstand, say, a hundred-year flood without accounting for what happens beyond their boundaries, since "water has no boundary".

Second, she said regulation and data routinely lag behind the pace of climate change itself, citing the lack of research into which tree species actually filter fine particulate pollution effectively.

Third, resilient design is still widely perceived as an avoidable added expense when its real returns — public health, livability, and long-term value — are simply harder to put a number on.

Satoshi Iemoto, an expert affiliated with a Japan International Cooperation Agency project, said no single country can adapt alone, because climate risk ignores administrative borders — river basins and coastlines connect neighboring states regardless of policy.

He had three recommendations for the region: strengthen knowledge-sharing between countries facing similar disaster risks; empower local governments and communities, since disasters are ultimately experienced locally; and combine modern technology with traditional wisdom — from Thailand's sufficiency economy philosophy to comparable community-based traditions in Indonesia, the Philippines, Malaysia and Cambodia.

Stripped of its technical detail, the panel's case was straightforward: ASEAN's physical resilience has been undermined less by a lack of engineering knowledge than by fragmentation — of agencies, of data, of individual construction projects, and of national policies that stop at borders that climate risks do not respect.

Fixing that, the panelists agreed, is less about inventing new technology than integrating what already exists: shared data, nature-based design, community knowledge and cross-border cooperation.

As the moderator summarized in closing, resilience cannot be built by any single country, sector or discipline acting alone — it has to be, in Witaya's phrase, "everybody's responsibility".

Xi congratulates Alamgir on assuming presidency

By JI HAISHENG
jihaisheng@chinadaily.com.cn

President Xi Jinping sent a congratulatory message on Monday to Mirza Fakhrul Islam Alamgir on assuming office as president of Bangladesh, calling for joint efforts to carry forward the traditional friendship between the two countries, strengthen strategic communication and advance high-quality Belt and Road cooperation.

In the message, Xi called China and Bangladesh traditional friendly neighbors. Over the past 51 years since the establishment of diplomatic relations, the two countries have always upheld mutual respect and treated each other as equals, he said.

China and Bangladesh have supported each other on issues concerning their respective core interests and major concerns, and have moved forward hand-in-hand on their respective paths toward modernization, he said.

Bilateral relations have withstood the tests of a rapidly changing international situation, he added.

Xi said he attaches great importance to the development of China-Bangladesh relations.

He also expressed hope that the two sides will deepen exchanges and cooperation across various fields to make more solid progress in building a China-Bangladesh community with a shared future in the new era and bring greater benefits to the two peoples.

Alamgir, 78, a senior leader of the ruling Bangladesh Nationalist Party, was sworn in as the country's 23rd president on Friday, according to Xinhua News Agency.

Prime Minister Tarique Rahman, cabinet members and hundreds of distinguished guests attended the oath-taking ceremony at the presidential palace in Dhaka.

DPRK

State media slams Japan's militarism

The Democratic People's Republic of Korea on Monday condemned Japanese politicians for visiting the notorious Yasukuni war shrine on the anniversary of Japan's surrender in World War II, warning the country "will perish in the flames of neo-militarism". In a commentary issued by the Korean Central News Agency, the DPRK lambasted Japanese Prime Minister Sanae Takaichi for sending a ritual offering and paying a "surprise tribute" to the war shrine, calling her move "a blatant challenge to the desire of humankind for global peace and security". Defense Minister Shinjiro Koizumi also visited the shrine, a clear demonstration of the dangerous nature of the Yasukuni visit, the commentary said. "Japan is bound to repeat its past as it never draws a lesson but wantonly denies its past as a war criminal country and a defeated nation," it said.

UNITED STATES

Trump threatens 50% auto tariffs on Canada

US tariffs on all cars and trucks, automotive parts and steel will be increased to 50 percent starting Jan 1, President Donald Trump said in a social media post on Monday after trade talks with Canada collapsed over the weekend. "Build in the US and there are zero tariffs," Trump wrote. "On trade, and in other ways, also, they are among the worst nations in the world to deal with. They feel entitled, and yet, we don't need Canada, they need us!" The White House did not immediately respond to a request for comment seeking more details on the threatened tariffs. The two countries failed to reach a trade deal on Friday, with each side blaming the other as Canada readied tariffs on some US goods in retaliation for 50 percent levies ordered by Trump on other Canadian products.

Global tensions cloud trade

US tariffs make business decisions difficult, affecting manufacturing supply chains

By RENA LI in Los Angeles
renali@chinadailyusa.com

Tariffs and geopolitical tensions are adding uncertainty to global manufacturing supply chains, complicating sourcing decisions and long-term investment planning, industry and port leaders said.

Lance Hastings, president and CEO of the California Manufacturers & Technology Association, said manufacturers remain broadly positive about business prospects but are cautious about an unsettled global trading environment.

"There's still some anxiety as the year wraps up," Hastings said during a recent virtual media briefing with Port of Los Angeles executive director Gene Seroka.

"Manufacturing decisions aren't 30-day or 60-day decisions; they're actually six-year, 10-year horizons," he said, adding that sudden disruptions make it more difficult for companies to plan with confidence.

Manufacturing in California generates about $382 billion annually, accounting for roughly 10 percent of the state's economic output. China remains one of California's most important trading partners and a major part of its manufacturing and supply-chain network, with two-way goods trade totaling about $137 billion in 2024, much of it involving manufactured products and industrial components.

The relationship is increasingly shaped by a layered US tariff regime. Most covered Chinese imports currently face an additional 10 percent reciprocal tariff, while longstanding Section 301 duties remain as high as 100 percent on electric vehicles and 50 percent on semiconductors and solar cells, adding costs and complexity for companies with China-linked supply chains.

Asked by China Daily whether continuing China-US trade tensions were prompting California manufacturers to move production or sourcing away from China, or instead diversify while maintaining Chinese suppliers, Hastings said the latter better reflects what companies are doing.

"I think it's more of the latter," he said. "It's really assessing the global profile that we face right now."

Some manufacturers began reassessing supply chains following the COVID-19 pandemic and considered bringing certain operations closer to home, Hastings said. Tariffs and geopolitical tensions have since added further pressure.

"There is a lot of uncertainty," he said. "Manufacturers always are looking at the long term, and that's the more important view."

Seroka said those changing sourcing patterns are clearly visible at the Port of Los Angeles, but they should not be interpreted simply as a withdrawal from China.

"China accounted for about 60 percent of the port's overall business portfolio in 2018, compared with roughly 40 percent today," he said, adding that while trade with Vietnam has expanded sharply, China and Southeast Asia's manufacturing supply chains have become increasingly integrated.

Importers large and small have increasingly explored alternative sourcing locations, particularly in Asia, while maintaining complex supplier relationships that often span several countries, according to Seroka.

At the same time, Washington is increasing scrutiny of China-linked global supply chains as it seeks to identify suspected tariff evasion through transshipment, raising questions about how authorities will distinguish illegal practices from legitimate cross-border manufacturing.

A White House report released this month outlines an artificial intelligence-supported initiative called "Detective Border", designed to help US Customs and Border Protection analyze shipment origins, trade routes and product information to flag potentially suspicious cargo.

Seroka said greater use of AI has not yet disrupted cargo moving through Los Angeles.

"We'll see the advent of AI and trying to explore a realm of possibilities and maybe even theories, but nothing yet that is inhibiting the trade that comes through this port," he said.

He cautioned policymakers against confusing illegal tariff evasion with the complexity of legitimate international production networks.

Seroka compared Asian manufacturing networks with the tiered supplier systems around US automobile plants. A vehicle assembled in Michigan, for example, may rely on tires, wiring harnesses and other components from multiple suppliers. Asian manufacturing works in much the same way, he said, except that parts often cross national borders before final assembly.

A garment, for example, may include buttons or other components made in China before being assembled elsewhere in Asia and exported to the United States.

"There are some policymakers that think they're trying to evade these new tariff policies and the prices that are associated with them," Seroka said. "And while there are some bad actors out there, I'm sure, in general, it's a sourcing complexity of parts and components that go into a finished good."

US customs rules similarly recognize that determining a product's origin can depend on where it undergoes a "substantial transformation", rather than simply the country from which the final shipment departed.

Seroka said more sophisticated enforcement should therefore be accompanied by a practical understanding of how deeply integrated global manufacturing has become.

"I'd like to see more awareness," he said. "I'd like to see folks really get some practical understanding of how supply chains work on the international stage."

For California manufacturers, Hastings said the underlying challenge remains making long-term decisions in an environment where trade rules can change far more quickly than factories, supplier relationships or investment plans.

UK missile help for Ukraine 'adds fuel to fire': Kremlin

MOSCOW — The Kremlin said on Monday that the United Kingdom's decision to hand Ukraine information on British-made components used to make SCALP long-range missiles would "add fuel to the fire" and was regarded by Moscow extremely negatively.

UK Prime Minister Andy Burnham arrived in Kyiv on Monday on his first overseas trip since taking office and was due to announce British support to help Kyiv improve its domestic production of long-range missiles.

Asked about the visit and the support, Kremlin spokesman Dmitry Peskov accused the UK of doing everything it could to prevent any progress toward an eventual peace deal.

"Britain methodically and regularly adds fuel to the fire and methodically and regularly hatches schemes to prevent even the slightest progress in the peaceful settlement process," Peskov told reporters.

"Our armed forces are carrying out work accordingly, gathering the relevant intelligence to identify the production sites of such missiles and other military equipment, and taking measures to destroy these facilities," he said.

The SCALP missile is a long-range cruise missile capable of hitting targets around 250 kilometers away.

The UK and France have supplied the weapon to Ukraine since its conflict with Russia broke out in 2022, but Kyiv has not yet produced them domestically.

Burnham visited Kyiv on Monday for Ukraine's Independence Day commemorations and vowed to maintain Britain's military backing for the government.

"Despite Russia's outrageous threats to my country, we will continue our support for Ukraine's defense," Burnham said in a speech in Kyiv.

Ukraine was scheduled to host a meeting of its key European backers on Monday to press for critical air defense supplies.

The so-called Coalition of the Willing meeting will be jointly chaired by Burnham and the leaders of France and Germany, who will participate remotely.

The leaders of Luxembourg, Moldova, Estonia and European Council President Antonio Costa are also in Kyiv for the talks hosted on Ukraine's Independence Day.

The European Commission said on Monday that it had released another 6.1 billion euros ($7.1 billion) in new defense procurement for Ukraine, covering air defense systems, missiles, ammunition and radars.

The commission said the latest approval added to 16 billion euros in previously approved procurement plans, of which 8.35 billion euros have been disbursed.

Most of the equipment will be sourced from European Union defense companies, the commission said.

It said Russia's increased use of ballistic missiles and jet-engined drones had heightened the need to accelerate deliveries to Ukraine by reprioritizing orders and ramping up production.

The funding comes from the EU's 90 billion euro Ukraine Support Loan for 2026 and 2027. The European Parliament and the Council of the EU adopted legislation establishing the loan in February.

Under the disbursement procedure, Ukraine can request payments after signing procurement contracts with defense companies. The European Commission will review the contracts before releasing funds to ensure the purchases align with procurement plans agreed upon by EU member states.

On the battlefield, the Russian Defense Ministry said on Monday that air defense systems have intercepted and destroyed 351 fixed-wing Ukrainian drones over its territory overnight.

Russian forces continued overnight strikes with precision air-launched weapons and attack drones against Ukrainian ports and vessels allegedly involved in transporting cargo for the military, the ministry said.

Ukrainian Foreign Minister Andrii Sybiha (second from left) greets United Kingdom Prime Minister Andy Burnham upon his arrival by train in Kyiv on Monday. HENRY NICHOLLS VIA REUTERS

COMMENT

Editorials

Some US politicians' China obsession a confession of their own misdemeanors

In his address at the TechNet Augusta conference last week, US National Security Agency Deputy Director Tim Kosiba tried to falsely portray China as a global "spoiler" and "disruptor" actively seeking to undermine the interests of the United States and its allies in almost every sphere across domains and environments — from the South China Sea to Greenland, from the Middle East to Latin America. "We must push back collectively by using all the levers of power smartly and strategically," he said.

His remarks, a manifestation of a Cold War mentality, reveal the deterioration in US strategic thinking. To claim China's presence is "adversarial" to the US and its allies in "nearly every engagement" and wherever the US seeks to defend itself and its allies is not an analytical assessment of reality. Rather, it is a reflection of the US' increasing unease about its capabilities to exercise hegemony in a multipolar world.

Baselessly labeling China as a "spoiler" confuses diplomatic engagement with hostility. China's extensive economic partnerships across the world are normal and beneficial to the international community. The country's footprint is characterized by trade, infrastructure development and dialogue, rather than the US style of military expansion or regime-change operations. Yet Kosiba interprets these as "adversarial", treating the entire world as the US' own exclusive domain.

Kosiba attempted to cast China's presence in Greenland and Antarctica as a "military threat". This groundless claim inadvertently exposes Washington's own intent to militarize these regions, where China's activities are transparent, scientific and cooperative. It is the US government that has defied international norms by repeatedly trying to assert control over Greenland, which is a sovereign territory of Denmark.

China has been a consistent defender of the international order and contributor to global peace and development. In its bilateral cooperation with other countries, China does not target third parties.

Kosiba's claim that Chinese companies are "passing intelligence to Iran" and "undermining" US operations is unfounded and intended to create a pretext for the US to use long-arm jurisdiction and impose unilateral and unlawful sanctions on Chinese entities.

The historical record shows that the US has frequently played the role of spoiler and disruptor in various regions — invading sovereign nations, meddling in domestic politics, and cultivating proxies to foment bloc confrontation, all while invoking the self-serving justifications of "human rights", "freedom" and "democracy" to lend "moral cover" to strategic overreach.

As a major country pursuing peaceful development, China's rise confounds some in the US. In response, they have repeatedly sought to provoke tensions or project the US' own behaviors onto China, levying unfounded accusations. Yet the more aggressively these US politicians make such absurd claims, the more they reveal their palpable anxiety in the face of a changing world.

Kosiba's call for "collective pushback" is actually a demand for allies to sacrifice their own interests and pick sides to alleviate Washington's anxiety. By falsely framing China as a "foe", these China-bashing politicians in the US are seeking to steer the world toward a new Cold War.

The US should follow the trend of the times, abandon its outdated zero-sum mindset and view China's development with a rational and pragmatic attitude. Resolving differences through equal dialogue serves the interests of both sides. The US is only shooting itself in the foot by continuing to perpetuate confrontation and spreading falsehoods that erode the international order.

Japan's remilitarization a fiscal dead end

The latest public opinion poll in Japan is a caution to the Sanae Takaichi government that it shouldn't allow the military buildup to consume the country's economic vigor. The Takaichi Cabinet's approval rating has fallen to 50.2 percent, its lowest level since she took office, while 71.7 percent of respondents say they are worried about Japan's fiscal health.

The immediate trigger may be a proposed cut in the consumption tax on food. The majority of respondents were worried the tax reduction could make it difficult for the government to sustain its social security system as Takaichi has failed to offer any alternative source of revenue to fill the fiscal gap to be left by the tax cut.

In fact, Takaichi appears to be promising everything at once: lower taxes, higher military spending, massive industrial investment, stronger security ties and faster growth. Japan's balance sheet, however, will not play ball.

She wants to protect households from inflation while maintaining an expansive fiscal and investment agenda. But the most conventional way to fight persistent inflation and support a weak yen is to allow the central bank to tighten monetary policy. The problem is that Japan cannot raise interest rates without confronting its debt mountain. This is the bind at the heart of Takaichi-nomics.

Takaichi's answer has increasingly been to promise investment and military spending as engines of "national renewal". But Japan has an aging population, a shrinking workforce, weak domestic demand and a shortage of resources. The proposed 370 trillion yen ($2.32 trillion) investment program over 14 years may help strategic industries, but no amount of government subsidy can substitute indefinitely for productivity growth, labor reform and a sustainable social security system.

The proposed domestic investment is to be accompanied by the cut in the food consumption tax from 8 percent to 1 percent. A complete elimination would represent roughly 5 trillion yen a year in lost revenue, so even the proposed reduction would leave a substantial hole. Meanwhile, the fiscal year 2027 military budget request stands at a record 8.9 trillion yen, and the final tally is on track to exceed 10 trillion yen as additional appropriations pile on.

This is where the rhetoric of "national strength" collides with the realities of the country's national debt. Japan already carries one of the heaviest public-debt burdens in the developed world. The 10-year Japanese government bond yield recently climbed to 2.95 percent, its highest level in about three decades. The Japanese Finance Ministry is preparing 36.6 trillion yen for government-bond principal and interest payments in fiscal year 2027, a 17 percent increase from the previous year.

The danger is a feedback loop: more spending requires more borrowing; more borrowing can raise investors' concerns; higher yields increase interest costs; higher interest costs consume fiscal space; and shrinking fiscal space makes every subsequent policy choice harder.

The Takaichi government has invested a considerable stake in promoting Japan's military, economic security and national identity. It has pressed ahead with controversial legislation on imperial succession and a backup capital, while its security policy is a de facto neo-militarist to-do list.

Yet unlike the right-wing forces, voters appear less interested in recovering yesterday's military "glory" than paying tomorrow's grocery bills.

In other words, Takaichi's main interest is remilitarization, while issues such as people's livelihoods and alleviating the burden on households take a back seat. The poll numbers on historical issues indicate that Japanese society is not unanimously behind her neo-militarist agenda. That is a big political gap.

The strongest mandate in the world cannot repeal arithmetic. Takaichi's ruling coalition may have won a Lower House majority, but it still faces resistance in the Upper House, and her popularity is already losing some of its protective cushion.

Takaichi vows to make Japan stronger. But strength is not measured by the number of missiles, submarines and warplanes a government can finance, but whether a country can pay its bills, maintain policy credibility and improve its people's well-being.

No country can become stronger in the long run by confusing military expenditure with economic vitality. Takaichi has a choice between political theater and economic discipline.

But even as the Japanese public grapples with the rising cost of living, Japanese Defense Minister Shinjiro Koizumi visited Australia and India last week, advocating Japan's "counterstrike capabilities" and promoting weapons exports. These moves reflect Takaichi is recklessly pursuing the wrong choice of expanding military and related industries while trying to cut taxes.

The more rational choice would be to embrace the trade-offs required for "national renewal": a credible tax base, structural reform, monetary-policy independence and spending that prioritizes the economy's long-term capacity. The neo-militarist drive should be discarded.

Japan's strained fiscal reality should serve as a stark warning to Takaichi: sacrificing public welfare for military expansion is a path to ruin. The problem, however, is that you can never wake someone who is pretending to be asleep.

Opinion Line

Middle East crisis cannot be sanctioned away by coercion

When Chinese Vice-Foreign Minister Miao Deyu met his Iranian counterpart Kazem Gharibabadi in Beijing on Aug 17, he reaffirmed China's commitment to dialogue and peace in the Middle East, saying that Beijing will continue helping restore peace and tranquility to the region.

The Ministry of Foreign Affairs published a news release about the meeting on Sunday, after US Treasury Secretary Scott Bessent publicly urged China, on Thursday, to join Washington's economic pressure campaign against Tehran. China's message was simple: It will not be pressured into being the US' accomplice in a conflict Washington created — along with Israel — and which it cannot resolve.

The conflict is entering its sixth month. The US' "Epic Fury" strikes in February and following campaigns failed to break Tehran's will. A full-scale invasion, according to Pentagon estimates, would cost trillions of dollars and require years of input — a political death sentence.

So Washington has increasingly pivoted to "economic warfare", with US President Donald Trump calling it "economic D-Day", a phrase that evokes the Normandy landings but increasingly sounds like a retreat.

This is a familiar Washington reflex: When military pressure fails, double down on sanctions. But three realities complicate that strategy.

First, Venezuela. Tehran has watched what happened under the US sanctions regime and drawn its own conclusion. Second, the Strait of Hormuz. Iran does not need to defeat the US Navy to control the choke point. Washington can squeeze Iranian oil exports, but it cannot open the strait. Third, the US' own fiscal predicament. Trump's suggestion that military force could be used if the national debt becomes unmanageable exposes an uncomfortable truth: domestic economic anxieties are increasingly bleeding into strategic calculations. A foreign confrontation can become a convenient distraction from problems at home.

So where does China fit in? China is Iran's trading partner. Bessent urged Beijing to sever those ties, but Chinese Ministry of Foreign Affairs spokesman Lin Jian was explicit: China opposes unilateral sanctions that lack a UN Security Council mandate.

Washington should discard the wishful thinking that it can compel China to cut economic ties with Iran. If the rest of the world is forced to do the US' bidding, international commerce stops being commerce and becomes permission-based globalization, in which Washington decides who may trade with whom.

There is also a larger geopolitical question. Washington's pressure campaign could produce the opposite effect. There have been reports that Iran has been invited to join the Mecca Joint Defense Agreement. Tehran has denied this, but it highlights that although the US seeks to isolate Iran economically, regional countries may be exploring ways to integrate it into a new security architecture.

Talk about the irony: the US threatens secondary sanctions against countries that trade with Iran at a time when some of its own allies and partners may be contemplating deeper security ties with Tehran.

Unilateral sanctions can concentrate pressure on one country, but they cannot prevent the costs from spreading. War cannot solve the problem; sanctions often create new ones.

Washington has been trying to turn economic interdependence into strategic leverage. But leverage works only when others are willing to accept the rules. Even US allies and partners reject US rules in many fields.

And the golden rule of being in a hole still applies: When you are in one, stop digging. Washington is scrabbling with both hands — military conflict and economic coercion.

— LI YANG, CHINA DAILY

What They Say

AI can speed up development of Global South

Editor's note: *Artificial intelligence can speed up the growth of developing countries. But these countries should take proactive steps to fully capitalize on the opportunities. People's Daily Overseas Edition spoke to Xu Xiujun, deputy head of the National Academy of Chinese Modernization at the Chinese Academy of Social Sciences, and Jiang Tianjiao, associate professor at the Development Institute of Fudan University, about the challenges the Global South faces in leveraging AI and how international cooperation can help overcome these hurdles. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

AI technologies can diffuse through open source frameworks, pretrained models and cloud-based application programming interface calls. This allows developing countries to avoid costly hardware and gain direct access to advanced algorithmic capabilities.

Developing countries don't have to develop state-of-the-art AI models from scratch. Instead, they can adopt existing tools and tailor them to local conditions. AI applications in agriculture, healthcare, education, public governance, disaster response and other fields can enhance public services. This way, AI can ease the shortage of professionals and public services in some developing countries.

The competition over AI involves a comprehensive ecosystem that integrates data, algorithms and computing power. Currently, a few countries and enterprises dominate advanced computing resources, which raises barriers for developing countries. At the same time, many Global South countries face challenges such as insufficient power and network infrastructure, limited access to computing power, lack of localized data and talent, as well as underdeveloped industrial ecosystems for research and development and the application of AI. This threatens to turn the "access divide" of the internet era into an "intelligence divide".

AI has also given rise to a new "representational divide". Large-model training relies heavily on data, yet languages, cultures and knowledge of many developing countries are under-represented in the training datasets of mainstream models. This could lower the suitability of models and lead to algorithmic bias, undermining the performance of such AI models in local contexts.

The AI era requires not only basic digital literacy but also skills in human-machine collaboration, placing greater demands on education, vocational training and talent development. A country's ability to build a talent base compatible with intelligent transformation will determine whether it can fully unlock the dividends of AI.

Without an adequate understanding of AI application and regulation, and without policies and rules for AI development, governments risk long-term dependence on foreign technology suppliers and large platform enterprises. This dependence could hinder the development and growth of domestic industrial ecosystems and innovation capacity.

Future international cooperation should focus on systematically enhancing the capabilities of Global South countries. Priority should be given to developing inclusive digital infrastructure, including the power supply, networks and computing capacity, to support Global South countries in building more local, green and resilient intelligent computing centers. Efforts should also be made to establish an open-source and inclusive technology ecosystem. This includes encouraging the development and application of open-source AI models, frameworks and tools, and supporting Global South countries in cultivating local talent, native language models and AI applications tailored to their local needs.

Furthermore, countries should cooperate to establish a fair and reasonable global AI governance system. Platforms such as the newly established World Artificial Intelligence Cooperation Organization should be leveraged to ensure Global South countries participate on an equal footing in formulating international AI rules, technical standards and ethical norms. Priority should be given to cooperation in areas related to people's well-being, including agriculture, healthcare, education, and disaster early-warning, to ensure that AI dividends can truly benefit broader populations.

VIEWS

Asit K. Biswas, Qu Yanping, and Yang Xiaojing

Tackling drought from parched to prepared

Throughout history, climatic fluctuations have been a constant companion of human civilization.

Early human civilizations developed along the fertile banks of rivers such as the Nile in Egypt, the Tigris and Euphrates in Mesopotamia, the Indus in the Indian subcontinent, and China's Yellow and Yangtze rivers.

There was abundant water for drinking and irrigation, and the rivers were also main arteries for transportation.

However, living close to the rivers also made these civilizations vulnerable to the threat of floods, while regions away from water sources faced the risk of droughts. The Indus civilization declined due to a prolonged drought, while in China, several dynasties lost power because the rulers were unable to protect the population from serious floods and droughts. Flood and drought management therefore became key issues for all dynasties.

As nations grew wealthier and technology advanced, policymakers across the world gained more alternatives to tackle extreme weather events. But floods have received more attention from scientists and policymakers than droughts because their impact is more visible and dramatic.

This is paradoxical, because floods can last for days, while droughts can extend for several months, years and even decades.

Moreover, prolonged droughts often inflict significantly greater human suffering than do heavy floods.

Droughts are now seen as multi-sector crises because they not only affect agriculture and food security but also reduce energy production, disrupt transportation systems, increase wildfire risks, and cause widespread economic losses that persist long after the drought itself has ended.

The severe drought in the Yangtze River Basin in 2022 exemplifies how droughts can evolve into a widespread socio-economic crisis when water shortage affects multiple sectors simultaneously. Prolonged high temperatures and extremely low precipitation led to reduced river inflows, declining reservoir levels and widespread deficits in soil moisture.

The impact extended beyond agriculture, disrupting urban and rural water supplies, hydropower generation, inland navigation and ecosystem health.

Unlike floods, which have clear beginnings and ends, droughts develop through an intricate interplay among precipitation, temperature, soil moisture, and human activities.

Global Lens

Advances in data analytics, artificial intelligence, remote sensing, and numerical modeling are improving drought prediction capabilities, but it is not yet possible to forecast when a drought may start, how severe it may become and how long it may persist.

Recognizing these challenges, institutions such as the China Institute of Water Resources and Hydropower Research are spearheading efforts to improve drought monitoring, forecasting and early-warning systems. Although significant knowledge gaps remain, advances in forecasting science are expected to provide policymakers and water managers more time to prepare for droughts and reduce their impact.

The good news is that China is better equipped to handle droughts than ever before. Substantial investments in water infrastructure, improved water management practices, expanded grain storage capacity, and more effective drought preparedness measures have bolstered the country's resilience.

As a result, although droughts will continue to occur and pose serious multisectoral challenges, their social, economic, and environmental consequences can be mitigated more effectively than in the past.

In addition, China's transport connectivity is now among the best in the world. Grain reserves can be moved quickly from one part of the country to drought-hit regions. This was not so easy just two decades ago.

However, future drought management must shift from reactive crisis response to proactive risk management. Historically, governments across the world have focused on emergency measures only after the impact of drought becomes visible.

A more effective approach involves drought preparedness, continuous monitoring, early-warning systems, risk assessment and institutional coordination to mitigate severe impact before it occurs. Such approaches can reduce vulnerability and increase societal resilience to droughts.

LI MIN / CHINA DAILY

China's 15th Five-Year Plan (2026-30) proposes new strategies for managing natural disasters, including droughts, and emphasizes proactive resilience. This will require a deeper understanding of droughts, extensive monitoring and a thorough analysis of their impact.

As climate change increases the frequency, intensity and duration of extreme weather events, research by institutions such as the IWHR will be crucial. These efforts aim to enhance our understanding of drought processes, strengthen forecasting capabilities, and develop more effective early-warning systems.

While droughts will remain an inevitable aspect of climatic variability, advances in science and risk management should enable societies to anticipate them earlier and respond more effectively. Such progress would benefit not only China but also drought-prone regions across the world.

Asit K. Biswas is the director of Water Management International Pte Ltd in Singapore; Qu Yanping is a professor at the China Institute of Water Resources and Hydropower Research; Yang Xiaojing is a senior engineer in the same institute.

Chen Guiqing

Washington urged to honor one-China principle for stable ties

When the presidents of China and the United States met in May, they agreed to explore building a constructive and strategically stable relationship between the two countries. The Taiwan question, the most sensitive topic in China-US relations, was discussed in depth. The US made several commitments, including US President Donald Trump's remark that "I'm not looking to have somebody go independent", as well as signals that Washington would exercise restraint on arms sales to Taiwan and would not back the calls for "Taiwan independence".

Yet, months later, the reality is mixed. While Washington has shown some signs of restraint, it has simultaneously created new risks in the Taiwan Strait.

Stability in the Taiwan Strait is essential for maintaining steady China-US relations. Whether the US honors its commitments to China will directly affect the prospects for a stable relationship between the two countries.

Since the presidential meeting, Washington seems to understand the risks of conflict in the Taiwan Strait.

Following the meeting, the US temporarily paused major arms sales to Taiwan, stressed the importance of peace across the Strait, and resumed diplomatic communication with China at multiple levels.

Washington also publicly reiterated its adherence to the one-China principle, showing no fundamental shift in its Taiwan policy.

This period of relative restraint enabled the resumption of dialogue in areas such as trade, temporarily easing tensions across the Strait. Strategically, Washington recognizes that a conflict over Taiwan would incur enormous costs the US could ill afford. This reflects a calculation based on US interests, and aligns with the understandings reached by the two presidents.

Yet, high-level verbal commitments do not always translate into action on the ground. Provocative moves reveal a persistent problem in US policy: a divergence between Washington's words and its actions.

Raymond Greene, director of the "American Institute in Taiwan", often oversteps his role and intervenes in the island's political affairs.

In the current political environment, this distorts the status quo across the Strait and promotes the so-called "dialogue without preconditions", which emboldens separatist activities.

At the same time, the US continues to deepen military ties with Taiwan authorities, promoting defense concepts, pressing for increased defense spending, and accelerating efforts to build up "asymmetric capabilities".

It is also deeply involved in tactical defense planning, encouraging preparations for urban combat. Such moves embolden separatist forces seeking "Taiwan independence".

The US policy is marked by contradictions. While senior White House officials pledge to manage risks, anti-China lawmakers in the US push Taiwan-related legislation and military exchanges continue between the US and Taiwan authorities.

This double-faced approach seriously undermines the understandings reached by President Xi Jinping and President Trump, eroding peace and stability in the Taiwan Strait.

This contradiction stems from the US desire to contain the Chinese mainland, using Taiwan as leverage. Washington seeks to constrain China's development without being dragged into war by "Taiwan independence" forces.

This opportunism has made US policy unstable. Washington seems to believe that it can test China's limits while arming Taiwan and slow down China's reunification process without triggering a conflict.

But this dangerous ambiguity risks uncontrollable escalation. Separatist forces will not be satisfied with limited US "support" and will push Washington toward direct confrontation.

Those who play with fire risk getting burned. Provocations will only shrink the space for peace across the Strait and could lead to a dangerous strategic collision.

The Taiwan question is pivotal for a stable China-US relationship. Such a relationship should be defined by cooperation, healthy competition, manageable differences, and the promise of peace. Yet, Taiwan is a destabilizing factor in this path.

China and the US have differences over trade, technology, global governance and many other issues, but these allow room for negotiation. The Taiwan question is different and concerns China's sovereignty and territorial integrity, leaving no room for compromise.

The one-China principle is the political foundation of China-US diplomatic relations. If Washington continues to play the "Taiwan card", all the high-level understandings and plans for cooperation will rest on shaky ground.

A conflict could wipe out years of progress in China-US dialogue, dismantling the framework for a stable relationship and severely disrupting peace and stability across the Asia-Pacific.

Handling the Taiwan question is therefore a critical test for avoiding the trap of major-power confrontation. For a constructive and strategically stable relationship, Washington must abandon opportunism, honor its commitments and translate the understandings reached by the two presidents into concrete action. The following measures can take the relationship in that direction.

First, Washington should ensure consistency in its Taiwan policy, restrain provocative behavior by officials and stop further escalation of military ties between the US and the Taiwan authorities. Its words and actions on Taiwan should be consistent.

Second, the US should uphold its one-China principle, halt official exchanges and military ties with Taiwan, stop pushing Taiwan to expand its military capabilities, and abandon the idea of using the Taiwan question to contain the Chinese mainland.

Third, Washington should recognize the incompatibility of "Taiwan independence" and peace in the Taiwan Strait. It should stop encouraging separatist activities on the island.

The historical trend toward reunification across the Taiwan Strait cannot be stopped. China's central government consistently pursues peaceful reunification, but it has not renounced the use of force against separatism and interference by external forces.

Only by properly managing the Taiwan question and upholding the one-China principle can China and the US remove the biggest obstacle in their relationship and create broader space for a constructive and strategically stable relationship.

By preserving stability in the Taiwan Strait and abandoning the "Taiwan card", Washington can stabilize China-US relations and contribute to global peace.

kangbing@chinadaily.com.cn

Key to realizing life expectancy goals lies in rural areas

Six decades ago, when I was just six years old, for several months it was my uncle who came to fetch me from my boarding kindergarten to spend weekends with my grandparents.

My parents, I was told, were in the hospital, with my father suffering from tuberculosis and my mother from hepatitis. At that time, both diseases were infectious and, sometimes, fatal.

As a six-year-old, I could only cry and pray that they recover and live till the age of 60 — a target I also set for myself. As a child, I had no idea about life expectancy and set the goal just because I had heard people talk about someone having lived till "the ripe old age of 70".

Thanks to China's better living conditions, improved medical care, and probably my prayers, both my parents lived longer than I had prayed for, with my father passing away at the age of 91 and my mother at 86, even though they had to spend their last few years in the hospital.

The National Health Plan for the 15th Five-Year Plan period (2026-30), released by the State Council, China's Cabinet, has set the country's life expectancy at 80 years, an increase of three months over last year. If China successfully meets the target, it will surpass many developed countries, and the world average of 73.5 years in 2024.

Checking China's historical records, I have little doubt that the target will be met — over the past few decades, the country has never failed to meet its Five-Year Plan goals. In fact, China has achieved the feat of raising the country's life expectancy from 67.9 years in 1981 to 79.25 years in 2025.

Health literacy indicates a citizen's ability to obtain and understand health information and their capability to make the right healthcare choices.

Every time I go through the details of the health plan, I feel I can sit back and relax. Going by the dozens of indices and practical measures in place, it seems that realizing the life expectancy goal is not going to be a problem. In fact, I feel, they have been extra cautious in setting the target.

The rates of infant mortality, maternal mortality and premature deaths, and of major chronic diseases, are likely to fall in tandem with the rise in life expectancy.

According to the plan, better-equipped hospitals will be established and measures will be taken to ensure citizens can find treatment options within 15 minutes' walking distance from their homes. The number of doctors and nurses will be increased to provide patients with better care.

To deal with the shortage of medical staff in rural areas, medical schools will open their doors wider to students and trainees from these regions on the condition that they return to their hometowns and villages after graduation and training to provide health services there.

More doctor exchange programs will be arranged so that rural doctors have more opportunities for training. Remote medical care will be encouraged to provide timely healthcare to the rural population. Of the approximately one million licensed doctors working in village clinics, many are nearing retirement age, leading to the closing down of many village clinics.

Providing rural societies with better medical care remains a big challenge for health authorities in their quest to raise the country's life expectancy. The challenge becomes tough when we realize that rural areas are fast turning into aging societies, as millions of young people from rural areas migrate to the cities in search of jobs.

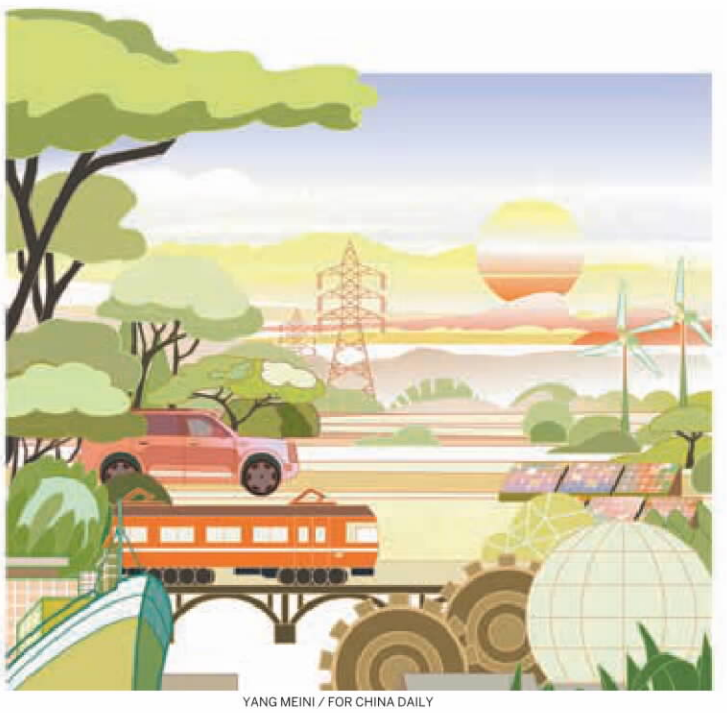
While the required tweak (increase or decrease) in the rate of other indexes to meet the plan's goal is less than one percent, the biggest hurdle to cross is in residents' health literacy levels, from 33.69 percent last year to 40 percent five years later.

Health literacy indicates a citizen's ability to obtain and understand health information and their capability to make the right healthcare choices.

Publicity drives should be undertaken to encourage residents to adopt healthy living habits, such as not smoking, controlled drinking, and reduced sugar and salt intake. Awareness should be raised among citizens about chronic diseases such as hypertension and hyperglycemia, and they should undergo routine physical check-ups.

They should also engage in regular physical exercise — at least three times a week and no less than 30 minutes each time.

Surveys find disparities in urban and rural areas regarding sports, with around 38.5 percent of urban residents regularly engaging in sports activities compared with about 31 percent of their counterparts in rural areas.



It seems the rural areas hold the key to realizing, or not realizing, the country's improved life expectancy goal.

Health authorities will find that a lot needs to be done in this regard in the rural areas.

GLOBAL VIEWS

YANG MEINI / FOR CHINA DAILY

BERNARDO MENDIA

Enabling, not squeezing

China's development enlarges the global industrial pie for shared prosperity across the Global South

A persistent narrative has gained traction among certain Western policy circles and think tanks: China's manufacturing capacity is "squeezing" the industrial space of other developing nations. Under this framing, global manufacturing is portrayed as a fixed, zero-sum pie in which one nation's export expansion inherently denies others the chance to industrialize.

This view relies on an outdated model of international trade. It fundamentally misinterprets the dynamic realities of modern global value chains and ignores how industrial upgrading actually occurs. Far from pulling up the development ladder behind it, China is constructing critical structural steps, through intermediate capital exports, greenfield foreign direct investment and joint production ecosystems, that lower the threshold of industrialization across the Global South.

Expanding market access and sharing development dividends are key measures through which China supports the shared prosperity of the Global South. A landmark development is China's zero-tariff policy, effective May 1, covering 53 African countries with which it has diplomatic ties. China is the first major economy to grant unilateral, comprehensive duty-free access to these African nations.

China is taking concrete actions to help African nations better integrate into the global market and unlock their development potential. According to China's General Administration of Customs, in May and June, China's imports from Africa totaled 193.8 billion yuan ($28.8 billion), marking a 23.5 percent year-on-year increase. The import volumes of African specialty agricultural products and semi-processed mineral goods have steadily risen. The structure of China-Africa trade continues to improve: Chinese imports can match Africa's distinctive products and resource endowments; Chinese exports can deliver its high-quality equipment, mature technologies and full industrial chain capabilities. The partnership — characterized by complementary supply and demand, integrated industries and interconnected markets — is growing ever more robust.

The zero-sum argument also overlooks a profound structural shift in global trade statistics. China's export architecture has evolved from final consumer goods toward intermediate components, advanced machinery and green technology. According to data released by the National Bureau of Statistics, China's equipment manufacturing sector became a major driver of the country's export growth in the first half of 2026, with exports of mechanical and electrical products increasing by 20.1 percent. Based on data released by the Ministry of Industry and Information Technology, exports of wind turbine generators, lithium batteries and automobiles have registered growth in the first half of this year.

This development provides other developing economies with competitively priced capital inputs. Critics often worry that relying on imported intermediate goods leads to premature deindustrialization or locks some developing nations into low-value assembly. Yet history demonstrates that almost every modern industrial power, including China during its early reform era, began by mastering processing and assembly before moving up the technological ladder. Importing cost-effective components, energy systems and industrial machinery lowers operational baselines for local manufacturers.

Furthermore, this mechanism generates a vital macroeconomic benefit: input-cost disinflation. Instead of forcing emerging markets into capital-intensive, high-risk import substitution from scratch, cost-effective goods act as a structural anti-inflationary buffer. Local industries gain immediate price competitiveness, enabling domestic capital to focus on downstream processing, customized manufacturing and regional market distribution. The emerging pattern is a highly collaborative division of labor where China supplies intermediate goods, partner countries process and assemble and both benefit from joint global exports.

Trade flows alone, however, tell only half of the story. The transition from simple commerce to long-term economic integration is powered by direct capital deployment. Data highlights a pivot in cross-border investment: China's non-financial direct investment in Belt and Road partner nations surpassed $39.67 billion in 2025, accompanied by over $257.98 billion in signed construction contracts.

This capital is no longer limited to basic infrastructure or sovereign loans. It is increasingly directed into physical greenfield production. From manufacturing complexes in Egypt's Suez Canal Economic Zone to multi-billion-dollar green ammonia and renewable energy programs in Ethiopia, capital is being anchored directly inside host countries. Dedicated industrial parks act as ecosystem anchors, generating local employment, transferring operational skills and converting raw materials into processed, value-added exports on-site. Greenfield investment ensures that host nations do not remain passive consumers, but steadily construct durable domestic industrial capacity.

In this sense, China and other Global South countries are complementary and mutually reinforcing partners working hand-in-hand, rather than competitors in homogeneous rivalry. China serves as an important enabler of industrialization and the green transition across the Global South.

The assertion that China's industrial power "squeezes" other Global South countries fails to withstand empirical scrutiny. Industrial growth in the 21st century is not achieved through isolation or protectionist barriers, but through deep integration into global value chains. By supplying cost-effective intermediate goods, mitigating domestic inflationary pressures, and committing direct capital to greenfield industrial ecosystems, China is expanding the global industrial pie. When integrated with various dynamic multilateral platforms, this model demonstrates that South-South cooperation is fundamentally transformational, building the steps for shared, long-term economic prosperity.

China's development is an opportunity, not a challenge, for the world. Committed to an open strategy of mutual benefits and win-win cooperation, China can empower global economic recovery through its own high-quality development.

Today, aligning with China's development opportunities, deepening practical cooperation with China, and participating in the Belt and Road Initiative have become significant choices for many countries around the world. Multilateral platforms such as the Forum on China-Africa Cooperation, the China-Arab States Cooperation Forum and the China-CELAC Forum have delivered tangible results.

Strategic cross-regional frameworks, such as the historical ties connecting Portugal and the broader Portuguese-speaking world (representing more than 270 million consumers), offer an additional blueprint for trilateral economic cooperation. As an EU member state with deep corporate networks across Latin America and Africa, Portugal can combine Chinese capital equipment and advanced technologies with local engineering, logistics, and management expertise. Coupled with the institutional clearing mechanisms of Forum Macao, this trilateral model can ensure that South-South trade is supported by balanced, multi-party supply chains to help deepen cooperation in global production capacity, technological innovation, infrastructure connectivity and green development.

Out of double trap

The US faces difficult task of managing both external competition and internal pressures

For more than a decade, strategic debate in the United States has been echoing an influential proposition: the Thucydides Trap. Popularized by Harvard professor Graham Allison and inspired by the Peloponnesian War, the concept warns that the rise of an emerging power can generate dangerous structural tensions with an established one.

Despite scholarly criticism and even dismiss across continents, the proposition has often been cited in the US to interpret the contemporary strategic competition with China.

Recently, Ian Bremmer, founder of the Eurasia Group, drew on lessons from the collapse of the Roman Republic to revive the concept of the Gracchi Trap. Unlike the Thucydides Trap, which attributes the risk of conflict primarily to the structural dynamics of external power competition, the Gracchi Trap directs attention to the internal sources of a great power's decline. It argues that major powers ultimately lose their preeminence because they fail to reform themselves in the face of mounting domestic dysfunction. Political paralysis, institutional decay, widening polarization and growing inequality progressively erode state capacity and national cohesion, leaving a great power increasingly vulnerable to external competition and strategic pressure.

Taken separately, both traps offer peculiar viewpoints for understanding the internality and externality of crises. Taken together, however, they present a far more challenging picture of strategic predicament for the United States, which is simultaneously confronting both external struggles for global leadership and the internal polarization of governance and legitimacy.

The Thucydides Trap is most commonly applied by people from the US to the context of relations with China, although many Asia-Pacific researchers have pinpointed its inherent logical faults, disregard of Chinese philosophical tradition and structural mismatch with current circumstances. As China's economic, technological and military capabilities expand, Washington increasingly views Beijing not merely as a competitor but as the only country capable of fundamentally reshaping the global balance of power. Successive US administrations — Republican and Democratic alike — have increasingly viewed the bilateral relationship through the lens of the Thucydides Trap, making strategic competition with China the organizing principle of US foreign policy.

This contest now extends far beyond the traditional domains of military and security competition. It encompasses advanced technologies such as artificial intelligence and semiconductors, global supply chains, investment screening, export controls, critical minerals, maritime security and competing visions of global governance. Relations between the world's two largest economies have had resounding impact on the rest of the world as well as global development.

Such structural competition undoubtedly generates significant risks. History demonstrates that power transitions have frequently been accompanied by miscalculation, arms races and, in some cases, major conflicts. Escalating tensions and even conflict cannot be dismissed by many US personalities. Yet, hopes have been refreshed by the new vision of a constructive China-US relationship of strategic stability agreed upon by both sides during the landmark visit to China by US President Donald Trump in May this year.

The Gracchi Trap, however, shifts analytical attention away from China and back to the US itself. The concept derives from the Gracchi brothers of the Roman Republic, whose attempts to reform an increasingly unequal political system ended not in compromise but in political violence. Their failure marked the beginning of decades of instability that ultimately contributed to the decline and eventual collapse of the Roman Republic. The central implication of the Gracchi Trap is straightforward: great powers often weaken from internal dysfunction long before they are overcome by external adversaries.

In the US, the warning signs have become increasingly difficult to ignore. Political polarization has reached levels unseen for generations. Congress increasingly struggles to pass major legislation. Electoral outcomes are routinely contested. Public trust in government institutions continues to decline. Social divisions over race, immigration, inequality, identity politics and economic opportunity have become deeply entrenched. Meanwhile, mounting fiscal pressures, rising public debt and deteriorating infrastructure further complicate the prospects for effective long-term governance.

These domestic contradictions inevitably shape US foreign policy. When governments face difficult internal challenges, they often seek external sources of political cohesion and strategic purpose. Adopting a more hawkish stance toward China can serve to generate domestic political unity and reinforce an "America First" identity. Economic difficulties are increasingly attributed to competition from China, while even long-standing allies are portrayed as having taken advantage of the US. At the same time, perceived external security threats often receive greater political attention than the pursuit of necessary structural reforms at home.

This interaction between domestic politics and international strategies demonstrates why the Thucydides Trap and the Gracchi Trap should not be understood in isolation. Rather, they are mutually reinforcing dynamics. External competition intensifies domestic political pressures, while domestic political dysfunction, in turn, encourages more confrontational foreign-policy choices. The result is a self-reinforcing cycle in which external competition and internal instability become mutually amplifying forces, potentially accelerating both strategic overextension abroad and institutional erosion at home.

This has important implications beyond the US. Much of Europe has historically aligned itself with the US' strategic assessment of China, while US allies across Asia and Latin America have also adjusted their security policies in response to intensifying US-China competition. As a result, the trajectory of US domestic politics is no longer merely a national concern; it increasingly shapes the stability, direction and strategic dynamics of the broader international system.

While some observers may interpret US political dysfunction as evidence of inevitable decline, the realities of economic globalization suggest a more complex and double-edged dynamic. The relative weakening of the US should not be regarded as an unqualified strategic advantage for China, given the extensive economic interdependence, cultural exchanges and people-to-people ties that have developed between the two countries. In other words, a weaker US does not necessarily benefit China. Rather, instability in the world's largest and most influential economy could generate profound uncertainties for the global system, with significant repercussions for China itself.

Historical analogies should be applied with caution. Neither the Thucydides Trap nor the Gracchi Trap should be taken as deterministic predictions. History does not mechanically repeat itself. Rather, these concepts highlight structural pressures that policymakers should seek to resolve rather than allow to unfold.

Avoiding the Thucydides Trap requires strategic trust-building, crisis-management mechanisms and sustained dialogue between the US and China. Avoiding the Gracchi Trap requires something even more difficult for the US: restoring public trust in the political system, strengthening domestic institutions, addressing widening inequalities and rebuilding national consensus.

Throughout history, great powers rarely collapse because they lose a single external confrontation. More often, they decline gradually because internal weaknesses prevent them from adapting to changing circumstances.

The future global order will therefore depend not only on how the US manages competition with China but also on whether it can overcome its own domestic fragmentation.

Alibaba seeks HK$80 billion placement

Raising equity gives firm longer-term funding; sends vote of confidence

By **CHENG YU**
chengyu@chinadaily.com.cn

View of Alibaba's booth at the recent World AI Conference held in Shanghai. AP

Alibaba Group is seeking to raise about HK$80 billion ($10.2 billion) through a new share placement in Hong Kong, which, if completed, would become the world's third-largest primary follow-on offering this year, behind only those placed by Alphabet and Intel.

The placement, announced on Sunday, would mark Alibaba's first new share sale since its Hong Kong listing in 2019. More striking is where every dollar raised is headed — the company plans to use 100 percent of its net proceeds to strengthen its artificial intelligence capabilities, including expanding and upgrading AI infrastructure.

Several sources close to the matter told China Daily that the offering was oversubscribed within an hour of its launch. One source close to the company disclosed that sovereign wealth funds and some long-term institutional investors showed keen interest.

Right after the move, Alibaba's Chairman Cai Chongxin and CEO Wu Yongming bought a combined about HK$120 million of Alibaba shares.

Guo Tao, deputy director of China Electronic Commerce Expert Service Center, said: "Alibaba's placement also has benchmark significance for China's AI industry. Alibaba's continued expansion in AI capital spending could accelerate development across China's domestic AI supply chain, from AI chip adaptation and intelligent computing centers to liquid-cooling systems."

As the AI race shifts from a technology contest into a "capital endurance race", raising equity gives Alibaba longer-term funding while sending a vote of confidence through the broader sector, Guo said.

The aggressive spending comes as AI emerges as an increasingly important growth engine for Alibaba.

The company reported revenue of 268.95 billion yuan ($37.5 billion) for its fiscal first quarter ended June 30, with net profit attributable to shareholders of 10.54 billion yuan.

Alibaba CEO Wu Yongming told analysts after the earnings release that annualized recurring revenue from AI-related products was expected to approach $10 billion in the next quarter. AI-related product ARR had already surpassed 49.5 billion yuan in the first quarter, Wu said.

Jiang Han, a senior researcher at market consultancy Pangoal, said: "Alibaba's organizational restructuring was effectively designed to build a vertically integrated, full-stack AI operation, lowering transaction costs and speeding the deployment of new technologies. The improvement in commercialization returns mentioned by Wu is a direct monetization of that full-stack capability." Jiang added that Alibaba's AI investment was beginning to move from simply "burning cash" toward generating its own financial returns.

Alibaba's fundraising also comes as the AI sector's capital requirements are ballooning globally, pushing companies to seek ever larger pools of financing.

Anthropic confidentially filed for a United States' initial public offering in June and could list as early as October, with a targeted valuation of as much as $2 trillion. OpenAI is also targeting a potential fourth-quarter listing, while its valuation in private markets stands at around $850 billion.

Alibaba's HK$80 billion placement puts China's largest tech firms squarely into that global capital race. But raising more money does not remove the biggest uncertainty hanging over the AI boom — whether commercial returns can keep pace with the extraordinary amount of investment.

Investors are already showing some caution. Alibaba's US-listed shares closed at $119.34 on Monday, down 8.57 percent, while its Hong Kong-listed shares ended at HK$112, down 8.54 percent.

"The biggest risk investors need to watch is not that AI fails, but that the pace of AI commercialization fails to keep up with capital spending. In the end, this competition will not be about who spends the most. It will be about who can make returns on AI investment exceed the cost of capital first," Jiang added.

Smart agriculture

Staffers from State Grid Yangzhou check power facilities at Jiangdu District Modern Agricultural Industrial Park in Yangzhou, Jiangsu province, aiming to optimize power supply for electricity-intensive projects such as smart greenhouses, water and fertilizer irrigation infrastructure, and cold chain storage facilities. The power supplier aims to inject strong momentum into developing local smart agriculture. REN FEI / FOR CHINA DAILY

Briefly

Railway cargo transport volume up

The China-Laos Railway has handled over 90 million metric tons of cargo since the railway began operation in 2021, with cross-border cargo surpassing 21 million tons, said China Railway Kunming Group Co Ltd. The number of cross-border freight trains operated daily has risen to a peak of 23, while the maximum hauling capacity per train has increased from 2,000 tons to 2,800 tons.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 24 pips to 6.7841 against the US dollar on Monday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

Digital yuan use gathering pace

By **ZHOU LANXU**
zhoulanxv@chinadaily.com.cn

China's digital yuan is gaining traction in cross-border use as a growing number of transactions point to broader and more regular commercial applications, potentially bolstering the renminbi's role in international settlement and payments, experts said.

The development comes as recent volatility in the United States Treasury market has renewed discussion about diversification of the international monetary system. Central bank digital currencies — including e-CNY or the digital yuan — have been viewed as one possible avenue for supporting a more diversified system, given their potential to make cross-border payments faster, less costly and more secure.

Against this backdrop, Ping An Bank recently said that its Hangzhou branch in Zhejiang province had made the first e-CNY transaction in the lender's cross-border business. Using the Multilateral Central Bank Digital Currency Bridge (mBridge), the branch had processed a goods trade settlement for a high-end manufacturer in Jiaxing, Zhejiang.

Ping An Bank said the transaction shortened the intermediate clearing chain and significantly improved transaction security and settlement efficiency compared with conventional cross-border remittances.

The mBridge project is a new type of multicurrency international cross-border infrastructure leveraging blockchain technology, allowing direct transactions in local digital currencies.

The platform's cumulative transaction value had reached almost 500 billion yuan ($74.4 billion) by end-2025, with more than 95 percent of the transactions made using e-CNY as of end-November 2025, according to the People's Bank of China.

This month, the Beijing Municipal Branch of the PBOC said that Postal Savings Bank of China's Beijing branch had completed the city's first mBridge cross-border transaction involving the Macao Special Administrative Region, making a payment to a Macao company related to public transport card settlement.

Last month, Industrial Bank also announced that it had launched in Guangzhou, Guangdong province mBridge payment services to the Macao SAR, while having lately used the platform to process a 500 million yuan cross-border transfer for an equity acquisition involving an industrial park.

"Together, the cases show that cross-border e-CNY payments have moved beyond proof-of-concept testing into real-value transactions, and are accelerating toward regular, large-scale use," said Lou Feipeng, a researcher at Postal Savings Bank of China.

"The next breakthroughs are likely to come from deeper expansion of application scenarios," Lou said, as the digital yuan is extending usage from goods trade into services trade, cross-border investment and financing, commodity transactions, shipping insurance and other financial activities.

Further progress will also require broader infrastructure connectivity and a stronger institutional ecosystem, including cross-border anti-money laundering cooperation, he added.

Policy and institutional support have been strengthened. At its work conference held this month, the PBOC called for improving cross-border digital yuan infrastructure. The central bank subsequently expanded the number of e-CNY operating institutions to 30, broadening the banking network that could develop related applications.

Miao Yanliang, chief economist at China International Capital Corp, said, "The digital yuan has the potential to expand the RMB's role in international settlement and payments, with its programmability enabling fast and secure large-value cross-border transactions."

However, Miao said that the key challenge is interoperability — connecting different payment infrastructures across jurisdictions while bridging differences in technical standards and compliance regimes, thereby broadening the range of markets and users the digital yuan can serve.

Unlocking growth via county-level markets

By **LI JING**
lijing2009@chinadaily.com.cn

China's vast county-level markets are rapidly evolving beyond a cheaper extension of urban markets into an increasingly important source of domestic consumer growth, industry experts and data show.

According to data from the National Bureau of Statistics, retail sales of consumer goods in rural areas climbed 2.4 percent year-on-year in the first seven months of this year, more than double the 1.1 percent growth in urban areas. Today, county and township economies generate approximately 40 percent of China's total GDP.

Rural retail growth has outpaced or roughly matched urban growth for 55 consecutive months, a span of more than four years, highlighting the durability of a shift in consumption toward smaller markets, said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

"Covering more than 90 percent of the nation's land area, county-level markets form complete, independent economic units with diverse consumption scenarios," Zhou said. "With rising living standards and incomes, pent-up demand for high-quality lifestyles is surging. This is being met by an influx of major retailers expanding downward, creating an efficient supply-and-demand alignment."

Crucially, experts note that county-level consumers enjoy a distinct structural advantage. "Compared with cities, consumers in county-level areas generally face significantly lower burdens for housing, mortgages and daily transportation," said Chen Liping, a professor specializing in retail at the Capital University of Economics and Business. "This lower cost structure frees up substantial disposable income, fostering stronger willingness to spend and higher resilience against economic headwinds."

However, stronger demand does not automatically translate into stronger brand sales. According to a recent report by market research firm NielsenIQ, also known as NIQ, county-level fast-moving consumer goods sales expanded 2.5 percent year-on-year, five times the 0.5 percent growth recorded in tier-one and tier-two cities. Yet, among the 20 leading FMCG manufacturers tracked by NIQ, only four posted sales gains in county markets, while 16 saw declines.

"County markets are no longer just a 'delayed version' of top-tier cities," said Ding Na, retail insights manager at NielsenIQ China. "Simply relying on downward channel expansion and price wars is no longer enough. Brands need to tailor their strategies to distinct local lifestyles and generational demands."

NIQ data show 53 percent of county consumers remain price-sensitive, while quality, practicality and experience are becoming more important. Consumers under 30 have relatively strong purchasing power and are increasingly interested in technology, design and new experiences, while older consumers tend to place greater weight on practicality and reliability.

"The diversity of county-level markets means businesses have broad room to develop new service models and create new momentum for consumption," said Shen Bing, a researcher at an institute under the National Development and Reform Commission.

Policy tailwinds are set to accelerate this transition. The Ministry of Commerce and eight other government departments released a guideline recently, setting out 18 measures covering upgrades to retail infrastructure, business format innovation, the supply of goods and services, distribution networks and financial support.

"County and township markets now hold the key to further consumption growth," said Yuan Xiaoming, assistant minister of commerce.

China's pet industry evolving at unprecedented rate

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

China's pet industry is evolving at a pace unmatched worldwide, with consumer and industrial upgrades that take five to seven years in mature markets compressed into just one to two years locally, Ganesh Ramani, general manager of Mars Pet Nutrition China, said in an exclusive interview with China Daily.

"The changes we see across the globe happen at a certain pace, but in China they happen much faster. The timelines are compressed," Ramani said on the sidelines of the 28th Pet Fair Asia held at the Shanghai New International Expo Center from Wednesday to Sunday, which gathered over 2,600 exhibitors from across the full pet industry chain.

Ramani attributed the speed to a comprehensive supply chain, a highly digital retail environment and strong social media influence. Additionally, the influx of first-time pet owners has further energized the market.

China is home to over 100 million pets, and most new pet-owning families have no multi-generational tradition of keeping animals. Consumers actively search for pet care knowledge online and are highly receptive to new information, fueling the growth of more than 3,000 pet food brands in constant innovation, said Ramani.

"Chinese consumers are probably among the most demanding in the world. They pay very close attention to what is on the back of the pack — they research ingredients, formulas, recipes and production processes, and look for validation of what companies are claiming," Ramani said, adding that such rational consumption will push the industry to raise standards and drive out speculative players.

This view echoes observations from Royal Canin, another Mars brand. Xu Juan, general manager of Royal Canin China, said the country's pet market has completed a transition from "quantity" to "quality" over three decades — evolving from functional home guarding to basic sustenance, then premium feeding, and now the pursuit of health and longevity. China has become the world's second-largest market by pet population, Xu said.

Strategic focus on China has translated into tangible investment. Mars Pet Nutrition entered the country in 1989 and started local manufacturing as early as 1995, making it one of the first foreign pet food companies to build production capacity here. Today, 90 percent of Mars' products sold in China are locally made.

"One of the key shifts we have made in recent years is building a portfolio designed around Chinese consumers and local insights," Ramani said, noting that more than 40 localized products have been launched since 2025. While Chinese factories currently prioritize domestic demand, innovations validated here may be exported to other markets in the future.

Royal Canin is also ramping up local manufacturing. With its Tianjin factory's wet pet food line now operational, the company has formed a Tianjin-Shanghai dual-factory footprint with both dry and wet pet food lines. The 88-gram single-serve can and Corgi-specific formula, Xu said, show how local consumer insights drive product innovation.

Pet aging is one of the most definitive niche trends. Xu said that around 20 million pets in China have reached senior age — pets over 7 and large breed dogs over 5 are considered early seniors — and it is estimated that half of the country's pets will be seniors by 2040. However, public awareness lags behind.

Mars Pet Nutrition is approaching the aging trend from a preventive nutrition angle. Ramani said the core logic behind the Nutro brand refresh is proactive health, as the gut serves as the first line of immune defense.

HK, Macao key gateways to the world

Cities are ideal testing grounds for products on way to overseas markets

By LI JIAYING
lijiaying@chinadaily.com.cn

For an autonomous driving company, moving a vehicle from a left-hand-drive market to a right-hand-drive city is not just a matter of shifting the steering wheel.

The work involves developing the system from the ground up, with everything from product definition and the vehicle platform to the autonomous-driving system and human-machine interface redesigned around the traffic rules, road conditions and user habits of right-hand-drive markets, according to Guangzhou, Guangdong province-based autonomous driving technology company WeRide.

That is why WeRide's new right-hand-drive Robotaxi project began in Hong Kong.

"Few cities offer a tougher real-world test for autonomous vehicles than Hong Kong, where dense roads, mixed traffic and a mature public transport system converge in one of the world's busiest right-hand-drive markets," said Tony Han, founder and CEO of WeRide.

The autonomous driving developer recently announced that it is working with vehicle maker Geely Farizon and local transport operator Kwoon Chung Bus Holdings on a mass-produced model designed around Hong Kong regulations, road conditions and operating requirements.

Han added that if the vehicle works in the city's dense traffic, the experience can support its expansion into other key right-hand-drive markets including Singapore, the United Kingdom, Japan and Australia.

WeRide is not alone in assigning Hong Kong a specific role in a wider innovation chain. For a growing group of Chinese mainland technology companies, Hong Kong and Macao are where products encounter new operating conditions, local partners and international capital before entering overseas markets.

China's 15th Five-Year Plan (2026-30) calls for faster progress toward high-level technological self-reliance and again supports Hong Kong as an international innovation and technology center. Hong Kong is also preparing its first five-year plan, where technological development is expected to play a pivotal role.

Technological self-reliance, however, does not mean geographic self-sufficiency. An algorithm developed in a Beijing laboratory may need to be engineered, financed, tested against different rules and sold into markets with different languages and business practices, just as the emerging Beijing-Guangdong-Hong Kong-Macao network connects those stages.

"Hong Kong and Macao boast diversified international business environments, leading innovation resources and mature global trade and financial systems," said Huang Heping, general manager of international business development at Beijing-based space company GalaxySpace.

"They are important gateways for mainland companies to connect with the global technology frontier, participate in international scientific cooperation and share China's innovation achievements," Huang said.

GalaxySpace develops communications payloads, satellite platforms and related systems and has built capacity for lower-cost, large-scale satellite production. In early 2025, it established a low-Earth orbit broadband demonstration station in Hong Kong, followed by a connected-car trial project, placing a mainland-developed satellite system in a local transport setting with Hong Kong researchers.

"Just as travelers need a power adapter when they go abroad, mainland space products need a 'converter' to enter international markets," Huang said. "Hong Kong is that crucial platform."

For GalaxySpace, the next steps include further tests, research cooperation and applications that can be assessed by local partners. "We believe Hong Kong and Macao will connect the mainland aerospace industry chain with the global market and create considerable value for the global space industry," Huang said.

Beijing Zhongke WengeAI Science and Technology Co is using Hong Kong in a different part of the same process. Founded in 2017 by artificial intelligence scientists from the Institute of Automation of the Chinese Academy of Sciences, the company specializing in AI-assisted decision-making went public on the Hong Kong bourse in June under the exchange's specialist technology company regime.

In a bid to provide further support for high-potential specialist technology companies in their pre-commercial or commercial stages, Hong Kong Exchanges and Clearing Limited, also known as HKEX, launched a listing framework under Chapter 18C of the Main Board Listing Rules in March 2023 to allow such companies in frontier sectors to list without meeting traditional profit or heavy revenue requirements.

> "Just as travelers need a power adapter when they go abroad, mainland space products need a 'converter' to enter international markets. Hong Kong is that crucial platform."
>
> **Huang Heping,** general manager of international business development at Beijing-based GalaxySpace

As of June 30, 21 specialist technology companies had been listed under the framework, raising a combined HK$38.74 billion ($4.94 billion) through their initial public offerings, according to data compiled by RyanBen Capital. Thirteen of them listed in the first half, raising HK$29.82 billion.

"What attracts us most to Hong Kong is its international business environment and its unique role as a bridge between the mainland and international financing markets," said Wang Lei, chairman of Wenge AI.

Wang said the company hopes its Hong Kong listing will broaden access to international capital, providing sustained support for core technology development, AI product upgrades and expansion into new application scenarios.

Its Hong Kong operation has also put it in contact with about a dozen overseas customers so far and allowed its products to be demonstrated in local financial settings, which can provide valuable feedback on compliance language, data formats and professional workflows, he said.

Macao offers a multilingual route into another group of markets. Pachira, an AI speech recognition, analysis and synthesis company, has placed core research and talent in Beijing, its Chinese mainland headquarters, and operating functions in Hengqin, an island district of Zhuhai in Guangdong, adjacent to Macao, and its international operations center in Macao.

"With Hengqin serving as the main base for commercialization, technologies refined in Beijing can be adapted to a wider range of applications and replicated at scale," said Ho Kuok Tou, founder and CEO of the company.

21
number of specialist technology companies that had been listed in Hong Kong under a new listing framework as of June 30

"Macao, meanwhile, provides a natural testing ground for our international expansion — its concentration of hotels, tourism and leisure businesses, and cross-border financial services allows AI products to sharpen their multilingual capabilities and readiness for global markets," Ho added.

To navigate Macao's multilingual environment and distinctive customer-service habits, Pachira has carried out localized iterations of its proprietary speech large language model. The resulting AI voice system, developed for local electricity supplier CEM, now handles high-volume billing inquiries, marking Macao's first use of an LLM in a customer-service system.

The company said it plans to use its Macao operation to pursue opportunities in Portuguese-speaking markets, initially targeting smart-energy and cross-border financial applications in Brazil, as well as factory-installed automotive systems and overseas banking operations in Portugal.

Hong Kong banking on AI, robotics acumen

By LI JIAYING

With Hong Kong's abundant internationally connected services sector enterprises, research and development capabilities, and financial advantages, the special administrative region is becoming a testing ground for robotics companies seeking to take embodied artificial intelligence into overseas markets.

"Hong Kong was chosen as our first overseas stop because reference cases tested here travel well to Southeast Asia, Japan and the Middle East, where some service patterns and consumer habits mirror those in Hong Kong," said Xie Yunpeng, chief development officer of Yunji Technology.

Founded in 2014, the Beijing-based service robot manufacturer established its international business headquarters in Hong Kong in October 2024 and was listed on the main board there a year later.

Now used in Hong Kong hotels, senior living facilities, hospitals and factories, the company's Hong Kong presence combines R&D, market development and support for overseas operations, including a joint innovation lab built by the company and Hong Kong Polytechnic University to push forward intelligent practices for hotel services.

"A robot making reliable deliveries along a hotel corridor may draw on a Beijing company's engineering capabilities, Hong Kong academics' strengths in hotel management research, and the city's international services-sector environment," Xie said.

The city's financial sector can also support continued research and wider deployment, Xie said, adding that the company hopes to build ties with regional conglomerates and family-run offices.

Government support is reinforcing that role. The Hong Kong SAR government's 2026-27 Budget published in February includes embodied AI for the first time, and outlines measures to guide market capital into AI, robotics and other strategic cutting-edge technological fields.

At the first Hong Kong Embodied AI Industry Summit in May, Hong Kong SAR Chief Executive John Lee Ka-chiu said Hong Kong will establish a committee on AI+ and industry development strategy to formulate policies for driving industrial transformation through AI, with an initial focus on life and health technology and embodied intelligence.

Embodied AI companies on the Chinese mainland are backing that interest with concrete plans. Shanghai-based AGIBOT said in May it would establish an international R&D headquarters in Hong Kong and, over five years, work with the HKSAR government to set up several joint industry-research laboratories, nurture dozens of start-ups and develop hundreds of industry partners. Shenzhen, Guangdong province-based Pudu Robotics is establishing R&D, operations and production centers in the city, while Beijing-based Galbot has also pledged to build a local team, co-found an international embodied-AI talent exchange center with Hong Kong universities, and test its robots in commercial, tourism and other service sector environments.

That strategy is beginning to show up in the companies' accounts. Yunji's latest interim results put first-half overseas revenue at 5.4 million yuan ($803,220), surging 638.1 percent year-on-year, although it still accounted for only 2.8 percent of group revenue.

Yunji attributed the increase to deliveries to new customers and wider channel coverage. As projects reached more customers and service environments, its business abroad has moved from early validation toward more consistent product delivery, the company said.

What robots are asked to do also changes from one market to another, Xie said. Dense delivery networks on the Chinese mainland generate a large number of food orders, while higher costs and thinner logistics networks overseas shift hotel robots toward guests' needs during their stays, such as bringing slippers or toiletries, he said.

"For overseas resorts offering children's souvenirs, specialty foods, medicines and translation-device rentals, robots can handle final deliveries 24/7," Xie said, adding that Yunji has linked its robots with retail outlets, allowing them to receive an order, collect the item and deliver it without human staff intervention.

A robot developed by Yunji Technology cooks noodles on July 7 while reporters visit the Beijing-based service robot manufacturer.
MENG JIA / XINHUA

"Imagine if one wants an iced coffee in the middle of the night, the front desk may no longer be staffed, but a robot can get it ready with one click and bring it straight to the room," Xie said. "That's where hotels eye the robots for higher non-room revenue."

More HK, Macao buyers obtain homes in mainland GBA cities

Better transport links and favorable living conditions are driving purchases

By ZHOU MO in Shenzhen
sally@chinadailyhk.com

Hong Kong and Macao residents bought a growing share of homes across mainland cities in the Guangdong-Hong Kong-Macao Greater Bay Area during the first half of this year, driven largely by better transport links and favorable living conditions.

According to the Zhongshan housing and urban-rural development bureau, the city recorded 9,308 commercial housing transactions between January and June, of which 23.2 percent were made by buyers from Hong Kong and Macao.

Earlier official figures also showed a growing presence of Hong Kong and Macao buyers in Zhongshan. The group accounted for more than 18 percent of the city's housing purchases in the first two months of 2025. By the first 10 months of that year, its share had exceeded 20 percent.

In Huizhou, Hong Kong and Macao residents bought an average of 4,865 homes a year over the past three years, accounting for 5 to 6 percent of the city's total residential transactions, according to data cited by Huizhou Daily.

The composition of those purchases is changing. Local media reported that second-hand home purchases by Hong Kong and Macao residents overtook new home purchases for the first time in 2024. The pattern continued through 2025 and the first half of 2026, with the gap widening.

Data from Jiangmen's housing authority showed that Hong Kong residents bought 760 homes in the city in the first half of this year, while more than 2,200 Hong Kong residents had purchased homes in the city since 2025.

Li Yujia, chief researcher at the residential policy research center of Guangdong planning institute, attributed the trend to improved transport connectivity, deeper regional integration and a favorable living environment.

"Links between Hong Kong and other mainland cities in the Greater Bay Area have become more convenient, while infrastructure, community facilities and the coordination of social services across the region have also improved," he said.

"Also, mainland cities in the Greater Bay Area offer a familiar linguistic, cultural and climatic environment while providing more living space at a comparatively lower cost for Hong Kong residents, particularly middle-aged and elderly residents."

Li noted that housing preferences among Hong Kong buyers have become more diverse. While some favor homes close to boundary crossings, properties delivered with interior decoration and communities with convenient transport links, others view mature community facilities, property management and easy access to cross-boundary transport as important considerations.

A Zhuhai-based property developer said Hong Kong and Macao residents accounted for more than 30 percent of total buyers in its Zhuhai projects in the first half of this year, up from 18 percent in 2025.

Lin Genghao, sales director of the Zhonghai Huanyu Tianxia residential project in Zhuhai, said more frequent cross-boundary travel and changing consumption patterns have contributed to the increase in Hong Kong and Macao buyers in Zhuhai.

"Most of their demand is for homes used for part-time residence or retirement," he said.

For Hong Kong buyers, who range from people in their 30s to around 65, Lin said three-bedroom homes of around 100 square meters and smaller two-bedroom units of around 60 to 70 sq m are the most common choices.

"Buyers with stronger purchasing power tend to place greater emphasis on views," he added.

Budgets also vary considerably among different groups of buyers. While ordinary Hong Kong buyers looking for retirement homes tend to seek properties priced between 1 million yuan and 1.5 million yuan ($149,000 to $223,000), wealthier ones prefer luxury residential projects priced from around 3 million yuan to 15 million yuan.

A Hong Kong resident who bought a home in Huizhou wrote on Chinese social media platform RedNote, or Xiaohongshu, that a pleasant environment and relatively low living costs were among the reasons for considering the city as a place to spend retirement.

Meanwhile, regional financial data provide another indication of cross-boundary property activity. The Guangdong branch of the People's Bank of China, the country's central bank, said it had handled 3,341 home-purchase transactions on the mainland for Hong Kong and Macao residents as of the end of June 2025, with cross-boundary inflows hitting 3.08 billion yuan.

Yao Xi contributed to this story.

Elephants test peaceful coexistence in Yunnan

By YAN YUJIE and **LIU BOQIAN**

Forty-two wild Asian elephants have gathered in a rural area of southwestern China's Yunnan province, moving between forests and farmland and occasionally venturing near villages.

The elephants, belonging to three herds, have been feeding in maize fields and passing close to villages in Mengxian township in Ning'er Hani and Yi autonomous county, prompting authorities to step up efforts to keep both people and elephants safe.

Their return is a sign of a recovering ecosystem. But for people sharing the landscape with the elephants, it also brings the challenge of living alongside them.

In Mengxian, the elephants have become a familiar sight since April this year, with their numbers reaching an annual peak in August.

For Fu Chun, a 50-year-old resident of Zhushan village, the animals are hardly strangers. He has worked as an elephant monitor for more than a decade.

Since the herds arrived, Fu has spent his days tracking the elephants and warning villagers to keep away from their activity areas, particularly when farmers are working in the fields.

At times, the elephants have come within about 500 meters of him. When one charges, monitors run uphill.

"It doesn't happen often. Most of the time, we can keep a safe distance," Fu said.

The first elephant of the year arrived in Zhushan in April. The number detected in the area has risen sharply, from nine on Aug 14 to 42 on Sunday.

The elephants move between Ning'er and neighboring Jiangcheng Hani and Yi autonomous county.

"They come and go," said Wang Siqi, a worker with the agriculture and rural development service center in Mengxian township. "In some years, they come almost every month."

The elephants typically enter Mengxian from Dashujiao village in Jiangcheng, moving through forests and farmland in search of food. Based on past patterns, Wang said they are unlikely to continue north and will probably remain around Zhushan village and nearby areas.

Greater forest coverage and stronger biodiversity protection have made the area increasingly suitable for Asian elephants, Wang said. But forests, farmland and villages now overlap with the animals' routes, making encounters difficult to avoid.

"Elephants do not only live inside protected areas, they also live outside, where they interact with people," said Ahimsa Campos-Arceiz, a Spanish ecologist and professor at the Xishuangbanna Tropical Botanical Garden of the Chinese Academy of Sciences.

"They need to move from one place to another, instead of staying in the same place forever," he said. "We don't expect human-elephant conflict to finish. What we want is to make the conflict not too intense."

A revised wildlife protection regulation in Yunnan, which took effect on Aug 15, further strengthened measures covering habitat protection, monitoring and early warning, wildlife corridors and compensation for damage caused by wild animals.

In Zhushan village, that means drones in the sky and monitors on the ground.

Six monitors are deployed each day to track the elephants. When the animals are far from villages, drones typically survey the area every 30 minutes. At night, thermal-imaging drones are used to track their movements.

Once the elephants' location is confirmed, the information is shared in villagers' WeChat groups, warning residents to stay away and avoid working in affected fields.

The cost of coexistence is also partly offset through insurance.

Forestry authorities in Pu'er city have purchased insurance covering wildlife-related damage, including compensation for injuries, crop losses and some property damage caused by Asian elephants.

For example, compensation for rubber trees more than five years old is set at 52 yuan ($7.74) per tree. Damage to brick-and-timber structures is compensated at 300 yuan per square meter.

Ecological action protects Xizang salmon industry

By YANG ZEKUN in Shigatse, Xizang
yangzekun@chinadaily.com.cn

Clear water has resumed running through a section of the Yadong River in Dromo county, Xizang autonomous region, while new grass sprouts on land once covered by construction debris — tangible signs of ecological restoration that prosecutors say helped avert risks to a local salmon industry.

The changes followed a public-interest litigation investigation into pollution upstream from salmon farms in local Xiayadong township.

Penpa Norbu, deputy chief procurator of the Dromo County People's Procuratorate, said prosecutors discovered large amounts of food packaging, construction waste and other rubbish scattered and piled along the riverbank while conducting follow-up supervision in connection with Xizang's second round of ecological and environmental protection inspections.

Waste was stacked nearly 1 meter high in some places without protective measures. Temporary toilets at a construction site lacked septic tanks or wastewater collection facilities, allowing domestic sewage to flow directly into the river.

Downstream, sections of the river had turned yellow and turbid and carried a noticeable sewage odor.

The river is the main water source for nearby salmon farms, leaving operators vulnerable to pollution originating upstream.

"The farms could only passively bear the consequences because the pollution sources were beyond their control," Penpa Norbu said.

Farm operators reported that some salmon had died or shown abnormal behavior. They feared greater economic losses if sewage and waste continued entering the river.

Yadong salmon, recognized as a geographical indication product, is one of the border county's best-known specialties and relies heavily on clean, cold plateau water. Wild Yadong salmon, classified as second-class protected aquatic wildlife in Xizang, are found only in a nearly 20-kilometer stretch of mountain streams running from Shangyadong township to Xiayadong township. The local commercial industry, meanwhile, uses legally bred sterile triploid fish.

The farm involved in the case has 20 breeding pools and produces about 200,000 salmon fry annually.

Since its establishment in 2019 through 2025, the local cooperative generated more than 8 million yuan ($1.2 million) in revenue from salmon sales and distributed more than 5 million yuan in dividends to residents.

Across the county, the salmon industry has helped 857 households and more than 2,300 border residents increase their income through employment and related economic activities.

Given the potential threat to both the environment and local livelihoods, prosecutors moved their consultation meeting from an office to the riverbank.

They conducted field inspections, used drones to collect evidence and visited salmon farms before bringing relevant government departments and the construction company together at the site.

Prosecutors presented evidence, clarified the regulatory responsibilities of different parties and coordinated discussions on an immediate remediation plan.

The construction company, responsible for an infrastructure project in the upper reaches of the river and whose proximity to the river caused pollution, was initially reluctant to make changes, Penpa Norbu said. It regarded the waste and sewage as temporary by-products of construction and underestimated the potential impact on salmon farms downstream.

"The main obstacle was not funding or the construction schedule, but weak environmental awareness on the part of the company," he said.

After prosecutors explained the relevant legal responsibilities and potential damage to the public interest, the company agreed to remove the rubbish, improve sewage disposal facilities and strengthen daily management.

However, the remediation process was not entirely smooth.

Because the construction area lacked a regular waste collection system, rubbish would begin accumulating again whenever removal was delayed by a day or two.

Prosecutors therefore carried out unannounced inspections and follow-up visits, urging the company to install garbage bins, build standardized sewage treatment facilities, establish enclosed temporary waste storage areas and introduce a daily collection system, with designated personnel responsible for implementation.

Grass seed was also planted on damaged bare land.

"When we returned, the river was clear again, and what touched us most was seeing new shoots emerging from land that had been damaged by old temporary structures," Penpa Norbu said.

"Vegetation grows extremely slowly on the plateau, so seeing those new shoots was the most direct evidence that the restoration was taking effect."

The case later prompted prosecutors to look beyond the area around the salmon farms.

Dromo county, also known as Yadong county, is an important border area with a frontier stretching about 290 km. As infrastructure projects have advanced, prosecutors have also identified problems including waste dumping, damage to native grassland and unauthorized excavation at some construction sites.

Prosecutors have since worked with multiple government departments to push for corrective measures and urge construction companies to standardize operations, seeking to protect the fragile plateau environment while allowing border infrastructure projects to proceed.

For Penpa Norbu, the salmon case showcased how environmental protection and economic development can reinforce each other.

"Protecting the river also means protecting an important source of income for local people," he said. "In the end, we safeguarded both the environment and their livelihoods."

Robot on the line

China's massive parcel logistics industry embraces tech in race for efficiency

By LUO WANGSHU in Guangzhou
luowangshu@chinadaily.com.cn

At a busy parcel sorting center in Guangzhou, Guangdong province, a humanoid robot works alongside human colleagues on a sorting line, repeatedly picking up packages and feeding them into the system. On a large screen overlooking the floor, its output is displayed directly against performance figures for human workers.

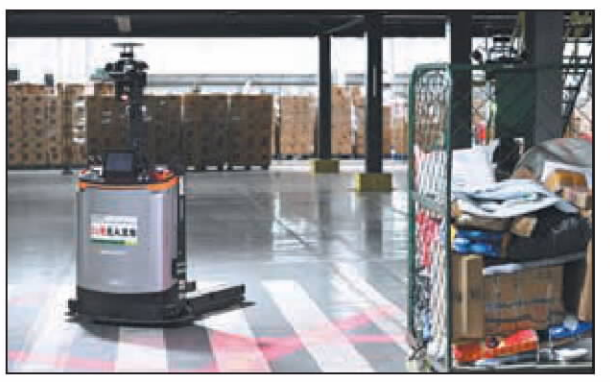
It does not tire, but for now, it remains slower and far more expensive than an experienced human operator.

Eight of these humanoid units have undergone trial runs at the center since March, capable of feeding as many as 1,200 parcels an hour into the sorting system, said He Yong, deputy director of China Post's Jianggao mail processing center.

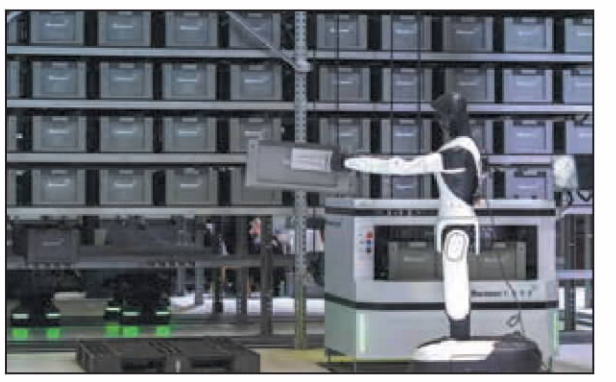
Yet while eye-catching, the machines represent a technology still in its rough experimental phase — a high-tech snapshot of the transformation unfolding across China's logistics landscape.

By 2030, annual express delivery volume is expected to reach 270 billion items, according to the country's postal industry development plan for the 15th Five-Year Plan (2026-30) period.

After decades of explosive, volume-driven growth powered by the expansion of e-commerce, China's express delivery sector has reached a structural turning point. Volume is no longer the metric that matters most.



Handling over 100 billion parcels in the first half of the year alone, logistics giants can no longer survive simply by adding handling capacity, and so have shifted their focus to operational efficiency and unit-cost reduction.



Companies are increasingly turning to artificial intelligence, robotics, autonomous vehicles and digital management systems to improve the efficiency and resilience of one of the world's largest logistics networks.

Test bed at scale

According to the postal sector's current Five-Year Plan, China aims for an 88 percent full-automation rate across large-scale processing centers.

In Guangdong, which processes approximately 22 percent of the national parcel volume, automation is expanding rapidly. Automated guided vehicles traverse warehouse floors, while 820 autonomous delivery vehicles and 247 drones operate across urban routes.

At large processing centers in Guangzhou, automation has moved well beyond conventional conveyor belts.

Robotic arms feed parcels into sorting systems, automated guided vehicles move cages and pallets across processing floors, while software increasingly monitors parcel flows and adjusts equipment in real time.

One digital system, for example, monitors congestion across sorting lines and automatically adjusts their operating speeds when traffic begins to build. At one processing center, sorting-line jams during the night shift fell from more than 20 a month to just one after the system was introduced, according to He.

Another trial system uses three-dimensional sensing to measure how much space remains inside trucks, check whether parcels are loaded properly and alert workers as vehicles approach loading bays. The center said it has cut waiting time between successive vehicles by about 20 percent.

Such changes point to an important evolution in logistics technology. Earlier automation largely focused on replacing a particular manual task with a machine. Increasingly, digital systems are being used to detect problems, adjust operations and coordinate equipment across an entire processing center.

Real-world problems

The same shift is taking place among logistics technology suppliers.

At Guangzhou-based Genye Technology, engineers have developed a three-dimensional sorting system aimed at two persistent problems in warehousing — long picking routes and limited floor space.

"Warehouse pickers used to spend much of their time walking back and forth between shelves. When orders surged, they were constantly on their feet, while labor and space costs kept rising," said Zuo Wen, general manager of the company's innovation business center.

"We developed the 3D sorting wall precisely to address those practical problems on the front line."

Instead of spreading sorting destinations across a large horizontal area, the system uses AI vision to identify items and scheduling software to direct them to vertically arranged compartments, allowing more sorting positions to be packed into a smaller footprint.

Genye said its larger systems can process up to 20,000 items an hour while taking up roughly half the space of conventional layouts.

The example illustrates how logistics technology is increasingly being designed around specific operational bottlenecks rather than automation for its own sake.

That technology is also moving out of warehouses and processing centers.

In Foshan, also in Guangdong, autonomous delivery vehicles are being tested on routes connecting express outlets, parcel stations and other logistics nodes. The city currently has 124 postal and express delivery autonomous vehicles involved in road testing across 219 routes, according to the Foshan Postal Administration.

Some companies are also experimenting with shared autonomous transport, allowing retailers and other small businesses to summon unmanned vehicles when they need to move goods rather than purchasing vehicles themselves.

The model points to a wider possibility of autonomous vehicles eventually becoming flexible urban logistics capacity rather than equipment dedicated to a single company.

National push

The postal industry's 15th Five-Year Plan calls for China to "actively develop smart postal services" and significantly increase digitalization across the delivery process. It also calls for wider use of artificial intelligence in customer service, operations, transport, collection and delivery, safety, management and warehousing, as well as upgrades to sorting, loading, transport and other equipment.

Hu Kai, spokesman for the State Post Bureau of China and director-general of its department of policies and regulations, said the sector would promote the "broad and deep integration" of AI with postal and express delivery services, accelerating applications ranging from intelligent transport and warehousing to operations and last-mile delivery.

Chen Kai, deputy head of the State Post Bureau, also said the sector will seek to extract greater value from industry data, strengthen the use of AI and develop low-altitude delivery logistics.

The push comes as the industry itself enters a different stage of development.

During the previous five-year period, China's express delivery volume rose from more than 80 billion parcels a year to nearly 200 billion, while postal industry revenue increased from 1.1 trillion yuan to 1.8 trillion yuan, according to the bureau.

The new planning period places greater emphasis on quality and efficiency rather than expansion alone.

That makes technologies such as AI, robotics and autonomous transport important not simply because they are novel, but because relatively small efficiency gains can be multiplied across an enormous network.

Human cost

For an industry that is estimated to employ as many as 8 million people, this tech-forward efficiency drive carries potentially profound consequences.

Despite this, automation does not necessarily mean removing people completely.

Parcel handling remains difficult to fully automate. Packages come in different shapes, materials and weights, while soft bags and irregular parcels can still pose problems for machines. When equipment encounters an exception, human workers often step in.

At some processing centers, the result is a gradual change in job roles rather than straightforward replacement. Workers who once spent much of their shifts repeatedly feeding parcels or moving heavy loads are increasingly taking on equipment inspection, system monitoring and exception handling.
